<thead>
<tr>
<th>Property</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>false</td>
<td>false</td>
</tr>
</tbody>
</table>

**-ProvisioningType**

Specifies the provisioning type for the catalog. Values can be:

- Manual - No provisioning.
- PVS - Machine provisioned by PVS (machine may be physical, blade, VM...).
- **MCS** - Machine provisioned by MCS (machine must be VM).

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **PublishedApplication**<String>

  Gets desktops with a specific application published on them (identified by its browser name).

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **PublishedName**<String>

  Gets desktops with a specific published name.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **PvdStage**<PvdStage>

  Gets machines with a specific personal vDisk stage.

  Valid values are None, Requested, Starting and Working.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **RegistrationState**<RegistrationState>

  Gets desktops with a specific registration state.

  Valid values are Unregistered, Initializing, Registered and AgentError.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **SecureicaActive**<Boolean>

  Gets desktops depending on whether the current session uses SecureICA or not.

  Session properties are always $null for multi-session desktops.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **SecureicaRequired**<Boolean>
Gets desktops configured with a particular SecureICARequired setting. Note that the desktop setting of $null indicates that the desktop group value is used. Session properties are always $null for multi-session desktops.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-SessionHidden<Boolean>

Gets desktops by whether their sessions are hidden or not. Hidden sessions are treated as though they do not exist when launching sessions; a hidden session cannot be reconnected to, but a new session may be launched using the same entitlement. Session properties are always $null for multi-session desktops.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-SessionId<int32>

Deprecated.

Gets desktops by session ID, a unique identifier that Remote Desktop Services uses to track the session but it is only unique on that machine.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-SessionState<SessionState>

Gets desktops with a specific session state. Valid values are $null, Other, PreparingSession, Connected, Active, Disconnected, Reconnecting, NonBrokeredSession, and Unknown. Session properties are always $null for multi-session desktops.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-SessionStateChangeTime<DateTime>

Gets desktops whose sessions last changed state at a specific time. Session properties are always $null for multi-session desktops.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-SessionUid<int64>

Gets desktops with a specific session UID ($null for no session).
Session properties are always $null for multi-session desktops.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>-SessionUserName</strong></td>
<td>false</td>
<td></td>
<td>false</td>
</tr>
<tr>
<td><strong>-SessionUserSID</strong></td>
<td>false</td>
<td></td>
<td>false</td>
</tr>
<tr>
<td><strong>-SID</strong></td>
<td>false</td>
<td></td>
<td>false</td>
</tr>
<tr>
<td><strong>-SmartAccessTag</strong></td>
<td>false</td>
<td></td>
<td>false</td>
</tr>
<tr>
<td><strong>-StartTime</strong></td>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>
**-SummaryState**<DesktopSummaryState>

Gets desktops with a specific summary state.

Valid values are Off, Unregistered, Available, Disconnected, and InUse.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-Tag**<String>

Gets desktops with a specific tag.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-WillShutdownAfterUse**<Boolean>

Gets desktops depending on whether they shut down after use or not.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-ApplicationUid**<Int32>

Gets desktops with a specific published application (identified by its UID).

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-ReturnTotalRecordCount**<SwitchParameter>

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>False</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-MaxRecordCount**<Int32>

Specifies the maximum number of records to return.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>250</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-Skip**<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

**-SortBy/String**

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

**Filter/String**

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

**-AdminAddress/String**

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

**Input Type**

None You cannot pipe input into this cmdlet.

**Return Values**

Citrix.BrokerAdminSDK.GroupInfo

Each GroupInfo object represents one group, and contains the following properties:

-- Count: The count of desktops in this group.

-- Name: The value of the property the desktops were grouped by (as a string).

If you do not specify -SortBy, groups are sorted with the largest count first.

**Notes**

To compare dates or times, use -Filter and relative comparisons. For more information, see about_Broker_Filtering and the examples.

**Examples**

------------- EXAMPLE 1 ---------------

C:\PS> Group-BrokerDesktop -Property SummaryState -DesktopGroupName dg1
Group desktops from the dg1 group by summary state.
-------------------------- EXAMPLE 2 --------------------------

C:\PS> Group-BrokerDesktop -Property LastConnectionFailure -Filter { LastConnectionFailure -ne "None" -and LastConnectionTime -ge '-7' } -MaxRecordCount 1
For desktops where the last connection attempt failed, list the most common reason for failure, ignoring connections that failed over a week ago.

-------------------------- EXAMPLE 3 --------------------------

C:\PS> Group-BrokerDesktop -Property HostingServerName -DesktopCondition ICALatency -SortBy Name
List alphabetically the hypervisor servers hosting desktops that are currently experiencing high network latency.
Group-BrokerMachine

Oct 01, 2013
Groups and counts machines with the same value for a specified property.

Syntax

Group-BrokerMachine [-Uid <Int32>] -Property <String> [-AdminAddress <String>] [<CommonParameters>]
Group-BrokerMachine -Property <String> [{[MachineName <String>] [AgentVersion <String>] [AllocationType <AllocationType>] [ApplicationInUse <String>] [AssignedClientName <String>] [AssignedIPAddress <String>] [AssociatedUserFullName <String>] [AssociatedUserName <String>] [AssociatedUserSID <String>] [AssociatedUserUPN <String>] [CatalogName <String>] [CatalogUid <Int32>] [CatalogUUID <Guid>] [ColorDepth <ColorDepth>] [ControllerDNSName <String>] [DeliveryType <DeliveryType>] [Description <String>] [DesktopCondition <String>] [DesktopGroupName <String>] [DesktopGroupUid <Int32>] [DesktopGroupUUID <Guid>] [DesktopKind <DesktopKind>] [DesktopUid <Int32>] [DNSName <String>] [FaultState MachineFaultState] [FunctionalLevel FunctionalLevel] [HostedMachineId <String>] [HostedMachineName <String>] [HostingServerName <String>] [HypervisorConnectionName <String>] [HypervisorConnectionUid <Int32>] [HypervisorState <String>] [HypervisorStateDetails <String>] [ImageOutOfDate <Boolean>] [InMaintenanceMode <Boolean>] [IsAssigned <Boolean>] [IsPhysical <Boolean>] [LastConnectionFailure <Boolean>] [LastConnectionTime <DateTime>] [LastConnectionUser <String>] [LastDeregistrationReason <DeregistrationReason>] [LastDeregistrationTime <DateTime>] [LastHostingUpdateTime <DateTime>] [LoadIndex <Int32>] [MachineInternalState <MachineInternalState>] [Metadata <String>] [OSType <String>] [OSVersion <String>] [PersistUserChanges <PersistUserChanges>] [PowerActionPending <Boolean>] [PowerState <PowerState>] [PowerStatus <PowerStatus>] [ProvisioningType ProvisioningType] [PublishedApplication <String>] [PublishedName <String>] [PvdStage PvdStage] [RegistrationState RegistrationState] [ScheduledReboot ScheduledReboot] [SecureICARequired <Boolean>] [SessionAutonomouslyBrokered <Boolean>] [SessionClientAddress <String>] [SessionClientName <String>] [SessionClientVersion <String>] [SessionConnectedViaHostName <String>] [SessionConnectedViaIP <String>] [SessionCount <Int32>] [SessionDeviceId <String>] [SessionHardwareId <String>] [SessionHidden <Boolean>] [SessionKey <Guid>] [SessionLaunchedViaHostName <String>] [SessionLaunchedViaIP <String>] [SessionProtocol <String>] [SessionSecureICAActive <Boolean>] [SessionsEstablished <Int32>] [SessionSmartAccessTag <String>] [SessionsPending <Int32>] [SessionStartDateTime <DateTime>] [SessionState <SessionState>] [SessionStateChangeTime <DateTime>] [SessionSupport <SessionSupport>] [SessionUid <Int64>] [SessionUserName <String>] [SessionUserSID <String>] [SID <String>] [SummaryState DesktopSummaryState] [Tag <String>] [UUID <Guid>] [VMToolsState VMToolsState] [WillShutDownAfterUse <Boolean>] [WindowsConnectionSetting <WindowsConnectionSetting>] [WithSession <Boolean>] [ReturnTotalRecordCount] [MaxRecordCount <Int32>] [Skip <Int32>] [SortBy <String>] [Filter <String>] [AdminAddress <String>] [<CommonParameters>]

Detailed Description

Filters machines using the specified criteria, then groups and counts matching machines with the same value for a particular property. The number of machines in the group, and the property value for the group, is output. For example:

C:\PS> Group-BrokerMachine -Property SummaryState

Count Name
----- ----
43 Available
17 InUse
3 Disconnected

Filtering supports the same options as the Get-BrokerMachine cmdlet, and allows filtering on both machine and session properties.

Group-BrokerMachine is similar to the standard PowerShell Group-Object, but is faster than piping the output of Get-BrokerMachine into Group-Object when working with many machines.

Note that the MaxRecordCount, ReturnTotalRecordCount, Skip, and SortBy parameters apply to GroupInfo records output rather than the filtered machines.

</tbody>
</table>

**-CatalogUid**<Int32>

Gets machines from the catalog with the specific UID.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

**-CatalogUUID**<Guid>

Gets machines from the catalog with the specific UUID.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

**-ColorDepth**<ColorDepth>

Gets machines configured with a specific color depth.

Valid values are FourBit, EightBit, SixteenBit, and TwentyFourBit.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

**-ControllerDNSName**<String>

Gets machines by the DNS name of the controller they are registered with.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

**-DeliveryType**<DeliveryType>

Gets machines of a particular delivery type.

Valid values are AppsOnly, DesktopsOnly, DesktopsAndApps

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

**-Description**<String>

Get machines by description.

| Required? | false |
-DesktopCondition:String
Gets machines with an outstanding desktop condition condition.
Valid values are:
  o CPU: Indicates the machine has high CPU usage
  o ICALatency: Indicates the network latency is high
  o UPMLogonTime: Indicates that the profile load time was high

-DesktopGroupName<String>
Gets machines from a desktop group with the specified name.

-DesktopGroupUid<Int32>
Gets machines from a desktop group with a specific UID.

-DesktopGroupUUID<Guid>
Gets machines from a desktop group with a specific UUID.

-DesktopKind<DesktopKind>
Deprecated: Use AllocationType parameter.
Gets machines of a particular kind.
Valid values are Private, Shared.
-DesktopUid<Int32>

Gets the machine that corresponds to the desktop with the specific UID.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>

</tr>
</tbody>
</table>

-HostedMachineId<String>

Gets machines with the specific machine ID known to the hypervisor.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-HostedMachineName<String>

Gets machines with the specific machine name known to the hypervisor.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-HostingServerName<String>

Gets machines by the name of the hosting hypervisor server.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Required?</strong></td>
<td>false</td>
</tr>
<tr>

</table>

**-IconUid**<Int32>

Gets machines by configured icon. Note that machines with a null IconUid use the icon of the desktop group.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-ImageOutOfDate**<Boolean>

Gets machines by whether their disk image is out of date (for machines provisioned using MCS only).

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-InMaintenanceMode**<Boolean>

Gets machines by whether they are in maintenance mode or not.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------</td>
</tr>
<tr>
<td>-IPAddress &lt;String&gt;</td>
<td>Gets machines with a specific IP address.</td>
</tr>
<tr>
<td>Required?</td>
<td>false</td>
</tr>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-IsAssigned <Boolean>**

Gets machines according to whether they are assigned or not. Machines may be assigned to one or more users or groups, a client IP address or a client endpoint name.

| Required?             | false |
| Default Value         |       |
| Accept Pipeline Input?| false |

**-IsPhysical <Boolean>**

Gets machines according to whether they can be power managed by XenDesktop.

| Required?             | false |
| Default Value         |       |
| Accept Pipeline Input?| false |

**-LastConnectionFailure <ConnectionFailureReason>**

Gets machines with a specific reason for the last recorded connection failure. This value is None if the last connection was successful or if there has been no attempt to connect to the machine yet.

Valid values are None, SessionPreparation, RegistrationTimeout, ConnectionTimeout, Licensing, Ticketing, and Other.

| Required?             | false |
| Default Value         |       |
| Accept Pipeline Input?| false |

**-LastConnectionTime <DateTime>**

Gets machines to which a user session connection occurred at a specific time. This is the time that the broker detected that the connection attempt either succeeded or failed.

| Required?             | false |
| Default Value         |       |
| Accept Pipeline Input?| false |

**-LastConnectionUser <String>**

Gets machines where a specific user name last attempted a connection (in the form 'domain\user').

<p>| Required?             | false |
| Default Value         |       |</p>
<table>
<thead>
<tr>

<td></td>
<td>Gets machines with the specified last error reason.</td>
</tr>
<tr>
<td>-LastErrorTime**&lt;DateTime&gt;**</td>
<td></td>
<td>Gets machines with the specified last error time.</td>
</tr>
<tr>
<td>-LastHostingUpdateTime**&lt;DateTime&gt;**</td>
<td></td>
<td>Gets machines with a specific time that the hosting information was last updated.</td>
</tr>
<tr>
<td>-LoadIndex**&lt;Int32&gt;**</td>
<td></td>
<td>Gets machines by their current load index.</td>
</tr>
</tbody>
</table>
### Default Value

| Accept Pipeline Input? | false |

### MachineInternalState

**MachineInternalState**<MachineInternalState>

Gets machines with the specified internal state.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

### Metadata

**Metadata**<String>

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: `-Metadata "abc:x*"` matches records with a metadata entry having a key name of "abc" and a value starting with the letter "x".

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

### OSType

**OSType**<String>

Gets machines by the type of operating system they are running.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

### OSVersion

**OSVersion**<String>

Gets machines by the version of the operating system they are running.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

### PersistUserChanges

**PersistUserChanges**<PersistUserChanges>

Gets machines according to the location where the user changes will be persisted. Values can be:

- **OnLocal** - User changes are persisted locally.
- **Discard** - User changes are discarded.
- **OnPvd** - User changes are persisted on the Pvd.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

### PowerActionPending

**PowerActionPending**<Boolean>
Gets machines depending on whether a power action is pending or not.

Valid values are $true or $false.

| Required? | false |
| Default Value |
| Accept Pipeline Input? | false |

- `PowerState`<sup>PowerState</sup>

Gets machines with a specific power state.

Valid values are Unmanaged, Unknown, Unavailable, Off, On, Suspended, TurningOn, TurningOff, Suspending, and Resuming.

| Required? | false |
| Default Value |
| Accept Pipeline Input? | false |

- `ProvisioningType`<sup>ProvisioningType</sup>

Specifies the provisioning type for the catalog. Values can be:

- Manual - No provisioning.
- PVS - Machine provisioned by PVS (machine may be physical, blade, VM,...).
- MCS - Machine provisioned by MCS (machine must be VM).

| Required? | false |
| Default Value |
| Accept Pipeline Input? | false |

- `PublishedApplication`<sup>String</sup>

Gets machines with a specific application published to them (identified by its browser name).

| Required? | false |
| Default Value |
| Accept Pipeline Input? | false |

- `PublishedName`<sup>String</sup>

Gets desktops with a specific published name.

| Required? | false |
| Default Value |
| Accept Pipeline Input? | false |

- `PvdStage`<sup>PvdStage</sup>

Gets machines at a specific personal vDisk stage.

Valid values are None, Requested, PoweringOn and Working.

| Required? | false |
| Default Value |
| Accept Pipeline Input? | false |
### -RegistrationState

Gets machines in a specific registration state.

Valid values are Unregistered, Initializing, Registered, and AgentError.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

### -ScheduledReboot

Gets machines according to their current status with respect to any scheduled reboots (for either scheduled desktop group reboots or image rollout purposes).

Valid values are:

- None - No reboot currently scheduled.
- Pending - Reboot scheduled but machine still available for use.
- Draining - Reboot scheduled. New logons are disabled, but reconnections to existing sessions are allowed.
- InProgress - Machine is actively being rebooted.
- Natural - Natural reboot in progress. Machine is awaiting a restart.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

### -SecureIcaRequired

Gets machines configured with a particular SecureIcaRequired setting. Note that the machine setting of $null indicates that the desktop group value is used.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

### -SessionAutonomouslyBrokered

Gets machines with the autonomously brokered session flag.

Session properties are always $null for multi-session machines.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

### -SessionClientAddress

Gets machines with a specific client IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>false</td>

<tr>
<td>Parameter</td>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>---------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td></td>
</tr>
<tr>
<td>-SessionClientName&lt;String&gt;</td>
<td>Gets machines with a specific client name.</td>
<td></td>
</tr>
<tr>
<td>-SessionClientVersion&lt;String&gt;</td>
<td>Gets machines with a specific client version.</td>
<td></td>
</tr>
<tr>
<td>-SessionConnectedViaHostName&lt;String&gt;</td>
<td>Gets machines with a specific host name of the incoming connection. This is usually a proxy or Citrix Access Gateway server. Session properties are always null for multi-session machines.</td>
<td></td>
</tr>
<tr>
<td>-SessionConnectedViaIP&lt;String&gt;</td>
<td>Gets machines with a specific IP address of the incoming connection. Session properties are always null for multi-session machines.</td>
<td></td>
</tr>
<tr>
<td>-SessionCount&lt;Int32&gt;</td>
<td>Gets machines according to the total number of both pending and established user sessions on the machine.</td>
<td></td>
</tr>
<tr>
<td>-SessionDeviceId&lt;String&gt;</td>
<td>Gets machines with a specific client device ID.</td>
<td></td>
</tr>
</tbody>
</table>

| Accept Pipeline Input?    | false       |                                                                             |
| -SessionLaunchedViaIP     | <String>    | Gets machines with a specific IP address of the Web Interface server from    |
| Required?                 | false       | which the user launched the session.                                        |
|                           |             | Session properties are always $null for multi-session machines.             |
| Default Value             |             |                                                                             |
| Accept Pipeline Input?    | false       |                                                                             |
| -SessionProtocol          | <String>    | Gets machines with connections using a specific protocol, for example 'HDX', |
| Required?                 | false       | or 'RDP'.                                                                   |
| Default Value             |             |                                                                             |
| Accept Pipeline Input?    | false       |                                                                             |
### -SessionSecureicaActive

**Type:** Boolean

Gets machines depending on whether the current session uses SecureICA or not. Session properties are always $null for multi-session machines.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -SessionsEstablished

**Type:** Int32

Gets machines according to the number of established user sessions present on the machine.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -SessionSmartAccessTag

**Type:** String

Gets session machines where the session has the specific SmartAccess tag. Session properties are always $null for multi-session machines.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -SessionsPending

**Type:** Int32

Get machines according to the number of pending user sessions for the machine.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -SessionStartTime

**Type:** DateTime

Gets machines with a specific session start time. Session properties are always $null for multi-session machines.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -SessionState

**Type:** SessionState

Gets machines with a specific session state. Valid values are $null, Other, PreparingSession, Connected, Active, Disconnected, Reconnecting, NonBrokeredSession, and Unknown.
Session properties are always $null for multi-session machines.

<table>
<thead>
<tr>
<th>Property</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>-SessionStateChangeTime &lt;DateTime&gt;</td>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

Gets machines whose sessions last changed state at a specific time.

Session properties are always $null for multi-session machines.

<table>
<thead>
<tr>
<th>Property</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>-SessionSupport &lt;SessionSupport&gt;</td>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

Gets machines that have the specified session capability. Values can be:

- SingleSession - Single-session only machine.
- MultiSession - Multi-session capable machine.

<table>
<thead>
<tr>
<th>Property</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>-SessionUid &lt;int64&gt;</td>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

Gets single-session machines with a specific session U ID ($null for no session).

Session properties are always $null for multi-session machines.

<table>
<thead>
<tr>
<th>Property</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>-SessionUserName &lt;String&gt;</td>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

Gets machines with a specific user name for the current session (in the form 'domain\user').

Session properties are always $null for multi-session machines.

<table>
<thead>
<tr>
<th>Property</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>-SessionUserSID &lt;String&gt;</td>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

Gets machines with a specific SID of the current session user.

Session properties are always $null for multi-session machines.
<table>
<thead>
<tr>
<th>Field</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-SID</code>&lt;String&gt;</td>
<td>false</td>
<td></td>
<td>false</td>
</tr>
<tr>
<td>Gets machines with a specific machine SID.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>-SummaryState</code>&lt;DesktopSummaryState&gt;</td>
<td>false</td>
<td></td>
<td>false</td>
</tr>
<tr>
<td>Gets machines with a specific summary state.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>Valid values are Off, Unregistered, Available, Disconnected, and InUse.</code></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>-Tag</code>&lt;String&gt;</td>
<td>false</td>
<td></td>
<td>false</td>
</tr>
<tr>
<td>Gets machines where the session has the given SmartAccess tag.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>-UUID</code>&lt;Guid&gt;</td>
<td>false</td>
<td></td>
<td>false</td>
</tr>
<tr>
<td>Gets machines with the specified value of UUID.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>-VMToolsState</code>&lt;VMToolsState&gt;</td>
<td>false</td>
<td></td>
<td>false</td>
</tr>
<tr>
<td>Gets machines with a specific VM tools state.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>Valid values are NotPresent, Unknown, NotStarted, and Running.</code></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>-WillShutdownAfterUse</code>&lt;Boolean&gt;</td>
<td>false</td>
<td></td>
<td>false</td>
</tr>
<tr>
<td>Gets machines depending on whether they shut down after use or not.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Accept Pipeline Input?    false

-**WindowsConnectionSetting**<WindowsConnectionSetting>

Gets machines according to their current Windows connection setting (logon mode). Valid values are:

- **LogonEnabled** - All logons are enabled.
- **Draining** - New logons are disabled, but reconnections to existing sessions are allowed.
- **DrainingUntilRestart** - Same as Draining, but setting will revert to LogonEnabled when machine next restarts.
- **LogonDisabled** - All logons and reconnections are disabled.

This is a Windows setting and is not controlled by XenDesktop. It applies only to multi-session machines; for single-session machines its value is always LogonEnabled.

```
| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |
```

-**AssignedUserSID**<String>

Gets machines with the specific SID of the user to whom the desktop is assigned.

```
| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |
```

-**ReturnTotalRecordCount**<SwitchParameter>

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

```
| Required? | false |
| Default Value | False |
| Accept Pipeline Input? | false |
```

-**MaxRecordCount**<Int32>

Specifies the maximum number of records to return.

```
| Required? | false |
| Default Value | 250 |
| Accept Pipeline Input? | false |
```

-**Skip**<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

```
| Required? | false |
| Default Value | 0 |
| Accept Pipeline Input? | false |
```
-**SortBy**<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

| Required? | false |
| Default Value | The default sort order is by name or unique identifier. |
| Accept Pipeline Input? | false |

-**Filter**<String>

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

| Required? | false |
| Default Value |
| Accept Pipeline Input? | false |

-**AdminAddress**<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

| Required? | false |
| Default Value | Localhost. Once a value is provided by any cmdlet, this value will become the default. |
| Accept Pipeline Input? | false |

**Input Type**

None You cannot pipe input into this cmdlet.

**Return Values**

Citrix.BrokerAdminSDK.GroupInfo

Each GroupInfo object represents one group, and contains the following properties:

- **Count**: The count of machines in this group.

- **Name**: The value of the property the machines were grouped by (as a string).

If you do not specify -SortBy, groups are sorted with the largest count first.

**Notes**

To compare dates or times, use -Filter and relative comparisons. For more information, see about_Broker_Filtering and the examples.

**Examples**

-------------- EXAMPLE 1 --------------

C:\PS> Group-BrokerMachine -Property SummaryState -DesktopGroupName dg1
Group machines from the dg1 group by summary state.

-------------- EXAMPLE 2 --------------

C:\PS> Group-BrokerMachine -Property LastConnectionFailure -Filter { LastConnectionFailure -ne "None" -and LastConnectionTime -ge '7d' } -MaxRecordCount 1
For machines where the last connection attempt failed, list the most common reason for failure, ignoring connections that failed over a week ago.

-------------- EXAMPLE 3 --------------

C:\PS> Group-BrokerMachine -Property HostingServerName -DesktopCondition ICALatency -SortBy Name
List alphabetically the hypervisor servers hosting machines that are currently experiencing high network latency.
Import-BrokerDesktopPolicy

Oct 01, 2013
Sets the site wide Citrix Group Policy settings for the site.

Syntax

Import-BrokerDesktopPolicy [-Policy] <Byte[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Import-BrokerDesktopPolicy sets the site wide Citrix Group Policy settings. A successful call to this cmdlet will result in the supplied data being uploaded to every machine in the site prior to its next session launch.

Related topics

Export-BrokerDesktopPolicy
New-BrokerConfigurationSlot
New-BrokerMachineConfiguration

Parameters

-Policy <Byte[]>

The configuration data containing the Citrix Group Policy settings to apply to every machine in the site.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-LoggingId <Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-AdminAddress <String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td></td>
</tr>
</tbody>
</table>

https://docs.citrix.com © 1999-2017 Citrix Systems, Inc. All rights reserved. p.1170
Required? | false  
---|---  
Default Value | Localhost. Once a value is provided by any cmdlet, this value will become the default.  
Accept Pipeline Input? | false

Input Type

System.Byte[]. The configuration data as an opaque binary blob.

Return Values

None

Notes

Import-BrokerDesktopPolicy performs a specialized operation. Direct usage of it in scripts is discouraged, and could result in data corruption. It is recommended that this operation be performed via the Citrix Studio.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Import-BrokerDesktopPolicy $policyData
This command sets the Citrix Group Policy settings in the site. These policy settings are then applied to every machine prior to the next session launch.
New-BrokerAccessPolicyRule

Oct 01, 2013
Creates a new rule in the site's access policy.

Syntax
[<CommonParameters>]

Detailed Description
The New-BrokerAccessPolicyRule cmdlet adds a new rule to the site's access policy.

An access policy rule defines a set of connection filters and access control rights relating to a desktop group. These allow fine-grained control of what access is granted to a desktop group based on details of, for example, a user's endpoint device, its address, and the user's identity.

Multiple rules in the access policy can apply to the same desktop group.

For a user to gain access to a desktop group via a rule their connection must match all its enabled include filters, and none of its enabled exclude filters. In addition, for a user to be able to launch a desktop or application resource session from the desktop group, they must have an entitlement to use the resource granted by the entitlement or assignment policies, or by direct machine assignment.

Related topics
Get-BrokerAccessPolicyRule
Set-BrokerAccessPolicyRule
Rename-BrokerAccessPolicyRule
Remove-BrokerAccessPolicyRule

Parameters
-Name<String>
Specifies the administrative name of the new rule. Each rule within the site's access policy must have a unique name.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-DesktopGroupUid<Int32>
Specifies the desktop group to which the new rule applies.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-IncludedDesktopGroups<DesktopGroup>[
This parameter is supported for backward compatibility only. If used only a single desktop group UID can be specified.
The IncludedDesktopGroups and IncludedDesktopGroupFilterEnabled parameters have been superseded by the DesktopGroupUid parameter.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>(empty list)</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

---

### AllowedConnections <AllowedConnection>

Specifies whether connections must be local or via Access Gateway, and if so whether specified SmartAccess tags must be provided by Access Gateway with the connection.

This property forms part of the included SmartAccess tags filter.

Valid values are Filtered, NotViaAG, and ViaAG.

For a detailed description of this property see "help about_Broker_AccessPolicy".

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>false</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

---

### AllowedProtocols <String[]>

Specifies the protocols (for example HDX, RDP) available to the user for sessions delivered from the new rule's desktop group.

If the user gains access to a desktop group by multiple rules, the allowed protocol list is the combination of the protocol lists from all those rules.

If the protocol list is empty, access to the desktop group is implicitly denied.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>HDX</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

---

### AllowedUsers <AllowedUser>

Specifies the behavior of the included users filter of the new rule.

This can restrict access to a list of named users or groups, or allow access to any authenticated user.

For a detailed description of this property see "help about_Broker_AccessPolicy".

Valid values are Filtered, AnyAuthenticated, and Any.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Filtered</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

---

### AllowRestart <Boolean>

Specifies if the user can restart sessions delivered from the new rule's desktop group.

Session restart is handled as follows: For sessions on single-session power-managed machines, the machine is powered off, and a new session launch request made; for sessions on multi-session machines, a logoff request is issued to the session, and a new session launch request made; otherwise the property is ignored.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>false</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

---

### Description <String>

Specifies an optional description of the new rule.

The text is purely informational for the administrator; it is never visible to the end user.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Filtered</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>
**-Enabled[Boolean]**

Specifies whether the new rule is initially enabled. A disabled rule is ignored when evaluating the site's access policy.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>false</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-ExcludedClientIPFilterEnabled[Boolean]**

Specifies whether the excluded client IP address filter is initially enabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>false</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-ExcludedClientIPs[IPAddressRange[]]**

Specifies IP addresses of user devices explicitly denied access to the new rule's desktop group. Addresses can be specified as simple numeric addresses or as subnet masks (for example, 10.40.37.5 or 10.40.0.0/16). This property forms part of the excluded client IP address filter.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>{empty list}</td>
</tr>
</tbody>
</table>

**-ExcludedClientNameFilterEnabled[Boolean]**

Specifies whether the excluded client names filter is initially enabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

<table>

**Additional Information**

- **Input Type**: None
- You cannot pipe input into this cmdlet.
Return Values

Citrix.BrokerAdmin.SDK.AccessPolicyRule

New-BrokerAccessPolicyRule returns the newly created access policy rule.

Examples

-------------------------- EXAMPLE 1 --------------------------
C:\PS> $dg = Get-BrokerDesktopGroup 'Tech Support'
C:\PS> New-BrokerAccessPolicyRule 'UK Tech Support' -IncludedUserFilterEnabled $true -IncludedUsers support\uk-staff -DesktopGroupUid $dg.Uid -AllowedProtocols 'HDX'
Creates an access policy rule allowing access to the Tech Support desktop group for all users of the SUPPORT\uk-staff group. Connections to desktop or application resources in the group can only be made using the HDX protocol.

For users to gain access to resources in the group also requires that, depending on the desktop kind of the group, appropriate assignment or entitlement policy rules, or explicit machine assignments exist.
New-BrokerAppAssignmentPolicyRule

Oct 01, 2013
Creates a new application rule in the site's assignment policy.

Syntax

Detailed Description

The New-BrokerAppAssignmentPolicyRule cmdlet adds a new application rule to the site's assignment policy.

An application rule in the assignment policy defines the users who are entitled to a self-service persistent machine assignment from the rule's desktop group; once assigned the machine can run one or more applications published from the group.

The following constraints apply when creating an application assignment rule for a desktop group:

- The group's desktop kind must be Private
- The group's delivery type must be AppsOnly
- Only a single application rule can apply to a given group
- Application assignment rules cannot be applied to RemotePC groups.

When a user selects an application published from a private group, a currently unassigned machine is selected from the group and permanently assigned to the user. An application session is then launched to the machine. Subsequent launches are routed directly to the now assigned machine.

Once a machine has been assigned in this way, the original assignment rule plays no further part in access to the machine.

Remove-BrokerAppAssignmentPolicyRule

Parameters

-Name <String>

Specifies the administrative name of the new application rule. Each rule in the site's assignment policy must have a unique name (irrespective of whether they are desktop or application rules).
### -DesktopGroupId\<int32>\>

Specifies the unique ID of the desktop group to which the new application rule applies.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByPropertyName) |

### -Description\<String>\>

Specifies an optional description of the new application rule. The text is purely informational for the administrator, it is never visible to the end user.

| Required? | false |
| Default Value | null |
| Accept Pipeline Input? | true (ByPropertyName) |

### -Enabled\<Boolean>\>

Specifies whether the new application rule is initially enabled. A disabled rule is ignored when evaluating the site's assignment policy.

| Required? | false |
| Default Value | true |
| Accept Pipeline Input? | true (ByPropertyName) |

### -ExcludedUserFilterEnabled\<Boolean>\>

Specifies whether the excluded users filter is initially enabled. If the filter is disabled then any user entries in the filter are ignored when assignment policy rules are evaluated.

| Required? | false |
| Default Value | false |
| Accept Pipeline Input? | true (ByPropertyName) |

### -ExcludedUsers\<User[]>\>
Specifies the excluded users filter of the new application rule, that is, the users and groups who are explicitly denied an entitlement to a machine assignment from the rule.

This can be used to exclude users or groups who would otherwise gain access by groups specified in the included users filter.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>(empty list)</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **-IncludedUserFilterEnabled**: Boolean

Specifies whether the included users filter is initially enabled. If the filter is disabled then any user who satisfies the requirements of the access policy is implicitly granted an entitlement to a machine assignment by the new application rule.

Users who would be implicitly granted access when the filter is disabled can still be explicitly denied access using the excluded users filter.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>true</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **-IncludedUsers**: User

Specifies the included users filter of the new application rule, that is, the users and groups who are granted an entitlement to a machine assignment by the rule.

If a user appears explicitly in the excluded users filter of the rule or is a member of a group that appears in the excluded users filter, no entitlement is granted whether or not the user appears in the included users filter.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>(empty list)</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **-LoggingId**: Guid

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>
-AdminAddress\:<String>\:

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.BrokerAdmin.SDK.AppAssignmentPolicyRule

New-BrokerAppAssignmentPolicyRule returns the newly created application rule in the assignment policy.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> $dg = Get-BrokerDesktopGroup 'Sales Support'
C:\PS> New-BrokerAppAssignmentPolicyRule 'UK Office' -DesktopGroupUid $dg.Uid -IncludedUsers sales\uk-staff

Creates an application rule in the assignment policy that grants all members of the SALES\uk-staff group an entitlement to a single machine from the Sales Support desktop group. The machine can be used for running applications published from the group.
New-BrokerAppEntitlementPolicyRule

Oct 01, 2013
Creates a new application rule in the site's entitlement policy.

Syntax

Detailed Description

The New-BrokerAppEntitlementPolicyRule cmdlet adds a new application rule to the site's entitlement policy.

An application rule in the entitlement policy defines the users who are allowed per-session access to a machine to run one or more applications published from the rule's desktop group.

The following constraints apply when creating an application entitlement rule for a desktop group:

- The group's desktop kind must be Shared
- The group's delivery type must be AppsOnly or DesktopsAndApps
- Only a single application rule can apply to a given group

When a user selects an application published from a shared group, a machine is selected from the group on which to run the application. No permanent association exists between the user and the selected machine; once the session ends the association also ends.

Even though only a single application entitlement and therefore session can be defined for a group, the user can still run multiple applications from the group because the applications run within the same session.

Related topics

- Get-BrokerAppEntitlementPolicyRule
- Set-BrokerAppEntitlementPolicyRule
- Rename-BrokerAppEntitlementPolicyRule
- Remove-BrokerAppEntitlementPolicyRule

Parameters

- **-Name <String>**

Specifies the administrative name of the new application rule. Each rule in the site's entitlement policy must have a unique name (irrespective of whether they are desktop or application rules).
### Accept Pipeline Input?

| Accept Pipeline Input? | true (ByPropertyName) |

### -DesktopGroupUid<Int32>

Specifies the unique ID of the desktop group to which the new application rule applies.

| Required? | true |
| Default Value |
| Accept Pipeline Input? | true (ByPropertyName) |

### -Description<String>

Specifies an optional description of the new application rule. The text is purely informational for the administrator, it is never visible to the end user.

| Required? | false |
| Default Value | null |
| Accept Pipeline Input? | true (ByPropertyName) |

### -Enabled<Boolean>

Specifies whether the new application rule is initially enabled. A disabled rule is ignored when evaluating the site's entitlement policy.

| Required? | false |
| Default Value | true |
| Accept Pipeline Input? | true (ByPropertyName) |

### -ExcludedUserFilterEnabled<Boolean>

Specifies whether the excluded users filter is initially enabled. If the filter is disabled then any user entries in the filter are ignored when entitlement policy rules are evaluated.

| Required? | false |
| Default Value | false |
| Accept Pipeline Input? | true (ByPropertyName) |

### -ExcludedUsers<User[]>

Specifies the excluded users filter of the application rule, that is, the users and groups who are explicitly denied entitlements to published applications from the desktop group.
This can be used to exclude users or groups who would otherwise gain access by groups specified in the included users filter.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>-IncludedUserFilterEnabled</td>
<td>false</td>
<td>(empty list)</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-IncludedUserFilterEnabled<Boolean>**

Specifies whether the included users filter is initially enabled. If the filter is disabled then any user who satisfies the requirements of the access policy is implicitly granted an entitlement to an application session by the new rule.

Users who would be implicitly granted access when the filter is disabled can still be explicitly denied access using the excluded users filter.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>-IncludedUsers&lt;User[]&gt;</td>
<td>false</td>
<td>true</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-IncludedUsers<User[]>**

Specifies the included users filter of the application rule, that is, the users and groups who are granted an entitlement to an application session by the new rule.

If a user appears explicitly in the excluded users filter of the rule or is a member of a group that appears in the excluded users filter, no entitlement is granted whether or not the user appears in the included users filter.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>-LoggingId&lt;Guid&gt;</td>
<td>false</td>
<td>(empty list)</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-LoggingId<Guid>**

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>

<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>-AdminAddress&lt;String&gt;</td>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

**-AdminAddress<String>**
Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type
None You cannot pipe input into this cmdlet.

Return Values
Citrix.BrokerAdmin.SDK.AppEntitlementPolicyRule

New-BrokerEntitlementPolicyRule returns the newly created application rule in the entitlement policy.

Examples
-------------------------- EXAMPLE 1 --------------------------
C:\PS> $dg = Get-BrokerDesktopGroup 'Customer Support'
C:\PS> New-BrokerAppEntitlementPolicyRule 'UK Office' -DesktopGroupUid $dg.Uid -IncludedUsers support\uk-staff
Creates an application rule in the entitlement policy that entitles all members of the SUPPORT\uk-staff group to a machine for running applications published from the Customer Support desktop group.
New-BrokerApplication

Oct 01, 2013
Creates a new published application.

Syntax

```
```

Detailed Description

The New-BrokerApplication cmdlet creates a new published application in the site.

New-BrokerApplication creates the application object, and associates it with a desktop group. Application objects have three names that identify them (in addition to their Uid): the Name, BrowserName and the PublishedName. The BrowserName is unique across the entire site, and is primarily used internally. The Name is also unique and is what is seen by the administrator. The PublishedName is not unique and is what is seen by the users.

You can create both HostedOnDesktop and InstalledOnClient applications but the ApplicationType cannot be changed later.

The following special characters are not allowed in either the Name, BrowserName or the PublishedName: \ / ; : # . * ? = < > | \[ \] ( ) " '

See about_Broker_Applications for more information.

Parameters

- **-Name**: <String>

Specifies the unique name of the application.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
</tr>
</tbody>
</table>

- **-CommandLineExecutable**: <String>

Specifies the name of the executable file to launch. The full path need not be provided if it’s already in the path. Environment variables can also be used.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>(required)</td>
</tr>
</tbody>
</table>

https://docs.citrix.com © 1999-2017 Citrix Systems, Inc. All rights reserved. p.1186
### DesktopGroup <DesktopGroup>

Specifies which desktop group this application should be associated with. The association between application and desktop groups can be added or removed using the Add-BrokerApplication and Remove-BrokerApplication cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

### ApplicationType <ApplicationType>

Specifies the type of the application: HostedOnDesktop or InstalledOnClient.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>(required)</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

### BrowserName <String>

Specifies the internal name for this application. It must be unique in the site.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>(same as Name)</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

### ClientFolder <String>

Specifies the folder that the application belongs to as the user sees it. This is the application folder that is seen in the Citrix Online Plug-in, in Web Services, and also in the end-user's Start menu. Subdirectories can be specified with '\' character. The following special characters are not allowed: / * ? < > | " :.

Note that this property cannot be set for applications of type InstalledOnClient.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>null</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

### CommandLineArguments <String>

Specifies the command-line arguments that should be used when launching the executable. Environment variables can be used.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>null</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

### CpuPriorityLevel <CpuPriorityLevel>

Specifies the CPU priority for the launched process. Valid values are: Low, BelowNormal, Normal, AboveNormal, and High. Note that this property cannot be set for applications of type InstalledOnClient.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Normal</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------</td>
</tr>
</tbody>
</table>

**-Description**<String>

Specifies the description of the application. This is only seen by Citrix administrators and is not visible to users.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>null</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-Enabled**<Boolean>

Specifies whether or not this application can be launched.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>true</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-IconFromClient**<Boolean>

Specifies if the app icon should be retrieved from the application on the client. This is reserved for possible future use, and all applications of type HostedOnDesktop cannot set or change this value.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>false</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-IconUid**<Int32>

Specifies which icon to use for this application. This icon is visible both to the administrator (in the consoles) and to the user. If no icon is specified, then a generic built-in application icon is used.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>2</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-Priority**<Int32>

Specifies the priority of the mapping between the application and desktop group. The semantics of the priority value are such that a value of zero has the highest priority with increasing values indicating lower priorities.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-PublishedName**<String>

The name seen by end users who have access to this application.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>The same value as that supplied for the name of the application.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
<tr>
<td>-------------------------</td>
<td>----------------------</td>
</tr>
</tbody>
</table>

**-SecureCmdLineArgumentsEnabled (Boolean)**

Specifies whether the command-line arguments should be secured. This is reserved for possible future use, and all applications of type HostedOnDesktop can only have this value set to true.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>true</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-ShortcutAddedToDesktop (Boolean)**

Specifies whether or not a shortcut to the application should be placed on the user device. This is only valid for the Citrix Online Plug-in.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>false</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-ShortcutAddedToStartMenu (Boolean)**

Specifies whether a shortcut to the application should be placed in the user's start menu on their user device.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>false</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-StartMenuFolder (String)**

Specifies the name of the start menu folder that holds the application shortcut (if any). This is only valid for the Citrix Online Plug-in. Subdirectories can be specified with '\' character. The following special characters are not allowed: / * ? < > | " :.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>null</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-UserFilterEnabled (Boolean)**

Specifies whether the application's user filter is enabled or disabled. Where the user filter is enabled, the application is only visible to users who appear in the filter (either explicitly or by virtue of group membership).

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>false</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-UUID (Guid)**

An optional GUID for this application.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------</td>

<td>false</td>
</tr>
</tbody>
</table>

Input Type
Depends on parameter. Parameters can be piped by property name.

Return Values

https://docs.citrix.com  © 1999-2017 Citrix Systems, Inc. All rights reserved.  p.1190
New-BrokerApplication returns an Application object.

Notes

Usually only the Name is specified with the New-BrokerApplication cmdlet, and the system chooses a BrowserName and PublishedName for you. By default the BrowserName is the same as the Name, if it is unique in the site. If not, then "-x" is appended to the name, where "x" is a number. For instance, if there is already an application with a BrowserName of "Notepad" and a new application is being created with a Name of "Notepad", then the new application gets a BrowserName of "Notepad-1". If yet another "Notepad" was published, then it would have a BrowserName of "Notepad-2".

That said, the BrowserName can optionally be specified as well.

Examples

-------------------------- EXAMPLE 1 --------------------------
C:\PS> New-BrokerApplication -ApplicationType HostedOnDesktop -Name "Notepad" -CommandLineExecutable "notepad.exe" -DesktopGroup PrivateDG1
Creates and returns an object for a published application called "Notepad" that launches "notepad.exe".

-------------------------- EXAMPLE 2 --------------------------
C:\PS> $dg = Get-BrokerDesktopGroup "SharedDG1"
C:\PS> $app = New-BrokerApplication -ApplicationType HostedOnDesktop -Name "Notepad" -CommandLineExecutable "notepad.exe" -DesktopGroup $dg
C:\PS> $group = Get-BrokerDesktopGroup -Name "Shared Desktop Group"
C:\PS> Add-BrokerApplication $app -DesktopGroup $group
C:\PS> $fta = Get-BrokerImportedFTA -ExtensionName ".txt"
C:\PS> New-BrokerConfiguredFTA -ImportedFTA $fta -ApplicationUid $app.Uid
This is a much more complete example. It creates an application object to publish Notepad and associates it first with the "SharedDG1" desktop group.

Next it adds an additional desktop group (one that can host applications), and publishes the application to that desktop group. It then gets the ImportedFTA object for the .txt file-type extension (this assumes file-type associations have already been imported), and then configures it so that ".txt" is associated with the published application.

Note: The appropriate access policy and app assignment/entitlement rules must also be configured to allow access to the application.
New-BrokerAssignmentPolicyRule

Oct 01, 2013
Creates a new desktop rule in the site's assignment policy.

Syntax

Detailed Description

The New-BrokerAssignmentPolicyRule cmdlet adds a new desktop rule to the site's assignment policy.

A desktop rule in the assignment policy defines the users who are entitled to self-service persistent machine assignments from the rule's desktop group. A rule defines how many machines a user is allowed from the group for delivery of full desktop sessions.

The following constraints apply when creating a desktop assignment rule for a desktop group:

- The group's desktop kind must be Private
- The group's delivery type must be DesktopsOnly
- Only one desktop assignment rule can be created for RemotePC groups.

When a user selects a machine assignment entitlement from a private group, a currently unassigned machine is selected from the group and permanently assigned to the user to create an assigned desktop. A desktop session is then launched to the machine. Subsequent launches are routed directly to the now assigned machine.

Once a machine has been assigned in this way, the original assignment rule plays no further part in access to the new desktop.

Multiple desktop rules in the assignment policy can apply to the same desktop group. Where a user is granted entitlements by more than one rule for the same group, they can have as many machine assignments from the group as the total of their entitlements.

Related topics

Get-BrokerAssignmentPolicyRule
Set-BrokerAssignmentPolicyRule
Rename-BrokerAssignmentPolicyRule
Remove-BrokerAssignmentPolicyRule

Parameters

- **-Name** <String>

  Specifies the administrative name of the new desktop rule. Each rule in the site's assignment policy must have a unique name (irrespective of whether they are desktop or application rules).

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **-DesktopGroupUid** <Int32>
Specifies the unique ID of the desktop group to which the new desktop rule applies.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-ColorDepth**<ColorDepth>

Specifies the color depth of any desktop sessions to machines assigned by the new rule.

Valid values are $null, FourBit, EightBit, SixteenBit, and TwentyFourBit.

The default null value indicates that the equivalent setting from the rule's desktop group is used.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>null (dynamically inherited from the desktop group)</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-Description**<String>

Specifies an optional description of the new desktop rule. The text may be visible to the end user, for example, as a tooltip associated with the desktop entitlement.

The default null value indicates that the equivalent setting from the rule's desktop group is used.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>null (dynamically inherited from the desktop group)</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-Enabled**<Boolean>

Specifies whether the new desktop rule is initially enabled. A disabled rule is ignored when evaluating the site's assignment policy.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>true</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-ExcludedUserFilterEnabled**<Boolean>

Specifies whether the excluded users filter is initially enabled. If the filter is disabled then any user entries in the filter are ignored when assignment policy rules are evaluated.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>false</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-ExcludedUsers**<User[]>
Specifies the excluded users filter of the new desktop rule, that is, the users and groups who are explicitly denied an entitlement to a machine assignment from the rule.

This can be used to exclude users or groups who would otherwise gain access by groups specified in the included users filter.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>(empty list)</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **-IconUid<Int32>**

Specifies the unique ID of the icon used to display the machine assignment entitlement to the user, and of the assigned desktop itself following the assignment.

The default null value indicates that the equivalent setting from the rule’s desktop group is used.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>null (dynamically inherited from the desktop group)</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **-IncludedUserFilterEnabled<Boolean>**

Specifies whether the included users filter is initially enabled. If the filter is disabled then any user who satisfies the requirements of the access policy is implicitly granted an entitlement to a machine assignment by the new desktop rule.

Users who would be implicitly granted access when the filter is disabled can still be explicitly denied access using the excluded users filter.

For rules that relate to RemotePC desktop groups however, if the included user filter is disabled, the rule is effectively disabled.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>true</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **-IncludedUsers<User[]>**

Specifies the included users filter of the new desktop rule, that is, the users and groups who are granted an entitlement to a machine assignment by the rule.

If a user appears explicitly in the excluded users filter of the rule or is a member of a group that appears in the excluded users filter, no entitlement is granted whether or not the user appears in the included users filter.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>(empty list)</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **-MaxDesktops<Int32>**

The number of machines from the rule's desktop group to which a user is entitled. Where an entitlement is granted to a user group rather than an individual, the number of machines applies to each member of the user group independently.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Required?</strong></td>
<td></td>
<td><strong>false</strong></td>
</tr>
<tr>
<td><strong>Default Value</strong></td>
<td></td>
<td><strong>1</strong></td>
</tr>
<tr>
<td><strong>Accept Pipeline Input?</strong></td>
<td></td>
<td><strong>true (ByPropertyName)</strong></td>
</tr>
<tr>
<td><strong>-PublishedName</strong></td>
<td><strong>String</strong></td>
<td>The name of the new machine assignment entitlement as seen by the user, and of the assigned desktop following its usage. The default null value indicates that the equivalent setting from the rule's desktop group is used.</td>
</tr>
<tr>
<td><strong>Required?</strong></td>
<td></td>
<td><strong>false</strong></td>
</tr>
<tr>
<td><strong>Default Value</strong></td>

</tr>
<tr>
<td><strong>Accept Pipeline Input?</strong></td>
<td></td>
<td><strong>true (ByPropertyName)</strong></td>
</tr>
<tr>
<td><strong>-UUID</strong></td>
<td><strong>Guid</strong></td>
<td>An optional GUID for this rule.</td>
</tr>
<tr>
<td><strong>Required?</strong></td>
<td></td>
<td><strong>false</strong></td>
</tr>
<tr>
<td><strong>Default Value</strong></td>
<td></td>
<td><strong>A new GUID is generated if none is supplied.</strong></td>
</tr>
<tr>
<td><strong>Accept Pipeline Input?</strong></td>
<td></td>
<td><strong>true (ByPropertyName)</strong></td>
</tr>
<tr>
<td><strong>-LoggingId</strong></td>
<td><strong>Guid</strong></td>
<td>Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.</td>
</tr>
<tr>
<td><strong>Required?</strong></td>
<td></td>
<td><strong>false</strong></td>
</tr>
<tr>
<td><strong>Default Value</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Accept Pipeline Input?</strong></td>
<td></td>
<td><strong>false</strong></td>
</tr>
<tr>
<td><strong>-AdminAddress</strong></td>
<td><strong>String</strong></td>
<td>Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.</td>
</tr>
</tbody>
</table>
### New-BrokerAssignmentPolicyRule

**Description**

Creates a desktop rule in the assignment policy that grants all members of the specified users group entitlement to a single machine from the specified desktop group. The entitlement name seen by users is the published name.

**Syntax**

```powershell
New-BrokerAssignmentPolicyRule -DesktopGroup <Guid> -IncludedUsers <User> [Other parameters]
```

**Parameters**

- **DesktopGroup**: Specify the desktop group's GUID
- **IncludedUsers**: Specify the users that will receive the entitlement
- **Required**: False
- **Default Value**: Localhost. Once a value is provided by any cmdlet, this value will become the default.
- **Accept Pipeline Input?**: False
- **Input Type**: None

**Examples**

**-------------------------- EXAMPLE 1 --------------------------**

```powershell
C:\PS> $dg = Get-BrokerDesktopGroup 'Sales Support'
C:\PS> New-BrokerAssignmentPolicyRule 'UK Office' -DesktopGroup $dg.Uid -IncludedUsers sales\uk-staff -PublishedName 'Sales Desktop'
```

Creates a desktop rule in the assignment policy that grants all members of the SALES\uk-staff group an entitlement to a single machine from the Sales Support desktop group. The entitlement name seen by users is Sales Desktop.
New-BrokerCatalog

Oct 01, 2013

Adds a new catalog to the site.

Syntax

New-BrokerCatalog [-Name] <String> [-AllocationType] <AllocationType> [-CatalogKind] <CatalogKind> [-PvsForVM <String>]] [-Description <String>]] [-IsRemotePC <Boolean>]] [-MachinesArePhysical <Boolean>]] [-MinimumFunctionalLevel <FunctionalLevel>]] [-PvsAddress <String>]] [-PvsDomain <String>]] [-Scope <String>]] [-UUID <Guid>]] [-LoggingId <Guid>]] [-AdminAddress <String>]]

New-BrokerCatalog [-Name] <String> [-AllocationType] <AllocationType> [-ProvisioningType] <ProvisioningType> [-SessionSupport] <SessionSupport> [-PersistUserChanges] <PersistUserChanges> [-ProvisioningSchemeId <Guid>]] [-Description <String>]] [-IsRemotePC <Boolean>]] [-MachinesArePhysical <Boolean>]] [-MinimumFunctionalLevel <FunctionalLevel>]] [-PvsAddress <String>]] [-PvsDomain <String>]] [-Scope <String>]] [-UUID <Guid>]] [-LoggingId <Guid>]] [-AdminAddress <String>]]

Detailed Description

New-BrokerCatalog adds a catalog, through which machines can be provided to the site.

In order for a machine to register in a site, the machine must belong to a catalog with which it is compatible. The compatibility of a machine with a catalog is determined by two of the parameters of New-BrokerCatalog:

o MinimalFunctionalLevel: The minimal functional level supported in the catalog. The functional level of the machine is determined by the capabilities of the Citrix VDA software on it.

o SessionSupport: The session support (single/multi) of the catalog. The session support of the machine is determined by the variant of the Citrix VDA software installed (workstation/terminal services, respectively).

Related topics

Get-BrokerCatalog
Rename-BrokerCatalog
Remove-BrokerCatalog
Set-BrokerCatalog

Parameters

-Name <String>

Specifies a name for the catalog. Each catalog within a site must have a unique name.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-AllocationType <AllocationType>

Specifies how machines in the catalog are assigned to users. Values can be:

o Static - Machines in a catalog of this type are permanently assigned to a user.

o Permanent - equivalent to 'Static'.

o Random - Machines in a catalog of this type are picked at random and temporarily assigned to a user.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-CatalogKind <CatalogKind>

Deprecated: The type of machines the catalog will contain. Values can be: ThinCloned, SingleImage, PowerManaged, Unmanaged, Pvs, Pvd or PvsPvd.

Thin-Cloned, Single-Image and Personal vDisk Catalogs

Thin-cloned and single-image catalog kinds are for machines created and managed with Provisioning Services for VMs. All machines in this type of catalog are managed, and so must be associated with a hypervisor connection.

A thin-cloned catalog is used for original golden VM images that are cloned when they are assigned to a VM, and users’ changes to the VM image are retained after the VM is restarted.

A single-image catalog is used when multiple machines provisioned with Provisioning Services for VMs all share a single golden VM image when they run and, when restarted, they revert to the original VM image state.

A personal vDisk catalog is similar to a single-image catalog, but it also uses personal vDisk technology.

PowerManaged
This catalog kind is for managed machines that are manually provisioned by administrators. All machines in this type of catalog are managed, and so must be associated with a hypervisor connection.

Unmanaged

This catalog kind is for unmanaged machines, so there is no associated hypervisor connection.

PVS

This catalog kind is for managed machines that are provisioned using Provisioning Services. All machines in this type of catalog are managed, and so must be associated with a hypervisor connection. Only shared desktops are suitable for this catalog kind.

A Provisioning Services-personal vDisk (PvsPvd) catalog is similar to a Provisioning Services catalog, but it also uses personal vDisk technology.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>true</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-ProvisioningType={ProvisioningType}*

Specifies the ProvisioningType for the catalog. Values can be:
- Manual - No provisioning
- PVS - Machine provisioned by PVS (machine may be physical blade, VM,...).
- MCS - Machine provisioned by MCS (machine must be VM)

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>true</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-SessionSupport={SessionSupport}*

Specifies whether machines in the catalog are single or multi-session capable. Values can be:
- SingleSession - Single-session only machine.
- MultiSession - Multi-session capable machine.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>true</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-PersistUserChanges={PersistUserChanges}*

Specifies the location where the user changes will be persisted. Can only be set for single session catalogs. Values can be:
- OnLocal - User changes are persisted locally.
- Discard - User changes are discarded.
- OnPvd - User changes are persisted on the Pvd.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>true</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-PvsForVM={String[]}*

Deprecated:
Identifies the provisioning scheme used by this catalog. To be specified in the format: ProvisioningSchemeGuid:ServiceGroupGuid. Applicable only to thin-cloned, single-image or personal vDisk catalogs.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>true</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-Description={String}*

A description for the catalog.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>false</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-IsRemotePC**<Boolean>

Specifies whether this is to be a Remote PC catalog. IsRemotePC can only be enabled when:
- SessionSupport is SingleSession
- MachinesArePhysical is true.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>false</td>
<td>false</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-MachinesArePhysical**<Boolean>

Specifies if machines in the catalog can be power managed by the Citrix Broker Service. Where the Citrix Broker Service cannot control the power state of the machine specify $true, otherwise $false. Can only be specified together with a provisioning type of Pvs or Manual, or if used with the legacy CatalogKind parameter only with Pvs or PvsPvd catalog kinds.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>false</td>
<td>false</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-MinimumFunctionalLevel**<FunctionalLevel>

The minimum FunctionalLevel required for machines to register in the site. Valid values are L5, L7

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>false</td>
<td>The FunctionalLevel of the current release ($L7) by default no machines with less than the most current FunctionalLevel will be functional</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-PvSAddress**<String>

Specifies the URL of the Provisioning Services server. Only applicable to Provisioning Services or Provisioning Services-personal vDisk catalogs.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>false</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-PvSDomain**<String>

Specifies the Active Directory domain of the Provisioning Services server. Only applicable to Provisioning Services or Provisioning Services-personal vDisk catalogs.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>false</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-Scope**<String>

Specifies the name of the delegated administration scope to which the catalog belongs.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>false</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-UUID**<Guid>

An optional GUID for this catalog.
- **LoggingId**<Guid>
  Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>A new GUID is generated if none is supplied.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **AdminAddress**<String>
  Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>$null</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **ProvisioningSchemeId**<Guid>
  Specifies the identity of the MCS provisioning scheme the new catalog is associated with (can only be specified for new catalogs with a ProvisioningType of MCS).

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>$null</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

### Input Type
None You cannot pipe input into this cmdlet.

### Return Values
Citrix.Broker.Admin.SDK.Catalog

New-BrokerCatalog returns the created catalog.

### Examples

```
----- EXAMPLE 1 --------------------------
C:\PS> New-BrokerCatalog -AllocationType Static -CatalogKind Unmanaged -Description "Catalog1 Description" -Name "Catalog1 Name"
This command creates a catalog that can contain unmanaged physical or virtual machines that are permanently assigned to the user.

----- EXAMPLE 2 --------------------------
C:\PS> New-BrokerCatalog -AllocationType Random -CatalogKind PowerManaged -Description "catalog 2 Description" -Name "Catalog2 Name"
This command creates a catalog that can contain power-managed machines that are randomly assigned to the user.

----- EXAMPLE 3 --------------------------
C:\PS> New-BrokerCatalog -AllocationType Random -CatalogKind PVS -Description "PVS Catalog Desc" -Name "PVS Catalog Name" -PvsAddress "pvsServer@pvsDomain.com" -PvsDomain "pvsDomain" -PvsFarms $farmGuid:$schemeGuid
This command creates a catalog that can contain managed machines that are provisioned using Provisioning Services.
```
New-BrokerConfigurationSlot

Oct 01, 2013
Creates a new configuration slot.

Syntax

New-BrokerConfigurationSlot [-Name] <String> -SettingsGroup <String> [-Description <String>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Creates a new configuration slot. The SettingsGroup of the slot determines the particular collection of related settings that may be specified in a machine configuration associated with this slot.

For example, the configuration slot may be restricted to configuring Citrix User Profile Manager settings by specifying the SettingsGroup parameter as "G=UPM".

Related topics

Get-BrokerConfigurationSlot
Remove-BrokerConfigurationSlot
New-BrokerMachineConfiguration

Parameters

-Name <String>
Name of the new configuration slot. This must be alphanumeric and not contain white space.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-SettingsGroup <String>

The settings group determines the particular collection of related settings that may be controlled by this slot. This must match the format of a Citrix Group Policy configuration group (e.g. "G=UPM"). Only settings that have this exact group may be specified in a machine configuration associated with this configuration slot.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-Description <String>
Description of configuration slot.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-LoggingId<Guid>**

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-AdminAddress<String>**

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

None You cannot pipe input into this cmdlet.

**Return Values**

Citrix.BrokerAdmin.SDK.ConfigurationSlot

New-BrokerConfigurationSlot returns an object representing the newly created configuration slot

**Examples**

```
-------------------------- EXAMPLE 1 --------------------------
New-BrokerConfigurationSlot -Name "UPM" -SettingsGroup "G=UPM"
Create a new slot named "UPM" to configure settings specific to “User Profile Management”
```
New-BrokerConfiguredFTA

Oct 01, 2013

Create a file type association with a published application.

Syntax

New-BrokerConfiguredFTA -ImportedFTA <ImportedFTA> -ApplicationUid <Int32> -UUID <Guid> -LoggingId <Guid> -AdminAddress <String> -<CommonParameters>

New-BrokerConfiguredFTA -ExtensionName <String> -HandlerName <String> -ApplicationUid <Int32> -ContentType <String> -HandlerDescription <String> -HandlerOpenArguments <String> -UUID <Guid> -LoggingId <Guid> -AdminAddress <String> -<CommonParameters>

Detailed Description

Creates an association between a file type and a published application for the purposes of the content redirection.

File type association associates a file extension (such as "txt") with an application (such as Notepad). In a Citrix environment file type associations on a user device can be configured so that when a user clicks on a document it launches the appropriate published application. This is known as "content redirection".

Configured file type associations are different from imported file type associations. Configured file type associations are those that are actually associated with published applications for the purposes of content redirection. Imported file type associations are lists of known file type associations for a given desktop group. See Update-BrokerImportedFTA for more information about imported file type associations.

This cmdlet has two parameter sets, that correspond to the cmdlet's two use cases.

The first use case leverages imported file type associations to configure file types for published applications. Information about the file type association is read from the imported object. See the Update-BrokerImportedFTA cmdlet for more information about importing file type associations from a worker machine.

The second use case is more complex and allows you to create your own file type association without having to import it first. This also lets you create custom file type associations that may not already exist on the worker machines. This use case is more error-prone, however, because the individual attributes of the file type association must be correctly specified by you.

Related topics

Get-BrokerImportedFTA

Get-BrokerConfiguredFTA

Remove-BrokerConfiguredFTA

Parameters

-ApplicationUid <Int32>

Specifies the application with which the file type should be associated.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>(required)</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-ImportedFTA <ImportedFTA>

Specifies the importedFTA object to use for creating the ConfiguredFTA object. All values needed to create a ConfiguredFTA object are read from the ImportedFTA object.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>(required)</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-ExtensionName <String>

Specifies the extension name for the file type association. For example, "txt" or "doc".

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>(required)</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-HandlerName <String>

Specifies the name of the handler for the file type association (as seen in the Registry). For example, "TXTFILE" or "Word.Document.8".

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>(required)</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-UUID <Guid>

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>(required)</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>
An optional GUID for this ConfiguredFTA.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>A new GUID is generated if none is supplied.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **LoggingId**<Guid>

   Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **AdminAddress**<String>

   Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>LocalHost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **ContentType**<String>

   Specifies the content type of the file type (as listed in the Registry). For example, content type would be "text/plain" or "application/msword".

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>null</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **HandlerDescription**<String>

   Specifies the description of the handler for the file type association.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **HandlerOpenArguments**<String>

   Specifies the arguments for the open command that the handler should use. For example, "%1".

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>null</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

Input Type

Variable, based on property name This cmdlet does accept input from the pipeline but only by property name.

Return Values

Citrix.Broker.Admin.SDK.ConfiguredFTA

This cmdlet returns a single ConfiguredFTA object.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> $app = Get-BrokerApplication "Notepad"
C:\PS> $fta = Get-BrokerImportedFTA -ExtensionName ".txt"
C:\PS> New-BrokerConfiguredFTA -ImportedFTA $fta -ApplicationUid $app.Uid

Gets the Uid for the application, gets the ImportedFTA object for the file extension, and finally associates "txt" with the published "Notepad" application.

Note that the Get-BrokerImportedFTA cmdlet may return more than one ImportedFTA objects for a specific extension name. See the help for that cmdlet for more details.

-------------------------- EXAMPLE 2 --------------------------
This example is identical to the first, but shows the the second use case of the cmdlet, specifying each attribute manually.
New-BrokerDelayedHostingPowerAction

Oct 01, 2013
Causes a power action to be queued after a delay.

Syntax

Detailed Description
Causes a power action to be queued after the specified period of time.

Only ShutDown or Suspend actions can be requested to be delayed in this manner.

For a detailed description of the queuing mechanism, see 'help about_Broker_PowerManagement'.

Related topics
Get-BrokerDelayedHostingPowerAction
New-BrokerDelayedHostingPowerAction

Parameters
-MachineName <String>
Specifies the machine that the action is to be performed on.

The machine can be identified by DNS name, short name, SID, or name of the form domain\machine.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByPropertyName) |

-Action <PowerManagementAction>
Specifies the power state change action that is to be performed on the specified machine after the specified delay.

Valid values are Shutdown and Suspend.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByPropertyName) |

-Delay <TimeSpan>
Specifies a timespan delay before the action is queued.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**LoggingId**<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**AdminAddress**<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

None You cannot pipe input into this cmdlet.

**Return Values**

Citrix.BrokerAdminSDK.DelayedHostingPowerAction

New-BrokerDelayedHostingPowerAction returns the created delayed power action.

**Examples**

-------------------------- EXAMPLE 1 --------------------------

C:\PS> New-BrokerDelayedHostingPowerAction -Action Shutdown -MachineName 'XD_VDA1' -Delay '00:02:00'
Causes the machine called XD_VDA1 to be shut down after a delay of two minutes.
New-BrokerDesktopGroup

Oct 01, 2013
Create a new desktop group for managing the brokering of groups of desktops.

Syntax

Detailed Description

The New-BrokerDesktopGroup cmdlet creates a new broker desktop group that can then be used to manage the brokering settings of all desktops within that desktop group. Once the desktop group has been created, you can create desktops in it by adding the appropriate broker machines to it using the Add-BrokerMachine or Add-BrokerMachinesToDesktopGroup cmdlets.

Desktop groups hold settings that apply to all desktops they contain.

For any automatic power management settings of a desktop group to take effect, the group's TimeZone property must be specified. Automatic power management operations include pool management (power time schemes), reboot schedules, session disconnect and logoff actions, and powering on assigned machines etc.

Parameters

https://docs.citrix.com © 1999-2017 Citrix Systems, Inc. All rights reserved.  p.1208
**Name**<String>

The name of the new broker desktop group.

| Required? | true |
| Default Value |  |
| Accept Pipeline Input? | true (ByPropertyName) |

**DesktopKind**<DesktopKind>

The kind of desktops this group will hold. Valid values are Private and Shared.

| Required? | true |
| Default Value |  |
| Accept Pipeline Input? | true (ByPropertyName) |

**AutomaticPowerOnForAssigned**<Boolean>

Specifies whether assigned desktops in the desktop group should be automatically started at the start of peak time periods. Only relevant for groups whose DesktopKind is Private.

| Required? | false |
| Default Value | true |
| Accept Pipeline Input? | true (ByPropertyName) |

**AutomaticPowerOnForAssignedDuringPeak**<Boolean>

Specifies whether assigned desktops in the desktop group should be automatically started throughout peak time periods. Only relevant for groups whose DesktopKind is Private and which have AutomaticPowerOnForAssigned set to true.

| Required? | false |
| Default Value | false |
| Accept Pipeline Input? | true (ByPropertyName) |

**ColorDepth**<ColorDepth>

Specifies the color depth that the ICA session should use for desktops in this group. Valid values are FourBit, EightBit, SixteenBit, and TwentyFourBit.

| Required? | false |
| Default Value | TwentyFourBit |
### Accept Pipeline Input?
- **true (ByPropertyName)**

### DeliveryType

Specifies whether desktops, applications, or both, can be delivered from machines contained within the new desktop group. Desktop groups with a DesktopKind of Private cannot be used to deliver both desktops and applications. Defaults to DesktopsOnly if not specified.

| Required? | false |
| Default Value | DesktopsOnly |
| Accept Pipeline Input? | true (ByPropertyName) |

### Description

A description for this desktop group useful for administrators of the site.

| Required? | false |
| Default Value | null |
| Accept Pipeline Input? | true (ByPropertyName) |

### Enabled

Whether the desktop group should be in the enabled state; disabled desktop groups do not appear to users.

| Required? | false |
| Default Value | true |
| Accept Pipeline Input? | true (ByPropertyName) |

### IconUid

The UID of the broker icon to be displayed to users for their desktop(s) in this desktop group.

| Required? | false |
| Default Value | The Uid of the default desktop icon in this site - use the Get-BrokerSite cmdlet to find this value. |
| Accept Pipeline Input? | true (ByPropertyName) |

### InMaintenanceMode

| Required? | false |
| Default Value | The Uid of the default desktop icon in this site - use the Get-BrokerSite cmdlet to find this value. |
| Accept Pipeline Input? | true (ByPropertyName) |
Whether the desktop should be created in maintenance mode; a desktop group in maintenance mode will not allow users to connect or reconnect to their desktops.

| Required? | false |
| Default Value | false |
| Accept Pipeline Input? | true (ByPropertyName) |

-IsRemotePC<Boolean>

Specifies whether this is to be a Remote PC desktop group. IsRemotePC can only be enabled when:
- SessionSupport is SingleSession
- DeliveryType is DesktopsOnly
- DesktopKind is Private

| Required? | false |
| Default Value | false |
| Accept Pipeline Input? | true (ByPropertyName) |

-MinimumFunctionalLevel<FuncionalLevel>

The minimum FunctionalLevel required for machines to work successfully in the desktop group. Valid values are L5, L7

| Required? | false |
| Default Value | The FunctionalLevel of the current release (L7); by default no machines with less than the most current FunctionalLevel will be functional. |
| Accept Pipeline Input? | true (ByPropertyName) |

-OffPeakBufferSizePercent<Int32>

The percentage of machines in the desktop group that should be kept available in an idle state outside peak hours.

| Required? | false |
| Default Value | 0 |
| Accept Pipeline Input? | true (ByPropertyName) |
-OffPeakDisconnectAction<SessionChangeHostingAction>

The action to be performed after a configurable period of a user session disconnecting outside peak hours. Possible values are Nothing, Suspend, or Shutdown.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Nothing</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-OffPeakDisconnectTimeout<Int32>

The number of minutes before the configured action should be performed after a user session disconnects outside peak hours.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>0</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-OffPeakExtendedDisconnectAction<SessionChangeHostingAction>

The action to be performed after a second configurable period of a user session disconnecting outside peak hours. Possible values are Nothing, Suspend, or Shutdown.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Nothing</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-OffPeakExtendedDisconnectTimeout<Int32>

The number of minutes before the second configured action should be performed after a user session disconnects outside peak hours.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>0</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-OffPeakLogOffAction<SessionChangeHostingAction>

The action to be performed after a configurable period of a user session ending outside peak hours. Possible values are Nothing, Suspend, or Shutdown.
**-OffPeakLogOffTimeout**<Int32>

The number of minutes before the configured action should be performed after a user session ends outside peak hours.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>0</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-PeakBufferSizePercent**<Int32>

The percentage of machines in the desktop group that should be kept available in an idle state in peak hours.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>0</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-PeakDisconnectAction**<SessionChangeHostingAction>

The action to be performed after a configurable period of a user session disconnecting in peak hours. Possible values are Nothing, Suspend, or Shutdown.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Nothing</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-PeakDisconnectTimeout**<Int32>

The number of minutes before the configured action should be performed after a user session disconnects in peak hours.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>0</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-PeakExtendedDisconnectAction**<SessionChangeHostingAction>

The action to be performed after a second configurable period of a user session disconnecting in peak hours. Possible
values are Nothing, Suspend, or Shutdown.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Nothing</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-PeakExtendedDisconnectTimeout<Int32>**

The number of minutes before the second configured action should be performed after a user session disconnects in peak hours.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>0</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-PeakLogOffAction<SessionChangeHostingAction>**

The action to be performed after a configurable period of a user session ending in peak hours. Possible values are Nothing, Suspend, or Shutdown.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Nothing</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-PeakLogOffTimeout<Int32>**

The number of minutes before the configured action should be performed after a user session ends in peak hours.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>0</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-ProtocolPriority<String[]>**

A list of protocol names in the order in which they should be attempted for use during connection.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>null</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>
**-PublishedName**: `<String>`

The name that will be displayed to users for their desktop(s) in this desktop group.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>The same value as that supplied for the name of the desktop group.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-Scope**: `<String[]>`

Specifies the name of the delegated administration scope to which the desktop group should belong.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-SecureIcaRequired**: `<Boolean>`

Whether HDX connections to desktops in the new desktop group require the use of a secure protocol.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>false</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-SessionSupport**: `<SessionSupport>`

Specifies whether machines in the desktop group are single or multi-session capable. Values can be:

- SingleSession - Single-session only machine.
- MultiSession - Multi-session capable machine.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-ShutdownDesktopsAfterUse**: `<Boolean>`

Whether desktops in this desktop group should be automatically shut down when each user session completes (only relevant to power-managed desktops).

| Required? | false |
### TimeZone <String>

The time zone in which this desktop group's machines reside.

The time zone must be specified for any of the group's automatic power management settings to take effect. Automatic power management operations include pool management (power time schemes), reboot schedules, session disconnect and logoff actions, and powering on assigned machines etc.

| Required? | false |
| Default Value | null |
| Accept Pipeline Input? | true (ByPropertyName) |

### TurnOnAddedMachine <Boolean>

This flag specifies whether the Broker Service should attempt to power on machines when they are added to the desktop group.

| Required? | false |
| Default Value | $false for single session machines and $true for multi-session machines. |
| Accept Pipeline Input? | true (ByPropertyName) |

### UUID <Guid>

An optional Guid for this desktop group.

| Required? | false |
| Default Value | A new GUID is generated if none is supplied. |
| Accept Pipeline Input? | true (ByPropertyName) |

### LoggingId <Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
| Default Value |  |
| Accept Pipeline Input? | false |
**AdminAddress**<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

None. You cannot pipe input into this cmdlet.

**Return Values**

Citrix.BrokerAdmin.SDK.DesktopGroup

The newly created desktop group.

**Notes**

Once a new desktop group is created, you can create desktops in it by adding the appropriate broker machines to it using the Add-BrokerMachine or Add-BrokerMachinesToDesktopGroup cmdlets.

**Examples**

-------------------------- EXAMPLE 1 --------------------------

C:\PS> New-BrokerDesktopGroup "Assigned Desktops" -PublishedName "MyDesktop" -DesktopKind Private

Create a desktop group to manage the brokering of private desktops, which will appear to users with the name "MyDesktop."
New-BrokerEntitlementPolicyRule

Oct 01, 2013
Creates a new desktop rule in the site's entitlement policy.

Syntax

Detailed Description

The New-BrokerEntitlementPolicyRule cmdlet adds a new desktop rule to the site's entitlement policy.

A desktop rule in the entitlement policy defines the users who are allowed per-session access to a machine from the rule's associated desktop group to run a full desktop session.

The following constraints apply when creating a desktop entitlement rule for a desktop group:

- The group's desktop kind must be Shared
- The group's delivery type must be DesktopsOnly or DesktopsAndApps

When a user selects a desktop entitlement published from a shared group, a machine is selected from the group on which to run the desktop session. No permanent association exists between the user and the selected machine; once the session ends the association also ends.

Multiple desktop rules in the entitlement policy can apply to the same desktop group. Where a user is granted an entitlement by more than one rule for the same group, they can use as many desktop sessions at the same time as they have entitlements.

Related topics

Get-BrokerEntitlementPolicyRule
Set-BrokerEntitlementPolicyRule
Rename-BrokerEntitlementPolicyRule
Remove-BrokerEntitlementPolicyRule

Parameters

- **Name**: Specifies the administrative name of the new desktop rule. Each rule in the site's entitlement policy must have a unique name (irrespective of whether they are desktop or application rules).

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **DesktopGroupUid**: Specifies the unique ID of the desktop group to which the new desktop rule applies.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
</tbody>
</table>

https://docs.citrix.com © 1999-2017 Citrix Systems, Inc. All rights reserved. p.1218
-ColorDepth

Specifies the color depth of any desktop sessions launched by a user from this entitlement.

Valid values are Snull, FourBit, EightBit, SixteenBit, and TwentyFourBit.

The default null value indicates that the equivalent setting from the rule's desktop group is used.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>null (dynamically inherited from the desktop group)</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-Description

Specifies an optional description of the new desktop rule. The text may be visible to the end user, for example, as a tooltip associated with the desktop entitlement.

The default null value indicates that the equivalent setting from the rule's desktop group is used.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>null (dynamically inherited from the desktop group)</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-Enabled

Specifies whether the new desktop rule is initially enabled. A disabled rule is ignored when evaluating the site's entitlement policy.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>true</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-ExcludedUserFilterEnabled

Specifies whether the excluded users filter is initially enabled. If the filter is disabled then any user entries in the filter are ignored when entitlement policy rules are evaluated.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>false</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-ExcludedUsers

Specifies the excluded users filter of the desktop rule, that is, the users and groups who are explicitly denied an entitlement to a desktop session from the new rule.

This can be used to exclude users or groups who would otherwise gain access by groups specified in the included users filter.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>(empty list)</td>
</tr>
</tbody>
</table>
Accept Pipeline Input?  true (ByPropertyName)

- **IconUid**: Int32

  Specifies the unique ID of the icon used to display the desktop session entitlement to the user.

  The default null value indicates that the equivalent setting from the rule's desktop group is used.

  | Required? | false |
  | Default Value | null (dynamically inherited from the desktop group) |
  | Accept Pipeline Input? | true (ByPropertyName) |

- **IncludedUserFilterEnabled**: Boolean

  Specifies whether the included users filter is initially enabled. If the filter is disabled then any user who satisfies the requirements of the access policy is implicitly granted an entitlement to a desktop session by the new rule.

  Users who would be implicitly granted access when the filter is disabled can still be explicitly denied access using the excluded users filter.

  | Required? | false |
  | Default Value | true |
  | Accept Pipeline Input? | true (ByPropertyName) |

- **IncludedUsers**: User[]

  Specifies the included users filter of the rule, that is, the users and groups who are granted an entitlement to a desktop session by the new rule.

  If a user appears explicitly in the excluded users filter of the rule or is a member of a group that appears in the excluded users filter, no entitlement is granted whether or not the user appears in the included users filter.

  | Required? | false |
  | Default Value | (empty list) |
  | Accept Pipeline Input? | true (ByPropertyName) |

- **PublishedName**: String

  The name of the new desktop session entitlement as seen by the user.

  The default null value indicates that the equivalent setting from the rule's desktop group is used.

  | Required? | false |
  | Default Value | null (dynamically inherited from the desktop group) |
  | Accept Pipeline Input? | true (ByPropertyName) |

- **SecureIcaRequired**: Boolean

  Specifies whether the new desktop rule requires the SecureICA protocol for desktop sessions launched using the entitlement.

  The default null value indicates that the equivalent setting from the rule's desktop group is used.

  | Required? | false |
- **UUID**: <Guid>

An optional GUID for this rule.

| Required? | false |
| Default Value | A new GUID is generated if none is supplied. |
| Accept Pipeline Input? | true (ByPropertyName) |

- **LoggingId**: <Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

- **AdminAddress**: <String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

| Required? | false |
| Default Value | Localhost. Once a value is provided by any cmdlet, this value will become the default. |
| Accept Pipeline Input? | false |

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.BrokerAdmin.SDK.EntitlementPolicyRule

New-BrokerEntitlementPolicyRule returns the newly created desktop rule in the entitlement policy.

Examples

-------------- EXAMPLE 1 ---------------

C:\PS> $dg = Get-BrokerDesktopGroup 'Customer Support'
C:\PS> New-BrokerEntitlementPolicyRule 'UK Office' -DesktopGroupId $dg.Uid -IncludedUsers support\uk-staff -PublishedName 'Support Desktop'

Creates an desktop rule in the entitlement policy that entitles all members of the SUPPORT\uk-staff group to a desktop session from the Customer Support desktop group. The desktop entitlement name seen by users is Support Desktop.
New-BrokerHostingPowerAction

Oct 01, 2013
Creates a new action in the power action queue.

Syntax

Detailed Description

The New-BrokerHostingPowerAction cmdlet adds a new power action record into the queue of power actions to be performed. The power actions in the queue are processed on a priority basis and sent to the relevant hypervisor to change the power state of a virtual machine.

A power action record defines the action to be performed, the machine on which the action is to be performed, and an initial priority value for the action. Multiple actions may be created that relate to the same machine.

For a detailed description of the queuing mechanism, see 'help about_Broker_PowerManagement'.

Related topics

Get-BrokerHostingPowerAction
Set-BrokerHostingPowerAction
Remove-BrokerHostingPowerAction

Parameters

-MachineName <String>

Specifies the machine that the action is to be performed on.

The machine can be identified by DNS name or short name or SID or 'machine\domain' form name.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
</tr>
</tbody>
</table>

-Action <PowerManagementAction>

Specifies the power state change action that is to be performed on the specified machine.

Valid values are: TurnOn, TurnOff, ShutDown, Reset, Restart, Suspend and Resume.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
</tr>
</tbody>
</table>
Accept Pipeline Input? | true (ByPropertyName)

- **ActualPriority**<Int32>

Specifies an initial priority value for the action in the queue.

This priority is the current action priority; the 'base' priority for actions created via this cmdlet is always 30. Numerically lower priority values indicate more important actions that are processed in preference to actions with numerically higher priority settings.

| Required? | false |
| Default Value | 30 |

Accept Pipeline Input? | true (ByPropertyName)

- **LoggingId**<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
| Accept Pipeline Input? | false |

- **AdminAddress**<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

| Required? | false |
| Default Value | Localhost. Once a value is provided by any cmdlet, this value will become the default. |
| Accept Pipeline Input? | false |

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.BrokerAdmin.SDK.HostingPowerAction

New-BrokerHostingPowerAction returns the newly created power action record.

Examples
EXAMPLE 1

C:\PS> New-BrokerHostingPowerAction -Action Shutdown -MachineName 'XD_VDA1'
Causes the machine called 'XD_VDA1' to be shut down.
New-BrokerHypervisorConnection

Oct 01, 2013
Creates a new hypervisor connection.

Syntax

New-BrokerHypervisorConnection [-HypHypervisorConnectionUid] <Guid> [-PreferredController <String>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The New-BrokerHypervisorConnection cmdlet creates a new hypervisor connection.

Related topics

Get-BrokerHypervisorConnection
Remove-BrokerHypervisorConnection
Set-BrokerHypervisorConnection

Parameters

-HypHypervisorConnectionUid <Guid>
The Guid that identifies the hypervisor connection, as defined in DUM.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-PreferredController <String>
The preferred controller machine for the hypervisor connection. Can be specified as (first match is used):

- Full SAM name.
- Full DNS name.
- SID value.
- Partial SAM name.
- Partial DNS name.
- NetBIOS name (SAM without domain).
- Partial DNS name (DNS name without some or all domain information).

Where not specified, the system selects preferred controller machine based on loading.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-LoggingId <Guid>
Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
</tr>
</tbody>
</table>

-AdminAddress <String>

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>
Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type
None

Return Values
C:|rix.BrokerAdmin.SDK.HypervisorConnection

New-BrokerHypervisorConnection returns an opaque object containing information about the hypervisor connection.

Examples
----------------------------- EXAMPLE 1 -----------------------------
C:\PS> New-BrokerHypervisorConnection -PreferredController "domainName\controllerName" -HypHypervisorConnectionUid "d16f4e56-b85e-4ba6-b745-0e978ae4f192"
This command creates a new hypervisor connection with a preferred controller.

----------------------------- EXAMPLE 2 -----------------------------
C:\PS> New-BrokerHypervisorConnection -HypHypervisorConnectionUid "d16f4e56-b85e-4ba6-b745-0e978ae4f192"
This command creates a new hypervisor connection, and leaves it to the system to select a preferred controller.
New-BrokerIcon

Oct 01, 2013
Creates a new icon.

Syntax

New-BrokerIcon [-EncodedIconData <String>] [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Detailed Description

Accepts Base64 encoded .ICO format icon data, stores it in the database and returns an Icon object containing the Uid assigned to it.

New-BrokerIcon can be used with the Get-CtxIcon cmdlet from Citrix.Common.Commands, to obtain the Base64 icon. See Examples for a demonstration.

Related topics

Get-CtxIcon
Get-BrokerIcon
Remove-BrokerIcon

Parameters

-**EncodedIconData**<String>

Specifies the Base64 encoded .ICO format icon data.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-**LoggingId**<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**AdminAddress**<String>
Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type

None Input cannot be piped to this cmdlet.

Return Values

Citrix.BrokerAdmin.SDK.Icon

Returns an Icon object.

Examples

-------------------------- EXAMPLE 1 --------------------------
C:\PS> Add-PSSnapin Citrix.Common.Commands
C:\PS> $ctxIcon = Get-CtxIcon -FileName C:\Windows\System32\notepad.exe -index 0
C:\PS> $brokerIcon = New-BrokerIcon -EncodedIconData $ctxIcon.EncodedIconData
C:\PS> $desktopGroup = Get-BrokerDesktopGroup -Name 'MyDesktopGroup'
C:\PS> Set-BrokerDesktopGroup $desktopGroup -IconUid $brokerIcon.Uid
Extracts the first icon resource from notepad.exe, and sets this as the icon for a desktop group.
New-BrokerMachine

Oct 01, 2013
Adds a machine that can be used to run desktops and applications.

Syntax

Detailed Description

By adding a machine to a catalog, New-BrokerMachine adds a machine to the site, and is the first step in making the machine available to run users' desktops and applications. The machine may be physical or virtual.

For physical machines, you must specify the machine's SID and the catalog to which it will belong. For virtual machines which are not provisioned by MCS, you must also provide the hypervisor connection responsible for running the machine and the hosted machine ID by which the hypervisor recognizes the machine.

The machine must support the expected capabilities of the catalog; the catalog specifies a SessionType and a MinimalFunctionalLevel. The session support of the machine is determined by the type of Citrix VDA software installed (server or workstation) and the functional level depends on the version of the Citrix VDA software installed. The New-BrokerMachine command will complete successfully if these are not correct but the machine will be unable to register.

For more information about machines, see about_Broker_Machines.

Related topics

Add-BrokerMachine

Parameters

-MachineName:<String>

Specify the name of the machine to create (in the form 'domain\machine'). A SID can also be specified.

Required?  true

Accept Pipeline Input?  true (ByPropertyName)

-CatalogUid:<Int32>

The catalog to which this machine will belong.

Required?  true

Accept Pipeline Input?  true (ByPropertyName)

-AssignedClientName:<String>

The client name to which this machine will be assigned. Machines can be assigned to multiple users, a single client IP address, or a single client name, but only to one of these categories at a time.

Required?  false

Accept Pipeline Input?  true (ByPropertyName)

-AssignedIPAddress:<String>

The client IP address to which this machine will be assigned. Machines can be assigned to multiple users, a single client IP address, or a single client name, but only to one of these categories at a time.

Required?  false

Accept Pipeline Input?  true (ByPropertyName)
### Accept Pipeline Input?
true (ByPropertyName)

#### -HostedMachineId<String>
The unique ID by which the hypervisor recognizes the machine. Omit this for physical machines or MCS-provisioned VMs.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>null</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

#### -HypervisorConnectionUid<Int32>
The hypervisor connection that runs the machine. Omit this for physical machines or MCS-provisioned VMs.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>null</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

#### -InMaintenanceMode<Boolean>
Specifies whether the machine is initially in maintenance mode. A machine in maintenance mode is not available for new sessions, and for managed machines all automatic power management is disabled.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>false</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

#### -UUID<Guid>
An optional GUID for this machine.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>A new GUID is generated if none is supplied.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

#### -LoggingId<Guid>
Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

#### -AdminAddress<String>
Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

https://docs.citrix.com © 1999-2017 Citrix Systems, Inc. All rights reserved. p.1230
None You cannot pipe input into this cmdlet.

Return Values
Citrix.BrokerAdmin.SDK.Machine
New-BrokerMachine returns the created machine.

Examples
-------------------------- EXAMPLE 1 --------------------------
C:\PS> New-BrokerMachine -CatalogUid 2 -MachineName 'domain\machine'
This adds the physical machine with the specified SAM name to this site and places it in the specified catalog.

-------------------------- EXAMPLE 2 --------------------------
C:\PS> New-BrokerMachine -CatalogUid 2 -MachineName 'S-1-5-12-1234567890-1234567890-1234567890-1234'
This adds the physical machine with the specified SID to this site and places it in the specified catalog.

-------------------------- EXAMPLE 3 --------------------------
C:\PS> New-BrokerMachine -CatalogUid 2 -MachineName 'domain\machine' -HostedMachineId 'F8143B4F-7371-4efa-868A-54787EF9F64E' -HypervisorConnectionUid 5
This adds the virtual machine, running on the specified hypervisor, to this site and places it in the catalog.

-------------------------- EXAMPLE 4 --------------------------
C:\PS> $m = New-BrokerMachine -CatalogUid 2 -MachineName 'domain\machine'
C:\PS> Add-BrokerMachine -InputObject $m -DesktopGroup 3
This adds the specified physical machine to the site and uses Add-BrokerMachine to add it to a desktop group.

New-BrokerMachineCommand

Oct 01, 2013
Creates a new command to deliver to a desktop.

Syntax

Detailed Description

Create a new command queued for delivery to a desktop. Commands are sent to a specific handler installed on the desktop using the Category parameter. Each handler has its own list of commands identified by the CommandName parameter. Optional command data can be provided using the CommandData parameter in a format specified by the handler.

Commands are targeted at a specific user, session or machine. Commands targeted at a user can be further be restricted to one or more desktop groups.

The SendTrigger is used to restrict the command to a specific event related to the target. For example, when the target machine registers or when the target user reconnects to a session. The command will be sent to the machine when the SendTrigger occurs for the target.

If the Synchronous switch is provided, the target must be a machine and no SendTrigger can be specified. The command is sent immediately to the machine if it is currently registered and fails if the machine is not registered.

Note that the combined length of the Category and CommandName is limited to 64 characters. The Category and CommandName must both be entirely alphanumeric and not include any white space.

Related topics

Get-BrokerMachineCommand
Remove-BrokerMachineCommand

Parameters

-Category <String>
The service on the desktop to send command to.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

https://docs.citrix.com © 1999-2017 Citrix Systems, Inc. All rights reserved. p.1232
### CommandName <String>
The name of the command to send (as defined by the service).

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

### User <String>
User whose desktop or session should receive the command.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Any user.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

### SessionUid <Int64>
Currently logged in user session that should receive the command.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Any session.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

### MachineUid <Int32>
Specific machine that should receive the command.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

### Synchronous <SwitchParameter>
Send the command immediately and block while waiting for the reply.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>false</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### CommandData <Byte[]>
Optional additional data to include with the command.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
</table>
### Default Value

<table>
<thead>
<tr>
<th>Default Value</th>
<th>None</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

#### -LoggingId <Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

#### -AdminAddress <String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

#### -DesktopGroups <DesktopGroup[]>

Further restrict the command targeted at a user to machines in these desktop groups.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>No restriction by desktop group.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

#### -SendTrigger <MachineCommandTrigger>

Queue command for delivery until this particular event occurs. Valid values are NextContact, Broker, LogOn, Logoff, Disconnect and Reconnect.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Default value is 'NextContact' so the command is sent during the next communication with the desktop.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

#### -SendDeadline <TimeSpan>

Automatically cancel the command if it not delivered before the specified time span passes.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Command expires after 24 hours.</td>
</tr>
</tbody>
</table>
Accept Pipeline Input? | true (ByPropertyName)

Input Type

None No parameter is accepted from the input pipeline.

Return Values

Citrix.BrokerAdmin.SDK.MachineCommand

New command that was added to the command queue.

Citrix.BrokerAdmin.SDK.MachineSynchronousCommandResponse

When the Synchronous option is used, the command is immediately sent to the specified machine and processed. The SDK object returned describes the command and the result of this command processing.

Notes

Commands are subject to delegated administration restrictions based on the desktop group, category and command name.

Examples

-------------------------- EXAMPLE 1 --------------------------

New-BrokerMachineCommand -Category "UPM" -CommandName "ResetProfile" -DesktopGroups 1 -UserUid 23 -SendTrigger Authentication
Instruct the User Profile Manager service to execute the "ResetProfile" command when user 23 logs on to any machine in desktop group 1

-------------------------- EXAMPLE 2 --------------------------

New-BrokerMachineCommand -Synchronous -Category "MonitorService" -CommandName "EnableLogging" -MachineUid 13
Instruct the monitor service to immediately execute the "EnableLogging" command on the machine having Uid 13.
New-BrokerMachineConfiguration

Oct 01, 2013
Creates a new machine configuration associated with an existing configuration slot.

Syntax
New-BrokerMachineConfiguration -ConfigurationSlotUid <Int32> -LeafName <String> -Policy <Byte[]> [-Description <String>] [-LoggingId <Guid>] [AdminAddress <String>] [CommonParameters]

Detailed Description
Creates a new machine configuration containing settings that match the SettingsGroup of the associated configuration slot. This machine configuration can then be applied to a desktop group to have the settings applied to machines in that group.

The SettingsGroup of the configuration slot restricts the permitted settings. Use the SDK snap-in that matches the SettingsGroup to create the encoded settings data.

Related topics
Get-BrokerMachineConfiguration
Set-BrokerMachineConfiguration
Rename-BrokerMachineConfiguration
Remove-BrokerMachineConfiguration
Add-BrokerMachineConfiguration

Parameters
-ConfigurationSlotUid <Int32>
Unique identifier of the configuration slot to associate with this machine configuration.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>None</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-LeafName <String>
Name of the new machine configuration. This must be unique amongst the machine configurations associated with the same configuration slot.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>None</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-Policy <Byte[]>
A binary array of encoded settings (policy) data created with the SDK snap-in that matches the SettingsGroup of the configuration slot.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>None</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-Description <String>
Description of the new machine configuration.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>None</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-LoggingId <Guid>
Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

**-AdminAddress <String>**

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

| Required? | false |
| Default Value | localhost. Once a value is provided by any cmdlet, this value will become the default. |
| Accept Pipeline Input? | false |

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.BrokerAdmin.SDK.MachineConfiguration

New-BrokerMachineConfiguration returns the newly created configuration

Notes

Delegated Administration can be used to restrict the configuration slots that an administrator can use and hence which components of the system that can be configured.

Examples

-------------------------- EXAMPLE 1 --------------------------

New-BrokerMachineConfiguration -LeafName "Finance Department" -Description "Finance Dept. User Profile Management policy" -Policy $policy -ConfigurationSlotUid $csUid

Creates a new configuration named "%SlotName%\Finance Department" where %SlotName% is the name of the configuration slot having the Uid $csUid. The encoded settings in the $policy variable must match the SettingsGroup of the configuration slot having the Uid $csUid.
New-BrokerPowerTimeScheme

Oct 01, 2013
Creates a new power time scheme for a desktop group.

Syntax

Detailed Description
The New-BrokerPowerTimeScheme cmdlet adds a new power time scheme to be associated with a desktop group. The power time scheme must relate to days of the week that are not already covered by an existing power time scheme.

Each power time scheme is associated with a particular desktop group, and covers one or more days of the week, defining which hours of those days are considered peak times and which are off-peak times. In addition, the time scheme defines a pool size value for each hour of the day for the days of the week covered by the time scheme. No one desktop group can be associated with two or more time schemes that cover the same day of the week.

See 'help about_Broker_PowerManagement' for a detailed description of the power policy mechanism and pool size management.

Related topics
Get-BrokerPowerTimeScheme
Set-BrokerPowerTimeScheme
Remove-BrokerPowerTimeScheme
Rename-BrokerPowerTimeScheme

Parameters
-Name <String>
Specifies the administrative name of the new power time scheme. Each scheme must have a name which is unique within the site.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-DaysOfWeek <TimeSchemeDays>
Specifies the pattern of days of the week that the power time scheme covers.

Valid values are (singly or a list of) Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, Sunday, Weekdays and Weekend.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-DesktopGroupUid <Int32>
Specifies the desktop group that the power time scheme applies to.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-DisplayName <String>
Specifies the name of the new power time scheme as displayed in the DesktopStudio console. Each scheme associated with a desktop group must have a display name which is unique within its desktop group, although the same display name can be used on power schemes for different desktop groups.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>
### -PeakHours<Boolean[]>-
A set of 24 boolean flag values, one for each hour of the day. The first value in the array relates to midnight to 00:59, the next one to 1 AM to 01:59 and so on, with the last array element relating to 11 PM to 11:59. If the flag is $true it means that the associated hour of the day is considered a peak time; if $false it means that it is considered off-peak.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>24 $false values, meaning all hours are off-peak</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

### -PoolSize<int32[]>-
A set of 24 integer values, one for each hour of the day. The first value in the array relates to midnight to 00:59, the next one to 1 AM to 01:59 and so on, with the last array element relating to 11 PM to 11:59. The value defines the number of machines (either as an absolute number or a percentage of the machines in the desktop group) that are to be maintained in a running state, whether they are in use or not. A value of `-1` has special meaning: pool size management does not apply during such hours.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>24 values of <code>-1</code>, meaning no pool size management is to be performed</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

### -PoolUsingPercentage<Boolean>-
A boolean flag to indicate whether the integer values in the pool size array are to be treated as absolute values (if this value is $false) or as percentages of the number of machines in the desktop group (if this value is $true).

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>false</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

### -LoggingId<Guid>-
Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>false</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

### -AdminAddress<String>-
Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type
None You cannot pipe input into this cmdlet.

Return Values
Citrix.BrokerAdmin.SDK.PowerTimeScheme

New-BrokerPowerTimeScheme returns the newly created power time scheme.
Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> New-BrokerPowerTimeScheme -Name 'First Half Week' -DaysOfWeek Weekend,Monday,Tuesday -DesktopGroupUid 3 -PeakHours (0..23 | %{ $_ -gt 8 -and $_ -lt 18 } )

Creates a new scheme attached to the desktop group whose UID value is 3. This new scheme covers the weekend and Monday and Tuesday, and defines 'peak' hours as 9am to 17:59, with all other times being 'off-peak'. No pool size values are supplied, so all size values for all the hours default to -1.
New-BrokerRebootSchedule

Oct 01, 2013

Creates a new reboot schedule for a desktop group.

Syntax

Detailed Description

The New-BrokerRebootSchedule cmdlet is used to define a reboot schedule for a desktop group.

Related topics

Get-BrokerRebootSchedule
Set-BrokerRebootSchedule
Remove-BrokerRebootSchedule
Start-BrokerRebootCycle

Parameters

- **-DesktopGroupName**<String>

  The name of the desktop group that this reboot schedule is applied to.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **-RebootDuration**<Int32>

  Approximate maximum number of minutes over which the scheduled reboot cycle runs.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **-DesktopGroupUid**<Int32>

  The Uid of the desktop group that this reboot schedule is applied to.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **-Day**<RebootScheduleDays>

  For weekly schedules, the day of the week on which the scheduled reboot cycle starts (one of Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, Sunday).

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **-Enabled**<Boolean>

  Boolean that indicates if the new reboot schedule is enabled.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **-Frequency**<RebootScheduleFrequency>

  Frequency with which this schedule runs (either Weekly or Daily).
<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-StartTime (Type: TimeSpan)**

Time of day at which the scheduled reboot cycle starts (HH:MM).

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-WarningDuration (Type: Int32)**

Time prior to the initiation of a machine reboot at which warning message is displayed in all user sessions on that machine. If the warning duration is zero then no message is displayed.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-WarningMessage (Type: String)**

Warning message displayed in user sessions on a machine scheduled for reboot. If the message is blank then no message is displayed.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-WarningTitle (Type: String)**

The window title used when showing the warning message in user sessions on a machine scheduled for reboot.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-LoggingId (Type: Guid)**

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-AdminAddress (Type: String)**

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**Input Type**

None input cannot be piped to this cmdlet.

**Return Values**

Citrix.Broker.Admin.SDK.RebootSchedule

**Examples**

-------------------------- EXAMPLE 1 --------------------------

C:\PS> New-BrokerRebootSchedule -DesktopGroupName BankTellers -Frequency Daily -StartTime "02:00" -Enabled $true -Duration 120

Schedules the machines in the desktop group named 'BankTellers' to be rebooted every night between 2 AM and 4 AM.
C:\PS> New-BrokerRebootSchedule -DesktopGroupUid 17 -Frequency Weekly -Day Saturday -StartTime "01:00" -Enabled $true -Duration 240 -WarningTitle "WARNING: Reboot pending" -WarningMessage
Schedules the machines in the desktop group having Uid 17 to be rebooted every Saturday night between 1 AM and 5 AM. Ten minutes prior to rebooting, each machine will display a message box with the title "WARNING: Reboot pending" and message "Save your work" in every user session.
New-BrokerRemotePCAccount

Oct 01, 2013
Create a new RemotePCAccount.

Syntax

Detailed Description

Create a new RemotePCAccount. A RemotePCAccount defines machine filters to support Remote PC automation adding unconfigured machines to catalogs.

Related topics

Get-BrokerRemotePCAccount
Set-BrokerRemotePCAccount
Remove-BrokerRemotePCAccount

Parameters

-CatalogUid <Int32>

Specifies the catalog which Remote PC automation adds an unconfigured machine to if it matches this RemotePCAccount.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByPropertyName) |

-OU <String>

Specifies the DN of an AD container, or has the special value ‘any’.

When an AD container is specified a machine may only match with the RemotePCAccount when the AD computer object is located relative to the OU.

When ‘any’ is specified the location of the AD computer object is ignored for purposes of matching this RemotePCAccount. The machine must still meet the MachinesIncluded and MachinesExcluded filters for a match to occur.

In the event that a machine matches with multiple RemotePCAccounts then the RemotePCAccount OU with the longest canonical name takes precedence. The special ‘any’ OU is treated as lowest priority.

Note that the OU value of every RemotePCAccount must be unique, and this includes only one ‘any’ entry being permitted.

| Required? | true |
| Default Value | null |
| Accept Pipeline Input? | true (ByPropertyName) |

-AllowSubfolderMatches <Boolean>

When true a machine matches this RemotePCAccount if the AD computer object exists within the container specified by the OU property, or within a child container of the OU.

When false the AD computer object only matches if it exists directly in the AD container specified by the OU property.
This property is not meaningful when OU has the special value ‘any’.

<table>
<thead>
<tr>
<th>Property</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>MachinesExcluded</td>
<td>false</td>
<td>false</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-MachinesExcluded<String[]>

MachinesExcluded specifies a set of strings that can include asterisk wildcards. If a machine name matches any entries in MachinesExcluded then it cannot match with this RemotePCAccount regardless of whether there is a MachinesIncluded match.

Matches are performed against the domain name joined with the machine name by a backslash (DOMAIN\MACHINE), e.g.:

- DOMAIN1\M*
- DOMAIN*\M*
- *\M*

<table>
<thead>
<tr>
<th>Property</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>MachinesIncluded</td>
<td>false</td>
<td>@()</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-MachinesIncluded<String[]>

MachinesIncluded specifies a set of strings that can include asterisk wildcards. A machine may only match with this RemotePCAccount if it matches a MachinesIncluded entry and does not match any MachinesExcluded entries.

Matches are performed against the domain name joined with the machine name by a backslash (DOMAIN\MACHINE), e.g.:

- DOMAIN1\M*
- DOMAIN*\M*
- *\M*

<table>
<thead>
<tr>
<th>Property</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>MachinesIncluded</td>
<td>false</td>
<td>@('**')</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Property</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>LoggingId</td>
<td>false</td>
<td>false</td>
<td>false</td>
</tr>
</tbody>
</table>

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.
<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.BrokerAdmin.SDK.RemotePCAccount
The newly created RemotePCAccount.

Examples

-------------------------- EXAMPLE 1 --------------------------
C:\PS> New-BrokerRemotePCAccount -OU 'ou=MyOU,dc=MyDomain,dc=com' -CatalogUid 42
Create a RemotePCAccount that adds unconfigured machines with computer objects in MyOU into catalog 42.

-------------------------- EXAMPLE 2 --------------------------
C:\PS> New-BrokerRemotePCAccount -OU 'any' -CatalogUid 42 -MachinesIncluded @('DOMAIN1\*') -MachinesExcluded @('DOMAIN1\JOHNOE*')
Create a RemotePCAccount matching unconfigured machines from DOMAIN1, except those with hostnames containing JOHNOE, and add them to catalog 42.

-------------------------- EXAMPLE 3 --------------------------
C:\PS> New-BrokerRemotePCAccount -OU 'any' -CatalogUid 42
Create a RemotePCAccount that matches any unconfigured machine, causing automation to add matching machines to catalog 42.
New-BrokerTag

Oct 01, 2013
Creates a new tag.

Syntax

New-BrokerTag [-Name] <String> [-UUID <Guid>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Creates a tag that can be associated with other objects using Add-BrokerTag.

Related topics

Add-BrokerTag
Get-BrokerTag
Remove-BrokerTag
Rename-BrokerTag

Parameters

- **-Name** <String>
  
  Specifies a name for the new tag.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **-UUID** <Guid>
  
  Specifies a UUID for the new tag. When not specified, a UUID is automatically assigned.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **-LoggingId** <Guid>
  
  Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.
-AdminAddress <String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type

None Input cannot be piped to this cmdlet.

Return Values

Citrix.BrokerAdmin.SDK.Tag

Outputs the generated tag.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> New-BrokerTag -Name 'Tag1'
Creates a new tag with name 'Tag1'.

-------------------------- EXAMPLE 2 --------------------------

C:\PS> New-BrokerTag 'Tag2' | Add-BrokerTag -Desktop $desktop
Creates a new tag with name 'Tag2' and associates it with Desktop $desktop.
New-BrokerUser

Oct 01, 2013
Creates a new broker user object

Syntax

New-BrokerUser [-SID] <SecurityIdentifier> [-AdminAddress <String>] [CommonParameters]
New-BrokerUser [-Name] <String> [-AdminAddress <String>] [CommonParameters]

Detailed Description

The New-BrokerUser cmdlet creates a new broker object to represent a user identity (or the identity of a group of users). The object is created local to the PowerShell environment in which the cmdlet is run; no new user object is created in the broker configuration, unless the object is added to another broker object, such as a machine or a desktop. For details, see Add-BrokerUser.

The identity of the user or group must be specified using either the Name or SID parameter

Related topics

Add-BrokerUser
Get-BrokerUser
Remove-BrokerUser

Parameters

-SID <SecurityIdentifier>
The SID of the user or group

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>null</td>
<td>false</td>
</tr>
</tbody>
</table>

-Name <String>
The name of the user or group

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>null</td>
<td>false</td>
</tr>
</tbody>
</table>

-AdminAddress <String>
Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type
None You cannot pipe input into this cmdlet.

Return Values
Citrix.BrokerAdmin.SDK.User
The broker user object

Notes
Typically, broker user objects are created implicitly using the Add-BrokerUser cmdlet with a user name or SID.

Examples

-------------------------- EXAMPLE 1 --------------------------

$user = New-BrokerUser DOMAIN\UserName
Create a broker user object for the specified user.

-------------------------- EXAMPLE 2 --------------------------

$user = New-BrokerUser -SID S-1-5-23-1763203430-193137401-908696819-3450
Create a broker user object for the specified user.
Remove-BrokerAccessPolicyRule

Oct 01, 2013
Deletes a rule from the site's access policy.

Syntax

Remove-BrokerAccessPolicyRule [-Name] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-BrokerAccessPolicyRule cmdlet deletes a rule from the site's access policy.

An access policy rule defines a set of connection filters and access control rights relating to a desktop group. These allow fine-grained control of what access is granted to a desktop group based on details of, for example, a user's endpoint device, its address, and the user's identity.

Deleting a rule does not affect existing user sessions, but it may result in users being unable to launch new sessions, or reconnect to disconnected sessions if access to the desktop group delivering those sessions was granted by the deleted rule.

Related topics

New-BrokerAccessPolicyRule

Get-BrokerAccessPolicyRule

Set-BrokerAccessPolicyRule

Rename-BrokerAccessPolicyRule

Parameters

- **-InputObject** <AccessPolicyRule[]>

  The access policy rule to be deleted.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
</tr>
</tbody>
</table>

  | Accept Pipeline Input? | true (ByValue) |

- **-Name** <String>

  The name of the access policy rule to be deleted.

<table>
<thead>

<th>Required?</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
</tr>
</tbody>
</table>

https://docs.citrix.com  © 1999-2017 Citrix Systems, Inc. All rights reserved.
- **LoggingId**:<Guid>

  Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

  | Required? | false |
  | Default Value | 
  | Accept Pipeline Input? | false |

- **AdminAddress**:<String>

  Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

  | Required? | false |
  | Default Value | Localhost. Once a value is provided by any cmdlet, this value will become the default. |
  | Accept Pipeline Input? | false |

**Input Type**

Citrix.BrokerAdmin.SDK.AccessPolicyRule The access policy rule to be deleted.

**Return Values**

None

**Examples**

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Remove-BrokerAccessPolicyRule 'Temp Staff'

Deletes the access policy rule called Temp Staff. Existing sessions are not affected, but if access was granted by the deleted rule users may be unable to reconnect to sessions if they are subsequently disconnected.

-------------------------- EXAMPLE 2 --------------------------

Deletes all access policy rules explicitly granting user SALES\johndoe access to any desktop group in the site. Any existing desktop sessions for the user are not affected. The user may still be able to access site resources by access policy rules that grant access through group membership or non-user-based connection filters.
Remove-BrokerAccessPolicyRuleMetadata

Oct 01, 2013

Syntax

Detailed Description

Related topics

Parameters

- **-InputObject**<AccessPolicyRule[]>

  Specifies the AccessPolicyRule object's instance whose Metadata is to be deleted.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **-Name**<String>

  Specifies the name of the Metadata to be deleted

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>

<td>false</td>
</tr>
</tbody>
</table>
**-AdminAddress <String>**

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

**Return Values**

None

**Examples**

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Remove-BrokerAccessPolicyRuleMetadata -InputObject $obj-Uid -Name "MyMetadataName"

This command deletes the Metadata "MyMetadataName" key-value pair for the AccessPolicyRule whose instance is pointed by $obj-Uid

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Remove-BrokerAccessPolicyRuleMetadata -Name "MyMetadataName"

This command deletes the Metadata "MyMetadataName" key-value pair for all the AccessPolicyRule in the site
Remove-BrokerAppAssignmentPolicyRule

Oct 01, 2013
Deletes an application rule from the site's assignment policy.

Syntax

Remove-BrokerAppAssignmentPolicyRule [-Name] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<<CommonParameters>>]

Detailed Description

The Remove-BrokerAppAssignmentPolicyRule cmdlet deletes an application rule from the site's assignment policy.

An application rule in the assignment policy defines the users who are entitled to a self-service persistent machine assignment from the rule's desktop group; once assigned the machine can run one or more applications published from the group.

Deleting an application rule does not remove machine assignments that have already been made by the rule, nor does it affect active sessions to those machines in any way.

Related topics

New-BrokerAppAssignmentPolicyRule
Get-BrokerAppAssignmentPolicyRule
Set-BrokerAppAssignmentPolicyRule
Rename-BrokerAppAssignmentPolicyRule

Parameters

-InputObject <AppAssignmentPolicyRule[]>
The application rule to be deleted from the assignment policy.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-Name <String>
The name of the application rule to be deleted from the assignment policy.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
</table>
Default Value

Accept Pipeline Input? true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required? false

Default Value

Accept Pipeline Input? false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required? false

Default Value Localhost. Once a value is provided by any cmdlet, this value will become the default.

Accept Pipeline Input? false

Input Type

Citrix.BrokerAdmin.SDK.AppAssignmentPolicyRule The application rule to be deleted from the assignment policy.

Return Values

None

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Remove-BrokerAppAssignmentPolicyRule 'Temp Staff'

Deletes the application rule called Temp Staff from the assignment policy. Access to machines already assigned by this rule is not affected in any way.

-------------------------- EXAMPLE 2 --------------------------

C:\PS> $dg = Get-BrokerDesktopGroup 'Sales Support'

Deletes the application rule for the Sales Support desktop group from the site's assignment policy. This prevents any further machine assignments being made from this group, but it does not affect existing assignments made by the rule.
Remove-BrokerAppEntitlementPolicyRule

Oct 01, 2013
Deletes an application rule from the site's entitlement policy.

Syntax

Remove-BrokerAppEntitlementPolicyRule [-Name] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-BrokerAppEntitlementPolicyRule cmdlet deletes an application rule from the site's entitlement policy.

An application rule in the entitlement policy defines the users who are allowed per-session access to a machine to run one or more applications published from the rule's desktop group.

Deleting a rule does not affect existing sessions launched using the rule, but users cannot reconnect to those sessions if they are subsequently disconnected.

Related topics

New-BrokerAppEntitlementPolicyRule
Get-BrokerAppEntitlementPolicyRule
Set-BrokerAppEntitlementPolicyRule
Rename-BrokerAppEntitlementPolicyRule

Parameters

- **InputObject** <AppEntitlementPolicyRule[]>
  
The application rule to be deleted from the entitlement policy.

<table>
<thead>
<tr>
<th>Required?</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>true</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Default Value</th>
</tr>
</thead>
</table>

- **Name** <String>
  
The name of the application rule to be deleted from the entitlement policy.

<table>
<thead>
<tr>
<th>Required?</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>true</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Default Value</th>
</tr>
</thead>
</table>
Accept Pipeline Input? | true (ByPropertyName)
---|---

- **LoggingId**<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>

<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **AdminAddress**<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type

Citrix.BrokerAdmin.SDK.AppEntitlementPolicyRule The application rule to be deleted from the entitlement policy.

Return Values

None

Examples

------------- EXAMPLE 1 -------------

C:\PS> Remove-BrokerAppEntitlementPolicyRule 'Temp Workers'

Deletes the application rule called Temp Workers from the entitlement policy rule. Existing application sessions launched using that rule are not affected, but users cannot reconnect to those sessions if they are subsequently disconnected.

------------- EXAMPLE 2 -------------

C:\PS> $dg = Get-BrokerDesktopGroup 'Customer Support'

Deletes the application rule from the entitlement policy rule applied to the Customer Support desktop group. This effectively removes all access to the applications published from this group. Existing application sessions are not affected, but users cannot reconnect to those sessions if they are subsequently disconnected.
Remove-BrokerApplication

Oct 01, 2013
Deletes one or more applications, or an association of an application.

Syntax

Detailed Description

The Remove-BrokerApplication cmdlet deletes one or more applications, or it can be used to delete just the association of an application to a desktop group.

Its usage dictates the behavior of the cmdlet. If only the application is specified as a parameter, then the cmdlet deletes the application. It also deletes any associations this application has with other objects, such as with access policy rules or desktop groups. More specifically, when an application is deleted the following happens:

- The association to any desktop groups is removed.
- The association to any tags is removed.
- Any configured file-type association objects for this application are deleted.
- The association to any user accounts is removed.
- The association to any access session conditions is removed.
- The access policy rule object for this application, if one existed, is deleted.
- Finally, the application object itself is deleted.

Note that if the application is in use by a user then the application cannot be deleted.

If more than just the application is supplied as a parameter to the cmdlet, for instance if a DesktopGroup object is also specified, then the application is not deleted. Instead, only the association from the application to that desktop group is removed.

Related topics

New-BrokerApplication
Add-BrokerApplication
Get-BrokerApplication
Rename-BrokerApplication
Set-BrokerApplication
Parameters

- **InputObject** &lt;Application[]&gt;

Specifies the applications to delete. The Uid can also be substituted for the application objects.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **Name** &lt;String&gt;

Specifies the name of the application to remove.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **Force** &lt;SwitchParameter&gt;

Remove application even if it's in use. Removing an application that is currently in use, can potentially leave an application session containing no applications. If all the applications that are currently active in a disconnected application session are removed, the user will not be able to reconnect to the session. Forcing removal of an in use application does not impact the actual session itself.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>false</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **DesktopGroup** &lt;DesktopGroup&gt;

Specifies the desktop group that this application should no longer be associated with. The Uid or Name can also be substituted for the desktop group object.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **LoggingId** &lt;Guid&gt;

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level
Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-AdminAddress**<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type

Citrix.BrokerAdmin.SDK.Application The application objects can be specified as input.

Return Values

None

This cmdlet does not return any output.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Remove-BrokerApplication "Notepad"
This command deletes the application that has a BrowserName of "Notepad".

-------------------------- EXAMPLE 2 --------------------------

C:\PS> $app = Get-BrokerApplication -BrowserName "Notepad"
C:\PS> $group = Get-BrokerDesktopGroup -Name "Private DesktopGroup"
C:\PS> Remove-BrokerApplication -InputObject $app -DesktopGroup $group
This command removes the association of the desktop group that has a name of "Private DesktopGroup" from the application that has a BrowserName of "Notepad". It does not otherwise modify the application.
Remove-BrokerApplicationInstanceMetadata

Oct 01, 2013

Deletes ApplicationInstance Metadata from the ApplicationInstance objects

Syntax

Remove-BrokerApplicationInstanceMetadata [-InputObject] <ApplicationInstance[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-BrokerApplicationInstanceMetadata cmdlet deletes Metadata from the ApplicationInstance objects.

Related topics

Parameters

- **-InputObject** <ApplicationInstance[]>

Specifies the ApplicationInstance object's instance whose Metadata is to be deleted.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **-Name** <String>

Specifies the name of the Metadata to be deleted

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

- **-LoggingId** <Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>
-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type
Citrix.BrokerAdmin.SDK.BrokerApplicationInstance You can pipe the ApplicationInstance to delete the metadata.

Return Values
None

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Remove-BrokerApplicationInstanceMetadata -InputObject $obj-Uid -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for the ApplicationInstance whose instance is pointed by $obj-Uid

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Remove-BrokerApplicationInstanceMetadata -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for all the ApplicationInstance in the site
Remove-BrokerApplicationMetadata

Oct 01, 2013
Deletes Application Metadata from the Application objects

Syntax

Remove-BrokerApplicationMetadata [-InputObject] <Application[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-BrokerApplicationMetadata cmdlet deletes Metadata from the Application objects.

Related topics

Parameters

-**InputObject**<Application[]>

Specifies the Application object's instance whose Metadata is to be deleted.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>

<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

Citrix.BrokerAdmin.SDK.BrokerApplication You can pipe the Application to delete the metadata.

**Return Values**

None

**Examples**

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Remove-BrokerApplicationMetadata -InputObject $obj-Uid -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for the Application whose instance is pointed by $obj-Uid

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Remove-BrokerApplicationMetadata -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for all the Application in the site
Remove-BrokerAssignmentPolicyRule

Oct 01, 2013
Deletes a desktop rule from the site's assignment policy.

Syntax

Remove-BrokerAssignmentPolicyRule [-Name] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-BrokerAssignmentPolicyRule cmdlet deletes a desktop rule from the site's assignment policy.

A desktop rule in the assignment policy defines the users who are entitled to self-service persistent machine assignments from the rule's desktop group. A rule defines how many machines a user is allowed from the group for delivery of full desktop sessions.

Deleting a desktop rule does not remove machine assignments that have already been made by the rule, nor does it affect active sessions to those machines in any way.

Related topics

New-BrokerAssignmentPolicyRule
Get-BrokerAssignmentPolicyRule
Set-BrokerAssignmentPolicyRule
Rename-BrokerAssignmentPolicyRule

Parameters

- **-InputObject** <AssignmentPolicyRule[]>
  The desktop rule to be deleted from the assignment policy.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
</tr>
</tbody>
</table>

  | Accept Pipeline Input? | true (ByValue) |

- **-Name** <String>
  The name of the desktop rule to be deleted from the assignment policy.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
</table>
- **LoggingId**<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **AdminAddress**<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type

Citrix.BrokerAdmin.SDK.AssignmentPolicyRule The desktop rule to be deleted from the assignment policy.

Return Values

None

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Remove-BrokerAssignmentPolicyRule 'Temp Staff'

Deletes the desktop rule called Temp Staff from the assignment policy. Access to machines already assigned by this rule is not affected in any way.

-------------------------- EXAMPLE 2 --------------------------

C:\PS> $dg = Get-BrokerDesktopGroup 'Sales Support'
C:\PS> Get-BrokerAssignmentPolicyRule -DesktopGroupId $dg.Uid | Remove-BrokerAssignmentPolicyRule

Deletes all desktop rules for the Sales Support desktop group from the site's assignment policy. This prevents any further machine assignments being made from this group, but it does not affect existing assignments made by these rules.
Remove-BrokerAssignmentPolicyRuleMetadata

Oct 01, 2013
 Deletes AssignmentPolicyRule Metadata from the AssignmentPolicyRule objects

Syntax

Detailed Description

<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>
- **AdminAddress**: String

  Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

  **Input Type**
  
  Citrix.BrokerAdmin.SDK.BrokerAssignmentPolicyRule You can pipe the AssignmentPolicyRule to delete the metadata.

  **Return Values**
  
  None

  **Examples**

  -------------------------- EXAMPLE 1 --------------------------
  
  C:\PS> Remove-BrokerAssignmentPolicyRuleMetadata -InputObject $obj-Uid -Name "MyMetadataName"
  
  This command deletes the Metadata "MyMetadataName" key-value pair for the AssignmentPolicyRule whose instance is pointed by $obj-Uid

  -------------------------- EXAMPLE 2 --------------------------
  
  C:\PS> Remove-BrokerAssignmentPolicyRuleMetadata -Name "MyMetadataName"
  
  This command deletes the Metadata "MyMetadataName" key-value pair for all the AssignmentPolicyRule in the site
Remove-BrokerCatalog

Oct 01, 2013
Removes catalogs from the site.

Syntax

Remove-BrokerCatalog [-InputObject] <Catalog[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
Remove-BrokerCatalog [-Name] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Remove catalogs from the site.

In order to remove a catalog from a site, the catalog must not contain machines. To remove a machine from a catalog use the Remove-BrokerMachine cmdlet. Note: in order to remove a machine from a catalog, it must not belong to a desktop group.

Related topics

Add-BrokerCatalog
Get-BrokerCatalog
New-BrokerCatalog
Rename-BrokerCatalog
Set-BrokerCatalog
Add-BrokerDesktopGroup
Remove-BrokerDesktopGroup

Parameters

- **InputObject**<Catalog[]>

  Specifies the catalog objects to delete.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>null</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **Name**<String>

  Specifies the name of the catalog to delete.

<table>
<thead>
<tr>
<th>Required?</th>
<th></th>
</tr>
</thead>
</table>
**-LoggingId<Guid>**

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

**-AdminAddress<String>**

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

| Required? | false |
| Default Value | Localhost. Once a value is provided by any cmdlet, this value will become the default. |
| Accept Pipeline Input? | false |

Input Type

Citrix.BrokerAdmin.SDK.Catalog You can pipe the catalogs to be deleted to Remove-BrokerCatalog.

Return Values

None

Examples

--------------- EXAMPLE 1 ---------------

C:\PS> Remove-BrokerCatalog -Name "MyCatalog"
C:\PS> Remove-BrokerCatalog -InputObject (Get-BrokerCatalog -Name "MyCatalog")
These commands delete the catalog with the name "MyCatalog".

--------------- EXAMPLE 2 ---------------

C:\PS> Remove-BrokerCatalog -Name 'test*'
This command deletes all catalogs with names beginning with "test".

--------------- EXAMPLE 3 ---------------

C:\PS> Get-BrokerCatalog -RemotePCDesktopGroupUid 42 | Remove-BrokerCatalog -RemotePCDesktopGroup 42
Remove all the Remote PC catalogs that are associated with desktop group 42. Note that this only breaks the Remote PC
relationships and does not delete the desktop groups.
Remove-BrokerCatalogMetadata

Oct 01, 2013
Deletes Catalog Metadata from the Catalog objects

Syntax

```
Remove-BrokerCatalogMetadata [-InputObject] <Catalog[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>]
[<CommonParameters>]
```

Detailed Description

The Remove-BrokerCatalogMetadata cmdlet deletes Metadata from the Catalog objects.

Related topics

Parameters

- **-InputObject** `<Catalog[]>`

</table>
- **AdminAddress**: String

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

Citrix.BrokerAdmin.SDK.BrokerCatalog You can pipe the Catalog to delete the metadata.

**Return Values**

None

**Examples**

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Remove-BrokerCatalogMetadata -InputObject $obj-Uid -Name "MyMetadataName"

This command deletes the Metadata "MyMetadataName" key-value pair for the Catalog whose instance is pointed by $obj-Uid

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Remove-BrokerCatalogMetadata -Name "MyMetadataName"

This command deletes the Metadata "MyMetadataName" key-value pair for all the Catalog in the site
Remove-BrokerConfigurationSlot

Oct 01, 2013
Removes a configuration slot.

Syntax

Remove-BrokerConfigurationSlot [-InputObject] <ConfigurationSlot[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-BrokerConfigurationSlot [-Name] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Removes a configuration slot from the site. All machine configurations associated with this slot are also removed.

Related topics

New-BrokerConfigurationSlot
Get-BrokerConfigurationSlot

Parameters

- **-InputObject** <ConfigurationSlot[]>
  
  Configuration slot to remove.
  
  | Required? | true |
  | Default Value | |
  | Accept Pipeline Input? | true (ByValue) |

- **-Name** <String>
  
  Name of configuration slot to remove.
  
  | Required? | true |
  | Default Value | |
  | Accept Pipeline Input? | true (ByPropertyName) |

- **-LoggingId** <Guid>
  
  Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.
  
  | Required? | false |
- **AdminAddress**<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

Configuration slot to remove Configuration slots may be specified through pipeline input.

**Return Values**

None

**Examples**

```
-------------------------- EXAMPLE 1 --------------------------

Remove-BrokerConfigurationSlot -Name "User Profile Manager"

Remove the configuration slot named "User Profile Manager".
```
Remove-BrokerConfigurationSlotMetadata

Oct 01, 2013

Deletes ConfigurationSlot Metadata from the ConfigurationSlot objects

Syntax

Remove-BrokerConfigurationSlotMetadata [-InputObject] <ConfigurationSlot[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Detailed Description

The Remove-BrokerConfigurationSlotMetadata cmdlet deletes Metadata from the ConfigurationSlot objects.

Related topics

Parameters

- **-InputObject** <ConfigurationSlot[]>
  
  Specifies the ConfigurationSlot object's instance whose Metadata is to be deleted.

</tbody>
</table>

**Input Type**

Citrix.BrokerAdmin.SDK.BrokerConfigurationSlot You can pipe the ConfigurationSlot to delete the metadata.

**Return Values**

None

**Examples**

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Remove-BrokerConfigurationSlotMetadata -InputObject $obj-Uid -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for the ConfigurationSlot whose instance is pointed by $obj-Uid

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Remove-BrokerConfigurationSlotMetadata -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for all the ConfigurationSlot in the site
Remove-BrokerConfiguredFTA

Oct 01, 2013
Deletes one or more configured file type associations.

Syntax
Remove-BrokerConfiguredFTA [-InputObject] <ConfiguredFTA[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<-CommonParameters>]

Detailed Description
Deletes one or more file type associations configured for a published application. At least one configured file type association object must be specified.

Related topics
Get-BrokerConfiguredFTA
New-BrokerConfiguredFTA

Parameters
-InputObject <ConfiguredFTA[]>
Specifies the ConfiguredFTA objects to delete.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByValue) |

-LoggingId <Guid>
Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

-AdminAddress <String>
Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<p>| Required? | false |
| Default Value | |</p>
<table>
<thead>
<tr>
<th>Default Value</th>
<th>Localhost. Once a value is provided by any cmdlet, this value will become the default.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type

Citrix.BrokerAdmin.SDK.ConfiguredFTA[] One or more ConfiguredFTA objects can be supplied as input.

Return Values

None

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\> $ftas = Get-BrokerConfiguredFTA -ExtensionName ".txt"
C:\> Remove-BrokerConfiguredFTA $ftas
Deletes all configured file type associations with an extension name of ".txt".
Remove-BrokerControllerMetadata

Oct 01, 2013
Deletes Controller Metadata from the Controller objects

Syntax

Remove-BrokerControllerMetadata [-InputObject] <Controller[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters>

Detailed Description

The Remove-BrokerControllerMetadata cmdlet deletes Metadata from the Controller objects.

Related topics

Parameters

- **-InputObject** <Controller[]>

Specifies the Controller object's instance whose Metadata is to be deleted.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByValue) |

- **-Name** <String>

Specifies the name of the Metadata to be deleted

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | false |

- **-LoggingId** <Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |
- **AdminAddress**: String

  Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

  **Input Type**

  Citrix.BrokerAdmin.SDK.BrokerController You can pipe the Controller to delete the metadata.

  **Return Values**

  None

  **Examples**

  -------------------------- EXAMPLE 1 --------------------------

  C:\PS> Remove-BrokerControllerMetadata -InputObject $obj-Uid -Name "MyMetadataName"

  This command deletes the Metadata "MyMetadataName" key-value pair for the Controller whose instance is pointed by $obj-Uid

  -------------------------- EXAMPLE 2 --------------------------

  C:\PS> Remove-BrokerControllerMetadata -Name "MyMetadataName"

  This command deletes the Metadata "MyMetadataName" key-value pair for all the Controller in the site
Remove-BrokerDelayedHostingPowerAction

Oct 01, 2013
Cancels one or more delayed power actions.

Syntax

Remove-BrokerDelayedHostingPowerAction [-InputObject] <DelayedHostingPowerAction[]> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters>

Remove-BrokerDelayedHostingPowerAction [-MachineName] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters>

Detailed Description

Removes one or more delayed power actions that have not yet been queued for execution.

Related topics

Get-BrokerDelayedHostingPowerAction
New-BrokerDelayedHostingPowerAction

Parameters

-InputObject <DelayedHostingPowerAction[]>

The power action to be cancelled.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-MachineName <String>

Cancels only actions for machines whose name (of the form domain\machine) matches the specified string.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-LoggingId <Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.
-AdminAddress <String>

Provides the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a hostname or an IP address.

| Required? | false |
| Default Value | Localhost. Once a value is provided by any cmdlet, this value will become the default. |
| Accept Pipeline Input? | false |

**Input Type**

Citrix.BrokerAdminSDK.DelayedHostingPowerAction The power action to be cancelled.

**Return Values**

None

**Examples**

```
C:\PS> Remove-BrokerHostingPowerAction -MachineName 'XD_VDA1'
```

Cancels any pending delayed power actions for the machine called XD_VDA1.
Remove-BrokerDesktopGroup

Oct 01, 2013
Remove desktop groups from the system or remove them from a Remote PC catalog.

Syntax

Remove-BrokerDesktopGroup [-Name] <String> [-Force] [-RemotePCCatalog <Catalog>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

This cmdlet has 2 functions:

- Remove desktop groups from the system.
- Break Remote PC associations between desktop groups and a catalog.

The Remote PC relationships are used by Remote PC automation to determine which desktop groups a machine in a particular Remote PC catalog can be published to. The assignment policy rules belonging to those desktop groups also determines the set of users that are allowed to be assigned to machines from the catalog.

Related topics

Get-BrokerDesktopGroup

Remove-BrokerCatalog

Parameters

- **InputObject** <DesktopGroup[]>

  Specifies the desktop groups to remove.

---

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>null</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>
## -Name (String)

Specifies the name of the desktop group to remove.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>null</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

## -Force (SwitchParameter)

Remove desktop groups even if there are active sessions.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>false</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

## -RemotePCCatalog (Catalog)

When this parameter is specified, Remote PC desktop groups are removed from the specified Remote PC catalog.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>null</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

## -LoggingId (Guid)

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

## -AdminAddress (String)

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
</tbody>
</table>
Accept Pipeline Input? | false

Input Type
Citrix.BrokerAdmin.SDK.DesktopGroup You can pipe desktop groups to Remove-BrokerDesktopGroup.

Return Values
None

Notes
If a desktop group contains desktops when it is removed, these desktops are also removed (but the underlying broker machine remains).

A desktop group that still has active sessions cannot be removed unless the -Force switch is used.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Remove-BrokerDesktopGroup EMEA*
Remove all desktop groups with names starting with "EMEA".

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Get-BrokerDesktopGroup -Enabled $false | Remove-BrokerDesktopGroup -Force
Remove all desktops that are currently disabled even if there are active sessions.

-------------------------- EXAMPLE 3 --------------------------

C:\PS> Get-BrokerDesktopGroup -RemotePCCatalogUid 42 | Remove-BrokerDesktopGroup -RemotePCCatalog 42
Remove all the Remote PC desktop groups that are associated with catalog 42. Note that this only breaks the Remote PC relationships and does not delete the desktop groups.
Remove-BrokerDesktopGroupMetadata

Oct 01, 2013
Deletes DesktopGroup Metadata from the DesktopGroup objects

Syntax

Remove-BrokerDesktopGroupMetadata [-InputObject] <DesktopGroup[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-BrokerDesktopGroupMetadata cmdlet deletes Metadata from the DesktopGroup objects.

Related topics

Parameters

- **-InputObject** <DesktopGroup[]>
  
  Specifies the DesktopGroup object's instance whose Metadata is to be deleted.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **-Name** <String>
  
  Specifies the name of the Metadata to be deleted

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

- **-LoggingId** <Guid>
  
  Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>
**-AdminAddress**: `<String>`

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

`Citrix.BrokerAdmin.SDK.BrokerDesktopGroup` You can pipe the DesktopGroup to delete the metadata.

**Return Values**

None

**Examples**

-------------------------- EXAMPLE 1 --------------------------

```powershell
C:\PS> Remove-BrokerDesktopGroupMetadata -InputObject $obj-Uid -Name "MyMetadataName"
```

This command deletes the Metadata "MyMetadataName" key-value pair for the DesktopGroup whose instance is pointed by $obj-Uid

-------------------------- EXAMPLE 2 --------------------------

```powershell
C:\PS> Remove-BrokerDesktopGroupMetadata -Name "MyMetadataName"
```

This command deletes the Metadata "MyMetadataName" key-value pair for all the DesktopGroup in the site
Remove-BrokerEntitlementPolicyRule

Oct 01, 2013
Deletes a desktop rule from the site's entitlement policy.

Syntax

Detailed Description

The Remove-BrokerEntitlementPolicyRule cmdlet deletes a desktop rule from the site's entitlement policy.

A desktop rule in the entitlement policy defines the users who are allowed per-session access to a machine from the rule's associated desktop group to run a full desktop session.

Deleting a rule does not affect existing sessions launched using the rule, but users cannot reconnect to those sessions if they are subsequently disconnected.

Related topics

New-BrokerEntitlementPolicyRule
Get-BrokerEntitlementPolicyRule

Parameters

- **-InputObject** <EntitlementPolicyRule[]>
  The desktop rule to be deleted from the entitlement policy.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **-Name** <String>
  The name of the desktop rule to be deleted from the entitlement policy.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
</tbody>
</table>

Accept Pipeline Input? | true (ByPropertyName)
---|---

**-LoggingId<Guid>**

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-AdminAddress<String>**

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

Citrix.BrokerAdminSDK.EntitlementPolicyRule The desktop rule to be deleted from the entitlement policy.

**Return Values**

None

**Examples**

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Remove-BrokerEntitlementPolicyRule 'Temp Workers'

Deletes the desktop rule called Temp Workers from the entitlement policy. Existing desktop sessions launched using the rule are not affected, but users cannot reconnect to sessions if they are subsequently disconnected.

-------------------------- EXAMPLE 2 --------------------------

C:\PS> $dg = Get-BrokerDesktopGroup 'Customer Support'

Deletes all desktop rules from the entitlement policy applying to the Customer Support desktop group. This effectively removes all access to the desktops published from this group. Existing desktop sessions are not affected, but users cannot reconnect to sessions if they are subsequently disconnected.
Remove-BrokerEntitlementPolicyRuleMetadata

Oct 01, 2013
Deletes EntitlementPolicyRule Metadata from the EntitlementPolicyRule objects

Syntax

Detailed Description

Related topics

Parameters

- **-InputObject** <EntitlementPolicyRule[]>

  Specifies the EntitlementPolicyRule object's instance whose Metadata is to be deleted.

    | Required? | Default Value | Accept Pipeline Input? |
    |-----------|--------------|------------------------|
    | true      |              | true (ByValue)         |

- **-Name** <String>

  Specifies the name of the Metadata to be deleted

    | Required? | Default Value | Accept Pipeline Input? |
    |-----------|--------------|------------------------|
    | true      |              | false                  |

- **-LoggingId** <Guid>

  Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

    | Required? | Default Value | Accept Pipeline Input? |
    |-----------|--------------|------------------------|
    | false     |              | false                  |
-AdminAddress <String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a hostname or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>

<td>false</td>
</tr>
</tbody>
</table>

Input Type

Return Values

None

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Remove-BrokerEntitlementPolicyRuleMetadata -InputObject $obj-Uid -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for the EntitlementPolicyRule whose instance is pointed by $obj-Uid

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Remove-BrokerEntitlementPolicyRuleMetadata -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for all the EntitlementPolicyRule in the site
Remove-BrokerHostingPowerAction

Oct 01, 2013
Cancel one or more pending power actions.

Syntax

Remove-BrokerHostingPowerAction [-InputObject] <HostingPowerAction>[] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-BrokerHostingPowerAction [-MachineName] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Causes one or more of the pending power actions in the queue to be marked as cancelled. The affected power actions are not sent to the hypervisor for processing, and take no further part in the queuing activity.

Power actions cannot be cancelled once they have started to be processed by the hypervisor.

<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **AdminAddress** <String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
</tbody>
</table>
## Accept Pipeline Input?
| false |

### Input Type
**Citrix.BrokerAdmin.SDK.Icon** The icon to be removed can be piped into the cmdlet.

### Return Values
None

### Notes
Note that if the icon is currently in use, for example, as a desktop icon, it cannot be removed until the association is cleared.

### Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Remove-BrokerIcon 3
Removes the icon with Uid 3.
Remove-BrokerIconMetadata

Oct 01, 2013
Deletes Icon Metadata from the Icon objects

Syntax

Remove-BrokerIconMetadata [-InputObject] <Icon[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-BrokerIconMetadata cmdlet deletes Metadata from the Icon objects.

Related topics

Parameters

-InputObject <Icon[]>

Specifies the Icon object's instance whose Metadata is to be deleted.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-Name <String>

Specifies the name of the Metadata to be deleted.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-LoggingId <Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>
-**AdminAddress**<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type

Citrix.BrokerAdmin.SDK.BrokerIcon You can pipe the Icon to delete the metadata.

Return Values

None

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Remove-BrokerIconMetadata -InputObject $obj-Uid -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for the Icon whose instance is pointed by $obj-Uid

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Remove-BrokerIconMetadata -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for all the Icon in the site
Remove-BrokerImportedFTA

Oct 01, 2013
Deletes one or more imported file type associations.

Syntax

Remove-BrokerImportedFTA -DesktopGroupUids <Int32[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Deletes all of the imported file type associations belonging to one or more desktop groups. At least one desktop group must be specified.

Imported file type associations are grouped together based on the desktop group of the machine from which they were imported. All file types for a desktop group are deleted. There is no mechanism for deleting a subset imported file type associations for a specific desktop group.

Imported file type associations are different from configured file type associations. Imported file type associations are lists of known file type associations for a given desktop group. Configured file type associations are those that are actually associated with published applications for the purposes of content redirection.

Related topics

Get-BrokerImportedFTA
Update-BrokerImportedFTA

Parameters

-DesktopGroupUids <Int32[]>

Deletes the imported file type associations belonging to specified desktop groups.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-LoggingId <Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
-AdminAddress</String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type

Int32[] An array of Uids for the desktop groups can be supplied as input. The desktop groups must be of the Private or Shared desktop kind.

Return Values

None

Notes

If an imported file type association is used to create a new configured file type association and the imported file type association is subsequently deleted, the configured file type association is not affected.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> $dg = Get-BrokerDesktopGroup -Name "Sales VMs"
C:\PS> Remove-BrokerImportedFTA -DesktopGroupUids $dg.Uid
Deletes all imported file type associations belonging to the "Sales VMs" desktop group.
Remove-BrokerMachine

Removes one or more machines from its desktop group or catalog.

Syntax

Detailed Description

The Remove-BrokerMachine cmdlet removes one or more machines from their desktop group or catalog. There are three forms:

- Use the -InputObject parameter to remove a single machine instance or array of instances from their desktop group or catalog.
- Use the -MachineName parameter to remove the single named machine from its group or catalog.
- Use pipelining to pipe machine instances to the command.

To remove machines from their desktop group use the -DesktopGroup parameter; the specified group must be the one that contains the machines. If more than one machine is being removed from its group they must all be members of the same group.

If the -DesktopGroup parameter is not used then the machines are removed from their catalog. Removing a machine from its catalog deletes the record of the machine from the Citrix Broker Service.

Machines cannot be removed from their catalog while they are members of a desktop group.

Related topics

Add-BrokerMachine
Get-BrokerMachine

Parameters

- **-InputObject**: <Machine[]>

An array of machines to be removed from their desktop group or catalog.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Required?</td>
<td>true</td>
</tr>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>
-MachineName<String>

The name of the single machine to remove (must match the MachineName property of the machine).

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-Force<SwitchParameter>

Forces removal of machine from a desktop group even if it is still in use (that is, there are user sessions running on the machine). Forcing removal of a machine does not disconnect or logoff the user sessions.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-DesktopGroup<DesktopGroup>

The desktop group from which the machines are to be removed, specified by name, UID, or instance.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>----------------</td>
<td>----------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

Citrix.BrokerAdmin.SDK.Machine You can pipe in the machines to be removed.

**Return Values**

None

**Examples**

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Remove-BrokerMachine -InputObject $machine -DesktopGroup $desktopGroup
C:\PS> Remove-BrokerMachine -InputObject $machine -DesktopGroup 2
C:\PS> Remove-BrokerMachine $machine -DesktopGroup "MyDesktopGroup"
These all remove a single machine from a desktop group, identifying the group by instance, UID, or name.

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Remove-BrokerMachine -MachineName "DOMAIN\MyMachine" -DesktopGroup 2
C:\PS> Remove-BrokerMachine DOMAIN\MyMachine -DesktopGroup "MyDesktopGroup"
C:\PS> Remove-BrokerMachine DOMAIN\MyMachine -DesktopGroup $desktopGroup
These remove the machine called "DOMAIN\MyMachine" from its desktop group.

-------------------------- EXAMPLE 3 --------------------------

C:\PS> Remove-BrokerMachine -MachineName DOMAIN\MyMachine
C:\PS> Remove-BrokerMachine "DOMAIN\MyMachine"
C:\PS> Remove-BrokerMachine $machine
These all remove a machine from its catalog.

-------------------------- EXAMPLE 4 --------------------------

C:\PS> Get-BrokerMachine -Uid 3 | Remove-BrokerMachine -DesktopGroup $dg
C:\PS> Get-BrokerMachine -CatalogUid 4 | Remove-BrokerMachine
These find specific machines and remove them from their desktop group or catalog.
Remove-BrokerMachineCommand

Oct 01, 2013
Cancel a pending command queued for delivery to a desktop.

Syntax

Detailed Description

Sets the state of a pending command queued for delivery to a desktop to Canceled. The command is not removed from the system.

Related topics

Get-BrokerMachineCommand
New-BrokerMachineCommand

Parameters

-**InputObject**<MachineCommand[]>

Commands to cancel

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-**LoggingId**<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**AdminAddress**<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td></td>
</tr>
</tbody>
</table>
Default Value | Localhost. Once a value is provided by any cmdlet, this value will become the default.
--- | ---
Accept Pipeline Input? | false

### Input Type

### Return Values

None

### Examples

-------------------------- EXAMPLE 1 --------------------------

Get-BrokerMachineCommand | Remove-BrokerMachineCommand
Cancel all pending commands.

-------------------------- EXAMPLE 2 --------------------------

Get-BrokerMachineCommand -Category "UPM" | Remove-BrokerMachineCommand
Cancel all pending commands that have the category "UPM".
Remove-BrokerMachineCommandMetadata

Oct 01, 2013
Deletes MachineCommand Metadata from the MachineCommand objects

Syntax

Remove-BrokerMachineCommandMetadata [-InputObject] <MachineCommand[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-BrokerMachineCommandMetadata cmdlet deletes Metadata from the MachineCommand objects.

Related topics

Parameters

- **-InputObject**<MachineCommand[]>

Specifies the MachineCommand object's instance whose Metadata is to be deleted.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **-Name**<String>

</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>
**-AdminAddress**<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

Citrix.BrokerAdmin.SDK.BrokerMachineCommand You can pipe the MachineCommand to delete the metadata.

**Return Values**

None

**Examples**

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Remove-BrokerMachineCommandMetadata -InputObject $obj-Uid -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for the MachineCommand whose instance is pointed by $obj-Uid

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Remove-BrokerMachineCommandMetadata -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for all the MachineCommand in the site
Remove-BrokerMachineConfiguration

Oct 01, 2013
Deletes a machine configuration from the site or removes the association from a desktop group.

Syntax

Remove-BrokerMachineConfiguration [-Name] <String> [-DesktopGroup <DesktopGroup>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-MachineConfiguration cmdlet deletes machine configurations from the site. A machine configuration cannot be removed while it is applied to a desktop group.

When a desktop group is provided, the Remove-MachineConfiguration cmdlet removes the association between machine configuration and the desktop group. In this case, the machine configuration is not removed from the site.

Input Type

Citrix.BrokerAdmin.SDK.MachineConfiguration Machine configuration to remove

Return Values

None

Notes

A machine configuration can only be removed if it is not currently applied to a desktop group.

Examples

-------------------------- EXAMPLE 1 --------------------------
Remove-BrokerMachineConfiguration -Name UPM\Finance
Removes the machine configuration named "UPM\Finance".

-------------------------- EXAMPLE 2 --------------------------

Remove-BrokerMachineConfiguration -Name Receiver\HumanResources -DesktopGroup SharedWorkers
Removes the association of the machine configuration named "Receiver\HumanResources" from the "SharedWorkers" desktop group.
Remove-BrokerMachineConfigurationMetadata

Oct 01, 2013
Deletes MachineConfiguration Metadata from the MachineConfiguration objects

Syntax

</tbody>
</table>

Input Type

Citrix.BrokerAdmin.SDK.BrokerMachine You can pipe the Machine to delete the metadata.

Return Values

None

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Remove-BrokerMachineMetadata -InputObject $obj-Uid -Name "MyMetadataName"

This command deletes the Metadata "MyMetadataName" key-value pair for the Machine whose instance is pointed by $obj-Uid

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Remove-BrokerMachineMetadata -Name "MyMetadataName"

This command deletes the Metadata "MyMetadataName" key-value pair for all the Machine in the site
Remove-BrokerPowerTimeScheme

Oct 01, 2013
Deletes an existing power time scheme.

Syntax
Remove-BrokerPowerTimeScheme [-InputObject] <PowerTimeScheme[]> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]
Remove-BrokerPowerTimeScheme [-Name] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Detailed Description
The Remove-BrokerPowerTimeScheme cmdlet deletes a power time scheme from the system, and leaves the days that the time scheme used to cover for the associated desktop group as defaulting to all hours off-peak and all hours with pool size of -1.

Each power time scheme is associated with a particular desktop group, and covers one or more days of the week, defining which hours of those days are considered peak times and which are off-peak times. In addition, the time scheme defines a pool size value for each hour of the day for the days of the week covered by the time scheme. No one desktop group can be associated with two or more time schemes that cover the same day of the week.

For more information about the power policy mechanism and pool size management, see 'help about_Broker_PowerManagement'.

**Input Type**

Citrix.BrokerAdmin.SDK.PowerTimeScheme The power time scheme to be deleted.

**Return Values**

None

**Examples**

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Remove-BrokerPowerTimeScheme -Name 'Development Weekdays'

Deletes the power time scheme named 'Development Weekdays'.

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Get-BrokerPowerTimeScheme -DesktopGroupUid (Get-BrokerDesktopGroup -name 'Finance desk1').Uid | Remove-BrokerPowerTimeScheme

Deletes all power time schemes for the desktop group named 'Finance desk1'.

---
# Remove-BrokerPowerTimeSchemeMetadata

**Oct 01, 2013**  
Deletes PowerTimeScheme Metadata from the PowerTimeScheme objects

## Syntax

```powershell
Remove-BrokerPowerTimeSchemeMetadata [-InputObject] <PowerTimeScheme[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]
```

## Detailed Description

The Remove-BrokerPowerTimeSchemeMetadata cmdlet deletes Metadata from the PowerTimeScheme objects.

## Related topics

## Parameters

- **-InputObject** `<PowerTimeScheme[]>`  
  Specifies the PowerTimeScheme object's instance whose Metadata is to be deleted.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **-Name** `<String>`  
  Specifies the name of the Metadata to be deleted.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
</tr>
</tbody>
</table>

- **-LoggingId** `<Guid>`  
  Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>false</td>
</tr>
</tbody>
</table>
- **AdminAddress**: <String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a hostname or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

Citrix.BrokerAdmin.SDK.BrokerPowerTimeScheme You can pipe the PowerTimeScheme to delete the metadata.

**Return Values**

None

**Examples**

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Remove-BrokerPowerTimeSchemeMetadata -InputObject $obj-Uid -Name "MyMetadataName"

This command deletes the Metadata "MyMetadataName" key-value pair for the PowerTimeScheme whose instance is pointed by $obj-Uid

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Remove-BrokerPowerTimeSchemeMetadata -Name "MyMetadataName"

This command deletes the Metadata "MyMetadataName" key-value pair for all the PowerTimeScheme in the site
Remove-BrokerRebootCycleMetadata

Oct 01, 2013
Deletes RebootCycle Metadata from the RebootCycle objects

Syntax

Detailed Description

The Remove-BrokerRebootCycleMetadata cmdlet deletes Metadata from the RebootCycle objects.

Related topics

Parameters

- **-InputObject** <RebootCycle[]>

Specifies the RebootCycle object's instance whose Metadata is to be deleted.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByValue)</td>
</tr>
</tbody>

<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type

Citrix.BrokerAdmin.SDK.BrokerRebootCycle You can pipe the RebootCycle to delete the metadata.

Return Values

None

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Remove-BrokerRebootCycleMetadata -InputObject $obj-Uid -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for the RebootCycle whose instance is pointed by $obj-Uid

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Remove-BrokerRebootCycleMetadata -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for all the RebootCycle in the site
Remove-BrokerRebootSchedule

Oct 01, 2013
Removes the reboot schedule.

Syntax

Remove-BrokerRebootSchedule [-InputObject] <RebootSchedule[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-BrokerRebootSchedule [-DesktopGroupName] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-BrokerRebootSchedule cmdlet is used to delete an existing reboot schedule.

Related topics

Get-BrokerRebootSchedule

Parameters

-**InputObject**<RebootSchedule[]>
The reboot schedule to be deleted.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-**DesktopGroupName**<String>
The name of the desktop group whose reboot schedule is to be removed.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-**LoggingId**<Guid>
Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Studio

https://docs.citrix.com
Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

**-AdminAddress <String>**

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

| Required? | false |
| Default Value | Localhost. Once a value is provided by any cmdlet, this value will become the default. |
| Accept Pipeline Input? | false |

**Input Type**

Citrix.BrokerAdmin.SDK.RebootSchedule Reboot schedules may be specified through pipeline input.

**Return Values**

None

**Examples**

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Get-BrokerRebootSchedule | Remove-BrokerRebootSchedule
Deletes every reboot schedule.

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Remove-BrokerRebootSchedule 12
Deletes the reboot schedule for the desktop group having Uid 12.

-------------------------- EXAMPLE 3 --------------------------

C:\PS> Remove-BrokerRebootSchedule -DesktopGroupName Accounting
Deletes the reboot schedule for the desktop group named Accounting.
Remove-BrokerRemotePCAccount

Oct 01, 2013
Delete RemotePCAccounts from the system.

Syntax

Remove-BrokerRemotePCAccount [-InputObject <RemotePCAccount[]>] [-LoggingId <Guid>] [-AdminAddress <String>]
[<CommonParameters>]

Detailed Description
Delete RemotePCAccounts from the site.

Related topics
Get-BrokerRemotePCAccount
New-BrokerRemotePCAccount
Set-BrokerRemotePCAccount

Parameters

-InputObject <RemotePCAccount[]>

Specifies the RemotePCAccounts to delete.

<table>
<thead>
<tr>

<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-AdminAddress <String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.
Required? false

Default Value Localhost. Once a value is provided by any cmdlet, this value will become the default.

Accept Pipeline Input? false

Input Type

Citrix.BrokerAdmin.SDK.RemotePCAccount You can pipe the RemotePCAccounts to be deleted into this cmdlet.

Return Values

None

Examples

-------------------------- EXAMPLE 1 --------------------------
C:\PS> Remove-BrokerRemotePCAccount 42
Delete RemotePCAccount 42.

-------------------------- EXAMPLE 2 --------------------------
C:\PS> Get-BrokerRemotePCAccount -OU 'any' | Remove-BrokerRemotePCAccount
Delete the 'any' OU RemotePCAccount.

-------------------------- EXAMPLE 3 --------------------------
C:\PS> Get-BrokerRemotePCAccount | Remove-BrokerRemotePCAccount
Delete all RemotePCAccounts.
Remove-BrokerScope

Oct 01, 2013
Remove the specified catalog/desktop group from the given scope(s).

Syntax

Remove-BrokerScope [-InputObject] <Scope[]> [-Catalog <Catalog>] [-DesktopGroup <DesktopGroup>] [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Detailed Description

The Remove-BrokerScope cmdlet is used to remove a catalog/desktop group object from the given scope(s).

To remove a catalog/desktop group from a scope you need permission to change the scopes of the catalog/desktop group.

If the catalog/desktop group is not in a specified scope, that scope will be silently ignored.

Related topics

Parameters

- **-InputObject** <Scope[]>

Specifies the scopes to remove the object from.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>null</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **-Catalog** <Catalog>

Specifies the catalog object to be removed.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **-DesktopGroup** <DesktopGroup>

Specifies the desktop group object to be removed.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
</tbody>
</table>
Accept Pipeline Input? | true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

| Required? | false |
| Default Value | Localhost. Once a value is provided by any cmdlet, this value will become the default. |
| Accept Pipeline Input? | false |

Input Type

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Remove-BrokerScope -Scope Chalfont,Cambourne -DesktopGroup "Win7 Desktops"
Removes the "Win7 Desktops" desktop group from both the Chalfont and Cambourne scopes.

-------------------------- EXAMPLE 2 --------------------------

C:\PS> 'Chalfont','Cambourne' | Remove-BrokerScope -DesktopGroup 'Win7 Desktops'
Removes the "Win7 Desktops" desktop group from both the Chalfont and Cambourne scopes.
Remove-BrokerSessionMetadata

Oct 01, 2013
Deletes Session Metadata from the Session objects

Syntax

Remove-BrokerSessionMetadata [-InputObject] <Session[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [-<CommonParameters>]

Detailed Description

The Remove-BrokerSessionMetadata cmdlet deletes Metadata from the Session objects.

Related topics

Parameters

-**InputObject** <Session[]>

Specifies the Session object's instance whose Metadata is to be deleted.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>

</tbody>
</table>
**-AdminAddress**<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

Citrix.BrokerAdmin.SDK.BrokerSession You can pipe the Session to delete the metadata.

**Return Values**

None

**Examples**

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Remove-BrokerSessionMetadata -InputObject $obj-Uid -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for the Session whose instance is pointed by $obj-Uid

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Remove-BrokerSessionMetadata -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for all the Session in the site
Remove-BrokerSiteMetadata

Oct 01, 2013
Deletes Site Metadata from the Site objects

Syntax

Remove-BrokerSiteMetadata -Name <String> [-InputObject <Site[]>] [-LoggingId <Guid>] [-AdminAddress <String>] [-<CommonParameters>]

Detailed Description

The Remove-BrokerSiteMetadata cmdlet deletes Metadata from the Site objects.

Related topics

Parameters

- **Name**:<String>

  Specifies the name of the Metadata to be deleted

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>

</tbody>
</table>
**-AdminAddress (String)**

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

Citrix.BrokerAdmin.SDK.BrokerSite You can pipe the Site to delete the metadata.

**Return Values**

None

**Examples**

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Remove-BrokerSiteMetadata -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for the Site
Remove-BrokerTag

Oct 01, 2013
Removes a tag from the system or clears a tag to object association.

Syntax

Remove-BrokerTag [-Name] <String> [-Desktop <Desktop>] [-DesktopGroup <DesktopGroup>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Clears tag to object associations or delete tags from the system altogether.

To clear an association, supply one of the Application, DesktopGroup or PrivateDesktop parameters.

To delete the tag, and any associations between the tag and other objects in the database, specify the tag without any associated object parameters.

Related topics

Get-BrokerTag
New-BrokerTag
Rename-BrokerTag

Parameters

-**InputObject** <Tag[]>

Specifies one or more tag objects.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-**Name** <String>

Specifies a tag by name.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
</tbody>
</table>

https://docs.citrix.com © 1999-2017 Citrix Systems, Inc. All rights reserved. p.1340
Accept Pipeline Input? | true (ByPropertyName)

-**<Desktop>**

Clears the association between the given tag and Desktop.

| Required? | false |
| Default Value |
| Accept Pipeline Input? | true (ByValue) |

-**<DesktopGroup>**

Clears the association between the given tag and desktop group.

| Required? | false |
| Default Value |
| Accept Pipeline Input? | true (ByValue) |

-**<Guid>**

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
| Default Value |
| Accept Pipeline Input? | false |

-**<String>**

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

| Required? | false |
| Default Value | Localhost. Once a value is provided by any cmdlet, this value will become the default. |
| Accept Pipeline Input? | false |

Input Type

Citrix.BrokerAdmin.SDK.Tag Tags may be specified through pipeline input.

Return Values
None

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Remove-BrokerTag $tag -Desktop $desktop
Clears the association between a tag and a desktop. Note that the tag itself continues to exist as an object in the
database.

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Remove-BrokerTag $tag
Deletes the tag object from the database and clears any associations that may exist between that tag and other objects.
Remove-BrokerTagMetadata

Oct 01, 2013
Deletes Tag Metadata from the Tag objects

Syntax

Remove-BrokerTagMetadata [-InputObject] <Tag[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [-<CommonParameters>]

Detailed Description

The Remove-BrokerTagMetadata cmdlet deletes Metadata from the Tag objects.

Related topics

Parameters

- **-InputObject** <Tag[]>
  Specifies the Tag object's instance whose Metadata is to be deleted.

<table>
<thead>
<tr>
<th>Required?</th>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

Citrix.BrokerAdmin.SDK.BrokerTag You can pipe the Tag to delete the metadata.

**Return Values**

None

**Examples**

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Remove-BrokerTagMetadata -InputObject $obj-Uid -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for the Tag whose instance is pointed by $obj-Uid

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Remove-BrokerTagMetadata -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for all the Tag in the site
Remove-BrokerUser

Oct 01, 2013
Remove broker user objects from another broker object

Syntax

Detailed Description
The Remove-BrokerUser cmdlet removes broker user objects from another specified object, such as a broker private desktop, to which the user had previously been added.

Related topics
Add-BrokerUser
Get-BrokerUser

Parameters
-InputObject <User[]>
Specifies the user objects to remove.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-Name <String>
Specifies the user objects to remove, based on their Name property.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>null</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-Application <Application>
The application from which to remove the user

Required? false
### -Machine

**Description:** The machine from which to remove the user

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>null</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

### -PrivateDesktop

**Description:** The desktop from which to remove the user

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>null</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

### -LoggingId

**Description:** Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -AdminAddress

**Description:** Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>
You can pipe the users to be removed to Remove-BrokerUser.

**Return Values**
None

**Notes**
Specify one of the -Machine or -PrivateDesktop parameters only.

**Examples**

-------------------------- EXAMPLE 1 --------------------------

Remove-BrokerUser "DOMAIN\UserName" -PrivateDesktop "DOMAIN\MachineName"

Remove the assignment of the specified private desktop to the specified user.
Rename-BrokerAccessPolicyRule

Oct 01, 2013
Renames a rule in the site's access policy.

Syntax

Detailed Description

The Rename-BrokerAccessPolicyRule cmdlet renames a rule in the site's access policy. The Name property of the rule is changed.

An access policy rule defines a set of connection filters and access control rights relating to a desktop group. These allow fine-grained control of what access is granted to a desktop group based on details of, for example, a user's endpoint device, its address, and the user's identity.

Related topics

New-BrokerAccessPolicyRule
Get-BrokerAccessPolicyRule
Set-BrokerAccessPolicyRule
Remove-BrokerAccessPolicyRule

Parameters

- **InputObject** <AccessPolicyRule[]>
  The access policy rule to be renamed.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **Name**<String>
  The existing name of the access policy rule to be renamed.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
</tbody>
</table>
Accept Pipeline Input? | true (ByPropertyName)
---|---
**-NewName**: String
The new name for the access policy rule being renamed. The new name must not match that of any other existing rules in the policy.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | false |

**-PassThru**: SwitchParameter
This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

| Required? | false |
| Default Value | False |
| Accept Pipeline Input? | false |

**-LoggingId**: Guid
Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

**-AdminAddress**: String
Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

| Required? | false |
| Default Value | Localhost. Once a value is provided by any cmdlet, this value will become the default. |
| Accept Pipeline Input? | false |

Input Type

Citrix.BrokerAdmin.SDK.AccessPolicyRule The access policy rule to be renamed.
Return Values

None or Citrix.BrokerAdmin.SDK.AccessPolicyRule

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.AccessPolicyRule object.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Rename-BrokerAccessPolicyRule 'Sales' -NewName 'TeleSales'
Renames the access policy rule called Sales to TeleSales. The new name of the rule must be unique in the access policy.
Rename-BrokerAppAssignmentPolicyRule

Oct 01, 2013
Renames an application rule in the site's assignment policy.

Syntax

Detailed Description

The Rename-BrokerAppAssignmentPolicyRule cmdlet renames an application rule in the site's assignment policy. The Name property of the rule is changed.

An application rule in the assignment policy defines the users who are entitled to a self-service persistent machine assignment from the rule's desktop group; once assigned the machine can run one or more applications published from the group.

Related topics

New-BrokerAppAssignmentPolicyRule

Parameters

- **-InputObject** <AppAssignmentPolicyRule[]>-

  The application rule in the assignment policy to be renamed.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **-Name**<String>

  The existing name of the application rule in the assignment policy to be renamed.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
</tr>
</tbody>
</table>
### -NewName <String>  
The new name of the application rule in the assignment policy being renamed. The new name must not match that of any other existing rule in the policy (irrespective of whether it is a desktop or application rule).

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | false |

### -PassThru <SwitchParameter>  
This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

| Required? | false |
| Default Value | False |
| Accept Pipeline Input? | false |

### -LoggingId <Guid>  
Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

### -AdminAddress <String>  
Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

| Required? | false |
| Default Value | Localhost. Once a value is provided by any cmdlet, this value will become the default. |
| Accept Pipeline Input? | false |

**Input Type**  
Return Values

None or Citrix.BrokerAdmin.SDK.AppAssignmentPolicyRule

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.AppAssignmentPolicyRule object.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Rename-BrokerAppAssignmentPolicyRule 'Offshore' -NewName 'Remote Workers'
Renames the application rule in the assignment policy called Offshore to Remote Workers. The new name of the rule must be unique in the assignment policy.
Rename-BrokerAppEntitlementPolicyRule

Oct 01, 2013
Renames an application rule in the site’s entitlement policy.

Syntax

Detailed Description

The Rename-BrokerAppEntitlementPolicyRule cmdlet renames an application rule in the site’s entitlement policy. The Name property of the rule is changed.

An application rule in the entitlement policy defines the users who are allowed per-session access to a machine to run one or more applications published from the rule’s desktop group.

Related topics

Parameters

-InputObject <AppEntitlementPolicyRule[]>

The application rule in the entitlement policy to be renamed.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-Name <String>

The existing name of the application rule in the entitlement policy to be renamed.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>
- **NewName**: `<String>`

The new name of the application rule in the entitlement policy being renamed. The new name must not match that of any other existing rule in the policy (irrespective of whether it is a desktop or application rule).

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **PassThru**: `<SwitchParameter>`

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>False</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **LoggingId**: `<Guid>`

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **AdminAddress**: `<String>`

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>
Return Values
None or Citrix.BrokerAdmin.SDK.AppEntitlementPolicyRule

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.AppEntitlementPolicyRule object.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Rename-BrokerAppEntitlementPolicyRule 'Prod Dev' -NewName 'Product Development'
Renames the application rule in the entitlement policy called Prod Dev to Product Development. The new name of the rule must be unique in the entitlement policy.
Rename-BrokerApplication

Oct 01, 2013
Renames an application.

Syntax

Rename-BrokerApplication [-Name] <String> [-NewName] <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Rename-BrokerApplication cmdlet changes the administrative name of an application. An application cannot have the same name as another application.

Renaming an application does not alter its published name. If you need to change the name with which this application appears to end-users, set a new value for the PublishedName property using the Set-BrokerApplication cmdlet.

Renaming an application does not alter its BrowserName. If the BrowserName property also needs to be changed this can be modified using the Set-BrokerApplication cmdlet.

Related topics

Parameters

-InputObject <Application[]>

Specifies the application to rename.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>null</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-Name <String>

Specifies the name of the application to rename.

| Required? | true |
Default Value | null
---|---
Accept Pipeline Input? | true (ByPropertyName)

**-NewName(String)**

Specifies the new name for the application.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | false |

**-PassThru(SwitchParameter)**

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

| Required? | false |
| Default Value | False |
| Accept Pipeline Input? | false |

**-LoggingId(Guid)**

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

**-AdminAddress(String)**

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

| Required? | false |
| Default Value | Localhost. Once a value is provided by any cmdlet, this value will become the default. |
| Accept Pipeline Input? | false |
Citrix.BrokerAdmin.SDK.Application You can pipe applications to Rename-BrokerApplication.

Return Values

None or Citrix.BrokerAdmin.SDK.Application

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.Application object.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Rename-BrokerApplication -Name "Old Name" -NewName "New Name"
Renames the application with name "Old Name" to "New Name".

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Get-BrokerApplication -Uid 1 | Rename-BrokerApplication -NewName "New Name" -PassThru
Renames application with the Uid 1 to "New Name", showing the result.
Rename-BrokerAssignmentPolicyRule

Oct 01, 2013
Renames a desktop rule in the site's assignment policy.

Syntax

Detailed Description

The Rename-BrokerAssignmentPolicyRule cmdlet renames a desktop rule in the site's assignment policy. The Name property of the rule is changed.

A desktop rule in the assignment policy defines the users who are entitled to self-service persistent machine assignments from the rule's desktop group. A rule defines how many machines a user is allowed from the group for delivery of full desktop sessions.

**Input Type**

Return Values

None, or Citrix.BrokerAdmin.SDK.AssignmentPolicyRule

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.AssignmentPolicyRule object.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Rename-BrokerAssignmentPolicyRule 'Offshore' -NewName 'Remote Workers'
Renames the desktop rule in the assignment policy called Offshore to Remote Workers. The new name of the rule must be unique in the assignment policy.
Rename-BrokerCatalog

Oct 01, 2013
Renames a catalog.

Syntax

Rename-BrokerCatalog [-InputObject] <Catalog[]> -NewName <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Rename-BrokerCatalog [-Name] <String> [-NewName] <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Rename-BrokerCatalog cmdlet changes the name of a catalog. A catalog cannot have the same name as another catalog.

The following special characters are not allowed in a catalog name: \\ / ; : # * ? = < > | {} "'

</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

Citrix.BrokerAdmin.SDK.Catalog You can pipe catalogs to Rename-BrokerCatalog.

**Return Values**
None or Citrix.BrokerAdmin.SDK.Catalog

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.Catalog object.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Rename-BrokerCatalog -Name "Old Name" -NewName "New Name"
Renames the catalog with the name "Old Name" to "New Name".

-------------------------- EXAMPLE 2 --------------------------

C:\PS> c:\$catalog = Get-BrokerCatalog -Name "Old Name"
C:\PS> Rename-BrokerCatalog -InputObject $catalog -NewName "New Name"
Renames the catalog with the name "Old Name" to "New Name".
Rename-BrokerDesktopGroup

Oct 01, 2013
Renames a desktop group.

Syntax

Rename-BrokerDesktopGroup [-Name] <String> [-NewName] <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters>

Detailed Description

The Rename-BrokerDesktopGroup cmdlet changes the name of a desktop group. A desktop group cannot have the same name as another desktop group.

Related topics

Get-BrokerDesktopGroup

New-BrokerDesktopGroup

Set-BrokerDesktopGroup

</table>

-Name <String>

Specifies the name of the desktop group to rename.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Required?</td>
<td>true</td>
</tr>
<tr>
<td>Default Value</td>
<td>null</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-NewName <String>

Specifies the new name that the desktop group will have.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | false |

**-PassThru**<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

| Required? | false |
| Default Value | False |
| Accept Pipeline Input? | false |

**-LoggingId**<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

**-AdminAddress**<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

| Required? | false |
| Default Value | Localhost. Once a value is provided by any cmdlet, this value will become the default. |
| Accept Pipeline Input? | false |

**Input Type**

Citrix.BrokerAdmin.SDK.DesktopGroup You can pipe desktop groups to Rename-BrokerDesktopGroup.

**Return Values**

None or Citrix.BrokerAdmin.SDK.DesktopGroup
This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.DesktopGroup object.

Notes

Renaming a desktop group does not alter its published name. If you need to change the name with which this desktop group appears to end-users, set a new value for the PublishedName property using the Set-BrokerDesktopGroup cmdlet.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Rename-BrokerDesktopGroup -Name "Old Name" -NewName "New Name"
Renames desktop group with the name "Old Name" to "New Name".

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Get-BrokerDesktopGroup -Uid 1 | Rename-BrokerDesktopGroup -NewName "New Name" -PassThru
Renames desktop group with the Uid 1 to "New Name", showing the result.
Oct 01, 2013

Renames a desktop rule in the site's entitlement policy.

Syntax

Detailed Description

The Rename-BrokerEntitlementPolicyRule cmdlet renames a desktop rule in the site's entitlement policy. The Name property of the rule is changed.

A desktop rule in the entitlement policy defines the users who are allowed per-session access to a machine from the rule's associated desktop group to run a full desktop session.

</tbody>
</table>

**Input Type**

Return Values

None or Citrix.BrokerAdmin.SDK.MachineConfiguration

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a

Notes

The configuration slot can not be changed. Thus the left term of the Name and NewName must match.

Examples

-------------------------- EXAMPLE 1 --------------------------

Rename-BrokerMachineConfiguration -Name "UPM\All Departments" -NewName "UPM\Finance Department"

Renames the machine configuration named “UPM\All Departments” to “UPM\Finance Department”.

-------------------------- EXAMPLE 2 --------------------------

Rename-BrokerMachineConfiguration -Name "UPM\All Departments" -NewName "Finance Department"

Renames the machine configuration named “UPM\All Departments” to “UPM\Finance Department”. 
## Rename-BrokerPowerTimeScheme

Oct 01, 2013
Changes the name of an existing power time scheme.

### Syntax

- For the input object:
  ```
  ```

- For the name:
  ```
  Rename-BrokerPowerTimeScheme [-Name] <String> [-NewName] <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
  ```

### Detailed Description

The `Rename-BrokerPowerTimeScheme` cmdlet renames a particular power time scheme.

Each power time scheme is associated with a particular desktop group, and covers one or more days of the week, defining which hours of those days are considered peak times and which are off-peak times. In addition, the time scheme defines a pool size value for each hour of the day for the days of the week covered by the time scheme. No one desktop group can be associated with two or more time schemes that cover the same day of the week.

For more information about the power policy mechanism and pool size management, see 'help about_Broker_PowerManagement'.

### Related topics

### Parameters

- **-InputObject** `<PowerTimeScheme[]>`
  
  The power time scheme to be renamed.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **-Name** `<String>`
  
  The current name of the power time scheme to be renamed.

<table>
<thead>
<tr>
<th>Required?</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
</tr>
</tbody>
</table>
### -NewName <String>

The new name to be applied to the power time scheme.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -PassThru <SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>False</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -LoggingId <Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -AdminAddress <String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>
Citrix.BrokerAdmin.SDK.PowerTimeScheme The power time scheme to be renamed.

Return Values

None or Citrix.BrokerAdmin.SDK.PowerTimeScheme

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.PowerTimeScheme object.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Rename-BrokerPowerTimeScheme -Name 'Development Weekdays' -NewName 'Dev Week'
Renames the power time scheme named 'Development Weekdays' to 'Dev Week'.
Rename-BrokerTag

Oct 01, 2013
Rename one or more tags.

Syntax

Rename-BrokerTag [-InputObject] <Tag[]> [-NewName] <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Rename-BrokerTag [-Name] <String> [-NewName] <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Renames one or more tags with the supplied name.

Related topics

Add-BrokerTag
Get-BrokerTag
New-BrokerTag
Remove-BrokerTag

Parameters

-InputObject <Tag[]>

Specifies one or more tag objects to rename.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-Name <String>

Identifies tags to be renamed by name.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-NewName <String>

Specifies new name for the tags.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Required?</strong></td>
<td>true</td>
</tr>
<tr>
<td><strong>Default Value</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Accept Pipeline Input?</strong></td>
<td>false</td>
</tr>
</tbody>
</table>

**-PassThru**<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Required?</strong></td>
<td>false</td>
</tr>
<tr>
<td><strong>Default Value</strong></td>
<td>False</td>
</tr>
<tr>
<td><strong>Accept Pipeline Input?</strong></td>
<td>false</td>
</tr>
</tbody>
</table>

**-LoggingId**<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Required?</strong></td>
<td>false</td>
</tr>
<tr>
<td><strong>Default Value</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Accept Pipeline Input?</strong></td>
<td>false</td>
</tr>
</tbody>
</table>

**-AdminAddress**<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Required?</strong></td>
<td>false</td>
</tr>
<tr>
<td><strong>Default Value</strong></td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td><strong>Accept Pipeline Input?</strong></td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

Citrix.BrokerAdmin.SDK.Tag The tag to rename can be piped into this cmdlet.

**Return Values**

None or Citrix.BrokerAdmin.SDK.Tag

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.Tag object.
Notes

Note that when renaming a tag, its UUID remains the same and any associations are maintained.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Rename-BrokerTag -Name 'OldName' -NewName 'ReplacementName'
Renames tags with the name 'OldName' to 'ReplacementName'.
Reset-BrokerLicensingConnection

Oct 01, 2013
Resets the broker's license server connection.

Syntax

Reset-BrokerLicensingConnection [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Detailed Description

The Reset-BrokerLicensingConnection cmdlet resets the broker's connection to the license server.

Licensing changes resulting from new license files or alterations to the site-level licensing properties don't become effective immediately. There will typically be a delay as the changes are propagated across the site based on the scheduling of refresh logic built into the controllers and the license server.

Resetting the connection causes the list of available licenses for the connection to be updated. After adding licenses or changing the site-level licensing properties you can run Reset-BrokerLicensingConnection to ensure that the broker can access the new licenses immediately.

Each broker service instance holds its own connection to the license server. In order for the licensing changes to be applied immediately throughout the XenDesktop site this command needs to be run on every controller in the site.

Related topics

Get-BrokerSite
Set-BrokerSite

Parameters

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

| Required? | false |
## Default Value

<table>
<thead>
<tr>
<th>Default Value</th>
<th>Localhost. Once a value is provided by any cmdlet, this value will become the default.</th>
</tr>
</thead>
</table>

## Accept Pipeline Input?

<table>
<thead>
<tr>
<th>Accept Pipeline Input?</th>
<th>false</th>
</tr>
</thead>
</table>

### Input Type

None You cannot pipe input into this cmdlet.

### Return Values

None

### Examples

```
----------- EXAMPLE 1 -----------
C:\PS> Reset-BrokerLicensingConnection
Reset the broker's license server connection.
```
Reset-BrokerServiceGroupMembership

Oct 01, 2013
Makes the broker load, from the specified Configuration Service instance, the addresses that the Service can be reached on.

Syntax

Reset-BrokerServiceGroupMembership -ConfigServiceInstance <PSObject[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

This cmdlet reloads the access permissions and Configuration Service locations for the Broker Service. It must be run on at least one instance of the Broker Service after installation and registration with the Configuration Service. Without this operation, the Broker Services cannot communicate with the other services that form part of the Citrix XenDesktop deployment. Once the cmdlet is run, the services keep up to date when additional services are added to the deployment provided that the Configuration Service is not stopped. Run this cmdlet to refresh this information if automatic updates do not occur when new services are added to the deployment. If more than one Configuration Service instance is passed to the cmdlet, only the first is used that meets the expected service type requirements.

Related topics

Get-BrokerServiceInstance
Get-BrokerServiceStatus
Get-ConfigRegisteredServiceInstance

Parameters

-ConfigServiceInstance <PSObject[]>

The Configuration Service Instance object that represents a service instance of the type InterService that in turn references a Configuration Service for the deployment.

| Required? | true |
| Default Value | LocalHost |
| Accept Pipeline Input? | true (ByValue) |

-LoggingId <Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
| Default Value | 
| Accept Pipeline Input? | false |

-AdminAddress <String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.
Required? | false
---|---
Default Value | Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input? | false

**Input Type**

Citrix.XDPowerShell.ServiceInstance You can pipe a ServiceInstance that contains a ServiceInstance object that in turn refers to the Configuration Service InterService interface.

**Return Values**

Citrix.XDPowerShell.ServiceInstance

Reset-BrokerServiceGroupMembership returns opaque objects containing Configuration Service instances that are used by the Broker Service instance.

**Examples**

-------------------------- EXAMPLE 1 --------------------------

```
c:\PS$gt;Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-BrokerServiceGroupMembership
```
Resets the Broker Service's group membership. This assumes that the Configuration Service is running and configured on the same machine as the Broker service.

-------------------------- EXAMPLE 2 --------------------------

```
c:\PS$gt;Get-ConfigRegisteredServiceInstance -ServiceType Config -AdminAddress OtherServer.com | Reset-BrokerServiceGroupMembership
```
Resets the Broker Service's group membership. This uses a Configuration Service that is running and configured on a server called OtherServer.com.
Send-BrokerSessionMessage

Oct 01, 2013
Sends a message to a session.

Syntax

Send-BrokerSessionMessage [-InputObject] <Session[]> [-MessageStyle] <SendMessageStyle> [-Title] <String> [-Text] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters>

Detailed Description

Generates a message box in the target session(s).

Related topics

Get-BrokerSession

Parameters

- **InputObject** <Session[]>

The target session(s) to send the message to.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByValue) |

- **MessageStyle** <SendMessageStyle>

The style of message box to use (valid values are Critical, Question, Exclamation, or Information).

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByValue) |

- **Title** <String>

Text to display in the messagebox title bar.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByValue) |

- **Text** <String>
The message to display.

### -LoggingId

<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

### -AdminAddress

<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

| Required? | false |
| Default Value | Localhost. Once a value is provided by any cmdlet, this value will become the default. |
| Accept Pipeline Input? | false |

**Input Type**

Citrix.BrokerAdmin.SDK.Session The session to which to send the message can be piped in.

**Return Values**

None

**Notes**

Sessions can be passed as the InputObject parameter as either session objects or their numeric Uids.

This operation is non-blocking and returns before it completes. The operation, however, is unlikely to fail unless there are communication problems between controller and machine, if bad arguments are passed to the cmdlet itself or if the machine cannot successfully execute the operation.

The transient nature of sessions means that the list of session objects or UIDs supplied to Send-BrokerSessionMessage could consist of valid and invalid sessions. Invalid sessions are detected and disregarded and the send message operation is invoked on the machines running valid sessions.

The system can fail to invoke the operation if the machine is not in an appropriate state or if there are problems in communicating with the machine. When an operation is invoked the system detects if the operation was initiated successfully.
or not by the session. As this operation is non-blocking the system doesn't detect or report whether the operation ultimately succeeded or failed after its successful initialization in the session.

Operation failures are reported through the broker SDK error handling mechanism (see about_Broker_ErrorHandling). In the event of errors the SdkErrorRecord error status code is set to SessionOperationFailed and its error data dictionary is populated with the following entries:

- OperationsAttemptedCount: The number of operations attempted.
- OperationsFailedCount: The number of failed operations.
- OperationsSucceededCount: The number of successfully executed operations.
- UnresolvedSessionFailuresCount: The number of operations that failed due to invalid sessions being supplied.
- OperationInvocationFailuresCount: The number of operations that failed because they could not be invoked in the session.
- DesktopExecutionFailuresCount: The number of operations that failed because they could not be successfully executed in the session.

The SdkErrorRecord message will also display the number of attempted, failed and successful operations in the following format:

Examples

-------------------------- EXAMPLE 1 --------------------------
C:\PS> $sessions = Get-BrokerSession -UserName MYDOMAIN\*
C:\PS> Send-BrokerSessionMessage $sessions -MessageStyle Information -Title TestTitle -Text TestMessage
Sends a message to all the sessions for any user in MYDOMAIN.

-------------------------- EXAMPLE 2 --------------------------
C:\PS> $desktop = Get-BrokerDesktop -Uid 1
C:\PS> Send-BrokerSessionMessage $desktop.SessionUid -MessageStyle Information -Title TestTitle -Text TestMessage
Sends a message to the session on the desktop with Uid 1.

-------------------------- EXAMPLE 3 --------------------------
C:\PS> trap [Citrix.Broker.Admin.SDK.SdkOperationException]
C:\PS> {
C:\PS>   write ($"Exception name = " + $_.Exception.GetType().FullName)
C:\PS>   write ($"SdkOperationException.Status = " + $_.Exception.Status)
C:\PS>   write ($"SdkOperationException.ErrorData=")
C:\PS>   $_.Exception.ErrorData
C:\PS>   write ($"SdkOperationException.InnerException = " + $_.Exception.InnerException)
C:\PS>   $_.Exception.InnerException
C:\PS>   continue
C:\PS> }
C:\PS>
C:\PS> Send-BrokerSessionMessage -InputObject 10,11,12 -MessageStyle Information -Title "message title" -Text "message text"
Trap and display error information.
Set-BrokerAccessPolicyRule

Oct 01, 2013
Modifies an existing rule in the site's access policy.

Syntax

Detailed Description

The Set-BrokerAccessPolicyRule cmdlet modifies an existing rule in the site's access policy.

An access policy rule defines a set of connection filters and access control rights relating to a desktop group. These allow fine-grained control of what access is granted to a desktop group based on details of, for example, a user's endpoint device, its address, and the user's identity.

Changing a rule does not affect existing user sessions, but it may result in users being unable to launch new sessions, or reconnect to disconnected sessions if the change removes access to the desktop group delivering those sessions.

Related topics

New-BrokerAccessPolicyRule
Get-BrokerAccessPolicyRule
Rename-BrokerAccessPolicyRule
Remove-BrokerAccessPolicyRule

Parameters

-InputObject <AccessPolicyRule[]>

The access policy rule to be modified.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
</tr>
</tbody>
</table>
- **Accept Pipeline Input?**
  - true (ByValue)

- **-Name**: <String>
  
  The name of the access policy rule to be modified.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **-PassThru**: <SwitchParameter>
  
  This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>False</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **-AddExcludedClientIPs**: <IPAddressRange[]>
  
  Adds the specified user device IP addresses to the excluded client IP address filter of the rule.

  See the ExcludedClientIPs parameter for more information.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **-AddExcludedClientNames**: <String[]>
  
  Adds the specified user device names to the excluded client names filter of the rule.

  See the ExcludedClientNames parameter for more information.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **-AddExcludedSmartAccessTags**: <String[]>
  
  Adds the specified SmartAccess tags to the excluded SmartAccess tags filter of the rule.

  See the ExcludedSmartAccessTags parameter for more information.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **-AddExcludedUsers**: <User[]>
  
  Adds the specified users and groups to the excluded users filter of the rule.
See the ExcludedUsers parameter for more information.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>-AddIncludedClientIPs&lt;IPAddressRange[]&gt;</td>
<td>false</td>
<td></td>
<td>false</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| Adds the specified user device IP addresses to the included client IP address filter of the rule. See the IncludedClientIPs parameter for more information.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>-AddIncludedClientNames&lt;String[]&gt;</td>
<td>false</td>
<td></td>
<td>false</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| Adds the specified user device names to the included client names filter of the rule. See the IncludedClientNames parameter for more information.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>-AddIncludedSmartAccessTags&lt;String[]&gt;</td>
<td>false</td>
<td></td>
<td>false</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| Adds the specified SmartAccess tags to the included SmartAccess tags filter of the rule. See the IncludedSmartAccessTags parameter for more information.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>-AddIncludedUsers&lt;User[]&gt;</td>
<td>false</td>
<td></td>
<td>false</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| Adds the specified users and groups to the included users filter of the rule. See the IncludedUsers parameter for more information.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>-AllowedConnections&lt;AllowedConnection&gt;</td>
<td>false</td>
<td></td>
<td>false</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| Changes whether connections must be local or via Access Gateway, and if so whether specified SmartAccess tags must be provided by Access Gateway with the connection. This property forms part of the included SmartAccess tags filter.

Valid values are Filtered, NotViaAG, and ViaAG.
For a detailed description of this property see "help about_Broker_AccessPolicy".

**-AllowedProtocols<String[]>**
Changes the protocols (for example HDX, RDP) available to the user for sessions delivered from the rule's desktop group. If the user gains access to a desktop group by multiple rules, the allowed protocol list is the combination of the protocol lists from all those rules.

If the protocol list is empty, access to the desktop group is implicitly denied.

**-AllowedUsers<AllowedUser>**
Changes the behavior of the included users filter of the rule. This can restrict access to a list of named users or groups, or allow access to any authenticated user. For a detailed description of this property see "help about_Broker_AccessPolicy".

Valid values are Filtered, AnyAuthenticated, and Any.

**-AllowRestart<Boolean>**
Changes whether the user can restart sessions delivered from the rule's desktop group. Session restart is handled as follows: For sessions on single-session power-managed machines, the machine is powered off, and a new session launch request made; for sessions on multi-session machines, a logoff request is issued to the session, and a new session launch request made; otherwise the property is ignored.

**-Description<String>**
Changes the description of the rule. The text is purely informational for the administrator, it is never visible to the end user.

**-Enabled<Boolean>**
Changes whether the rule is enabled or disabled. A disabled rule is ignored when evaluating the site's access policy.
### `-ExcludedClientIPFilterEnabled`<Boolean>
Changes whether the excluded client IP address filter is enabled or disabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### `-ExcludedClientIPs`<IPAddressRange[]>
Changes the IP addresses of user devices explicitly denied access to the rule's desktop group. Addresses can be specified as simple numeric addresses or as subnet masks (for example, 10.40.37.5 or 10.40.0.0/16). This property forms part of the excluded client IP address filter.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### `-ExcludedClientNameFilterEnabled`<Boolean>
Changes whether the excluded client names filter is enabled or disabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### `-ExcludedClientNames`<String[]>
Changes which names of user devices are explicitly denied access to the rule's desktop group. This property forms part of the excluded client names filter.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### `-ExcludedSmartAccessFilterEnabled`<Boolean>
Changes whether the excluded SmartAccess tags filter is enabled or disabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### `-ExcludedSmartAccessTags`<String[]>
Changes which SmartAccess tags explicitly deny access to the rule's desktop group if any occur in those provided by Access Gateway with the user's connection. This property forms part of the excluded SmartAccess tags filter.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>
-ExcludedUserFilterEnabled<Boolean>
Changes whether the excluded users filter is enabled or disabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

Required? false
Default Value
Accept Pipeline Input? false

-ExcludedUsers<User[]>
Changes which users and groups are explicitly denied access to the rule's desktop group. This property forms part of the excluded users filter.

Required? false
Default Value
Accept Pipeline Input? false

-IncludedClientIPFilterEnabled<Boolean>
Changes whether the included client IP address filter is enabled or disabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

Required? false
Default Value
Accept Pipeline Input? false

-IncludedClientIPs<IPAddressRange[]>
Changes which IP addresses of user devices allowed access to the rule's desktop group. Addresses can be specified as simple numeric addresses or as subnet masks (for example, 10.40.37.5 or 10.40.0.0/16). This property forms part of the included client IP address filter.

Required? false
Default Value
Accept Pipeline Input? false

-IncludedClientNameFilterEnabled<Boolean>
Changes whether the included client name filter is enabled or disabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

Required? false
Default Value
Accept Pipeline Input? false

-IncludedClientNames<String[]>
Changes which names of user devices are allowed access to the rule's desktop group. This property forms part of the included client names filter.
- `IncludedSmartAccessFilterEnabled <Boolean>`
  Changes whether the included SmartAccess tags filter is enabled or disabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

- `IncludedSmartAccessTags <String[]>`
  Changes which SmartAccess tags grant access to the rule's desktop group if any occur in those provided by Access Gateway with the user's connection. This property forms part of the excluded SmartAccess tags filter.

- `IncludedUserFilterEnabled <Boolean>`
  Changes whether the included users filter is enabled or disabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

- `IncludedUsers <User[]>`
  Changes which users and groups are granted access to the rule's desktop group. This property forms part of the included users filter.

- `RemoveExcludedClientIPs <IPAddressRange[]>`
  Removes the specified user device IP addresses from the excluded client IP address filter of the rule. See the ExcludedClientIPs parameter for more information.

- `RemoveExcludedClientNames <String[]>`
  Removes the specified user device names from the excluded client names filter of the rule.
-RemoveExcludedSmartAccessTags<String[]>
Removes the specified SmartAccess tags from the excluded SmartAccess tags filter of the rule. See the ExcludedSmartAccessTags parameter for more information.

-RemoveExcludedUsers<User[]>
Removes the specified users and groups from the excluded users filter of the rule. See the ExcludedUsers parameter for more information.

-RemoveIncludedClientIPs<IPAddressRange[]>
Removes the specified user device IP addresses from the included client IP address filter of the rule. See the IncludedClientIPs parameter for more information.

-RemoveIncludedClientNames<String[]>
Removes the specified client names from the included client names filter of the rule. See the IncludedClientNames parameter for more information.

-RemoveIncludedSmartAccessTags<String[]>
Removes the specified SmartAccess tags from the included SmartAccess tags filter of the rule. See the IncludedSmartAccessTags parameter for more information.
### -RemoveIncludedUsers<User[]>

Removes the specified users and groups from the included users filter of the rule.

See the `IncludedUsers` parameter for more information.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the `Start-LogHighLevelOperation` and `Stop-LogHighLevelOperation` cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td><code>Localhost</code>. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### Input Type

### Return Values

None, or `Citrix.Broker.Admin.SDK.AccessPolicyRule`

This cmdlet does not generate any output, unless you use the `PassThru` parameter, in which case it generates a `Citrix.Broker.Admin.SDK.AccessPolicyRule` object.

### Examples

-------------------------- EXAMPLE 1 --------------------------

```powershell
C:\PS> Set-BrokerAccessPolicyRule 'Temp Staff' -AddIncludedUsers office\contractors
```

Adds user group `OFFICE\contractors` to the `Temp Staff` access policy rule. The resources that the group can access are dependent on the existing properties of the rule in addition to the site's assignment and entitlement policies.

-------------------------- EXAMPLE 2 --------------------------

```powershell
C:\PS> Set-BrokerAccessPolicyRule 'Temp Staff' -ExcludedClientIPFilterEnabled $true -AddExcludedClientIPs '10.15.0.0/16' -AllowedConnections ViaAG
```

Modifies the `Temp Staff` access policy rule to remove access to any user device with an IP address matching `10.15.0.0/16`, and requires that all
connections by the rule must come through Access Gateway (assuming that the included SmartAccess tags filter is enabled).
Set-BrokerAccessPolicyRuleMetadata

Oct 01, 2013
Creates/Updates metadata key-value pairs for AccessPolicyRule

Syntax

Detailed Description

Related topics

Parameters

- **-AccessPolicyRuleId**<Int32>

Specifies the AccessPolicyRule object whose Metadata is to be created/updated by ID.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

- **-InputObject**<AccessPolicyRule[]>

Specifies the AccessPolicyRule objects whose Metadata is to be created/updated.
### `AccessPolicyRuleName`<String>

Specifies the AccessPolicyRule object whose Metadata is to be created/updated by name.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

### `-Map`<PSObject>

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

### `-Name`<String>

Specifies the name of the Metadata member to be created/updated

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

### `-Value`<String>

Specifies the value of the Metadata member to be created/updated

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

### `-PassThru`<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.
## -LoggingId <Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>False</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -AdminAddress <String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

#### Input Type

#### Return Values

None or Citrix.BrokerAdmin.SDK.BrokerAccessPolicyRule

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.BrokerAccessPolicyRule object.

#### Examples

```
-------------------------- EXAMPLE 1 --------------------------
C:\PS> Set-BrokerAccessPolicyRuleMetadata -InputObject $obj-Uid -Name "MyMetadataName" -Value "1234"
```

This command creates/updates the Metadata "MyMetadataName" key-value pair for the AccessPolicyRule whose instance is pointed by $obj-Uid

```
-------------------------- EXAMPLE 2 --------------------------
C:\PS> Get-BrokerAccessPolicyRule | Set-BrokerAccessPolicyRuleMetadata -Name "MyMetadataName" -Value "1234"
```
This command creates/updates metadata key "MyMetadataName" with the value "1234" for all the AccessPolicyRule in the site

-------------------------- EXAMPLE 3 --------------------------

C:\PS> @{ 'name1' = 'value1'; 'name2' = 'value2' } | Set-BrokerAccessPolicyRuleMetadata 'objname'

This command creates/updates two metadata keys "name1" and "name2" with the values "value1" and "value2" respectively for the AccessPolicyRule in the site whose name is 'objname'
Set-BrokerAppAssignmentPolicyRule

Oct 01, 2013
Modifies an existing application rule in the site's assignment policy.

Syntax

Detailed Description

The Set-BrokerAppAssignmentPolicyRule cmdlet modifies an existing application rule in the site's assignment policy.

An application rule in the assignment policy defines the users who are entitled to a self-service persistent machine assignment from the rule's desktop group; once assigned the machine can run one or more applications published from the group.

Changing an application rule does not alter machine assignments that have already been made by the rule, nor does it affect active sessions to those machines in any way.

Parameters

- **InputObject** <AppAssignmentPolicyRule[]>

The application rule in the assignment policy to be modified.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

https://docs.citrix.com © 1999-2017 Citrix Systems, Inc. All rights reserved. p.1403
-**Name**<String>

Specifies the name of the application rule in the assignment policy to be modified.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-**PassThru**<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>False</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**AddExcludedUsers**<User[]>

Adds the specified users to the excluded users filter of the application rule, that is, the users and groups who are explicitly denied an entitlement to a machine assignment from this rule.

See the ExcludedUsers parameter for more information.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**AddIncludedUsers**<User[]>

Adds the specified users to the included users filter of the application rule, that is, the users and groups who are granted an entitlement to a machine assignment by the rule.

See the IncludedUsers parameter for more information.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**Description**<String>

Changes the description of the application rule. The text is purely informational for the administrator; it is never visible to
the end user.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-Enabled<Boolean>**

Enables or disables the application rule. A disabled rule is ignored when evaluating the site's assignment policy.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-ExcludedUserFilterEnabled<Boolean>**

Enables or disables the excluded users filter. If the filter is disabled then any user entries in the filter are ignored when assignment policy rules are evaluated.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-ExcludedUsers<User[]>**

Changes the excluded users filter of the application rule, that is, the users and groups who are explicitly denied an entitlement to a machine assignment from the rule.

This can be used to exclude users or groups who would otherwise gain access by groups specified in the included users filter.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**- IncludedUserFilterEnabled<Boolean>**

Enables or disables the included users filter. If the filter is disabled then any user who satisfies the requirements of the access policy is implicitly granted an entitlement to a machine assignment by the application rule.

Users who would be implicitly granted access when the filter is disabled can still be explicitly denied access using the excluded users filter.
- **Required?:** false
- **Default Value:**
- **Accept Pipeline Input?:** false

### - IncludedUsers <User[]>

Changes the included users filter of the application rule, that is, the users and groups who are granted an entitlement to a machine assignment by the rule.

If a user appears explicitly in the excluded users filter of the rule, or is a member of a group that appears in the excluded users filter, no entitlement is granted whether or not the user appears in the included users filter.

- **Required?:** false
- **Default Value:**
- **Accept Pipeline Input?:** false

### - RemoveExcludedUsers <User[]>

Removes the specified users from the excluded users filter of the application rule, that is, the users and groups who are explicitly denied an entitlement to a machine assignment from this rule.

See the ExcludedUsers parameter for more information.

- **Required?:** false
- **Default Value:**
- **Accept Pipeline Input?:** false

### - RemoveIncludedUsers <User[]>

Removes the specified users from the included users filter of the application rule, that is, the users and groups who are granted an entitlement to a machine assignment by the rule.

See the IncludedUsers parameter for more information.

- **Required?:** false
- **Default Value:**
- **Accept Pipeline Input?:** false

### - LoggingId <Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level...
Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-AdminAddress**<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

Citrix.BrokerAdmin.SDK.AppAssignmentPolicyRule The application rule within the assignment policy to be modified.

**Return Values**

None or Citrix.BrokerAdmin.SDK.AppAssignmentPolicyRule

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.AppAssignmentPolicyRule object.

**Examples**

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Set-BrokerAppAssignmentPolicyRule 'Temp Staff' -AddIncludedUsers office\interns
Add the user group OFFICE\interns to the Temp Staff application rule in the assignment policy. This grants all members of that user group an entitlement to a machine in the rule's desktop group. The machines can run applications published from the group. The application session properties obtained using the rule are determined by the rule's other properties.

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Set-BrokerAppAssignmentPolicyRule 'Temp Staff' -Enabled $false
Disables the Temp Staff application rule in the assignment policy. This prevents further machine assignments being made using this rule until it is re-enabled. However, access to machines already assigned using the rule is not impacted.
Set-BrokerAppEntitlementPolicyRule

Oct 01, 2013
Modifies an existing application rule in the site's entitlement policy.

Syntax

Detailed Description

The Set-BrokerAppEntitlementPolicyRule cmdlet modifies an existing application rule in the site's entitlement policy.

An application rule in the entitlement policy defines the users who are allowed per-session access to a machine to run one or more applications published from the rule's desktop group.

Changing a rule does not affect existing sessions launched using the rule, but if the change removes an entitlement to a machine that was previously granted, users may be unable to reconnect to a disconnected session on that machine.

### Required?
- **true**

### Default Value

### Accept Pipeline Input?
- **true (ByPropertyName)**

---

**-PassThru**<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

### Required?
- **false**

### Default Value

### Accept Pipeline Input?
- **false**

---

**-AddExcludedUsers**<User[]>

Add the specified users to the excluded users filter of the rule, that is, the users and groups who are explicitly denied entitlements to run applications published from the desktop group.

See the ExcludedUsers parameter for more information.

### Required?
- **false**

### Default Value

### Accept Pipeline Input?
- **false**

---

**-AddIncludedUsers**<User[]>

Add the specified users to the included users filter of the rule, that is, the users and groups who are granted an entitlement to an application session by the rule.

See the IncludedUsers parameter for more information.

### Required?
- **false**

### Default Value

### Accept Pipeline Input?
- **false**

---

**-Description**<String>

Changes the description of the application rule. The text is purely informational for the administrator, it is never visible to the end user.

### Required?
- **false**
<table>
<thead>
<tr>
<th>Default Value</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-Enabled<Boolean>**

Enables or disables the application rule. A disabled rule is ignored when evaluating the site's entitlement policy.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>

**-IncludedUsers\<User[]>**

Changes the included users filter of the rule, that is, the users and groups who are granted an entitlement to an application session by the rule.

If a user appears explicitly in the excluded users filter of the rule or is a member of a group that appears in the excluded users filter, no entitlement is granted whether or not the user appears in the included users filter.

| Required? | false |
| Default Value |
| Accept Pipeline Input? | false |

**-RemoveExcludedUsers\<User[]>**

Removes the specified users from the excluded users filter of the application rule, that is, the users and groups who are explicitly denied entitlements to run applications published from the desktop group.

See the ExcludedUsers parameter for more information.

| Required? | false |
| Default Value |
| Accept Pipeline Input? | false |

**-RemoveIncludedUsers\<User[]>**

Removes the specified users from the included users filter of the rule, that is, the users and groups who are granted an entitlement to an application session by the rule.

See the IncludedUsers parameter for more information.

| Required? | false |
| Default Value |
| Accept Pipeline Input? | false |

**-LoggingId\<Guid>**

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

</tbody>
</table>

**-AdminAddress <String>**

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

Citrix.BrokerAdmin.SDK.AppEntitlementPolicyRule The application rule in the entitlement policy rule to be modified.

**Return Values**

None or Citrix.BrokerAdmin.SDK.AppEntitlementPolicyRule

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.AppEntitlementPolicyRule object.

**Examples**

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Set-BrokerAppEntitlementPolicyRule 'Temp Workers' -AddIncludedUsers office\contractors

Adds the user group OFFICE\contractors to those entitled to run applications from the rule's associated desktop group. This grants all members of that group an entitlement to an application session from that group.

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Set-BrokerAppEntitlementPolicyRule 'Temp Workers' -Enabled $false

Disables the Temp Workers application rule in the entitlement policy. This prevents further application sessions being launched using this rule until it is re-enabled. However, access to existing application sessions is not affected.
Set-BrokerApplication

Oct 01, 2013
Changes the settings of an application to the value specified in the command.

Syntax

Detailed Description

The Set-BrokerApplication cmdlet changes the value of one or more properties of an application, such as its CpuPriorityLevel or its CommandLineArguments, to the value specified in the command.

This cmdlet only lets you change the settings of the Application object, and not any of the relationships to other objects. For instance, it does not let you change which users can access this application, or change which desktop groups this application is published to. To do so, you typically need to remove the existing association, and then add a new association. The following is an example of changing the desktop group that an application is associated with from $group1 to $group2:

Remove-BrokerApplication -DesktopGroup $group1
Add-BrokerApplication -DesktopGroup $group2

You can change properties of both HostedOnDesktop and InstalledOnClient applications but it is not possible to change the ApplicationType. Also, the Name cannot be changed using this cmdlet, but can be changed with the Rename-BrokerApplication cmdlet.

Rename-BrokerApplication
Parameters

- **InputObject**<Application[]>

  Specifies the application to modify. The Uid of the application can also be substituted for the object.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **Name**<String>

  Specifies the name of the application to be modified.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **PassThru**<SwitchParameter>

  This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>False</td>
<td>false</td>
</tr>
</tbody>
</table>

- **BrowserName**<String>

  Specifies the name of the application to modify. Note that the BrowserName cannot actually be changed in this manner. In order to modify the BrowserName of an application use the Rename-BrokerApplication cmdlet.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

- **ClientFolder**<String>

  Specifies the folder that the application belongs to as the user sees it. This is the application folder that is seen in the Citrix Online Plug-in, in Web Services, and also in the user's start menu. Subdirectories can be specified with \ character. The following special characters are not allowed: / * ? < > | " : Note that this property cannot be set for applications of type InstalledOnClient.
### Required?

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Default Value</th>
<th></th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Accept Pipeline Input?</th>
<th>false</th>
</tr>
</thead>
</table>

### CommandLineArguments

<String>

Specifies the command-line arguments that should be used when launching the executable.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Default Value</th>
<th></th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Accept Pipeline Input?</th>
<th>false</th>
</tr>
</thead>
</table>

### CommandLineExecutable

<String>

Specifies the name of the executable file to launch.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Default Value</th>
<th></th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Accept Pipeline Input?</th>
<th>false</th>
</tr>
</thead>
</table>

### CpuPriorityLevel

<CpuPriorityLevel>

Specifies the CPU priority for the launched executable. Valid values are: Low, BelowNormal, Normal, AboveNormal, and High. Note that this property cannot be set for applications of type InstalledOnClient.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Default Value</th>
<th></th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Accept Pipeline Input?</th>
<th>false</th>
</tr>
</thead>
</table>

### Description

<String>

Specifies the description of the application.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Default Value</th>
<th></th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Accept Pipeline Input?</th>
<th>false</th>
</tr>
</thead>
</table>

### Enabled

<Boolean>

Specifies whether or not this application can be launched.
| Required? | false |
| Default Value | 
| Accept Pipeline Input? | false |

**-IconFromClient** `<Boolean>`

Specifies if the app icon should be retrieved from the application on the client. This is reserved for possible future use, and all applications of type HostedOnDesktop cannot set or change this value.

| Required? | false |
| Default Value | 
| Accept Pipeline Input? | false |

**-IconUid** `<Int32>`

Specifies which icon to use for this application. This application is visible both to the administrator (in the consoles) and also to the user. If no icon is specified, then a generic built-in application icon is used.

| Required? | false |
| Default Value | 
| Accept Pipeline Input? | false |

**-PublishedName** `<String>`

Specifies the name seen by end users who have access to this application.

| Required? | false |
| Default Value | 
| Accept Pipeline Input? | false |

**-SecureCmdLineArgumentsEnabled** `<Boolean>`

Specifies whether the command-line arguments should be secured. This is reserved for possible future use, and all applications of type HostedOnDesktop can only have this value set to true.

| Required? | false |
| Default Value | 
| Accept Pipeline Input? | false |
- **ShortcutAddedToDesktop**<Boolean>

Specifies whether or not a shortcut to the application should be placed on the user device.

<table>
<thead>
<tr>
<th>Required?</th>
<th>False</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>False</td>
</tr>
</tbody>
</table>

- **ShortcutAddedToStartMenu**<Boolean>

Specifies whether a shortcut to the application should be placed in the user's start menu on their user device.

<table>
<thead>
<tr>
<th>Required?</th>
<th>False</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>False</td>
</tr>
</tbody>
</table>

- **StartMenuFolder**<String>

Specifies the name of the start menu folder that holds the application shortcut (if any). This is only valid for the Citrix Online Plug-in. Subdirectories can be specified with `\` character. The following special characters are not allowed: `/ * ? < > | "`:

<table>
<thead>
<tr>
<th>Required?</th>
<th>False</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>False</td>
</tr>
</tbody>
</table>

- **UserFilterEnabled**<Boolean>

Specifies whether the application's user filter is enabled or disabled. Where the user filter is enabled, the application is only visible to users who appear in the filter (either explicitly or by virtue of group membership).

<table>
<thead>
<tr>
<th>Required?</th>
<th>False</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>False</td>
</tr>
</tbody>
</table>

- **Visible**<Boolean>

Specifies whether or not this application is visible to users. Note that it's possible for an application to be disabled and still visible.

<table>
<thead>
<tr>
<th>Required?</th>
<th>False</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td><strong>Accept Pipeline Input?</strong></td>
<td>false</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-------</td>
</tr>
</tbody>
</table>

**-WaitForPrinterCreation**<br>Boolean<br>
Specifies whether or not the session waits for the printers to be created before allowing the end-user to interact with the session. Note that this property cannot be set for applications of type InstalledOnClient.

<table>
<thead>
<tr>
<th><strong>Required?</strong></th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Default Value</strong></td>
<td>No value specified</td>
</tr>
<tr>
<td><strong>Accept Pipeline Input?</strong></td>
<td>false</td>
</tr>
</tbody>
</table>

**-WorkingDirectory**<br>String<br>
Specifies from which working directory the executable is launched from.

<table>
<thead>
<tr>
<th><strong>Required?</strong></th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Default Value</strong></td>
<td>No value specified</td>
</tr>
<tr>
<td><strong>Accept Pipeline Input?</strong></td>
<td>false</td>
</tr>
</tbody>
</table>

**-LoggingId**<br>Guid<br>
Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th><strong>Required?</strong></th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Default Value</strong></td>
<td>No value specified</td>
</tr>
<tr>
<td><strong>Accept Pipeline Input?</strong></td>
<td>false</td>
</tr>
</tbody>
</table>

**-AdminAddress**<br>String<br>
Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th><strong>Required?</strong></th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Default Value</strong></td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td><strong>Accept Pipeline Input?</strong></td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**
Citrix.BrokerAdminSDK.Application, or depends on parameter You can pipe the application to be added to Set-
BrokerApplication. You can also pipe some of the other parameters by name.

Return Values

None or Citrix.Broker.Admin.SDK.Application

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.Application object.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Set-BrokerApplication -Name "Notepad" -Description 'Windows Notepad'
Modifies the application that has a Name of "Notepad" so that its description reads Windows Notepad.

-------------------------- EXAMPLE 2 --------------------------

C:\PS> $app = Get-BrokerApplication -BrowserName "Calculator"
C:\PS> Set-BrokerApplication -InputObject $app -Enabled $false
First gets the application with a BrowserName of "Calculator", then modifies that application (by supplying the application object in the first position) so that it is disabled for users.
Set-BrokerApplicationInstanceMetadata

Oct 01, 2013
Creates/Updates metadata key-value pairs for ApplicationInstance

Syntax

Set-BrokerApplicationInstanceMetadata [-ApplicationInstanceId] <Int64> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerApplicationInstanceMetadata [-ApplicationInstanceId] <Int64> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerApplicationInstanceMetadata [-ApplicationInstanceId] <Int64> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerApplicationInstanceMetadata cmdlet creates/updates metadata key-value pairs for ApplicationInstance. The ApplicationInstance can be specified by InputObject or piping.

Related topics

Parameters

-**ApplicationInstanceId**<Int64>

Specifies the ApplicationInstance object whose Metadata is to be created/updated by ID.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-**InputObject**<ApplicationInstance[]>

Specifies the ApplicationInstance objects whose Metadata is to be created/updated.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>
- **Name**<String>

  Specifies the name of the Metadata member to be created/updated

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **Value**<String>

  Specifies the value of the Metadata member to be created/updated

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **Map**<PSObject>

  Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **PassThru**<SwitchParameter>

  This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>False</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **LoggingId**<Guid>

  Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
</tbody>
</table>
- **AdminAddress**: `<String>`

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

Citrix.BrokerAdmin.SDK.BrokerApplicationInstance You can pipe the ApplicationInstance to hold the new or updated metadata.

**Return Values**

None or Citrix.BrokerAdmin.SDK.BrokerApplicationInstance

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.BrokerApplicationInstance object.

**Examples**

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Set-BrokerApplicationInstanceMetadata -InputObject $obj-Uid -Name "MyMetadataName" -Value "1234"

This command creates/updates the Metadata "MyMetadataName" key-value pair for the ApplicationInstance whose instance is pointed by $obj-Uid

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Get-BrokerApplicationInstance | Set-BrokerApplicationInstanceMetadata -Name "MyMetadataName" -Value "1234"

This command creates/updates metadata key "MyMetadataName" with the value "1234" for all the ApplicationInstance in the site
Set-BrokerApplicationMetadata

Oct 01, 2013
Creates/Updates metadata key-value pairs for Application

Syntax

Set-BrokerApplicationMetadata [-ApplicationId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Set-BrokerApplicationMetadata [-ApplicationId] <Int32> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Set-BrokerApplicationMetadata [-ApplicationId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Set-BrokerApplicationMetadata [-InputObject] <Application[]> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Set-BrokerApplicationMetadata [-InputObject] <Application[]> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Set-BrokerApplicationMetadata [-ApplicationName] <String> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Set-BrokerApplicationMetadata [-ApplicationName] <String> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Detailed Description

The Set-BrokerApplicationMetadata cmdlet creates/updates metadata key-value pairs for Application. The Application can be specified by InputObject or piping.

Related topics

Parameters

-**ApplicationId** <Int32>

Specifies the Application object whose Metadata is to be created/updated by ID.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-**InputObject** <Application[]>

Specifies the Application objects whose Metadata is to be created/updated.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Required?</strong></td>
<td>true</td>
</tr>
<tr>
<td><strong>Default Value</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Accept Pipeline Input?</strong></td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

**-ApplicationName<String>**

Specifies the Application object whose Metadata is to be created/updated by name.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

**-Name<String>**

Specifies the name of the Metadata member to be created/updated

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-Value<String>**

Specifies the value of the Metadata member to be created/updated

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-Map<PSObject>**

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

**-PassThru<SwitchParameter>**

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.
### -LoggingId (Guid)

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -AdminAddress (String)

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

Citrix.BrokerAdmin.SDK.BrokerApplication You can pipe the Application to hold the new or updated metadata.

**Return Values**

None or Citrix.BrokerAdmin.SDK.BrokerApplication

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.BrokerApplication object.

**Examples**

------------- EXAMPLE 1 ---------------

C:\PS> Set-BrokerApplicationMetadata -InputObject $obj-Uid -Name "MyMetadataName" -Value "1234"
This command creates/updates the Metadata "MyMetadataName" key-value pair for the Application whose instance is pointed by $obj-Uid

------------- EXAMPLE 2 ---------------

C:\PS> Get-BrokerApplication | Set-BrokerApplicationMetadata -Name "MyMetadataName" -Value "1234"
This command creates/updates metadata key "MyMetadataName" with the value "1234" for all the Application in the site

-------------------------- EXAMPLE 3 --------------------------

C:\PS> @{ 'name1' = 'value1'; 'name2' = 'value2' } | Set-BrokerApplicationMetadata 'objname'

This command creates/updates two metadata keys "name1" and "name2" with the values "value1" and "value2" respectively for the Application in the site whose name is 'objname'
Set-BrokerAssignmentPolicyRule

Oct 01, 2013
Modifies an existing desktop rule in the site's assignment policy.

Syntax

Detailed Description

The Set-BrokerAssignmentPolicyRule cmdlet modifies an existing desktop rule in the site's assignment policy.

A desktop rule in the assignment policy defines the users who are entitled to self-service persistent machine assignments from the rule's desktop group. A rule defines how many machines a user is allowed from the group for delivery of full desktop sessions.

Changing a desktop rule does not alter machine assignments that have already been made by the rule, nor does it affect active sessions to those machines in any way.

Related topics

New-BrokerAssignmentPolicyRule
Get-BrokerAssignmentPolicyRule
Rename-BrokerAssignmentPolicyRule
Remove-BrokerAssignmentPolicyRule

Parameters

- **InputObject** <AssignmentPolicyRule[]>
  
The desktop rule in the assignment policy to be modified.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
</tr>
</tbody>
</table>

https://docs.citrix.com © 1999-2017 Citrix Systems, Inc. All rights reserved. p.1427
### Accept Pipeline Input?
| true (ByValue) |

- **Name**<String>

Specifies the name of the desktop rule in the assignment policy to be modified.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **PassThru**<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>False</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **AddExcludedUsers**<User[]>

Adds the specified users to the excluded users filter of the rule, that is, the users and groups who are explicitly denied an entitlement to a machine assignment from this rule.

See the ExcludedUsers parameter for more information.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **AddIncludedUsers**<User[]>

Adds the specified users to the included users filter of the rule, that is, the users and groups who are granted an entitlement to a machine assignment by the rule.

See the IncludedUsers parameter for more information.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **ColorDepth**<ColorDepth>
Changes the color depth of any desktop sessions to machines assigned by the rule.

Valid values are $null, FourBit, EightBit, SixteenBit, and TwentyFourBit.

The default null value indicates that the equivalent setting from the rule's desktop group is used.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

- **-Description**:<String>

Changes the description of the desktop rule. The text may be visible to the end user, for example, as a tooltip associated with the desktop entitlement.

A null value indicates that the equivalent setting from the rule's desktop group is used.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

- **-Enabled**:<Boolean>

Enables or disables the desktop rule. A disabled rule is ignored when evaluating the site's assignment policy.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

- **-ExcludedUserFilterEnabled**:<Boolean>

Enables or disables the excluded users filter. If the filter is disabled then any user entries in the filter are ignored when assignment policy rules are evaluated.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

- **-ExcludedUsers**:<User[]>

Changes the excluded users filter of the desktop rule, that is, the users and groups who are explicitly denied an entitlement to a machine assignment from this rule.
This can be used to exclude users or groups who would otherwise gain access by groups specified in the included users filter.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-IconUid<Int32>**

Changes the unique ID of the icon used to display the machine assignment entitlement to the user, and of the assigned desktop itself following the assignment.

The default null value indicates that the equivalent setting from the rule's desktop group is used.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-IncludedUserFilterEnabled<Boolean>**

Enables or disables the included users filter. If the filter is disabled then any user who satisfies the requirements of the access policy is implicitly granted an entitlement to a machine assignment by the rule.

Users who would be implicitly granted access when the filter is disabled can still be explicitly denied access using the excluded users filter.

For rules that relate to RemotePC desktop groups however, if the included user filter is disabled, the rule is effectively disabled.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-IncludedUsers<User[]>**

Changes the included users filter of the rule, that is, the users and groups who are granted an entitlement to a machine assignment by the rule.

If a user appears explicitly in the excluded users filter of the rule, or is a member of a group that appears in the excluded users filter, no entitlement is granted whether or not the user appears in the included users filter.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
</tbody>
</table>
### -MaxDesktops<Int32>

The number of machines from the rule's desktop group to which a user is entitled. Where an entitlement is granted to a user group rather than an individual, the number of machines applies to each member of the user group independently.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -PublishedName<String>

Changes the published name of the machine assignment entitlement as seen by the user. Changing the published name does not affect the names of desktops that have already been assigned by the rule.

The default null value indicates that the equivalent setting from the rule's desktop group is used.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -RemoveExcludedUsers<User[]>

Removes the specified users from the excluded users filter of the rule, that is, the users and groups who are explicitly denied an entitlement to a machine assignment from this rule.

See the ExcludedUsers parameter for more information.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -RemoveIncludedUsers<User[]>

Removes the specified users from the included users filter of the desktop rule, that is, the users and groups who are granted an entitlement to a machine assignment by the rule.

See the IncludedUsers parameter for more information.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
</tbody>
</table>
Accept Pipeline Input? | false
---|---

**-SecureICARequired**<Boolean>

Changes whether the desktop rule requires the SecureICA protocol for desktop sessions to machines assigned using the entitlement.

The default null value indicates that the equivalent setting from the rule’s desktop group is used.

| Required? | false |
| Default Value |
| Accept Pipeline Input? | false |

**-LoggingId**<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
| Default Value |
| Accept Pipeline Input? | false |

**-AdminAddress**<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

| Required? | false |
| Default Value | Localhost. Once a value is provided by any cmdlet, this value will become the default. |
| Accept Pipeline Input? | false |

Input Type

Citrix.BrokerAdmin.SDK.AssignmentPolicyRule The desktop rule within the assignment policy to be modified.

Return Values

None or Citrix.BrokerAdmin.SDK.AssignmentPolicyRule

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.AssignmentPolicyRule object.

Examples

https://docs.citrix.com  © 1999-2017 Citrix Systems, Inc. All rights reserved.  p.1432
-------------------------- EXAMPLE 1 --------------------------

C:\PS> Set-BrokerAssignmentPolicyRule 'Temp Staff' -AddIncludedUsers office\interns
Adds the user group OFFICE\interns to the Temp Staff desktop rule in the assignment policy. This grants all members of that user group entitlements to machines in the rule's desktop group. The number of machine entitlements per user and the session properties of the desktops obtained using the rule are determined by the rule's other properties.

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Set-BrokerAssignmentPolicyRule 'Temp Staff' -Enabled $false
Disables the Temp Staff desktop rule in the assignment policy. This prevents further machine assignments being made using this rule until it is re-enabled. However, access to machines already assigned using the rule is not impacted.
Set-BrokerAssignmentPolicyRuleMetadata

Oct 01, 2013
Creates/Updates metadata key-value pairs for AssignmentPolicyRule

Syntax

Detailed Description

The Set-BrokerAssignmentPolicyRuleMetadata cmdlet creates/updates metadata key-value pairs for AssignmentPolicyRule. The AssignmentPolicyRule can be specified by InputObject or piping.

Related topics

Parameters

-AssignmentPolicyRuleId <Int32>

Specifies the AssignmentPolicyRule object whose Metadata is to be created/updated by ID.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-InputObject <AssignmentPolicyRule[]>

Specifies the AssignmentPolicyRule objects whose Metadata is to be created/updated.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>-AssignmentPolicyRuleName</strong>&lt;String&gt;</td>
<td></td>
</tr>
<tr>
<td>--------------------------------------</td>
<td></td>
</tr>
<tr>
<td>Specifies the AssignmentPolicyRule object whose Metadata is to be created/updated by name.</td>
<td></td>
</tr>
<tr>
<td>Required?</td>
<td>true</td>
</tr>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>-Name</strong>&lt;String&gt;</th>
</tr>
</thead>
<tbody>
<tr>

<tbody>
<tr>
<td>This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.</td>
</tr>
<tr>
<td>Required?</td>
</tr>
</tbody>
</table>
### `-LoggingId <Guid>`

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept PipeLine Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### `-AdminAddress <String>`

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept PipeLine Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

Citrix.BrokerAdmin.SDK.BrokerAssignmentPolicyRule You can pipe the AssignmentPolicyRule to hold the new or updated metadata.

**Return Values**

None or Citrix.BrokerAdmin.SDK.BrokerAssignmentPolicyRule

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.BrokerAssignmentPolicyRule object.

**Examples**

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Set-BrokerAssignmentPolicyRuleMetadata -InputObject $obj-Uid -Name "MyMetadataName" -Value "1234"
This command creates/updates the Metadata "MyMetadataName" key-value pair for the AssignmentPolicyRule whose instance is pointed by $obj-Uid

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Get-BrokerAssignmentPolicyRule | Set-BrokerAssignmentPolicyRuleMetadata -Name "MyMetadataName" -Value "1234"
This command creates/updates metadata key "MyMetadataName" with the value "1234" for all the AssignmentPolicyRule in the site
-------------------------- EXAMPLE 3 --------------------------

C:\PS> @{ 'name1' = 'value1'; 'name2' = 'value2' } | Set-BrokerAssignmentPolicyRuleMetadata 'objname'
This command creates/updates two metadata keys "name1" and "name2" with the values "value1" and "value2" respectively for the AssignmentPolicyRule in the site whose name is 'objname'
Set-BrokerCatalog

Sets the properties of a catalog.

Syntax

Detailed Description

The Set-BrokerCatalog cmdlet sets properties of a catalog or set of catalogs. The catalog can be specified by name, in which case only one catalog can be specified, or one or more catalog instances can be passed to the command either by piping or by using the -InputObject parameter.

Related topics

- Get-BrokerCatalog
- New-BrokerCatalog
- Remove-BrokerCatalog
- Rename-BrokerCatalog

Parameters

- **-InputObject**<Catalog[]>

  Specifies the catalog objects to modify.

  - Required? true
  - Default Value
  - Accept Pipeline Input? true (ByValue)

- **-Name**<String>

  Identifies the catalog to modify.

  - Required? true
  - Default Value
Accept Pipeline Input? | true (ByPropertyName)
---|---

**-PassThru**<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

| Required? | false |
| Default Value | False |
| Accept Pipeline Input? | false |

**-Description**<String>

Supplies the new value of the Description property.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

**-IsRemotePC**<Boolean>

Supplies a new value for IsRemotePC.

IsRemotePC can only be enabled when:

- SessionSupport is SingleSession
- MachinesArePhysical is true.

IsRemotePC can only be set from true to false when no RemotePCAccount references this catalog, and when no Remote PC relationship exists between this catalog and a desktop group.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

**-MinimumFunctionalLevel**<FunctionalLevel>

The new minimum FunctionalLevel required for machines to work successfully in the catalog. If this is higher than the FunctionalLevel of any machines already in the catalog, they will immediately cease to function.

Valid values are L5, L7

| Required? | false |
Default Value

Accept Pipeline Input? | false

-ProvisioningSchemeId (Guid)
Specifies the identity of the MCS provisioning scheme the catalog is associated with (can only be specified for new catalogs with a ProvisioningType of MCS; once set can never be changed).

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

-PvsAddress (String)
Supplies the new value of the PvsAddress property. Can only be set if CatalogKind is Pvs or PvsPvd.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

-PvsDomain (String)
Supplies the new value of the PvsDomain property. Can only be set if CatalogKind is PvsPvd.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

-LoggingId (Guid)
Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

-AdminAddress (String)
Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host
name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

Citrix.BrokerAdmin.SDK.Catalog You can pipe the catalogs to be modified to Set-BrokerCatalog.

**Return Values**

None or Citrix.BrokerAdmin.SDK.Catalog

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.Catalog object.

**Notes**

A catalog's Name property cannot be changed by Set-BrokerCatalog. To rename a catalog use Rename-BrokerCatalog.

**Examples**

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Set-BrokerCatalog -Name "MyCatalog" -Description "New Description"

This example specifies a catalog by name and sets its description.

-------------------------- EXAMPLE 2 --------------------------

C:\PS> $permCatalogs = Get-BrokerCatalog -AllocationType Static
C:\PS> Set-BrokerCatalog -InputObject $permCatalogs -Description "Permanently assigned machines"

This example sets the description for all catalogs with AllocationType 'Static'.
Set-BrokerCatalogMetadata

Oct 01, 2013
Creates/Updates metadata key-value pairs for Catalog

Syntax

Set-BrokerCatalogMetadata [-CatalogId] <Int32> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
Set-BrokerCatalogMetadata [-CatalogId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
Set-BrokerCatalogMetadata [-CatalogId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
Set-BrokerCatalogMetadata [-InputObject] <Catalog[]> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
Set-BrokerCatalogMetadata [-InputObject] <Catalog[]> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
Set-BrokerCatalogMetadata [-CatalogName] <String> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
Set-BrokerCatalogMetadata [-CatalogName] <String> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerCatalogMetadata cmdlet creates/updates metadata key-value pairs for Catalog. The Catalog can be specified by InputObject or piping.

Related topics

Parameters

-CatalogId <Int32>
Specifies the Catalog object whose Metadata is to be created/updated by ID.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

-InputObject <Catalog[]>
Specifies the Catalog objects whose Metadata is to be created/updated.

https://docs.citrix.com © 1999-2017 Citrix Systems, Inc. All rights reserved. p.1442
<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **CatalogName**<String>

Specifies the Catalog object whose Metadata is to be created/updated by name.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

- **Map**<PSObject>

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **Name**<String>

Specifies the name of the Metadata member to be created/updated.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **Value**<String>

Specifies the value of the Metadata member to be created/updated.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **PassThru**<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.
### -LoggingId

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>False</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

#### -AdminAddress

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

Citrix.BrokerAdmin.SDK.BrokerCatalog You can pipe the Catalog to hold the new or updated metadata.

**Return Values**

None or Citrix.BrokerAdmin.SDK.BrokerCatalog

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.BrokerCatalog object.

**Examples**

```
-------------------------- EXAMPLE 1 --------------------------
C:\PS> Set-BrokerCatalogMetadata -InputObject $obj-Uid -Name "MyMetadataName" -Value "1234"
This command creates/updates the Metadata "MyMetadataName" key-value pair for the Catalog whose instance is pointed by $obj-Uid

-------------------------- EXAMPLE 2 --------------------------
C:\PS> Get-BrokerCatalog | Set-BrokerCatalogMetadata -Name "MyMetadataName" -Value "1234"
```
This command creates/updates metadata key "MyMetadataName" with the value "1234" for all the Catalog in the site

-------------------------- EXAMPLE 3 --------------------------

C:\PS> @{ 'name1' = 'value1'; 'name2' = 'value2' } | Set-BrokerCatalogMetadata 'objname'
This command creates/updates two metadata keys "name1" and "name2" with the values "value1" and "value2"
respectively for the Catalog in the site whose name is 'objname'
Set-BrokerConfigurationSlotMetadata

Oct 01, 2013
Creates/Updates metadata key-value pairs for ConfigurationSlot

Syntax

Set-BrokerConfigurationSlotMetadata [-ConfigurationSlotId] <Int32> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerConfigurationSlotMetadata [-ConfigurationSlotId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerConfigurationSlotMetadata [-ConfigurationSlotId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerConfigurationSlotMetadata [-InputObject] <ConfigurationSlot[]> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerConfigurationSlotMetadata [-InputObject] <ConfigurationSlot[]> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerConfigurationSlotMetadata [-ConfigurationSlotName] <String> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerConfigurationSlotMetadata [-ConfigurationSlotName] <String> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerConfigurationSlotMetadata cmdlet creates/updates metadata key-value pairs for ConfigurationSlot. The ConfigurationSlot can be specified by InputObject or piping.

Related topics

Parameters

- **-ConfigurationSlotId** <Int32>

  Specifies the ConfigurationSlot object whose Metadata is to be created/updated by ID.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

- **-InputObject** <ConfigurationSlot[]>

  Specifies the ConfigurationSlot objects whose Metadata is to be created/updated.
| **Required?** | **true** |
| **Default Value** | |
| **Accept Pipeline Input?** | **true (ByValue)** |

**-ConfigurationSlotName:<String>**

Specifies the ConfigurationSlot object whose Metadata is to be created/updated by name.

| **Required?** | **true** |
| **Default Value** | |
| **Accept Pipeline Input?** | **true (ByValue, ByPropertyName)** |

**-Map:<PSObject>**

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

| **Required?** | **true** |
| **Default Value** | |
| **Accept Pipeline Input?** | **true (ByValue)** |

**-Name:<String>**

Specifies the name of the Metadata member to be created/updated

| **Required?** | **true** |
| **Default Value** | |
| **Accept Pipeline Input?** | **true (ByPropertyName)** |

**-Value:<String>**

Specifies the value of the Metadata member to be created/updated

| **Required?** | **true** |
| **Default Value** | |
| **Accept Pipeline Input?** | **true (ByPropertyName)** |

**-PassThru:<SwitchParameter>**

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.
### -LoggingId <Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>False</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

#### Example 1

```powershell
C:\PS> Set-BrokerConfigurationSlotMetadata -InputObject $obj-Uid -Name "MyMetadataName" -Value "1234"
```

This command creates/updates the Metadata "MyMetadataName" key-value pair for the ConfigurationSlot whose instance is pointed by $obj-Uid

### -AdminAddress <String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type

Citrix.BrokerAdmin.SDK.BrokerConfigurationSlot You can pipe the ConfigurationSlot to hold the new or updated metadata.

Return Values

None or Citrix.BrokerAdmin.SDK.BrokerConfigurationSlot

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.BrokerConfigurationSlot object.

### Examples

```
-------------------------- EXAMPLE 1 --------------------------
C:\PS> Set-BrokerConfigurationSlotMetadata -InputObject $obj-Uid -Name "MyMetadataName" -Value "1234"
```

This command creates/updates the Metadata "MyMetadataName" key-value pair for the ConfigurationSlot whose instance is pointed by $obj-Uid

```
-------------------------- EXAMPLE 2 --------------------------
C:\PS> Get-BrokerConfigurationSlot | Set-BrokerConfigurationSlotMetadata -Name "MyMetadataName" -Value "1234"
```
This command creates/updates metadata key "MyMetadataName" with the value "1234" for all the ConfigurationSlot in the site

-------------------------- EXAMPLE 3 --------------------------

C:\PS> @{ 'name1' = 'value1'; 'name2' = 'value2' } | Set-BrokerConfigurationSlotMetadata 'objname'
This command creates/updates two metadata keys "name1" and "name2" with the values "value1" and "value2" respectively for the ConfigurationSlot in the site whose name is 'objname'
Set-BrokerControllerMetadata

Oct 01, 2013
Creates/Updates metadata key-value pairs for Controller

Syntax

Set-BrokerControllerMetadata [-ControllerId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Set-BrokerControllerMetadata [-ControllerId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Set-BrokerControllerMetadata [-ControllerId] <Int32> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Set-BrokerControllerMetadata [-InputObject] <Controller[]> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Set-BrokerControllerMetadata [-InputObject] <Controller[]> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Set-BrokerControllerMetadata [-ControllerName] <String> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Set-BrokerControllerMetadata [-ControllerName] <String> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Detailed Description

The Set-BrokerControllerMetadata cmdlet creates/updates metadata key-value pairs for Controller. The Controller can be specified by InputObject or piping.

Related topics

Parameters

- **ControllerId**<Int32>

Specifies the Controller object whose Metadata is to be created/updated by ID.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Required?</td>
<td>true</td>
</tr>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **InputObject**<Controller[]>

Specifies the Controller objects whose Metadata is to be created/updated.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Required?</td>
<td></td>
</tr>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td></td>
</tr>
</tbody>
</table>
Required? true
Default Value
Accept Pipeline Input? true (ByValue)

-**ControllerName**<String>

Specifies the Controller object whose Metadata is to be created/updated by name.

Required? true
Default Value
Accept Pipeline Input? true (ByValue, ByPropertyName)

-**Name**<String>

Specifies the name of the Metadata member to be created/updated

Required? true
Default Value
Accept Pipeline Input? true (ByPropertyName)

-**Value**<String>

Specifies the value of the Metadata member to be created/updated

Required? true
Default Value
Accept Pipeline Input? true (ByPropertyName)

-**Map**<PSObject>

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Required? true
Default Value
Accept Pipeline Input? true (ByValue)

-**PassThru**<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.
### -LoggingId\<Guid\>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>False</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -AdminAddress\<String\>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>

#### Input Type

Citrix.BrokerAdmin.SDK.BrokerController You can pipe the Controller to hold the new or updated metadata.

#### Return Values

None or Citrix.BrokerAdmin.SDK.BrokerController

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.BrokerController object.

#### Examples

------------- EXAMPLE 1 -------------

C:\PS> Set-BrokerControllerMetadata -InputObject $obj-Uid -Name "MyMetadataName" -Value "1234"

This command creates/updates the Metadata "MyMetadataName" key-value pair for the Controller whose instance is pointed by $obj-Uid

------------- EXAMPLE 2 -------------

C:\PS> Get-BrokerController | Set-BrokerControllerMetadata -Name "MyMetadataName" -Value "1234"
This command creates/updates metadata key "MyMetadataName" with the value "1234" for all the Controller in the site.

-------------------------- EXAMPLE 3 --------------------------

C:\PS> @{ 'name1' = 'value1'; 'name2' = 'value2' } | Set-BrokerControllerMetadata 'objname'
This command creates/updates two metadata keys "name1" and "name2" with the values "value1" and "value2" respectively for the Controller in the site whose name is 'objname'
Set-BrokerDBConnection

Oct 01, 2013
Specifies the Citrix Broker Service's database connection string.

Syntax

Set-BrokerDBConnection [-DBConnection] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Specifies the database connection string for use by the currently selected Citrix Broker Service instance.

The service records the connection string and attempts to contact the specified database. If the database cannot initially be contacted the service retries the connection at intervals until contact with the database is successfully established.

It is not possible to set a new database connection string for the service if one is already recorded. The connection string must first be set to $null. This action causes the service to reset and return to its idle state, at which point a new connection string can be set.

When a database connection string is successfully set for the service, a status of OK is returned by the cmdlet. If the database connection string is set to $null, a DBUnconfigured status is returned.

A syntactically invalid connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is that on the local machine, or that explicitly specified by the last usage of the -AdminAddress parameter to a Broker SDK cmdlet.

Related topics

Get-BrokerServiceStatus
Get-BrokerDBConnection
Test-BrokerDBConnection

Parameters

-DBConnection <String>

Specifies the new database connection string for the currently selected Citrix Broker Service instance.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>false</td>
</tr>
</tbody>
</table>

-LoggingId <Guid>

https://docs.citrix.com  © 1999-2017 Citrix Systems, Inc. All rights reserved.  p.1454
Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-AdminAddress**<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type

None You cannot pipe input into this cmdlet.

Return Values

System.String

The Set-BrokerDBConnection cmdlet returns a string describing the new status of the selected Citrix Broker Service instance. Possible values are:

-- OK:
The service instance is configured with a valid database and service schema. The service is operational.

-- DBUnconfigured:
No database connection string is set for the service instance.

-- DBRejectedConnection:
The database server rejected the logon from the service instance. This is typically caused by invalid credentials.

-- InvalidDBConfigured:
The specified database does not exist, is not visible to the service instance, or the service's schema within the database is invalid.

-- DBNotFound:
The specified database could not be located with the given connection string.
-- DBNewerVersionThanService:
The service instance is older than, and incompatible with, the service's schema in the database. The service instance needs upgrading.

-- DBOlderVersionThanService:
The service instance is newer than, and incompatible with, the service's schema in the database. The database schema needs upgrading.

-- DBVersionChangeInProgress:
A database schema upgrade is in progress.

-- PendingFailure:
Connectivity between the service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

-- Failed:
Connectivity between the service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

-- Unknown:
Service status cannot be determined.

Examples

-------------------------- EXAMPLE 1 --------------------------
C:\PS>Set-BrokerDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;Trusted_Connection=True"
Configures the service instance to use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

-------------------------- EXAMPLE 2 --------------------------
C:\PS>Set-BrokerDBConnection -DBConnection $null
Resets the service instance's database connection string. The service instance resets and returns to an idle state until a valid new database connection string is specified.
Set-BrokerDesktopGroup

Oct 01, 2013
Adjusts the settings of a broker desktop group.

Syntax

Detailed Description

The Set-BrokerDesktopGroup cmdlet is used to disable or enable an existing broker desktop group or to alter its settings.

Related topics

Get-BrokerDesktopGroup
New-BrokerDesktopGroup
Rename-BrokerDesktopGroup
Remove-BrokerDesktopGroup

Parameters

-InputObject <DesktopGroup[]>
Specifies the desktop groups to adjust.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **Name**<String>

Specifies the desktop groups to adjust, based on their Name property.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **PassThru**<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>False</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **AutomaticPowerOnForAssigned**<Boolean>

Specifies whether assigned desktops in the desktop group should be automatically started at the start of peak time periods. Only relevant for groups whose DesktopKind is Private.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **AutomaticPowerOnForAssignedDuringPeak**<Boolean>

Specifies whether assigned desktops in the desktop group should be automatically started throughout peak time periods. Only relevant for groups whose DesktopKind is Private and which have AutomaticPowerOnForAssigned set to true.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>
**-ColorDepth**<ColorDepth>

Specifies the color depth that the ICA session should use for desktops in this group. Valid values are FourBit, EightBit, SixteenBit, and TwentyFourBit.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-DeliveryType**<DeliveryType>

Specifies whether desktops, applications, or both, can be delivered from machines contained within the desktop group. Desktop groups with a DesktopKind of Private cannot be used to deliver both desktops and applications.

When changing the delivery type to desktops only, there must be no remaining desktop-hosted applications associated with the group, or application-specific assignment/entitlement policy rules for the group.

When changing the delivery type to applications only, there must be no remaining client-hosted applications associated with the group, or desktop-specific assignment/entitlement policy rules for the group.

Valid values are DesktopsOnly, AppsOnly, and DesktopsAndApps.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-Description**<String>

A description for this desktop group useful for administrators of the site.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-Enabled**<Boolean>

Whether the desktop group should be in the enabled state; disabled desktop groups do not appear to users.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>
### -IconUid<br/>&lt;Int32&gt;

The UID of the broker icon to be displayed to users for their desktop(s) in this desktop group.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

### -InMaintenanceMode<br/>&lt;Boolean&gt;

Whether the desktop should be put into maintenance mode; a desktop group in maintenance mode will not allow users to connect or reconnect to their desktops.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

### -IsRemotePC<br/>&lt;Boolean&gt;

Supplies a new value for IsRemotePC.

IsRemotePC can only be enabled when:

- SessionSupport is SingleSession
- DeliveryType is DesktopsOnly
- DesktopKind is Private

IsRemotePC can be switched from true to false only if no RemotePC relationship exists between a catalog and this desktop group.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

### -MinimumFunctionalLevel<br/>&lt;FunctionalLevel&gt;

The new minimum FunctionalLevel required for machines to work successfully in the desktop group. If this is higher than the FunctionalLevel of any machines already in the desktop group, they will immediately cease to function.

| Required? | false |
| Default Value | |
### OffPeakBufferSizePercent <Int32>

The percentage of machines in the desktop group that should be kept available in an idle state outside peak hours.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### OffPeakDisconnectAction <SessionChangeHostingAction>

The action to be performed after a configurable period of a user session disconnecting outside peak hours. Possible values are Nothing, Suspend, or Shutdown.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### OffPeakDisconnectTimeout <Int32>

The number of minutes before the configured action should be performed after a user session disconnects outside peak hours.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### OffPeakExtendedDisconnectAction <SessionChangeHostingAction>

The action to be performed after a second configurable period of a user session disconnecting outside peak hours. Possible values are Nothing, Suspend, or Shutdown.

<table>

The number of minutes before the configured action should be performed after a user session disconnects in peak hours.

| Required? | false |
| Default Value |
| Accept Pipeline Input? | false |

**PeakExtendedDisconnectAction**: `<SessionChangeHostingAction>`

The action to be performed after a second configurable period of a user session disconnecting in peak hours. Possible values are Nothing, Suspend, or Shutdown.

| Required? | false |
| Default Value |
| Accept Pipeline Input? | false |

**PeakExtendedDisconnectTimeout**: `<Int32>`

The number of minutes before the second configured action should be performed after a user session disconnects in peak hours.

| Required? | false |
| Default Value |
| Accept Pipeline Input? | false |

**PeakLogOffAction**: `<SessionChangeHostingAction>`

The action to be performed after a configurable period of a user session ending in peak hours. Possible values are Nothing, Suspend, or Shutdown.

| Required? | false |
| Default Value |
| Accept Pipeline Input? | false |

**PeakLogOffTimeout**: `<Int32>`

The number of minutes before the configured action should be performed after a user session ends in peak hours.

| Required? | false |
| Default Value |
| Accept Pipeline Input? | false |
-**ProtocolPriority**<String[]>

A list of protocol names in the order in which they should be attempted for use during connection.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**PublishedName**<String>

The name that will be displayed to users for their desktop(s) in this desktop group.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**SecureIcaRequired**<Boolean>

Whether HDX connections to desktops in the new desktop group require the use of a secure protocol.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**ShutdownDesktopsAfterUse**<Boolean>

Whether desktops in this desktop group should be automatically shut down when each user session completes (only relevant to power-managed desktops).

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**TimeZone**<String>

The time zone in which this desktop group's machines reside.

The time zone must be specified for any of the group's automatic power management settings to take effect. Automatic power management operations include pool management (power time schemes), reboot schedules, session disconnect and logoff actions, and powering on assigned machines etc.
- **TurnOnAddedMachine**<Boolean>

This flag specifies whether the Broker Service should attempt to power on machines when they are added to the desktop group.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

- **LoggingId**<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

- **AdminAddress**<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

| Required? | false |
| Default Value | Localhost. Once a value is provided by any cmdlet, this value will become the default. |
| Accept Pipeline Input? | false |

**Input Type**

Citrix.BrokerAdmin.SDK.DesktopGroup You can pipe the desktop groups to be adjusted to Set-BrokerDesktopGroup.

**Return Values**

None or Citrix.BrokerAdmin.SDK.DesktopGroup

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.DesktopGroup object.
Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Set-BrokerDesktopGroup EMEA* -InMaintenanceMode $true -PassThru
Sets all desktop groups with names starting "EMEA" into maintenance mode, returning the set of desktop groups.

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Get-BrokerDesktopGroup -InMaintenanceMode $true | Set-BrokerDesktopGroup -Enabled $false
Disable all desktop groups that are in maintenance mode.
Set-BrokerDesktopGroupMetadata

Oct 01, 2013
Creates/Updates metadata key-value pairs for DesktopGroup

Syntax

Set-BrokerDesktopGroupMetadata [-DesktopGroupId] <Int32> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerDesktopGroupMetadata [-DesktopGroupId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerDesktopGroupMetadata [-DesktopGroupId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerDesktopGroupMetadata [-InputObject] <DesktopGroup[]> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerDesktopGroupMetadata [-InputObject] <DesktopGroup[]> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerDesktopGroupMetadata [-DesktopGroupName] <String> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerDesktopGroupMetadata [-DesktopGroupName] <String> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerDesktopGroupMetadata cmdlet creates/updates metadata key-value pairs for DesktopGroup. The DesktopGroup can be specified by InputObject or piping.

Related topics

Parameters

-DesktopGroupId <Int32>

Specifies the DesktopGroup object whose Metadata is to be created/updated by ID.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

-InputObject <DesktopGroup[]>

Specifies the DesktopGroup objects whose Metadata is to be created/updated.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-DesktopGroupName</td>
<td>Specifies the DesktopGroup object whose Metadata is to be created/updated by name.</td>
</tr>
<tr>
<td>-Map</td>
<td>Specifies a hashtable containing name/value pairs to be used to create or update Metadata members</td>
</tr>
<tr>
<td>-Name</td>
<td>Specifies the name of the Metadata member to be created/updated</td>
</tr>
<tr>
<td>-Value</td>
<td>Specifies the value of the Metadata member to be created/updated</td>
</tr>
</tbody>
</table>

-**PassThru**<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.
-**LoggingId**<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>False</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**AdminAddress**<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type

Citrix.BrokerAdmin.SDK.BrokerDesktopGroup You can pipe the DesktopGroup to hold the new or updated metadata.

Return Values

None or Citrix.BrokerAdmin.SDK.BrokerDesktopGroup

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.BrokerDesktopGroup object.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Set-BrokerDesktopGroupMetadata -InputObject $obj-Uid -Name "MyMetadataName" -Value "1234"
This command creates/updates the Metadata "MyMetadataName" key-value pair for the DesktopGroup whose instance is pointed by $obj-Uid

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Get-BrokerDesktopGroup | Set-BrokerDesktopGroupMetadata -Name "MyMetadataName" -Value "1234"
This command creates/updates metadata key "MyMetadataName" with the value "1234" for all the DesktopGroup in the site.

-------------------------- EXAMPLE 3 --------------------------

C:\PS> @{ 'name1' = 'value1'; 'name2' = 'value2' } | Set-BrokerDesktopGroupMetadata 'objname'

This command creates/updates two metadata keys "name1" and "name2" with the values "value1" and "value2" respectively for the DesktopGroup in the site whose name is 'objname'.
Set-BrokerEntitlementPolicyRule

Oct 01, 2013
Modifies an existing desktop rule in the site's entitlement policy.

Syntax

Detailed Description

The Set-BrokerEntitlementPolicyRule cmdlet modifies an existing desktop rule in the site's entitlement policy.

A desktop rule in the entitlement policy defines the users who are allowed per-session access to a machine from the rule's associated desktop group to run a full desktop session.

Changing a rule does not affect existing sessions launched using the rule, but if the change removes an entitlement to a machine that was previously granted, users may be unable to reconnect to a disconnected session on that machine.

Related topics

New-BrokerEntitlementPolicyRule
Get-BrokerEntitlementPolicyRule
Rename-BrokerEntitlementPolicyRule
Remove-BrokerEntitlementPolicyRule

Parameters

- **-InputObject** <EntitlementPolicyRule[]>

The desktop rule in the entitlement policy to be modified.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>
**-Name (String)**

The name of the desktop rule in the entitlement policy to be modified.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-PassThru (SwitchParameter)**

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>False</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-AddExcludedUsers (User[])**

Adds the specified users to the excluded users filter of the rule, that is, the users and groups who are explicitly denied an entitlement to a desktop session from this rule.

See the ExcludedUsers parameter for more information.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-AddIncludedUsers (User[])**

Adds the specified users to the included users filter of the rule, that is, the users and groups who are granted an entitlement to a desktop session by the rule.

See the IncludedUsers parameter for more information.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-ColorDepth (ColorDepth)**

Changes the color depth of any desktop sessions launched by a user from this entitlement. Existing sessions are not...
**-BitDepth**<br>
Valid values are $null, FourBit, EightBit, SixteenBit, and TwentyFourBit.

A null value indicates that the equivalent setting from the rule's desktop group is used.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-Description**<br>
Changes the description of the desktop rule. The text may be visible to the end user, for example, as a tooltip associated with the desktop entitlement.

A null value indicates that the equivalent setting from the rule's desktop group is used.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-Enabled**<br>
Enables or disables the desktop rule. A disabled rule is ignored when evaluating the site's entitlement policy.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-ExcludedUserFilterEnabled**<br>
Enables or disables the excluded users filter. If the filter is disabled then any user entries in the filter are ignored when entitlement policy rules are evaluated.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-ExcludedUsers**<br>
Changes the excluded users filter of the desktop rule, that is, the users and groups who are explicitly denied an entitlement to a desktop session from this rule.
This can be used to exclude users or groups who would otherwise gain access by groups specified in the included users filter.

| Required? | false |
| Default Value | 
| Accept Pipeline Input? | false |

- **-IconUid<Int32>**

Changes the icon (identified by its unique ID) for the published desktop entitlement as seen by the user.

A null value indicates that the equivalent setting from the rule's desktop group is used.

| Required? | false |
| Default Value | 
| Accept Pipeline Input? | false |

- **-IncludedUserFilterEnabled<Boolean>**

Enables or disables the included users filter. If the filter is disabled then any user who satisfies the requirements of the access policy is implicitly granted an entitlement to a desktop session by the rule.

Users who would be implicitly granted access when the filter is disabled can still be explicitly denied access using the excluded users filter.

| Required? | false |
| Default Value | 
| Accept Pipeline Input? | false |

- **-IncludedUsers<User[]>**

Changes the included users filter of the desktop rule, that is, the users and groups who are granted an entitlement to a desktop session by the rule.

If a user appears explicitly in the excluded users filter of the rule or is a member of a group that appears in the excluded users filter, no entitlement is granted whether or not the user appears in the included users filter.

| Required? | false |
| Default Value | 
| Accept Pipeline Input? | false |

- **-PublishedName<String>**
Changes the name of the published desktop entitlement as seen by the user.

A null value indicates that the equivalent setting from the rule's desktop group is used.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>RemoveExcludedUsers&lt;User[]&gt;</td>
<td>false</td>
<td></td>
<td>false</td>
</tr>
<tr>
<td>RemoveIncludedUsers&lt;User[]&gt;</td>
<td>false</td>
<td></td>
<td>false</td>
</tr>
<tr>
<td>SecureICARequired&lt;Boolean&gt;</td>
<td>false</td>
<td></td>
<td>false</td>
</tr>
<tr>
<td>LoggingId&lt;Guid&gt;</td>
<td></td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

- **RemoveExcludedUsers<User[]>**

Removes the specified users from the excluded users filter of the rule, that is, the users and groups who are explicitly denied an entitlement to a desktop session from this rule.

See the ExcludedUsers parameter for more information.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>RemoveExcludedUsers&lt;User[]&gt;</td>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

- **RemoveIncludedUsers<User[]>**

Removes the specified users from the included users filter of the desktop rule, that is, the users and groups who are granted an entitlement to a desktop session by the rule.

See the IncludedUsers parameter for more information.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>RemoveIncludedUsers&lt;User[]&gt;</td>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

- **SecureICARequired<Boolean>**

Changes whether the desktop rule requires the SecureICA protocol for desktop sessions launched using the entitlement.

A null value indicates that the equivalent setting from the rule's desktop group is used.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>SecureICARequired&lt;Boolean&gt;</td>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

- **LoggingId<Guid>**

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop
Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

### Required?
- **false**

### Default Value
- **false**

### Accept Pipeline Input?
- **false**

#### -AdminAddress <String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### Input Type
- Citrix.BrokerAdmin.SDK.EntitlementPolicyRule The desktop rule in the entitlement policy to be modified.

### Return Values
- None or Citrix.BrokerAdmin.SDK.EntitlementPolicyRule

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.EntitlementPolicyRule object.

### Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Set-BrokerEntitlementPolicyRule 'Temp Workers' -AddIncludedUsers office\contractors

Adds the user group OFFICE\contractors to the Temp Workers desktop rule of the entitlement policy. This grants all members of that group an entitlement to a desktop session in the rule's associated desktop group. The session properties of the desktops obtained using the rule are determined by the rule's other properties.

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Set-BrokerEntitlementPolicyRule 'Temp Workers' -Enabled $false

Disables the Temp Workers desktop rule in the entitlement policy. This prevents further desktop sessions being launched using this rule until it is re-enabled. However, access to existing desktop sessions is not affected.
Set-BrokerEntitlementPolicyRuleMetadata

Oct 01, 2013
Creates/Updates metadata key-value pairs for EntitlementPolicyRule

Syntax

Detailed Description

The Set-BrokerEntitlementPolicyRuleMetadata cmdlet creates/updates metadata key-value pairs for EntitlementPolicyRule. The EntitlementPolicyRule can be specified by InputObject or piping.

Related topics

Parameters

- **-EntitlementPolicyRuleId** <Int32>

Specifies the EntitlementPolicyRule object whose Metadata is to be created/updated by ID.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **-InputObject** <EntitlementPolicyRule[]>

Specifies the EntitlementPolicyRule objects whose Metadata is to be created/updated.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
</table>
-EntitlementPolicyRuleName &lt;String&gt;

Specifies the EntitlementPolicyRule object whose Metadata is to be created/updated by name.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

-Name &lt;String&gt;

Specifies the name of the Metadata member to be created/updated

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-Value &lt;String&gt;

Specifies the value of the Metadata member to be created/updated

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-Map &lt;PSObject&gt;

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-PassThru &lt;SwitchParameter&gt;

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

| Required? | false |
### -LoggingId\<Guid\>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -AdminAddress\<String\>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

**Return Values**

None or Citrix.Broker.Admin.SDK.BrokerEntitlementPolicyRule

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerEntitlementPolicyRule object.

**Examples**

------------- EXAMPLE 1 -------------

C:\PS> Set-BrokerEntitlementPolicyRuleMetadata -InputObject $obj-Uid -Name "MyMetadataName" -Value "1234"

This command creates/updates the Metadata "MyMetadataName" key-value pair for the EntitlementPolicyRule whose instance is pointed by $obj-Uid

------------- EXAMPLE 2 -------------

C:\PS> Get-BrokerEntitlementPolicyRule | Set-BrokerEntitlementPolicyRuleMetadata -Name "MyMetadataName" -Value "1234"

This command creates/updates metadata key "MyMetadataName" with the value "1234" for all the EntitlementPolicyRule in the site
C:\PS> @{ 'name1' = 'value1'; 'name2' = 'value2' } | Set-BrokerEntitlementPolicyRuleMetadata 'objname'
This command creates/updates two metadata keys "name1" and "name2" with the values "value1" and "value2" respectively for the EntitlementPolicyRule in the site whose name is 'objname'
Set-BrokerHostingPowerAction

Oct 01, 2013
Changes the priority of one or more pending power actions.

Syntax

Detailed Description

The Set-BrokerHostingPowerAction cmdlet modifies an existing power action in the site's power action queue. The only property of power actions you can change, is the current priority of the action.

For a detailed description of the queuing mechanism, see 'help about_Broker_PowerManagement'.

Related topics

Get-BrokerHostingPowerAction

New-BrokerHostingPowerAction

Remove-BrokerHostingPowerAction

Parameters

- **-InputObject**<HostingPowerAction[]>

  The power action whose priority is to be changed.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>true (ByValue)</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **-MachineName**<String>

  Changes the priority of actions that are for machines whose name (of the form domain\machine) matches the specified string.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>true (ByPropertyName)</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>
- **PassThru** `<SwitchParameter>`

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

| Required? | false |
| Default Value | False |
| Accept Pipeline Input? | false |

- **ActualPriority** `<Int32>`

Specifies a new priority value for the action in the queue.

This priority is the current action priority; the 'base' or original priority for actions cannot be altered. Numerically lower priority values indicate more important actions that are processed in preference to actions with numerically higher priority settings.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

- **LoggingId** `<Guid>`

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

- **AdminAddress** `<String>`

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

| Required? | false |
| Default Value | Localhost. Once a value is provided by any cmdlet, this value will become the default. |
| Accept Pipeline Input? | false |
Citrix.Broker.Admin.SDK.HostingPowerAction The power action whose priority is to be changed.

Return Values

None or Citrix.BrokerAdmin.SDK.HostingPowerAction

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a

Examples

-------------------------- EXAMPLE 1 --------------------------
C:\PS> Set-BrokerHostingPowerAction -MachineName 'XD_VDA1' -ActualPriority 25
Sets the current priority of actions for the machine called 'XD_VDA1' to 25. Numerically lower priority values indicate more
important actions that will be processed in preference to actions with numerically higher priority settings.
Set-BrokerHostingPowerActionMetadata

Oct 01, 2013
Creates/Updates metadata key-value pairs for HostingPowerAction

Syntax

Set-BrokerHostingPowerActionMetadata [-HostingPowerActionId] <Int64> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerHostingPowerActionMetadata [-HostingPowerActionId] <Int64> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description
The Set-BrokerHostingPowerActionMetadata cmdlet creates/updates metadata key-value pairs for HostingPowerAction. The HostingPowerAction can be specified by InputObject or piping.

Parameters

-HostingPowerActionId <Int64>

Specifies the HostingPowerAction object whose Metadata is to be created/updated by ID.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-InputObject <HostingPowerAction[]>

Specifies the HostingPowerAction objects whose Metadata is to be created/updated.
Required? | true  
---|---  
Default Value |  
Accept Pipeline Input? | true (ByValue)

**-HostingPowerActionName**<String>

Specifies the HostingPowerAction object whose Metadata is to be created/updated by name.

Required? | true  
---|---  
Default Value |  
Accept Pipeline Input? | true (ByValue, ByPropertyName)

**-Name**<String>

Specifies the name of the Metadata member to be created/updated.

Required? | true  
---|---  
Default Value |  
Accept Pipeline Input? | true (ByPropertyName)

**-Value**<String>

Specifies the value of the Metadata member to be created/updated.

Required? | true  
---|---  
Default Value |  
Accept Pipeline Input? | true (ByPropertyName)

**-Map**<PSObject>

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members.

Required? | true  
---|---  
Default Value |  
Accept Pipeline Input? | true (ByValue)

**-PassThru**<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.
-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required? | false
Default Value | False
Accept Pipeline Input? | false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required? | false
Default Value | Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input? | false

Input Type

Citrix.BrokerAdmin.SDK.BrokerHostingPowerAction You can pipe the HostingPowerAction to hold the new or updated metadata.

Return Values

None or Citrix.BrokerAdmin.SDK.BrokerHostingPowerAction

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.BrokerHostingPowerAction object.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Set-BrokerHostingPowerActionMetadata -InputObject $obj-Uid -Name "MyMetadataName" -Value "1234"
This command creates/updates the Metadata "MyMetadataName" key-value pair for the HostingPowerAction whose instance is pointed by $obj-Uid

-------------------------- EXAMPLE 2 --------------------------
C:\PS> Get-BrokerHostingPowerAction | Set-BrokerHostingPowerActionMetadata -Name "MyMetadataName" -Value "1234"
This command creates/updates metadata key "MyMetadataName" with the value "1234" for all the HostingPowerAction in the site

-------------------------- EXAMPLE 3 --------------------------

C:\PS> @{'name1' = 'value1'; 'name2' = 'value2'} | Set-BrokerHostingPowerActionMetadata 'objname'
This command creates/updates two metadata keys "name1" and "name2" with the values "value1" and "value2" respectively for the HostingPowerAction in the site whose name is 'objname'
Set-BrokerHypervisorAlertMetadata

Oct 01, 2013
Creates/Updates metadata key-value pairs for HypervisorAlert

Syntax

Set-BrokerHypervisorAlertMetadata [-HypervisorAlertId] <Int64> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerHypervisorAlertMetadata [-HypervisorAlertId] <Int64> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerHypervisorAlertMetadata [-HypervisorAlertId] <Int64> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerHypervisorAlertMetadata [-InputObject] <HypervisorAlert[]> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerHypervisorAlertMetadata cmdlet creates/updates metadata key-value pairs for HypervisorAlert. The HypervisorAlert can be specified by InputObject or piping.

Related topics

Parameters

-HypervisorAlertId <Int64>

Specifies the HypervisorAlert object whose Metadata is to be created/updated by ID.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByValue, ByPropertyName) |

-InputObject <HypervisorAlert[]>

Specifies the HypervisorAlert objects whose Metadata is to be created/updated.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByValue) |
- **Map**<PSObject>
  Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **Name**<String>
  Specifies the name of the Metadata member to be created/updated

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **Value**<String>
  Specifies the value of the Metadata member to be created/updated

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **PassThru**<SwitchParameter>
  This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>False</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **LoggingId**<Guid>
  Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
</tbody>
</table>

Accept Pipeline Input? | false
---|---

**AdminAddress**: <String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

Citrix.BrokerAdmin.SDK.BrokerHypervisorAlert You can pipe the HypervisorAlert to hold the new or updated metadata.

**Return Values**

None or Citrix.BrokerAdmin.SDK.BrokerHypervisorAlert

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.BrokerHypervisorAlert object.

**Examples**

```
-------------------- EXAMPLE 1 ---------------------
C:\PS> Set-BrokerHypervisorAlertMetadata -InputObject $obj-Uid -Name "MyMetadataName" -Value "1234"
This command creates/updates the Metadata "MyMetadataName" key-value pair for the HypervisorAlert whose instance is pointed by $obj-Uid

-------------------- EXAMPLE 2 ---------------------
C:\PS> Get-BrokerHypervisorAlert | Set-BrokerHypervisorAlertMetadata -Name "MyMetadataName" -Value "1234"
This command creates/updates metadata key "MyMetadataName" with the value "1234" for all the HypervisorAlert in the site
```
Set-BrokerHypervisorConnection

Oct 01, 2013
Sets the properties of a hypervisor connection.

Syntax

Set-BrokerHypervisorConnection [-InputObject] <HypervisorConnection[]> [-PassThru] [-PreferredController <String>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerHypervisorConnection [-Name] <String> [-PassThru] [-PreferredController <String>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerHypervisorConnection cmdlet sets the properties on a hypervisor connection.

Related topics

Get-BrokerHypervisorConnection
New-BrokerHypervisorConnection
Remove-BrokerHypervisorConnection

Parameters

-InputObject <HypervisorConnection[]>

Specifies the hypervisor connection object to adjust.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-Name <String>

Specifies the name of the hypervisor connection object to adjust.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-PassThru <SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.
### PreferredController<String>

Supplies the new value of the PreferredController property.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>False</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

Citrix.BrokerAdmin.SDK.HypervisorConnection You can pipe the hypervisor connection to be modified to Set-BrokerHypervisorConnection.

**Return Values**

None or Citrix.BrokerAdmin.SDK.HypervisorConnection

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.HypervisorConnection object.
Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS> $hvConn = Get-BrokerHypervisorConnection -PreferredController "oldController" -Name "Xen Server Connection"
c:\PS> Set-BrokerHypervisorConnection -InputObject $hvConn -PreferredController "newController"

Updates the preferred controller for a hypervisor connection.
Set-BrokerHypervisorConnectionMetadata

Oct 01, 2013
Creates/Updates metadata key-value pairs for HypervisorConnection

Syntax

Set-BrokerHypervisorConnectionMetadata [-HypervisorConnectionId] <Int32> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerHypervisorConnectionMetadata [-HypervisorConnectionId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerHypervisorConnectionMetadata [-InputObject] <HypervisorConnection[]> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerHypervisorConnectionMetadata cmdlet creates/updates metadata key-value pairs for HypervisorConnection. The HypervisorConnection can be specified by InputObject or piping.

Related topics

Parameters

-HypervisorConnectionId <Int32>

Specifies the HypervisorConnection object whose Metadata is to be created/updated by ID.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyId)</td>
</tr>
</tbody>
</table>

-InputObject <HypervisorConnection[]>

Specifies the HypervisorConnection objects whose Metadata is to be created/updated.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>----------------</td>
<td>---</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

**-HypervisorConnectionName<String>**

Specifies the HypervisorConnection object whose Metadata is to be created/updated by name.

| Required? | true |
| Default Value |  |
| Accept Pipeline Input? | true (ByValue, ByPropertyName) |

**-Map<PSObject>**

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members.

| Required? | true |
| Default Value |  |
| Accept Pipeline Input? | true (ByValue) |

**-Name<String>**

Specifies the name of the Metadata member to be created/updated.

| Required? | true |
| Default Value |  |
| Accept Pipeline Input? | true (ByPropertyName) |

**-Value<String>**

Specifies the value of the Metadata member to be created/updated.

| Required? | true |
| Default Value |  |
| Accept Pipeline Input? | true (ByPropertyName) |

**-PassThru<SwitchParameter>**

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

| Required? | false |
Default Value | False  
---|---  
Accept Pipeline Input? | false  

**-LoggingId**<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false  
---|---  
| Default Value |  
| Accept Pipeline Input? | false  

**-AdminAddress**<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a hostname or an IP address.

| Required? | false  
---|---  
| Default Value | Localhost. Once a value is provided by any cmdlet, this value will become the default.  
| Accept Pipeline Input? | false  

**Input Type**

Citrix.BrokerAdmin.SDK.BrokerHypervisorConnection You can pipe the HypervisorConnection to hold the new or updated metadata.

**Return Values**

None or Citrix.BrokerAdmin.SDK.BrokerHypervisorConnection

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.BrokerHypervisorConnection object.

**Examples**

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Set-BrokerHypervisorConnectionMetadata -InputObject $obj-Uid -Name "MyMetadataName" -Value "1234"

This command creates/updates the Metadata "MyMetadataName" key-value pair for the HypervisorConnection whose instance is pointed by $obj-Uid

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Get-BrokerHypervisorConnection | Set-BrokerHypervisorConnectionMetadata -Name "MyMetadataName" -Value "1234"

This command creates/updates metadata key "MyMetadataName" with the value "1234" for all the HypervisorConnection in the site
C:\PS> @{ 'name1' = 'value1'; 'name2' = 'value2' } | Set-BrokerHypervisorConnectionMetadata 'objname'
This command creates/updates two metadata keys "name1" and "name2" with the values "value1" and "value2" respectively
for the HypervisorConnection in the site whose name is 'objname'
**Set-BrokerIconMetadata**

Oct 01, 2013
Creates/Updates metadata key-value pairs for Icon

**Syntax**

Set-BrokerIconMetadata [-IconId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters>

Set-BrokerIconMetadata [-IconId] <Int32> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters>

Set-BrokerIconMetadata [-IconId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters>

Set-BrokerIconMetadata [-InputObject] <Icon[]> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters>

Set-BrokerIconMetadata [-InputObject] <Icon[]> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters>

**Detailed Description**

The Set-BrokerIconMetadata cmdlet creates/updates metadata key-value pairs for Icon. The Icon can be specified by InputObject or piping.

**Related topics**

**Parameters**

- `-IconId` <Int32>

Specifies the Icon object whose Metadata is to be created/updated by ID.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>

</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

Citrix.BrokerAdmin.SDK.BrokerIcon You can pipe the Icon to hold the new or updated metadata.

**Return Values**

None or Citrix.BrokerAdmin.SDK.BrokerIcon

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.BrokerIcon object.

**Examples**

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Set-BrokerIconMetadata -InputObject $obj-Uid -Name "MyMetadataName" -Value "1234"
This command creates/updates the Metadata "MyMetadataName" key-value pair for the Icon whose instance is pointed by $obj-Uid

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Get-BrokerIcon | Set-BrokerIconMetadata -Name "MyMetadataName" -Value "1234"
This command creates/updates metadata key "MyMetadataName" with the value "1234" for all the Icon in the site
Set-BrokerMachine

Oct 01, 2013
Sets properties on a machine.

Syntax

Detailed Description

The Set-BrokerMachine cmdlet sets properties on a machine or set of machines. You can specify a single machine by name or multiple machine instances can be passed to the command by piping or using the -InputObject parameter.

Related topics

Get-BrokerMachine
New-BrokerMachine

Parameters

-InputObject <Machine[]>

The machine instances whose properties you want to set.

| Required? | true |
|———|———|
| Default Value |
| Accept Pipeline Input? | true (ByValue) |

-MachineName <String>

The machine whose properties you want to set.

| Required? | true |
|———|———|
| Default Value |
| Accept Pipeline Input? | true (ByPropertyName) |

-PassThru <SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected
Changes the client name assignment of the machine. Set this to $null to remove the assignment. You can assign machines to multiple users, a single client IP address, or a single client name, but only to one of these categories at a time.

Changes the client IP address assignment of the machine. Set this to $null to remove the assignment. You can assign machines to multiple users, a single client IP address, or a single client name, but only to one of these categories at a time.

The unique ID by which the hypervisor recognizes the machine. This may only be set for VMs which are not provisioned by MCS.

The hypervisor connection that runs the machine. This may only be set for VMs which are not provisioned by MCS.
-**InMaintenanceMode**: Boolean

Sets whether the machine is in maintenance mode or not. A machine in maintenance mode is not available for new sessions, and for managed machines all automatic power management is disabled.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**LoggingId**: Guid

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>

<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**AdminAddress**: String

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type

Citrix.BrokerAdmin.SDK.Machine You can pipe in the machines whose properties you want to set.

Return Values

None or Citrix.BrokerAdmin.SDK.Machine

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.Machine object.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Set-BrokerMachine -MachineName 'MyDomain\MyMachine' -HypervisorConnectionUid 3
This example specifies a machine by name and sets its hypervisor connection.

-------------------------- EXAMPLE 2 --------------------------
C:\PS> $machines = Get-BrokerMachine -MachineName 'MyDomain\*'  
C:\PS> Set-BrokerMachine -InputObject $machines -HypervisorConnectionUid 3  
This example finds all machines in domain MyDomain and sets their hypervisor connections.

-------------------------- EXAMPLE 3 --------------------------
This example also finds all machines in domain MyDomain and sets their hypervisor connections.
Set-BrokerMachineCatalog

Oct 01, 2013
Moves one or more machines into a different catalog.

Syntax

Detailed Description

The Set-BrokerMachineCatalog cmdlet is used to move machines into a different catalog. The following properties of the destination catalog must exactly match those of the machine's current catalog otherwise the command fails:

- AllocationType
- ProvisioningType
- PersistUserChanges
- SessionSupport
- IsRemotePC
- MinimumFunctionalLevel
- PhysicalMachines

Changing a machine's catalog does not change the machine's desktop group membership. There is no effect on user sessions present on a machine if its catalog is changed.

Related topics

Set-BrokerMachine

New-BrokerCatalog

Parameters

- **-InputObject**<Machine[]>

The machine instances that are being moved into a different catalog.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **-CatalogUid**<Int32>

The unique identifier of the catalog into which the machines are being moved.
**-LoggingId**<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-AdminAddress**<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type

Citrix.BrokerAdmin.SDK.Machine You can pipe in the machines that are to be moved into a new catalog.

Return Values

None

Examples

-------------- EXAMPLE 1 ---------------

C:\PS> $catalog = Get-BrokerCatalog MarketingMachines
C:\PS> $machines = Get-BrokerMachine -MachineName 'Marketing\*'  
C:\PS> Set-BrokerMachineCatalog $machines -CatalogUid $cat.Uid

This example finds all machines in domain Marketing and moves them into a catalog called MarketingMachines.
Set-BrokerMachineCommandMetadata

Oct 01, 2013
Creates/Updates metadata key-value pairs for MachineCommand

Syntax

Set-BrokerMachineCommandMetadata [-MachineCommandId] <Int64> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerMachineCommandMetadata [-MachineCommandId] <Int64> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerMachineCommandMetadata [-MachineCommandId] <Int64> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerMachineCommandMetadata cmdlet creates/updates metadata key-value pairs for MachineCommand. The MachineCommand can be specified by InputObject or piping.

Related topics

Parameters

-MachineCommandId <Int64>

Specifies the MachineCommand object whose Metadata is to be created/updated by ID.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-InputObject <MachineCommand[]>

Specifies the MachineCommand objects whose Metadata is to be created/updated.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>
- **Name**<String>

Specifies the name of the Metadata member to be created/updated

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByPropertyName) |

- **Value**<String>

Specifies the value of the Metadata member to be created/updated

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByPropertyName) |

- **Map**<PSObject>

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByValue) |

- **PassThru**<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

| Required? | false |
| Default Value | False |
| Accept Pipeline Input? | false |

- **LoggingId**<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
| Default Value | |
- **AdminAddress**<String>

  Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

Citrix.BrokerAdmin SDK.BrokerMachineCommand You can pipe the MachineCommand to hold the new or updated metadata.

**Return Values**

None or Citrix.BrokerAdmin SDK.BrokerMachineCommand

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin SDK.BrokerMachineCommand object.

**Examples**

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Set-BrokerMachineCommandMetadata -InputObject $obj-Uid -Name "MyMetadataName" -Value "1234"
This command creates/updates the Metadata "MyMetadataName" key-value pair for the MachineCommand whose instance is pointed by $obj-Uid

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Get-BrokerMachineCommand | Set-BrokerMachineCommandMetadata -Name "MyMetadataName" -Value "1234"
This command creates/updates metadata key "MyMetadataName" with the value "1234" for all the MachineCommand in the site
Set-BrokerMachineConfiguration

Oct 01, 2013
Sets the properties of a machine configuration.

Syntax

Detailed Description

Sets the properties of a machine configuration. The encoded settings data must only contain settings that match the SettingsGroup of the associated configuration slot. Use the SDK snap-in that matches the SettingsGroup of the associated configuration slot to generate new encoded settings data or modify existing settings values.

Related topics

New-BrokerMachineConfiguration

Add-BrokerMachineConfiguration

Parameters

- **InputObject** <MachineConfiguration[]>

Machine configuration to modify.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **Name** <String>

Name of machine configuration to modify.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>
- **PassThru**<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>False</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **Description**<String>

New description for the machine configuration.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **Policy**<Byte[]>

New binary array of encoded settings data.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **LoggingId**<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **AdminAddress**<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
</table>

https://docs.citrix.com   © 1999-2017 Citrix Systems, Inc. All rights reserved.   p.1511
Default Value | Localhost. Once a value is provided by any cmdlet, this value will become the default.
---|---
Accept Pipeline Input? | false

Input Type

Return Values

None or Citrix.BrokerAdmin.SDK.MachineConfiguration

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.MachineConfiguration object.

Examples

-------------------------- EXAMPLE 1 --------------------------

Set-BrokerMachineConfiguration -Name "UPM\Finance Department" -Policy $newPolicy
Use the encoded settings binary data in $newPolicy to update the machine configuration.

-------------------------- EXAMPLE 2 --------------------------

Get-BrokerMachineConfiguration -Name "UPM\*" | Set-BrokerMachineConfiguration -Description "User Profile Management"
Assign the description "User Profile Management" to every machine configuration associated with the UPM slot.
Set-BrokerMachineConfigurationMetadata

Oct 01, 2013
Creates/Updates metadata key-value pairs for MachineConfiguration

Syntax

Set-BrokerMachineConfigurationMetadata [-MachineConfigurationId] <Int32> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerMachineConfigurationMetadata [-MachineConfigurationId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerMachineConfigurationMetadata [-MachineConfigurationId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerMachineConfigurationMetadata [-MachineConfigurationName] <String> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description
The Set-BrokerMachineConfigurationMetadata cmdlet creates/updates metadata key-value pairs for MachineConfiguration. The MachineConfiguration can be specified by InputObject or piping.

Related topics

Parameters

-MachineConfigurationId [Int32]
Specifies the MachineConfiguration object whose Metadata is to be created/updated by ID.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>

<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type

Citrix.BrokerAdmin.SDK.BrokerMachineConfiguration You can pipe the MachineConfiguration to hold the new or updated metadata.

Return Values

None or Citrix.BrokerAdmin.SDK.BrokerMachineConfiguration

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.BrokerMachineConfiguration object.

Examples

-------------------------- EXAMPLE 1 --------------------------
C:\PS> Set-BrokerMachineConfigurationMetadata -InputObject $obj-Uid -Name "MyMetadataName" -Value "1234"
This command creates/updates the Metadata "MyMetadataName" key-value pair for the MachineConfiguration whose instance is pointed by $obj-Uid

-------------------------- EXAMPLE 2 --------------------------
C:\PS> Get-BrokerMachineConfiguration | Set-BrokerMachineConfigurationMetadata -Name "MyMetadataName" -Value "1234"
This command creates/updates metadata key "MyMetadataName" with the value "1234" for all the MachineConfiguration in the site
C:\PS> @{ 'name1' = 'value1'; 'name2' = 'value2' } | Set-BrokerMachineConfigurationMetadata 'objname'
This command creates/updates two metadata keys "name1" and "name2" with the values "value1" and "value2" respectively for the MachineConfiguration in the site whose name is 'objname'
Set-BrokerMachineMaintenanceMode

Oct 01, 2013
Sets whether the specified machine(s) are in maintenance mode.

Syntax

Detailed Description

The cmdlet can be used to set whether a machine is in maintenance mode or not. A machine in maintenance mode is not available for new sessions, and for managed machines all automatic power management is disabled.

There are times when it is necessary to disable desktops. You can do this by setting the InMaintenanceMode property of a desktop to $true. This puts it into maintenance mode. The broker excludes single-session desktops in maintenance mode from brokering decisions and does not start new sessions on them. Existing sessions are unaffected. For multi-session desktops in maintenance mode, reconnections to existing sessions are allowed, but no new sessions are created on the machine.

Desktops in maintenance mode are also excluded from automatic power management, although explicit power actions are still performed.

This cmdlet is equivalent to using the Set-BrokerMachine cmdlet to set the value of only the InMaintenanceMode property.

Related topics

Set-BrokerMachine

Parameters

- **-InputObject** <Machine[]>

The machine instances whose InMaintenanceMode property you want to set.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>true</td>
</tr>
</tbody>
</table>

- **-MaintenanceMode** <Boolean>

Sets whether the machine is in maintenance mode or not. A machine in maintenance mode is not available for new sessions, and for managed machines all automatic power management is disabled.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>true</td>
</tr>
</tbody>
</table>
Accept Pipeline Input? | true (ByValue)
---|---

- **LoggingId**<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **AdminAddress**<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type

Citrix.BrokerAdmin.SDK.Machine You can pipe in the machines whose properties you want to set.

Return Values

None

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> $machines = Get-BrokerMachine -MachineName 'MyDomain\*'  
C:\PS> Set-BrokerMachineMaintenanceMode -InputObject $machines $false  
This example finds all machines in domain MyDomain and removes them from maintenance mode by setting their InMaintenanceMode property to false.
Set-BrokerMachineMetadata

Oct 01, 2013
Creates/Updates metadata key-value pairs for Machine

Syntax

Set-BrokerMachineMetadata [-MachineId] <Int32> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerMachineMetadata [-MachineId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerMachineMetadata [-MachineId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerMachineMetadata [-MachineName] <String> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerMachineMetadata cmdlet creates/updates metadata key-value pairs for Machine. The Machine can be specified by InputObject or piping.

Related topics

Parameters

-MachineId <Int32>

Specifies the Machine object whose Metadata is to be created/updated by ID.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

-InputObject <Machine[]>

 Specifies the Machine objects whose Metadata is to be created/updated.
| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByValue) |

**-MachineName <String>**

Specifies the Machine object whose Metadata is to be created/updated by name.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByValue, ByPropertyName) |

**-Map <PSObject>**

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByValue) |

**-Name <String>**

Specifies the name of the Metadata member to be created/updated.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByPropertyName) |

**-Value <String>**

Specifies the value of the Metadata member to be created/updated.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByPropertyName) |

**-PassThru <SwitchParameter>**

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.
-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required? false
Default Value False
Accept Pipeline Input? false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required? false
Default Value Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input? false

Input Type
Citrix.BrokerAdmin.SDK.BrokerMachine You can pipe the Machine to hold the new or updated metadata.

Return Values
None or Citrix.BrokerAdmin.SDK.BrokerMachine

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.BrokerMachine object.

Examples
-------------------------- EXAMPLE 1 --------------------------
C:\PS> Set-BrokerMachineMetadata -InputObject $obj-Uid -Name "MyMetadataName" -Value "1234"
This command creates/updates the Metadata "MyMetadataName" key-value pair for the Machine whose instance is pointed by $obj-Uid

-------------------------- EXAMPLE 2 --------------------------
C:\PS> Get-BrokerMachine | Set-BrokerMachineMetadata -Name "MyMetadataName" -Value "1234"
This command creates/updates metadata key "MyMetadataName" with the value "1234" for all the Machine in the site

-------------------------- EXAMPLE 3 --------------------------

C:\PS> @{ 'name1' = 'value1'; 'name2' = 'value2' } | Set-BrokerMachineMetadata 'objname'
This command creates/updates two metadata keys "name1" and "name2" with the values "value1" and "value2" respectively for the Machine in the site whose name is 'objname'
Set-BrokerPowerTimeScheme

Oct 01, 2013
Modifies an existing power time scheme.

Syntax

Detailed Description

The Set-BrokerPowerTimeScheme cmdlet modifies an existing power time scheme.

Each power time scheme is associated with a particular desktop group, and covers one or more days of the week, defining which hours of those days are considered peak times and which are off-peak times. In addition, the time scheme defines a pool size value for each hour of the day for the days of the week covered by the time scheme. No one desktop group can be associated with two or more time schemes that cover the same day of the week.

For more information about the power policy mechanism and pool size management, see ‘help about_Broker_PowerManagement’.

Related topics

Get-BrokerPowerTimeScheme

Rename-BrokerPowerTimeScheme

New-BrokerPowerTimeScheme

Remove-BrokerPowerTimeScheme

Parameters

-InputObject <PowerTimeScheme[]>

The power time scheme to be changed.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-Name <String>

Identifies the power time scheme to be changed by name.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
</tr>
</tbody>
</table>
Accept Pipeline Input?               true (ByPropertyName)

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

<table>
<thead>
<tr>
<th>Required?</th>
<th>False</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>False</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>False</td>
</tr>
</tbody>
</table>

-DaysOfWeek<TimeSchemeDays>

Changes the pattern of days of the week that the time scheme applies to. The pattern of days is specified as a single value or a list of values, where each value refers to either a single day or defined group of days.

Valid values are: Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, Weekend and Weekdays.

<table>
<thead>
<tr>
<th>Required?</th>
<th>False</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>False</td>
</tr>
</tbody>
</table>

-DisplayName<String>

Changes the name that is used by the DesktopStudio console when showing the time scheme.

<table>
<thead>
<tr>
<th>Required?</th>
<th>False</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>False</td>
</tr>
</tbody>
</table>

-PeakHours<Boolean[]>

Changes the pattern of hours considered 'peak' vs 'off-peak' for the days covered by the time scheme. A 24-entry array of boolean truth values is expected, where the zeroth entry of the array relates to the time period between midnight and 0:59, the first relates to 1am to 1:59 and so on, with the last array element relating to 11 PM to 11:59. If the flag value is $true it means the associated hour of the day is considered a peak time; if $false it means that it is considered off-peak.

If fewer than 24 values are supplied, the final missing values are assumed to be 'false', and if more than 24 values are supplied, only the first 24 are used.

<table>
<thead>
<tr>
<th>Required?</th>
<th>False</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>False</td>
</tr>
</tbody>
</table>

-PoolSize<Int32[]>

https://docs.citrix.com  © 1999-2017 Citrix Systems, Inc. All rights reserved.  p.1524
Changes the requested pool size of running machines at the various hours of the day for the days covered by the time scheme. A 24-entry array of integer values is expected, where the zeroth entry of the array relates to the time period between midnight and 0:59, the first relates to 1am to 1:59 and so on, with the last array element relating to 11 PM to 11:59. The pool size array entry values are either absolute numbers of machines that should be running or are a percentage of the machines in the desktop group that should be running during the associated hour of the day. A value of -1 in the array signifies that no management of the number of running machines should be attempted during the associated hour of the day.

If fewer than 24 values are supplied, the final missing values are assumed to be -1, and if more than 24 values are supplied, only the first 24 are used.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **PoolUsingPercentage**<Boolean>

Changes whether pool size values from the 'PoolSize' array are evaluated as absolute numbers of running machines or as a percentage of machines in the desktop group that are to be maintained as running.

A value of $true indicates that the pool size array values are percentages of total machines in the desktop group and a value of $false indicates that the pool size array values are absolute numbers of machines to maintain as running.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **LoggingId**<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **AdminAddress**<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>
Input Type
Citrix.BrokerAdmin.SDK.PowerTimeScheme The power time scheme to be changed.

Return Values
None or Citrix.BrokerAdmin.SDK.PowerTimeScheme

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.PowerTimeScheme object.

Examples
-------------------------- EXAMPLE 1 --------------------------
C:\PS> Set-BrokerPowerTimeScheme -Name 'Development Weekdays' -PoolSize ( 0..23 | %{ if ($_.lt 8 -or $_.gt 19) { 5 } else { 20 } } )
Sets the pool size for the power time scheme named 'Development Weekdays' to be 20 for the time between 8am to 7:59pm, and 5 for other times.
Set-BrokerPowerTimeSchemeMetadata

Oct 01, 2013
Creates/Updates metadata key-value pairs for PowerTimeScheme

Syntax

Set-BrokerPowerTimeSchemeMetadata [-PowerTimeSchemelmId] <Int32> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerPowerTimeSchemeMetadata [-PowerTimeSchemelmId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerPowerTimeSchemeMetadata cmdlet creates/updates metadata key-value pairs for PowerTimeScheme. The PowerTimeScheme can be specified by InputObject or piping.

Parameters

-PowerTimeSchemelmId <Int32>
Specifies the PowerTimeScheme object whose Metadata is to be created/updated by ID.

-InputObject <PowerTimeScheme[]>
Specifies the PowerTimeScheme objects whose Metadata is to be created/updated.
---PowerTimeSchemeName<String>---

Specifies the PowerTimeScheme object whose Metadata is to be created/updated by name.

---Map<PSObject>---

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

---Name<String>---

Specifies the name of the Metadata member to be created/updated

---Value<String>---

Specifies the value of the Metadata member to be created/updated

---PassThru<SwitchParameter>---

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.
### `Set-BrokerPowerTimeSchemeMetadata` cmdlet

**Required?** false  
**Default Value** False  
**Accept Pipeline Input?** false

**-LoggingId**<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-AdminAddress**<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

Citrix.BrokerAdmin.SDK.BrokerPowerTimeScheme  
You can pipe the PowerTimeScheme to hold the new or updated metadata.

**Return Values**

None or Citrix.BrokerAdmin.SDK.BrokerPowerTimeScheme  
This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.BrokerPowerTimeScheme object.

**Examples**

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Set-BrokerPowerTimeSchemeMetadata -InputObject $obj-Uid -Name "MyMetadataName" -Value "1234"  
This command creates/updates the Metadata "MyMetadataName" key-value pair for the PowerTimeScheme whose instance is pointed by $obj-Uid

-------------------------- EXAMPLE 2 --------------------------
C:\PS> Get-BrokerPowerTimeScheme | Set-BrokerPowerTimeSchemeMetadata -Name "MyMetadataName" -Value "1234"
This command creates/updates metadata key "MyMetadataName" with the value "1234" for all the PowerTimeScheme in
the site

-------------------------- EXAMPLE 3 --------------------------

C:\PS> @{ 'name1' = 'value1'; 'name2' = 'value2' } | Set-BrokerPowerTimeSchemeMetadata 'objname'
This command creates/updates two metadata keys "name1" and "name2" with the values "value1" and "value2"
respectively for the PowerTimeScheme in the site whose name is 'objname'
Set-BrokerPrivateDesktop

Oct 01, 2013
Change the settings of a private desktop.

Syntax

Detailed Description

Private desktops are automatically created when a machine is added to a desktop group with a DesktopKind of 'Private', and these inherit default properties. Use Set-BrokerPrivateDesktop to change the configuration settings of an existing private desktop.

To specify private desktops, you can choose whether to update by machine name, or by passing a PrivateDesktop or an array of PrivateDesktop objects. You can also use the Uid or an array of Uids instead.

You cannot modify many properties of a private desktop as these contain status information; for example DNSName, RegistrationState, and OSVersion.

Use Add- and Remove- cmdlets to update relationships between private desktops and other objects. For example, you can add a tag to a private desktop with:

Add-BrokerTag $tag -Desktop $desktop.Uid

Similarly, assign users to private desktops with:

Add-BrokerUser $user -PrivateDesktop $desktop

Many of the fields that can be set with this cmdlet can also be set with Set-BrokerMachine, such as MaintenanceMode. Using Set-BrokerMachine is preferred in these cases.

For more information about desktops, see about_Broker_Desktops; for more information about machines, see about_Broker_Machines.

Related topics

Get-BrokerMachine

Parameters

-InputObject <PrivateDesktop[]>
Specifies the desktop or array of desktops to modify. You can also use an integer Uid of the desktop instead.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByValue) |

-MachineName<String>

Specifies the desktop to modify using its machine name (in the form 'domain\machine').

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByPropertyName) |

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

| Required? | false |
| Default Value | False |
| Accept Pipeline Input? | false |

-AssignedClientName<String>

Changes the client name assignment of the desktop. Set this to $null to remove the assignment. Desktops can be assigned to multiple users, a single IP address, or a single client name, but only to one of these categories at one time.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

-AssignedIPAddress<String>

Changes the IP address assignment of the desktop. Set this to $null to remove the assignment. Desktops can be assigned to multiple users, a single IP address, or a single client name, but only to one of these categories at one time.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |
-**ColorDepth**<ColorDepth>

Changes the color depth connections to this desktop should use.

Valid values are $null, FourBit, EightBit, SixteenBit, and TwentyFourBit. A value of $null results in the desktop group value being used instead.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**Description**<String>

Changes the description of the desktop. This is seen only by Citrix Administrators and is not visible to users.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**IconUid**<Int32>

Changes the icon displayed for this desktop. When this setting is $null, the icon displayed is determined by the desktop group.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**InMaintenanceMode**<Boolean>

Changes the maintenance mode setting of a desktop. When a desktop is in maintenance mode, it is not included as a candidate when brokering new sessions, and it does not participate in automatic power management (idle pool); however, it still responds to explicit power operations.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**PublishedName**<String>

Changes the name displayed to the user for this desktop. When this setting is $null, the name displayed is determined by
the PublishedName of the desktop group.

<table>
<thead>
<tr>
<th>Name</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>-SecureIcaRequired</td>
<td>false</td>
<td>false</td>
<td>false</td>
</tr>
</tbody>
</table>

**-SecureIcaRequired**<Boolean>

Changes whether or not SecureICA is required for connections to this desktop. When this setting is $null, the SecureIcaRequired setting from the desktop group is used.

<table>
<thead>
<tr>
<th>Name</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>-SecureIcaRequired</td>
<td>false</td>
<td>false</td>
<td>false</td>
</tr>
</tbody>
</table>

**-LoggingId**<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Name</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>-LoggingId</td>
<td>false</td>
<td>false</td>
<td>false</td>
</tr>
</tbody>
</table>

**-AdminAddress**<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Name</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>-AdminAddress</td>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

Citrix.BrokerAdmin.SDK.PrivateDesktop You can pipe PrivateDesktop objects into this cmdlet instead of on the command line with the -InputObject parameter.

**Return Values**

None or Citrix.BrokerAdmin.SDK.PrivateDesktop
This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a `Citrix.BrokerAdmin.SDK.PrivateDesktop` object.

Examples

-------------------------- EXAMPLE 1 --------------------------
C:\PS> Set-BrokerPrivateDesktop DOMAIN\Machine1 -ColorDepth SixteenBit
Change the color depth of Machine1 to be 16-bit.

-------------------------- EXAMPLE 2 --------------------------
C:\PS> Get-BrokerPrivateDesktop -InMaintenanceMode $true | Set-BrokerPrivateDesktop -InMaintenanceMode $false
Bring all private desktops currently in maintenance mode back into normal service.
Set-BrokerRebootCycleMetadata

Oct 01, 2013
Creates/Updates metadata key-value pairs for RebootCycle

Syntax

Set-BrokerRebootCycleMetadata [-RebootCycleId] <Int64> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerRebootCycleMetadata [-RebootCycleId] <Int64> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerRebootCycleMetadata [-RebootCycleId] <Int64> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerRebootCycleMetadata [-InputObject] <RebootCycle[]> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerRebootCycleMetadata [-InputObject] <RebootCycle[]> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerRebootCycleMetadata cmdlet creates/updates metadata key-value pairs for RebootCycle. The RebootCycle can be specified by InputObject or piping.

Related topics

Parameters

-RebootCycleId <Int64>

Specifies the RebootCycle object whose Metadata is to be created/updated by ID.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-InputObject <RebootCycle[]>

Specifies the RebootCycle objects whose Metadata is to be created/updated.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>
### -Name<br> Specifies the name of the Metadata member to be created/updated

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

### -Value<br> Specifies the value of the Metadata member to be created/updated

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

### -Map<br> Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

### -PassThru<br> This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>False</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -LoggingId<br> Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
</tbody>
</table>
- AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

Citrix.BrokerAdmin.SDK.BrokerRebootCycle You can pipe the RebootCycle to hold the new or updated metadata.

**Return Values**

None or Citrix.BrokerAdmin.SDK.BrokerRebootCycle

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.BrokerRebootCycle object.

**Examples**

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Set-BrokerRebootCycleMetadata -InputObject $obj-Uid -Name "MyMetadataName" -Value "1234"
This command creates/updates the Metadata "MyMetadataName" key-value pair for the RebootCycle whose instance is pointed by $obj-Uid

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Get-BrokerRebootCycle | Set-BrokerRebootCycleMetadata -Name "MyMetadataName" -Value "1234"
This command creates/updates metadata key "MyMetadataName" with the value "1234" for all the RebootCycle in the site
Set-BrokerRebootSchedule

Oct 01, 2013
Updates the values of one or more desktop group reboot schedules.

Syntax

Detailed Description
The Set-BrokerRebootSchedule cmdlet is used to alter the settings of an existing desktop group reboot schedule.

Related topics
Get-BrokerRebootSchedule
New-BrokerRebootSchedule
Remove-BrokerRebootSchedule

Parameters
-InputObject <RebootSchedule[]>
The reboot schedule to be modified.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-DesktopGroupName <String>
The name of the desktop group whose reboot schedule is to be modified.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-PassThru <SwitchParameter>
This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-Day <RebootScheduleDays>
For weekly schedules, the day of the week on which the scheduled reboot-cycle starts (one of Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, Sunday).

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-Enabled <Boolean>

https://docs.citrix.com © 1999-2017 Citrix Systems, Inc. All rights reserved. p.1539
Boolean that indicates if the reboot schedule is to be enabled or disabled.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-Frequency<RebootScheduleFrequency>

Frequency with which this schedule runs (either Weekly or Daily).

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-RebootDuration<int32>

Approximate maximum number of minutes over which the scheduled reboot cycle runs.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-StartTime<TimeSpan>

Time of day at which the scheduled reboot cycle starts (HH:MM).

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-WarningDuration<int32>

Time prior to the initiation of a machine reboot at which warning message is displayed in all user sessions on that machine. If the warning duration is zero then no message is displayed.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-WarningMessage<string>

Warning message displayed in user sessions on a machine scheduled for reboot. If the message is blank then no message is displayed.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-WarningTitle<string>

The window title used when showing the warning message in user sessions on a machine scheduled for reboot.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>
-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

| Required? | false |
| Default Value | Localhost. Once a value is provided by any cmdlet, this value will become the default. |
| Accept Pipeline Input? | false |

Input Type
Citrix.BrokerAdminSDK.RebootSchedule Reboot schedules may be specified through pipeline input.

Return Values
None

Examples
-------------------------- EXAMPLE 1 --------------------------
C:\PS> Set-BrokerRebootSchedule -DesktopGroupName Accounting -WarningMessage "Save your work" -WarningDuration 10 -WarningTitle "WARNING: Reboot pending"
Sets the reboot schedule for the desktop group named Accounting to display a message with the title "WARNING: Reboot pending" and body "Save your work" ten minutes prior to rebooting each machine. The message is displayed in every user session on that machine.

-------------------------- EXAMPLE 2 --------------------------
C:\PS> Get-BrokerRebootSchedule -Frequency Weekly | Set-BrokerRebootSchedule -Day Friday
Sets all weekly reboot schedules to run on Friday.
Set-BrokerRemotePCAccount

Oct 01, 2013
Modify one or more RemotePCAccounts.

Syntax

Detailed Description

Modify one or more RemotePCAccounts.

Related topics

Get-BrokerRemotePCAccount
New-BrokerRemotePCAccount
Remove-BrokerRemotePCAccount

Parameters

- **InputObject** <RemotePCAccount[]>

  Specifies the RemotePCAccounts to modify.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
</tr>
</tbody>
</table>

- **PassThru**<SwitchParameter>

  This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>False</td>
</tr>
</tbody>
</table>

- **AllowSubfolderMatches**<Boolean>

  When true a machine matches this RemotePCAccount if the AD computer is in the container specified by the OU property, or within a child container of the OU.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>false</td>
</tr>
</tbody>
</table>
When false the AD computer object only matches if it is directly in the AD container specified by the OU property.

This property is not meaningful when OU has the special value ‘any’.

<table>
<thead>
<tr>
<th>Property</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>MachinesExcluded</td>
<td>false</td>
<td></td>
<td>false</td>
</tr>
<tr>
<td>MachinesIncluded</td>
<td>false</td>
<td></td>
<td>false</td>
</tr>
<tr>
<td>OU</td>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

**-MachinesExcluded <String[]>**

MachinesExcluded specifies a set of strings that can include asterisk wildcards. If a machine name matches any entries in MachinesExcluded then it cannot match with this RemotePCAccount regardless of whether there is a MachinesIncluded match.

Matches are performed against the domain name joined with the machine name by a backslash (DOMAIN\MACHINE), e.g.:

- DOMAIN1\M*
- DOMAIN*\M*
- *\M*

**-MachinesIncluded <String[]>**

MachinesIncluded specifies a set of strings that can include asterisk wildcards. A machine may only match with this RemotePCAccount if it matches a MachinesIncluded entry and does not match any MachinesExcluded entries.

Matches are performed against the domain name joined with the machine name by a backslash (DOMAIN\MACHINE), e.g.:

- DOMAIN1\M*
- DOMAIN*\M*
- *\M*

**-OU <String>**

Specifies the DN of an AD container, or has the special value ‘any’.
When an AD container is specified a machine may only match with the RemotePCAccount when the AD computer object is located relative to the OU.

When 'any' is specified the location of the AD computer object is ignored for purposes of matching this RemotePCAccount. The machine must still meet the MachinesIncluded and MachinesExcluded filters for a match to occur.

In the event that a machine matches with multiple RemotePCAccounts then the RemotePCAccount OU with the longest canonical name takes precedence. The special 'any' OU is treated as lowest priority.

Note that the OU value of every RemotePCAccount must be unique, and this includes only one 'any' entry being permitted.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **LoggingId**<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **AdminAddress**<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type

Citrix.BrokerAdmin.SDK.RemotePCAccount You can pipe the RemotePCAccounts to be modified into this cmdlet.

Return Values

None or Citrix.BrokerAdmin.SDK.RemotePCAccount

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.RemotePCAccount object.
Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Get-BrokerRemotePCAccount | Set-BrokerRemotePCAccount -MachinesExcluded @('DOMAIN42\*')
Make all RemotePCAccounts filter out machines from DOMAIN42.
Set-BrokerSession

Oct 01, 2013
Sets properties of a session.

Syntax

Set-BrokerSession [-InputObject] <Session[]> [-PassThru] [-Hidden <Boolean>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerSession cmdlet sets properties on a session or set of sessions. You can specify a single session by Uid or multiple session instances can be passed to the command by piping or using the -InputObject parameter.

Related topics

Get-BrokerSession

Parameters

-InputObject <Session[]>
The session instances whose properties you want to set.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-PassThru <SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>False</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-Hidden <Boolean>

Changes whether the session is hidden or not. Hidden sessions are treated as though they do not exist when brokering sessions; a hidden session cannot be reconnected to, but a new session may be launched using the same entitlement.

A session may be hidden automatically by the system when an attempt is made to reconnect to a session that is unreachable due to, for example, the failure of a VM's hypervisor. This allows a new session to be brokered provided that other machines in the same desktop group are still available. If the original session still exists after the hypervisor is restored then it must be unhidden to allow the user to reconnect to it.
Only sessions for shared desktops or applications can be hidden or unhidden. Private desktop or application sessions can never be hidden.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

*(-LoggingId*< Guid>*)

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

*(-AdminAddress*< String>*)

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type

Citrix.BrokerAdmin.SDK.Session You can pipe in the sessions whose properties you want to set.

Return Values

None or Citrix.BrokerAdmin.SDK.Session

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.Session object.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> $sessions = Get-BrokerSession -User ACCOUNTS\JohnSmith -Hidden $true
C:\PS> $sessions | Set-BrokerSession -Hidden $false

Finds all sessions in the site for user John Smith that have been hidden, and makes them available for reconection again.
Set-BrokerSessionMetadata

Oct 01, 2013
Creates/Updates metadata key-value pairs for Session

Syntax

Set-BrokerSessionMetadata [-SessionId] <Int64> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerSessionMetadata [-SessionId] <Int64> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerSessionMetadata [-SessionId] <Int64> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerSessionMetadata [-InputObject] <Session[]> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerSessionMetadata [-InputObject] <Session[]> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerSessionMetadata cmdlet creates/updates metadata key-value pairs for Session. The Session can be specified by InputObject or piping.

Related topics

Parameters

- **SessionId** <Int64>

Specifies the Session object whose Metadata is to be created/updated by ID.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **InputObject** <Session[]>

Specifies the Session objects whose Metadata is to be created/updated.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>
### -Name <String>

Specifies the name of the Metadata member to be created/updated

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

### -Value <String>

Specifies the value of the Metadata member to be created/updated

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

### -Map <PSObject>

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

### -PassThru <SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>False</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -LoggingId <Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
</tbody>
</table>

Accept Pipeline Input?  false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type

Citrix.BrokerAdmin.SDK.BrokerSession You can pipe the Session to hold the new or updated metadata.

Return Values

None or Citrix.BrokerAdmin.SDK.BrokerSession

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.BrokerSession object.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Set-BrokerSessionMetadata -InputObject $obj-Uid -Name "MyMetadataName" -Value "1234"
This command creates/updates the Metadata "MyMetadataName" key-value pair for the Session whose instance is pointed by $obj-Uid

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Get-BrokerSession | Set-BrokerSessionMetadata -Name "MyMetadataName" -Value "1234"
This command creates/updates metadata key "MyMetadataName" with the value "1234" for all the Session in the site
Set-BrokerSharedDesktop

Oct 01, 2013
Change the settings of a shared desktop.

Syntax

Detailed Description

Shared desktops are automatically created when a machine is added to a desktop group with a DesktopKind of 'Shared', and these inherit default properties. Use Set-BrokerSharedDesktop to change the configuration settings of an existing shared desktop.

To specify shared desktops, you can choose whether to update by machine name or by passing a SharedDesktop or an array of SharedDesktop objects. You can also use the Uid or an array of Uids instead.

Most properties of a shared desktop cannot be modified as these contain status information; for example DNSName, RegistrationState, and OSVersion. You can change only the maintenance mode setting with this cmdlet.

Many of the properties that can be set with Set-BrokerSharedDesktop can be set by using Set-BrokerMachine (e.g. InMaintenanceMode). Using the Set-BrokerMachine cmdlet, where possible, is the preferred behaviour.

See about_Broker_Desktops for more information about desktops.

Related topics

Get-BrokerSharedDesktop

Parameters

- **InputObject** <SharedDesktop[]>

  Specifies the desktop or array of desktops to modify. You can also use an integer Uid of the desktop instead.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **MachineName** <String>

  Specifies the desktop to modify using its machine name (in the form 'domain\machine').

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
</table>
Default Value

Accept Pipeline Input? true (ByPropertyName)

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

- InMaintenanceMode<Boolean>

Changes the maintenance mode setting of a desktop. When a desktop is in maintenance mode, it is not included as a candidate when brokering new sessions, and it does not participate in automatic power management (idle pool); however, it still responds to explicit power operations.

- LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

- AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.
Input Type
Citrix.BrokerAdmin.SDK.SharedDesktop You can pipe SharedDesktop objects into this cmdlet instead of on the command line with the -InputObject parameter.

Return Values
None or Citrix.BrokerAdmin.SDK.SharedDesktop
This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.SharedDesktop object.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Set-BrokerSharedDesktop DOMAIN\Machine1 -InMaintenanceMode $true
Put the Machine1 shared desktop into maintenance mode.

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Get-BrokerSharedDesktop -InMaintenanceMode $true | Set-BrokerSharedDesktop -InMaintenanceMode $false
Bring all shared desktops currently in maintenance mode back into normal service.
Set-BrokerSite

Oct 01, 2013
Changes the overall settings of the current XenDesktop broker site.

Syntax

Detailed Description

The Set-BrokerSite cmdlet modifies properties of the current broker site. The broker site is a top-level, logical representation of the XenDesktop site, from the perspective of the brokering services running within the site. It defines various site-wide default attributes used by the brokering services.

A XenDesktop installation has only a single broker site instance.

Related topics

Get-BrokerSite
New-BrokerIcon

Parameters

- **-PassThru**<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

| Required? | false |
| Default Value | False |
| Accept Pipeline Input? | false |

- **-BaseOU**<Guid>

Changes the objectGUID property identifying the base OU in Active Directory used for desktop registrations. For sites using only registry-based discovery (the default) this value is $null.

Any desktop attempting to register through a different OU from the one specified here is rejected. Note that desktops configured for registry-based discovery can register with the site, even if a BaseOU value is specified.

Information held in Active Directory is not modified by changing this value.

Typically, this property is changed only by using the Set-ADControllerDiscovery.ps1 script.
-ColorDepth

Changes the default color depth for new desktop groups, if no color depth is specified explicitly when a group is created. Changing this default has no impact on the color depths used already by existing groups.

Valid values are FourBit, EightBit, SixteenBit, and TwentyFourBit.

-DesktopGroupIconUid

Changes the default desktop icon used for new desktop groups if no icon is specified explicitly when a group is created. Changing this default has no impact on the icons used already by existing groups.

The specified icon must already have been added to the site using New-BrokerIcon.

-DnsResolutionEnabled

Changes whether ICA files returned by a broker service to a user device contain the numeric IP address or the DNS name of the desktop machine to which a session should be established.

With the default value ($false), ICA files will always contain a numeric IP address. To have DNS names appear in the ICA files, set the value to $true.

Even when DNS resolution is enabled ($true), IP addresses may still appear in ICA files. The reasons for this include, for example, that the broker service is unable to obtain a DNS name for the target machine, or that Web Interface is configured to always use numeric IP addresses in this context.

-SecureIcaRequired

Changes the default SecureICA usage requirements for new desktop groups if no SecureICA setting is specified explicitly when a group is created. Changing this default has no impact on the SecureICA usage requirements of existing groups.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-TrustRequestsSentToTheXmlServicePort**<Boolean>

Changes whether the XML Service (as used by Web Interface) implicitly trusts the originator of requests it receives, or whether it fully authenticates them.

With the default value ($false), full authentication checks are performed. However, you must enable this setting ($true) to allow support for "Pass-through" authentication, and/or connections routed through Access Gateway.

If this setting is enabled, you must ensure that controllers running the brokering services are securely firewalled.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-LoggingId**<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-AdminAddress**<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**
None You cannot pipe input into this cmdlet.

Return Values

None or Citrix.BrokerAdmin.SDK.Site

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.Site object.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Set-BrokerSite -ColorDepth SixteenBit
Specifies that any new desktop groups created, where a color depth value is not specified, default to using 16-bit color depth for user sessions to desktops or applications within that group.
Set-BrokerSiteMetadata

Oct 01, 2013
Creates/Updates metadata key-value pairs for Site

Syntax

Detailed Description

The Set-BrokerSiteMetadata cmdlet creates/updates metadata key-value pairs for Site. The Site can be specified by InputObject or piping.

Related topics

Parameters

-Map <PSObject>

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-Name <String>

Specifies the name of the Metadata member to be created/updated

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>
-**Value**<String>

Specifies the value of the Metadata member to be created/updated

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-**InputObject**<Site[]>

Specifies the Site objects whose Metadata is to be created/updated.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-**PassThru**<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>False</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**LoggingId**<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**AdminAddress**<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
</table>
Default Value  |  Localhost. Once a value is provided by any cmdlet, this value will become the default.
---|---
Accept Pipeline Input?  |  false

Input Type

Citrix.BrokerAdmin.SDK.BrokerSite You can pipe the Site to hold the new or updated metadata.

Return Values

None or Citrix.BrokerAdmin.SDK.BrokerSite

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.BrokerSite object.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Set-BrokerSiteMetadata -Name "MyMetadataName" -Value "1234"
This command creates/updates the Metadata "MyMetadataName" key-value pair for the Site

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Get-BrokerSite | Set-BrokerSiteMetadata -Name "MyMetadataName" -Value "1234"
This command creates/updates metadata key "MyMetadataName" with the value "1234"
Set-BrokerTagMetadata

Oct 01, 2013
Creates/Updates metadata key-value pairs for Tag

Syntax

Set-BrokerTagMetadata [-TagId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters>

Set-BrokerTagMetadata [-TagId] <Int32> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters>

Set-BrokerTagMetadata [-TagId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters>

Set-BrokerTagMetadata [-TagId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters>

Set-BrokerTagMetadata [-TagName] <String> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters>

Set-BrokerTagMetadata [-TagName] <String> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters>

Detailed Description

The Set-BrokerTagMetadata cmdlet creates/updates metadata key-value pairs for Tag. The Tag can be specified by InputObject or piping.

Related topics

Parameters

-TagId <Int32>

Specifies the Tag object whose Metadata is to be created/updated by ID.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByPropertyName) |

-InputObject <Tag[]>

Specifies the Tag objects whose Metadata is to be created/updated.
- **TagName**<String>
  Specifies the Tag object whose Metadata is to be created/updated by name.

  | Required? | true |
  | Default Value | |
  | Accept Pipeline Input? | true (ByValue, ByPropertyName) |

- **Name**<String>
  Specifies the name of the Metadata member to be created/updated

  | Required? | true |
  | Default Value | |
  | Accept Pipeline Input? | true (ByPropertyName) |

- **Value**<String>
  Specifies the value of the Metadata member to be created/updated

  | Required? | true |
  | Default Value | |
  | Accept Pipeline Input? | true (ByPropertyName) |

- **Map**<PSObject>
  Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

  | Required? | true |
  | Default Value | |
  | Accept Pipeline Input? | true (ByValue) |

- **PassThru**<SwitchParameter>
  This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.
### -LoggingId <Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -AdminAddress <String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

Citrix.BrokerAdmin.SDK.BrokerTag You can pipe the Tag to hold the new or updated metadata.

**Return Values**

None or Citrix.BrokerAdmin.SDK.BrokerTag

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.BrokerAdmin.SDK.BrokerTag object.

**Examples**

------------- EXAMPLE 1 -------------

C:\PS> Set-BrokerTagMetadata -InputObject $obj-Uid -Name "MyMetadataName" -Value "1234"

This command creates/updates the Metadata "MyMetadataName" key-value pair for the Tag whose instance is pointed by $obj-Uid

------------- EXAMPLE 2 -------------

C:\PS> Get-BrokerTag | Set-BrokerTagMetadata -Name "MyMetadataName" -Value "1234"
This command creates/updates metadata key "MyMetadataName" with the value "1234" for all the Tag in the site

-------------------------- EXAMPLE 3 --------------------------

C:\PS> @{ 'name1' = 'value1'; 'name2' = 'value2' } | Set-BrokerTagMetadata 'objname'
This command creates/updates two metadata keys "name1" and "name2" with the values "value1" and "value2" respectively for the Tag in the site whose name is 'objname'
Start-BrokerCatalogPvdImagePrepare

Oct 01, 2013
Start the PVD Image prepare process in the Broker for the machines in specified catalog(s).

Syntax

Start-BrokerCatalogPvdImagePrepare [-InputObject] <Catalog[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Start-BrokerCatalogPvdImagePrepare cmdlet instructs the Broker to request the Personal VDisk (PVD) preparation process for all of the machines in the specified catalog(s). The process begins when each machine is subsequently powered off, at which point brokering of user desktop sessions is suspended as well as regular machine power operations until the process completes. Only catalogs with a PersistUserChanges value of OnPvd are supported by this cmdlet.

Related topics

Start-BrokerMachinePvdImagePrepare

Parameters

- **-InputObject** <Catalog[]>

The catalog(s) holding the machines to start the PVD Image Preparation process on.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>

<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
<td></td>
</tr>
</tbody>
</table>

**Input Type**

Citrix.BrokerAdmin.SDK.Catalog You can pipe in the catalogs to start the PVD image preparation process on.

**Return Values**

None

**Examples**

```
-------------------------- EXAMPLE 1 --------------------------

C:\PS> Get-BrokerCatalog 'MyCatalog' | Start-BrokerCatalogPvdImagePrepare
Instruct the Broker that the Personal VDisk preparation process will start the next time the machines in the specified catalog are powered off.
```
Start-BrokerMachinePvdImagePrepare

Oct 01, 2013
Start the PVD Image prepare process in the Broker for the specified machine(s).

Syntax

Detailed Description

The Start-BrokerMachinePvdImagePrepare cmdlet instructs the Broker to request the Personal VDisk (PVD) preparation process for the specified machine(s). The process begins when each machine is subsequently powered off, at which point brokering of user desktop sessions is suspended as well as regular machine power operations until the process completes. Only machines in catalogs with a PersistUserChanges value of OnPvd are supported by this cmdlet.

**Input Type**

Citrix.BrokerAdmin.SDK.Machine You can pipe in the machines to start the PVD image preparation process on.

**Return Values**

None

**Examples**

-------------------------- EXAMPLE 1 --------------------------

```
```

Instruct the Broker that the Personal VDisk preparation process will start the next time the specified machine(s) are powered off.
Start-BrokerNaturalRebootCycle

Oct 01, 2013
Reboots all machines from the specified catalog when they are not in use.

Syntax

Detailed Description

Creating a natural reboot cycle for catalog ensures that all machines in the catalog are running the most recent image for the catalog and that all PvD image updates have been performed.

The machines are rebooted in a non-disruptive manner, allowing machines that are in use to continue working and be restarted only after they become idle.

Related topics

None

Parameters

- **-InputObject** <Catalog[]>

Reboots all machines from this input catalog. The catalogs can be specified using UID values, name values (including wildcards) or catalog objects.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **-LoggingId** <Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **-AdminAddress** <String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.
Required? false

Default Value Localhost. Once a value is provided by any cmdlet, this value will become the default.

Accept Pipeline Input? false

Input Type
Citrix.BrokerAdmin.SDK.Catalog Catalogs may be specified through pipeline input. The catalogs can be specified using UID values, name values (including wildcards) or catalog objects

Return Values
None

Notes
Natural reboot cycles do not apply to non-power managed and multi session catalogs

Examples

-------------------------- EXAMPLE 1 --------------------------

$c = Get-BrokerCatalog -Uid 1
    Start-BrokerNaturalRebootCycle -InputObject $c

The above code applies a natural reboot cycle on catalog with Id 1
Start-BrokerRebootCycle

Oct 01, 2013
Creates and starts a reboot cycle for each desktop group that contains machines from the specified catalog.

Syntax

Detailed Description

The Start-BrokerRebootCycle cmdlet is used to create and start a reboot cycle for each desktop group that contains machines from the specified catalog. For a given desktop group, only the machines from the target catalog are rebooted and any machines from other catalogs are not rebooted.

Creating a reboot cycle for catalog ensures that all machines in the catalog are running the most recent image for the catalog and that all PvD image updates have been performed.

Related topics

Stop-BrokerRebootCycle
Get-BrokerRebootCycle

Parameters

-InputObject <Catalog[]>
Creates a reboot cycle for each desktop group that contains machines from this input catalog SDK object. The catalogs can be specified using UID values, name values (including wildcards) or catalog objects.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-RebootDuration <Int32>
Approximate maximum duration in minutes over which the reboot cycle runs.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-WarningDuration <Int32>
Time in minutes prior to a machine reboot at which a warning message is displayed in all user sessions on that machine. If the warning duration value is zero then no message is displayed.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-WarningTitle <String>
The window title used when showing the warning message in user sessions on a machine scheduled for reboot.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>
-**WarningMessage**<String>

Warning message displayed in user sessions on a machine scheduled for reboot. If the message is blank then no message is displayed.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**LoggingId**<Guid>

Specifies the identifier of the high-level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**AdminAddress**<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

Citrix.BrokerAdmin.SDK.Catalog Catalogs may be specified through pipeline input. The catalogs can be specified using UID values, name values (including wildcards) or catalog objects

**Return Values**

none

**Examples**

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Get-BrokerCatalog -Name "SampleCatalog" | Start-BrokerRebootCycle -RebootDuration 240 -WarningMessage "Save your work" -WarningDuration 15

Starts a new reboot cycle for each desktop group containing machines from the catalog "SampleCatalog". Each reboot cycle will have a duration of six hours. Fifteen minutes prior to rebooting a machine, the message "Save your work" will be displayed in each active user session.
Stop-BrokerRebootCycle

Oct 01, 2013
Cancels the specified reboot cycle.

Syntax

Detailed Description

The Stop-BrokerRebootCycle cmdlet is used to cancel the specified reboot cycle.

Related topics

Get-BrokerRebootCycle
Start-BrokerRebootCycle

Parameters

-InputObject<RebootCycle[]>
Cancels this reboot cycle.

| Required? | true |
|------------|
| Default Value |
| Accept Pipeline Input? | true (ByValue) |

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
|------------|
| Default Value |
| Accept Pipeline Input? | false |

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

| Required? | false |
|------------|
Default Value

<table>
<thead>
<tr>
<th>Default Value</th>
<th>Localhost. Once a value is provided by any cmdlet, this value will become the default.</th>
</tr>
</thead>
</table>

Accept Pipeline Input?

| Accept Pipeline Input? | false |

Input Type

Citrix.BrokerAdmin.SDK.RebootCycle Reboot cycles may be specified through pipeline input.

Return Values

none

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Get-BrokerRebootCycle -CatalogUid 7 | Stop-BrokerRebootCycle
Cancels every reboot cycle for the catalog that has theUid of 7.
Stop-BrokerSession

Oct 01, 2013
Stop or log off a session.

Syntax

Stop-BrokerSession [-InputObject] <Session[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<<CommonParameters>>]

Detailed Description

Stops or logs off sessions.

Related topics

Disconnect-BrokerSession
Get-BrokerSession

Parameters

-InputObject <Session[]>

Identifies the session(s) to terminate. This can be expressed as either a session Uid or a session object.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-LoggingId <Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-AdminAddress <String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
</tbody>
</table>
Accept Pipeline Input?  false

Input Type

Citrix.BrokerAdmin.SDK.Session  The sessions to stop can be piped into this cmdlet.

Return Values

None

Notes

This operation is non-blocking and returns before it completes. The operation, however, is unlikely to fail unless there are communication problems between the controller and the machine, if bad arguments are passed to the cmdlet itself or if the machine cannot successfully execute the operation.

The transient nature of sessions means that the list of session objects or UIDs supplied to Stop-BrokerSession could consist of valid and invalid sessions. Invalid sessions are detected and disregarded and the stop session operation is invoked on the valid sessions.

The system can fail to invoke the operation if the machine is not in an appropriate state or if there are problems in communicating with the machine. When an operation is invoked the system detects if the operation was initiated successfully or not by the machine. As this operation is non-blocking the system doesn't detect or report whether the operation ultimately succeeded or failed after its successful initialization on the machine.

Operation failures are reported through the broker SDK error handling mechanism (see about_Broker_ErrorHandling). In the event of errors the SdkErrorRecord error status is set to SessionOperationFailed and its error data dictionary is populated with the following entries:

- OperationsAttemptedCount - The number of operations attempted.
- OperationsFailedCount - The number of failed operations.
- OperationsSucceededCount - The number of successfully executed operations.
- UnresolvedSessionFailuresCount - The number of operations that failed due to invalid sessions being supplied.
- OperationInvocationFailuresCount - The number of operations that failed because they could not be invoked on the desktop.
- DesktopExecutionFailuresCount - The number of operations that failed because they could not be successfully executed by the desktop.

The SdkErrorRecord message will also display the number of attempted, failed and successful operations in the following format:

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Get-BrokerSession -UserName MyDomain\MyAccount | Stop-BrokerSession
Stops all sessions for the user MyDomain\MyAccount.

-------------------------- EXAMPLE 2 --------------------------
C:\PS> $desktop = Get-BrokerDesktop -DNSName MyMachine.MyDomain.com
C:\PS> Stop-BrokerSession $desktop.SessionUid
Stops the session on MyMachine.

-------------------------- EXAMPLE 3 --------------------------
C:\PS> Get-BrokerSession -Filter { SessionState -eq Disconnected -and SessionStateChangeTime -lt '-1' } | Stop-BrokerSession
Stop sessions that have been disconnected for more than one day.

-------------------------- EXAMPLE 4 --------------------------
C:\PS> trap [Citrix.Broker.Admin.SDK.SdkOperationException]
C:\PS> {
C:\PS>   write (!$Exception.name = "$_.Exception.GetType().FullName"
C:\PS>   write (!$SdkOperationException.Status = "$_.Exception.Status"
C:\PS>   write (!$SdkOperationException.ErrorData"
C:\PS>   $_.Exception.ErrorData
C:\PS>   write (!$SdkOperationException.InnerException = "$_.Exception.InnerException"
C:\PS>   $_.Exception.InnerException
C:\PS>   continue
C:\PS> }
C:\PS>
C:\PS> Stop-BrokerSession -InputObject 10,11,12
Trap and display error information.
Test-BrokerAccessPolicyRuleNameAvailable

Oct 01, 2013
Determine whether the proposed AccessPolicyRule Name is available for use.

Syntax

Test-BrokerAccessPolicyRuleNameAvailable [-Name] <String[]> [-AdminAddress <String>] [CommonParameters>

Detailed Description

This cmdlet checks whether proposed AccessPolicyRule Name is available for use. It returns a record for each Name indicating the availability of that Name, with $true indicating that the Name is unused and available for use, or $false if it is not available.

Related topics

Get-BrokerAccessPolicyRule
New-BrokerAccessPolicyRule
Rename-BrokerAccessPolicyRule

Parameters

-Name <String[]>

The AccessPolicyRule Name to be tested.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByValue, ByPropertyName) |

-AdminAddress <String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

| Required? | false |
| Default Value | Localhost. Once a value is provided by any cmdlet, this value will become the default. |
| Accept Pipeline Input? | false |

Input Type

System.String You can pipe a string that contains the Name to test.

Return Values
The cmdlet returns a result for each Name specified. An availability of "True" indicates the Name is available for use, and "False" if it is not available.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Test-BrokerAccessPolicyRuleNameAvailable -Name Test1
Checks whether the Name "Test1" is available.

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Test-BrokerAccessPolicyRuleNameAvailable @("Test1","Test2","Test3")
Checks whether each of the specified names is available.
Test-BrokerAppAssignmentPolicyRuleNameAvailable

Oct 01, 2013
Determine whether the proposed AppAssignmentPolicyRule Name is available for use.

Syntax

Test-BrokerAppAssignmentPolicyRuleNameAvailable [-Name <String>] [-AdminAddress <String>] [<<CommonParameters>>]

Detailed Description

This cmdlet checks whether proposed AppAssignmentPolicyRule Name is available for use. It returns a record for each Name indicating the availability of that Name, with $true indicating that the Name is unused and available for use, or $false if it is not available.

Related topics

Parameters

-Name <String[]>

The AppAssignmentPolicyRule Name to be tested.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

-AdminAddress <String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

| Required? | false |
| Default Value | Localhost. Once a value is provided by any cmdlet, this value will become the default. |
| Accept Pipeline Input? | false |

Input Type

System.String You can pipe a string that contains the Name to test.

Return Values
The cmdlet returns a result for each Name specified. An availability of "True" indicates the Name is available for use, and "False" if it is not available.

Examples

-------------------------- EXAMPLE 1 --------------------------
C:\PS> Test-BrokerAppAssignmentPolicyRuleNameAvailable -Name Test1
Checks whether the Name "Test1" is available.

-------------------------- EXAMPLE 2 --------------------------
C:\PS> Test-BrokerAppAssignmentPolicyRuleNameAvailable @("Test1","Test2","Test3")
Checks whether each of the specified names is available.
Test-BrokerAppEntitlementPolicyRuleNameAvailable

Oct 01, 2013
Determine whether the proposed AppEntitlementPolicyRule Name is available for use.

Syntax

Test-BrokerAppEntitlementPolicyRuleNameAvailable [-Name <String[]>] [-AdminAddress <String>] [CommonParameters>

Detailed Description

This cmdlet checks whether proposed AppEntitlementPolicyRule Name is available for use. It returns a record for each Name indicating the availability of that Name, with $true indicating that the Name is unused and available for use, or $false if it is not available.

Related topics

Get-BrokerAppEntitlementPolicyRule
New-BrokerAppEntitlementPolicyRule
Rename-BrokerAppEntitlementPolicyRule

Parameters

- **-Name <String[]>**

The AppEntitlementPolicyRule Name to be tested.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyName)</td>

<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type

System.String You can pipe a string that contains the Name to test.

Return Values
Citrix.BrokerAdmin.SDK.NameAvailability

The cmdlet returns a result for each Name specified. An availability of "True" indicates the Name is available for use, and "False" if it is not available.

Examples

-------------------------- EXAMPLE 1 --------------------------
C:\PS> Test-BrokerAppEntitlementPolicyRuleNameAvailable -Name Test1
Checks whether the Name "Test1" is available.

-------------------------- EXAMPLE 2 --------------------------
C:\PS> Test-BrokerAppEntitlementPolicyRuleNameAvailable @("Test1", "Test2", "Test3")
Checks whether each of the specified names is available.
Test-BrokerApplicationNameAvailable

Oct 01, 2013
Determine whether the proposed Application Name is available for use.

Syntax

Test-BrokerApplicationNameAvailable [-Name <String[]>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

This cmdlet checks whether proposed Application Name is available for use. It returns a record for each Name indicating the availability of that Name, with True indicating that the Name is unused and available for use, or False if it is not available.

</table>

Input Type

System.String You can pipe a string that contains the Name to test.

Return Values

Citrix.BrokerAdminSDK.NameAvailability
The cmdlet returns a result for each Name specified. An availability of "True" indicates the Name is available for use, and "False" if it is not available.

Examples

---------------------------- EXAMPLE 1 -----------------------------

C:\PS> Test-BrokerCatalogNameAvailable -Name Test1
Checks whether the Name "Test1" is available.

---------------------------- EXAMPLE 2 -----------------------------

C:\PS> Test-BrokerCatalogNameAvailable @("Test1", "Test2", "Test3")
Checks whether each of the specified names is available.
Test-BrokerDBConnection

Oct 01, 2013
Tests whether a database is suitable for use by the Citrix Broker Service.

Syntax

Test-BrokerDBConnection [-DBConnection] <String> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Tests whether the database specified in the given connection string is suitable for use by the currently selected Citrix Broker Service instance.

The service attempts to contact the specified database and returns a status indicating whether the database is both contactable and usable. The test does not impact any currently established connection from the service instance to another database in any way. The tested connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is that on the local machine, or that explicitly specified by the last usage of the -AdminAddress parameter to a Broker SDK cmdlet.

Related topics

Get-BrokerServiceStatus
Get-BrokerDBConnection
Set-BrokerDBConnection

Parameters

- **-DBConnection**: <String>
  Specifies the database connection string to be tested by the currently selected Citrix Broker Service instance.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | false |

- **-AdminAddress**: <String>
  Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

| Required? | false |

https://docs.citrix.com © 1999-2017 Citrix Systems, Inc. All rights reserved. p.1590
Default Value | Localhost. Once a value is provided by any cmdlet, this value will become the default.
--- | ---
Accept Pipeline Input? | false

Return Values

System.String

The Test-BrokerDBConnection cmdlet returns a string describing the status of the selected Citrix Broker Service instance that would result if the connection string were used with the Set-BrokerDBConnection cmdlet; the actual current status of the service is not changed. Possible values are:

-- **OK:**

The service instance is configured with a valid database and service schema. The service is operational.

-- **DBUnconfigured:**

No database connection string is set for the service instance.

-- **DBRejectedConnection:**

The database server rejected the logon from the service instance. This is typically caused by invalid credentials.

-- **InvalidDBConfigured:**

The specified database does not exist, is not visible to the service instance, or the service's schema within the database is invalid.

-- **DBNotFound:**

The specified database could not be located with the given connection string.

-- **DBNewerVersionThanService:**

The service instance is older than, and incompatible with, the service's schema in the database. The service instance needs upgrading.

-- **DBOlderVersionThanService:**

The service instance is newer than, and incompatible with, the service's schema in the database. The database schema needs upgrading.

-- **DBVersionChangeInProgress:**

A database schema upgrade is in progress.

-- **PendingFailure:**

Connectivity between the service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

-- **Failed:**
Connectivity between the service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

-- Unknown:

Service status cannot be determined.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS>Test-BrokerDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;Trusted_Connection=True"
Tests whether the service instance could use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.
Test-BrokerDesktopGroupNameAvailable

Oct 01, 2013
Determine whether the proposed DesktopGroup Name is available for use.

Syntax

Test-BrokerDesktopGroupNameAvailable [-Name <String[]>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

This cmdlet checks whether proposed DesktopGroup Name is available for use. It returns a record for each Name indicating the availability of that Name, with $true indicating that the Name is unused and available for use, or $false if it is not available.

Related topics

Get-BrokerDesktopGroup

Return Values

System.String

Test-BrokerLicenseServer returns:

- 'Compatible' - the server is a compatible license server that can be used.
- 'Incompatible' - the server is an incompatible license server that can't be used.
- 'Inaccessible' - the server cannot be accessed. The server may be down, unreachable, or non-existent.
- 'InternalError' - the server can't be used due to an internal error. A required licensing component on the server may not be installed, configured, or working correctly.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Test-BrokerLicenseServer -LicenseServerAddress "machine.domain" 1234
Tests whether or not the license server "machine.domain" with port number 1234 can be used.

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Test-BrokerLicenseServer -LicenseServerAddress "machine.domain"
Tests whether or not the license server "machine.domain" with port number 2700 can be used.
Test-BrokerMachineNameAvailable

Oct 01, 2013
Determine whether the proposed Machine MachineName is available for use.

Syntax

Test-BrokerMachineNameAvailable [-MachineName <String[]>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

This cmdlet checks whether proposed Machine MachineName is available for use. It returns a record for each MachineName indicating the availability of that MachineName, with $true indicating that the MachineName is unused and available for use, or $false if it is not available.

Related topics

Get-BrokerMachine
New-BrokerMachine
Rename-BrokerMachine

Parameters

-MachineName <String[]>

The Machine MachineName to be tested.

| Required? | true |
| Default Value | 
| Accept Pipeline Input? | true (ByValue, ByPropertyName) |

-AdminAddress <String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

| Required? | false |
| Default Value | Localhost. Once a value is provided by any cmdlet, this value will become the default. |
| Accept Pipeline Input? | false |

Input Type

System.String You can pipe a string that contains the MachineName to test.

Return Values
The cmdlet returns a result for each MachineName specified. An availability of "True" indicates the MachineName is available for use, and "False" if it is not available.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Test-BrokerMachineNameAvailable -MachineName Test1
Checks whether the MachineName "Test1" is available.

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Test-BrokerMachineNameAvailable @("Test1","Test2","Test3")
Checks whether each of the specified names is available.
Determine whether the proposed PowerTimeScheme Name is available for use.

Syntax

Test-BrokerPowerTimeSchemeNameAvailable [-Name <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

This cmdlet checks whether proposed PowerTimeScheme Name is available for use. It returns a record for each Name indicating the availability of that Name, with $true indicating that the Name is unused and available for use, or $false if it is not available.

Related topics

Get-BrokerPowerTimeScheme

</table>

- **-AdminAddress <String>**

  Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type

System.String You can pipe a string that contains the Name to test.

Return Values
Citrix.BrokerAdmin.SDK.NameAvailability

The cmdlet returns a result for each Name specified. An availability of "True" indicates the Name is available for use, and "False" if it is not available.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Test-BrokerPowerTimeSchemeNameAvailable -Name Test1
Checks whether the Name "Test1" is available.

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Test-BrokerPowerTimeSchemeNameAvailable @("Test1","Test2","Test3")
Checks whether each of the specified names is available.
Test-BrokerRemotePCAccountNameAvailable

Oct 01, 2013
Determine whether the proposed RemotePCAccount OU is available for use.

Syntax

Test-BrokerRemotePCAccountNameAvailable [-OU] <String[]> [-AdminAddress <String>] [CommonParameters]

Detailed Description

This cmdlet checks whether proposed RemotePCAccount OU is available for use. It returns a record for each OU indicating the availability of that OU, with $true indicating that the OU is unused and available for use, or $false if it is not available.

Related topics

Get-BrokerRemotePCAccount
New-BrokerRemotePCAccount

</tr>
</tbody>
</table>

Input Type

System.String You can pipe a string that contains the OU to test.

Return Values

Citrix.BrokerAdminSDK.NameAvailability
The cmdlet returns a result for each OU specified. An availability of "True" indicates the OU is available for use, and "False" if it is not available.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Test-BrokerRemotePCAccountNameAvailable -OU Test1
Checks whether the OU "Test1" is available.

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Test-BrokerRemotePCAccountNameAvailable @("Test1","Test2","Test3")
Checks whether each of the specified names is available.
Update-BrokerImportedFTA

Oct 01, 2013
Imports or updates all of the file type associations for the specified worker.

Syntax

Update-BrokerImportedFTA -DesktopUids <Int32[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Imports or updates the file type associations from a specified worker machine.

File type association associates a file extension (such as ".txt") with an application (such as Notepad). In a Citrix environment file type associations on a user device can be configured so that when an user clicks on a document it launches the appropriate published application. This is known as "content redirection".

Imported file type associations are different from configured file type associations. Imported file type associations are lists of known file type associations for a given desktop group. Configured file type associations are those that are actually associated with published applications for the purposes of content redirection.

Initially the system is not aware of any extensions, and they must be imported by the Citrix administrator. To import or update file type associations from a worker machine, two criteria must be met:

- The worker machine must not be in use
- The worker machine must be in maintenance mode

For more information about putting a worker machine in maintenance mode, see the Set-BrokerPrivateDesktop and Set-BrokerSharedDesktop cmdlets.

Imported file type associations are grouped together based on the desktop group of the machine from which they were imported. All file types for a desktop group are deleted. There is no mechanism for deleting a subset imported file type associations for a specific desktop group.

If file type associations are imported more than once for a desktop group, for example, if this cmdlet is run twice for two workers belonging to the same desktop group, all existing imported file type associations for that desktop group are deleted and imported again.

Related topics

Get-BrokerImportedFTA
Remove-BrokerImportedFTA

Parameters

-DesktopUids<Int32[]>

Imports or updates the file type associations from the specified desktop. The desktop must belong to a desktop group of the Private or Shared desktop kind.
### -LoggingId <Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -AdminAddress <String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

Int32[] An array of Uids for desktops can be supplied as input.

**Return Values**

None

**Examples**

```
C:\PS> $desktop = Get-BrokerSharedDesktop -MachineName "ACME\Worker1"
C:\PS> Set-BrokerSharedDesktop $desktop -InMaintenanceMode $true
C:\PS> Update-BrokerImportedFTA -DesktopUids $desktop.Uid
C:\PS> Set-BrokerSharedDesktop $desktop -InMaintenanceMode $false
```

Gets an object for the worker machine named "Worker1" in the "ACME" domain, and ensures no users can connect to it, before importing the file type associations from that desktop and re-enabling it.
Update-BrokerNameCache

Oct 01, 2013
Performs administrative operations on the user and machine name cache.

Syntax
Update-BrokerNameCache [-Machines] [-Users] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description
Triggers an immediate asynchronous refresh of the name cache. This may be useful to ensure up-to-date name information is present in the cache after user and/or machine accounts are known to have changed and you need to see those changes immediately instead of waiting for the periodic automatic refresh.

The Broker Service maintains a cache of the names of users and machines in use by the site. By default, name information is obtained periodically from Active Directory and the cache refreshed automatically.

During normal usage, you should not need to perform administrative operations on the name cache.

For users/groups, the following name information is cached:

Windows name (DOMAIN\user)
User Principal Name or 'UPN' (user@upndomain)
Full Name or 'Common Name' (typically a user's full name)

For machines, the following name information is cached:

Windows name (DOMAIN\machine)
DNS name (machine.dnsdomain)

Related topics

Parameters

-Machines <SwitchParameter>
Triggers an asynchronous refresh of all cached machine name information.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

-Users <SwitchParameter>
Triggers an asynchronous refresh of all cached user name information.
**-AdminAddress**<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type

None You cannot pipe input into this cmdlet.

Return Values

None

Notes

For some user accounts, for example, the built-in domain administrator, the UPN and/or Full Name values may not be available because they are not typically specified within Active Directory.

For group accounts, UPN and Full Name values are not available because they are not applicable or not specified within Active Directory.

The DNS name information for a machine is obtained from Active Directory and not from the DNS sub-system. If a machine has only recently been configured, the DNS information may not be available initially.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Update-BrokerNameCache -Machines
Triggers an immediate asynchronous refresh of all machine name information held within the name cache.

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Update-BrokerNameCache -Machines -Users
Triggers an immediate asynchronous refresh of all machine and user name information held within the name cache.

</tbody>
</table>
The Configuration service PowerShell snap-in provides administrative functions for the Configuration service. All commands in this snap-in have 'Config' in their name.

The Configuration service PowerShell snap-in enables both local and remote administration of the Configuration service. It provides facilities to store details about other services that are used in the XenDesktop deployment. All the services in the XenDesktop deployment use the Configuration service as a directory to locate other services with which they need to communicate. The directory publishes a list of all the services, the communication types they accept, and the facilities they offer.

The snap-in provides the following main entities:

Site Metadata

Metadata for the entire XenDesktop deployment. This metadata is not used directly by any of the XenDesktop services, but can be used by third parties to store information for other purposes.

Registered Service Instances

Service instance items that have been retrieved from the available services in the XenDesktop deployment and held in a directory in the Configuration service. Each physical service can host a collection of service instances to provide different facilities.

Service Groups

A collection of service instances that are considered equivalent. Service instances that are registered in the same service group provide the same state and offer the same functionality.

Only one service group of each type is supported. For example, there
must not be more than one service group with a ServiceType of 'Config'.

Site and Features

The configuration site is a top-level, logical representation of the XenDesktop site, from the perspective of the configuration services running within the site.
about_Config_Filtering

Oct 01, 2013

TOPIC

XenDesktop - Advanced Dataset Filtering

SHORT DESCRIPTION

Describes the common filtering options for XenDesktop cmdlets.

LONG DESCRIPTION

Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get-cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

        Get-Noun | Where { $_.Size = 'Small' } | Sort 'Date' | Select -First 10

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get-cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

        Get-Noun -Size 'Small' -SortBy 'Date' -MaxRecordCount 10

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

- **-MaxRecordCount <int>**

  Specifies the maximum number of results to return.
  For example, to return only the first nine results use:

  `Get-Noun -MaxRecordCount 9`

  If not specified, only the first 250 records are returned, and if more are available, a warning is produced:
WARNING: Only first 250 records returned. Use -MaxRecordCount to retrieve more.

You can suppress this warning by using -WarningAction or by specifying a value for -MaxRecordCount.

To retrieve all records, specify a large number for -MaxRecordCount. As the value is an integer, you can use the following:

```
Get-<Noun> -MaxRecordCount [int]:MaxValue
```

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. For example:

```
Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
```

```
Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<-MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo : OperationStopped: (:) [Get-<Noun>], PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>

The count can be accessed using the TotalAvailableResultCount property:

```
$count = $error[0].TotalAvailableResultCount
```

-Skip <int>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order, respectively. Ascending order is assumed if no prefix is present.
Sorting occurs before -MaxRecordCount and -Skip parameters are applied. For example, to sort by Name and then by Count (largest first) use:

-`sortBy 'Name,-Count'`

By default, sorting by an enumeration property uses the numeric value of the elements. You can specify a different sort order by qualifying the name with an ordered list of elements or their numeric values, or `<null>` to indicate the placement of null values.

Elements not mentioned are placed at the end in their numeric order.

For example, to sort by two different enums and then by the object id:

-`sortBy 'MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id'`

-`Filter <String>`

This parameter lets you specify advanced filter expressions, and supports combination of conditions with -and and -or, and grouping with braces. For example:

Get-<Noun> -Filter 'Name -like "High*" -or (Priority -eq 1 -and Severity -ge 2)'

The syntax is close enough to PowerShell syntax that you can use script blocks in most cases. This can be easier to read as it reduces quoting:

Get-<Noun> -Filter { Count -ne $null }

The full -Filter syntax is provided below.

**EXAMPLES**

Filtering by strings performs a case-insensitive wildcard match. Separate parameters are combined with an implicit -and operator. Normal PowerShell quoting rules apply, so you can use single or double quotes, and omit the quotes altogether for many strings. The order of parameters does not make any difference. The following are equivalent:

Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company "citrix" -Product *[X]EN"
Get-<Noun> -Product "Xen*" -Company "CITRIX"
Get-<Noun> -Filter { Company -eq 'Citrix' -and Product -like 'Xen*'}
See about_Quoting_Rules and about_Wildcards for details about PowerShell handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape the wildcards using the normal PowerShell escape mechanisms (see about_Escape_Characters), or switch to a filter expression and the -eq operator:

```
Get-<Noun> -Company "Abc[*]"                 # Matches Abc*
Get-<Noun> -Company "Abc**"                  # Matches Abc*
Get-<Noun> -Filter { Company -eq "Abc**" }  # Matches Abc*
Get-<Noun> -Filter { Company -eq "A""B""C" }  # Matches A"B"C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```
Get-<Noun> -Uid 123
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

```
Get-<Noun> -Filter 'Capacity -ge 10gb'
Get-<Noun> -Filter 'Age -ge 20 -and Age -lt 40'
Get-<Noun> -Filter 'VolumeLevel -like "[123]"'
Get-<Noun> -Filter 'Enabled -ne $false'
Get-<Noun> -Filter 'NullableProperty -ne $null'
```

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

```
Get-<Noun> -Filter 'Enabled'      # Equivalent to 'Enabled -eq $true'
Get-<Noun> -Filter '-not Enabled' # Equivalent to 'Enabled -eq $false'
```

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

```
Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle
```

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:
$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq "Circle" }
Get-<Noun> -Filter { Shape -like 'C*' }

By their nature, floating point values, DateTime values, and TimeSpan values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDTH:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

Get-<Noun> -Filter { StartTime -ge "2010-08-23T12:30:00.0Z" }
$d = [DateTime]"2010-08-23T12:30:00.0Z"
Get-<Noun> -Filter { StartTime -ge $d }
$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter { StartTime -ge $d }

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

Get-<Noun> -Filter { StartTime -ge "-2" }   # Two days ago
Get-<Noun> -Filter { StartTime -ge "-1:30" } # Hour and a half ago
Get-<Noun> -Filter { StartTime -ge "-0:0:30" } # 30 seconds ago

ARRAY PROPERTIES
When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings. Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

Get-<Noun> -User Fred*
Get-<Noun> -Filter { User -like "Fred*" }
Get-<Noun> -Filter { Users -contains "Fred*" }

You can also use the singular form with -Filter to search using other operators:

# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter { User -eq "Frederick" }
# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter { User -lt 'F' }

COMPLEX EXPRESSIONS
When matching against multiple values, you can use a sequence of
comparisons joined with -or operators, or you can use -in and -notin:

```
Get-<Noun> -Filter { Shape -eq 'Circle' -or Shape -eq 'Square' }
```

```
$shapes = 'Circle','Square'
Get-<Noun> -Filter { Shape -in $shapes }
```

```
$sides = 1..4
Get-<Noun> -Filter { Sides -notin $sides }
```

Braces can be used to group complex expressions, and override the default
left-to-right evaluation of -and and -or. You can also use -not to invert
the sense of any sub-expression:

```
Get-<Noun> -Filter { Size -gt 4 -or (Color -eq 'Blue' -and Shape -eq 'Circle') }
```

```
Get-<Noun> -Filter { Sides -lt 5 -and -not (Color -eq 'Blue' -and Shape -eq 'Circle') }
```

### PAGING

The simplest way to page through data is to use the -Skip and
-MaxRecordCount parameters. So, to read the first three pages of data with
10 records per page, use:

```
Get-<Noun> -Skip 0 -MaxRecordCount 10 <other filtering criteria>
```

```
Get-<Noun> -Skip 10 -MaxRecordCount 10 <other filtering criteria>
```

```
Get-<Noun> -Skip 20 -MaxRecordCount 10 <other filtering criteria>
```

You must include the same filtering criteria on each call, and
ensure that the data is sorted consistently.

The above approach is often acceptable, but as each call performs an
independent query, data changes can result in records being skipped or
appearing twice. One approach to improve this is to sort by a unique id
field and then start the search for the next page at the unique id after
the last unique id of the previous page. For example:

```
# Get the first page
Get-<Noun> -MaxRecordCount 10 -SortBy SerialNumber
```

```
SerialNumber  ...
----------  ---
A120004
A120007
... 7 other records ...
A120900

# Get the next page
Get-<Noun> -MaxRecordCount 10 -Filter { FirstName -gt 'A120900' }
```

```
SerialNumber  ...
```
FILTER SYNTAX DEFINITION

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= "{" <ComponentList> "}"

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> |

  <Component>

<Component> ::= <NotOperator> <Factor> |

  <Factor>

<Factor> ::= "{" <ComponentList> "}" |

  <PropertyName> <ComparisonOperator> <Value> |
  <PropertyName>

<AndOrOperator> ::= "-and" | "-or"

<NotOperator> ::= "-not" | "!

<ComparisonOperator> ::= "-eq" | "-ne" | "-le" | "-ge" | "-lt" | "-gt" |
"-like" | "-notlike" | "-contains" | "-notcontains" |
"-in" | "-notin"

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> |

  <scalar variable> | <array variable> |
  "$null" | "$true" | "$false"
Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, "-1:30" means 1 hour and 30 minutes ago.
Add-ConfigRegisteredServiceInstanceMetadata

Oct 01, 2013
Adds metadata on the given ServiceInstance.

Syntax

Add-ConfigRegisteredServiceInstanceMetadata [-ServiceInstanceUid] <Guid> -Map <PSObject> [-LoggingId <Guid>] [AdminAddress <String>] [CommonParameters>

Add-ConfigRegisteredServiceInstanceMetadata [-ServiceInstanceUid] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [AdminAddress <String>] [CommonParameters>

Add-ConfigRegisteredServiceInstanceMetadata [-InputObject] <ServiceInstance[]> -Name <String> -Value <String> [-LoggingId <Guid>] [AdminAddress <String>] [CommonParameters>

Add-ConfigRegisteredServiceInstanceMetadata [-InputObject] <ServiceInstance[]> -Map <PSObject> [-LoggingId <Guid>] [AdminAddress <String>] [CommonParameters>

Detailed Description

Provides the ability for additional custom data to be stored against given ServiceInstance objects. This cmdlet will not overwrite existing metadata on an object - use the Set-ConfigRegisteredServiceInstanceMetadata cmdlet instead.

Related topics

Set-ConfigRegisteredServiceInstanceMetadata
Remove-ConfigRegisteredServiceInstanceMetadata

Parameters

- **-ServiceInstanceUid**: <Guid>
  
  Id of the ServiceInstance

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

- **-InputObject**: <ServiceInstance[]>
  
  Objects to which the metadata is to be added.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **-Map**: <PSObject>
  
  Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @("name1" = "val1"; "name2" = "val2")) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>
-Name <String>

Specifies the property name of the metadata to be added. The property must be unique for the ServiceInstance specified. The property cannot contain any of the following characters: /:#.?<>|[]"'

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-Value <String>

Specifies the value for the property.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-LoggingId <Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

Citrix.Configuration.Sdk.Metadata

Add-ConfigRegisteredServiceInstanceMetadata returns an array of objects containing the new definition of the metadata.

\n Property <string>
\n Specifies the name of the property.
\n Value <string>
\n Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes
InvalidParameterCombination
The cmdlet parameters are inconsistent.

UnknownObject
One of the specified objects was not found.

DuplicateObject
One of the specified metadata already exists.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples
------------------------------------------- EXAMPLE 1 -------------------------------------------
c:\PS> Add-ConfigRegisteredServiceInstanceMetadata -ServiceInstanceUid 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>property</td>
<td>value</td>
</tr>
</tbody>
</table>

Add metadata with a name of 'property' and a value of 'value' to the ServiceInstance with the identifier 4CECC26E-48E1-423F-A1F0-2A06DDD0805C.
Add-ConfigServiceGroupMetadata

Oct 01, 2013

Adds metadata on the given ServiceGroup.

Syntax

Add-ConfigServiceGroupMetadata [-ServiceGroupUid] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Add-ConfigServiceGroupMetadata [-ServiceGroupUid] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Add-ConfigServiceGroupMetadata [-InputObject] <ServiceGroup[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Add-ConfigServiceGroupMetadata [-InputObject] <ServiceGroup[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Detailed Description

Provides the ability for additional custom data to be stored against given ServiceGroup objects. This cmdlet will not overwrite existing metadata on an object - use the Set-ConfigServiceGroupMetadata cmdlet instead.

Related topics

Set-ConfigServiceGroupMetadata
Remove-ConfigServiceGroupMetadata

Parameters

- **ServiceGroupUid**<Guid>

Id of the ServiceGroup

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

- **InputObject**<ServiceGroup[]>

Objects to which the metadata is to be added.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **Name**<String>

Specifies the property name of the metadata to be added. The property must be unique for the ServiceGroup specified. The property cannot contain any of the following characters \/:.*?=&gt;&lt;[|]"
Required? | true
---|---
Default Value | 
Accept Pipeline Input? | false

- **Value**: <String>

Specifies the value for the property.

Required? | true
---|---
Default Value | 
Accept Pipeline Input? | false

- **Map**: <PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with `@{“name1” = “val1”; “name2” = “val2”}`) or a string dictionary (created with `new-object “System.Collections.Generic.Dictionary[String,String]”`).

Required? | true
---|---
Default Value | 
Accept Pipeline Input? | true (ByValue)

- **LoggingId**: <Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required? | false
---|---
Default Value | 
Accept Pipeline Input? | false

- **AdminAddress**: <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required? | false
---|---
Default Value | Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input? | false

Return Values

Citrix.Configuration.Sdk.Metadata

Add-ConfigServiceGroupMetadata returns an array of objects containing the new definition of the metadata.
Property <string>

Specifies the name of the property.

Value <string>

Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

------------

InvalidParameterCombination
The cmdlet parameters are inconsistent.

UnknownObject
One of the specified objects was not found.

DuplicateObject
One of the specified metadata already exists.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples
**EXAMPLE 1**

```bash
c:\PS> Add-ConfigServiceGroupMetadata -ServiceGroupUid 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name 'property' -Value 'value'
```

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>property</td>
<td>value</td>
</tr>
</tbody>
</table>

Add metadata with a name of `property` and a value of `value` to the ServiceGroup with the identifier `4CECC26E-48E1-423F-A1F0-2A06DDD0805C`.
Get-ConfigDBConnection

Oct 01, 2013

Gets the database string for the specified data store used by the Configuration Service.

Syntax

Get-ConfigDBConnection [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns the database connection string for the specified data store.

If the returned string is blank, no valid connection string has been specified. In this case the service is running, but is idle and awaiting specification of a valid connection string.

Related topics

Get-ConfigServiceStatus
Get-ConfigDataStore
Set-ConfigDBConnection
Test-ConfigDBConnection

Parameters

-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
</tbody>
</table>

Accept Pipeline Input? false

Return Values

system:string

The database connection string configured for the Configuration Service.

Notes

If the command fails, the following errors can be returned.

Error Codes

--------
NoDBConnections

The database connection string for the Configuration Service has not been specified.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-ConfigDBConnection

Server=serverName\SQLExpress;Initial Catalog = databaseName; Integrated Security = True
Get the database connection string for the Configuration Service.
Get-ConfigDBSchema

Oct 01, 2013

Gets a script that creates the Configuration Service database schema for the specified data store.

Syntax

Get-ConfigDBSchema [-DatabaseName <String>] [-ServiceGroupName <String>] [-ScriptType <ScriptTypes>] [-LocalDatabase] [-Sid <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Gets SQL scripts that can be used to create a new Configuration Service database schema, add a new Configuration Service to an existing site, remove a Configuration Service from a site, or create a database server logon for a Configuration Service. If no Sid parameter is provided, the scripts obtained relate to the currently selected Configuration Service instance. otherwise the scripts relate to Configuration Service instance running on the machine identified by the Sid provided. When obtaining the Evict script, a Sid parameter must be supplied. The current service instance is that on the local machine, or that explicitly specified by the last usage of the -AdminAddress parameter to a Configuration SDK cmdlet. The service instance used to obtain the scripts does not need to be a member of a site or to have had its database connection configured. The database scripts support only Microsoft SQL Server, or SQL Server Express, and require Windows integrated authentication to be used. They can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SMDCMD mode'. The ScriptType parameter determines which script is obtained. If ScriptType is not specified, or is FullDatabase, the script contains:

- Creation of service schema
- Creation of database server logon
- Creation of database user
- Addition of database user to Configuration Service roles

If ScriptType is Instance, the returned script contains:

- Creation of database server logon
- Creation of database user
- Addition of database user to Configuration Service roles

If ScriptType is Evict, the returned script contains:

- Removal of Configuration Service instance from database
- Removal of database user

If ScriptType is Login, the returned script contains:

- Creation of database server logon only

If the service uses two data stores they can exist in the same database. You do not need to configure a database before
using this command.

Related topics
Get-ConfigDataStore
Set-ConfigDBConnection

Parameters
-**DatabaseName**<String>

Specifies the name of the database for which the schema will be generated.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**ServiceGroupName**<String>

Specifies the name of the service group to be used when creating the database schema. The service group is a collection of all the Configuration services that share the same database instance and are considered equivalent; that is, all the services within a service group can be used interchangeably.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**ScriptType**<ScriptTypes>

Specifies the type of database script returned. Available script types are:

Database

Returns a full database script that can be used to create a database schema for the Configuration Service in a database instance that does not already contain a schema for this service. The DatabaseName and ServiceGroupName parameters must be specified to create a script of this type.

Instance

Returns a permissions script that can be used to add further Configuration services to an existing database instance that already contains the full Configuration service schema, associating the services to the Service Group. The Sid parameter can optionally be specified to create a script of this type.

Login

Returns a database logon script that can be used to add the required logon accounts to an existing database instance that contains the Configuration Service schema. This is used primarily when creating a mirrored database environment. The
DatabaseName parameter must be specified to create a script of this type.

Evict

Returns a script that can be used to remove the specified Configuration Service from the database entirely. The DatabaseName and Sid parameters must be specified to create a script of this type.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Database</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-LocalDatabase<SwitchParameter>

Specifies whether the database script is to be used in a database instance run on the same controller as other services in the service group. Including this parameter ensures the script creates only the required permissions for local services to access the database schema for Configuration services.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-Sid<String>

Specifies the SID of the controller on which the Configuration Service instance to remove from the database is running.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values
System.string
A string containing the required SQL script for application to a database.

Notes

The scripts returned support Microsoft SQL Server Express Edition, Microsoft SQL Server Standard Edition, and Microsoft SQL Server Enterprise Edition databases only, and are generated on the assumption that integrated authentication will be used.

If the ScriptType parameter is not included or set to 'FullDatabase', the full database script is returned, which will:

Create the database schema.
Create the user and the role (providing the schema does not already exist).
Create the logon (providing the schema does not already exist).

If the ScriptType parameter is set to 'Instance', the script will:
Create the user and the role (providing the schema does not already exist).
Create the logon (providing the schema does not already exist) and associate it with a user.

If the ScriptType parameter is set to 'Login', the script will:
Create the logon (providing the schema does not already exist) and associate it with a pre-existing user of the same name.

If the LocalDatabase parameter is included, the NetworkService account will be added to the list of accounts permitted to access the database. This is required only if the database is run on a controller.

If the command fails, the following errors can be returned.

Error Codes

GetSchemasFailed
The database schema could not be found.
ActiveDirectoryAccountResolutionFailed
The specified Active Directory account or Group could not be found.
DatabaseError
An error occurred in the service while attempting a database operation.
DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.
DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.
PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------
c:\PS>Get-ConfigDBSchema -DatabaseName MyDB -ServiceGroupName MyServiceGroup > c:\ConfigSchema.sql
Get the full database schema for site data store of the Configuration Service and copy it to a file called 'c:\ConfigSchema.sql'.

This script can then be used to create the schema in a pre-existing database named 'MyDB' that does not already contain a Configuration Service site schema.

-------------------------- EXAMPLE 2 --------------------------
c:\PS>Get-ConfigDBSchema -DatabaseName MyDB -scriptType Login > c:\ConfigurationLogins.sql
Get the logon scripts for the Configuration Service.
Get-ConfigDBVersionChangeScript

Oct 01, 2013
Gets a script that updates the Configuration Service database schema.

Syntax

Get-ConfigDBVersionChangeScript -DatabaseName <String> -TargetVersion <Version> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns a database script that can be used to upgrade or downgrade the site or secondary schema for the Configuration Service from the current schema version to a different version.

Related topics

Get-ConfigInstalledDBVersion

Parameters

- **-DatabaseName**<String>

  Specifies the name of the database instance to which the update applies.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

- **-TargetVersion**<Version>

  Specifies the version of the database you want to update to.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

- **-AdminAddress**<String>

  Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
<td>false</td>
</tr>
</tbody>
</table>
Return Values

System.Management.Automation.PSObject

A PSObject containing the required SQL script for application to a database.

Notes

The PSObject returned by this cmdlet contains the following properties:

-- Script The raw text of the SQL script to apply the update, or null in the case when no upgrade path to the specified target version exists.

-- NeedExclusiveAccess Indicates whether all services in the service group must be shut down during the update or not.

-- CanUndo Indicates whether the generated script allows the updated schema to be reverted to the state prior to the update.

Scripts to update the schema version are stored in the database so any service in the service group can obtain these scripts. Extreme caution should be exercised when using update scripts. Citrix recommends backing up the database before attempting to upgrade the schema. Database update scripts may require exclusive use of the schema and so may not be able to execute while any Configuration services are running. However, this depends on the specific update being carried out.

After a schema update has been carried out, services that require the previous version of the schema may cease to operate. The ServiceState parameter reported by the Get-ConfigServiceStatus command provides information about service compatibility. For example, if the schema has been upgraded to a more recent version that a service cannot use, the service reports "DBNewerVersionThanService".

If the command fails, the following errors can be returned.

Error Codes

----------

NoOp

The operation was successful but had no effect.

NoDBConnections

The database connection string for the Configuration Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> $update = Get-ConfigDBVersionChangeScript -DatabaseName MyDb -TargetVersion 1.0.75.0
C:\PS> $update.Script > update_75.sql

Gets an SQL update script to update the current schema to version 1.0.75.0. The resulting update_75.sql script is suitable for direct use with the SQL Server SQLCMD utility.
Get-ConfigEnabledFeature

Oct 01, 2013
Lists features of the site that are enabled.

Syntax

Get-ConfigEnabledFeature [-AdminAddress <String>] [CommonParameters]

Detailed Description

Related topics

Set-ConfigSite
Import-ConfigFeatureTable

Parameters

-AdminAddress

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

System.String

Examples

------------ EXAMPLE 1 -------------

C:\PS> Get-ConfigEnabledFeature
Retrieves the list of enabled features for the site's current configuration.
Get-ConfigInstalledDBVersion

Oct 01, 2013

Gets a list of all available database schema versions for the Configuration Service.

Syntax

Get-ConfigInstalledDBVersion [-Upgrade] [-Downgrade] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns the current version of the Configuration Service database schema, if no flags are set, otherwise returns versions for which upgrade or downgrade scripts are available and have been stored in the database.

Related topics

Parameters

- **-Upgrade**<SwitchParameter>

Specifies that only schema versions to which the current database version can be updated should be returned.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **-Downgrade**<SwitchParameter>

Specifies that only schema versions to which the current database version can be reverted should be returned.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **-AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values
System.Version

The Get-ConfigInstalledDbVersion command returns objects containing the new definition of the Configuration Service database schema version.

Major <Integer>
Minor <Integer>
Build <Integer>
Revision <Integer>

Notes
If the command fails, the following errors can be returned.

Error Codes
-----------
InvalidParameterCombination
Both the Upgrade and Downgrade flags were specified.
NoOp
The operation was successful but had no effect.
NoDBConnections
The database connection string for the Configuration Service has not been specified.
DatabaseError
An error occurred in the service while attempting a database operation.
DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.
DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.
PermissionDenied
You do not have permission to execute this command.
AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.
CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------
c:\PS>Get-ConfigInstalledDBVersion

Major Minor Build Revision
----- ----- ---- --------
5    6    0    0
Get the currently installed version of the Configuration Service database schema.

-------------------------- EXAMPLE 2 --------------------------
c:\PS>Get-ConfigInstalledDBVersion -Upgrade

Major Minor Build Revision
----- ----- ---- --------
6    0    0    0
Get the versions of the Configuration Service database schema for which upgrade scripts are supplied.
Get-ConfigLicensingModel

Oct 01, 2013
Lists the supported licensing models.

Syntax

Get-ConfigLicensingModel -ProductCode <String> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Related topics

Get-ConfigProduct
Get-ConfigSite
Set-ConfigSite
Import-ConfigFeatureTable

Parameters

-ProductCode <String>
The product code

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

-AdminAddress <String>
Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

System.String
The list of supported licensing models for the specified product code.

Notes
The Get-ConfigProduct cmdlet lists the available product codes.

The site object returned by the Get-ConfigSite cmdlet contains the currently configured product code.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Get-ConfigLicensingModel -ProductCode "XDS"
Retrieves the list of supported licensing models for product code "XDS".
Get-ConfigProduct

Oct 01, 2013
Lists the site's supported product names and codes.

Syntax
Get-ConfigProduct [-AdminAddress <String>] [CommonParameters]}

Detailed Description

Retrieves the list of supported versions for XenDesktop.
Get-ConfigRegisteredServiceInstance

Oct 01, 2013
Gets the service instances that are registered in the directory.

Syntax

Detailed Description

Use this cmdlet to retrieve the service instances currently registered with the Configuration Service that match the parameters supplied. If no parameters are supplied, all the service instances are returned.

Related topics

Register-ConfigServiceInstance
UnRegister-ConfigServiceInstance
Set-ConfigServiceInstance

Parameters

- **-ServiceInstanceUid**: <Guid>

  The unique identifier for the service instance.

  Required? | Default Value | Accept Pipeline Input?
  --- | --- | ---
  false | | false

- **-ServiceGroupUid**: <Guid>

  The unique identifier for the service group to which the service instance belongs.

  Required? | Default Value | Accept Pipeline Input?
  --- | --- | ---
  false | | false

- **-ServiceGroupName**: <String>

  The name for the service group to which the service instance belongs.

  Required? | Default Value | Accept Pipeline Input?
  --- | --- | ---
<p>| | |
| | |</p>
<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-ServiceType<String>**

The service type for the service instance.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-Address<String>**

The connection address for the service instance.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-Binding<String>**

The binding for the service instance.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-Version<Int32>**

The service instance version.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>

</tr>
</tbody>
</table>
Return Values

Citrix.Configuration.Sdk.ServiceInstance
This represents a service instance and has the following parameters;

ServiceGroupUid <Guid>
The unique identifier for the service group to which the service instance belongs.

ServiceGroupName <string>
The name of the service group to which the service instance belongs.

ServiceInstanceUid <Guid>
The unique identifier for the service instance.

ServiceType <string>
The type of the service group.

Address <string>
The contact address for the service instance.

Binding <string>
The binding to use for connections to the service instance.

Version <int>
The version of the service instance.

ServiceAccount <string>
The AD computer account for the computer that is providing the service instance.

ServiceAccountSid <string>
The AD computer account SID for the computer that is providing the service instance.

InterfaceType <string>
The interface type for the service instance.

Metadata <Citrix.Configuration.Sdk.Metadata[]>
The metadata for the service instance.

Notes
In the case of failure, the following errors can result.

Error Codes  PartialData Only a subset of the available data was returned. CouldNotQueryDatabase The query
required to get the database was not defined. CommunicationError An error occurred while communicating with the service. DatabaseNotConfigured The operation could not be completed because the database for the service is not configured. InvalidFilter A filtering expression was supplied that could not be interpreted for this cmdlet. ExceptionThrown An unexpected error occurred. To locate more details see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Get-ConfigService

Oct 01, 2013
Gets the service record entries for the Configuration Service.

Syntax

Detailed Description

Returns instances of the Configuration Service that the service publishes. The service records contain account security identifier information that can be used to remove each service from the database.

A database connection for the service is required to use this command.

Related topics

Parameters

- **-Property** <String[]>

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

- **-ReturnTotalRecordCount** <SwitchParameter>

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Config_Filtering for details.

| Required? | false |
| Default Value | False |
| Accept Pipeline Input? | false |

- **-MaxRecordCount** <Int32>

Specifies the maximum number of records to return.

<p>| Required? | false |</p>
<table>
<thead>
<tr>

<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
<td></td>
</tr>
</tbody>
</table>

Return Values
Citrix.Configuration.Sdk.Service

The `Get-ConfigServiceInstance` command returns an object containing the following properties.

**Uid <Integer>**
Specifies the unique identifier for the service in the group. The unique identifier is an index number.

**ServiceHostId <Guid>**
Specifies the unique identifier for the service instance.

**DNSName <String>**
Specifies the domain name of the host on which the service runs.

**MachineName <String>**
Specifies the short name of the host on which the service runs.

**CurrentState <Citrix.Fma.Sdk.ServiceCore.ServiceState>**
Specifies whether the service is running, started but inactive, stopped, or failed.

**LastStartTime <DateTime>**
Specifies the date and time at which the service was last restarted.

**LastActivityTime <DateTime>**
Specifies the date and time at which the service was last stopped or restarted.

**OSType**
Specifies the operating system installed on the host on which the service runs.

**OSVersion**
Specifies the version of the operating system installed on the host on which the service runs.

**ServiceVersion**
Specifies the version number of the service instance. The version number is a string that reflects the full build version of the service.

**DatabaseUserName <string>**
Specifies for the service instance the Active Directory account name with permissions to access the database. This will be either the machine account or, if the database is running on a controller, the NetworkService account.

**Sid <string>**
Specifies the Active Directory account security identifier for the machine on which the service instance is running.

**ActiveSiteServices <string[]>**
Specifies the names of active site services currently running in the service. Site services are components that perform long-running background processing in some services. This field is empty for services that do not contain site services.

Notes

If the command fails, the following errors can be returned.

Error Codes

----------

UnknownObject

One of the specified objects was not found.

PartialData

Only a subset of the available data was returned.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.
Examples

-------------------------- EXAMPLE 1 --------------------------
c:\PS>Get-ConfigService

ActiveSiteServices : {MySiteService1, MySiteService2...}

Get all the instances of the Configuration Service running in the current service group.
Get-ConfigServiceAddedCapability

Oct 01, 2013

Gets any added capabilities for the Configuration Service on the controller.

Syntax

Get-ConfigServiceAddedCapability [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Enables updates to the Configuration Service on the controller to be detected.

You do not need to configure a database connection before using this command.

Related topics

Parameters

- **-AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

System.String

String containing added capabilities.

Notes

If the command fails, the following errors can be returned.

Error Codes

----------

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-ConfigServiceAddedCapability
Get the added capabilities of the Configuration Service.
Get-ConfigServiceGroup

Oct 01, 2013
Gets the service groups that match the parameters supplied.

Syntax

Detailed Description

Use this cmdlet to retrieve existing service groups that match the parameters supplied. If no parameters are supplied, all the service groups are returned.

Related topics

Return Values

Citrix.Configuration.Sdk.ServiceGroup

This represents a service instance and has the following parameters:

ServiceGroupUid <Guid>
The unique identifier for the service group.

ServiceGroupName <string>
The name of the service group.

ServiceType <string>
The type of the service group.

Metadata <Citrix.Configuration.Sdk.Metadata[]>
The metadata for the service group.

Notes

In the case of failure, the following errors can result.

Error Codes

DatabaseNotConfigured The operation could not be completed because the database for the service is not configured.
PartialData Only a subset of the available data was returned.
CouldNotQueryDatabase The Query required to get the database was not defined.
CommunicationError An error occurred while communicating with the service.
InvalidFilter A filtering expression was supplied that could not be interpreted for this cmdlet.
ExceptionThrown An unexpected error occurred.

To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\>Get-ConfigServiceGroup
Return all the service groups that are registered in the Configuration Service.

-------------------------- EXAMPLE 2 --------------------------

C:\>Get-ConfigRegisteredServiceInstance -ServiceType "config"
Return all the service groups that are registered in the Configuration Service and are of type 'config' (i.e. the service groups
for the Configuration Service).
Get-ConfigServiceInstance

Oct 01, 2013
Gets the service instance entries for the Configuration Service.

Syntax
Get-ConfigServiceInstance [-AdminAddress <String>] [CommonParameters]

Detailed Description
Returns service interfaces published by the instance of the Configuration Service. Each instance of a service publishes multiple interfaces with distinct interface types, and each of these interfaces is represented as a ServiceInstance object. Service instances can be used to register the service with a central configuration service so that other services can use the functionality.

You do not need to configure a database connection to use this command.

Related topics
Parameters
-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
</tr>
</tbody>
</table>

Default Value
Localhost. Once a value is provided by any cmdlet, this value becomes the default.

Accept Pipeline Input?
false

Return Values
Citrix.Configuration.Sdk.ServiceInstance
The Get-ConfigServiceInstance command returns an object containing the following properties.

ServiceGroupUid <Guid>

Specifies the unique identifier for the service group of which the service is a member.

ServiceGroupName <String>

Specifies the name of the service group of which the service is a member.

ServiceInstanceUID <Guid>

Specifies the unique identifier for registered service instances, which are service instances held by and obtained from a central configuration service. Unregistered service instances do not have unique identifiers.
ServiceType <String>

Specifies the service instance type. For this service, the service instance type is always Config.

Address

Specifies the address of the service instance. The address can be used to access the service and, when registered in the central configuration service, can be used by other services to access the service.

Binding

Specifies the binding type that must be used to communicate with the service instance. In this release of XenDesktop, the binding type is always 'wcf_HTTP_kerb'. This indicates that the service provides a Windows Communication Foundation endpoint that uses HTTP binding with integrated authentication.

Version

Specifies the version of the service instance. The version number is used to ensure that the correct versions of the services are used for communications.

ServiceAccount <String>

Specifies the Active Directory account name for the machine on which the service instance is running. The account name is used to provide information about the permissions required for interservice communications.

ServiceAccountSid <String>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

InterfaceType <String>

Specifies the interface type. Each service can provide multiple service instances, each for a different purpose, and the interface defines the purpose. Available interfaces are:

SDK - for PowerShell operations
InterService - for operations between different services
Peer - for communications between services of the same type

Metadata <Citrix.Configuration.Sdk.Metadata[]>

The collection of metadata associated with registered service instances, which are service instances held by and obtained from a central configuration service. Metadata is not stored for unregistered service instances.

Notes

If the command fails, the following errors can be returned.

Error Codes

----------

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

ServiceType        : Config
Version            : 1

Get all instances of the Configuration Service running on the specified machine. For remote services, use the AdminAddress parameter to define the service for which the interfaces are required. If the AdminAddress parameter has not been specified for the runspace, service instances running on the local machine are returned.
Get-ConfigServiceStatus

Oct 01, 2013

Gets the current status of the Configuration Service on the controller.

Syntax

Get-ConfigServiceStatus [-AdminAddress <String>] [CommonParameters]

Detailed Description

Enables the status of the Configuration Service on the controller to be monitored. If the service has multiple data stores it will return the overall state as an aggregate of all the data store states. For example, if the site data store status is OK and the secondary data store status is DBUnconfigured then it will return DBUnconfigured.

Related topics

Set-ConfigDataStore

Set-ConfigDBConnection

Test-ConfigDBConnection

Get-ConfigDBConnection

Get-ConfigDBSchema

Parameters

-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

The Get-ConfigServiceStatus command returns an object containing the status of the Configuration Service together with extra diagnostics information.

DBUnconfigured

The Configuration Service does not have a database connection configured.

DBRejectedConnection
The database rejected the logon attempt from the Configuration Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the Configuration Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBNewerVersionThanService

The version of the Configuration Service currently in use is incompatible with the version of the Configuration Service schema on the database. Upgrade the Configuration Service to a more recent version.

DBOlderVersionThanService

The version of the Configuration Service schema on the database is incompatible with the version of the Configuration Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The Configuration Service is running and is connected to a database containing a valid schema.

Failed

The Configuration Service has failed.

Unknown

(0) The service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

---------

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

--------------- EXAMPLE 1 ---------------

c:\PS>Get-ConfigServiceStatus

DBUnconfigured
Get the current status of the Configuration Service.
Get-ConfigSite

Oct 01, 2013

Gets the site.

Syntax

Get-ConfigSite [-AdminAddress <String>] [CommonParameters]

Detailed Description

The Get-ConfigSite cmdlet gets the site.

A XenDesktop installation has only a single site instance.

Related topics

Set-ConfigSite

Import-ConfigFeatureTable

Parameters

-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>false</td>
</tr>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

Get-ConfigSite returns the site instance.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Get-ConfigSite

Gets the site.
Import-ConfigFeatureTable

Oct 01, 2013
Sets the feature table of the site.

Syntax

Import-ConfigFeatureTable [-Path] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
Import-ConfigFeatureTable -Content <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Related topics

Get-ConfigSite
Set-ConfigSite
Get-ConfigProduct
Get-ConfigProductEdition
Get-ConfigProductFeature
Get-ConfigProductVersion
Get-ConfigLicensingModel

Parameters

-Path <String>

The path to the file containing the feature table

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-Content <String>

Set the site's feature table.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-LoggingId <Guid>
Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

- **-AdminAddress** <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

| Required? | false |
| Default Value | Localhost. Once a value is provided by any cmdlet, this value becomes the default. |
| Accept Pipeline Input? | false |

Examples

-------------- EXAMPLE 1 ---------------

C:\PS> Import-ConfigFeatureTable $xml

Specifies the use of a Platinum edition license. A suitable license must be available on the site's license server.
Register-ConfigServiceInstance

Oct 01, 2013
Allows the registration of a service instance.

Syntax

Register-ConfigServiceInstance -ServiceGroupUid <Guid> -ServiceGroupName <String> -ServiceType <String> -Address <String> -Binding <String> -Version <Int32> -ServiceAccount <String> -InterfaceType <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Register-ConfigServiceInstance -ServiceGroupUid <Guid> -ServiceGroupName <String> -ServiceType <String> -Address <String> -Binding <String> -Version <Int32> -ServiceAccountSid <String> -InterfaceType <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Register-ConfigServiceInstance -ServiceInstance <ServiceInstance[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Use this cmdlet to register service instance items in the Configuration Service. Service instances can be registered either by retrieving the data directly from other services or by manually entering the details into this command.

If the service group specified by the service instance already exists, the service is added to the service group, otherwise a new service group is created to hold the service instance.

Parameters

-ServiceGroupUid <Guid>

The Service Group Unique Identifier

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

https://docs.citrix.com © 1999-2017 Citrix Systems, Inc. All rights reserved. p.1679
**-ServiceGroupName<String>**

The name of the service group

| Required? | true |
| Default Value |  |
| Accept Pipeline Input? | true (ByPropertyName) |

**-ServiceType<String>**

The type of the service group

| Required? | true |
| Default Value |  |
| Accept Pipeline Input? | true (ByPropertyName) |

**-Address<String>**

The address that is used to access the service instance.

| Required? | true |
| Default Value |  |
| Accept Pipeline Input? | true (ByPropertyName) |

**-Binding<String>**

The binding type that must be used to access the service instance.

| Required? | true |
| Default Value |  |
| Accept Pipeline Input? | true (ByPropertyName) |

**-Version<Int32>**

The version of the service instance.

| Required? | true |
| Default Value |  |
| Accept Pipeline Input? | true (ByPropertyName) |

**-ServiceAccount<String>**
The AD computer account name (domain qualified) for the computer on which the service instance is hosted.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **InterfaceType**<String>

The type of interface that the service provides (i.e. SDK, InterService, Peer).

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **ServiceAccountSid**<String>

The AD computer account Sid for the computer on which the service instance is hosted.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **ServiceInstance**<ServiceInstance[]>

The service instances to register.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **LoggingId**<Guid>

Specifies the logging id of the high-level operation that this cmdlet is part of.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **AdminAddress**<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. You can be provide this as a host
name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>LocalHost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

Citrix.Configuration.Sdk.ServiceInstance An object with the following parameters can be used to register a service instance. Address, ServiceGroupUid, ServiceGroupName, ServiceType, Binding, Version, InterfaceType.

**Return Values**

Citrix.Configuration.Sdk.ServiceInstance

This represents a service instance and has the following parameters:

- **ServiceGroupUid** <Guid>
  The unique identifier for the service group to which the service instance belongs.

- **ServiceGroupName** <string>
  The name of the service group to which the service instance belongs.

- **ServiceInstanceUid** <Guid>
  The unique identifier for the service instance.

- **ServiceType** <string>
  The type of the service group.

- **Address** <string>
  The contact address for the service instance.

- **Binding** <string>
  The binding to use for connections to the service instance.

- **Version** <int>
  The version of the service instance.

- **ServiceAccount** <string>
  The AD computer account for the computer that is providing the service instance.

- **ServiceAccountSid** <string>
  The AD computer account SID for the computer that is providing the service instance.

- **InterfaceType** <string>
The interface type for the service instance.

Metadata `<Citrix.Configuration.Sdk.Metadata[]>`

The metadata for the service instance.

Notes

In the case of failure, the following errors can result.

Error Codes

- **ActiveDirectoryAccountResolutionFailed** The account name provided could not be found in Active Directory.
- **ServiceGroupWithSameUidExistsForDifferentServiceGroupName** The service group name or service type do not match the service group found with the specified uid.
- **TypeAlreadyExists** A different service group with the same type is registered already in the Configuration Service.
- **DatabaseError** An error occurred in the service while attempting a database operation.
- **DatabaseNotConfigured** The operation could not be completed because the database for the service is not configured.
- **DataStoreException** An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.
- **CommunicationError** An error occurred while communicating with the service.
- **ExceptionThrown** An unexpected error occurred.

For more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS>Get-ConfigServiceInstance | Register-ConfigServiceInstance

Gets the service instances for the Configuration Service and registers them.
Remove-ConfigRegisteredServiceInstanceMetadata

Oct 01, 2013
Removes metadata from the given ServiceInstance.

Syntax

Remove-ConfigRegisteredServiceInstanceMetadata [-ServiceInstanceUid] <Guid> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ConfigRegisteredServiceInstanceMetadata [-ServiceInstanceUid] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ConfigRegisteredServiceInstanceMetadata [-InputObject] <ServiceInstance[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ConfigRegisteredServiceInstanceMetadata [-InputObject] <ServiceInstance[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to remove metadata from the given ServiceInstance.

Related topics

Add-ConfigRegisteredServiceInstanceMetadata
Set-ConfigRegisteredServiceInstanceMetadata

Parameters

- **ServiceInstanceUid**: <Guid>

Id of the ServiceInstance

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

- **InputObject**: <ServiceInstance[]>

Objects to which the metadata is to be added.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>
- **Name**<String>
  
  The metadata property to remove.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **Map**<PSObject>
  
  Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **LoggingId**<Guid>
  
  Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **AdminAddress**<String>
  
  Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Notes

If the command fails, the following errors can be returned.

Error Codes
-------------------------
InvalidParameterCombination
The cmdlet parameters are inconsistent.

UnknownObject
One of the specified objects was not found.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------
c:\PS>Get-ConfigServiceInstance | Remove-ConfigRegisteredServiceInstanceMetadata
Remove all metadata from all ServiceInstance objects.
Remove-ConfigServiceGroup

Oct 01, 2013
Removes service groups.

Syntax

Detailed Description

Use this cmdlet to remove a service group and all the service instances that it contains.

Related topics

Register-ConfigServiceInstance
Add-ConfigServiceGroupMetadata
Set-ConfigServiceGroupMetadata
Remove-ConfigServiceGroupMetadata

Parameters

-ServiceGroupUid <Guid>
The unique identifier for the service group.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-LoggingId <Guid>
Specifies the logging id of the high-level operation this cmdlet invocation is part of.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-AdminAddress <String>
Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. You can provide this as a host name or an IP address.
Required?  false

Default Value  LocalHost. Once a value is provided by any cmdlet, this value becomes the default.

Accept Pipeline Input?  false

Notes

In the case of failure, the following errors can result.

Error Codes  
ServiceGroupObjectNotFound  The service group specified could not be located.
DatabaseError  An error occurred in the service while attempting a database operation.
DatabaseNotConfigured  The operation could not be completed because the database for the service is not configured.
DataStoreException  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.
CommunicationError  An error occurred while communicating with the service.
ExceptionThrown  An unexpected error occurred.

For more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS>Remove-ConfigServiceGroup -ServiceGroupId 31951f6f-7703-4abb-938a-2861d76ecfeae
Removes the service group (and all contained service instances) for the service group with a unique identifier of '31951f6f-7703-4abb-938a-2861d76ecfeae'.

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Get-configServiceGroup | remove-ConfigServiceGroup
Removes all the service groups (and all contained service instances) for the XenDesktop deployment.
Remove-ConfigServiceGroupMetadata

Oct 01, 2013
Removes metadata from the given ServiceGroup.

Syntax

Remove-ConfigServiceGroupMetadata [-ServiceGroupUid] <Guid> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ConfigServiceGroupMetadata [-ServiceGroupUid] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ConfigServiceGroupMetadata [-InputObject] <ServiceGroup[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ConfigServiceGroupMetadata [-InputObject] <ServiceGroup[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to remove metadata from the given ServiceGroup.

Related topics

Add-ConfigServiceGroupMetadata
Set-ConfigServiceGroupMetadata

Parameters

- **-ServiceGroupUid** <Guid>
  
  Id of the ServiceGroup

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>

</table>

- **AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Notes

If the command fails, the following errors can be returned.

Error Codes
InvalidParameterCombination
The cmdlet parameters are inconsistent.

UnknownObject
One of the specified objects was not found.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-ConfigServiceGroup | % { Remove-ConfigServiceGroupMetadata -Map $_.MetadataMap }
Remove all metadata from all ServiceGroup objects.
**Remove-ConfigServiceMetadata**

Oct 01, 2013
Removes metadata from the given Service.

**Syntax**

Remove-ConfigServiceMetadata [-ServiceHostId] <Guid> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ConfigServiceMetadata [-ServiceHostId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ConfigServiceMetadata [-InputObject] <Service[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ConfigServiceMetadata [-InputObject] <Service[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

**Detailed Description**

Provides the ability to remove metadata from the given Service.

**Related topics**

Set-ConfigServiceMetadata

**Parameters**

**-ServiceHostId**<Guid>

Id of the Service

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByValue, ByPropertyName) |

**-InputObject**<Service[]>

Objects to which metadata is to be removed.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByValue) |

**-Name**<String>
The metadata property to remove.

<table>
<thead>
<tr>
<th>Property</th>
<th>Required</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>-Map&lt;PSObject&gt;</td>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with `@{"name1" = "val1"; "name2" = "val2"}`) or a string dictionary (created with `new-object System.Collections.Generic.Dictionary[String,String]`). The properties whose names match keys in the map will be removed.

<table>
<thead>
<tr>
<th>Property</th>
<th>Required</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>-LoggingId&lt;Guid&gt;</td>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Property</th>
<th>Required</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>-AdminAddress&lt;String&gt;</td>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
<td>false</td>
</tr>
</tbody>
</table>

Notes

If the command fails, the following errors can be returned.

Error Codes

----------
InvalidParameterCombination
The cmdlet parameters are inconsistent.

UnknownObject
One of the specified objects was not found.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-ConfigService | % { Remove-ConfigServiceMetadata -Map $_.MetadataMap }
Remove all metadata from all Service objects.
Remove-ConfigSiteMetadata

Oct 01, 2013
Removes metadata from the given Site.

Syntax

Remove-ConfigSiteMetadata -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
Remove-ConfigSiteMetadata -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to remove metadata from the given Site.

Related topics

Set-ConfigSiteMetadata

Parameters

- **Name**: <String>
The metadata property to remove.

| Required? | True |
| Default Value | |
| Accept Pipeline Input? | False |

- **Map**: <PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]"). The properties whose names match keys in the map will be removed.

| Required? | True |
| Default Value | |
| Accept Pipeline Input? | True (ByValue) |

- **LoggingId**: <Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

  You do not have permission to execute this command.

- **AuthorizationError**
  There was a problem communicating with the Citrix Delegated Administration Service.

- **ConfigurationLoggingError**
The operation could not be performed because of a configuration logging error.

**CommunicationError**

There was a problem communicating with the remote service.

**ExceptionThrown**

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

**Examples**

-------------------------- EXAMPLE 1 --------------------------

c:\PS> Get-ConfigSite | % { Remove-ConfigSiteMetadata -Map $_.MetadataMap }  
Remove all metadata from all Site objects.
Reset-ConfigServiceGroupMembership

Oct 01, 2013
Reloads the access permissions and configuration service locations for the Configuration Service.

Syntax

```
Reset-ConfigServiceGroupMembership [-ConfigServiceInstance] <ServiceInstance[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
```

Detailed Description

Enables you to reload Configuration Service access permissions and configuration service locations. The Reset-ConfigServiceGroupMembership command must be run on at least one instance of the service type (Config) after installation and registration with the configuration service. Without this operation, the Configuration services will be unable to communicate with other services in the XenDesktop deployment. When the command is run, the services are updated when additional services are added to the deployment, provided that the configuration service is not stopped. The Reset-ConfigServiceGroupMembership command can be run again to refresh this information if automatic updates do not occur when new services are added to the deployment. If more than one configuration service instance is passed to the command, the first instance that meets the expected service type requirements is used.

Related topics

Parameters

- **-ConfigServiceInstance**<ServiceInstance[]>

Specifies the configuration service instance object that represents the service instance for the type 'InterService' that references a configuration service for the deployment.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **-LoggingId**<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>

<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

- **-AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
<td>false</td>
</tr>
</tbody>
</table>
Citrix.Configuration.Sdk.ServiceInstance[] Service instances containing a ServiceInstance object that refers to the central configuration service interservice interface can be piped to the Reset-ConfigServiceGroupMembership command.

Notes
If the command fails, the following errors can be returned.

Error Codes
----------
NoSuitableServiceInstance
None of the supplied service instance objects were suitable for resetting service group membership.
DatabaseError
An error occurred in the service while attempting a database operation.
DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.
DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.
PermissionDenied
You do not have permission to execute this command.
AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.
ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.
CommunicationError
There was a problem communicating with the remote service.
ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples
-------------------------- EXAMPLE 1 --------------------------
c:\PS>Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-ConfigServiceGroupMembership
Reset the service group membership for a service in a deployment where the configuration service is configured and running on the same machine as the service.

-------------------------- EXAMPLE 2 --------------------------
c:\PS>Get-ConfigRegisteredServiceInstance -ServiceType Config -AdminAddress OtherServer.example.com | Reset-ConfigServiceGroupMembership
Reset the service group membership for a service in a deployment where the configuration service that is configured and running on a machine named 'OtherServer.example.com'.
Set-ConfigDBConnection

Oct 01, 2013
Configures a database connection for the Configuration Service.

Syntax
Set-ConfigDBConnection [-DBConnection] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description
Configures a connection to a database in which the Configuration Service can store its state. The service will attempt to connect and start using the database immediately after the connection is configured. The database connection string is updated to the specified value regardless of whether it is valid or not. Specifying an invalid connection string prevents a service from functioning until the error is corrected.

After a connection is configured, you cannot alter it without first clearing it (by setting the connection to $null).

You do not need to configure a database connection to use this command.

Related topics
Get-ConfigServiceStatus
Get-ConfigDBConnection
Test-ConfigDBConnection

Parameters
-DBConnection <String>
Specifies the database connection string to be used by the Configuration Service. Passing in $null will clear any existing database connection configured.

| Required? | true |
| Default Value |  |
| Accept Pipeline Input? | false |

-LoggingId <Guid>
Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
| Default Value |  |
| Accept Pipeline Input? | false |

-AdminAddress <String>
Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

| Required? | false |
| Default Value | Localhost. Once a value is provided by any cmdlet, this value becomes the default. |

https://docs.citrix.com © 1999-2017 Citrix Systems, Inc. All rights reserved. p.1700
Accept Pipeline Input? | false

Return Values

The Set-ConfigDBConnection command returns an object containing the status of the Configuration Service together with extra diagnostics information.

DBUnconfigured
The Configuration Service does not have a database connection configured.

DBRejectedConnection
The database rejected the logon attempt from the Configuration Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured
The expected stored procedures are missing from the database. This may be because the Configuration Service schema has not been added to the database.

DBNotFound
The specified database could not be located with the configured connection string.

DBNewerVersionThanService
The version of the Configuration Service currently in use is incompatible with the version of the Configuration Service schema on the database. Upgrade the Configuration Service to a more recent version.

DBOlderVersionThanService
The version of the Configuration Service schema on the database is incompatible with the version of the Configuration Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress
A database schema upgrade is currently in progress.

OK
The Configuration Service is running and is connected to a database containing a valid schema.

Failed
The Configuration Service has failed.

Unknown
The status of the Configuration Service cannot be determined.

Notes
If the command fails, the following errors can be returned.

Error Codes

------------

InvalidDBConnectionString
The database connection string has an invalid format.
DatabaseConnectionDetailsAlreadyConfigured

There was already a database connection configured. After a configuration is set, it can only be set to $null.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Set-ConfigDBConnection -DBConnection "Server=serverName\SQLEXPRESS;Initial Catalog = databaseName; Integrated Security = True"

OK

Configures a database connection string for the Configuration Service.

-------------------------- EXAMPLE 2 --------------------------

c:\PS>Set-ConfigDBConnection -DBConnection "Invalid Connection String"

Invalid database connection string format.

Configures an invalid database connection string for the Configuration Service.
Set-ConfigRegisteredServiceInstance

Oct 01, 2013
Updates a service instance.

Syntax

Set-ConfigRegisteredServiceInstance -ServiceInstanceUid <Guid> -Address <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Use this cmdlet to change the address property of an existing service instance that is registered in the Configuration Service.

Related topics

Get-ConfigRegisteredServiceInstance
Register-ConfigServiceInstance
UnRegister-ConfigServiceInstance

Parameters

-ServiceInstanceUid <Guid>
The unique identifier for the service instance to be updated.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-Address <String>
The new address for the service instance.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-PassThru <SwitchParameter>
Defines whether or not the command returns a result showing the new state of the updated service instance.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>true</td>
</tr>
</tbody>
</table>

-LoggingId <Guid>
Specifies the logging id of the high-level operation this cmdlet invocation is part of.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-AdminAddress <String>
Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>LocalHost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

Citrix.Configuration.Sdk.ServiceInstance

This represents a service instance and has the following parameters:

ServiceGroupUid <Guid>
The unique identifier for the service group to which the service instance belongs.

ServiceGroupName <string>
The name of the service group to which the service instance belongs.

ServiceInstanceUid <Guid>
The unique identifier for the service instance.

ServiceType <string>
The type of the service group.

Address <string>
The contact address for the service instance.

Binding <string>
The binding to use for connections to the service instance.

Version <int>
The version of the service instance.

ServiceAccount <string>
The AD computer account for the computer that is providing the service instance.

ServiceAccountSid <string>
The AD computer account SID for the computer that is providing the service instance.

InterfaceType <string>
The interface type for the service instance.

Metadata <Citrix.Configuration.Sdk.Metadata[]>
The metadata for the service instance.

Notes

In the case of failure, the following errors can result.

Error Codes

ObjectToUpdateDoesNotExist The service instance specified could not be located.

DatabaseError An error occurred in the service while attempting a database operation.

DatabaseNotConfigured The operation could not be completed because the database for the service is not configured.

DataStoreException An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

CommunicationError An error occurred while communicating with the service.

ExceptionThrown An unexpected error occurred. For more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

https://docs.citrix.com © 1999-2017 Citrix Systems, Inc. All rights reserved.
C:\PS> Set-ConfigResgisteredService -ServiceInstanceId "9805f39d-99eb-44f0-8f63-9d8e3f1228e0" -Address "http://myServer.com/Citrix/sdkHostingUnitService"

Update the service instance with the unique identifier of '9805f39d-99eb-44f0-8f63-9d8e3f1228e0' to use the new address.
Set-ConfigRegisteredServiceInstanceMetadata

Oct 01, 2013

Adds or updates metadata on the given ServiceInstance.

Syntax

Set-ConfigRegisteredServiceInstanceMetadata [-ServiceInstanceUid] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [-<CommonParameters>]

Set-ConfigRegisteredServiceInstanceMetadata [-InputObject] <ServiceInstance[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [-<CommonParameters>]

Detailed Description

Provides the ability for additional custom data to be stored against given ServiceInstance objects.

Related topics

Add-ConfigRegisteredServiceInstanceMetadata
Remove-ConfigRegisteredServiceInstanceMetadata

Parameters

- **-ServiceInstanceUid**<Guid>
  
  Id of the ServiceInstance

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

- **-InputObject**<ServiceInstance[]>
  
  Objects to which the metadata is to be added.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **-Name**<String>
  
  Specifies the property name of the metadata to be added. The property must be unique for the ServiceInstance specified. The property cannot contain any of the following characters `\/:*?<> | []’"`

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>
### -Value

Specifies the value for the property.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -Map

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

### -LoggingId

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -AdminAddress

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### Return Values

Set-ConfigRegisteredServiceInstanceMetadata returns a dictionary containing the new (name, value)-pairs.

### Notes

If the command fails, the following errors can be returned.

### Error Codes
InvalidParameterCombination
The cmdlet parameters are inconsistent.

UnknownObject
One of the specified objects was not found.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS> Set-ConfigRegisteredServiceInstanceMetadata -ServiceInstanceUid 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

Key       Value
---       -----
property   value

Add metadata with a name of 'property' and a value of 'value' to the ServiceInstance with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.
Set-ConfigServiceGroupMetadata

Oct 01, 2013
Adds or updates metadata on the given ServiceGroup.

Syntax

Set-ConfigServiceGroupMetadata [-ServiceGroupUid] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-ConfigServiceGroupMetadata [-ServiceGroupUid] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples
-------------------------- EXAMPLE 1 --------------------------
c:\PS>Set-ConfigServiceGroupMetadata -ServiceGroupUid 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value
Add metadata with a name of 'property' and a value of 'value' to the ServiceGroup with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.
Set-ConfigServiceMetadata

Oct 01, 2013
Adds or updates metadata on the given Service.

Syntax

Set-ConfigServiceMetadata [-ServiceHostId] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Set-ConfigServiceMetadata [-ServiceHostId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Set-ConfigServiceMetadata [-InputObject] <Service[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Set-ConfigServiceMetadata [-InputObject] <Service[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Detailed Description

Allows you to store additional custom data against given Service objects.

Related topics

Remove-ConfigServiceMetadata

Parameters

-ServiceHostId <Guid>
Id of the Service

| Required? | true |
| Default Value |
| Accept Pipeline Input? | true (ByValue, ByPropertyName) |

-InputObject <Service[]>
Objects to which metadata is to be added.

| Required? | true |
| Default Value |
| Accept Pipeline Input? | true (ByValue) |

-Name <String>
Specifies the property name of the metadata to be added. The property must be unique for the Service specified. The
property cannot contain any of the following characters \\;#.*?=<> |[]""

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **Value**<String>

Specifies the value for the property.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **Map**<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with `@{"name1" = "val1"; "name2" = "val2"}`) or a string dictionary (created with `new-object "System.Collections.Generic.Dictionary[String,String]"`).

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **LoggingId**<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>
Return Values

Set-ConfigServiceMetadata returns a dictionary containing the new (name, value)-pairs.

Key <string>
Specifies the name of the property.

Value <string>
Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

-----------

InvalidParameterCombination
The cmdlet parameters are inconsistent.

UnknownObject
One of the specified objects was not found.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Set-ConfigServiceMetadata -ServiceHostId 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>property</td>
<td>value</td>
</tr>
</tbody>
</table>

Add metadata with a name of 'property' and a value of 'value' to the Service with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.
Set-ConfigSite

Oct 01, 2013
Changes the overall settings of the site.

Syntax

Detailed Description

The Set-ConfigSite cmdlet modifies properties of the site.

The site is a top-level logical representation of the XenDesktop site, from the perspective of the configuration services running within the site.

A XenDesktop installation has only a single site instance.

Modifications to the product code, product edition, product version and licensing model properties are successful only if their values are consistent with the feature table. Use the Get-ConfigProduct, Get-ConfigProductEdition, Get-ConfigProductVersion and Get-ConfigLicensingModel cmdlets to determine consistent values.

To configure the site, first import the feature table using the Import-ConfigFeatureTable cmdlet.

Related topics

Get-ConfigSite
Get-ConfigProduct
Get-ConfigProductEdition
Get-ConfigProductFeature
Get-ConfigProductVersion
Get-ConfigLicensingModel

Parameters

-SiteName <String>
Changes the name of the site.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>false</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
- **ProductCode**<String>

Changes the product code.

The `Get-ConfigProduct` cmdlet returns a list of supported values.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **ProductEdition**<String>

Changes the license edition. A license matching the specified edition must be available within the site's license server.

The `Get-ConfigProductEdition` returns a list of supported values.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **ProductVersion**<String>

Changes the product version.

The `Get-ConfigProductVersion` returns a list of supported values.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **LicensingModel**<String>

Changes the license model. A license matching the specified model must be available within the site's license server.

The `Get-ConfigLicensingModel` returns a list of supported values.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **LicenseServerName**<String>

Changes the machine used by the brokering services to obtain licenses for desktop and application session brokering. The
specified machine must be running a Citrix license server and have suitable licenses installed.

The license server machine can be specified by its DNS name ('machine.domain') or its numeric IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-LicenseServerPort**<Int32>

Changes the port number on the license server machine used by the brokering services to contact the Citrix license server.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-LoggingId**<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Return Values**

Site

**Examples**

-------------------------- EXAMPLE 1 --------------------------
C:\PS> Set-ConfigSite -ProductEdition PLT
Specifies the use of a Platinum edition license. A suitable license must be available on the site's license server.
Set-ConfigSiteMetadata

Oct 01, 2013
Adds or updates metadata on the Site.

Syntax

Set-ConfigSiteMetadata -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [-<CommonParameters>]
Set-ConfigSiteMetadata -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [-<CommonParameters>]

Detailed Description
Provides the ability for additional custom data to be stored against the Site.

Related topics

Remove-ConfigSiteMetadata

Parameters

- **Name**<String>
  Specifies the property name of the metadata to be added. The property must be unique for the Site specified. The property cannot contain any of the following characters \/:#.*?=<>|[]()"'

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **Value**<String>
  Specifies the value for the property.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **Map**<PSObject>
  Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
</table>
### Default Value

| Accept Pipeline Input? | true (ByValue) |

### -LoggingId (Guid)

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -AdminAddress (String)

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### Return Values

Set-ConfigSiteMetadata returns a dictionary containing the new (name, value)-pairs.

- **Key <string>**
  - Specifies the name of the property.

- **Value <string>**
  - Specifies the value for the property.

### Notes

If the command fails, the following errors can be returned.

### Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.
UnknownObject
One of the specified objects was not found.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS> Set-ConfigSiteMetadata -Name property -Value value

<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>property</td>
<td>value</td>
</tr>
</tbody>
</table>

Add metadata with a name of 'property' and a value of 'value' to the Site.
Test-ConfigDBConnection

Oct 01, 2013
Tests a database connection for the Configuration Service.

Syntax

Test-ConfigDBConnection [-DBConnection] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Tests a connection to the database in which the Configuration Service can store its state. The service will attempt to connect to the database without affecting the current connection to the database.

You do not have to clear the connection to use this command.

Related topics

Get-ConfigServiceStatus
Get-ConfigDBConnection
Set-ConfigDBConnection

Parameters

- **DBConnection**<String>

Specifies the database connection string to be tested by the Configuration Service.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | false |

- **LoggingId**<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

- **AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

| Required? | false |
| Default Value | Localhost. Once a value is provided by any cmdlet, this value becomes the default. |
| Accept Pipeline Input? | false |

Return Values
The Test-ConfigDBConnection command returns an object containing the status of the Configuration Service if the connection string of the specified data store were to be set to the string being tested, together with extra diagnostics information for the specified connection string.

**DBRejectedConnection**

The database rejected the logon attempt from the Configuration Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

**InvalidDBConfigured**

The expected stored procedures are missing from the database. This may be because the Configuration Service schema has not been added to the database.

**DBNotFound**

The specified database could not be located with the configured connection string.

**DBNewerVersionThanService**

The version of the Configuration Service currently in use is incompatible with the version of the Configuration Service schema on the database. Upgrade the Configuration Service to a more recent version.

**DBOlderVersionThanService**

The version of the Configuration Service schema on the database is incompatible with the version of the Configuration Service currently in use. Upgrade the database schema to a more recent version.

**DBVersionChangeInProgress**

A database schema upgrade is currently in progress.

**OK**

The Set-ConfigDBConnection command would succeed if it were executed with the supplied connection string.

**Failed**

The Configuration Service has failed.

**Unknown**

The status of the Configuration Service cannot be determined.

**Notes**

If the command fails, the following errors can be returned.

**Error Codes**

********

**InvalidDBConnectionString**

The database connection string has an invalid format.

**PermissionDenied**

You do not have permission to execute this command.

**AuthorizationError**

There was a problem communicating with the Citrix Delegated Administration Service.

**ConfigurationLoggingError**
The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Test-ConfigDBConnection -DBConnection "Server=serverName\SQLEXPRESS;Initial Catalog = databaseName; Integrated Security = True"

OK
Tests a database connection string for the Configuration Service.

-------------------------- EXAMPLE 2 --------------------------

c:\PS>Test-ConfigDBConnection -DBConnection "Invalid Connection String"

Invalid database connection string format.
Tests an invalid database connection string for the Configuration Service.
Test-ConfigServiceInstanceAvailability

Oct 01, 2013
Tests whether the supplied service instances are responding to requests.

Syntax

Test-ConfigServiceInstanceAvailability [-ServiceInstance] <ServiceInstance[]> [-MaxDelaySeconds <Int32>] [-ForceWaitForOneOfEachType] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Related topics

Register-ConfigServiceInstance
UnRegister-ConfigServiceInstance
Get-ConfigRegisteredServiceInstance

Parameters

-ServiceInstance <ServiceInstance[]>
The service instances to test.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByValue) |

-MaxDelaySeconds <Int32>
The timeout period to wait before concluding that services are unresponsive.

| Required? | false |
| Default Value | Infinite |
| Accept Pipeline Input? | false |

-ForceWaitForOneOfEachType <SwitchParameter>
If at least one of each type of service responds, finish immediately.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |
- **AdminAddress**:<String>

  Specifies the host name or IP address of the controller to which the PowerShell snap-in connects.

<table>
<thead>
<tr>
<th>Required?</th>
<th>False</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>'LocalHost'. Once a value is specified by any command, this value becomes the new default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>False</td>
</tr>
</tbody>
</table>

**Return Values**

System.Management.Automation.PSObject

This represents a service instance and has the following parameters:

- **ServiceGroupUid**<Guid>
  The unique identifier for the service group to which the service instance belongs.

- **ServiceGroupName**<string>
  The name of the service group that the service instance is part of.

- **ServiceInstanceId**<Guid>
  The unique identifier for the service instance.

- **ServiceType**<string>
  The type of the service group.

- **Address**<string>
  The contact address for the service instance.

- **Binding**<string>
  The binding to use for connections to the service instance.

- **Version**<int>
  The version of the service instance.

- **ServiceAccount**<string>
  The AD computer account for the computer that is providing the service instance.

- **ServiceAccountSid**<string>
  The AD computer account SID for the computer that is providing the service instance.

- **InterfaceType**<string>
The interface type for the service instance.

Metadata `<Citrix.Configuration.Sdk.Metadata[]>`

The metadata for the service instance.

An enumeration value indicating whether the service is Responding, NotResponding, Unknown, or BadBindingType.

ResponseTime `<System.TimeSpan>`

The interval elapsed between hailing the service and getting a definite response

Notes

The Availability Status Codes are:
- Responding: Got a positive response
- NotResponding: Got a response, but it was negative or the connection was refused
- Unknown: Did not respond in time / timed-out
- BadBindingType: Binding parameter in ServiceInstance is not wcf_HTTP_kerb

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\>Get-ConfigRegisteredServiceInstance | Test-ConfigServiceInstanceAvailability -ForceWaitForOneOfEachType
Test all the service instances that are registered in the Configuration Service, returning when one of each type is responding.

-------------------------- EXAMPLE 2 --------------------------

C:\>Test-ConfigServiceInstanceAvailability -ServiceInstance $services -MaxDelaySeconds 5
Test each of the given services, allowing a 5 second time-out.
Unregister-ConfigRegisteredServiceInstance

Oct 01, 2013
Removes a service instance from the Configuration Service registry.

Syntax

Unregister-ConfigRegisteredServiceInstance [-ServiceInstanceUid <Guid>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Use this cmdlet to remove a service instance from the Configuration Service registry. This does not remove any service groups (if all service instances for a Service Group are removed, an empty service group remains and must be removed using the Remove-ConfigServiceGroup command).

Related topics

Register-ConfigServiceInstance

Parameters

-ServiceInstanceUid

The unique identifier for the service instance to be removed.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-LoggingId

Specifies the logging id of the high-level operation this cmdlet invocation is part of.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-AdminAddress

Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
</tbody>
</table>
Accept Pipeline Input?  false

Input Type
Citrix.Configuration.Sdk.ServiceInstance An object with a parameter called 'ServiceInstanceUid' can be used to unregister service instances.

Notes
In the case of failure, the following errors can result.

Error Codes  
ServiceInstanceObjectNotFound The service instance specified could not be located. DatabaseError An error occurred in the service while attempting a database operation. DatabaseNotConfigured The operation could not be completed because the database for the service is not configured. DataStoreException An error occurred in the service while attempting a database operation - communication with the database failed for various reasons. CommunicationError An error occurred while communicating with the service. ExceptionThrown An unexpected error occurred. For more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS>Get-ConfigRegisteredServiceInstance -ServiceType "Config" | Unregister-ConfigRegisteredServiceInstance
Unregisters all the service instances that are for a service type of 'Config' from the Configuration Service instance register.

about_LogConfigurationLoggingSnapin

Oct 01, 2013

TOPIC

about_LogConfigurationLoggingSnapin

SHORT DESCRIPTION

The Configuration Logging Service PowerShell snap-in provides administrative functions for the Configuration Logging Service.

COMMAND PREFIX

All commands in this snap-in have the noun prefixed with 'Log'.

LONG DESCRIPTION

The Configuration Logging Service PowerShell snap-in enables both local and remote administration of the Configuration Logging Service.

The Configuration Logging Service logs configuration changes or administrator requested state changes made to the site. Configuration Logging can be configured, site wide, to be mandatory or optional. If mandatory logging is selected, then any attempts to change site configuration or state when the logging mechanism is unavailable are denied.

The Configuration Logging Service stores information about the logged changes in a database which can be configured to be separate from the site database.

The snap-in provides storage and configuration of these entities:

Site

The Configuration Logging Site object holds global settings which control the behaviour of the Configuration Logging Service. The site object can be configured by the Set-LogSite cmdlet. The properties of the site object are returned by the Get-LogSite cmdlet.

High Level Operations

A high level operation object represents a logged configuration change performed from Desktop Studio, Desktop Director or a PowerShell Script.

The XenDesktop consoles log high level operations when:

1) Executing operations which performs configuration changes.
2) Executing operations which performs administration related activities which may affect site configuration.
PowerShell scripts which carry out customized configuration changes can also log high level operations via cmdlets Start-LogHighLevelOperation and Stop-LogHighLevelOperation.

Low Level Operations

A low level operation object represents a logged configuration change performed by a service. One or more low level operation objects are used to record the actions performed by a services in order to fulfill a high level operation initiated from the consoles, or from PowerShell scripts.

Low level operations in the system are returned by cmdlet Get-LogLowLevelOperation.

Operation Details

A low level operation performed by a service can affect a number of individual objects, or a number of properties on an object. An operation detail log records each individual change to an object. This includes the creation and deletion of the object, as well as changes to individual properties of the object.

One or more operation detail objects are used to record specific changes to each object that is affected by a low level service operation.

Operation details are included in the data returned from the Get-LogLowLevelOperation cmdlet.

High Level Operations, Low Level Operations and Operation Details are arranged in a hierarchy. A High Level Operation can have multiple Low Level Operations, and each Low Level Operation can have multiple Operation Details.

Setting up a separate logging database ------------------------------- After creating the database on the database server, the logging database can be setup and configured for use by:

1) Generating the database schema, and applying it the logging database
2) Configuring the configuration logging service to use the new logging database.

The logging database schema can be generated from the Get-LogDBSchem cmdlet, as illustrated below:
Get-LogDBSchema -DatabaseName "loggingDB"
  -ServiceGroupName "service group name"
  -ScriptType Database
  -LocalDatabase:$LocalDB
  -DataStore Logging

The configuration logging service can be configured to use the logging database with the Set-LogDBConnection cmdlet, as illustrated below:

Set-LogDBConnection -DataStore Logging -DBConnection $null
Set-LogDBConnection -DataStore Logging -DBConnection "new logging db connection string"

Configuration Logging site settings -------------------------------

On the Site object:

- The 'State' setting allows configuration logging to be disabled, enabled, or made mandatory.

- The 'Locale' setting specifies the language in which configuration logging data text will be stored.

See Get-LogSite cmdlet help for further information on these settings.

This locale setting applies to the text description that is associated with each log, e.g. Create Catalog. It doesn't apply to other textual information in the log like the names of parameters passed to operations, e.g. CatalogName.

This localisation is applied when the data is logged, and not when the logs are viewed later. For example, logs which are created in English will be displayed in English on an end user system which may be configured with a different locale.
Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get- cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort- Object, for example:

```
Get-Noun | Where { $_.Size = 'Small' } | Sort 'Date' | Select -First 10
```

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

```
Get-Noun -Size 'Small' -SortBy 'Date' -MaxRecordCount 10
```

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

- **-MaxRecordCount <int>**
  
  Specifies the maximum number of results to return.
  
  For example, to return only the first nine results use:

  ```
  Get-Noun -MaxRecordCount 9
  ```

  If not specified, only the first 250 records are returned, and if more are available, a warning is produced:
WARNING: Only first 250 records returned. Use -MaxRecordCount to retrieve more.

You can suppress this warning by using -WarningAction or by specifying a value for -MaxRecordCount.

To retrieve all records, specify a large number for -MaxRecordCount. As the value is an integer, you can use the following:

```
Get-<Noun> -MaxRecordCount [int]:::MaxValue
```

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. For example:

```
Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
```

....

```
Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<-MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo : OperationStopped: (?) [Get-<Noun>], PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>

The count can be accessed using the TotalAvailableResultCount property:

```
$count = $error[0].TotalAvailableResultCount
```

-Skip <int>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order, respectively. Ascending order is assumed if no prefix is present.
Sorting occurs before -MaxRecordCount and -Skip parameters are applied. For example, to sort by Name and then by Count (largest first) use:

- sortBy 'Name,-Count'

By default, sorting by an enumeration property uses the numeric value of the elements. You can specify a different sort order by qualifying the name with an ordered list of elements or their numeric values, or <null> to indicate the placement of null values. Elements not mentioned are placed at the end in their numeric order. For example, to sort by two different enums and then by the object id:

- sortBy 'MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id'

- Filter <String>

This parameter lets you specify advanced filter expressions, and supports combination of conditions with -and and -or, and grouping with braces. For example:

Get-<Noun> -Filter 'Name -like "High*" -or (Priority -eq 1 -and Severity -ge 2)'

The syntax is close enough to PowerShell syntax that you can use script blocks in most cases. This can be easier to read as it reduces quoting:

Get-<Noun> -Filter { Count -ne $null }

The full -Filter syntax is provided below.

EXAMPLES

Filtering by strings performs a case-insensitive wildcard match. Separate parameters are combined with an implicit -and operator. Normal PowerShell quoting rules apply, so you can use single or double quotes, and omit the quotes altogether for many strings. The order of parameters does not make any difference. The following are equivalent:

Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company "citrix" -Product '[X]EN''
Get-<Noun> -Product "Xen" -Company "CITRIX"
Get-<Noun> -Filter { Company -eq 'Citrix' -and Product -like 'Xen'* }
See about_Quoting_Rules and about_Wildcards for details about PowerShell handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape the wildcards using the normal PowerShell escape mechanisms (see about_Escape_Characters), or switch to a filter expression and the -eq operator:

```powershell
Get-<Noun> -Company "Abc[*]"                 # Matches Abc*
Get-<Noun> -Company "Abc"**                   # Matches Abc*
Get-<Noun> -Filter { Company -eq "Abc"** }   # Matches Abc*
Get-<Noun> -Filter { Company -eq "A""B""C" }  # Matches A"B"C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```powershell
Get-<Noun> -Uid 123
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

```powershell
Get-<Noun> -Filter 'Capacity -ge 10gb'
Get-<Noun> -Filter 'Age -ge 20 -and Age -lt 40'
Get-<Noun> -Filter 'VolumeLevel -like "[123]"'
Get-<Noun> -Filter 'Enabled -ne $false'
Get-<Noun> -Filter 'NullableProperty -ne $null'
```

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

```powershell
Get-<Noun> -Filter 'Enabled'      # Equivalent to 'Enabled -eq $true'
Get-<Noun> -Filter '-not Enabled' # Equivalent to 'Enabled -eq $false'
```

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

```powershell
Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle
```

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:
$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq "Circle" }
Get-<Noun> -Filter { Shape -like 'C*' }

By their nature, floating point values, DateTime values, and TimeSpan values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

Get-<Noun> -Filter { StartTime -ge "2010-08-23T12:30:00.0Z" }
$d = [DateTime]"2010-08-23T12:30:00.0Z"
Get-<Noun> -Filter { StartTime -ge $d }
$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter { StartTime -ge $d }

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

Get-<Noun> -Filter { StartTime -ge ‘-2’ }         # Two days ago
Get-<Noun> -Filter { StartTime -ge ‘-1:30’ }      # Hour and a half ago
Get-<Noun> -Filter { StartTime -ge ‘-0:0:30’ }    # 30 seconds ago

ARRAY PROPERTIES
When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings. Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

Get-<Noun> -User Fred*
Get-<Noun> -Filter { User -like "Fred*" }
Get-<Noun> -Filter { Users -contains "Fred*" }

You can also use the singular form with -Filter to search using other operators:

# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter { User -eq "Frederick" }
# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter { User -lt 'F' }

COMPLEX EXPRESSIONS
When matching against multiple values, you can use a sequence of comparisons joined with -or operators, or you can use -in and -notin:

```
Get-<Noun> -Filter { Shape -eq 'Circle' -or Shape -eq 'Square' }
$shapes = 'Circle','Square'
Get-<Noun> -Filter { Shape -in $shapes }
$sides = 1..4
Get-<Noun> -Filter { Sides -notin $sides }
```

Braces can be used to group complex expressions, and override the default left-to-right evaluation of -and and -or. You can also use -not to invert the sense of any sub-expression:

```
Get-<Noun> -Filter { Size -gt 4 -or (Color -eq 'Blue' -and Shape -eq 'Circle') }
Get-<Noun> -Filter { Sides -lt 5 -and -not (Color -eq 'Blue' -and Shape -eq 'Circle') }
```

PAGING
The simplest way to page through data is to use the -Skip and -MaxRecordCount parameters. So, to read the first three pages of data with 10 records per page, use:

```
Get-<Noun> -Skip 0  -MaxRecordCount 10 <other filtering criteria>
Get-<Noun> -Skip 10 -MaxRecordCount 10 <other filtering criteria>
Get-<Noun> -Skip 20 -MaxRecordCount 10 <other filtering criteria>
```

You must include the same filtering criteria on each call, and ensure that the data is sorted consistently.

The above approach is often acceptable, but as each call performs an independent query, data changes can result in records being skipped or appearing twice. One approach to improve this is to sort by a unique id field and then start the search for the next page at the unique id after the last unique id of the previous page. For example:

```
# Get the first page
Get-<Noun> -MaxRecordCount 10 -SortBy SerialNumber

SerialNumber ...
------------- ...
A120004
A120007
... 7 other records ...
A120900

# Get the next page
Get-<Noun> -MaxRecordCount 10 -Filter { FirstName -gt 'A120900' }

SerialNumber ...
```
FILTER SYNTAX DEFINITION

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= "{" <ComponentList> "}"

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> |

  <Component>

<Component> ::= <NotOperator> <Factor> |

  <Factor>

<Factor> ::= "{" <ComponentList> "}" |

  <PropertyName> <ComparisonOperator> <Value> | <PropertyName>

<AndOrOperator> ::= "-and" | "-or"

<NotOperator> ::= "-not" | "!

<ComparisonOperator>

  ::= "-eq" | "-ne" | "-le" | "-ge" | "-lt" | "-gt" |
  "-like" | "-notlike" | "-contains" | "-notcontains" |
  "-in" | "-notin"

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> | 
  <scalar variable> | <array variable> |
  "$null" | "$true" | "$false"
Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, "-1:30" means 1 hour and 30 minutes ago.
The Windows PowerShell logical operators connect expressions and statements, allowing you to use a single expression to test for multiple conditions.

For example, the following statement uses the and operator and the or operator to connect three conditional statements. The statement is true only when the value of $a is greater than the value of $b, and either $a or $b is less than 20.

```
($a -gt $b) -and (($a -lt 20) -or ($b -lt 20))
```

Windows PowerShell supports the following logical operators.

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>-and</td>
<td>Logical and. TRUE only when both statements are TRUE.</td>
<td>(1 -eq 1) -and (1 -eq 2) False</td>
</tr>
<tr>
<td>-or</td>
<td>Logical or. TRUE when either or both statements are TRUE.</td>
<td>(1 -eq 1) -or (1 -eq 2) True</td>
</tr>
<tr>
<td>-xor</td>
<td>Logical exclusive or. TRUE only when one of the statements is TRUE and the other is FALSE.</td>
<td>(1 -eq 1) -xor (2 -eq 2) False</td>
</tr>
<tr>
<td>-not</td>
<td>Logical not. Negates the statement that follows it.</td>
<td>-not (1 -eq 1) False</td>
</tr>
<tr>
<td>!</td>
<td>Logical not. Negates the statement that follows it. (Same as -not)</td>
<td>!(1 -eq 1) False</td>
</tr>
</tbody>
</table>
Note: The previous examples also use the equal to comparison operator (-eq). For more information, see about_Comparison_Operators. The examples also use the Boolean values of integers. The integer 0 has a value of FALSE. All other integers have a value of TRUE.

The syntax of the logical operators is as follows:

```
<statement> {-AND | -OR | -XOR} <statement>
{! | -NOT} <statement>
```

Statements that use the logical operators return Boolean (TRUE or FALSE) values.

The Windows PowerShell logical operators evaluate only the statements required to determine the truth value of the statement. If the left operand in a statement that contains the and operator is FALSE, the right operand is not evaluated. If the left operand in a statement that contains the or statement is TRUE, the right operand is not evaluated. As a result, you can use these statements in the same way that you would use the If statement.

Export-LogReportCsv

Oct 01, 2013
Exports Configuration Logging data into a CSV file.

Syntax
Export-LogReportCsv -OutputFile <String> [-StartDateRange <DateTime>] [-EndDateRange <DateTime>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description
This cmdlet exports the Configuration Logging data into a CSV data file. The hierarchical logging data is flattened into a single CSV 'table'. The content of CSV file is not intended to be human-readable. It is meant to be input data for external reporting or manipulation tools (for example, a spreadsheet application).

Related topics
Export-LogReportHtml

Parameters
- **OutputFile <String>**
  Specifies the path to a file where the CSV data will be saved.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

- **StartDateRange <DateTime>**
  Specifies the start time of the earliest operation to include.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>DateTime.Min</td>
<td>false</td>
</tr>
</tbody>
</table>

- **EndDateRange <DateTime>**
  Specifies the end time of the latest operation to include.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>DateTime.UtcNow</td>
<td>false</td>
</tr>
</tbody>
</table>

- **AdminAddress <String>**
  Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
<td>false</td>
</tr>
</tbody>
</table>
Accept Pipeline Input? | false

Examples

-------------------------- EXAMPLE 1 --------------------------
C:\PS> Export-LogReportCsv -OutputFile "c:\MyReports\LoggingData.csv"
Export all logged operations to a csv file.

-------------------------- EXAMPLE 2 --------------------------
C:\PS> Export-LogReportCsv -OutputFile "c:\MyReports\LoggingData.csv" -StartDateRange "2012-12-21 09:00"
Export to a CSV file logged operations started on or after a specified datetime.

-------------------------- EXAMPLE 3 --------------------------
C:\PS> Export-LogReportCsv -OutputFile "c:\MyReports\LoggingData.csv" -StartDateRange "2012-12-21 09:00" -EndDateRange "2012-12-31 18:00"
Export to a CSV file logged operations started and completed between a date range.
Export-LogReportHtml

Oct 01, 2013
Exports Configuration Logging data into a HTML report.

Syntax

Export-LogReportHtml -OutputDirectory <String> [-StartDateRange <DateTime>] [-EndDateRange <DateTime>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

This cmdlet exports the Configuration Logging data into a HTML report. The report consists of two HTML files:

- Summary.Html - this shows summary information from the high level operation logs.
- Details.Html - this shows additional logging data from the low level operation and operation detail logs.

Hyperlinks in summary.html allow drill-down into the associated low level logging data contained within details.html.

Related topics

Export-LogReportCsv

Parameters

- **OutputDirectory**<String>

  Specifies the path to a directory where the HTML report files will will be saved.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

- **StartDateRange**<DateTime>

  Specifies the start time of the earliest operation to include.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>DateTime.Min</td>
<td>false</td>
</tr>
</tbody>
</table>

- **EndDateRange**<DateTime>

  Specifies the end time of the latest operation to include.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>DateTime.UtcNow</td>
<td>false</td>
</tr>
</tbody>
</table>
**-AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Examples

-------------------------- EXAMPLE 1 --------------------------
C:\PS> Export-LogReportHtml -OutputDirectory "c:\MyReports"
Export all logged operations to HTML.

-------------------------- EXAMPLE 2 --------------------------
C:\PS> Export-LogReportHtml -OutputDirectory "c:\MyReports" -StartDateRange "2012-12-21 09:00"
Export to a HTML logged operations started on or after a specified datetime.

-------------------------- EXAMPLE 3 --------------------------
C:\PS> Export-LogReportHtml -OutputDirectory "c:\MyReports" -StartDateRange "2012-12-21 09:00" -EndDateRange "2012-12-31 18:00"
Export to HTML logged operations started and completed between a date range.
Get-LogDataStore

Oct 01, 2013
Gets details for each of the ConfigurationLogging data stores.

Syntax
Get-LogDataStore [-AdminAddress <String>] [CommonParameters]

Detailed Description
Returns an object for each of the ConfigurationLogging data stores describing the connection string, data store name, db type, provider, schema name, and DB status.

A database connection must be configured in order for this command to be used if the service has a secondary data store. This is not required for the site data store.

Related topics
Reset-LogDataStore

Parameters
-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values
Citrix.ConfigurationLogging.Sdk.DataStoreConfiguration

An object describing the connection string, data store name, database type, provider, schema name and database status.

Notes
If the command fails, the following errors can be returned.

Error Codes
---------

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples
-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-LogDataStore

ConnectionString : Server=\SQLEXPRESS;Initial Catalog = databaseName; Integrated Security = True
DataStore        : Site
DatabaseType     : SqlServer
Provider         : MSSQL
SchemaName       : LogSiteSchema
Status           : OK

ConnectionString :
DataStore        : Secondary
DatabaseType     : SqlServer
Provider         : MSSQL
SchemaName       : LogSecondarySchema
Status           : DBUnconfigured

Get the database connection string for the ConfigurationLogging Service.
Get-LogDBConnection

Oct 01, 2013
Gets the database string for the specified data store used by the ConfigurationLogging Service.

Syntax

Get-LogDBConnection [-DataStore <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns the database connection string for the specified data store.

If the returned string is blank, no valid connection string has been specified. In this case the service is running, but is idle and awaiting specification of a valid connection string.

Related topics

Get-LogServiceStatus
Get-LogDataStore
Set-LogDBConnection
Test-LogDBConnection

Parameters

-DataStore <String>

Specifies the logical name of the data store for the ConfigurationLogging Service. Can be either be 'Site' or the logical name of the secondary data store.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Site</td>
</tr>
</tbody>
</table>

-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
</tbody>
</table>

Accept Pipeline Input? false

Return Values
The database connection string configured for the Configuration Logging Service.

Notes
If the command fails, the following errors can be returned.

Error Codes
-----------
NoDBConnections
The database connection string for the Configuration Logging Service has not been specified.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples
-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-LogDBConnection

Server=serverName\SQLEXPRESS;Initial Catalog = databaseName; Integrated Security = True
Get the database connection string for the Configuration Logging Service.
Get-LogDBSchema

Oct 01, 2013
Gets a script that creates the ConfigurationLogging Service database schema for the specified data store.

Syntax

Detailed Description

Gets SQL scripts that can be used to create a new ConfigurationLogging Service database schema, add a new ConfigurationLogging Service to an existing site, remove a ConfigurationLogging Service from a site, or create a database server logon for a ConfigurationLogging Service. If no Sid parameter is provided, the scripts obtained relate to the currently selected ConfigurationLogging Service instance, otherwise the scripts relate to ConfigurationLogging Service instance running on the machine identified by the Sid provided. When obtaining the Evict script, a Sid parameter must be supplied. The current service instance is that on the local machine, or that explicitly specified by the last usage of the -AdminAddress parameter to a ConfigurationLogging SDK cmdlet. The service instance used to obtain the scripts does not need to be a member of a site or to have had its database connection configured. The database scripts support only Microsoft SQL Server, or SQL Server Express, and require Windows integrated authentication to be used. They can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SMDCMD mode'. The ScriptType parameter determines which script is obtained. If ScriptType is not specified, or is FullDatabase, the script contains:

- Creation of service schema
- Creation of database server logon
- Creation of database user
- Addition of database user to ConfigurationLogging Service roles

If ScriptType is Instance, the returned script contains:

- Creation of database server logon
- Creation of database user
- Addition of database user to ConfigurationLogging Service roles

If ScriptType is Evict, the returned script contains:

- Removal of ConfigurationLogging Service instance from database
- Removal of database user

If ScriptType is Login, the returned script contains:

- Creation of database server logon only

If the service uses two data stores they can exist in the same database. You do not need to configure a database before using this command.

Get-LogDataStore

Set-LogDBConnection

Parameters

-**DatabaseName**<String>

Specifies the name of the database for which the schema will be generated.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**ServiceGroupName**<String>

Specifies the name of the service group to be used when creating the database schema. The service group is a collection of all the ConfigurationLogging services that share the same database instance and are considered equivalent; that is, all the services within a service group can be used interchangeably.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**ScriptType**<ScriptTypes>

Specifies the type of database script returned. Available script types are:

**Database**

Returns a full database script that can be used to create a database schema for the ConfigurationLogging Service in a database instance that does not already contain a schema for this service. The DatabaseName and ServiceGroupName parameters must be specified to create a script of this type.

**Instance**

Returns a permissions script that can be used to add further ConfigurationLogging services to an existing database instance that already contains the full ConfigurationLogging service schema, associating the services to the Service Group. The Sid parameter can optionally be specified to create a script of this type.

**Login**

Returns a database logon script that can be used to add the required logon accounts to an existing database instance that contains the ConfigurationLogging Service schema. This is used primarily when creating a mirrored database environment. The DatabaseName parameter must be specified to create a script of this type.

**Evict**

Returns a script that can be used to remove the specified ConfigurationLogging Service from the database entirely. The DatabaseName and Sid parameters must be specified to create a script of this type.
<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Database</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-LocalDatabase**<SwitchParameter>

Specifies whether the database script is to be used in a database instance run on the same controller as other services in the service group. Including this parameter ensures the script creates only the required permissions for local services to access the database schema for ConfigurationLogging services.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-Sid**<String>

Specifies the SID of the controller on which the ConfigurationLogging Service instance to remove from the database is running.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

**-DataStore**<String>

Specifies the logical name of the data store for the ConfigurationLogging Service. Can be either be ‘Site’ or the logical name of the secondary data store.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Site</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Return Values**
System.string

A string containing the required SQL script for application to a database.

Notes

The scripts returned support Microsoft SQL Server Express Edition, Microsoft SQL Server Standard Edition, and Microsoft SQL Server Enterprise Edition databases only, and are generated on the assumption that integrated authentication will be used.

If the ScriptType parameter is not included or set to 'FullDatabase', the full database script is returned, which will:

Create the database schema.

Create the user and the role (providing the schema does not already exist).

Create the logon (providing the schema does not already exist).

If the ScriptType parameter is set to 'Instance', the script will:

Create the user and the role (providing the schema does not already exist).

Create the logon (providing the schema does not already exist) and associate it with a user.

If the ScriptType parameter is set to 'Login', the script will:

Create the logon (providing the schema does not already exist) and associate it with a pre-existing user of the same name.

If the LocalDatabase parameter is included, the NetworkService account will be added to the list of accounts permitted to access the database. This is required only if the database is run on a controller.

If the command fails, the following errors can be returned.

Error Codes

---------

GetSchemasFailed

The database schema could not be found.

ActiveDirectoryAccountResolutionFailed

The specified Active Directory account or Group could not be found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

https://docs.citrix.com © 1999-2017 Citrix Systems, Inc. All rights reserved. p.1758
You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-LogDBSchema -DatabaseName MyDB -ServiceGroupName MyServiceGroup > c:\LogSchema.sql
Get the full database schema for site data store of the ConfigurationLogging Service and copy it to a file called
'c:\LogSchema.sql'.

This script can then be used to create the schema in a pre-existing database named 'MyDB' that does not already contain a
ConfigurationLogging Service site schema.

-------------------------- EXAMPLE 2 --------------------------

c:\PS>Get-LogDBSchema -DatabaseName MyDB -scriptType Login > c:\ConfigurationLoggingLogins.sql
Get the logon scripts for the ConfigurationLogging Service.

-------------------------- EXAMPLE 3 --------------------------

c:\PS>Get-LogDBSchema -DatabaseName MyDB -ServiceGroupName MyServiceGroup -DataStore Secondary > c:\LogSchema.sql
Get the full database schema for the secondary data store of the ConfigurationLogging Service and copy it to a file called
'c:\LogSecondarySchema.sql'.

This script can then be used to create the schema in a pre-existing database named 'MyDB' that does not already contain a
ConfigurationLogging Service secondary schema.
Get-LogDBVersionChangeScript

Oct 01, 2013
Gets a script that updates the ConfigurationLogging Service database schema.

Syntax

Get-LogDBVersionChangeScript -DatabaseName <String> -TargetVersion <Version> [-DataStore <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns a database script that can be used to upgrade or downgrade the site or secondary schema for the ConfigurationLogging Service from the current schema version to a different version.

Related topics

Get-LogInstalledDBVersion

Parameters

- **DatabaseName**<String>

  Specifies the name of the database instance to which the update applies.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

- **TargetVersion**<Version>

  Specifies the version of the database you want to update to.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

- **DataStore**<String>

  Specifies the logical name of the data store for the ConfigurationLogging Service. Can be either be 'Site' or the logical name of the secondary data store.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Site</td>
<td>false</td>
</tr>
</tbody>
</table>
**-AdminAddress:String**

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Return Values**

System.Management.Automation.PSObject

A PSObject containing the required SQL script for application to a database.

**Notes**

The PSObject returned by this cmdlet contains the following properties:

-- Script The raw text of the SQL script to apply the update, or null in the case when no upgrade path to the specified target version exists.

-- NeedExclusiveAccess Indicates whether all services in the service group must be shut down during the update or not.

-- CanUndo Indicates whether the generated script allows the updated schema to be reverted to the state prior to the update.

Scripts to update the schema version are stored in the database so any service in the service group can obtain these scripts. Extreme caution should be exercised when using update scripts. Citrix recommends backing up the database before attempting to upgrade the schema. Database update scripts may require exclusive use of the schema and so may not be able to execute while any ConfigurationLogging services are running. However, this depends on the specific update being carried out.

After a schema update has been carried out, services that require the previous version of the schema may cease to operate. The ServiceState parameter reported by the Get-LogServiceStatus command provides information about service compatibility. For example, if the schema has been upgraded to a more recent version that a service cannot use, the service reports "DBNewerVersionThanService".

If the command fails, the following errors can be returned.

**Error Codes**

---------

NoOp

The operation was successful but had no effect.

NoDBConnections
The database connection string for the ConfigurationLogging Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> $update = Get-LogDBVersionChangeScript -DatabaseName MyDb -TargetVersion 1.0.75.0
C:\PS> $update.Script > update_75.sql

Gets an SQL update script to update the current schema to version 1.0.75.0. The resulting update_75.sql script is suitable for direct use with the SQL Server SQLCMD utility.
Get-LogHighLevelOperation

Oct 01, 2013
Gets high level operations

Syntax

Detailed Description

Retrieves high level operations matching the specified criteria. If no parameters are specified this cmdlet returns all high level operations.

Related topics

Start-LogHighLevelOperation
Stop-LogHighLevelOperation
Get-LogLowLevelOperation

Parameters

-Id <Guid>

Gets the high level operation with the specified identifier.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-Text <String>

Gets high level operations with the specified text

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-StartTime <DateTime>

Gets high level operations with the specified start time
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-Source</td>
<td>String</td>
<td>Gets high level operations with the specified source.</td>
</tr>
<tr>
<td>-EndTime</td>
<td>DateTime</td>
<td>Gets high level operations with the specified end time.</td>
</tr>
<tr>
<td>-IsSuccessful</td>
<td>Boolean</td>
<td>Gets high level operations with the specified success indicator.</td>
</tr>
<tr>
<td>-User</td>
<td>String</td>
<td>Gets high level operations logged by the specified user.</td>
</tr>
<tr>
<td>-AdminMachineIP</td>
<td>String</td>
<td>Gets high level operations logged from the machine with the specified IP address.</td>
</tr>
</tbody>
</table>
-**OperationType**<OperationType>

Gets high level operations with the specified operation type. Values can be:

- AdminActivity - to get operations which log administration activity.
- ConfigurationChange - to get operations which log configuration changes.

-**TargetType**<String>

Gets high level operations with the specified target type. The target type describes the type of object that was the target of the configuration change. For example, "Session" or "Machine".

-**ReturnTotalRecordCount**<SwitchParameter>

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Log_Filtering for details.

-**MaxRecordCount**<Int32>

Specifies the maximum number of records to return.
<table>
<thead>
<tr>
<th>Accept Pipeline Input?</th>
<th>false</th>
</tr>
</thead>
</table>

**-Skip<Int32>**

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>0</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-SortBy<String>**

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>The default sort order is by name or unique identifier.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-Filter<String>**

Gets records that match a PowerShell-style filter expression. See about_Log_Filtering for details.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-AdminAddress<String>**

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

Citrix.ConfigurationLogging.Sdk.HighLevelOperation
The returned HighLevelOperation object has the following properties:

- **Id** - The unique identifier of the operation.
- **Text** - A description of the operation.
- **StartTime** - The date and time that the operation started.
- **EndTime** - The date and time that the operation completed. This will be null if the operation is still in progress, or if the operation never completed.
- **IsSuccessful** - Indicates whether the operation completed successfully or not. This will be null if the operation is still in progress, or if the operation never completed.
- **User** - The identifier of the administrator who performed the operation.
- **AdminMachineIP** - The IP address of the machine that the operation was initiated from.
- **Source** - Identifies the XenDesktop console, or custom script, where the operation was initiated from. For example, "Desktop Studio", "Desktop Director", "My custom script".
- **OperationType** - The operation type. This can be 'AdminActivity' or 'ConfigurationChange'.
- **TargetTypes** - Identifies the type of objects that were affected by the operation. For example, "Catalog" or "Desktop","Machine".
- **Parameters** - The names and values of the parameters that were supplied for the operation.

Examples

-------------------------- EXAMPLE 1 --------------------------
C:\PS> Get-LogHighLevelOperation
Get all high level operations

-------------------------- EXAMPLE 2 --------------------------
C:\PS> Get-LogHighLevelOperation -OperationType ConfigurationChange
Get high level operations which log configuration changes.

-------------------------- EXAMPLE 3 --------------------------
C:\PS> Get-LogHighLevelOperation -OperationType AdminActivity
Get high level operations which log administration activities.

-------------------------- EXAMPLE 4 --------------------------
C:\PS> Get-LogHighLevelOperation -Filter{ StartTime -ge "2013-02-27 09:00:00" -and EndTime -le "2013-02-27 18:00:00"}
Use advanced filtering to get high level operations with a start time on or after "2013-02-27 09:00:00" and an end time on or before "2013-02-27 18:00:00".

-------------------------- EXAMPLE 5 --------------------------
C:\PS> Get-LogHighLevelOperation -EndTime $null
C:\PS> Get-LogHighLevelOperation -IsSuccessful $null
Either of these commands will get high level operations which have not yet been completed.

---------------------------- EXAMPLE 6 -----------------------------

C:\PS> Get-LogHighLevelOperation -User "DOMAIN\UserName"
Get high level operations performed by user "DOMAIN\UserName".
Get-LogInstalledDBVersion

Oct 01, 2013

Gets a list of all available database schema versions for the Configuration Logging Service.

Syntax

Detailed Description

Returns the current version of the Configuration Logging Service database schema, if no flags are set, otherwise returns versions for which upgrade or downgrade scripts are available and have been stored in the database.

Related topics

Parameters

-**Upgrade**<SwitchParameter>

Specifies that only schema versions to which the current database version can be updated should be returned.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>false</td>
<td>false</td>
</tr>
</tbody>
</table>

-**Downgrade**<SwitchParameter>

Specifies that only schema versions to which the current database version can be reverted should be returned.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>false</td>
<td>false</td>
</tr>
</tbody>
</table>

-**DataStore**<String>

Specifies the database connection logical name the schema script should be returned for. The parameter is optional.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>false</td>
<td>false</td>
</tr>
</tbody>
</table>

-**AdminAddress**<String>

https://docs.citrix.com  © 1999-2017 Citrix Systems, Inc. All rights reserved.
Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

System.Version

The Get-LogInstalledDbVersion command returns objects containing the new definition of the ConfigurationLogging Service database schema version.

Major <Integer>

Minor <Integer>

Build <Integer>

Revision <Integer>

Notes

If the command fails, the following errors can be returned.

Error Codes

--------

InvalidParameterCombination

Both the Upgrade and Downgrade flags were specified.

NoOp

The operation was successful but had no effect.

NoDBConnections

The database connection string for the ConfigurationLogging Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for
PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------
c:\PS>Get-LogInstalledDBVersion

Major Minor Build Revision
----- ----- ----- --------
5     6     0     0
Get the currently installed version of the ConfigurationLogging Service database schema.

-------------------------- EXAMPLE 2 --------------------------
c:\PS>Get-LogInstalledDBVersion -Upgrade

Major Minor Build Revision
----- ----- ----- --------
6     0     0     0
Get the versions of the ConfigurationLogging Service database schema for which upgrade scripts are supplied.
Get-LogLowLevelOperation

Oct 01, 2013
Gets low level operations

Syntax

Detailed Description

Retrieves low level operations matching the specified criteria. If no parameters are specified this cmdlet returns all low level operations.

Related topics

Get-LogLowLevelOperation

Parameters

-Id<Guid>

Gets the low level operation with the specified identifier.

<table>

<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

Citrix.ConfigurationLogging.Sdk.LowLevelOperation

The returned LowLevelOperation object has the following properties:

- Id - The unique identifier of the operation.
- Text - A description of the operation.
- HighLevelOperationId - The unique identifier of the related high level operation.
- StartTime - The date and time that the operation started.
- EndTime - The date and time that the operation completed. This will be null if the operation is still in progress, or if the operation never completed.
- IsSuccessful - Indicates whether the operation completed successfully or not. This will be null if the operation is still in progress, or if the operation never completed.
- AdminSid - The identifier of the administrator who performed the operation.
- AdminMachineIP - The IP address of the machine that the operation was performed on.
- Source - The name of the XenDesktop service that the operation was performed on; for example, "MachineCreation", "DelegatedAdmin".
- SourceSdk - The identifier of the XenDesktop service SDK through which the operation was performed; for example, "Prov", "Admin".
- OperationType - The operation type. This can be 'AdminActivity' or 'ConfigurationChange'.
- TargetTypes - Identifies the type of objects that were affected by the operation. For example, "Catalog" or "Desktop","Machine".
- Parameters - The names and values of the parameters that were supplied for the operation.
- Details - A collection of OperationDetail objects containing specific information about each object affected by the operation.

Each OperationDetail object in the 'Details' collection has the following properties:
TargetUid - The unique identifier of the target object affected by the operation.

TargetName - The name of the target object affected by the operation.

TargetType - The type of the target object.

Text - The description of operation performed on the target object.

StartTime - The date and time that the operation started.

EndTime - The date and time that the operation completed. This will be null if the operation is still in progress, or if the operation never completed.

IsSuccessful - Indicates whether the operation completed successfully or not. This will be null if the operation is still in progress, or if the operation didn't complete.

The following properties will be set if the operation changed a property on the object:

PropertyName - The name of the changed property.

NewValue - The new property value.

PreviousValue - The previous property value.

AddValue - If the object property contains a set of values, this specifies the new value which was added to the set.

RemoveValue - If the object property contains a set of values, this specifies the value which was removed from the set.

Examples

-------------------------- EXAMPLE 1 --------------------------
C:\PS> Get-LogLowLevelOperation
Get all low level operations

-------------------------- EXAMPLE 2 --------------------------
C:\PS> Get-LogLowLevelOperation -OperationType ConfigurationChange
Get low level operations which log configuration changes.

-------------------------- EXAMPLE 3 --------------------------
C:\PS> Get-LogLowLevelOperation -OperationType AdminActivity
Get low level operations which log administration activities.

-------------------------- EXAMPLE 4 --------------------------
C:\PS> Get-LogLowLevelOperation -Filter { StartTime -ge "2013-02-27 09:00:00" -and EndTime -le "2013-02-27 18:00:00"}
Use advanced filtering to get low level operations with a start time on or after "2013-02-27 09:00:00" and an end time on or before "2013-02-27 18:00:00".

-------------------------- EXAMPLE 5 --------------------------
C:\PS> Get-LogLowLevelOperation -EndTime $null
C:\PS> Get-LogLowLevelOperation -IsSuccessful $null
Either of these commands will get low level operations which have not yet been completed.

-------------------------- EXAMPLE 6 --------------------------

C:\PS> Get-LogLowLevelOperation -User "DOMAIN\UserName"
Get low level operations performed by user "DOMAIN\UserName".
Get-LogService

Oct 01, 2013
Gets the service record entries for the ConfigurationLogging Service.

Syntax

Detailed Description

Returns instances of the ConfigurationLogging Service that the service publishes. The service records contain account security identifier information that can be used to remove each service from the database.

A database connection for the service is required to use this command.

Related topics

Parameters

- **-Property** <String[]>

  Specifies the properties to be be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>false</td>
<td>false</td>
</tr>
</tbody>
</table>

- **-ReturnTotalRecordCount** <SwitchParameter>

  When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Log_Filtering for details.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>False</td>
<td>false</td>
</tr>
</tbody>
</table>

- **-MaxRecordCount** <Int32>

  Specifies the maximum number of records to return.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>250</td>
</tr>
</tbody>
</table>
### -Skip<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>0</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>The default sort order is by name or unique identifier.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -Filter<String>

Gets records that match a PowerShell-style filter expression. See about_Log_Filtering for details.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Return Values**

Citrix.ConfigurationLogging.Sdk.Service
The Get-LogServiceInstance command returns an object containing the following properties.

Uid <Integer>
Specifications the unique identifier for the service in the group. The unique identifier is an index number.

ServiceHostId <Guid>
Specifications the unique identifier for the service instance.

DNSName <String>
Specifications the domain name of the host on which the service runs.

MachineName <String>
Specifications the short name of the host on which the service runs.

CurrentState <Citrix.Fma.Sdk.ServiceCore.ServiceState>
Specifications whether the service is running, started but inactive, stopped, or failed.

LastStartTime <DateTime>
Specifications the date and time at which the service was last restarted.

LastActivityTime <DateTime>
Specifications the date and time at which the service was last stopped or restarted.

OSType
Specifications the operating system installed on the host on which the service runs.

OSVersion
Specifications the version of the operating system installed on the host on which the service runs.

ServiceVersion
Specifications the version number of the service instance. The version number is a string that reflects the full build version of the service.

DatabaseUserName <string>
Specifications for the service instance the Active Directory account name with permissions to access the database. This will be either the machine account or, if the database is running on a controller, the NetworkService account.

Sid <string>
Specifications the Active Directory account security identifier for the machine on which the service instance is running.

ActiveSiteServices <string[]>
Specifications the names of active site services currently running in the service. Site services are components that perform long-running background processing in some services. This field is empty for services that do not contain site services.
Notes
If the command fails, the following errors can be returned.

Error Codes
----------

UnknownObject
One of the specified objects was not found.

PartialData
Only a subset of the available data was returned.

InvalidFilter
A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase
The query required to get the database was not defined.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------
Get all the instances of the ConfigurationLogging Service running in the current service group.
Get-LogServiceAddedCapability

Oct 01, 2013

Gets any added capabilities for the ConfigurationLogging Service on the controller.

Syntax

Get-LogServiceAddedCapability [-AdminAddress <String>] [CommonParameters]

Detailed Description

Enables updates to the ConfigurationLogging Service on the controller to be detected.

You do not need to configure a database connection before using this command.

Related topics

Parameters

- **-AdminAddress**<String>

  Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

**System.String**

String containing added capabilities.

Notes

If the command fails, the following errors can be returned.

Error Codes

-----------

**DatabaseError**

An error occurred in the service while attempting a database operation.

**DatabaseNotConfigured**

The operation could not be completed because the database for the service is not configured.

**DataStoreException**
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-LogServiceAddedCapability
Get the added capabilities of the ConfigurationLogging Service.
Get-LogServiceInstance

Oct 01, 2013
Gets the service instance entries for the ConfigurationLogging Service.

Syntax

Get-LogServiceInstance [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns service interfaces published by the instance of the ConfigurationLogging Service. Each instance of a service publishes multiple interfaces with distinct interface types, and each of these interfaces is represented as a ServiceInstance object. Service instances can be used to register the service with a central configuration service so that other services can use the functionality.

You do not need to configure a database connection to use this command.

Related topics

Parameters

-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

Citrix.ConfigurationLogging.Sdk.ServiceInstance

The Get-LogServiceInstance command returns an object containing the following properties.

ServiceGroupUid <Guid>

Specifies the unique identifier for the service group of which the service is a member.

ServiceGroupName <String>

Specifies the name of the service group of which the service is a member.

ServiceInstanceUID <Guid>

Specifies the unique identifier for registered service instances, which are service instances held by and obtained from a central configuration service. Unregistered service instances do not have unique identifiers.
ServiceType <String>

Specifies the service instance type. For this service, the service instance type is always Log.

Address

Specifies the address of the service instance. The address can be used to access the service and, when registered in the central configuration service, can be used by other services to access the service.

Binding

Specifies the binding type that must be used to communicate with the service instance. In this release of XenDesktop, the binding type is always 'wcf_HTTP_kerb'. This indicates that the service provides a Windows Communication Foundation endpoint that uses HTTP binding with integrated authentication.

Version

Specifies the version of the service instance. The version number is used to ensure that the correct versions of the services are used for communications.

ServiceAccount <String>

Specifies the Active Directory account name for the machine on which the service instance is running. The account name is used to provide information about the permissions required for interservice communications.

ServiceAccountSid <String>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

InterfaceType <String>

Specifies the interface type. Each service can provide multiple service instances, each for a different purpose, and the interface defines the purpose. Available interfaces are:

SDK - for PowerShell operations
InterService - for operations between different services
Peer - for communications between services of the same type

Metadata <Citrix.ConfigurationLogging.Sdk.Metadata[]>

The collection of metadata associated with registered service instances, which are service instances held by and obtained from a central configuration service. Metadata is not stored for unregistered service instances.

Notes

If the command fails, the following errors can be returned.

Error Codes

----------

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

ServiceType        : Log
Version            : 1

Get all instances of the ConfigurationLogging Service running on the specified machine. For remote services, use the AdminAddress parameter to define the service for which the interfaces are required. If the AdminAddress parameter has not been specified for the runspace, service instances running on the local machine are returned.
Get-LogServiceStatus

Oct 01, 2013
Gets the current status of the ConfigurationLogging Service on the controller.

Syntax

Get-LogServiceStatus [-AdminAddress <String>] [CommonParameters>

Detailed Description

Enables the status of the ConfigurationLogging Service on the controller to be monitored. If the service has multiple data stores it will return the overall state as an aggregate of all the data store states. For example, if the site data store status is OK and the secondary data store status is DBUnconfigured then it will return DBUnconfigured.

Related topics

Set-LogDataStore
Set-LogDBConnection
Test-LogDBConnection
Get-LogDBConnection
Get-LogDBSchema

Parameters

-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

The Get-LogServiceStatus command returns an object containing the status of the ConfigurationLogging Service together with extra diagnostics information.

DBUnconfigured

The ConfigurationLogging Service does not have a database connection configured.

DBRejectedConnection
The database rejected the logon attempt from the ConfigurationLogging Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured
The expected stored procedures are missing from the database. This may be because the ConfigurationLogging Service schema has not been added to the database.

DBNotFound
The specified database could not be located with the configured connection string.

DBNewerVersionThanService
The version of the ConfigurationLogging Service currently in use is incompatible with the version of the ConfigurationLogging Service schema on the database. Upgrade the ConfigurationLogging Service to a more recent version.

DBOlderVersionThanService
The version of the ConfigurationLogging Service schema on the database is incompatible with the version of the ConfigurationLogging Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress
A database schema upgrade is currently in progress.

OK
The ConfigurationLogging Service is running and is connected to a database containing a valid schema.

Failed
The ConfigurationLogging Service has failed.

Unknown
(0) The service status cannot be determined.

Notes
If the command fails, the following errors can be returned.

Error Codes
---------

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-LogServiceStatus

DBUnconfigured
Get the current status of the ConfigurationLogging Service.
Get-LogSite

Oct 01, 2013
Gets global configuration logging settings.

Syntax
Get-LogSite [-AdminAddress <String>] [<CommonParameters>]

Detailed Description
This cmdlet retrieves the global configuration logging settings.

Related topics
Set-LogSite

Parameters
-AdminAddress <String>
Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
</tbody>
</table>

Accept Pipeline Input? false

Return Values
Citrix.ConfigurationLogging.Sdk.Site

Get-LogSite returns an object containing the following properties:

- Locale - the current language that logs should be recorded in. Can be: 'en', 'ja', 'zh-CN', 'de', 'es' or 'fr'.
- State - the current state of configuration logging. Can be: Enabled, Disabled, Mandatory or NotSupported.

Examples
-------------------------- EXAMPLE 1 --------------------------
C:\PS> Get-LogSite
Gets configuration logging site settings.
Get-LogSummary

Oct 01, 2013
Gets operations logged within time intervals inside a date range.

Syntax

Get-LogSummary [-StartDateRange <DateTime>] [-EndDateRange <DateTime>] [-IntervalSeconds <Int64>] [-GetLowLevelOperations] [-IncludeIncomplete] [-OperationType <OperationType>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Get-LogSummary cmdlet retrieves summary counts of operations logged within time intervals inside a date range. The returned data indicates the rate at which configuration changes and activities were performed out within a time period.

Related topics

Get-LogHighLevelOperation
Get-LogLowLevelOperation

Parameters

- **StartDateRange**<DateTime>

  Specifies the start of the summary period date range

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>1900-01-01 00:00:00</td>
<td>false</td>
</tr>
</tbody>
</table>

- **EndDateRange**<DateTime>

  Specifies the end of the summary period date range.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>DateTime.UtcNow</td>
<td>false</td>
</tr>
</tbody>
</table>

- **IntervalSeconds**<Int64>

  Specifies the size, in seconds, of each time interval required within the summary date range. If this is not specified, is null, zero or exceeds the specified date range, it defaults to the total number of seconds between EndDateRange and StartDateRange.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Total number of seconds in the EndDateRange and StartDateRange time span.</td>
</tr>
</tbody>
</table>

- **GetLowLevelOperations**<SwitchParameter>
Specifies if the cmdlet should return low level operation summary counts.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>$false - high level operations counts are returned.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **-IncludeIncomplete** (SwitchParameter)

Specifies if incomplete operations should be included in the returned summary counts.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>$false - incomplete operations are excluded.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **-OperationType** (OperationType)

Specifies the type of logged operations to include. Values can be 'AdminActivity' or 'ConfigurationChange'.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **-AdminAddress** (String)

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

The summary data is returned as a collection of dictionary items. The 'Key' value of each dictionary item specifies the start of the time interval within the overall summary date range. The 'Value' data in each dictionary item contains the count of operations which were started within that time interval.

Notes

If the specified summary date range and interval period will result in more than 50,000 intervals being returned Get-LogSummary will generate an error and abort the operation.

Examples

-------------------------- EXAMPLE 1 --------------------------
C:\PS> $logSummary = Get-LogSummary
Get a summary of all completed high level operations. The returned log summary collection will contain a single item for the time period spanning the entire [1900-01-01 00:00:00]-[UtcNow] date range. e.g.

Key ==> Value
01/01/1900 00:00:00 ==> 41

-------------------------- EXAMPLE 2 --------------------------

C:\PS> $daily = 60*60*24
C:\PS> [DateTime]$startRange = "2013-02-01 14:50:39"
C:\PS> [DateTime]$endRange = $startRange.AddDays(14)
C:\PS> Get-LogSummary -StartDateRange $startRange -EndDateRange $endRange -intervalSeconds $daily
Gets a summarised count of completed high level operations logged over two weeks, at daily intervals. The returned log summary collection will contain multiple items; one for each day in the summary date range. - e.g.

Key ==> Value
01/02/2013 14:50:39 ==> 0
02/02/2013 14:50:39 ==> 4
03/02/2013 14:50:39 ==> 21
04/02/2013 14:50:39 ==> 0
05/02/2013 14:50:39 ==> 0
06/02/2013 14:50:39 ==> 0
07/02/2013 14:50:39 ==> 5
08/02/2013 14:50:39 ==> 0
09/02/2013 14:50:39 ==> 0
10/02/2013 14:50:39 ==> 0
11/02/2013 14:50:39 ==> 0
12/02/2013 14:50:39 ==> 7
13/02/2013 14:50:39 ==> 0
14/02/2013 14:50:39 ==> 0
15/02/2013 14:50:39 ==> 12

-------------------------- EXAMPLE 3 --------------------------

C:\PS> $hourly = 60*60
C:\PS> [DateTime]$startRange = "2013-02-03 00:00:00"
C:\PS> [DateTime]$endRange = "2013-02-03 23:59:59"
C:\PS> Get-LogSummary -StartDateRange $startRange -EndDateRange $endRange -intervalSeconds $hourly -GetLowLevelOperations
Gets a summarised count of completed low level operations logged during a day, at hourly intervals. The returned log summary collection will contain multiple items; one for each hour in the summary date range - e.g.

Key ==> Value

<table>
<thead>
<tr>
<th>Date Time</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>04/03/2013 00:00:00</td>
<td>12</td>
</tr>
<tr>
<td>04/03/2013 01:00:00</td>
<td>10</td>
</tr>
<tr>
<td>04/03/2013 02:00:00</td>
<td>5</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>04/03/2013 21:00:00</td>
<td>26</td>
</tr>
<tr>
<td>04/03/2013 22:00:00</td>
<td>0</td>
</tr>
<tr>
<td>04/03/2013 23:00:00</td>
<td>9</td>
</tr>
</tbody>
</table>
Remove-LogOperation

Oct 01, 2013
Deletes configuration logs

Syntax

Remove-LogOperation -DatabaseCredentials <PSCredential> [-StartDateRange <DateTime>] [-EndDateRange <DateTime>] [-IncludeIncomplete] [-LoggingId <Guid>] [-AdminAddress <String>] [-CommonParameters]

Remove-LogOperation -UserName <String> -SecurePassword <SecureString> [-StartDateRange <DateTime>] [-EndDateRange <DateTime>] [-IncludeIncomplete] [-LoggingId <Guid>] [-AdminAddress <String>] [-CommonParameters]

Detailed Description

Remove-LogOperation deletes logs from the Configuration Logging database. This cmdlet targets high level operation logs for deletion. The associated low level operations logs are deleted as part of this operation via cascade deletion functionality present in the configuration logging database schema.

Related topics

Parameters

-DatabaseCredentials <PSCredential>

Specifies the credentials of a database user with permission to delete records from the Configuration Logging database.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-UserName <String>

Specifies the user name of a database user with permission to delete records from the Configuration Logging database.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-SecurePassword <SecureString>

Specifies the password a database user, in secure string form, with permission to delete records from the Configuration Logging database.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-Password <String>

Specifies the password of a database user with permission to delete records from the Configuration Logging database.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-StartDateRange <DateTime>
Specifies the start time of the earliest high level operation to delete

```
-StartDateRange <DateTime>
```

Required? false
Default Value DateTime.Min
Accept Pipeline Input? false

Specifies the end time of the latest high level operation to delete

```
-EndDateRange <DateTime>
```

Required? false
Default Value DateTime.UtcNow
Accept Pipeline Input? false

Specifies if incomplete high level operations should be deleted.

```
-Incomplete <SwitchParameter>
```

Required? false
Default Value
Accept Pipeline Input? false

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

```
-LoggingId <Guid>
```

Required? false
Default Value
Accept Pipeline Input? false

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

```
-AdminAddress <String>
```

Required? false
Default Value Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input? false

Examples

```
-------------------------- EXAMPLE 1 --------------------------
C:\PS> Remove-LogOperation -UserName "DOMAIN\User" -Password "UserPassword"
Remove all completed operation logs

-------------------------- EXAMPLE 2 --------------------------
C:\PS> Remove-LogOperation -UserName "DOMAIN\User" -Password "UserPassword" -Incomplete
Remove all operations

-------------------------- EXAMPLE 3 --------------------------
C:\PS> Remove-LogOperation -UserName "domain\userName" -Password "password" -StartDateRange "2013-01-01 12:00:00" -EndDateRange "2013-01-31 12:00:00"
Delete logs started on or after "2013-01-01 12:00:00" and completed on or before "2013-01-31 12:00:00"

-------------------------- EXAMPLE 4 --------------------------
```
Delete logs by supplying database user credentials via a credentials object.
Remove-LogServiceMetadata

Oct 01, 2013
Removes metadata from the given Service.

Syntax

Remove-LogServiceMetadata [-ServiceHostId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
Remove-LogServiceMetadata [-ServiceHostId] <Guid> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
Remove-LogServiceMetadata [-InputObject] <Service[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
Remove-LogServiceMetadata [-InputObject] <Service[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to remove metadata from the given Service.

Related topics

Set-LogServiceMetadata

Parameters

- **-ServiceHostId**<Guid>
  
  Id of the Service

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

- **-InputObject**<Service[]>
  
  Objects to which metadata is to be removed.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **-Map**<PSObject>
Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with `@{"name1" = "val1"; "name2" = "val2"}`) or a string dictionary (created with `new-object "System.Collections.Generic.Dictionary[String,String]"`). The properties whose names match keys in the map will be removed.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

**-Name <String>**

The metadata property to remove.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-LoggingId <Guid>**

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-AdminAddress <String>**

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Notes**

If the command fails, the following errors can be returned.

**Error Codes**

-----------
InvalidParameterCombination
The cmdlet parameters are inconsistent.

UnknownObject
One of the specified objects was not found.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-LogService | % { Remove-LogServiceMetadata -Map $_.MetadataMap }  
Remove all metadata from all Service objects.
Remove-LogSiteMetadata

Oct 01, 2013
Removes metadata from the given Site.

Syntax

Remove-LogSiteMetadata -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
Remove-LogSiteMetadata -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
Remove-LogSiteMetadata -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
Remove-LogSiteMetadata -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to remove metadata from the given Site.

Related topics

Set-LogSiteMetadata

Parameters

-Name <String>
The metadata property to remove.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-Map <PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]"). The properties whose names match keys in the map will be removed.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-LoggingId <Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-
LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **AdminAddress**: String

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Notes

If the command fails, the following errors can be returned.

Error Codes

--------

- **InvalidParameterCombination**
  The cmdlet parameters are inconsistent.

- **UnknownObject**
  One of the specified objects was not found.

- **DatabaseError**
  An error occurred in the service while attempting a database operation.

- **DatabaseNotConfigured**
  The operation could not be completed because the database for the service is not configured.

- **DataStoreException**
  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- **PermissionDenied**
  You do not have permission to execute this command.

- **AuthorizationError**
There was a problem communicating with the Citrix Delegated Administration Service.

**ConfigurationLoggingError**

The operation could not be performed because of a configuration logging error.

**CommunicationError**

There was a problem communicating with the remote service.

**ExceptionThrown**

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

**Examples**

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-LogSite | % { Remove-LogSiteMetadata -Map $_.MetadataMap }
Remove all metadata from all Site objects.
Reset-LogDataStore

Oct 01, 2013
Refreshes the database string currently being used by the Log service.

Syntax

Reset-LogDataStore [-DataStore <String>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns the string for the database connection currently being used by the ConfigurationLogging Service. Can only be called for secondary data stores.

There is no requirement for a database connection to be configured in order for this command to be used.

Related topics

Get-LogDataStore

Parameters

- **-DataStore <String>**

  Specifies the database connection logical name to be used by the ConfigurationLogging Service. Can be either be 'Site' or the logical name of the secondary data store. Specifying the site data store will display an error because this operation is not supported for site data stores.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Site</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **-LoggingId <Guid>**

  Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **-AdminAddress <String>**

  Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.
<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

**Citrix.ConfigurationLogging.Sdk.ServiceStatus**

The status of the specified data store.

Notes

If the command fails, the following errors can be returned.

Error Codes

-------------

**DatabaseError**

An error occurred in the service while attempting a database operation.

**DatabaseNotConfigured**

The operation could not be completed because the database for the service is not configured.

**DataStoreException**

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

**PermissionDenied**

You do not have permission to execute this command.

**AuthorizationError**

There was a problem communicating with the Citrix Delegated Administration Service.

**ConfigurationLoggingError**

The operation could not be performed because of a configuration logging error.

**CommunicationError**

There was a problem communicating with the remote service.

**ExceptionThrown**

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples
EXAMPLE 1

c:\PS> Reset-LogDataStore -DataStore Secondary
OK
Refresh the database connection string for the Configuration Logging Service.
Reset-LogServiceGroupMembership

Oct 01, 2013
Reloads the access permissions and configuration service locations for the Configuration Logging Service.

Syntax

Detailed Description

Enables you to reload Configuration Logging Service access permissions and configuration service locations. The Reset-LogServiceGroupMembership command must be run on at least one instance of the service type (Log) after installation and registration with the configuration service. Without this operation, the Configuration Logging services will be unable to communicate with other services in the XenDesktop deployment. When the command is run, the services are updated when additional services are added to the deployment, provided that the configuration service is not stopped. The Reset-LogServiceGroupMembership command can be run again to refresh this information if automatic updates do not occur when new services are added to the deployment. If more than one configuration service instance is passed to the command, the first instance that meets the expected service type requirements is used.

Related topics

Parameters

-ConfigServiceInstance <ServiceInstance[]>

Specifies the configuration service instance object that represents the service instance for the type 'InterService' that references a configuration service for the deployment.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
</tr>
</tbody>
</table>

-LoggingId <Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
</tr>
</tbody>
</table>

-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
</tbody>
</table>

Input Type
Citrix.ConfigurationLogging.Sdk.ServiceInstance[] Service instances containing a ServiceInstance object that refers to the central configuration service interservice interface can be piped to the Reset-LogServiceGroupMembership command.

Notes
If the command fails, the following errors can be returned.

Error Codes
--------

NoSuitableServiceInstance
None of the supplied service instance objects were suitable for resetting service group membership.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples
-------------------------- EXAMPLE 1 --------------------------
c:\PS>Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-LogServiceGroupMembership
Reset the service group membership for a service in a deployment where the configuration service is configured and running on the same machine as the service.

-------------------------- EXAMPLE 2 --------------------------
c:\PS>Get-ConfigRegisteredServiceInstance -ServiceType Config -AdminAddress OtherServer.example.com | Reset-LogServiceGroupMembership
Reset the service group membership for a service in a deployment where the configuration service that is configured and running on a machine named 'OtherServer.example.com'.

Set-LogDBConnection

Oct 01, 2013
Configures a database connection for the ConfigurationLogging Service.

Syntax

Set-LogDBConnection [-DBConnection] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [-DataStore <String>] [CommonParameters]

Detailed Description

Configures a connection to a database in which the ConfigurationLogging Service can store its state. The service will attempt to connect and start using the database immediately after the connection is configured. The database connection string is updated to the specified value regardless of whether it is valid or not. Specifying an invalid connection string prevents a service from functioning until the error is corrected.

After a connection is configured, you cannot alter it without first clearing it (by setting the connection to $null).

You do not need to configure a database connection to use this command.

Related topics

Get-LogServiceStatus
Get-LogDBConnection
Test-LogDBConnection

Parameters

-DBConnection <String>

Specifies the database connection string to be used by the ConfigurationLogging Service. Passing in $null will clear any existing database connection configured.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Required?</td>
<td>true</td>
</tr>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-LoggingId <Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Required?</td>
<td>false</td>
</tr>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Required?</td>
<td>false</td>
</tr>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
</tbody>
</table>
Accept Pipeline Input? | false

- `<DataStore>`

Specifies the logical name of the data store for the ConfigurationLogging Service. Can be either be ‘Site’ or the logical name of the secondary data store.

| Required? | false |
| Default Value | Site |

Accept Pipeline Input? | false

Return Values

The Set-LogDBConnection command returns an object containing the status of the ConfigurationLogging Service together with extra diagnostics information.

DBUnconfigured

The ConfigurationLogging Service does not have a database connection configured.

DBRejectedConnection

The database rejected the logon attempt from the ConfigurationLogging Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the ConfigurationLogging Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBNewerVersionThanService

The version of the ConfigurationLogging Service currently in use is incompatible with the version of the ConfigurationLogging Service schema on the database. Upgrade the ConfigurationLogging Service to a more recent version.

DBOlderVersionThanService

The version of the ConfigurationLogging Service schema on the database is incompatible with the version of the ConfigurationLogging Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The ConfigurationLogging Service is running and is connected to a database containing a valid schema.

Failed

The ConfigurationLogging Service has failed.

Unknown
The status of the ConfigurationLogging Service cannot be determined.

Notes
If the command fails, the following errors can be returned.

Error Codes
----------

InvalidDBConnectionString
The database connection string has an invalid format.

DatabaseConnectionDetailsAlreadyConfigured
There was already a database connection configured. After a configuration is set, it can only be set to $null.

DatabaseError
An error occurred in the service while attempting a database operation.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples
-------------------------- EXAMPLE 1 --------------------------
c:\PS>Set-LogDBConnection -DBConnection "Server=serverName\SQLEXPRESS;Initial Catalog = databaseName; Integrated Security = True"
OK
Configures a database connection string for the ConfigurationLogging Service.

-------------------------- EXAMPLE 2 --------------------------
c:\PS>Set-LogDBConnection -DBConnection "Invalid Connection String"
Invalid database connection string format.
Configures an invalid database connection string for the ConfigurationLogging Service.
Set-LogServiceMetadata

Oct 01, 2013
Adds or updates metadata on the given Service.

Syntax

Set-LogServiceMetadata [-ServiceHostId] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<>CommonParameters>

Set-LogServiceMetadata [-ServiceHostId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<>CommonParameters>

Set-LogServiceMetadata [-InputObject] <Service[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<>CommonParameters>

Set-LogServiceMetadata [-InputObject] <Service[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<>CommonParameters>

Detailed Description

Allows you to store additional custom data against given Service objects.

Related topics

Remove-LogServiceMetadata

Parameters

-ServiceHostId <Guid>

Id of the Service

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

-InputObject <Service[]>

Objects to which metadata is to be added.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-Name <String>
Specifies the property name of the metadata to be added. The property must be unique for the Service specified. The property cannot contain any of the following characters `/;:#.*?=<>|[]()"'

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-Value<String>

Specifies the value for the property.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

| Required? | false |
Default Value

<table>
<thead>
<tr>
<th>Default Value</th>
<th>localhost. Once a value is provided by any cmdlet, this value becomes the default.</th>
</tr>
</thead>
</table>

Accept Pipeline Input?

<table>
<thead>
<tr>
<th>Accept Pipeline Input?</th>
<th>false</th>
</tr>
</thead>
</table>

Return Values

Set-LogServiceMetadata returns a dictionary containing the new (name, value)-pairs.

Key <string>

Specifies the name of the property.

Value <string>

Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

----------

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.
ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS> Set-LogServiceMetadata -ServiceHostId 4CECC26E-48E1-423F-A1F0-2A06DD0805C -Name property -Value value

<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>property</td>
<td>value</td>
</tr>
</tbody>
</table>

Add metadata with a name of 'property' and a value of 'value' to the Service with the identifier '4CECC26E-48E1-423F-A1F0-2A06DD0805C'.
Set-LogSite

Oct 01, 2013
Sets global configuration logging settings.

Syntax

[<CommonParameters>]

Detailed Description

This cmdlet sets the global configuration logging settings.

Related topics

Get-LogSite

Parameters

- **-State**: <LoggingState>

Sets the state of configuration logging. Values can be:

- Enabled - state changes will be logged. If logging is unavailable, the state change will still be permitted.
- Disabled - state changes will not be logged.
- Mandatory - state change will be logged. If logging is unavailable, the state change will not be permitted.

When the state is set to Enabled or Mandatory, XenDesktop services will attempt to log operations (which perform configuration changes) before performing them.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **-Locale**: <String>

Sets the language that logs should be recorded in. Values can be: 'en', 'ja', 'zh-CN', 'de', 'es' or 'fr'.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **-PassThru**: <SwitchParameter>

Returns the affected record. By default, this cmdlet does not generate any output.
Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

---

**-LoggingId**<Guid>

Required? false
Default Value
Accept Pipeline Input? false

- **-AdminAddress**<String>

Required? false
Default Value Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input? false

**Return Values**

Citrix.ConfigurationLogging.Sdk.Site
Current logging settings

**Notes**

Configuration logging will automatically transition to a 'NotSupported' state if the logging feature is not licensed. Set-LogSite will reject request to set logging to 'Enabled' or 'Mandatory' while the logging feature is not licensed.

**Examples**

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Set-LogSite -Locale "zh-CN"
Set the logging language to Chinese. The logging state will be unchanged.

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Set-LogSite -State "Mandatory"
Set the logging state to mandatory. The logging locale will be unaffected. In this state, no configuration change will be
allowed unless it is successfully logged.

-------------------------- EXAMPLE 3 --------------------------

C:\PS> Set-LogSite -Locale "de" -State "Enabled"
Set the logging language to German and the state to Enabled.
Set-LogSiteMetadata

Oct 01, 2013
Adds or updates metadata on the given Site.

Syntax

Set-LogSiteMetadata -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]
Set-LogSiteMetadata -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]
Set-LogSiteMetadata -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]
Set-LogSiteMetadata -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Detailed Description

Provides the ability for additional custom data to be stored against given Site objects.

Related topics
Remove-LogSiteMetadata

Parameters

-Name <String>

Specifies the property name of the metadata to be added. The property must be unique for the Site specified. The property cannot contain any of the following characters \:/#.*=?<> []["'"

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | false |

-Value <String>

Specifies the value for the property.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | false |

-Map <PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{

| name1 = "val1";
| name2 = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

| Required? | true |
| Default Value | |
Accept Pipeline Input? true (ByValue)

- **LoggingId**<Guid>
  Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
</tbody>
</table>

Accept Pipeline Input? false

- **AdminAddress**<String>
  Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

Set-LogSiteMetadata returns a dictionary containing the new (name, value)-pairs.

Key <string>

Specifies the name of the property.

Value <string>

Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

----------

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.
DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples
-------------------------- EXAMPLE 1 --------------------------
c:\PS> Set-LogSiteMetadata SiteDUMMY_IdProperty 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>property</td>
<td>value</td>
</tr>
</tbody>
</table>

Add metadata with a name of 'property' and a value of 'value' to the Site with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.
Start-LogHighLevelOperation

Start-LogHighLevelOperation -Text <String> -Source <String> [-StartTime <DateTime>] [-OperationType <OperationType>] [-TargetTypes <String[]>] [-Parameters <Hashtable>][ -AdminAddress <String>][<CommonParameters>

Detailed Description

Start-LogHighLevelOperation creates a log entry to record the start of a high level operation.

Start-LogHighLevelOperation can be called to log high level configuration changes which originate from customized configuration scripts. Start-LogHighLevelOperation should be called before the script invokes service SDK cmdlets which execute the configuration changes.

Start-LogHighLevelOperation returns a HighLevelOperation object which contains information about the started high level operation. The "Id" property of the returned HighLevelOperation uniquely identifies the started high level operation. This can be supplied into the "LoggingId" parameter which is implemented in all service SDK cmdlets which execute loggable configuration changes.

High level operation logs are automatically created by the XenDesktop consoles when:

- Initiating an operation which performs configuration changes.
- Initiating an operation which performs an administration activity.

Configuration Change and Administrator Activity

A configuration change is an operation which alters the configuration of the XenDesktop site. Examples of a configuration changes include:

- Creating or editing a host.
- Creating or editing a catalog.
- Adding a user to a delivery group.
- Deleting a machine.

An administrator activity operation doesn't directly alter site configuration, but it could be an operation carried out by an administrator as part of site management or helpdesk support. Examples of administrator activities include:

- Shutdown/start/restart of a user desktop.
- Studio or Director sending a message to a user.
- Rebooting a user's desktop.

Once the change being logged has completed (whether successfully or not) the Stop-LogHighLevelOperation cmdlet should be called to log the completion of a started high level operation.

Related topics

Stop-LogHighLevelOperation
Get-LogHighLevelOperation

Parameters

- **Text <String>**

  Specifies text to describe the high level operation.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true</td>
</tr>
</tbody>
</table>

- **Source <String>**

  Specifies the source of the high level operation.
### Properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Required?</strong></td>
<td>true</td>
<td></td>
<td>false</td>
</tr>
<tr>
<td><strong>Default Value</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Accept Pipeline Input?</strong></td>
<td>false</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### -StartTime (DateTime)

Specifies the start time of the high level operation.

| Required? | False
| Default Value | DateTime.UtcNow
| Accept Pipeline Input? | False

### -OperationType (OperationType)

Specifies the type of operation being logged. Values can be:

- **AdminActivity** - If the operation being logged performs an administration activity.
- **ConfigurationChange** - If the operation being logged performs a configuration change.

| Required? | False
| Default Value | ConfigurationChange
| Accept Pipeline Input? | False

### -TargetTypes (String)

Specifies the names of the object types that will be affected by the operation being logged.

| Required? | False
| Default Value |               |
| Accept Pipeline Input? | False

### -Parameters (Hashtable)

Specifies the names and values of parameters that are supplied to the operation being logged.

| Required? | False
| Default Value |               |
| Accept Pipeline Input? | False

### -AdminAddress (String)

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

| Required? | False
| Default Value | Localhost. Once a value is provided by any cmdlet, this value becomes the default.
| Accept Pipeline Input? | False

**Return Values**

Citrix.ConfigurationLogging.Sdk.HighLevelOperation

The newly logged high level operation start.

**Examples**

```
C:\PS> $succeeded = $false #indicates if high level operation succeeded.
C:\PS> # Log high level operation start.
C:\PS> $highLevelOp = Start-LogHighLevelOperation -Text "Create catalog" -Source "My Custom Script"
```
C:\PS> try
C:\PS> # Create catalog object
C:\PS> $catalog = New-BrokerCatalog -Name "MyCatalog" -ProvisioningType Manual -AllocationType Permanent -MinimumFunctionalLevel 'LMAX' -LoggingId $highLevelOp.Id
C:\PS>
C:\PS> # Add a machine to the catalog
C:\PS> $machine = New-BrokerMachine -CatalogUid $catalog.Uid -MachineName "DOMAIN\Machine" -LoggingId $highLevelOp.Id
C:\PS> $succeeded = $true
C:\PS>
C:\PS> catch{ "Error encountered" }
C:\PS>
C:\PS> finally{
C:\PS>   # Log high level operation stop, and indicate its success
C:\PS>   Stop-LogHighLevelOperation -HighLevelOperationId $highLevelOp.Id -IsSuccessful $succeeded
C:\PS> }

Creates an unmanaged catalog and assigns a machine to it, within the scope of a high level operation start and stop. The identifier of the high level operation is passed into the "-LoggingId" parameter of the service SDK cmdlets. The execution of the cmdlets in the services will create the low level operation logs for the supplied high level operation.
Stop-LogHighLevelOperation

Oct 01, 2013
Logs the completion of a previously started high level operation.

Syntax
Stop-LogHighLevelOperation -HighLevelOperationId <String> -IsSuccessful <Boolean> [-EndTime <DateTime>] [-AdminAddress <String>] [-<CommonParameters>]

Detailed Description
Stop-LogHighLevelOperation logs the completion of a started high level operation.

Related topics
Start-LogHighLevelOperation
Get-LogHighLevelOperation

Parameters

- **HighLevelOperationId**<String>
  Specifies the identifier of the high level operation being completed.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

- **IsSuccessful**<Boolean>
  Specifies if the started high level operation completed successfully.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

- **EndTime**<DateTime>
  Specifies the end time of the high level operation being completed.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>DateTime.UtcNow</td>
<td>false</td>
</tr>
</tbody>
</table>

- **AdminAddress**<String>
  Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
<td>false</td>
</tr>
</tbody>
</table>

Examples

-------------- EXAMPLE 1 --------------
C:\PS> $succeeded = $false #indicates if high level operation succeeded.
C:\PS> # Log high level operation start.
C:\PS> $highLevelOp = Start-LogHighLevelOperation -Text "Create unmanaged catalog" -Source "My Custom Script"
C:\PS>
C:\PS> try
C:\PS> {
C:\PS>   # Create catalog object

https://docs.citrix.com © 1999-2017 Citrix Systems, Inc. All rights reserved.  p.1828
C:\PS> $catalog = New-BrokerCatalog -Name "MyCatalog" -ProvisioningType Manual -AllocationType Permanent -MinimumFunctionalLevel 'LMAX' -LoggingId $highLevelOp.Id
C:\PS>
C:\PS> # Add a machine to the catalog
C:\PS> $machine = New-BrokerMachine -CatalogUid $catalog.Uid -MachineName "DOMAIN\Machine" -LoggingId $highLevelOp.Id
C:\PS> $succeeded = $true
C:\PS>
C:\PS> catch{ "Error encountered" }
C:\PS>
C:\PS> finally{
C:\PS> # Log high level operation stop, and indicate its success
C:\PS> Stop-LogHighLevelOperation -HighLevelOperationId $highLevelOp.Id -IsSuccessful $succeeded
C:\PS> }

Creates an unmanaged catalog and assigns a machine to it, within the scope of a high level operation start and stop. The identifier of the high level operation is passed into the "-LoggingId" parameter of the service SDK cmdlets. The execution of the cmdlets in the services will create the low level operation logs for the supplied high level operation.
Test-LogDBConnection

Oct 01, 2013
Tests a database connection for the ConfigurationLogging Service.

Syntax

Test-LogDBConnection [-DBConnection] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [-DataStore <String>] [<CommonParameters>]

Detailed Description

Tests a connection to the database in which the ConfigurationLogging Service can store its state. The service will attempt to connect to the database without affecting the current connection to the database.

You do not have to clear the connection to use this command.

Related topics

Get-LogServiceStatus
Get-LogDBConnection
Set-LogDBConnection

Parameters

-DBConnection <String>

Specifies the database connection string to be tested by the ConfigurationLogging Service.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-LoggingId <Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
<td>false</td>
</tr>
</tbody>
</table>

-DataStore <String>

Specifies the logical name of the data store for the ConfigurationLogging Service. Can be either be 'Site' or the logical name of the secondary data store.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Required?</td>
<td>false</td>
</tr>
<tr>
<td>Default Value</td>
<td>Site</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

The Test-LogDBConnection command returns an object containing the status of the ConfigurationLogging Service if the connection string of the specified data store were to be set to the string being tested, together with extra diagnostics information for the specified connection string.

DBRejectedConnection

The database rejected the logon attempt from the ConfigurationLogging Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the ConfigurationLogging Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBNewerVersionThanService

The version of the ConfigurationLogging Service currently in use is incompatible with the version of the ConfigurationLogging Service schema on the database. Upgrade the ConfigurationLogging Service to a more recent version.

DBOlderVersionThanService

The version of the ConfigurationLogging Service schema on the database is incompatible with the version of the ConfigurationLogging Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The Set-LogDBConnection command would succeed if it were executed with the supplied connection string.

Failed

The ConfigurationLogging Service has failed.

Unknown

The status of the ConfigurationLogging Service cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes
InvalidDBConnectionString
The database connection string has an invalid format.

DatabaseError
An error occurred in the service while attempting a database operation.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples
-------------------------- EXAMPLE 1 --------------------------

c:\PS>Test-LogDBConnection -DBConnection "Server=serverName\SQLEXPRESS;Initial Catalog = databaseName; Integrated Security = True"
OK
Tests a database connection string for the ConfigurationLogging Service.

-------------------------- EXAMPLE 2 --------------------------

c:\PS>Test-LogDBConnection -DBConnection "Invalid Connection String"

Invalid database connection string format.
Tests an invalid database connection string for the ConfigurationLogging Service.

about_AdminDelegatedAdminSnapin

Oct 01, 2013

TOPIC

about_AdminDelegatedAdminSnapin

SHORT DESCRIPTION

The Delegated Administration Service PowerShell snap-in provides administrative functions for the Delegated Administration Service.

COMMAND PREFIX

All commands in this snap-in are prefixed with 'Admin'.

LONG DESCRIPTION

The Delegated Administration Service PowerShell snap-in enables both local and remote administration of the Delegated Administration Service.

The Delegated Administration Service (or DAS for short) stores information about Citrix administrators and the rights they have. Services in the XenDesktop deployment use the DAS to determine whether a particular user has the privilege to perform an operation or not.

The snap-in provides storage and configuration of these entities:

Administrators

Each administrator object represents an individual person or a group of people identified by their Active Directory account. Administrators can be enabled and disabled.

The effective rights that a user has is the superset of any rights that they have by looking at their Active Directory group membership. Disabled administrator entries are ignored for this calculation.

Once a site is setup, there must always be a full administrator and the Delegated Administration snap-in rejects requests to remove or disable the last full administrator.

Roles

A role represents a job function. That is, anyone with a given role is expected to be able to use or perform the tasks, wizards, and actions associated with that role. Administrators may have multiple roles for a particular site.
Some roles are built-in, and some editions of the product allow custom roles to be created with different combinations of permissions.

Scopes

Scopes represent a collection of objects, and are used to group objects for administrative purposes in a way that is relevant to the organisation. They can be used to represent both hierarchical and non-hierarchical relationships.

Objects can exist in multiple scopes at once. You may find it easier to think of scopes as labels, or a non-exclusive grouping such as a play-list.

All objects are implicitly in the built-in 'All' scope.

Some objects are not scoped, and access to them is through either the 'All' scope or indirectly through a scoped object. For example sessions are not directly scoped but can be accessed using the scope of the desktop group.

The DAS stores information about scopes, but the mapping between scopes and objects is stored and updated using the PowerShell snap-ins of each corresponding service. For example, Delivery Group scopes are managed using the Broker PowerShell snap-in.

Rights

Rights determine what an administrator can do and where they can do it. They are expressed as a number of <role, scope> pairs associated with each administrator.

To gain access to any particular object, a person must match an administrator object that has an appropriate right that allows the required operation in a scope that the object is a member of.

Permissions

Each task, wizard or action in the Citrix Studio or Director consoles represents a unit of functionality that an administrator can perform. Permissions are expressed at a high level and generally correspond directly to the labels in the consoles. For example: "Edit catalog", or "Create delivery group".
Permission groups:

Permissions are grouped into related functionality when displayed by the console.

Operations

Operations are the indivisible unit of functionality that each XenDesktop service can perform, and usually correspond to individual cmdlets. Internally, each permission requires a number of operations to be performed, possibly by different services.

TOPIC

XenDesktop - Advanced Dataset Filtering

SHORT DESCRIPTION

Describes the common filtering options for XenDesktop cmdlets.

LONG DESCRIPTION

Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get- cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

```
Get-<Noun> | Where { $_.Size = 'Small' } | Sort 'Date' | Select -First 10
```

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

```
Get-<Noun> -Size 'Small' -SortBy 'Date' -MaxRecordCount 10
```

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

- **-MaxRecordCount <int>**

  Specifies the maximum number of results to return.
  For example, to return only the first nine results use:

  ```
  Get-<Noun> -MaxRecordCount 9
  ```

  If not specified, only the first 250 records are returned, and if more are available, a warning is produced:
WARNING: Only first 250 records returned. Use -MaxRecordCount to retrieve more.

You can suppress this warning by using -WarningAction or by specifying a value for -MaxRecordCount.

To retrieve all records, specify a large number for -MaxRecordCount. As the value is an integer, you can use the following:

Get-<Noun> -MaxRecordCount [int]:MaxValue

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. For example:

Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
....
Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<< -MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo : OperationStopped: () [Get-<Noun>], PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>

The count can be accessed using the TotalAvailableResultCount property:

$count = $error[0].TotalAvailableResultCount

-Skip <int>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order, respectively. Ascending order is assumed if no prefix is present.
Sorting occurs before -MaxRecordCount and -Skip parameters are applied. For example, to sort by Name and then by Count (largest first) use:

-`SortBy 'Name,-Count'`

By default, sorting by an enumeration property uses the numeric value of the elements. You can specify a different sort order by qualifying the name with an ordered list of elements or their numeric values, or `<null>` to indicate the placement of null values.
Elements not mentioned are placed at the end in their numeric order.
For example, to sort by two different enums and then by the object id:

-`SortBy 'MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id'`

-`Filter <String>`

This parameter lets you specify advanced filter expressions, and supports combination of conditions with `-and` and `-or`, and grouping with braces. For example:

Get-<Noun> -Filter 'Name -like "High*" -or (Priority -eq 1 -and Severity -ge 2)'

The syntax is close enough to PowerShell syntax that you can use script blocks in most cases. This can be easier to read as it reduces quoting:

Get-<Noun> -Filter { Count -ne $null }

The full `-Filter` syntax is provided below.

**EXAMPLES**

Filtering by strings performs a case-insensitive wildcard match.
Separate parameters are combined with an implicit `-and` operator.
Normal PowerShell quoting rules apply, so you can use single or double quotes, and omit the quotes altogether for many strings. The order of parameters does not make any difference. The following are equivalent:

Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company "citrix" -Product "[X]EN*"
Get-<Noun> -Product "Xen*" -Company "CITRIX"
Get-<Noun> -Filter { Company -eq 'Citrix' -and Product -like 'Xen*' }
See about_Quoting_Rules and about_Wildcards for details about PowerShell handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape the wildcards using the normal PowerShell escape mechanisms (see about_Escape_Characters), or switch to a filter expression and the -eq operator:

\[
\begin{align*}
\text{Get-Noun} -\text{Company} \text{"Abc[^]*"} & \quad \# \text{ Matches Abc*} \\
\text{Get-Noun} -\text{Company} \text{"Abc\*"} & \quad \# \text{ Matches Abc*} \\
\text{Get-Noun} -\text{Filter} \{ \text{Company} -\text{eq} \text{"Abc\*"} \} & \quad \# \text{ Matches Abc*} \\
\text{Get-Noun} -\text{Filter} \{ \text{Company} -\text{eq} \text{"A\"B\"C"} \} & \quad \# \text{ Matches A"B"C} \\
\end{align*}
\]

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

\[
\begin{align*}
\text{Get-Noun} -\text{Uid} 123 \\
\text{Get-Noun} -\text{Enabled} \text{$true} \\
\text{Get-Noun} -\text{Duration} 1:30:40 \\
\text{Get-Noun} -\text{NullableProperty} \text{$null} \\
\end{align*}
\]

More comparisons are possible using advanced filtering with -Filter:

\[
\begin{align*}
\text{Get-Noun} -\text{Filter} \text{"Capacity} \text{-ge} \text{10gb} \text{'} \\
\text{Get-Noun} -\text{Filter} \text{"Age} \text{-ge} 20 \text{ and Age} \text{-lt} 40 \text{'} \\
\text{Get-Noun} -\text{Filter} \text{"VolumeLevel} \text{-like} \text{"[123]"} \\
\text{Get-Noun} -\text{Filter} \text{"Enabled} \text{-ne} \text{$false} \text{"} \\
\text{Get-Noun} -\text{Filter} \text{"NullableProperty} \text{-ne} \text{$null} \text{"} \\
\end{align*}
\]

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

\[
\begin{align*}
\text{Get-Noun} -\text{Filter} \text{"Enabled"} & \quad \# \text{ Equivalent to } \text{"Enabled} \text{-eq} \text{$true} \text{"} \\
\text{Get-Noun} -\text{Filter} \text{"-not Enabled"} & \quad \# \text{ Equivalent to } \text{"Enabled} \text{-eq} \text{$false} \text{"} \\
\end{align*}
\]

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

\[
\begin{align*}
\text{Get-Noun} -\text{Shape} \text{[Shapes]}::\text{Square} \\
\text{Get-Noun} -\text{Shape} \text{Circle} \\
\end{align*}
\]

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:
$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq "Circle" }
Get-<Noun> -Filter { Shape -like 'C' }

By their nature, floating point values, DateTime values, and TimeSpan values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

Get-<Noun> -Filter { StartTime -ge "2010-08-23T12:30:00.0Z" }
$d = [DateTime]"2010-08-23T12:30:00.0Z"
Get-<Noun> -Filter { StartTime -ge $d }
$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter { StartTime -ge $d }

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

Get-<Noun> -Filter { StartTime -ge '-2' }       # Two days ago
Get-<Noun> -Filter { StartTime -ge '-1:30' }    # Hour and a half ago
Get-<Noun> -Filter { StartTime -ge '-0:0:30' }  # 30 seconds ago

ARRAY PROPERTIES
When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings. Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

Get-<Noun> -User Fred*
Get-<Noun> -Filter { User -like "Fred*" }
Get-<Noun> -Filter { Users -contains "Fred*" }

You can also use the singular form with -Filter to search using other operators:

# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter { User -eq "Frederick" }
# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter { User -lt 'F' }

COMPLEX EXPRESSIONS
When matching against multiple values, you can use a sequence of comparisons joined with -or operators, or you can use -in and -notin:

```
Get-<Noun> -Filter { Shape -eq 'Circle' -or Shape -eq 'Square'}
$shapes = 'Circle','Square'
Get-<Noun> -Filter { Shape -in $shapes }
$sides = 1..4
Get-<Noun> -Filter { Sides -notin $sides }
```

Braces can be used to group complex expressions, and override the default left-to-right evaluation of -and and -or. You can also use -not to invert the sense of any sub-expression:

```
Get-<Noun> -Filter { Size -gt 4 -or (Color -eq 'Blue' -and Shape -eq 'Circle')} 
Get-<Noun> -Filter { Sides -lt 5 -and -not (Color -eq 'Blue' -and Shape -eq 'Circle')} 
```

**PAGING**

The simplest way to page through data is to use the -Skip and -MaxRecordCount parameters. So, to read the first three pages of data with 10 records per page, use:

```
Get-<Noun> -Skip 0  -MaxRecordCount 10 <other filtering criteria>
Get-<Noun> -Skip 10 -MaxRecordCount 10 <other filtering criteria>
Get-<Noun> -Skip 20 -MaxRecordCount 10 <other filtering criteria>
```

You must include the same filtering criteria on each call, and ensure that the data is sorted consistently.

The above approach is often acceptable, but as each call performs an independent query, data changes can result in records being skipped or appearing twice. One approach to improve this is to sort by a unique id field and then start the search for the next page at the unique id after the last unique id of the previous page. For example:

```
# Get the first page
Get-<Noun> -MaxRecordCount 10 -SortBy SerialNumber

SerialNumber ... 
----------- ...
A120004
A120007
... 7 other records ...
A120900

# Get the next page
Get-<Noun> -MaxRecordCount 10 -Filter { FirstName -gt 'A120900'}

SerialNumber ...
```
FILTER SYNTAX DEFINITION

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= "{" <ComponentList> "}" 

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> | <Component>

<Component> ::= <NotOperator> <Factor> | <Factor>

<Factor> ::= "{" <ComponentList> "}" | <PropertyName> <ComparisonOperator> <Value> | <PropertyName>

<AndOrOperator> ::= "-and" | "-or"

<NotOperator> ::= "-not" | "!"

<ComparisonOperator>

 ::= "-eq" | "-ne" | "-le" | "-ge" | "-lt" | "-gt" | "-like" | "-notlike" | "-contains" | "-notcontains" | "-in" | "-notin"

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> | <scalar variable> | <array variable> | "$null" | "$true" | "$false"
Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, "-1:30" means 1 hour and 30 minutes ago.
Add-AdminPermission

Add permissions to the set of permissions of a role.

Syntax

Add-AdminPermission [-InputObject] <Permission[]> -Role <String> [-LoggingId <Guid>] [-AdminAddress <String>] [-<CommonParameters>]

Add-AdminPermission [-Permission] <String[]> -Role <String> [-LoggingId <Guid>] [-AdminAddress <String>] [-<CommonParameters>]

Detailed Description

Add extra permissions to the set of permissions that a role maps to.

Any administrator with a right including that role immediately gains the ability to use the operations of the new permissions.

Duplicate permissions do not produce an error, and permissions are skipped if the role already contains the permission (without error).

You cannot modify the permissions of built-in roles.

Related topics

Remove-AdminPermission

Get-AdminPermission

Get-AdminRole

Get-AdminPermissionGroup

Test-AdminAccess

Parameters

-InputObject <Permission[]>

Specifies the permissions to add.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-Permission <String[]>

Specifies the list of permissions to add (by identifier).
- **Role**: String

Role name or identifier of the role to update.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **LoggingId**: Guid

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **AdminAddress**: String

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type

Citrix.DelegatedAdmin.Sdk.Permission You can pipe a list of permissions to be added into this command.

Return Values

None

Examples

-------------------------- EXAMPLE 1 --------------------------
C:\PS> Add-AdminPermission -Role MyRole -Permission Global_Read,Logging_Read
Add a couple of specific permissions to the 'MyRole' role.

-------------------------- EXAMPLE 2 --------------------------

C:\PS> $list = Get-AdminRole "Delivery Administrator" | Select -Expand Permissions
C:\PS> Add-AdminPermission -Role MyRole -Permission $list
Add all of the permissions of the Delivery Administrator role to MyRole.
Add-AdminRight

Oct 01, 2013
Grants a given right to the specified administrator.

Syntax

Add-AdminRight -Scope <String> -Role <String> -Administrator <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
Add-AdminRight -Role <String> -Administrator <String> [-All] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
Add-AdminRight [-InputObject] <Right[]> -Administrator <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Use the Add-AdminRight cmdlet to add rights (role and scope pairs) to an administrator.

For convenience, you can use the -All parameter to specify the 'All' scope.

Use the Get-AdminAdministrator cmdlet to determine what rights an administrator has.

Related topics

Get-AdminAdministrator
Get-AdminEffectiveRight
Remove-AdminRight

Parameters

-InputObject <Right[]>

Specifies the rights to add from Right objects.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-Scope <String>

Specifies the scope name or scope identifier.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
<td></td>
</tr>
<tr>
<td>------------------------</td>
<td>-------</td>
<td></td>
</tr>
</tbody>
</table>

**-Role**<String>

Specifies the role name or role identifier.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-Administrator**<String>

Specifies the name or SID of the administrator.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-All**<SwitchParameter>

Specifies the 'All' scope. This parameter avoids localization issues or having to type the identifier of the 'All' scope.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-LoggingId**<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<p>| | |
| | |
| | |</p>
<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

*Citrix.DelegatedAdmin.Sdk.Right* You can pipe the rights to be added into this command.

**Return Values**

None

**Examples**

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Add-AdminRight -Role 'Help Desk Administrator' -Scope London -Administrator DOMAIN\Admin1
Assigns the 'Help Desk Administrator' role and 'London' scope to the 'Admin1' administrator.

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Add-AdminRight -Role 'Full Administrator' -All -Administrator DOMAIN\Admin1
Assigns the 'Full Administrator' role and 'All' scope to the 'Admin1' administrator.

-------------------------- EXAMPLE 3 --------------------------

C:\PS> $admin = Get-AdminAdministrator -Name DOMAIN\ExistingAdmin
C:\PS> Add-AdminRight -InputObject $admin.Rights -Administrator DOMAIN\NewAdmin
Copies the administrator rights from 'ExistingAdmin' to 'NewAdmin'.
Get-AdminAdministrator

Oct 01, 2013
Gets administrators configured for this site.

Syntax

Detailed Description

Retrieves administrators matching the specified criteria. If no parameters are specified this cmdlet enumerates all administrators.

See about_Admin_Filtering for information about advanced filtering options.

Related topics

New-AdminAdministrator
Set-AdminAdministrator
Remove-AdminAdministrator
Set-AdminAdministratorMetadata
Remove-AdminAdministratorMetadata

Parameters

- **Name**: <String>
  
  Gets administrators with the specified name.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
</tr>
</tbody>
</table>

Accept Pipeline Input? | true (ByValue, ByPropertyName)

- **Sid**: <String>
  
  Gets administrators with the specified SID (security identifier).

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
</tr>
</tbody>
</table>

Accept Pipeline Input? | true (ByProperty Name)
### -Enabled<Boolean>

Gets administrators with the specified value of Enabled.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -Metadata<String>

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: `-Metadata "abc:x*"` matches records with a metadata entry having a key name of "abc" and a value starting with the letter "x".

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -Property<String[]>

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -ReturnTotalRecordCount<SwitchParameter>

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Admin_Filtering for details.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>False</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -MaxRecordCount<Int32>

Specifies the maximum number of records to return.
- **Skip**<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>250</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **SortBy**<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>The default sort order is by name or unique identifier.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **Filter**<String>

Gets records that match a PowerShell-style filter expression. See about_Admin_Filtering for details.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>
Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.DelegatedAdmin.Sdk.Administrator

Get-AdminAdministrator returns an object for each matching administrator.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Get-AdminAdministrator -Name DOMAIN\TestUser
Finds the administrator object (if one exists) for user "DOMAIN\TestUser".

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Get-AdminAdministrator -Enabled $false
Finds all disabled administrator objects.
Get-AdminDBConnection

Oct 01, 2013
Gets the database string for the specified data store used by the DelegatedAdmin Service.

Syntax

Get-AdminDBConnection [-AdminAddress <String>] [CommonParameters]

Detailed Description

Returns the database connection string for the specified data store.

If the returned string is blank, no valid connection string has been specified. In this case the service is running, but is idle and
awaiting specification of a valid connection string.

Related topics

Get-AdminServiceStatus
Get-AdminDataStore
Set-AdminDBConnection
Test-AdminDBConnection

Parameters

/AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name
or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

system.string

The database connection string configured for the DelegatedAdmin Service.

Notes

If the command fails, the following errors can be returned.

Error Codes

---------
NoDBConnections

The database connection string for the DelegatedAdmin Service has not been specified.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-AdminDBConnection

Server=serverName\SQLEXPRESS;Initial Catalog = databaseName; Integrated Security = True
Get the database connection string for the DelegatedAdmin Service.
Get-AdminDBSchema

Oct 01, 2013

Gets a script that creates the DelegatedAdmin Service database schema for the specified data store.

Syntax

Get-AdminDBSchema [-DatabaseName <String>] [-ServiceGroupName <String>] [-ScriptType <ScriptTypes>] [-LocalDatabase] [-Sid <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Gets SQL scripts that can be used to create a new DelegatedAdmin Service database schema, add a new DelegatedAdmin Service to an existing site, remove a DelegatedAdmin Service from a site, or create a database server logon for a DelegatedAdmin Service. If no Sid parameter is provided, the scripts obtained relate to the currently selected DelegatedAdmin Service instance, otherwise the scripts relate to DelegatedAdmin Service instance running on the machine identified by the Sid provided. When obtaining the Evict script, a Sid parameter must be supplied. The current service instance is that on the local machine, or that explicitly specified by the last usage of the -AdminAddress parameter to a DelegatedAdmin SDK cmdlet. The service instance used to obtain the scripts does not need to be a member of a site or to have had its database connection configured. The database scripts support only Microsoft SQL Server, or SQL Server Express, and require Windows integrated authentication to be used. They can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SMDCMD mode'. The ScriptType parameter determines which script is obtained. If ScriptType is not specified, or is FullDatabase, the script contains:

- Creation of service schema
- Creation of database server logon
- Creation of database user
- Addition of database user to DelegatedAdmin Service roles

If ScriptType is Instance, the returned script contains:

- Creation of database server logon
- Creation of database user
- Addition of database user to DelegatedAdmin Service roles

If ScriptType is Evict, the returned script contains:

- Removal of DelegatedAdmin Service instance from database
- Removal of database user

If ScriptType is Login, the returned script contains:

- Creation of database server logon only

If the service uses two data stores they can exist in the same database. You do not need to configure a database before...
using this command.

Related topics
Get-AdminDataStore
Set-AdminDBConnection

Parameters

- **DatabaseName**: String
  
  Specifies the name of the database for which the schema will be generated.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>DatabaseName</td>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

- **ServiceGroupName**: String
  
  Specifies the name of the service group to be used when creating the database schema. The service group is a collection of all the DelegatedAdmin services that share the same database instance and are considered equivalent; that is, all the services within a service group can be used interchangeably.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>ServiceGroupName</td>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

- **ScriptType**: ScriptTypes
  
  Specifies the type of database script returned. Available script types are:

  Database
  
  Returns a full database script that can be used to create a database schema for the DelegatedAdmin Service in a database instance that does not already contain a schema for this service. The DatabaseName and ServiceGroupName parameters must be specified to create a script of this type.

  Instance
  
  Returns a permissions script that can be used to add further DelegatedAdmin services to an existing database instance that already contains the full DelegatedAdmin service schema, associating the services to the Service Group. The Sid parameter can optionally be specified to create a script of this type.

  Login
  
  Returns a database logon script that can be used to add the required logon accounts to an existing database instance that contains the DelegatedAdmin Service schema. This is used primarily when creating a mirrored database environment.
The DatabaseName parameter must be specified to create a script of this type.

Evict

Returns a script that can be used to remove the specified DelegatedAdmin Service from the database entirely. The DatabaseName and Sid parameters must be specified to create a script of this type.

| Required? | false |
| Default Value | Database |
| Accept Pipeline Input? | false |

-LocalDatabase $SwitchParameter

Specifies whether the database script is to be used in a database instance run on the same controller as other services in the service group. Including this parameter ensures the script creates only the required permissions for local services to access the database schema for DelegatedAdmin services.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

-Sid $String

Specifies the SID of the controller on which the DelegatedAdmin Service instance to remove from the database is running.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | true (ByValue) |

-AdminAddress $String

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

| Required? | false |
| Default Value | Localhost. Once a value is provided by any cmdlet, this value becomes the default. |
| Accept Pipeline Input? | false |

Return Values

System.String
A string containing the required SQL script for application to a database.

Notes

The scripts returned support Microsoft SQL Server Express Edition, Microsoft SQL Server Standard Edition, and Microsoft SQL Server Enterprise Edition databases only, and are generated on the assumption that integrated authentication will be used.

If the ScriptType parameter is not included or set to 'FullDatabase', the full database script is returned, which will:

Create the database schema.

Create the user and the role (providing the schema does not already exist).

Create the logon (providing the schema does not already exist).

If the ScriptType parameter is set to 'Instance', the script will:

Create the user and the role (providing the schema does not already exist).

Create the logon (providing the schema does not already exist) and associate it with a user.

If the ScriptType parameter is set to 'Login', the script will:

Create the logon (providing the schema does not already exist) and associate it with a pre-existing user of the same name.

If the LocalDatabase parameter is included, the NetworkService account will be added to the list of accounts permitted to access the database. This is required only if the database is run on a controller.

If the command fails, the following errors can be returned.

Error Codes

-----------

GetSchemasFailed

The database schema could not be found.

ActiveDirectoryAccountResolutionFailed

The specified Active Directory account or Group could not be found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.
PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-AdminDBSchema -DatabaseName MyDB -ServiceGroupName MyServiceGroup > c:\AdminSchema.sql
Get the full database schema for site data store of the DelegatedAdmin Service and copy it to a file called 'c:\AdminSchema.sql'.

This script can then be used to create the schema in a pre-existing database named 'MyDB' that does not already contain a DelegatedAdmin Service site schema.

-------------------------- EXAMPLE 2 --------------------------

c:\PS>Get-AdminDBSchema -DatabaseName MyDB -scriptType Login > c:\DelegatedAdminLogins.sql
Get the logon scripts for the DelegatedAdmin Service.
Get-AdminDBVersionChangeScript

Oct 01, 2013
Gets a script that updates the DelegatedAdmin Service database schema.

Syntax

Get-AdminDBVersionChangeScript -DatabaseName <String> -TargetVersion <Version> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns a database script that can be used to upgrade or downgrade the site or secondary schema for the DelegatedAdmin Service from the current schema version to a different version.

Related topics

Get-AdminInstalledDBVersion

Parameters

-DatabaseName <String>

Specifies the name of the database instance to which the update applies.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-TargetVersion <Version>

Specifies the version of the database you want to update to.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
<td>false</td>
</tr>
</tbody>
</table>
Return Values

System.Management.Automation.PSObject

A PSObject containing the required SQL script for application to a database.

Notes

The PSObject returned by this cmdlet contains the following properties:

-- Script The raw text of the SQL script to apply the update, or null in the case when no upgrade path to the specified target version exists.

-- NeedExclusiveAccess Indicates whether all services in the service group must be shut down during the update or not.

-- CanUndo Indicates whether the generated script allows the updated schema to be reverted to the state prior to the update.

Scripts to update the schema version are stored in the database so any service in the service group can obtain these scripts. Extreme caution should be exercised when using update scripts. Citrix recommends backing up the database before attempting to upgrade the schema. Database update scripts may require exclusive use of the schema and so may not be able to execute while any DelegatedAdmin services are running. However, this depends on the specific update being carried out.

After a schema update has been carried out, services that require the previous version of the schema may cease to operate. The ServiceState parameter reported by the Get-AdminServiceStatus command provides information about service compatibility. For example, if the schema has been upgraded to a more recent version that a service cannot use, the service reports "DBNewerVersionThanService".

If the command fails, the following errors can be returned.

Error Codes

-------

NoOp

The operation was successful but had no effect.

NoDBConnections

The database connection string for the DelegatedAdmin Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> $update = Get-AdminDBVersionChangeScript -DatabaseName MyDb -TargetVersion 1.0.75.0
C:\PS> $update.Script > update_75.sql
Gets an SQL update script to update the current schema to version 1.0.75.0. The resulting update_75.sql script is suitable for direct use with the SQL Server SQLCMD utility.
Get-AdminEffectiveAdministrator

Oct 01, 2013
Retrieve the effective administrator objects for a user.

Syntax
Get-AdminEffectiveAdministrator [-Name] <String> [-AdminAddress <String>] [CommonParameters]

Detailed Description
This command determines what groups the specified user belongs to and retrieves the matching administrator records. It includes the set of rights that would be granted to the user if he or she used the system.

As this command uses Active Directory to determine what groups the user has, the caller must have the ability to read this information from Active Directory.

Only enabled administrator records are returned.

Related topics
Get-AdminAdministrator

Parameters
-Name <String>
User name or SID of user to query

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
</tbody>
</table>

-AdminAddress <String>
Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type
string User name or SID of user to query

Return Values
Citrix.DelegatedAdmin.Sdk.Administrator

Administrator records matching the specified user

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Get-AdminEffectiveAdministrator MYDOMAIN\testuser
Retrieve the administrator records matching user 'testuser'.
Get-AdminEffectiveRight

Oct 01, 2013

 Gets the set of Right objects associated with the current user.

Syntax

Get-AdminEffectiveRight [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Get-AdminEffectiveRight cmdlet returns the effective rights of the current user. This is the superset of all rights of the enabled administrators that the current user matches, taking into account Active Directory group membership.

Related topics

Get-AdminAdministrator
Add-AdminRight
Remove-AdminRight

Parameters

- **-AdminAddress**<String>

  Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.DelegatedAdmin.Sdk.Right

The Rights associated with the current user

Examples

------------- EXAMPLE 1 -------------

C:\PS> Get-AdminEffectiveRight
Return the effective rights for the current user.
Get-AdminInstalledDBVersion

Oct 01, 2013
Gets a list of all available database schema versions for the DelegatedAdmin Service.

Syntax

Get-AdminInstalledDBVersion [-Upgrade] [-Downgrade] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns the current version of the DelegatedAdmin Service database schema, if no flags are set, otherwise returns versions for which upgrade or downgrade scripts are available and have been stored in the database.

Related topics

Parameters

- **-Upgrade** <SwitchParameter>
  Specifies that only schema versions to which the current database version can be updated should be returned.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **-Downgrade** <SwitchParameter>
  Specifies that only schema versions to which the current database version can be reverted should be returned.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **-AdminAddress** <String>
  Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values
System.Version
The Get-AdminInstalledDbVersion command returns objects containing the new definition of the DelegatedAdmin Service database schema version.

Major <Integer>
Minor <Integer>
Build <Integer>
Revision <Integer>

Notes
If the command fails, the following errors can be returned.

Error Codes
-----------

InvalidParameterCombination
Both the Upgrade and Downgrade flags were specified.

NoOp
The operation was successful but had no effect.

NoDBConnections
The database connection string for the DelegatedAdmin Service has not been specified.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------
c:\PS>Get-AdminInstalledDBVersion

<table>
<thead>
<tr>
<th>Major</th>
<th>Minor</th>
<th>Build</th>
<th>Revision</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>6</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

Get the currently installed version of the DelegatedAdmin Service database schema.

-------------------------- EXAMPLE 2 --------------------------
c:\PS>Get-AdminInstalledDBVersion -Upgrade

<table>
<thead>
<tr>
<th>Major</th>
<th>Minor</th>
<th>Build</th>
<th>Revision</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

Get the versions of the DelegatedAdmin Service database schema for which upgrade scripts are supplied.
Get-AdminPermission

Oct 01, 2013
Gets permissions configured for the site.

Syntax

Detailed Description

Retrieves permission matching the specified criteria. If no parameters are specified this cmdlet enumerates all permissions.

Permissions are configured using the Import-AdminRoleConfiguration command, and are used to represent collections of operations that are needed to perform a particular task. These permissions are presented in Citrix Studio when configuring roles.

Permissions can also have metadata associated with them.

See about_Admin_Filtering for information about advanced filtering options.

Related topics

Add-AdminPermission
Remove-AdminPermission
Get-AdminRole
Get-AdminPermissionGroup
Test-AdminAccess

Parameters

-Name <String>
Gets permissions with the specified name (localized)

| Required? | false |
| Default Value |
| Accept Pipeline Input? | true (ByValue, ByPropertyName) |

-Id <String>
Gets permissions with the specified identifier.

| Required? | false |
- **Description**<String>

Gets permissions with the specified description.

| Required? | false |
| Default Value |
| Accept Pipeline Input? | false |

- **GroupId**<String>

Gets permissions that are a member of the specified permission group (by group id).

| Required? | false |
| Default Value |
| Accept Pipeline Input? | false |

- **GroupName**<String>

Gets permissions that are a member of the specified permission group (by group name).

| Required? | false |
| Default Value |
| Accept Pipeline Input? | false |

- **Metadata**<String>

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: `-Metadata "abc:x*"` matches records with a metadata entry having a key name of "abc" and a value starting with the letter "x".

| Required? | false |
| Default Value |
| Accept Pipeline Input? | false |

- **Operation**<String>

Gets permissions that contain a specific operation.
### -ReadOnly [Boolean]

Gets permissions with the specified value for the ReadOnly flag.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -Property [String[]]

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -ReturnTotalRecordCount [SwitchParameter]

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Admin_Filtering for details.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>False</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -MaxRecordCount [Int32]

Specifies the maximum number of records to return.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>250</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -Skip [Int32]

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.
-**SortBy**<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>The default sort order is by name or unique identifier.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**Filter**<String>

Gets records that match a PowerShell-style filter expression. See about_Admin_Filtering for details.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

None You cannot pipe input into this cmdlet.

**Return Values**

Citrix.DelegatedAdmin.Sdk.Permission

Get-AdminPermission returns an object for each matching permission.

**Examples**

-------------------------- EXAMPLE 1 --------------------------
C:\PS> Get-AdminPermission -Name "Edit"
Finds all permissions with 'Edit' in their names.

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Get-AdminPermission -Operation "Broker:SetCatalog"
C:\PS> Get-AdminPermission -Filter { Operations -contains "Broker:SetCatalog" -or Operations -contains "Broker:NewCatalog" }
Finds permissions that contain specific operations, with the -Filter form needed to match multiple values.
Get-AdminPermissionGroup

Oct 01, 2013
Gets permission groups configured for the site.

Syntax

Detailed Description

Retrieves permission groups matching the specified criteria. If no parameters are specified this cmdlet enumerates all permission groups.

Permission groups are configured using the Import-AdminRoleConfiguration command, and are primarily used to store the localized name for a group of permissions. Permission groups can also have metadata associated with them.

See about_Admin_Filtering for information about advanced filtering options.

Related topics

Import-AdminRoleConfiguration
Get-AdminPermission

Parameters

-Name <String>

Gets permission groups matching the given name. This is the localized name of the group.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

-Id <String>

Gets permission groups with the given identifier. This is the non-localized identifier used to associate permissions with permission groups.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-Metadata <String>

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: `-Metadata "abc:x*"` matches records with a metadata entry having a key name of "abc" and a value starting with the letter "x".

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>-Property&lt;String[]&gt;</td>
<td>false</td>
<td>false</td>
<td>false</td>
</tr>
</tbody>
</table>

Specifies the properties to be returned. This is similar to piping the output of the command through `Select-Object`, but the properties are filtered more efficiently at the server.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>-ReturnTotalRecordCount&lt;SwitchParameter&gt;</td>
<td>false</td>
<td>False</td>
<td>false</td>
</tr>
</tbody>
</table>

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Admin_Filtering for details.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>-MaxRecordCount&lt;Int32&gt;</td>
<td>false</td>
<td>250</td>
<td>false</td>
</tr>
</tbody>
</table>

Specifies the maximum number of records to return.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>-Skip&lt;Int32&gt;</td>
<td>false</td>
<td>false</td>
<td>false</td>
</tr>
</tbody>
</table>
-**SortBy**<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>The default sort order is by name or unique identifier.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**Filter**<String>

Gets records that match a PowerShell-style filter expression. See about_Admin_Filtering for details.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

None You cannot pipe input into this cmdlet.

**Return Values**

Citrix.DelegatedAdmin.Sdk.PermissionGroup

Get-AdminPermissionGroup returns an object for each matching permission group.

**Examples**
-------------------------- EXAMPLE 1 --------------------------
C:\PS> Get-AdminPermissionGroup -Name "s"
Finds all permission groups that end with the letter 's'.

-------------------------- EXAMPLE 2 --------------------------
C:\PS> $list = @("Hosts","Other")
C:\PS> Get-AdminPermissionGroup -Filter { Id -in $list } -SortBy Name
Retrieve two specific permission group objects with the matching identifiers.
Get-AdminRevision

Oct 01, 2013
Get the current revision of the delegated administration configuration data.

Syntax

Get-AdminRevision [-AdminAddress <String>] [CommonParameters]

Detailed Description

The Delegated Administration Service maintains a revision number that is incremented whenever its configuration is changed. This command retrieves the current revision number.

Related topics

Parameters

-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type
None
You cannot pipe input into this cmdlet.

Return Values

System.Int32

The configuration revision number

Notes

If Int32.MaxValue is reached the value of the revision number will wrap around to Int32.MinValue.

In some cases the value may be incremented by more than one.

Examples

-------------------- EXAMPLE 1 --------------------

C:\PS> Get-AdminRevision

Retrieve the current revision number.
Get-AdminRole

Oct 01, 2013
Gets roles configured for this site.

Syntax

Detailed Description

Retrieves roles matching the specified criteria. If no parameters are specified, this cmdlet enumerates all roles.

See about_Admin_Filtering for information about advanced filtering options.

Related topics

New-AdminRole
Set-AdminRole
Rename-AdminRole
Remove-AdminRole
Set-AdminRoleMetadata
Remove-AdminRoleMetadata

Parameters

-Name <String>

Gets roles with the specified name.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

-Id <Guid>

Gets the role with the specified identifier.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>true (ByProperty)</td>
</tr>
</tbody>
</table>
### -BuiltIn-<Boolean>

Gets roles with the specified value of the BuiltIn flag.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -Description-<String>

Gets roles with the specified description.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -Metadata-<String>

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: `-Metadata "abc:x*"` matches records with a metadata entry having a key name of "abc" and a value starting with the letter "x".

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -Permission-<String>

Gets roles that contain a specific permission.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -Property-<String[]>

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
</table>
-ReturnTotalRecordCount <SwitchParameter>

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Admin_Filtering for details.

- MaxRecordCount <Int32>

Specifies the maximum number of records to return.

-Skip <Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.
-Filter <String>

Gets records that match a PowerShell-style filter expression. See about_Admin_Filtering for details.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.DelegatedAdmin.Sdk.Role

Get-AdminRole returns an object for each matching role.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Get-AdminRole -Id 20852cdf-527-4953-ba6-e7545217122d

Gets the details of the role with the specific id.

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Get-AdminRole -BuiltIn $false

List all custom roles.
Get-AdminRoleConfiguration

Oct 01, 2013
Gets role configurations for this site.

Syntax

Detailed Description
Retrieves role configurations matching the specified criteria. If no parameters are specified, this cmdlet enumerates and returns all role configurations.

Role configurations are part of the product configuration and define what permissions, permission groups, and built-in roles the product has. This cmdlet also provides the mapping of permissions to operations.

Related topics
Import-AdminRoleConfiguration

Parameters

- **-Name**<String>
  
  Gets role configurations matching the specified name.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

- **-Id**<Guid>

  Gets role configurations with the specified id.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **-Locale**<String>

  Gets role configurations with the specified locale. Role configurations usually have a consistent locale.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
</tr>
</tbody>
</table>
-**Priority** `<Int32>`

Gets role configurations with the specified priority.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**Version** `<String>`

Gets role configurations with the matching version number.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**Property** `<String[]>`

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**ReturnTotalRecordCount** `<SwitchParameter>`

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Admin_Filtering for details.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>False</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**MaxRecordCount** `<Int32>`

Specifies the maximum number of records to return.
## -Skip<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>250</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

## -SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>The default sort order is by name or unique identifier.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

## -Filter<String>

 Gets records that match a PowerShell-style filter expression. See about_Admin_Filtering for details.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

## -AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>
Input Type
None You cannot pipe input into this cmdlet.

Return Values
Citrix.DelegatedAdmin.Sdk.RoleConfiguration

Get-AdminRoleConfiguration returns an object for each matching role configuration.

Notes
This command is supplied for infrastructure purposes only and is not intended for public use.

Examples

-------------------------- EXAMPLE 1 --------------------------
C:\PS> Get-AdminRoleConfiguration -Name Director
Retrieve the role configuration for the Citrix Director component.
Get-AdminScope

Oct 01, 2013
Gets scopes configured for this site.

Syntax

Detailed Description

Retrieves scopes matching the specified criteria. If no parameters are specified this cmdlet enumerates all scopes.

There is one special built-in scope, the 'All' scope.

To determine what objects are currently in a scope, use the Get-<Prefix>ScopedObject from each of the relevant PowerShell snap-ins.

See about_Admin_Filtering for information about advanced filtering options.

Related topics

New-AdminScope

Remove-AdminScopeMetadata

Parameters

-Name <String>

Gets scopes with the specified name.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

Default Value

Accept Pipeline Input?

true (ByValue, ByPropertyName)

-Id <Guid>

Gets the scope with the specified identifier.

<p>| |</p>
<table>
<thead>
<tr>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
</tr>
</tbody>
</table>
-**BuiltIn**<Boolean>

Gets scopes with the specified value of the BuiltIn flag.

-**Description**<String>

Gets scopes with the specified description.

-**Metadata**<String>

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata "abc:x*" matches records with a metadata entry having a key name of "abc" and a value starting with the letter "x".

-**Property**<String[]>

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.
-**ReturnTotalRecordCount**<SwitchParameter>

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Admin_Filtering for details.

| Required? | false |
| Default Value | False |
| Accept Pipeline Input? | false |

-**MaxRecordCount**<Int32>

Specifies the maximum number of records to return.

| Required? | false |
| Default Value | 250 |
| Accept Pipeline Input? | false |

-**Skip**<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

| Required? | false |
| Default Value | 0 |
| Accept Pipeline Input? | false |

-**SortBy**<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

| Required? | false |
| Default Value | The default sort order is by name or unique identifier. |
| Accept Pipeline Input? | false |

-**Filter**<String>

Gets records that match a PowerShell-style filter expression. See about_Admin_Filtering for details.
<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**AdminAddress** `<String>`

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

None You cannot pipe input into this cmdlet.

**Return Values**

Citrix.DelegatedAdmin.Sdk.Scope

Get-AdminScope returns an object for each matching scope.

**Examples**

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Get-AdminScope -Name *Sales*
List all scopes that contain the word 'Sales'.

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Get-AdminScope -Id 21862daf-e529-4553-ba6e-f7543217111e
Gets the details of the scope with the specific id.
Get-AdminService

Oct 01, 2013
Gets the service record entries for the DelegatedAdmin Service.

Syntax

Detailed Description

Returns instances of the DelegatedAdmin Service that the service publishes. The service records contain account security identifier information that can be used to remove each service from the database.

A database connection for the service is required to use this command.

Related topics

Parameters

- **-Property <String[]>**

  Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

<table>
<thead>

**-AdminAddress<String>**

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>
Citrix.DelegatedAdmin.Sdk.Service

The `Get-AdminServiceInstance` command returns an object containing the following properties.

**Uid <Integer>**

Specifies the unique identifier for the service in the group. The unique identifier is an index number.

**ServiceHostId <Guid>**

Specifies the unique identifier for the service instance.

**DNSName <String>**

Specifies the domain name of the host on which the service runs.

**MachineName <String>**

Specifies the short name of the host on which the service runs.

**CurrentState <Citrix.Fma.Sdk.ServiceCore.ServiceState>**

Specifies whether the service is running, started but inactive, stopped, or failed.

**LastStartTime <DateTime>**

Specifies the date and time at which the service was last restarted.

**LastActivityTime <DateTime>**

Specifies the date and time at which the service was last stopped or restarted.

**OSType**

Specifies the operating system installed on the host on which the service runs.

**OSVersion**

Specifies the version of the operating system installed on the host on which the service runs.

**ServiceVersion**

Specifies the version number of the service instance. The version number is a string that reflects the full build version of the service.

**DatabaseUserName <string>**

Specifies for the service instance the Active Directory account name with permissions to access the database. This will be either the machine account or, if the database is running on a controller, the NetworkService account.

**Sid <string>**

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

**ActiveSiteServices <string[]>**
Specifies the names of active site services currently running in the service. Site services are components that perform long-running background processing in some services. This field is empty for services that do not contain site services.

Notes
If the command fails, the following errors can be returned.

Error Codes
----------

UnknownObject
One of the specified objects was not found.

PartialData
Only a subset of the available data was returned.

InvalidFilter
A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase
The query required to get the database was not defined.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.
Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-AdminService

Uid : 1
ServiceHostId : aef6f464-f1ee-4042-a523-66982e0cecd0

ActiveSiteServices : {MySiteService1, MySiteService2...}

Get all the instances of the DelegatedAdmin Service running in the current service group.
Get-AdminServiceAddedCapability

Oct 01, 2013
Gets any added capabilities for the DelegatedAdmin Service on the controller.

Syntax
Get-AdminServiceAddedCapability [-AdminAddress <String>] [CommonParameters]

Detailed Description
Enables updates to the DelegatedAdmin Service on the controller to be detected.
You do not need to configure a database connection before using this command.

Related topics
Parameters

- **-AdminAddress**: <String>
  Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values
System.String
String containing added capabilities.

Notes
If the command fails, the following errors can be returned.

Error Codes
---------
DatabaseError
An error occurred in the service while attempting a database operation.
DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.
DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-AdminServiceAddedCapability
Get the added capabilities of the DelegatedAdmin Service.
Get-AdminServiceInstance

Oct 01, 2013
Gets the service instance entries for the DelegatedAdmin Service.

Syntax

Get-AdminServiceInstance [-AdminAddress <String>] [〈CommonParameters〉]

Detailed Description

Returns service interfaces published by the instance of the DelegatedAdmin Service. Each instance of a service publishes multiple interfaces with distinct interface types, and each of these interfaces is represented as a ServiceInstance object. Service instances can be used to register the service with a central configuration service so that other services can use the functionality.

You do not need to configure a database connection to use this command.

Related topics

Parameters

-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

Citrix.DelegatedAdmin.Sdk.ServiceInstance

The Get-AdminServiceInstance command returns an object containing the following properties.

ServiceGroupUid <Guid>

Specifies the unique identifier for the service group of which the service is a member.

ServiceGroupName <String>

Specifies the name of the service group of which the service is a member.

ServiceInstanceUid <Guid>

Specifies the unique identifier for registered service instances, which are service instances held by and obtained from a central configuration service. Unregistered service instances do not have unique identifiers.
ServiceType <String>

Specifies the service instance type. For this service, the service instance type is always Admin.

Address

Specifies the address of the service instance. The address can be used to access the service and, when registered in the central configuration service, can be used by other services to access the service.

Binding

Specifies the binding type that must be used to communicate with the service instance. In this release of XenDesktop, the binding type is always 'wcf_HTTP_kerb'. This indicates that the service provides a Windows Communication Foundation endpoint that uses HTTP binding with integrated authentication.

Version

Specifies the version of the service instance. The version number is used to ensure that the correct versions of the services are used for communications.

ServiceAccount <String>

Specifies the Active Directory account name for the machine on which the service instance is running. The account name is used to provide information about the permissions required for interservice communications.

ServiceAccountSid <String>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

InterfaceType <String>

Specifies the interface type. Each service can provide multiple service instances, each for a different purpose, and the interface defines the purpose. Available interfaces are:

- SDK - for PowerShell operations
- InterService - for operations between different services
- Peer - for communications between services of the same type

Metadata <Citrix.DelegatedAdmin.Sdk.Metadata[]>

The collection of metadata associated with registered service instances, which are service instances held by and obtained from a central configuration service. Metadata is not stored for unregistered service instances.

Notes

If the command fails, the following errors can be returned.

Error Codes

---------

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

ServiceType : Admin
Version : 1

Get all instances of the DelegatedAdmin Service running on the specified machine. For remote services, use the AdminAddress parameter to define the service for which the interfaces are required. If the AdminAddress parameter has not been specified for the runspace, service instances running on the local machine are returned.
Get-AdminServiceStatus

Oct 01, 2013
Gets the current status of the DelegatedAdmin Service on the controller.

Syntax

Get-AdminServiceStatus [-AdminAddress <String>] [CommonParameters]

Detailed Description

Enables the status of the DelegatedAdmin Service on the controller to be monitored. If the service has multiple data stores it will return the overall state as an aggregate of all the data store states. For example, if the site data store status is OK and the secondary data store status is DBUnconfigured then it will return DBUnconfigured.

Related topics

Set-AdminDataStore
Set-AdminDBConnection
Test-AdminDBConnection
Get-AdminDBConnection
Get-AdminDBSchema

Parameters

-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

The Get-AdminServiceStatus command returns an object containing the status of the DelegatedAdmin Service together with extra diagnostics information.

DBUnconfigured

The DelegatedAdmin Service does not have a database connection configured.

DBRejectedConnection
The database rejected the logon attempt from the DelegatedAdmin Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the DelegatedAdmin Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBNewerVersionThanService

The version of the DelegatedAdmin Service currently in use is incompatible with the version of the DelegatedAdmin Service schema on the database. Upgrade the DelegatedAdmin Service to a more recent version.

DBOlderVersionThanService

The version of the DelegatedAdmin Service schema on the database is incompatible with the version of the DelegatedAdmin Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The DelegatedAdmin Service is running and is connected to a database containing a valid schema.

Failed

The DelegatedAdmin Service has failed.

Unknown

(0) The service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

----------

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

https://docs.citrix.com  © 1999-2017 Citrix Systems, Inc. All rights reserved.  p.1907
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-AdminServiceStatus

DBUnconfigured
Get the current status of the DelegatedAdmin Service.
Import-AdminRoleConfiguration

Oct 01, 2013
Imports role configuration data into the Delegated Administration Service.

Syntax

Detailed Description

This command is intended for use by Citrix Studio to import definitions, roles, permissions, and their mappings to operations.

The supplied configuration requires a digital signature; this is used to validate the integrity of the configuration.

Related topics

Get-AdminRoleConfiguration

Parameters

-Path <String>

The path to the file containing the role configuration data.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-Content <String>

The content of the role configuration data.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-Force <SwitchParameter>

Allows older versions of role configuration to replace newer versions.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
</table>
-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
| Default Value | 
| Accept Pipeline Input? | false |

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

| Required? | false |
| Default Value | Localhost. Once a value is provided by any cmdlet, this value becomes the default. |
| Accept Pipeline Input? | false |

Input Type
None You cannot pipe input into this cmdlet.

Return Values
None

Notes
This command is supplied for infrastructure purposes only and is not intended for public use.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Import-AdminRoleConfiguration -Path 'C:\MyAdminConfig.xml'
Imports the contents of 'C:\MyAdminConfig.xml' to the Delegated Administration Service.
New-AdminAdministrator

Oct 01, 2013
Adds a new administrator to the site.

Syntax

New-AdminAdministrator [-Name] <String> [-Enabled <Boolean>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

New-AdminAdministrator -Sid <String> [-Enabled <Boolean>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

New-AdminAdministrator creates a new administrator object in the site. Once a new administrator has been created you can assign rights (role and scope pairs) to the administrator.

Administrator objects are used to determine what rights, and therefore what permissions a particular Active Directory user has through the various SDKs and consoles of the site.

When the Enabled flag of an administrator is set to false, any rights of the administrator are ignored by the system when performing permission checks.

<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.DelegatedAdmin.Sdk/Administrator

The newly created administrator.

Examples
EXAMPLE 1

C:\PS> New-AdminAdministrator -Name DOMAIN\TestUser
Creates a new administrator object for user "DOMAIN\TestUser". It defaults to enabled.

EXAMPLE 2

C:\PS> New-AdminAdministrator -Sid S-1-2-34-1234567890-1234567890-1234567890-123
Creates a new administrator object for user with SID "S-1-2-34-1234567890-1234567890-1234567890-123". It defaults to enabled.
New-AdminRole

Oct 01, 2013
Adds a new custom role to the site.

Syntax

Detailed Description

New-AdminRole adds a new custom role object to the site. Once a new role has been created, you can add permissions to the role which define what operations the role conveys.

Roles represent a job function, such as 'help desk administrator', and contain a list of permissions that are required to perform that job function.

To assign a role to an administrator, you combine it with a scope which indicates what objects the role can operate on. This pair (also known as a 'right') can then be assigned to an administrator. See Add-AdminRight for further details.

The identifier of the new role is chosen automatically, and custom roles created with this cmdlet always have their BuiltIn flag set to false.

You cannot modify built-in roles, and only some license editions support custom roles.

Related topics

Get-AdminRole
Set-AdminRole
Rename-AdminRole
Remove-AdminRole
Set-AdminRoleMetadata
Remove-AdminRoleMetadata
Add-AdminPermission
Add-AdminRight

Parameters

-Name <String>

Specifies the name of the role. Each role in a site must have a unique name.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------</td>
</tr>
</tbody>
</table>

**-Description**<String>

Specifies the description of the role.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-LoggingId**<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

None You cannot pipe input into this cmdlet.

**Return Values**

Citrix.DelegatedAdmin.Sdk.Role

The newly created role.

**Notes**

Roles are created without any permissions. Use the Add-AdminPermission to add permissions.

**Examples**
EXAMPLE 1

C:\PS> New-AdminRole -Name Supervisor -Description "My custom supervisor role"
C:\PS> $list = Get-AdminRole 'Help Desk Administrator' | Select -Expand Permissions
C:\PS> Add-AdminPermission -Role Supervisor -Permission $list
C:\PS> Add-AdminPermission -Role Supervisor -Permission $extras
C:\PS> Add-AdminRight -Administrator DOMAIN\TestUser -Role Supervisor -All

Creates a new role called 'Supervisor', and then copies the permissions from the help desk role and adds some extras. Then gives this role (with the all scope) to user 'TestUser'.
New-AdminScope

Oct 01, 2013
Adds a new scope to the site.

Syntax

New-AdminScope [-Name <String>] [-Description <String>] [-LoggingId <Guid>] [-AdminAddress <String>]
[<CommonParameters>]

Detailed Description

New-AdminScope adds a new scope object to the site.

A scope represents a collection of objects. Scopes are used to group objects in a way that is relevant to the organization; for example, the set of delivery groups used by the Sales team.

You can create objects in particular scopes by specifying the -Scope parameter of a New- cmdlet for an object that can be scoped. You can then modify the contents of a scope with Add-<Noun>Scope and Remove-<Noun>Scope cmdlets from the corresponding PowerShell snap-ins.

To assign a scope to an administrator, combine it with a role and then assign this pair (also known as a 'right') to an administrator. See Add-AdminRight for further details.

The identifier of the new scope is chosen automatically.

Related topics

<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>
-Description<String>

Specifies the description of the scope.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-LoggingId<Guid>

<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.DelegatedAdmin.Sdk.Scope

The newly created scope.

Examples

-------------------------- EXAMPLE 1 --------------------------
C:\PS> New-AdminScope -Name Sales -Description "Sales department scope"
C:\PS> Add-HypHypervisorConnectionScope -HypervisorConnectionName XenServer2 -Scope Sales
C:\PS> Add-AdminRight -Administrator DOMAIN\TestUser -Role Hosting -Scope Sales
Creates a new scope called 'Sales', adds a hypervisor connection object to the scope, and then assigns the right to use the hosting role on the Sales scope to the 'TestUser' administrator.
Remove-AdminAdministrator

Oct 01, 2013
Removes administrators from the site.

Syntax

Remove-AdminAdministrator [-InputObject] <Administrator[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-AdminAdministrator -Sid <String[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-AdminAdministrator [-Name] <String[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-AdminAdministrator cmdlet deletes administrators from the site.

</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type

Citrix.DelegatedAdmin.Sdk.Administrator You can pipe the administrators to be deleted into this command.

Return Values

None

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Remove-AdminAdministrator DOMAIN\TestUser
Remove the administrator called “DOMAIN\TestUser”.

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Get-AdminAdministrator -Enabled $false | Remove-AdminAdministrator
Remove all disabled administrators.
Remove-AdminAdministratorMetadata

Oct 01, 2013
Removes metadata from the given Administrator.

Syntax

Remove-AdminAdministratorMetadata -AdministratorSid <String> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-AdminAdministratorMetadata -AdministratorSid <String> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-AdminAdministratorMetadata [-AdministratorName] <String> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-AdminAdministratorMetadata [-AdministratorName] <String> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-AdminAdministratorMetadata [-InputObject] <Administrator[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-AdminAdministratorMetadata [-InputObject] <Administrator[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to remove metadata from the given Administrator.

Related topics

Set-AdminAdministratorMetadata

Parameters

-AdministratorName <String>

Name of the Administrator

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
</table>

Default Value

Accept Pipeline Input? true (ByValue, ByPropertyName)

-InputObject <Administrator[]>

Objects to which the metadata is to be added.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>-AdministratorSid</strong>&lt;String&gt;</td>
<td>Sid of the Administrator</td>
</tr>
<tr>
<td><strong>-Map</strong>&lt;PSObject&gt;</td>
<td>Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{&quot;name1&quot; = &quot;val1&quot;; &quot;name2&quot; = &quot;val2&quot;}) or a string dictionary (created with new-object &quot;System.Collections.Generic.Dictionary[String,String]&quot;). <tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Notes

If the command fails, the following errors can be returned.

Error Codes

----------

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-AdminAdministrator | % { Remove-AdminAdministratorMetadata -Map $_.MetadataMap }
Remove all metadata from all Administrator objects.
Remove-AdminPermission

Oct 01, 2013
Remove permissions from the set of permissions of a role.

Syntax

Remove-AdminPermission [-InputObject] <Permission[]> -Role <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-AdminPermission [-Permission] <String[]> -Role <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-AdminPermission -All -Role <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description
Remove permissions from the set of permissions that a role maps to.

Any administrator with a right including that role immediately loses the ability to use the operations of the removed permissions.

Duplicate permissions do not produce an error, and permissions that the roles does not already have are skipped (without error).

You cannot modify the permissions of built-in roles.

Input Type

Citrix.DelegatedAdmin.Sdk.Permission You can pipe a list of permissions to be removed into this command.

Return Values

None

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Remove-AdminPermission -Role MyRole -Permission Global_Read,Logging_Read
Remove a couple of specific permissions from the 'MyRole' role.

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Remove-AdminPermission -Role MyRole -All
Remove all permissions from the 'MyRole' role.
Remove-AdminRight

Oct 01, 2013
Removes rights from an administrator.

Syntax

Remove-AdminRight -Scope <String> -Role <String> -Administrator <String> [-LoggingId <Guid>] [-AdminAddress <String>] [-<CommonParameters>]

Remove-AdminRight -Role <String> -Administrator <String> [-All] [-LoggingId <Guid>] [-AdminAddress <String>] [-<CommonParameters>]

Detailed Description

This command removes rights from the specified administrator.

For convenience, you can use the -All parameter to specify the 'All' scope.

Use the Get-AdminAdministrator cmdlet to determine what rights an administrator has.

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.
### Input Type

Citrix.DelegatedAdmin.Sdk.Right You can pipe the rights to be removed into this command.

### Return Values

None

### Examples

```
-------------------------- EXAMPLE 1 --------------------------
C:\PS> RemoveAdminRight -Role 'Help Desk Administrator' -Scope London -Administrator DOMAIN\Admin1
Removes the 'Help Desk Administrator' role and 'London' scope from user 'Admin1'

-------------------------- EXAMPLE 2 --------------------------
C:\PS> $admin = Get-AdminAdministrator -Name DOMAIN\Admin
C:\PS> Remove-AdminRight -InputObject $admin.Rights -Administrator DOMAIN\Admin
Removes all rights from administrator 'Admin'.
```
Remove-AdminRole

Oct 01, 2013
Removes a role from the site.

Syntax

Remove-AdminRole [-InputObject] <Role[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
Remove-AdminRole [-Id] <Guid[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
Remove-AdminRole [-Name] <String[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-AdminRole cmdlet deletes roles from the site.

You cannot remove built-in roles or roles that are currently assigned to an administrator.

**-AdminAddress**<String>
Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.
---|---
Required? | false
Default Value | Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input? | false

Input Type
Citrix.DelegatedAdmin.Sdk.Role You can pipe the roles to be deleted into this command.

Return Values
None

Examples
-------------------------- EXAMPLE 1 --------------------------
C:\PS> Remove-AdminRole -Name Supervisor
Remove the Supervisor role.

-------------------------- EXAMPLE 2 --------------------------
C:\PS> Get-AdminRole -BuiltIn $false | Remove-AdminRole
Attempt to remove all custom roles. This fails if one of the roles is assigned to an administrator.
Remove-AdminRoleMetadata

Oct 01, 2013
Removes metadata from the given Role.

Syntax

Remove-AdminRoleMetadata [-RoleId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-AdminRoleMetadata [-RoleId] <Guid> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-AdminRoleMetadata [-RoleName] <String> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-AdminRoleMetadata [-RoleName] <String> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-AdminRoleMetadata [-InputObject] <Role[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-AdminRoleMetadata [-InputObject] <Role[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to remove metadata from the given Role.

Related topics

Set-AdminRoleMetadata

Parameters

-**-RoleId**<Guid>
  
Id of the Role

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

-**-RoleName**<String>
  
Name of the Role

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
</table>
### -InputObject `<Role[]>`

Objects to which the metadata is to be added.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>true (ByValue)</td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

### -Map `<PSObject>`

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with `@{"name1" = "val1"; "name2" = "val2"}`) or a string dictionary (created with `new-object "System.Collections.Generic.Dictionary[String,String]"`). The properties whose names match keys in the map will be removed.

<table>

<tbody>
<tr>
<td>true</td>
<td>true (ByValue)</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

### -Name `<String>`

The metadata property to remove.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>true (ByValue)</td>
<td>false</td>
</tr>
</tbody>
</table>

### -LoggingId `<Guid>`

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the `Start-LogHighLevelOperation` and `Stop-LogHighLevelOperation` cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

### -AdminAddress `<String>`
Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Notes

If the command fails, the following errors can be returned.

Error Codes

--------

InvalidParameterCombination
The cmdlet parameters are inconsistent.

UnknownObject
One of the specified objects was not found.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-AdminRole | % { Remove-AdminRoleMetadata -Map $_.MetadataMap }
Remove all metadata from all Role objects.
Remove-AdminScope

Oct 01, 2013
Removes a scope from the site.

Syntax

Remove-AdminScope [-InputObject] <Scope[]> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]
Remove-AdminScope [-Id] <Guid[]> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]
Remove-AdminScope [-Name] <String[]> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Detailed Description

The Remove-AdminScope cmdlet deletes scopes from the site.

You cannot remove the built-in 'All' scope or scopes that are currently assigned to an administrator.

Related topics

New-AdminScope
Get-AdminScope
Set-AdminScope
Rename-AdminScope
Set-AdminScopeMetadata
Remove-AdminScopeMetadata

Parameters

-InputObject <Scope[]>

Specifies the scopes to remove (by scope object).

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByValue) |

-Id <Guid[]>

Specifies the scopes to remove (by scope id).

<p>| Required? | true |
| Default Value | |</p>
<table>
<thead>
<tr>
<th>Accept Pipeline Input?</th>
<th>true (ByPropertyName)</th>
</tr>
</thead>
</table>

**-Name<String[]>**

Specifies the scopes to remove (by scope name).

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-LoggingId<Guid>**

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-AdminAddress<String>**

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type

Citrix.DelegatedAdmin.Sdk.Scope You can pipe the scopes to be deleted into this command.

Return Values

None

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Remove-AdminScope -Name Sales
Remove the Sales scope.

-------------------------- EXAMPLE 2 --------------------------
C:\PS> Get-AdminScope -BuiltIn $false | Remove-AdminScope
Attempt to remove all scopes (excluding the built-in 'All' scope). This fails if one of the scopes is assigned to an administrator.
Remove-AdminScopeMetadata

Oct 01, 2013
Removes metadata from the given Scope.

Syntax

Remove-AdminScopeMetadata [-Scopeld] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
Remove-AdminScopeMetadata [-Scopeld] <Guid> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
Remove-AdminScopeMetadata [-ScopeName] <String> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
Remove-AdminScopeMetadata [-ScopeName] <String> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
Remove-AdminScopeMetadata [-InputObject] <Scope[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
Remove-AdminScopeMetadata [-InputObject] <Scope[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to remove metadata from the given Scope.

Related topics

</table>

**-AdminAddress** `<String>`
Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

| Required? | false |
| Default Value | Localhost. Once a value is provided by any cmdlet, this value becomes the default. |
| Accept Pipeline Input? | false |

Notes
If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination
The cmdlet parameters are inconsistent.

UnknownObject
One of the specified objects was not found.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:PS>Get-AdminScope | % { Remove-AdminScopeMetadata -Map $_.MetadataMap }
Remove all metadata from all Scope objects.
Remove-AdminServiceMetadata

Oct 01, 2013
Removes metadata from the given Service.

Syntax

Remove-AdminServiceMetadata [-ServiceHostId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [-CommonParameters>

Remove-AdminServiceMetadata [-ServiceHostId] <Guid> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [-CommonParameters>

Remove-AdminServiceMetadata [-InputObject] <Service[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [-CommonParameters>

Detailed Description

Provides the ability to remove metadata from the given Service.

Related topics

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------
c:\PS>Get-AdminService | % { Remove-AdminServiceMetadata -Map $_.MetadataMap }
Remove all metadata from all Service objects.
Rename-AdminRole

Oct 01, 2013
Rename a role

Syntax

[<CommonParameters>]

[<CommonParameters>]

[<CommonParameters>]

Detailed Description

The Rename-AdminRole cmdlet changes the name of a role.

Role names must be unique, and you cannot modify the name of built-in roles.

Related topics

New-AdminRole
Get-AdminRole

Remove-AdminRoleMetadata

Parameters

-InputObject <Role>

Specifies the role to rename (by object).

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-Id <Guid>

Specifies the role to rename (by id).

**-Name**<String>

Specifies the role to rename (by name).

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

**-NewName**<String>

Specifies the new name of the role.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-PassThru**<SwitchParameter>

Returns the affected record. By default, this cmdlet does not generate any output.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>False</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-LoggingId**<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-AdminAddress**<String>
Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type

Citrix.DelegatedAdmin.Sdk.Role You can pipe the role to be renamed into this command.

Return Values

None or Citrix.DelegatedAdmin.Sdk.Role

When you use the PassThru parameter, Rename-AdminRole generates a Citrix.DelegatedAdmin.Sdk.Role object. Otherwise, this cmdlet does not generate any output.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Rename-AdminRole -Name Supervisor -NewName HelpDeskLead
Renames the 'Supervisor' role to 'HelpDeskLead'.
Rename-AdminScope

Oct 01, 2013
Rename a scope

Syntax

Rename-AdminScope [-InputObject] <Scope> [-NewName] <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Rename-AdminScope [-Id] <Guid> [-NewName] <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Rename-AdminScope [-Name] <String> [-NewName] <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Rename-AdminScope cmdlet changes the name of a scope.

Scope names must be unique, and you cannot modify the name of the built-in 'All' scope.

Related topics

<td>False</td>
</tr>
<tr>
<td><strong>Default Value</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Accept Pipeline Input?</strong></td>
<td>false</td>
</tr>
</tbody>
</table>

**-AdminAddress <String>**
Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type

Citrix.DelegatedAdmin.Sdk.Scope You can pipe the scope to be renamed into this command.

Return Values

None or Citrix.DelegatedAdmin.Sdk.Scope

When you use the PassThru parameter, Rename-AdminScope generates a Citrix.DelegatedAdmin.Sdk.Scope object. Otherwise, this cmdlet does not generate any output.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Rename-AdminScope -Name Sales -NewName SalesDesktops
Renames the 'Sales' scope to 'SalesDesktops'.
Reset-AdminServiceGroupMembership

Oct 01, 2013
Reloads the access permissions and configuration service locations for the DelegatedAdmin Service.

Syntax

Reset-AdminServiceGroupMembership [-ConfigServiceInstance] <ServiceInstance[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Enables you to reload DelegatedAdmin Service access permissions and configuration service locations. The Reset-AdminServiceGroupMembership command must be run on at least one instance of the service type (Admin) after installation and registration with the configuration service. Without this operation, the DelegatedAdmin services will be unable to communicate with other services in the XenDesktop deployment. When the command is run, the services are updated when additional services are added to the deployment, provided that the configuration service is not stopped. The Reset-AdminServiceGroupMembership command can be run again to refresh this information if automatic updates do not occur when new services are added to the deployment. If more than one configuration service instance is passed to the command, the first instance that meets the expected service type requirements is used.

Related topics

Parameters

- **-ConfigServiceInstance**<ServiceInstance[]>

  Specifies the configuration service instance object that represents the service instance for the type 'InterService' that references a configuration service for the deployment.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **-LoggingId**<Guid>

  Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>false</td>
</tr>
</tbody>
</table>

- **-AdminAddress**<String>

  Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
</tbody>
</table>

Input Type
Citrix.DelegatedAdmin.Sdk.ServiceInstance[] Service instances containing a ServiceInstance object that refers to the central configuration service interservice interface can be piped to the Reset-AdminServiceGroupMembership command.

Notes
If the command fails, the following errors can be returned.

Error Codes
----------
NoSuitableServiceInstance
None of the supplied service instance objects were suitable for resetting service group membership.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples
-------------------------- EXAMPLE 1 --------------------------
c:\PS>Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-AdminServiceGroupMembership
Reset the service group membership for a service in a deployment where the configuration service is configured and running on the same machine as the service.

-------------------------- EXAMPLE 2 --------------------------
c:\PS>Get-ConfigRegisteredServiceInstance -ServiceType Config -AdminAddress OtherServer.example.com | Reset-AdminServiceGroupMembership
Reset the service group membership for a service in a deployment where the configuration service that is configured and running on a machine named 'OtherServer.example.com'.
Set-AdminAdministrator

Sets the properties of an administrator.

Syntax

Set-AdminAdministrator -Sid <String[]> [-Enabled <Boolean>] [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminAdministrator [-Name] <String[]> [-Enabled <Boolean>] [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-AdminAdministrator cmdlet is used to enable or disable an existing administrator.

You can specify the administrators to modify in a number of ways, by piping in existing objects, by passing existing objects with the InputObject parameter, or by specifying the names or SIDs explicitly.

<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

Citrix.DelegatedAdmin.Sdk.Administrator You can pipe the administrators to be modified into this command.

**Return Values**

None or Citrix.DelegatedAdmin.Sdk.Administrator

When you use the PassThru parameter, Set-AdminAdministrator generates a Citrix.DelegatedAdmin.Sdk.Administrator object. Otherwise, this cmdlet does not generate any output.

**Examples**

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Get-AdminAdministrator -Enabled $false | Set-AdminAdministrator -Enabled $true
Enable all administrators that are currently disabled.

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Set-AdminAdministrator -Name DOMAIN\TestUser1,DOMAIN\TestUser2 -Enabled $true
Enable two specific users specified by name (TestUser1 and TestUser2).
Set-AdminAdministratorMetadata

Oct 01, 2013
Adds or updates metadata on the given Administrator.

Syntax

Set-AdminAdministratorMetadata -AdministratorSid <String> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminAdministratorMetadata -AdministratorSid <String> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminAdministratorMetadata [-AdministratorName] <String> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminAdministratorMetadata [-AdministratorName] <String> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminAdministratorMetadata [-InputObject] <Administrator[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminAdministratorMetadata [-InputObject] <Administrator[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability for additional custom data to be stored against given Administrator objects.

Related topics

Remove-AdminAdministratorMetadata

Parameters

-AdministratorName <String>
Name of the Administrator

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByValue, ByPropertyName) |

-InputObject <Administrator[]>
Objects to which the metadata is to be added.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByValue) |

-AdministratorSid <String>
Sid of the Administrator

</table>
Accept Pipeline Input?  false

Return Values
Set-AdminAdministratorMetadata returns a dictionary containing the new (name, value)-pairs.

Key <string>
Specifies the name of the property.

Value <string>
Specifies the value for the property.

Notes
If the command fails, the following errors can be returned.

Error Codes
----------
InvalidParameterCombination
The cmdlet parameters are inconsistent.

UnknownObject
One of the specified objects was not found.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.
Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Set-AdminAdministratorMetadata -AdministratorSid S-1-5-21-1505241163-3345470479-1241728991-1000 -Name property -Value value

<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>property</td>
<td>value</td>
</tr>
</tbody>
</table>

Add metadata with a name of 'property' and a value of 'value' to the Administrator with the identifier 'S-1-5-21-1505241163-3345470479-1241728991-1000'.
Set-AdminDBConnection

Oct 01, 2013
Configures a database connection for the DelegatedAdmin Service.

Syntax

Set-AdminDBConnection [-DBConnection <String>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Configures a connection to a database in which the DelegatedAdmin Service can store its state. The service will attempt to connect and start using the database immediately after the connection is configured. The database connection string is updated to the specified value regardless of whether it is valid or not. Specifying an invalid connection string prevents a service from functioning until the error is corrected.

After a connection is configured, you cannot alter it without first clearing it (by setting the connection to $null).

You do not need to configure a database connection to use this command.

Related topics

Get-AdminServiceStatus
Get-AdminDBConnection
Test-AdminDBConnection

Parameters

-**DBConnection**<String>

Specifies the database connection string to be used by the DelegatedAdmin Service. Passing in $null will clear any existing database connection configured.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
</tr>
</tbody>
</table>

-**LoggingId**<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
</tr>
</tbody>
</table>

-**AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
</tbody>
</table>
Accept Pipeline Input? false

Return Values

The Set-AdminDBConnection command returns an object containing the status of the DelegatedAdmin Service together with extra diagnostics information.

DBUnconfigured

The DelegatedAdmin Service does not have a database connection configured.

DBRejectedConnection

The database rejected the logon attempt from the DelegatedAdmin Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the DelegatedAdmin Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBNewerVersionThanService

The version of the DelegatedAdmin Service currently in use is incompatible with the version of the DelegatedAdmin Service schema on the database. Upgrade the DelegatedAdmin Service to a more recent version.

DBOlderVersionThanService

The version of the DelegatedAdmin Service schema on the database is incompatible with the version of the DelegatedAdmin Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The DelegatedAdmin Service is running and is connected to a database containing a valid schema.

Failed

The DelegatedAdmin Service has failed.

Unknown

The status of the DelegatedAdmin Service cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.
DatabaseConnectionDetailsAlreadyConfigured
There was already a database connection configured. After a configuration is set, it can only be set to $null.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples
-------------------------- EXAMPLE 1 --------------------------
c:\PS>Set-AdminDBConnection -DBConnection "Server=serverName\SQLEXPRESS;Initial Catalog = databaseName; Integrated Security = True"
OK
Configures a database connection string for the DelegatedAdmin Service.
-------------------------- EXAMPLE 2 --------------------------
c:\PS>Set-AdminDBConnection -DBConnection "Invalid Connection String"
Invalid database connection string format.
Configures an invalid database connection string for the DelegatedAdmin Service.
Set-AdminRole

Oct 01, 2013
Set the properties of a role.

Syntax

Set-AdminRole [-InputObject] <Role[]> [-Description <String>] [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminRole [-Id] <Guid[]> [-Description <String>] [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminRole [-Name] <String[]> [-Description <String>] [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-AdminRole command allows the description of custom roles to be updated. You cannot modify built-in roles.

To modify the permissions of a role, use the Add-AdminPermission and Remove-AdminPermission cmdlets.

To update the metadata associated with a role, use the Set-AdminRoleMetadata and Remove-AdminRoleMetadata cmdlets.

Related topics

New-AdminRole
Get-AdminRole
Remove-AdminRole
Rename-AdminRole
Set-AdminRoleMetadata
Remove-AdminRoleMetadata
Add-AdminPermission
Remove-AdminPermission

Parameters

-InputObject <Role[]>

Specifies the roles to update (by object).

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
</tbody>
</table>
**-Id <Guid[]>**

Specifies the roles to update (by id).

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByPropertyName) |

**-Name <String[]>**

Specifies the roles to update (by name).

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByPropertyName) |

**-Description <String>**

Supplies the new description value.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

**-PassThru <SwitchParameter>**

Returns the affected record. By default, this cmdlet does not generate any output.

| Required? | false |
| Default Value | False |
| Accept Pipeline Input? | false |

**-LoggingId <Guid>**

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
### -AdminAddress\<String>\>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

Citrix.DelegatedAdmin.Sdk.Role You can pipe the roles to be updated into this command.

**Return Values**

None or Citrix.DelegatedAdmin.Sdk.Role

When you use the PassThru parameter, Set-AdminRole generates a Citrix.DelegatedAdmin.Sdk.Role object. Otherwise, this cmdlet does not generate any output.

**Examples**

---------- EXAMPLE 1 ----------

C:\PS> Set-AdminRole -Name Supervisor -Description "Helpdesk supervisor role"
Change the description of the 'Supervisor' role.
Set-AdminRoleMetadata

Oct 01, 2013
Adds or updates metadata on the given Role.

Syntax

Set-AdminRoleMetadata [-RoleId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminRoleMetadata [-RoleId] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminRoleMetadata [-RoleName] <String> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminRoleMetadata [-RoleName] <String> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminRoleMetadata [-InputObject] <Role[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminRoleMetadata [-InputObject] <Role[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description
Provides the ability for additional custom data to be stored against given Role objects.

Related topics
Remove-AdminRoleMetadata

Parameters

- **RoleId**<Guid>

Id of the Role

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

- **RoleName**<String>

Name of the Role

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
</table>
**-InputObject** `<Role[]>`

Objects to which the metadata is to be added.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

**-Map** `<PSObject>`

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with `@{"name1" = "val1"; "name2" = "val2"}`) or a string dictionary (created with `new-object "System.Collections.Generic.Dictionary[String,String]"`).

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

**-Name** `<String>`

Specifies the property name of the metadata to be added. The property must be unique for the Role specified. The property cannot contain any of the following characters `/:.#.*?=<|[]"'`.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-Value** `<String>`

Specifies the value for the property.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-LoggingId** `<Guid>`

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create...
high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Return Values**

Set-AdminRoleMetadata returns a dictionary containing the new (name, value)-pairs.

**Key** <string>

Specifies the name of the property.

**Value** <string>

Specifies the value for the property.

**Notes**

If the command fails, the following errors can be returned.

**Error Codes**

---------

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.
DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------
c:\PS>Set-AdminRoleMetadata -RoleId 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>property</td>
<td>value</td>
</tr>
</tbody>
</table>

Add metadata with a name of 'property' and a value of 'value' to the Role with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.
Set-AdminScope

Oct 01, 2013
Set the properties of a scope.

Syntax

Set-AdminScope [-InputObject] <Scope[]> [-Description <String>] [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminScope [-Id] <Guid[]> [-Description <String>] [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminScope [-Name] <String[]> [-Description <String>] [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-AdminScope command allows the description of scopes to be updated. You cannot modify the built-in 'All' scope.

To change the contents of a scope, use the Add-<Noun>Scope and Remove-<Noun>Scope cmdlets from the corresponding PowerShell snap-in.

To update the metadata associated with a scope, use the Set-AdminScopeMetadata and Remove-AdminScopeMetadata cmdlets.

Related topics

</tr>
</tbody>
</table>

-Description<String>
Supplies the new description value.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-PassThru<SwitchParameter>
Returns the affected record. By default, this cmdlet does not generate any output.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>False</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-LoggingId<Guid>
Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>

<td></td>
</tr>
</tbody>
</table>

https://docs.citrix.com © 1999-2017 Citrix Systems, Inc. All rights reserved. p.1976
**-AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

Citrix.DelegatedAdmin.Sdk.Scope You can pipe the scopes to be updated into this command.

**Return Values**

None or Citrix.DelegatedAdmin.Sdk.Scope

When you use the PassThru parameter, Set-AdminScope generates a Citrix.DelegatedAdmin.Sdk.Scope object. Otherwise, this cmdlet does not generate any output.

**Examples**

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Set-AdminScope -Name Sales -Description "Sales department desktops"
Change the description of the 'Sales' scope.
Set-AdminScopeMetadata

Oct 01, 2013
Adds or updates metadata on the given Scope.

Syntax

Set-AdminScopeMetadata [-ScopeId] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminScopeMetadata [-ScopeId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminScopeMetadata [-ScopeName] <String> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminScopeMetadata [-ScopeName] <String> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminScopeMetadata [-InputObject] <Scope[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminScopeMetadata [-InputObject] <Scope[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability for additional custom data to be stored against given Scope objects.

Related topics

Remove-AdminScopeMetadata

Parameters

- **ScopeId** <Guid>

Id of the Scope

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>

<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

Set-AdminScopeMetadata returns a dictionary containing the new (name, value)-pairs.

**Key**<string>

Specifies the name of the property.

**Value**<string>

Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

----------

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.
DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS> Set-AdminScopeMetadata -Scopeld 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>property</td>
<td>value</td>
</tr>
</tbody>
</table>

Add metadata with a name of 'property' and a value of 'value' to the Scope with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

Set-AdminServiceMetadata

Oct 01, 2013
Adds or updates metadata on the given Service.

Syntax

Set-AdminServiceMetadata [-ServiceHostId] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminServiceMetadata [-ServiceHostId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminServiceMetadata [-InputObject] <Service[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminServiceMetadata [-InputObject] <Service[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Allows you to store additional custom data against given Service objects.

Related topics

</table>

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>
Return Values

Set-AdminServiceMetadata returns a dictionary containing the new (name, value)-pairs.

Key <string>
Specifies the name of the property.

Value <string>
Specifies the value for the property.

Notes
If the command fails, the following errors can be returned.

Error Codes

-----------

InvalidParameterCombination
The cmdlet parameters are inconsistent.

UnknownObject
One of the specified objects was not found.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS> Set-AdminServiceMetadata -ServiceHostId 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

Key    Value
---    ----- 
property  value

Add metadata with a name of 'property' and a value of 'value' to the Service with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.
Test-AdminAccess

Oct 01, 2013
Retrieves the scopes where the specified operation is permitted.

Syntax

Test-AdminAccess [-Operation] <String> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

This cmdlet evaluates what rights the current user has, and from these determines the scopes where the specified operation is permitted.

Operations are the indivisible unit of functionality that each XenDesktop service can perform, and usually correspond to individual cmdlets.

Related topics

Parameters

- **-Operation** <String>
  The operation to query.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **-AdminAddress** <String>
  Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

Citrix.DelegatedAdmin.Sdk.ScopeReference

The list of permissible scopes for the specified operation.

Notes

If the specified operation has unrestricted access a single object is returned representing the 'All' scope with a ScopeId of
Guid.Empty (00000000-0000-0000-0000-000000000000).

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Test-AdminAccess -Operation 'Broker:GetCatalog'
Queries the scopes where 'Broker:GetCatalog' is permitted.
Test-AdminDBConnection

Oct 01, 2013
Tests a database connection for the DelegatedAdmin Service.

Syntax

Test-AdminDBConnection [-DBConnection] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Detailed Description

Tests a connection to the database in which the DelegatedAdmin Service can store its state. The service will attempt to connect to the database without affecting the current connection to the database.

You do not have to clear the connection to use this command.

Related topics

Get-AdminServiceStatus
Get-AdminDBConnection
Set-AdminDBConnection

Parameters

-**DBConnection**<String>

Specifies the database connection string to be tested by the DelegatedAdmin Service.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | false |

-**LoggingId**<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

-**AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

| Required? | false |
| Default Value | Localhost. Once a value is provided by any cmdlet, this value becomes the default. |
| Accept Pipeline Input? | false |

Return Values

The Test-AdminDBConnection command returns an object containing the status of the DelegatedAdmin Service if the connection string of the specified data store were to be set to the string being tested, together with extra diagnostics information for the specified connection string.

DBRejectedConnection

The database rejected the logon attempt from the DelegatedAdmin Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the DelegatedAdmin Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBNewerVersionThanService

The version of the DelegatedAdmin Service currently in use is incompatible with the version of the DelegatedAdmin Service schema on the database. Upgrade the DelegatedAdmin Service to a more recent version.

DBOlderVersionThanService

The version of the DelegatedAdmin Service schema on the database is incompatible with the version of the DelegatedAdmin Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The Set-AdminDBConnection command would succeed if it were executed with the supplied connection string.

Failed

The DelegatedAdmin Service has failed.

Unknown

The status of the DelegatedAdmin Service cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

----------

InvalidDBConnectionString

The database connection string has an invalid format.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.
ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------
c:\PS>Test-AdminDBConnection -DBConnection "Server=serverName\SQLEXPRESS;Initial Catalog = databaseName; Integrated Security = True"
OK
Tests a database connection string for the DelegatedAdmin Service.

-------------------------- EXAMPLE 2 --------------------------
c:\PS>Test-AdminDBConnection -DBConnection "Invalid Connection String"
Invalid database connection string format.
Tests an invalid database connection string for the DelegatedAdmin Service.

about_EnvTestEnvTestSnapin

SHORT DESCRIPTION
The Citrix Environment Test Service provides tools to test and inspect the state of a XenDesktop installation.

COMMAND PREFIX
All commands in this snap-in have the noun prefixed with 'EnvTest'.

LONG DESCRIPTION
The Citrix Environment Test Service provides tools to test and inspect the state of a XenDesktop installation at different points during and after configuration and install.
Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get-cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

```
Get-<Noun> | Where { $_.Size = 'Small' } | Sort 'Date' | Select -First 10
```

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get-cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

```
Get-<Noun> -Size 'Small' -SortBy 'Date' -MaxRecordCount 10
```

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

- `-MaxRecordCount <int>`

  Specifies the maximum number of results to return.
  For example, to return only the first nine results use:

  ```
  Get-<Noun> -MaxRecordCount 9
  ```

  If not specified, only the first 250 records are returned, and if more are available, a warning is produced:
WARNING: Only first 250 records returned. Use -MaxRecordCount to retrieve more.

You can suppress this warning by using -WarningAction or by specifying a value for -MaxRecordCount.

To retrieve all records, specify a large number for -MaxRecordCount. As the value is an integer, you can use the following:

```
Get-<Noun> -MaxRecordCount [int]:MaxValue
```

-ReturnTotalRecordCount [<SwitchParameter>]  

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. For example:

```
Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
```

The count can be accessed using the TotalAvailableResultCount property:

```
$count = $error[0].TotalAvailableResultCount
```

-Skip <int>  

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>  

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order, respectively. Ascending order is assumed if no prefix is present.
Sorting occurs before -MaxRecordCount and -Skip parameters are applied. For example, to sort by Name and then by Count (largest first) use:

-SortBy 'Name,-Count'

By default, sorting by an enumeration property uses the numeric value of the elements. You can specify a different sort order by qualifying the name with an ordered list of elements or their numeric values, or <null> to indicate the placement of null values.

Elements not mentioned are placed at the end in their numeric order.
For example, to sort by two different enums and then by the object id:

-SortBy 'MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id'

-Filter <String>

This parameter lets you specify advanced filter expressions, and supports combination of conditions with -and and -or, and grouping with braces. For example:

Get-<Noun> -Filter 'Name -like "High*" -or (Priority -eq 1 -and Severity -ge 2)'

The syntax is close enough to PowerShell syntax that you can use script blocks in most cases. This can be easier to read as it reduces quoting:

Get-<Noun> -Filter { Count -ne $null }

The full -Filter syntax is provided below.

EXAMPLES

Filtering by strings performs a case-insensitive wildcard match.
Separate parameters are combined with an implicit -and operator.
Normal PowerShell quoting rules apply, so you can use single or double quotes, and omit the quotes altogether for many strings. The order of parameters does not make any difference. The following are equivalent:

Get-<Noun> -Company Citrix -Product Xen`
Get-<Noun> -Company "citrix" -Product '[X]EN"'
Get-<Noun> -Product "Xen*** -Company "CITRIX"
Get-<Noun> -Filter { Company -eq 'Citrix' -and Product -like 'Xen***' }
See about_Quoting_Rules and about_Wildcards for details about PowerShell handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape the wildcards using the normal PowerShell escape mechanisms (see about_Escape_Characters), or switch to a filter expression and the -eq operator:

```powershell
Get-<Noun> -Company "Abc[\*]"                 # Matches Abc*
Get-<Noun> -Company "Abc**"                    # Matches Abc*
Get-<Noun> -Filter { Company -eq "Abc**" }    # Matches Abc*
Get-<Noun> -Filter { Company -eq "A""B""C" }   # Matches A"B"C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```powershell
Get-<Noun> -Uid 123
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

```powershell
Get-<Noun> -Filter 'Capacity -ge 10gb'
Get-<Noun> -Filter 'Age -ge 20 -and Age -lt 40'
Get-<Noun> -Filter 'VolumeLevel -like "[123]"'
Get-<Noun> -Filter 'Enabled -ne $false'
Get-<Noun> -Filter 'NullableProperty -ne $null'
```

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

```powershell
Get-<Noun> -Filter 'Enabled'      # Equivalent to 'Enabled -eq $true'
Get-<Noun> -Filter '-not Enabled' # Equivalent to 'Enabled -eq $false'
```

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

```powershell
Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle
```

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:
$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq "Circle" }
Get-<Noun> -Filter { Shape -like 'C' }

By their nature, floating point values, DateTime values, and TimeSpan values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

Get-<Noun> -Filter { StartTime -ge "2010-08-23T12:30:00.0Z" }
$d = [DateTime]"2010-08-23T12:30:00.0Z"
Get-<Noun> -Filter { StartTime -ge $d }
$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter { StartTime -ge $d }

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

Get-<Noun> -Filter { StartTime -ge '-2' }  # Two days ago
Get-<Noun> -Filter { StartTime -ge '-1:30' }  # Hour and a half ago
Get-<Noun> -Filter { StartTime -ge '-0:0:30' }  # 30 seconds ago

ARRAY PROPERTIES
When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings. Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

Get-<Noun> -User Fred*
Get-<Noun> -Filter { User -like "Fred*" }
Get-<Noun> -Filter { Users -contains "Fred*" }

You can also use the singular form with -Filter to search using other operators:

# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter { User -eq "Frederick" }
# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter { User -lt 'F' }

COMPLEX EXPRESSIONS
When matching against multiple values, you can use a sequence of comparisons joined with -or operators, or you can use -in and -notin:

```
Get-<Noun> -Filter { Shape -eq 'Circle' -or Shape -eq 'Square' }
$shapes = 'Circle','Square'
Get-<Noun> -Filter { Shape -in $shapes }
$sides = 1..4
Get-<Noun> -Filter { Sides -notin $sides }
```

Braces can be used to group complex expressions, and override the default left-to-right evaluation of -and and -or. You can also use -not to invert the sense of any sub-expression:

```
Get-<Noun> -Filter { Size -gt 4 -or (Color -eq 'Blue' -and Shape -eq 'Circle') }
Get-<Noun> -Filter { Sides -lt 5 -and -not (Color -eq 'Blue' -and Shape -eq 'Circle') }
```

### PAGING

The simplest way to page through data is to use the -Skip and -MaxRecordCount parameters. So, to read the first three pages of data with 10 records per page, use:

```
Get-<Noun> -Skip 0 -MaxRecordCount 10 <other filtering criteria>
Get-<Noun> -Skip 10 -MaxRecordCount 10 <other filtering criteria>
Get-<Noun> -Skip 20 -MaxRecordCount 10 <other filtering criteria>
```

You must include the same filtering criteria on each call, and ensure that the data is sorted consistently.

The above approach is often acceptable, but as each call performs an independent query, data changes can result in records being skipped or appearing twice. One approach to improve this is to sort by a unique id field and then start the search for the next page at the unique id after the last unique id of the previous page. For example:

```
# Get the first page
Get-<Noun> -MaxRecordCount 10 -SortBy SerialNumber

SerialNumber ... 
----------- ... 
A120004 
A120007 
... 7 other records ...
A120900 

# Get the next page
Get-<Noun> -MaxRecordCount 10 -Filter { FirstName -gt 'A120900' }

SerialNumber ... 
```
FILTER SYNTAX DEFINITION

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= "{" <ComponentList> "}"

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> | <Component>

<Component> ::= <NotOperator> <Factor> | <Factor>

<Factor> ::= "{" <ComponentList> "}" | <PropertyName> <ComparisonOperator> <Value> | <PropertyName>

<AndOrOperator> ::= "-and" | "-or"

<NotOperator> ::= "-not" | "!

<ComparisonOperator>

 ::= ":eq" | ":ne" | ":le" | ":ge" | ":lt" | ":gt" | ":like" | ":notlike" | ":contains" | ":notcontains" | ":in" | ":notin"

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> | <scalar variable> | <array variable> | "$null" | "$true" | "$false"
Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, "-1:30" means 1 hour and 30 minutes ago.
Get-EnvTestDBConnection

Oct 01, 2013

Gets the database string for the specified data store used by the EnvTest Service.

Syntax

Get-EnvTestDBConnection [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns the database connection string for the specified data store.

If the returned string is blank, no valid connection string has been specified. In this case the service is running, but is idle and awaiting specification of a valid connection string.

Related topics

Get-EnvTestServiceStatus
Get-EnvTestDataStore
Set-EnvTestDBConnection
Test-EnvTestDBConnection

Parameters

-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
</tbody>
</table>

Return Values

system:string

The database connection string configured for the EnvTest Service.

Notes

If the command fails, the following errors can be returned.

Error Codes

---------

https://docs.citrix.com

© 1999-2017 Citrix Systems, Inc. All rights reserved.
NoDBConnections

The database connection string for the EnvTest Service has not been specified.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------
c:\PS>Get-EnvTestDBConnection

Server=serverName\SQLEXPRESS;Initial Catalog = databaseName; Integrated Security = True
Get the database connection string for the EnvTest Service.
Get-EnvTestDBSchema

Oct 01, 2013
Gets a script that creates the EnvTest Service database schema for the specified data store.

Syntax

Get-EnvTestDBSchema [-DatabaseName <String>] [-ServiceGroupName <String>] [-ScriptType <ScriptTypes>] [-LocalDatabase] [-Sid <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Gets SQL scripts that can be used to create a new EnvTest Service database schema, add a new EnvTest Service to an existing site, remove a EnvTest Service from a site, or create a database server logon for a EnvTest Service. If no Sid parameter is provided, the scripts obtained relate to the currently selected EnvTest Service instance, otherwise the scripts relate to EnvTest Service instance running on the machine identified by the Sid provided. When obtaining the Evict script, a Sid parameter must be supplied. The current service instance is that on the local machine, or that explicitly specified by the last usage of the -AdminAddress parameter to a EnvTest SDK cmdlet. The service instance used to obtain the scripts does not need to be a member of a site or to have had its database connection configured. The database scripts support only Microsoft SQL Server, or SQL Server Express, and require Windows integrated authentication to be used. They can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SMDCMD mode'. The ScriptType parameter determines which script is obtained. If ScriptType is not specified, or is FullDatabase, the script contains:

- Creation of service schema
- Creation of database server logon
- Creation of database user
- Addition of database user to EnvTest Service roles

If ScriptType is Instance, the returned script contains:

- Creation of database server logon
- Creation of database user
- Addition of database user to EnvTest Service roles

If ScriptType is Evict, the returned script contains:

- Removal of EnvTest Service instance from database
- Removal of database user

If ScriptType is Login, the returned script contains:

- Creation of database server logon only

If the service uses two data stores they can exist in the same database. You do not need to configure a database before using this command.
Related topics
Get-EnvTestDataStore
Set-EnvTestDBConnection

Parameters

- **DatabaseName**<String>
  Specifies the name of the database for which the schema will be generated.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **ServiceGroupName**<String>
  Specifies the name of the service group to be used when creating the database schema. The service group is a collection of all the EnvTest services that share the same database instance and are considered equivalent; that is, all the services within a service group can be used interchangeably.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **ScriptType**<ScriptTypes>
  Specifies the type of database script returned. Available script types are:

  **Database**
  Returns a full database script that can be used to create a database schema for the EnvTest Service in a database instance that does not already contain a schema for this service. The DatabaseName and ServiceGroupName parameters must be specified to create a script of this type.

  **Instance**
  Returns a permissions script that can be used to add further EnvTest services to an existing database instance that already contains the full EnvTest service schema, associating the services to the Service Group. The Sid parameter can optionally be specified to create a script of this type.

  **Login**
  Returns a database logon script that can be used to add the required logon accounts to an existing database instance that contains the EnvTest Service schema. This is used primarily when creating a mirrored database environment. The DatabaseName parameter must be specified to create a script of this type.
Evict

Returns a script that can be used to remove the specified EnvTest Service from the database entirely. The DatabaseName and Sid parameters must be specified to create a script of this type.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Database</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **-LocalDatabase** *(SwitchParameter)*

Specifies whether the database script is to be used in a database instance run on the same controller as other services in the service group. Including this parameter ensures the script creates only the required permissions for local services to access the database schema for EnvTest services.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>false</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **-Sid** *(String)*

Specifies the SID of the controller on which the EnvTest Service instance to remove from the database is running.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>false</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **-AdminAddress** *(String)*

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

`System.String`.

A string containing the required SQL script for application to a database.
Notes

The scripts returned support Microsoft SQL Server Express Edition, Microsoft SQL Server Standard Edition, and Microsoft SQL Server Enterprise Edition databases only, and are generated on the assumption that integrated authentication will be used.

If the ScriptType parameter is not included or set to 'FullDatabase', the full database script is returned, which will:

Create the database schema.

Create the user and the role (providing the schema does not already exist).

Create the logon (providing the schema does not already exist).

If the ScriptType parameter is set to 'Instance', the script will:

Create the user and the role (providing the schema does not already exist).

Create the logon (providing the schema does not already exist) and associate it with a user.

If the ScriptType parameter is set to 'Login', the script will:

Create the logon (providing the schema does not already exist) and associate it with a pre-existing user of the same name.

If the LocalDatabase parameter is included, the NetworkService account will be added to the list of accounts permitted to access the database. This is required only if the database is run on a controller.

If the command fails, the following errors can be returned.

Error Codes

---

GetSchemasFailed

The database schema could not be found.

ActiveDirectoryAccountResolutionFailed

The specified Active Directory account or Group could not be found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-EnvTestDBSchema -DatabaseName MyDB -ServiceGroupName MyServiceGroup > c:\EnvTestSchema.sql
Get the full database schema for site data store of the EnvTest Service and copy it to a file called 'c:\EnvTestSchema.sql'.

This script can then be used to create the schema in a pre-existing database named 'MyDB' that does not already contain a EnvTest Service site schema.

-------------------------- EXAMPLE 2 --------------------------

c:\PS>Get-EnvTestDBSchema -DatabaseName MyDB -scriptType Login > c:\EnvTestLogins.sql
Get the logon scripts for the EnvTest Service.
Get-EnvTestDBVersionChangeScript

Oct 01, 2013
Gets a script that updates the EnvTest Service database schema.

Syntax
Get-EnvTestDBVersionChangeScript -DatabaseName <String> -TargetVersion <Version> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description
Returns a database script that can be used to upgrade or downgrade the site or secondary schema for the EnvTest Service from the current schema version to a different version.

Related topics
Get-EnvTestInstalledDBVersion

Parameters
-DatabaseName <String>
Specifies the name of the database instance to which the update applies.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-TargetVersion <Version>
Specifies the version of the database you want to update to.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-AdminAddress <String>
Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
<td>false</td>
</tr>
</tbody>
</table>
Return Values

System.Management.Automation.PSObject

A PSObject containing the required SQL script for application to a database.

Notes

The PSObject returned by this cmdlet contains the following properties:

-- Script The raw text of the SQL script to apply the update, or null in the case when no upgrade path to the specified target version exists.

-- NeedExclusiveAccess Indicates whether all services in the service group must be shut down during the update or not.

-- CanUndo Indicates whether the generated script allows the updated schema to be reverted to the state prior to the update.

Scripts to update the schema version are stored in the database so any service in the service group can obtain these scripts. Extreme caution should be exercised when using update scripts. Citrix recommends backing up the database before attempting to upgrade the schema. Database update scripts may require exclusive use of the schema and so may not be able to execute while any EnvTest services are running. However, this depends on the specific update being carried out.

After a schema update has been carried out, services that require the previous version of the schema may cease to operate. The ServiceState parameter reported by the Get-EnvTestServiceStatus command provides information about service compatibility. For example, if the schema has been upgraded to a more recent version that a service cannot use, the service reports "DBNewerVersionThanService".

If the command fails, the following errors can be returned.

Error Codes

--------

NoOp

The operation was successful but had no effect.

NoDBConnections

The database connection string for the EnvTest Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for
PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> $update = Get-EnvTestDBVersionChangeScript -DatabaseName MyDb -TargetVersion 1.0.75.0
C:\PS> $update.Script > update_75.sql

Gets an SQL update script to update the current schema to version 1.0.75.0. The resulting update_75.sql script is suitable for direct use with the SQL Server SQLCMD utility.
Get-EnvTestDefinition

Oct 01, 2013
Gets the one or more test definitions

Syntax

Get-EnvTestDefinition [-TestId <String[]>] [-CultureName <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns a list of test definitions that are available from currently running components.

Related topics

Get-EnvTestSuiteDefinition
Get-EnvTestTask
Start-EnvTestTask
Switch-EnvTestTask
Stop-EnvTestTask
Remove-EnvTestTask
Add-EnvTestTaskMetadata
Remove-EnvTestTaskMetadata

Parameters

-TestId <String[]>
The id of one or more tests.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-CultureName <String>
The culture name in which to produce results. The culture name is in standard language/region-code format; for example "en-US".

<table>
<thead>
<tr>
<th>Required?</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
</tr>
</tbody>
</table>
Accept Pipeline Input? | false

**AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

| Required? | false |
| Default Value | Localhost. Once a value is provided by any cmdlet, this value becomes the default. |
| Accept Pipeline Input? | false |

### Input Type

### Return Values

Citrix.EnvTest.Sdk.EnvTestDefinition

One or more test definitions.

### Examples

--------------------------------- EXAMPLE 1 ---------------------------------

```powershell
$allTestDefinitions = Get-EnvTestDefinition
Retrieve all tests.
```

--------------------------------- EXAMPLE 2 ---------------------------------

```powershell
$allTestDefinitionsTranslatedIntoSpanish = Get-EnvTestDefinition -CultureName es-ES
Retrieve all tests with localized properties returned in Spanish.
```

--------------------------------- EXAMPLE 3 ---------------------------------

```powershell
$monitorConfigServiceRegistrationDefinition = Get-EnvTestDefinition -TestId Monitor_RegisteredWithConfigurationService
Retrieve the definition of the 'Monitor_RegisteredWithConfigurationService' test.
```
Get-EnvTestInstalledDBVersion

Oct 01, 2013

Gets a list of all available database schema versions for the EnvTest Service.

Syntax

Get-EnvTestInstalledDBVersion [-Upgrade] [-Downgrade] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns the current version of the EnvTest Service database schema, if no flags are set, otherwise returns versions for which upgrade or downgrade scripts are available and have been stored in the database.

Related topics

Parameters

- **-Upgrade** <SwitchParameter>

  Specifies that only schema versions to which the current database version can be updated should be returned.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

- **-Downgrade** <SwitchParameter>

  Specifies that only schema versions to which the current database version can be reverted should be returned.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

- **-AdminAddress** <String>

  Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values
System.Version

The Get-EnvTestInstalledDbVersion command returns objects containing the new definition of the EnvTest Service
database schema version.

Major <Integer>
Minor <Integer>
Build <Integer>
Revision <Integer>

Notes

If the command fails, the following errors can be returned.

Error Codes

-----------

InvalidParameterCombination

Both the Upgrade and Downgrade flags were specified.

NoOp

The operation was successful but had no effect.

NoDBConnections

The database connection string for the EnvTest Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for
various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-EnvTestInstalledDBVersion

Major Minor Build Revision
----- ----- ----- --------
5    6    0    0
Get the currently installed version of the EnvTest Service database schema.

-------------------------- EXAMPLE 2 --------------------------

c:\PS>Get-EnvTestInstalledDBVersion -Upgrade

Major Minor Build Revision
----- ----- ----- --------
6    0    0    0
Get the versions of the EnvTest Service database schema for which upgrade scripts are supplied.
Get-EnvTestService

Oct 01, 2013

Gets the service record entries for the EnvTest Service.

Syntax

Detailed Description

Returns instances of the EnvTest Service that the service publishes. The service records contain account security identifier information that can be used to remove each service from the database.

A database connection for the service is required to use this command.

Related topics

Parameters

-Property <String[]>

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-ReturnTotalRecordCount <SwitchParameter>

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_EnvTest_Filtering for details.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>False</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-MaxRecordCount <Int32>

Specifies the maximum number of records to return.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
<td>Default Value</td>
</tr>
<tr>
<td>-----------</td>
<td>---------------</td>
</tr>
<tr>
<td>Skip</td>
<td>false</td>
</tr>
<tr>
<td>Default Value</td>
<td>0</td>
</tr>
<tr>
<td>SortBy</td>
<td>false</td>
</tr>
<tr>
<td>Default Value</td>
<td>The default sort order is by name or unique identifier.</td>
</tr>
<tr>
<td>Filter</td>
<td>false</td>
</tr>
<tr>
<td>AdminAddress</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
</tbody>
</table>

**-Skip<Int32>**

Skips the specified number of records before returning results. Also reduces the count returned by `-ReturnTotalRecordCount`.

**-SortBy<String>**

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

**-Filter<String>**

Gets records that match a PowerShell-style filter expression. See about_EnvTest_Filtering for details.

**-AdminAddress<String>**

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.
Citrix.EnvTest.Sdk.Service

The Get-EnvTestServiceInstance command returns an object containing the following properties.

Uid <Integer>

Specifies the unique identifier for the service in the group. The unique identifier is an index number.

ServiceHostId <Guid>

Specifies the unique identifier for the service instance.

DNSName <String>

Specifies the domain name of the host on which the service runs.

MachineName <String>

Specifies the short name of the host on which the service runs.

CurrentState <Citrix.Fma.Sdk.ServiceCore.ServiceState>

Specifies whether the service is running, started but inactive, stopped, or failed.

LastStartTime <DateTime>

Specifies the date and time at which the service was last restarted.

LastActivityTime <DateTime>

Specifies the date and time at which the service was last stopped or restarted.

OSType

Specifies the operating system installed on the host on which the service runs.

OSVersion

Specifies the version of the operating system installed on the host on which the service runs.

ServiceVersion

Specifies the version number of the service instance. The version number is a string that reflects the full build version of the service.

DatabaseUserName <string>

Specifies for the service instance the Active Directory account name with permissions to access the database. This will be either the machine account or, if the database is running on a controller, the NetworkService account.

Sid <string>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

ActiveSiteServices <string[]>
Specifies the names of active site services currently running in the service. Site services are components that perform long-running background processing in some services. This field is empty for services that do not contain site services.

Notes

If the command fails, the following errors can be returned.

Error Codes

----------

UnknownObject
One of the specified objects was not found.

PartialData
Only a subset of the available data was returned.

InvalidFilter
A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase
The query required to get the database was not defined.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.
Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-EnvTestService

Uid          : 1
ServiceHostId : aef6f464-f1ee-4042-a523-66982e0cecd0
DNSName      : MyServer.company.com
MachineName  : MYSERVER
CurrentState : On
LastStartTime: 04/04/2011 15:25:38
LastActivityTime: 04/04/2011 15:33:39
OSType       : Win32NT
OSVersion    : 6.1.7600.0
ServiceVersion: 5.1.0.0
DatabaseUserName : NT AUTHORITY\NETWORK SERVICE
SID          : S-1-5-21-2316621082-1546847349-2782505528-1165
ActiveSiteServices : {MySiteService1, MySiteService2...}

Get all the instances of the EnvTest Service running in the current service group.
Get-EnvTestServiceAddedCapability

Oct 01, 2013
Gets any added capabilities for the EnvTest Service on the controller.

Syntax

Get-EnvTestServiceAddedCapability [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Enables updates to the EnvTest Service on the controller to be detected.
You do not need to configure a database connection before using this command.

Related topics

Parameters

-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

System.String

String containing added capabilities.

Notes

If the command fails, the following errors can be returned.

Error Codes

-----------

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-EnvTestServiceAddedCapability
Get the added capabilities of the EnvTest Service.
Get-EnvTestServiceInstance

Oct 01, 2013

Gets the service instance entries for the EnvTest Service.

Syntax

Get-EnvTestServiceInstance [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns service interfaces published by the instance of the EnvTest Service. Each instance of a service publishes multiple interfaces with distinct interface types, and each of these interfaces is represented as a ServiceInstance object. Service instances can be used to register the service with a central configuration service so that other services can use the functionality.

You do not need to configure a database connection to use this command.

Related topics

Parameters

-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Default Value</th>
<th>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

Citrix.EnvTest.Sdk.ServiceInstance

The Get-EnvTestServiceInstance command returns an object containing the following properties.

ServiceGroupUid <Guid>

Specifies the unique identifier for the service group of which the service is a member.

ServiceGroupName <String>

Specifies the name of the service group of which the service is a member.

ServiceInstanceUID <Guid>

Specifies the unique identifier for registered service instances, which are service instances held by and obtained from a central configuration service. Unregistered service instances do not have unique identifiers.
ServiceType <String>

Specifies the service instance type. For this service, the service instance type is always EnvTest.

Address

Specifies the address of the service instance. The address can be used to access the service and, when registered in the central configuration service, can be used by other services to access the service.

Binding

Specifies the binding type that must be used to communicate with the service instance. In this release of XenDesktop, the binding type is always 'wcf_HTTP_kerb'. This indicates that the service provides a Windows Communication Foundation endpoint that uses HTTP binding with integrated authentication.

Version

Specifies the version of the service instance. The version number is used to ensure that the correct versions of the services are used for communications.

ServiceAccount <String>

Specifies the Active Directory account name for the machine on which the service instance is running. The account name is used to provide information about the permissions required for interservice communications.

ServiceAccountSid <String>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

InterfaceType <String>

Specifies the interface type. Each service can provide multiple service instances, each for a different purpose, and the interface defines the purpose. Available interfaces are:

SDK - for PowerShell operations

InterService - for operations between different services

Peer - for communications between services of the same type

Metadata <Citrix.EnvTest.Sdk.Metadata[]>

The collection of metadata associated with registered service instances, which are service instances held by and obtained from a central configuration service. Metadata is not stored for unregistered service instances.

Notes

If the command fails, the following errors can be returned.

Error Codes

---------

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

ServiceType : EnvTest
Version : 1

Get all instances of the EnvTest Service running on the specified machine. For remote services, use the AdminAddress parameter to define the service for which the interfaces are required. If the AdminAddress parameter has not been specified for the runspace, service instances running on the local machine are returned.
Get-EnvTestServiceStatus

Oct 01, 2013

Gets the current status of the EnvTest Service on the controller.

Syntax

Get-EnvTestServiceStatus [-AdminAddress <String>] [CommonParameters]

Detailed Description

Enables the status of the EnvTest Service on the controller to be monitored. If the service has multiple data stores it will return the overall state as an aggregate of all the data store states. For example, if the site data store status is OK and the secondary data store status is DBUnconfigured then it will return DBUnconfigured.

Related topics

Set-EnvTestDataStore
Set-EnvTestDBConnection
Test-EnvTestDBConnection
Get-EnvTestDBConnection
Get-EnvTestDBSchema

Parameters

-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

The Get-EnvTestServiceStatus command returns an object containing the status of the EnvTest Service together with extra diagnostics information.

DBUnconfigured

The EnvTest Service does not have a database connection configured.

DBRejectedConnection
The database rejected the logon attempt from the EnvTest Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the EnvTest Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBNewerVersionThanService

The version of the EnvTest Service currently in use is incompatible with the version of the EnvTest Service schema on the database. Upgrade the EnvTest Service to a more recent version.

DBOlderVersionThanService

The version of the EnvTest Service schema on the database is incompatible with the version of the EnvTest Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The EnvTest Service is running and is connected to a database containing a valid schema.

Failed

The EnvTest Service has failed.

Unknown

(0) The service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-EnvTestServiceStatus

DBUnconfigured
Get the current status of the EnvTest Service.
Get-EnvTestSuiteDefinition

Oct 01, 2013
Gets one or more test suite definitions.

Syntax

Get-EnvTestSuiteDefinition [-TestSuiteId <String[]>] [-CultureName <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns a list of test suite definitions that are available from currently running components.

Related topics

Switch-EnvTestTask
Stop-EnvTestTask
Remove-EnvTestTask
Add-EnvTestTaskMetadata
Remove-EnvTestTaskMetadata

Parameters

-<TestSuiteId><String[]>

The id of one or more test suites.

<table>
<thead>
<tr>
<th>Required?</th>
<th></th>
<th>Default Value</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>false</td>
<td></td>
</tr>
</tbody>
</table>

-<CultureName><String>

The culture name in which to produce results. The culture name is in standard language/region-code format; for example "en-US".

<table>
<thead>
<tr>
<th>Required?</th>
<th></th>
<th>Default Value</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>false</td>
<td></td>
</tr>
</tbody>
</table>
Accept Pipeline Input? | false

**AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

**Return Values**

Citrix.EnvTest.Sdk.EnvTestSuiteDefinition

The definition of a test suite

**Examples**

-------------------------- EXAMPLE 1 --------------------------

```powershell
$allTestSuiteDefinitions = Get-EnvTestSuiteDefinition
Retrieve all test suites.
```

-------------------------- EXAMPLE 2 --------------------------

```powershell
$allTestSuiteDefinitionsTranslatedIntoSpanish = Get-EnvTestSuiteDefinition -CultureName es-ES
Retrieve all test suites with localized properties returned in Spanish.
```

-------------------------- EXAMPLE 3 --------------------------

```powershell
$infrastructureSuiteDefinition = Get-EnvTestSuiteDefinition -TestSuiteId Infrastructure
Retrieve the definition of the 'Infrastructure' test suite.
```
Get-EnvTestTask

Oct 01, 2013
Gets one or more EnvTestTask(s)

Syntax

Get-EnvTestTask [-TaskId <Guid>] [-List] [-AdminAddress <String>] [CommonParameters>

Detailed Description

Returns either the current task, a specified task, or list of tasks that are currently known to the EnvTest Service.

Related topics

Get-EnvTestDefinition
Get-EnvTestSuiteDefinition
Start-EnvTestTask
Switch-EnvTestTask
Stop-EnvTestTask
Remove-EnvTestTask
Add-EnvTestTaskMetadata
Remove-EnvTestTaskMetadata

Parameters

-**TaskId**<Guid>

Specifies the task identifier to be returned. This value can be retrieved from an existing task's $task TaskId property.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
</tr>
</tbody>
</table>

-**List**<SwitchParameter>

List all running tasks, including the current one.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>false</td>
<td>false</td>
</tr>
</tbody>
</table>
**-AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values
Citrix.EnvTest.Sdk.EnvTestTask
A description of a previously started task.

Examples

-------------- EXAMPLE 1 ---------------

$currentTask = Get-EnvTestTask
Retrieve the current task. The current task is the most recently created task unless Switch-EnvTestTask explicitly changes it.

-------------- EXAMPLE 2 ---------------

$taskOfSpecificId = Get-EnvTestTask -TaskId 36C0EC52-2039-4D6E-B690-9F02F8CEFFCC
Retrieve a fresh copy of a task object based on a known task id, which is always a Guid. This id can be retrieved from an existing task object via its $task.TaskId property.

-------------- EXAMPLE 3 ---------------

$allKnownTasks = Get-EnvTestTask -List
Retrieve the list of current tasks. This list includes any task started by the Start-EnvTestTask cmdlet since the service started that has not later been removed via Remove-EnvTestTask.
New-EnvTestDiscoveryTargetDefinition

Oct 01, 2013
Creates a new EnvTestDiscoveryTargetDefinition object

Syntax
New-EnvTestDiscoveryTargetDefinition -TestId <String> [-TargetIdType <String>] [-TargetId <String>] [-AdminAddress <String>] [<CommonParameters>]
New-EnvTestDiscoveryTargetDefinition -TestSuiteId <String> [-TargetIdType <String>] [-TargetId <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description
Creates a new EnvTestDiscoveryTargetDefinition object that can be piped into Start-EnvTestTask to define one or more targets of execution, optionally including root objects for discovery.

Related topics
Get-EnvTestDefinition
Get-EnvTestSuiteDefinition
Get-EnvTestTask
Start-EnvTestTask
Switch-EnvTestTask
Stop-EnvTestTask
Remove-EnvTestTask
Add-EnvTestTaskMetadata
Remove-EnvTestTaskMetadata

Parameters
-TestId <String>
Test identifiers. If specified, do not specify -TestSuiteId.

| Required? | true |
| Default Value | Empty |
| Accept Pipeline Input? | false |

-TestSuiteId <String>
Test suite identifiers. If specified, do not specify -TestId.

| Required? | true |
| Default Value | Empty |
| Accept Pipeline Input? | false |

-TargetIdType <String>
Describes the type of corresponding object passed with -TargetId.
### -TargetId<String>

The Ids that object tests or test suites will target. By default, other components are queried for objects related to these.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Empty</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Description:**

The Ids that object tests or test suites will target. By default, other components are queried for objects related to these.

**Required?** false

**Default Value** Empty

**Accept Pipeline Input?** false

### -AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Description:**

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

**Required?** false

**Default Value** Localhost. Once a value is provided by any cmdlet, this value becomes the default.

**Accept Pipeline Input?** false

### Return Values

Citrix.EnvTest.Sdk.EnvTestDiscoveryTargetDefinition

Defines a target of a task

### Examples

--------- EXAMPLE 1 ---------

```
$singleSimpleTestTaskTarget = New-EnvTestDiscoveryTargetDefinition -TestId Monitor_RegisteredWithConfigurationService
$singleSimpleTestTaskTarget | Start-EnvTestTask
```

Create a discovery target definition with a single test and no target object, then start a task based on it.

--------- EXAMPLE 2 ---------

```
$singleSimpleTestSuiteTaskTarget = New-EnvTestDiscoveryTargetDefinition -TestSuiteId Infrastructure
$singleSimpleTestSuiteTaskTarget | Start-EnvTestTask
```

Create a discovery target definition with a single test suite and no target object, then start a task based on it.

--------- EXAMPLE 3 ---------

```
$singleTestSuiteTaskTarget = New-EnvTestDiscoveryTargetDefinition -TestSuiteId Catalog -TargetIdType Catalog -TargetId $(Get-BrokerCatalog).Uuid
$singleTestSuiteTaskTarget | Start-EnvTestTask
```

Create a discovery target definition with a single test suite and a catalog target object, then start a task based on it.

--------- EXAMPLE 4 ---------

```
@$singleSimpleTestSuiteTaskTarget, $singleTestSuiteTaskTarget | Start-EnvTestTask
```

Create two different discovery target definitions, put them in an array, then start a task based on both.
Remove-EnvTestServiceMetadata

Oct 01, 2013
Removes metadata from the given Service.

Syntax

Remove-EnvTestServiceMetadata [-ServiceHostId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-EnvTestServiceMetadata [-ServiceHostId] <Guid> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-EnvTestServiceMetadata [-InputObject] <Service[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-EnvTestServiceMetadata [-InputObject] <Service[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to remove metadata from the given Service.

Related topics

Set-EnvTestServiceMetadata

Parameters

-ServiceHostId <Guid>
Id of the Service

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

-InputObject <Service[]>
Objects to which metadata is to be removed.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-Map <PSObject>
Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with `@{"name1" = "val1"; "name2" = "val2"}`) or a string dictionary (created with `new-object System.Collections.Generic.Dictionary[String,String]`). The properties whose names match keys in the map will be removed.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **Name**: `<String>`

The metadata property to remove.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

- **LoggingId**: `<Guid>`

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

- **AdminAddress**: `<String>`

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
<td>false</td>
</tr>
</tbody>
</table>

Notes

If the command fails, the following errors can be returned.

Error Codes

----------
InvalidParameterCombination
The cmdlet parameters are inconsistent.

UnknownObject
One of the specified objects was not found.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-EnvTestService | % { Remove-EnvTestServiceMetadata -Map $_.MetadataMap }.

Remove all metadata from all Service objects.
Remove-EnvTestTask

Oct 01, 2013
Removes from the database completed tasks for the EnvTest Service.

Syntax

Remove-EnvTestTask [-TaskId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
Remove-EnvTestTask [-Task <EnvTestTask>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Enables completed tasks that have run within the EnvTest Service to be removed from the database.

Related topics

Get-EnvTestDefinition
Get-EnvTestSuiteDefinition
Get-EnvTestTask
Start-EnvTestTask
Switch-EnvTestTask
Stop-EnvTestTask
Add-EnvTestTaskMetadata
Remove-EnvTestTaskMetadata

Parameters

-TaskId <Guid>

Specifies the identifier of the task to be removed, retrieveable from the $Task.TaskId property.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>false</td>
<td>false</td>
</tr>
</tbody>
</table>

-Task <EnvTestTask>

Specifies the task to be removed.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
</tr>
</tbody>
</table>
- **AdminAddress**: `<String>`

  Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Examples**

---------------------------- EXAMPLE 1 ----------------------------

Remove-EnvTestTask
Removes the current task from the EnvTest service.

---------------------------- EXAMPLE 2 ----------------------------

Remove-EnvTestTask -TaskId 50A4139F-2B55-4A97-A1BE-20EE4E124AA3
Removes a task from the EnvTest service via its id, which is available from an existing task's $task.TaskId property.

---------------------------- EXAMPLE 3 ----------------------------

$secondTask = $(Get-EnvTestTask -List)[1]
Remove-EnvTestTask -Task $secondTask
Removes the second task in the list returned by Get-EnvTestTask -List.
Remove-EnvTestTaskMetadata

Oct 01, 2013
Removes metadata from the given Task.

Syntax

Remove-EnvTestTaskMetadata [-TaskTaskId] <Guid> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-EnvTestTaskMetadata [-TaskTaskId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-EnvTestTaskMetadata [-InputObject] <EnvTestTask[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-EnvTestTaskMetadata [-InputObject] <EnvTestTask[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to remove metadata from the given Task.

Related topics

Set-EnvTestTaskMetadata

Parameters

-TaskTaskId

Id of the Task

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByValue, ByPropertyName) |

-InputObject

Objects to which the metadata is to be added.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByValue) |

-Name

The metadata property to remove.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS> Get-EnvTestTask | % { Remove-EnvTestTaskMetadata -Map $_.MetadataMap }
Remove all metadata from all Task objects.
Reset-EnvTestServiceGroupMembership

Oct 01, 2013
Reloads the access permissions and configuration service locations for the EnvTest Service.

Syntax

Reset-EnvTestServiceGroupMembership [-ConfigServiceInstance] <ServiceInstance[]> [-LoggingId <Guid>] [-AdminAddress <String>] [-<CommonParameters>]

Detailed Description

Enables you to reload EnvTest Service access permissions and configuration service locations. The Reset-EnvTestServiceGroupMembership command must be run on at least one instance of the service type (EnvTest) after installation and registration with the configuration service. Without this operation, the EnvTest services will be unable to communicate with other services in the XenDesktop deployment. When the command is run, the services are updated when additional services are added to the deployment, provided that the configuration service is not stopped. The Reset-EnvTestServiceGroupMembership command can be run again to refresh this information if automatic updates do not occur when new services are added to the deployment. If more than one configuration service instance is passed to the command, the first instance that meets the expected service type requirements is used.

Related topics

Parameters

-ConfigServiceInstance<ServiceInstance[]>

Specifies the configuration service instance object that represents the service instance for the type 'InterService' that references a configuration service for the deployment.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByValue) |

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

| Required? | false |
| Default Value | Localhost. Once a value is provided by any cmdlet, this value becomes the default. |
| Accept Pipeline Input? | false |

Input Type

Citrix.EnvTest.Sdk.ServiceInstance[] Service instances containing a ServiceInstance object that refers to the central configuration service interservice
interface can be piped to the `Reset-EnvTestServiceGroupMembership` command.

Notes
If the command fails, the following errors can be returned.

Error Codes
-----------

`NoSuitableServiceInstance`
None of the supplied service instance objects were suitable for resetting service group membership.

`DatabaseError`
An error occurred in the service while attempting a database operation.

`DatabaseNotConfigured`
The operation could not be completed because the database for the service is not configured.

`DataStoreException`
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

`PermissionDenied`
You do not have permission to execute this command.

`AuthorizationError`
There was a problem communicating with the Citrix Delegated Administration Service.

`ConfigurationLoggingError`
The operation could not be performed because of a configuration logging error.

`CommunicationError`
There was a problem communicating with the remote service.

`ExceptionThrown`
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples
-------------------------- EXAMPLE 1 --------------------------
c:\PS>Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-EnvTestServiceGroupMembership
Reset the service group membership for a service in a deployment where the configuration service is configured and running on the same machine as the service.

-------------------------- EXAMPLE 2 --------------------------
c:\PS>Get-ConfigRegisteredServiceInstance -ServiceType Config -AdminAddress OtherServer.example.com | Reset-EnvTestServiceGroupMembership
Reset the service group membership for a service in a deployment where the configuration service that is configured and running on a machine named 'OtherServer.example.com'.

Set-EnvTestDBConnection

Oct 01, 2013
Configures a database connection for the EnvTest Service.

Syntax
Set-EnvTestDBConnection [-DBConnection] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters>

Detailed Description
Configures a connection to a database in which the EnvTest Service can store its state. The service will attempt to connect and start using the database immediately after the connection is configured. The database connection string is updated to the specified value regardless of whether it is valid or not. Specifying an invalid connection string prevents a service from functioning until the error is corrected.

After a connection is configured, you cannot alter it without first clearing it (by setting the connection to $null).

You do not need to configure a database connection to use this command.

Related topics
Get-EnvTestServiceStatus
Get-EnvTestDBConnection
Test-EnvTestDBConnection

Parameters
-**DBConnection**<String>
  Specifies the database connection string to be used by the EnvTest Service. Passing in $null will clear any existing database connection configured.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
</tr>
</tbody>
</table>

-**LoggingId**<Guid>
  Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>

</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
</tr>
</tbody>
</table>

-**AdminAddress**<String>
  Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
</tr>
</tbody>
</table>
Return Values
The Set-EnvTestDBConnection command returns an object containing the status of the EnvTest Service together with extra diagnostics information.

DBUnconfigured
The EnvTest Service does not have a database connection configured.

DBRejectedConnection
The database rejected the logon attempt from the EnvTest Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured
The expected stored procedures are missing from the database. This may be because the EnvTest Service schema has not been added to the database.

DBNotFound
The specified database could not be located with the configured connection string.

DBNewerVersionThanService
The version of the EnvTest Service currently in use is incompatible with the version of the EnvTest Service schema on the database. Upgrade the EnvTest Service to a more recent version.

DBOlderVersionThanService
The version of the EnvTest Service schema on the database is incompatible with the version of the EnvTest Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress
A database schema upgrade is currently in progress.

OK
The EnvTest Service is running and is connected to a database containing a valid schema.

Failed
The EnvTest Service has failed.

Unknown
The status of the EnvTest Service cannot be determined.

Notes
If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString
The database connection string has an invalid format.

DatabaseConnectionDetailsAlreadyConfigured
There was already a database connection configured. After a configuration is set, it can only be set to $null.
PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationException
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples
-------------------- EXAMPLE 1 --------------------
c:\PS> Set-EnvTestDBConnection -DBConnection "Server=serverName\SQLEXPRESS;Initial Catalog = databaseName; Integrated Security = True"
OK
Configures a database connection string for the EnvTest Service.

-------------------- EXAMPLE 2 --------------------
c:\PS> Set-EnvTestDBConnection -DBConnection "Invalid Connection String"
Invalid database connection string format.
Configures an invalid database connection string for the EnvTest Service.
Set-EnvTestServiceMetadata

Oct 01, 2013
Adds or updates metadata on the given Service.

Syntax

Set-EnvTestServiceMetadata [-ServiceHostId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-EnvTestServiceMetadata [-ServiceHostId] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-EnvTestServiceMetadata [-InputObject] <Service[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-EnvTestServiceMetadata [-InputObject] <Service[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Allows you to store additional custom data against given Service objects.

Related topics
Remove-EnvTestServiceMetadata

Parameters

-ServiceHostId <Guid>
Id of the Service

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

-InputObject <Service[]>
Objects to which metadata is to be added.

<table>

### Return Values

Set-EnvTestServiceMetadata returns a dictionary containing the new (name, value)-pairs.

Key <string>
Specifies the name of the property.

Value <string>
Specifies the value for the property.

Notes
If the command fails, the following errors can be returned.

Error Codes
---------

InvalidParameterCombination
The cmdlet parameters are inconsistent.

UnknownObject
One of the specified objects was not found.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS> Set-EnvTestServiceMetadata -ServiceHostId 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>property</td>
<td>value</td>
</tr>
</tbody>
</table>

Add metadata with a name of 'property' and a value of 'value' to the Service with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.
Set-EnvTestTaskMetadata

Oct 01, 2013
Adds or updates metadata on the given Task.

Syntax

Set-EnvTestTaskMetadata [-TaskTaskId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-EnvTestTaskMetadata [-TaskTaskId] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-EnvTestTaskMetadata [-InputObject] <EnvTestTask[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-EnvTestTaskMetadata [-InputObject] <EnvTestTask[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description
Provides the ability for additional custom data to be stored against given Task objects.

Related topics
Remove-EnvTestTaskMetadata

Parameters

- **TaskTaskId**<Guid>
  Id of the Task

| Required? | true |
| Default Value |
| Accept Pipeline Input? | true (ByValue, ByPropertyName) |

- **InputObject**<EnvTestTask[]>
  Objects to which the metadata is to be added.

| Required? | true |
| Default Value |
| Accept Pipeline Input? | true (ByValue) |

- **Map**<PSObject>
Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object System.Collections.Generic.Dictionary[String,String]).

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-Name<String>

Specifies the property name of the metadata to be added. The property must be unique for the Task specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-Value<String>

Specifies the value for the property.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td></td>
</tr>
</tbody>
</table>
Default Value | Localhost. Once a value is provided by any cmdlet, this value becomes the default.
---|---
Accept Pipeline Input? | false

**Return Values**

Set-EnvTestTaskMetadata returns a dictionary containing the new (name, value)-pairs.

**Key <string>**

Specifies the name of the property.

**Value <string>**

Specifies the value for the property.

**Notes**

If the command fails, the following errors can be returned.

**Error Codes**

---------

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.
ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples
-------------------------- EXAMPLE 1 --------------------------
c:\PS>Set-EnvTestTaskMetadata -TaskTaskId 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>property</td>
<td>value</td>
</tr>
</tbody>
</table>

Add metadata with a name of 'property' and a value of 'value' to the Task with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.
Start-EnvTestTask

Oct 01, 2013
Starts a new test task.

Syntax

Start-EnvTestTask -TestId <String> [-TargetIdType <String>] [-TargetId <String>] [-CultureName <String>] [-IgnoreRelatedObjects] [-RunAsynchronously] [-ExcludeNotRunTests] [-AdminAddress <String>] [<CommonParameters>]

Start-EnvTestTask -TestSuiteId <String> [-TargetIdType <String>] [-TargetId <String>] [-CultureName <String>] [-IgnoreRelatedObjects] [-RunAsynchronously] [-ExcludeNotRunTests] [-AdminAddress <String>] [<CommonParameters>]

Start-EnvTestTask -InputObject <PSObject[]> [-CultureName <String>] [-IgnoreRelatedObjects] [-RunAsynchronously] [-ExcludeNotRunTests] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Starts a new test task based on a set of criteria provided via parameters or piped input and either waits for the tests to run or returns immediately depending on how it is called. When running a test suite and providing a target object for that suite, the service will discover related objects by default, but this behavior may be disabled if desired.

Parameters

-TestId <String>

Test identifiers. If specified, do not specify -TestSuiteId.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>Empty</td>
<td>false</td>
</tr>
</tbody>
</table>

-TestSuiteId <String>

Test suite identifiers. If specified, do not specify -TestId.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>Empty</td>
<td>false</td>
</tr>
</tbody>
</table>

-InputObject <PSObject[]>

One or more test targets defining the task, see Input Types for details about what kind of objects are permissible. Any valid object passed to this parameter may also be piped into this cmdlet.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>Empty</td>
<td>true [ByValue]</td>
</tr>
</tbody>
</table>

-TargetIdType <String>

Describes the type of corresponding object passed with -TargetId.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Empty</td>
<td>false</td>
</tr>
</tbody>
</table>

-TargetId <String>

https://docs.citrix.com  © 1999-2017 Citrix Systems, Inc. All rights reserved.  p.2058
The Ids that object tests or tests suites will target. By default, other components are queried for objects related to these.

| Required? | false |
| Default Value | Empty |
| Accept Pipeline Input? | false |

-CultureName:String

The culture name in which to produce results. The culture name is in standard language/region-code format; for example "en-US".

| Required? | false |
| Default Value | The current user interface culture |
| Accept Pipeline Input? | false |

-IgnoreRelatedObjects:SwitchParameter

Do not ask other components for objects related to a specified target.

| Required? | false |
| Default Value | False |
| Accept Pipeline Input? | false |

-RunAsynchronously:SwitchParameter

Do not wait for the test run to complete, return immediately.

| Required? | false |
| Default Value | False |
| Accept Pipeline Input? | false |

-ExcludeNotRunTests:SwitchParameter

If set, tests that are not run because no object matching their requirements is found are NOT included in test counts and results.

| Required? | false |
| Default Value | False (include Not Run tests) |
| Accept Pipeline Input? | false |

-AdminAddress:String

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

| Required? | false |
| Default Value | Localhost. Once a value is provided by any cmdlet, this value becomes the default. |
| Accept Pipeline Input? | false |

Input Type

Citrix.EnvTest.Sdk.EnvTestDiscoveryTargetDefinition A single EnvTestDiscoveryTargetDefinition can be specified to target one test or test suite. Citrix.EnvTest.Sdk.EnvTestDiscoveryTargetDefinition[] An array of EnvTestDiscoveryTargetDefinition(s) can be specified to target any combination of tests and/or test suites. PSCustomObject A single PSCustomObject with properties matching the required EnvTestDiscoveryTargetDefinition properties can be specified to target one test or test suite. PSCustomObject[] An array of PSCustomObject(s) with properties matching the required EnvTestDiscoveryTargetDefinition properties can be specified to target any combination of tests and/or test suites.

Return Values

Citrix.EnvTest.Sdk.EnvTestTask

The newly started task.

Examples

---------- EXAMPLE 1 ----------

$singleSimpleTestTask = Start-EnvTestTask -TestId Monitor_RegisteredWithConfigurationService
Create and start a task with a single test and no target object.

---------- EXAMPLE 2 ----------

$singleSimpleTestTaskInSpanish = Start-EnvTestTask -TestId Monitor_RegisteredWithConfigurationService -CultureName es-ES
Create and start a task with a single test and no target object, with localized properties translated into Spanish.
EXAMPLE 3
$singleSimpleTestSuiteTask = Start-EnvTestTask -TestSuiteId Infrastructure
Create and start a task with a single test suite and no target object.

EXAMPLE 4
$singleTestSuiteTask = Start-EnvTestTask -TestSuiteId Catalog -TargetIdType Catalog -TargetId $(Get-BrokerCatalog).Uuid
Create and start a task with a single test suite and a catalog target object.

EXAMPLE 5
$singleTestSuiteTask = Start-EnvTestTask -TestSuiteId Catalog -TargetIdType Catalog -TargetId $(Get-BrokerCatalog).Uuid -RunAsynchronously
Create and start a task with a single test suite and a catalog target object, and return immediately not waiting for the tests to complete.

EXAMPLE 6
$adAccountPool = Get-AcctIdentityPool
$singleTestTaskWithNoObjectDiscovery = StartEnvTestTask -IgnoreRelatedObjects -TestId ADIdentity_IdentityPool_ValidatePoolIsUnlocked -TargetIdType IdentityPool -TargetId $adAccountPool.
Create and start a task with a single test, a target object for that test, and no object discovery based on that target.

EXAMPLE 7
$singleSimpleTestSuiteTaskTarget = New-EnvTestDiscoveryTargetDefinition -TestSuiteId Infrastructure
$singleTestSuiteTaskTarget = New-EnvTestDiscoveryTargetDefinition -TestSuiteId Catalog -TargetIdType Catalog -TargetId $(Get-BrokerCatalog).Uuid
$inputObjects = @($singleSimpleTestSuiteTaskTarget, $singleTestSuiteTaskTarget)
Start-EnvTestTask -InputObject $inputObjects
Create two different discovery target definitions, put them in an array, then start a task based on both via -InputObject.
Stop-EnvTestTask

Oct 01, 2013
Stops a still running task from completing.

Syntax

Stop-EnvTestTask [-TaskId <Guid>] [-AdminAddress <String>] [CommonParameters]

Stop-EnvTestTask [-Task <EnvTestTask>] [-AdminAddress <String>] [CommonParameters]

Detailed Description

Stops a still running task from completing. A task may still be retrieved via Get-EnvTestTask until it Remove-EnvTestTask is called with its task id.

Related topics

Get-EnvTestDefinition
Get-EnvTestSuiteDefinition
Get-EnvTestTask
New-EnvTestTask
Start-EnvTestTask
Switch-EnvTestTask
Remove-EnvTestTask
Add-EnvTestTaskMetadata
Remove-EnvTestTaskMetadata

Parameters

-TaskId <Guid>
The id of the task to stop, retrieveable from the Task.TaskId property.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-Task <EnvTestTask>

An EnvTestTask representing the task to stop

<table>
<thead>
<tr>
<th>Required?</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>false</td>
</tr>
</tbody>
</table>
**Default Value**

Accept Pipeline Input? | true (ByValue)

---

**AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

| Required? | false |
| Default Value | Localhost. Once a value is provided by any cmdlet, this value becomes the default. |
| Accept Pipeline Input? | false |

**Examples**

-------------------------- EXAMPLE 1 --------------------------

Stop-EnvTestTask
Stops the current task from completing if it is still running.

-------------------------- EXAMPLE 2 --------------------------

Stop-EnvTestTask -TestId 50A4139F-2B55-4A97-A1BE-20EE4E124AA3
Stops a task from completing via its id, which is available from an existing task's $Task.TaskId property.

-------------------------- EXAMPLE 3 --------------------------

$secondTask = $(Get-EnvTestTask -List)[1]
Stop-EnvTestTask -Task $secondTask
Stops the second task in the list returned by Get-EnvTestTask -List.
Switch-EnvTestTask

Oct 01, 2013

Sets the current task that will be returned by a call to Get-EnvTestTask with no parameters.

Syntax

Switch-EnvTestTask [-TaskId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
Switch-EnvTestTask [-Task <EnvTestTask>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Sets the current task that will be returned by a call to Get-EnvTestTask with no parameters.

Related topics

Get-EnvTestDefinition
Get-EnvTestSuiteDefinition
Get-EnvTestTask
New-EnvTestTask
Start-EnvTestTask
Stop-EnvTestTask
Remove-EnvTestTask
Add-EnvTestTaskMetadata
Remove-EnvTestTaskMetadata

Parameters

-TaskId <Guid>

Specifies the identifier of the task to be made current.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-Task <EnvTestTask>

The task object to be made current, retrievable from the $task.TaskId property.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
</table>

https://docs.citrix.com © 1999-2017 Citrix Systems, Inc. All rights reserved. p.2063
### -AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

System.Management.Automation.PSObject Objects containing the TaskId parameter can be piped to the Remove-EnvTestTask command.

**Examples**

-------------------------- EXAMPLE 1 --------------------------

```powershell
Switch-EnvTestTask -TaskId 50A4139F-2B55-4A97-A1BE-20EE4E124AA3
```

Switches the current task to another via its id, which is available from an existing task's $task.TaskId property.

-------------------------- EXAMPLE 2 --------------------------

```powershell
$secondTask = $(Get-EnvTestTask -List)[1]
Switch-EnvTestTask -Task $switchTask
```

Switches the current task to the second in the list returned by Get-EnvTestTask -List.
Test-EnvTestDBConnection

Test-EnvTestDBConnection [-DBConnection] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters>

Detailed Description
Tests a connection to the database in which the EnvTest Service can store its state. The service will attempt to connect to the database without affecting the current connection to the database.

You do not have to clear the connection to use this command.

Related topics
Get-EnvTestServiceStatus
Get-EnvTestDBConnection
Set-EnvTestDBConnection

Parameters

- **-DBConnection**:<String>

  Specifies the database connection string to be tested by the EnvTest Service.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

- **-LoggingId**:<Guid>

  Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

- **-AdminAddress**:<String>

  Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values
The Test-EnvTestDBConnection command returns an object containing the status of the EnvTest Service if the connection string of the specified data store were to be set to the string being tested, together with extra diagnostics information for the specified connection string.

**DBRejectedConnection**

The database rejected the logon attempt from the EnvTest Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

**InvalidDBConfigured**

The expected stored procedures are missing from the database. This may be because the EnvTest Service schema has not been added to the database.

**DBNotFound**

The specified database could not be located with the configured connection string.

**DBNewerVersionThanService**

The version of the EnvTest Service currently in use is incompatible with the version of the EnvTest Service schema on the database. Upgrade the EnvTest Service to a more recent version.

**DBOlderVersionThanService**

The version of the EnvTest Service schema on the database is incompatible with the version of the EnvTest Service currently in use. Upgrade the database schema to a more recent version.

**DBVersionChangeInProgress**

A database schema upgrade is currently in progress.

**OK**

The Set-EnvTestDBConnection command would succeed if it were executed with the supplied connection string.

**Failed**

The EnvTest Service has failed.

**Unknown**

The status of the EnvTest Service cannot be determined.

**Notes**

If the command fails, the following errors can be returned.

**Error Codes**

---------

**InvalidDBConnectionString**

The database connection string has an invalid format.

**PermissionDenied**

You do not have permission to execute this command.

**AuthorizationError**

There was a problem communicating with the Citrix Delegated Administration Service.

**ConfigurationLoggingError**

The operation could not be performed because of a configuration logging error.
CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples
-------------------------- EXAMPLE 1 --------------------------
c:\PS>Test-EnvTestDBConnection -DBConnection "Server=serverName\SQLExpress;Initial Catalog = databaseName; Integrated Security = True"
OK
Tests a database connection string for the EnvTest Service.

-------------------------- EXAMPLE 2 --------------------------
c:\PS>Test-EnvTestDBConnection -DBConnection "Invalid Connection String"
Invalid database connection string format.
Tests an invalid database connection string for the EnvTest Service.

about_HypHostSnapin

Oct 01, 2013

TOPIC

about_HypHostSnapin

SHORT DESCRIPTION

The Host Service PowerShell snap-in provides administrative functions for the Host Service.

COMMAND PREFIX

All commands in this snap-in have the noun prefixed with 'Hyp'.

LONG DESCRIPTION

The Host Service PowerShell snap-in enables both local and remote administration of the Host Service. It lets you configure XenDesktop deployments to make use of hypervisors, networks, and storage, and enables browsing of their contents using the Host PowerShell provider (Citrix.HypervisorProvider).

The provider creates a default PSDrive with a drive identifier of ‘XDHyp’. This drive provides two root folders:

HostingUnits Folder

Contains a list of all the hosting units that have been defined using the new-Item provider command.

Hosting units define not only a hypervisor connection, but also reference networks and storage. Hosting units are used by the Machine Creation Service to provide the information required to create and manage virtual machines that can be used by other services. A hosting unit references a root path. This is a specific point in the provider connection tree. The hosting unit is constrained to provide only items below this point in the tree, which restricts the locations that the Machine Creation Service can use to create virtual machines and the networks and storage that can be used.

Connections Folder

Contains a list of all the hosting unit connections that are defined using the new-Item provider command.

Change directory to a specific connection and use the dir/Get-ChildItem command to list all of the infrastructure (such as folders, hypervisors, networks, storage, and virtual machines) that is available in the hosting unit to which the connection refers. The paths to these items
are used as the input to commands in the Host Service and Machine Creation Service snap-ins.

The contents of the Hosting Unit and Connection folders reflect the content and structure of the hypervisor to which they refer. The item extensions reflect the object type for each item. Not all item types are appropriate for all hypervisor types. Possible item types are:

- Virtual Machine (.vm)
- Snapshot (.snapshot)
- Cluster (.cluster)
- Host (.host)
- HostGroup (.hostgroup)
- DataCenter (.datacenter)
- Folder (.folder)
- ResourcePool (.resourcepool)
- ComputeResource (.computeresource)

When used with a path that refers to the Host provider (with a default drive of 'XDHyp:'), the Host provider extends the standard New-Item, Get-Item, Get-ChildItem, Remove-Item, Rename-Item, and Set-Item commands as described below. For more information about the basic behavior of these commands, see the help for the command. The Move-Item and Copy-Item commands are not supported for the Host provider.

New-Item

The following parameters are available when using New-Item in the Connections directory (or a path that refers to the directory). The Credential parameter is not supported.

- **Name**
  Specifies the name of the connection, which must not contain any of the following characters: \\#.*?=<>|[](){}'. The Name parameter is optional but, if not included, the connection name must be specified as part of the Path parameter.

- **HypervisorAddress <String[]>>**
  Specifies an array of addresses that can be used to contact the required hypervisor. All the addresses are considered equivalent, that is, all of the addresses provide access to the same virtual machines, snapshots, network, and storage.

- **ConnectionType <ConnectionType>**
  Specifies the type of hypervisor that the connection is for. Supported hypervisor types are:

  - XenServer
SCVMM (Microsoft Hyper-V)
vCenter (VMware vSphere/ESX)
Custom

-PluginId <String>
  Specifies the class name for the Citrix Managed Machine library
  that is used to access the hypervisor. This list can be
  obtained using the Get-HypHypervisorPlugin command. The PluginId
  parameter must be specified if the ConnectionType is set to
  'Custom'.

-UserName <String>, -Password <String>, -SecurePassword <SecureString>
  Specifies the credentials for the connection to the hypervisor. The
  password can be given as either Password or SecurePassword, but not
  both. The UserName parameter and either Password or SecurePassword specify
  the same information as the HypervisorCredential parameter, so use
  of one precludes use of the other.

-HypervisorCredential <PSCredential>
  Specifies credentials for the connection to the hypervisor. The
  HypervisorCredential parameter specifies the same information as
  UserName and either Password or SecurePassword, so use of one
  precludes use of the other.

-Persist
  Specifies that the connection details are persistent. If this
  parameter is not included, the connection is only held for the
  duration of the current runspace and PSDrive combination.
  Only persistent connection items are visible to administrators in other
  runspaces and PSDrives. Hosting units cannot be created from
  connections that are not persistent.

-AdminAddress <String>
  Specifies the address of the Host Service that the command
  communicates with. After it is set, this address is used for all commands
  in the Host Service PowerShell snap-in. If this parameter is not
  included or set by another command, or if Set-HypAdminConnection
  has not been used, the command attempts to use a local Host
  Service.

-LoggingId <String>
  Specifies the identifier of the high level operation that this cmdlet call
  forms a part of. Desktop Studio and Desktop Director typically create
  High Level Operations. PowerShell scripts can also wrap a series of cmdlet
  calls in a High Level Operation by way of the Start-LogHighLevelOperation
  and Stop-LogHighLevelOperation cmdlets.

-Scopes <String[]>
Specifies the list of administrative scopes that the new connection will be a part of. The scopes will control which administrators are able to work with the connection.

The following parameters are available when using New-Item in the HostingUnits directory (or a path that refers to the directory).

-Name
   Specifies the name of the hosting unit, which must not contain any of the following characters: V;#.*?<=<>[]{}(). The Name parameter is optional but, if not included, the hosting unit name must be provided as part of the Path parameter.

-HypervisorConnectionName <String>
   Specifies the name of the connection that the hosting unit uses. To create a hosting unit, the referenced connection must be persistent and the ConnectionType must not be set to 'Custom'.

-HypervisorConnectionUid <Guid>
   Specifies the unique identifier of the connection that the hosting unit uses. To create a hosting unit, the referenced connection must be persistent and the ConnectionType must not be set to 'Custom'.

-RootPath <String>
   Specifies the location in a connection that is used as the starting reference for the hosting unit. The path must point to an item in the connection that is marked as a SymLink. The root of a XenServer connection is a special case that is also considered a SymLink. If this parameter is not included, the current location in the provider is used.

-NetworkPath <String>
   Specifies the path in a connection to the network item that is used when the Machine Creation Service creates new virtual machines.

-StoragePath <String>
   Specifies one or more paths in a connection to storage items that are used when the Machine Creation Service creates new virtual machines. After they are set, storage paths can be modified using the Add-HypHostingUnitStorage and Remove-HypHostingUnitStorage commands.

-PersonalvDiskStoragePath <String>
   Specifies one or more paths in a connection to storage items that are used when the Machine Creation Service creates disks for the virtual machines. After they are set, storage paths can be modified
using the Add-HypHostingUnitStorage and Remove-HypHostingUnitStorage commands.

-NoVmTagging
Specifies that new virtual machines are not tagged with metadata from the hypervisor. By default, all virtual machines created by the Machine Creation Service are tagged to show they are created by XenDesktop. These tags are used by the provider to restrict the list of virtual machines displayed when viewing the content of the Connections or HostingUnit paths. If this parameter is not included, all virtual machines are displayed at all times.

-AdminAddress <String>
Specifies the address of the Host Service that the command will communicate with. After it is set, this address is used for all commands in the Host Service PowerShell snap-in. If this parameter is not included or set by another command, or if Set-HypAdminConnection has not been used, the command attempts to use a local Host Service.

-UseLocalStorageCaching
When Get-HypServiceAddedCapability indicates that the LocalStorageCaching feature is available this parameter can be set to specify that the virtual machines created for this hosting unit will use local storage caching for their disk images.

-LoggingId <String>
Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Get-Item
Get-ChildItem (alias dir)
Rename-Item
Remove-Item

The following additional parameters are available.

AdminAddress
Specifies the address of the Host Service that the command communicates with. After it is set, this address is used for all commands in the Host Service PowerShell snap-in. If this parameter is not
included or set by another command, or if Set-HypAdminConnection has not been used, the command attempts to use a local Host Service.

-LoggingId <String>
  Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

The Path parameter can be specified by name or by using the unique identifier for the connection or hosting unit enclosed in braces. For example:

  -Path XDHyp:\{1233-3213ACDF-12323}

The Filter parameter is not supported. Virtual machines created by the Machine Creation Service are only returned if the -Force parameter is used or if virtual machine tagging was disabled on the hosting unit with the NoVmTagging parameter when the VMs were created.

Set-Item

The following parameters are available when using Set-Item in the Connections directory.

-UserName <String>, -Password <String>, -SecurePassword <SecureString>
  Specifies the credentials for the connection to the hypervisor. The password can be given as either Password or SecurePassword, but not both. The UserName parameter and either Password or SecurePassword specify the same information as the HypervisorCredential parameter, so use of one precludes use of the other.

-HypervisorCredential <PSCredential>
  Specifies credentials for the connection to the hypervisor. The HypervisorCredential parameter specifies the same information as the UserName parameter and either Password or SecurePassword, so use of one precludes use of the other.

-HypervisorAddress <string[]>
  Specifies the addresses of the hypervisor that this connection represents. This replaces all existing addresses.

-LoggingId <String>
  Specifies the identifier of the high level operation that this cmdlet call
forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

-MaintenanceMode <Boolean>

Places the connection into maintenance mode which will disable all communication between XenDesktop and the Hypervisor. Use this mode when making changes to the hypervisor, for instance if the password for the access account needs to be changed.

-AdminAddress <String>

Specifies the address of the Host Service that the command communicates with. After it is set, this address is used for all commands in the Host Service PowerShell snap-in. If this parameter is not included or set by another command, or if Set-HypAdminConnection has not been used, the command tries to use a local Host Service.

The Credential parameter is not supported. Addresses can be modified with the Add-HypHypervisorConnectionAddress and Remove-HypHypervisorConnectionAddress commands. Metadata can be modified with the Add-HypMetadata and Remove-HypMetadata commands.

The following parameters are available when using New-Item in the HostingUnits directory.

-Name

Specifies the name of the hosting unit, which must not contain any of the following characters: \;#:*?=<>|[]{}(). The Name parameter is optional but, if not included, the hosting unit name must be provided as part of the Path parameter.

-NetworkPath <String>

Specifies the path in a connection to the network item that is used when the Machine Creation Service creates new virtual machines.

-NoVmTagging

Specifies that new virtual machines are not tagged with metadata from the hypervisor. By default, all virtual machines created by the Machine Creation Service are tagged to show they are created by XenDesktop. These tags are used by the provider to restrict the list of virtual machines displayed when viewing the content of the Connections or HostingUnit paths. If this parameter is not included, all virtual machines are displayed at all times.

-AdminAddress <String>

Specifies the address of the Host Service that the command
communicates with. After it is set, this address is used for all commands in the Host Service PowerShell snap-in. If this parameter is not included or set by another command, or if Set-HypAdminConnection has not been used, the command attempts to use a local Host Service.

-UseLocalStorageCaching <bool>
   When Get-HypServiceAddedCapability indicates that the LocalStorageCaching feature is available this parameter can be set to specify that the virtual machines created for this hosting unit will use local storage caching for their disk images.

-LoggingId <String>
   Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Storage can be modified with the Add-HypHostingUnitStorage and Remove-HypHostingUnitStorage commands. Metadata can be modified with the Add-HypMetadata and Remove-HypMetadata commands.

The item types returned when these commands are used in the Host Service provider are defined in the Object Definitions section below.

EXAMPLES

To Create a Persistent Hypervisor Connection

new-item -path "xdhyp:\Connections" -Name MyConn -ConnectionType XenServer -HypervisorAddress "http:\address" -UserName user -Password password -Persist

PSPath: Citrix.HostingUnitService.Admin.V1.0\Citrix.Hypervisor::XDHyp:\Connections\MyConn
PSParentPath: Citrix.HostingUnitService.Admin.V1.0\Citrix.Hypervisor::XDHyp:\Connections
PSChildName: MyConn
PSDrive: XDHyp
PSProvider: Citrix.HostingUnitService.Admin.V1.0\Citrix.Hypervisor
PSIsContainer: True
HypervisorConnectionUid: 04e6daa2-5cbd-4491-b70c-6daf733ee82a
HypervisorConnectionName: MyConn
ConnectionType: XenServer
HypervisorAddress: {http:\address}
UserName:                 user  
Persistent:               True  
PluginId:                 XenFactory  
SupportsPvsVMs:           True  
Revision:                 1b0b0d02-bc1b-49d8-b2b0-be6fb7f150ad  
MaintenanceMode:          False  
Metadata:                 
|MaxAbsoluteActiveActions = 100,  
MaxAbsoluteNewActionsPerMinute = 100,  
MaxPowerActionsPercentageOfDesktops = 20|

To Create a Hosting Unit

    new-item -Path "xdhyp:\HostingUnits"  
    -Name MyHU  
    -HypervisorConnectionName MyConn  
    -RootPath XDHYP:\Connections\MyConn  
    -NetworkPath XDHYP:\Connections\MyConn\Network 0.network  
    -StoragePath XDHYP:\Connections\MyConn\Local storage on myXenServer.storage

    PSPath:               Citrix.HostingUnitService.Admin.V1.0\Citrix.Hypervisor::XDHyp:\HostingUnits\MyHU  
    PSParentPath:         Citrix.HostingUnitService.Admin.V1.0\Citrix.Hypervisor::XDHyp:\HostingUnits  
    PSChildName:          MyHU  
    PSDrive:              XDHyp  
    PSPProvider:          Citrix.HostingUnitService.Admin.V1.0\Citrix.Hypervisor  
    PSIsContainer:        True  
    HostingUnitUid:       df91f886-1141-4280-bd59-2ee260a4df79  
    HostingUnitName:      MyHU  
    HypervisorConnection: MyConn  
    RootPath:             /  
    RootId:               NetworkPath:    /Network 0.network  
    NetworkId:            ab47080b-ca15-771a-c8dc-6ad9650158f1  
    Storage:              {/Local storage on myXenServer.storage}  
    VMTaggingEnabled:     True  
    Metadata:             {}

Relative paths can be used for all parameters.

OBJECT DEFINITIONS

Citrix.XDInterServiceTypes.HypervisorConnection

The hypervisor connection object is returned when a connection item is
located. This item has the following parameters.

HypervisorConnectionUid <Guid>
  Specifies the unique identifier for the connection item.

HypervisorConnectionName <String>
  Specifies the name of the connection item.

ConnectionType <Citrix.XDInterServiceTypes.ConnectionType>
  Specifies the type of hypervisor that the connection is for.
  Supported hypervisor types are:
    XenServer
    SCVMM (Microsoft Hyper-V)
    vCenter (VMware vSphere/ESX)
    Custom

HypervisorAddress <String[]>
  Specifies the addresses that can be used to contact the required hypervisor.

Username <String>
  Specifies the administrator user name for the connection to the hypervisor
  (from the user name and password given as administrator credentials when setting up this connection)

Persistent <Boolean>
  Specifies whether or not the connection is persistent.

PluginId <String>
  Specifies the Citrix Managed Machine class identifier for the hypervisor.

SupportsPvsVM <Boolean>
  Specifies whether or not the connection can be used as part of a hosting unit. If this parameter is set to 'True', a hosting unit referencing this connection can be created.

Revision <Guid>
  A unique identifier that is changed every time any properties of the connection are changed.

MaintenanceMode <Boolean>
  Specifies whether or not the connection is currently in maintenance mode.

Metadata <Citrix.XDInterServiceTypes.Metadata[]>
  The collection of metadata associated with the connection.
Citrix.XDInterServiceTypes.HostingUnit

The hosting unit object is returned when a hosting unit item is located. This item has the following parameters.

HostingUnitName <String>
   Specifies the name of the hosting unit.

HostingUnitUid <Guid>
   Specifies the unique identifier for the hosting unit.

HypervisorConnection <Citrix.XDInterServiceTypes.HypervisorConnection>
   Specifies the hypervisor connection item that the hosting unit references.

NetworkId <String>
   Specifies the unique identifier for the network in the hypervisor context that the hosting unit references.

NetworkPath <String>
   Specifies the path to the network in the Host Service provider.

RootId <String>
   Specifies the unique identifier for the root connection item in the hypervisor context that the hosting unit references.

RootPath <String>
   Specifies the path to the root of the hosting unit from within the Host Service provider.

Storage <Citrix.XDInterServiceTypes.Storage[]>
   Specifies the collection of storage objects that are defined for use as part of the hosting unit. This object contains the following parameters.

   StorageID <String>
      Specifies the identifier for the storage in the hypervisor context.

   StoragePath <String>
      Specifies the path to the storage in the Host Service provider.

VMTaggingEnabled <Boolean>
   Specifies whether or not virtual machine metadata is used to tag virtual machines created by XenDesktop.
Metadata `<Citrix.XDInterServiceTypes.Metadata[]>`
  Specifies the collection of metadata associated with the hosting unit.

`Citrix.HostingUnitService.Sdk.HypervisorObject`

The hypervisor object is returned when any item is located from within a Connection or HostingUnit folder. This item has the following parameters.

AdditionalData `<Dictionary<String,String>>`
  Stores extra untyped data for the item. This dictionary contains different information for each item type.

  For Storage Items
  Key = StorageType
  Values = Shared or Local

  For VM Items
  Key = PowerState
  Values = PoweredOn,
  PoweredOff,
  Suspended,
  TransitioningToOn,
  TransitioningToOff,
  Suspending,
  Resuming,
  Unknown,
  Error

Name `<String>`
  Specifies the name of the item.

FullName `<String>`
  Specifies the name with the appropriate file extension.

ObjectPath `<String>`
  Specifies the relative path to the item from the root of the connection of which the item is part.

FullPath `<String>`
Specifies the absolute path to the item in the Citrix.Hypervisor provider.

Id <String>
Specifies the identity of the item in the hypervisor context.

IsContainer <Boolean>
Specifies whether or not the item can contain other items.

IsSymLink <Boolean>
Specifies whether or not the item can be used as a RootPath of a hosting unit.

ObjectType <Citrix.HostingUnitService.Sdk.NodeType>
Specifies the item type.

ERROR CODES
The provider commands can return the following error codes.

New-Item

ConnectionNameOrUidInvalid
The name or unique identifier of the hypervisor connection specified for the hosting unit is invalid.

HostingUnitRootPathInvalid
The root path specified for the hosting unit is invalid. The root path must be a valid item in the hypervisor tree and a SymLink.

HostingUnitNetworkPathInvalid
The network path specified for the hosting unit is invalid. The network path must be a valid item in the hypervisor tree and relative to the root path.

HostingUnitStoragePathInvalid
The storage path specified for the hosting unit is invalid. The storage path must be a valid item in the hypervisor tree and relative to the root path.

HostingUnitDuplicateObjectExists
A hosting unit object with the same name already exists. Hosting unit names must be unique.

HostingUnitStorageDuplicateObjectExists
A hosting unit storage object with the same storage path already exists for this hosting unit. There can only be one object for
each combination of hosting unit and storage path.

HypervisorNotContactable
The hypervisor could not be contacted at the supplied address, which is either invalid or unreachable.

HypervisorAddressInvalidFormat
The address is not in a valid form for the specified hypervisor type.

ConnectionAddressInvalid
The specified address is invalid and does not belong to the same pool.

HypervisorConnectionDuplicateObjectExists
A hypervisor connection object with the same name already exists. Hypervisor connection names must be unique.

HypervisorConnectionAddressDuplicateObjectExists
A hypervisor connection address object with the same address already exists for this hypervisor connection. There can only be one object for each combination of hypervisor connection and address.

HypervisorConnectionForHostingUnitsIsVirtual
The specified hypervisor connection for the hosting unit is a virtual non-persistent connection. A persistent connection is required when creating a hosting unit.

InputNameInvalid
The name specified for the hosting unit or hypervisor connection is invalid because it contains one or more of the following characters: \/:*?<>|@\[

InputPathInvalid
The specified path is invalid because it is not in one of the following formats:

XDHyp:\Connections\<Name>
XDHyp:\Connections\{Guid\}

ExceptionThrown
An unexpected error occurred.

DatabaseError
There was a problem communicating with the database.
CommunicationError
   There was a problem communicating with the remote service.

PermissionDenied
   The user does not have administrative rights to perform this operation.

ScopeNotFound
   One or more of the scopes nominated for the new connection do not exist.

Get-Item and Get-ChildItem

HypervisorConnectionObjectNotFound
   The hypervisor connection object specified in the path could not be found.

HostingUnitObjectNotFound
   The specified hosting unit object could not be found.

HypervisorInMaintenanceMode
   The hypervisor for the specified connection is currently in maintenance mode and cannot be accessed.

FailureToRetrieveConnectionPassword
   The password for the HypervisorConnection cannot be retrieved or decrypted.

ExceptionThrown
   An unexpected error occurred.

DatabaseError
   There was a problem communicating with the database.

CommunicationError
   There was a problem communicating with the remote service.

Remove-Item

HostingUnitObjectToDeleteDoesNotExist
   The specified hosting unit object does not exist.

HypervisorConnectionObjectToDeleteDoesNotExist
   The specified hypervisor connection object does not exist.

InputPathInvalid
   The specified path is invalid because it is not in one of the following formats:
HypervisorConnectionObjectToDeleteIsInUse
   The specified hypervisor connection object cannot be deleted because it is being used by one or more hosting units.

ExceptionThrown
   An unexpected error occurred.

DatabaseError
   There was a problem communicating with the database.

CommunicationError
   There was a problem communicating with the remote service.

Rename-Item

InputPathInvalid
   The specified path is invalid because it is not in one of the following formats:

   XDHyp:\Connections\<Name>
   XDHyp:\Connections\{Guid}
   XDHyp:\HostingUnits\<Name>
   XDHyp:\HostingUnits\{Guid}

HostingUnitDuplicateNameExists
   A hosting unit object with the same name already exists. Hosting unit names must be unique.

HypervisorConnectionDuplicateNameExists
   A hypervisor connection object with the same name already exists. Hypervisor connection names must be unique.

InputNameInvalid
   The new name specified for the hosting unit or hypervisor connection is invalid because it contains one or more of the following characters: \/:*.?=<>][)"{}.

ExceptionThrown
   An unexpected error occurred.

DatabaseError
   There was a problem communicating with the database.
CommunicationError
There was a problem communicating with the remote service.

Set-Item

InputPathInvalid
The specified path is invalid because it is not in one of the following formats:

  XDHyp:\Connections\<Name>
  XDHyp:\Connections\{Guid}
  XDHyp:\HostingUnits\<Name>
  XDHyp:\HostingUnits\{Guid}

HostingUnitObjectToUpdateDoesNotExist
The specified hosting unit object does not exist.

HostingUnitNetworkPathInvalid
The new network path specified for the hosting unit is invalid. Either the network path does not exist or it is not relative to the root path of the hosting unit.

HypervisorConnectionObjectToUpdateDoesNotExist
The specified hypervisor connection object does not exist.

ExceptionThrown
An unexpected error occurred.

DatabaseError
There was a problem communicating with the database.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation. Communication to the database failed for various reasons.

CommunicationError
There was a problem communicating with the remote service.
some cmdlets support server-side filtering of the results. The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

\[ Get-<Noun> | Where \{ $_.Size = 'Small' \} | Sort 'Date' | Select -First 10 \]

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

\[ Get-<Noun> -Size 'Small' -SortBy 'Date' -MaxRecordCount 10 \]

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

- **MaxRecordCount <int>**

  Specifies the maximum number of results to return. For example, to return only the first nine results use:

  \[ Get-<Noun> -MaxRecordCount 9 \]

  If not specified, only the first 250 records are returned, and if more are available, a warning is produced:
WARNING: Only first 250 records returned. Use -MaxRecordCount to retrieve more.

You can suppress this warning by using -WarningAction or by specifying a value for -MaxRecordCount.

To retrieve all records, specify a large number for -MaxRecordCount. As the value is an integer, you can use the following:

```
Get-<Noun> -MaxRecordCount [int]:MaxValue
```

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. For example:

```
Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
....
Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<< -MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo          : OperationStopped: (-) [Get-<Noun>], PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>
```

The count can be accessed using the TotalAvailableResultCount property:

```
$count = $error[0].TotalAvailableResultCount
```

-Skip <int>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order, respectively. Ascending order is assumed if no prefix is present.
Sorting occurs before -MaxRecordCount and -Skip parameters are applied. For example, to sort by Name and then by Count (largest first) use:

-SortBy 'Name,-Count'

By default, sorting by an enumeration property uses the numeric value of the elements. You can specify a different sort order by qualifying the name with an ordered list of elements or their numeric values, or <null> to indicate the placement of null values. Elements not mentioned are placed at the end in their numeric order. For example, to sort by two different enums and then by the object id:

-SortBy 'MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id'

-Filter <String>

This parameter lets you specify advanced filter expressions, and supports combination of conditions with -and and -or, and grouping with braces. For example:

Get-<Noun> -Filter 'Name -like "High*" -or (Priority -eq 1 -and Severity -ge 2)'

The syntax is close enough to PowerShell syntax that you can use script blocks in most cases. This can be easier to read as it reduces quoting:

Get-<Noun> -Filter { Count -ne $null }

The full -Filter syntax is provided below.

EXAMPLES

Filtering by strings performs a case-insensitive wildcard match. Separate parameters are combined with an implicit -and operator. Normal PowerShell quoting rules apply, so you can use single or double quotes, and omit the quotes altogether for many strings. The order of parameters does not make any difference. The following are equivalent:

Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company "citrix" -Product '[X]EN''
Get-<Noun> -Product "Xen" -Company "CITRIX"
Get-<Noun> -Filter { Company -eq 'Citrix' -and Product -like 'Xen' }
See about\_Quoting\_Rules and about\_Wildcards for details about PowerShell handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape the wildcards using the normal PowerShell escape mechanisms (see about\_Escape\_Characters), or switch to a filter expression and the -eq operator:

```
Get-<Noun> -Company "Abc[*]"                 # Matches Abc*
Get-<Noun> -Company "Abc"**                   # Matches Abc*
Get-<Noun> -Filter { Company -eq "Abc"** }   # Matches Abc*
Get-<Noun> -Filter { Company -eq "A""B""C" }  # Matches A"B"C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```
Get-<Noun> -Uid 123
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

```
Get-<Noun> -Filter 'Capacity -ge 10gb'
Get-<Noun> -Filter 'Age -ge 20 -and Age -lt 40'
Get-<Noun> -Filter 'VolumeLevel -like "][123]\"'
Get-<Noun> -Filter 'Enabled -ne $false'
Get-<Noun> -Filter 'NullableProperty -ne $null'
```

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

```
Get-<Noun> -Filter 'Enabled'      # Equivalent to 'Enabled -eq $true'
Get-<Noun> -Filter '-not Enabled' # Equivalent to 'Enabled -eq $false'
```

See about\_Comparison\_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

```
Get-<Noun> -Shape [Shapes]\::Square
Get-<Noun> -Shape Circle
```

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:
$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq "Circle" }
Get-<Noun> -Filter { Shape -like 'C' }

By their nature, floating point values, DateTime values, and TimeSpan values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

Get-<Noun> -Filter { StartTime -ge "2010-08-23T12:30:00.0Z" }
$d = [DateTime]"2010-08-23T12:30:00.0Z"
Get-<Noun> -Filter { StartTime -ge $d }
$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter { StartTime -ge $d }

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

Get-<Noun> -Filter { StartTime -ge '-2' }         # Two days ago
Get-<Noun> -Filter { StartTime -ge '-1:30' }      # Hour and a half ago
Get-<Noun> -Filter { StartTime -ge '-0:0:30' }    # 30 seconds ago

ARRAY PROPERTIES
When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings. Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

Get-<Noun> -User Fred*
Get-<Noun> -Filter { User -like "Fred*" }
Get-<Noun> -Filter { Users -contains "Fred*" }

You can also use the singular form with -Filter to search using other operators:

# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter { User -eq "Frederick" }
# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter { User -lt 'F' }

COMPLEX EXPRESSIONS
When matching against multiple values, you can use a sequence of comparisons joined with -or operators, or you can use -in and -notin:

```
Get-<Noun> -Filter { Shape -eq 'Circle' -or Shape -eq 'Square' }
shapes = 'Circle','Square'
Get-<Noun> -Filter { Shape -in $shapes }
$sides = 1..4
Get-<Noun> -Filter { Sides -notin $sides }
```

Braces can be used to group complex expressions, and override the default left-to-right evaluation of -and and -or. You can also use -not to invert the sense of any sub-expression:

```
Get-<Noun> -Filter { Size -gt 4 -or (Color -eq 'Blue' -and Shape -eq 'Circle') }
Get-<Noun> -Filter { Sides -lt 5 -and -not (Color -eq 'Blue' -and Shape -eq 'Circle') }
```

**PAGING**

The simplest way to page through data is to use the -Skip and -MaxRecordCount parameters. So, to read the first three pages of data with 10 records per page, use:

```
Get-<Noun> -Skip 0 -MaxRecordCount 10 <other filtering criteria>
Get-<Noun> -Skip 10 -MaxRecordCount 10 <other filtering criteria>
Get-<Noun> -Skip 20 -MaxRecordCount 10 <other filtering criteria>
```

You must include the same filtering criteria on each call, and ensure that the data is sorted consistently.

The above approach is often acceptable, but as each call performs an independent query, data changes can result in records being skipped or appearing twice. One approach to improve this is to sort by a unique id field and then start the search for the next page at the unique id after the last unique id of the previous page. For example:

```
# Get the first page
Get-<Noun> -MaxRecordCount 10 -SortBy SerialNumber

SerialNumber ...
--------- ...
A120004
A120007
... 7 other records ...
A120900

# Get the next page
Get-<Noun> -MaxRecordCount 10 -Filter { FirstName -gt 'A120900' }

SerialNumber ...
```
FILTER SYNTAX DEFINITION

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= "{" <ComponentList> "}"

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> |

  <Component>

<Component> ::= <NotOperator> <Factor> |

  <Factor>

<Factor> ::= "{" <ComponentList> "}" |

  <PropertyName> <ComparisonOperator> <Value> |<PropertyName>

<AndOrOperator> ::= "-and" | "-or"

<NotOperator> ::= "-not" | "!

<ComparisonOperator>

  ::= "-eq" | "-ne" | "-le" | "-ge" | "-lt" | "-gt" |
  "-like" | "-notlike" | "-contains" | "-notcontains" |
  "-in" | "-notin"

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> |

  <scalar variable> | <array variable> |
  "$null" "$true" "$false"
Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, "-1:30" means 1 hour and 30 minutes ago.
Add-HypHostingUnitMetadata

Oct 01, 2013
Adds metadata on the given HostingUnit.

Syntax

Add-HypHostingUnitMetadata [-HostingUnitUid] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Add-HypHostingUnitMetadata [-HostingUnitUid] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Add-HypHostingUnitMetadata [-HostingUnitName] <String> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Add-HypHostingUnitMetadata [-HostingUnitName] <String> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Add-HypHostingUnitMetadata [-InputObject] <HostingUnit[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Add-HypHostingUnitMetadata [-InputObject] <HostingUnit[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Detailed Description

Provides the ability for additional custom data to be stored against given HostingUnit objects. This cmdlet will not overwrite existing metadata on an object - use the Set-HypHostingUnitMetadata cmdlet instead.

Related topics

Set-HypHostingUnitMetadata
Remove-HypHostingUnitMetadata

Parameters

-HostingUnitUid <Guid>
Id of the HostingUnit

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

-HostingUnitName <String>
Name of the HostingUnit

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td></td>
</tr>
</tbody>
</table>

https://docs.citrix.com © 1999-2017 Citrix Systems, Inc. All rights reserved. p.2096
-InputObject: <HostingUnit[]>

Objects to which the metadata is to be added.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByValue) |

-Map: <PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByValue) |

-Name: <String>

Specifies the property name of the metadata to be added. The property must be unique for the HostingUnit specified. The property cannot contain any of the following characters /;:.#?=<>|[]()

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | false |

-Value: <String>

Specifies the value for the property.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | false |

-LoggingId: <Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.
- **AdminAddress**: <String>

  Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Return Values**

Citrix.Host.Sdk.Metadata

Add-HypHostingUnitMetadata returns an array of objects containing the new definition of the metadata.

- **Property**: <string>
  - Specifies the name of the property.
- **Value**: <string>
  - Specifies the value for the property.

**Notes**

If the command fails, the following errors can be returned.

**Error Codes**

----------

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DuplicateObject

One of the specified metadata already exists.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS> Add-HypHostingUnitMetadata -HostingUnitId 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>property</td>
<td>value</td>
</tr>
</tbody>
</table>

Add metadata with a name of 'property' and a value of 'value' to the HostingUnit with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.
Add-HypHostingUnitNetwork

Oct 01, 2013
Makes additional hypervisor networks available for use in a HostingUnit.

Syntax

Detailed Description
This command lets you extend the set of hypervisor networks that are made available through the HostingUnit to the Citrix Machine Creation Services. When new machines are created, their virtual NICs can be associated only with networks that are in this set. This command cannot be used if the connection for the hosting unit is in maintenance mode.

New-Item
Add-HypMetadata
remove-HypHostingUnitNetwork

Parameters

-LiteralPath <String>
Specifies the path to the hosting unit to which network will be added. The path must be in one of the following formats: \<drive>\HostingUnits\<HostingUnitName> or \<drive>\HostingUnits\{<HostingUnit Uid>\}

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-NetworkPath <String>
Specifies the path to the network that will be added. The path must be in one of the following formats: \<drive>\ Connections\<ConnectionName>\MyNetwork.network or \<drive>\ Connections\{<Connection Uid>\}\MyNetwork.network or \<drive>\ HostingUnits\<HostingUnitName>\MyNetwork.network or \<drive>\ HostingUnits\{<hostingUnit Uid>\}\MyNetwork.network

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-LoggingId <Guid>
Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-AdminAddress <String>
Specifies the address of a XenDesktop controller that the PowerShell snap-in connects. This can be a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
**Default Value**
LocalHost. When a value is provided by any cmdlet, this value becomes the default.

<table>
<thead>
<tr>
<th>Input Type</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>System.String</td>
<td>false</td>
</tr>
</tbody>
</table>

You can pipe a string that contains a path to Add-HypHostingUnitNetwork (NetworkPath parameter).

**Return Values**

- **Citrix.Host.Sdk.HostingUnit**
  
  Add-HypHostingUnitNetwork returns an object containing the new definition of the hosting unit.

- **HostingUnitUid <Guid>**
  
  Specifies the unique identifier for the hosting unit.

- **HostingUnitName <string>**
  
  Specifies the name of the hosting unit.

- **HypervisorConnection <Citrix.Host.Sdk.HypervisorConnection>**
  
  Specifies the connection that the hosting unit uses to access a hypervisor.

- **RootId <string>**
  
  Identifies, to the hypervisor, the root of the hosting unit.

- **RootPath <string>**
  
  The hosting unit provider path that represents the root of the hosting unit.

- **Storage <Citrix.Host.Sdk.Storage[]>**
  
  The list of storage items that the hosting unit can use.

- **PersonalvDiskStorage <Citrix.XDPowerShell.Storage[]>**
  
  The list of storage items that the hosting unit can use for storing personal data.

- **VMTaggingEnabled <Boolean>**
  
  Specifies whether the metadata in the hypervisor can be used to store information about the XenDesktop Machine Creation Services.

- **NetworkId <string>**
  
  The hypervisor's internal identifier that represents the default network specified for the hosting unit.

- **NetworkPath <string>**
  
  The hosting unit provider path to the default network specified for the hosting unit.

- **Metadata <Citrix.Host.Sdk.Metadata[]>**
  
  A list of key value pairs that can store additional information about the hosting unit.

- **PermittedNetworks <Citrix.Host.Sdk.Network[]>**
  
  A full list of the hypervisor networks that are exposed for use in the hosting unit.

**Notes**

The network path must be valid for the hosting unit. The rules that are applied are as follows: XenServer (HypervisorConnection Type = XenServer)

- NA

VMWare vSphere/ESX (HypervisorConnection Type = vCenter)

- The network path must be directly contained in the root path item of the hosting unit.
Microsoft SCVMM/Hyper-v (HypervisorConnection Type = SCVMM)

NA

In the case of failure, the following errors can be produced.

Error Codes
-----------

HostingUnitsPathInvalid
The path provided is not to an item in a subdirectory of a hosting unit item.

HostingUnitNetworkPathInvalid
The specified path is invalid.

HostingUnitNetworkPathInvalid
The network path cannot be found or is invalid. See notes above about validity.

HostingUnitNetworkDuplicateObjectExists
The specified network path is already part of the hosting unit.

HypervisorInMaintenanceMode
The hypervisor for the connection is in maintenance mode.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation. Communication to the database failed for
for various reasons.

CommunicationError
An error occurred while communicating with the service.

PermissionDenied
The user does not have administrative rights to perform this operation.

ExceptionThrown
An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Examples
-------------------------- EXAMPLE 1 --------------------------

```
c:\PS>Add-HypHostingUnitNetwork -LiteralPath XDHyp:\HostingUnits\MyHostingUnit -NetworkPath 'XDHyp:\HostingUnits\MyHostingUnits\newNetwork.network'
```

<table>
<thead>
<tr>
<th>HostingUnitUid</th>
<th>bcd3d649-86d1-4aa8-8ec2-d322b6a2c457</th>
</tr>
</thead>
<tbody>
<tr>
<td>HostingUnitName</td>
<td>MyHostingUnit</td>
</tr>
<tr>
<td>HypervisorConnection</td>
<td>MyConnection</td>
</tr>
<tr>
<td>RootPath</td>
<td>/</td>
</tr>
<tr>
<td>RootId</td>
<td></td>
</tr>
<tr>
<td>NetworkPath</td>
<td>/Network 0.network</td>
</tr>
<tr>
<td>NetworkId</td>
<td>ab47080b-ca15-771a-c8dc-6ad9650158f1</td>
</tr>
<tr>
<td>Storage</td>
<td>{Local storage.storage}</td>
</tr>
<tr>
<td>PersonalvDiskStorage</td>
<td>{}</td>
</tr>
</tbody>
</table>

https://docs.citrix.com © 1999-2017 Citrix Systems, Inc. All rights reserved. p.2102
The command adds a new network called "newNetwork.network" to the hosting unit called "MyHostingUnit".

-------------------------- EXAMPLE 2 --------------------------

XDHyp: \HostingUnits\MyHostingUnit> Add-HypHostingUnitNetwork -LiteralPath . -NetworkPath 'XDHyp: \HostingUnits\MyHostingUnits\newNetwork.network'

HostingUnitUid : bcd3d649-86d1-4aa8-8ec2-d322b6a2c457
HostingUnitName : MyHostingUnit
HypervisorConnection : MyConnection
RootPath : /
RootId : 
NetworkPath : /Network 0.network
NetworkId : ab47080b-ca15-771a-c8dc-6ad9650158f1
Storage : {/Local storage.storage}
PersonalvDiskStorage : {}
VMTaggingEnabled : True
Metadata : {}
PermittedNetworks : {/Network 0.network, /newNetwork.network}

The command adds a new network called "newNetwork.network" to the current directory. The dot (.) represents the current location (not its contents).

-------------------------- EXAMPLE 3 --------------------------

XDHyp: \HostingUnits\MyHostingUnit> dir *.network | Add-HypHostingUnitNetwork -LiteralPath XDHyp: \HostingUnits\MyHostingUnits\newNetwork.network

HostingUnitUid : bcd3d649-86d1-4aa8-8ec2-d322b6a2c457
HostingUnitName : MyHostingUnit
HypervisorConnection : MyConnection
RootPath : /
RootId : 
NetworkPath : /Network 0.network
NetworkId : ab47080b-ca15-771a-c8dc-6ad9650158f1
Storage : {/Local storage.storage}
PersonalvDiskStorage : {}
VMTaggingEnabled : True
Metadata : {}
PermittedNetworks : {/Network 0.network, /newNetwork.network}

The command adds all of the networks that are available in the hosting unit to the specified hosting unit.

-------------------------- EXAMPLE 4 --------------------------

c:\PS> Add-HypHostingUnitNetwork -LiteralPath XDHyp: \HostingUnits\MyHostingUnit -NetworkPath 'XDHyp: \HostingUnits\MyHostingUnits\newNetwork.network'

HostingUnitUid : bcd3d649-86d1-4aa8-8ec2-d322b6a2c457
HostingUnitName : MyHostingUnit
HypervisorConnection : MyConnection
RootPath : /
RootId : 
NetworkPath : /Network 0.network
NetworkId : ab47080b-ca15-771a-c8dc-6ad9650158f1
Storage : {/Local storage.storage}
PersonalvDiskStorage : {}
VMTaggingEnabled : True
Metadata : {}
PermittedNetworks : {/Network 0.network, /newNetwork.network}

The command adds a new network location called "newNetwork.network" to the hosting unit called "MyHostingUnit".
Add-HypHostingUnitStorage

Oct 01, 2013

Adds storage locations to a hosting unit.

Syntax

Add-HypHostingUnitStorage [-LiteralPath] <String> [-StoragePath] <String> [-StorageType <StorageType>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

This command lets you add storage locations that can store the hard disks required by the virtual machines created by the Citrix Machine Creation Services. This command cannot be used if the connection for the hosting unit is in maintenance mode.

Related topics

New-item
Add-HypMetadata
remove-HypHostingUnitStorage

Parameters

- **-LiteralPath**: <String>
  Specifies the path to the hosting unit to which storage will be added. The path must be in one of the following formats: `<drive>:\HostingUnits\<HostingUnitName>` or `<drive>:\HostingUnits\{<HostingUnit Uid>`

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

- **-StoragePath**: <String>
  Specifies the path to the storage that will be added. The path must be in one of the following formats: `<drive>:\Connections\<ConnectionName>\MyStorage.storage` or `<drive>:\Connections\{<Connection Uid>\}MyStorage.storage` or `<drive>:\HostingUnits\<HostingUnitName>\MyStorage.storage` or `<drive>:\HostingUnits\{<hostingUnit Uid>\}MyStorage.storage`

<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **-StorageType**: <StorageType>
  Specifies the type of storage in StoragePath. Supported storage types are: OSStorage PersonalvDiskStorage

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>OSStorage</td>
<td>false</td>
</tr>
</tbody>
</table>

- **-LoggingId**: <Guid>
  Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

- **-AdminAddress**: <String>
  Specifies the address of a XenDesktop controller that the PowerShell snap-in connects. This can be a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>localhost</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type

`System.String` You can pipe a string that contains a path to Add-HypHostingUnitStorage (StoragePath parameter).
Return Values
Citrix.Host.Sdk.HostingUnit
Add-HypHostingUnitStorage returns an object containing the new definition of the hosting unit.
HostingUnitUid <Guid>
Specifies the unique identifier for the hosting unit.
HostingUnitName <string>
Specifies the name of the hosting unit.
HypervisorConnection <Citrix.Host.Sdk.HypervisorConnection>
Specifies the connection that the hosting unit uses to access a hypervisor.
RootId <string>
Identifies, to the hypervisor, the root of the hosting unit.
RootPath <string>
The hosting unit provider path that represents the root of the hosting unit.
Storage <Citrix.Host.Sdk.Storage[]>
The list of storage items that the hosting unit can use.
PersonalvDiskStorage <Citrix.XDPowerShell.Storage[]>
The list of storage items that the hosting unit can use for storing personal data.
VMTaggingEnabled <Boolean>
Specifies whether the metadata in the hypervisor can be used to store information about the XenDesktop Machine Creation Services.
NetworkId <string>
The hypervisor's internal identifier that represents the network specified for the hosting unit.
NetworkPath <string>
The hosting unit provider path to the network specified for the hosting unit.
Metadata <Citrix.Host.Sdk.Metadata[]>
A list of key value pairs that can store additional information about the hosting unit.

Notes
The storage path must be valid for the hosting unit. The rules that are applied are as follows: XenServer (HypervisorConnection Type = XenServer)
NA
VMWare vSphere/ESX (HypervisorConnection Type = vCenter)
The storage path must be directly contained in the root path item of the hosting unit.
Microsoft SCVMM/Hyper-v (HypervisorConnection Type = SCVMM)
Only one storage entry for these connection types is valid, and it must reference an SMB share. Additionally, if a Hyper-V failover cluster is used the SMB share must be the top-level mount point of the cluster shared volume on one of the servers in the cluster (i.e. C:\ClusterStorage).
In the case of failure, the following errors can be produced.

Error Codes
----------
HostingUnitsPathInvalid
The path provided is not to an item in a subdirectory of a hosting unit item.
HostingUnitStoragePathInvalid
The specified path is invalid.
HostingUnitStorageDuplicateObjectExists
The specified storage path is already part of the hosting unit.
HypervisorInMaintenanceMode
The hypervisor for the connection is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation. Communication to the database failed for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

PersonalvDiskStorage : {/newStorage.storage}
VMTaggingEnabled     : True
Metadata             : {}  
The command adds a new storage location called "newStorage.storage" to the hosting unit called "MyHostingUnit".

-------------------------- EXAMPLE 2 --------------------------

XDHyp:HostingUnits\MyHostingUnit\HostingUnits\MyHostingUnit\Storage -LiteralPath . -StoragePath 'XDHyp:HostingUnits\MyHostingUnit\newStorage.storage' -StorageType OSStorage

HostingUnitUid       : bcd3d49-86d1-4aa8-8ec2-d322b6a2c457
HostingUnitName      : MyHostingUnit
HypervisorConnection : MyConnection
RootPath             : /
RootId               :
NetworkPath          : /Network 0.network
NetworkId            : ab47080b-ca15-771a-c8dc-fad9650158f1
Storage              : {/Local storage.storage, /newStorage.storage}
PersonalvDiskStorage : {/Local storage.storage}
VMTaggingEnabled     : True
Metadata             : {}  
The command adds a new storage location called "newStorage.storage" to the current directory. The dot (.) represents the current location (not its contents).

-------------------------- EXAMPLE 3 --------------------------

XDHyp:HostingUnits\MyHostingUnit\HostingUnits\MyHostingUnit\Storage \*.storage | Add-HypHostingUnitStorage -LiteralPath XDHyp:HostingUnits\MyHostingUnit\newStorage.storage'

HostingUnitUid       : bcd3d49-86d1-4aa8-8ec2-d322b6a2c457
HostingUnitName      : MyHostingUnit
HypervisorConnection : MyConnection
RootPath             : /
RootId               :
NetworkPath          : /Network 0.network
NetworkId            : ab47080b-ca15-771a-c8dc-fad9650158f1
Storage              : {/Local storage.storage}

The command adds all of the storage that is available in the hosting unit to the specified hosting unit.

-------------------------- EXAMPLE 4 --------------------------

c:\PS> Add-HypHostingUnitStorage -LiteralPath XDHyp:HostingUnits\MyHostingUnit\StoragePath 'XDHyp:HostingUnits\MyHostingUnit\newStorage.storage' -StorageType PersonalvDiskStorage

HostingUnitUid       : bcd3d49-86d1-4aa8-8ec2-d322b6a2c457
HostingUnitName      : MyHostingUnit
HypervisorConnection : MyConnection
RootPath             : /
RootId               :
NetworkPath          : /Network 0.network
NetworkId            : ab47080b-ca15-771a-c8dc-fad9650158f1
Storage              : {/Local storage.storage}

The command adds a new storage location called "newStorage.storage" to the hosting unit called "MyHostingUnit".
PersonalDiskStorage : {Local storage, /newStorage.storage}
VMTaggingEnabled : True
Metadata : {}

The command adds a new storage location called "newStorage.storage" to the hosting unit called "MyHostingUnit".
Add-HypHypervisorConnectionAddress

Oct 01, 2013
Add a connection address to a hypervisor connection.

Syntax

Detailed Description

This provides the ability to add addresses by which a hypervisor can be contacted. All the addresses added to a single hypervisor connection are assumed to be equivalent (i.e. they all result in the ability to communicate with the same hypervisors). The hypervisor that the addresses reference is stored at the point of creation of the hypervisor connection. Once this is done all addresses must resolve to this hypervisor to be valid.

The addresses required are: XenServer - The address of the XenServer machines (must all reference the same XenServer pool). VMWare vSphere/ESX - The address of a vCenter server. Microsoft SCVMM/Hyper-V - the address of an SCVMM server.

Related topics

Remove-HypHypervisorConnectionAddress
Get-HypXenServerAddress

Parameters

-LiteralPath <String>
Specifies the path within a Host Service provider to the hypervisor connection item to which to add the address. The path specified must be in one of the following formats: <drive>:\Connections\<HypervisorConnectionName> or <drive>:\Connections\{HypervisorConnection Uid>}

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | false |

-HypervisorAddress <String>

Specifies the address to be used. The address will be validated and the hypervisor must be contactable at the address supplied.

XenServer (ConnectionType = XenServer) The address being added must reference the same XenServer pool referenced by any existing addresses for the same connection. VMWare vSphere\ESX (ConnectionType = vCenter) The address being added must be to the same VMWare vCenter as the existing addresses. SCVMM\Hyper-v (ConnectionType = SCVMM) The address being added must be to the same SCVMM server as the existing addresses. Custom Connection Types ?Validation here I assume none need to check? #PUBS NOTE: ASSUME THIS TO BE UPDATED?#

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByValue) |
-**LoggingId**<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
| Default Value |
| Accept Pipeline Input? | false |

-**AdminAddress**<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in will connect to. This can be provided as a host name or an IP address.

| Required? | false |
| Default Value | LocalHost. Once a value is provided by any cmdlet, this value will become the default. |
| Accept Pipeline Input? | false |

## Return Values

Citrix.Host.Sdk.HypervisorConnection

Add-HypHypervisorConnectionAddress returns an object containing the new definition of the hypervisor connection.

**HypervisorConnectionUid**<Guid>

 Specifies the unique identifier for the hypervisor connection.

**HypervisorConnectionName**<string>

 Specifies the name of the hypervisor connection.

**ConnectionType**<Citrix.XDInterServiceTypes.ConnectionType>

 Specifies the connection type of the connection.

XenServer - A Citrix XenServer hypervisor

SCVMM - A Microsoft SCVMM/Hyper-V hypervisor

vCenter - A VMWare vsphere/ESX hypervisor

Custom - A 3rd party hypervisor

**HypervisorAddress**<string[]>

A list of addresses that can be used to communicate with the hypervisor.

**UserName**<string>

The user name that is used when connecting to the hypervisor.
Persistent <Boolean>
Indicates whether the connection is stored in the database or is only a temporary connection that has the same lifetime as the current Powershell session.

PlugInId <string>
The Citrix identifier for the Citrix Machine Management plug-in.

Revision <Guid>
Identifier for the current version of the hypervisor connection. This value changes every time a property of the hypervisor connection is updated.

SupportsPvsVMs <Boolean>
Indicates whether the connection can be used as part of a hosting unit and therefore used by the Citrix XenDesktop Machine Creation Services to create virtual machines. Only the built-in supported hypervisor connection types can be used for this (i.e. XenServer, SCVMM and vCenter).

Metadata <Citrix.Host.Sdk.Metadata[]>
A list of key value pairs that can store additional information relating to the hosting unit.

Notes
The address format must be valid for the hypervisor connection. The rules that are applied are as below: XenServer (HypervisorConnection Type = XenServer)
http:\<IP Address>
or http:\<server Name>
or https:\<server Name>

Note: To use multiple addresses to the same XenServer pool in order to provide failover functionality, all the XenServers in the pool must have a shared block storage device. If using https connections and failover is required, the certificates on the servers must be trusted by all of the controllers (typically this means having a root certificate installed).

VMWare vSphere/ESX (HypervisorConnection Type = vCenter)
http:\<IP Address>\<sdk path>
http:\<server Name>\<sdk path>
or https:\<Server Name>\<sdk path>

Notes:
* Http requires manual vCenter configuration; https is the only supported default format.
* Default sdk path is ‘sdk’

Microsoft SCVMM/Hyper-v (HypervisorConnection Type = SCVMM)
IP Address
server Name (short or FQDN)

Note: If XenServers are moved to new XenServer pools after being added to a hypervisor connection, unpredictable results will occur.
Once a XenServer is assigned to a hypervisor connection it should not be moved to a new XenServer pool.

In the case of failure the following errors can be produced.

Error Codes
-----------

**InputConnectionsPathInvalid**
The path provided is not to an item in a sub directory of a hosting unit item.

**HypervisorConnectionAddressForeignKeyObjectDoesNotExist**
The hypervisor connection to which the address is to be added could not be located.

**ConnectionAddressInvalid**
The address could not be used to contact a hypervisor or the validation rules have not been met.

**HypervisorConnectionAddressDuplicateObjectExists**
The address specified is already part of the hypervisor connection.

**HypervisorInMaintenanceMode**
The hypervisor for the connection is in maintenance mode.

**DatabaseError**
An error occurred in the service whilst attempting a database operation.

**DatabaseNotConfigured**
The operation could not be completed as the database for the service is not configured.

**DataStoreException**
An error occurred in the service whilst attempting a database operation - communication to database failed for various reasons.

**CommunicationError**
An error occurred whilst communicating with the service.

**PermissionDenied**
The user does not have administrative rights to perform this operation.

**ExceptionThrown**
An unexpected error occurred. To locate more details see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Examples
---------

**EXAMPLE 1**

c:\PS> Add-HypHypervisorConnectionAddress -LiteralPath XDHyp:\Connections\MyConnection -HypervisorAddress http:\myserver.com
PSPath : Citrix.HostingUnitService/Admin/V1.0/Citrix.Hypervisor::XDHyp::Connections\MyConnection
PSParentPath : Citrix.HostingUnitService/Admin/V1.0/Citrix.Hypervisor::XDHyp::Connections
PSCredential : MyConnection
PSProvider : Citrix.HostingUnitService/Admin/V1.0/Citrix.Hypervisor
PSIsContainer : True
HypervisorConnectionUid : 85581f42-c5da-4976-970c-ebc3448ea1e3
HypervisorConnectionName : MyConnection
ConnectionType : XenServer
HypervisorAddress : {http:\myserver2.com,http:\myserver.com}
UserName : root
Persistent : False
PluginId : XenFactory
SupportsPvsVMs : True
Revision : 4c95c857-c54d-4f92-abef-0c0e32c02502
Metadata :

Add the address 'http:\myserver.com' to the hypervisor connection called "MyConnection".
Add-HypHypervisorConnectionMetadata

Oct 01, 2013
Adds metadata on the given HypervisorConnection.

Syntax

Add-HypHypervisorConnectionMetadata [-HypervisorConnectionName] <String> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [-CommonParameters]

Detailed Description

Provides the ability for additional custom data to be stored against given HypervisorConnection objects. This cmdlet will not overwrite existing metadata on an object - use the Set-HypHypervisorConnectionMetadata cmdlet instead.

Related topics

Set-HypHypervisorConnectionMetadata
Remove-HypHypervisorConnectionMetadata

Parameters

-HypervisorConnectionUid <Guid>
Id of the HypervisorConnection

Required? | true
---|---
Default Value | 
Accept Pipeline Input? | true [ByValue, ByPropertyName]

-HypervisorConnectionName <String>
Name of the HypervisorConnection

Required? | true
---|---
Default Value | 
Accept Pipeline Input? | true [ByValue, ByPropertyName]

-InputObject <HypervisorConnection[]>
Objects to which the metadata is to be added.

Required? | true
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>-Name</td>
<td>String</td>
<td>Specifies the property name of the metadata to be added. The property must be unique.</td>
<td>true</td>
<td></td>
<td>false</td>
</tr>
<tr>
<td>-Value</td>
<td>String</td>
<td>Specifies the value for the property.</td>
<td>true</td>
<td></td>
<td>false</td>
</tr>
<tr>
<td>-Map</td>
<td>PSObject</td>
<td>Specifies a dictionary of (name, value)-pairs for the properties. Can be a hashtable or string dictionary.</td>
<td>true</td>
<td></td>
<td>true (ByValue)</td>
</tr>
<tr>
<td>-LoggingId</td>
<td>Guid</td>
<td>Specifies the identifier of the high-level operation this cmdlet call forms a part of.</td>
<td>false</td>
<td></td>
<td>false</td>
</tr>
<tr>
<td>-AdminAddress</td>
<td>String</td>
<td>Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.</td>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
<td>false</td>
</tr>
</tbody>
</table>

**Return Values**
Add-HypHypervisorConnectionMetadata returns an array of objects containing the new definition of the metadata.

Property <string>

Specifies the name of the property.

Value <string>

Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

----------

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DuplicateObject

One of the specified metadata already exists.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS> Add-HypHypervisorConnectionMetadata -HypervisorConnectionUid 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value
<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>property</td>
<td>value</td>
</tr>
</tbody>
</table>

Add metadata with a name of 'property' and a value of 'value' to the HypervisorConnection with the identifier '4CECC26E-48E1-423F-A1F0-2A06DD0805C'.
Add-HypHypervisorConnectionScope

Oct 01, 2013
Add the specified HypervisorConnection(s) to the given scope(s).

Syntax
Add-HypHypervisorConnectionScope [-Scope] <String[]> -InputObject <HypervisorConnection[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
Add-HypHypervisorConnectionScope [-Scope] <String[]> -HypervisorConnectionUid <Guid[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
Add-HypHypervisorConnectionScope [-Scope] <String[]> -HypervisorConnectionName <String[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description
The Add-HypHypervisorConnectionScope cmdlet is used to associate one or more HypervisorConnection objects with given scope(s). There are multiple parameter sets for this cmdlet, allowing you to identify the HypervisorConnection objects in different ways:
- HypervisorConnection objects can be piped in or specified by the InputObject parameter
- The HypervisorConnectionUid parameter specifies objects by HypervisorConnectionUid
- The HypervisorConnectionName parameter specifies objects by HypervisorConnectionName (supports wildcards)

To add a HypervisorConnection to a scope you need permission to change the scopes of the HypervisorConnection and permission to add objects to all of the scopes you have specified.

If the HypervisorConnection is already in a scope, that scope will be silently ignored.

Related topics
Remove-HypHypervisorConnectionScope
Get-HypScopedObject

Parameters
-Scope <String[]>
Specifies the scopes to add the objects to.

| Required? | true |
| Default Value |
| Accept Pipeline Input? | false |

-InputObject <HypervisorConnection[]>
Specifies the HypervisorConnection objects to be added.

<p>| Required? | true |
| Default Value |</p>
<table>

<td>Specifies the HypervisorConnection objects to be added by HypervisorConnectionName.</td>
</tr>
<tr>
<td><strong>-LoggingId</strong></td>
<td>Guid</td>
<td>Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.</td>
</tr>
<tr>
<td><strong>-AdminAddress</strong></td>
<td>String</td>
<td>Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.</td>
</tr>
</tbody>
</table>

### Return Values

None

### Notes

If the command fails, the following errors can be returned.

### Error Codes

--------
UnknownObject
One of the specified objects was not found.

ScopeNotFound
One of the specified scopes was not found.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command with the specified objects or scopes.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------
c:\PS>Add-HypHypervisorConnectionScope Finance -HypervisorConnectionUid 6702C5D0-C073-4080-A0EE-EC74CB537C52
Adds a single HypervisorConnection to the 'Finance' scope.

-------------------------- EXAMPLE 2 --------------------------
c:\PS>Add-HypHypervisorConnectionScope Finance,Marketing -HypervisorConnectionUid 6702C5D0-C073-4080-A0EE-EC74CB537C52
Adds a single HypervisorConnection to the multiple scopes.

-------------------------- EXAMPLE 3 --------------------------
c:\PS>Get-HypHypervisorConnection | Add-HypHypervisorConnectionScope Finance
Adds all visible HypervisorConnection objects to the 'Finance' scope.

-------------------------- EXAMPLE 4 --------------------------
c:\PS>Add-HypHypervisorConnectionScope Finance -HypervisorConnectionName A*
Adds HypervisorConnection objects with a name starting with an 'A' to the 'Finance' scope.
Add-HypMetadata

Oct 01, 2013
Adds metadata to a hypervisor connection or a hosting unit.

Syntax

```
[<CommonParameters>]
```

Detailed Description

Provides the ability for additional custom data to be stored against a hosting unit or hypervisor Connection. This data is never used by the Machine Creation Services, and is provided for consumers of the services to store any data that might be required for their operations. The metadata is returned along with the hypervisor connection or hosting unit that it is assigned to.

Related topics

Get-HypMetadata

Parameters

- **-LiteralPath**<String>

  Specifies the path within a hosting unit provider to the hosting unit or hypervisor connection item to which to add the metadata. The path specified must be in one of the following formats: 
  `<drive>:\HostingUnits\<HostingUnitName>` or `<drive>:\HostingUnits\{<HostingUnit Uid>` or `<drive>:\Connections\<Connection Name>` or `<drive>:\Connections\{<Connection Uid>`

  Required? true

  Default Value

  Accept Pipeline Input? true (ByValue)

- **-Property**<String>

  Specifies the property name of the metadata to be added. The property must be unique for the item specified by the path.

  The property cannot contain any of the following characters \/:.\*?=<> | []^"'

  Required? true

  Default Value

  Accept Pipeline Input? false

- **-Value**<String>

  Specifies the value for the property.
<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **LoggingId**<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **AdminAddress**<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>LocalHost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type

System.String You can pipe a string the contains a path to Add-HypMetadata (Path parameter).

Return Values

Citrix.Host.Sdk.Metadata

Add-HypMetadata returns an object containing the new definition of the metadata.

Property <string>

Specifies the property of the metadata.

Value <string>

Specifies the value of the metadata.

Notes

In the case of failure the following errors can be produced.
Error Codes

---------

InvalidPath

The path provided is not in the required format.

HostingUnitMetadataForeignKeyObjectDoesNotExist

The hosting unit supplied in the path does not exist.

HypervisorConnectionMetadataForeignKeyObjectDoesNotExist

The hypervisor connection supplied in the path does not exist.

HostingUnitMetadataDuplicateObjectExists

Metadata for the specified hosting unit item already exists with the same property name.

HypervisorConnectionMetadataDuplicateObjectExists

Metadata for the specified hypervisor connection item already exists with the same property name.

MetadataContainerUndefined

The specified path does not reference a hosting unit or a hypervisor connection.

DatabaseError

An error occurred in the service whilst attempting a database operation.

DatabaseNotConfigured

The operation could not be completed as the database for the service is not configured.

DataStoreException

An error occurred in the service whilst attempting a database operation - communication to database failed for various reasons.

CommunicationError

An error occurred whilst communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Examples
%-------------------------- EXAMPLE 1 --------------------------%
c:\PS>Add-HypMetadata -LiteralPath XDHyp:\Connections\MyConnection -Property MyProperty -Value MyValue

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>MyProperty</td>
<td>MyValue</td>
</tr>
</tbody>
</table>

The command adds the metadata with the property name of "MyProperty" and value of "MyValue" to the hypervisor connection item called "MyConnection".

%-------------------------- EXAMPLE 2 --------------------------%
c:\PS>dir xdhyp\connections\Citrix* | Add-HypMetadata -Property MyProperty -Value MyValue

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>MyProperty</td>
<td>MyValue</td>
</tr>
<tr>
<td>MyProperty</td>
<td>MyValue</td>
</tr>
<tr>
<td>MyProperty</td>
<td>MyValue</td>
</tr>
</tbody>
</table>

The command adds the metadata with the property name of "MyProperty" and value of "MyValue" to all the hypervisor connection items that begin with the string "Citrix".
Get-HypConfigurationDataForItem

Oct 01, 2013

Retrieves the configuration data for an item in the Host Service provider path. Note: For this release, only VM items are supported for this operation.

Syntax

Get-HypConfigurationDataForItem [-LiteralPath] <String> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

This command provides a mechanism for retrieving extra data about an entry in the hosting unit service provider. The referenced item must be contained within the connections directory in the provider (i.e. XDHypr:Connections).

This mechanism is used for obtaining data that is not required frequently and/or has a high overhead associated with its retrieval (so as to maintain the responsiveness of the provider). For this release of the PowerShell snap-in the only provider items that can be used with this operation are VM items. For a VM this provides a mechanism to obtain the number of CPUs, the amount of Memory (in MB) and hard disk drive capacity (GB).

Related topics

Get-Item

Parameters

-LiteralPath <String>

Specifies the path within a hosting unit provider to the item for which configuration data is to be retrieved. The path specified must be in one of the following formats; <drive>:\Connections\<Connection Name>\<Item Path of VM object> or <drive>:\Connections\{<connection Uid>\<Item Path of VM object>} or <drive>:\HostingUnits\<HostingUnit Name>\<Item Path of VM object> or <drive>:\HostingUnits\{<hostingUnit Uid>\<Item Path of VM object>}

| Required? | true |
| Default Value | 
| Accept Pipeline Input? | true (ByValue) |

-AdminAddress <String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in will connect to. This can be provided as a host name or an IP address.

| Required? | false |
| Default Value | localhost. Once a value is provided by any cmdlet, this value will become the default. |
| Accept Pipeline Input? | false |
Input Type
System.String
You can pipe a string that contains a path to Get-HypConfigurationDataForItem

Return Values
PSObject
Get-HypConfigurationDataForItem returns a PSObject containing the properties that are appropriate for the item specified by the path.

Properties for VM Item
----------------------
CPUCount <int>
Specifies the number of CPUs assigned to the VM.
MemoryMB <int>
The amount of memory allocated to the VM.
HardDiskSizeGB <int>
The capacity of the primary hard drive assigned to the VM.

Notes
For this release this cmdlet only provides configuration data for VM objects in the provider. Using a path to an item that is not a VM will result in an error.

In the case of failure the following errors can be produced.

Error Codes
-----------
InputHypervisorItemPathInvalid
The path provided is not to an item in a sub directory of a connection item or a hosting unit item.
InvalidHypervisorItemPath
No item exists with the specified path.
InvalidHypervisorItem
The item specified by the path exists, but is not a VM Item.
DatabaseError
An error occurred in the service whilst attempting a database operation.
DatabaseNotConfigured
The operation could not be completed as the database for the service is not configured.

DataStoreException

An error occurred in the service whilst attempting a database operation - communication to database failed for various reasons.

CommunicationError

An error occurred whilst communicating with the service.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

HypervisorPermissionDenied

The hypervisor login used does not provide authorization to access the data for this item.

ExceptionThrown

An unexpected error occurred. To locate more details see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS>Get-HypConfigurationDataForItem -LiteralPath XDHyp:\Connections\MyConnection\MyVm.vm

<table>
<thead>
<tr>
<th>CpuCount</th>
<th>MemoryMB</th>
<th>HardDiskSizeGB</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1024</td>
<td>24</td>
</tr>
</tbody>
</table>

This command gets the configuration properties for a VM called 'MyVm.vm' within a hypervisor connection called 'MyConnection'.

-------------------------- EXAMPLE 2 --------------------------

XDHyp:HostingUnits\PS>Get-HypConfigurationDataForItem -LiteralPath .\MyVm.vm

<table>
<thead>
<tr>
<th>CpuCount</th>
<th>MemoryMB</th>
<th>HardDiskSizeGB</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1024</td>
<td>24</td>
</tr>
</tbody>
</table>

This command gets the configuration properties for a VM called 'MyVm.vm' within the current directory. The dot (.) represents the current location (not its contents).

-------------------------- EXAMPLE 3 --------------------------

C:\PS>(Get-HypConfigurationDataForItem -LiteralPath XDHyp:\Connections\MyConnection\MyVm.vm).CPUCount

This command gets the CPU count for a VM called 'MyVm.vm'. The CPUCount is just one property of the VM items. To see all properties of an item, type "(Get-HypConfigurationDataForItem <ItemPath>) | Get-Member".
Get-HypConfigurationObjectForItem

Oct 01, 2013

Retrieves the configuration data for an item in the Host Service provider path. Note: For this release, only VM items are supported for this operation.

Syntax

Get-HypConfigurationObjectForItem [-LiteralPath] <String> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

This command provides a mechanism for retrieving extra data about an entry in the hosting unit service provider. The referenced item must be contained within the connections directory in the provider (i.e. XDHyp:\Connections).

This mechanism is used for obtaining data that is not required frequently and/or has a high overhead associated with its retrieval (so as to maintain the responsiveness of the provider). For this release of the PowerShell snap-in the only provider items that can be used with this operation are VM items. For a VM this provides a mechanism to obtain the number of CPUs, the amount of Memory (in MB) and hard disk drive capacity (GB).

Related topics

Get-Item

Parameters

-LiteralPath<String>

Specifies the path within a hosting unit provider to the item for which configuration data is to be retrieved. The path specified must be in one of the following formats; <drive>\Connections\<Connection Name>\<Item Path of VM object> or <drive>\Connections\{<connection Uid>\<Item Path of VM object>\} or <drive>\HostingUnits\<HostingUnit Name>\<Item Path of VM object> or <drive>\HostingUnits\{<hostingUnit Uid>\<Item Path of VM object>\}

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>
Input Type

System.String You can pipe a string the contains a path to Get-HypConfigurationDataForItem

Return Values

PSObject

Get-HypConfigurationDataForItem returns a PSObject containing the properties that are appropriate for the item specified by the path.

Properties for VM Item

----------------------

CPUCount <int>

Specifies the number of CPUs assigned to the VM.

MemoryMB <int>

The amount of memory allocated to the VM.

HardDiskSizeGB <int>

The capacity of the primary hard drive assigned to the VM.

Network Map

The networks that this VM or Snapshot is connected to

Notes

For this release this cmdlet only provides configuration data for VM objects in the provider. Using a path to an item that is not a VM will result in an error.

In the case of failure the following errors can be produced.

Error Codes

----------

InputHypervisorItemPathInvalid

The path provided is not to an item in a sub directory of a connection item or a hosting unit item.

InvalidHypervisorItemPath

No item exists with the specified path.

InvalidHypervisorItem

The item specified by the path exists, but is not a VM Item.

DatabaseError
An error occurred in the service whilst attempting a database operation.

DatabaseNotConfigured
The operation could not be completed as the database for the service is not configured.

DataStoreException
An error occurred in the service whilst attempting a database operation - communication to database failed for various reasons.

CommunicationError
An error occurred whilst communicating with the service.

InvalidFilter
A filtering expression was supplied that could not be interpreted for this cmdlet.

HypervisorPermissionDenied
The hypervisor login used does not provide authorization to access the data for this item.

ExceptionThrown
An unexpected error occurred. To locate more details see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Examples
-------------------------- EXAMPLE 1 --------------------------
C:\PS>Get-HypConfigurationDataForItem -LiteralPath XDHyp:\Connections\MyConnection\MyVm.vm

<table>
<thead>
<tr>
<th>CpuCount</th>
<th>MemoryMB</th>
<th>HardDiskSizeGB</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1024</td>
<td>24</td>
</tr>
</tbody>
</table>

This command gets the configuration properties for a VM called 'MyVm.vm' within a hypervisor connection called 'MyConnection'.

-------------------------- EXAMPLE 2 --------------------------
XDHyp:\HostingUnits\PS>Get-HypConfigurationDataForItem -LiteralPath .\MyVm.vm

<table>
<thead>
<tr>
<th>CpuCount</th>
<th>MemoryMB</th>
<th>HardDiskSizeGB</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1024</td>
<td>24</td>
</tr>
</tbody>
</table>

This command gets the configuration properties for a VM called 'MyVm.vm' within the current directory. The dot (.) represents the current location (not its contents).

-------------------------- EXAMPLE 3 --------------------------
C:\PS>(Get-HypConfigurationDataForItem -LiteralPath XDHyp:\Connections\MyConnection\MyVm.vm).CPUCount
This command gets the CPU count for a VM called 'MyVm.vm'. The CPUCount is just one property of the VM items. To see all properties of an item, type 

```
(Get-HypConfigurationDataForItem <ItemPath>) | Get-Member
```

Get-HypDBConnection

Oct 01, 2013
Gets the database string for the specified data store used by the Host Service.

Syntax
Get-HypDBConnection [-AdminAddress <String>] [<CommonParameters>]

Detailed Description
Returns the database connection string for the specified data store.
If the returned string is blank, no valid connection string has been specified. In this case the service is running, but is idle and awaiting specification of a valid connection string.

Related topics
Get-HypServiceStatus
Get-HypDataStore
Set-HypDBConnection
Test-HypDBConnection

Parameters
-AdminAddress <String>
Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
</tbody>
</table>

Accept Pipeline Input? false

Return Values
system:string
The database connection string configured for the Host Service.

Notes
If the command fails, the following errors can be returned.

Error Codes
-----------

https://docs.citrix.com   © 1999-2017 Citrix Systems, Inc. All rights reserved.   p.2131
NoDBConnections
The database connection string for the Host Service has not been specified.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------
c:\PS>Get-HypDBConnection

Server=serverName\SQLEXPRESS;Initial Catalog = databaseName; Integrated Security = True
Get the database connection string for the Host Service.
Get-HypDBSchema

Oct 01, 2013
Gets a script that creates the Host Service database schema for the specified data store.

Syntax

Detailed Description

Gets SQL scripts that can be used to create a new Host Service database schema, add a new Host Service to an existing site, remove a Host Service from a site, or create a database server logon for a Host Service. If no Sid parameter is provided, the scripts obtained relate to the currently selected Host Service instance, otherwise the scripts relate to Host Service instance running on the machine identified by the Sid provided. When obtaining the Evict script, a Sid parameter must be supplied. The current service instance is that on the local machine, or that explicitly specified by the last usage of the -AdminAddress parameter to a Host SDK cmdlet. The service instance used to obtain the scripts does not need to be a member of a site or to have had its database connection configured. The database scripts support only Microsoft SQL Server, or SQL Server Express, and require Windows integrated authentication to be used. They can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SMDCMD mode'. The ScriptType parameter determines which script is obtained. If ScriptType is not specified, or is FullDatabase, the script contains:

- Creation of service schema
- Creation of database server logon
- Creation of database user
- Addition of database user to Host Service roles

If ScriptType is Instance, the returned script contains:

- Creation of database server logon
- Creation of database user
- Addition of database user to Host Service roles

If ScriptType is Evict, the returned script contains:

- Removal of Host Service instance from database
- Removal of database user

If ScriptType is Login, the returned script contains:

- Creation of database server logon only

If the service uses two data stores they can exist in the same database. You do not need to configure a database before using this command.
Related topics
Get-HypDataStore
Set-HypDBConnection

Parameters

- **DatabaseName**<String>

Specifies the name of the database for which the schema will be generated.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **ServiceGroupName**<String>

Specifies the name of the service group to be used when creating the database schema. The service group is a collection of all the Host services that share the same database instance and are considered equivalent; that is, all the services within a service group can be used interchangeably.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **ScriptType**<ScriptTypes>

Specifies the type of database script returned. Available script types are:

**Database**

Returns a full database script that can be used to create a database schema for the Host Service in a database instance that does not already contain a schema for this service. The DatabaseName and ServiceGroupName parameters must be specified to create a script of this type.

**Instance**

Returns a permissions script that can be used to add further Host services to an existing database instance that already contains the full Host service schema, associating the services to the Service Group. The Sid parameter can optionally be specified to create a script of this type.

**Login**

Returns a database logon script that can be used to add the required logon accounts to an existing database instance that contains the Host Service schema. This is used primarily when creating a mirrored database environment. The DatabaseName parameter must be specified to create a script of this type.
Evict

Returns a script that can be used to remove the specified Host Service from the database entirely. The DatabaseName and Sid parameters must be specified to create a script of this type.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Database</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**LocalDatabase**<SwitchParameter>

Specifies whether the database script is to be used in a database instance run on the same controller as other services in the service group. Including this parameter ensures the script creates only the required permissions for local services to access the database schema for Host services.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Database</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**Sid**<String>

Specifies the SID of the controller on which the Host Service instance to remove from the database is running.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Database</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Database</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

**System.String**

A string containing the required SQL script for application to a database.
Notes

The scripts returned support Microsoft SQL Server Express Edition, Microsoft SQL Server Standard Edition, and Microsoft SQL Server Enterprise Edition databases only, and are generated on the assumption that integrated authentication will be used.

If the ScriptType parameter is not included or set to 'FullDatabase', the full database script is returned, which will:

Create the database schema.
Create the user and the role (providing the schema does not already exist).
Create the logon (providing the schema does not already exist).

If the ScriptType parameter is set to 'Instance', the script will:
Create the user and the role (providing the schema does not already exist).
Create the logon (providing the schema does not already exist) and associate it with a user.

If the ScriptType parameter is set to 'Login', the script will:
Create the logon (providing the schema does not already exist) and associate it with a pre-existing user of the same name.

If the LocalDatabase parameter is included, the NetworkService account will be added to the list of accounts permitted to access the database. This is required only if the database is run on a controller.

If the command fails, the following errors can be returned.

Error Codes
----------

GetSchemasFailed
The database schema could not be found.

ActiveDirectoryAccountResolutionFailed
The specified Active Directory account or Group could not be found.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------
c:\PS>Get-HypDBSchema -DatabaseName MyDB -ServiceGroupName MyServiceGroup > c:\HypSchema.sql
Get the full database schema for site data store of the Host Service and copy it to a file called 'c:\HypSchema.sql'.
This script can then be used to create the schema in a pre-existing database named 'MyDB' that does not already contain a Host Service site schema.

-------------------------- EXAMPLE 2 --------------------------
c:\PS>Get-HypDBSchema -DatabaseName MyDB -scriptType Login > c:\HostLogins.sql
Get the logon scripts for the Host Service.
Get-HypDBVersionChangeScript

Oct 01, 2013
Gets a script that updates the Host Service database schema.

Syntax

Detailed Description

Returns a database script that can be used to upgrade or downgrade the site or secondary schema for the Host Service from the current schema version to a different version.

Related topics

Get-HypInstalledDBVersion

Parameters

-**DatabaseName**<String>

Specifies the name of the database instance to which the update applies.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-**TargetVersion**<Version>

Specifies the version of the database you want to update to.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-**AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
<td>false</td>
</tr>
</tbody>
</table>
Return Values

System.Management.Automation.PSObject

A PSObject containing the required SQL script for application to a database.

Notes

The PSObject returned by this cmdlet contains the following properties:

-- Script The raw text of the SQL script to apply the update, or null in the case when no upgrade path to the specified target version exists.

-- NeedExclusiveAccess Indicates whether all services in the service group must be shut down during the update or not.

-- CanUndo Indicates whether the generated script allows the updated schema to be reverted to the state prior to the update.

Scripts to update the schema version are stored in the database so any service in the service group can obtain these scripts. Extreme caution should be exercised when using update scripts. Citrix recommends backing up the database before attempting to upgrade the schema. Database update scripts may require exclusive use of the schema and so may not be able to execute while any Host services are running. However, this depends on the specific update being carried out.

After a schema update has been carried out, services that require the previous version of the schema may cease to operate. The ServiceState parameter reported by the Get-HypServiceStatus command provides information about service compatibility. For example, if the schema has been upgraded to a more recent version that a service cannot use, the service reports "DBNewerVersionThanService".

If the command fails, the following errors can be returned.

Error Codes

--------

NoOp

The operation was successful but had no effect.

NoDBCConnections

The database connection string for the Host Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for
PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> $update = Get-HypDBVersionChangeScript -DatabaseName MyDb -TargetVersion 1.0.75.0
C:\PS> $update.Script > update_75.sql

Gets an SQL update script to update the current schema to version 1.0.75.0. The resulting update_75.sql script is suitable for direct use with the SQL Server SQLCMD utility.
Get-HypHypervisorPlugin

Oct 01, 2013
Gets the available hypervisor types.

Syntax

Get-HypHypervisorPlugin [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The provides the ability to retrieve a list of all the available hypervisor types, and their localized names.

Related topics
New-Item

Parameters

- **<AdminAddress><String>**
  Specifies the address of a XenDesktop controller that the PowerShell snap-in will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>LocalHost. Once a value is provided by any cmdlet, this value will become the default.</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

Citrix.Host.Sdk.HypervisorPlugin

Get-HypHypervisorPlugin returns a list of objects containing the definition of the hypervisor plug-ins.

ConnectionType <Citrix.XDInterServiceTypes.ConnectionType>

The hypervisor connection type. This can be one of the following:

- XenServer - Xenserver hypervisor
- SCVMM - Microsoft SCVMM/Hyper-v
- vCenter - VMware vSphere/ESX
- Custom - a third party hypervisor

DisplayName <string>

The localized display name (localized using the locale of the Powershell snap-in session)

PluginFactoryName <string>

The name of the hypervisor plug-in factory used to manage the hypervisor connections.

Notes

To utilize third party plug-ins, the plug-in assemblies must be installed into the appropriate location on each controller machine that forms part of the Citrix controller site. Failure to do this will result in unpredictable behavior, especially during service failover conditions.

In the case of failure the following errors can be produced.

Error Codes

----------

DatabaseError
An error occurred in the service whilst attempting a database operation.

CommunicationError
An error occurred whilst communicating with the service.

InvalidFilter
A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown
An unexpected error occurred. To locate more details see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Examples

------------------------------- EXAMPLE 1 -------------------------------

c:\PS> Get-HypHypervisorPlugin | Format-Table -AutoSize

<table>
<thead>
<tr>
<th>ConnectionType</th>
<th>DisplayName</th>
<th>PluginFactoryName</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCVMM</td>
<td>Microsoft virtualization</td>
<td>MicrosoftPSFactory</td>
</tr>
<tr>
<td>VCenter</td>
<td>VMware virtualization</td>
<td>VmwareFactory</td>
</tr>
<tr>
<td>XenServer</td>
<td>Citrix XenServer</td>
<td>XenFactory</td>
</tr>
</tbody>
</table>

Get the available hypervisor management plug-ins.
Get-HypInstalledDBVersion

Oct 01, 2013
Gets a list of all available database schema versions for the Host Service.

Syntax

Get-HypInstalledDBVersion [-Upgrade] [-Downgrade] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns the current version of the Host Service database schema, if no flags are set, otherwise returns versions for which upgrade or downgrade scripts are available and have been stored in the database.

Related topics

Parameters

- **Upgrade**<SwitchParameter>

Specifies that only schema versions to which the current database version can be updated should be returned.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **Downgrade**<SwitchParameter>

Specifies that only schema versions to which the current database version can be reverted should be returned.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values
The Get-HypInstalledDbVersion command returns objects containing the new definition of the Host Service database schema version.

Major <Integer>
Minor <Integer>
Build <Integer>
Revision <Integer>

Notes
If the command fails, the following errors can be returned.

Error Codes
----------

InvalidParameterCombination
Both the Upgrade and Downgrade flags were specified.

NoOp
The operation was successful but had no effect.

NoDBConnections
The database connection string for the Host Service has not been specified.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

--------------- EXAMPLE 1 ---------------

c:\PS> Get-HypInstalledDBVersion

Major Minor Build Revision
---- ---- ---- ------
5     6     0     0
Get the currently installed version of the Host Service database schema.

--------------- EXAMPLE 2 ---------------

c:\PS> Get-HypInstalledDBVersion -Upgrade

Major Minor Build Revision
---- ---- ---- ------
6     0     0     0
Get the versions of the Host Service database schema for which upgrade scripts are supplied.
Get-HypScopedObject

Oct 01, 2013
Gets the details of the scoped objects for the Host Service.

Syntax

Detailed Description

Returns a list of directly scoped objects including the names and identifiers of both the scope and object as well as the object description for display purposes.

There will be at least one result for every directly scoped object. When an object is associated with multiple scopes the output contains one result per scope duplicating the object details.

No records are returned for the All scope, though if an object is not in any scope a result with a null ScopeId and ScopeName will be returned.

Related topics

Parameters

- **-ScopeId**<Guid>

Gets scoped object entries for the given scope identifier.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **-ScopeName**<String>

Gets scoped object entries with the given scope name.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **-ObjectType**<ScopedObjectType>

Gets scoped object entries for objects of the given type.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td></td>
</tr>
</tbody>
</table>
-ObjectId<String>

Gets scoped object entries for objects with the specified object identifier.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-ObjectName<String>

Gets scoped object entries for objects with the specified object identifier.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-Description<String>

Gets scoped object entries for objects with the specified description.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-Property<String[]>

Specifies the properties to be be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-ReturnTotalRecordCount <SwitchParameter>

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Hyp_Filtering for details.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-MaxRecordCount</code>&lt;Int32&gt;</td>
<td>false</td>
<td>250</td>
<td>false</td>
</tr>
<tr>
<td>Specifies the maximum number of records to return.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>-Skip</code>&lt;Int32&gt;</td>
<td>false</td>
<td>0</td>
<td>false</td>
</tr>
<tr>
<td>Skips the specified number of records before returning results. Also reduces the count returned by <code>-ReturnTotalRecordCount</code>.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>-SortBy</code>&lt;String&gt;</td>
<td>false</td>
<td>The default sort order is by name or unique identifier.</td>
<td>false</td>
</tr>
<tr>
<td>Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>-Filter</code>&lt;String&gt;</td>
<td>false</td>
<td></td>
<td>false</td>
</tr>
<tr>
<td>Gets records that match a PowerShell-style filter expression. See about_Hyp_Filtering for details.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
**-AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

Citrix.Host.Sdk.ScopedObject

The Get-HypScopedObject command returns an object containing the following properties:

* Scopeld <Guid?>
  Specifies the unique identifier of the scope.

* ScopeName <String>
  Specifies the display name of the scope.

* ObjectType <ScopedObjectType>
  Type of the object this entry relates to.

* ObjectId <String>
  Unique identifier of the object.

* ObjectName <String>
  Display name of the object

* Description <String>
  Description of the object (possibly $null if the object type does not have a description).

Notes

If the command fails, the following errors can be returned.

Error Codes

----------

UnknownObject

One of the specified objects was not found.

PartialData
Only a subset of the available data was returned.

InvalidFilter
A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase
The query required to get the database was not defined.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------
c:\PS>Get-HypScopedObject -ObjectType Scheme

ScopeId       : eff6f464-f1ee-4442-add3-99982e0cec01
ScopeName     : Sales
ObjectType    : Scheme
ObjectId      : cd4174ee-9e4b-4e57-b126-9dbf757fe493
ObjectName    : MyExampleScheme
Description   : Test scheme
ScopeId       : 304e0fa7-d390-47f0-a94f-7e956a324c41
ScopeName     : Finance
Gets all of the scoped objects with type Scheme. The example output shows a scheme object (MyExampleScheme) in two scopes Sales and Finance, and another scheme (AnotherScheme) that is not in any scope. The ScopeId and ScopeName values returned are null in the final record.
Get-HypService

Oct 01, 2013
Gets the service record entries for the Host Service.

Syntax

Detailed Description
Returns instances of the Host Service that the service publishes. The service records contain account security identifier information that can be used to remove each service from the database.

A database connection for the service is required to use this command.

Related topics
Parameters

-Property <String[]>
Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

-ReturnTotalRecordCount <SwitchParameter>
When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Hyp_Filtering for details.

| Required? | false |
| Default Value | False |
| Accept Pipeline Input? | false |

-MaxRecordCount <Int32>
Specifies the maximum number of records to return.

| Required? | false |
| Default Value | 250 |
Accept Pipeline Input? | false
---|---
-Skip<Int32>
Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.
| Required? | false |
| Default Value | 0 |
Accept Pipeline Input? | false
-SortBy<String>
Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.
| Required? | false |
| Default Value | The default sort order is by name or unique identifier. |
Accept Pipeline Input? | false
-Filter<String>
Gets records that match a PowerShell-style filter expression. See about_Hyp_Filtering for details.
| Required? | false |
Accept Pipeline Input? | false
-AdminAddress<String>
Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.
| Required? | false |
| Default Value | Localhost. Once a value is provided by any cmdlet, this value becomes the default. |
Accept Pipeline Input? | false

Return Values
Citrix.Host.Sdk.Service
The Get-HypServiceInstance command returns an object containing the following properties.

**Uid** <Integer>
Specifies the unique identifier for the service in the group. The unique identifier is an index number.

**ServiceHostId** <Guid>
Specifies the unique identifier for the service instance.

**DNSName** <String>
Specifies the domain name of the host on which the service runs.

**MachineName** <String>
Specifies the short name of the host on which the service runs.

**CurrentState** <Citrix.Fma.Sdk.ServiceCore.ServiceState>
Specifies whether the service is running, started but inactive, stopped, or failed.

**LastStartTime** <DateTime>
Specifies the date and time at which the service was last restarted.

**LastActivityTime** <DateTime>
Specifies the date and time at which the service was last stopped or restarted.

**OSType**
Specifies the operating system installed on the host on which the service runs.

**OSVersion**
Specifies the version of the operating system installed on the host on which the service runs.

**ServiceVersion**
Specifies the version number of the service instance. The version number is a string that reflects the full build version of the service.

**DatabaseUserName** <string>
Specifies for the service instance the Active Directory account name with permissions to access the database. This will be either the machine account or, if the database is running on a controller, the NetworkService account.

**Sid** <string>
Specifies the Active Directory account security identifier for the machine on which the service instance is running.

**ActiveSiteServices** <string[]>
Specifies the names of active site services currently running in the service. Site services are components that perform long-running background processing in some services. This field is empty for services that do not contain site services.
Notes
If the command fails, the following errors can be returned.

Error Codes
----------

UnknownObject
One of the specified objects was not found.

PartialData
Only a subset of the available data was returned.

InvalidFilter
A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase
The query required to get the database was not defined.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

ActiveSiteServices : [MySiteService1, MySiteService2...]

Get all the instances of the Host Service running in the current service group.
Get-HypServiceAddedCapability

Oct 01, 2013
Gets any added capabilities for the Host Service on the controller.

Syntax
Get-HypServiceAddedCapability [-AdminAddress <String>] [=<CommonParameters>]

Detailed Description
Enables updates to the Host Service on the controller to be detected.
You do not need to configure a database connection before using this command.

Related topics

Parameters

- **<AdminAddress>**<string>

  Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

System.String

List containing added capabilities.

String containing added capabilities.

Notes

If the command fails, the following errors can be returned.

Error Codes

----------

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.
DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-HypServiceAddedCapability
Get the added capabilities of the Host Service.
Get-HypServiceInstance

Oct 01, 2013
Gets the service instance entries for the Host Service.

Syntax

Get-HypServiceInstance [-AdminAddress <String>] [CommonParameters]

Detailed Description

Returns service interfaces published by the instance of the Host Service. Each instance of a service publishes multiple interfaces with distinct interface types, and each of these interfaces is represented as a ServiceInstance object. Service instances can be used to register the service with a central configuration service so that other services can use the functionality.

You do not need to configure a database connection to use this command.

Related topics

Parameters

-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

Citrix.Host.Sdk.ServiceInstance

The Get-HypServiceInstance command returns an object containing the following properties.

ServiceGroupUid <Guid>

\nSpecifies the unique identifier for the service group of which the service is a member.

ServiceGroupName <String>

\nSpecifies the name of the service group of which the service is a member.

ServiceInstanceUID <Guid>

\nSpecifies the unique identifier for registered service instances, which are service instances held by and obtained from a central configuration service. Unregistered service instances do not have unique identifiers.
ServiceType <String>

Specifies the service instance type. For this service, the service instance type is always Hyp.

Address

Specifies the address of the service instance. The address can be used to access the service and, when registered in the central configuration service, can be used by other services to access the service.

Binding

Specifies the binding type that must be used to communicate with the service instance. In this release of XenDesktop, the binding type is always 'wcf_HTTP_kerb'. This indicates that the service provides a Windows Communication Foundation endpoint that uses HTTP binding with integrated authentication.

Version

Specifies the version of the service instance. The version number is used to ensure that the correct versions of the services are used for communications.

ServiceAccount <String>

Specifies the Active Directory account name for the machine on which the service instance is running. The account name is used to provide information about the permissions required for interservice communications.

ServiceAccountSid <String>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

InterfaceType <String>

Specifies the interface type. Each service can provide multiple service instances, each for a different purpose, and the interface defines the purpose. Available interfaces are:

SDK - for PowerShell operations

InterService - for operations between different services

Peer - for communications between services of the same type

Metadata <Citrix.Host.Sdk.Metadata[]>

The collection of metadata associated with registered service instances, which are service instances held by and obtained from a central configuration service. Metadata is not stored for unregistered service instances.

Notes

If the command fails, the following errors can be returned.

Error Codes

----------

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

ServiceType : Hyp
Version : 1

Get all instances of the Host Service running on the specified machine. For remote services, use the AdminAddress parameter to define the service for which the interfaces are required. If the AdminAddress parameter has not been specified for the runspace, service instances running on the local machine are returned.
Get-HypServiceStatus

Oct 01, 2013
Gets the current status of the Host Service on the controller.

Syntax

Get-HypServiceStatus [-AdminAddress <String>] [CommonParameters]

Detailed Description

Enables the status of the Host Service on the controller to be monitored. If the service has multiple data stores it will return the overall state as an aggregate of all the data store states. For example, if the site data store status is OK and the secondary data store status is DBUnconfigured then it will return DBUnconfigured.

Related topics

Set-HypDataStore
Set-HypDBConnection
Test-HypDBConnection
Get-HypDBConnection
Get-HypDBSchema

Parameters

-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

The Get-HypServiceStatus command returns an object containing the status of the Host Service together with extra diagnostics information.

DBUnconfigured

The Host Service does not have a database connection configured.

DBRejectedConnection
The database rejected the logon attempt from the Host Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the Host Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBNewerVersionThanService

The version of the Host Service currently in use is incompatible with the version of the Host Service schema on the database. Upgrade the Host Service to a more recent version.

DBOlderVersionThanService

The version of the Host Service schema on the database is incompatible with the version of the Host Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The Host Service is running and is connected to a database containing a valid schema.

Failed

The Host Service has failed.

Unknown

(0) The service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

----------

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples
-------------------------- EXAMPLE 1 --------------------------
c:\PS>Get-HypServiceStatus

DBUnconfigured
Get the current status of the Host Service.
Get-HypVMMacAddress

Oct 01, 2013
Retrieves a list the MAC addresses for the VMs in the specified connection.

Syntax

Get-HypVMMacAddress [-LiteralPath] <String> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

This command obtains a list of MAC addresses of all the virtual machines in the connection specified.

Related topics

Get-Item

Parameters

-LiteralPath <String>

The path to a connection item in the hosting provider. Paths to anything other than a connection item will result in an error being returned. The path can be provided as either <drive>:\connections\<Connection Name> or <drive>:\connections\{<Connection Uid>}

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-AdminAddress <String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>LocalHost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type

System.String

You can pipe a string the contains a path to Get-HypConfigurationDataForItem

Return Values

Citrix.Host.Sdk.HypervisorVMObject

Get-HypVMMacAddress returns an object containing the following properties.
MacAddress <string> - specifies the MAC address of the VM.

VMId <string> - specifies the identifier for the VM as defined in the hypervisor hosting it.

Notes
The path must refer to a connection item. Hosting unit items are not valid.

In the case of failure the following errors can be produced.

Error Codes

-------------
InputConnectionsPathInvalid

If the path is not provided in an expected format an InputConnectionsPathInvalid error will result.

HypervisorConnectionObjectNotFound

Why is this different from invalid Path?#AUTHOR'S NOTE - THIS NEEDS UPDATING#

HypervisorInMaintenanceMode

The hypervisor for the connection is in maintenance mode.

DatabaseError

An error occurred in the service whilst attempting a database operation.

DatabaseNotConfigured

The operation could not be completed as the database for the service is not configured.

DataStoreException

An error occurred in the service whilst attempting a database operation - communication to database failed for various reasons.

CommunicationError

An error occurred whilst communicating with the service.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown

An unexpected error occurred. To locate more details see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Examples
EXAMPLE 1

C:\PS>Get-HypVMMacAddress -LiteralPath XDHyp:\Connections\MyConnection

MacAddress                  VMId
----------                  ----
52:b0:1c:ed:60:fa          f3395d2a-a196-41c2-e37d-764ac871599
62:6f:40:d5:af             5f4457b0-cc3c-f806-8ca7-5f57e4bf2d1
4e:a5:9f:00:b2:0c           3115177b-85a9-d8ee-d0f9-0c7437483c09

This command gets the MAC addresses for the connection called "MyConnection".

EXAMPLE 2

XDHyp:\Connections\MyConnection>Get-HypVMMacAddress -Path .

MacAddress                  VMId
----------                  ----
52:b0:1c:ed:60:fa          f3395d2a-a196-41c2-e37d-764ac871599
62:6f:40:d5:af             5f4457b0-cc3c-f806-8ca7-5f57e4bf2d1
4e:a5:9f:00:b2:0c           3115177b-85a9-d8ee-d0f9-0c7437483c09

This command gets the MAC addresses for the connection at the current directory. The dot (.) represents the current location (not its contents).

EXAMPLE 3

C:\PS>Get-HypVMMacAddress -LiteralPath Xdhyp:\connections\"{268c66db-9b8c-47f6-9265-42326dbff006}";

This command gets the MAC addresses for the connection that has a ConnectionUid of 268c66db-9b8c-47f6-9265-42326dbff006.
Get-HypXenServerAddress

Oct 01, 2013
Gets all the available addresses for a XenServer hypervisor connection.

Syntax
Get-HypXenServerAddress [-LiteralPath] <String> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description
This cmdlet provides the ability to retrieve all the available hypervisor connection addresses that can be used to connect to the same XenServer pool. When used in conjunction with Add-HypHypervisorAddress this can be used to easily populate a connection with all the addresses that can be used to provide full failover support for a XenServer connection.

If the addresses are https addresses the command will use the certificates installed on the XenServers to provide suitable https addresses where possible. Only servers that can be resolved will be returned.

Related topics
Add-HypHypervisorConnectionAddress

Parameters

-LiteralPath <String>
Specifies the path within a Host Service provider to the hypervisor connection item to which to add the address. The path specified must be in one of the following formats: <drive>:\Connections\<HypervisorConnectionName> or <drive>:\Connections\{HHypervisorConnection Uid\>

Required? true
Default Value
Accept Pipeline Input? true (ByValue)

-AdminAddress <String>
Specifies the address of a XenDesktop controller that the PowerShell snap-in will connect to. This can be provided as a host name or an IP address.

Required? false
Default Value localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input? false

Return Values
System.String
Get-HypXenServerAddress returns a list of strings containing the available address.

Notes
For this to work as required with https connections, the certificates installed on the XenServers must be trusted by all controllers. Typically this means having the root certificate for the certificate trust chain installed on all controllers.Wildcard certificates are not supported for this operation.

In the case of failure the following errors can be produced.

Error Codes
-----------
InputConnectionsPathInvalid
The path provided is not to an item in a sub directory of a hosting unit item.

HypervisorConnectionNotXenServer
The hypervisor connection to which the path refers is not for a Citrix XenServer hypervisor.

HypervisorConnectionObjectNotFound
The hypervisor connection at the path specified cannot be located.

**HypervisorInMaintenanceMode**

The hypervisor for the connection is in maintenance mode.

**DatabaseError**

An error occurred in the service whilst attempting a database operation.

**DatabaseNotConfigured**

The operation could not be completed as the database for the service is not configured.

**DataStoreException**

An error occurred in the service whilst attempting a database operation - communication to database failed for various reasons.

**CommunicationError**

An error occurred whilst communicating with the service.

**InvalidFilter**

A filtering expression was supplied that could not be interpreted for this cmdlet.

**ExceptionThrown**

An unexpected error occurred. To locate more details see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:s\PS> Get-HypXenServerAddress -Path XDHyp:\Connections\MyConnection

https:\myserver.com
https:\myServer1.com

Gets the available addresses for the connection "MyConnection".

-------------------------- EXAMPLE 2 --------------------------

c:s\PS> Get-HypXenServerAddress -LiteralPath XDHyp:\Connections\MyConnection | Add-HypHypervisorConnectionAddress -Path XDHyp:\Connections\MyConnectionPath

Adds all the available addresses for the XenServer pool in "MyConnection" to the hypervisor connection.
New-HypVMSnapshot

Oct 01, 2013
Creates a new snapshot for the specified VM item path.

Syntax

[-CommonParameters]

Detailed Description

This command provides a mechanism for creating a new snapshot of a virtual machine given a Host Service provider path to a VM. The resulting snapshot can then be used for operations that require a snapshot to work.

Related topics

Parameters

-**LiteralPath**<String>

Specifies the path within a hosting unit provider to the virtual machine item for which to create a new snapshot. The path specified must be in one of the following formats: <drive>:\Connections\<Connection Name>\<Item Path of VM object> or <drive>:\Connections\{<connection Uid>\<Item Path of VM object>\} or <drive>:\HostingUnits\<HostingUnit Name>\<Item Path of VM object> or <drive>:\HostingUnits\{<hostingUnit Uid>\<Item Path of VM object>\}

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-**SnapshotName**<String>

The name to give the new snapshot. This will be visible in the hypervisor management console.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-**LoggingId**<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-**AdminAddress**<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>LocalHost. Once a value is provided by any cmdlet, this value will become the default.</td>
<td>false</td>
</tr>
</tbody>
</table>

-**SnapshotDescription**<String>

The description to add to the snapshot. This will be visible in the hypervisor management console.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Input Type
System.string You can pipe a string that contains a path to `Get-HypConfigurationDataForItem`.

Return Values
System.string.
The provider path to the newly created snapshot.

Notes
In the case of failure the following errors can be produced.

Error Codes
-----------
InputHypervisorItemPathInvalid
The path provided is not to an item in a sub directory of a connection item or a hosting unit item.

InvalidHypervisorItemPath
No item exists with the specified path.

InvalidHypervisorItem
The item specified by the path exists, but is not a VM Item.

SnapshotNameAlreadyInUse
The specified name is already in use and would cause a name resolution clash.

FailedToCreateSnapshot
The snapshot creation process failed.

HypervisorInMaintenanceMode
The hypervisor is in maintenance mode.

DatabaseError
An error occurred in the service whilst attempting a database operation.

DatabaseNotConfigured
The operation could not be completed as the database for the service is not configured.

DataStoreException
An error occurred in the service whilst attempting a database operation - communication to database failed for various reasons.

CommunicationError
An error occurred whilst communicating with the service.

PermissionDenied
The user does not have administrative rights to perform this operation.

ExceptionThrown
An unexpected error occurred. To locate more details see the Windows event logs on the controller being used, or examine the XenDesktop logs.
Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> New-HypVMSnapshot -LiteralPath XDHyp:\Connections\MyConnection\MyVm.vm -SnapshotName "New snapshot" -SnapshotDescription "Example snapshot"

XDHyp:\Connections\MyConnection\MyVm.vm\New snapshot.snapshot

This command creates a snapshot of a VM called 'MyVm.vm' within a hypervisor connection called 'MyConnection'.
Remove-HypHostingUnitMetadata

Oct 01, 2013
Removes metadata from the given HostingUnit.

Syntax

Remove-HypHostingUnitMetadata [-HostingUnitUid] <Guid> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-HypHostingUnitMetadata [-HostingUnitUid] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-HypHostingUnitMetadata [-HostingUnitName] <String> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-HypHostingUnitMetadata [-HostingUnitName] <String> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-HypHostingUnitMetadata [-InputObject] <HostingUnit[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-HypHostingUnitMetadata [-InputObject] <HostingUnit[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to remove metadata from the given HostingUnit.

Related topics

Add-HypHostingUnitMetadata
Set-HypHostingUnitMetadata

Parameters

-**HostingUnitUid**<Guid>

Id of the HostingUnit

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

-**HostingUnitName**<String>

Name of the HostingUnit

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
- **InputObject** `<HostingUnit[]>`

Objects to which the metadata is to be added.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **Name** `<String>`

The metadata property to remove.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **Map** `<PSObject>`

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]"). The properties whose names match keys in the map will be removed.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **LoggingId** `<Guid>`

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **AdminAddress** `<String>`
Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Notes

If the command fails, the following errors can be returned.

Error Codes

-----------

InvalidParameterCombination
The cmdlet parameters are inconsistent.

UnknownObject
One of the specified objects was not found.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.
ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS> Get-HypHostingUnit | % { Remove-HypHostingUnitMetadata -Map $_.MetadataMap }
Remove all metadata from all HostingUnit objects.
Remove-HypHostingUnitNetwork

Oct 01, 2013
Removes network from a hosting unit.

Syntax

Remove-HypHostingUnitNetwork [-LiteralPath] <String> [-NetworkPath] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Detailed Description

Lets you remove networks from a hosting unit. This does not remove the network from the hypervisor, just the reference to the network for the Host Service. After it is removed, the network is no longer available for associating with virtual NICs (when creating new virtual machines with the Machine Creation Services). Any virtual machines that have already been created continue to use the network until they are removed from the deployment. This command cannot be used if the connection for the hosting unit is in maintenance mode. If the network to be removed no longer exists on the hypervisor for the hosting unit, you must supply a fully qualified path to the network location.

Related topics

Add-HypHostingUnitNetwork

Parameters

-LiteralPath<String>

Required? true
Default Value
Accept Pipeline Input? false

-NetworkPath<String>

Required? true
Default Value
Accept Pipeline Input? true (ByValue)

-LoggingId<Guid>

Required? false
Default Value
Accept Pipeline Input? false

-AdminAddress<String>

Required? false
Default Value
Accept Pipeline Input? false

Input Type

System.String You can pipe a string that contains a path to Remove-HypHostingUnitNetwork (Path parameter).
Notes

In the case of failure, the following errors can be produced.

Error Codes

------------

HostingUnitsPathInvalid

The path provided is not to an item in a subdirectory of a hosting unit item.

HostingUnitNetworkObjectToDeleteDoesNotExist

The network path specified is not part of the hosting unit.

HypervisorInMaintenanceMode

The hypervisor for the connection is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation. Communication to the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Remove-HypHostingUnitNetwork -LiteralPath XDHyp:HostingUnits\MyHostingUnit -NetworkPath 'XDHyp:HostingUnits\MyHostingUnits\newNetwork.network'
The command removes the network called "newNetwork.network" from the hosting unit called "MyHostingUnit"
Remove-HypHostingUnitStorage

Oct 01, 2013
Removes storage from a hosting unit.

Syntax

Detailed Description

Lets you remove storage locations from a hosting unit. This does not remove the storage from the hypervisor, just the reference to the storage for the Host Service. After it is removed, the storage is no longer used to store hard disks (when creating new virtual machines with the Machine Creation Services). The hard disks already located on the storage remain in place and virtual machines that have already been created continue to use the storage until they are removed from the deployment. This command cannot be used if the connection for the hosting unit is in maintenance mode. If the storage location to be removed no longer exists on the hypervisor for the hosting unit, you must supply a fully qualified path to the storage location.

Related topics

Add-HypHostingUnitStorage

Parameters

- **-LiteralPath**:<String>
  
  Required? | true
  
  Default Value
  
  Accept Pipeline Input? | false

- **-StoragePath**:<String>
  
  Specifies the path in the hosting unit provider of the storage to remove. If StoragePath is not specified, all storage is removed from the hosting unit. The path specified must be in one of the following formats: <drive>\Connections\<HostingUnitName>\MyStorage.storage or <drive>\Connections\{<hostingUnit Uid>\}MyStorage.storage

  Required? | false
  
  Default Value
  
  Accept Pipeline Input? | true (ByValue)

- **-StorageType**:<StorageType>
  
  Specifies the type of storage in StoragePath. Supported storage types are: OSStorage PersonalvDiskStorage

  Required? | false
  
  Default Value | OSStorage
  
  Accept Pipeline Input? | false

- **-LoggingId**:<Guid>
  
  Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

  Required? | false
  
  Default Value
  
  Accept Pipeline Input? | false
-AdminAddress:<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. This can be a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>LocalHost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type

System.String You can pipe a string the contains a path to Remove-HypHostingUnitStorage (Path parameter).

Notes

After storage is removed, it is the administrator's responsibility to maintain its contents. The Citrix XenDesktop Machine Creation Services do not try to clean up any data that is stored in the storage location.

If all storage is removed from the hosting unit, other features of the Machine Creation Services stop functioning until some storage is added again.

In the case of failure, the following errors can be produced.

Error Codes

-----------
HostingUnitsPathInvalid

The path provided is not to an item in a subdirectory of a hosting unit item.

HostingUnitStorageObjectToDeleteDoesNotExist

The storage path specified is not part of the hosting unit.

HypervisorInMaintenanceMode

The hypervisor for the connection is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation. Communication to the database failed for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Remove-HypHostingUnitStorage -LiteralPath XDHyp:\HostingUnits\MyHostingUnit -StoragePath 'XDHyp:\HostingUnits\MyHostingUnits\newStorage.storage'

The command removes the OS storage location called "newStorage.storage" from the hosting unit called "MyHostingUnit"
EXAMPLE 2

```powershell
c:PS\>Get-ChildItem XDHYP:\HostingUnits\Host\*.storage | Remove-HypHostingUnitStorage XDHYP:\HostingUnits\Host1
The command removes all OS storage from all of the hosting unit called "Host1".
```

EXAMPLE 3

```powershell
c:PS\>Get-ChildItem XDHYP:\HostingUnits\Host\*.storage | Remove-HypHostingUnitStorage -StorageType PersonalvDiskStorage
The command removes all PersonalvDisk storage from all of the hosting unit called "Host1".
```
Remove-HypHypervisorConnectionAddress

Oct 01, 2013
Removes addresses from the list of available connection addresses.

Syntax

Remove-HypHypervisorConnectionAddress [-LiteralPath <String>] [-HypervisorAddress <String>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to remove addresses that can be used to connect to the hypervisor specified by the hypervisor connection. If all addresses are removed, the connection will not be able to be used until a valid connection is added to the hypervisor connection.

Related topics

Add-HypHypervisorConnectionAddress

Parameters

-LiteralPath <String>

Specifies the path within a Host Service provider to the hosting unit item to which to add the address. The path specified must be in one of the following formats: <drive>:\HostingUnits\HostingUnitName or <drive>:\HostingUnits\{HostingUnit Uid}\n
<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-HypervisorAddress <String>

Specifies the address to be removed. If this parameter is not provided then all addresses will be removed from the hypervisor connection.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-LoggingId <Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-AdminAddress <String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>LocalHost. Once a value is provided by any cmdlet, this value will become the default.</td>
<td>false</td>
</tr>
</tbody>
</table>
Input Type
System.String You can pipe a string that contains a path to Remove-HypHypervisorConnectionAddress (Path parameter).

Notes
Alterations to a hypervisor connection will affect all entities that reference the connection. If all addresses are removed from the connection, any other entities that reference the hypervisor connection (e.g. hosting units) will not be able to make new connections to the hypervisor.

In the case of failure the following errors can be produced.

Error Codes
----------

InputConnectionsPathInvalid
The path provided is not to an item in a sub directory of a hosting unit item.

HypervisorConnectionAddressForeignKeyObjectDoesNotExist
The hypervisor connection to which the address is to be added could not be located.

HypervisorInMaintenanceMode
The hypervisor for the connection is in maintenance mode.

DatabaseError
An error occurred in the service whilst attempting a database operation.

DatabaseNotConfigured
The operation could not be completed as the database for the service is not configured.

DataStoreException
An error occurred in the service whilst attempting a database operation - communication to database failed for various reasons.

CommunicationError
An error occurred whilst communicating with the service.

PermissionDenied
The user does not have administrative rights to perform this operation.

ExceptionThrown
An unexpected error occurred. To locate more details see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------
c:\PS>Remove-HypHypervisorConnectionAddress -LiteralPath XDHyp:HostingUnits\MyHypervisorConnection -HypervisorAddress 'http:\myserver.com'
The command removes the address "http:\myserver.com" from the hypervisor connection called "MyHypervisorConnection".

-------------------------- EXAMPLE 2 --------------------------
c:\PS>Get-Item -Path XDHYP:\Connections* | Remove-HypHypervisorConnectionAddress
The command removes all addresses from all the hypervisor connections currently defined.
Remove-HypHypervisorConnectionMetadata

Oct 01, 2013
Removes metadata from the given HypervisorConnection.

Syntax

Remove-HypHypervisorConnectionMetadata [-HypervisorConnectionUid] <Guid> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Remove-HypHypervisorConnectionMetadata [-HypervisorConnectionUid] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Remove-HypHypervisorConnectionMetadata [-HypervisorConnectionName] <String> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Remove-HypHypervisorConnectionMetadata [-HypervisorConnectionName] <String> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Remove-HypHypervisorConnectionMetadata [-InputObject] <HypervisorConnection[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Remove-HypHypervisorConnectionMetadata [-InputObject] <HypervisorConnection[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Detailed Description

Provides the ability to remove metadata from the given HypervisorConnection.

Related topics

Add-HypHypervisorConnectionMetadata
Set-HypHypervisorConnectionMetadata

Parameters

-HypervisorConnectionUid -Guid

Id of the HypervisorConnection

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

-HypervisorConnectionName -String

Name of the HypervisorConnection

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-----------------------------------------------------------------------------</td>

Notes

If the command fails, the following errors can be returned.

Error Codes

----------

InvalidParameterCombination
The cmdlet parameters are inconsistent.

UnknownObject
One of the specified objects was not found.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.
ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-HypHypervisorConnection | % { Remove-HypHypervisorConnectionMetadata -Map $_.MetadataMap }
Remove all metadata from all HypervisorConnection objects.
Remove-HypHypervisorConnectionScope

Oct 01, 2013
Remove the specified HypervisorConnection(s) from the given scope(s).

Syntax

Remove-HypHypervisorConnectionScope [-Scope] <String[]> -InputObject <HypervisorConnection[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-HypHypervisorConnectionScope [-Scope] <String[]> -HypervisorConnectionUid <Guid[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-HypHypervisorConnectionScope [-Scope] <String[]> -HypervisorConnectionName <String[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-HypHypervisorConnectionScope cmdlet is used to remove one or more HypervisorConnection objects from the given scope(s).

There are multiple parameter sets for this cmdlet, allowing you to identify the HypervisorConnection objects in different ways:

- HypervisorConnection objects can be piped in or specified by the InputObject parameter
- The HypervisorConnectionUid parameter specifies objects by HypervisorConnectionUid
- The HypervisorConnectionName parameter specifies objects by HypervisorConnectionName (supports wildcards)

To remove a HypervisorConnection from a scope you need permission to change the scopes of the HypervisorConnection.

If the HypervisorConnection is not in a specified scope, that scope will be silently ignored.

Related topics

Add-HypHypervisorConnectionScope
Get-HypScopedObject

Parameters

-Scope <String[]>

Specifies the scopes to remove the objects from.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-InputObject <HypervisorConnection[]>

Specifies the HypervisorConnection objects to be removed.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>
-**HypervisorConnectionUid**<Guid[]>>

Specifies the HypervisorConnection objects to be removed by HypervisorConnectionUid.

| Required? | true |
| Default Value | 
| Accept Pipeline Input? | true (ByValue, ByPropertyName) |

-**HypervisorConnectionName**<String[]>>

Specifies the HypervisorConnection objects to be removed by HypervisorConnectionName.

| Required? | true |
| Default Value | 
| Accept Pipeline Input? | true (ByValue, ByPropertyName) |

-**LoggingId**<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
| Default Value | 
| Accept Pipeline Input? | false |

-**AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

| Required? | false |
| Default Value | Localhost. Once a value is provided by any cmdlet, this value becomes the default. |
| Accept Pipeline Input? | false |

Return Values

None

Notes

If the command fails, the following errors can be returned.

Error Codes

----------

UnknownObject

One of the specified objects was not found.
ScopeNotFound
One of the specified scopes was not found.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command with the specified objects or scopes.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------
c:\PS> Remove-HypHypervisorConnectionScope Finance -HypervisorConnectionUid 6702C5D0-C073-4080-A0EE-EC74CB537C52
Removes a single HypervisorConnection from the 'Finance' scope.

-------------------------- EXAMPLE 2 --------------------------
c:\PS> Remove-HypHypervisorConnectionScope Finance,Marketing -HypervisorConnectionUid 6702C5D0-C073-4080-A0EE-EC74CB537C52
Removes a single HypervisorConnection from multiple scopes.

-------------------------- EXAMPLE 3 --------------------------
c:\PS> Get-HypHypervisorConnection | Remove-HypHypervisorConnectionScope Finance
Removes all visible HypervisorConnection objects from the 'Finance' scope.

-------------------------- EXAMPLE 4 --------------------------
c:\PS> Remove-HypHypervisorConnectionScope Finance -HypervisorConnectionName A*
Removes HypervisorConnection objects with a name starting with an 'A' from the 'Finance' scope.
Remove-HypMetadata

Oct 01, 2013
Removes metadata from a hypervisor connection or hosting unit.

Syntax

Detailed Description

Provides the ability for custom data to be removed from a specific hosting unit or hypervisor connection. If the Property parameter is not provided, all metadata will be removed from the specified item.

Related topics

Remove-HypMetadata

Parameters

-LiteralPath<String>

Specifies the path within a Host Service provider to the hosting unit or hypervisor connection item from which to remove the metadata. The path specified must be in one of the following formats: <drive>\HostingUnits\<HostingUnitName> or <drive>\HostingUnits\{<HostingUnit Uid> or <drive>\Connections\<Connection Name> or <drive>\Connections\{<Connection Uid>

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-Property<String>

Specifies the property name of the metadata to be removed.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.
- **AdminAddress**<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

`System.String` You can pipe a string the contains a path to Add-HypMetadata (Path parameter).

**Notes**

In the case of failure the following errors can be produced.

**Error Codes**

--------

InvalidPath

The path provided is not in the required format.

HostingUnitMetadataObjectToDeleteDoesNotExist

The hosting unit supplied in the path does not exist.

HypervisorConnectionObjectToDeleteDoesNotExist

The hypervisor connection supplied in the path does not exist.

MetadataContainerUndefined

The specified path does not reference a hosting unit or a hypervisor connection.

DatabaseError

An error occurred in the service whilst attempting a database operation.

DatabaseNotConfigured

The operation could not be completed as the database for the service is not configured.

DataStoreException
An error occurred in the service whilst attempting a database operation - communication to database failed for various reasons.

CommunicationError

An error occurred whilst communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS>Remove-HypMetadata -LiteralPath XDHyp:\Connections\MyConnection -Property MyProperty
The command removes the metadata with the property "MyProperty" from the hypervisor connection called "MyConnection".

-------------------------- EXAMPLE 2 --------------------------

C:\PS>Remove-HypMetadata -LiteralPath XDHyp:\Connections\MyConnection
The command removes all the metadata from the hypervisor connection called "MyConnection".

-------------------------- EXAMPLE 3 --------------------------

C:\PS>dir XDHyp:\connections | Remove-HypMetadata
The command removes all the metadata from all the hypervisor connections.
Remove-HypServiceMetadata

Oct 01, 2013
Removes metadata from the given Service.

Syntax

Remove-HypServiceMetadata [-ServiceHostId] <Guid> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Remove-HypServiceMetadata [-ServiceHostId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Remove-HypServiceMetadata [-InputObject] <Service[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Remove-HypServiceMetadata [-InputObject] <Service[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Detailed Description
Provides the ability to remove metadata from the given Service.

Related topics
Set-HypServiceMetadata

Parameters

-ServiceHostId <Guid>
Id of the Service

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

-InputObject <Service[]>
Objects to which metadata is to be removed.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-Name <String>
The metadata property to remove.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-Map<PSObject>**

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with `@{"name1" = "val1"; "name2" = "val2"}`) or a string dictionary (created with `new-object "System.Collections.Generic.Dictionary[String,String]"`). The properties whose names match keys in the map will be removed.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

**-LoggingId<Guid>**

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-AdminAddress<String>**

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td><code>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</code></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Notes**

If the command fails, the following errors can be returned.

**Error Codes**

---------
InvalidParameterCombination
The cmdlet parameters are inconsistent.

UnknownObject
One of the specified objects was not found.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-HypService | % { Remove-HypServiceMetadata -Map $_.MetadataMap }
Remove all metadata from all Service objects.
Reset-HypServiceGroupMembership

Oct 01, 2013
Reloads the access permissions and configuration service locations for the Host Service.

Syntax

Reset-HypServiceGroupMembership [-ConfigServiceInstance] <ServiceInstance[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Enables you to reload Host Service access permissions and configuration service locations. The Reset-HypServiceGroupMembership command must be run on at least one instance of the service type (Hyp) after installation and registration with the configuration service. Without this operation, the Host services will be unable to communicate with other services in the XenDesktop deployment. When the command is run, the services are updated when additional services are added to the deployment, provided that the configuration service is not stopped. The Reset-HypServiceGroupMembership command can be run again to refresh this information if automatic updates do not occur when new services are added to the deployment. If more than one configuration service instance is passed to the command, the first instance that meets the expected service type requirements is used.

Related topics

Parameters

-**ConfigServiceInstance**<ServiceInstance[]>

Specifies the configuration service instance object that represents the service instance for the type 'InterService' that references a configuration service for the deployment.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>true</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-**LoggingId**<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>false</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type
Citrix.Host.Sdk.ServiceInstance[] Service instances containing a ServiceInstance object that refers to the central configuration service interservice interface can be piped to the Reset-HypServiceGroupMembership command.

Notes
If the command fails, the following errors can be returned.

Error Codes
---------

NoSuitableServiceInstance
None of the supplied service instance objects were suitable for resetting service group membership.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples
-------------------------- EXAMPLE 1 --------------------------
c:\PS>Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-HypServiceGroupMembership
Reset the service group membership for a service in a deployment where the configuration service is configured and running on the same machine as the service.

-------------------------- EXAMPLE 2 --------------------------
c:\PS>Get-ConfigRegisteredServiceInstance -ServiceType Config -AdminAddress OtherServer.example.com | Reset-HypServiceGroupMembership
Reset the service group membership for a service in a deployment where the configuration service that is configured and running on a machine named 'OtherServer.example.com'.
Set-HypAdminConnection

Oct 01, 2013
Set the controller that will be used by the cmdlets that form the Host Service PowerShell snap-in.

Syntax

Set-HypAdminConnection [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to set the default controller address that will be used by the cmdlets in order to communicate with the controller. Most Host Service cmdlets take an 'AdminAddress' parameter that can be used to define the controller (when used this will override this setting). However the Set-Location cmdlet(inside) in the Host Service provider cannot offer this option and the controller address must be set using this cmdlet if no other cmdlets have been used to set the address previously during the use of the current runspace.

Related topics

Parameters

- **-AdminAddress <String>**

  Specifies the address of a XenDesktop controller that the PowerShell snap-in will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Examples

```
-------------------------- EXAMPLE 1 --------------------------
c:\PS>Set-HypAdminConnection -AdminAddress myserver.com
This command sets the controller address for the commands to be "myserver.com". All commands run will use this address until it is altered either by another call to this command, or the use of the 'AdminAddress' parameter on another command in the Host Service snap-in.
```
Set-HypDBConnection

Oct 01, 2013
Configures a database connection for the Host Service.

Syntax

Set-HypDBConnection [-DBConnection <String>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Configures a connection to a database in which the Host Service can store its state. The service will attempt to connect and start using the database immediately after the connection is configured. The database connection string is updated to the specified value regardless of whether it is valid or not. Specifying an invalid connection string prevents a service from functioning until the error is corrected.

After a connection is configured, you cannot alter it without first clearing it (by setting the connection to $null).

You do not need to configure a database connection to use this command.

Related topics

Get-HypServiceStatus
Get-HypDBConnection
Test-HypDBConnection

Parameters

-DBConnection <String>

Specifies the database connection string to be used by the Host Service. Passing in $null will clear any existing database connection configured.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>true</td>
<td>false</td>
</tr>
</tbody>
</table>

-LoggingId <Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>false</td>
<td>false</td>
</tr>
</tbody>
</table>

-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

The Set-HypDBConnection command returns an object containing the status of the Host Service together with extra diagnostics information.

DBUnconfigured
The Host Service does not have a database connection configured.

DBRejectedConnection
The database rejected the logon attempt from the Host Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured
The expected stored procedures are missing from the database. This may be because the Host Service schema has not been added to the database.

DBNotFound
The specified database could not be located with the configured connection string.

DBNewerVersionThanService
The version of the Host Service currently in use is incompatible with the version of the Host Service schema on the database. Upgrade the Host Service to a more recent version.

DBOlderVersionThanService
The version of the Host Service schema on the database is incompatible with the version of the Host Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress
A database schema upgrade is currently in progress.

OK
The Host Service is running and is connected to a database containing a valid schema.

Failed
The Host Service has failed.

Unknown
The status of the Host Service cannot be determined.

Notes
If the command fails, the following errors can be returned.

Error Codes

---------

InvalidDBConnectionString
The database connection string has an invalid format.

**DatabaseConnectionDetailsAlreadyConfigured**

There was already a database connection configured. After a configuration is set, it can only be set to $null.

**PermissionDenied**

You do not have permission to execute this command.

**AuthorizationError**

There was a problem communicating with the Citrix Delegated Administration Service.

**ConfigurationLoggingError**

The operation could not be performed because of a configuration logging error.

**CommunicationError**

There was a problem communicating with the remote service.

**ExceptionThrown**

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

**Examples**

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Set-HypDBConnection -DBConnection "Server=serverName\SQLEXPRESS;Initial Catalog = databaseName; Integrated Security = True"

OK

Configures a database connection string for the Host Service.

-------------------------- EXAMPLE 2 --------------------------

c:\PS>Set-HypDBConnection -DBConnection "Invalid Connection String"

Invalid database connection string format.

Configures an invalid database connection string for the Host Service.
Set-HypHostingUnitMetadata

Oct 01, 2013
Adds or updates metadata on the given HostingUnit.

Syntax

```
Set-HypHostingUnitMetadata [-HostingUnitUid] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]
```

```
Set-HypHostingUnitMetadata [-HostingUnitUid] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]
```

```
Set-HypHostingUnitMetadata [-HostingUnitName] <String> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]
```

```
Set-HypHostingUnitMetadata [-HostingUnitName] <String> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]
```

```
Set-HypHostingUnitMetadata [-InputObject] <HostingUnit[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]
```

```
Set-HypHostingUnitMetadata [-InputObject] <HostingUnit[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]
```

Detailed Description

Provides the ability for additional custom data to be stored against given HostingUnit objects.

Related topics

Add-HypHostingUnitMetadata
Remove-HypHostingUnitMetadata

Parameters

- **-HostingUnitUid** `<Guid>`

  Id of the HostingUnit

<table>
<thead>
<tr>
<th>Required?</th>

</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

- **-HostingUnitName** `<String>`

  Name of the HostingUnit

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>InputObject</td>
<td>Objects to which the metadata is to be added.</td>
</tr>
<tr>
<td>-Name</td>
<td>Specifies the property name of the metadata to be added. The property must</td>
</tr>
<tr>
<td></td>
<td>be unique for the HostingUnit specified. The property cannot contain any of</td>
</tr>
<tr>
<td></td>
<td>the following characters /:.*?&lt;=&lt;&gt;</td>
</tr>
<tr>
<td>Value</td>
<td>Specifies the value for the property.</td>
</tr>
<tr>
<td>Map</td>
<td>Specifies a dictionary of (name, value)-pairs for the properties. This can</td>
</tr>
<tr>
<td></td>
<td>either be a hashtable (created with @{&quot;name1&quot; = &quot;val1&quot;;</td>
</tr>
<tr>
<td></td>
<td>&quot;name2&quot; = &quot;val2&quot;}) or a string dictionary (created with new-object &quot;System.Collections.Generic.Dictionary[String,String]&quot;).</td>
</tr>
<tr>
<td>LoggingId</td>
<td>Specifies the identifier of the high-level operation this cmdlet call forms</td>
</tr>
</tbody>
</table>

**Notes:**
- `-InputObject` and `-Map` support ByValue and ByVal input. The property name and value must be unique for the HostingUnit specified. The value cannot contain any of the following characters: `\/:.*?<=<>|[]()`. 
- `-Name` and `-Value` are required parameters. 
- `-LoggingId` is optional. 

**Examples:**

```powershell
Set-HostingUnit -Name MyProperty -Value MyValue
```

```powershell
Set-HostingUnit -InputObject MyHostingUnits
```

```powershell
Set-HostingUnit -Map @{Name1="Value1"; Name2="Value2"}
```
Default Value

Accept Pipeline Input?  false

-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

Set-HypHostingUnitMetadata returns a dictionary containing the new (name, value)-pairs.

Key <string>

Specifies the name of the property.

Value <string>

Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

---------

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.
PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples
-------------------------- EXAMPLE 1 --------------------------
c:\PS>Set-HypHostingUnitMetadata -HostingUnitUid 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>property</td>
<td>value</td>
</tr>
</tbody>
</table>

Add metadata with a name of 'property' and a value of 'value' to the HostingUnit with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.
Set-HypHostingUnitStorage

Sets options for a storage location on a hosting unit.

Syntax

Detailed Description

This command lets you set options for storage locations that are defined for a hosting unit. This command cannot be used if the connection for the hosting unit is in maintenance mode.

Related topics

Parameters

-LiteralPath <String>

Specifies the path to the hosting unit which defines the storage. The path must be in one of the following formats: `<drive>:\HostingUnits\<HostingUnitName>` or `<drive>:\HostingUnits\{<HostingUnit Uid>}

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
</tr>
</tbody>
</table>

-StoragePath <String>

Specifies the path to the storage that will be modified. The path must be in one of the following formats: `<drive>:\Connections\<ConnectionName>\MyStorage.storage` or `<drive>:\Connections\{<Connection Uid>\}\MyStorage.storage` or `<drive>:\HostingUnits\<HostingUnitName>\MyStorage.storage` or `<drive>:\HostingUnits\{<hostingUnit Uid>\}\MyStorage.storage`

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
</tr>
</tbody>
</table>

-StorageType <StorageType>

Specifies the type of storage in StoragePath. Supported storage types are: OSStorage PersonalvDiskStorage

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>OSStorage</td>
</tr>
</tbody>
</table>

-Superseded <Boolean>

Specifies that this storage has been superseded and should not be used for future provisioning operations. Existing virtual machines using this storage will continue to function.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
</tr>
</tbody>
</table>

-LoggingId <Guid>

 Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
</tr>
</tbody>
</table>
Accept Pipeline Input? false

**-AdminAddress <String>**

Specifies the address of a XenDesktop controller that the PowerShell snap-in connects. This can be a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>LocalHost. When a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

*System.String* You can pipe a string that contains a path to Add-HypHostingUnitStorage (StoragePath parameter).

**Return Values**

*Citrix.XDPowerShell.HostingUnit*

Add-HypHostingUnitStorage returns an object containing the new definition of the hosting unit.

**HostingUnitUid <Guid>**

Specifies the unique identifier for the hosting unit.

**HostingUnitName <string>**

Specifies the name of the hosting unit.

**HypervisorConnection <Citrix.XDPowerShell.HypervisorConnection>**

Specifies the connection that the hosting unit uses to access a hypervisor.

**RootId <string>**

Identifies, to the hypervisor, the root of the hosting unit.

**RootPath <string>**

The hosting unit provider path that represents the root of the hosting unit.

**Storage <Citrix.XDPowerShell.Storage[]>**

The list of storage items that the hosting unit can use.

**PersonalDiskStorage <Citrix.XDPowerShell.Storage[]>**

The list of storage items that the hosting unit can use for storing personal data.

**VMTaggingEnabled <Boolean>**

Specifies whether the metadata in the hypervisor can be used to store information about the XenDesktop Machine Creation Services.

**NetworkId <string>**

The hypervisor's internal identifier that represents the network specified for the hosting unit.

**NetworkPath <string>**

The hosting unit provider path to the network specified for the hosting unit.

**Metadata <Citrix.XDPowerShell.Metadata[]>**

A list of key value pairs that can store additional information about the hosting unit.

**Notes**

The storage path must be valid for the hosting unit. The rules that are applied are as follows: XenServer (HypervisorConnection Type = XenServer)

VMWare vSphere/ESX (HypervisorConnection Type = vCenter)

The storage path must be directly contained in the root path item of the hosting unit.

Microsoft SCVMM/Hyper-v (HypervisorConnection Type = SCVMM)
Only one storage entry for these connection types is valid, and it must reference an SMB share. Additionally, if a Hyper-V failover cluster is used the SMB share must be the
top-level mount point of the cluster shared volume on one of the servers in the cluster (i.e. C:\ClusterStorage).

In the case of failure, the following errors can be produced.

Error Codes
-----------
HostingUnitsPathInvalid
The path provided is not to an item in a subdirectory of a hosting unit item.
HostingUnitStoragePathInvalid
The specified path is invalid.
HostingUnitStoragePathInvalid
The storage path cannot be found or is invalid. See notes above about validity.
HostingUnitStorageDuplicateObjectExists
The specified storage path is already part of the hosting unit.
HypervisorInMaintenanceMode
The hypervisor for the connection is in maintenance mode.
DatabaseError
An error occurred in the service while attempting a database operation.
DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.
DataStoreException
An error occurred in the service while attempting a database operation. Communication to the database failed for
for various reasons.
CommunicationError
An error occurred while communicating with the service.
PermissionDenied
The user does not have administrative rights to perform this operation.
ExceptionThrown
An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Examples
-------------------------- EXAMPLE 1 --------------------------

c:\PS>Set-HypHostingUnitStorage -LiteralPath XDHyp:\HostingUnits\MyHostingUnit -StoragePath 'XDHyp:\HostingUnits\MyHostingUnits\newStorage.storage' -Superseded $true

HostingUnitUid       : bcd3d649-86d1-4aa8-8ec2-d322b6a2c457
HostingUnitName      : MyHostingUnit
HypervisorConnection : MyConnection
RootPath             : /
RootId               :
NetworkPath          : /Network 0.network
NetworkId            : ab47080b-ca15-771a-c8dc-6ad9650158f1
Storage              : [{Local storage.storage, /newStorage.storage}]
PersonalvDiskStorage : [/newStorage.storage]
VMTaggingEnabled     : True
Metadata             : {}

The command updates a storage location called "newStorage.storage" associated with the hosting unit called "MyHostingUnit".
Set-HypHypervisorConnectionMetadata

Oct 01, 2013
Adds or updates metadata on the given HypervisorConnection.

Syntax
Set-HypHypervisorConnectionMetadata [-HypervisorConnectionUid] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
Set-HypHypervisorConnectionMetadata [-HypervisorConnectionUid] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
Set-HypHypervisorConnectionMetadata [-HypervisorConnectionName] <String> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
Set-HypHypervisorConnectionMetadata [-HypervisorConnectionName] <String> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
Set-HypHypervisorConnectionMetadata [-InputObject] <HypervisorConnection[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
Set-HypHypervisorConnectionMetadata [-InputObject] <HypervisorConnection[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description
Provides the ability for additional custom data to be stored against given HypervisorConnection objects.

Related topics
Add-HypHypervisorConnectionMetadata
Remove-HypHypervisorConnectionMetadata

Parameters
-HypervisorConnectionUid <Guid>
Id of the HypervisorConnection

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByValue, ByPropertyName) |

-HypervisorConnectionName <String>
Name of the HypervisorConnection

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByValue, ByPropertyName) |

-InputObject <HypervisorConnection[]>
Objects to which the metadata is to be added.

| Required? | true |
-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByValue) |

-Name<String>

Specifies the property name of the metadata to be added. The property must be unique for the HypervisorConnection specified. The property cannot contain any of the following characters \/:.*?=<>|[]"'

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | false |

-Value<String>

Specifies the value for the property.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | false |

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

| Required? | false |
| Default Value | Localhost. Once a value is provided by any cmdlet, this value becomes the default. |
| Accept Pipeline Input? | false |

Set-HypHypervisorConnectionMetadata returns a dictionary containing the new (name, value)-pairs.

Key <string>
Specifies the name of the property.

Value <string>
Specifies the value for the property.

Notes
If the command fails, the following errors can be returned.

Error Codes
-----------
InvalidParameterCombination
The cmdlet parameters are inconsistent.

UnknownObject
One of the specified objects was not found.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples
-------------------------- EXAMPLE 1 --------------------------
c:\PS> Set-HypHypervisorConnectionMetadata -HypervisorConnectionUid 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Add metadata with a name of 'property' and a value of 'value' to the HypervisorConnection with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.
Set-HypServiceMetadata

Oct 01, 2013
Adds or updates metadata on the given Service.

Syntax

Set-HypServiceMetadata [-ServiceHostId] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]
Set-HypServiceMetadata [-ServiceHostId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]
Set-HypServiceMetadata [-InputObject] <Service[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]
Set-HypServiceMetadata [-InputObject] <Service[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Detailed Description

Allows you to store additional custom data against given Service objects.

Related topics

Remove-HypServiceMetadata

Parameters

-ServiceHostId <Guid>
Id of the Service

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

-InputObject <Service[]>
Objects to which metadata is to be added.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-Name <String>
Specifies the property name of the metadata to be added. The property must be unique for the Service specified. The property cannot contain any of the following characters \/:.*?=<>|[]()

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **-Value**: <String>

Specifies the value for the property.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **-Map**: <PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **-LoggingId**: <Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **-AdminAddress**: <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td></td>
</tr>
</tbody>
</table>
Default Value | Localhost. Once a value is provided by any cmdlet, this value becomes the default.
--- | ---
Accept Pipeline Input? | false

Return Values

Set-HypServiceMetadata returns a dictionary containing the new (name, value)-pairs.

Key <string>
Specifies the name of the property.

Value <string>
Specifies the value for the property.

Notes
If the command fails, the following errors can be returned.

Error Codes

---------

InvalidParameterCombination
The cmdlet parameters are inconsistent.

UnknownObject
One of the specified objects was not found.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

**CommunicationError**

There was a problem communicating with the remote service.

**ExceptionThrown**

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

**Examples**

------------- EXAMPLE 1 --------------------------

c:\PS>Set-HypServiceMetadata -ServiceHostId 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>property</td>
<td>value</td>
</tr>
</tbody>
</table>

Add metadata with a name of 'property' and a value of 'value' to the Service with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.
Start-HypVM

Oct 01, 2013
Starts a VM.

Syntax
Start-HypVM [-LiteralPath] <String> [-AdminAddress <String>][<CommonParameters>]

Detailed Description
This command provides a mechanism to start a VM.

Related topics
Parameters

-LiteralPath <String>
Specifies the path within a hosting unit provider to the virtual machine item to start. The path specified must be in one of the following formats: <drive>:\Connections\<Connection Name>\<Item Path of VM object> or <drive>:\Connections\{<connection Uid>\<Item Path of VM object>\} or <drive>:\HostingUnits\<HostingUnit Name>\<Item Path of VM object> or <drive>:\HostingUnits\{<hostingUnit Uid>\<Item Path of VM object>\}

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-AdminAddress <String>
Specifies the address of a XenDesktop controller that the PowerShell snap-in will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>localhost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type
System.string You can pipe a string the contains a path.

Return Values
System.void.

Notes
In the case of failure the following errors can be produced.
Error Codes
----------

InputHypervisorItemPathInvalid
The path provided is not to an item in a sub directory of a connection item or a hosting unit item.

InvalidHypervisorItemPath
No item exists with the specified path.

InvalidHypervisorItem
The item specified by the path exists, but is not a VM Item.

HypervisorInMaintenanceMode
The hypervisor is in maintenance mode.

DatabaseError
An error occurred in the service whilst attempting a database operation.

DatabaseNotConfigured
The operation could not be completed as the database for the service is not configured.

CommunicationError
An error occurred whilst communicating with the service.

PermissionDenied
The user does not have administrative rights to perform this operation.

ExceptionThrown
An unexpected error occurred. To locate more details see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Examples
-------------------------- EXAMPLE 1 --------------------------

C:\PS>Start-HypVM -LiteralPath XDHyp:\Connections\MyConnection\MyVm.vm
This command starts a VM called 'MyVm.vm' within a hypervisor connection called 'MyConnection'.
## Stop-HypVM

**Oct 01, 2013**  
Stops a VM by issuing a Shutdown request

### Syntax

```
Stop-HypVM [-LiteralPath] <String> [-AdminAddress <String>] [<CommonParameters>]
```

### Detailed Description

This command provides a mechanism to change the power state of a VM from running to stopped.

### Related topics

### Parameters

- **-LiteralPath**<String>
  
  Specifies the path within a hosting unit provider to the virtual machine item to stop. The path specified must be in one of the following formats: `<drive>:\Connections\<Connection Name>\<Item Path of VM object>` or `<drive>:\Connections\{<connection Uid>\<Item Path of VM object>}` or `<drive>:\HostingUnits\<HostingUnit Name>\<Item Path of VM object>` or `<drive>:\HostingUnits\{<hostingUnit Uid>\<Item Path of VM object>}

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **-AdminAddress**<String>

  Specifies the address of a XenDesktop controller that the PowerShell snap-in will connect to. This can be provided as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>LocalHost. Once a value is provided by any cmdlet, this value will become the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### Input Type

**System.String** You can pipe a string that contains a path.

### Return Values

**System.Void**

### Notes

In the case of failure, the following errors can be produced.
Error Codes

------------

InputHypervisorItemPathInvalid
The path provided is not to an item in a sub directory of a connection item or a hosting unit item.

InvalidHypervisorItemPath
No item exists with the specified path.

InvalidHypervisorItem
The item specified by the path exists, but is not a VM Item.

HypervisorInMaintenanceMode
The hypervisor is in maintenance mode.

DatabaseError
An error occurred in the service whilst attempting a database operation.

DatabaseNotConfigured
The operation could not be completed as the database for the service is not configured.

CommunicationError
An error occurred whilst communicating with the service.

PermissionDenied
The user does not have administrative rights to perform this operation.

ExceptionThrown
An unexpected error occurred. To locate more details see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS>Stop-HypVM -LiteralPath XDHyp:\Connections\MyConnection\MyVm.vm
This command stops a VM called 'MyVm.vm' within a hypervisor connection called 'MyConnection'.
Test-HypDBConnection

Oct 01, 2013
Tests a database connection for the Host Service.

Syntax

Test-HypDBConnection [-DBConnection] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Tests a connection to the database in which the Host Service can store its state. The service will attempt to connect to the database without affecting the current connection to the database.

You do not have to clear the connection to use this command.

Related topics

Get-HypServiceStatus

Get-HypDBConnection

Set-HypDBConnection

Parameters

-DBConnection <String>

Specifies the database connection string to be tested by the Host Service.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-LoggingId <Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
</tr>
</tbody>
</table>

-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
</tbody>
</table>

Return Values
The Test-HypDBConnection command returns an object containing the status of the Host Service if the connection string of the specified data store were to be set to the string being tested, together with extra diagnostics information for the specified connection string.

**DBRejectedConnection**

The database rejected the logon attempt from the Host Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

**InvalidDBConfigured**

The expected stored procedures are missing from the database. This may be because the Host Service schema has not been added to the database.

**DBNotFound**

The specified database could not be located with the configured connection string.

**DBNewerVersionThanService**

The version of the Host Service currently in use is incompatible with the version of the Host Service schema on the database. Upgrade the Host Service to a more recent version.

**DBOlderVersionThanService**

The version of the Host Service schema on the database is incompatible with the version of the Host Service currently in use. Upgrade the database schema to a more recent version.

**DBVersionChangeInProgress**

A database schema upgrade is currently in progress.

**OK**

The Set-HypDBConnection command would succeed if it were executed with the supplied connection string.

**Failed**

The Host Service has failed.

**Unknown**

The status of the Host Service cannot be determined.

**Notes**

If the command fails, the following errors can be returned.

**Error Codes**

---------

**InvalidDBConnectionString**

The database connection string has an invalid format.

**PermissionDenied**

You do not have permission to execute this command.

**AuthorizationError**

There was a problem communicating with the Citrix Delegated Administration Service.
ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------- EXAMPLE 1 ---------------------
c:\PS> Test-HypDBConnection -DBConnection "Server=serverName\SQLEXPRESS;Initial Catalog = databaseName; Integrated Security = True"
OK
Tests a database connection string for the Host Service.

-------------------- EXAMPLE 2 ---------------------
c:\PS> Test-HypDBConnection -DBConnection "Invalid Connection String"
Invalid database connection string format.
Tests an invalid database connection string for the Host Service.
Test-HypHostingUnitNameAvailable

Oct 01, 2013
Checks to see if the proposed name for a hosting unit is unused.

Syntax

```
Test-HypHostingUnitNameAvailable -HostingUnitName <String[]> -AdminAddress <String> [CommonParameters]
```

Detailed Description
Checks to see if the proposed name for a hosting unit is unused. This check is done without regard for scoping of existing
hosting unit, so even the names of inaccessible hosting units will be checked.

Related topics
New-Item
Rename-Item

Parameters

- **-HostingUnitName <String[]>**

  The name or names of the hosting units(s) to be tested.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

- **-AdminAddress <String>**

  Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host
name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

object[]

An array of PSObjects which pair the name and availability of the name

Notes

In the case of failure the following errors can be produced.
Error Codes

--------

DatabaseError
An error occurred in the service whilst attempting a database operation.

DatabaseNotConfigured
The operation could not be completed as the database for the service is not configured.

DataStoreException
An error occurred in the service whilst attempting a database operation - communication to database failed for various reasons.

CommunicationError
An error occurred whilst communicating with the service.

PermissionDenied
The user does not have administrative rights to perform this operation.

ExceptionThrown
An unexpected error occurred. To locate more details see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

Test-HypHostingUnitNameAvailable -HostingUnitName $NewHostingUnitName
This will test whether the if the value of $NewHostingUnitName could be used to create a new hosting unit or rename an existing one without failing because the name is not unique, returning true if the name is good.
Test-<HypHypervisorConnectionNameAvailable

Oct 01, 2013
Checks to see if the proposed name for a hypervisor connection is unused.

Syntax
Test-HypHypervisorConnectionNameAvailable -HypervisorConnectionName <String[]> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description
Checks to see if the proposed name for a hypervisor connection is unused. This check is done without regard for scoping of existing hypervisor connection, so even the names of inaccessible hypervisor connection will be checked.

Related topics
New-Item
Rename-Item

Parameters
-HypervisorConnectionName <String[]>
The name or names of the hypervisor connection(s) to be tested.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

-AdminAddress <String>
Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values
object[]
An array of PSObjects which pair the name and availability of the name

Notes
In the case of failure the following errors can be produced.

Error Codes
-----------

DatabaseError
An error occurred in the service whilst attempting a database operation.

DatabaseNotConfigured
The operation could not be completed as the database for the service is not configured.

DataStoreException
An error occurred in the service whilst attempting a database operation - communication to database failed for various reasons.

CommunicationError
An error occurred whilst communicating with the service.

PermissionDenied
The user does not have administrative rights to perform this operation.

ExceptionThrown
An unexpected error occurred. To locate more details see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

Test-HypHypervisorConnectionNameAvailable -HypervisorConnectionName $NewConnectionName
This will test whether the if the value of $NewConnectionName could be used to create a new hypervisor connection or rename an existing one without failing because the name is not unique, returning true if the name is good.
Update-HypHypervisorConnection

Oct 01, 2013
Requests the host service to update the connection properties that depend on the version of hypervisor in use.

Syntax

Detailed Description

Allows the version specific properties of a hypervisor connection to be updated after an upgrade to the hypervisor system which may provide new capabilities.

Parameters

-LiteralPath<String>
Specifies the path within a Host Service provider to the hypervisor connection item to be updated. The path specified must be in one of the following formats; <drive>:\Connections\<HypervisorConnectionName> or <drive>:\Connections\{HypervisorConnection Uid>

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByValue) |

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in will connect to. This can be provided as a host name or an IP address.

| Required? | false |
| Default Value | |

https://docs.citrix.com  © 1999-2017 Citrix Systems, Inc. All rights reserved.  p.2230
Default Value | LocalHost. Once a value is provided by any cmdlet, this value will become the default.
--- | ---
Accept Pipeline Input? | false

Notes
In the case of failure the following errors can be produced.

Error Codes
----------
InvalidPath
The path provided is not in the required format.

HypervisorInMaintenanceMode
The hypervisor is in maintenance mode and cannot be updated.

DatabaseError
An error occurred in the service whilst attempting a database operation.

DatabaseNotConfigured
The operation could not be completed as the database for the service is not configured.

DataStoreException
An error occurred in the service whilst attempting a database operation - communication to database failed for various reasons.

CommunicationError
An error occurred whilst communicating with the service.

PermissionDenied
The user does not have administrative rights to perform this operation.

ExceptionThrown
An unexpected error occurred. To locate more details see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Examples
-------------------------- EXAMPLE 1 --------------------------
c:\PS>Update-HypHypervisorConnection -LiteralPath xdhyp:\connections\Connection1
This command requests that the properties of Connection1 be updated to match the current capabilities of the hypervisor.

about_ProvMachineCreationSnapin

Oct 01, 2013

TOPIC

about_ProvMachineCreationSnapin

SHORT DESCRIPTION

The Machine Creation Service PowerShell snap-in provides administrative functions for the Machine Creation Service.

COMMAND PREFIX

All commands in this snap-in have 'Prov' in their name.

LONG DESCRIPTION

The Machine Creation Service PowerShell snap-in enables both local and remote administration of the Machine Creation Service. It provides facilities to create virtual machines and manage the associated disk images.

The snap-in provides two main entities:

Provisioning Scheme

- Specifies details of new virtual machines created by the Machine Creation Service. Provisioning schemes define the following information.

  Hosting Unit
  - Provides details of the hypervisor and storage on which new virtual machines will be created. Stored and maintained by the Host Service and PowerShell snap-in.

  Identity Pool
  - Lists the Active Directory computer accounts available for use by new virtual machines. Stored and maintained by the Active Directory Identity Service and PowerShell snap-in.

  Master Image
  - Specifies the disk image that will be used for new virtual machines. Accessed through the hosting provider in the Host Service snap-in.

Provisioned VM

- Defines the virtual machines created by the Machine Creation Services. These virtual machines are associated with the provisioning scheme from
which they were created.

The processes of creating provisioning schemes and new virtual machines can take a significant amount of time to complete. For this reason, these long-running tasks can be run asynchronously so that other commands are accessible while the processes are running. Note, however, that only one long-running task can operate on a provisioning scheme at any one time. The processes are monitored using the Get-ProvTask command. For more information, see the help for Get-ProvTask.

TOPIC

XenDesktop - Advanced Dataset Filtering

SHORT DESCRIPTION

Describes the common filtering options for XenDesktop cmdlets.

LONG DESCRIPTION

Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get- cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

```powershell
Get-<Noun> | Where { $_.Size = 'Small' } | Sort 'Date' | Select -First 10
```

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

```powershell
Get-<Noun> -Size 'Small' -SortBy 'Date' -MaxRecordCount 10
```

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

- `MaxRecordCount <int>`

  Specifies the maximum number of results to return.
  For example, to return only the first nine results use:

  ```powershell
  Get-<Noun> -MaxRecordCount 9
  ```

  If not specified, only the first 250 records are returned, and if more are available, a warning is produced:
WARNING: Only first 250 records returned. Use -MaxRecordCount to retrieve more.

You can suppress this warning by using -WarningAction or by specifying a value for -MaxRecordCount.

To retrieve all records, specify a large number for -MaxRecordCount. As the value is an integer, you can use the following:

Get-<Noun> -MaxRecordCount [int]:MaxValue

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. For example:

Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
...

Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<< -MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo : OperationStopped: (.) [Get-<Noun>], PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>

The count can be accessed using the TotalAvailableResultCount property:

$count = $error[0].TotalAvailableResultCount

-Skip <int>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order, respectively. Ascending order is assumed if no prefix is present.
Sorting occurs before -MaxRecordCount and -Skip parameters are applied. For example, to sort by Name and then by Count (largest first) use:

-`SortBy 'Name,-Count'`

By default, sorting by an enumeration property uses the numeric value of the elements. You can specify a different sort order by qualifying the name with an ordered list of elements or their numeric values, or `<null>` to indicate the placement of null values. Elements not mentioned are placed at the end in their numeric order. For example, to sort by two different enums and then by the object id:

-`SortBy 'MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id'`

-`Filter <String>`

This parameter lets you specify advanced filter expressions, and supports combination of conditions with `-and` and `-or`, and grouping with braces. For example:

Get-<Noun> -Filter 'Name -like "High**" -or (Priority -eq 1 -and Severity -ge 2)'

The syntax is close enough to PowerShell syntax that you can use script blocks in most cases. This can be easier to read as it reduces quoting:

Get-<Noun> -Filter { Count -ne $null }

The full -Filter syntax is provided below.

EXAMPLES

Filtering by strings performs a case-insensitive wildcard match. Separate parameters are combined with an implicit -and operator. Normal PowerShell quoting rules apply, so you can use single or double quotes, and omit the quotes altogether for many strings. The order of parameters does not make any difference. The following are equivalent:

Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company "citrix" -Product [X]EN**
Get-<Noun> -Product "Xen**" -Company "CITRIX"
Get-<Noun> -Filter { Company -eq 'Citrix' -and Product -like 'Xen**' }
See about_Quoting_Rules and about_Wildcards for details about PowerShell handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape the wildcards using the normal PowerShell escape mechanisms (see about_Escape_Characters), or switch to a filter expression and the -eq operator:

```powershell
Get-<Noun> -Company "Abc[*]"                 # Matches Abc*
Get-<Noun> -Company "Abc"**                   # Matches Abc*
Get-<Noun> -Filter { Company -eq "Abc"** }    # Matches Abc*
Get-<Noun> -Filter { Company -eq "A""B""C" }   # Matches A"B"C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```powershell
Get-<Noun> -Uid 123
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

```powershell
Get-<Noun> -Filter 'Capacity -ge 10gb'
Get-<Noun> -Filter 'Age -ge 20 -and Age -lt 40'
Get-<Noun> -Filter 'VolumeLevel -like "[123]"'
Get-<Noun> -Filter 'Enabled -ne $false'
Get-<Noun> -Filter 'NullableProperty -ne $null'
```

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

```powershell
Get-<Noun> -Filter 'Enabled'      # Equivalent to 'Enabled -eq $true'
Get-<Noun> -Filter '-not Enabled' # Equivalent to 'Enabled -eq $false'
```

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

```powershell
Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle
```

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:
$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq "Circle" }
Get-<Noun> -Filter { Shape -like 'C' }

By their nature, floating point values, DateTime values, and TimeSpan values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

Get-<Noun> -Filter { StartTime -ge "2010-08-23T12:30:00.0Z" }
$d = [DateTime]"2010-08-23T12:30:00.0Z"
Get-<Noun> -Filter { StartTime -ge $d }
$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter { StartTime -ge $d }

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

Get-<Noun> -Filter { StartTime -ge '-2' }         # Two days ago
Get-<Noun> -Filter { StartTime -ge '-1:30' }      # Hour and a half ago
Get-<Noun> -Filter { StartTime -ge '-0:0:30' }    # 30 seconds ago

ARRAY PROPERTIES
When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings. Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

Get-<Noun> -User Fred*
Get-<Noun> -Filter { User -like "Fred*" }
Get-<Noun> -Filter { Users -contains "Fred*" }

You can also use the singular form with -Filter to search using other operators:

# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter { User -eq "Frederick" }
# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter { User -lt 'F' }

COMPLEX EXPRESSIONS
When matching against multiple values, you can use a sequence of comparisons joined with -or operators, or you can use -in and -notin:

```powershell
Get-<Noun> -Filter { Shape -eq 'Circle' -or Shape -eq 'Square' }
$shapes = 'Circle','Square'
Get-<Noun> -Filter { Shape -in $shapes }
$sides = 1..4
Get-<Noun> -Filter { Sides -notin $sides }
```

Braces can be used to group complex expressions, and override the default left-to-right evaluation of -and and -or. You can also use -not to invert the sense of any sub-expression:

```powershell
Get-<Noun> -Filter { Size -gt 4 -or (Color -eq 'Blue' -and Shape -eq 'Circle') }
Get-<Noun> -Filter { Sides -lt 5 -and -not (Color -eq 'Blue' -and Shape -eq 'Circle') }
```

**PAGING**

The simplest way to page through data is to use the -Skip and -MaxRecordCount parameters. So, to read the first three pages of data with 10 records per page, use:

```powershell
Get-<Noun> -Skip 0 -MaxRecordCount 10 <other filtering criteria>
Get-<Noun> -Skip 10 -MaxRecordCount 10 <other filtering criteria>
Get-<Noun> -Skip 20 -MaxRecordCount 10 <other filtering criteria>
```

You must include the same filtering criteria on each call, and ensure that the data is sorted consistently.

The above approach is often acceptable, but as each call performs an independent query, data changes can result in records being skipped or appearing twice. One approach to improve this is to sort by a unique id field and then start the search for the next page at the unique id after the last unique id of the previous page. For example:

```powershell
# Get the first page
Get-<Noun> -MaxRecordCount 10 -SortBy SerialNumber

SerialNumber   ...
--------------
A120004
A120007
... 7 other records ...
A120900

# Get the next page
Get-<Noun> -MaxRecordCount 10 -Filter { FirstName -gt 'A120900' }

SerialNumber   ...
--------------
```
FILTER SYNTAX DEFINITION

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= "{" <ComponentList> "}"

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> | <Component>

<Component> ::= <NotOperator> <Factor> | <Factor>

<Factor> ::= "(" <ComponentList> ")" | <PropertyName> <ComparisonOperator> <Value> | <PropertyName>

<AndOrOperator> ::= "-and" | "-or"

<NotOperator> ::= "-not" | "!"

<ComparisonOperator>

::= "-eq" | "-ne" | "-le" | "-ge" | "-lt" | "-gt" | "-like" | "-notlike" | "-contains" | "-notcontains" | "-in" | "-notin"

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> | <scalar variable> | <array variable> | "$null" | "$true" | "$false"
Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, "-1:30" means 1 hour and 30 minutes ago.
about_providers

TOPIC

about_Providers

SHORT DESCRIPTION

Describes how Windows PowerShell providers provide access to data and components that would not otherwise be easily accessible at the command line. The data is presented in a consistent format that resembles a file system drive.

LONG DESCRIPTION

Windows PowerShell providers are Microsoft .NET Framework-based programs that make the data in a specialized data store available in Windows PowerShell so that you can view and manage it.

The data that a provider exposes appears in a drive, and you access the data in a path like you would on a hard disk drive. You can use any of the built-in cmdlets that the provider supports to manage the data in the provider drive. And, you can use custom cmdlets that are designed especially for the data.

The providers can also add dynamic parameters to the built-in cmdlets. These are parameters that are available only when you use the cmdlet with the provider data.

BUILT-IN PROVIDERS

Windows PowerShell includes a set of built-in providers that you can use to access the different types of data stores.

Provider Drive Data store -------- ----- ----------- Alias Alias: Windows PowerShell aliases

Certificate Cert: x509 certificates for digital signatures

Environment Env: Windows environment variables

FileSystem * File system drives, directories, and files

Function Function: Windows PowerShell functions

Registry HKLM:, HKCU Windows registry

Variable Variable: Windows PowerShell variables

WS-Management WSMen WSH-Management configuration information

* The FileSystem drives vary on each system.

You can also create your own Windows PowerShell providers, and you can install providers that others develop. To list the providers that are available in your session, type:

    get-psprovider

INSTALLING AND REMOVING PROVIDERS

Windows PowerShell providers are delivered to you in Windows PowerShell snap-ins, which are .NET Framework-based programs that are compiled into .dll files. The snap-ins can include providers and cmdlets.

Before you use the provider features, you have to install the snap-in and then add it to your Windows PowerShell session. For more information, see about_PsSnapins.

You cannot uninstall a provider, although you can remove the Windows PowerShell snap-in for the provider from the current session. If you do, you will remove all the contents of the snap-in, including its cmdlets.

To remove a provider from the current session, use the Remove-PsSnapin cmdlet. This cmdlet does not uninstall the provider, but it makes the provider unavailable in the session.

You can also use the Remove-PsDrive cmdlet to remove any drive from the current session. This data on the drive is not affected, but the drive is no longer available in that session.

VIEWING PROVIDERS

To view the Windows PowerShell providers on your computer, type:

get-psprovider

The output lists the built-in providers and the providers that you added to the session.

THE PROVIDER CMDLETS

The following cmdlets are designed to work with the data exposed by any provider. You can use the same cmdlets in the same way to manage the different types of data that providers expose. After you learn to manage the data of one provider, you can use the same procedures with the data from any provider.

For example, the New-Item cmdlet creates a new item. In the C: drive that is supported by the FileSystem provider, you can use New-Item to create a new file or folder. In the drives that are supported by the Registry provider, you can use New-Item to create a new registry key. In the Alias: drive, you can use New-Item to create a new alias.

For detailed information about any of the following cmdlets, type:

get-help <cmdlet-name> -detailed

CHILDITEM CMDLETS

Get-ChildItem

CONTENT CMDLETS

Convert-Path
Split-Path
Resolve-Path
Test-Path
VIEWING PROVIDER DATA

The primary benefit of a provider is that it exposes its data in a familiar and consistent way. The model for data presentation is a file system drive.

To use data that the provider exposes, you view it, move through it, and change it as though it were data on a hard drive. Therefore, the most important information about a provider is the name of the drive that it supports.

The drive is listed in the default display of the Get-PsProvider cmdlet, but you can get information about the provider drive by using the Get-PsDrive cmdlet. For example, to get all the properties of the Function: drive, type:

```powershell
get-psdrive Function | format-list *
```

You can view and move through the data in a provider drive just as you would on a file system drive.

To view the contents of a provider drive, use the Get-Item or Get-ChildItem cmdlets. Type the drive name followed by a colon (:). For example, to view the contents of the Alias: drive, type:

```powershell
get-item alias:
```

You can view and manage the data in any drive from another drive by including the drive name in the path. For example, to view the HKLM\Software registry key in the HKLM: drive from another drive, type:

```powershell
get-childitem hklm:\software
```

To open the drive, use the Set-Location cmdlet. Remember the colon when you specify the drive path. For example, to change your location to the root directory of the Cert: drive, type:
set-location cert:

Then, to view the contents of the Cert: drive, type:

get-childitem

MOVING THROUGH HIERARCHICAL DATA

You can move through a provider drive just as you would a hard disk drive. If the data is arranged in a hierarchy of items within items, use a backslash (\) to indicate a child item. Use the following format:

drive:\location\child-location\...

For example, to change your location to the HKLM\Software registry key, type a Set-Location command, such as:

    set-location hklm:\software

You can also use relative references to locations. A dot (.) represents the current location. For example, if you are in the HKLM\Software\Microsoft registry key, and you want to list the registry subkeys in the HKLM\Software\Microsoft\PowerShell key, type the following command:

    get-childitem .\powershell

FINDING DYNAMIC PARAMETERS

Dynamic parameters are cmdlet parameters that are added to a cmdlet by a provider. These parameters are available only when the cmdlet is used with the provider that added them.

For example, the Cert: drive adds the CodeSigningCert parameter to the Get-Item and Get-ChildItem cmdlets. You can use this parameter only when you use Get-Item or Get-ChildItem in the Cert: drive.

For a list of the dynamic parameters that a provider supports, see the Help file for the provider. Type:

get-help <provider-name>

For example:

get-help certificate

LEARNING ABOUT PROVIDERS

Although all provider data appears in drives, and you use the same methods to move through them, the similarity stops there. The data stores that the provider exposes can be as varied as Active Directory locations and Microsoft Exchange Server mailboxes.
For information about individual Windows PowerShell providers, type:

get-help <ProviderName>

For example:

get-help registry

For a list of Help topics about the providers, type:

get-help * -category provider

about_Locations

about_Path_Syntax
Add-ProvSchemeControllerAddress

Oct 01, 2013
Add a list of host names (as DNS addresses) to a provisioning scheme.

Syntax
Add-ProvSchemeControllerAddress [-ProvisioningSchemeName] <String> [-ControllerAddress] <String[]> [-LoggingId <Guid>] [-AdminAddress <String>] [-CommonParameters]
Add-ProvSchemeControllerAddress -ProvisioningSchemeUid <Guid> [-ControllerAddress] <String[]> [-LoggingId <Guid>] [-AdminAddress <String>] [-CommonParameters]

Detailed Description
Provides the ability to associate controller hosts (and hence implicitly a set of brokers) with a specific provisioning scheme. This optional data is passed to the machines created by the Machine Creation Services, where it is used to associate the newly created machine with a broker. The list is returned along with the provisioning scheme that it is assigned to.

Related topics
Get-ProvScheme
Remove-ProvSchemeControllerAddress

Parameters
-ProvisioningSchemeName <String>
The name for the provisioning scheme that the list of addresses is to be added to.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-ProvisioningSchemeUid <Guid>
The unique identifier for the provisioning scheme that the list of addresses is to be added to.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-ControllerAddress <String[]>
 Specifies the array of DNS names to be added to the provisioning scheme.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-LoggingId <Guid>
 Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-AdminAddress <String>
 Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>LocalHost. Once a value is provided by any cmdlet, this value becomes the default.</td>
<td>false</td>
</tr>
</tbody>
</table>
Input Type

Citrix.MachineCreation.Sdk.ProvisioningScheme: You can pipe an object containing a parameter called 'ProvisioningSchemeName' to Add-ProvSchemeControllerAddress.

Return Values

Citrix.MachineCreation.Sdk.ProvisioningScheme: Add-ProvSchemeControllerAddress returns the updated ProvisioningScheme object containing the union of the old and new controller address lists.

ProvisioningSchemeUid <Guid>

The unique identifier for the provisioning scheme.

ProvisioningSchemeName <string>

The name of the provisioning scheme.

CpuCount <int>

The number of processors that VMs will be created with when using this scheme.

MemoryMB <int>

The maximum amount of memory that VMs will be created with when using this scheme.

MasterImageVM <string>

The path within the hosting unit provider to the VM or snapshot of which the scheme is currently using a copy.

MasterImageVMDate <DateTime>

The date and time that the copy of the VM image was made for the scheme.

IdentityPoolUid <Guid>

The unique identifier of the identity pool (from the ADIdentity PowerShell snap-in) that the scheme uses.

IdentityPoolName <string>

The name of the identity pool (from the ADIdentity PowerShell snap-in) that the scheme uses.

HostingUnitUid <Guid>

The unique identifier of the hosting unit (from the Hosting Unit PowerShell snap-in) that the scheme will use.

HostingUnitName <string>

The name of the hosting unit (from the Hosting Unit PowerShell snap-in) that the scheme will use.

CleanOnBoot <Boolean>

Indicates whether or not the VMs created are to be reset to a clean state on each boot.

TaskId <Guid>

The identifier of any current task that is running for the provisioning scheme.

The metadata associated with this provisioning scheme.

ControllerAddress <string[]>

The DNS names of the controllers associated with this provisioning scheme for Quick Deploy purposes.

Notes

In the case of failure, the following errors can result.

Error Codes

----------

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

https://docs.citrix.com © 1999-2017 Citrix Systems, Inc. All rights reserved. p.2252
The operation could not be performed because of a configuration logging error

**DatabaseError**

An error occurred in the service while attempting a database operation.

**DatabaseNotConfigured**

The operation could not be completed because the database for the service is not configured.

**ServiceStatusInvalidDb**

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

**CommunicationError**

An error occurred while communicating with the service.

**PermissionDenied**

The user does not have administrative rights to perform this operation.

**ExceptionThrown**

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

**Examples**

-------------------------- EXAMPLE 1 --------------------------

```
C:\PS>Add-ProvSchemeControllerAddress -ProvisioningSchemeUid "01a4a008-8ce8-4165-ba9c-cdf15a6b0501" -ControllerAddress (ddcA.citrix.com,ddcB.citrix.com,ddcC.citrix2.com)
```

IdentityPoolName         : idPool1
HostingUnitUid           : 01a4a08-8ce8-4165-ba9c-cdf15a6b0501
HostingUnitName          : HostUnit1
CleanOnBoot              : True
TaskId                   : 00000000-0000-0000-0000-000000000000
Metadata                 : {}
ControllerAddress        : {ddcA.citrix.com,ddcB.citrix.com,ddcC.citrix2.com}

Add controller addresses to a provisioning scheme using a ProvisioningScheme object.
Add-ProvSchemeMetadata

Oct 01, 2013

Adds metadata on the given ProvisioningScheme.

Syntax

Add-ProvSchemeMetadata [-ProvisioningSchemeUid] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Add-ProvSchemeMetadata [-ProvisioningSchemeUid] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Add-ProvSchemeMetadata [-ProvisioningSchemeName] <String> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Add-ProvSchemeMetadata [-ProvisioningSchemeName] <String> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Add-ProvSchemeMetadata [-InputObject] <ProvisioningScheme>[] -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Add-ProvSchemeMetadata [-InputObject] <ProvisioningScheme>[] -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability for additional custom data to be stored against given ProvisioningScheme objects. This cmdlet will not overwrite existing metadata on an object - use the Set-ProvSchemeMetadata cmdlet instead.

Related topics

Set-ProvSchemeMetadata

Remove-ProvSchemeMetadata

Parameters

-ProvisioningSchemeUid <Guid>

Id of the ProvisioningScheme

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByValue, ByPropertyName) |

-ProvisioningSchemeName <String>

Name of the ProvisioningScheme

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByValue, ByPropertyName) |
### -InputObject\ `<ProvisioningScheme[]>`

Objects to which the metadata is to be added.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

### -Map\ `<PSObject>`

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with `@{"name1" = "val1"; "name2" = "val2"}`) or a string dictionary (created with `new-object "System.Collections.Generic.Dictionary[String,String]"`).

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

### -Name\ `<String>`

Specifies the property name of the metadata to be added. The property must be unique for the ProvisioningScheme specified. The property cannot contain any of the following characters `/;#;*?=<>|[]()`. 

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -Value\ `<String>`

Specifies the value for the property.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -LoggingId\ `<Guid>`

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>
-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

Add-ProvSchemeMetadata returns an array of objects containing the new definition of the metadata.

Property <string>

Specifies the name of the property.

Value <string>

Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

-----------

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DuplicateObject

One of the specified metadata already exists.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.
AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples
-------------------------- EXAMPLE 1 --------------------------
c:\PS> Add-ProvSchemeMetadata -ProvisioningSchemeUid 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>property</td>
<td>value</td>
</tr>
</tbody>
</table>

Add metadata with a name of 'property' and a value of 'value' to the ProvisioningScheme with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

Add-ProvSchemeScope

Oct 01, 2013
Add the specified ProvisioningScheme(s) to the given scope(s).

Syntax

Add-ProvSchemeScope [-Scope] <String[]> -InputObject <ProvisioningScheme[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
Add-ProvSchemeScope [-Scope] <String[]> -ProvisioningSchemeUid <Guid[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
Add-ProvSchemeScope [-Scope] <String[]> -ProvisioningSchemeName <String[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The AddProvSchemeScope cmdlet is used to associate one or more ProvisioningScheme objects with given scope(s).

There are multiple parameter sets for this cmdlet, allowing you to identify the ProvisioningScheme objects in different ways:

- ProvisioningScheme objects can be piped in or specified by the InputObject parameter
- The ProvisioningSchemeUid parameter specifies objects by ProvisioningSchemeUid
- The ProvisioningSchemeName parameter specifies objects by ProvisioningSchemeName (supports wildcards)

To add a ProvisioningScheme to a scope you need permission to change the scopes of the ProvisioningScheme and permission to add objects to all of the scopes you have specified.

If the ProvisioningScheme is already in a scope, that scope will be silently ignored.

Related topics

Remove-ProvSchemeScope
Get-ProvScopedObject

Parameters

- **-Scope**<String[]>

  Specifies the scopes to add the objects to.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

https://docs.citrix.com © 1999-2017 Citrix Systems, Inc. All rights reserved.
-**InputObject** `<ProvisioningScheme[]>`

Specifies the ProvisioningScheme objects to be added.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

-**ProvisioningSchemeUid** `<Guid[]>`

Specifies the ProvisioningScheme objects to be added by ProvisioningSchemeUid.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

-**ProvisioningSchemeName** `<String[]>`

Specifies the ProvisioningScheme objects to be added by ProvisioningSchemeName.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

-**LoggingId** `<Guid>`

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**AdminAddress** `<String>`

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

None

Notes

If the command fails, the following errors can be returned.

Error Codes

---------

UnknownObject

One of the specified objects was not found.

ScopeNotFound

One of the specified scopes was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command with the specified objects or scopes.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.
Examples

-------------------------- EXAMPLE 1 --------------------------
c:\PS> Add-ProvSchemeScope Finance -ProvisioningSchemeUid 6702C5D0-C073-4080-A0EE-EC74CB537C52
Adds a single ProvisioningScheme to the 'Finance' scope.

-------------------------- EXAMPLE 2 --------------------------
c:\PS> Add-ProvSchemeScope Finance,Marketing -ProvisioningSchemeUid 6702C5D0-C073-4080-A0EE-EC74CB537C52
Adds a single ProvisioningScheme to the multiple scopes.

-------------------------- EXAMPLE 3 --------------------------
c:\PS> Get-ProvScheme | Add-ProvSchemeScope Finance
Adds all visible ProvisioningScheme objects to the 'Finance' scope.

-------------------------- EXAMPLE 4 --------------------------
c:\PS> Add-ProvSchemeScope Finance -ProvisioningSchemeName A*
Adds ProvisioningScheme objects with a name starting with an 'A' to the 'Finance' scope.
Add-ProvTaskMetadata

Oct 01, 2013

Adds metadata on the given Task.

Syntax

Add-ProvTaskMetadata [-TaskId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Add-ProvTaskMetadata [-TaskId] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Add-ProvTaskMetadata [-InputObject] <Task[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Add-ProvTaskMetadata [-InputObject] <Task[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Use this cmdlet to store additional custom data against given Task objects. This cmdlet does not overwrite existing metadata on an object - use the Set-ProvTaskMetadata cmdlet instead.

Related topics

Set-ProvTaskMetadata

Parameters

- **TaskId**<Guid>
  
  Id of the Task

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
</tbody>
</table>

| Accept Pipeline Input? | true (ByValue, ByPropertyName) |

- **InputObject**<Task[]>

https://docs.citrix.com  © 1999-2017 Citrix Systems, Inc. All rights reserved.  p.2262
Objects to which the metadata is to be added.

<table>
<thead>
<tr>
<th>Name</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>-Map&lt;PSObject&gt;</td>
<td>true</td>
<td></td>
<td>true (ByValue)</td>
</tr>
<tr>
<td>-Name&lt;String&gt;</td>
<td>true</td>
<td></td>
<td>false</td>
</tr>
<tr>
<td>-Value&lt;String&gt;</td>
<td>true</td>
<td></td>
<td>false</td>
</tr>
<tr>
<td>-LoggingId&lt;Guid&gt;</td>
<td>false</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- **Map<PSObject>**

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with `@{"name1" = "val1"; "name2" = "val2"}`) or a string dictionary (created with `new-object "System.Collections.Generic.Dictionary[String,String]"`).

- **Name<String>**

Specifies the property name of the metadata to be added. The property must be unique for the Task specified. The property cannot contain any of the following characters `\;/:#.*?=<>|[]"'`

- **Value<String>**

Specifies the value for the property.

- **LoggingId<Guid>**

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.
### -AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Return Values**

Add-ProvTaskMetadata returns an array of objects containing the new definition of the metadata.

**Property <string>**

Specifies the name of the property.

**Value <string>**

Specifies the value for the property.

**Notes**

If the command fails, the following errors can result.

**Error Codes**

--------------

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DuplicateObject

One of the specified metadata already exists.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

https://docs.citrix.com
The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS> Add-ProvTaskMetadata -TaskId 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>property</td>
<td>value</td>
</tr>
</tbody>
</table>

Add metadata with a name of 'property' and a value of 'value' to the Task with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.
Get-ProvDBConnection

Oct 01, 2013
Gets the database string for the specified data store used by the MachineCreation Service.

Syntax

Get-ProvDBConnection [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns the database connection string for the specified data store.

If the returned string is blank, no valid connection string has been specified. In this case the service is running, but is idle and awaiting specification of a valid connection string.

Related topics

Get-ProvServiceStatus
Get-ProvDataStore
Set-ProvDBConnection
Test-ProvDBConnection

Parameters

-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

system: string

The database connection string configured for the MachineCreation Service.

Notes

If the command fails, the following errors can be returned.

Error Codes

-----------
NoDBConnections

The database connection string for the MachineCreation Service has not been specified.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-ProvDBConnection

Server=serverName\SQLEXPRESS;Initial Catalog = databaseName; Integrated Security = True

Get the database connection string for the MachineCreation Service.
Get-ProvDBSchema

Oct 01, 2013

Gets a script that creates the MachineCreation Service database schema for the specified data store.

Syntax

Get-ProvDBSchema [-DatabaseName <String>] [-ServiceGroupName <String>] [-ScriptType <ScriptTypes>] [-LocalDatabase] [-Sid <String>] [-AdminAddress <String>] [CommonParameters]

Detailed Description

Gets SQL scripts that can be used to create a new MachineCreation Service database schema, add a new MachineCreation Service to an existing site, remove a MachineCreation Service from a site, or create a database server logon for a MachineCreation Service. If no Sid parameter is provided, the scripts obtained relate to the currently selected MachineCreation Service instance, otherwise the scripts relate to MachineCreation Service instance running on the machine identified by the Sid provided. When obtaining the Evict script, a Sid parameter must be supplied. The current service instance is that on the local machine, or that explicitly specified by the last usage of the -AdminAddress parameter to a MachineCreation SDK cmdlet. The service instance used to obtain the scripts does not need to be a member of a site or to have had its database connection configured. The database scripts support only Microsoft SQL Server, or SQL Server Express, and require Windows integrated authentication to be used. They can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SMDCMD mode'. The ScriptType parameter determines which script is obtained. If ScriptType is not specified, or is FullDatabase, the script contains:

- Creation of service schema
- Creation of database server logon
- Creation of database user
- Addition of database user to MachineCreation Service roles

If ScriptType is Instance, the returned script contains:

- Creation of database server logon
- Creation of database user
- Addition of database user to MachineCreation Service roles

If ScriptType is Evict, the returned script contains:

- Removal of MachineCreation Service instance from database
- Removal of database user

If ScriptType is Login, the returned script contains:

- Creation of database server logon only

If the service uses two data stores they can exist in the same database. You do not need to configure a database before
using this command.

Related topics
Get-ProvDataStore
Set-ProvDBConnection

Parameters

**-DatabaseName**<String>

Specifies the name of the database for which the schema will be generated.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-ServiceGroupName**<String>

Specifies the name of the service group to be used when creating the database schema. The service group is a collection of all the MachineCreation services that share the same database instance and are considered equivalent; that is, all the services within a service group can be used interchangeably.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-ScriptType**<ScriptTypes>

Specifies the type of database script returned. Available script types are:

Database

Returns a full database script that can be used to create a database schema for the MachineCreation Service in a database instance that does not already contain a schema for this service. The DatabaseName and ServiceGroupName parameters must be specified to create a script of this type.

Instance

Returns a permissions script that can be used to add further MachineCreation services to an existing database instance that already contains the full MachineCreation service schema, associating the services to the Service Group. The Sid parameter can optionally be specified to create a script of this type.

Login

Returns a database logon script that can be used to add the required logon accounts to an existing database instance that contains the MachineCreation Service schema. This is used primarily when creating a mirrored database environment.
The `DatabaseName` parameter must be specified to create a script of this type.

### Evict

Returns a script that can be used to remove the specified MachineCreation Service from the database entirely. The `DatabaseName` and `Sid` parameters must be specified to create a script of this type.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Database</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

#### `-LocalDatabase`<SwitchParameter>

Specifies whether the database script is to be used in a database instance run on the same controller as other services in the service group. Including this parameter ensures the script creates only the required permissions for local services to access the database schema for MachineCreation services.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

#### `-Sid`<String>

Specifies the SID of the controller on which the MachineCreation Service instance to remove from the database is running.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

#### `-AdminAddress`<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

System.String
A string containing the required SQL script for application to a database.

Notes

The scripts returned support Microsoft SQL Server Express Edition, Microsoft SQL Server Standard Edition, and Microsoft SQL Server Enterprise Edition databases only, and are generated on the assumption that integrated authentication will be used.

If the ScriptType parameter is not included or set to 'FullDatabase', the full database script is returned, which will:

Create the database schema.

Create the user and the role (providing the schema does not already exist).

Create the logon (providing the schema does not already exist).

If the ScriptType parameter is set to 'Instance', the script will:

Create the user and the role (providing the schema does not already exist).

Create the logon (providing the schema does not already exist) and associate it with a user.

If the ScriptType parameter is set to 'Login', the script will:

Create the logon (providing the schema does not already exist) and associate it with a pre-existing user of the same name.

If the LocalDatabase parameter is included, the NetworkService account will be added to the list of accounts permitted to access the database. This is required only if the database is run on a controller.

If the command fails, the following errors can be returned.

Error Codes

---------

GetSchemasFailed

The database schema could not be found.

ActiveDirectoryAccountResolutionFailed

The specified Active Directory account or Group could not be found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.
PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples
-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-ProvDBSchema -DatabaseName MyDB -ServiceGroupName MyServiceGroup > c:\ProvSchema.sql
Get the full database schema for site data store of the MachineCreation Service and copy it to a file called ‘c:\ProvSchema.sql’.

This script can then be used to create the schema in a pre-existing database named ‘MyDB’ that does not already contain a MachineCreation Service site schema.

-------------------------- EXAMPLE 2 --------------------------

c:\PS>Get-ProvDBSchema -DatabaseName MyDB -scriptType Login > c:\MachineCreationLogins.sql
Get the logon scripts for the MachineCreation Service.
Get-ProvDBVersionChangeScript

Oct 01, 2013
Gets a script that updates the MachineCreation Service database schema.

Syntax

Get-ProvDBVersionChangeScript -DatabaseName <String> -TargetVersion <Version> [-AdminAddress <String>] [-<CommonParameters>]

Detailed Description

Returns a database script that can be used to upgrade or downgrade the site or secondary schema for the MachineCreation Service from the current schema version to a different version.

Related topics

Get-ProvInstalledDBVersion

Parameters

-**DatabaseName**<String>

Specifies the name of the database instance to which the update applies.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-**TargetVersion**<Version>

Specifies the version of the database you want to update to.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-**AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
<td>false</td>
</tr>
</tbody>
</table>
Return Values

System.Management.Automation.PSObject

A PSObject containing the required SQL script for application to a database.

Notes

The PSObject returned by this cmdlet contains the following properties:

-- Script The raw text of the SQL script to apply the update, or null in the case when no upgrade path to the specified target version exists.

-- NeedExclusiveAccess Indicates whether all services in the service group must be shut down during the update or not.

-- CanUndo Indicates whether the generated script allows the updated schema to be reverted to the state prior to the update.

Scripts to update the schema version are stored in the database so any service in the service group can obtain these scripts. Extreme caution should be exercised when using update scripts. Citrix recommends backing up the database before attempting to upgrade the schema. Database update scripts may require exclusive use of the schema and so may not be able to execute while any MachineCreation services are running. However, this depends on the specific update being carried out.

After a schema update has been carried out, services that require the previous version of the schema may cease to operate. The ServiceState parameter reported by the Get-ProvServiceStatus command provides information about service compatibility. For example, if the schema has been upgraded to a more recent version that a service cannot use, the service reports "DBNewerVersionThanService".

If the command fails, the following errors can be returned.

Error Codes

--------

NoOp

The operation was successful but had no effect.

NoDBConnections

The database connection string for the MachineCreation Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------- EXAMPLE 1 --------------

C:\PS> $update = Get-ProvDBVersionChangeScript -DatabaseName MyDb -TargetVersion 1.0.75.0
C:\PS> $update.Script > update_75.sql
Gets an SQL update script to update the current schema to version 1.0.75.0. The resulting update_75.sql script is suitable for direct use with the SQL Server SQLCMD utility.
Get-ProvInstalledDBVersion

Oct 01, 2013

Gets a list of all available database schema versions for the MachineCreation Service.

Syntax

Get-ProvInstalledDBVersion [-Upgrade] [-Downgrade] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns the current version of the MachineCreation Service database schema, if no flags are set, otherwise returns versions for which upgrade or downgrade scripts are available and have been stored in the database.

Related topics

Parameters

-Upgrade <SwitchParameter>

Specifies that only schema versions to which the current database version can be updated should be returned.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
</tr>
</tbody>
</table>

| Accept Pipeline Input? | false |

-Downgrade <SwitchParameter>

Specifies that only schema versions to which the current database version can be reverted should be returned.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
</tr>
</tbody>
</table>

| Accept Pipeline Input? | false |

-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
</tbody>
</table>

| Accept Pipeline Input? | false |

Return Values
System.Version

The Get-ProvInstalledDbVersion command returns objects containing the new definition of the MachineCreation Service database schema version.

Major <Integer>

Minor <Integer>

Build <Integer>

Revision <Integer>

Notes

If the command fails, the following errors can be returned.

Error Codes

---------

InvalidParameterCombination

Both the Upgrade and Downgrade flags were specified.

NoOp

The operation was successful but had no effect.

NoDBConnections

The database connection string for the MachineCreation Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-ProvInstalledDBVersion

Major Minor Build Revision
----- ----- ----- --------
5 6 0 0

Get the currently installed version of the MachineCreation Service database schema.

-------------------------- EXAMPLE 2 --------------------------

c:\PS>Get-ProvInstalledDBVersion -Upgrade

Major Minor Build Revision
----- ----- ----- --------
6 0 0 0

Get the versions of the MachineCreation Service database schema for which upgrade scripts are supplied.
Get-ProvObjectReference

Oct 01, 2013
Returns the number of local objects holding references to objects from other services.

Syntax
Get-ProvObjectReference [-HostingUnitUid <Guid[]>] [-IdentityPoolUid <Guid[]>] [-AdminAddress <String>]
[-<CommonParameters>]

Detailed Description
Returns for each hosting unit or identity pool GUID the number of references by provisioning schemes or by long running task. This check is done without regard for scoping of existing provisioning schemes, references by inaccessible schemes are also checked.

Related topics
Parameters

- **HostingUnitUid**<Guid[]>
The identifiers of the hosting units(s) to be tested.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **IdentityPoolUid**<Guid[]>
The identifiers of the identity pool(s) to be tested.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **AdminAddress**<String>
Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>
Return Values

ObjectReferenceCount

An object which contain the input object identifier, its type, the type of referencing object and the number of references.

Notes

In the case of failure, the following errors can result.

Error Codes

-----------

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

Get-ProvObjectReference -HostingUnitUid 5B66A060-85E1-4DBD-9D1B-BF79881D3BB1

Count : 1
ObjectId : 5b66a060-85e1-4dbd-9d1b-bf79881d3bb1
Source : ProvisioningScheme
Target : HostingUnit

Count : 0
ObjectId : 5b66a060-85e1-4dbd-9d1b-bf79881d3bb1
Source : Task
Target: HostingUnit

This checks a single hosting unit for objects that have references to them; in this case we only have a single provisioning scheme that relates to it.
Get-ProvScheme

Oct 01, 2013
Gets the list of provisioning schemes.

Syntax

Detailed Description

Lets you retrieve the list of defined provisioning schemes.

Related topics

Parameters

-ProvisioningSchemeName <String>
The name of the provisioning scheme.

<table>
<thead>
<tr>
<th>Required?</th>
<th>False</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>False</td>
</tr>
</tbody>
</table>

-ProvisioningSchemeUid <Guid>
The unique identifier of the provisioning scheme.

<table>
<thead>
<tr>
<th>Required?</th>
<th>False</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>False</td>
</tr>
</tbody>
</table>

-Scopeld <Guid>

https://docs.citrix.com © 1999-2017 Citrix Systems, Inc. All rights reserved.
Gets only results with a scope matching the specified scope identifier.

<table>
<thead>
<tr>
<th>Field</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>-ScopeName</td>
<td>false</td>
<td>&lt;String&gt;</td>
<td>false</td>
</tr>
</tbody>
</table>

- **ScopeName**<String>

Gets only results with a scope matching the specified scope name.

<table>
<thead>
<tr>
<th>Field</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>-ScopeName</td>
<td>false</td>
<td>&lt;String&gt;</td>
<td>false</td>
</tr>
</tbody>
</table>

- **ReturnTotalRecordCount**<SwitchParameter>

See about_Prov_Filtering for details.

<table>
<thead>
<tr>
<th>Field</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>-ReturnTotalRecordCount</td>
<td>false</td>
<td>false</td>
<td>false</td>
</tr>
</tbody>
</table>

- **MaxRecordCount**<Int32>

See about_Prov_Filtering for details.

<table>
<thead>
<tr>
<th>Field</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>-MaxRecordCount</td>
<td>false</td>
<td>&lt;Int32&gt;</td>
<td>false</td>
</tr>
</tbody>
</table>

- **Skip**<Int32>

See about_Prov_Filtering for details.

<table>
<thead>
<tr>
<th>Field</th>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>-Skip</td>
<td>false</td>
<td>0</td>
<td>false</td>
</tr>
</tbody>
</table>

- **SortBy**<String>
See about_Prov_Filtering for details.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-Filter**<String>

See about_Prov_Filtering for details.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-AdminAddress**<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>LocalHost. When a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Return Values**

Citrix.MachineCreation.Sdk.ProvisioningScheme

This object provides details of the provisioning scheme and contains the following information:

**ProvisioningSchemeUid**<Guid>

The unique identifier for the provisioning scheme.

**ProvisioningSchemeName**<string>

The name of the provisioning scheme.

**CpuCount**<int>

The number of processors that VMs will be created with when using this scheme.

**MemoryMB**<int>

The maximum amount of memory that VMs will be created with when using this scheme.

**MasterImageVM**<string>
The path within the hosting unit provider to the copy of the VM snapshot that the scheme uses.

MasterImageVMDate <DateTime>

The date and time that the copy was made of the VM snapshot used by the scheme.

IdentityPoolUid <Guid>

The unique identifier of the identity pool (from the ADIdentity PowerShell snap-in) that the scheme uses.

IdentityPoolName <string>

The name of the identity pool (from the ADIdentity PowerShell snap-in) that the scheme uses.

HostingUnitUid <Guid>

The unique identifier of the hosting unit (from the Hosting Unit PowerShell snap-in) that the scheme uses.

HostingUnitName <string>

The name of the hosting unit (from the Hosting Unit PowerShell snap-in) that the scheme uses.

CleanOnBoot <Boolean>

Indicates whether the VMs that are created will be reset to a clean state on each boot.

TaskId <Guid>

The identifier of any current task that is running for the provisioning scheme.

The metadata associated with this provisioning scheme.

ControllerAddress <string[]>

The DNS names of the controllers associated with this provisioning scheme for Quick Deploy purposes.

VMMetadata <char[]>

The opaque VM metadata block

UsePersonalVDiskStorage <bool>

True if the scheme will use personal vDisk storage.

PersonalVDiskDriveLetter <char>

The drive letter for the personal vDisk

PersonalVDiskDriveSize <int>

The size of the personal vDisk in GB

ProfileUsagePercentage <double>
The percentage of the personal vDisk to be used for profile data

Notes

In the case of failure, the following errors can result.

Error Codes

-----------

PartialData

Only a subset of the available data was returned.

CouldNotQueryDatabase

The query to get the database was not defined.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

An error occurred while communicating with the service.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS>Get-ProvScheme

ProvisioningSchemeUid : 7585f0de-192e-4847-a6d8-22713c3a2f42
ProvisioningSchemeName : Scheme1
CpuCount                : 1
MemoryMB                : 1024
MasterImageVM           : /Base.vm/base.snapshot
Returns all of the available provisioning schemes.

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Get-ProvScheme -ProvisioningSchemeName Scheme[0-1]

ProvisioningSchemeUid : 7585f0de-192e-4847-a6d8-22713c3a2f42
ProvisioningSchemeName : Scheme1
CpuCount : 1
MemoryMB : 1024
MasterImageVM : /Base.vm/base.snapshot
MasterImageVMDate : 17/05/2010 09:27:50
IdentityPoolUid : 03743136-e43b-4a87-ab71686b3c16
IdentityPoolName : idPool1
HostingUnitUid : 01a4a008-8ce8-4165-ba9c-cdf15a6b0501
HostingUnitName : HostUnit1
CleanOnBoot : True
TaskId : 00000000-0000-0000-0000-000000000000
Metadata : {}
ControllerAddress : {}
VMMetadata : {0, 1, 0, 0...}

Returns all of the provisioning schemes that have the name 'Scheme0' or 'Scheme1'.
Get-ProvSchemeMasterVMImageHistory

Oct 01, 2013
Gets the list of master VM snapshots that have been used to provide hard disks to provisioning schemes.

Syntax

Detailed Description
Provides the ability to discover the master VM snapshots that have been used previously to provide the hard disk image for provisioning schemes. This information includes the date and time when the image was introduced. This information can be used to roll back a provisioning scheme to a previous image.

Related topics
Publish-ProvMasterVMImage
Remove-ProvMasterVMImageHistory

Parameters
-ProvisioningSchemeName:<String>
The name of the provisioning scheme.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

-ProvisioningSchemeUid:<Guid>
The unique identifier of the provisioning scheme.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

-MasterImageVM:<String>
The path to the snapshot item in the hosting unit PowerShell provider.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

-VMImageHistoryUid:<Guid>
The unique identifier for the Image History item.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

-ReturnTotalRecordCount:<SwitchParameter>
See about_Prov_Filtering for details.

<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td>-AdminAddress</td>
<td>false</td>
<td>LocalHost. Once a value is provided by any cmdlet, this value becomes the default.</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

Citrix.MachineCreation.Sdk.VMImage

The object that represents a master VM history. This contains the following parameters:

VMImageHistoryUid <Guid>
The unique identifier for the History item.
ProvisioningSchemeUid <Guid>
The unique identifier for the provisioning scheme that the VM was used for.
ProvisioningSchemeName <string>
The name of the provisioning scheme that the VM was used for.
MasterImageVM <string>
The path to the Snapshot item that was used as the master VM image.
Date <DateTime>
The date and time that the VM or snapshot was used in the provisioning scheme.

Notes
In the case of failure, the following errors can result.

Error Codes
----------
PartialData
Only a subset of the available data was returned.
PermissionDenied
The user does not have administrative rights to perform this operation.
ConfigurationLoggingError
The operation could not be performed because of a configuration logging error
CouldNotQueryDatabase
The query required to get the database was not defined.
CommunicationError
An error occurred while communicating with the service.
DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.
InvalidFilter
A filtering expression was supplied that could not be interpreted for this cmdlet.
ExceptionThrown
An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples
-------------------------- EXAMPLE 1 --------------------------
C:\PS>Get-ProvSchemeMasterVMImageHistory

VMImageHistoryUid : 3cba3a75-89cd-4868-989b-27feb378fec5
ProvisioningSchemeUid : 7585f0de-192e-4847-a6d8-22713c3a2f42
ProvisioningSchemeName : MyScheme
MasterImageVM : /Base.vm/base.snapshot
Date : 17/05/2010 09:27:50

Gets all the hard disk images that have been used across all provisioning schemes.
EXAMPLE 2

C:\PS>Get-ProvSchemeMasterVMImageHistory -ProvisioningScheme MyScheme -masterImageVM "C:\BaseXp.vm\update1.snapshot" | Publish-ProvMasterVmImage
Roll back the provisioning scheme to use the hard disk from the update1.snapshot for the provisioning scheme called "MyScheme".
Get-ProvScopedObject

Oct 01, 2013
Gets the details of the scoped objects for the MachineCreation Service.

Syntax

Detailed Description

Returns a list of directly scoped objects including the names and identifiers of both the scope and object as well as the object description for display purposes.

There will be at least one result for every directly scoped object. When an object is associated with multiple scopes the output contains one result per scope duplicating the object details.

No records are returned for the All scope, though if an object is not in any scope a result with a null ScopeId and ScopeName will be returned.

Related topics

Parameters

- **-ScopeId** <Guid>
  Gets scoped object entries for the given scope identifier.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **-ScopeName** <String>
  Gets scoped object entries with the given scope name.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

- **-ObjectType** <ScopedObjectType>
  Gets scoped object entries for objects of the given type.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td></td>
</tr>
</tbody>
</table>

https://docs.citrix.com © 1999-2017 Citrix Systems, Inc. All rights reserved. p.2293
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>-ObjectId &lt;String&gt;</td>
<td>-</td>
<td>false</td>
</tr>
<tr>
<td>Description</td>
<td>-</td>
<td>false</td>
</tr>
<tr>
<td>Property &lt;String[]&gt;</td>
<td>-</td>
<td>false</td>
</tr>
<tr>
<td>ReturnTotalRecordCount &lt;SwitchParameter&gt;</td>
<td>-</td>
<td>false</td>
</tr>
</tbody>
</table>

- **ObjectId <String>**
  Gets scoped object entries for objects with the specified object identifier.

- **ObjectName <String>**
  Gets scoped object entries for objects with the specified object identifier.

- **Description <String>**
  Gets scoped object entries for objects with the specified description.

- **Property <String[]>**
  Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

- **ReturnTotalRecordCount <SwitchParameter>**
  When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Prov_Filtering for details.
- **MaxRecordCount**<Int32>

  Specifies the maximum number of records to return.

- **Skip**<Int32>

  Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

- **SortBy**<String>

  Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

- **Filter**<String>

  Gets records that match a PowerShell-style filter expression. See about_Prov_Filtering for details.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>True</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>True</td>
</tr>
</tbody>
</table>
-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

Citrix.MachineCreation.Sdk.ScopedObject

The Get-ProvScopedObject command returns an object containing the following properties:

ScopeId <Guid?>

Specifies the unique identifier of the scope.

ScopeName <String>

Specifies the display name of the scope.

ObjectType <ScopedObjectType>

Type of the object this entry relates to.

ObjectId <String>

Unique identifier of the object.

ObjectName <String>

Display name of the object

Description <String>

Description of the object (possibly $null if the object type does not have a description).

Notes

If the command fails, the following errors can be returned.

Error Codes

----------

UnknownObject

One of the specified objects was not found.

PartialData
Only a subset of the available data was returned.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-ProvScopedObject -ObjectType Scheme

ScopeId     : eff6f464-f1ee-4442-add3-99982e0cec01
ScopeName   : Sales
ObjectType  : Scheme
ObjectId    : cd4174ee-9e4b-4e57-b126-9dbf757fe493
ObjectName  : MyExampleScheme
Description : Test scheme

ScopeId     : 304e0fa7-d390-47f0-a94f-7e956a324c41
ScopeName   : Finance
Gets all of the scoped objects with type Scheme. The example output shows a scheme object (MyExampleScheme) in two scopes Sales and Finance, and another scheme (AnotherScheme) that is not in any scope. The ScopeId and ScopeName values returned are null in the final record.
Get-ProvService

Oct 01, 2013
Gets the service record entries for the MachineCreation Service.

Syntax

Detailed Description

Returns instances of the MachineCreation Service that the service publishes. The service records contain account security identifier information that can be used to remove each service from the database.

A database connection for the service is required to use this command.

Related topics

Parameters

-Property <String[]>

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Required? | false
---|---
Default Value | 
Accept Pipeline Input? | false

-ReturnTotalRecordCount <SwitchParameter>

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Prov_Filtering for details.

Required? | false
---|---
Default Value | False
Accept Pipeline Input? | false

-MaxRecordCount <Int32>

Specifies the maximum number of records to return.

Required? | false
---|---
Default Value | 250
<table>
<thead>

<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

Citrix.MachineCreation.Sdk.Service
The Get-ProvServiceInstance command returns an object containing the following properties.

**Uid <Integer>**
Specifies the unique identifier for the service in the group. The unique identifier is an index number.

**ServiceHostId <Guid>**
Specifies the unique identifier for the service instance.

**DNSName <String>**
Specifies the domain name of the host on which the service runs.

**MachineName <String>**
Specifies the short name of the host on which the service runs.

**CurrentState <Citrix.Fma.Sdk.ServiceCore.ServiceState>**
Specifies whether the service is running, started but inactive, stopped, or failed.

**LastStartTime <DateTime>**
Specifies the date and time at which the service was last restarted.

**LastActivityTime <DateTime>**
Specifies the date and time at which the service was last stopped or restarted.

**OSType**
Specifies the operating system installed on the host on which the service runs.

**OSVersion**
Specifies the version of the operating system installed on the host on which the service runs.

**ServiceVersion**
Specifies the version number of the service instance. The version number is a string that reflects the full build version of the service.

**DatabaseUserName <string>**
Specifies for the service instance the Active Directory account name with permissions to access the database. This will be either the machine account or, if the database is running on a controller, the NetworkService account.

**Sid <string>**
Specifies the Active Directory account security identifier for the machine on which the service instance is running.

**ActiveSiteServices <string[]>**
Specifies the names of active site services currently running in the service. Site services are components that perform long-running background processing in some services. This field is empty for services that do not contain site services.
Notes
If the command fails, the following errors can be returned.

Error Codes
------------

UnknownObject
One of the specified objects was not found.

PartialData
Only a subset of the available data was returned.

InvalidFilter
A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase
The query required to get the database was not defined.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples
-------------------------- EXAMPLE 1 --------------------------
c:\PS>Get-ProvService

Uid : 1
ServiceHostId : aef6f464-f1ee-4042-a523-66982e0cecd0
DNSName : MyServer.company.com
MachineName : MYSERVER
CurrentState : On
LastStartTime : 04/04/2011 15:25:38
LastActivityTime : 04/04/2011 15:33:39
OSType : Win32NT
OSVersion : 6.1.7600.0
ServiceVersion : 5.1.0.0
DatabaseUserName : NT AUTHORITY\NETWORK SERVICE
SID : S-1-5-21-2316621082-1546847349-2782505528-1165
ActiveSiteServices : {MySiteService1, MySiteService2...}

Get all the instances of the MachineCreation Service running in the current service group.
Get-ProvServiceAddedCapability

Oct 01, 2013
Gets any added capabilities for the MachineCreation Service on the controller.

Syntax
Get-ProvServiceAddedCapability [-AdminAddress <String>] [<CommonParameters>]

Detailed Description
Enables updates to the MachineCreation Service on the controller to be detected.
You do not need to configure a database connection before using this command.

Related topics

Parameters
- **-AdminAddress <String>**
  Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values
System.String
String containing added capabilities.

Notes
If the command fails, the following errors can be returned.

Error Codes
-----------
DatabaseError
An error occurred in the service while attempting a database operation.
DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.
DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-ProvServiceAddedCapability
Get the added capabilities of the MachineCreation Service.
Get-ProvServiceConfigurationData

Oct 01, 2013
Gets configuration data for the service.

Syntax

Detailed Description

Provides the ability to determine the configuration parameters for the service

Related topics

Set-ProvServiceConfigurationData
Remove-ProvServiceConfigurationData

Parameters

-Name <String[]>
The Configuration data item Name.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-Value <String[]>
The Configuration data item value.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-ReturnTotalRecordCount <SwitchParameter>

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Prov_Filtering for details.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>False</td>
<td></td>
</tr>
</tbody>
</table>
### Accept Pipeline Input?

**false**

#### -MaxRecordCount

**<Int32>**

Specifies the maximum number of records to return.

| Required? | false |
| Default Value | 250 |
| Accept Pipeline Input? | false |

#### -Skip

**<Int32>**

Skips the specified number of records before returning results. Also reduces the count returned by **-ReturnTotalRecordCount**.

| Required? | false |
| Default Value | 0 |
| Accept Pipeline Input? | false |

#### -SortBy

**<String>**

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

| Required? | false |
| Default Value | The default sort order is by name or unique identifier. |
| Accept Pipeline Input? | false |

#### -Filter

**<String>**

Gets records that match a PowerShell-style filter expression. See about_Prov_Filtering for details.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

#### -AdminAddress

**<String>**

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Return Values**

`Citrix.MachineCreation.Sdk.ServiceConfigurationData`

This object provides details of the configuration data and contains the following information:

- **Name <string>**
  - The Name for the configuration item.

- **Value <string>**
  - The value for the configuration item.

**Notes**

In the case of failure the following errors can be produced.

**Error Codes**

------------

- **PartialData**
  - Only a subset of the available data was returned.

- **CouldNotQueryDatabase**
  - The query required to get the database was not defined.

- **DatabaseError**
  - An error occurred in the service while attempting a database operation.

- **DatabaseNotConfigured**
  - The operation could not be completed because the database for the service is not configured.

- **DataStoreException**
  - An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- **PermissionDenied**
  - You do not have permission to execute this command.

- **AuthorizationError**
There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

An error occurred while communicating with the service.

ExceptionThrown

An unexpected error occurred. To locate more details see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS>Get-ProviderConfigurationData

Name : DeltaDiskDelete.timeDelay
Value : 10

Get the Configuration data for the service.
Get-ProvServiceInstance

Oct 01, 2013
Gets the service instance entries for the MachineCreation Service.

Syntax
Get-ProvServiceInstance [-AdminAddress <String>] [CommonParameters]

Detailed Description
Returns service interfaces published by the instance of the MachineCreation Service. Each instance of a service publishes multiple interfaces with distinct interface types, and each of these interfaces is represented as a ServiceInstance object. Service instances can be used to register the service with a central configuration service so that other services can use the functionality.

You do not need to configure a database connection to use this command.

Related topics
Parameters
-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
</tbody>
</table>

Return Values
Citrix.MachineCreation.Sdk.ServiceInstance

The Get-ProvServiceInstance command returns an object containing the following properties.

ServiceGroupUid <Guid>

Specifies the unique identifier for the service group of which the service is a member.

ServiceGroupName <String>

Specifies the name of the service group of which the service is a member.

ServiceInstanceUID <Guid>

Specifies the unique identifier for registered service instances, which are service instances held by and obtained from a central configuration service. Unregistered service instances do not have unique identifiers.
ServiceType <String>

Specifies the service instance type. For this service, the service instance type is always Prov.

Address

Specifies the address of the service instance. The address can be used to access the service and, when registered in the central configuration service, can be used by other services to access the service.

Binding

Specifies the binding type that must be used to communicate with the service instance. In this release of XenDesktop, the binding type is always 'wcf_HTTP_kerb'. This indicates that the service provides a Windows Communication Foundation endpoint that uses HTTP binding with integrated authentication.

Version

Specifies the version of the service instance. The version number is used to ensure that the correct versions of the services are used for communications.

ServiceAccount <String>

Specifies the Active Directory account name for the machine on which the service instance is running. The account name is used to provide information about the permissions required for interservice communications.

ServiceAccountSid <String>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

InterfaceType <String>

Specifies the interface type. Each service can provide multiple service instances, each for a different purpose, and the interface defines the purpose. Available interfaces are:

  SDK - for PowerShell operations

  InterService - for operations between different services

  Peer - for communications between services of the same type

The collection of metadata associated with registered service instances, which are service instances held by and obtained from a central configuration service. Metadata is not stored for unregistered service instances.

Notes

If the command fails, the following errors can be returned.

Error Codes

----------

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

ServiceType : Prov
Version : 1

Get all instances of the MachineCreation Service running on the specified machine. For remote services, use the AdminAddress parameter to define the service for which the interfaces are required. If the AdminAddress parameter has not been specified for the runspace, service instances running on the local machine are returned.
Get-ProvServiceStatus

Oct 01, 2013
Gets the current status of the MachineCreation Service on the controller.

Syntax
Get-ProvServiceStatus [-AdminAddress <String>] [<CommonParameters>]

Detailed Description
Enables the status of the MachineCreation Service on the controller to be monitored. If the service has multiple data stores it will return the overall state as an aggregate of all the data store states. For example, if the site data store status is OK and the secondary data store status is DBUnconfigured then it will return DBUnconfigured.

Related topics
Set-ProvDataStore
Set-ProvDBConnection
Test-ProvDBConnection
Get-ProvDBConnection
Get-ProvDBSchema

Parameters

- **-AdminAddress**<String>

  Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

The Get-ProvServiceStatus command returns an object containing the status of the MachineCreation Service together with extra diagnostics information.

DBUnconfigured
The MachineCreation Service does not have a database connection configured.

DBRejectedConnection
The database rejected the logon attempt from the MachineCreation Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

**InvalidDBConfigured**

The expected stored procedures are missing from the database. This may be because the MachineCreation Service schema has not been added to the database.

**DBNotFound**

The specified database could not be located with the configured connection string.

**DBNewerVersionThanService**

The version of the MachineCreation Service currently in use is incompatible with the version of the MachineCreation Service schema on the database. Upgrade the MachineCreation Service to a more recent version.

**DBOlderVersionThanService**

The version of the MachineCreation Service schema on the database is incompatible with the version of the MachineCreation Service currently in use. Upgrade the database schema to a more recent version.

**DBVersionChangeInProgress**

A database schema upgrade is currently in progress.

**OK**

The MachineCreation Service is running and is connected to a database containing a valid schema.

**Failed**

The MachineCreation Service has failed.

**Unknown**

(0) The service status cannot be determined.

**Notes**

If the command fails, the following errors can be returned.

**Error Codes**

-------------

**DatabaseError**

An error occurred in the service while attempting a database operation.

**DatabaseNotConfigured**

The operation could not be completed because the database for the service is not configured.

**DataStoreException**
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-ProvServiceStatus

DBUnconfigured
Get the current status of the MachineCreation Service.
Get-ProvTask

Oct 01, 2013
Gets the task history for the MachineCreation Service.

Syntax

Detailed Description
Returns a list of tasks that have run or are currently running within the MachineCreation Service.

Related topics
Remove-ProvTask

Get all completed tasks for the MachineCreation Service.

All tasks will publish at least the fields listed above, plus more related to the particular task being performed.
Get-ProvVM

Oct 01, 2013
Gets the VMs that were created using Citrix XenDesktop Machine Creation Services.

Syntax

Detailed Description

Provides the ability to obtain a list of the VMs that were created using Machine Creation Services.

Related topics

New-ProvVM
Remove-ProvVM
Lock-ProvVM
Unlock-ProvVM

Parameters

-ProvisioningSchemeName <String>

The name of the provisioning scheme.

| Required? | false |
| Default Value |

-ProvisioningSchemeUid <Guid>

The unique identifier of the provisioning scheme.

| Required? | false |
| Default Value |

-VMName <String>

The name of the VM in the hypervisor context.
| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

**-Locked**<Boolean>

Indicates whether only VMs that are marked as locked are returned or not (see Lock-ProvVM and Unlock-ProvVM for details).

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

**-Tag**<String>

The tag string that was associated with the VM when it was locked.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

**-OutOfDate**<SwitchParameter>

Indicates that the image currently assigned to the VM is out of date. The image will be updated the next time the VM is restarted.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

**-ReturnTotalRecordCount**<SwitchParameter>

See about_Prov_Filtering for details.

| Required? | false |
| Default Value | false |
| Accept Pipeline Input? | false |

**-MaxRecordCount**<Int32>
See about_Prov_Filtering for details.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>false</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-Skip**<Int32>

See about_Prov_Filtering for details.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>0</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-SortBy**<String>

See about_Prov_Filtering for details.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-Filter**<String>

See about_Prov_Filtering for details.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-AdminAddress**<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>LocalHost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>
Return Values

The object has the following properties:

ADAccountSid <string>
The SID of the AD computer account that the VM is using.

ADAccountName <string>
The name of the AD computer account that the VM is using.

CpuCount <int>
The number of processors that the VM has been allocated.

CreationDate <DateTime>
The date and time that the VM was created.

Domain <string>
The Domain of the AD computer account that the VM is using.

ImageOutOfDate <Boolean>
Indicates if the image will be updated next time the VM is started.

Lock <Boolean>
Indicates whether the VM is locked or not.

MemoryMB <int>
The maximum amount of memory that VMs will be created with when using this scheme.

ProvisioningSchemeName <string>
The name of the provisioning scheme that the VM is part of.

ProvisioningSchemeUid <Guid>
The unique identifier for the provisioning scheme that the VM is part of.

Tag <string>
Provides the string associated with a locked VM.

VMId <string>
The identifier for the VM (hypervisor context).

VMName <string>
The name of the VM (hypervisor context).

AssignedImage <string>

The identifier (in the hypervisor) for the hard disk image that the VM is currently assigned.

BootedImage <string>

The identifier (in the hypervisor) for the hard disk image with which the VM is currently started.

HostingUnitUid <Guid>

The unique identifier for the hosting unit that was used to create the VM.

HypervisorConnectionUid <Guid>

The unique identifier of the hypervisor connection that was used to create the VM.

LastBootTime <DateTime>

The date and time of the last start of the VM.

OSDiskIndex <int>

The disk index at which the hard disk image, from which the VM is currently started, is attached (or [int]:MinValue for VMs inherited from versions of XenDesktop before 5.6)

PersonalVDiskIndex <int>

The disk index at which the personal vdisk is attached (defaults to [int]:MinValue for VMs without a personal vdisk)

PersonalVDiskStorage <string>

The identifier (in the hypervisor) for the storage on which the personal virtual disk image from which the VM is currently started is located. This is set only if the VM has a personal vDisk attached

StorageId <string>

The identifier (in the hypervisor) for the storage on which the hard disk image, from which the VM is currently started, is located.

Notes

In the case of failure, the following errors can result.

Error Codes

----------

PartialData

Only a subset of the available data was returned.

CouldNotQueryDatabase

The query required to get the database was not defined.
PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

An error occurred while communicating with the service.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Gets all the Virtual Machines that were locked, regardless of which Provisioning Scheme the VM is part of.
Lock-ProvVM

Oct 01, 2013

Locks a VM.

Syntax

Lock-ProvVM [-VMID] <String[]> -ProvisioningSchemeName <String> [-Tag <String>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Lock-ProvVM [-VMID] <String[]> -ProvisioningSchemeUid <Guid> [-Tag <String>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to 'lock' a virtual machine with a tag string. This stops other commands from being able to remove the virtual machine without unlocking the VM first. This is to enable consumers of the virtual machines to indicate that the VM is being used.

Related topics

UnLock-ProvVM

Get-ProvVM

Remove-ProvVM

Parameters

-VMID<String[]>

The virtual machine Id (hypervisor context).

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-ProvisioningSchemeName<String>

The name of the provisioning scheme.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-ProvisioningSchemeUid<Guid>

The unique identifier of the provisioning scheme.
-Tag <String>

The string to be held against the VM being locked.

-LoggingId <Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

-AdminAddress <String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Input Type

Citrix.MachineCreation.Sdk.ProvisionedVirtualMachine You can pipe an object containing a parameter called 'VMId' and 'ProvisioningSchemeName' to Lock-ProvVM

Notes

In the case of failure, the following errors can result.

Error Codes

--------------

VMDoesNotExist

https://docs.citrix.com © 1999-2017 Citrix Systems, Inc. All rights reserved.
The specified VM cannot be located.

VMAlreadyLocked

The VM is already unlocked.

VMDoesNotExistForProvisioningScheme

The specified VM does exist in the hypervisor, but is not part of the specified provisioning scheme.

PermissionDenied

The user is not authorized to perform this operation

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS>Lock-ProvVM -provisioningSchemeName MyScheme -VMId bc79802c-ba6e-8de8-99e9-4c35d7ad24b4 -Tag LockedString

Locks the VM with the Id 'bc79802c-ba6e-8de8-99e9-4c35d7ad24b4' in the provisioning scheme 'MyScheme' with the tag 'LockedString'.

-------------------------- EXAMPLE 2 --------------------------

C:\PS>Get-ProvVM -provisioningSchemeName MyScheme | Lock-ProvVM -Tag LockedString

Locks all the VMs in the provisioning scheme 'MyScheme' with the tag 'LockedString'.

New-ProvScheme

Oct 01, 2013

Creates a new provisioning scheme.

Syntax

Detailed Description

Lets you create a new provisioning scheme. The creation process makes a copy of the hard disk attached to a virtual machine snapshot and stores it in every storage location that the hosting unit referenced by the provisioning scheme defines. This is a long-running task and typically takes several minutes to complete (depending on the size of the hard disk that is being copied and the number of snapshots that the hard disk consists of).

A snapshot must be used rather than a VM, so that the content of the hard disk for the provisioning scheme can be easily determined.

As the snapshot is specified using a path into the Citrix Host Service PowerShell Provider the Citrix Host Service PowerShell snap-in must also be loaded for this cmdlet to be used.

This cmdlet requires information to be provided that is retrieved using other snap-ins that form part of the Citrix Machine Creation Services: Hosting Unit Service SnapIn The snap-in that provides information about the hypervisors. AD Identity Service SnapIn The snap-in that provides information about the identity pools.

The provisioning scheme is a collection of all of the data that is required to form a template against which virtual machines can be created. It therefore requires the following: Hosting Unit A reference to an item defined in the Host Service that defines the hypervisor, the network, and the storage to be used. Identity Pool A reference to the collection of Active Directory accounts that is used for virtual machines created from the provisioning scheme.

Related topics

Get-ProvTask
Get-ProvScheme
Test-ProvSchemeNameAvailable

Parameters

-ProvisioningSchemeName <String>

The name of the provisioning scheme to be created. This must be a name that is not being used by an existing provisioning scheme, and it must not contain any of the following characters /;:#.*?=

Required? true
Default Value
Accept Pipeline Input? false

-HostingUnitUid <Guid>

The identifier for the hosting unit used for the provisioning scheme.

Required? true
Default Value
Accept Pipeline Input? false

-IdentityPoolUid <Guid>

The identifier of the identity pool used for the provisioning scheme.

Required? true
Default Value
Accept Pipeline Input? false

-HostingUnitName <String>

The name of the hosting unit used for the provisioning scheme.

Required? true
Default Value
Accept Pipeline Input? false
### IdentityPoolName
The name for the identity pool used for the provisioning scheme.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>true</td>
<td>false</td>
</tr>
</tbody>
</table>

### MasterImageVM
The path in the hosting unit provider to the virtual machine snapshot that is used. This identifies the hard disk to be used and the default values for the memory and processors. This must be a path to a Snapshot item in the same hosting unit that the hosting unit name or hosting unit UID refers to.

Valid paths are of the format: `XDHyp:\HostingUnits\<HostingUnitName>\<path>\<VmName>.vm\<SnapshotName>.snapshot`

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>true</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

### VMCPUCount
The number of processors used by virtual machines created from the provisioning scheme.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>false</td>
<td>true</td>
</tr>
</tbody>
</table>

### VMMemoryMB
The maximum amount of memory used by virtual machines created from the provisioning scheme.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>false</td>
<td>true</td>
</tr>
</tbody>
</table>

### CleanOnBoot
Indicates whether or not the virtual machines created from this provisioning scheme are reset to their initial condition each time they are started.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>false</td>
<td>true</td>
</tr>
</tbody>
</table>

### UsePersonalVDiskStorage
Indicates whether or not personal vDisks are used for the VMs in this provisioning scheme.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>false</td>
<td>true</td>
</tr>
</tbody>
</table>

### Scope
The administration scopes to be applied to the new provisioning scheme.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>false</td>
<td>true</td>
</tr>
</tbody>
</table>

### NoImagePreparation
Indicates that Image Preparation should not be performed on this Provisioning Scheme.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>false</td>
<td>true</td>
</tr>
</tbody>
</table>
Accept Pipeline Input? | false  
---|---  
-NetworkMapping<Hashtable>  
Specifies how the attached NICs are mapped to networks. If this parameter is omitted, provisioned VMs are created with a single NIC, which is mapped to the default network in the HostingUnit. If this parameter is supplied, machines are created with the number of NICs specified in the map, and each NIC is attached to the specified network.  
Required? | false  
Default Value  
Accept Pipeline Input? | false  
-Metadata<Hashtable>  
Specifies any metadata to be attached to the scheme when it is created.  
Required? | false  
Default Value  
Accept Pipeline Input? | false  
-RunAsynchronously<SwitchParameter>  
Indicates whether or not the command returns before it is complete. If specified, the command returns an identifier for the task that was created. This task can be monitored using the get-ProvTask command.  
Required? | false  
Default Value  
Accept Pipeline Input? | false  
-PurgeJobOnSuccess<SwitchParameter>  
Indicates that the task history is removed from the database when the task has finished. This can only be specified for tasks that are not run asynchronously.  
Required? | false  
Default Value  
Accept Pipeline Input? | false  
-LoggingId<Guid>  
Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.  
Required? | false  
Default Value  
Accept Pipeline Input? | false  
-AdminAddress<String>  
Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. This can be provided as a host name or an IP address.  
Required? | false  
Default Value  
Accept Pipeline Input? | false  
Return Values  
System.Guid  
When the RunAsynchronously identifier is specified, this GUID is returned and provides the task identifier.  
System.Management.Automation.PSCustomObject  
This object provides details of the task that was run and contains the following information:  
TaskId <Guid>  
The identifier for the task that was performed.  
Active <Boolean>
Indicates whether the task is still processing or is complete.

Host :string:
The name of the host on which the task is running or was run.

DateStarted :DateTime:
The date and time that the task was initiated.

Type :Citrix.XDInterServiceTypes.JobType:
The type of task. For new provisioning scheme tasks, this is always NewProvisioningScheme.

The list of metadata stored against the task. For new tasks, this is empty until metadata is added.

WorkflowStatus :System.Workflow.Runtime.WorkflowStatus:
Indicates the status of the workflow that is used to process the task.

ProvisioningSchemeName :string:
The name of the provisioning scheme that the task was for.

ProvisioningSchemeUid :Guid:
The unique identifier of the provisioning scheme that the task was for.

MasterImage :string:
The path (in the hosting unit provider) of the virtual machine snapshot that was used as the master VM image for the task.

IdentityPoolName :string:
The name of the identity pool (from the ADIdentity PowerShell snap-in) that the new provisioning scheme uses.

IdentityPoolUid :guid:
The unique identifier name of the identity pool (from the ADIdentity PowerShell snap-in) that the new provisioning scheme uses.

HostingUnitName :string:
The name of the hosting unit (from the Hosting Unit PowerShell snap-in) that the new provisioning scheme uses.

HostingUnitUid:
The unique identifier of the hosting unit (from the Hosting Unit PowerShell snap-in) that the new provisioning scheme uses.

PersonalVDiskDriveLetter:
The drive letter on which a personal vDisk is mounted (blank if the personal vDisk feature was not selected).

PersonalVDiskDriveSize:
The size of any personal vDisk (zero if the personal vDisk feature was not selected).

Scopes :Citrix.Fma.Sdk.ServiceCoreScopeReference[]:
The delegated administration scopes to which the scheme will belong.

NetworkMap :Citrix.MachineCreation.Sdk.NetworkMap:
The list of NIC to network associations, if specified.

ProvisioningSchemeMetadata :Dictionary<string, string>:
The metadata to apply to the provisioning scheme, if specified.

TaskState :Citrix.MachineCreation.Sdk.NewProvisioningSchemeState:
The state of the task. This can be any of the following:

Processing:
The task has begun but has not done anything yet.

LocatingResources:
The workflow is locating resources from other services.

HostingUnitNotFound:
The task failed because the required hosting unit could not be located.

VirtualMachineSnapshotNotFound:
The task failed because the required VM snapshot could not be located.

ConsolidatingMasterImage:
The task is consolidating the master image.

ReplicatingConsolidatedImageToAllStorage
The task is replicating the consolidated master image.

StoringProvisioningScheme
The task is storing the provisioning scheme data in the database.

Finished
The task completed with no errors.

ProvisioningSchemeAlreadyExists
The task failed because a provisioning scheme with the same name already exists.

IdentityPoolNotFound
The task failed because the specified identity pool could not be found.

MasterVMImageIsNotPartOfProvisioningSchemeHostingUnit,
The task failed because the hosting unit from which the master image originated is not the same hosting unit that the provisioning scheme is using.

MasterVMImageIsASnapshot
The task failed because the master VM path does not refer to a Snapshot item

ProvisioningSchemeNotFound
The task failed because it could not find a provisioning scheme with the specified name.

TaskAlreadyRunningForProvisioningScheme
The task failed because a task for a provisioning scheme with the same name is already running.

InvalidMasterVMConfiguration
The task failed because the VM snapshot specified as the master has an invalid configuration.

InvalidMasterVMState
The task failed because the VM snapshot specified as the master is currently in an invalid state.

InsufficientResources
The task failed because the hypervisor did not have enough resources to complete the task.

DiskConsolidationFailed
The disk consolidation task failed. Details are in the task state information string.

StorageNotFound
The task failed because no associated storage was found in the hosting unit.

ConfigurationError
The task failed because the service is unable to contact one of the other services. This is because not all appropriate Configuration Service registrations have been performed.

Canceled
The task was stopped by user intervention (using Stop-ProvTask).

TaskStateInformation
Additional information about the current task state.

TaskProgress
The progress of the task 0-100%.

DiskSize
The size of the master image in GB

Notes
Only one long-running task for each provisioning scheme can be processed at a time.
In case of failure, the following errors can result.

Error Codes
-----------
JobCreationFailed
The requested task could not be started.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb
An error occurred in the service while attempting a database operation. Communication with the database failed for various reasons.

MachineCreationServiceDoesNotSupportPersonalDisk
The service instance being used has not been upgraded to support the personal vDisk feature.

DatabaseMissingCapabilities
The database supporting the service instance being used has not been upgraded to support the personal vDisk feature.

CommunicationError
An error occurred while communicating with the service.

InvalidParameterCombination
Both PurgeJobOnSuccess and RunAsynchronously were specified. When running asynchronously, the cmdlet terminates before the job does, so it cannot clean up the completed job.

PermissionDenied
The user does not have administrative rights to perform this operation.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

ScopeNotFound
One or more of the scopes nominated for the new provisioning scheme do not exist.

WorkflowHostUnavailable
The task could not be started because the database connection is inactive.

ExceptionThrown
An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used, or examine the XenDesktop logs.

The cmdlet is associated with a task of type NewProvisioningScheme, and while active will move through the following operations (CurrentOperation field):

ValidatingInputs
ConsolidatingMasterImage
PreparingMasterImage
ReplicatingMasterImage
CommittingScheme

New-ProvVM

Oct 01, 2013
Creates a new virtual machine.

Syntax

Detailed Description

Lets you create new virtual machines with the configuration specified by a provisioning scheme.

The virtual machines are created using all of the storage specified in the provisioning scheme. The storage is used in a round robin mechanism. For the duration of this task, the AD accounts are locked (by the AD Identity Service), which stops the same accounts being used by other virtual machine creation tasks.

Related topics

Lock-ProvVM
Unlock-ProvVM

Parameters

-ProvisioningSchemeName <String>

The name of the provisioning scheme in which the virtual machines are created.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | false |

-ProvisioningSchemeUid <Guid>

The unique identifier for the provisioning scheme in which the virtual machines are created.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | false |
-**ADAccountName**<String[]>

A list of the Active Directory account names that are used for the virtual machines. The accounts must be provided in a domain-qualified format. This parameter accepts Identity objects as returned by the New-AcctADAccount cmdlet, or any PSObject with string properties "Domain" and "ADAccountName".

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**FastBuild**<SwitchParameter>

Indicates whether or not the command can improve speed by using optimizations in the creation process. This may mean that machines you create cannot be booted until ResetVM operations have been performed by the Broker and Machine Identity Services.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**NetworkMapping**<Hashtable>

Specifies how the attached NICs are mapped to networks. If this parameter is omitted, provisioned VMs are created with network settings as inherited from the provisioning scheme. If this parameter is supplied, machines are created with the number of NICs specified in the map, and each NIC is attached to the specified network.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**RunAsynchronously**<SwitchParameter>

Indicates whether or not the command returns before it is complete. If specified, the command returns an identifier for the task that was created. This task can be monitored using the get-ProvTask command.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>

</table>

Return Values

System.Guid

When the RunAsynchronously identifier is specified, this GUID is returned and provides the task identifier.

System.Management.Automation.PSCustomObject

This object provides details of the task that was run and contains the following information:

TaskId <Guid>

The identifier for the task that was performed.

Active <Boolean>

Indicates whether the task is still processing or is complete.

Host <string>
The name of the host on which the task is running or was run.

DateStarted <DateTime>
The date and time that the task was initiated.

Type <Citrix.XDInterServiceTypes.JobType>
The type of task. For newly provisioned VM tasks, this is always "NewVirtualMachine".

The list of metadata stored against the task. For new tasks this is empty until metadata is added.

Indicates the status of the workflow that is used to process the task.

ProvisioningSchemeName <string>
The name of the provisioning scheme that the task was for.

ProvisioningSchemeUid <Guid>
The unique identifier of the provisioning scheme that the task was for.

MasterImage <string>
The path (in the hosting unit provider) of the virtual machine snapshot that was used as the master image for the task.

IdentityPoolName <string>
The name of the identity pool (from the ADIdentity PowerShell snap-in) that the new provisioning scheme uses.

IdentityPoolUid <guid>
The unique identifier name of the identity pool (from the ADIdentity PowerShell snap-in) that the new provisioning scheme uses.

HostingUnitName <string>
The name of the hosting unit (from the Hosting Unit PowerShell snap-in) that the new provisioning scheme uses.

HostingUnitUid
The unique identifier of the hosting unit (from the Hosting Unit PowerShell snap-in) that the new provisioning scheme uses.

TaskState <Citrix.DesktopUpdateManagerSDK.ProvisionVMState>
The state of the task. This can be any of the following:

Processing
Indicates that the task is in its initial state.

LocatingResources,
Indicates that the task is locating information from other services.

HostingUnitNotFound

Indicates that the required hosting unit could not be located.

ProvisioningSchemeNotFound

Indicates that the required provisioning scheme could not be located.

Provisioning

Indicates that the task is at the provisioning stage.

IdentityPoolNotFound

Indicates that the required identity pool could not be located.

TaskAlreadyRunningForProvisioningScheme

Indicates that the provisioning scheme already has another task running.

HypervisorInMaintenanceMode

Indicates that the hypervisor is not available for normal use.

NoAvailableStorage

Indicates that no storage is available for the hypervisor.

NoAvailableNetwork

Indicates that no network is available for the hypervisor.

Finalizing

Indicates that the task is finalizing.

Finished

Indicates that the task is complete.

FinishedWithErrors

Indicates that the task is complete but there were errors. Specific details of errors are included with each failed virtual machine.

Removing

Indicates that the task is removing virtual machines from the hypervisor.

Failed

The job failed for reasons specified in TaskStateInformation.

Canceled
Indicates that the task was stopped by user intervention (using Stop-ProvTask).

TaskStateInformation

Provides more detailed information about the current task state.

VirtualMachinesToCreateCount <int>

The total number of virtual machines that the task is trying to create.

VirtualMachinesCreatedCount <int>

The number of virtual machines that the task has created so far. Details of the machines that were created are in the CreatedVirtualMachines parameter.

VirtualMachinesCreationFailedCount <int>

The number of virtual machines that the task has failed to create. Details of the machines that were not created are in the FailedVirtualMachines parameter.

FailedVirtualMachines <Citrix.DesktopUpdateManager.SDK.VirtualMachineCreation[]>

ADAccountName <string>

The domain qualified AD Account name of the machine.

ADAccountSid <string>

The AD account SID of the machine account.

DiagnosticInformation <Citrix.MachineCreation.Sdk.ExceptionSurrogate[]>

A collection of handled error states which caused the provisioning to fail.

ExceptionType <string>

The type of exception this object represents

Message <string>

The exception message

Details <string>

The full exception content including stack trace

InnerException <Citrix.MachineCreation.Sdk.ExceptionSurrogate>

Information relating to any contributing error state

Status <string>

StatusAdditionalInformation <string>

VMId <string>
The virtual machine identifier within the hypervisor in which the VM resides.

VMName <string>

The display name of the virtual machine within the hypervisor in which the VM resides.

CreatedVirtualMachines <Citrix.DesktopUpdateManager.SDK.VirtualMachineCreation[]>

See FailedVirtualMachines for details of the object parameters.

Notes

Only one long-running task in each provisioning scheme can be processed at a time.

In the case of failure, the following errors can result.

Error Codes

----------

JobCreationFailed
The requested task could not be started.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb
An error occurred in the service while attempting a database operation. Communication with the database failed for various reasons.

WorkflowHostUnavailable
The task could not be started because the database connection is inactive.

PermissionDenied
The user does not have administrative rights to perform this operation.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error

CommunicationError
An error occurred while communicating with the service.

InvalidParameterCombination
Both PurgeJobOnSuccess and RunAsynchronously were specified.

When running asynchronously, the cmdlet terminates before the job does, so it cannot clean up the completed job.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used, or examine the XenDesktop logs.

The cmdlet is associated with a task of type NewVirtualMachine, and while active will move through the following operations (CurrentOperation field)

ValidatingInputs

CreatingVirtualMachines

ReleasingAccountLocks

ProvisioningStatus : Completed
Publish-ProvMasterVmImage

Oct 01, 2013
Update the master image associated with the provisioning scheme.

Syntax

Publish-ProvMasterVmImage [-ProvisioningSchemeName] <String> -MasterImageVM <String> [-DoNotStoreOldImage] [-RunAsynchronously] [-PurgeJobOnSuccess] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Publish-ProvMasterVmImage -ProvisioningSchemeUid <Guid> -MasterImageVM <String> [-DoNotStoreOldImage] [-RunAsynchronously] [-PurgeJobOnSuccess] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to update the hard disk image used to provision virtual machines. If the provisioning scheme is a ‘CleanOnBoot’ type, then the next time that virtual machines are started, their hard disks are updated to this new image. Regardless of the ‘CleanOnBoot’ type, all new virtual machines created after this command will use this new hard disk image.

A background task will be created to remove the old hard disk copies. You can locate and monitor this task using the Get-ProvTask cmdlet.

A snapshot is used rather than a VM, so that the content of the hard disk for the provisioning scheme can be easily determined.

As the snapshot is specified using a path into the Citrix Host Service Powershell Provider, the Citrix Host Service Powershell snap-in must also be loaded for this cmdlet to be used.

The previous hard disk image path is stored into the history (see Get-provSchemeMasterVMImageHistory). The data stored in the history allows for a roll back to be undertaken, to revert to the previous hard disk image if required.

Related topics

Get-ProvSchemeMasterVMImageHistory

Get-ProvScheme

Parameters

-ProvisioningSchemeName <String>

The provisioning scheme to which the hard disk image should be updated.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByPropertyName) |

-ProvisioningSchemeUid <Guid>
The provisioning scheme identifier to which the hard disk image should be updated.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | false |

-MasterImageVM<String>

The path in the hosting unit provider to the virtual machine snapshot that will be used. This identifies the hard disk to be used and the default values for the memory and processors. This must be a path to a Snapshot Item in the same hosting unit that the hosting unit name or hosting unit Uid refers to.

Valid paths are of the format: XDHyp:\HostingUnits\<HostingUnitName>\<path>\<VmName>.vm\<SnapshotName>.snapshot

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByPropertyName) |

-DoNotStoreOldImage<SwitchParameter>

Specifies that the current image should not be added to the image history list for the provisioning scheme. This is useful when rolling back to a previous image.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

-RunAsynchronously<SwitchParameter>

Indicates whether or not the cmdlet should return before it is complete. If specified, the command returns an identifier for the task that was created. You can monitor this task using the get-ProvTask cmdlet.

| Required? | false |
| Default Value | false |
| Accept Pipeline Input? | false |

-PurgeJobOnSuccess<SwitchParameter>

Indicates that the task history will be removed from the database once the task has finished. This cannot be specified for tasks that are run asynchronously.
Required? false
Default Value false
Accept Pipeline Input? false

-LoggingId <Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required? false
Default Value
Accept Pipeline Input? false

-AdminAddress <String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required? false
Default Value LocalHost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input? false

Return Values
System.Guid

When "RunAsynchronously" is specified, this identifier is returned to provide the task identifier.

System.Management.Automation.PSCustomObject

This object provides details of the task run and contains the following information:

TaskId <Guid>
The identifier for the task that was performed.

Active <Boolean>
Indicates whether the task is still processing or is complete.

Host <string>
The name of the host on which the task is running or was run.

DateStarted <DateTime>
The date and time that the task was initiated.

Type <Citrix.XDInterServiceTypes.JobType>

The type of the task. For new provisioning scheme tasks this is always "New Provisioning Scheme".

The list of metadata stored against the task. For new tasks this will be empty until metadata is added.

Indicates the status of the workflow that is being used to process the task.

ProvisioningSchemeName <string>

The name of the provisioning scheme that the task was for.

ProvisioningSchemeUid <Guid>

The unique identifier of the provisioning scheme that the task was for.

MasterImage <string>

The path (in the hosting unit provider) of the virtual machine snapshot that was used as the master image for the task.

IdentityPoolName <string>

The name of the identity pool (from the AD Identity PowerShell snap-in) that the new provisioning scheme will use.

IdentityPoolUid <guid>

The unique identifier name of the identity pool (from the AD Identity PowerShell snap-in) that the new provisioning scheme will use.

HostingUnitName <string>

The name of the hosting unit (from the Hosting Unit PowerShell snap-in) that the new provisioning scheme will use.

HostingUnitUid

The unique identifier of the hosting unit (from the Hosting Unit PowerShell snap-in) that the new provisioning scheme will use.

TaskState <Citrix.DesktopUpdateManager.SDK.NewProvisioningSchemeState>

The state of the task. This can be any of the following:

Processing

Indicates that the task has just begun and has not done anything yet.

LocatingResources,

Indicates that the workflow is locating resources from other services.
HostingUnitNotFound
Indicates that the task failed because the required hosting unit could not be located.

VirtualMachineSnapshotNotFound
Indicates that the task failed because the required snapshot could not be located.

ConsolidatingMasterImage
Indicates that the task is consolidating the master image.

ReplicatingConsolidatedImageToAllStorage
Indicates that the task is replicating the consolidated master image.

StoringProvisioningScheme
Indicates that the task is storing the provisioning scheme data to the database.

Finished
Indicates that the task has completed with no errors.

ProvisioningSchemeAlreadyExists
Indicates that the task failed because a provisioning scheme with the same name already exists.

IdentityPoolNotFound
Indicates that the task failed because the identity pool specified could not be found.

MasterVMImageIsNotPartOfProvisioningSchemeHostingUnit
Indicates that the hosting unit that the master image originated from is not the same hosting unit that the provisioning scheme is defined to use.

MasterVmImageIsNotASnapshot
Indicates that the task failed because the master VM Image path does not refer to a Snapshot item.

ProvisioningSchemeNotFound
Could not find a provisioning scheme with the specified name.

TaskAlreadyRunningForProvisioningScheme
A task for a provisioning scheme with the same name is already running.

InvalidMasterVMConfiguration
The VM snapshot specified as the master had an invalid configuration.

InvalidMasterVMState
The VM snapshot specified as the master is currently in an invalid state.
InsufficientResources
Indicates that the task failed because the hypervisor did not have enough resources to complete the task.

StorageNotFound
Indicates that no associated storage was found in the hosting unit.

Canceled
Indicates that the task was stopped by user intervention (using Stop-ProvTask)

TaskStateInformation <string>
Holds string data providing more details about the current task state.

TaskProgress
The progress of the task 0-100%.

Notes
Only one long running task per provisioning scheme can be processed at any one time.

In the case of failure, the following errors can result.

Error Codes
----------

JobCreationFailed
The requested task could not be started.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

WorkflowHostUnavailable
The task could not be started because the database connection is inactive.

CommunicationError
An error occurred while communicating with the service.
PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationException

The operation could not be performed because of a configuration logging error

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

The cmdlet is associated with a task of type PublishImage, and while active will move through the following operations (CurrentOperation field)

TaskState              : Finished
TaskStateInformation   :
Updates the master hard disk image for the provisioning Scheme "MyScheme" to use the "base.snapshot" hard disk image.
Remove-ProvScheme

Oct 01, 2013
Removes a provisioning scheme

Syntax

Remove-ProvScheme [-ProvisioningSchemeName] <String> [-ForgetVM] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ProvScheme -ProvisioningSchemeUid <Guid> [-ForgetVM] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to remove a provisioning Scheme. The provisioning scheme must not contain any VMs unless the 'ForgetVM' option is specified.

If 'ForgetVM' is not specified, a cmdlet task is created that runs in the background to remove the hard disk copies that have been created for the provisioning scheme in hypervisor storage. Use the Get-ProvTask command to monitor the progress of this task.

Related topics

Get-ProvTask

New-ProvScheme

Parameters

-ProvisioningSchemeName<String>

The name of the provisioning scheme to be removed.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByPropertyName) |

-ProvisioningSchemeUid<Guid>

The unique identifier for the provisioning scheme to be removed.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByPropertyName) |

-ForgetVM<SwitchParameter>
Indicates whether or not the VMs in the provisioning scheme should be left in the hypervisor and only the data held in the Machine Creation Services removed. If this is specified, it is up to the administrator of the hypervisor to remove the VMs and hard disk images using the tools provided by the hypervisor itself.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

- **-LoggingId<Guid>**

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

- **-AdminAddress<String>**

Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

| Required? | false |
| Default Value | localhost. Once a value is provided by any cmdlet, this value becomes the default. |
| Accept Pipeline Input? | false |

**Return Values**

Citrix.MachineCreation.Sdk.ProvisioningScheme

This object provides details of the provisioning scheme and contains the following information:

- **ProvisioningSchemeUid**
  The unique identifier for the provisioning scheme.

- **ProvisioningSchemeName**
  The name of the provisioning scheme.

- **CpuCount**
  The number of processors that VMs will be created with when using this scheme.
MemoryMB
The maximum amount of memory that VMs will be created with when using this scheme.

MasterImageVM
The path within the hosting unit provider to the VM or snapshot of which the scheme is currently using a copy.

MasterImageVMDate
The date and time that the copy of the VM image was made for the scheme.

IdentityPoolUid
The unique identifier of the identity pool (from the ADIdentity PowerShell snap-in) that the scheme uses.

IdentityPoolName
The name of the identity pool (from the ADIdentity PowerShell snap-in) that the scheme uses.

HostingUnitUid
The unique identifier of the hosting unit (from the Hosting Unit PowerShell snap-in) that the new provisioning scheme will use.

HostingUnitName
The name of the hosting unit (from the hosting unit PowerShell snap-in) that the new provisioning scheme will use.

CleanOnBoot
Indicates whether the VMs created are to be reset to a clean state on each boot.

TaskId
The identifier of any current task that is running for the provisioning scheme.

Notes
If the hosting unit referenced by the provisioning scheme no longer exists (i.e. it has been removed using the Hosting Unit PowerShell snap-in), the provisioning scheme data is deleted from the database without errors. However, the hard disks associated with the provisioning scheme cannot be removed and remain in the hypervisor.

In the case of failure, the following errors can result.

Error Codes
----------

IllegalParameter
One or more parameters are illegal or are not specified.

ProvisioningSchemeNotFound
The specified provisioning scheme could not be located.
UnableToRemoveProvisioningSchemeDueToAssociatedVM
The provisioning scheme contained VMs and the 'ForgetVM' parameter was not specified.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

CommunicationError
An error occurred while communicating with the service.

PermissionDenied
The user does not have administrative rights to perform this operation.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error

ExceptionThrown
An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

The cmdlet is associated with a task of type DisusedImageCleanUp, and while active will move through the following operations (CurrentOperation field)

Running

Examples

-------------------------- EXAMPLE 1 --------------------------
c:\PS>Remove-ProvScheme -ProvisioningSchemeName $provScheme.ProvisioningSchemeName
Remove the empty provisioning scheme by name.
Remove-ProvSchemeControllerAddress

October 1, 2013
Removes metadata from a provisioning scheme.

Syntax

Remove-ProvSchemeControllerAddress [-ProvisioningSchemeName] <String> [-ControllerAddress] <String[]> [-LoggingId <Guid>] [-AdminAddress <String>] [-<CommonParameters>]

Remove-ProvSchemeControllerAddress -ProvisioningSchemeUid <Guid> -ControllerAddress <String[]> [-LoggingId <Guid>] [-AdminAddress <String>] [-<CommonParameters>]

Detailed Description

Removes the specified controller addresses from the specified object. Attempting to remove an address not present writes an error record to the pipeline.

Related topics

Get-ProvScheme
Add-ProvSchemeControllerAddress

Parameters

-ProvisioningSchemeName <String>
The name of the provisioning scheme from which metadata is to be removed.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByPropertyName) |

-ProvisioningSchemeUid <Guid>
The identifier of the provisioning scheme from which metadata is to be removed.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | false |

-ControllerAddress <String[]>
Specifies the array of DNS names to be removed from the provisioning scheme.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByPropertyName) |

-LoggingId <Guid>
Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

-AdminAddress <String>
Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. You can provide this as a host name or an IP address.
Input Type
Citrix.MachineCreation.Sdk.ProvisioningScheme You can pipe an object containing a parameter called 'ProvisioningSchemeName' to Remove-ProvSchemeMetadata.

Notes
In the case of failure, the following errors can result.

Error Codes
-------------

ProvisioningSchemeNotFound
The specified provisioning scheme could not be located.

ControllerAddressNotFound
The specified address was not associated with the provisioning scheme.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

CommunicationError
An error occurred while communicating with the service.

PermissionDenied
The user does not have administrative rights to perform this operation.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

ExceptionThrown
An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples
--------------- EXAMPLE 1 --------------------------

C:\PS>Get-ProvScheme -ProvisioningSchemeName scheme1 | Remove-ProvSchemeControllerAddress

ProvisioningSchemeUid : 7585f0de-192e-4847-a6d8-22713c3a2f42
ProvisioningSchemeName : Scheme1
CpuCount : 1
MemoryMB : 1024
MasterImageVM : Base.vm/Base.snapshot
MasterImageVDate : 17/05/2010 09:53:40
IdentityPoolUid : 03743136-e43b-4a87-af74-ab716d6b3c16
IdentityPoolName : idPool1
HostingUnitUid : 01a4a008-8ce8-4165-ba9c-cdf15a6b0501
HostingUnitName : HostUnit1
CleanOnBoot : True
TaskId : 00000000-0000-0000-0000-000000000000
Metadata : {""}
ControllerAddress : {}
Remove all controller addresses from the provisioning scheme with the name "scheme1".

-------------------------- EXAMPLE 2 --------------------------
C:\PS>Remove-ProvSchemeControllerAddress -ProvisioningSchemeUid "01a4a008-8ce8-4165-ba9c-cdf15a6b0501" -ControllerAddress (ddcA.citrix.com,ddcC.citrix2.com)

ProvisioningSchemeUid : 01a4a008-8ce8-4165-ba9c-cdf15a6b0501
ProvisioningSchemeName : Scheme2
CpuCount : 1
MemoryMB : 1024
MasterImageVM : Base.vm/Base.snapshot
MasterImageVMDate : 17/05/2010 09:53:40
IdentityPoolUid : 03743136-e43b-4a87-af74-ab71686b3c16
IdentityPoolName : idPool1
HostingUnitUid : 01a4a008-8ce8-4165-ba9c-cdf15a6b0501
HostingUnitName : HostUnit1
CleanOnBoot : True
Taskid : 00000000-0000-0000-0000-000000000000
Metadata : {}
ControllerAddress : {ddcB.citrix.com}
Remove a subset of the controller address list from the provisioning scheme with the identifier "01a4a008-8ce8-4165-ba9c-cdf15a6b0501".
Remove-ProvSchemeMasterVMImageHistory

Oct 01, 2013
Removes the history of provisioning scheme master image VMs.

Syntax

Remove-ProvSchemeMasterVMImageHistory [-ProvisioningSchemeName] <String> [-VMImageHistoryUid <Guid>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ProvSchemeMasterVMImageHistory -ProvisioningSchemeUid <Guid> [-VMImageHistoryUid <Guid>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ProvSchemeMasterVMImageHistory -VMImageHistoryUid <Guid> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to remove the record of previously used master VMs or snapshots for provisioning schemes.

Related topics

Get-ProvSchemeMasterVMImageHistory
Publish-ProvMasterVMImage

Parameters

-ProvisioningSchemeName <String>
The name of the provisioning scheme.

| Required? | true |
| Default Value |
| Accept Pipeline Input? | true (ByPropertyName) |

-ProvisioningSchemeUid <Guid>
The unique identifier of the provisioning scheme.

| Required? | true |
| Default Value |
| Accept Pipeline Input? | false |

-VMImageHistoryUid <Guid>
The unique identifier for the Image History item.
### -LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

#### Notes

In the case of failure, the following errors can result.

**Error Codes**

----------

**DatabaseError**

An error occurred in the service while attempting a database operation.

**DatabaseNotConfigured**

The operation could not be completed because the database for the service is not configured.

**ServiceStatusInvalidDb**

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

**CommunicationError**
An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------
c:\PS>Remove-ProvSchemeMasterVMImageHistory -ProvisioningSchemeName MyScheme
Removes all history for the provisioning scheme called "MyScheme".

-------------------------- EXAMPLE 2 --------------------------
c:\PS>Get-ProvScheme | Remove-ProvSchemeMasterVMImageHistory
Removes all history for all provisioning schemes.
Remove-ProvSchemeMetadata

Oct 01, 2013
Removes metadata from the given ProvisioningScheme.

Syntax

Remove-ProvSchemeMetadata [-ProvisioningSchemeUid] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Remove-ProvSchemeMetadata [-ProvisioningSchemeUid] <Guid> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Remove-ProvSchemeMetadata [-ProvisioningSchemeName] <String> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Remove-ProvSchemeMetadata [-ProvisioningSchemeName] <String> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Remove-ProvSchemeMetadata [-InputObject] <ProvisioningScheme[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Remove-ProvSchemeMetadata [-InputObject] <ProvisioningScheme[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Detailed Description

Provides the ability to remove metadata from the given ProvisioningScheme.

Related topics

Add-ProvSchemeMetadata
Set-ProvSchemeMetadata

Parameters

- **-ProvisioningSchemeUid** <Guid>

Id of the ProvisioningScheme

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

- **-ProvisioningSchemeName** <String>

Name of the ProvisioningScheme

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
</tr>
</tbody>
</table>
### Default Value

| Accept Pipeline Input?          | true (ByValue, ByPropertyName) |

### InputObject

- **<ProvisioningScheme[]>**

Objects to which the metadata is to be added.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

### Map

- **<PSObject>**

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @

```
{name1 = "val1"; name2 = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").
```

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

### Name

- **<String>**

The metadata property to remove.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### LoggingId

- **<Guid>**

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### AdminAddress

- **<String>**
Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Notes

If the command fails, the following errors can be returned.

Error Codes

------------

InvalidParameterCombination
The cmdlet parameters are inconsistent.

UnknownObject
One of the specified objects was not found.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.
ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-ProvScheme | Remove-ProvSchemeMetadata
Remove all metadata from all ProvisioningScheme objects.
Remove-ProvSchemeScope

Oct 01, 2013
Remove the specified ProvisioningScheme(s) from the given scope(s).

Syntax

Remove-ProvSchemeScope [-Scope] <String[]> -InputObject <ProvisioningScheme[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ProvSchemeScope [-Scope] <String[]> -ProvisioningSchemeUid <Guid[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ProvSchemeScope [-Scope] <String[]> -ProvisioningSchemeName <String[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The RemoveProvSchemeScope cmdlet is used to remove one or more ProvisioningScheme objects from the given scope(s).

There are multiple parameter sets for this cmdlet, allowing you to identify the ProvisioningScheme objects in different ways:

- ProvisioningScheme objects can be piped in or specified by the InputObject parameter
- The ProvisioningSchemeUid parameter specifies objects by ProvisioningSchemeUid
- The ProvisioningSchemeName parameter specifies objects by ProvisioningSchemeName (supports wildcards)

To remove a ProvisioningScheme from a scope you need permission to change the scopes of the ProvisioningScheme.

If the ProvisioningScheme is not in a specified scope, that scope will be silently ignored.

Related topics

Add-ProvSchemeScope

Get-ProvScopedObject

Parameters

- **Scope**<String[]>

  Specifies the scopes to remove the objects from.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

- **InputObject**<ProvisioningScheme[]>

  Specifies the ProvisioningScheme objects to be removed.

https://docs.citrix.com © 1999-2017 Citrix Systems, Inc. All rights reserved. p.2371
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>ProvisioningSchemeUid</td>
<td>true</td>
<td>&lt;Guid[]&gt;</td>
</tr>
<tr>
<td>ProvisioningSchemeName</td>
<td>true</td>
<td>&lt;String[]&gt;</td>
</tr>
<tr>
<td>LoggingId</td>
<td>false</td>
<td>&lt;Guid&gt;</td>
</tr>
<tr>
<td>AdminAddress</td>
<td>false</td>
<td>&lt;String&gt;</td>
</tr>
</tbody>
</table>

**-ProvisioningSchemeUid**<Guid[]>

Specifies the ProvisioningScheme objects to be removed by ProvisioningSchemeUid.

**-ProvisioningSchemeName**<String[]>

Specifies the ProvisioningScheme objects to be removed by ProvisioningSchemeName.

**-LoggingId**<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

**-AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Return Values
Notes

If the command fails, the following errors can be returned.

Error Codes

----------

UnknownObject
One of the specified objects was not found.

ScopeNotFound
One of the specified scopes was not found.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command with the specified objects or scopes.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------
c:\PS>Remove-ProvSchemeScope Finance -ProvisioningSchemeUid 6702C5D0-C073-4080-A0EE-EC74CB537C52
Removes a single ProvisioningScheme from the 'Finance' scope.
--- EXAMPLE 2 ---

c:\PS> Remove-ProvSchemeScope Finance,Marketing -ProvisioningSchemeUid 6702C5D0-C073-4080-A0EE-EC74CB537C52
Removes a single ProvisioningScheme from multiple scopes.

--- EXAMPLE 3 ---

c:\PS> Get-ProvScheme | Remove-ProvSchemeScope Finance
Removes all visible ProvisioningScheme objects from the 'Finance' scope.

--- EXAMPLE 4 ---

c:\PS> Remove-ProvSchemeScope Finance -ProvisioningSchemeName A*
Removes ProvisioningScheme objects with a name starting with an 'A' from the 'Finance' scope.
Remove-ProvServiceConfigurationData

Oct 01, 2013
Removes configuration data from the service.

Syntax

Detailed Description

Provides the ability to remove data from the MachineCreation Service configuration data.

Related topics

Set-ProvServiceConfigurationData
Get-ProvServiceConfigurationData

Parameters

-Name <String>

The name of the configuration data item to remove.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-LoggingId <Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
</tr>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>----------------</td>
<td>-----------------------------------------------------------------</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Notes**

In the case of failure the following errors can be produced.

**Error Codes**

-------------

**DatabaseError**

An error occurred in the service while attempting a database operation.

**DatabaseNotConfigured**

The operation could not be completed because the database for the service is not configured.

**DataStoreException**

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

**PermissionDenied**

You do not have permission to execute this command.

**AuthorizationError**

There was a problem communicating with the Citrix Delegated Administration Service.

**ConfigurationLoggingError**

The operation could not be performed because of a configuration logging error.

**CommunicationError**

An error occurred while communicating with the service.

**ExceptionThrown**

An unexpected error occurred. To locate more details see the Windows event logs on the controller being used, or examine the XenDesktop logs.

**Examples**

-------------------------- EXAMPLE 1 --------------------------

C:\PS>Remove-ProvServiceConfigurationData -Name "MyName"

Removes the configuration data item with name "MyName".
Remove-ProvServiceMetadata

Oct 01, 2013
Removes metadata from the given Service.

Syntax

Remove-ProvServiceMetadata [-ServiceHostId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ProvServiceMetadata [-ServiceHostId] <Guid> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ProvServiceMetadata [-InputObject] <Service[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ProvServiceMetadata [-InputObject] <Service[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to remove metadata from the given Service.

Related topics

Set-ProvServiceMetadata

Parameters

-ServiceHostId <Guid>

Id of the Service

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

-InputObject <Service[]>

Objects to which metadata is to be removed.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>
Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]"). The properties whose names match keys in the map will be removed.

- **-Name <String>**

The metadata property to remove.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **-LoggingId <Guid>**

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **-AdminAddress <String>**

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Notes**

If the command fails, the following errors can be returned.

**Error Codes**

---------
InvalidParameterCombination
The cmdlet parameters are inconsistent.

UnknownObject
One of the specified objects was not found.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------
c:\PS>Get-ProvService | % { Remove-ProvServiceMetadata -Map $_.MetadataMap }
Remove all metadata from all Service objects.
Remove-ProvTask

Oct 01, 2013
Removes from the database completed tasks for the MachineCreation Service.

Syntax

Remove-ProvTask [-TaskId] <Guid> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Enables completed tasks that have run within the MachineCreation Service to be removed from the database.

Related topics

Get-ProvTask

Add-ProvTaskMetadata

Remove-ProvTaskMetadata

Parameters

-TaskId <Guid>

Specifies the identifier for the task to be removed.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-LoggingId <Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

</tr>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
<td></td>
</tr>
<tr>
<td>---------------</td>
<td>----------------------------------------------------------------------------------</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
<td></td>
</tr>
</tbody>
</table>

**Input Type**

System.Management.Automation.PSObject Objects containing the TaskId parameter can be piped to the Remove-ProvTask command.

**Notes**

If the command fails, the following errors can result.

**Error Codes**

-------

InvalidParameterCombination
The cmdlet parameters are inconsistent.

InvalidWorkflow
The specified task could not be found.

InvalidWorkflowState
The task was not in an appropriate state for the requested operation.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-ProvTask -active $false | Remove-ProvTask
Success
Remove entries for all completed tasks from the MachineCreation Service.
Remove-ProvTaskMetadata

Oct 01, 2013
Removes metadata from the given Task.

Syntax

Remove-ProvTaskMetadata [-TaskId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ProvTaskMetadata [-TaskId] <Guid> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ProvTaskMetadata [-InputObject] <Task[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ProvTaskMetadata [-InputObject] <Task[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description
Provides the ability to remove metadata from the given Task.

Related topics

</tr>
</tbody>
</table>
Accept Pipeline Input? | false

Notes
If the command fails, the following errors can be returned.

Error Codes
---------

UnknownObject
One of the specified objects was not found.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------
c:\PS>Get-ProvTask | Remove-ProvTaskMetadata
Remove all metadata from all Task objects.

Remove-ProvVM

Oct 01, 2013
Removes virtual machines.

Syntax

Detailed Description

Lets you remove VMs from the Machine Creation Services and the hypervisor that they run on.

Related topics

Get-ProvVM
New-ProvVM

Parameters

-ProvisioningSchemeName <String>
The name of the provisioning scheme from which virtual machines will be removed.

| Required? | true |
| Default Value |
| Accept Pipeline Input? | true (ByPropertyName) |

-ProvisioningSchemeUid <Guid>
The unique identifier for the provisioning scheme from which the virtual machines are removed.

| Required? | true |
| Default Value |
| Accept Pipeline Input? | true (ByPropertyName) |

-VMName String[]>
List of VM names that will be removed from the provisioning scheme.

<p>| Required? | true |
|</p>
<table>
<thead>
<tr>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

**-ForgetVM**<SwitchParameter>

The named VMs will only be removed from the provisioning scheme database, but will remain in the hypervisor.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-RunAsynchronously**<SwitchParameter>

Indicates whether or not the command returns before it is complete. If this is specified, the command returns an identifier for the task that was created. This task can be monitored using the get-ProvTask command.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-PurgeJobOnSuccess**<SwitchParameter>

Indicates that the task history is removed from the database when the task finishes. This cannot be specified for tasks that are run asynchronously.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-LoggingId**<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-AdminAddress**<String>
Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>LocalHost. When a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

System.Guid

When the RunAsynchronously identifier is specified, this GUID is returned and provides the task identifier.

System.Management.Automation.PSCustomObject

This object provides details of the task that was run and contains the following information:

TaskId <Guid>
The identifier for the task that was performed.

Active <Boolean>
Indicates whether the task is still processing or is complete.

Host <string>
The name of the host on which the task is running or was run.

DateStarted <DateTime>
The date and time that the task was initiated.

Type <Citrix.XDInterServiceTypes.JobType>
The type of task. For new remove-VM tasks, this is always "RemoveVirtualMachine".

The list of metadata stored for the task. For new tasks, this is empty until metadata is added.

Indicates the status of the workflow that is used to process the task.

ProvisioningSchemeName <string>
The name of the provisioning scheme that the task is for.

ProvisioningSchemeUid <Guid>
The unique identifier of the provisioning scheme that the task is for.
TaskState <Citrix.DesktopUpdateManager.SDK.ProvisionVMState>

The state of the task. This can be any of the following:

Processing
Indicates that the task is in its initial state.

LocatingResources,
Indicates that the task is locating information from other services.

HostingUnitNotFound
Indicates that the required hosting unit could not be located.

ProvisioningSchemeNotFound
Indicates that the required provisioning scheme could not be located.

Provisioning
Indicates that the task is at the provisioning stage.

IdentityPoolNotFound
Indicates that the required identity pool could not be located.

TaskAlreadyRunningForProvisioningScheme
Indicates that the provisioning scheme already has another task running.

Finalizing
Indicates that the task is finalizing.

Finished
Indicates that the task is complete.

FinishedWithErrors
Indicates that the task is complete but there were errors. Specific details of errors are included with each failed virtual machine.

Removing
Indicates that the task is removing virtual machines from the hypervisor.

Failed
Job failed for reasons specified in TaskStateInformation.

Canceled
Indicates that the task was stopped by user intervention (using Stop-ProvTask)
TaskStateInformation

Provides more detailed information about the current task state.

VirtualMachinesToRemoveCount <int>

The total number of virtual machines that the task is trying to remove.

VirtualMachinesRemovedCount <int>

The number of virtual machines that the task has removed so far. Details of the machines that have been removed are in the RemovedVirtualMachines parameter.

VirtualMachinesFailedCount <int>

The number of virtual machines that the task has failed to remove. Details of the machines that failed are in the FailedVirtualMachines parameter.

FailedVirtualMachines <Citrix.DesktopUpdateManager.SDK.VirtualMachineCreation[]>

ADAccountName <string>

The domain-qualified AD Account name of the machine.

ADAccountSid <string>

The AD account SID of the machine account.

DiagnosticInformation <Citrix.MachineCreation.Sdk.ExceptionSurrogate[]>

A collection of handled error states which caused the provisioning to fail.

ExceptionType <string>

The type of exception this object represents

Message <string>

The exception message

Details <string>

The full exception content including stack trace

InnerException <Citrix.MachineCreation.Sdk.ExceptionSurrogate>

Information relating to any contributing error state

Status <string>

StatusAdditionalInformation <string>

VMId <string>

The virtual machine identifier in the hypervisor.
VMName <string>

The display name of the virtual machine in the hypervisor.

RemovedVirtualMachines <Citrix.DesktopUpdateManager.SDK.VirtualMachineCreation[]>

See FailedVirtualMachines for details of the object parameters.

ProgressEstimator

Gives an estimate of the number of virtual machines processed, averaging over virtual machines that were both partly and completely processed.

Notes

Only one long-running task for each provisioning scheme can be processed at a time.

This task still operates if the hosting unit or VMs in the hypervisor are missing. This removes the data from the Citrix Machine Creation Services, but the VMs remain in the hypervisor.

In the case of failure, the following errors can result.

Error Codes

----------

JobCreationFailed

The requested task could not be started.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation. Communication with the database failed for various reasons.

WorkflowHostUnavailable

The task could not be started because the database connection is inactive.

CommunicationError

An error occurred while communicating with the service.

InvalidParameterCombination

Both PurgeJobOnSuccess and RunAsynchronously were specified. When running asynchronously, the cmdlet terminates before the job does, so it cannot clean up the completed job.
PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

The cmdlet is associated with a task of type RemoveVirtualMachine, and while active will move through the following operations (CurrentOperation field)

ValidatingInputs

RemovingVirtualMachines

Examples

Remove all VMs from provisioning scheme XenPS
Rename-ProvScheme

Oct 01, 2013
 Renames a provisioning scheme.

Syntax

Rename-ProvScheme [-ProvisioningSchemeName] <String> [-NewProvisioningSchemeName] <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Rename-ProvScheme -ProvisioningSchemeUid <Guid> [-NewProvisioningSchemeName] <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to change the name of an existing provisioning scheme. The unique identifier for the provisioning scheme never changes after it has been created so, regardless of any name changes, the provisioning scheme can always be identified by its unique identifier.

Related topics

New-ProvScheme

Set-ProvScheme

Get-ProvScheme

Test-ProvSchemeNameAvailable

Parameters

-ProvisioningSchemeName <String>

The current name of the provisioning scheme.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>false</td>
</tr>
</tbody>
</table>

-ProvisioningSchemeUid <Guid>

The identifier for the provisioning scheme that is to be renamed.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>false</td>
</tr>
</tbody>
</table>

-NewProvisioningSchemeName <String>

The new name of the provisioning scheme.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>false</td>
</tr>
</tbody>
</table>
The new name for the provisioning scheme. This must be a name that is not being used by an existing provisioning scheme, and it must not contain any of the following characters \/:*?<>|[]\""""'

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-PassThru**<SwitchParameter>

Defines whether or not the command returns a result showing the new state of the updated identity pool.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true</td>
</tr>
</tbody>
</table>

**-LoggingId**<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-AdminAddress**<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Return Values**

Citrix.MachineCreation.Sdk.ProvisioningScheme

This object provides details of the provisioning scheme and contains the following information:

ProvisioningSchemeUid

The unique identifier for the provisioning scheme.
ProvisioningSchemeName
The name of the provisioning scheme.

CpuCount
The number of processors that VMs will be created with when using this scheme.

MemoryMB
The maximum amount of memory that VMs will be created with when using this scheme.

MasterImageVM
The path within the hosting unit provider to the VM or snapshot of which the scheme is currently using a copy.

MasterImageVMDate
The date and time that the copy of the VM image was made for the scheme.

IdentityPoolUid
The unique identifier of the identity pool (from the ADIdentity PowerShell snap-in) that the scheme uses.

IdentityPoolName
The name of the identity pool (from the ADIdentity PowerShell snap-in) that the scheme uses.

HostingUnitUid
The unique identifier of the hosting unit (from the Hosting Unit PowerShell snap-in) that the new provisioning scheme will use.

HostingUnitName
The name of the hosting unit (from the Hosting Unit PowerShell snap-in) that the new provisioning scheme will use.

CleanOnBoot
Indicates whether the VMs created are to be reset to a clean state on each boot.

TaskId
The identifier of any current task that is running for the provisioning scheme.

Metadata
The metadata for the provisioning scheme.

Notes
In the case of failure, the following errors can result.

Error Codes
---------

ProvisioningSchemeNotFound
The specified provisioning scheme could not be located.

**ProvisioningSchemeNameAlreadyExists**

A provisioning scheme with the same name as the new provisioning scheme name already exists.

**DatabaseError**

An error occurred in the service while attempting a database operation.

**DatabaseNotConfigured**

The operation could not be completed because the database for the service is not configured.

**ServiceStatusInvalidDb**

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

**CommunicationError**

An error occurred while communicating with the service.

**PermissionDenied**

The user does not have administrative rights to perform this operation.

**ConfigurationLoggingError**

The operation could not be performed because of a configuration logging error.

**ExceptionThrown**

An unexpected error occurred. To locate more details, see the windows event logs on the controller being used or examine the XenDesktop logs.

**Examples**

```
-------------------------- EXAMPLE 1 --------------------------
C:\PS>Rename-ProvScheme -provisioningSchemeName CurrentName -NewProvisioningSchemeName NewName
Renames a provisioning scheme from "currentName" to "NewName".

-------------------------- EXAMPLE 2 --------------------------
C:\PS>Rename-ProvScheme -provisioningSchemeName CurrentName -NewProvisioningSchemeName NewName -PassThru
```

- **ProvisioningSchemeUid**: 7585f0de-192e-4847-a6d8-22713c3a2f42
- **ProvisioningSchemeName**: NewName
- **CpuCount**: 1
- **MemoryMB**: 1024
- **MasterImageVM**: /Base.vm
- **MasterImageVMDate**: 17/05/2010 08:27:50
Renames a provisioning scheme from "currentName" to "NewName" and displays the resulting state.
Reset-ProvServiceGroupMembership

Oct 01, 2013
Reloads the access permissions and configuration service locations for the MachineCreation Service.

Syntax

Reset-ProvServiceGroupMembership [-ConfigServiceInstance] <ServiceInstance[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Enables you to reload MachineCreation Service access permissions and configuration service locations. The Reset-ProvServiceGroupMembership command must be run on at least one instance of the service type (Prov) after installation and registration with the configuration service. Without this operation, the MachineCreation services will be unable to communicate with other services in the XenDesktop deployment. When the command is run, the services are updated when additional services are added to the deployment, provided that the configuration service is not stopped. The Reset-ProvServiceGroupMembership command can be run again to refresh this information if automatic updates do not occur when new services are added to the deployment. If more than one configuration service instance is passed to the command, the first instance that meets the expected service type requirements is used.

Related topics

Parameters

-ConfigServiceInstance <ServiceInstance[]>

Specifies the configuration service instance object that represents the service instance for the type 'InterService' that references a configuration service for the deployment.

| Required? | True |
| Default Value | |
| Accept Pipeline Input? | True (ByValue) |

-LoggingId <Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and StopLogHighLevelOperation cmdlets.

| Required? | False |
| Default Value | |
| Accept Pipeline Input? | False |

-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

| Required? | False |
| Default Value | Localhost. Once a value is provided by any cmdlet, this value becomes the default. |
| Accept Pipeline Input? | False |

Input Type
Service instances containing a ServiceInstance object that refers to the central configuration service interservice interface can be piped to the Reset-ProvServiceGroupMembership command.

Notes
If the command fails, the following errors can be returned.

Error Codes
-------------

NoSuitableServiceInstance
None of the supplied service instance objects were suitable for resetting service group membership.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples
-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-ProvServiceGroupMembership
Reset the service group membership for a service in a deployment where the configuration service is configured and running on the same machine as the service.

-------------------------- EXAMPLE 2 --------------------------

c:\PS>Get-ConfigRegisteredServiceInstance -ServiceType Config -AdminAddress OtherServer.example.com | Reset-ProvServiceGroupMembership
Reset the service group membership for a service in a deployment where the configuration service that is configured and running on a machine named 'OtherServer.example.com'.

https://docs.citrix.com © 1999-2017 Citrix Systems, Inc. All rights reserved. p.2400
Set-ProvDBConnection

Oct 01, 2013
Configures a database connection for the MachineCreation Service.

Syntax

Set-ProvDBConnection [-DBConnection] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Detailed Description

Configures a connection to a database in which the MachineCreation Service can store its state. The service will attempt to connect and start using the database immediately after the connection is configured. The database connection string is updated to the specified value regardless of whether it is valid or not. Specifying an invalid connection string prevents a service from functioning until the error is corrected.

After a connection is configured, you cannot alter it without first clearing it (by setting the connection to $null).

You do not need to configure a database connection to use this command.

Related topics

Get-ProvServiceStatus
Get-ProvDBConnection
Test-ProvDBConnection

Parameters

-DBConnection <String>

Specifies the database connection string to be used by the MachineCreation Service. Passing in $null will clear any existing database connection configured.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>true</td>
<td>false</td>
</tr>
</tbody>
</table>

-LoggingId <Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>false</td>
<td>false</td>
</tr>
</tbody>
</table>

-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost</td>
<td>false</td>
</tr>
</tbody>
</table>
Accept Pipeline Input?  false

Return Values

The Set-ProvDBConnection command returns an object containing the status of the MachineCreation Service together with extra diagnostics information.

DBUnconfigured

The MachineCreation Service does not have a database connection configured.

DBRejectedConnection

The database rejected the logon attempt from the MachineCreation Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the MachineCreation Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBNewerVersionThanService

The version of the MachineCreation Service currently in use is incompatible with the version of the MachineCreation Service schema on the database. Upgrade the MachineCreation Service to a more recent version.

DBOlderVersionThanService

The version of the MachineCreation Service schema on the database is incompatible with the version of the MachineCreation Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The MachineCreation Service is running and is connected to a database containing a valid schema.

Failed

The MachineCreation Service has failed.

Unknown

The status of the MachineCreation Service cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

----------

InvalidDBConnectionString
The database connection string has an invalid format.

DatabaseConnectionDetailsAlreadyConfigured

There was already a database connection configured. After a configuration is set, it can only be set to $null.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

--------------------------------- EXAMPLE 1 ---------------------------------

c:\PS>Set-ProvDBConnection -DBConnection "Server=servername\SQLExpress;Initial Catalog = databaseName; Integrated Security = True"
OK
Configures a database connection string for the MachineCreation Service.

--------------------------------- EXAMPLE 2 ---------------------------------

c:\PS>Set-ProvDBConnection -DBConnection "Invalid Connection String"

Invalid database connection string format.
Configures an invalid database connection string for the MachineCreation Service.
Set-ProvScheme

Oct 01, 2013
Changes the parameter values for a provisioning scheme.

Syntax

Set-ProvScheme [-ProvisioningSchemeName] <String> -IdentityPoolName <String> [-VMCpuCount <Int32>] [-VMMemoryMB <Int32>] [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-ProvScheme [-ProvisioningSchemeName] <String> [-VMCpuCount <Int32>] [-VMMemoryMB <Int32>] [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-ProvScheme -ProvisioningSchemeUid <Guid> -IdentityPoolName <String> [-VMCpuCount <Int32>] [-VMMemoryMB <Int32>] [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to update the parameters of an existing provisioning scheme.

This allows the following parameters to be updated:

Number of CPUs that will be used for VMs created from the provisioning scheme. Maximum amount of memory that will be used for VMs created from the provisioning scheme.

To change the name of the provisioning scheme see Rename-ProvScheme.

Related topics

New-ProvScheme
Remove-ProvScheme
Get-ProvScheme
Rename-ProvScheme

Parameters

-ProvisioningSchemeName <String>

The name of the provisioning scheme to be updated.

<p>| Required? | true |</p>
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-IdentityPoolName</code></td>
<td><code>&lt;String&gt;</code></td>
<td>The name of an identity pool to associate with the provisioning scheme, replacing the present one.</td>
</tr>
<tr>
<td><code>-IdentityPoolUid</code></td>
<td><code>&lt;Guid&gt;</code></td>
<td>The identifier of an identity pool to associate with the provisioning scheme, replacing the present one.</td>
</tr>
<tr>
<td><code>-ProvisioningSchemeUid</code></td>
<td><code>&lt;Guid&gt;</code></td>
<td>The identifier of the provisioning scheme to be updated.</td>
</tr>
<tr>
<td><code>-VMCpuCount</code></td>
<td><code>&lt;Int32&gt;</code></td>
<td>The number of processors that virtual machines created from the provisioning scheme should use.</td>
</tr>
<tr>
<td><code>-VMMemoryMB</code></td>
<td><code>&lt;Int32&gt;</code></td>
<td>The maximum amount of memory that virtual machines created from the provisioning scheme should use.</td>
</tr>
</tbody>
</table>
### -PassThru<SwitchParameter>

Defines whether or not the command returns a result showing the new state of the updated provisioning scheme.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>true</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### -AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>LocalHost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Return Values**

Citrix.MachineCreation.Sdk.ProvisioningScheme

This object provides details of the provisioning scheme and contains the following information:

- ProvisioningSchemeUid
- ProvisioningSchemeName
- The name of the provisioning scheme.
- CpuCount
The number of processors that VMs will be created with when using this scheme.

MemoryMB
The maximum amount of memory that VMs will be created with when using this scheme.

MasterImageVM
The path within the hosting unit provider to the VM or snapshot of which the scheme is currently using a copy.

MasterImageVMDate
The date and time that the copy of the VM image was made for the scheme.

IdentityPoolUid
The unique identifier of the identity pool (from the ADIdentity PowerShell snap-in) that the scheme uses.

IdentityPoolName
The name of the identity pool (from the ADIdentity PowerShell snap-in) that the scheme uses.

HostingUnitUid
The unique identifier of the hosting unit (from the Hosting Unit PowerShell snap-in) that the new provisioning scheme will use.

HostingUnitName
The name of the hosting unit (from the Hosting Unit PowerShell snap-in) that the new provisioning scheme will use.

CleanOnBoot
Indicates whether the VMs created are to be reset to a clean state on each boot.

TaskId
The identifier of any current task that is running for the provisioning scheme.

Notes
In the case of failure, the following errors can result.

Error Codes
----------
ProvisioningSchemeNotFound
The specified provisioning scheme could not be located.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples

--------------- EXAMPLE 1 ---------------

C:\PS> Set-ProvScheme -ProvisioningSchemeName MyScheme -VMCpuCount 2
Updates a provisioning scheme called "MyScheme" to use two processors on the VMs that are created from the provisioning scheme.
Set-ProvSchemeMetadata

Oct 01, 2013
Adds or updates metadata on the given ProvisioningScheme.

Syntax

Set-ProvSchemeMetadata [-ProvisioningSchemeUid] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-ProvSchemeMetadata [-ProvisioningSchemeUid] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-ProvSchemeMetadata [-ProvisioningSchemeName] <String> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-ProvSchemeMetadata [-ProvisioningSchemeName] <String> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-ProvSchemeMetadata [-InputObject] <ProvisioningScheme[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-ProvSchemeMetadata [-InputObject] <ProvisioningScheme[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description
Provides the ability for additional custom data to be stored against given ProvisioningScheme objects.

Related topics
Add-ProvSchemeMetadata
Remove-ProvSchemeMetadata

Parameters

-ProvisioningSchemeUid <Guid>
Id of the ProvisioningScheme

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

-ProvisioningSchemeName <String>
Name of the ProvisioningScheme

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>
**-InputObject** `<ProvisioningScheme[]>`

Objects to which the metadata is to be added.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>true</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

**-Map** `<PSObject>`

Specifies a dictionary of `(name, value)`-pairs for the properties. This can either be a hashtable (created with `@{“name1” = “val1”; “name2” = “val2”}`) or a string dictionary (created with `new-object “System.Collections.Generic.Dictionary[String,String]”`).

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>true</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

**-Name** `<String>`

Specifies the property name of the metadata to be added. The property must be unique for the ProvisioningScheme specified. The property cannot contain any of the following characters `\/:*?<>|[]()'`

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>false</td>
<td>false</td>
</tr>
</tbody>
</table>

**-Value** `<String>`

Specifies the value for the property.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>false</td>
<td>false</td>
</tr>
</tbody>
</table>

**-LoggingId** `<Guid>`

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the `Start-LogHighLevelOperation` and `Stop-LogHighLevelOperation` cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>false</td>
<td>false</td>
</tr>
</tbody>
</table>
**AdminAddress**: <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

Set-ProvSchemeMetadata returns a dictionary containing the new (name, value)-pairs.

Key <string>

Specifies the name of the property.

Value <string>

Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

---------

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.
ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Set-ProvSchemeMetadata -ProvisioningSchemeUid 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>property</td>
<td>value</td>
</tr>
</tbody>
</table>

Add metadata with a name of 'property' and a value of 'value' to the ProvisioningScheme with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.
Set-ProvServiceConfigurationData

Oct 01, 2013
Sets the value for the given key in the service configuration data.

Syntax

Set-ProvServiceConfigurationData [-Name] <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Detailed Description
Provides the ability for additional custom data to be stored for the MachineCreation Service.

Related topics
Remove-ProvServiceConfigurationData
Get-ProvServiceConfigurationData

Parameters

- **Name**<String>

Specifies the key name of the metadata to be added. The key must be unique.

The Name cannot contain any of the following characters: \\

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **Value**<String>

Specifies the value for the name. If the name already exists, its value is updated.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **LoggingId**<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Default Value</strong></td>
<td></td>
</tr>
<tr>
<td>------------------</td>
<td>---</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-** **AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th><strong>Required?</strong></th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Default Value</strong></td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

Citrix.MachineCreation.Sdk.ServiceConfigurationData

Set-ProvServiceConfigurationData returns an object containing the new definition of the configuration.

Name <string>

Specifies the name for the item of data.

Value <string>

Specifies the value of the data.

Notes

In the case of failure the following errors can be produced.

Error Codes

----------

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.
AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

An error occurred while communicating with the service.

ExceptionThrown

An unexpected error occurred. To locate more details see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS>Set-ProvServiceConfigurationData -Name "customProperty1" -Value "value2"

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>customProperty1</td>
<td>value2</td>
</tr>
</tbody>
</table>

Set data with a name of 'customProperty1' and value of 'value2' to the service configuration.
Set-ProvServiceMetadata

Oct 01, 2013
Adds or updates metadata on the given Service.

Syntax

Set-ProvServiceMetadata [-ServiceHostId] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-ProvServiceMetadata [-ServiceHostId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-ProvServiceMetadata [-InputObject] <Service[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-ProvServiceMetadata [-InputObject] <Service[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Allows you to store additional custom data against given Service objects.

Related topics

Remove-ProvServiceMetadata

Parameters

-ServiceHostId <Guid>
Id of the Service

<table>
<thead>
<tr>
<th>Required?</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

-InputObject <Service[]>
Objects to which metadata is to be added.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-Name <String>
Specifies the property name of the metadata to be added. The property must be unique for the Service specified.
property cannot contain any of the following characters \/:.*?<> | ]()"’

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-Meta <String>

Specifies the value for the property.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-Map <PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object System.Collections.Generic.Dictionary[String,String]).

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-LoggingId <Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
</tbody>
</table>
Accept Pipeline Input? | false

Return Values

Set-ProvServiceMetadata returns a dictionary containing the new (name, value)-pairs.

Key <string>

Specifies the name of the property.

Value <string>

Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

-----------

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Set-_provServiceMetadata -serviceHostId 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -name property -value value

Key         Value
---         -----
property    value

Add metadata with a name of 'property' and a value of 'value' to the Service with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.
Set-ProvTaskMetadata

Oct 01, 2013
Adds or updates metadata on the given Task.

Syntax

Set-ProvTaskMetadata [-TaskId] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [-<CommonParameters>]

Set-ProvTaskMetadata [-TaskId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [-<CommonParameters>]

Detailed Description

Use this cmdlet to store additional custom data against given Task objects.

Related topics

</tr>
</tbody>
</table>
Accept Pipeline Input? | false

**-AdminAddress <String>**

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

| Required? | false |
| Default Value | Localhost. Once a value is provided by any cmdlet, this value becomes the default. |
| Accept Pipeline Input? | false |

**Return Values**

`Set-ProvTaskMetadata` returns a dictionary containing the new (name, value)-pairs.

**Key <string>**

Specifies the name of the property.

**Value <string>**

Specifies the value for the property.

**Notes**

If the command fails, the following errors can result.

**Error Codes**

----------

`InvalidParameterCombination`

The cmdlet parameters are inconsistent.

`UnknownObject`

One of the specified objects was not found.

`DatabaseError`

An error occurred in the service while attempting a database operation.

`DatabaseNotConfigured`

The operation could not be completed because the database for the service is not configured.

`DataStoreException`

An error occurred in the service while attempting a database operation - communication with the database failed for
various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Set-ProvTaskMetadata -TaskId 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>property</td>
<td>value</td>
</tr>
</tbody>
</table>

Add metadata with a name of 'property' and a value of 'value' to the Task with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.
Stop-ProvTask

Oct 01, 2013
Stops currently running MachineCreation Service tasks.

Syntax

Stop-ProvTask [-TaskId] <Guid> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters>

Detailed Description

Enables tasks currently running in the MachineCreation Service to be stopped. Once stopped, tasks cannot be restarted.

Related topics

Get-ProvTask
Remove-ProvTask
Switch-ProvTask

Parameters

-TaskId <Guid>

Specifies the identifier for the task to be stopped.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-LoggingId <Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
</tr>
</tbody>
</table>
Default Value: Localhost. Once a value is provided by any cmdlet, this value becomes the default.

Accept Pipeline Input?: false

Input Type:
System.Management.Automation.PSObject Objects containing the TaskId parameter can be piped to the Stop-ProvTask command.

Notes:
If the command fails, the following errors can result.

Error Codes:

--------
InvalidWorkflow
The specified task could not be found.

InvalidWorkflowHost
The specified task is executing on a different server.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

DatabaseError
There was a problem communicating with the database.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-ProvTask -active $true | Stop-ProvTask
Success
Terminate all tasks currently executing on the MachineCreation Service.

-------------------------- EXAMPLE 2 --------------------------

c:\PS>Stop-ProvTask -TaskId bd52e688-e40d-4790-83de-9f7633481454
Success
Terminate the named task executing on the MachineCreation Service.
Switch-ProvTask

Oct 01, 2013
Moves all MachineCreation Service tasks from the current execution host to another.

Syntax

Switch-ProvTask [-Host2] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Enables tasks running within the MachineCreation Service to be moved from one execution host to a different host.

Tasks can only execute on a single host. If the host is removed from a deployment, the tasks cannot continue to execute. These 'orphaned' tasks can be moved to a different host within the deployment so that they can continue to execute. All tasks must be moved; there is no mechanism to move individual tasks. Run the Switch-ProvTask command against the host to which the tasks are to be moved; that is, if you are not running the command directly on the host, use the AdminAddress parameter to specify the host to which tasks will be moved.

Related topics

Get-ProvTask
Stop-ProvTask
Remove-ProvTask

Parameters

-Host2 <String>

Specifies the host from which the tasks should be removed.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-LoggingId <Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>
**AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Notes**

If the command fails, the following errors can result.

**Error Codes**

--------

PartialData

Only a subset of the requested data was returned.

NoOp

The operation was successful but had no effect.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.
ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Switch-ProvTask -Host CRASHED
Success
Transfer the execution of tasks that had been executing on the MachineCreation Service instance on host CRASHED to the local instance.
Test-ProvDBConnection

Oct 01, 2013
Tests a database connection for the MachineCreation Service.

Syntax

Test-ProvDBConnection [-DBConnection] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Tests a connection to the database in which the MachineCreation Service can store its state. The service will attempt to connect to the database without affecting the current connection to the database.

You do not have to clear the connection to use this command.

Related topics

Get-ProvServiceStatus
Get-ProvDBConnection
Set-ProvDBConnection

Parameters

-**DBConnection**<String>

Specifies the database connection string to be tested by the MachineCreation Service.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-**LoggingId**<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>

<td>false</td>
</tr>
</tbody>
</table>

-**AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values
The Test-ProvDBConnection command returns an object containing the status of the MachineCreation Service if the connection string of the specified data store were to be set to the string being tested, together with extra diagnostics information for the specified connection string.

DBRejectedConnection

The database rejected the logon attempt from the MachineCreation Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the MachineCreation Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBNewerVersionThanService

The version of the MachineCreation Service currently in use is incompatible with the version of the MachineCreation Service schema on the database. Upgrade the MachineCreation Service to a more recent version.

DBOlderVersionThanService

The version of the MachineCreation Service schema on the database is incompatible with the version of the MachineCreation Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The Set-ProvDBConnection command would succeed if it were executed with the supplied connection string.

Failed

The MachineCreation Service has failed.

Unknown

The status of the MachineCreation Service cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

-------------

InvalidDBConnectionString

The database connection string has an invalid format.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.
ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples
-------------------------- EXAMPLE 1 --------------------------
c:\PS>Test-ProvDBConnection -DBConnection "Server=serverName\SQLExpress;Initial Catalog = databaseName; Integrated Security = True"
OK
Tests a database connection string for the MachineCreation Service.

-------------------------- EXAMPLE 2 --------------------------
c:\PS>Test-ProvDBConnection -DBConnection "Invalid Connection String"
Invalid database connection string format.
Tests an invalid database connection string for the MachineCreation Service.
Test-ProvSchemeNameAvailable

Oct 01, 2013
Checks to ensure that the proposed name for a provisioning scheme is unused.

Syntax

Test-ProvSchemeNameAvailable -ProvisioningSchemeName <String[]> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Checks to ensure that the proposed name for a provisioning scheme is unused. This check is done without regard for scoping of existing provisioning schemes, so the names of inaccessible schemes are also checked.

Related topics

New-ProvScheme
Rename-ProvScheme

Parameters

-ProvisioningSchemeName <String[]>

The name or names of the provisioning scheme(s) to be tested.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

NameAvailability
Pairs of name and the availability of the name

Notes

In the case of failure, the following errors can result.
Error Codes
-----------

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

CommunicationError
An error occurred while communicating with the service.

PermissionDenied
The user does not have administrative rights to perform this operation.

ExceptionThrown
An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples
-------------------------- EXAMPLE 1 --------------------------

Test-ProvSchemeNameAvailable -ProvisioningSchemeName $NewSchemeName
This tests whether the value of $NewSchemeName is unique or not, and can be used to create a new provisioning scheme or rename an existing one without failing. True is returned if the name is good.
Unlock-ProvScheme

Oct 01, 2013
Unlocks a Provisioning Scheme.

Syntax

Unlock-ProvScheme [-ProvisioningSchemeName] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [-<CommonParameters>]
Unlock-ProvScheme -ProvisioningSchemeUid <Guid> [-LoggingId <Guid>] [-AdminAddress <String>] [-<CommonParameters>]

Detailed Description

Provides the ability to unlock a provisioning scheme that has the Id of a failed Task still associated with it. This allows another long-running task to operate on that scheme. The cmdlet will not unlock a scheme with a task still marked as being active. Use Stop-ProvTask (or, if the task is registered with a failed server, Switch-ProvTask and Stop-ProvTask) to stop any active task first.

Related topics

Get-ProvScheme
Stop-ProvTask

Parameters

-ProvisioningSchemeName <String>
The name of the provisioning scheme.

Required? true
Default Value
Accept Pipeline Input? true (ByPropertyName)

-ProvisioningSchemeUid <Guid>
The unique identifier of the provisioning scheme.

Required? true
Default Value
Accept Pipeline Input? false

-LoggingId <Guid>
Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create
high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

- **-AdminAddress**: <String>

  Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

  | Required? | false |
  | Default Value | localhost. Once a value is provided by any cmdlet, this value becomes the default. |
  | Accept Pipeline Input? | false |

Notes

In the case of failure, the following errors can result.

Error Codes

----------

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

NoOp

The specified provisioning scheme had no task object associated.

TaskActive

The task object associated with the provisioning scheme is still active.

DatabaseError

An error occurred in the service while attempting a database operation.

CouldNotQueryDatabase

The query required to get the database was not defined.

CommunicationError

An error occurred while communicating with the service.

InvalidFilter

https://docs.citrix.com © 1999-2017 Citrix Systems, Inc. All rights reserved.
A filtering expression was supplied that could not be interpreted for this cmdlet.

PermissionDenied
The user does not have administrative rights to perform this operation.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error

ExceptionThrown
An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS>Unlock-ProvScheme -provisioningSchemeName MyScheme
Unlocks the provisioning scheme 'MyScheme'.
Unlock-ProvVM

Oct 01, 2013
Unlocks a VM.

Syntax

Unlock-ProvVM [-VMID] <String[]> -ProvisioningSchemeName <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Unlock-ProvVM [-VMID] <String[]> -ProvisioningSchemeUid <Guid> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to unlock a virtual machine.

Related topics

Get-ProvVM
Lock-ProvVM

Parameters

-VMID <String[]>

The virtual machine Id (hypervisor context)

<table>

</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Default Value

Accept Pipeline Input? | false

**-LoggingId</Guid>**

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
| Default Value |
| Accept Pipeline Input? | false |

**-AdminAddress</String>**

Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

| Required? | false |
| Default Value | LocalHost. Once a value is provided by any cmdlet, this value becomes the default. |
| Accept Pipeline Input? | false |

**Input Type**

Citrix.MachineCreation.Sdk.ProvisionedVirtualMachine You can pipe an object containing a parameter called 'VMId' and 'ProvisioningSchemeName' to Lock-ProvVM

**Notes**

In the case of failure, the following errors can result.

**Error Codes**

**********

VMDoesNotExist

The specified VM cannot be located.

VMAAlreadyUnLocked

The VM is already unlocked.

VMDoesNotExistForProvisioningScheme

The specified VM does exist in the hypervisor, but is not part of the specified provisioning scheme.
DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

CommunicationError
An error occurred while communicating with the service.

PermissionDenied
The user does not have administrative rights to perform this operation.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error

ExceptionThrown
An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------
C:\PS>Unlock-ProvVM -provisioningSchemeName MyScheme -VMId bc79802c-ba6e-8de8-99e9-4c35d7ad24b4
Unlocks the VM with the Id 'bc79802c-ba6e-8de8-99e9-4c35d7ad24b4' in the provisioning scheme 'MyScheme'.

-------------------------- EXAMPLE 2 --------------------------
C:\PS>Get-ProvVM -provisioningSchemeName MyScheme | Unlock-ProvVM
Unlocks all the VMs in the provisioning scheme 'MyScheme'.

-------------------------- EXAMPLE 3 --------------------------
C:\PS>Get-ProvVM -Locked $True | Unlock-ProvVM
Unlocks all the VMs that are currently locked.

TOPIC

XenDesktop - Advanced Dataset Filtering

SHORT DESCRIPTION

Describes the common filtering options for XenDesktop cmdlets.

LONG DESCRIPTION

Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get- cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

```
Get-Noun > Where { $_.Size = 'Small' } > Sort 'Date' > Select -First 10
```

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

```
Get-Noun -Size 'Small' -SortBy 'Date' -MaxRecordCount 10
```

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

- **-MaxRecordCount <int>**

  Specifies the maximum number of results to return.
  For example, to return only the first nine results use:

  ```
  Get-Noun -MaxRecordCount 9
  ```

  If not specified, only the first 250 records are returned, and if more are available, a warning is produced:
WARNING: Only first 250 records returned. Use -MaxRecordCount to retrieve more.

You can suppress this warning by using -WarningAction or by specifying a value for -MaxRecordCount.

To retrieve all records, specify a large number for -MaxRecordCount. As the value is an integer, you can use the following:

```
Get-<Noun> -MaxRecordCount [int]::MaxValue
```

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. For example:

```
Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
```

```
Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo : OperationStopped: (): [Get-<Noun>], PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>

The count can be accessed using the TotalAvailableResultCount property:

```
$count = $error[0].TotalAvailableResultCount
```

-Skip <int>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order, respectively. Ascending order is assumed if no prefix is present.
Sorting occurs before -MaxRecordCount and -Skip parameters are applied. For example, to sort by Name and then by Count (largest first) use:

-SortBy 'Name,-Count'

By default, sorting by an enumeration property uses the numeric value of the elements. You can specify a different sort order by qualifying the name with an ordered list of elements or their numeric values, or <null> to indicate the placement of null values.

Elements not mentioned are placed at the end in their numeric order.

For example, to sort by two different enums and then by the object id:

-SortBy 'MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id'

-Filter <String>

This parameter lets you specify advanced filter expressions, and supports combination of conditions with -and and -or, and grouping with braces. For example:

Get-<Noun> -Filter 'Name -like "High"* -or (Priority -eq 1 -and Severity -ge 2)'

The syntax is close enough to PowerShell syntax that you can use script blocks in most cases. This can be easier to read as it reduces quoting:

Get-<Noun> -Filter { Count -ne $null }

The full -Filter syntax is provided below.

EXAMPLES

Filtering by strings performs a case-insensitive wildcard match.
Separate parameters are combined with an implicit -and operator.
Normal PowerShell quoting rules apply, so you can use single or double quotes, and omit the quotes altogether for many strings. The order of parameters does not make any difference. The following are equivalent:

Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company "citrix" -Product '[X]EN''
Get-<Noun> -Product 'Xen'' -Company "CITRIX"
Get-<Noun> -Filter { Company -eq 'Citrix' -and Product -like 'Xen'' }
See about_Quoting_Rules and about_Wildcards for details about PowerShell handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape the wildcards using the normal PowerShell escape mechanisms (see about_Escape_Characters), or switch to a filter expression and the -eq operator:

```
Get-<Noun> -Company "Abc[*]"                 # Matches Abc*
Get-<Noun> -Company "Abc`*"                  # Matches Abc*
Get-<Noun> -Filter { Company -eq "Abc`*" }  # Matches Abc*
Get-<Noun> -Filter { Company -eq "A\"B\"C\"" } # Matches A"B'C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```
Get-<Noun> -Uid 123
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

```
Get-<Noun> -Filter 'Capacity -ge 10gb'
Get-<Noun> -Filter 'Age -ge 20 -and Age -lt 40'
Get-<Noun> -Filter 'VolumeLevel -like "[123]"'
Get-<Noun> -Filter 'Enabled -ne $false'
Get-<Noun> -Filter 'NullableProperty -ne $null'
```

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

```
Get-<Noun> -Filter 'Enabled'      # Equivalent to 'Enabled -eq $true'
Get-<Noun> -Filter '-not Enabled' # Equivalent to 'Enabled -eq $false'
```

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

```
Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle
```

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:
$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq "Circle" }
Get-<Noun> -Filter { Shape -like 'C' }

By their nature, floating point values, DateTime values, and TimeSpan values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

Get-<Noun> -Filter { StartTime -ge "2010-08-23T12:30:00.0Z" }
$d = [DateTime]"2010-08-23T12:30:00.0Z"
Get-<Noun> -Filter { StartTime -ge $d }
$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter { StartTime -ge $d }

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

Get-<Noun> -Filter { StartTime -ge '-2' }         # Two days ago
Get-<Noun> -Filter { StartTime -ge '-1:30' }      # Hour and a half ago
Get-<Noun> -Filter { StartTime -ge '-0:0:30' }    # 30 seconds ago

ARRAY PROPERTIES
When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings. Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

Get-<Noun> -User Fred*
Get-<Noun> -Filter { User -like "Fred*" }
Get-<Noun> -Filter { Users -contains "Fred*" }

You can also use the singular form with -Filter to search using other operators:

# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter { User -eq "Frederick" }
# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter { User -lt 'F' }

COMPLEX EXPRESSIONS
When matching against multiple values, you can use a sequence of comparisons joined with -or operators, or you can use -in and -notin:

```
Get-<Noun> -Filter { Shape -eq 'Circle' -or Shape -eq 'Square' }
$shapes = 'Circle','Square'
Get-<Noun> -Filter { Shape -in $shapes }
$sides = 1..4
Get-<Noun> -Filter { Sides -notin $sides }
```

Braces can be used to group complex expressions, and override the default left-to-right evaluation of -and and -or. You can also use -not to invert the sense of any sub-expression:

```
Get-<Noun> -Filter { Size -gt 4 -or (Color -eq 'Blue' -and Shape -eq 'Circle') }  
Get-<Noun> -Filter { Sides -lt 5 -and -not (Color -eq 'Blue' -and Shape -eq 'Circle') }  
```

### PAGING

The simplest way to page through data is to use the -Skip and -MaxRecordCount parameters. So, to read the first three pages of data with 10 records per page, use:

```
Get-<Noun> -Skip 0 -MaxRecordCount 10 <other filtering criteria>
Get-<Noun> -Skip 10 -MaxRecordCount 10 <other filtering criteria>
Get-<Noun> -Skip 20 -MaxRecordCount 10 <other filtering criteria>
```

You must include the same filtering criteria on each call, and ensure that the data is sorted consistently.

The above approach is often acceptable, but as each call performs an independent query, data changes can result in records being skipped or appearing twice. One approach to improve this is to sort by a unique id field and then start the search for the next page at the unique id after the last unique id of the previous page. For example:

```
# Get the first page
Get-<Noun> -MaxRecordCount 10 -SortBy SerialNumber

SerialNumber  ...
------------- ...
A120004
A120007
... 7 other records ...
A120900

# Get the next page
Get-<Noun> -MaxRecordCount 10 -Filter { FirstName -gt 'A120900' }

SerialNumber  ...
```
FILTER SYNTAX DEFINITION

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= "{" <ComponentList> "}" |

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> | <Component>

<Component> ::= <NotOperator> <Factor> | <Factor>

<Factor> ::= "{" <ComponentList> "}" |

<Property> ::= <PropertyName> <ComparisonOperator> <Value> | <PropertyName>

<AndOrOperator> ::= ":-and" | ":-or"

<NotOperator> ::= ":-not" | "!" 

<ComparisonOperator> ::= ":-eq" | ":-ne" | ":-le" | ":-ge" | ":-lt" | ":-gt" |
":-like" | ":-notlike" | ":-contains" | ":-notcontains" |
":-in" | ":-notin"

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> | <scalar variable> | <array variable> |
"$null" | "$true" | "$false"
Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, "-1:30" means 1 hour and 30 minutes ago.
Get-MonitorConfiguration

Oct 01, 2013

Gets the configuration settings currently being used by the Monitor Service.

Syntax

Get-MonitorConfiguration [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns the configuration currently being used by the Monitor Service.

A site database connection must be configured for this command to be used.

Related topics

Set-MonitorConfiguration

Parameters

-LoggingId <Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

Get-MonitorConfiguration returns the configuration settings.

Examples

-------------------------- EXAMPLE 1 --------------------------
c:\PS>Get-MonitorConfiguration
Gets the current configuration for the Monitor Service.
Get-MonitorDataStore

Oct 01, 2013
Gets details for each of the Monitor data stores.

Syntax

Get-MonitorDataStore [-AdminAddress <String>] [CommonParameters]

Detailed Description

Returns an object for each of the Monitor data stores describing the connection string, data store name, db type, provider, schema name, and DB status.

A database connection must be configured in order for this command to be used if the service has a secondary data store. This is not required for the site data store.

Related topics

Reset-MonitorDataStore

Parameters

-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

Citrix.Monitor.Sdk.DataStoreConfiguration

An object describing the connection string, data store name, database type, provider, schema name and database status.

Notes

If the command fails, the following errors can be returned.

Error Codes

-------------

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-MonitorDataStore

ConnectionString : Server=\SQLEXPRESS;Initial Catalog = databaseName; Integrated Security = True
DataStore        : Site
DatabaseType     : SqlServer
Provider         : MSSQL
SchemaName       : MonitorSiteSchema
Status           : OK

ConnectionString :
DataStore        : Secondary
DatabaseType     : SqlServer
Provider         : MSSQL
SchemaName       : MonitorSecondarySchema
Status           : DBUnconfigured

Get the database connection string for the Monitor Service.
Get-MonitorDBConnection

Oct 01, 2013

Gets the database string for the specified data store used by the Monitor Service.

Syntax

Get-MonitorDBConnection [[-DataStore <String>] [-AdminAddress <String>] [<CommonParameters>]]

Detailed Description

Returns the database connection string for the specified data store.

If the returned string is blank, no valid connection string has been specified. In this case the service is running, but is idle and awaiting specification of a valid connection string.

Related topics

Get-MonitorServiceStatus
Get-MonitorDataStore
Set-MonitorDBConnection
Test-MonitorDBConnection

Parameters

- **DataStore <String>**

  Specifies the logical name of the data store for the Monitor Service. Can be either be ‘Site’ or the logical name of the secondary data store.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Site</td>
<td>false</td>
</tr>
</tbody>
</table>

- **AdminAddress <String>**

  Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values
The database connection string configured for the Monitor Service.

Notes
If the command fails, the following errors can be returned.

Error Codes
----------
NoDBConnections
The database connection string for the Monitor Service has not been specified.
DatabaseError
An error occurred in the service while attempting a database operation.
DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.
DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.
PermissionDenied
You do not have permission to execute this command.
AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.
CommunicationError
There was a problem communicating with the remote service.
ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples
-------------------------- EXAMPLE 1 --------------------------
c:\PS>Get-MonitorDBConnection
Server=serverName\SQLEXPRESS;Initial Catalog = databaseName;  Integrated Security = True
Get the database connection string for the Monitor Service.
Get-MonitorDBSchema

Oct 01, 2013
Gets a script that creates the Monitor Service database schema for the specified data store.

Syntax

Detailed Description

Gets SQL scripts that can be used to create a new Monitor Service database schema, add a new Monitor Service to an existing site, remove a Monitor Service from a site, or create a database server logon for a Monitor Service. If no Sid parameter is provided, the scripts obtained relate to the currently selected Monitor Service instance, otherwise the scripts relate to Monitor Service instance running on the machine identified by the Sid provided. When obtaining the Evict script, a Sid parameter must be supplied. The current service instance is that on the local machine, or that explicitly specified by the last usage of the -AdminAddress parameter to a Monitor SDK cmdlet. The service instance used to obtain the scripts does not need to be a member of a site or to have had its database connection configured. The database scripts support only Microsoft SQL Server, or SQL Server Express, and require Windows integrated authentication to be used. They can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SMDCMD mode'. The ScriptType parameter determines which script is obtained. If ScriptType is not specified, or is FullDatabase, the script contains:

- Creation of service schema
- Creation of database server logon
- Creation of database user
- Addition of database user to Monitor Service roles

If ScriptType is Instance, the returned script contains:

- Creation of database server logon
- Creation of database user
- Addition of database user to Monitor Service roles

If ScriptType is Evict, the returned script contains:

- Removal of Monitor Service instance from database
- Removal of database user

If ScriptType is Login, the returned script contains:

- Creation of database server logon only

If the service uses two data stores they can exist in the same database. You do not need to configure a database before using this command.

Related topics

Get-MonitorDataStore
Set-MonitorDBConnection
Parameters

- **DatabaseName**: <String>

  Specifies the name of the database for which the schema will be generated.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>false</td>
<td>false</td>
</tr>
</tbody>
</table>

- **ServiceGroupName**: <String>

  Specifies the name of the service group to be used when creating the database schema. The service group is a collection of all the Monitor services that share the same database instance and are considered equivalent; that is, all the services within a service group can be used interchangeably.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>false</td>
<td>false</td>
</tr>
</tbody>
</table>

- **ScriptType**: <ScriptTypes>

  Specifies the type of database script returned. Available script types are:

  - **Database**

    Returns a full database script that can be used to create a database schema for the Monitor Service in a database instance that does not already contain a schema for this service. The `DatabaseName` and `ServiceGroupName` parameters must be specified to create a script of this type.

  - **Instance**

    Returns a permissions script that can be used to add further Monitor services to an existing database instance that already contains the full Monitor service schema, associating the services to the Service Group. The `Sid` parameter can optionally be specified to create a script of this type.

  - **Login**

    Returns a database logon script that can be used to add the required logon accounts to an existing database instance that contains the Monitor Service schema. This is used primarily when creating a mirrored database environment. The `DatabaseName` parameter must be specified to create a script of this type.

  - **Evict**

    Returns a script that can be used to remove the specified Monitor Service from the database entirely. The `DatabaseName` and `Sid` parameters must be specified to create a script of this type.
**-LocalDatabase**<SwitchParameter>

Specifies whether the database script is to be used in a database instance run on the same controller as other services in the service group. Including this parameter ensures the script creates only the required permissions for local services to access the database schema for Monitor services.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-Sid**<String>

Specifies the SID of the controller on which the Monitor Service instance to remove from the database is running.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

**-DataStore**<String>

Specifies the logical name of the data store for the Monitor Service. Can be either 'Site' or the logical name of the secondary data store.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Site</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

System.String

A string containing the required SQL script for application to a database.

Notes

The scripts returned support Microsoft SQL Server Express Edition, Microsoft SQL Server Standard Edition, and Microsoft SQL Server Enterprise Edition databases only, and are generated on the assumption that integrated authentication will be used.

If the ScriptType parameter is not included or set to 'FullDatabase', the full database script is returned, which will:

---

https://docs.citrix.com © 1999-2017 Citrix Systems, Inc. All rights reserved.
Create the database schema.
Create the user and the role (providing the schema does not already exist).
Create the logon (providing the schema does not already exist).

If the ScriptType parameter is set to 'Instance', the script will:
Create the user and the role (providing the schema does not already exist).
Create the logon (providing the schema does not already exist) and associate it with a user.

If the ScriptType parameter is set to 'Login', the script will:
Create the logon (providing the schema does not already exist) and associate it with a pre-existing user of the same name.

If the LocalDatabase parameter is included, the NetworkService account will be added to the list of accounts permitted to access the database. This is required only if the database is run on a controller.

If the command fails, the following errors can be returned.

Error Codes
-----------

GetSchemasFailed
The database schema could not be found.

ActiveDirectoryAccountResolutionFailed
The specified Active Directory account or Group could not be found.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples
-------------------------- EXAMPLE 1 --------------------------

```bash
c:\PS>Get-MonitorDBSchema -DatabaseName MyDB -ServiceGroupName MyServiceGroup > c:\MonitorSchema.sql
```

Get the full database schema for site data store of the Monitor Service and copy it to a file called 'c:\MonitorSchema.sql'.

This script can then be used to create the schema in a pre-existing database named 'MyDB' that does not already contain a Monitor Service site schema.

-------------------------- EXAMPLE 2 --------------------------

```bash
c:\PS>Get-MonitorDBSchema -DatabaseName MyDB -scriptType Login > c:\MonitorLogins.sql
```

Get the logon scripts for the Monitor Service.

-------------------------- EXAMPLE 3 --------------------------

```bash
c:\PS>Get-MonitorDBSchema -DatabaseName MyDB -ServiceGroupName MyServiceGroup -DataStore Secondary > c:\MonitorSchema.sql
```

Get the full database schema for the secondary data store of the Monitor Service and copy it to a file called 'c:\MonitorSecondarySchema.sql'.

This script can then be used to create the schema in a pre-existing database named 'MyDB' that does not already contain a Monitor Service secondary schema.
Get-MonitorDBVersionChangeScript

Oct 01, 2013
Gets a script that updates the Monitor Service database schema.

Syntax

Get-MonitorDBVersionChangeScript -DatabaseName <String> -TargetVersion <Version> [-DataStore <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns a database script that can be used to upgrade or downgrade the site or secondary schema for the Monitor Service from the current schema version to a different version.

Related topics

Get-MonitorInstalledDBVersion

Parameters

-**DatabaseName**<String>

Specifies the name of the database instance to which the update applies.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-**TargetVersion**<Version>

Specifies the version of the database you want to update to.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-**DataStore**<String>

Specifies the logical name of the data store for the Monitor Service. Can be either be 'Site' or the logical name of the secondary data store.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Site</td>
<td>false</td>
</tr>
</tbody>
</table>
**-AdminAddress:String**

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

System.Management.Automation.PSObject

A PSObject containing the required SQL script for application to a database.

Notes

The PSObject returned by this cmdlet contains the following properties:

-- **Script** The raw text of the SQL script to apply the update, or null in the case when no upgrade path to the specified target version exists.

-- **NeedExclusiveAccess** Indicates whether all services in the service group must be shut down during the update or not.

-- **CanUndo** Indicates whether the generated script allows the updated schema to be reverted to the state prior to the update.

Scripts to update the schema version are stored in the database so any service in the service group can obtain these scripts. Extreme caution should be exercised when using update scripts. Citrix recommends backing up the database before attempting to upgrade the schema. Database update scripts may require exclusive use of the schema and so may not be able to execute while any Monitor services are running. However, this depends on the specific update being carried out.

After a schema update has been carried out, services that require the previous version of the schema may cease to operate. The ServiceState parameter reported by the Get-MonitorServiceStatus command provides information about service compatibility. For example, if the schema has been upgraded to a more recent version that a service cannot use, the service reports "DBNewerVersionThanService".

If the command fails, the following errors can be returned.

Error Codes

------------

NoOp

The operation was successful but had no effect.

NoDBConnections

The database connection string for the Monitor Service has not been specified.
DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> $update = Get-MonitorDBVersionChangeScript -DatabaseName MyDb -TargetVersion 1.0.75.0
C:\PS> $update.Script > update_75.sql

Gets an SQL update script to update the current schema to version 1.0.75.0. The resulting update_75.sql script is suitable for direct use with the SQL Server SQLCMD utility.
Get-MonitorInstalledDBVersion

Oct 01, 2013
Gets a list of all available database schema versions for the Monitor Service.

Syntax

Detailed Description

Returns the current version of the Monitor Service database schema, if no flags are set, otherwise returns versions for which upgrade or downgrade scripts are available and have been stored in the database.

Related topics

Parameters

- **Upgrade**<SwitchParameter>

  Specifies that only schema versions to which the current database version can be updated should be returned.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>false</td>
<td>false</td>
</tr>
</tbody>
</table>

- **Downgrade**<SwitchParameter>

  Specifies that only schema versions to which the current database version can be reverted should be returned.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>false</td>
<td>false</td>
</tr>
</tbody>
</table>

- **DataStore**<String>

  Specifies the database connection logical name the schema script should be returned for. The parameter is optional.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>false</td>
<td>false</td>
</tr>
</tbody>
</table>

- **AdminAddress**<String>

  Specifies the database connection logical name the schema script should be returned for. The parameter is optional.
Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

System.Version

The `Get-MonitorInstalledDbVersion` command returns objects containing the new definition of the Monitor Service database schema version.

Major <Integer>

Minor <Integer>

Build <Integer>

Revision <Integer>

Notes

If the command fails, the following errors can be returned.

Error Codes

---------

InvalidParameterCombination

Both the Upgrade and Downgrade flags were specified.

NoOp

The operation was successful but had no effect.

NoDBConnections

The database connection string for the Monitor Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for
various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-MonitorInstalledDBVersion

<table>
<thead>
<tr>
<th>Major</th>
<th>Minor</th>
<th>Build</th>
<th>Revision</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>6</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

Get the currently installed version of the Monitor Service database schema.

-------------------------- EXAMPLE 2 --------------------------

c:\PS>Get-MonitorInstalledDBVersion -Upgrade

<table>
<thead>
<tr>
<th>Major</th>
<th>Minor</th>
<th>Build</th>
<th>Revision</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

Get the versions of the Monitor Service database schema for which upgrade scripts are supplied.
Get-MonitorService

Oct 01, 2013
Gets the service record entries for the Monitor Service.

Syntax

Detailed Description

Returns instances of the Monitor Service that the service publishes. The service records contain account security identifier information that can be used to remove each service from the database.

A database connection for the service is required to use this command.

Related topics

Parameters

-**Property** <String[]>

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**ReturnTotalRecordCount** <SwitchParameter>

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Monitor_Filtering for details.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>False</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**MaxRecordCount** <Int32>

Specifies the maximum number of records to return.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
</tbody>
</table>
-Skip<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>0</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>The default sort order is by name or unique identifier.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-Filter<String>

Gets records that match a PowerShell-style filter expression. See about_Monitor_Filtering for details.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values
Citrix.Monitor.Sdk.Service

The `Get-MonitorServiceInstance` command returns an object containing the following properties.

**Uid <Integer>**

Specifies the unique identifier for the service in the group. The unique identifier is an index number.

**ServiceHostId <Guid>**

Specifies the unique identifier for the service instance.

**DNSName <String>**

Specifies the domain name of the host on which the service runs.

**MachineName <String>**

Specifies the short name of the host on which the service runs.

**CurrentState <Citrix.Fma.Sdk.ServiceCore.ServiceState>**

Specifies whether the service is running, started but inactive, stopped, or failed.

**LastStartTime <DateTime>**

Specifies the date and time at which the service was last restarted.

**LastActivityTime <DateTime>**

Specifies the date and time at which the service was last stopped or restarted.

**OSType**

Specifies the operating system installed on the host on which the service runs.

**OSVersion**

Specifies the version of the operating system installed on the host on which the service runs.

**ServiceVersion**

Specifies the version number of the service instance. The version number is a string that reflects the full build version of the service.

**DatabaseUserName <string>**

Specifies for the service instance the Active Directory account name with permissions to access the database. This will be either the machine account or, if the database is running on a controller, the NetworkService account.

**Sid <string>**

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

**ActiveSiteServices <string[]>**
Specifies the names of active site services currently running in the service. Site services are components that perform long-running background processing in some services. This field is empty for services that do not contain site services.

Notes
If the command fails, the following errors can be returned.

Error Codes
-----------

UnknownObject
One of the specified objects was not found.

PartialData
Only a subset of the available data was returned.

InvalidFilter
A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase
The query required to get the database was not defined.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.
Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-MonitorService

Uid : 1

ActiveSiteServices : {MySiteService1, MySiteService2...}

Get all the instances of the Monitor Service running in the current service group.
Get-MonitorServiceAddedCapability

Oct 01, 2013
Gets any added capabilities for the Monitor Service on the controller.

Syntax

Get-MonitorServiceAddedCapability [-AdminAddress <String>] [CommonParameters]

Detailed Description

Enables updates to the Monitor Service on the controller to be detected.

You do not need to configure a database connection before using this command.

Related topics

Parameters

- **-AdminAddress** <String>

  Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
</tbody>
</table>

Return Values

System.String

String containing added capabilities.

Notes

If the command fails, the following errors can be returned.

Error Codes

----------

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-MonitorServiceAddedCapability
Get the added capabilities of the Monitor Service.
Get-MonitorServiceInstance

Oct 01, 2013
Gets the service instance entries for the Monitor Service.

Syntax
Get-MonitorServiceInstance [-AdminAddress <String>] [<CommonParameters>]

Detailed Description
Returns service interfaces published by the instance of the Monitor Service. Each instance of a service publishes multiple interfaces with distinct interface types, and each of these interfaces is represented as a ServiceInstance object. Service instances can be used to register the service with a central configuration service so that other services can use the functionality.

You do not need to configure a database connection to use this command.

Related topics
Parameters
-AdminAddress <String>
Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
</tbody>
</table>

Accept Pipeline Input? false

Return Values
Citrix.Monitor.Sdk.ServiceInstance
The Get-MonitorServiceInstance command returns an object containing the following properties.

ServiceGroupUid <Guid>
Specifies the unique identifier for the service group of which the service is a member.

ServiceGroupName <String>
Specifies the name of the service group of which the service is a member.

ServiceInstanceUID <Guid>
Specifies the unique identifier for registered service instances, which are service instances held by and obtained from a central configuration service. Unregistered service instances do not have unique identifiers.
ServiceType <String>

Specifies the service instance type. For this service, the service instance type is always Monitor.

Address

Specifies the address of the service instance. The address can be used to access the service and, when registered in the central configuration service, can be used by other services to access the service.

Binding

Specifies the binding type that must be used to communicate with the service instance. In this release of XenDesktop, the binding type is always 'wcf_HTTP_kerb'. This indicates that the service provides a Windows Communication Foundation endpoint that uses HTTP binding with integrated authentication.

Version

Specifies the version of the service instance. The version number is used to ensure that the correct versions of the services are used for communications.

ServiceAccount <String>

Specifies the Active Directory account name for the machine on which the service instance is running. The account name is used to provide information about the permissions required for interservice communications.

ServiceAccountSid <String>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

InterfaceType <String>

Specifies the interface type. Each service can provide multiple service instances, each for a different purpose, and the interface defines the purpose. Available interfaces are:

- SDK - for PowerShell operations
- InterService - for operations between different services
- Peer - for communications between services of the same type

Metadata <Citrix.Monitor.Sdk.Metadata[]>

The collection of metadata associated with registered service instances, which are service instances held by and obtained from a central configuration service. Metadata is not stored for unregistered service instances.

Notes

If the command fails, the following errors can be returned.

Error Codes

--------

DatabaseError
An error occurred in the service while attempting a database operation.

**DatabaseNotConfigured**

The operation could not be completed because the database for the service is not configured.

**DataStoreException**

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

**PermissionDenied**

You do not have permission to execute this command.

**AuthorizationError**

There was a problem communicating with the Citrix Delegated Administration Service.

**CommunicationError**

There was a problem communicating with the remote service.

**ExceptionThrown**

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

**Examples**

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-MonitorServiceInstance

Address : http://MyServer.com:80/Citrix/Monitor
Binding : wcf_HTTP_kerb
InterfaceType : SDK
Metadata :
MetadataMap :
ServiceAccount : ENG\MyAccount$
ServiceAccountSid : S-1-5-21-2406005612-3133289213-1653143164

ServiceGroupUid : a88d2f6b-c00a-4f76-9c38-e8330093b54d
ServiceInstanceUid : 00000000-0000-0000-0000-000000000000
ServiceType : Monitor
Version : 1

Address : http://MyServer.com:80/Citrix/Monitor/IServiceApi
Binding : wcf_HTTP_kerb
InterfaceType : InterService
Metadata :
MetadataMap :
ServiceAccount : ENG\MyAccount
ServiceAccountSid : S-1-5-21-2406005612-3133289213-1653143164
Get all instances of the Monitor Service running on the specified machine. For remote services, use the `AdminAddress` parameter to define the service for which the interfaces are required. If the `AdminAddress` parameter has not been specified for the runspace, service instances running on the local machine are returned.
Get-MonitorServiceStatus

Oct 01, 2013
Gets the current status of the Monitor Service on the controller.

Syntax
Get-MonitorServiceStatus [-AdminAddress <String>] [CommonParameters]

Detailed Description
Enables the status of the Monitor Service on the controller to be monitored. If the service has multiple data stores it will return the overall state as an aggregate of all the data store states. For example, if the site data store status is OK and the secondary data store status is DBUnconfigured then it will return DBUnconfigured.

Related topics
Set-MonitorDataStore
Set-MonitorDBConnection
Test-MonitorDBConnection
Get-MonitorDBConnection
Get-MonitorDBSchema

Parameters
-AdminAddress <String>
Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
</tbody>
</table>

Accept Pipeline Input? false

Return Values

The Get-MonitorServiceStatus command returns an object containing the status of the Monitor Service together with extra diagnostics information.

DBUnconfigured
The Monitor Service does not have a database connection configured.

DBRejectedConnection
The database rejected the logon attempt from the Monitor Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the Monitor Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBNewerVersionThanService

The version of the Monitor Service currently in use is incompatible with the version of the Monitor Service schema on the database. Upgrade the Monitor Service to a more recent version.

DBOlderVersionThanService

The version of the Monitor Service schema on the database is incompatible with the version of the Monitor Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The Monitor Service is running and is connected to a database containing a valid schema.

Failed

The Monitor Service has failed.

Unknown

(0) The service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-MonitorServiceStatus

DBUnconfigured
Get the current status of the Monitor Service.
Remove-MonitorServiceMetadata

Oct 01, 2013
Removes metadata from the given Service.

Syntax

Remove-MonitorServiceMetadata [-ServiceHostId] <Guid> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-MonitorServiceMetadata [-ServiceHostId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-MonitorServiceMetadata [-InputObject] <Service[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-MonitorServiceMetadata [-InputObject] <Service[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to remove metadata from the given Service.

Related topics

Set-MonitorServiceMetadata

Parameters

-ServiceHostId <Guid>

Id of the Service

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

-InputObject <Service[]>

Objects to which metadata is to be removed.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-Name <String>
The metadata property to remove.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-Map<PSObject>**

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with `@{"name1" = "val1"; "name2" = "val2"}`) or a string dictionary (created with `new-object "System.Collections.Generic.Dictionary[String,String]"`). The properties whose names match keys in the map will be removed.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

**-LoggingId<Guid>**

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-AdminAddress<String>**

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td><code>Localhost</code>. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Notes**

If the command fails, the following errors can be returned.

**Error Codes**

--------
InvalidParameterCombination
The cmdlet parameters are inconsistent.

UnknownObject
One of the specified objects was not found.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------
c:\PS>Get-MonitorService | % { Remove-MonitorServiceMetadata -Map $_.MetadataMap }
Remove all metadata from all Service objects.
Reset-MonitorDataStore

Oct 01, 2013
Refreshes the database string currently being used by the Monitor service.

Syntax

Reset-MonitorDataStore [-DataStore <String>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns the string for the database connection currently being used by the Monitor Service. Can only be called for secondary data stores.

There is no requirement for a database connection to be configured in order for this command to be used.

Related topics

Get-MonitorDataStore

Parameters

-**DataStore**<String>

Specifies the database connection logical name to be used by the Monitor Service. Can be either be 'Site' or the logical name of the secondary data store. Specifying the site data store will display an error because this operation is not supported for site data stores.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Site</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**LoggingId**<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.
<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

Citrix.MonitorSdk.ServiceStatus

The status of the specified data store.

Notes

If the command fails, the following errors can be returned.

Error Codes

---------

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples
EXAMPLE 1

c:\PS>Reset-MonitorDataStore -DataStore Secondary
OK
Refresh the database connection string for the Monitor Service.
Reset-MonitorServiceGroupMembership

Oct 01, 2013
Replaces the access permissions and configuration service locations for the Monitor Service.

Syntax

Detailed Description

Enables you to reload Monitor Service access permissions and configuration service locations. The Reset-MonitorServiceGroupMembership command must be run on at least one instance of the service type (Monitor) after installation and registration with the configuration service. Without this operation, the Monitor services will be unable to communicate with other services in the XenDesktop deployment. When the command is run, the services are updated when additional services are added to the deployment, provided that the configuration service is not stopped. The Reset-MonitorServiceGroupMembership command can be run again to refresh this information if automatic updates do not occur when new services are added to the deployment. If more than one configuration service instance is passed to the command, the first instance that meets the expected service type requirements is used.

Related topics

Parameters

-ConfigServiceInstance <ServiceInstance[]>

Specifies the configuration service instance object that represents the service instance for the type 'InterService' that references a configuration service for the deployment.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-LoggingId <Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
<td>false</td>
</tr>
</tbody>
</table>
Citrix.Monitor.Sdk.ServiceInstance[] Service instances containing a ServiceInstance object that refers to the central configuration service interservice interface can be piped to the Reset-MonitorServiceGroupMembership command.

Notes
If the command fails, the following errors can be returned.

Error Codes
--------
NoSuitableServiceInstance
None of the supplied service instance objects were suitable for resetting service group membership.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples
-------------------------- EXAMPLE 1 --------------------------
c:\PS>Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-MonitorServiceGroupMembership
Reset the service group membership for a service in a deployment where the configuration service is configured and running on the same machine as the service.

-------------------------- EXAMPLE 2 --------------------------
c:\PS>Get-ConfigRegisteredServiceInstance -ServiceType Config -AdminAddress OtherServer.example.com | Reset-MonitorServiceGroupMembership
Reset the service group membership for a service in a deployment where the configuration service that is configured and running on a machine named 'OtherServer.example.com'.
Set-MonitorConfiguration

Oct 01, 2013
Sets the database string currently being used by the Monitor Service.

Syntax

Detailed Description

Sets the string for the database connection currently being used by the Monitor Service.

A database connection need not be configured for this command to be used.

Related topics

Get-MonitorConfiguration

Parameters

-GroomSessionsRetentionDays <Int32>

Determines how many days to keep Session and Connection records after the Session is terminated.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>7 for non-platinum, 90 for platinum.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-GroomFailuresRetentionDays <Int32>

Determines how many days to keep MachineFailureLog and ConnectionFailureLog records after these are created.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>7 for non-platinum, 90 for platinum.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>

</tr>
</tbody>
</table>

- **GroomDeletedRetentionDays**<Int32>

Determines how many days to keep Machine, Catalog, DesktopGroup and Hypervisor entities around that have a LifecycleState of 'Deleted'. This also deletes any related Session, Connection, Summary, Failure or LoadIndex records.

| Required? | false |
| Default Value | 7 for non-platinum, 90 for platinum. |
| Accept Pipeline Input? | false |

- **GroomSummariesRetentionDays**<Int32>

Determines how many days to keep DesktopGroupSummary, FailureLogSummary and LoadIndexSummary records at the daily granularity.

| Required? | false |
| Default Value | 7 for non-platinum, 90 for platinum. |
| Accept Pipeline Input? | false |

- **DataCollectionEnabled**<Boolean>

Starts / stops data collection. Stopping data collection turns off polling, and does not persist operational event data to the database.

| Required? | false |
| Default Value | True |
| Accept Pipeline Input? | false |

- **FullPollStartHour**<Int32>

Hour of day when Full Poll should begin.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

- **ResolutionPollTimeHours**<Int32>

Start time for the Resolution Poll worker.
<table>

**Default Value**
- false

**Accept Pipeline Input?**
- false
Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS>Set-MonitorConfiguration -GroomSessionsRetentionDays 5 -GroomFailuresRetentionDays 4 ...
Updates the settings in the site database with the newly specified values.
Set-MonitorDBConnection

Oct 01, 2013
Configures a database connection for the Monitor Service.

Syntax

Set-MonitorDBConnection [-DBConnection] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [-DataStore <String>] [<CommonParameters>]

Detailed Description

Configures a connection to a database in which the Monitor Service can store its state. The service will attempt to connect and start using the database immediately after the connection is configured. The database connection string is updated to the specified value regardless of whether it is valid or not. Specifying an invalid connection string prevents a service from functioning until the error is corrected.

After a connection is configured, you cannot alter it without first clearing it (by setting the connection to $null).

You do not need to configure a database connection to use this command.

Related topics

Get-MonitorServiceStatus
Get-MonitorDBConnection
Test-MonitorDBConnection

Parameters

-**DBConnection**<String>

Specifies the database connection string to be used by the Monitor Service. Passing in $null will clear any existing database connection configured.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**LoggingId**<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>
Accept Pipeline Input? | false
---|---

**DataStore**<String>

Specifies the logical name of the data store for the Monitor Service. Can be either be 'Site' or the logical name of the secondary data store.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
<th>Default Value</th>
<th>Site</th>
</tr>
</thead>
</table>

Accept Pipeline Input? | false

Return Values

The Set-MonitorDBConnection command returns an object containing the status of the Monitor Service together with extra diagnostics information.

DBUnconfigured

The Monitor Service does not have a database connection configured.

DBRejectedConnection

The database rejected the logon attempt from the Monitor Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the Monitor Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBNewerVersionThanService

The version of the Monitor Service currently in use is incompatible with the version of the Monitor Service schema on the database. Upgrade the Monitor Service to a more recent version.

DBOlderVersionThanService

The version of the Monitor Service schema on the database is incompatible with the version of the Monitor Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The Monitor Service is running and is connected to a database containing a valid schema.

Failed

The Monitor Service has failed.

Unknown

The status of the Monitor Service cannot be determined.

Notes
If the command fails, the following errors can be returned.

Error Codes
-----------

InvalidDBCConnectionString
The database connection string has an invalid format.

DatabaseConnectionDetailsAlreadyConfigured
There was already a database connection configured. After a configuration is set, it can only be set to $null.

DatabaseError
An error occurred in the service while attempting a database operation.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples
-------------------------- EXAMPLE 1 --------------------------
c:\PS> Set-MonitorDBConnection -DBConnection "Server=serverName\SQLEXPRESS;Initial Catalog = databaseName; Integrated Security = True"
OK
Configures a database connection string for the Monitor Service.

-------------------------- EXAMPLE 2 --------------------------
c:\PS> Set-MonitorDBConnection -DBConnection "Invalid Connection String"
Invalid database connection string format.
Configures an invalid database connection string for the Monitor Service.
Set-MonitorServiceMetadata

Oct 01, 2013
Adds or updates metadata on the given Service.

Syntax
Set-MonitorServiceMetadata [-ServiceHostId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
Set-MonitorServiceMetadata [-ServiceHostId] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
Set-MonitorServiceMetadata [-InputObject] <Service[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
Set-MonitorServiceMetadata [-InputObject] <Service[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description
Allows you to store additional custom data against given Service objects.

Related topics
Remove-MonitorServiceMetadata

Parameters
-ServiceHostId <Guid>
Id of the Service

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

-Input Object <Service[]>
Objects to which metadata is to be added.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-Map <PSObject>
Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").
-**Name**<String>

Specifies the property name of the metadata to be added. The property must be unique for the Service specified. The property cannot contain any of the following characters \/:*.?=<>|[]"'

-**Value**<String>

Specifies the value for the property.

-**LoggingId**<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

-**AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Set-MonitorServiceMetadata returns a dictionary containing the new (name, value)-pairs.

Key <string>

Specifies the name of the property.

Value <string>

Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

----------

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.
ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Set-MonitorServiceMetadata -ServiceHostId 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>property</td>
<td>value</td>
</tr>
</tbody>
</table>

Add metadata with a name of 'property' and a value of 'value' to the Service with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.
Test-MonitorDBConnection

Oct 01, 2013
Tests a database connection for the Monitor Service.

Syntax

Detailed Description

Tests a connection to the database in which the Monitor Service can store its state. The service will attempt to connect to the database without affecting the current connection to the database.

You do not have to clear the connection to use this command.

Related topics

Get-MonitorServiceStatus
Get-MonitorDBConnection
Set-MonitorDBConnection

Parameters

-**DBConnection**<String>

Specifies the database connection string to be tested by the Monitor Service.

<table>
<thead>
<tr>
<th>Required?</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Default Value</th>
<th></th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Accept Pipeline Input?</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
</tr>
</tbody>
</table>

-**LoggingId**<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Default Value</th>
<th></th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Accept Pipeline Input?</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
</tr>
</tbody>
</table>

-**AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
</tr>
</tbody>
</table>

| Default Value | Localhost. Once a value is provided by any cmdlet, this value becomes the default. |

<table>
<thead>
<tr>
<th>Accept Pipeline Input?</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
</tr>
</tbody>
</table>

-**DataStore**<String>

Specifies the logical name of the data store for the Monitor Service. Can be either be 'Site' or the logical name of the secondary data store.

<table>
<thead>
<tr>
<th>Required?</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Default Value</th>
<th></th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Accept Pipeline Input?</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
</tr>
</tbody>
</table>
The Test-MonitorDBConnection command returns an object containing the status of the Monitor Service if the connection string of the specified data store were to be set to the string being tested, together with extra diagnostics information for the specified connection string.

**DBRejectedConnection**
The database rejected the logon attempt from the Monitor Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

**InvalidDBConfigured**
The expected stored procedures are missing from the database. This may be because the Monitor Service schema has not been added to the database.

**DBNotFound**
The specified database could not be located with the configured connection string.

**DBNewerVersionThanService**
The version of the Monitor Service currently in use is incompatible with the version of the Monitor Service schema on the database. Upgrade the Monitor Service to a more recent version.

**DBOlderVersionThanService**
The version of the Monitor Service schema on the database is incompatible with the version of the Monitor Service currently in use. Upgrade the database schema to a more recent version.

**DBVersionChangeInProgress**
A database schema upgrade is currently in progress.

**OK**
The Set-MonitorDBConnection command would succeed if it were executed with the supplied connection string.

**Failed**
The Monitor Service has failed.

**Unknown**
The status of the Monitor Service cannot be determined.

**Notes**
If the command fails, the following errors can be returned.

**Error Codes**

----------

**InvalidDBConnectionString**
The database connection string has an invalid format.
DatabaseError
An error occurred in the service while attempting a database operation.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples
-------------------------- EXAMPLE 1 --------------------------
c:\PS> Test-MonitorDBConnection -DBConnection "Server=serverName\SQLEXPRESS;Initial Catalog = databaseName; Integrated Security = True"
OK
Tests a database connection string for the Monitor Service.

-------------------------- EXAMPLE 2 --------------------------
c:\PS> Test-MonitorDBConnection -DBConnection "Invalid Connection String"
Invalid database connection string format.
Tests an invalid database connection string for the Monitor Service.

about_SfStorefrontSnapin

Oct 01, 2013

TOPIC

about_SfStorefrontSnapin

SHORT DESCRIPTION

This service short descrition

COMMAND PREFIX

All commands in this snap-in have the noun prefixed with ‘Sf’.

LONG DESCRIPTION

This service long descrition
Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get- cmdlets support server-side filtering of the results. The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

```
Get-<Noun> | Where { $_.Size = 'Small' } | Sort 'Date' | Select -First 10
```

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

```
Get-<Noun> -Size 'Small' -SortBy 'Date' -MaxRecordCount 10
```

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

- `-MaxRecordCount <int>`

  Specifies the maximum number of results to return. For example, to return only the first nine results use:

  ```powershell
  Get-<Noun> -MaxRecordCount 9
  ```

  If not specified, only the first 250 records are returned, and if more are available, a warning is produced:
WARNING: Only first 250 records returned. Use -MaxRecordCount to retrieve more.

You can suppress this warning by using -WarningAction or by specifying a value for -MaxRecordCount.

To retrieve all records, specify a large number for -MaxRecordCount. As the value is an integer, you can use the following:

Get-<Noun> -MaxRecordCount [int]:::MaxValue

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. For example:

Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount

....

Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo : OperationStopped: (:) [Get-<Noun>], PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>

The count can be accessed using the TotalAvailableResultCount property:

$count = $error[0].TotalAvailableResultCount

-Skip <int>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order, respectively. Ascending order is assumed if no prefix is present.
Sorting occurs before -MaxRecordCount and -Skip parameters are applied. For example, to sort by Name and then by Count (largest first) use:

-SortBy 'Name,-Count'

By default, sorting by an enumeration property uses the numeric value of the elements. You can specify a different sort order by qualifying the name with an ordered list of elements or their numeric values, or <null> to indicate the placement of null values. Elements not mentioned are placed at the end in their numeric order. For example, to sort by two different enums and then by the object id:

-SortBy 'MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id'

-Filter <String>

This parameter lets you specify advanced filter expressions, and supports combination of conditions with -and and -or, and grouping with braces. For example:

Get-<Noun> -Filter 'Name -like "High*" -or (Priority -eq 1 -and Severity -ge 2)'

The syntax is close enough to PowerShell syntax that you can use script blocks in most cases. This can be easier to read as it reduces quoting:

Get-<Noun> -Filter { Count -ne $null }

The full -Filter syntax is provided below.

EXAMPLES

Filtering by strings performs a case-insensitive wildcard match. Separate parameters are combined with an implicit -and operator. Normal PowerShell quoting rules apply, so you can use single or double quotes, and omit the quotes altogether for many strings. The order of parameters does not make any difference. The following are equivalent:

Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company "citrix" -Product '[X]EN''
Get-<Noun> -Product "Xen**" -Company "CITRIX"
Get-<Noun> -Filter { Company -eq 'Citrix' -and Product -like 'Xen**' }
See about_Quoting_Rules and about_Wildcards for details about PowerShell handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape the wildcards using the normal PowerShell escape mechanisms (see about_Escape_Characters), or switch to a filter expression and the -eq operator:

```
Get-<Noun> -Company "Abc[*]"                  # Matches Abc*
Get-<Noun> -Company "Abc**"                   # Matches Abc*
Get-<Noun> -Filter { Company -eq "Abc**" }    # Matches Abc*
Get-<Noun> -Filter { Company -eq "A""B""C" }   # Matches A"B'C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```
Get-<Noun> -Uid 123
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

```
Get-<Noun> -Filter 'Capacity -ge 10gb'
Get-<Noun> -Filter 'Age -ge 20 -and Age -lt 40'
Get-<Noun> -Filter 'VolumeLevel -like "[123]"'
Get-<Noun> -Filter 'Enabled -ne $false'
Get-<Noun> -Filter 'NullableProperty -ne $null'
```

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

```
Get-<Noun> -Filter 'Enabled'      # Equivalent to 'Enabled -eq $true'
Get-<Noun> -Filter '-not Enabled' # Equivalent to 'Enabled -eq $false'
```

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

```
Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle
```

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:
$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq "Circle" }
Get-<Noun> -Filter { Shape -like 'C*' }

By their nature, floating point values, DateTime values, and TimeSpan values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

Get-<Noun> -Filter { StartTime -ge "2010-08-23T12:30:00.0Z" }
$d = [DateTime]"2010-08-23T12:30:00.0Z"
Get-<Noun> -Filter { StartTime -ge $d }
$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter { StartTime -ge $d }

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

Get-<Noun> -Filter { StartTime -ge '-2' }         # Two days ago
Get-<Noun> -Filter { StartTime -ge '-1:30' }      # Hour and a half ago
Get-<Noun> -Filter { StartTime -ge '-0:0:30' }    # 30 seconds ago

ARRAY PROPERTIES
When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings. Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

Get-<Noun> -User Fred*
Get-<Noun> -Filter { User -like "Fred*" }
Get-<Noun> -Filter { Users -contains "Fred*" }

You can also use the singular form with -Filter to search using other operators:

# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter { User -eq "Frederick" }
# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter { User -lt 'F' }

COMPLEX EXPRESSIONS
When matching against multiple values, you can use a sequence of comparisons joined with -or operators, or you can use -in and -notin:

```powershell
Get-<Noun> -Filter { Shape -eq 'Circle' -or Shape -eq 'Square' }
$shapes = 'Circle','Square'
Get-<Noun> -Filter { Shape -in $shapes }
$sides = 1..4
Get-<Noun> -Filter { Sides -notin $sides }
```

Braces can be used to group complex expressions, and override the default left-to-right evaluation of -and and -or. You can also use -not to invert the sense of any sub-expression:

```powershell
Get-<Noun> -Filter { Size -gt 4 -or (Color -eq 'Blue' -and Shape -eq 'Circle') }
Get-<Noun> -Filter { Sides -lt 5 -and -not (Color -eq 'Blue' -and Shape -eq 'Circle') }
```

**PAGING**

The simplest way to page through data is to use the -Skip and -MaxRecordCount parameters. So, to read the first three pages of data with 10 records per page, use:

```powershell
Get-<Noun> -Skip 0 -MaxRecordCount 10 <other filtering criteria>
Get-<Noun> -Skip 10 -MaxRecordCount 10 <other filtering criteria>
Get-<Noun> -Skip 20 -MaxRecordCount 10 <other filtering criteria>
```

You must include the same filtering criteria on each call, and ensure that the data is sorted consistently.

The above approach is often acceptable, but as each call performs an independent query, data changes can result in records being skipped or appearing twice. One approach to improve this is to sort by a unique id field and then start the search for the next page at the unique id after the last unique id of the previous page. For example:

```powershell
# Get the first page
Get-<Noun> -MaxRecordCount 10 -SortBy SerialNumber

SerialNumber ...
----------- ...
A120004
A120007
... 7 other records ...
A120900

# Get the next page
Get-<Noun> -MaxRecordCount 10 -Filter { FirstName -gt 'A120900' }

SerialNumber ...
```
FILTER SYNTAX DEFINITION

FILTER := <ScriptBlock> | <ComponentList>

ScriptBlock := "{" <ComponentList> "}"

ComponentList := <Component> <AndOrOperator> <ComponentList> | <Component>

Component := <NotOperator> <Factor> | <Factor>

Factor := "{" <ComponentList> "}" | <PropertyName> <ComparisonOperator> <Value> | <PropertyName>

AndOrOperator := "-and" | "-or"

NotOperator := "-not" | "!

ComparisonOperator := "-eq" | "-ne" | "-le" | "-ge" | "-lt" | "-gt" | "-like" | "-notlike" | "-contains" | "-notcontains" | "-in" | "-notin"

PropertyName := <simple name of property>

Value := <string literal> | <numeric literal> | <scalar variable> | <array variable> | "$null" | "$true" | "$false"
Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, "-1:30" means 1 hour and 30 minutes ago.
Add-SfServerToCluster

Oct 01, 2013

Adds a new server to an existing cluster.

Syntax

Add-SfServerToCluster -ClusterId <Guid> -ServerName <String> [-StorefrontUrl <Uri>] [-FarmName <String>] [-XmlServices <Uri[]>] [-RunAsynchronously <Boolean>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Adds a new server to an existing cluster. Optionally updates Farm and Storefront Url. After operation succeeds, all servers are configured identically.

Related topics

Get-SfCluster
New-SfCluster
Remove-SfServerFromCluster
Set-SfCluster

Parameters

-ClusterId <Guid>

The id of the cluster to perform operation on.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-ServerName <String>

The name of the server to join to existing cluster. The name must be one of the values returned by Get-SfCluster

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-StorefrontUrl <Uri>

The url that will be used by Receivers to contact Storefront. Http or https absolute urls are accepted.
<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Server name and http binding.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-FarmName**<String>

Name of the farm that will be used within Store service. Either both FarmName and XmlServices need to be specified or none of them.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-XmlServices**<Uri[]>

Collection of the url of xml services that will be used inside a farm. The urls need to be http or https, be absolute and share the same schema and port. Either both FarmName and XmlServices need to be specified or none of them.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-RunAsynchronously**<Boolean>

If set, the command will run asynchronously.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>false</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-LoggingId**<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>
-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

Returns cluster description or a task, if ran asynchronously.

Examples

-------------------------- EXAMPLE 1 --------------------------

Add-SfServerToCluster -ClusterId (Guid) -ServerName NewSfServer -RunAsynchronously $true
Adds "NewSfServer" to cluster with id (Guid).
Add-SfStorefrontAddress

Oct 01, 2013

Syntax

Add-SfStorefrontAddress [ -ByteArray ] <Byte[]> -Name <String> -Url <String> -Enabled <Boolean> -Description <String>

[<CommonParameters>]

Detailed Description

Related topics

Parameters

- **ByteArray</ByteArray>**

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | true (ByValue) |

- **Name</String>**

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | false |

- **Url</String>**

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | false |

- **Enabled</Boolean>**

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | false |

- **Description</String>**
<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>

<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

**Return Values**

System.Byte[]

**Notes**
Get-SfCluster

Oct 01, 2013
Gets all Storefront clusters present in the site.

Syntax
Get-SfCluster [-AdminAddress <String>] [CommonParameters]

Detailed Description
Gets all Storefront clusters present in the site. There is one special Cluster with null id that lists the servers that are not part to any cluster (they are available to join any).

Related topics
New-SfCluster
Add-SfServerToCluster
Remove-SfServerFromCluster
Set-SfCluster

Parameters

-AdminAddress <String>
Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
</tbody>
</table>

Accept Pipeline Input? | false

Return Values
Citrix.Storefront.DataModel.Cluster[]

Returns array of clusters available in current deployment.
Get-SfDBConnection

Oct 01, 2013

Gets the database string for the specified data store used by the Storefront Service.

Syntax

Get-SfDBConnection [-AdminAddress <String>] [CommonParameters]

Detailed Description

Returns the database connection string for the specified data store.

If the returned string is blank, no valid connection string has been specified. In this case the service is running, but is idle and awaiting specification of a valid connection string.

Related topics

Get-SfServiceStatus
Get-SfDataStore
Set-SfDBConnection
Test-SfDBConnection

Parameters

-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

system.string

The database connection string configured for the Storefront Service.

Notes

If the command fails, the following errors can be returned.

Error Codes

-----------
NoDBConnections
The database connection string for the Storefront Service has not been specified.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------
c:\PS>Get-SfDBConnection

Server=serverName\SQLExpress;Initial Catalog = databaseName; Integrated Security = True
Get the database connection string for the Storefront Service.
Get-SfDBSchema

Oct 01, 2013
Gets a script that creates the Storefront Service database schema for the specified data store.

Syntax

Get-SfDBSchema [-DatabaseName <String>] [-ServiceGroupName <String>] [-ScriptType <ScriptTypes>] [-LocalDatabase] [-Sid <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Gets SQL scripts that can be used to create a new Storefront Service database schema, add a new Storefront Service to an existing site, or create a database server logon for a Storefront Service. If no Sid parameter is provided, the scripts obtained relate to the currently selected Storefront Service instance, otherwise the scripts relate to Storefront Service instance running on the machine identified by the Sid provided. When obtaining the Evict script, a Sid parameter must be supplied. The current service instance is that on the local machine, or that explicitly specified by the last usage of the -AdminAddress parameter to a Storefront SDK cmdlet. The service instance used to obtain the scripts does not need to be a member of a site or to have had its database connection configured. The database scripts support only Microsoft SQL Server, or SQL Server Express, and require Windows integrated authentication to be used. They can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SMDCMD mode'. The ScriptType parameter determines which script is obtained. If ScriptType is not specified, or is FullDatabase, the script contains:

- Creation of service schema
- Creation of database server logon
- Creation of database user
- Addition of database user to Storefront Service roles

If ScriptType is Instance, the returned script contains:

- Creation of database server logon
- Creation of database user
- Addition of database user to Storefront Service roles

If ScriptType is Evict, the returned script contains:

- Removal of Storefront Service instance from database
- Removal of database user

If ScriptType is Login, the returned script contains:

- Creation of database server logon only

If the service uses two data stores they can exist in the same database. You do not need to configure a database before using this command.
Related topics

Get-SfDataStore

Set-SfDBConnection

Parameters

- **DatabaseName**<String>

  Specifies the name of the database for which the schema will be generated.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **ServiceGroupName**<String>

  Specifies the name of the service group to be used when creating the database schema. The service group is a collection of all the Storefront services that share the same database instance and are considered equivalent; that is, all the services within a service group can be used interchangeably.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

- **ScriptType**<ScriptTypes>

  Specifies the type of database script returned. Available script types are:

  **Database**

  Returns a full database script that can be used to create a database schema for the Storefront Service in a database instance that does not already contain a schema for this service. The DatabaseName and ServiceGroupName parameters must be specified to create a script of this type.

  **Instance**

  Returns a permissions script that can be used to add further Storefront services to an existing database instance that already contains the full Storefront service schema, associating the services to the Service Group. The Sid parameter can optionally be specified to create a script of this type.

  **Login**

  Returns a database logon script that can be used to add the required logon accounts to an existing database instance that contains the Storefront Service schema. This is used primarily when creating a mirrored database environment. The DatabaseName parameter must be specified to create a script of this type.
Evict

Returns a script that can be used to remove the specified Storefront Service from the database entirely. The DatabaseName and Sid parameters must be specified to create a script of this type.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Database</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-LocalDatabase**<SwitchParameter>

Specifies whether the database script is to be used in a database instance run on the same controller as other services in the service group. Including this parameter ensures the script creates only the required permissions for local services to access the database schema for Storefront services.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Database</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-Sid**<String>

Specifies the SID of the controller on which the Storefront Service instance to remove from the database is running.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Database</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

System.String

A string containing the required SQL script for application to a database.
Notes
The scripts returned support Microsoft SQL Server Express Edition, Microsoft SQL Server Standard Edition, and Microsoft SQL Server Enterprise Edition databases only, and are generated on the assumption that integrated authentication will be used.

If the ScriptType parameter is not included or set to 'FullDatabase', the full database script is returned, which will:

Create the database schema.
Create the user and the role (providing the schema does not already exist).
Create the logon (providing the schema does not already exist).

If the ScriptType parameter is set to 'Instance', the script will:
Create the user and the role (providing the schema does not already exist).
Create the logon (providing the schema does not already exist) and associate it with a user.

If the ScriptType parameter is set to 'Login', the script will:
Create the logon (providing the schema does not already exist) and associate it with a pre-existing user of the same name.

If the LocalDatabase parameter is included, the NetworkService account will be added to the list of accounts permitted to access the database. This is required only if the database is run on a controller.

If the command fails, the following errors can be returned.

Error Codes
-----------

GetSchemasFailed
The database schema could not be found.

ActiveDirectoryAccountResolutionFailed
The specified Active Directory account or Group could not be found.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-SfDBSchema -DatabaseName MyDB -ServiceGroupName MyServiceGroup > c:\SfSchema.sql
Get the full database schema for site data store of the Storefront Service and copy it to a file called 'c:\SfSchema.sql'.

This script can then be used to create the schema in a pre-existing database named 'MyDB' that does not already contain a Storefront Service site schema.

-------------------------- EXAMPLE 2 --------------------------

c:\PS>Get-SfDBSchema -DatabaseName MyDB -scriptType Login > c:\StorefrontLogins.sql
Get the logon scripts for the Storefront Service.
Get-SfDBVersionChangeScript

Oct 01, 2013
Gets a script that updates the Storefront Service database schema.

Syntax

Get-SfDBVersionChangeScript -DatabaseName <String> -TargetVersion <Version> [-AdminAddress <String>] [-<CommonParameters>]

Detailed Description

Returns a database script that can be used to upgrade or downgrade the site or secondary schema for the Storefront Service from the current schema version to a different version.

Related topics

Get-SfInstalledDBVersion

Parameters

-DatabaseName <String>

Specifies the name of the database instance to which the update applies.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-TargetVersion <Version>

Specifies the version of the database you want to update to.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>localhost</td>
<td>false</td>
</tr>
</tbody>
</table>
Return Values

System.Management.Automation.PSObject

A PSSObject containing the required SQL script for application to a database.

Notes

The PSSObject returned by this cmdlet contains the following properties:

-- Script The raw text of the SQL script to apply the update, or null in the case when no upgrade path to the specified target version exists.

-- NeedExclusiveAccess Indicates whether all services in the service group must be shut down during the update or not.

-- CanUndo Indicates whether the generated script allows the updated schema to be reverted to the state prior to the update.

Scripts to update the schema version are stored in the database so any service in the service group can obtain these scripts. Extreme caution should be exercised when using update scripts. Citrix recommends backing up the database before attempting to upgrade the schema. Database update scripts may require exclusive use of the schema and so may not be able to execute while any Storefront services are running. However, this depends on the specific update being carried out.

After a schema update has been carried out, services that require the previous version of the schema may cease to operate. The ServiceState parameter reported by the Get-SfServiceStatus command provides information about service compatibility. For example, if the schema has been upgraded to a more recent version that a service cannot use, the service reports "DBNewerVersionThanService".

If the command fails, the following errors can be returned.

Error Codes

-----------

NoOp

The operation was successful but had no effect.

NoDBConnections

The database connection string for the Storefront Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for
various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------------------------- EXAMPLE 1 ------------------------------

C:\PS> $update = Get-SfDBVersionChangeScript -DatabaseName MyDb -TargetVersion 1.0.75.0
C:\PS> $update.Script > update_75.sql

Gets an SQL update script to update the current schema to version 1.0.75.0. The resulting update_75.sql script is suitable for direct use with the SQL Server SQLCMD utility.
Get-SfInstalledDBVersion

Oct 01, 2013

Gets a list of all available database schema versions for the Storefront Service.

Syntax

Get-SfInstalledDBVersion [-Upgrade] [-Downgrade] [-AdminAddress <String>] [CommonParameters]

Detailed Description

Returns the current version of the Storefront Service database schema, if no flags are set, otherwise returns versions for which upgrade or downgrade scripts are available and have been stored in the database.

Related topics

Parameters

- **Upgrade**<SwitchParameter>

  Specifies that only schema versions to which the current database version can be updated should be returned.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>false</td>
</tr>
</tbody>
</table>

- **Downgrade**<SwitchParameter>

  Specifies that only schema versions to which the current database version can be reverted should be returned.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>false</td>
</tr>
</tbody>
</table>

- **AdminAddress**<String>

  Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
</tbody>
</table>

Return Values

-
The `Get-SfInstalledDbVersion` command returns objects containing the new definition of the Storefront Service database schema version.

- **Major**: <Integer>
- **Minor**: <Integer>
- **Build**: <Integer>
- **Revision**: <Integer>

**Notes**

If the command fails, the following errors can be returned.

**Error Codes**

- **InvalidParameterCombination**
  Both the Upgrade and Downgrade flags were specified.

- **NoOp**
  The operation was successful but had no effect.

- **NoDBConnections**
  The database connection string for the Storefront Service has not been specified.

- **DatabaseError**
  An error occurred in the service while attempting a database operation.

- **DatabaseNotConfigured**
  The operation could not be completed because the database for the service is not configured.

- **DataStoreException**
  An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

- **PermissionDenied**
  You do not have permission to execute this command.

- **AuthorizationError**
  There was a problem communicating with the Citrix Delegated Administration Service.

- **CommunicationError**
There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-SfInstalledDBVersion

<table>
<thead>
<tr>
<th>Major</th>
<th>Minor</th>
<th>Build</th>
<th>Revision</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>6</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

Get the currently installed version of the Storefront Service database schema.

-------------------------- EXAMPLE 2 --------------------------

c:\PS>Get-SfInstalledDBVersion -Upgrade

<table>
<thead>
<tr>
<th>Major</th>
<th>Minor</th>
<th>Build</th>
<th>Revision</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

Get the versions of the Storefront Service database schema for which upgrade scripts are supplied.
Get-SfIsStorefrontInstalled

Oct 01, 2013
Tells whether StoreFront Services and Privileged Service are installed.

Syntax

Get-SfIsStorefrontInstalled [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Related topics

Parameters

- **-AdminAddress**: <String>

  Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

bool

True if both StoreFront Services and Privileged Service are installed, false otherwise.
Get-SfService

Oct 01, 2013

Gets the service record entries for the Storefront Service.

Syntax

Detailed Description

Returns instances of the Storefront Service that the service publishes. The service records contain account security identifier information that can be used to remove each service from the database.

A database connection for the service is required to use this command.

Related topics

Parameters

- **-Property**<String[]>

  Specifies the properties to be be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

- **-ReturnTotalRecordCount**<SwitchParameter>

  When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Sf_Filtering for details.

| Required? | false |
| Default Value | False |
| Accept Pipeline Input? | false |

- **-MaxRecordCount**<Int32>

  Specifies the maximum number of records to return.

| Required? | false |
| Default Value | 250 |
Accept Pipeline Input? | false |  
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>-Skip&lt;Int32&gt;</td>
<td></td>
</tr>
</tbody>
</table>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>0</td>
</tr>
</tbody>
</table>

Accept Pipeline Input? | false |  
|---|---|

-SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>The default sort order is by name or unique identifier.</td>
</tr>
</tbody>
</table>

Accept Pipeline Input? | false |  
|---|---|

-Filter<String>

Gets records that match a PowerShell-style filter expression. See about_Sf_Filtering for details.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
<tr>
<td>---</td>
<td>---</td>
</tr>
</tbody>
</table>

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
</tbody>
</table>

Accept Pipeline Input? | false |  
|---|---|

Return Values

Citrix.Storefront.Sdk.Service
The Get-SfServiceInstance command returns an object containing the following properties.

Uid <Integer>
Specifies the unique identifier for the service in the group. The unique identifier is an index number.

ServiceHostId <Guid>
Specifies the unique identifier for the service instance.

DNSName <String>
Specifies the domain name of the host on which the service runs.

MachineName <String>
Specifies the short name of the host on which the service runs.

CurrentState <Citrix.Fma.Sdk.ServiceCore.ServiceState>
Specifies whether the service is running, started but inactive, stopped, or failed.

LastStartTime <DateTime>
Specifies the date and time at which the service was last restarted.

LastActivityTime <DateTime>
Specifies the date and time at which the service was last stopped or restarted.

OSType
Specifies the operating system installed on the host on which the service runs.

OSVersion
Specifies the version of the operating system installed on the host on which the service runs.

ServiceVersion
Specifies the version number of the service instance. The version number is a string that reflects the full build version of the service.

DatabaseUserName <string>
Specifies for the service instance the Active Directory account name with permissions to access the database. This will be either the machine account or, if the database is running on a controller, the NetworkService account.

Sid <string>
Specifies the Active Directory account security identifier for the machine on which the service instance is running.

ActiveSiteServices <string[]>
Specifies the names of active site services currently running in the service. Site services are components that perform long-running background processing in some services. This field is empty for services that do not contain site services.
Notes
If the command fails, the following errors can be returned.

Error Codes
------------

UnknownObject
One of the specified objects was not found.

PartialData
Only a subset of the available data was returned.

InvalidFilter
A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase
The query required to get the database was not defined.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------
Get all the instances of the Storefront Service running in the current service group.
Get-SfServiceAddedCapability

Oct 01, 2013
Gets any added capabilities for the Storefront Service on the controller.

Syntax
Get-SfServiceAddedCapability [-AdminAddress <String>] [<CommonParameters>]

Detailed Description
Enables updates to the Storefront Service on the controller to be detected.
You do not need to configure a database connection before using this command.

Related topics

Parameters

- `<AdminAddress <String>>`
  Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
</tbody>
</table>

Return Values

System.String

String containing added capabilities.

Notes
If the command fails, the following errors can be returned.

Error Codes

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-SfServiceAddedCapability
Get the added capabilities of the Storefront Service.
Get-SfServiceInstance

Oct 01, 2013
Gets the service instance entries for the Storefront Service.

Syntax

```
Get-SfServiceInstance [-AdminAddress <String>] [<CommonParameters>]
```

Detailed Description

Returns service interfaces published by the instance of the Storefront Service. Each instance of a service publishes multiple interfaces with distinct interface types, and each of these interfaces is represented as a ServiceInstance object. Service instances can be used to register the service with a central configuration service so that other services can use the functionality.

You do not need to configure a database connection to use this command.

Related topics

Parameters

- **-AdminAddress**<String>

  Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
</tbody>
</table>

Accept Pipeline Input? false

Return Values

Citrix.Storefront.Sdk.ServiceInstance

The Get-SfServiceInstance command returns an object containing the following properties.

- **ServiceGroupUid**<Guid>

  Specifies the unique identifier for the service group of which the service is a member.

- **ServiceGroupName**<String>

  Specifies the name of the service group of which the service is a member.

- **ServiceInstanceUID**<Guid>

  Specifies the unique identifier for registered service instances, which are service instances held by and obtained from a central configuration service. Unregistered service instances do not have unique identifiers.
ServiceType <String>
Specifies the service instance type. For this service, the service instance type is always Sf.

Address
Specifies the address of the service instance. The address can be used to access the service and, when registered in the central configuration service, can be used by other services to access the service.

Binding
Specifies the binding type that must be used to communicate with the service instance. In this release of XenDesktop, the binding type is always 'wcf_HTTP_kerb'. This indicates that the service provides a Windows Communication Foundation endpoint that uses HTTP binding with integrated authentication.

Version
Specifies the version of the service instance. The version number is used to ensure that the correct versions of the services are used for communications.

ServiceAccount <String>
Specifies the Active Directory account name for the machine on which the service instance is running. The account name is used to provide information about the permissions required for interservice communications.

ServiceAccountSid <String>
Specifies the Active Directory account security identifier for the machine on which the service instance is running.

InterfaceType <String>
Specifies the interface type. Each service can provide multiple service instances, each for a different purpose, and the interface defines the purpose. Available interfaces are:

- SDK - for PowerShell operations
- InterService - for operations between different services
- Peer - for communications between services of the same type

Metadata <Citrix.Storefront.Sdk.Metadata[]>
The collection of metadata associated with registered service instances, which are service instances held by and obtained from a central configuration service. Metadata is not stored for unregistered service instances.

Notes
If the command fails, the following errors can be returned.

Error Codes
----------

DatabaseError
An error occurred in the service while attempting a database operation.

**DatabaseNotConfigured**

The operation could not be completed because the database for the service is not configured.

**DataStoreException**

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

**PermissionDenied**

You do not have permission to execute this command.

**AuthorizationError**

There was a problem communicating with the Citrix Delegated Administration Service.

**CommunicationError**

There was a problem communicating with the remote service.

**ExceptionThrown**

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

**Examples**

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-SfServiceInstance

Address            : http://MyServer.com:80/Citrix/StorefrontContract
Binding            : wcf_HTTP_kerb
InterfaceType      : SDK
Metadata           :
MetadataMap        :
ServiceAccount     : ENG\MyAccount$
ServiceAccountSid  : S-1-5-21-2406005612-3133289213-1653143164
ServiceGroupName   : MyServiceGroup
ServiceGroupUid    : a88d2f6b-c00a-4f76-9c38-e8330093b54d
ServiceInstanceUid : 00000000-0000-0000-0000-000000000000
ServiceType        : Sf
Version            : 1

Address            : http://MyServer.com:80/Citrix/StorefrontContract/IServiceApi
Binding            : wcf_HTTP_kerb
InterfaceType      : InterService

ServiceAccount     : ENG\MyAccount
ServiceAccountSid  : S-1-5-21-2406005612-3133289213-1653143164
Get all instances of the Storefront Service running on the specified machine. For remote services, use the AdminAddress parameter to define the service for which the interfaces are required. If the AdminAddress parameter has not been specified for the runspace, service instances running on the local machine are returned.
Get-SfServiceStatus

Oct 01, 2013
Gets the current status of the Storefront Service on the controller.

Syntax

Get-SfServiceStatus [-AdminAddress <String>] [CommonParameters]

Detailed Description

Enables the status of the Storefront Service on the controller to be monitored. If the service has multiple data stores it will return the overall state as an aggregate of all the data store states. For example, if the site data store status is OK and the secondary data store status is DBUnconfigured then it will return DBUnconfigured.

Related topics

Set-SfDataStore
Set-SfDBConnection
Test-SfDBConnection
Get-SfDBConnection
Get-SfDBSchema

Parameters

-AdminAddress <String>

 Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

| Required? | false |
| Default Value | Localhost. Once a value is provided by any cmdlet, this value becomes the default. |
| Accept Pipeline Input? | false |

Return Values

The Get-SfServiceStatus command returns an object containing the status of the Storefront Service together with extra diagnostics information.

DBUnconfigured

The Storefront Service does not have a database connection configured.

DBRejectedConnection
The database rejected the logon attempt from the Storefront Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the Storefront Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBNewerVersionThanService

The version of the Storefront Service currently in use is incompatible with the version of the Storefront Service schema on the database. Upgrade the Storefront Service to a more recent version.

dboOlderVersionThanService

The version of the Storefront Service schema on the database is incompatible with the version of the Storefront Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The Storefront Service is running and is connected to a database containing a valid schema.

Failed

The Storefront Service has failed.

Unknown

(0) The service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

---------

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-SfServiceStatus

DBUnconfigured
Get the current status of the Storefront Service.
Get-SfStorefrontAddress

Oct 01, 2013
Get the high level description of a configuration for storefront addresses, based on a byte array (blob).

Syntax
Get-SfStorefrontAddress [-ByteArray] <Byte[]> [CommonParameters]

Detailed Description
Use this command to convert a configuration byte array into a set of named property settings. The byte array will either have been retrieved from the Broker, or from the New-SfStorefrontAddress cmdlet.

Related topics
Parameters
-ByteArray
Specifies the low-level byte array (blob) to be interpreted.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

Input Type
byte[] The cmdlet accepts the ByteArray parameter as pipeline input.

Return Values
System.Management.Automation.PSObject
This cmdlet outputs a single PSObject with multiple properties. Each property denotes one setting within the configuration set. The following is a summary of the properties and their data types:

Examples
-------------------------------- EXAMPLE 1 --------------------------------
C:\PS> $blob = New-SfStorefrontAddress

C:\PS> Get-SfStorefrontAddress -ByteArray $blob
The first command creates a fresh configuration set in its default state, and stores it in a Windows PowerShell variable. The second command interprets the new blob, and would output the individual properties of the default configuration.

-------------------------------- EXAMPLE 2 --------------------------------
C:\PS> New-SfStorefrontAddress | Get-SfStorefrontAddress
This command creates a fresh configuration set in its default state, and pipes the resulting byte array through to Get-SfStorefrontAddress, which will interpret it and output its individual properties.
Get-SfTask

Oct 01, 2013
Gets the task history for the Storefront Service.

Syntax

Detailed Description
Retums a list of tasks that have run or are currently running within the Storefront Service.

Related topics
Remove-SfTask
Add-SfTaskMetadata
Remove-SfTaskMetadata

Parameters

-TaskId <Guid>
Specifies the task identifier to be returned.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-ReturnTotalRecordCount <SwitchParameter>
When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Sf_Filtering for details.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>False</td>
<td>false</td>
</tr>
</tbody>
</table>

-MaxRecordCount <Int32>
Specifies the maximum number of records to return.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>false</td>
</tr>
</tbody>
</table>
Default Value | 250
---|---
Accept Pipeline Input? | false

**-Skip<Int32>**

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

| Required? | false |
| Default Value | 0 |
| Accept Pipeline Input? | false |

**-SortBy<String>**

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

| Required? | false |
| Default Value | The default sort order is by name or unique identifier. |
| Accept Pipeline Input? | false |

**-Filter<String>**

Gets records that match a PowerShell-style filter expression. See about_Sf_Filtering for details.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

**-AdminAddress<String>**

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

| Required? | false |
| Default Value | Localhost. Once a value is provided by any cmdlet, this value becomes the default. |
| Accept Pipeline Input? | false |

Notes
If the command fails, the following errors can be returned.

Error Codes
-----------

UnknownObject
One of the specified objects was not found.

PartialData
Only a subset of the available data was returned.

InvalidFilter
A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase
The query required to get the database was not defined.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration service.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.
New-SfCluster

Oct 01, 2013
Creates new Storefront cluster with default set of services.

Syntax

New-SfCluster -ServerName <String> -FarmName <String> -XmlServices <Uri[]> [-StorefrontUrl <Uri>] [-RunAsynchronously <Boolean>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The server will have a default set of services containing fully-functionally Storefront server with Authentication, Store, Receiver for Web and Desktop Appliance.

Related topics

Get-SfCluster
Add-SfServerToCluster
Remove-SfServerFromCluster
Set-SfCluster

Parameters

-ServerName <String>
The name of the server to build a cluster on. The name must be one of the values returned by Get-SfCluster

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | false |

-FarmName <String>
Name of the farm that will be used within Store service.

| Required? | true |
| Default Value | |
| Accept Pipeline Input? | false |

-XmlServices <Uri[]>
Collection of the url of xml services that will be used inside a farm. The urls need to be http or https, be absolute and share the same schema and port.

| Required? | true |
-StorefrontUrl\<Uri\>

The url that will be used by Receivers to contact Storefront. Http or https absolute urls are accepted.

| Required? | false |
| Default Value | Server name and http binding. |
| Accept Pipeline Input? | false |

-RunAsynchronously\<Boolean\>  

If set, the command will run asynchronously.

| Required? | false |
| Default Value | false |
| Accept Pipeline Input? | false |

-LoggingId\<Guid\>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
| Default Value | |
| Accept Pipeline Input? | false |

-AdminAddress\<String\>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

| Required? | false |
| Default Value | Localhost. Once a value is provided by any cmdlet, this value becomes the default. |
| Accept Pipeline Input? | false |

Return Values

Returns cluster description or a task, if ran asynchronously.

Examples

-------------------------- EXAMPLE 1 --------------------------

New-SfCluster -FarmName "XdSiteName" -XmlServices http://farm1,http://farm2 -ServerName SfServer -RunAsynchronously $true

Creates a new cluster on server "SfServer". The server will have a default set of services containing fully-functional Storefront server with Authentication, Store, Receiver for Web, Desktop Appliance site and the required infrastructure. The Store service will have a farm named "XdSiteName" that will contain servers farm1 and farm2, whose will be contacted using http on default port 80.
New-SfStorefrontAddress

Syntax

New-SfStorefrontAddress -Name <String> -Url <String> -Enabled <Boolean> -Description <String> [-<CommonParameters>]

Detailed Description

Use this cmdlet to edit the configurations for profile management. The cmdlet defines one input parameter for each settable property. Any number of these settings can be modified in a single call to the cmdlet. The cmdlet also requires the low-level byte array blob containing the original configuration set to be modified. It will return an updated byte array with the settings applied. The resulting byte array can then be stored back at the Broker.

Related topics

Parameters

-Name <String>

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-Url <String>

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-Enabled <Boolean>

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-Description <String>

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

Input Type

None

Return Values

byte[]

The new configuration set, with all of the given modifications applied.

Examples

-------------------------- EXAMPLE 1 --------------------------
C:PS> $blob = New-SfStorefrontAddress
C:PS> $updatedBlob = Set-SfStorefrontAddress -ByteArray $blob -ServiceActive $true -UserStorePath \ProfileServer\Profiles$%USERNAME%,%USERDOMAIN
The first command creates a new user profile configuration in its default state, and stores the byte array in a Windows PowerShell variable. The second command then edits this configuration by setting the ServiceActive property to TRUE (which has the effect of enabling the profile management service), and by setting the path to the profile store. All other settings remain unaffected, and hence in their default state.
Remove-SfServerFromCluster

Oct 01, 2013
Removes server from the cluster.

Syntax

Remove-SfServerFromCluster -ClusterId <Guid> -ServerName <String> [-StorefrontUrl <Uri>] [-FarmName <String>] [-XmlServices <Uri[]>] [-RunAsynchronously <Boolean>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Removes server from the cluster and propagates information to other servers. The configuration of the server is wiped out, so the server can be reused.

Related topics

Get-SfCluster
New-SfCluster
Add-SfServerToCluster
Set-SfCluster

Parameters

-ClusterId <Guid>

The id of the cluster to perform operation on.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
</tr>
</tbody>
</table>

-ServerName <String>

The name of the server to remove from cluster. The name must be one of the values returned by Get-SfCluster.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
</tr>
</tbody>
</table>

-StorefrontUrl <Uri>

The url that will be used by Receivers to contact Storefront. Http or https absolute urls are accepted.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
</tr>
</tbody>
</table>
### FarmName <String>
Name of the farm that will be used within Store service. Either both FarmName and XmlServices need to be specified or none of them.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Server name and http binding.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### XmlServices <Uri[]>
Collection of the url of xml services that will be used inside a farm. The urls need to be http or https, be absolute and share the same schema and port. Either both FarmName and XmlServices need to be specified or none of them.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### RunAsynchronously <Boolean>
If set, the command will run asynchronously.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>false</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

### LoggingId <Guid>
Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>
**-AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Return Values

Returns cluster description or a task, if ran asynchronously.

Examples

--------------- EXAMPLE 1 ---------------

Remove-SfServerFromCluster -ClusterId (Guid) -ServerName BrokenSfServer -RunAsynchronously $true

Removes Server “BrokenSfServer” from a Cluster with id (Guid).
Remove-SfServiceMetadata

Oct 01, 2013
Removes metadata from the given service.

Syntax

Remove-SfServiceMetadata [-ServiceHostId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-SfServiceMetadata [-ServiceHostId] <Guid> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-SfServiceMetadata [-InputObject] <Service[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-SfServiceMetadata [-InputObject] <Service[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to remove metadata from the given service.

Related topics
Set-SfServiceMetadata

Parameters

-ServiceHostId <Guid>

Id of the service

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

-InputObject <Service[]>

Objects to which metadata is to be removed.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-Map <PSObject>
Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]"). The properties whose names match keys in the map will be removed.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

**-Name**<String>

The metadata property to remove.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-LoggingId**<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**-AdminAddress**<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>false</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

Notes

If the command fails, the following errors can be returned.

Error Codes

-----------
InvalidParameterCombination
The cmdlet parameters are inconsistent.

UnknownObject
One of the specified objects was not found.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-SfService | % { Remove-SfServiceMetadata -Map $_.MetadataMap }  
Remove all metadata from all service objects.
Remove-SfTask

Oct 01, 2013
Removes from the database completed tasks for the Storefront Service.

Syntax

Remove-SfTask [-TaskId] <Guid> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Enables completed tasks that have run within the Storefront Service to be removed from the database.

Related topics

Get-SfTask
Add-SfTaskMetadata
Remove-SfTaskMetadata

Parameters

-TaskId<Guid>

Specifies the identifier for the task to be removed.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByPropertyName)</td>
</tr>
</tbody>
</table>

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<th>Default Value</th>
<th>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

**Input Type**

System.Management.Automation.PSObject Objects containing the TaskId parameter can be piped to the Remove-SfTask command.

**Notes**

If the command fails, the following errors can be returned.

**Error Codes**

----------

**DatabaseError**

An error occurred in the service while attempting a database operation.

**DatabaseNotConfigured**

The operation could not be completed because the database for the service is not configured.

**ServiceStatusInvalidDb**

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

**PermissionDenied**

You do not have permission to execute this command.

**AuthorizationError**

There was a problem communicating with the Citrix Delegated Administration service.

**OperationDeniedByConfigurationLoggingError**

The operation could not be performed because of a configuration logging error.

**CommunicationError**

There was a problem communicating with the remote service.

**ExceptionThrown**

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.
Remove-SfTaskMetadata

Oct 01, 2013
Removes metadata from the given Task.

Syntax

Remove-SfTaskMetadata [-TaskId] <Guid> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Remove-SfTaskMetadata [-TaskId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Remove-SfTaskMetadata [-InputObject] <Task[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Remove-SfTaskMetadata [-InputObject] <Task[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [CommonParameters]

Detailed Description

Provides the ability to remove metadata from the given Task.

Related topics

Set-SfTaskMetadata

Parameters

-**TaskId**: Guid

Id of the Task

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyName)</td>

</tbody>
</table>

-**InputObject**: Task[]

Objects to which the metadata is to be added.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-**Name**: String
The metadata property to remove.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>false</td>
</tr>
</tbody>
</table>

-**Map**<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with `@{"name1" = "val1"; "name2" = "val2"}`) or a string dictionary (created with `new-object "System.Collections.Generic.Dictionary[String,String]"`). The properties whose names match keys in the map will be removed.

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------- EXAMPLE 1 ---------------------

c:\PS>Get-SfTask | % { Remove-SfTaskMetadata -Map $_.MetadataMap }
Remove all metadata from all Task objects.
Reset-SfServiceGroupMembership

Oct 01, 2013
Reloads the access permissions and configuration service locations for the Storefront Service.

Syntax

Reset-SfServiceGroupMembership [-ConfigServiceInstance] <ServiceInstance[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Enables you to reload Storefront Service access permissions and configuration service locations. The Reset-SfServiceGroupMembership command must be run on at least one instance of the service type (Sf) after installation and registration with the configuration service. Without this operation, the Storefront services will be unable to communicate with other services in the XenDesktop deployment. When the command is run, the services are updated when additional services are added to the deployment, provided that the configuration service is not stopped. The Reset-SfServiceGroupMembership command can be run again to refresh this information if automatic updates do not occur when new services are added to the deployment. If more than one configuration service instance is passed to the command, the first instance that meets the expected service type requirements is used.

Related topics

Parameters

- **-ConfigServiceInstance**<ServiceInstance[]>

  Specifies the configuration service instance object that represents the service instance for the type 'InterService' that references a configuration service for the deployment.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **-LoggingId**<Guid>

  Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

- **-AdminAddress**<String>

  Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
<td>false</td>
</tr>
</tbody>
</table>
Input Type
Citrix.Storefront.Sdk.ServiceInstance[] Service instances containing a ServiceInstance object that refers to the central configuration service interservice interface can be piped to the Reset-SfServiceGroupMembership command.

Notes
If the command fails, the following errors can be returned.

Error Codes
----------

NoSuitableServiceInstance
None of the supplied service instance objects were suitable for resetting service group membership.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples
-------------------------- EXAMPLE 1 --------------------------
c:\PS>Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-SfServiceGroupMembership
Reset the service group membership for a service in a deployment where the configuration service is configured and running on the same machine as the service.

-------------------------- EXAMPLE 2 --------------------------
c:\PS>Get-ConfigRegisteredServiceInstance -ServiceType Config -AdminAddress OtherServer.example.com | Reset-SfServiceGroupMembership
Reset the service group membership for a service in a deployment where the configuration service that is configured and running on a machine named 'OtherServer.example.com'.

Set-SfCluster

Oct 01, 2013
Sets the parameters on the given cluster.

Syntax

Set-SfCluster -ClusterId <Guid> [-StorefrontUrl <Uri>] [-FarmName <String>] [-XmlServices <Uri>] [-RunAsynchronously <Boolean>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Sets the parameters on the given cluster and propagate the changes to all servers within a given cluster.

Related topics

Get-SfCluster
New-SfCluster
Add-SfServerToCluster
Remove-SfServerFromCluster

Parameters

-ClusterId <Guid>
The id of the cluster to perform operation on.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-StorefrontUrl <Uri>
The url that will be used by Receivers to contact Storefront. Http or https absolute urls are accepted.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Server name and http binding.</td>
<td>false</td>
</tr>
</tbody>
</table>

-FarmName <String>
Name of the farm that will be used within Store service. Either both FarmName and XmlServices need to be specified or none of them.
### -XmlServices <Uri[]>

Collection of the url of xml services that will be used inside a farm. The urls need to be http or https, be absolute and share the same schema and port. Either both FarmName and XmlServices need to be specified or none of them.

| Required? | false |
| Default Value |  |
| Accept Pipeline Input? | false |

### -RunAsynchronously <Boolean>

If set, the command will run asynchronously.

| Required? | false |
| Default Value | false |
| Accept Pipeline Input? | false |

### -LoggingId <Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
| Default Value |  |
| Accept Pipeline Input? | false |

### -AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

| Required? | false |
| Default Value | Localhost. Once a value is provided by any cmdlet, this value becomes the default. |
| Accept Pipeline Input? | false |
Return Values

Returns cluster description or a task, if ran asynchronously.

Examples

-------------------------- EXAMPLE 1 --------------------------

Set-SfCluster -StorefrontUrl http://SfUrl -ClusterId (Guid) -RunAsynchronously $true
Sets a Storefront Url in a Cluster with id (Guid). Propagates changes to all servers that are part of the cluster.
Set-SfDBConnection

Oct 01, 2013
Configures a database connection for the Storefront Service.

Syntax

Set-SfDBConnection [-DBConnection] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Configures a connection to a database in which the Storefront Service can store its state. The service will attempt to connect and start using the database immediately after the connection is configured. The database connection string is updated to the specified value regardless of whether it is valid or not. Specifying an invalid connection string prevents a service from functioning until the error is corrected.

After a connection is configured, you cannot alter it without first clearing it (by setting the connection to $null).

You do not need to configure a database connection to use this command.

Related topics

Get-SfServiceStatus
Get-SfDBConnection
Test-SfDBConnection

Parameters

-**DBConnection**<String>

  Specifies the database connection string to be used by the Storefront Service. Passing in $null will clear any existing database connection configured.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-**LoggingId**<Guid>

  Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>false</td>
<td>false</td>
</tr>
</tbody>
</table>

-**AdminAddress**<String>

  Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>
Return Values

The Set-SfDBConnection command returns an object containing the status of the Storefront Service together with extra diagnostics information.

DBUnconfigured
The Storefront Service does not have a database connection configured.

DBRejectedConnection
The database rejected the logon attempt from the Storefront Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured
The expected stored procedures are missing from the database. This may be because the Storefront Service schema has not been added to the database.

DBNotFound
The specified database could not be located with the configured connection string.

DBNewerVersionThanService
The version of the Storefront Service currently in use is incompatible with the version of the Storefront Service schema on the database. Upgrade the Storefront Service to a more recent version.

DBOlderVersionThanService
The version of the Storefront Service schema on the database is incompatible with the version of the Storefront Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress
A database schema upgrade is currently in progress.

OK
The Storefront Service is running and is connected to a database containing a valid schema.

Failed
The Storefront Service has failed.

Unknown
The status of the Storefront Service cannot be determined.

Notes
If the command fails, the following errors can be returned.

Error Codes
-----------
InvalidDBConnectionString
The database connection string has an invalid format.

DatabaseConnectionDetailsAlreadyConfigured
There was already a database connection configured. After a configuration is set, it can only be set to $null.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationExceptionLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------
c:\PS>Set-SfDBConnection -DBConnection "Server=servername\SQLEXPRESS;Initial Catalog = databaseName; Integrated Security = True"
OK
Configures a database connection string for the Storefront Service.

-------------------------- EXAMPLE 2 --------------------------
c:\PS>Set-SfDBConnection -DBConnection "Invalid Connection String"

Invalid database connection string format.
Configures an invalid database connection string for the Storefront Service.
Set-SfServiceMetadata

Oct 01, 2013
Adds or updates metadata on the given service.

Syntax

Set-SfServiceMetadata [-ServiceHostId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-SfServiceMetadata [-ServiceHostId] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-SfServiceMetadata [-InputObject] <Service[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-SfServiceMetadata [-InputObject] <Service[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description
Allows you to store additional custom data against given service objects.

Related topics
Remove-SfServiceMetadata

Parameters

-ServiceHostId <Guid>
Id of the service

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

-InputObject <Service[]>
Objects to which metadata is to be added.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

-Map <PSObject>
Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with ```@{"name1" = "val1"; "name2" = "val2"}``) or a string dictionary (created with ```new-object System.Collections.Generic.Dictionary[String,String]```).

| Required? | true |
| Default Value |
| Accept Pipeline Input? | true (ByValue) |

- **-Name**: String

Specifies the property name of the metadata to be added. The property must be unique for the service specified. The property cannot contain any of the following characters \/:#.*?=<>|[]"

| Required? | true |
| Default Value |
| Accept Pipeline Input? | false |

- **-Value**: String

Specifies the value for the property.

| Required? | true |
| Default Value |
| Accept Pipeline Input? | false |

- **-LoggingId**: Guid

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
| Default Value |
| Accept Pipeline Input? | false |

- **-AdminAddress**: String

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

| Required? | false |
| Default Value |
| Accept Pipeline Input? |
Default Value: Localhost. Once a value is provided by any cmdlet, this value becomes the default.

Accept Pipeline Input?: false

Return Values

Set-SfServiceMetadata returns a dictionary containing the new (name, value)-pairs.

Key <string>
Specifies the name of the property.

Value <string>
Specifies the value for the property.

Notes
If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination
The cmdlet parameters are inconsistent.

UnknownObject
One of the specified objects was not found.

DatabaseError
An error occurred in the service while attempting a database operation.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied
You do not have permission to execute this command.

AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.
ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS> Set-SfServiceMetadata -ServiceHostId 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>property</td>
<td>value</td>
</tr>
</tbody>
</table>

Add metadata with a name of 'property' and a value of 'value' to the service with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.
Set-SfTaskMetadata

Oct 01, 2013
Adds or updates metadata on the given Task.

Syntax

Set-SfTaskMetadata [-TaskId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-SfTaskMetadata [-TaskId] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-SfTaskMetadata [-InputObject] <Task[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-SfTaskMetadata [-InputObject] <Task[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability for additional custom data to be stored against given Task objects.

Related topics

Remove-SfTaskMetadata

Parameters

- **TaskId**: <Guid>
  
  Id of the Task

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue, ByPropertyName)</td>
</tr>
</tbody>
</table>

- **InputObject**: <Task[]>
  
  Objects to which the metadata is to be added.

<table>
<thead>
<tr>
<th>Required?</th>
<th>true</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Value</td>
<td></td>
</tr>
<tr>
<td>Accept Pipeline Input?</td>
<td>true (ByValue)</td>
</tr>
</tbody>
</table>

- **Map**: <PSObject>

https://docs.citrix.com  © 1999-2017 Citrix Systems, Inc. All rights reserved.  p.2583
Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

| Required? | true |
| Default Value |  |
| Accept Pipeline Input? | true (ByValue) |

**-Name<String>**

Specifies the property name of the metadata to be added. The property must be unique for the Task specified. The property cannot contain any of the following characters \/:*?=<>|[]"'

| Required? | true |
| Default Value |  |
| Accept Pipeline Input? | false |

**-Value<String>**

Specifies the value for the property.

| Required? | true |
| Default Value |  |
| Accept Pipeline Input? | false |

**-LoggingId<Guid>**

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

| Required? | false |
| Default Value |  |
| Accept Pipeline Input? | false |

**-AdminAddress<String>**

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

| Required? | false |
Default Value | Localhost. Once a value is provided by any cmdlet, this value becomes the default.
---|---
Accept Pipeline Input? | false

Return Values

Set-SfTaskMetadata returns a dictionary containing the new (name, value)-pairs.

Key <string>

Specifies the name of the property.

Value <string>

Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

--------

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.
ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------
c:\PS>Set-SfTaskMetadata -TaskId 4CECC26E-48E1-423F-A1F0-2A06DD0805C -Name property -Value value

<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>property</td>
<td>value</td>
</tr>
</tbody>
</table>

Add metadata with a name of 'property' and a value of 'value' to the Task with the identifier '4CECC26E-48E1-423F-A1F0-2A06DD0805C'.
Test-SfDBConnection

Oct 01, 2013
Tests a database connection for the Storefront Service.

Syntax

Test-SfDBConnection [-DBConnection] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Tests a connection to the database in which the Storefront Service can store its state. The service will attempt to connect to the database without affecting the current connection to the database.

You do not have to clear the connection to use this command.

Related topics

Get-SfServiceStatus

Get-SfDBConnection

Set-SfDBConnection

Parameters

-DBConnection <String>

Specifies the database connection string to be tested by the Storefront Service.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-LoggingId <Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. <table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
<td>false</td>
</tr>
</tbody>
</table>

-AdminAddress <String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

<table>
<thead>
<tr>
<th>Required?</th>
<th>Default Value</th>
<th>Accept Pipeline Input?</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Localhost. Once a value is provided by any cmdlet, this value becomes the default.</td>
<td>false</td>
</tr>
</tbody>
</table>
Return Values

The Test-SfDBConnection command returns an object containing the status of the Storefront Service if the connection string of the specified data store were to be set to the string being tested, together with extra diagnostics information for the specified connection string.

DBRejectedConnection

The database rejected the logon attempt from the Storefront Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the Storefront Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBNewerVersionThanService

The version of the Storefront Service currently in use is incompatible with the version of the Storefront Service schema on the database. Upgrade the Storefront Service to a more recent version.

DBOlderVersionThanService

The version of the Storefront Service schema on the database is incompatible with the version of the Storefront Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The Set-SfDBConnection command would succeed if it were executed with the supplied connection string.

Failed

The Storefront Service has failed.

Unknown

The status of the Storefront Service cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

-------------

InvalidDBConnectionString

The database connection string has an invalid format.

PermissionDenied

You do not have permission to execute this command.
AuthorizationError
There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError
The operation could not be performed because of a configuration logging error.

CommunicationError
There was a problem communicating with the remote service.

ExceptionThrown
An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples
-------------------------- EXAMPLE 1 --------------------------
c:\PS>Test-SfDBConnection -DBConnection "Server=serverName\SQLEXPRESS;Initial Catalog = databaseName; Integrated Security = True"
OK
Tests a database connection string for the Storefront Service.

-------------------------- EXAMPLE 2 --------------------------
c:\PS>Test-SfDBConnection -DBConnection "Invalid Connection String"
Invalid database connection string format.
Tests an invalid database connection string for the Storefront Service.
Policy settings reference

Mar 07, 2013
Policies contain settings that are applied when the policy is enforced. You configure these settings using Studio in XenDesktop. If required, you can also use Active Directory Group Policy Editor.

The descriptions for each policy setting include the following information:
- The name of the policy setting
- The Citrix products to which the policy setting applies
- The additional settings, if applicable, required to enable a particular feature
- Other settings that are similar to the policy setting in question, if applicable
# Policy Settings: Quick Reference Table

Jun 19, 2013

The following tables present settings you can configure within a policy. Find the task you want to perform in the left column, then locate its corresponding setting in the right column.

## Audio

<table>
<thead>
<tr>
<th>To perform this task</th>
<th>Use this policy setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Control whether to allow the use of multiple audio devices</td>
<td>Audio Plug N Play</td>
</tr>
<tr>
<td>Control whether to allow audio input from microphones on the user device</td>
<td>Client microphone redirection</td>
</tr>
<tr>
<td>Control audio quality on the user device</td>
<td>Audio quality</td>
</tr>
<tr>
<td>Control audio mapping to speakers on the user device</td>
<td>Client audio redirection</td>
</tr>
</tbody>
</table>

## Bandwidth for user devices

<table>
<thead>
<tr>
<th>To limit bandwidth used for:</th>
<th>Use this policy setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client audio mapping</td>
<td>Audio redirection bandwidth limit or</td>
</tr>
<tr>
<td></td>
<td>Audio redirection bandwidth limit percent</td>
</tr>
<tr>
<td>Cut-and-paste using local clipboard</td>
<td>Clipboard redirection bandwidth limit or</td>
</tr>
<tr>
<td></td>
<td>Clipboard redirection bandwidth limit percent</td>
</tr>
<tr>
<td>Access in a session to local client drives</td>
<td>File redirection bandwidth limit or</td>
</tr>
<tr>
<td></td>
<td>File redirection bandwidth limit percent</td>
</tr>
<tr>
<td>HDX MediaStream Multimedia Acceleration</td>
<td>HDX MediaStream Multimedia Acceleration bandwidth limit or</td>
</tr>
<tr>
<td></td>
<td>HDX MediaStream Multimedia Acceleration bandwidth limit percent</td>
</tr>
<tr>
<td>Client session</td>
<td>Overall session bandwidth limit</td>
</tr>
<tr>
<td>Printing</td>
<td>Printer redirection bandwidth limit or</td>
</tr>
<tr>
<td>To limit bandwidth used for:</td>
<td>Use this policy setting:</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>------------------------</td>
</tr>
</tbody>
</table>
| TWAIN devices (such as a camera or scanner) | • TWAIN device redirection bandwidth limit or   
• TWAIN device redirection bandwidth limit percent |
| USB devices | • Client USB device redirection bandwidth limit or   
• Client USB device redirection bandwidth limit percent |

Redirection of client drives and user devices

<table>
<thead>
<tr>
<th>To perform this task:</th>
<th>Use this policy setting:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Control whether or not drives on the user device are connected when users log on to the server</td>
<td>Auto connect client drives</td>
</tr>
<tr>
<td>Control cut-and-paste data transfer between the server and the local clipboard</td>
<td>Client clipboard redirection</td>
</tr>
<tr>
<td>Control how drives map from the user device</td>
<td>Client drive redirection</td>
</tr>
</tbody>
</table>
| Control whether users' local hard drives are available in a session | • Client fixed drives and   
• Client drive redirection |
| Control whether users' local floppy drives are available in a session | • Client floppy drives and   
• Client drive redirection |
| Control whether users' network drives are available in a session | • Client network drives and   
• Client drive redirection |
| Control whether users' local CD, DVD, or Blu-ray drives are available in a session | • Client optical drives and   
• Client drive redirection |
| Control whether users' local removable drives are available in a session | • Client removable drives and   
• Client drive redirection |
| Control whether users' TWAIN devices, such as scanners and cameras, are available in a session and control compression of image data transfers | • Client TWAIN device redirection   
• TWAIN compression redirection |
| Control whether USB devices are available in a session | • Client USB device redirection and   
• Client USB device redirection bandwidth limit or   
• Client USB device redirection bandwidth limit percent |
### Client USB device redirection rules

<table>
<thead>
<tr>
<th>To perform this task</th>
<th>Use this policy setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Improve the speed of writing and copying files to a client disk over a WAN</td>
<td>Use asynchronous writes</td>
</tr>
</tbody>

ICA policy settings

Dec 13, 2013
The ICA section contains policy settings related to ICA listener connections and mapping to the Clipboard.

Client clipboard redirection
This setting allows or prevents the Clipboard on the user device being mapped to the Clipboard on the server.
By default, clipboard redirection is allowed.
To prevent cut-and-paste data transfer between a session and the local Clipboard, select Prohibit. Users can still cut and paste data between applications running in sessions.
After allowing this setting, configure the maximum allowed bandwidth the Clipboard can consume in a client connection using the Clipboard redirection bandwidth limit or the Clipboard redirection bandwidth limit percent settings.

Desktop launches
This setting allows or prevents non-administrative users connecting to a desktop session on the server.
By default, non-administrative users cannot connect to these sessions.

ICA listener connection timeout
This setting specifies the maximum wait time for a connection using the ICA protocol to be completed.
By default, the maximum wait time is 120000 milliseconds, or two minutes.

ICA listener port number
This setting specifies the TCP/IP port number used by the ICA protocol on the server.
By default, the port number is set to 1494.
Valid port numbers must be in the range of 0–65535 and must not conflict with other well-known port numbers. If you change the port number, restart the server for the new value to take effect. If you change the port number on the server, you must also change it on every Receiver or plug-in that connects to the server.

Launching of non-published programs during client connection
This setting specifies whether to launch initial applications or published applications through ICA or RDP on the server.
By default, only published applications are allowed to launch.

Read-only clipboard
This setting enables or disables the copying and pasting of data from the session to the local user device.
By default, this setting is disabled and users can copy and paste data from the session to the local user device and from the local user device to the session.
When enabled, users can cut and paste data only from the local user device to the session.
When enabling this setting, make sure the Client clipboard redirection setting is present and set to Allowed. If this setting is disabled, the Clipboard on the user device is not mapped to the Clipboard on the server, and users cannot copy and paste data between the session and the local user device.
Audio policy settings

Dec 13, 2013

The Audio section contains policy settings you can configure to permit user devices to send and receive audio in sessions without reducing performance.

Audio over UDP real-time transport

This setting allows or prevents the transmission and receipt of audio between the VDA and user device over RTP using the User Datagram Protocol (UDP). When this setting is disabled, audio is sent and received over TCP.

By default, audio over UDP is allowed.

Audio Plug N Play

This setting allows or prevents the use of multiple audio devices to record and play sound.

By default, the use of multiple audio devices is allowed.

Audio quality

This setting specifies the quality level of sound received in user sessions.

By default, sound quality is set to High - high definition audio.

To control sound quality, choose one of the following options:
- Select Low - for low speed connections for low-bandwidth connections. Sounds sent to the client are compressed up to 16 Kbps. This compression results in a significant decrease in the quality of the sound but allows reasonable performance for a low-bandwidth connection.
- Select Medium - optimized for speech for most LAN-based connections. Sounds sent to the client are compressed up to 64 Kbps.
- Select High - high definition audio for connections where bandwidth is plentiful and sound quality is important. Clients can play sound at its native rate. Sounds can use up to 1.3 Mbps of bandwidth to play clearly. Transmitting this amount of data can result in increased CPU utilization and network congestion.

Bandwidth is consumed only while audio is recording or playing. If both occur at the same time, the bandwidth consumption is doubled.

To specify the maximum amount of bandwidth, configure the Audio redirection bandwidth limit or the Audio redirection bandwidth limit percent settings.

Client audio redirection

This setting specifies whether applications hosted on the server can play sounds through a sound device installed on the user device. This setting also specifies whether users can record audio input.

By default, audio redirection is allowed.

After allowing this setting, you can limit the bandwidth consumed by playing or recording audio. Limiting the amount of bandwidth consumed by audio can improve application performance but may also degrade audio quality. Bandwidth is consumed only while audio is recording or playing. If both occur at the same time, the bandwidth consumption doubles.
To specify the maximum amount of bandwidth, configure the Audio redirection bandwidth limit or the Audio redirection bandwidth limit percent settings.

Client microphone redirection

This setting enables or disables client microphone redirection. When enabled, users can use microphones to record audio input in a session.

By default, microphone redirection is allowed.

For security, users are alerted when servers that are not trusted by their devices try to access microphones. Users can choose to accept or not accept access. Users can disable the alert on Citrix Receiver.

If the Client audio redirection setting is disabled on the user device, this rule has no effect.
Auto Client Reconnect policy settings

Dec 13, 2013
The Auto Client Reconnect section contains policy settings for controlling automatic reconnection of sessions.

Auto client reconnect

This setting allows or prevents automatic reconnection by the same client after a connection has been interrupted.

By default, automatic reconnection is allowed.

Allowing automatic reconnection allows users to resume working where they were interrupted when a connection was broken. Automatic reconnection detects broken connections and then reconnects the users to their sessions.

However, automatic reconnection can result in a new session being launched (instead of reconnecting to an existing session) if Receiver's cookie, containing the key to the session ID and credentials, is not used. The cookie is not used if it has expired, for example, because of a delay in reconnection, or if credentials must be reentered. Auto client reconnect is not triggered if users intentionally disconnect.

Auto client reconnect authentication

This setting requires authentication for automatic client reconnections.

By default, authentication is not required.

When a user initially logs on, XenDesktop encrypts and stores the user credentials in memory and creates a cookie containing the encryption key which is sent to Receiver. When this setting is added, cookies are not used. Instead, XenDesktop displays a dialog box to users requesting credentials when the plug-in attempts to reconnect automatically.

Auto client reconnect logging

This setting enables or disables the recording of auto client reconnections in the event log.

By default, logging is disabled.

When logging is enabled, the server's System log captures information about successful and failed automatic reconnection events. A site does not provide a combined log of reconnection events for all servers.
Bandwidth policy settings

Dec 13, 2013

The Bandwidth section contains policy settings you can configure to avoid performance problems related to client session bandwidth use.

Important: Using these policy settings in conjunction with the Multi-Stream policy settings may produce unexpected results. If you use Multi-Stream settings in a policy, ensure these bandwidth limit policy settings are not included.

Audio redirection bandwidth limit

This setting specifies the maximum allowed bandwidth, in kilobits per second, for playing or recording audio in a user session.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the Audio redirection bandwidth limit percent setting, the most restrictive setting (with the lower value) is applied.

Audio redirection bandwidth limit percent

This setting specifies the maximum allowed bandwidth limit for playing or recording audio as a percentage of the total session bandwidth.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the Audio redirection bandwidth limit setting, the most restrictive setting (with the lower value) is applied.

If you configure this setting, you must also configure the Overall session bandwidth limit setting which specifies the total amount of bandwidth available for client sessions.

Client USB device redirection bandwidth limit

This setting specifies the maximum allowed bandwidth, in kilobits per second, for the redirection of USB devices to and from the client.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the Client USB device redirection bandwidth limit percent setting, the most restrictive setting (with the lower value) is applied.

Client USB device redirection bandwidth limit percent

This setting specifies the maximum allowed bandwidth for the redirection of USB devices to and from the client as a percentage of the total session bandwidth.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the Client USB device redirection bandwidth limit setting, the most restrictive setting (with the lower value) is applied.

If you configure this setting, you must also configure the Overall session bandwidth limit setting which specifies the total amount of bandwidth available for client sessions.
Clipboard redirection bandwidth limit

This setting specifies the maximum allowed bandwidth, in kilobits per second, for data transfer between a session and the local Clipboard.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the Clipboard redirection bandwidth limit percent setting, the most restrictive setting (with the lower value) is applied.

Clipboard redirection bandwidth limit percent

This setting specifies the maximum allowed bandwidth for data transfer between a session and the local Clipboard as a percentage of the total session bandwidth.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the Clipboard redirection bandwidth limit setting, the most restrictive setting (with the lower value) is applied.

If you configure this setting, you must also configure the Overall session bandwidth limit setting which specifies the total amount of bandwidth available for client sessions.

COM port redirection bandwidth limit

Note: For XenDesktop 7, configure this setting using the registry. For more information, see Configure COM Port and LPT Port Redirection settings using the registry.

This setting specifies the maximum allowed bandwidth in kilobits per second for accessing a COM port in a client connection. If you enter a value for this setting and a value for the COM port redirection bandwidth limit percent setting, the most restrictive setting (with the lower value) is applied.

COM port redirection bandwidth limit percent

Note: For XenDesktop 7, configure this setting using the registry. For more information, see Configure COM Port and LPT Port Redirection settings using the registry.

This setting specifies the maximum allowed bandwidth for accessing COM ports in a client connection as a percentage of the total session bandwidth.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the COM port redirection bandwidth limit setting, the most restrictive setting (with the lower value) is applied.

If you configure this setting, you must also configure the Overall session bandwidth limit setting which specifies the total amount of bandwidth available for client sessions.

File redirection bandwidth limit

This setting specifies the maximum allowed bandwidth, in kilobits per second, for accessing a client drive in a user session.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the File redirection bandwidth limit percent setting, the most restrictive setting (with the lower value) takes effect.
File redirection bandwidth limit percent

This setting specifies the maximum allowed bandwidth limit for accessing client drives as a percentage of the total session bandwidth.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the File redirection bandwidth limit setting, the most restrictive setting (with the lower value) is applied.

If you configure this setting, you must also configure the Overall session bandwidth limit setting which specifies the total amount of bandwidth available for client sessions.

HDX MediaStream Multimedia Acceleration bandwidth limit

This setting specifies the maximum allowed bandwidth limit, in kilobits per second, for delivering streaming audio and video using HDX MediaStream Multimedia Acceleration.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the HDX MediaStream Multimedia Acceleration bandwidth limit percent setting, the most restrictive setting (with the lower value) takes effect.

HDX MediaStream Multimedia Acceleration bandwidth limit percent

This setting specifies the maximum allowed bandwidth for delivering streaming audio and video using HDX MediaStream Multimedia Acceleration as a percentage of the total session bandwidth.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the HDX MediaStream Multimedia Acceleration bandwidth limit setting, the most restrictive setting (with the lower value) takes effect.

If you configure this setting, you must also configure the Overall session bandwidth limit setting which specifies the total amount of bandwidth available for client sessions.

LPT port redirection bandwidth limit

Note: For XenDesktop 7, configure this setting using the registry. For more information, see Configure COM Port and LPT Port Redirection settings using the registry.

This setting specifies the maximum allowed bandwidth, in kilobits per second, for print jobs using an LPT port in a single user session.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the LPT port redirection bandwidth limit percent setting, the most restrictive setting (with the lower value) is applied.

LPT port redirection bandwidth limit percent

Note: For XenDesktop 7, configure this setting using the registry. For more information, see Configure COM Port and LPT Port Redirection settings using the registry.

This setting specifies the bandwidth limit for print jobs using an LPT port in a single client session as a percentage of the total session bandwidth.
By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the LPT port redirection bandwidth limit setting, the most restrictive setting (with the lower value) is applied.

If you configure this setting, you must also configure the Overall session bandwidth limit setting which specifies the total amount of bandwidth available for client sessions.

**Overall session bandwidth limit**

This setting specifies the total amount of bandwidth available, in kilobits per second, for user sessions.

By default, no maximum (zero) is specified.

Limiting the amount of bandwidth consumed by a client connection can improve performance when other applications outside the client connection are competing for limited bandwidth.

**Printer redirection bandwidth limit**

This setting specifies the maximum allowed bandwidth, in kilobits per second, for accessing client printers in a user session.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the Printer redirection bandwidth limit percent setting, the most restrictive setting (with the lower value) is applied.

**Printer redirection bandwidth limit percent**

This setting specifies the maximum allowed bandwidth for accessing client printers as a percentage of the total session bandwidth.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the Printer redirection bandwidth limit percent setting, the most restrictive setting (with the lower value) is applied.

If you configure this setting, you must also configure the Overall session bandwidth limit setting which specifies the total amount of bandwidth available for client sessions.

**TWAIN device redirection bandwidth limit**

This setting specifies the maximum allowed bandwidth, in kilobits per second, for controlling TWAIN imaging devices from published applications.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the TWAIN device redirection bandwidth limit percent setting, the most restrictive setting (with the lower value) is applied.

**TWAIN device redirection bandwidth limit percent**

This setting specifies the maximum allowed bandwidth for controlling TWAIN imaging devices from published applications as a percentage of the total session bandwidth.

By default, no maximum (zero) is specified.
If you enter a value for this setting and a value for the TWAIN device redirection bandwidth limit setting, the most restrictive setting (with the lower value) is applied.

If you configure this setting, you must also configure the Overall session bandwidth limit setting which specifies the total amount of bandwidth available for client sessions.
Client Sensors policy settings

Dec 13, 2013
The Client Sensors section contains policy settings for controlling how mobile device sensor information is handled in a user session.

Allow applications to use the physical location of the client device

This setting determines whether applications running in a session on a mobile device are allowed to use the physical location of the user device.

By default, the use of location information is prohibited.

When this setting is prohibited, attempts by an application to retrieve location information return a “permission denied” value.

When this setting is allowed, a user can prohibit use of location information by denying a Receiver request to access the location. Android and iOS devices prompt at the first request for location information in each session.

When developing hosted applications that use the Allow applications to use the physical location of the client device setting, consider the following:

- A location-enabled application should not rely on location information being available because:
  - A user might not allow access to location information.
  - The location might not be available or might change while the application is running.
  - A user might connect to the application session from a different device that does not support location information.

- A location-enabled application must:
  - Have the location feature off by default.
  - Provide a user option to allow or disallow the feature while the application is running.
  - Provide a user option to clear location data that is cached by the application. (Receiver does not cache location data.)

- A location-enabled application must manage the granularity of the location information so that the data acquired is appropriate to the purpose of the application and conforms to regulations in all relevant jurisdictions.

- A secure connection (for example, using SSL/TLS or a VPN) should be enforced when using location services. Citrix Receiver should connect to trusted servers.

- Consider obtaining legal advice regarding the use of location services.
The Desktop UI section contains policy settings that control visual effects, such as desktop wallpaper, menu animations, and drag-and-drop images, to manage the bandwidth used in client connections. You can improve application performance on a WAN by limiting bandwidth usage.

Desktop Composition Redirection
This setting specifies whether to use the processing capabilities of the graphics processing unit (GPU) or integrated graphics processor (IGP) on the user device for local DirectX graphics rendering to provide users with a more fluid Windows desktop experience. When enabled, Desktop Composition Redirection delivers a highly responsive Windows experience while maintaining high scalability on the server.

By default, Desktop Composition Redirection is enabled.

To turn off Desktop Composition Redirection and reduce the bandwidth required in user sessions, select Disabled when adding this setting to a policy.

Desktop Composition Redirection graphics quality
This setting specifies the quality of graphics used for Desktop Composition Redirection. By default, this is set to high. Choose from High, Medium, Low, or Lossless quality.

Desktop wallpaper
This setting allows or prevents wallpaper showing in user sessions. By default, user sessions can show wallpaper.

To turn off desktop wallpaper and reduce the bandwidth required in user sessions, select Prohibited when adding this setting to a policy.

Menu animation
This setting allows or prevents menu animation in user sessions. By default, menu animation is allowed.

Menu animation is a Microsoft personal preference setting that causes a menu to appear after a short delay, either by scrolling or fading in. When this policy setting is set to Allowed, an arrow icon appears at the bottom of the menu. The menu appears when you point to that arrow.

View window contents while dragging
This setting allows or prevents the display of window contents when dragging a window across the screen. By default, viewing window contents is allowed.

When set to Allowed, the entire window appears to move when you drag it. When set to Prohibited, only the window
outline appears to move until you drop it.
End User Monitoring policy settings

Dec 13, 2013
The End User Monitoring section contains policy settings for measuring session traffic.

ICA round trip calculation
This setting determines whether ICA round trip calculations are performed for active connections.
By default, calculations for active connections are enabled.
By default, each ICA round trip measurement initiation is delayed until some traffic occurs that indicates user interaction. This delay can be indefinite in length and is designed to prevent the ICA round trip measurement being the sole reason for ICA traffic.

ICA round trip calculation interval
This setting specifies the frequency, in seconds, at which ICA round trip calculations are performed.
By default, ICA round trip is calculated every 15 seconds.

ICA round trip calculations for idle connections
This setting determines whether ICA round trip calculations are performed for idle connections.
By default, calculations are not performed for idle connections.
By default, each ICA round trip measurement initiation is delayed until some traffic occurs that indicates user interaction. This delay can be indefinite in length and is designed to prevent the ICA round trip measurement being the sole reason for ICA traffic.
The Enhanced Desktop Experience section contains policy settings for configuring virtual desktops to look like local Windows 7 desktops.

**Enhanced Desktop Experience**

This setting configures sessions running on server operating systems to look like local Windows 7 desktops, providing users with an enhanced desktop experience.

By default, this setting is allowed and sessions running on server operating systems are configured to look like local Windows 7 desktops.

If a user profile with Windows Classic theme already exists on the virtual desktop, enabling this policy does not provide an enhanced desktop experience for that user. If a user, with a Windows 7 theme user profile, logs on to a virtual desktop running Windows Server 2012 for which this policy is either not configured or disabled, an error message, indicating failure to apply the theme is shown to that user.

In both cases resetting the user profile resolves the issue.

If the policy switches from enabled to disabled on a virtual desktop with active user sessions, the look and feel of those sessions is inconsistent with both the Windows 7 and Windows Classic desktop experience. To avoid this, ensure you restart the virtual desktop after changing the state of this policy setting. You must also delete any roaming profiles on the virtual desktop. Citrix also recommends deleting any other user profiles on the virtual desktop to avoid inconsistencies between profiles.

If you are using roaming user profiles in your environment, ensure the Enhanced Desktop Experience feature is enabled or disabled for all virtual desktops that share a profile.

Citrix does not recommend sharing roaming profiles between virtual desktops running server operating systems and client operating systems. Profiles for client and server operating systems differ and sharing roaming profiles across both types can lead to inconsistencies in profile properties when a user moves between the two.
File Redirection policy settings

Dec 13, 2013

The File Redirection section contains policy settings relating to client drive mapping and client drive optimization.

Auto connect client drives

This setting allows or prevents automatic connection of client drives when users log on.

By default, automatic connection is allowed.

When adding this setting to a policy, make sure you enable the settings for the drive types you want automatically connected. For example, to allow automatic connection of users' CD-ROM drives, configure this setting and the Client optical drives setting.

Related policy settings

- Client drive redirection
- Client floppy drives
- Client optical drives
- Client fixed drives
- Client network drives
- Client removable drives

Client drive redirection

This setting enables or disables file redirection to and from drives on the user device.

By default, file redirection is enabled.

When enabled, users can save files to all their client drives. When disabled, all file redirection is prevented, regardless of the state of the individual file redirection settings such as Client floppy drives and Client network drives.

Related policy settings

- Client floppy drives
- Client optical drives
- Client fixed drives
- Client network drives
- Client removable drives

Client fixed drives

This setting allows or prevents users from accessing or saving files to fixed drives on the user device.

By default, accessing client fixed drives is allowed.

When adding this setting to a policy, make sure the Client drive redirection setting is present and set to Allowed. If these settings are disabled, client fixed drives are not mapped and users cannot access these drives manually, regardless of the state of the Client fixed drives setting.

To ensure fixed drives are automatically connected when users log on, configure the Auto connect client drives setting.
Client floppy drives
This setting allows or prevents users from accessing or saving files to floppy drives on the user device.

By default, accessing client floppy drives is allowed.

When adding this setting to a policy, make sure the Client drive redirection setting is present and set to Allowed. If these settings are disabled, client floppy drives are not mapped and users cannot access these drives manually, regardless of the state of the Client floppy drives setting.

To ensure floppy drives are automatically connected when users log on, configure the Auto connect client drives setting.

Client network drives
This setting allows or prevents users from accessing and saving files to network (remote) drives through the user device.

By default, accessing client network drives is allowed.

When adding this setting to a policy, make sure the Client drive redirection setting is present and set to Allowed. If these settings are disabled, client network drives are not mapped and users cannot access these drives manually, regardless of the state of the Client network drives setting.

To ensure network drives are automatically connected when users log on, configure the Auto connect client drives setting.

Client optical drives
This setting allows or prevents users from accessing or saving files to CD-ROM, DVD-ROM, and BD-ROM drives on the user device.

By default, accessing client optical drives is allowed.

When adding this setting to a policy, make sure the Client drive redirection setting is present and set to Allowed. If these settings are disabled, client optical drives are not mapped and users cannot access these drives manually, regardless of the state of the Client optical drives setting.

To ensure optical drives are automatically connected when users log on, configure the Auto connect client drives setting.

Client removable drives
This setting allows or prevents users from accessing or saving files to USB drives on the user device.

By default, accessing client removable drives is allowed.

When adding this setting to a policy, make sure the Client drive redirection setting is present and set to Allowed. If these settings are disabled, client removable drives are not mapped and users cannot access these drives manually, regardless of the state of the Client removable drives setting.

To ensure removable drives are automatically connected when users log on, configure the Auto connect client drives setting.

Host to client redirection
This setting enables or disables file type associations for URLs and some media content to be opened on the user device. When disabled, content opens on the server.
By default, file type association is disabled.

These URL types are opened locally when you enable this setting:
- Hypertext Transfer Protocol (HTTP)
- Secure Hypertext Transfer Protocol (HTTPS)
- Real Player and QuickTime (RTSP)
- Real Player and QuickTime (RTSPU)
- Legacy Real Player (PNM)
- Microsoft Media Server (MMS)

Preserve client drive letters

This setting enables or disables mapping of client drives to the same drive letter in the session.

By default, client drive letters are not preserved.

When adding this setting to a policy, make sure the Client drive redirection setting is present and set to Allowed.

Read-only client drive access

This setting allows or prevents users and applications from creating or modifying files or folders on mapped client drives.

By default, files and folders on mapped client drives can be modified.

If set to Enabled, files and folders are accessible with read-only permissions.

When adding this setting to a policy, make sure the Client drive redirection setting is present and set to Allowed.

Special folder redirection

This setting allows or prevents Citrix Receiver and Web Interface users to see their local Documents and Desktop special folders from a session.

By default, special folder redirection is allowed.

This setting prevents any objects filtered through a policy from having special folder redirection, regardless of settings that exist elsewhere. When you allow this setting, any related settings specified for the Web Interface or Citrix Receiver are ignored.

To define which users can have special folder redirection, select Allowed and include this setting in a policy filtered on the users you want to have this feature. This setting overrides all other special folder redirection settings.

Because special folder redirection must interact with the user device, policy settings that prevent users from accessing or saving files to their local hard drives also prevent special folder redirection from working.

When adding this setting to a policy, make sure the Client fixed drives setting is present and set to Allowed.

Use asynchronous writes

This setting enables or disables asynchronous disk writes.

By default, asynchronous writes are disabled.

Asynchronous disk writes can improve the speed of file transfers and writing to client disks over WANs, which are typically
characterized by relatively high bandwidth and high latency. However, if there is a connection or disk fault, the client file or files being written may end in an undefined state. If this happens, a pop-up window informs the user of the files affected. The user can then take remedial action, such as restarting an interrupted file transfer on reconnection or when the disk fault is corrected.

Citrix recommends enabling asynchronous disk writes only for users who need remote connectivity with good file access speed and who can easily recover files or data lost in the event of connection or disk failure.

When adding this setting to a policy, make sure that the Client drive redirection setting is present and set to Allowed. If this setting is disabled, asynchronous writes will not occur.
Flash Redirection policy settings

Dec 13, 2013
The Flash Redirection section contains policy settings for handling Flash content in user sessions.

Flash acceleration

This setting enables or disables Flash content rendering on user devices instead of the server. By default, client-side Flash content rendering is enabled.

Note: This setting is used for legacy Flash redirection with Citrix online plug-in 12.1. When enabled, this setting reduces network and server load by rendering Flash content on the user device. Additionally, the Flash URL compatibility list setting forces Flash content from specific websites to be rendered on the server.

On the user device, the Enable HDX MediaStream for Flash on the user device setting must be enabled as well.

When this setting is disabled, Flash content from all websites, regardless of URL, is rendered on the server. To allow only certain websites to render Flash content on the user device, configure the Flash URL compatibility list setting.

Flash background color list

This setting enables you to set key colors for given URLs.

By default, no key colors are specified.

Key colors appear behind client-rendered Flash and help provide visible region detection. The key color specified should be rare; otherwise, visible region detection might not work properly.

Valid entries consist of a URL (with optional wildcards at the beginning or end) followed by a 24-bit RGB color hexadecimal code. For example: http://citrix.com 000003

Flash backwards compatibility

This setting enables or disables the use of original, legacy Flash redirection features with older versions of Citrix Receiver (formerly the Citrix online plug-in).

By default, this setting is enabled.

On the user device, the Enable HDX MediaStream for Flash on the user device setting must be enabled as well.

Second generation Flash redirection features are enabled for use with Citrix Receiver 3.0. Legacy redirection features are supported for use with the Citrix online plug-in 12.1. To ensure second generation Flash redirection features are used, both the server and the user device must have second generation Flash redirection enabled. If legacy redirection is enabled on either the server or the user device, legacy redirection features are used.

Flash default behavior

This setting establishes the default behavior for second generation Flash acceleration.

By default, Flash acceleration is enabled.

To configure this setting, choose one of the following options:
- Enable Flash acceleration—Flash Redirection is used.
- Block Flash Player—Flash Redirection and server-side rendering are not used. The user cannot view any Flash content.
- Disable Flash acceleration—Flash Redirection is not used. The user can view server-side rendered Flash content if a version of Adobe Flash Player for Windows Internet Explorer compatible with the content is installed on the server.

This setting can be overridden for individual Web pages and Flash instances based on the configuration of the Flash URL compatibility list setting. Additionally, the user device must have the Enable HDX MediaStream for Flash on the user device setting enabled.

Flash event logging

This setting enables Flash events to be recorded in the Windows application event log.

By default, logging is allowed.

On computers running Windows 7 or Windows Vista, a Flash redirection-specific log appears in the Applications and Services Log node.

Flash intelligent fallback

This setting enables or disables automatic attempts to employ server-side rendering for Flash Player instances where client-side rendering is either unnecessary or provides a poor user experience.

By default, this setting is enabled.

Flash latency threshold

This setting specifies a threshold between 0-30 milliseconds to determine where Adobe Flash content is rendered.

By default, the threshold is 30 milliseconds.

During startup, HDX MediaStream for Flash measures the current latency between the server and user device. If the latency is under the threshold, HDX MediaStream for Flash is used to render Flash content on the user device. If the latency is above the threshold, the network server renders the content if an Adobe Flash player is available there.

When enabling this setting, make sure the Flash backwards compatibility setting is also present and set to Enabled.

Note: Applies only when using HDX MediaStream Flash redirection in Legacy mode.

Flash server-side content fetching URL list

This setting specifies websites whose Flash content can be downloaded to the server and then transferred to the user device for rendering.

By default, no sites are specified.

This setting is used when the user device does not have direct access to the Internet; the server provides that connection. Additionally, the user device must have the Enable server-side content fetching setting enabled.

Second generation Flash redirection includes a fallback to server-side content fetching for Flash .swf files. If the user device is unable to fetch Flash content from a Web site, and the Web site is specified in the Flash server-side content fetching URL list, server-side content fetching occurs automatically.

When adding URLs to the list:
- Add the URL of the Flash application instead of the top-level HTML page that initiates the Flash Player.
Flash URL compatibility list

This setting specifies the rules which determine whether Flash content on certain websites are rendered on the user device, rendered on the server, or blocked from rendering.

By default, no rules are specified.

When adding URLs to the list:

- Use an asterisk (*) at the beginning or end of the URL as a wildcard.
- Use a trailing wildcard to allow all child URLs (http://www.citrix.com/*).
- The prefixes http:// and https:// are used when present, but are not required for valid list entries.
- Add to this list websites whose Flash content does not render correctly on the user device and select either the Render on Server or Block options.
The Graphics section contains policy settings for controlling how images are handled in user sessions.

Display memory limit

This setting specifies the maximum video buffer size in kilobytes for the session.

By default, the display memory limit is 32768 kilobytes.

Specify an amount in kilobytes from 128 to 131072. Using more color depth and higher resolution for connections requires more memory. If the memory limit is reached, the display degrades according to the Display mode degrade preference setting.

Display mode degrade preference

Note: In XenDesktop 7.0, this policy setting applies only when the Legacy graphics mode policy setting is enabled.

This setting specifies whether color depth or resolution degrades first when the session display memory limit is reached.

By default, color depth is degraded first.

When the session memory limit is reached, you can reduce the quality of displayed images by choosing whether color depth or resolution is degraded first. When color depth is degraded first, displayed images use fewer colors. When resolution is degraded first, displayed images use fewer pixels per inch.

To notify users when either color depth or resolution are degraded, configure the Notify user when display mode is degraded setting.

Dynamic windows preview

This setting enables or disables the display of seamless windows in Flip, Flip 3D, Taskbar Preview, and Peek window preview modes.

By default, this setting is enabled.

Image caching

Note: In XenDesktop 7.0, this policy setting applies only when the Legacy graphics mode policy setting is enabled.

This setting enables or disables caching of images in sessions. When needed, the images are retrieved in sections to make scrolling smoother.

By default, image caching is enabled.

Legacy graphics mode

Applies to XenDesktop 7.0 (Server OS and Desktop OS).

This setting disables the rich graphics experience, providing fallback to the legacy graphics experience to improve scalability over a WAN or mobile connection.

By default, this setting is disabled and users are provided with the rich graphics experience.
Maximum allowed color depth

Note: In XenDesktop 7.0, this policy setting applies only when the Legacy graphics mode policy setting is enabled. This setting specifies the maximum color depth allowed for a session.

This setting applies only to ThinWire drivers and connections. It does not apply to VDAs that have a non-ThinWire driver as the primary display driver, such as VDAs that use a Windows Display Driver Model (WDDM) driver as the primary display driver. For Desktop OS VDAs using a WDDM driver as the primary display driver, this setting has no effect. For Windows Server OS VDAs using a WDDM driver, this setting might prevent users from connecting to the VDA.

By default, the maximum allowed color depth is 32 bits per pixel.

Setting a high color depth requires more memory. To degrade color depth when the memory limit is reached, configure the Display mode degrade preference setting. When color depth is degraded, displayed images use fewer colors.

Notify user when display mode is degraded

Note: In XenDesktop 7.0, this policy setting applies only when the Legacy graphics mode policy setting is enabled. This setting displays a brief explanation to the user when the color depth or resolution is degraded.

By default, notifying users is disabled.

Queuing and tossing

Note: In XenDesktop 7.0, this policy setting applies only when the Legacy graphics mode policy setting is enabled. This setting discards queued images that are replaced by another image.

By default, queuing and tossing is enabled.

This improves response when graphics are sent to the user device. Configuring this setting can cause animations to become choppy due to dropped frames.
Caching policy settings

Dec 13, 2013
The Caching section contains policy settings that enable you to cache image data on user devices when client connections are limited in bandwidth.

Persistent Cache threshold

Note: In XenDesktop 7.0, this policy setting applies only when the Legacy graphics mode policy setting is enabled. This setting caches bitmaps on the hard drive of the user device. This enables re-use of large, frequently-used images from previous sessions.

By default, the threshold is 3000000 bits per second.

The threshold value represents the point below which you want the Persistent Cache feature to take effect. For example, with regard to the default value, bitmaps are cached on the hard drive of the user device when bandwidth is below 3000000 bps.
Keep Alive policy settings

Dec 13, 2013
The Keep Alive section contains policy settings for managing ICA keep-alive messages.

ICA keep alive timeout
This setting specifies the number of seconds between successive ICA keep-alive messages.
By default, the interval between keep-alive messages is 60 seconds.
Specify an interval between 1-3600 seconds in which to send ICA keep-alive messages. Do not configure this setting if your network monitoring software is responsible for closing inactive connections.

ICA keep alives
This setting enables or disables sending ICA keep-alive messages periodically.
By default, keep-alive messages are not sent.
Enabling this setting prevents broken connections from being disconnected. If the server detects no activity, this setting prevents Remote Desktop Services (RDS) from disconnecting the session. The server sends keep-alive messages every few seconds to detect if the session is active. If the session is no longer active, the server marks the session as disconnected.
ICA Keep-Alive does not work if you are using Session Reliability. Configure ICA Keep-Alive only for connections that are not using Session Reliability.

Related policy settings
Session reliability connections
Local App Access policy settings

Dec 13, 2013

The Local App Access section contains policy settings you can configure to enable the integration of users' locally-installed applications with hosted applications within a hosted desktop environment.

Allow local app access

This setting allows or prevents the integration of users' locally-installed applications with hosted applications within a hosted desktop environment.

When a user launches a locally-installed application, that application appears to run within their virtual desktop, even though it is actually running locally.

By default, local app access is prohibited.

URL redirection black list

This setting specifies websites that are redirected to and launched in the local Web browser. This might include websites requiring locale information, such as msn.com or news.google.com, or websites containing rich media content that are better rendered on the user device.

By default, no sites are specified.

URL redirection white list

This setting specifies websites that are rendered in the environment in which they are launched.

By default, no sites are specified.
Mobile Experience policy settings

Dec 13, 2013
The Mobile Experience section contains policy settings for handling the Citrix Mobility Pack.

Automatic keyboard display

This setting enables or disables the automatic display of the keyboard on mobile device screens.

By default, the automatic display of the keyboard is disabled.

Launch touch-optimized desktop

This setting determines the overall Receiver interface behavior by allowing or prohibiting a touch-friendly interface that is optimized for tablet devices.

By default, a touch-friendly interface is used.

To use only the Windows interface, set this policy to Prohibited.

Remote the combo box

This setting determines the types of combo boxes you can display in sessions on mobile devices. To display the device-native combo box control, set this policy to Allowed. When this setting is allowed, a user can change a Receiver for iOS session setting to use the Windows combo box.

By default, the Remote the combo box feature is prohibited.
Multimedia policy settings

Dec 13, 2013
The Multimedia section contains policy settings for managing streaming audio and video in user sessions.

Limit video quality
This setting specifies the maximum video quality level allowed for an HDX connection. When configured, maximum video quality is limited to the specified value, ensuring that multimedia Quality of Service (QoS) is maintained within an environment.

By default, this setting is not configured.

To limit the maximum video quality level allowed, choose one of the following options:
- 1080p/8.5mbps
- 720p/4.0mbps
- 480p/720kbps
- 380p/400kbps
- 240p/200kbps

Note: Playing multiple videos simultaneously on the same server consumes large amounts of resources and may impact server scalability.

Multimedia conferencing
This setting allows or prevents support for video conferencing applications.

By default, video conferencing support is allowed.

When adding this setting to a policy, make sure the Windows Media Redirection setting is present and set to Allowed.

When using multimedia conferencing, make sure the following conditions are met:
- Manufacturer-supplied drivers for the web cam used for multimedia conferencing must be installed.
- The web cam must be connected to the user device before initiating a video conferencing session. The server uses only one installed web cam at any given time. If multiple web cams are installed on the user device, the server attempts to use each web cam in succession until a video conferencing session is created successfully.
- An Office Communicator server must be present in your environment.
- The Office Communicator client software must be published on the server.

Optimization for Windows Media multimedia redirection over WAN
This setting enables real-time multimedia transcoding, allowing audio and video media streaming to mobile devices, and enhancing the user experience by improving how Windows Media content is delivered over a WAN.

By default, the delivery of Windows Media content over the WAN is optimized.

When adding this setting to a policy, make sure the Windows Media Redirection setting is present and set to Allowed.

When this setting is enabled, real-time multimedia transcoding is deployed automatically as needed to enable media streaming, providing a seamless user experience even in extreme network conditions.

Use GPU for optimizing Windows Media multimedia redirection over WAN
This setting enables real-time multimedia transcoding to be done in the Graphics Processing Unit (GPU) on the Delivery Agent, to improve server scalability. GPU transcoding is available only if the Delivery Agent has a supported GPU for hardware acceleration. Otherwise, transcoding falls back to the CPU.

Note: GPU transcoding is supported only on NVIDIA GPUs.
By default, using the GPU on the Delivery Agent to optimize the delivery of Windows Media content over the WAN is prohibited.

When adding this setting to a policy, make sure the Windows Media Redirection and Optimization for Windows Media multimedia redirection over WAN settings are present and set to Allowed.

**Windows Media client-side content fetching**

This setting enables a user device to stream multimedia files directly from the source provider on the Internet or Intranet, rather than through the host server.

By default, the streaming of multimedia files to the user device direct from the source provider is allowed.

Allowing this setting improves network utilization and server scalability by moving any processing on the media from the host server to the user device. It also removes the requirement that an advanced multimedia framework such as Microsoft DirectShow or Media Foundation be installed on the user device; the user device requires only the ability to play a file from a URL.

When adding this setting to a policy, make sure the Windows Media Redirection setting is present and set to Allowed. If this setting is disabled, the streaming of multimedia files to the user device direct from the source provider is also disabled.

**Windows Media Redirection**

This setting controls and optimizes the way servers deliver streaming audio and video to users.

By default, the delivery of streaming audio and video to users is allowed.

Allowing this setting increases the quality of audio and video rendered from the server to a level that compares with audio and video played locally on a user device. The server streams multimedia to the client in the original, compressed form and allows the user device to decompress and render the media.

Windows Media redirection optimizes multimedia files that are encoded with codecs that adhere to Microsoft’s DirectShow, DirectX Media Objects (DMO), and Media Foundation standards. To play back a given multimedia file, a codec compatible with the encoding format of the multimedia file must be present on the user device.

By default, audio is disabled on Citrix Receiver. To allow users to run multimedia applications in ICA sessions, turn on audio or give the users permission to turn on audio themselves in their Receiver interface.

Select Prohibited only if playing media using Windows Media redirection appears worse than when rendered using basic ICA compression and regular audio. This is rare but can happen under low bandwidth conditions; for example, with media in which there is a very low frequency of key frames.

**Windows Media Redirection buffer size**

This setting specifies a buffer size from 1 to 10 seconds for multimedia acceleration.

By default, the buffer size is 5 seconds.
Windows Media Redirection buffer size use

This setting enables or disables using the buffer size specified in the Windows Media Redirection buffer size setting.

By default, the buffer size specified is not used.

If this setting is disabled or if the Windows Media Redirection buffer size setting is not configured, the server uses the default buffer size value (5 seconds).
Multi-Stream Connections policy settings

Dec 13, 2013

The Multi-Stream Connections section contains policy settings for managing Quality of Service (QoS) prioritization for multiple ICA connections in a session.

Audio over UDP

This setting allows or prevents audio over UDP on the server.

By default, audio over UDP is allowed on the server.

When enabled, this setting opens a UDP port on the server to support all connections configured to use Audio over UDP Realtime Transport.

Audio UDP port range

This setting specifies the range of port numbers used by the VDA to exchange audio packet data with the user device.

By default, this is set to 16500,16509.

The VDA attempts to use each UDP port pair to exchange data with the user device, starting with the lowest and incrementing by 2 for each subsequent attempt. Each specified port handles both inbound and outbound traffic.

Enter a range, in the format lowest port number, highest port number.

Multi-Port policy

This setting specifies the TCP ports to be used for ICA traffic and establishes the network priority for each port.

By default, the primary port (2598) has a High priority.

When you configure ports, you can assign the following priorities:

- Very High
- High
- Medium
- Low

You might assign a Very High priority when real-time responsiveness is required, such as for audio and video conferencing. As well, you might assign a Low priority to background processes such as printing. Each port must have a unique priority. For example, you cannot assign a Very High priority to both CGP port 1 and CGP port 3.

To remove a port from prioritization, set the port number to 0. You cannot remove the primary port and you cannot modify its priority level.

When configuring this setting, reboot the server. This setting takes effect only when the Multi-Stream computer setting policy setting is enabled.

Multi-Stream computer setting

This setting enables or disables Multi-Stream on the server.
By default, Multi-Stream is disabled.

If you use Citrix Cloudbridge with Multi-Stream support in your environment, you do not need to configure this setting. Configure this policy setting when using third-party routers or legacy Branch Repeaters to achieve the desired Quality of Service.

When configuring this setting, reboot the server to ensure changes take effect. Important: Using this policy setting in conjunction with bandwidth limit policy settings such as Overall session bandwidth limit may produce unexpected results. When including this setting in a policy, ensure that bandwidth limit settings are not included.

**Multi-Stream user setting**

This setting enables or disables Multi-Stream on the user device.

By default, Multi-Stream is disabled for all users.

This setting takes effect only on hosts where the Multi-Stream computer setting policy setting is enabled. Important: Using this policy setting in conjunction with bandwidth limit policy settings such as Overall session bandwidth limit may produce unexpected results. When including this setting in a policy, ensure that bandwidth limit settings are not included.
Port Redirection policy settings

Dec 13, 2013
The Port Redirection section contains policy settings for client LPT and COM port mapping.

Note: For XenDesktop 7, configure these setting using the registry. For more information, see Configure COM Port and LPT Port Redirection settings using the registry.

Auto connect client COM ports
This setting enables or disables automatic connection of COM ports on user devices when users log on to a site.
By default, client COM ports are not automatically connected.

Auto connect client LPT ports
This setting enables or disables automatic connection of LPT ports on user devices when users log on to a site.
By default, client LPT ports are connected automatically.

Client COM port redirection
This setting allows or prevents access to COM ports on the user device.
By default, COM port redirection is prohibited.

Related policy settings
- COM port redirection bandwidth limit
- COM port redirection bandwidth limit percent

Client LPT port redirection
This setting allows or prevents access to LPT ports on the user device.
By default, LPT port redirection is prohibited.

LPT ports are used only by legacy applications that send print jobs to the LPT ports and not to the print objects on the user device. Most applications today can send print jobs to printer objects. This policy setting is necessary only for servers that host legacy applications that print to LPT ports.

Related policy settings
- LPT port redirection bandwidth limit
- LPT port redirection bandwidth limit percent
Printing policy settings

Dec 13, 2013
The Printing section contains policy settings for managing client printing.

Client printer redirection

This setting controls whether or not client printers are mapped to a server when a user logs on to a session.

By default, client printer mapping is allowed.

Related Policy Settings

Auto-create client printers

Default printer

This setting specifies how the default printer on the user device is established in a session.

By default, the user's current printer is used as the default printer for the session.

To use the current Remote Desktop Services or Windows user profile setting for the default printer, select Do not adjust the user's default printer. If you choose this option, the default printer is not saved in the profile and it does not change according to other session or client properties. The default printer in a session will be the first printer auto-created in the session, which is either:

- The first printer added locally to the Windows server in Control Panel > Devices and Printers.
- The first auto-created printer, if there are no printers added locally to the server.

You can use this option to present users with the nearest printer through profile settings (known as Proximity Printing).

Printer assignments

This setting provides an alternative to the Default printer and Session printers settings. Use the individual Default printer and Session printers settings to configure behaviors for a site, large group, or organizational unit. Use the Printer assignments setting to assign a large group of printers to multiple users.

This setting specifies how the default printer on the listed user devices is established in a session.

By default, the user's current printer is used as the default printer for the session.

It also specifies the network printers to be auto-created in a session for each user device. By default, no printers are specified.

- When setting the default printer value:
  - To use the current default printer for the user device, select Do not adjust.

  To use the current Remote Desktop Services or Windows user profile setting for the default printer, select Do no adjust. If you choose this option, the default printer is not saved in the profile and it does not change according to other session or client properties. The default printer in a session will be the first printer auto-created in the session, which is either:

  - The first printer added locally to the Windows server in Control Panel > Devices and Printers.
  - The first auto-created printer, if there are no printers added locally to the server.
When setting the session printers value:

- To add printers, type the UNC path of the printer you want to auto-create. After adding the printer, you can apply customized settings for the current session at every logon.

**Printer auto-creation event log preference**

This setting specifies the events that are logged during the printer auto-creation process. You can choose to log no errors or warnings, only errors, or errors and warnings.

By default, errors and warnings are logged.

An example of a warning is an event in which a printer's native driver could not be installed and the Universal print driver is installed instead. To use the Universal print driver in this scenario, configure the Universal print driver usage setting to Use universal printing only or Use universal printing only if requested driver is unavailable.

**Session printers**

This setting specifies the network printers to be auto-created in a session.

By default, no printers are specified.

To add printers, type the UNC path of the printer you want to auto-create. After adding the printer, you can apply customized settings for the current session at every logon.

**Wait for printers to be created (desktop)**

This setting allows or prevents a delay in connecting to a session so that desktop printers can be auto-created.

By default, a connection delay does not occur.
Client Printers policy settings

Dec 13, 2013

The Client Printers section contains policy settings for client printers, including settings to automate client printers, retain printer properties, and connect to print servers.

Auto-create client printers

This setting specifies the client printers that are auto-created. This setting overrides default client printer auto-creation settings.

By default, all client printers are auto-created.

This setting takes effect only if the Client printer redirection setting is present and set to Allowed.

When adding this setting to a policy, select an option:
- **Auto-create all client printers** automatically creates all printers on a user device.
- **Auto-create the client’s default printer only** automatically creates only the printer selected as the default printer on the user device.
- **Auto-create local (non-network) client printers only** automatically creates only printers directly connected to the user device through an LPT, COM, USB, TCP/IP, or other local port.
- **Do not auto-create client printers** turns off autocreation for all client printers when users log on. This causes the Remote Desktop Services (RDS) settings for autocreating client printers to override this setting in lower priority policies.

Auto-create generic universal printer

This setting enables or disables autocreation of the generic Citrix Universal Printer object for sessions where a user device compatible with Universal Printing is in use.

By default, the generic Universal Printer object is not autocreated.

**Related policy settings**
- Universal print driver usage
- Universal driver preference

Client printer names

This setting selects the naming convention for auto-created client printers.

By default, standard printer names are used.

Select Standard printer names to use printer names which are similar to those created by native Remote Desktop Services, such as “HPLaserJet 4 from clientname in session 3.”

Select Legacy printer names to use old-style client printer names and preserve backward compatibility for users or groups using MetaFrame Presentation Server 3.0 or earlier. An example of a legacy printer name is “Client/clientname#/HPLaserJet 4.” Because this option is less secure, use it only to provide backward compatibility for users or groups using MetaFrame Presentation Server 3.0 or earlier.

Note: This option is provided only for backwards compatibility with legacy versions of XenApp and XenDesktop.

Direct connections to print servers
This setting enables or disables direct connections from the virtual desktop or server hosting applications to a print server for client printers hosted on an accessible network share.

By default, direct connections are enabled.

Enable direct connections if the network print server is not across a WAN from the virtual desktop or server hosting applications. Direct communication results in faster printing if the network print server and the virtual desktop or server hosting applications are on the same LAN.

Disable direct connections if the network is across a WAN or has substantial latency or limited bandwidth. Print jobs are routed through the user device where they are redirected to the network print server. Data sent to the user device is compressed, so less bandwidth is consumed as the data travels across the WAN.

If two network printers have the same name, the printer on the same network as the user device is used.

Printer driver mapping and compatibility

This setting specifies the driver substitution rules for auto-created client printers.

By default, no rules are specified.

When you define driver substitution rules, you can allow or prevent printers to be created with the specified driver. Additionally, you can allow created printers to use only universal print drivers. Driver substitution overrides or maps printer driver names the user device provides, substituting an equivalent driver on the server. This gives server applications access to client printers that have the same drivers as the server, but different driver names.

You can add a driver mapping, edit an existing mapping, override custom settings for a mapping, remove a mapping, or change the order of driver entries in the list. When adding a mapping, enter the client printer driver name and then select the server driver you want to substitute.

Printer properties retention

This setting specifies whether or not to store printer properties and where to store them.

By default, the system determines if printer properties are stored on the user device, if available, or in the user profile.

When adding this setting to a policy, select an option:

- Saved on the client device only is for user devices that have a mandatory or roaming profile that is not saved. Choose this option only if all the servers in your farm are running XenApp 5 and above and your users are using Citrix online plug-in versions 9.x, 10.x, 11.x, and 12.x, or Citrix Receiver 3.x.
- Retained in user profile only is for user devices constrained by bandwidth (this option reduces network traffic) and logon speed or for users with legacy plug-ins. This option stores printer properties in the user profile on the server and prevents any properties exchange with the user device. Use this option with MetaFrame Presentation Server 3.0 or earlier and MetaFrame Presentation Server Client 8.x or earlier. Note that this is applicable only if a Remote Desktop Services (RDS) roaming profile is used.
- Held in profile only if not saved on client allows the system to determine where printer properties are stored. Printer properties are stored either on the user device, if available, or in the user profile. Although this option is the most flexible, it can also slow logon time and use extra bandwidth for system-checking.
- Do not retain printer properties prevents storing printer properties.

Retained and restored client printers
This setting enables or disables the retention and re-creation of printers on the user device. By default, client printers are auto-retained and auto-restored.

Retained printers are user-created printers that are created again, or remembered, at the start of the next session. When XenApp recreates a retained printer, it considers all policy settings except the Auto-create client printers setting.

Restored printers are printers fully customized by an administrator, with a saved state that is permanently attached to a client port.
Drivers policy settings

Dec 13, 2013
The Drivers section contains policy settings related to printer drivers.

Automatic installation of in-box printer drivers
This setting enables or disables the automatic installation of printer drivers from the Windows in-box driver set or from driver packages staged on the host using pnputil.exe /a.
By default, these drivers are installed as needed.

Universal driver preference
This setting specifies the order in which Universal printer drivers are used, beginning with the first entry in the list.
By default, the preference order is as follows:
- EMF
- XPS
- PCL5c
- PCL4
- PS
You can add, edit, or remove drivers, and change the order of drivers in the list.

Universal print driver usage
This setting specifies when to use universal printing.
By default, universal printing is used only if the requested driver is unavailable.
Universal printing employs generic printer drivers instead of standard model-specific drivers, potentially simplifying the burden of driver management on host computers. The availability of universal print drivers depends on the capabilities of the user device, host, and print server software. In certain configurations, universal printing might not be available.

When adding this setting to a policy, select an option:
- Use only printer model specific drivers specifies that the client printer uses only the standard model-specific drivers that are auto-created at logon. If the requested driver is unavailable, the client printer cannot be auto-created.
- Use universal printing only specifies that no standard model-specific drivers are used. Only universal print drivers are used to create printers.
- Use universal printing only if requested driver is unavailable uses standard model-specific drivers for printer creation if they are available. If the driver is not available on the server, the client printer is created automatically with the appropriate universal driver.
- Use printer model specific drivers only if universal printing is unavailable uses the universal print driver if it is available. If the driver is not available on the server, the client printer is created automatically with the appropriate model-specific printer driver.
Universal Print Server policy settings

Dec 13, 2013
The Universal Print Server section contains policy settings for handling the Universal Print Server.

Universal Print Server enable

This setting enables or disables the Universal Print Server feature on the virtual desktop or server hosting applications. Apply this policy setting to Organisational Units (OUs) containing the virtual desktop or server hosting applications.

By default, the Universal Print Server is disabled.

When adding this setting to a policy, select one of the following options:

- **Enabled with fallback to Windows native remote printing.** Network printer connections are serviced by the Universal Print Server, if possible. If the Universal Print Server is not available, the Windows Print Provider is used. The Windows Print Provider continues to handle all printers previously created with the Windows Print Provider.

- **Enabled with no fallback to Windows native remote printing.** Network printer connections are serviced by the Universal Print Server exclusively. If the Universal Print Server is unavailable, the network printer connection fails. This setting effectively disables network printing through the Windows Print Provider. Printers previously created with the Windows Print Provider are not created while a policy containing this setting is active.

- **Disabled.** The Universal Print Server feature is disabled. No attempt is made to connect with the Universal Print Server when connecting to a network printer with a UNC name. Connections to remote printers continue to use the Windows native remote printing facility.

Universal Print Server print data stream (CGP) port

This setting specifies the TCP port number used by the Universal Print Server print data stream Common Gateway Protocol (CGP) listener. Apply this policy setting only to OUs containing the print server.

By default, the port number is set to 7229.

Valid port numbers must be in the range of 1 to 65535.

Universal Print Server print stream input bandwidth limit (kpbs)

This setting specifies the upper boundary (in kilobits per second) for the transfer rate of print data delivered from each print job to the Universal Print Server using CGP. Apply this policy setting to OUs containing the virtual desktop or server hosting applications.

By default, the value is 0, which specifies no upper boundary.

Universal Print Server web service (HTTP/SOAP) port

This setting specifies the TCP port number used by the Universal Print Server Web service listener for incoming HTTP/SOAP requests. Ensure that the value specified for this setting is identical for both the OU containing the print server and the OU containing the virtual desktop or server hosting applications.

By default, the port number is set to 8080.

Valid port numbers must be in the range of 0 to 65535.
Universal Printing policy settings

Jan 20, 2014

The Universal Printing section contains policy settings for managing universal printing.

Universal printing EMF processing mode

This setting controls the method of processing the EMF spool file on the Windows user device.

By default, EMF records are spooled directly to the printer.

When adding this setting to a policy, select an option:

- Reprocess EMFs for printer forces the EMF spool file to be reprocessed and sent through the GDI subsystem on the user device. You can use this setting for drivers that require EMF reprocessing but that might not be selected automatically in a session.
- Spool directly to printer, when used with the Citrix Universal print driver, ensures the EMF records are spooled and delivered to the user device for processing. Typically, these EMF spool files are injected directly to the client's spool queue. For printers and drivers that are compatible with the EMF format, this is the fastest printing method.

Universal printing image compression limit

This setting specifies the maximum quality and the minimum compression level available for images printed with the Citrix Universal print driver.

By default, the image compression limit is set to Best quality (lossless compression).

If No Compression is selected, compression is disabled for EMF printing only.

When adding this setting to a policy, select an option:

- No compression
- Best quality (lossless compression)
- High quality
- Standard quality
- Reduced quality (maximum compression)

When adding this setting to a policy that includes the Universal printing optimization defaults setting, be aware of the following items:

- If the compression level in the Universal printing image compression limit setting is lower than the level defined in the Universal printing optimization defaults setting, images are compressed at the level defined in the Universal printing image compression limits setting.
- If compression is disabled, the Desired image quality and Enable heavyweight compression options of the Universal printing optimization defaults setting have no effect in the policy.

Universal printing optimization defaults

This setting specifies the default values for printing optimization when the universal print driver is created for a session.

- Desired image quality specifies the default image compression limit applied to universal printing. By default, Standard Quality is enabled, meaning that users can only print images using standard or reduced quality compression.
- Enable heavyweight compression enables or disables reducing bandwidth beyond the compression level set by Desired image quality, without losing image quality. By default, heavyweight compression is disabled.
- Image and Font Caching settings specify whether or not to cache images and fonts that appear multiple times in the print stream, ensuring each unique image or font is sent to the printer only once. By default, embedded images and fonts are cached. Note that these settings apply only if the user device supports this behavior.
- Allow non-administrators to modify these settings specifies whether or not users can change the default print optimization settings within a session. By default, users are not allowed to change the default print optimization settings.

Note: All of these options are supported for EMF printing. For XPS printing, only the Desired image quality option is supported.

When adding this setting to a policy that includes the Universal printing image compression limit setting, be aware of the following items:
- If the compression level in the Universal printing image compression limit setting is lower than the level defined in the Universal printing optimization defaults setting, images are compressed at the level defined in the Universal printing image compression limits setting.
- If compression is disabled, the Desired image quality and Enable heavyweight compression options of the Universal printing optimization defaults setting have no effect in the policy.

Universal printing preview preference

This setting specifies whether or not to use the print preview function for auto-created or generic universal printers.

By default, print preview is not used for auto-created or generic universal printers.

When adding this setting to a policy, select an option:
- Do not use print preview for auto-created or generic universal printers
- Use print preview for auto-created printers only
- Use print preview for generic universal printers only
- Use print preview for both auto-created and generic universal printers

Universal printing print quality limit

This setting specifies the maximum dots per inch (dpi) available for generating printed output in a session.

By default, No Limit is enabled, meaning users can select the maximum print quality allowed by the printer to which they connect.

If this setting is configured, it limits the maximum print quality available to users in terms of output resolution. Both the print quality itself and the print quality capabilities of the printer to which the user connects are restricted to the configured setting. For example, if configured to Medium Resolution (600 DPI), users are restricted to printing output with a maximum quality of 600 DPI and the Print Quality setting on the Advanced tab of the Universal Printer dialog box shows resolution settings only up to and including Medium Quality (600 DPI).

When adding this setting to a policy, select an option:
- Draft (150 DPI)
- Low Resolution (300 DPI)
- Medium Resolution (600 DPI)
- High Resolution (1200 DPI)
- No Limit
Security policy settings

Apr 22, 2015
The Security section contains the policy setting for configuring session encryption and encryption of logon data.

SecureICA minimum encryption level

Applies to:
- XenApp 6.0 and 6.5
- XenDesktop 7.0 (Server OS)

This setting specifies the minimum level at which to encrypt session data sent between the server and a user device.

Important:
For the Virtual Delivery Agent 7.x, this policy setting can be used only to enable the encryption of the logon data with RC5 128-bit encryption. Other settings are provided only for backwards compatibility with legacy versions of XenApp and XenDesktop.

For the VDA 7.x, encryption of session data is set using the basic settings of the VDA's Delivery group. If Enable Secure ICA is selected for the Delivery group, session data is encrypted with RC5 (128 bit) encryption. If Enable Secure ICA is not selected for the Delivery group, session data is encrypted with Basic encryption.

When adding this setting to a policy, select an option:
- Basic encrypts the client connection using a non-RC5 algorithm. It protects the data stream from being read directly, but it can be decrypted. By default, the server uses Basic encryption for client-server traffic.
- RC5 (128 bit) logon only encrypts the logon data with RC5 128-bit encryption and the client connection using Basic encryption.
- RC5 (40 bit) encrypts the client connection with RC5 40-bit encryption.
- RC5 (56 bit) encrypts the client connection with RC5 56-bit encryption.
- RC5 (128 bit) encrypts the client connection with RC5 128-bit encryption.

The settings you specify for client-server encryption can interact with any other encryption settings in your environment and your Windows operating system. If a higher priority encryption level is set on either a server or user device, settings you specify for published resources can be overridden.

You can raise encryption levels to further secure communications and message integrity for certain users. If a policy requires a higher encryption level, Receivers using a lower encryption level are denied connection.

SecureICA does not perform authentication or check data integrity. To provide end-to-end encryption for your site, use SecureICA with SSL/TLS encryption.

SecureICA does not use FIPS-compliant algorithms. If this is an issue, configure the server and Receivers to avoid using SecureICA.
Server Limits policy settings

Dec 13, 2013
The Server Limits section contains policy settings for controlling idle connections.

Server idle timer interval

This setting determines, in milliseconds, how long an uninterrupted user session is maintained if there is no input from the user.

By default, idle connections are not disconnected (Server idle timer interval = 0).
Session Limits policy settings

Dec 13, 2013
The Session Limits section contains policy settings you can use to control how long sessions remain connected before they are forced to log off.

Disconnected session timer
This setting enables or disables a timer to determine how long a disconnected, locked desktop can remain locked before the session is logged off.
By default, disconnected sessions are not logged off.

Disconnected session timer interval
This setting determines how long, in minutes, a disconnected, locked desktop can remain locked before the session is logged off.
By default, the time period is 1440 minutes (24 hours).

Session connection timer
This setting enables or disables a timer to determine the maximum duration of an uninterrupted connection between a user device and a desktop.
By default, this timer is disabled.

Session connection timer interval
This setting determines, in minutes, the maximum duration of an uninterrupted connection between a user device and a desktop.
By default, the maximum duration is 1440 minutes (24 hours).

Session idle timer
This setting enables or disables a timer to determine how long an uninterrupted user device connection to a desktop will be maintained if there is no input from the user.
By default, this timer is enabled.

Session idle timer interval
This setting determines, in minutes, how long an uninterrupted user device connection to a desktop will be maintained if there is no input from the user.
By default, idle connections are maintained for 1440 minutes (24 hours).
Session Reliability policy settings

Dec 13, 2013

The Session Reliability section contains policy settings for managing session reliability connections.

Session reliability connections

This setting allows or prevents sessions to remain open during a loss of network connectivity.

By default, session reliability is allowed.

Session Reliability keeps sessions active and on the user's screen when network connectivity is interrupted. Users continue to see the application they are using until network connectivity resumes.

With Session Reliability, the session remains active on the server. To indicate that connectivity is lost, the user's display freezes and the cursor changes to a spinning hourglass until connectivity resumes on the other side of the tunnel. The user continues to access the display during the interruption and can resume interacting with the application when the network connection is restored. Session Reliability reconnects users without reauthentication prompts.

If you do not want users to be able to reconnect to interrupted sessions without having to reauthenticate, configure the Auto client reconnect authentication setting to require authentication. Users are then prompted to reauthenticate when reconnecting to interrupted sessions.

If you use both Session Reliability and Auto Client Reconnect, the two features work in sequence. Session Reliability closes, or disconnects, the user session after the amount of time you specify in the Session reliability timeout setting. After that, the settings you configure for Auto Client Reconnect take effect, attempting to reconnect the user to the disconnected session.

Session reliability port number

This setting specifies the TCP port number for incoming session reliability connections.

By default, the port number is set to 2598.

Session reliability timeout

This setting specifies the length of time, in seconds, the session reliability proxy waits for a user to reconnect before allowing the session to be disconnected.

By default, this is set to 180 seconds, or three minutes.

Though you can extend the amount of time a session is kept open, this feature is designed to be convenient to the user and it does not prompt the user for reauthentication. As you extend the amount of time a session is kept open, chances increase that a user may get distracted and walk away from the user device, potentially leaving the session accessible to unauthorized users.

If you do not want users to be able to reconnect to interrupted sessions without having to reauthenticate, configure the Auto client reconnect authentication setting to require authentication. Users are then prompted to reauthenticate when reconnecting to interrupted sessions.

If you use both Session Reliability and Auto Client Reconnect, the two features work in sequence. Session Reliability closes,
or disconnects, the user session after the amount of time you specify in the Session reliability timeout setting. After that, the settings you configure for Auto Client Reconnect take effect, attempting to reconnect the user to the disconnected session.
Time Zone Control policy settings

Dec 13, 2013
The Time Zone Control section contains policy settings related to using local time in sessions.

**Estimate local time for legacy clients**

This setting enables or disables estimating the local time zone of user devices that send inaccurate time zone information to the server.

By default, the server estimates the local time zone when necessary.

**Use local time of client**

This setting determines the time zone setting of the user session. This can be either the time zone of the user session or the time zone of the user device.

By default, the time zone of the user session is used.

For this setting to take effect, enable the Allow time zone redirection setting in the Remote Desktop Session Host node of the Group Policy Management Editor (User Configuration > Policies > Administrative Templates > Windows Components > Remote Desktop Services > Remote Desktop Session Host > Device and Resource Redirection). For more information about time zone redirection, refer to the Citrix Knowledge Center.
TWAIN Devices policy settings

Dec 13, 2013
The TWAIN devices section contains policy settings related to mapping client TWAIN devices, such as digital cameras or scanners, and optimizing image transfers from server to client.

Note
TWAIN 2.0 is not currently supported.

Client TWAIN device redirection
This setting allows or prevents users from accessing TWAIN devices on the user device from image processing applications hosted on servers. By default, TWAIN device redirection is allowed.

Related policy settings
- TWAIN compression level
- TWAIN device redirection bandwidth limit
- TWAIN device redirection bandwidth limit percent

TWAIN compression level
This setting specifies the level of compression of image transfers from client to server. Use Low for best image quality, Medium for good image quality, or High for low image quality. By default, medium compression is applied.
USB Devices policy settings

Jan 20, 2014
The USB devices section contains policy settings for managing file redirection for USB devices.

Client USB device redirection

This setting allows or prevents redirection of USB devices to and from the user device.

By default, USB devices are not redirected.

Client USB device redirection rules

This setting specifies redirection rules for USB devices.

By default, no rules are specified.

When a user plugs in a USB device, the host device checks it against each policy rule in turn until a match is found. The first match for any device is considered definitive. If the first match is an Allow rule, the device is remoted to the virtual desktop. If the first match is a Deny rule, the device is available only to the local desktop. If no match is found, default rules are used.

Policy rules take the format {Allow:|Deny:} followed by a set of tag= value expressions separated by whitespace. The following tags are supported:

<table>
<thead>
<tr>
<th>Tag Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VID</td>
<td>Vendor ID from the device descriptor</td>
</tr>
<tr>
<td>PID</td>
<td>Product ID from the device descriptor</td>
</tr>
<tr>
<td>REL</td>
<td>Release ID from the device descriptor</td>
</tr>
<tr>
<td>Class</td>
<td>Class from either the device descriptor or an interface descriptor</td>
</tr>
<tr>
<td>SubClass</td>
<td>Subclass from either the device descriptor or an interface descriptor</td>
</tr>
<tr>
<td>Prot</td>
<td>Protocol from either the device descriptor or an interface descriptor</td>
</tr>
</tbody>
</table>

When creating new policy rules, be aware of the following:

- Rules are case-insensitive.
- Rules may have an optional comment at the end, introduced by #.
- Blank and pure comment lines are ignored.
- Tags must use the matching operator =. For example, VID=1230.
- Each rule must start on a new line or form part of a semicolon-separated list.
- Refer to the USB class codes available from the USB Implementers Forum, Inc. Web site.

Examples of administrator-defined USB policy rules

Allow: VID=1230 PID=0007 # ANOther Industries, ANOther Flash Drive

Deny: Class=08 subclass=05 # Mass Storage
To create a rule that denies all USB devices, use “DENY:” with no other tags.

Client USB Plug and Play device redirection

This setting allows or prevents plug-and-play devices such as cameras or point-of-sale (POS) devices to be used in a client session.

By default, plug-and-play device redirection is allowed. When set to Allowed, all plug-and-play devices for a specific user or group are redirected. When set to Prohibited, no devices are redirected.
Visual Display policy settings

Dec 13, 2013
The Visual Display section contains policy settings for controlling the quality of images sent from virtual desktops to the user device.

Target frame rate
This setting specifies the maximum number of frames per second sent to the user device from the virtual desktop.

By default, the maximum is 30 frames per second.

Setting a high number of frames per second (for example, 30) improves the user experience, but requires more bandwidth. Decreasing the number of frames per second (for example, 10) maximizes server scalability at the expense of user experience.

Visual quality
This setting specifies the desired visual quality for images displayed on the user device.

By default, this is set to Medium.

To specify the quality of images, choose one of the following options:

- Low
- Medium
- High
- Build to lossless
- Always lossless

In cases where preserving image data is vital, for example, when displaying X-ray images where no loss of quality is acceptable, select Always lossless to ensure lossy data is never sent to the user device.

Selecting Build to lossless sends lossy images to the user device during periods of high network activity and lossless images after network activity reduces.

Note: If the Legacy graphics mode setting is enabled for a policy, the Visual quality setting has no effect in that policy.
Moving Images policy settings

Dec 13, 2013

The Moving Images section contains settings that enable you to remove or alter compression for dynamic images.

Minimum image quality

Note: In XenDesktop 7.0, this policy setting applies only when the Legacy graphics mode policy setting is enabled. This setting specifies the minimum acceptable image quality for Adaptive Display. The less compression used, the higher the quality of images displayed. Choose from Ultra High, Very High, High, Normal, or Low compression.

By default, this is set to Normal.

Moving image compression

Note: In XenDesktop 7.0, this policy setting applies only when the Legacy graphics mode policy setting is enabled. This setting specifies whether or not Adaptive Display is enabled. Adaptive Display automatically adjusts the image quality of videos and transitional slides in slide shows based on available bandwidth. With Adaptive Display enabled, users should see smooth-running presentations with no reduction in quality.

By default, Adaptive Display is enabled.

Progressive compression level

Note: In XenDesktop 7.0, this policy setting applies only when the Legacy graphics mode policy setting is enabled. This setting provides a less detailed but faster initial display of images.

By default, no progressive compression is applied.

The more detailed image, defined by the normal lossy compression setting, appears when it becomes available. Use Very High or Ultra High compression for improved viewing of bandwidth-intensive graphics such as photographs.

For progressive compression to be effective, its compression level must be higher than the Lossy compression level setting.

Note: The increased level of compression associated with progressive compression also enhances the interactivity of dynamic images over client connections. The quality of a dynamic image, such as a rotating three-dimensional model, is temporarily decreased until the image stops moving, at which time the normal lossy compression setting is applied.

Related policy settings

- Progressive compression threshold value
- Progressive heavyweight compression

Progressive compression threshold value

Note: In XenDesktop 7.0, this policy setting applies only when the Legacy graphics mode policy setting is enabled. This setting represents the maximum bandwidth in kilobits per second for a connection to which progressive compression is applied. This is applied only to client connections under this bandwidth.

By default, the threshold value is 2147483647 kilobits per second.

Related policy settings

- Progressive compression threshold value
- Progressive heavyweight compression
Target minimum frame rate

Note: In XenDesktop 7.0, this policy setting applies only when the Legacy graphics mode policy setting is enabled. This setting specifies the minimum frame rate per second the system attempts to maintain, for dynamic images, under low bandwidth conditions.

By default, this is set to 10fps.
Still Images policy settings

Dec 13, 2013

The Still Images section contains settings that enable you to remove or alter compression for static images.

Extra color compression

Note: In XenDesktop 7.0, this policy setting applies only when the Legacy graphics mode policy setting is enabled. This setting enables or disables the use of extra color compression on images delivered over client connections that are limited in bandwidth, improving responsiveness by reducing the quality of displayed images.

By default, extra color compression is disabled.

When enabled, extra color compression is applied only when the client connection bandwidth is below the Extra color compression threshold value. When the client connection bandwidth is above the threshold value or Disabled is selected, extra color compression is not applied.

Extra color compression threshold

Note: In XenDesktop 7.0, this policy setting applies only when the Legacy graphics mode policy setting is enabled. This setting represents the maximum bandwidth in kilobits per second for a connection below which extra color compression is applied. If the client connection bandwidth drops below the set value, extra color compression, if enabled, is applied.

By default, the threshold value is 8192 kilobits per second.

Heavyweight compression

Note: In XenDesktop 7.0, this policy setting applies only when the Legacy graphics mode policy setting is enabled. This setting enables or disables reducing bandwidth beyond progressive compression without losing image quality by using a more advanced, but more CPU-intensive, graphical algorithm.

By default, heavyweight compression is disabled.

If enabled, heavyweight compression applies to all lossy compression settings. It is supported on Citrix Receiver but has no effect on other plug-ins.

Related policy settings

- Progressive compression level
- Progressive compression threshold value

Lossy compression level

Note: In XenDesktop 7.0, this policy setting applies only when the Legacy graphics mode policy setting is enabled. This setting controls the degree of lossy compression used on images delivered over client connections that are limited in bandwidth. In such cases, displaying images without compression can be slow.

By default, medium compression is selected.

For improved responsiveness with bandwidth-intensive images, use high compression. Where preserving image data is vital; for example, when displaying X-ray images where no loss of quality is acceptable, you may not want to use lossy
compression.

**Related policy settings**
- Lossy compression threshold value

**Lossy compression threshold value**

Note: In XenDesktop 7.0, this policy setting applies only when the Legacy graphics mode policy setting is enabled. This setting represents the maximum bandwidth in kilobits per second for a connection to which lossy compression is applied.

By default, the threshold value is 2147483647 kilobits per second.

Adding the Lossy compression level setting to a policy and including no specified threshold can improve the display speed of high-detail bitmaps, such as photographs, over a LAN.

**Related policy settings**
- Lossy compression level
WebSockets policy settings

Dec 13, 2013
The WebSockets section contains policy settings for accessing virtual desktops and hosted applications with Receiver for HTML5. The WebSockets feature increases security and reduces overhead by conducting two-way communication between browser-based applications and servers without opening multiple HTTP connections.

WebSockets connections
This setting allows or prohibits WebSockets connections.
By default, WebSocket connections are prohibited.

WebSockets port number
This setting identifies the port for incoming WebSocket connections.
By default, the value is 8008.

WebSockets trusted origin server list
This setting provides a comma-separated list of trusted origin servers, usually Receiver for Web, expressed as URLs. Only WebSockets connections originating from one of these addresses is accepted by the server.
By default, the wildcard * is used to trust all Receiver for Web URLs.
If you choose to type an address in the list, use this syntax:
<protocol>://<Fully qualified domain name of host>:[port]
The protocol should be HTTP or HTTPS. If the port is not specified, port 80 is used for HTTP and port 443 is used for HTTPS.
The wildcard * can be used within the URL, except as part of an IP address (10.105.*.*).
Load Management policy settings

Dec 13, 2013
The Load Management section contains policy settings for enabling and configuring load management between servers delivering Windows Server OS machines.

Concurrent logon tolerance
This setting specifies the maximum number of concurrent logons a server can accept.
By default, this is set to 2.

CPU usage
This setting specifies the level of CPU usage, as a percentage, at which the server reports a full load. When enabled, the default value at which the server reports a full load is 90%.
By default, this setting is disabled and CPU usage is excluded from load calculations.

CPU usage excluded process priority
This setting specifies the priority level at which a process' CPU usage is excluded from the CPU Usage load index.
By default, this is set to Below Normal or Low.

Disk usage
This setting specifies the disk queue length at which the server reports a 75% full load. When enabled, the default value for disk queue length is 8.
By default, this setting is disabled and disk usage is excluded from load calculations.

Maximum number of sessions
This setting specifies the maximum number of sessions a server can host. When enabled, the default setting for maximum number of sessions a server can host is 250.
By default, this setting is enabled.

Memory usage
This setting specifies the level of memory usage, as a percentage, at which the server reports a full load. When enabled, the default value at which the server reports a full load is 90%.
By default, this setting is disabled and memory usage is excluded from load calculations.

Memory usage base load
This setting specifies an approximation of the base operating system's memory usage and defines, in MB, the memory usage below which a server is considered to have zero load.
By default, this is set to 768MB.
Microsoft Application Virtualization (App-V) policy settings

Dec 13, 2013
The Microsoft Application Virtualization (App-V) section, contains policy settings for configuring App-V servers for use within your environment.

App-V servers
This setting specifies a list of App-V servers from which App-V applications are published within your environment.

Important: You must configure this setting using Active Directory's Group Policy Editor.
Profile Management policy settings

Mar 27, 2013

The Profile Management section contains policy settings for enabling Profile management and specifying which groups to include in and exclude from Profile management processing.

Other information, such as the names of the equivalent .ini file settings and which version of Profile management is required for any particular policy setting, is available in Profile Management ADM File Reference.
Advanced policy settings

Dec 13, 2013
The Advanced settings section contains policy settings relating to the advanced configuration of Profile management.

Disable automatic configuration
This setting enables Profile management to examine your environment; for example, to check for the presence of personal vDisks, and configure Group Policy accordingly. Only Profile management policies in the Not Configured state are adjusted, so any customizations made previously are preserved. This feature speeds up deployment and simplifies optimization. No configuration of the feature is necessary, but you can disable automatic configuration when upgrading (to retain settings from earlier versions) or when troubleshooting. Automatic configuration does not work in XenApp or other environments.

By default, automatic configuration is allowed.
If this setting is not configured here, the value from the .ini file is used.
If this setting is not configured here or in the .ini file, automatic configuration is turned on so Profile management settings might change if your environment changes.

Log off user if a problem is encountered
This setting enables Profile management to log a user off if a problem is encountered; for example, if the user store is unavailable. When enabled, an error message is displayed to the user before they are logged off. When disabled, users are given a temporary profile.

By default, this setting is disabled and users are given a temporary profile if a problem is encountered.
If this setting is not configured here, the value from the .ini file is used.
If this setting is not configured here or in the .ini file, a temporary profile is provided.

Number of retries when accessing locked files
This setting specifies the number of attempts Profile management makes to access locked files.

By default, this is set to five retries.
If this setting is not configured here, the value from the .ini file is used.
If this setting is not configured here or in the .ini file, the default value is used.

Process Internet cookie files on logoff
This setting enables Profile management to process index.dat on logoff to remove Internet cookies left in the file system after sustained browsing that can lead to profile bloat. Enabling this setting increases logoff times, so only enable it if you experience this issue.

By default, this setting is disabled and Profile management does not process index.dat on logoff.
If this setting is not configured here, the value from the .ini file is used.
If this setting is not configured here or in the .ini file, no processing of Index.dat takes place.
Basic policy settings

Feb 17, 2014

The Basic settings section contains policy settings relating to the basic configuration of Profile management.

Active write back

This setting enables modified files and folders (but not registry settings) to be synchronized to the user store during a session, before logoff.

By default, synchronization to the user store during a session is disabled.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, it is enabled.

Enable Profile management

This setting enables Profile management to process logons and logoffs.

By default, this setting is disabled to facilitate deployment.

Important: Citrix recommends enabling Profile management only after carrying out all other setup tasks and testing how Citrix user profiles perform in your environment.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, Profile management does not process Windows user profiles in any way.

Excluded groups

This setting specifies which computer local groups and domain groups (local, global, and universal) are excluded from Profile management processing.

When enabled, Profile management does not process members of the specified user groups.

By default, this setting is disabled and members of all user groups are processed.

Specify domain groups in the form `<DOMAIN NAME>`\`<GROUP NAME>`.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, members of all user groups are processed.

Offline profile support

This setting enables offline profile support, allowing profiles to synchronize with the user store at the earliest opportunity after a network disconnection.

By default, support for offline profiles is disabled.

This setting is applicable to laptop or mobile users who roam. When a network disconnection occurs, profiles remain intact on the laptop or device even after rebooting or hibernating. As mobile users work, their profiles are updated locally and are...
synchronized with the user store when the network connection is re-established.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, support for offline profiles is disabled.

**Path to user store**

This setting specifies the path to the directory (user store) in which user settings, such as registry settings and synchronized files, are saved.

By default, the Windows directory on the home drive is used.

If this setting is disabled, user settings are saved in the Windows subdirectory of the home directory.

The path can be:

- **A relative path**. This must be relative to the home directory, typically configured as the `#homeDirectory#` attribute for a user in Active Directory.

- **An absolute UNC path**. This typically specifies a server share or a DFS namespace.

- **Disabled or unconfigured**. In this case, a value of `#homeDirectory#\Windows` is assumed.

Use the following types of variables when configuring this policy setting:

- System environment variables enclosed in percent signs (for example, `%ProfVer%`). Note that system environment variables generally require additional setup.

- Attributes of the Active Directory user object enclosed in hashes (for example, `#sAMAccountName#`).

- Profile management variables. For more information, see the Profile Management section in eDocs.

You can also use the `%username%` and `%userdomain%` user environment variables and create custom attributes to fully define organizational variables such as location or users. Attributes are case-sensitive.

Examples:

- `\server\share\#sAMAccountName#` stores the user settings to the UNC path `\server\share\JohnSmith` (if `#sAMAccountName#` resolves to JohnSmith for the current user).

- `\server\profiles$\%USERNAME%\%USERDOMAIN%\!CTX_PROFILEVER!!CTX_OSBITNESS!` might expand to `\server\profiles$\JohnSmith.DOMAINCONTROLLER1\v2x64`

Important: Whichever attributes or variables you use, check that this setting expands to the folder one level higher than the folder containing NTUSER.DAT. For example, if this file is contained in `\server\profiles$\JohnSmith.Finance\v2x64\UPM_Profile`, set the path to the user store as `\server\profiles$\JohnSmith.Finance\v2x64`, not the \UPM_Profile subfolder.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, the Windows directory on the home drive is used.

**Process logons of local administrators**

This setting specifies whether or not logons of members of the BUILTIN\Administrators group are processed. This allows domain users with local administrator rights, typically users with assigned virtual desktops, to bypass processing, log on, and troubleshoot a desktop experiencing problems with Profile management.

If this setting is disabled or not configured on server operating systems, Profile management assumes that logons by domain users, but not local administrators, must be processed. On desktop operating systems, local administrator logons...
are processed.

By default this setting is disabled, and local administrator logons are not processed.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, local administrator logons are not processed.

**Processed groups**

This setting specifies which computer local groups and domain groups (local, global, and universal) are included in Profile management processing.

When enabled, Profile management processes only members of the specified user groups.

By default, this setting is disabled and members of all user groups are processed.

Specify domain groups in the form <DOMAIN NAME>\<GROUP NAME>.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, members of all user groups are processed.
Cross-Platform policy settings

Dec 13, 2013
The Cross-Platform section contains policy settings relating to configuring the Profile management cross-platform settings feature.

Cross-platform settings user groups
This setting specifies the Windows user groups whose profiles are processed when the cross-platform settings feature is enabled.

By default, this setting is disabled and all user groups specified in the Processed Group policy setting are processed.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, all user groups are processed.

Enable cross-platform settings
This setting enables or disables the cross-platforms settings feature, that allows you to migrate users' profiles and roam them when a user connects to the same application running on multiple operating systems.

By default the cross-platform settings feature is disabled.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, no cross-platform settings are applied.

Path to cross-platform definitions
This setting specifies the network location, as a UNC path, of the definition files copied from the download package.

Note: Users must have read access, and administrators write access, to this location and it must be either a Server Message Block (SMB) or Common Internet File System (CIFS) file share.

By default, no path is specified.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, no cross-platform settings are applied.

Path to cross-platform settings store
This setting specifies the path to the cross-settings store, the folder in which users' cross-platform settings are saved. This path can be either a UNC path or a path relative to the home directory.

Note: Users must have write access to the cross-settings store.

By default, this setting is disabled and the path Windows\PM_CP is used.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, the default value is used.

Source for creating cross-platform settings
This setting specifies a platform as the
— base platform
if this setting is enabled for that platform's OU. Data from the base platform's profiles is migrated to the cross-platform settings store.

Each platform's own set of profiles are stored in a separate OU. This means you must decide which platform's profile data to use to seed the cross-platform settings store. This is referred to as the
— base platform
.

When enabled, Profile management migrates the data from the single-platform profile to the store if the cross-platform settings store contains a definition file with no data, or if the cached data in a single-platform profile is newer than the definition's data in the store.

Important: If this setting is enabled in multiple OUs, or multiple user or machine objects, the platform that the first user logs on to becomes the base profile.
By default, this setting is disabled and Profile management does not migrate the data from the single-platform profile to the store.
File System policy settings

Mar 27, 2013
The File System section contains policy settings for configuring which files and directories in a user's profile are synchronized between the system on which the profile is installed and the user store.
Exclusions policy settings

Dec 13, 2013
The Exclusions section contains policy settings for configuring which files and directories in a user's profile are excluded from the synchronization process.

Exclusion list - directories

This setting specifies a list of folders in the user profile that are ignored during synchronization.

Specify folder names as paths relative to the user profile (%USERPROFILE%).

By default, this setting is disabled and all folders in the user profile are synchronized.

Examples:
- Desktop ignores the Desktop folder in the user profile

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, all folders in the user profile are synchronized.

Exclusion list - files

This setting specifies a list of files in the user profile that are ignored during synchronization.

Specify file names as paths relative to the user profile (%USERPROFILE%). Note that wildcards are allowed and are applied recursively.

Examples:
- Desktop\Desktop.ini ignores the file Desktop.ini in the Desktop folder

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, all files in the user profile are synchronized.
Synchronization policy settings

Dec 13, 2013

The Synchronization section contains policy settings for specifying which files and folders in a users profile are synchronized between the system on which the profile is installed and the user store.

Directories to synchronize

This setting specifies any folders you want Profile management to include in the synchronization process that are located either outside the user profile or in excluded folders. By default, Profile management synchronizes each user's entire profile between the system it is installed on and the user store. It is not necessary to include subfolders of the user profile by adding them to this list.

Paths on this list must be relative to the user profile.

Examples:
- Desktop\exclude\include ensures that the subfolder called include is synchronized even if the folder called Desktop\exclude is not

By default, this setting is disabled and no folders are specified.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, only non-excluded folders in the user profile are synchronized.

Files to synchronize

This setting specifies any files you want Profile management to include in the synchronization process that are located either outside the user profile or in excluded folders. By default, Profile management synchronizes each user's entire profile between the system it is installed on and the user store. It is not necessary to include files in the user profile by adding them to this list.

Paths on this list must be relative to the user profile. Relative paths are interpreted as being relative to the user profile. Wildcards can be used but are allowed only for file names. Wildcards cannot be nested and are applied recursively.

Examples:
- AppData\Local\Microsoft\Office\Access.qat specifies a file below a folder that is excluded in the default configuration
- AppData\Local\MyApp\*.cfg specifies all files with the extension .cfg in the profile folder AppData\Local\MyApp and its subfolders

By default, this setting is disabled and no files are specified.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, only non-excluded files in the user profile are synchronized.

Folders to mirror

This setting specifies which folders relative to a users' profile root folder to mirror. Configuring this policy setting can help solve issues involving any transactional folder (also known as a referential folder), that is a folder containing interdependent files, where one file references others.
Mirroring folders allows Profile management to process a transactional folder and its contents as a single entity, avoiding profile bloat. Be aware that, in these situations the "last write wins" so files in mirrored folders that have been modified in more than one session will be overwritten by the last update, resulting in loss of profile changes.

For example, you can mirror the Internet Explorer cookies folder so that Index.dat is synchronized with the cookies that it indexes.

If a user has two Internet Explorer sessions, each on a different server, and they visit different sites in each session, cookies from each site are added to the appropriate server. When the user logs off from the first session (or in the middle of a session, if the active write back feature is configured), the cookies from the second session should replace those from the first session. However, instead they are merged, and the references to the cookies in Index.dat become out of date. Further browsing in new sessions results in repeated merging and a bloated cookie folder.

Mirroring the cookie folder solves the issue by overwriting the cookies with those from the last session each time the user logs off so Index.dat stays up to date.

By default, this setting is disabled and no folders are mirrored.

If this setting is not configured here, the value from the .ini file is used.

If this policy is not configured here or in the .ini file, no folders are mirrored.
Folder Redirection policy settings

Dec 13, 2013
The Folder Redirection section contains policy settings for specifying whether to redirect folders that commonly appear in profiles to a shared network location.

Grant administrator access
This setting enables an administrator to access the contents of a users' redirected folders.
By default, this setting is disabled and users are granted exclusive access to the contents of their redirected folders.

Include domain name
This setting enables the inclusion of the %userdomain% environment variable as part of the UNC path specified for redirected folders.
By default, this setting is disabled and the %userdomain% environment variable is not included as part of the UNC path specified for redirected folders.
AppData(Roaming) policy settings

Dec 13, 2013

The AppData(Roaming) section contains policy settings for specifying whether to redirect the contents the AppData(Roaming) folder to a shared network location.

AppData(Roaming) path

This setting specifies the network location to which the contents of the AppData(Roaming) folder are redirected.

By default, this setting is disabled and no location is specified.

If this setting is not configured here, Profile management does not redirect the specified folder.

Redirection settings for AppData(Roaming)

This setting specifies how to redirect the contents of the AppData(Roaming) folder.

By default, contents are redirected to a UNC path.

If this setting is not configured here, Profile management does not redirect the specified folder.
Contacts policy settings

Dec 13, 2013
The Contacts section contains policy settings for specifying whether to redirect the contents the Contacts folder to a shared network location.

Contacts path
This setting specifies the network location to which the contents of the Contacts folder are redirected.
By default, this setting is disabled and no location is specified.
If this setting is not configured here, Profile management does not redirect the specified folder.

Redirection settings for Contacts
This setting specifies how to redirect the contents of the Contacts folder.
By default, contents are redirected to a UNC path.
If this setting is not configured here, Profile management does not redirect the specified folder.
Desktop policy settings

Dec 13, 2013
The Desktop section contains policy settings for specifying whether to redirect the contents the Desktop folder to a shared network location.

Desktop path
This setting specifies the network location to which the contents of the Contacts folder are redirected.

By default, this setting is disabled and no location is specified.

If this setting is not configured here, Profile management does not redirect the specified folder.

Redirection settings for Desktop
This setting specifies how to redirect the contents of the Desktop folder.

By default, contents are redirected to a UNC path.

If this setting is not configured here, Profile management does not redirect the specified folder.
The Documents section contains policy settings for specifying whether to redirect the contents the Documents folder to a shared network location.

Documents path

This setting specifies the network location to which files in the Documents folder are redirected. By default, this setting is disabled and no location is specified. If this setting is not configured here, Profile management does not redirect the specified folder.

Redirection settings for Documents

This setting specifies how to redirect the contents of the Documents folder. By default, contents are redirected to a UNC path.

To control how to redirect the contents of the Documents folder, choose one of the following options:

- Redirect to the following UNC path. Redirects content to the UNC path specified in the Documents path policy setting.
- Redirect to the users home directory. Redirects content to the users home directory, typically configured as the #homeDirectory# attribute for a user in Active Directory.

If this setting is not configured here, Profile management does not redirect the specified folder.
Downloads policy settings

Jan 15, 2014
The Downloads section contains policy settings for specifying whether to redirect the contents the Downloads folder to a shared network location.

Downloads path
This setting specifies the network location to which files in the Downloads folder are redirected.
By default, this setting is disabled and no location is specified.
If this setting is not configured here, Profile management does not redirect the specified folder.

Redirection settings for Downloads
This setting specifies how to redirect the contents of the Downloads folder.
By default, contents are redirected to a UNC path.
If this setting is not configured here, Profile management does not redirect the specified folder.
Favorites policy settings

Dec 13, 2013
The Favorites section contains policy settings for specifying whether to redirect the contents the Favorites folder to a shared network location.

Favorites path
This setting specifies the network location to which the contents of the Favorites folder are redirected.
By default, this setting is disabled and no location is specified.
If this setting is not configured here, Profile management does not redirect the specified folder.

Redirection settings for Favorites
This setting specifies how to redirect the contents of the Favorites folder.
By default, contents are redirected to a UNC path.
If this setting is not configured here, Profile management does not redirect the specified folder.
Links policy settings

Dec 13, 2013
The Links section contains policy settings for specifying whether to redirect the contents the Links folder to a shared network location.

Links path
This setting specifies the network location to which the contents of the Links folder are redirected.

By default, this setting is disabled and no location is specified.

If this setting is not configured here, Profile management does not redirect the specified folder.

Redirection settings for Links
This setting specifies how to redirect the contents of the Links folder.

By default, contents are redirected to a UNC path.

If this setting is not configured here, Profile management does not redirect the specified folder.
Music policy settings

Dec 13, 2013
The Music section contains policy settings for specifying whether to redirect the contents the Music folder to a shared network location.

Music path

This setting specifies the network location to which the contents of the Music folder are redirected.

By default, this setting is disabled and no location is specified.

If this setting is not configured here, Profile management does not redirect the specified folder.

Redirection settings for Music

This setting specifies how to redirect the contents of the Music folder.

By default, contents are redirected to a UNC path.

To control how to redirect the contents of the Music folder, choose one of the following options:

- Redirect to the following UNC path. Redirects content to the UNC path specified in the Music path policy setting.
- Redirect relative to Documents folder. Redirects content to a folder relative to the Documents folder.

If this setting is not configured here, Profile management does not redirect the specified folder.
Pictures policy settings

Dec 13, 2013
The Pictures section contains policy settings for specifying whether to redirect the contents the Pictures folder to a shared network location.

Pictures path
This setting specifies the network location to which the contents of the Pictures folder are redirected.

By default, this setting is disabled and no location is specified.

If this setting is not configured here, Profile management does not redirect the specified folder.

Redirection settings for Pictures
This setting specifies how to redirect the contents of the Pictures folder.

By default, contents are redirected to a UNC path.

To control how to redirect the contents of the Pictures folder, choose one of the following options:
- Redirect to the following UNC path. Redirects content to the UNC path specified in the Pictures path policy setting.
- Redirect relative to Documents folder. Redirects content to a folder relative to the Documents folder.

If this setting is not configured here, Profile management does not redirect the specified folder.
Saved Games policy settings

Dec 13, 2013
The Saved Games section contains policy settings for specifying whether to redirect the contents the Saved Games folder to a shared network location.

Redirection settings for Saved Games
This setting specifies how to redirect the contents of the Saved Games folder.

By default, contents are redirected to a UNC path.

If this setting is not configured here, Profile management does not redirect the specified folder.

Saved Games path
This setting specifies the network location to which the contents of the Saved Games folder are redirected.

By default, this setting is disabled and no location is specified.

If this setting is not configured here, Profile management does not redirect the specified folder.
Searches policy settings

Dec 13, 2013
The Searches section contains policy settings for specifying whether to redirect the contents the Searches folder to a shared network location.

Redirection settings for Searches
This setting specifies how to redirect the contents of the Searches folder.
By default, contents are redirected to a UNC path.
If this setting is not configured here, Profile management does not redirect the specified folder.

Searches path
This setting specifies the network location to which the contents of the Searches folder are redirected.
By default, this setting is disabled and no location is specified.
If this setting is not configured here, Profile management does not redirect the specified folder.
Start Menu policy settings

Dec 13, 2013
The Start Menu section contains policy settings for specifying whether to redirect the contents the Start Menu folder to a shared network location.

Redirection settings for Start Menu
This setting specifies how to redirect the contents of the Start Menu folder.
By default, contents are redirected to a UNC path.
If this setting is not configured here, Profile management does not redirect the specified folder.

Start Menu path
This setting specifies the network location to which the contents of the Start Menu folder are redirected.
By default, this setting is disabled and no location is specified.
If this setting is not configured here, Profile management does not redirect the specified folder.
Video policy settings

Dec 13, 2013
The Video section contains policy settings for specifying whether to redirect the contents the Video folder to a shared network location.

Redirection settings for Video

This setting specifies how to redirect the contents of the Video folder.

By default, contents are redirected to a UNC path.

To control how to redirect the contents of the Video folder, choose one of the following options:
- Redirect to the following UNC path. Redirects content to the UNC path specified in the Video path policy setting.
- Redirect relative to Documents folder. Redirects content to a folder relative to the Documents folder.

If this setting is not configured here, Profile management does not redirect the specified folder.

Video path

This setting specifies the network location to which the contents of the Video folder are redirected.

By default, this setting is disabled and no location is specified.

If this setting is not configured here, Profile management does not redirect the specified folder.
Log policy settings

Dec 13, 2013

The Log section contains policy settings for configuring Profile management logging.

Active Directory actions

This setting enables or disables verbose logging of actions performed in Active Directory.

By default, this setting is disabled.

When enabling this setting, make sure the Enable logging setting is also enabled.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, errors and general information are logged.

Common information

This setting enables or disables verbose logging of common information.

By default, this setting is disabled.

When enabling this setting, make sure the Enable logging setting is also enabled.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, errors and general information are logged.

Common warnings

This setting enables or disables verbose logging of common warnings.

By default, this setting is disabled.

When enabling this setting, make sure the Enable logging setting is also enabled.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, errors and general information are logged.

Enable logging

This setting enables or disables Profile management logging in debug (verbose logging) mode. In debug mode, extensive status information is logged in the log files located in "%SystemRoot%\System32\Logfiles\UserProfileManager".

By default, this setting is disabled and only errors are logged.

Citrix recommends enabling this setting only if you are troubleshooting Profile management.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, only errors are logged.
File system actions
This setting enables or disables verbose logging of actioned performed in the file system.
By default, this setting is disabled.
When enabling this setting, make sure the Enable logging setting is also enabled.
If this setting is not configured here, the value from the .ini file is used.
If this setting is not configured here or in the .ini file, errors and general information are logged.

File system notifications
This setting enables or disables verbose logging of file systems notifications.
By default, this setting is disabled.
When enabling this setting, make sure the Enable logging setting is also enabled.
If this setting is not configured here, the value from the .ini file is used.
If this setting is not configured here or in the .ini file, errors and general information are logged.

Logoff
This setting enables or disables verbose logging of user logoffs.
By default, this setting is disabled.
When enabling this setting, make sure the Enable logging setting is also enabled.
If this setting is not configured here, the value from the .ini file is used.
If this setting is not configured here or in the .ini file, errors and general information are logged.

Logon
This setting enables or disables verbose logging of user logons.
By default, this setting is disabled.
When enabling this setting, make sure the Enable logging setting is also enabled.
If this setting is not configured here, the value from the .ini file is used.
If this setting is not configured here or in the .ini file, errors and general information are logged.

Maximum size of the log file
This setting specifies the maximum permitted size for the Profile management log file, in bytes.
By default, this is set to 1048576 bytes (1MB).
Citrix recommends increasing the size of this file to 5 MB or more, if you have sufficient disk space. If the log file grows beyond the maximum size, an existing backup of the file (.bak) is deleted, the log file is renamed to .bak, and a new log file is
The log file is created in %SystemRoot%\System32\Logfiles\UserProfileManager.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, the default value is used.

Path to log file

This setting specifies an alternative path to which to save the Profile management log file.

By default, this setting is disabled and log files are saved in the default location; %SystemRoot%\System32\Logfiles\UserProfileManager.

The path can point to a local drive or a remote, network-based drive (a UNC path). Remote paths can be useful in large, distributed environments but they may create significant network traffic, which may be inappropriate for log files. For provisioned, virtual machines with a persistent hard drive, set a local path to that drive. This ensures log files are preserved when the machine restarts. For virtual machines without a persistent hard drive, setting a UNC path allows you to retain the log files but the system account for the machines must have write access to the UNC share. Use a local path for any laptops managed by the offline profiles feature.

If a UNC path is used for log files, Citrix recommends that an appropriate access control list is applied to the log file folder to ensure that only authorized user or computer accounts can access the stored files.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, the default location %SystemRoot%\System32\Logfiles\UserProfileManager is used.

Personalized user information

This setting enables or disables verbose logging of personalized user information.

By default, this setting is disabled.

When enabling this setting, make sure the Enable logging setting is also enabled.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, errors and general information are logged.

Policy values at logon and logoff

This setting enables or disables verbose logging of policy values when a user logs on and off.

By default, this setting is disabled.

When enabling this setting, make sure the Enable logging setting is also enabled.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, errors and general information are logged.

Registry actions
This setting enables or disables verbose logging of actions performed in the registry.

By default, this setting is disabled.

When enabling this setting, make sure the Enable logging setting is also enabled.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, errors and general information are logged.

Registry differences at logoff

This setting enables or disables verbose logging of any differences in the registry when a user logs off.

By default, this setting is disabled.

When enabling this setting, make sure the Enable logging setting is also enabled.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, errors and general information are logged.
Profile handling policy settings

Dec 13, 2013
The Profile handling section contains policy settings for configuring how Profile management handles user profiles.

Delay before deleting cached profiles
This setting specifies an optional extension to the delay, in minutes, before Profile management deletes locally cached profiles at logoff.

A value of 0 deletes the profiles immediately, at the end of the logoff process. Profile management checks for logoffs every minute, so a value of 60 ensures that profiles are deleted between one and two minutes after users have logged off (depending on when the last check took place). Extending the delay is useful if you know that a process keeps files or the user registry hive open during logoff. With large profiles, this can also speed up logoff.

By default, this is set to 0 and Profile management deletes locally cached profiles immediately.

When enabling this setting, ensure the Delete locally cached profiles on logoff is also enabled.

If this setting is not configured here, the value from the .ini file is used.

Delete locally cached profiles on logoff
This setting specifies whether locally cached profiles are deleted after a user logs off.

When this setting is enabled, a user's local profile cache is deleted after they have logged off. Citrix recommends enabling this setting for terminal servers.

By default, this setting is disabled and a user's local profile cache is retained after they log off.

If this setting is not configured here, the value from the .ini file is used.

Local profile conflict handling
This setting configures how Profile management behaves if a user profile exists both in the user store and as a local Windows user profile (not a Citrix user profile).

By default, Profile management uses the local Windows profile, but does not change it in any way.

To control how Profile management behaves, choose one of the following options:
- Use local profile. Profile management uses the local profile, but does not change it in any way.
- Delete local profile. Profile management deletes the local Windows user profile, and then imports the Citrix user profile from the user store.
- Rename local profile. Profile management renames the local Windows user profile (for backup purposes) and then imports the Citrix user profile from the user store.

If this setting is not configured here, the value from the .ini file is used.
If this setting is not configured here or in the .ini file, existing local profiles are used.

Migration of existing profiles

This setting specifies the types of profile migrated to the user store during logon if a user has no current profile in the user store.

Profile management can migrate existing profiles "on the fly" during logon if a user has no profile in the user store. After this, the user store profile is used by Profile management in both the current session and any other session configured with the path to the same user store.

By default, both local and roaming profiles are migrated to the user store during logon.

To specify the types of profile migrated to the user store during logon, choose one of the following options:

- Local and roaming profiles
- Local
- Roaming
- None (Disabled)

If you select None, the system uses the existing Windows mechanism to create new profiles, as if in an environment where Profile management is not installed.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, existing local and roaming profiles are migrated.

Path to the template profile

This setting specifies the path to the profile you want Profile management to use as a template to create new user profiles.

The specified path must be the full path to the folder containing the NTUSER.DAT registry file and any other folders and files required for the template profile.

Note: Ensure that you do not include NTUSER.DAT in the path. For example, with the file \myservername\myprofiles\template\ntuser.dat, set the location as \myservername\myprofiles\template.

Use absolute paths, which can be either UNC paths or paths on the local machine. Use the latter, for example, to specify a template profile permanently on a Citrix Provisioning Services image. Relative paths are not supported.

Note: This setting does not support expansion of Active Directory attributes, system environment variables, or the %USERNAME% and %USERDOMAIN% variables.

By default, this setting is disabled and new user profiles are created from the default user profile on the device where a user first logs on.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, no template is used.

Template profile overrides local profile

This setting enables the template profile to override the local profile when creating new user profiles.

If a user has no Citrix user profile, but a local Windows user profile exists, by default the local profile is used (and migrated to the user store, if this is not disabled). Enabling this policy setting allows the template profile to override the local profile used.
when creating new user profiles.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, no template is used.

Template profile overrides roaming profile

This setting enables the template profile to override a roaming profile when creating new user profiles.

If a user has no Citrix user profile, but a roaming Windows user profile exists, by default the roaming profile is used (and migrated to the user store, if this is not disabled). Enabling this policy setting allows the template profile to override the roaming profile used when creating new user profiles.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, no template is used.

Template profile used as a Citrix mandatory profile for all logons

This setting enables Profile management to use the template profile as the default profile for creating all new user profiles.

By default, this setting is disabled and new user profiles are created from the default user profile on the device where a user first logs on.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, no template is used.
Registry policy settings

Dec 13, 2013

The Registry section contains policy settings for configuring which Registry keys are included in or excluded from Profile management processing.

Exclusion list

This setting specifies the list of registry keys in the HKCU hive excluded from Profile management processing when a user logs off.

When enabled, keys specified in this list are excluded from processing when a user logs off.

By default, this setting is disabled, and all registry keys in the HKCU hive are processed when a user logs off.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, no registry keys are excluded from processing.

Inclusion list

This setting specifies the list of registry keys in the HKCU hive included in Profile management processing when a user logs off.

When enabled, only keys specified in this list are processed when a user logs off.

By default, this setting is disabled, and all registry keys in the HKCU hive are processed when a user logs off.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, all of HKCU is processed.
Streamed user profiles policy settings

Dec 13, 2013

The Streamed user profiles section contains policy settings for configuring how Profile management processes streamed user profiles.

Always cache

This setting specifies whether or not Profile management caches streamed files as soon as possible after a user logs on. Caching files after a user logs on saves on network bandwidth, enhancing the user experience.

Use this setting in conjunction with the Profile streaming setting.

By default, this setting is disabled and streamed files are not cached as soon as possible after a user logs on.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, it is disabled.

Always cache size

This setting specifies a lower limit, in megabytes, on the size of files that are streamed. Profile management caches any files this size or larger as soon as possible after a user logs on.

By default, this is set to 0 (zero) and the cache entire profile feature is used. When the cache entire profile feature is enabled, Profile management fetches all profile contents in the user store, after a user logs on, as a background task.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, it is disabled.

Profile streaming

This setting enables and disables the Citrix streamed user profiles feature. When enabled, files and folders contained in a profile are fetched from the user store to the local computer only when they are accessed by users after they have logged on. Registry entries and any files in the pending area are fetched immediately.

By default, profile streaming is disabled.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, it is disabled.

Streamed user profile groups

This setting specifies which user profiles within an OU are streamed, based on Windows user groups.

When enabled, only user profiles within the specified user groups are streamed. All other user profiles are processed normally.

By default, this setting is disabled and all user profiles within an OU are processed normally.

If this setting is not configured here, the value from the .ini file is used.
If this setting is not configured here or in the .ini file, all user profiles are processed.

Timeout for pending area lock files

This setting specifies a period of time (in days) after which users' files are written back to the user store from the pending area in the event that the user store remains locked when a server becomes unresponsive. This prevents bloat in the pending area and ensures the user store always contains the most up-to-date files.

By default, this is set to 1 (one) day.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, the default value is used.
Receiver policy settings

Dec 13, 2013
The Receiver section contains policy settings for configuring a list of Storefront addresses to push to Receiver for Windows running on the virtual desktop.

StoreFront accounts list

This setting specifies a list of StoreFront stores administrators can choose to push to Receiver for Windows running on the virtual desktop. When creating a Delivery Group, administrators can select which stores to push to Receiver for Windows running on virtual desktops within that group.

By default, no stores are specified.

For each store, specify the following information as a semicolon-delimited entry:

- **Store name.** The name displayed to users of the store.
- **Store URL.** The URL for the store.
- **Store enabled state.** Specifies whether or not the store is available to users. This is either On or Off.
- **Store description.** The description displayed to users of the store.

For example:

Sales Store:https://sales.mycompany.com/Citrix/Store/discovery;On;Store for Sales staff
Virtual Delivery Agent policy settings

The Virtual Delivery Agent (VDA) section contains policy settings you can configure to control communication between the VDA and controllers for a site.

Important: The VDA requires information provided by these settings to register with a controller, if you are not using the auto-update feature. Because this information is required for registration, you must configure the following settings using Active Directory's Group Policy Editor, unless you provide this information during the VDA install:

- Controller registration IPv6 netmask
- Controller registration port
- Controller SIDs
- Controllers
- Only use IPv6 controller registration
- Site GUID

Controller registration IPv6 netmask

This policy setting allows administrators to restrict the VDA to only a preferred subnet (rather than a global IP, if one is registered). This setting specifies the IPv6 address and network where the VDA will register. The VDA will register only on the first address that matches the specified netmask. This setting is valid only if the Only use IPv6 controller registration policy setting is enabled.

By default this setting is blank.

Controller registration port

Use this setting only if the Enable auto update of controllers setting is disabled.

This setting specifies the TCP/IP port number the VDA uses to register with a controller, when using registry-based registration.

By default, the port number is set to 80.

Controller SIDs

Use this setting only if the Enable auto update of controllers setting is disabled.

This setting specifies a space-separated list of controller Security Identifiers (SIDs) the VDA uses to register with a controller, when using registry-based registration. This is an optional setting, that may be used in conjunction with the Controllers setting, to restrict the list of controllers used for registration.

By default, this setting is blank.

Controllers

Use this setting only if the Enable auto update of controllers setting is disabled.

This setting specifies a space-separated list of controller Fully Qualified Domain Names (FQDNs) the VDA uses to register with a controller, when using registry-based registration. This is an optional setting, that may be used in conjunction with the Controller SIDs setting.
By default, this setting is blank.

Enable auto update of controllers

This setting enables the VDA to register with a controller automatically after installation.

After the VDA registers, the controller with which it registered sends a list of the current controller FQDNs and SIDs to the VDA. The VDA writes this list to persistent storage. Each controller also checks the site database every 90 minutes for controller information; if a controller has been added or removed since the last check, or if a policy change has occurred, the controller sends updated lists to its registered VDAs. The VDA will accept connections from all the controllers in the most recent list it received.

By default, this setting is enabled.

Only use IPv6 controller registration

This setting controls which form of address the VDA uses to register with the controller:
- When enabled, the VDA registers with the controller using the machine's IPv6 address. When the VDA communicates with the controller, it uses the following address order: global IP address, Unique Local Address (ULA), link-local address (if no other IPv6 addresses are available).
- When disabled, the VDA registers and communicates with the controller using the machine's IPv4 address.

By default, this setting is disabled.

Site GUID

Use this setting only if the Enable auto update of controllers setting is disabled.

This setting specifies the Globally Unique Identifier (GUID) of the site the VDA uses to register with a controller, when using Active Directory-based registration.

By default, this setting is blank.
The HDX 3D Pro section contains policy settings for enabling and configuring the image quality configuration tool for your users. The tool enables users to optimize their use of the available bandwidth by adjusting in real time the balance between image quality and responsiveness.

Enable lossless

This setting specifies whether or not users can enable and disable lossless compression using the image quality configuration tool. By default, users are not given the option to enable lossless compression.

When a user enables lossless compression, the image quality is automatically set to the maximum value available in the image configuration tool. By default, either GPU or CPU-based compression can be used, according to the capabilities of the user device and the host computer.

HDX 3D Pro quality settings

This setting specifies the minimum and maximum values that define the range of image quality adjustment available to users in the image quality configuration tool.

Specify image quality values of between 0 and 100, inclusive. The maximum value must be greater than or equal to the minimum value.
Configure COM Port and LPT Port Redirection settings using the registry

Nov 04, 2015

Policy settings for COM Port and LPT Port Redirection have been deprecated from the Studio, and moved to the registry, and are now located under HKLM\Software\Citrix\GroupPolicy\Defaults\Deprecated on either your Master VDA image or your physical VDA machines.

To enable COM port and LPT port redirection, add new registry keys of type REG_DWORD, as follows:

Caution: Editing the registry incorrectly can cause serious problems that may require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.

<table>
<thead>
<tr>
<th>Registry key</th>
<th>Description</th>
<th>Permitted values</th>
</tr>
</thead>
<tbody>
<tr>
<td>AllowComPortRedirection</td>
<td>Allow or prohibit COM port redirection</td>
<td>1 (Allow) or 0 (Prohibit)</td>
</tr>
<tr>
<td>LimitComBw</td>
<td>Bandwidth limit for COM port redirection channel</td>
<td>Numeric value</td>
</tr>
<tr>
<td>LimitComBWPercent</td>
<td>Bandwidth limit for COM port redirection channel as a percentage of total session bandwidth</td>
<td>Numeric value between 0 and 100</td>
</tr>
<tr>
<td>AutoConnectClientComPorts</td>
<td>Automatically connect COM ports from the user device</td>
<td>1 (Allow) or 0 (Prohibit)</td>
</tr>
<tr>
<td>AllowLptPortRedirection</td>
<td>Allow or prohibit LPT port redirection</td>
<td>1 (Allow) or 0 (Prohibit)</td>

</tr>
<tr>
<td>AutoConnectClientLptPorts</td>
<td>Automatically connect LPT ports from the user device</td>
<td>1 (Allow) or 0 (Prohibit)</td>
</tr>
</tbody>
</table>

After configuring these settings, modify your machine catalogs to use the new master image or updated physical machine. Desktops are updated with the new settings the next time users log off.
Use the Monitor Service OData API

Mar 23, 2015
These documents introduce the Monitor Service application programming interface (API), describe what data is available using the API, and how to access it. Examples are provided to illustrate the API's use. Also explained is how to use SSL to secure the Monitor Service OData API endpoints. These documents are aimed at experienced administrators who are familiar with using OData APIs.

In addition to using the Citrix Director console to display historical data, you can query data using the Monitor Service's API. The API uses a broad framework that provides considerable flexibility for querying data. You can use the API to analyze historical trends for future planning, or to perform detailed troubleshooting of connection and machine failures. You can also use the API to extract information for feeding into other tools and processes; for example, using Microsoft Excel's PowerPivot tables to display the data in different ways. Or, you can build a custom user interface on top of the data that the API provides.

The Monitor Service API uses the Open Data (OData) protocol, which is a Web protocol for querying and updating data, built upon Web technologies such as HTTP. For more information about the OData protocol, see: http://www.odata.org.
Data available using the API

Mar 23, 2015
This document describes the data that can be accessed using the Monitor Service OData API, and provides a schema diagram.

The Schema

The Monitor Service schema provides the following types of data:

- data relating to connection failures
- machines in a failure state
- session usage
- logon duration
- load balancing data

The following diagram illustrates the Monitor Service schema.
Accessing data using the API

Mar 23, 2015

The Monitor Service API is built on top of SQL Server databases using Windows Communication Foundation (WCF) Data Services that are populated during processing and consolidation. Two endpoints are exposed using WCF with wsHttpBinding. The base address is: http:// {dc-host}/Citrix/Monitor/OData/v1. You can also use SSL to secure endpoints; see Securing endpoints using SSL for more information.

1. The Methods endpoint exposes service operations which are used by Citrix Director to retrieve data that requires complex grouping and high performance standards, such as queries on the Dashboard and Trends pages. The Methods API URI is: http://{dc-host}/Citrix/Monitor/OData/v1/Methods

2. The Data endpoint exposes read-only access directly to the database entities and can be accessed using the OData query language. This endpoint allows highly flexible access in terms of filtering and column selection, but does not provide the same performance benefits associated with the highly specific service operations. The Data API URI is: http://{dc-host}/Citrix/Monitor/OData/v1/Data

Authentication

To use the Monitor Service OData API, you must be a XenDesktop administrator. To call the API you require read-only privileges; however, the data returned is determined by XenDesktop administrator roles and permissions. For example, Delivery Group Administrators can call the Monitor Service API but the data they can obtain is controlled by Delivery Group access set up using Citrix Studio. For more information about XenDesktop administrator roles and permissions, see Delegated Administration.

Querying the Data

The Monitor Service API is a REST-based API that can be accessed using an OData consumer. OData consumers are applications that consume data exposed using the OData protocol. OData consumers vary in sophistication, from simple web browsers to custom applications that can take advantage of all the features of the OData Protocol. For more information about OData consumers, see: http://www.odata.org/ecosystem#consumers.

Every part of the Monitor Service data model is accessible and can be filtered on the URL. OData provides a query language in the URL format you can use to retrieve entries from a service. For more information, see: http://msdn.microsoft.com/en-us/library/ff478141.aspx

The query is processed on the server side and can be filtered further using the OData protocol on the client side.

Note: Enums are not supported in the OData protocol; integers are used in their place. To determine the values returned by the Monitor Service OData API, see Determine enum values.

Categories of Data

The Monitor Service collects a variety of data, including user session usage, user logon performance details, session load balancing details, and connection and machine failure information. Data is aggregated differently depending on its category. Understanding the aggregation of data values presented using the OData Method APIs is critical to interpreting the data. For example:

- Connected Sessions and Machine Failures occur over a period of time, therefore they are exposed as maximums over a time period
- LogOn Duration is a measure of length of time, therefore it is exposed as an average over a time period
- LogOn Count and Connection Failures are counts of occurrences over a period of time, therefore they are exposed as sums
over a time period

**Concurrent Data Evaluation**

Sessions must be overlapping to be considered concurrent. However, when the time interval is 1 minute, all sessions in that minute (whether or not they overlap) are considered concurrent i.e. the size of the interval is so small that the performance overhead involved in calculating the precision is not worth the value added. If the sessions occur in the same hour, but not in the same minute, they are not considered to overlap.
About time and date ranges

This document explains how to specify and interpret time and date ranges in the Monitor Service API. You need to read this if you are using the Methods endpoint.

When specifying timestamp ranges in the Monitor Service API, note that the range is inclusive. In other words, the timestamp includes everything that happened during that interval up to the start of the next interval. Specifying the same start and end time yields a single data point at the requested granularity.

This model offers a consistent application of time and date range specifications that scale from minute to monthly granularity. The following table shows some examples.

<table>
<thead>
<tr>
<th>Range (start - end)</th>
<th>Interval/Granularity</th>
<th>Points Returned</th>
<th>Data</th>
</tr>
</thead>
<tbody>
<tr>
<td>1:00 - 1:00</td>
<td>1 minute</td>
<td>1</td>
<td>covers 1:00:00 - 1:00:59</td>
</tr>
<tr>
<td>1:00 - 1:01</td>
<td>1 minute</td>
<td>2</td>
<td>1:00, 1:01 and it covers 1:00:00 - 1:01:59</td>
</tr>
<tr>
<td>1:00 - 2:00</td>
<td>1 minute</td>
<td>61</td>
<td>includes up to 2:00:59</td>
</tr>

</table>
Securing endpoints using SSL

Mar 23, 2015

This document explains how to use SSL to secure the Monitor Service OData API endpoints. If you choose to use SSL, you must configure SSL on all Delivery Controllers in the site; you cannot use a mixture of SSL and non-SSL.

To secure Monitor Service endpoints using SSL, you must perform the following configuration. Some steps need to be done only once per site, others must be run from every machine hosting the Monitor Service in the site. The steps are described below.

**Part 1: Certificate registration with the system**

1. Create a certificate using a trusted certificate manager. The certificate must be associated with the port on the machine that you wish to use for OData SSL.
2. Configure the Monitor Service to use this port for SSL communication. The steps depend on your environment and how this works with certificates. The following example shows how to configure port 449:

   - Associate the certificate with a port:
     ```bash
     netsh http add sslcert ipport=0.0.0.0:449 certhash=97bb629e50d556c80528f4991721ad4f28fb74e9
     appid='{00000000-0000-0000-0000-000000000000}'}
     ```

     Tip: In a PowerShell command window, ensure you put single quotes around the GUID in the appID, as shown above, or the command will not work. Note that a line break has been added to this example for readability only.

**Part 2: Modify the Monitor Service configuration settings**

1. From any Delivery Controller in the site, run the following PowerShell commands once. This removes the Monitor Service registration with the Configuration Service.
   ```bash
   asnp citrix.*
   $serviceGroup = get-configregisteredserviceinstance -servicetype Monitor | Select -First 1 ServiceGroupUid
   remove-configserviceGroup -ServiceGroupUid $serviceGroup.ServiceGroupUid
   ```

2. Do the following on all Controllers in the site:
   - Using a cmd prompt, locate the installed Citrix Monitor directory (typically in C:\Program Files\Citrix\Monitor\Service).
     - Within that directory run:
       ```bash
       Citrix.Monitor.Exe -CONFIGUREFIREWALL -ODataPort 449 -RequireODataSsl
       ```
   - Run the following PowerShell commands:
     ```bash
     asnp citrix.* (if not already run within this window)
     ```

     - Get-MonitorServiceInstance | register-ConfigServiceInstance
     ```bash
     Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-MonitorServiceGroupMembership
     ```
Methods

Mar 23, 2015

The following documents describe the methods exposed by the API. Each method is described, together with the parameters provided, and what is returned by the API call. Example queries are also shown.

For more information about specifying time intervals, see About time and date ranges. For more information about the values returned by the Monitor Service OData API, see Determine enum values.

<table>

</tbody>
</table>
GetAverageLogOnBreakdown

Jul 24, 2013

Gets the average logon duration for the specified time period, user ID and desktopGroupUid.

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>startDate</td>
<td>DateTime</td>
<td>Start of the time window to get the average for. Must be UTC DateTime.</td>
</tr>
<tr>
<td>endDate</td>
<td>DateTime</td>
<td>End of the time window to get the average for. Must be UTC DateTime.</td>
</tr>
<tr>
<td>userSid</td>
<td>String</td>
<td>User Sid to limit the average to.</td>
</tr>
<tr>
<td>desktopGroupUid</td>
<td>Guid</td>
<td>DesktopGroupUid to limit the average to.</td>
</tr>
</tbody>
</table>

Returns

An IQueryable of LogOnBreakdown objects that contain the following for each logon step:

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>LogonStepItems</td>
<td>List&lt;LogOnStepItem&gt;</td>
<td>List of LogOnStepItems. Each LogonStepItem has LogonStep (Values can be Brokering=1, VMStart=2, HDX=3, Authentication=4, Gpos=5, LogonScripts=6, ProfileLoad=7, Interactive=8, Total=0) and Duration (Nullable&lt;double&gt;) in milliseconds. If no data is available for the step, Duration is null.</td>
</tr>
<tr>
<td>BreakdownType</td>
<td>int</td>
<td>Type of breakdown. UsersLastSession=1, UsersSessionAverage=2, DesktopGroupAverage=3</td>
</tr>
</tbody>
</table>

Note: The HDX duration is a new metric that requires changes to the ICA protocol. This means that, if the new version of the client is not being used, the metrics returned are NULL.

Example

GETs the average logon duration for March 15th, for this user ID and desktopGroupUid.

http://{dc-host}/Citrix/Monitor/OData/v1/Methods/GetAverageLogOnBreakdown?startDate=datetime'2012-03-15T00:00:00'&endDate=...012-03-30T00:00:00'&userSid='User%20Sid'&desktopGroupUid=guid'28D15C1F-7D4C-43BC-BAF2-5886D8514642'&$expand=LogOnStepItems
GetAverageLogOnDuration

Jul 03, 2014

Gets the average logon duration trend for the specified time period. Includes only logons that completed successfully (which have both a LogOnStartDate and a LogOnEndDate in the database).

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>start</td>
<td>DateTime</td>
<td>Start of the time window to be queried for the average logon duration trend. Must be UTC.</td>
</tr>
<tr>
<td>end</td>
<td>DateTime</td>
<td>End of the time window to be queried for the connection failure trend. Must be UTC.</td>
</tr>
</tbody>
</table>

**Returns**

Double representing the average logon duration for the specified time period.

**Example**

Gets the average logon duration over the hour specified for all Delivery Groups.

http://{dc-host}/Citrix/Monitor/OData/v1/Methods/GetAverageLogOnDuration?start='2012-06-05T12:24:00'&end='2012-06-05T13:24:00'
GetConcurrentSessionsTrend

Jul 24, 2013

Gets data points to represent a trend of concurrent sessions as a list of DateTime/value pairs for the specified time period. Each point represents the maximum number of concurrent sessions over the interval specified. The last point in the trend can represent the number of current users in the system.

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>startDate</td>
<td>DateTime</td>
<td>Start of the time window to be queried for concurrent sessions. Must be UTC. Inclusive.</td>
</tr>
<tr>
<td>endDate</td>
<td>DateTime</td>
<td>End of the time window to be queried for concurrent sessions. Must be UTC. Inclusive.</td>
</tr>
<tr>
<td>intervalLength</td>
<td>int</td>
<td>Interval between data points in minutes for the trend.</td>
</tr>
</tbody>
</table>

Returns

IQueryable list of TrendItem objects - IQueryable<TrendItem> ordered by Date ascending.

Each TrendItem contains a UTC Date (DateTime) property and a Value property (double) for plotting the trend.

Example

Gets a one hour trend (data point every minute) of the concurrent sessions:

http://{dc-host}/Citrix/Monitor/OData/v1/Methods/GetConcurrentSessionsTrend?startDate=datetime'2012-06-05T12:26:00'&endDate=datetime'2012-06-05T13:26:00'&intervalLength=1
GetConnectedUsersTrend

Gets the connected users trend for Server OS Machines for the specified time period. Each data point in the trend has the total number of users connected to Server OS Machines for the last interval (intervalLength).

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>startDate</td>
<td>DateTime</td>
<td>Start of the time window to be queried for the connected users trend. Must be UTC.</td>
</tr>
<tr>
<td>endDate</td>
<td>DateTime</td>
<td>End of the time window to be queried for the connected users trend. Must be UTC.</td>
</tr>
<tr>
<td>intervalLength</td>
<td>int</td>
<td>Interval between data points in minutes for the trend.</td>
</tr>
<tr>
<td>desktopGroupsFilter</td>
<td>string</td>
<td>Comma-separated list of Delivery Group Uids to limit the trend result to.</td>
</tr>
<tr>
<td>machineFilter</td>
<td>string</td>
<td>Comma-separated list of machine Sids to limit the trend result to.</td>
</tr>
</tbody>
</table>

Returns

An IQueryable of objects that contains the following:

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>ConnectedUsersTrend</td>
<td>List&lt;TrendItem&gt;</td>
<td>TrendItem contains a UTC Date (DateTime) and a Count (int) for the maximum number of connected users in the interval.</td>
</tr>
</tbody>
</table>

Examples

Gets a 24-hour trend (data point every 15 minutes) of the connected users trend for the two Delivery Groups specified.

http://{dc-host}/Citrix/Monitor/OData/v1/Methods/GetConnectedUsersTrend?startDate=datetime'2011-09-30T00:00:00'&endDate=dateTime'2011-10-01T00:00:00'intervalLength=15&desktopGroupsFilter='04D53BBE-F5CC-11E0-B401-3F054824019B,0FBEFBBE-F5CC-11E0-9472-40054824019B'

Gets a week-long trend (data point every 4 hours) of the connected users trend.

http://{dc-host}/Citrix/Monitor/OData/v1/Methods/GetConnectedUsersTrend?startDate=datetime'2011-09-23T00:00:00'&endDate=datetime'2011-10-01T00:00:00'intervalLength=240
GetConnectionFailureTrend

 Gets the connection failure trend for the specified time period. Each data point in the trend represents the total number of connection failures in the last interval (intervalLength parameter).

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>startDate</td>
<td>DateTime</td>
<td>Start of the time window to be queried for the connection failure trend. Must be UTC.</td>
</tr>
<tr>
<td>endDate</td>
<td>DateTime</td>
<td>End of the time window to be queried for the connection failure trend. Must be UTC.</td>
</tr>
<tr>
<td>intervalLength</td>
<td>int</td>
<td>Interval between data points in minutes for the trend.</td>
</tr>
<tr>
<td>desktopGroupsFilter</td>
<td>string</td>
<td>Comma-separated list of Delivery Group uids to limit the trend result to.</td>
</tr>
<tr>
<td>connectionFailureTypeFilter</td>
<td>string</td>
<td>Comma-separated list of connection failure type ints to limit the trend result to. This integer corresponds to ConnectionFailureType enum.</td>
</tr>
<tr>
<td>sessionSupportFilter</td>
<td>string</td>
<td>Comma-separated list of machine type ints (Single=1, Multiple=2, Unknown=0) to limit the trend result to. No value returns both types.</td>
</tr>
</tbody>
</table>

Returns

An IQueryable of TrendItem objects

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>FailureTrend</td>
<td>List&lt;TrendItem&gt;</td>
<td>TrendItem contains a UTC Date (DateTime) and a Count(int) of failures to indicate the trend of connection failures over the specified time period for the filters specified.</td>
</tr>
</tbody>
</table>

Examples

Gets a 24-hour trend (data point every 15 minutes) for all types of connection failures for the two Delivery Groups specified with Desktop OS Machine types.

http://{dc-host}/Citrix/Monitor/OData/v1/Methods/GetConnectionFailureTrend?startdate=datetime'2011-09-30T00:00:00'&enddate=datetime'2011-10-01T00:00:00'intervalLength=240&connectionFailureTypeFilter='2,3,4'

Gets a week-long trend (data point every 4 hours) for three types of connection failures (aggregated) for all Delivery Groups the user has access to.

http://{dc-host}/Citrix/Monitor/OData/v1/Methods/GetConnectionFailureTrend?startdate=datetime'2011-09-23T00:00:00'&enddate=datetime'2011-10-01T00:00:00'intervalLength=240&connectionFailureTypeFilter='2,3,4'

https://docs.citrix.com © 1999-2017 Citrix Systems, Inc. All rights reserved. p.2733
GetConnectionFailureTrendsByType
Jul 24 , 20 13

Gets a list of connection failure counts by type, together with a trend for each type, for the speciﬁed time period. Each data point in the trend represents the total number of connection failures in
the last interval (intervalLength parameter). Provides ability to specify a particular failure type to limit the query or get all failure types.
Parameter Name

Type

Comments

startDate

DateT ime

Start of the time window to be queried for the connection failure trend. Must be UT C.

endDate

DateT ime

End of the time window to be queried for the connection failure trend. Must be UT C.

intervalLength

Int

Interval between data points in minutes for the trend.

connectionFailureT ype

Int

[ConnectionFailureT ype] If provided (>0), returns only that connection failure type in the results. Otherwise (null or zero) returns a list of all failure types. T his
integer corresponds to ConnectionFailureT ype enum.

Returns
An IQueryable of ConnectionFailureTrend objects that contain the following for each ConnectionFailureType.
If all types are requested, then the sum is also returned with ConnectionFailureType = -1
If $expand=FailureTrend is included in the query, then the trend and TotalFailureCount properties are retrieved for each failure type.
If $expand=DesktopGroupBreakdown is included in the query, that property is also retrieved for each failure type.
Property Name

Type

Comments

ConnectionFailureT ype

int [ConnectionFailureT ype]

T ype of connection failure (from enum ConnectionFailureT ype).

FailureT rend

List<T rendItem>

T rendItem contains a UT C Date (DateT ime), and a Value (nullable double) to indicate the trend of connection failures over the
time period specified for this type of failure.

T otalFailureCount

int

T otal number of failures over the specified time period.

DesktopGroupBreakdown

List<DesktopGroupBreakdown>

DesktopGroupBreakdown contains a DesktopGroup object (must be included in the expand to be returned) and Count (int) to
represent the total number of failures in the specified time window.

Examples
Retrieve both Delivery Group breakdown and the failure trend for all failure types for Nov-14 at 5am (UTC) to Nov 14 at 7am (UTC) with a data point every 30 minutes:

http://{dc-host}/Citrix/Monitor/OData/v1/Methods/GetConnectionFailureTrendsByType?startDate=datetime'2011-11-14T05:00:00'&endDate=datetime'2011-11-14T07:00:00'&intervalLength=30&connectionFailureTyp
Retrieve Delivery Group breakdown only for the failure type 4 (No Capacity Available) for Nov-14 at 5am (UTC) to Nov 14 at 7am (UTC)

http://{dc-host}/Citrix/Monitor/OData/v1/Methods/GetConnectionFailureTrendsByType?startDate=datetime'2011-11-14T05:00:00'&endDate=datetime'2011-11-14T07:00:00'&connectionFailureType=4&$expand=Des
Retrieve the failure trend for all failure types from Nov-14 at 12am (UTC) to Nov 14 at 11pm (UTC) with a data point every hour:

http://{dc-host}/Citrix/Monitor/OData/v1/Methods/GetConnectionFailureTrendsByType?startDate=datetime'2011-11-14T00:00:00'&endDate=datetime'2011-11-14T23:00:00'&intervalLength=60&connectionFailureTyp

https://docs.citrix.com

p.2734


GetConnectionFailureTrendsByTypeLatest

Nov 11, 2013

Gets a list of connection failure counts by type, together with a trend for each type, for the specified number of intervals from now (UTC server time). Each data point in the trend represents the total number of connection failures in the last interval (intervalLength parameter). Provides ability to specify a particular failure type to limit the query or get all failure types.

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>intervalLength</td>
<td>int</td>
<td>Interval between data points in minutes for the trend.</td>
</tr>
<tr>
<td>numberOfIntervals</td>
<td>int</td>
<td>Number of requested data points. Used with intervalLength to calculate StartDate.</td>
</tr>
<tr>
<td>connectionFailureType</td>
<td>int</td>
<td>If provided (&gt;0), returns only that connection failure type in the results. Otherwise (null or zero) returns a list of all failure types. This integer corresponds to ConnectionFailureType enum.</td>
</tr>
</tbody>
</table>

Returns:

An IQueryable of ConnectionFailureTrend objects that contain the following for each ConnectionFailureType.

If all types are requested, then the sum is also returned with ConnectionFailureType = -1

If $expand=FailureTrend is included in the query, the trend and TotalFailureCount properties are retrieved for each failure type.

If $expand=DesktopGroupBreakdown is included in the query, that property is also retrieved for each failure type.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>ConnectionFailureType</td>
<td>int [ConnectionFailureType]</td>
<td>Type of connection failure (from enum ConnectionFailureType).</td>
</tr>
<tr>
<td>FailureTrend</td>
<td>List&lt;TrendItem&gt;</td>
<td>TrendItem contains a UTC Date (DateTime), and a Value (nullable double) to indicate the trend of connection failures over the time period specified for this type of failure.</td>
</tr>
<tr>
<td>TotalFailureCount</td>
<td>int</td>
<td>Total number of failures over the specified time period.</td>
</tr>
<tr>
<td>DesktopGroupBreakdown</td>
<td>List&lt;DesktopGroupBreakdown&gt;</td>
<td>DesktopGroupBreakdown contains a DesktopGroup object (must be included in the expand to be returned) and Count (int) to represent the total number of failures in the specified time window.</td>
</tr>
</tbody>
</table>

Examples

Retrieve both Delivery Group breakdown and the failure trend for the last 60 minutes with a data point every 1 minute:

http://{dc-host}/Citrix/Monitor/OData/v1/Methods/GetConnectionFailureTrendsByTypeLatest?&intervalLength=1&numberOfIntervals=60&connectionFailureType=0&$expand=FailureTrend,DesktopGroupBreakdown

Retrieve Delivery Group breakdown only for the failure type 4 (No Capacity Available) for the last 30 minutes:

http://{dc-host}/Citrix/Monitor/OData/v1/Methods/GetConnectionFailureTrendsByTypeLatest?&intervalLength=1&numberOfIntervals=30&connectionFailureType=4&$expand=DesktopGroupBreakdown

Retrieve the failure trend for all failure types for the last 24 hours with a data point every hour:

http://{dc-host}/Citrix/Monitor/OData/v1/Methods/GetConnectionFailureTrendsByTypeLatest?&intervalLength=60&numberOfIntervals=24&connectionFailureType=0&$expand=FailureTrend
GetLastSessionLogOnBreakdown

Jul 24, 2013

Gets the logon breakdown for User and Delivery Group. Returns the current User session, if one exists.

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Type</th>
<th>Required?</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>userSid</td>
<td>String</td>
<td>Yes</td>
<td>The ID of the user for whom information is being requested.</td>
</tr>
<tr>
<td>desktopGroupUid</td>
<td>Guid</td>
<td>Yes</td>
<td>Delivery Group being queried.</td>
</tr>
<tr>
<td>machineUid</td>
<td>String</td>
<td>No</td>
<td>The machine on which the last session was run. This may not be available.</td>
</tr>
</tbody>
</table>

Returns

An IQueryable of LogOnBreakdown objects that contain the following for each logon step:

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>LogonStepItems</td>
<td>List&lt;LogOnStepItem&gt;</td>
<td>List of LogOnStepItems. Each LogonStepItem has LogonStep (Values can be Brokering=1, VMStart=2, HDX=3, Authentication=4, Gpos=5, LogonScripts=6, ProfileLoad=7, Interactive=8, Total=0) and Duration (Nullable&lt;double&gt;) in milliseconds. If no data is available for the step, Duration is null.</td>
</tr>
<tr>
<td>BreakdownType</td>
<td>int</td>
<td>Type of breakdown - UsersLastSession=1, UsersSessionAverage=2, DesktopGroupAverage=3</td>
</tr>
</tbody>
</table>

Example

Get logon breakdown for User and Delivery Group. Returns the current User session if one exists.

http://{dc-host}/Citrix/Monitor/OData/v1/Methods/GetLastSessionLogOnBreakdown?userSid='User%20Sid'&desktopGroupUid=guid'28D15C1F-7D4C-43BC-BAF2-5886D8514642'&machineUid=guid'28D15C1F-7D4C-43BC-BAF2-5886D8514642'
GetEffectiveLoadIndexTrend

Gets the Load Evaluation Index (LEI) trend for Server OS Machines for the specified time period (in minutes). Each data point represents the average load index over this interval. An IQueryable of LoadIndexTrendItems is returned, which represents the effective load index and the breakdown by individual types (CPU, Memory, Disk, Network, SessionCount).

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>startDate</td>
<td>DateTime</td>
<td>Start of the time window to be queried for the load index trend. Must be UTC.</td>
</tr>
<tr>
<td>endDate</td>
<td>DateTime</td>
<td>End of the time window to be queried for the load index trend. Must be UTC.</td>
</tr>
<tr>
<td>intervalLength</td>
<td>int</td>
<td>Interval between data points in minutes for the trend.</td>
</tr>
<tr>
<td>desktopGroupsFilter</td>
<td>string</td>
<td>Comma-separated list of Delivery Group UIDs to limit the trend result to.</td>
</tr>
<tr>
<td>machineFilter</td>
<td>string</td>
<td>Comma-separated list of machine Sids to limit the trend result to. Expects MultiSession machines.</td>
</tr>
</tbody>
</table>

Returns

An IQueryable of objects that contains the following:

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>LoadIndexTrend</td>
<td>List&lt;LoadIndexTrendItem&gt;</td>
<td>LoadIndexTrendItem contains a UTC Date (DateTime) and an integer for total LEI, as well as integers for each of the LEI portions (CPU, Memory, Disk, Network, SessionCount) in a separate object (provided if $expand=Breakdown is included in the query).</td>
</tr>
</tbody>
</table>

Examples

Gets a 24-hour trend (data point every 15 minutes) of the load index trend and breakdown for the two Delivery Groups specified.

http://{dc-host}/Citrix/Monitor/OData/v1/Methods/GetEffectiveLoadIndexTrend?startDate=datetime'2011-09-30T00:00:00'&endDate=datetime'2011-10-01T00:00:00'&intervalLength=15&desktopGroupsFilter='04D53BBE-F5CC-11E0-B401-3F054824019B,0FBEFBBE-F5CC-11E0-9472-40054824019B'&$expand=Breakdown

Gets a week-long trend (data point every 4 hours) of the load index trend.

http://{dc-host}/Citrix/Monitor/OData/v1/Methods/GetEffectiveLoadIndexTrend?startDate=datetime'2011-09-23T00:00:00'&endDate=datetime'2011-10-01T00:00:00'&intervalLength=240&$expand=Breakdown
GetLoadIndexTrend

Gets the Load Evaluation Index (LEI) trend for Server OS Machines for the specified time period, limited by load index types. Each data point in the trend has the total LEI, as well as the breakdown for each load index type (CPU, Memory, Disk, Network, SessionCount).

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>startDate</td>
<td>DateTime</td>
<td>Start of the time window to be queried for the load index trend. Must be UTC.</td>
</tr>
<tr>
<td>endDate</td>
<td>DateTime</td>
<td>End of the time window to be queried for the load index trend. Must be UTC.</td>
</tr>
<tr>
<td>intervalLength</td>
<td>int</td>
<td>Interval between data points in minutes for the trend</td>
</tr>
<tr>
<td>desktopGroupsFilter</td>
<td>string</td>
<td>Comma-separated list of Delivery Group Uids to limit the trend result to.</td>
</tr>
<tr>
<td>machineFilter</td>
<td>string</td>
<td>Comma-separated list of machine Sids to limit the trend result to. Expects MultiSession machines.</td>
</tr>
<tr>
<td>indexTypeFilter</td>
<td>string</td>
<td>Comma-separated list of load index to include (effective, CPU, network, memory, disk, session count). Corresponds to the LoadIndexType enum. An empty or null string returns all.</td>
</tr>
</tbody>
</table>

Returns

An IQueryable of objects that contains the following for each index type specified:

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>LoadIndexType</td>
<td>int</td>
<td>[LoadIndexType] Corresponds to the LoadIndex type enum</td>
</tr>
<tr>
<td>LoadIndexTrend</td>
<td>List&lt;TrendItem&gt;</td>
<td>TrendItem contains a UTC Date (DateTime) and an integer for the index.</td>
</tr>
</tbody>
</table>

Examples

Gets a 24-hour trend (data point every 15 minutes) of the load index trend and breakdown for the two Delivery Groups specified.

http://{dc-host}/Citrix/Monitor/OData/v1/Methods/GetLoadIndexTrend?startDate=datetime'2011-09-30T00:00:00'&endDate=datetim ... 00:00:00'intervalLength=15&desktopGroupsFilter='04D53BBE-F5CC-11E0-B401-3F054824019B,0FBEFBBE-F5CC-11E0-9472-40054824019B'

Gets a week-long trend (data point every 4 hours) of the load index trend and breakdown.

http://{dc-host}/Citrix/Monitor/OData/v1/Methods/GetLoadIndexTrend?startDate=datetime'2011-09-23T00:00:0000'&endDate=datetim ... 00:00:00'intervalLength=240
GetLogonCountTrend

Jul 03, 2014
Gets the logon duration trend (average) grouped by an interval [TimeOfDay, DayOfWeek, etc] over the specified time period. Includes only logons that completed successfully (which have both a LogOnStartDate and a LogOnEndDate in the database).

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>start</td>
<td>DateTime</td>
<td>Start of the time window to be queried for the average logon duration trend. Must be UTC.</td>
</tr>
<tr>
<td>end</td>
<td>DateTime</td>
<td>End of the time window to be queried for the logon duration trend. Must be UTC.</td>
</tr>
<tr>
<td>intervalLength</td>
<td>int</td>
<td>Interval between data points in minutes for the trend.</td>
</tr>
</tbody>
</table>

Returns

An IQueryable of TrendItem objects. TrendItem contains a UTC Date (DateTime) and a Value to indicate the trend of average logon counts over the start and end time period specified.

Example

Gets one hour of data, single data point per minute representing the total number of logons for that minute. If no logons occurred during that minute, the value in the TrendItem is zero.

http://{dc-host}/Citrix/Monitor/OData/v1/Methods/GetLogonCountTrend?start=datetime'2012-06-05T12:24:00'&end=datetime'2012-06-05T13:24:00'&intervalLength=1
**GetLogonCountTrendFiltered**

Gets the logon count trend for the specified time period. Each data point in the trend represents the total number of logons in the last interval (intervalLength). Includes only logons that completed successfully (which have both a LogOnStartDate and a LogOnEndDate in the database).

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>startDate</td>
<td>DateTime</td>
<td>Start of the time window to be queried for the logon count trend. Must be UTC.</td>
</tr>
<tr>
<td>endDate</td>
<td>DateTime</td>
<td>End of the time window to be queried for the logon count trend. Must be UTC.</td>
</tr>
<tr>
<td>intervalLength</td>
<td>int</td>
<td>Interval between data points in minutes for the trend.</td>
</tr>
<tr>
<td>desktopGroupsFilter</td>
<td>string</td>
<td>Comma-separated list of desktop group Uids to limit the trend result to.</td>
</tr>
</tbody>
</table>

**Returns**

A list of TrendItems:

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>LogonCountTrend</td>
<td>List&lt;TrendItem&gt;</td>
<td>LogonDurationTrendItem contains a UTC Date (DateTime) and a Count (int) to represent the number of logons for the date.</td>
</tr>
</tbody>
</table>

**Example**

Gets a 24-hour trend (data point every 15 minutes) of the logon count trend (in milliseconds) for the two Delivery Groups specified.

```url
http://{dc-host}/Citrix/Monitor/OData/v1/Methods/GetLogonCountTrendFiltered?start=datetime'2011-09-30T00:00:00'&end=dateti ... 00:00:00'intervalLength=15&desktopGroupsFilter='04D53BBE-F5CC-11E0-B401-3F054824019B,0FBEFBBE-F5CC-11E0-9472-40054824019B'
```

Gets a week-long trend (data point every 4 hours) of the logon duration trend (in milliseconds).

```url
http://{dc-host}/Citrix/Monitor/OData/v1/Methods/GetLogonCountTrendFiltered?start=datetime'2011-09-23T00:00:00'&end=dateti ... 00:00:00'intervalLength=240
```
GetLogonDurationAverageTrend

Gets the logon duration average trend for the specified time window, with averages grouped by the specified interval. Each data point in the trend has average logon duration and breakdown for each interval in the groupByInterval.

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>start</td>
<td>DateTime</td>
<td>Start of the time window to be queried for the logon duration trend. Must be UTC.</td>
</tr>
<tr>
<td>end</td>
<td>DateTime</td>
<td>End of the time window to be queried for the logon duration trend. Must be UTC.</td>
</tr>
<tr>
<td>groupByInterval</td>
<td>int</td>
<td>How the averages are rolled up. Options: TimeOfDay=1, DayOfWeek=2, Month=3, Year=4. Required.</td>
</tr>
<tr>
<td>desktopGroupsFilter</td>
<td>string</td>
<td>Comma-separated list of Delivery Group Uids to limit the trend result to.</td>
</tr>
</tbody>
</table>

Returns

A list of GroupedLogOnDurationTrendItem

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>GroupByDate</td>
<td>int</td>
<td>Represents the group by date (4=4am, 2007=year 2007 depending on the groupByInterval that was input). Number of points returned: GroupByInterval=TimeOfDay (1) 24 points (0-23) 0=12AM, 1=AM, 2=2AM ... 23=11PM GroupByInterval=DayOfWeek (2) 7 points (0-6) 0=Sunday, 1=Monday ... 6=Saturday GroupByInterval=Month (3) 12 points (0-11) 0=January, 1=February ... 11=December GroupByInterval=Year (4) However many years are included in the start Date/end Date range. Order of Points: The data is always returned ordered by the GroupByDate, regardless of the start and end dates passed to the API.</td>
</tr>
<tr>
<td>Value Nullable&lt;double&gt;</td>
<td></td>
<td>Average total logon duration in milliseconds and the average duration of each step for this group.</td>
</tr>
<tr>
<td>Breakdown</td>
<td>Collection&lt;LogOnStepItem&gt;</td>
<td>Collection of LogOnStepItem objects which each contain: Duration Nullable&lt;double&gt; which has the average duration of this step in milliseconds and LogOnStep (int) which returns the integer enum value of the logon step (refers to the LogOnStep enum)</td>
</tr>
</tbody>
</table>

Example

Gets a 7-day average by time of day (hour) of the logon duration trend (in milliseconds) for the two Delivery Groups specified. This returns a trend item for each hour of the day that has the average logon duration for that time of day over the specified time frame (24 data points returned).

http://dc-host/Citrix/Monitor/0Data/v1/Methods/GetDurationAverageTrend?start=dateTime'2011-09-23T00:00:00'&end=dateTime'2011-10-11T00:00:00'&groupByInterval=1&desktopGroupsFilter='04D53BBE...
GetLogonDurationDetailsTrend

Gets the logon duration trend for the specified time period. Each data point in the trend has the total logon duration, as well as the breakdown for each step.

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>startDate</td>
<td>DateTime</td>
<td>Start of the time window to be queried for the connection failure trend. Must be UTC.</td>
</tr>
<tr>
<td>endDate</td>
<td>DateTime</td>
<td>End of the time window to be queried for the connection failure trend. Must be UTC.</td>
</tr>
<tr>
<td>intervalLength</td>
<td>int</td>
<td>Interval between data points in minutes for the trend.</td>
</tr>
<tr>
<td>desktopGroupsFilter</td>
<td>string</td>
<td>Comma-separated list of Delivery Group Uids to limit the trend result to.</td>
</tr>
</tbody>
</table>

Returns

A list of LogonDurationTrendItems:

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>LogonDurationTrend</td>
<td>List&lt;LogonDurationTrendItem&gt;</td>
<td>LogonDurationTrendItem contains a UTC Date (DateTime) and a double for average logon duration in milliseconds for that time. Also contains a breakdown for the average duration of each logon step for each data point.</td>
</tr>
</tbody>
</table>

Example

Gets a 24-hour trend (data point every 15 minutes) of the logon duration trend (in milliseconds) for the two Delivery Groups specified.

http://{dc-host}/Citrix/Monitor/OData/v1/Methods/GetLogonDurationDetailsTrend?startDate=datetime'2011-09-30T00:00:00'&endDate=datetime'2011-09-31T00:00:00'&intervalLength=15&desktopGroupsFilter='04D53BBE-F5CC-11E0-B401-3F054824019B,0FBEFBBE-F5CC-11E0-9472-40054824019B'

Gets a week-long trend (data point every 4 hours) of the logon duration trend (in milliseconds).

http://{dc-host}/Citrix/Monitor/OData/v1/Methods/GetLogonDurationDetailsTrend?startDate=datetime'2011-09-23T00:00:00'&endDate=datetime'2011-10-01T00:00:00'&intervalLength=240
GetLogonDurationTrend

July 03, 2014

Gets the logon duration trend (average) over the specified time period.

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>start</td>
<td>DateTime</td>
<td>Start of the time window to be queried for the average logon duration trend. Must be UTC.</td>
</tr>
<tr>
<td>end</td>
<td>DateTime</td>
<td>End of the time window to be queried for the average logon duration trend. Must be UTC.</td>
</tr>
<tr>
<td>intervalLength</td>
<td>int</td>
<td>Interval between data points in minutes for the trend.</td>
</tr>
</tbody>
</table>

**Returns**

An IQueryable of TrendItem objects. TrendItem contains a UTC Date (DateTime) and a Value (in milliseconds) to indicate average logon duration trend over the specified time period.

**Examples**

Gets one hour of data, single data point per minute representing the average logon duration for that minute. If no logons occurred during that minute, the value in the TrendItem is NaN (not a number).

http://{dc-host}/Citrix/Monitor/OData/v1/Methods/GetLogonDurationTrend?start=datetime'2012-06-05T12:24:00'&end=datetime'2012-06-05T13:24:00'&intervalLength=1

Gets single data point representing the average logon duration for that hour.

http://{dc-host}/Citrix/Monitor/OData/v1/Methods/GetLogonDurationTrend?start=datetime'2012-06-05T12:24:00'&end=datetime'2012-06-05T13:23:00'&intervalLength=60
GetMachineFailureTrend

Gets the concurrent machine failure trend for the specified time period. Each data point in the trend represents the maximum number of failed machines at any point in the last interval (intervalLength parameter). Provides ability to specify a particular machine failure type to limit the query or get all failure types.

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>startDate</td>
<td>DateTime</td>
<td>Start of the time window to be queried for the connection failure trend. Must be UTC.</td>
</tr>
<tr>
<td>endDate</td>
<td>DateTime</td>
<td>End of the time window to be queried for the connection failure trend. Must be UTC.</td>
</tr>
<tr>
<td>intervalLength</td>
<td>int</td>
<td>Interval between data points in minutes for the trend.</td>
</tr>
<tr>
<td>desktopGroupsFilter</td>
<td>string</td>
<td>Comma-separated list of Delivery Group Uids to limit the trend result to.</td>
</tr>
<tr>
<td>machineFailureTypeFilter</td>
<td>string</td>
<td>Comma-separated list of connection failure type integers to limit the trend result to. This integer corresponds to MachineFaultStateCode enum. If not provided, returns all types aggregated in the trend.</td>
</tr>
<tr>
<td>sessionSupportFilter</td>
<td>int</td>
<td>Comma-separated list of machine types integers (Single=1, Multiple=2, Unknown=0) to limit the trend result to. No value returns all types</td>
</tr>
</tbody>
</table>

Returns

A list of TrendItem objects (FailureTrend).

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>FailureTrend</td>
<td>List&lt;TrendItem&gt;</td>
<td>TrendItem contains a UTC Date (DateTime) and a Count (int) of failures to indicate the trend of machine failures over the specified time period for the filters specified.</td>
</tr>
</tbody>
</table>

Example

Gets a 24-hour trend (data point every 15 minutes) for all types of machine failures for the two Delivery Groups specified with Desktop OS Machine types.

http://{dc-host}/Citrix/Monitor/OData/v1/Methods/GetMachineFailureTrend?startDate=datetime'2011-09-30T00:00:00'&endDate=dateTime'2011-10-01T00:00:00'&intervalLength=15&sessionSupportFilter='1'&desktopGroupsFilter='04D53BBE-F5CC-11E0-B401-3F054824019B,0FBEFBBE-F5CC-11E0-9472-40054824019B'

Gets a 24-hour trend (data point every 2 hours) for all Delivery Groups, all Session Types, and for machine failures of type "Failed to Start" and "Stuck on Boot".

http://{dc-host}/Citrix/Monitor/OData/v1/Methods/GetMachineFailureTrend?startDate=datetime'2011-09-23T00:00:00'&endDate=dateTime'2011-10-01T00:00:00'&intervalLength=240&machineFailureTypeFilter='2,3'
GetMachineFailureTrendsByType

Gets a list of machine failure and success counts by type, together with a trend for each type, for the specified time period. Each data point in the trend represents the total number of machines in a failure state in the last interval (intervalLength parameter). You can specify a particular failure type to limit the query or get all failure types.

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>startDate</td>
<td>DateTime</td>
<td>Start of the time window to be queried for the machine failure trend. Must be UTC. Not required if not fetching trends.</td>
</tr>
<tr>
<td>endDate</td>
<td>DateTime</td>
<td>End of the time window to be queried for the machine failure trend. Must be UTC.</td>
</tr>
<tr>
<td>intervalLength</td>
<td>int</td>
<td>Interval between data points in minutes for the trend.</td>
</tr>
<tr>
<td>machineFailureType</td>
<td>int (MachineFailureType)</td>
<td>If provided (&gt;0), returns only that machine failure type in the results. Otherwise (null or zero) returns a list of all failure types. This integer corresponds to MachineFailureType enum.</td>
</tr>
<tr>
<td>sessionSupport</td>
<td>int (SessionSupport)</td>
<td>Nullable int. If not provided, then returns all sessionSupport types. Single=1, Multiple=2, Unknown=0</td>
</tr>
</tbody>
</table>

Returns

An IQueryable of MachineFailureTrend objects that contain the following for each MachineFailureType.

If all types are requested, the sum is also returned with MachineFailureType = -1

If $expand=FailureTrend is included in the query, the trend and TotalFailureCount properties are retrieved for each failure type.

If $expand=DesktopGroupBreakdown is included in the query, that property is also retrieved for each failure type.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>MachineFailureType</td>
<td>int [MachineFailureType]</td>
<td>Type of connection failure (see: Determine enum values).</td>
</tr>
<tr>
<td>TotalFailureCount</td>
<td>int</td>
<td>Total number of failures at the endDate specified.</td>
</tr>
<tr>
<td>FailureTrend</td>
<td>List&lt;TrendItem&gt;</td>
<td>TrendItem contains a UTC Date (DateTime), a Count (double) to indicate the trend of machine failures over the time period specified for the type of failure.</td>
</tr>
<tr>
<td>DesktopGroupBreakdown</td>
<td>List&lt;DesktopGroupBreakdown&gt;</td>
<td>DesktopGroupBreakdown contains a DesktopGroup object and Count (int) to represent the total number of machines in a failure state at the endDate specified.</td>
</tr>
</tbody>
</table>

Examples

Retrieve both Delivery Group breakdown and the failure trend for all machine failure types for Nov-14 at 5am (UTC) to Nov 14 at 7am (UTC) with a data point every 30 minutes for all Server OS Machines (i.e. sessionSupport = 2):

http://(dc-host)/Citrix/Monitor/OData/v1/Methods/GetMachineFailureTrendsByType?startDate=datetime'2011-11-14T05:00:00'&endDate=datetime'2011-11-14T07:00:00'&intervalLength=30&machineFailureType=0&$expand=FailureTrend,DesktopGroupBreakdown

Retrieve Delivery Group breakdown only for machine failure type 3 (Stuck on Boot) for Nov-14 at 5am (UTC) to Nov 14 at 7am (UTC) for Desktop OS Machines:

http://(dc-host)/Citrix/Monitor/OData/v1/Methods/GetMachineFailureTrendsByType?startDate=datetime'2011-11-14T05:00:00'&endDate=datetime'2011-11-14T07:00:00'&machineFailureType=3&$expand=FailureTrend

Retrieve the failure trend for all failure types for all machine session types from Nov-14 at 12am (UTC) to Nov 14 at 11pm (UTC) with a data point every hour:

http://(dc-host)/Citrix/Monitor/OData/v1/Methods/GetMachineFailureTrendsByType?startDate=datetime'2011-11-14T00:00:00'&endDate=datetime'2011-11-14T23:00:00'&intervalLength=60&machineFailureType=0&$expand=FailureTrend
GetSessionCountTrend

Jul 24, 2013

Gets the data points to represent a trend of concurrent sessions (connected) as a list of DateTime/value pairs for the specified time window. Each point represents the maximum number of concurrent connected sessions over the interval specified. This value is calculated as the sum of the DesktopGroups and the MAX of the sum.

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>startDate</td>
<td>DateTime</td>
<td>Start of the time window to be queried for concurrent sessions. Must be UTC.</td>
</tr>
<tr>
<td>endDate</td>
<td>DateTime</td>
<td>End of the time window to be queried for concurrent sessions. Must be UTC.</td>
</tr>
<tr>
<td>intervalLength</td>
<td>int</td>
<td>Interval between data points in minutes for the trend.</td>
</tr>
<tr>
<td>sessionSupportFilter</td>
<td>string</td>
<td>List of comma-delimited machine type ints to limit the query to (Single=1, Multiple=2, Unknown=0). If not specified, default is all.</td>
</tr>
<tr>
<td>connectionStateFilter</td>
<td>string</td>
<td>List of comma-delimited connection state integers to limit the query to (1=Connected, 2=Disconnected). If not specified, both are returned.</td>
</tr>
<tr>
<td>desktopGroupFilter</td>
<td>string</td>
<td>List of comma-delimited Delivery Group Uids to limit the query to. If not specified, returns all Delivery Groups.</td>
</tr>
</tbody>
</table>

Returns

IQueryable list of TrendItem objects - IQueryable<TrendItem> - ordered by Date ascending.

Each TrendItem contains a UTC Date (DateTime) property and a Value property (int) for plotting the trend.

Example

Gets a 24-hour trend with data points every hour for concurrent connected sessions. Each data point represents the maximum number of concurrent sessions (connected only) in the last interval (60 minutes in this case).

http://{dc-host}/Citrix/Monitor/OData/v1/Methods/GetSessionCountTrend?startDate=datetime'2011-09-30T00:00:00'&endDate=datetime'2011-10-01T00:00:00'&intervalLength=60&connectionStateFilter='1'

Gets a 24-hour trend with data points every hour for concurrent disconnected sessions. Each data point represents the maximum number of concurrent sessions (disconnected only) in the last interval (60 minutes in this case).

http://{dc-host}/Citrix/Monitor/OData/v1/Methods/GetSessionCountTrend?startDate=datetime'2011-09-30T00:00:00'&endDate=datetime'2011-10-01T00:00:00'&intervalLength=60&connectionStateFilter='2'

Gets past week’s trend with data points every 6 hours for concurrent sessions (connected and disconnected) for both machine types (Desktop OS and Server OS Machines). Each data point represents the maximum number of concurrent sessions in the last interval (6 hours in this case).

http://{dc-host}/Citrix/Monitor/OData/v1/Methods/GetSessionCountTrend?startDate=datetime'2011-09-23T00:00:00'&endDate=datetime'2011-10-01T00:00:00'&intervalLength=360
GetSessionSummary

 Jul 03, 2014

 Gets the data points to represent a trend of concurrent sessions (connected) as a list of DateTime/value pairs for the specified time period. Each point represents the maximum number of concurrent connected sessions over the interval specified.

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>startDate</td>
<td>DateTime</td>
<td>Start of the time window to be queried for concurrent sessions. Must be UTC.</td>
</tr>
<tr>
<td>endDate</td>
<td>DateTime</td>
<td>End of the time window to be queried for concurrent sessions. Must be UTC.</td>
</tr>
<tr>
<td>sessionSupportFilter</td>
<td>string</td>
<td>List of comma-delimited machine type integers to limit the query to (Single=1, Multiple=2, Unknown=0). Default is all types, if no filter specified.</td>
</tr>
<tr>
<td>desktopGroupFilter</td>
<td>string</td>
<td>List of comma-delimited Delivery Group Uids to limit the query to. If no value is specified, all Delivery Groups are returned.</td>
</tr>
<tr>
<td>connectionStateFilter</td>
<td>string</td>
<td>List of comma-delimited connection state integers to limit the query to (1=Connected, 2=Disconnected). If not specified, default is both.</td>
</tr>
</tbody>
</table>

Returns

IQueryable list of SessionSummary objects - IQueryable<SessionSummary>.

Each SessionSummary contains the following:

- DesktopGroup (name and Uid)
- AverageSessionCount (double)
- Average number of concurrent sessions for the specified time period. This is the average of the peak values for the time period using the granularity available for that time period
- AverageUserCount (double)
- Average number of users connected for the specified time period
- PeakUserCount (int)
- Peak number of users connected at any point in the specified time period
- UniqueUserCount (int)
- Total number of unique users over the specified time period
- AverageHoursPerDay (double)
- Average duration of a session (hours per user per day)
- DesktopGroup (name and Uid)

Example

Gets a list of all Session summary objects over 24 hours for all sessions.

http://{dc-host}/Citrix/Monitor/OData/v1/Methods/GetSessionSummary?startdate=datetime'2011-09-30T00:00:00'&enddate=datetime'2011-10-01T00:00:00'

Gets a list of summary objects over 24 hours for Server OS Machine sessions

http://{dc-host}/Citrix/Monitor/OData/v1/Methods/GetSessionSummary?startdate=datetime'2011-09-30T00:00:00'&enddate=datetime'2011-10-01T00:00:00'&sessionSupportFilter=2
Determine enum values

Mar 23, 2015
Several of the Monitor Service OData methods return enums, such as GetSessionCountTrend and GetMachineFailureTrend. To determine the value of these enums, use the following “metadata” OData APIs:

- **GetAllMonitoring Enums** returns an IQueryable<Monitoring Enumeration>, where Monitoring Enumeration is a class that encapsulates an enum type name and a set of values.
  ```csharp
  public IQueryable<Monitoring Enumeration> GetAllMonitoring Enums()
  ```
- **Get Monitoring Enum** returns the set of values for the specific type provided.
  ```csharp
  public IQueryable<Monitoring Enumeration> GetMonitoring Enum(string typeName)
  ```

The following enums are used as parameters in the Monitor Service OData APIs:

**sessionSupport Filter**
- maps to enum named SessionSupport Code
- used in:
  - GetSessionCountTrend
  - GetSessionSummary
  - GetConnectedUsers Trend
  - GetConnectionFailure Trend
  - GetMachineFailure Trend
  - GetMachineFailure Trends By Type
- Values:
  - 0 = Unknown (placeholder - do not use)
  - 1 = Single Session (Desktop OS Machines)
  - 2 = Multi Session (Server OS Machines)

**connectionState Filter**
- maps to enum named Connection State
- used in:
  - GetSessionCountTrend
  - GetSessionSummary
- Values:
  - 0 = Unknown (placeholder - do not use)
  - 1 = Connected
  - 2 = Disconnected
  - 3 = Terminated
  - 4 = Preparing
  - 5 = Active
  - 6 = Reconnecting
  - 7 = Non-brokered session
  - 8 = Other
  - 9 = Pending

**connectionFailure Filter**
maps to enum named ConnectionFailureType
used in:
- GetConnectionFailureTrendsByType
- GetConnectionFailureTrendsByTypeLatest
- GetConnectionFailureTrend
Values:
- 0 = None
- 1 = Client Connection Failure
- 2 = Machine Failure
- 3 = No Capacity Available
- 4 = No License Available
- 5 = Configuration

machineFailureTypeFilter
maps to enum named MachineFaultStateCode
used in:
- GetMachineFailureTrend
- GetMachineFailureTrendsByType
- GetMachineFailureTrendsByTypeLatest
Values:
- 0 = Unknown (placeholder - do not use)
- 1 = None
- 2 = Failed To Start
- 3 = Stuck On Boot
- 4 = Unregistered
- 5 = Maximum Capacity
Examples

Mar 23, 2015
The following examples show how to export Monitor Service data using the OData API. This document also provides a list of URLs for available data sets.

Example 1 - Raw XML

1. Place the URL for each data set into a web browser that is running with the appropriate administrative permissions for the XenDesktop site. Citrix recommends using the Chrome browser with the Advanced Rest Client add-in.
2. View the source.

Example 2 - PowerPivot with Excel

1. Install Microsoft Excel.
3. Open Excel (running with the appropriate administrative permissions for the XenDesktop site).

   ● Using Excel 2010

   1. Click the PowerPivot tab.
   2. Click PowerPivot Window.
   3. Click From Data Feeds in the ribbon.
   4. Choose a Friendly Connection Name (for example: XenDesktop Monitoring Data) and enter the data feed url: http://{dc-host}/Citrix/Monitor/OData/v1/Data (or https: if you are using SSL).
   5. Click Next.
   6. Select the tables you want to import into Excel and click Finish. The data is retrieved.

   ● Using Excel 2013

   1. Click the Data tab.
   2. Choose From Other Sources > From OData Data Feed
   3. Enter the data feed url: http://{dc-host}/Citrix/Monitor/OData/v1/Data (or https: if you are using SSL) and click Next.
   4. Select the tables you want to import into Excel and click Next.
   5. Accept name defaults or customize names and click Finish.
   6. Choose Connection Only or Pivot Report. The data is retrieved.

You can now use PowerPivot to view and analyze the data with PivotTables and PivotCharts. For more information, see the Learning Center: http://www.microsoft.com/en-us/bi/LearningCenter.aspx

Example 3 - LinqPad

1. Download and install the latest version of LinqPad from http://www.linqpad.net.
2. Run LinqPad with the appropriate administrative permissions for the XenDesktop site.
   Tip: the easiest way is to download, install and run on the Delivery Controller.
3. Click the Add connection link.
4. Choose WCF Data Services 5.1 (OData 3) and click Next.
5. Enter the data feed URL: http://{dc-host}/Citrix/Monitor/OData/v1/Data (or https: if you are using SSL). If necessary, enter the username and password to access the Delivery Controller. Click **OK**.

6. You can now run LINQ queries against the data feed and export the data as needed. For example, right-click Catalogs and choose **Catalogs.Take(100)**. This returns the first 100 Catalogs in the database. Choose Export>Export to Excel with formatting.

**URLs for Available Data Sets**

<table>
<thead>
<tr>
<th>URL</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>http://{dc-host}/Citrix/Monitor/OData/v1/Data/Catalogs</td>
<td>Catalog images in the site</td>
</tr>
<tr>
<td>http://{dc-host}/Citrix/Monitor/OData/v1/Data/ConnectionFailureCategories</td>
<td>Grouping for connection failure types</td>
</tr>
<tr>
<td>http://{dc-host}/Citrix/Monitor/OData/v1/Data/ConnectionFailureLogs</td>
<td>Log of each connection failure in the site</td>
</tr>
<tr>
<td>http://{dc-host}/Citrix/Monitor/OData/v1/Data/Connections</td>
<td>Represents an initial connection or reconnect for a session</td>
