# Contents

## NetScaler Release Notes

3

## Getting started with NetScaler

3

- Understanding the NetScaler .................................................. 3
- Switching features ...................................................................... 4
- Security and protection features ................................................. 4
- Optimization features ................................................................. 4
- Understanding policies and expressions ..................................... 4
- Processing order of features ....................................................... 5

## Where does a NetScaler appliance fit in the network?  

5

- Physical deployment modes ....................................................... 5
- NetScaler as an L2 device .......................................................... 6
- NetScaler as a packet forwarding device .................................... 6

## How a NetScaler appliance communicates with clients and servers

7

- Understanding NetScaler-owned IP addresses ............................. 7
- How Traffic flows are managed .................................................. 8
- Traffic management building blocks ......................................... 8
- A simple load balancing configuration ....................................... 9
- Understanding virtual servers .................................................... 9
- Understanding services .............................................................. 11

## Introduction to the NetScaler product line

12

- NetScaler Hardware Platforms .................................................. 12
- NetScaler Editions ..................................................................... 12
- Supported releases on NetScaler hardware ................................. 13
- Supported browsers ................................................................... 13

## Install the hardware

13

## Access a NetScaler

14

- Command line interface ........................................................... 15
- NetScaler GUI .......................................................................... 16

## Configure the ADC for the first time

18

- NITRO API ............................................................................. 18

## Secure your NetScaler deployment

19

NetScaler 11.1

Configure high availability
  Add a Node .................................................  
  Disable high availability monitoring for unused interfaces ............................................. 21

Change an RPC node password
  To change an RPC node password by using the GUI .........................................................  
  To change an RPC node password by using the CLI ......................................................... 23

Configure a FIPS appliance for the first time
  Configure secure HTTPS by using the CLI ................................................................. 24
  Configure secure HTTPS by using the GUI ................................................................. 25
  Configure secure RPC by using the CLI ................................................................. 25
  Configure secure RPC by using the GUI ................................................................. 26

Common network topologies
  Set up a common two-arm topology ................................................................. 27
  Set up common one-arm topologies ................................................................. 28

System management settings
  System settings .............................................................................................................. 30

Packet forwarding modes
  Enable and disable layer 2 mode ................................................................. 32
  Enable and disable layer 3 mode ................................................................. 33
  Enable and disable MAC based forwarding mode ................................................................. 35

Network interfaces
  Virtual LANs .............................................................................................................. 37
  Link aggregate channels .................................................................................................. 38

Clock synchronization ........................................................................................................ 38

DNS configuration
  Add a name server by using the CLI ................................................................. 40
  Add a name server by using the GUI ................................................................. 40

SNMP configuration
  Add SNMP managers .................................................................................................. 42
  Add SNMP traps listeners ................................................................................................. 42
  Configure SNMP alarms ................................................................................................. 43

© 1999-2018 Citrix Systems, Inc. All rights reserved.  

Verify configuration

Configuration checklist ........................................... 45
Topology configuration checklist ............................... 45
Server configuration checklist .................................. 46
Software features configuration checklist ..................... 47
Access checklist .................................................. 47
Firewall checklist ................................................ 48

Load balance traffic on a NetScaler appliance ............... 48

Load balancing .................................................. 49
Enable load balancing ............................................ 49
Configure services and a virtual server ....................... 50

Persistence settings ............................................. 51
Configure persistence based on cookies ....................... 53
Configure persistence based on server IDs in URLs .......... 55

Configure features to protect the load balancing configuration 57
Configure URL redirection ..................................... 57
Configure backup virtual servers .............................. 58

A typical load balancing scenario .............................. 60

Accelerate load balanced traffic by using compression .... 62
Compression configuration task sequence ...................... 62
Enable compression .............................................. 62
Configure services to compress data ......................... 64
Bind a compression policy to a virtual server ............... 66

Secure load balanced traffic by using SSL .................. 68
SSL configuration task sequence ............................... 68
Enable SSL offload .............................................. 69
Create HTTP services .......................................... 70
Add an SSL based virtual server ............................... 73
Bind services to the SSL virtual server ....................... 74
Add a certificate key pair ....................................... 76
Bind an SSL certificate key pair to the virtual server .... 78
Configure support for Outlook web access .................... 80
Create an SSL action to enable OWA support ............... 81
Create SSL policies ............................................ 82
Bind the SSL policy to the SSL virtual server ............... 83
### Features at a glance

<table>

TCP SYN Idle Timeout

Overriding LSN configuration with Load Balancing Configuration
   To enable override lsn in a net profile by using the CLI

Clearing LSN Sessions
   To clear all LSN sessions by using the command line interface
   To clear selective LSN sessions by using the command line interface
   To clear all LSN sessions by using the configuration utility
   Parameter Descriptions (of commands listed in the CLI procedure)

Load Balancing SYSLOG Servers
   Load balancing of SYSLOG servers using the configuration utility

Port Control Protocol
   Configuration Steps

Dual-Stack Lite
   Architecture
   Example

Points to Consider before Configuring DS-Lite

Configuring DS-Lite
   Configuration by Using the Command Line
   Configuration by Using the Configuration Utility
   Logging and Monitoring DS-Lite
   Displaying Current DS-Lite Sessions
   Clearing DS-Lite Sessions

Configuring DS-Lite Static Maps
   To create a DS-Lite static LSN mapping by using the command line
   To create a DS-Lite static LSN mapping by using the configuration utility

Configuring Deterministic NAT Allocation for DS-Lite
   Example: Deterministic DS-Lite
   Configuration Steps

Configuring Application Layer Gateways for DS-Lite

Application Layer Gateway for FTP, ICMP, and TFTP Protocols
Application Layer Gateway for SIP Protocol 246
  Limitations of SIP ALG ........................................ 246
  Configuring SIP ALG ........................................ 246

Application Layer Gateway for RTSP Protocol 248
  Limitations of RTSP ALG ....................................... 249
  Configuring RTSP ALG ....................................... 249

Logging and Monitoring DS-Lite 251
  Displaying Current DS-Lite Sessions .......................... 253
  Clearing DS-Lite Sessions ..................................... 254
  Logging HTTP Header Information .............................. 255
  IPFIX Logging .................................................. 257

Port Control Protocol for DS-Lite 259
  Configuration Steps .......................................... 259

Large Scale NAT64 261
  Architecture .................................................. 262
  Example: Traffic Flow of NAT64 and DNS64 Deployment ..... 263
  Large Scale NAT64 features Supported on NetScaler appliances 265

Points to Consider for Configuring Large Scale NAT64 266

Configuring DNS64 266
  To create a service of type DNS by using the command line interface ............. 267
  To create a DNS64 action by using the command line interface ................... 267
  To create a DNS64 policy by using the command line interface .................. 267
  To create a DNS load balancing virtual server by using the command line interface .... 267
  To bind the DNS services and the DNS64 policy to the DNS load balancing virtual server by using the command line interface ................... 268

Configuring Large Scaler NAT64 268
  Configuration Using the Command Line ................................ 270
  Sample Large Scale NAT64 Configurations ........................ 272

Configuring Application Layer Gateways for Large Scale NAT64 274

Application Layer Gateway for FTP, ICMP, and TFTP Protocols 274

Application Layer Gateway for SIP Protocol 275
  Limitations of SIP ALG ........................................ 275
  Configuring SIP ALG ........................................ 275
### Application Layer Gateway for RTSP Protocol
- Limitations of RTSP ALG .......... 278
- Configuring RTSP ALG .......... 278

### Configuring Static Large Scale NAT64 Maps
- To create a Large Scale NAT64 mapping by using the command line .......... 280
- Wildcard Port Static Large Scale NAT64 Maps .......... 280

### Logging and Monitoring Large Scale NAT64
- Logging Large Scale NAT64 .......... 282
- Logging MSISDN Information for Large Scale NAT64 .......... 285
- Compact Logging for Large Scale NAT .......... 287
- Logging HTTP Header Information .......... 289
- Displaying Current Large Scale NAT64 Sessions .......... 291
- Displaying Large Scale NAT64 Statistics .......... 291
- Clearing Large Scale NAT64 Sessions .......... 292

### Port Control Protocol for Large Scale NAT64
- Configuration Steps .......... 293

### Telco subscriber management
- Allocating memory for the subscriber session store module .......... 296
- Configure an interface for dynamic subscribers .......... 297
- Configure static subscribers .......... 303
- Default subscriber profile .......... 304
- View and clear subscriber sessions .......... 304
- Subscriber policy enforcement & management system .......... 305
- IPv6 prefix based subscriber sessions .......... 306
- Idle session management of subscriber sessions in a Telco network .......... 307
- Subscriber session event logging .......... 308
- Subscriber aware LSN session termination .......... 309
- Troubleshooting .......... 310

### Subscriber aware traffic steering
- To configure traffic steering for the above deployment by using the CLI .......... 311
- To configure traffic steering on the appliance by using the GUI .......... 314
- To configure service chaining on the appliance by using the GUI .......... 315

### Subscriber aware service chaining
- To configure service chaining for the above deployment by using the CLI .......... 316
- To configure service chaining on the appliance by using the GUI .......... 321
### Policy based TCP profile selection

Load Balance Control-Plane Traffic that is based on Diameter, SIP, and SMPP Protocols

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Page</th>
</tr>
</thead>
<tbody>
<tr>
<td>SIP</td>
<td>323</td>
</tr>
<tr>
<td>SMPP</td>
<td>324</td>
</tr>
<tr>
<td>Diameter</td>
<td>324</td>
</tr>
</tbody>
</table>

Provide DNS Infrastructure/Traffic Services, such as, Load Balancing, Caching, and Logging for Telecom Service Providers

Provide Subscriber Load Distribution Using GSLB Across Core-Networks of a Telecom Service Provider

Bandwidth Utilization Using Cache Redirection Functionality

NetScaler TCP Optimization

### Getting Started

<table>

NetScaler 11.1

SNMP 345
Memory ........................................ 345
Packet Engine CPU ................................ 345
Throughput ........................................ 346
Connections ...................................... 346
Errors ............................................. 347
Optimized/Bypass connections .................... 347

Technical Recipes 347
Per-user Connection Limit .......................... 348
Smooth Insertion/Deletion of Vserver .............. 348
Policy-Based TCP Profiling ......................... 349

Scalability 350
Topology .......................................... 350
Configuring TCP Optimization in a NetScaler T1000 Cluster ........... 351
Setting Up the Cluster .............................. 352
Distributing Traffic Across Cluster Nodes ........... 353
Configuring VLAN and IP Addresses ............... 354
Configuring TCP Optimization ..................... 355
Configuring Dynamic Routing ..................... 355

Optimizing TCP Performance using TCP Nile 356
Congestion Control Strategies ..................... 357
NILE Algorithm ................................... 357
Proportional Rate Recovery (PRR) Algorithm ........ 358
TCP Fast Open (TFO) ................................ 358
TCP Hystart .................................... 360
Optimization Techniques ......................... 361
Policy based TCP Profile Selection ................ 361
SACK Block Generation ........................... 365
Client Reneging .................................. 365
Memory checks for marking end_point on PCB is not considering total available memory .................. 365
Unnecessary retransmissions due to missing SACK blocks ............... 365
SNMP for number of connections bypassed optimization because of overload .................. 365

Troubleshooting Guidelines 366
Technical Support .................................. 366
Traces ............................................. 366
Trace Analysis .................................... 367
Connection Table .................................. 367

Frequently Asked Questions 367
  Timeouts .................................................. 367
  Maximum Segment Size Table .......................... 369
  Memory Overload Protection ........................... 371
  Support for Happy Eyeballs Clients .................. 371

NetScaler Solutions 372
  This section includes the following solutions ............ 372

Setting up NetScaler for Citrix Virtual Apps and Desktops 372
  Prerequisites .............................................. 373

Global Server Load Balancing (GSLB) Powered Zone Preference 373

NetScaler in a Private Cloud Managed by Microsoft Windows Azure Pack and Cisco ACI 374
  Prerequisites .............................................. 375

Creating a NetScaler Load Balancer in a Plan in the Service Management Portal (Admin Portal) 376

Configuring a NetScaler Load Balancer by Using the Service Management Portal (Tenant Portal) 376

Deleting a NetScaler Load Balancer from the Network 378

Deploying Citrix NetScaler VPX 378

Support matrix and usage guidelines 378
  Usage guidelines .......................................... 381

Install a NetScaler VPX instance on XenServer 382
  Prerequisites for installing a NetScaler VPX instance on XenServer .................. 383
  Install NetScaler VPX instances on XenServer by using XenCenter .................. 384

Configure VPX instances to use single root I/O virtualization (SR-IOV) network interfaces 385
  Limitations .................................................. 386
  Prerequisites .............................................. 386
  Assign SR-IOV VFs to the VPX instance by using the XenServer host .................. 386
  Unassign SR-IOV VFs to the VPX instance by using the XenServer host .............. 387
  Configuring VLAN on the SR-IOV Interface .................. 387
  Configure VLAN on the SR-IOV interface .................. 388
Install a NetScaler VPX instance on VMware ESX 388
   Prerequisites .............................................. 388
   Install a NetScaler VPX instance on VMware ESX ........ 392

Configure a NetScaler VPX instance to use VMXNET3 network interface 392

Configure a NetScaler VPX instance to use SR-IOV network interface 395
   Limitations ................................................... 395

Migrating the NetScaler VPX from E1000 to SR-IOV or VMXNET3 Network Interfaces 399

Configure a NetScaler VPX instance to use PCI passthrough network interface 400
   Overview ..................................................... 400
   Prerequisites .............................................. 400
   Configure passthrough devices on a host ................ 400
   Configure passthrough devices on a NetScaler VPX instance 401

Install a NetScaler VPX instance on Microsoft Hyper-V server 401
   Prerequisites for installing NetScaler VPX instance on Microsoft servers .... 402
   Install the NetScaler VPX instance on Microsoft servers .......... 403
   Auto-provision a NetScaler VPX instance on Hyper-V ........ 404

Install a NetScaler VPX instance on Linux-KVM platform 406
   Limitations and usage guidelines ........................ 406

Prerequisites for installing a NetScaler VPX instance on Linux-KVM platform 407
   Software requirements .................................... 407
   Guest VM hardware requirements ......................... 407
   Networking requirements ................................ 408
   Properties of source interfaces .......................... 409
   Module required .......................................... 411

Provision the NetScaler VPX instance by using OpenStack 411
   Userdata file .............................................. 412
   Network configuration .................................... 414
   Customer script ......................................... 414
   SSH key pair authentication .............................. 414
   Before you begin ......................................... 415
   Provisioning the VPX instance ......................... 415

Provisioning the NetScaler Virtual Appliance by using the Virtual Machine Manager 417
   Provisioning the NetScaler Virtual Appliance using the RAW Image .......... 417
Provisioning the NetScaler Virtual Appliance by using the QCOW2 Image ............... 418
Adding Additional Interfaces to NetScaler VPX by using Virtual Machine Manager .... 419

Configure a NetScaler VPX instance to use SR-IOV network interfaces ............... 420
Limitations .............................................................................................................. 420
Prerequisites .......................................................................................................... 421
Configure a NetScaler VPX instance to use SR-IOV network interface ............... 423
Configure static LA/LACP on the SR-IOV interface ......................................... 423
Configuring VLAN on the SR-IOV Interface ....................................................... 424

Configure a NetScaler VPX instance to use PCI passthrough network interfaces ... 424
Prerequisites .......................................................................................................... 424

Provision the NetScaler VPX instance by using the virsh program ............... 425
Add additional interfaces to NetScaler VPX instance using virsh program ......... 427

Manage the NetScaler VPX guest VMs ................................................................. 428
Manage the VPX guest VMs by using Virtual Machine Manager .................... 429
Manage the NetScaler VPX guest VMs using the virsh program ..................... 429

Deploy a NetScaler VPX instance on AWS ....................................................... 431
AWS terminology .................................................................................................. 431
How a NetScaler VPX instance on AWS works ............................................... 433
Supported instance type, ENI, and IP addresses ............................................... 434

Limitations and usage guidelines ............................................................................ 435

Deploy a NetScaler VPX standalone instance on AWS .................................. 436
Deploy a NetScaler VPX instance on AWS by using the AWS web console .... 437
Configure a NetScaler VPX instance by using the Citrix CloudFormation template 440
Configure a NetScaler VPX instance by using the AWS CLI ............................... 441

Download a NetScaler VPX license ..................................................................... 441

Load balancing servers in different availability zones ..................................... 441

Deploy a high availability pair on AWS ............................................................. 442
Points to note ......................................................................................................... 443
Deploy a high availability pair by using the Citrix CloudFormation template .... 443
Configuring SR-IOV on a high availability setup .......................................... 445

Upgrade a NetScaler VPX instance on AWS .................................................... 446
Change the EC2 instance type of a NetScaler VPX instance on AWS .......... 446
Upgrade the throughput or software edition of a NetScaler VPX instance on AWS ........................................ 446
Upgrade the system software of a NetScaler VPX instance on AWS ......................................................... 447
Upgrade to a new NetScaler AMI instance by using a NetScaler high availability configuration .... 447
Prerequisites and points to consider ................................................................. 448

Troubleshoot a VPX instance on AWS .............................................................. 450

Deploying Citrix NetScaler VPX on Microsoft Azure .............................................. 451
Network Architecture ............................................................................. 452
How NetScaler VPX Works on Azure .............................................................. 453
Traffic Flow through Port Address Translation .............................................. 454
Traffic Flow Through Network Address Translation ....................................... 454
Port Usage Guidelines ............................................................................... 455
Limitations ................................................................................................. 456

Configure a NetScaler VPX standalone instance ............................................ 457
Before you begin ...................................................................................... 457
Summary of configuration steps ................................................................. 458
Configure a configuration group ................................................................. 458
Configure a network security group ............................................................ 458
Configure a virtual network and subnets ...................................................... 459
Configure a storage account .................................................................... 459
Configure an availability set ..................................................................... 460
Configure a NetScaler VPX instance .......................................................... 460

Configure multiple IP addresses for a NetScaler VPX standalone instance .... 462
Use Case .................................................................................................. 462
Before you begin ...................................................................................... 463

Configure a high-availability setup with a single IP address and a single NIC .... 464
Before You Begin ...................................................................................... 465
Summary of Steps to Configure NetScaler VPX in a High Availability Mode .... 465
Configuring Internal and External Load Balancers ......................................... 466
Configuring a Health Probe on a Load Balancer .......................................... 466
Configuring a Backend Pool on a Load Balancer .......................................... 467
Configuring a NAT rule on a load balancer ................................................ 467
Configuring a Load Balancing Rule on a Load Balancer .............................. 468
Configuring NetScaler high availability with the Azure external load balancer 468
Configuring NetScaler high availability with the Azure internal load balancer 469
Accessing the NetScaler VPX Virtual Machine ............................................. 469

© 1999-2018 Citrix Systems, Inc. All rights reserved.
Scenario 521

Deploy a NetScaler VPX Instance on Cisco CSP 2100 525
  Points to Note .......................................................... 525
  Deploy a NetScaler VPX Instance on Cisco CSP 2100 ............ 525
  Limitations .............................................................. 526

Jumbo frames on NetScaler VPX instances 527
  Configure jumbo frames for a VPX instance running on VMware ESX ............. 527
  Configure jumbo frames for a VPX instance running on Linux-KVM server .......... 528
  Configure jumbo frames for a VPX instance running on Citrix XenServer .......... 528
  Configure jumbo frames for a VPX instance running on AWS ....................... 528

Hardware Installation 528

Licensing 529

NetScaler licensing overview 530
  Prerequisites .......................................................... 530
  Allocate a license by using the GUI ................................ 530
  Install a license ..................................................... 531
  Verify licensed features ........................................... 532
  Enable or disable a feature ....................................... 533

Citrix Gateway Universal License 535
  Obtaining the Universal License .................................. 535
  Installing the Universal License .................................. 536
  Verifying Installation of the Universal License .................. 536

NetScaler Pooled Capacity 537

Upgrade and downgrade a NetScaler appliance 537

Before you begin 538

Upgrade a Citrix NetScaler standalone appliance 539
  Upgrade a Citrix NetScaler standalone appliance by using the GUI ............... 539
  Upgrade a Citrix NetScaler standalone appliance by using the CLI ............... 539
  Upgrade a Citrix NetScaler standalone appliance by using NITRO API ........... 543
  Directory locations of script files for user monitors ......................... 543
  Check and install a Citrix NetScaler software update ....................... 543
Simplified login protocol support for AAA .................................................. 584

Configuring DNS 584

Verifying your setup for AAA 585
To verify authentication virtual server setup by using the command line interface ............. 585
To verify your AAA virtual server setup by using the configuration utility ....................... 585

Creating an authentication profile 585
To configure an authentication profile by using the CLI ........................................ 586
To configure an authentication profile by using the GUI ........................................ 586

Configuring users and groups 586
To create a local AAA user account by using the command line interface ........................ 587
To change the password for an existing AAA local user account by using the command line  interface .......................................................... 587
To configure AAA local users by using the configuration utility ................................. 587
To create AAA local groups and add users to them by using the command line interface . 588
To remove users from an AAA group by using the command line interface ................... 588
To remove an AAA group by using the command line interface ................................ 589
To configure AAA local groups and add users to them by using the configuration utility .... 589

Configuring AAA policies 590

Authentication policies 590
To add an authentication action by using the command line interface .......................... 592
To configure an authentication action by using the command line interface ..................... 592
To remove an authentication action by using the command line interface ....................... 593
To configure an authentication server by using the configuration utility ......................... 593
To create and bind an authentication policy by using the command line interface ............... 593
To modify an existing authentication policy by using the command line interface .............. 594
To remove an authentication policy by using the command line interface ........................ 594
To configure and bind authentication policies by using the configuration utility ............... 594

LDAP authentication policies 595
To enable LDAP referral support by using the command line interface .......................... 596
To enable LDAP referral support by using the configuration utility ............................... 597

Negotiate authentication policies 597
To configure AAA to extract user information from a keytab file by using the command line interface .......................................................... 597

© 1999-2018 Citrix Systems, Inc. All rights reserved.
To configure AAA to extract user information from a keytab file by using the configuration utility .......................................................... 598

RADIUS authentication policies .................................................. 598
To add an authentication action for a RADIUS server by using the command line interface ........................................................... 599
To configure an authentication action for an external RADIUS server by using the command line .......................................................... 600
To remove an authentication action for an external RADIUS server by using the command line interface ....................................... 600
To configure a RADIUS server by using the configuration utility .... 600

SAML authentication policies ....................................................... 601

Web authentication policies ......................................................... 602
To configure a Web authentication action by using the command line interface ........................................................... 602
To configure a Web authentication action by using the configuration utility .......................................................... 603

Configuring advanced authentication policies .............................. 604
To configure an advanced authentication policy by using the configuration utility .......................................................... 604

Authorizing user access to application resources .......................... 605
To configure authorization by using the CLI .................................. 605
To configure authorization by using the GUI (Configuration tab) .......................................................... 605

Auditing authenticated sessions ................................................... 606
To configure syslog auditing by using the CLI ................................ 607
To configure syslog auditing by using the GUI (Configuration tab) .......................................................... 607

Session settings ........................................................................... 608

Session profiles ........................................................................... 609
To create a session profile by using the command line interface .... 609
To modify a session profile by using the command line interface .... 609
To remove a session profile by using the command line interface .... 610
To configure session profiles by using the configuration utility ....... 610

Session policies ........................................................................... 611
To create a session policy by using the command line interface .... 611
To modify a session policy by using the command line interface .... 611
To globally bind a session policy by using the command line interface .......................................................... 612
To bind a session policy to an authentication virtual server by using the command line interface 612
To bind a traffic policy to a load balancing or content switching virtual server by using the command line interface ........................................... 619
To unbind a globally bound traffic policy by using the command line interface ........................................... 619
To unbind a traffic policy from a load balancing or content switching virtual server by using the command line interface ......................... 619
To remove a traffic policy by using the command line interface ................................................................. 620
To configure and bind traffic policies by using the configuration utility ......................................................... 620

Form SSO profiles 620
To create a form SSO profile by using the command line interface ............................................................. 621
To modify a form SSO by using the command line interface ................................................................. 621
To remove a form SSO profile by using the command line interface ............................................................ 621
To configure form SSO profiles by using the configuration utility ............................................................. 622

SAML SSO profiles 622
To create a SAML SSO profile by using the command line interface .......................................................... 622
To modify a SAML SSO by using the command line interface ................................................................. 623
To remove a SAML SSO profile by using the command line interface ............................................................ 623
To configure a SAML SSO profile by using the configuration utility .......................................................... 624
**Session timeout for OWA 2010**
To force OWA 2010 to timeout after a specified period by using the command line interface . 624

**Authenticating with client certificates**
To configure the AAA client certificate parameters by using the command line interface . 626
To configure the AAA client certificate parameters by using the configuration utility . 626
Support to notify number of unsuccessful login attempts . 627

**Client certificate pass-through**
To create and configure client certificate pass-through by using the command line interface 628

**Configuring AAA with commonly used protocols**

**Handling authentication, authorization and auditing with Kerberos/NTLM**
Optimizing Kerberos authentication on AAA . 631

**How NetScaler appliance implements Kerberos for client authentication**
Key Distribution Center (KDC) . 631
Authentication service and protocol negotiation . 632

**Configuring kerberos authentication on the NetScaler appliance**
Configuring Kerberos authentication on the CLI . 634
Configuring Kerberos authentication on the GUI . 636

**Configuring kerberos authentication on a client**
To configure Internet Explorer for Kerberos authentication . 637
To configure Mozilla Firefox for Kerberos authentication . 637

**Offloading Kerberos authentication from physical servers**
To configure Kerberos authentication on the NetScaler appliance . 638
To configure Internet Explorer for Kerberos authentication . 640
To configure Mozilla Firefox for Kerberos authentication . 640

**NetScaler appliance kerberos single sign-on**

**An overview of NetScaler appliance kerberos SSO**
Integration of NetScaler appliance Kerberos SSO with authentication methods . 642

**Setting up NetScaler appliance SSO**

**Prerequisites**
To create a server and service by using the command line . 644
Example . 645
To create a traffic management virtual server by using the command line ........................................ 645
Example ........................................................................................................................................... 645
To create an authentication virtual server by using the command line ........................................ 646
Example ........................................................................................................................................... 646
To configure a traffic management virtual server to use an authentication profile .............................. 646
Example ........................................................................................................................................... 647

Configuring SSO ................................................................................................................................. 648

Enabling integrated authentication on the web application server .................................................... 648
To configure Microsoft IIS to use integrated authentication ................................................................. 648

Setting up SSO by impersonation ........................................................................................................ 649
To create the KCD account for SSO by impersonation with a password ............................................ 649

Configuring SSO by Delegation ......................................................................................................... 650
 Installing the client CA certificate on the NetScaler appliance ......................................................... 650
 Creating the KCD account ................................................................................................................ 652
 Setting up Active Directory for NetScaler appliance SSO ............................................................... 655

Generating the KCD keytab script ....................................................................................................... 656
 To generate the KCD keytab script by using the configuration utility ................................................ 656

SAML authentication ............................................................................................................................ 656

NetScaler appliance as a SAML SP ...................................................................................................... 658
 To configure the NetScaler appliance as a SAML SP by using the command line interface ............ 660
 To configure a NetScaler appliance as a SAML SP by using the graphical user interface ............ 661

NetScaler appliance as a SAML IdP .................................................................................................... 661
 To configure a NetScaler appliance as a SAML IdP by using the command line interface ............ 663
 To configure a NetScaler appliance as a SAML IdP by using the graphical user interface ............ 663

Configuring SAML single sign-on ....................................................................................................... 663
 Configuring SAML single sign-on by using the command line interface ....................................... 664
 Configuring SAML single sign-on by using the graphical user interface ....................................... 664

OAuth authentication ............................................................................................................................ 665

Multi-Factor (nFactor) authentication ................................................................................................. 666

How to configure nFactor authentication .......................................................................................... 667

How nFactor authentication works .................................................................................................... 669
Configuring nFactor authentication 670

Admin Partitioning 671
  User access and roles .................................. 672

Supported NetScaler configurations 677
  Case 1 (global configurations) ......................... 677
  Case 2 (partition-specific configurations) ............ 677
  Case 3 .................................................. 678

Configure admin partitions 681
  Tip ......................................................... 682
  Configure an admin partition .............................. 683
  Command Policies for a Partition Users and Partition User Groups in Administrative Partition 687
  Configure an LACP ethernet channel on the default admin partition ................................. 687

SNMP support for admin partitions 689
  SNMP traps for admin partition rate limiting ........ 689
  Configuring PARTITION-RATE-LIMIT alarm ............. 690
  SNMP monitoring for partition resource utilization .... 691

AppExpert 692

Action analytics 693

Configure a selector 694
  Example .................................................... 695

Configure a stream identifier 696
  Example .................................................... 697

View statistics 698
  Examples ................................................... 699

Grouping records on attribute values 700
  To group the records on the values of selector expressions by using the command line interface 701
  To group the records on the values of selector expressions by using the GUI ....................... 703

Clearing a stream session 703
  To clear a stream session by using the command line interface .................................. 703
  To clear a stream session by using the GUI .......................................................... 704

AppQoE 768
Enabling AppQoE

To enable AppQoE by using the command line ........................................ 769
To enable AppQoE by using the GUI ...................................................... 769

AppQoE actions

To configure an AppQoE action by using the command line ....................... 770
To modify an existing AppQoE action by using the command line ............... 771
To remove an AppQoE action by using the command line .......................... 771
Parameters for configuring an AppQoE action ......................................... 771
To configure an AppQoE action by using the GUI ................................... 774

AppQoE parameters

To configure the AppQoE parameter settings by using the command line ....... 774
Parameters for configuring the AppQoE parameters .................................. 775
To configure the AppQoE parameter settings by using the GUI ................... 775

AppQoE Policies

To configure an AppQoE policy by using the command line ....................... 776
Parameters for configuring an AppQoE policy ......................................... 776
To configure an AppQoE policy by using the GUI ................................... 777

Entity templates

Configuring an entity template ............................................................. 779

Configuring variables in load balancing virtual server templates

To configure variables in a load balancing virtual server template ............... 781

Modifying an entity template .................................................................. 782
To modify an entity template by using the AppExpert feature node ............ 782
To modify an entity template by using its corresponding feature node ......... 782

Deleting an entity template ..................................................................... 782
To delete an entity template by using the AppExpert feature node ............. 783
To delete an entity template by using its corresponding feature node ........... 783

Creating an entity from a template ......................................................... 783
To create an entity from a template by using the AppExpert feature node .... 783
To create an entity from a template by using its corresponding feature node 784
To create a load balancing virtual server by using a load balancing virtual server template 784

Managing entity template folders ......................................................... 785
To organize load balancing virtual server template folders ....................... 785

Uploading and downloading entity templates 785
   To upload an entity template to the NetScaler appliance 785
   To download an entity template from the NetScaler appliance 786

Understanding load balancing entity templates and deployment files 786
   Example of a load balancing virtual server template 786
   Example of a deployment file 788

HTTP callouts 789

How an HTTP callout works 790

Notes on the format of HTTP requests and responses 791
   Format of an HTTP request 791
   Format of an HTTP Response 791

Configuring an HTTP callout 792
   To configure an HTTP callout by using the command line interface 793
   To configure an HTTP callout by using the GUI 795

Verifying the Configuration 795
   To view the hits counter for an HTTP callout 796

Invoking an HTTP Callout 796

Avoiding HTTP callout recursion 798

Caching HTTP Callout Responses 800
   To set the cache duration by using the command line interface 800
   To set the cache duration by using the GUI 800

Use Case: Filtering Clients by Using an IP Blacklist 801
   Enabling Responder 801
   Creating an HTTP Callout on the NetScaler Appliance 801
   Configuring a Responder Policy and Binding it Globally 801
   Creating an HTTP Callout Agent on the Remote Server 802

Use Case: ESI Support for Fetching and Updating Content Dynamically 803
   Enabling Rewrite 804
   Creating an HTTP Callout on the NetScaler Appliance 804
   Configuring the rewrite action 804
   Creating the rewrite policy and binding it globally 805
Use Case: Access control and authentication 806
- Enabling responder ................................................. 806
- Creating an HTTP Callout on the NetScaler Appliance ................................................. 806
- Creating a Responder policy to analyze the response ................................................. 807
- Creating an HTTP Callout agent on the remote server ................................................. 808

Use Case: OWA-Based Spam Filtering 808
- Enabling Responder ................................................. 809
- Creating an HTTP Callout on the NetScaler Appliance ................................................. 809
- Creating a Responder Action ................................................. 809
- Creating a Responder Policy to Invoke the HTTP Callout ................................................. 810
- Creating an HTTP Callout Agent on the Remote Server ................................................. 811

Use Case: Dynamic Content Switching 812
Pattern sets and data sets 813

How string matching works with pattern sets and data sets 813

Configuring a Pattern Set 814
- To configure a pattern set by using the command line interface ................................................. 815
- To configure a pattern set by using the configuration utility ................................................. 815

Configuring a data set 816
- To configure a data set by using the command line interface ................................................. 816
- To configure a data set by using the configuration utility ................................................. 817

Using pattern sets and data sets 817
Sample usage 818

Variables 819
- Variables Scope ................................................. 819

Configuring and using Variables 820
- To configure variables by using the command line interface ................................................. 820
- Use Case to insert HTTP header in the response side ................................................. 820
- To configure variables by using the GUI ................................................. 822

Use Case: Caching User Privileges 823
- To achieve this use case, perform the following operations ................................................. 823

Use Case: Limiting the Number of Sessions 824
Policies and expressions

Introduction to policies and expressions

Classic and advanced policies

Benefits of using advanced policies
Basic components of an advanced policy
How different NetScaler features use policies
About actions and profiles
About policy bindings
About evaluation order of policies
Order of evaluation based on traffic flow

Classic and advanced policy expressions

About classic expressions
About advanced policy expressions

Converting policy expressions using NSPEPI tool

About the conversion process
Convert expressions
Convert a NetScaler configuration file
Conversion warnings

Before you proceed

Configure advanced policy infrastructure

Rules for names in identifiers used in policies

Create or modify a policy

Create a policy by using the CLI
Create or modify a policy by using the GUI

Policy configuration examples

Bind policies using advanced policy

Feature-specific differences in policy bindings
Bind points and order of evaluation
Policy evaluation across features
Entries in a policy bank
Evaluation order within a policy bank
How policy evaluation ends
How features use actions after policy evaluation
Bind a policy globally 857
Bind an integrated caching policy globally by using the CLI 857
Bind a rewrite policy globally by using the CLI 858
Bind a compression policy globally by using the CLI 858
Bind a responder policy globally by using the CLI 859
Bind a DNS policy globally by using the CLI 859
Bind an integrated caching, responder, rewrite, or compression policy globally by using the GUI 860
Bind a DNS policy globally by using the GUI 860

Bind a policy to a virtual server 860
Bind a policy to a load balancing or content switching virtual server by using the CLI 861
Bind a policy to an SSL offload virtual server by using the CLI 862
Bind a policy to a virtual server by using the GUI 862

Display policy bindings 862
Display policy bindings by using the CLI 862
Display global policy bindings for integrated caching, rewrite, or responder by using the GUI 863
Display global policy bindings for DNS or clientless access in the NetScaler Gateway by using the GUI 863
Display global policy bindings for content switching by using the GUI 863

Unbind a policy 863
Unbind an integrated caching, rewrite, or compression advanced policy globally by using the CLI 864
Unbind a responder policy globally by using the CLI 864
Unbind a DNS policy globally by using the CLI 865
Unbind an advanced policy from a virtual server by using the CLI 865
Unbind an integrated caching, responder, rewrite, or compression Advanced policy globally by using the GUI 866
Unbind a DNS policy globally by using the GUI 866
Unbind an advanced policy from a load balancing or content switching virtual server by using the GUI 866

Create policy labels 867
Create a caching policy label by using the CLI 867
Create a content switching policy label by using the CLI 868
Create a rewrite policy label by using the CLI 868
Create a responder policy label by using the CLI 869
Create a policy label by using the GUI 869
Bind a policy to a policy label 870
Configure a policy label or virtual server policy bank 870
Configure a policy label .................................................. 871
Configure a policy bank for a virtual server ......................... 875

Invoke or remove a policy label or virtual server policy bank 877
Invoke a rewrite or integrated caching policy label by using the CLI ................................................. 877
Invoke a responder policy label by using the CLI ................. 878
Invoke a virtual server policy bank by using the CLI .......... 878
Remove a rewrite or integrated caching policy label by using the CLI ................................................. 879
Remove a responder policy label by using the CLI .............. 880
Remove a virtual server policy label by using the CLI ........ 880
Invoke a policy label or virtual server policy bank by using the GUI ...................................................... 881
Remove a policy label invocation by using the GUI ............ 882

Configure and bind policies with the policy manager 882
Configure policy bindings by using the policy manager .......... 883
Remove unused policies by using the policy manager .......... 884

Configuring advanced policy expression: getting started 884

Basic elements of an advanced policy expression 885
Prefixes ................................................................. 886
Single-element expressions ........................................... 888
Operations ............................................................... 888
Basic operations on expression prefixes .......................... 889

Compound advanced policy expressions 890
Booleans in compound expressions .................................. 891
Parentheses in compound expressions .............................. 891
Compound operations for strings .................................... 892
Compound operations for numbers .................................. 895

Specify the character set in expressions 903
Compound expressions with different character sets .......... 904
Specify the character set based on the character set of traffic 905
Character and string literals in expressions ........................ 905
Values in hexadecimal and octal formats .......................... 905
Functions that return UTF-8 strings ............................... 906
Terminal connection settings for UTF-8 .......................... 906

Classic expressions in advanced policy expressions 906
Convert text to hexadecimal format ........................................... 935
Encrypt and decrypt text ......................................................... 935
Configure encryption key for third-party encryption .................. 937
Configure HMAC keys ............................................................... 944
Show an HMAC key by using the CLI ........................................ 945

Advanced policy expressions: working with dates, times, and numbers 946
Format of dates and times in an expression .............................. 946
Expressions for the NetScaler system time ................................. 948
Expressions for SSL certificate dates ........................................ 951
Expressions for HTTP request and response dates .................... 960
Generate the day of the week, as a string, in short and long formats 961
Expression prefixes for numeric data other than date and time ...... 961
Converting numbers to text ....................................................... 962

Virtual server based expressions .............................................. 963

Advanced policy expressions: Parsing HTTP, TCP, and UDP data 965
About evaluating HTTP and TCP payload ................................. 965
Expressions for identifying the protocol in an incoming IP packet 966
  Arguments to the PROTOCOL function .................................... 967
  Use case scenarios ............................................................... 968

Expressions for HTTP and cache-control headers ..................... 968
  Prefixes for HTTP headers .................................................. 968
  Operations for HTTP headers .............................................. 984
  Prefixes for cache-control headers ..................................... 985
  Operations for cache-control headers .................................. 985

Expressions for extracting segments of URLs .......................... 988
Expressions for HTTP status codes and numeric HTTP payload data other than dates 989

SIP expressions .................................................................... 990
  SIP reference tables ............................................................ 991

Operations for HTTP, HTML, and XML encoding and “safe” characters 1002
Expressions for TCP, UDP, and VLAN data 1004
Expressions for evaluating a DNS message and identifying its carrier protocol 1009
XPath and HTML, XML, or JSON expressions 1011
Encrypt and decrypt XML payloads 1014
Use the XML_ENCRYPT() and XML_DECRYPT() functions in expressions 1015
Advanced policy expressions: parsing SSL 1017
Parse SSL certificates 1017
Prefixes for text-based SSL and certificate data 1018
Prefixes for numeric data in SSL certificates 1018
Expressions for SSL certificates 1019
Advanced policy expressions: IP and MAC addresses, throughput, VLAN IDs 1020
Expressions for IP Addresses and IP Subnets 1021
Expressions for MAC addresses 1026
Expressions for Numeric Client and Server Data 1027
Advanced policy expressions: stream analytics functions 1028
Advanced policy expressions: DataStream 1029
Expressions for the MySQL protocol 1029
Expressions for evaluating Microsoft SQL server connections 1037
Typecasting data 1042
Regular Expressions 1042
Basic characteristics of regular expressions 1043
Operations for regular expressions 1044
Configuring classic policies and expressions 1045
Configure a classic policy 1046
Create a classic policy by using the CLI 1046
Create a policy with classic expressions by using the GUI 1047
Configure a classic expression 1048
Create a classic policy expression by using the CLI 1049
### Bind a classic policy

### Summary examples of default syntax expressions and policies

### Tutorial examples of default syntax policies for rewrite

- Redirecting an external URL to an internal URL                               | 1076 |
- Redirecting a query                                                         | 1077 |
- Rewriting HTTP to HTTPS                                                     | 1078 |
- Removing Unwanted Headers                                                   | 1078 |
- Reducing Web Server Redirects                                               | 1079 |
- Masking the Server Header                                                   | 1080 |

### Tutorial Examples of Classic Policies

- NetScaler Gateway Policy to Check for a Valid Client Certificate             | 1081 |
Application firewall policy to protect a shopping cart application .................................. 1081
Application firewall policy to protect scripted web pages .................................................. 1084
DNS Policy to drop packets from specific IPs ................................................................. 1086
SSL policy to require valid client certificates ................................................................. 1086

Migration of Apache mod_rewrite rules to the default syntax .......................................... 1087
Converting URL variations into canonical URLs ............................................................. 1087
Apache mod_rewrite solution for converting a URL ......................................................... 1087
NetScaler solution for converting a URL ........................................................................ 1087
Converting host name variations to canonical host names ............................................. 1088
Apache mod_rewrite solution for enforcing a particular host name for sites running on a
port other than 80 ............................................................................................................... 1088
Apache mod_rewrite solution for enforcing a particular host name for sites running on port
80 ........................................................................................................................................ 1088
NetScaler solution for enforcing a particular host name for sites running on a port other than
80 ........................................................................................................................................ 1088
NetScaler solution for enforcing a particular host name for sites running on port 80 ........ 1089
Moving a document root .................................................................................................... 1089
Apache mod_rewrite solution for moving the document root ....................................... 1089
NetScaler solution for moving the document root ............................................................ 1089
NetScaler solution for moving the document root and appending path information to the
request .................................................................................................................................. 1090
Moving home directories to a new web server ............................................................... 1090
Apache mod_rewrite solution for redirecting to another Web server ............................ 1090
NetScaler solution for redirecting to another Web server (method 1) .......................... 1090
NetScaler solution for redirecting to another Web server (method 2) .......................... 1090
Working with structured home directories .................................................................... 1091
Apache mod_rewrite solution for structured home directories ..................................... 1091
NetScaler solution for structured home directories ......................................................... 1091
Redirecting invalid URLs to other web servers ............................................................. 1091
Apache mod_rewrite solution for redirection if a URL is wrong .................................. 1092
NetScaler solution for redirection if a URL is wrong (method 1) .................................. 1092
NetScaler solution for redirection if a URL is wrong (method 2) .................................. 1092
Rewriting a URL based on time ....................................................................................... 1092
Apache mod_rewrite solution for rewriting a URL based on the time ......................... 1093
NetScaler solution for rewriting a URL based on the time ............................................. 1093
Redirecting to a new file name (Invisible to the User) .................................................... 1093
Apache mod_rewrite solution for managing a file name change in a fixed location ... 1093
NetScaler solution for managing a file name change in a fixed location ....................... 1094
NetScaler solution for managing a file name change regardless of the base directory or query strings in the URL 
Redirecting to new file name (user-visible URL) 
Apache mod_rewrite solution for changing the file name and the URL displayed in the browser 
NetScaler solution for changing the file name and the URL displayed in the browser regardless of the base directory or query strings in the URL 
Accommodating browser dependent content 
Apache mod_rewrite solution for browser-specific settings 
Blocking access by robots 
Apache mod_rewrite solution for blocking a path and a User-Agent header 
NetScaler solution for blocking a path and a User-Agent header 
Blocking access to inline images 
Apache mod_rewrite solution for blocking access to an inline image 
NetScaler solution for blocking access to an inline image 
Creating extensionless links 
Apache mod_rewrite solution for adding a .php extension to all requests 
NetScaler policy for adding a .php extension to all requests 
Apache mod_rewrite solution for adding either .html or .php extensions to requests 
NetScaler policy for adding either .html or .php extensions to requests 
Redirecting a Working URI to a New Format 
Apache mod_rewrite solution 
Ensuring That a Secure Server Is Used for Selected Pages 
Apache mod_rewrite solution 
NetScaler solution using regular expressions 
NetScaler solution using pattern sets

Rewrite

Comparison between Rewrite and Responder options .............. 1138

How rewrite works

Policy Evaluation ............................................................. 1139
Rewrite Actions .............................................................. 1140

Enabling the rewrite feature

To enable the rewrite feature by using the command line interface ........................................ 1141
To enable the rewrite feature by using the GUI ........................... 1142

Configuring a Rewrite Action

To create a new rewrite action by using the command line interface ........................................ 1143
To modify an existing rewrite action by using the command line interface ................................... 1144
To remove a rewrite action by using the command line interface ................................................. 1144
To configure a rewrite action by using the GUI ....................... 1144
To add an expression by using the Add Expression dialog box ..................................................... 1145
To evaluate a rewrite action by using the Rewrite Action Evaluator dialog box .............................. 1146

Configuring a Rewrite Policy

To add a new rewrite policy by using the command line interface ................................................. 1147
To modify an existing rewrite policy by using the command line interface ...................................... 1148
To remove a rewrite policy by using the command line interface .................................................... 1149
To configure a rewrite policy by using the GUI ................................................................. 1149

Binding a Rewrite Policy

To globally bind a rewrite policy by using the command line interface ........................................... 1151
To bind rewrite policy to a specific virtual server by using the command line interface ...................... 1151
To bind a rewrite policy to a bind point by using the GUI ............................................................. 1152
To bind a rewrite policy to a specific virtual server by using the GUI ............................................. 1153

Configuring Rewrite Policy Labels

To configure a rewrite policy label by using the command line interface ......................................... 1154
To configure a rewrite policy label by using the GUI ................................................................. 1154

Configuring the Default Rewrite Action

To configure the default action by using the command line interface .............................................. 1156
To configure the default action by using the GUI ................................................................. 1156

Bypassing the Safety Check  
To bypass the safety check by using the command line interface  
To bypass safety check by using the GUI  

Rewrite Action and Policy Examples  

Example 1: Delete Old X-Forwarded-For and Client-IP Headers  
To delete old X-Forwarded and Client-IP headers from a request by using the command line interface  
To delete old X-Forwarded and Client-IP headers from a request by using the GUI  

Example 2: Adding a Local Client-IP Header  
To add a local Client-IP header by using the command line interface  
To add a local Client-IP header by using the GUI  

Example 3: Tagging Secure and Insecure Connections  

Example 4: Mask the HTTP Server Type  

Example 5: Redirect an External URL to an Internal URL  

Example 6: Migrating Apache Rewrite Module Rules  

Example 7: Marketing Keyword Redirection  

Example 8: Redirect Queries to the Queried Server  

Example 9: Home Page Redirection  

URL Transformation  

Configuring URL Transformation Profiles  
To create a URL transformation profile by using the NetScaler command line  
To modify an existing URL transformation profile or action by using the NetScaler command line  
To remove a URL transformation profile and actions by using the NetScaler command line  
To create a URL transformation profile by using the GUI  
To configure a URL transformation profile and actions by using the GUI  

Configuring URL Transformation Policies  
To configure a URL transformation policy by using the NetScaler command line  
To remove a URL transformation policy by using the NetScaler command line  
To configure a URL transformation policy by using the GUI  
To add an expression by using the Add Expression dialog box

Binding App Firewall policies 1432
To bind an App Firewall policy by using the command line interface .......................... 1432
To bind an App Firewall policy by using the GUI ....................................................... 1432

Viewing a policy bindings 1434
To view bindings for an App Firewall policy .............................................................. 1434

Supplemental information about App Firewall policies 1434
Correct but unexpected behavior ................................................................................... 1434

Auditing policies 1435
To create an auditing server by using the command line interface .............................. 1435
To modify or remove an auditing server by using the command line interface .......... 1435
To create or configure an auditing server by using the GUI .......................................... 1436
To create an auditing policy by using the command line interface .............................. 1437
To configure an auditing policy by using the command line interface ....................... 1437
To configure an auditing policy by using the GUI ....................................................... 1437

Imports 1438
HTML error object ........................................................................................................... 1438
XML error object ........................................................................................................... 1440
XML Schema .................................................................................................................. 1440
WSDL ............................................................................................................................ 1440

Importing and exporting files 1441
To import a file by using the command line interface .................................................. 1441
To import a file by using the GUI .................................................................................. 1441
To export a file by using the GUI .................................................................................. 1442
To edit an HTML or XML Error Object in the GUI ...................................................... 1443
Global configuration 1443

Engine settings 1444
   To configure engine settings by using the command line interface .................................. 1445
   To configure engine settings by using the GUI ................................................................. 1446

Confidential fields 1446
   To add a confidential field by using the command line interface .................................... 1447
   To modify a confidential field by using the command line interface ............................... 1448
   To remove a confidential field by using the command line interface ............................... 1448
   To configure a confidential field by using the GUI ......................................................... 1448

Field types 1450
   To add a field type by using the command line interface ................................................ 1451
   To modify a field type by using the command line interface .......................................... 1452
   To remove a field type by using the command line interface ......................................... 1452
   To configure a field type by using the GUI ................................................................. 1452

XML content types 1453
   To add an XML content type pattern by using the command line interface .................... 1454
   To remove an XML content type pattern by using the command line interface ............. 1454
   To configure the XML content type list by using the GUI .......................................... 1454

JSON content types 1455
   To add a JSON content type pattern by using the command line interface ................... 1455
   To configure the JSON content type list by using the GUI ............................................ 1456

Statistics and reports 1456
   The App Firewall statistics ................................................................................................. 1456
   The App Firewall reports ................................................................................................ 1457

App Firewall logs 1459
   NetScaler (Native) format logs ........................................................................................ 1459
   Common Event Format (CEF) Logs .................................................................................. 1460
   Logging geolocation in the App Firewall violation messages ......................................... 1462
   Using the command line to configure the log action and other log parameters ............. 1463
   Configuring Syslog policy to segregate App Firewall logs .............................................. 1465
   Viewing the App Firewall Logs ....................................................................................... 1466
   Highlights .......................................................................................................................... 1468

Appendices 1469

© 1999-2018 Citrix Systems, Inc. All rights reserved.
Configure a cache redirection policy 1494
  Add a cache redirection policy by using the CLI ........................................ 1495
  Add a default syntax cache redirection policy by using the CLI .................... 1496
  Modify or remove a cache redirection policy by using the CLI ...................... 1497
  Configure a cache redirection policy with a simple expression by using the GUI  1497
  Configure a cache redirection policy with a compound expression by using the GUI 1498

Cache redirection configurations 1502

Configure transparent redirection 1502

Enable cache redirection and load balancing 1503
  Enable cache redirection and load balancing by using the CLI ...................... 1503
  Enable cache redirection and load balancing by using the GUI ..................... 1504

Configure edge mode 1504
  Enable edge mode by using the CLI ............................................................. 1504
  Enable edge mode by using the GUI .......................................................... 1505

Configure a cache redirection virtual server 1505
  add a cache redirection virtual server in transparent mode by using the cli ........ 1506
  Modify or remove a cache redirection virtual server by using the CLI ............. 1506
  Add a cache redirection virtual server in transparent mode by using the GUI .... 1507

Bind policies to the cache redirection virtual server 1507
  Bind policies to a cache redirection virtual server by using the CLI ............... 1507
  Bind a user-defined policy to a cache redirection virtual server by using the GUI 1508

Unbind a policy from a cache redirection virtual server 1508
  Unbind a policy from a cache redirection virtual server by using the command CLI 1509
  Unbind a user-defined policy from a cache redirection virtual server by using the GUI 1509

Create a load balancing virtual server 1509
  Create a load balancing virtual server by using the CLI .................................. 1510
  Create a load balancing virtual server by using the GUI .................................. 1510

Configure an HTTP service 1511
  Configure an HTTP service by using the CLI ............................................... 1511
  Modify or remove a service by using the CLI .............................................. 1511
  Add an HTTP service by using the GUI ...................................................... 1512

Bind/unbind a service to/from a load balancing virtual server 1513
  Bind a service to a load balancing virtual server by using the CLI ................. 1513
Unbind a service from a load balancing virtual server by using the CLI .......................... 1514
Bind/unbind a service from a load balancing virtual server by using the GUI ..................... 1514

**Disable the use of the proxy port setting for transparent caching** .............................. 1514

**Assign a port range to the NetScaler appliance** ...................................................... 1514
Assign a source port range to a NetScaler appliance by using the CLI .......................... 1515
Assign a source port range to a NetScaler appliance by using the appliance GUI ............ 1515

**Enable load balancing virtual servers to redirect requests to cache** .......................... 1515
Enable load balancing virtual servers to redirect requests to the cache by using the CLI . . . 1515
Turn off caching for a load balancing virtual server by using the CLI ............................ 1515
Enable or disable load balancing virtual servers to redirect requests to the cache by using the GUI ................................................................. 1516

**Configure forward proxy redirection** .................................................................. 1517

**Create a DNS service** ..................................................................................... 1518
Create a DNS service by using the CLI ................................................................. 1518
Add a DNS service by using the GUI ................................................................ 1519

**Create a DNS load balancing virtual server** ...................................................... 1519
Create a DNS load balancing virtual server by using the CLI ................................. 1519
Create a DNS load balancing virtual server by using the GUI ................................. 1520

**Bind the DNS service to the virtual server** ....................................................... 1520
Bind the DNS service to the load balancing virtual server by using the CLI ............... 1520
Unbind a DNS service from the load balancing virtual server by using the CLI ............ 1521
Bind/Unbind a DNS service to/from a load balancing virtual server by using the GUI .... 1521

**Configure a client web browser to use a forward proxy** ....................................... 1522

**Configure reverse proxy redirection** ............................................................... 1522
Configure mapping policies ................................................................................. 1523

**Selective cache redirection** .............................................................................. 1526

**Enable content switching** ............................................................................... 1527
Enable content switching by using the CLI ............................................................ 1527
Enable cache redirection and load balancing by using the GUI ................................. 1528

**Configure a load balancing virtual server for the cache** .................................... 1528
Configure a cache redirection policy for a specific type of content ............................ 1529
**Configure policies for content switching**

- Create a content switching policy by using the command CLI .................................................. 1529
- Create a URL-based content switching policy by using the GUI ................................................. 1530
- Create a rule-based content switching policy by using the GUI .................................................. 1531
- Bind the content switching policy to a cache redirection virtual server by using the CLI ............... 1531
- Bind the content switching policy to a cache redirection virtual server by using the GUI ............... 1532

**Configure precedence for policy evaluation**

- Configure precedence for policy evaluation by using the CLI .................................................... 1533
- Configure precedence for policy evaluation by using the GUI .................................................... 1533

**Administer a cache redirection virtual server**

**View cache redirection virtual server statistics**

- View statistics for a cache redirection virtual server by using the CLI ......................................... 1534
- View statistics for a cache redirection virtual server by using the GUI ......................................... 1535
- View the statistics of a cache redirection virtual server by using the monitoring and dashboard utilities .................................................. 1535

**Enable or disable a cache redirection virtual server**

- Enable or disable a cache redirection virtual server by using the CLI ......................................... 1536
- Enable or disable a cache redirection virtual server by using the GUI ......................................... 1537

**Direct policy hits to the cache instead of the origin**

- Change the destination for a policy hit to the origin or the cache by using the CLI ...................... 1538
- Change the destination for a policy hit to the origin or the cache by using the GUI ...................... 1538

**Back up a cache redirection virtual server**

- Specify a backup cache redirection virtual server by using the CLI ......................................... 1539
- Specify a backup cache redirection virtual server by using the GUI ......................................... 1539

**Manage client connections for a virtual server**

- Configure client timeout ........................................................................................................... 1540
- Insert Via headers in the requests ............................................................................................... 1542
- Reuse TCP connections ............................................................................................................... 1543
- Configure delayed connection cleanup ...................................................................................... 1544

**N-Tier cache redirection**

- How N-tier cache redirection is implemented .............................................................................. 1546
- Setup necessary for configuring N-Tier CRD ............................................................................... 1546
- How N-tier cache redirection works during a cache hit ............................................................ 1547
- How N-tier cache redirection works during a cache bypass ...................................................... 1548
How N-tier cache redirection works during a cache miss .......................... 1548

Configure the upper-tier NetScaler appliances ................................. 1549
  Configure an upper-tier appliance for n-tier cache redirection by using the command CLI ...... 1549
  Configure an upper-tier appliance for n-tier cache redirection by using the GUI ............. 1550

Configure the lower-tier NetScaler appliances ................................. 1551
  Configure a lower-tier appliance for n-tier cache redirection by using the CLI ............. 1551
  Configure a lower-tier appliance for n-tier cache redirection by using the GUI ............. 1551

Clustering ................................................................................. 1552
Supportability matrix for NetScaler cluster ..................................... 1553
Prerequisites for cluster nodes ...................................................... 1557
Cluster overview ........................................................................ 1558
Synchronization across cluster nodes ............................................. 1559
Striped, partially striped, and spotted configurations ......................... 1560
Communication in a cluster setup .................................................. 1563
Traffic distribution in a cluster setup .............................................. 1564
Cluster node groups ................................................................... 1565
Cluster and node states ................................................................. 1566
Routing in a cluster ..................................................................... 1566
Setting up a NetScaler cluster ....................................................... 1567
Setting up inter-node communication ............................................. 1568
  To set up the cluster backplane, do the following for every node ........................................ 1568
Creating a NetScaler cluster .......................................................... 1569
  To create a cluster by using the command line interface .................................................. 1570
  To create a cluster by using the configuration utility ....................................................... 1572
Adding a node to the cluster .......................................................... 1573
  To add a node to the cluster by using the command line interface .................................... 1573
  To add a node to the cluster by using the configuration utility ........................................... 1575
  To join a previously added node to the cluster by using the configuration utility ............... 1575

Synchronizing cluster configurations
To synchronize cluster configurations by using the command line interface ........................................ 1596
To synchronize cluster configurations by using the configuration utility ........................................ 1597

Synchronizing time across cluster nodes
To enable/disable PTP by using the command line interface .................................................................. 1597
To enable/disable PTP by using the configuration utility ......................................................................... 1597

Synchronizing cluster files
To synchronize cluster files by using the command line interface ......................................................... 1598
To synchronize cluster files by using the configuration utility .............................................................. 1599

Viewing the statistics of a cluster
To view the statistics of a cluster instance by using the command line interface .......................... 1599
To view the statistics of a cluster node by using the command line interface .............................. 1599
To view the statistics of a cluster instance by using the configuration utility .............................. 1600
To view the statistics of a cluster node by using the configuration utility ...................................... 1600

Discovering NetScaler appliances
To discover appliances by using the configuration utility ...................................................................... 1600

Disabling a cluster node
To disable a cluster node by using the command line interface ......................................................... 1601
To disable a cluster node by using the configuration utility .............................................................. 1601

Removing a cluster node
To remove a cluster node by using the command line interface ....................................................... 1602
To remove a cluster node by using the configuration utility .............................................................. 1603

Removing a node from a cluster deployed using cluster link aggregation
To remove a node from a cluster that uses cluster link aggregation as the traffic distribution mechanism ......................................................................................................................... 1603

Detecting jumbo probe on a cluster ........................................................................................................ 1604

Route monitoring for dynamic routes in cluster
To bind a cluster node using the command line interface ................................................................. 1605

Monitoring cluster setup using SNMP MIB with SNMP link
Configuring SNMP MIB on CLIP ........................................................................................................... 1606

Monitoring command propagation failures in a cluster deployment ................................................... 1607

Graceful shutdown of nodes

Graceful handling of Nodes in cluster upgrade .................................................. 1608
Graceful handling of nodes during a new node addition ....................................... 1609
Configuring graceful shutdown of nodes in a cluster ............................................ 1610

Cluster setup and usage scenarios

Creating a two-node cluster .............................................................................. 1611

Migrating an HA setup to a cluster setup ............................................................... 1612
To convert a HA setup to cluster setup (without any downtime) by using the command line
interface ........................................................................................................... 1612

Transitioning between a L2 and L3 Cluster ......................................................... 1615
Transitioning a cluster from L2 to L3 ................................................................. 1616
Transitioning a cluster from L3 to L2 ................................................................. 1616

Setting up GSLB in a cluster .............................................................................. 1617

Using cache redirection in a cluster .................................................................... 1618

Using L2 mode in a cluster setup ......................................................................... 1619

Using cluster LA channel with linksets .............................................................. 1619
To configure cluster LA channel and linksets by using the NetScaler appliance command line 1620

Backplane on LA channel
To deploy a cluster with the backplane interfaces as LA channels ........................ 1620

Common interfaces for client and server and dedicated interfaces for backplane .... 1621

Common switch for client, server, and backplane .............................................. 1623

Common switch for client and server and dedicated switch for backplane .......... 1624

Different switch for every node .......................................................................... 1626

Sample cluster configurations .......................................................................... 1627

Monitoring services in a cluster using path monitoring ........................................ 1630
How path monitoring works ............................................................................... 1630
Configuring path monitoring ............................................................................. 1631
To enable path monitoring for services/service groups by using the CLI .......... 1631
To enable path monitoring for services/service groups by using the GUI .............. 1632
Upgrading or downgrading the NetScaler cluster

Operations supported on individual cluster nodes

FAQs

Viewing a Content Switching Virtual Server Configuration by Using the Visualizer 1670

Customizing the basic content switching configuration 1672
Configuring case sensitivity for policy evaluation 1672
Setting the precedence for policy evaluation 1672
Support for multiple ports for HTTP and SSL type content switching virtual servers 1674
Configuring per-VLAN Wildcarded virtual servers 1675
Configuring the Microsoft SQL server version setting 1676

Content switching for diameter protocol 1677
Sample Configuration 1677

Protecting the content switching setup against failure 1678
Configuring a Backup Virtual Server 1678
Diverting Excess Traffic to a Backup Virtual Server 1679
Configuring a Redirection URL 1680
Configuring the State Update Option 1681
Flushi ng the Surge Queue .................................................. 1682

Managing a content switching setup ............................... 1684
  Unbinding Policies from the Content Switching Virtual Server ...................................... 1685
  Removing Content Switching Virtual Servers ............................................................... 1685
  Disabling and Re-Enabling Content Switching Virtual Servers ...................................... 1686
  Renaming Content Switching Virtual Servers ............................................................... 1686
  Managing Content Switching Policies ........................................................................... 1687

Managing client connections ........................................... 1688
  Redirecting Client Requests to a Cache ........................................................................... 1688
  Enabling Delayed Cleanup of Virtual Server Connections ............................................. 1689
  Rewriting Ports and Protocols for Redirection .................................................................. 1690
  Inserting the IP Address and Port of a Virtual Server in the Request Header .................... 1690
  Setting a Time-out Value for Idle Client Connections ...................................................... 1691
  Identifying Connections with the 4-tuple and Layer 2 Connection Parameters .................. 1691

Troubleshooting .................................................................. 1692
  Resources for Troubleshooting Content Switching ............................................................ 1693
  Troubleshooting Content Switching Issues ........................................................................ 1693

DataStream ........................................................................... 1694
  How DataStream Works ................................................................................................. 1695

Configuring Database Users .............................................. 1696
  To add a database user by using the command line interface ........................................ 1696
  To add a database user by using the configuration utility ............................................... 1696
  To reset the password of a database user by using the command line interface .............. 1696
  To reset the password of database users by using the configuration utility ....................... 1697
  To remove a database user by using the configuration utility .......................................... 1697

Configuring a Database Profile .......................................... 1697
  To create a database profile by using the command line interface .................................. 1698
  To create a database profile by using the configuration utility ....................................... 1698
  To bind a database profile to a load balancing or content switching virtual server by using
  the command line interface ............................................................................................. 1698
  To bind a database profile to a load balancing or content switching virtual server by using
  the configuration utility ................................................................................................. 1698

Configuring Load Balancing for DataStream ...................... 1699
  Parameter values specific to DataStream ......................................................................... 1699
Configuring Content Switching for DataStream 1700
Parameter values specific to DataStream .......................... 1701

Configuring Monitors for DataStream 1702

Use Case 1: Configuring DataStream for a Master/Slave Database Architecture 1703
To configure DataStream for a master/slave database setup by using the command line interface ......................................................... 1705

Use Case 2: Configuring the Token Method of Load Balancing for DataStream 1705
To configure this example by using the command line interface ......................................................... 1706
To configure this example by using the configuration utility ......................................................... 1707

Use Case 3: Logging MSSQL Transactions in Transparent Mode 1707
Summary of Configuration Tasks ......................................................... 1707
Configuring Transparent Mode by Using a Wildcard Virtual Server ......................................................... 1708
Configuring Transparent Mode by Using MSSQL Services ......................................................... 1709

Use Case 4: Database Specific Load Balancing 1710
How Database Specific Load Balancing Works ......................................................... 1711
Enabling Load Balancing ......................................................... 1711
Configuring a Load Balancing Virtual Server for Database Specific Load Balancing ......................................................... 1712
To configure a load balancing virtual server for database specific load balancing ......................................................... 1713
Configuring Services ......................................................... 1713
Configuring Database Users ......................................................... 1713
Configuring a Monitor to Retrieve the Names of Active Databases ......................................................... 1715
Availability Groups Deployment Support for MSSQL ......................................................... 1716
Configuration examples for MSSQL virtual server ......................................................... 1718
Configuration examples for MySQL virtual server ......................................................... 1719

DataStream Reference 1720
Supported Database Versions, Protocols, and Authentication Methods ......................................................... 1721
Character Sets ......................................................... 1721
Transactions ......................................................... 1721
Special Queries ......................................................... 1722
Audit Log Message Support ......................................................... 1723

Domain Name System 1723
How DNS Works on the NetScaler ......................................................... 1724

Configure DNS resource records 1727

© 1999-2018 Citrix Systems, Inc. All rights reserved.
Create SRV records for a service 1728
  Add an SRV record by using the CLI .................................. 1728
  Modify or remove an SRV record by using the CLI .................... 1729
  Configure an SRV record by using the GUI ............................ 1729

Creating AAAA Records for a Domain Name 1729
  Add an AAAA record by using the CLI .................................. 1729
  Add an AAAA record by using the GUI .................................. 1730

Creating address records for a Domain Name 1730
  Add an Address record by using the CLI ................................ 1730
  Add an Address record by using the GUI ............................... 1731

Create MX records for a mail exchange server 1731
  Add an MX record by using the CLI ..................................... 1731
  Modify or remove an MX record by using the CLI ..................... 1732
  Add an MX record by using the GUI ..................................... 1732

Create NS Records for an authoritative server 1732
  Create an NS record by using the CLI ................................. 1732
  Create an NS record by using the GUI ............................... 1733

Create CNAME records for a subdomain 1733
  Add a CNAME record by using the CLI ................................. 1733
  Add a CNAME record by using the GUI ............................... 1734
  Cache CNAME records .................................................. 1734

Create NAPTR records for telecommunications domain 1734
  Create a NAPTR record by using CLI .................................. 1734
  Remove a NAPTR record by using CLU ................................ 1735
  Configure a NAPTR record using GUI ................................ 1735

Create PTR records for IPv4 and IPv6 addresses 1735
  Add a PTR record by using the CLI .................................... 1735
  Add a PTR record by using the GUI .................................... 1736

Create SOA records for authoritative information 1736
  Create an SOA record by using the CLI ............................... 1736
  Modify or remove an SOA record by using the CLI .................. 1737
  Configure an SOA record by using the GUI ........................... 1737

DNS VIPs

Configuring Global Server Load Balancing (GSLB)

Configuring a Standard Load Balancing Setup

Configuring an Authoritative DNS Service

To create an ADNS service by using the command line interface
To modify an ADNS service by using the command line interface
To remove an ADNS service by using the command line interface
To configure an ADNS service by using the configuration utility

Configuring a Basic GSLB Site

To create a GSLB site by using the command line interface
To modify or remove a GSLB Site by using the command line interface
To configure a basic GSLB site by using the configuration utility
To view the statistics of a GSLB site by using the command line interface
To view the statistics of a GSLB site by using the configuration utility

Configuring a GSLB Service

To create a GSLB service by using the command line interface

Configuring a GSLB Virtual Server

To create a GSLB virtual server by using the command line interface
Clearing the GSLB virtual server or service statistics
Enabling and Disabling GSLB Virtual Servers

Binding GSLB Services to a GSLB Virtual Server

To bind a GSLB service to a GSLB virtual server by using the command line interface
To unbind a GSLB service from a GSLB virtual server by using the command line interface 1849
To bind GSLB services by using the configuration utility 1850

Binding a Domain to a GSLB Virtual Server 1850
To bind a domain to a GSLB virtual server by using the command line interface 1850
To unbind a GSLB domain from a GSLB virtual server by using the command line interface 1850
To bind a domain to a GSLB virtual server by using the configuration utility 1850
To view the statistics of a domain by using the command line interface 1851
To view the statistics of a domain by using the configuration utility 1851
To view the configuration details of the entities bound to a GSLB domain using the command line 1851
To view the configuration details of the entities bound to a GSLB domain by using the configuration utility 1853

Synchronizing a Configuration in a GSLB Setup 1853
Limitations of synchronization 1854
Points to note before starting the synchronization of a GSLB setup 1855
To synchronize a GSLB configuration by using the command line interface 1855
To synchronize a GSLB configuration by using the NetScaler GUI 1856
Previewing GSLB synchronization 1856
Debugging the commands triggered during synchronization process 1857
Real-time synchronization between sites participating in GSLB 1857
Best practices for using the real-time synchronization feature 1858

Testing the GSLB setup 1858
To test the GSLB setup by using the NetScaler GUI 1859

Configuring the Metrics Exchange Protocol (MEP) 1859
Enabling Site Metrics Exchange 1860
Enabling Network Metric Exchange 1861
Enable network metric exchange 1861
Configuring a time delay for the GSLB services to be marked as DOWN when a MEP connection goes DOWN 1862
Enable persistence information exchange 1862

Configuring Site-to-Site Communication 1863
Changing the password of an RPC node 1864
Encrypt the exchange of site metrics 1865
Configure source IP address for an RPC node 1866
Customize your GSLB configuration
  Modify maximum connections or maximum bandwidth for a GSLB service
  Create CNAME-based GSLB services
  Configure transition Out-Of-Service State (TROFS) in GSLB
  Configure dynamic weights for services

Changing the GSLB methods
  Specifying a GSLB method other than static proximity or dynamic RTT

Configuring Static Proximity

Add a location file to create a static proximity database
  To add a static location file by using the CLI
  To add a static location file by using the GUI
  To view a static location file by using the GUI
  To convert a location file into the NetScaler format
  Add a third-party static database file on a NetScaler appliance

Add custom entries to a static proximity database
  To add custom entries by using the command line interface
  Parameters for adding custom entries
  To add custom entries by using the configuration utility

Set location qualifiers
  To set the location qualifiers by using the command line interface
  To set the location qualifiers by using the configuration utility

Specify proximity method
  To specify static proximity by using the command line interface
  To specify static proximity by using the configuration utility

Synchronize GSLB static proximity database

Configuring the Dynamic Method (RTT)
  Configure a GSLB virtual server for dynamic RTT
  Set the probing interval of local DNS servers

Configure persistent connections
  Configure persistence based on source IP address
  Configure persistence based on HTTP cookies

Override static proximity behavior by configuring preferred locations
  Example
## Monitoring GSLB Services

- Configure monitor trigger ........................................... 1890
- Add or remove monitors ............................................. 1891
- Bind monitors to a GSLB service ................................. 1892

## Monitoring GSLB Sites

- To configure monitor triggering by using the command line interface .......... 1893
- To configure monitor triggering by using the configuration utility ................. 1893

## Protecting the GSLB Setup Against Failure

- Configuring a Backup GSLB Virtual Server ................................ 1894
- Configuring a GSLB Setup to Respond with Multiple IP Addresses .......... 1895
- Configuring a GSLB Virtual Server to Respond with an Empty Address Record When DOWN . 1896
- Configuring a Backup IP Address for a GSLB Domain .......................... 1896
- Diverting Excess Traffic to a Backup Virtual Server ........................... 1897

## Managing Client Connections

- Enabling Delayed Cleanup of Virtual Server Connections ....................... 1899
- Managing Local DNS Traffic by Using DNS Policies .......................... 1900
- Adding DNS Views .................................................... 1907

## Configuring GSLB for Disaster Recovery

- Configuring GSLB for Disaster Recovery in an Active-Standby Data Center Setup .... 1909
- Configuring for Disaster Recovery in an Active-Active Data Center Setup .......... 1910
- Configuring for Disaster Recovery with Weighted Round Robin .................. 1910
- Configuring for Disaster Recovery with Data Center Persistence ................. 1912

## Configuring GSLB for Proximity

- Configuring Dynamic Method (RTT) .................................................. 1914
- Configuring Static Proximity .................................................... 1915
- Configuring Static Proximity and Dynamic RTT .................................. 1915

## Example of a Complete Parent-Child Configuration Using the Metrics Exchange Protocol

- site1 ................................................................. 1916
- site1_child1 ......................................................... 1917
- site1_child2 ......................................................... 1918
- site2 ................................................................. 1918
- site2_child1 ......................................................... 1919
- site2_child2 ......................................................... 1920

## Configuring GSLB Service Selection Using Content Switching

- Sample Configuration .................................................. 1922
NetScaler 11.1

Configuring Global Server Load Balancing for DNS Queries with NAPTR records 1923
- NAPTR Record Format ................................................. 1923
- Configuration procedure ............................................ 1924
- Sample configuration ................................................. 1925

Using the EDNS0 Client Subnet Option for Global Server Load Balancing 1926
- Address validation ................................................... 1927

Link load balancing 1929

Configuring a Basic LLB Setup 1930
- Configure services .................................................... 1930
- Configure an LLB virtual server and bind a service .............. 1932
- Configure the LLB method and persistence ......................... 1933
- Configure an LLB route .............................................. 1934
- Create and bind a transparent monitor ............................ 1936

Configuring RNAT with LLB 1939
- To configure RNAT by using the command line interface ........ 1939
- To add SNIPs for ISP routers by using the command line interface ........................................................................ 1939
- To configure RNAT by using the command line interface ........ 1940
- To configure RNAT by using the configuration utility .......... 1940
- To enable Use Subnet IP mode by using the command line interface ........................................................................ 1940
- To enable Use Subnet IP mode by using the configuration utility ........................................................................ 1941

Configuring a Backup Route 1941
- To set the secondary virtual server as the backup virtual server by using the command line interface ........................................................................ 1941
- To set the secondary virtual server as the backup virtual server by using the configuration utility ........................................................................ 1942

Resilient LLB Deployment Scenario 1942

Monitoring an LLB Setup 1943
- Viewing the Statistics of a Virtual Server ......................... 1943
- Viewing the Statistics of a Service ................................. 1944

Load Balancing 1945

How load balancing works 1945
- Load balancing basics ................................................... 1946
- Understanding the topology .......................................... 1947

© 1999-2018 Citrix Systems, Inc. All rights reserved. 74
Use of wildcards instead of IP addresses and ports .............................................. 1948
Configuring global HTTP ports ................................................................. 1952

Set up basic load balancing .......................................................... 1954
Enabling Load Balancing ................................................................. 1954
Configuring a Server Object ................................................................. 1955
Configuring Services ................................................................. 1956
Creating a Service ................................................................. 1956
Creating a Virtual Server ................................................................. 1960
Binding Services to the Virtual Server ..................................................... 1961
Verifying the Configuration ................................................................. 1962

Load balance virtual server and service states .............................................. 1965

Support for load balancing profile .................................................. 1967
To create an LB profile by using the CLI .................................................. 1967
To create an LB profile by using the GUI .................................................. 1968
To associate an LB profile with an LB virtual server by using the CLI .......... 1968
To associate an LB profile with an LB virtual server by using the GUI .......... 1969

Load balancing algorithms ............................................................. 1969
To set the startup round-robin factor by using the CLI .......................... 1972
To set the startup round-robin factor by using the GUI .......................... 1972

Least connection method ................................................................. 1972

Round robin method ................................................................. 1976

Least response time method ............................................................... 1977
Selection of services when weights are assigned ....................................... 1979

LRTM method ................................................................. 1981
Selection of services when weights are assigned ....................................... 1984

Hashing methods ................................................................. 1986
The URL Hash Method ................................................................. 1988
The Domain Hash Method ................................................................. 1988
The Destination IP Hash Method ............................................................. 1989
The Source IP Hash Method ................................................................. 1989
The Source IP Destination IP Hash Method .............................................. 1990
The Source IP Source Port Hash Method ..................................................... 1990
The Call ID Hash Method ................................................................. 1990

To unbind a service from a virtual server by using the configuration utility

**Load balancing visualizer**
- To view load balancing virtual server properties by using the Visualizer
- To view configuration details for services, service groups, and monitors by using the Visualizer
- To view configuration details for policies and policy labels by using the Visualizer in the configuration utility
- To modify a resource in a load balancing configuration by using the Visualizer
- To add a load balancing configuration by using the Visualizer

**Manage client traffic**

**Configure sessionless load balancing virtual servers**
- Supported setup
- Limitations
- To add a sessionless virtual server by using the CLI
- To configure a sessionless virtual server by using the GUI

**Redirect HTTP requests to a cache**
- To configure cache redirection on a virtual server by using the CLI
- To configure cache redirection on a virtual server by using the GUI

**Direct requests according to priority**
- To configure priority queuing on a virtual server by using the CLI
- To configure priority queuing on a virtual server by using the GUI

**Direct requests to a custom web page**
- To enable SureConnect on a virtual server by using the CLI
- To enable SureConnect on a virtual server by using the GUI

**Enable cleanup of virtual server connections**
- To configure the down state flush setting on a virtual server by using the CLI
- To configure the down state flush setting on a virtual server by using the GUI

**Rewrite ports and protocols for HTTP redirection**
- To configure HTTP redirection on a virtual server by using the CLI
- To configure HTTP redirection on a virtual server by using the GUI
- To configure SSL Redirect on an SSL virtual server or service by using the CLI
- To configure SSL redirection and SSL port rewrite on an SSL virtual server or service by using the GUI
### Insert IP address and port of a virtual server in the request header
- To insert the IP address and port of the virtual server in the client requests by using the CLI
- To insert the IP address and port of the virtual server in the client requests by using the GUI

### Use a specified source IP for backend communication
- Usage of a net profile for sending traffic
- Manage net profiles
- Create an IP set
- Create a net profile
- Bind a net profile to a NetScaler entity

### Set a time-out value for idle client connections
- To set a time-out value for idle client connections by using the CLI
- To set a time-out value for idle client connections by using the GUI

### Manage RTSP connections
- To configure RTSP NAT by using the CLI
- To configure RTSP NAT by using the GUI

### Manage client traffic on the basis of traffic rate

### Identify a connection with layer 2 parameters
- To configure the L2 connection option by using the CLI
- To configure the L2 connection option by using the GUI

### Configure the prefer direct route option
- To set the prefer direct route option by using the CLI
- To set the prefer direct route option by using the GUI

### Use a source port from a specified port range for backend communication
- To specify a source port range or ranges by using the CLI
- To specify a source port range or ranges by using the GUI

### Configure source IP persistency for backend communication
- To enable source IP persistency in a net profile by using the CLI
- To enable source IP persistency in a net profile by using the GUI
- Example

### Advanced load balancing settings
### Gradually stepping up the load on a new service with virtual server-level slow start
- Manual slow start
- Automated slow start
Set the slow start parameters .................................................. 2102

**The no-monitor option for services** 2103
To set the no-monitor option for a new service by using the CLI ........ 2104
To set the no-monitor option for an existing service by using the CLI .... 2105
To set the no-monitor option for a service by using the GUI ............ 2106

**Protect applications on protected servers against traffic surges** 2106
To set surge protection on the service by using the CLI .................. 2107
To set surge protection on the service by using the GUI .................. 2107

**Enable cleanup of virtual server and service connections** 2107
To set down state flush on the service by using the CLI ................. 2109
To set down state flush on the service by using the GUI ................. 2109
To set down state flush on the virtual server by using the CLI ........... 2109
To set down state flush on the virtual server by using the GUI ........... 2109

**Graceful shutdown of services** 2109
Adding a TROFS Code or String ............................................. 2110
Disabling a Service ............................................................ 2111
To configure graceful shutdown for a service by using the command line interface .... 2112
To configure graceful shutdown for a service by using the configuration utility .... 2113

**Direct requests to a custom web page** 2113
To set SureConnect on the service by using the CLI .................... 2114
To set SureConnect on the service by using the GUI .................... 2114

**Enable access to services when down** 2114
To enable access down on a service by using the CLI ................... 2114
To enable access down on a service by using the GUI ................... 2115

**Enable TCP buffering of responses** 2115
To enable TCP Buffering on a service by using the CLI .................. 2115
To enable TCP Buffering on a service by using the GUI .................. 2115

**Enable compression** 2115
To enable compression on a service by using the CLI .................... 2116
To enable compression on a service by using the GUI .................... 2116

**Maintain client connection for multiple client requests** 2116
To enable client keep-alive on a service by using the CLI ............... 2117
To enable client keep-alive on a service by using the GUI ............... 2117
Insert the IP address of the client in the request header
To insert client IP address in the client request by using the CLI .............................................. 2117
To insert client IP address in the client request by using the GUI ............................................. 2117
Use source IP address of the client when connecting to the server
To enable USIP mode for a service by using the CLI ................................................................. 2118
To enable USIP mode for a service by using the GUI ............................................................... 2118
Configure the source port for server-side connections
Configure the use proxy port setting on a service ................................................................. 2119
Configure the use proxy port setting globally ................................................................. 2120
Set a limit on the number of client connections
To set a limit to the number of client connections by using the CLI ................................................. 2121
To set a limit to the number of client connections by using the GUI ........................................... 2121
Set a limit on number of requests per connection to the server
To limit the number of client requests per connection by using the CLI ..................................... 2122
To limit the number of client requests per connection by using the GUI ..................................... 2122
Set a threshold value for the monitors bound to a service
To set the monitor threshold value on a service by using the CLI ............................................. 2123
To set the monitor threshold value on a service by using the GUI ............................................. 2123
Set a timeout value for idle client connections
To set a timeout value for idle client connections by using the CLI .............................................. 2123
To set a timeout value for idle client connections by using the GUI ........................................... 2124
Set a timeout value for idle server connections
To set a timeout value for idle server connections by using the CLI ............................................ 2124
To set a timeout value for idle server connections by using the GUI ........................................ 2124
Set a limit on the bandwidth usage by clients
To set a maximum bandwidth limit on a service by using the CLI ............................................ 2125
To set a maximum bandwidth limit on a service by using the GUI ........................................... 2125
Redirect client requests to a cache
To set cache redirection on a service by using the CLI ........................................................... 2125
To set cache redirection on a service by using the GUI ............................................................ 2125
Retain the VLAN identifier for VLAN transparency
To configure a load balancing virtual server to retain the client VLAN ID by using the CLI ...... 2126
To configure a load balancing virtual server to retain the client VLAN ID by using the GUI ...... 2126
**Configure automatic state transition based on percentage health of bound services**  
To configure percentage based automatic state transition by using the CLI ........................................... 2126  
To configure percentage based automatic state transition by using the GUI ........................................... 2127  
To enable the ENTITY-STATE alarm by using the CLI ............................................................................. 2127  
To enable the ENTITY-STATE alarm by using the GUI ............................................................................. 2127

**Built-in monitors** ................................................................................................................................. 2127

**TCP-based application monitoring** ........................................................................................................ 2128

**SSL service monitoring** ..................................................................................................................... 2130  
Sample configuration for HTTPS-ECV health check monitor ............................................................. 2131  
Bind a monitor to a service by using the GUI ...................................................................................... 2131  
Bind a monitor to a service by using the CLI ...................................................................................... 2132

**FTP service monitoring** ....................................................................................................................... 2132  
To send secure FTP probes to FTP services by using the CLI ............................................................ 2133  
To send secure FTP probes to FTP services by using the GUI ............................................................ 2133

**Secure monitoring of servers by using SFTP** ...................................................................................... 2133  
To configure secure monitoring using SFTP by using the CLI ........................................................... 2133  
To configure secure monitoring using SFTP by using the GUI ........................................................... 2134

**Set SSL parameters on a secure monitor** ............................................................................................ 2134  
Monitor Types that Support SSL Profiles .......................................................................................... 2134

**SIP service monitoring** ....................................................................................................................... 2135

**RADIUS service monitoring** .............................................................................................................. 2136

**Monitor accounting information delivery from a RADIUS server** .................................................... 2137  
To configure a RADIUS accounting monitor by using the CLI ............................................................. 2137

**DNS and DNS-TCP service monitoring** ............................................................................................. 2138

**LDAP service monitoring** ................................................................................................................ 2139

**MySQL service monitoring** ............................................................................................................... 2140

**SNMP service monitoring** .............................................................................................................. 2140

**NNTP service monitoring** ................................................................................................................ 2141

**POP3 service monitoring** .................................................................................................................. 2142

NetScaler 11.1

SMTP service monitoring 2143
RTSP service monitoring 2143
XML broker service monitoring 2145
ARP request monitoring 2146

XenDesktop Delivery Controller service monitoring 2146
To add an XD-DDC monitor with the validate credentials option by using the command line interface 2147
To specify the validate credentials option on an XD-DDC monitor by using the command line interface 2148
To configure an XD-DDC monitor with the validate credentials option by using the configuration utility 2148

Web interface service monitoring 2149
To add a WI monitor by using the command line interface 2150
To add a WI monitor by using the configuration utility 2150

Citrix StoreFront stores monitoring 2150
To create a StoreFront monitor by using the command line interface 2151
To create a StoreFront monitor by using the configuration utility 2152

Custom monitors 2152
Configure HTTP-inline monitors 2152
Understand user monitors 2153
How to use a user monitor to check web sites 2158
Understand the internal dispatcher 2159

Configure a user monitor 2160
To configure a user monitor by using the command line interface 2160

Understand load monitors 2161
Configure load monitors 2162
To create a metric table by using the command line interface 2162
To create a metric table and bind metrics to it by using the configuration utility 2162
Unbind metrics from a metrics table
To unbind metrics from a metric table by using the command line interface .......................... 2163
To unbind metrics from a metric table by using the configuration utility .................................. 2163

Configure reverse monitoring for a service
Configuring HTTP Reverse Monitoring for a Service .............................................................. 2164
Configuring ICMP Reverse Monitoring for a Service ............................................................. 2164
Configuring TCP Reverse Monitoring for a Service .............................................................. 2165

Configure monitors in a load balancing setup

Create monitors
To create a monitor by using the CLI ....................................................................................... 2166
To create a monitor by using the GUI ...................................................................................... 2166

Bind monitors to services
To bind a monitor to a service by using the command line interface ................................. 2167
To bind a monitor to a service by using the configuration utility ............................................. 2167

Modify monitors
To modify an existing monitor by using the command line interface ................................. 2168
To modify an existing monitor by using the configuration utility ............................................. 2168

Enable and disable monitors
To enable a monitor by using the command line interface ..................................................... 2168
To enable a monitor by using the configuration utility ............................................................ 2169
To disable a monitor by using the command line interface .................................................... 2169

Unbind monitors
To unbind a monitor from a service by using the command line interface ........................ 2169
To unbind a monitor from a service by using the configuration utility ................................... 2170

Remove monitors
To remove a monitor by using the command line interface .................................................... 2170
To remove a monitor by using the configuration utility ............................................................ 2170

View monitors
To view monitor bindings by using the command line interface ............................................. 2171
To view monitor bindings by using the configuration utility ..................................................... 2171
To view monitors by using the command line interface ........................................................ 2171
To view monitors by using the configuration utility ................................................................. 2171
Close monitor connections 2171
Closing Monitor Connections at the Service or Service Group Level 2172

Ignore the upper limit on client connections for monitor probes 2173
To set the Skip MaxClients for Monitor Connections option by using the command line interface 2173
To set the Skip MaxClients for Monitor Connections option by using the configuration utility 2174

Manage a large scale deployment 2174

Ranges of virtual servers and services 2174
Creating a range of virtual servers 2175
Creating a range of services 2176

Configure service groups 2177
Create service groups 2177
Bind a service group to a virtual server 2178
Bind a member to a service group 2178
Bind a monitor to a service group 2179
Retain the original state of a service group member after disabling and enabling a virtual server 2180

Manage service groups 2180
Modify a service group 2181
Remove a service group 2181
Unbind a member from a service group 2182
Unbind a service group from a virtual server 2182
Unbind monitors from service groups 2183
Enable or Disable a service group 2184
View the status of service groups members 2185
Viewing the properties of a service group 2185
Viewing service group statistics 2185
Load balancing virtual servers bound to a service group 2186

Configure automatic domain based service group scaling 2187
To configure a service group to scale automatically by using the command line interface 2188
To configure a service group to scale automatically by using the configuration utility 2189

Translate the IP address of a domain-based server 2190
To configure a translation IP address for a server by using the command line interface 2190
To configure a translation IP address for a server by using the configuration utility 2191

Use case 1: SMPP load balancing

Introduction to SMPP ................................................................. 2213
Architecture Overview of the Different SMPP Entities in a Mobile Network ...................... 2213
How SMPP Load Balancing Works on the NetScaler ................................................. 2214
Messages Originating from the ESMEs .................................................................. 2214
Messages Originating from a Message Center ...................................................... 2215
Health Monitoring of Message Centers .................................................................. 2216
Content Switching on Message Centers .................................................................. 2216
Concatenated Message Handling ........................................................................... 2217
Limitation ............................................................................................................. 2217
Configuring SMPP Load Balancing on the NetScaler .............................................. 2217

Use case 2: Configure rule based persistence based on a name-value pair in a TCP byte stream

Use case 3: Configure load balancing in direct server return mode

To configure the load balancing method and redirection mode for a sessionless virtual server by using the command line interface ................................................................. 2223
To configure the load balancing method and redirection mode for a sessionless virtual server by using the configuration utility ................................................................. 2223
To configure a service to use source IP address by using the command line interface .......... 2223
To configure a service to use source IP address by using the configuration utility .............. 2224

Use case 4: Configure LINUX servers in DSR mode

To configure LINUX server in DSR mode .............................................................. 2224

Use case 5: Configure DSR mode when using TOS

To configure the redirection mode for the virtual server by using the command line interface ..................................................................................................................... 2226
To configure the redirection mode for the virtual server by using the configuration utility ................................................................. 2226
To configure the transparent monitor for TOS by using the command line interface ... 2226
To create the transparent monitor for TOS by using the configuration utility .................. 2226
Wildcard TOS Monitors .......................................................................................... 2226

Use case 6: Configure load balancing in DSR mode for IPv6 networks by using the TOS field

To configure load balancing in DSR Mode using TOS, perform the following steps on the appliance ........................................................................................................... 2231
To configure load balancing in DSR Mode using TOS by using the command line interface ..................................................................................................................... 2231
To enable USIP mode by using the configuration utility .............................................. 2231
To create services by using the configuration utility .................................................. 2232
To create a load balancing virtual server and bind services by using the configuration utility ..................................................................................................................... 2232
Use case 7: Configure load balancing in DSR mode by using IP Over IP

- Configure a load balancing virtual server ........................................... 2232
- Configure services for IP Over IP DSR ................................................ 2233
- Decapsulator configuration ................................................................. 2235

Use case 8: Configure load balancing in one-arm mode ............................. 2236

Use case 9: Configure load balancing in the inline mode ............................ 2237

Use case 10: Load balancing of intrusion detection system servers ......... 2237
- To enable MAC-based forwarding by using the command line interface . 2238
- To enable MAC-based forwarding by using the configuration utility .. 2238
- To configure LB method and redirection mode for a sessionless virtual server by using the command line interface ............................... 2239
- To configure LB method and redirection mode for a sessionless virtual server by using the configuration utility ................................. 2239
- To set a service to use source IP address by using the command line interface ................................................................. 2239
- To set a service to use source IP address by using the configuration utility ................................................................. 2240

Use case 11: Isolating network traffic using listen policies ......................... 2240
- How network paths are isolated .......................................................... 2241
- Configuration Steps ........................................................................... 2242

Use case 12: Configure XenDesktop for load balancing ......................... 2245
- To configure load balancing for XenDesktop by using the GUI ............ 2246
- To configure load balancing for XenDesktop by using the command line interface ................................................................. 2246

Use case 13: Configure XenApp for load balancing ................................. 2247
- To configure load balancing for XenApp by using the GUI .................. 2248
- To configure load balancing for XenApp by using the command line interface ................................................................. 2248

Use case 14: ShareFile wizard for load balancing Citrix ShareFile .......... 2249
- To configure a NetScaler appliance for load balancing Citrix ShareFile .... 2249

Troubleshooting .................................................................................. 2250

NetScaler Release Notes

October 18, 2019

Release notes describe how the software has changed in a particular build, and the issues known to exist in that build.

The release notes document includes all or some of the following sections:

- **What’s New**: The enhancements and other changes released in the build.
- **Fixed Issues**: The issues that are fixed in the build.
- **Known Issues**: The issues that exist in the build.
- **Points to Note**: The important aspects to keep in mind while using the build.
- **Limitations**: The limitations that exist in the build.

**Note**

- The [# XXXXXX] labels under the issue descriptions are internal tracking IDs used by the NetScaler team.
- These release notes do not document security related fixes. For a list of security related fixes and advisories, see the Citrix security bulletin.

To view the latest release notes document, click this [link].

Getting started with NetScaler

January 6, 2019

Intended for system and network administrators who install and configure complex networking equipment, this section of the library describes initial set-up and basic configuration of the NetScaler.

Understanding the NetScaler

The NetScaler product is an application switch that performs application-specific traffic analysis to intelligently distribute, optimize, and secure Layer 4-Layer 7 (L4–L7) network traffic for web applications. For example, a NetScaler bases load balancing decisions on individual HTTP requests instead of on long-lived TCP connections, so that the failure or slowdown of a server is managed much more quickly and with less disruption to clients. The ADC feature set can be broadly categorized as consisting of switching features, security and protection features, and server-farm optimization features.
Switching features

When deployed in front of application servers, a NetScaler ensures optimal distribution of traffic by the way in which it directs client requests. Administrators can segment application traffic according to information in the body of an HTTP or TCP request, and on the basis of L4–L7 header information such as URL, application data type, or cookie. Numerous load balancing algorithms and extensive server health checks improve application availability by ensuring that client requests are directed to the appropriate servers.

Security and protection features

The NetScaler security and protection features protect web applications from Application Layer attacks. An ADC appliance allows legitimate client requests and can block malicious requests. It provides built-in defenses against denial-of-service (DoS) attacks and supports features that protect against legitimate surges in application traffic that would otherwise overwhelm the servers. An available built-in firewall protects web applications from Application Layer attacks, including buffer overflow exploits, SQL injection attempts, cross-site scripting attacks, and more. In addition, the firewall provides identity theft protection by securing confidential corporate information and sensitive customer data.

Optimization features

Optimization features offload resource-intensive operations, such as Secure Sockets Layer (SSL) processing, data compression, client keep-alive, TCP buffering, and the caching of static and dynamic content from servers. This improves the performance of the servers in the server farm and therefore speeds up applications. An ADC appliance supports several transparent TCP optimizations, which mitigate problems caused by high latency and congested network links, accelerating the delivery of applications while requiring no configuration changes to clients or servers.

Understanding policies and expressions

A policy defines specific details of traffic filtering and management on a NetScaler. It consists of two parts: the expression and the action. The expression defines the types of requests that the policy matches. The action tells the ADC appliance what to do when a request matches the expression. As an example, the expression might be to match a specific URL pattern to a type of security attack, with the action being to drop or reset the connection. Each policy has a priority, and the priorities determine the order in which the policies are evaluated.
When an ADC appliance receives traffic, the appropriate policy list determines how to process the traffic. Each policy on the list contains one or more expressions, which together define the criteria that a connection must meet to match the policy.

For all policy types except Rewrite policies, a NetScaler appliance implements only the first policy that a request matches, not any additional policies that it might also match. For Rewrite policies, the ADC appliance evaluates the policies in order and, in the case of multiple matches, performs the associated actions in that order. Policy priority is important for getting the results you want.

**Processing order of features**

Depending on requirements, you can choose to configure multiple features. For example, you might choose to configure both compression and SSL offload. As a result, an outgoing packet might be compressed and then encrypted before being sent to the client.

The following figure shows the DataStream packet flow in the NetScaler appliance. DataStream is supported for MySQL and MS SQL databases.

![DataStream Packet Flow Diagram](image)

**Where does a NetScaler appliance fit in the network?**

January 6, 2019

A NetScaler appliance resides between the clients and the servers, so that client requests and server responses pass through it. In a typical installation, virtual servers configured on the appliance provide connection points that clients use to access the applications behind the appliance. In this case, the appliance owns public IP addresses that are associated with its virtual servers, while the real servers are isolated in a private network. It is also possible to operate the appliance in a transparent mode as an L2 bridge or L3 router, or even to combine aspects of these and other modes.

**Physical deployment modes**

A NetScaler appliance logically residing between clients and servers can be deployed in either of two physical modes: inline and one-arm. In inline mode, multiple network interfaces are connected to
different Ethernet segments, and the appliance is placed between the clients and the servers. The appliance has a separate network interface to each client network and a separate network interface to each server network. The appliance and the servers can exist on different subnets in this configuration. It is possible for the servers to be in a public network and the clients to directly access the servers through the appliance, with the appliance transparently applying the L4-L7 features. Usually, virtual servers (described later) are configured to provide an abstraction of the real servers. The following figure shows a typical inline deployment.

Figure 1. Inline Deployment

In one-arm mode, only one network interface of the appliance is connected to an Ethernet segment. The appliance in this case does not isolate the client and server sides of the network, but provides access to applications through configured virtual servers. One-arm mode can simplify network changes needed for NetScaler installation in some environments.

For examples of inline (two-arm) and one-arm deployment, see Understanding Common Network Topologies.

**NetScaler as an L2 device**

A NetScaler appliance functioning as an L2 device is said to operate in L2 mode. In L2 mode, the ADC appliance forwards packets between network interfaces when all of the following conditions are met:

- The packets are destined to another device’s media access control (MAC) address.
- The destination MAC address is on a different network interface.
- The network interface is a member of the same virtual LAN (VLAN).

By default, all network interfaces are members of a pre-defined VLAN, VLAN 1. Address Resolution Protocol (ARP) requests and responses are forwarded to all network interfaces that are members of the same VLAN. To avoid bridging loops, L2 mode must be disabled if another L2 device is working in parallel with the NetScaler appliance.

For information about how the L2 and L3 modes interact, see Packet forwarding modes.

For information about configuring L2 mode, see the “Enable and disable layer 2 mode” section in Packet forwarding modes.

**NetScaler as a packet forwarding device**

A NetScaler appliance can function as a packet forwarding device, and this mode of operation is called L3 mode. With L3 mode enabled, the appliance forwards any received unicast packets that are destined for an IP address that does not belong to the appliance, if there is a route to the destination. The appliance can also route packets between VLANs.

In both modes of operation, L2 and L3, the appliance generally drops packets that are in:
NetScaler 11.1

- Multicast frames
- Unknown protocol frames destined for an appliance’s MAC address (non-IP and non-ARP)
- Spanning Tree protocol (unless BridgeBPDUs is ON)

For information about how the L2 and L3 modes interact, see Packet forwarding modes.
For information about configuring the L3 mode, see Packet forwarding modes.

How a NetScaler appliance communicates with clients and servers

January 6, 2019

A NetScaler appliance is usually deployed in front of a server farm and functions as a transparent TCP proxy between clients and servers, without requiring any client-side configuration. This basic mode of operation is called Request Switching technology and is the core of NetScaler functionality. Request Switching enables an appliance to multiplex and offload the TCP connections, maintain persistent connections, and manage traffic at the request (application layer) level. This is possible because the appliance can separate the HTTP request from the TCP connection on which the request is delivered.

Depending on the configuration, an appliance might process the traffic before forwarding the request to a server. For example, if the client attempts to access a secure application on the server, the appliance might perform the necessary SSL processing before sending traffic to the server.

To facilitate efficient and secure access to server resources, an appliance uses a set of IP addresses collectively known as NetScaler-owned IP addresses. To manage your network traffic, you assign NetScaler-owned IP addresses to virtual entities that become the building blocks of your configuration. For example, to configure load balancing, you create virtual servers to receive client requests and distribute them to services, which are entities representing the applications on your servers.

Understanding NetScaler-owned IP addresses

To function as a proxy, a NetScaler appliance uses a variety of IP addresses. The key NetScaler-owned IP addresses are:

- NetScaler IP (NSIP) address
  
  The NSIP address is the IP address for management and general system access to the appliance itself, and for communication between appliances in a high availability configuration.

- Virtual server IP (VIP) address
  
  A VIP address is the IP address associated with a virtual server. It is the public IP address to which clients connect. An appliance managing a wide range of traffic may have many VIPs configured.
- **Subnet IP (SNIP) address**
  
  A SNIP address is used in connection management and server monitoring. You can specify multiple SNIP addresses for each subnet. SNIP addresses can be bound to a VLAN.

- **IP Set**
  
  An IP set is a set of IP addresses, which are configured on the appliance as SNIP. An IP set is identified with a meaningful name that helps in identifying the usage of the IP addresses contained in it.

- **Net Profile**
  
  A net profile (or network profile) contains an IP address or an IP set. A net profile can be bound to load balancing or content switching virtual servers, services, service groups, or monitors. During communication with physical servers or peers, the appliance uses the addresses specified in the profile as source IP addresses.

### How Traffic flows are managed

Because a NetScaler appliance functions as a TCP proxy, it translates IP addresses before sending packets to a server. When you configure a virtual server, clients connect to a VIP address on the NetScaler appliance instead of directly connecting to a server. As determined by the settings on the virtual server, the appliance selects an appropriate server and sends the client's request to that server. By default, the appliance uses a SNIP address to establish connections with the server, as shown in the following figure.

**Figure 1. Virtual Server Based Connections**

In the absence of a virtual server, when an appliance receives a request, it transparently forwards the request to the server. This is called the transparent mode of operation. When operating in transparent mode, an appliance translates the source IP addresses of incoming client requests to the SNIP address but does not change the destination IP address. For this mode to work, L2 or L3 mode has to be configured appropriately.

For cases in which the servers need the actual client IP address, the appliance can be configured to modify the HTTP header by inserting the client IP address as an additional field, or configured to use the client IP address instead of a SNIP address for connections to the servers.

### Traffic management building blocks

The configuration of a NetScaler appliance is typically built up with a series of virtual entities that serve as building blocks for traffic management. The building block approach helps separate traffic flows. Virtual entities are abstractions, typically representing IP addresses, ports, and protocol handlers for
processing traffic. Clients access applications and resources through these virtual entities. The most commonly used entities are virtual servers and services. Virtual servers represent groups of servers in a server farm or remote network, and services represent specific applications on each server.

Most features and traffic settings are enabled through virtual entities. For example, you can configure an appliance to compress all server responses to a client that is connected to the server farm through a particular virtual server. To configure the appliance for a particular environment, you need to identify the appropriate features and then choose the right mix of virtual entities to deliver them. Most features are delivered through a cascade of virtual entities that are bound to each other. In this case, the virtual entities are like blocks being assembled into the final structure of a delivered application. You can add, remove, modify, bind, enable, and disable the virtual entities to configure the features. The following figure shows the concepts covered in this section.

Figure 2. How traffic management building blocks work

A simple load balancing configuration

In the example shown in the following figure, the NetScaler appliance is configured to function as a load balancer. For this configuration, you need to configure virtual entities specific to load balancing and bind them in a specific order. As a load balancer, an appliance distributes client requests across several servers and thus optimizes the utilization of resources.

The basic building blocks of a typical load balancing configuration are services and load balancing virtual servers. The services represent the applications on the servers. The virtual servers abstract the servers by providing a single IP address to which the clients connect. To ensure that client requests are sent to a server, you need to bind each service to a virtual server. That is, you must create services for every server and bind the services to a virtual server. Clients use the VIP address to connect to a NetScaler appliance. When the appliance receives client requests sent to the VIP address, it sends them to a server determined by the load balancing algorithm. Load balancing uses a virtual entity called a monitor to track whether a specific configured service (server plus application) is available to receive requests.

Figure 3. Load balancing virtual server, services, and monitors

In addition to configuring the load balancing algorithm, you can configure several parameters that affect the behavior and performance of the load balancing configuration. For example, you can configure the virtual server to maintain persistence based on source IP address. The appliance then directs all requests from any specific IP address to the same server.

Understanding virtual servers

A virtual server is a named NetScaler entity that external clients can use to access applications hosted on the servers. It is represented by an alphanumeric name, virtual IP (VIP) address, port, and protocol.
The name of the virtual server is of only local significance and is designed to make the virtual server easier to identify. When a client attempts to access applications on a server, it sends a request to the VIP instead of the IP address of the physical server. When the appliance receives a request at the VIP address, it terminates the connection at the virtual server and uses its own connection with the server on behalf of the client. The port and protocol settings of the virtual server determine the applications that the virtual server represents. For example, a web server can be represented by a virtual server and a service whose port and protocol are set to 80 and HTTP, respectively. Multiple virtual servers can use the same VIP address but different protocols and ports.

Virtual servers are points for delivering features. Most features, like compression, caching, and SSL offload, are normally enabled on a virtual server. When the appliance receives a request at a VIP address, it chooses the appropriate virtual server by the port on which the request was received and its protocol. The appliance then processes the request as appropriate for the features configured on the virtual server.

In most cases, virtual servers work in tandem with services. You can bind multiple services to a virtual server. These services represent the applications running on physical servers in a server farm. After the appliance processes requests received at a VIP address, it forwards them to the servers as determined by the load balancing algorithm configured on the virtual server. The following figure illustrates these concepts.

Figure 4. Multiple Virtual Servers with a Single VIP Address

The preceding figure shows a configuration consisting of two virtual servers with a common VIP address but different ports and protocols. Each of the virtual servers has two services bound to it. The services s1 and s2 are bound to VS_HTTP and represent the HTTP applications on Server 1 and Server 2. The services s3 and s4 are bound to VS_SSL and represent the SSL applications on Server 2 and Server 3 (Server 2 provides both HTTP and SSL applications). When the appliance receives an HTTP request at the VIP address, it processes the request as specified by the settings of VS_HTTP and sends it to either Server 1 or Server 2. Similarly, when the appliance receives an HTTPS request at the VIP address, it processes it as specified by the settings of VS_SSL and it sends it to either Server 2 or Server 3.

Virtual servers are not always represented by specific IP addresses, port numbers, or protocols. They can be represented by wildcards, in which case they are known as wildcard virtual servers. For example, when you configure a virtual server with a wildcard instead of a VIP, but with a specific port number, the appliance intercepts and processes all traffic conforming to that protocol and destined for the predefined port. For virtual servers with wildcards instead of VIPs and port numbers, the appliance intercepts and processes all traffic conforming to the protocol.

Virtual servers can be grouped into the following categories:

- Load balancing virtual server
  Receives and redirects requests to an appropriate server. Choice of the appropriate server is
based on which of the various load balancing methods the user configures.

- **Cache redirection virtual server**

  Redirects client requests for dynamic content to origin servers, and requests for static content to cache servers. Cache redirection virtual servers often work in conjunction with load balancing virtual servers.

- **Content switching virtual server**

  Directs traffic to a server on the basis of the content that the client has requested. For example, you can create a content switching virtual server that directs all client requests for images to a server that serves images only. Content switching virtual servers often work in conjunction with load balancing virtual servers.

- **Virtual private network (VPN) virtual server**

  Decrypts tunneled traffic and sends it to intranet applications.

- **SSL virtual server**

  Receives and decrypts SSL traffic, and then redirects to an appropriate server. Choosing the appropriate server is similar to choosing a load balancing virtual server.

### Understanding services

Services represent applications on a server. While services are normally combined with virtual servers, in the absence of a virtual server, a service can still manage application-specific traffic. For example, you can create an HTTP service on a NetScaler appliance to represent a web server application. When the client attempts to access a web site hosted on the web server, the appliance intercepts the HTTP requests and creates a transparent connection with the web server.

In service-only mode, an appliance functions as a proxy. It terminates client connections, uses a SNIP address to establish a connection to the server, and translates the source IP addresses of incoming client requests to a SNIP address. Although the clients send requests directly to the IP address of the server, the server sees them as coming from the SNIP address. The appliance translates the IP addresses, port numbers, and sequence numbers.

A service is also a point for applying features. Consider the example of SSL acceleration. To use this feature, you must create an SSL service and bind an SSL certificate to the service. When the appliance receives an HTTPS request, it decrypts the traffic and sends it, in clear text, to the server. Only a limited set of features can be configured in the service-only case.

Services use entities called monitors to track the health of applications. Every service has a default monitor, which is based on the service type, bound to it. As specified by the settings configured on the monitor, the appliance sends probes to the application at regular intervals to determine its state.
If the probes fail, the appliance marks the service as down. In such cases, the appliance responds to client requests with an appropriate error message or re-routes the request as determined by the configured load balancing policies.

**Introduction to the NetScaler product line**

January 3, 2019

The NetScaler product line optimizes delivery of applications over the internet and private networks, combining application-level security, optimization, and traffic management into a single, integrated appliance. You can install a NetScaler appliance in your server room and route all connections to your managed servers through it. The NetScaler features that you enable and the policies you set are then applied to incoming and outgoing traffic.

A NetScaler appliance can be integrated into any network as a complement to existing load balancers, servers, caches, and firewalls. It requires no additional client or server side software, and can be configured using the NetScaler web-based GUI and CLI configuration utilities.

**NetScaler Hardware Platforms**

NetScaler hardware is available in a variety of platforms that have a range of hardware specifications:

- NetScaler MPX hardware platform
- NetScaler SDX hardware platform

**NetScaler Editions**

The NetScaler operating system is available in three editions:

- Standard
- Enterprise
- Platinum

The Standard and Advanced editions have limited features available. Feature licenses are required for all editions.

For more information about NetScaler software editions, see the NetScaler Editions datasheet.

For information about how to obtain and install licenses, see Licensing.
Supported releases on NetScaler hardware

See the following compatibility matrix tables for all NetScaler hardware platforms and the software releases supported on these platforms:

NetScaler MPX Hardware-Software Compatibility Matrix
NetScaler SDX Hardware-Software Compatibility Matrix

Supported browsers

To access the NetScaler GUI, your workstation must have a supported web browser.

Operating system: Windows 7
Browser and versions:
  • Internet Explorer; versions 9, 10, and 11
  • Mozilla Firefox; versions 3.6.25 and above
  • Google Chrome; latest version

Operating system: Windows 64 bit
Browser and versions:
  • Internet Explorer; versions 8, 9, 10, and 11
  • Google Chrome; latest version

Operating system: MAC
Browser and versions:
  • Mozilla Firefox; versions 3.6.25 and above
  • Safari; versions 5.1.3 and above
  • Google Chrome; latest version

Install the hardware

December 18, 2018

Before installing a NetScaler appliance, review the pre-installation checklist.

To use the SDX appliance, you must complete the following tasks by following the instructions given in the resources provided in table. Complete the tasks in the sequence given.

Task
Description
1. Read safety, cautions, warnings, and other information

Read the caution and danger information you need to know, before installing the product.

2. Prepare for installation

Unpack your appliance and ensure all parts were delivered, prepare the site and rack, and follow basic electrical safety precautions before you install your new appliance.

3. Install the hardware

Rack mount the appliance, install transceivers (if available), and connect the appliance to the network and a power source.

4. Configure the appliance.

Configure the initial settings of the NetScaler appliance by using the GUI or the serial console.

Follow the steps given in the following documentations to complete these tasks:

- NetScaler MPX hardware documentation
- NetScaler SDX hardware documentation

Access a NetScaler

April 12, 2019

A NetScaler appliance has both a command line interface (CLI) and a graphical user interface (GUI). The GUI includes a configuration utility for configuring the appliance and a statistical utility, called Dashboard. For initial access, all appliances ship with the default NetScaler IP address (NSIP) of 192.168.100.1 and default subnet mask of 255.255.0.0. You can assign a new NSIP and an associated subnet mask during initial configuration.

If you encounter an IP address conflict when deploying multiple NetScaler units, check for the following possible causes:

- Did you select an NSIP that is an IP address already assigned to another device on your network?
- Did you assign the same NSIP to multiple NetScaler appliances?
- The NSIP is reachable on all physical ports. The ports on a NetScaler are host ports, not switch ports.

The following table summarizes the available access methods.

<table>
<thead>
<tr>
<th>Access Method</th>
<th>Port</th>
<th>Default IP Address Required? (Y/N)</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLI</td>
<td>Console</td>
<td>N</td>
</tr>
</tbody>
</table>
**NetScaler 11.1**

<table>
<thead>
<tr>
<th>Access Method</th>
<th>Port</th>
<th>Default IP Address Required?</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLI and GUI</td>
<td>Ethernet</td>
<td>Y</td>
</tr>
</tbody>
</table>

**Command line interface**

You can access the CLI either locally, by connecting a workstation to the console port, or remotely, by connecting through secure shell (SSH) from any workstation on the same network.

**Log on to the Command Line Interface through the Console Port**

The appliance has a console port for connecting to a computer workstation. To log on to the appliance, you need a serial crossover cable and a workstation with a terminal emulation program.

To log on to the CLI through the console port, follow these steps:

1. Connect the console port to a serial port on the workstation. For more information, see [Connect the console cable](#).
2. On the workstation, start HyperTerminal or any other terminal emulation program. If the login prompt does not appear, you may need to press ENTER one or more times to display it.
3. Log on by using the administrator credentials. The command prompt (>) appears on the workstation monitor.

**Log on to the Command Line Interface by using SSH**

The SSH protocol is the preferred remote access method for accessing an appliance remotely from any workstation on the same network. You can use either SSH version 1 (SSH1) or SSH version 2 (SSH2.)

If you do not have a working SSH client, you can download and install any of the following SSH client programs:

- **PuTTY**
  
  Open Source software supported on multiple platforms. Available at: “http://www.chiark.greenend.org.uk/~sgtatham/putty/”

- **Vandyke Software SecureCRT**
  
  Commercial software supported on the Windows platform. Available at: “http://www.vandyke.com/products/securecrt/”
These programs have been tested by the Citrix NetScaler team, which has verified that they work correctly with a NetScaler appliance. Other programs may also work correctly, but have not been tested.

To verify that the SSH client is installed properly, use it to connect to any device on your network that accepts SSH connections.

To log on to a NetScaler appliance by using an SSH client, follow these steps:

1. On your workstation, start the SSH client.
2. For initial configuration, use the default IP address (NSIP), which is 192.168.100.1. For subsequent access, use the NSIP that was assigned during initial configuration. Select either SSH1 or SSH2 as the protocol.
3. Log on by using the administrator credentials. For example.

```
1 login as: nsroot
2
4 Using keyboard-interactive authentication.
5
7 Password:
8
10 Last login: Tue Jun 16 10:37:28 2009 from 10.102.29.9
11
13
15
16 Done
17
18
```

### NetScaler GUI

**Important**

A certificate-key pair is required for HTTPS access to the Citrix ADC GUI. On the ADC, a certificate-key pair is automatically bound to the internal services. On an MPX or SDX appliance, the default key size is 1024 bytes, and on a VPX instance, the default key size is 512 bytes. However, most browsers today do not accept a key that is less than 1024 bytes. As a result, HTTPS access to the VPX configuration utility is blocked.
Additionally, if a license is not present on an MPX appliance when it starts, and you add a license later and restart the appliance, you might lose the certificate binding.

Citrix recommends that you install a certificate-key pair of at least 1024 bytes on a NetScaler for HTTPS access to the GUI, and that you install an appropriate license before starting the ADC.

The graphical user interface includes a configuration utility and a statistical utility, called Dashboard, either of which you access through a workstation connected to an Ethernet port on the appliance.

The system requirements for the workstation running the GUI are as follows:

- For Windows-based workstations, a Pentium 166 MHz or faster processor.
- For Linux-based workstations, a Pentium platform running Linux kernel v2.2.12 or above, and glibc version 2.12-11 or later. A minimum of 32 MB RAM is required, and 48 MB RAM is recommended. The workstation should support 16-bit color mode, KDE and KWM window managers used in conjunction, with displays set to local hosts.
- For Solaris-based workstations, a Sun running either Solaris 2.6, Solaris 7, or Solaris 8.

Your workstation must have a supported web browser to access the configuration utility and Dashboard.

The following browsers are supported.

**Operating System:**

Windows 7

**Browser:** Internet Explorer (version 9, 10, and 11), Mozilla Firefox (version 3.6.25 and above), Google Chrome (latest).

**Operating System:**

Windows 64 bit

**Browser:** Internet Explorer (version 8, 9, 10, and 11), Google Chrome (version latest)

**Operating System:**

MAC

**Browser:** Mozilla Firefox (version 3.6.25 and above), Safari (version 5.1.3 and above), Google Chrome (version latest)

**Use the NetScaler GUI**

Once you log on to the configuration utility, you can configure the appliance through a graphical interface that includes context-sensitive help.

To log on to the GUI, follow these steps:
1. Open your web browser and enter the NetScaler IP (NSIP) as an HTTP address. If you have not yet set up the initial configuration, enter the default NSIP (http://192.168.100.1). The Citrix Logon page appears.

Note: If you have two NetScaler appliances in a high availability setup, make sure that you do not access the GUI by entering the IP address of the secondary NetScaler appliance. If you do so and use the GUI to configure the secondary appliance, your configuration changes will not be applied to the primary NetScaler appliance.

2. In the User Name text box, type nsroot.

3. In the Password text box, type the administrative password you assigned to the nsroot account during initial configuration and click Login. The Configuration Utility page appears.

If you need to access the online help, select Help from the Help menu at the top right corner.

**Use the Statistical Utility**

Dashboard, the statistical utility, is a browser-based application that displays charts and tables on which you can monitor the performance of a NetScaler appliance.

To log on to Dashboard, follow these steps:

1. Open your web browser and enter the NSIP as an HTTP address. The Citrix Logon page appears.
2. In the User Name text box, type nsroot.
3. In the Password text box, type the administrative password you assigned to the nsroot account during initial configuration.

**Configure the ADC for the first time**

December 18, 2018

For initial configuration of a NetScaler MPX appliance, see Initial Configuration of a Citrix MPX appliance.

For initial configuration of a Citrix SDX appliance, see Initial Configuration of a Citrix SDX appliance.

**NITRO API**

You can use the NITRO API to configure the NetScaler appliance. NITRO exposes its functionality through Representational State Transfer (REST) interfaces. Therefore, NITRO applications can be developed in any programming language. Additionally, for applications that must be developed in Java
or .NET or Python, NITRO APIs are exposed through relevant libraries that are packaged as separate Software Development Kits (SDKs). For more information, see NITRO API.

**Secure your NetScaler deployment**

October 18, 2019

To maintain security through the deployment life cycle of NetScaler appliance, Citrix recommends you to consider the following security aspects:

- Physical Security
- Appliance Security
- Network Security
- Administration and Management

Different deployments might require different security considerations. The NetScaler secure deployment guidelines provide general security guidance to help you decide on an appropriate secure deployment based on your specific security requirements.

For more information on guidelines for securely deploying the NetScaler appliance, see Citrix ADC secure deployment guidelines.

**Configure high availability**

January 6, 2019

You can deploy two NetScaler appliances in a high availability configuration, where one unit actively accepts connections and manages servers while the secondary unit monitors the first. The NetScaler appliance that is actively accepting connections and managing the servers is called a primary unit and the other one is called a secondary unit in a high availability configuration. If there is a failure in the primary unit, the secondary unit becomes the primary and begins actively accepting connections.

Each NetScaler appliance in a high availability pair monitors the other by sending periodic messages, called heartbeat messages or health checks, to determine the health or state of the peer node. If a health check for a primary unit fails, the secondary unit retries the connection for a specific time period. For more information about high availability, see High Availability. If a retry does not succeed by the end of the specified time period, the secondary unit takes over for the primary unit in a process called failover. The following figure shows two high availability configurations, one in one-arm mode and the other in two-arm mode.
In one-arm configuration, both NS1 and NS2 and servers S1, S2, and S3 are connected to the switch.

In two-arm configuration, both NS1 and NS2 are connected to two switches. The servers S1, S2, and S3 are connected to the second switch. The traffic between client and the servers passes through either NS1 or NS2.

To set up a high availability environment, configure one ADC appliance as primary and another as secondary. Perform the following tasks on each of the ADC appliances:

- Add a node.
- Disable high availability monitoring for unused interfaces.

### Add a Node

A node is a logical representation of a peer NetScaler appliance. It identifies the peer unit by ID and NSIP. An appliance uses these parameters to communicate with the peer and track its state. When you add a node, the primary and secondary units exchange heartbeat messages asynchronously. The node ID is an integer that must not be greater than 64.

### Through CLI

To add a node by using the command line interface, follow these steps:

At the command prompt, type the following commands to add a node and verify that the node has been added:

- `add HA node <id> <IPAddress>`
- `show HA node <id>`

#### Example

<table>
<thead>
<tr>
<th></th>
<th>add HA node 0 10.102.29.170</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>Done</td>
</tr>
<tr>
<td>3</td>
<td>&gt; show HA node 0</td>
</tr>
<tr>
<td>4</td>
<td>1) Node ID: 0</td>
</tr>
<tr>
<td>5</td>
<td>IP: 10.102.29.200 (NS200)</td>
</tr>
<tr>
<td>6</td>
<td>Node State: UP</td>
</tr>
<tr>
<td>7</td>
<td>Master State: Primary</td>
</tr>
<tr>
<td>8</td>
<td>SSL Card Status: UP</td>
</tr>
<tr>
<td>9</td>
<td>Hello Interval: 200 msecs</td>
</tr>
<tr>
<td>10</td>
<td>Dead Interval: 3 secs</td>
</tr>
</tbody>
</table>
Through GUI

To add a node by using the GUI, follow these steps:

1. Navigate to System > High Availability.
2. Click Add on the Nodes tab.
3. On the Create HA Node page, in the Remote Node IP Address text box, type the NSIP Address (for example, 10.102.29.170) of the remote node.
4. Ensure that the Configure remote system to participate in High Availability setup check box is selected. Provide the login credentials of the remote node in the text boxes under Remote System Login Credentials.
5. Select the Turn off HA monitor on interfaces/channels that are down check box to disable the HA monitor on interfaces that are down.

Verify that the node you added appears in the list of nodes in the Nodes tab.

Disable high availability monitoring for unused interfaces

The high availability monitor is a virtual entity that monitors an interface. You must disable the monitor for interfaces that are not connected or being used for traffic. When the monitor is enabled on an interface whose status is DOWN, the state of the node becomes NOT UP. In a high availability configuration, a primary node entering a NOT UP state might cause a high availability failover. An interface is marked DOWN under the following conditions:

- The interface is not connected
- The interface is not working properly
- The cable connecting the interface is not working properly

Through CLI

To disable the high availability monitor for an unused interface by using the command line interface, follow these steps:

At the command prompt, type the following commands to disable the high availability monitor for an unused interface and verify that it is disabled:

- set interface <id> -haMonitor OFF
show interface <id>

Example

```
> set interface 1/8 -haMonitor OFF
Done
> show interface 1/8
Interface 1/8 (Gig Ethernet 10/100/1000 MBits) #2
  flags=0x4000 <ENABLED, DOWN, down, autoneg, 802.1q>
  MTU=1514, native vlan=1, MAC=00:d0:68:15:fd:3d, downtime 238h55m44s
  Requested: media AUTO, speed AUTO, duplex AUTO, fctl OFF,
              throughput 0
  RX: Pkts(0) Bytes(0) Errs(0) Drops(0) Stalls(0)
  TX: Pkts(0) Bytes(0) Errs(0) Drops(0) Stalls(0)
  NIC: InDisc(0) OutDisc(0) Fctls(0) Stalls(0) Hangs(0)
        Muted(0)
```

When the high availability monitor is disabled for an unused interface, the output of the show interface command for that interface does not include “HAMON.”

Through GUI

To disable the high availability monitor for unused interfaces by using the GUI, follow these steps:

1. Navigate to System > Network > Interfaces.
2. Select the interface for which the monitor must be disabled.
3. Click Open. The Modify Interface dialog box appears.
4. In HA Monitoring, select the OFF option.
5. Click OK.
6. Verify that, when the interface is selected, “HA Monitoring: OFF” appears in the details at the bottom of the page.

Change an RPC node password

October 18, 2019

To communicate with other NetScaler appliances, each appliance requires knowledge of the other appliances, including how to authenticate on NetScaler appliance. RPC nodes are internal system entities used for system-to-system communication of configuration and session information. One RPC
NetScaler 11.1

Node exists on each NetScaler appliance and stores information, such as the IP addresses of the other NetScaler appliance and the passwords used for authentication. The NetScaler appliance that contacts the other NetScaler appliance checks the password within the RPC node.

To change an RPC node password by using the GUI

1. Navigate to System > Network > RPC.
2. In the RPC pane, select the node and then click Edit.
3. In Configure RPC Node, type the new password.
4. In Source IPAddress, type the system IP address of the other NetScaler appliance.
5. Select Secure and then click OK.

Note

When you enable the Secure option, the appliance encrypts all communication sent from the node to other RPC nodes thus securing the RPC communication.

To change an RPC node password by using the CLI

At the command line, type the following commands:

```
set ns rpcNode <IPAddress> {
    -password }
    [-secure ( YES | NO )]
show ns rpcNode
```

Example:

```
> set ns rpcNode 192.0.2.4 -password mypassword -secure YES
Done
> show rpcNode
.
.
IPAddress: 192.0.2.4
Password: d336004164d4352ce39e
SrcIP: *
Secure: ON
Done
> 
```

Configure a FIPS appliance for the first time

October 18, 2019

A certificate-key pair is required for HTTPS access to the configuration utility and for secure remote procedure calls. RPC nodes are internal system entities used for system-to-system communication of configuration and session information. One RPC node exists on each appliance. This node stores the password, which is checked against the one provided by the contacting appliance. To communicate with other NetScaler appliances, each appliance requires knowledge of the other appliances, including how to authenticate on the other appliance. RPC nodes maintain this information, which includes the IP addresses of the other NetScaler appliances and the passwords used to authenticate on each.

On a NetScaler MPX appliance virtual appliance, a certificate-key pair is automatically bound to the internal services. On a FIPS appliance, a certificate-key pair must be imported into the hardware security module (HSM) of a FIPS card. To do so, you must configure the FIPS card, create a certificate-key pair, and bind it to the internal services.

Configure secure HTTPS by using the CLI

To configure secure HTTPS by using the CLI, follow these steps

1. Initialize the hardware security module (HSM) on the FIPS card of the appliance. For information about initializing the HSM, see Configure the HSM.

2. If the appliance is part of a high availability setup, enable the SIM. For information about enabling the SIM on the primary and secondary appliances, see “Configure FIPS appliances in a high availability setup.”

3. Import the FIPS key into the HSM of the FIPS card of the appliance. At the command prompt, type:

import ssl fipskey serverkey -key ns-server.key -inform PEM

4. Add a certificate-key pair. At the command prompt, type:

add certkey server -cert ns-server.cert -fipskey serverkey

5. Bind the certificate-key created in the previous step to the following internal services. At the command prompt, type:

bind ssl service nshttps-127.0.0.1-443 -certkeyname server
bind ssl service nshttps-::11-443 -certkeyname server
**Configure secure HTTPS by using the GUI**

To configure secure HTTPS by using the GUI, follow these steps:

1. Initialize the hardware security module (HSM) on the FIPS card of the appliance. For information about initializing the HSM, see Configure the HSM.

2. If the appliance is part of a high availability setup, enable the secure information system (SIM). For information about enabling the SIM on the primary and secondary appliances, see Configure FIPS appliances in a high availability setup.

3. Import the FIPS key into the HSM of the FIPS card of the appliance. For more information about importing a FIPS key, see the Import an existing FIPS key section.

4. Navigate to Traffic Management > SSL > Certificates.

5. In the details pane, click Install.

6. In the Install Certificate dialog box, type the certificate details.

7. Click Create, and then click Close.

9. In the details pane, on the Action tab, click Internal Services.

10. Select nshttps-127.0.0.1-443 from the list, and then click Open.

11. On the SSL Settings tab, in the Available pane, select the certificate created in step 7, click Add, and then click OK.

12. Select nshttps::11-443 from the list, and then click Open.

13. On the SSL Settings tab, in the Available pane, select the certificate created in step 7, click Add, and then click OK.

14. Click OK.

**Configure secure RPC by using the CLI**

To configure secure RPC by using the CLI, follow these steps:

1. Initialize the hardware security module (HSM) on the FIPS card of the appliance. For information about initializing the HSM, see Configure the HSM.

2. Enable the secure information system (SIM). For information about enabling the SIM on the primary and secondary appliances, see Configure FIPS appliances in a high availability setup.

3. Import the FIPS key into the HSM of the FIPS card of the appliance. At the command prompt, type:

   import ssl fipskey serverkey -key ns-server.key -inform PEM
4. Add a certificate-key pair. At the command prompt, type:
   `add certkey server -cert ns-server.cert -fipskey serverkey`

5. Bind the certificate-key pair to the following internal services. At the command prompt, type:
   `bind ssl service nsrpcs-127.0.0.1-3008 -certkeyname server`
   `bind ssl service nskrpcs-127.0.0.1-3009 -certkeyname server`
   `bind ssl service nsrpcs-::1l-3008 -certkeyname server`

6. Enable secure RPC mode. At the command prompt, type:
   `set ns rpcnode <IP address> -secure YES`
   For more information about changing an RPC node password, see Change an RPC node password.

**Configure secure RPC by using the GUI**

To configure secure RPC by using the GUI, follow these steps:

1. Initialize the hardware security module (HSM) on the FIPS card of the appliance. For information about initializing the HSM, see Configure the HSM.
2. Enable the secure information system (SIM). For information about enabling the SIM on the primary and secondary appliances, Configure FIPS appliances in a high availability setup.
3. Import the FIPS key into the HSM of the FIPS card of the appliance. For more information about importing a FIPS key, see Import an existing FIPS key section.
4. Navigate to Traffic Management > SSL > Certificates.
5. In the details pane, click Install.
6. In the Install Certificate dialog box, type the certificate details.
7. Click Create, and then click Close.
9. In the details pane, on the Action tab, click Internal Services.
10. Select nsrpcs-127.0.0.1-3008 from the list, and then click Open.
11. On the SSL Settings tab, in the Available pane, select the certificate created in step 7, click Add, and then click OK.
12. Select nskrpcs-127.0.0.1-3009 from the list, and then click Open.
13. On the SSL Settings tab, in the Available pane, select the certificate created in step 7, click Add, and then click OK.
14. Select nsrpcs-::1l-3008 from the list, and then click Open.
15. On the SSL Settings tab, in the Available pane, select the certificate created in step 7, click Add, and then click OK.
16. Click OK.
17. Navigate to System > Network > RPC.
18. In the details pane, select the IP address, and click Open.
19. In the Configure RPC Node dialog box, select Secure.
20. Click OK.

Common network topologies

January 6, 2019

As described in the “Physical deployment mode” section in Where does a NetScaler appliance fit in the network?, you can deploy the NetScaler appliance either inline between the clients and servers or in one-arm mode. Inline mode uses a two-arm topology, which is the most common type of deployment.

Set up a common two-arm topology

In a two-arm topology, one network interface is connected to the client network and another network interface is connected to the server network, ensuring that all traffic flows through the appliance. This topology might require you to reconnect your hardware and also might result in a momentary downtime. The basic variations of two-arm topology are multiple subnets, typically with the appliance on a public subnet and the servers on a private subnet, and transparent mode, with both the appliance and the servers on the public network.

Set up a simple two-arm multiple subnet topology

One of the most commonly used topologies has the NetScaler appliance inline between the clients and the servers, with a virtual server configured to handle the client requests. This configuration is used when the clients and servers reside on different subnets. In most cases, the clients and servers reside on public and private subnets, respectively.

For example, consider an appliance deployed in two-arm mode for managing servers S1, S2, and S3, with a virtual server of type HTTP configured on the appliance, and with HTTP services running on the servers. The servers are on a private subnet and a SNIP is configured on the appliance to communicate with the servers. The Use SNIP (USNIP) option must be enabled on the appliance so that it uses the SNIP instead of the MIP.

As shown in the following figure, the VIP is on public subnet 217.60.10.0, and the NSIP, the servers, and the SNIP are on private subnet 192.168.100.0/24.

Figure 1. Topology Diagram for Two-Arm Mode, Multiple Subnets

To deploy a NetScaler appliance in two-arm mode with multiple subnets, follow these steps:
1. Configure the NSIP and default gateway, as described in Configuring the NetScaler IP Address (NSIP).
2. Configure the SNIP, as described in Configuring Subnet IP Addresses.
3. Enable the USNIP option, as described in To enable or disable USNIP mode section.
4. Configure the virtual server and the services, as described in Creating a Virtual Server section and Configuring Services section.
5. Connect one of the network interfaces to a private subnet and the other interface to a public subnet.

**Set up a simple two-arm transparent topology**

Use transparent mode if the clients need to access the servers directly, with no intervening virtual server. The server IP addresses must be public because the clients need to be able to access them.

In the example shown in the following figure, a NetScaler appliance is placed between the client and the server, so the traffic must pass through the appliance. You must enable L2 mode for bridging the packets. The NSIP and MIP are on the same public subnet, 217.60.10.0/24.

Figure 2. Topology Diagram for Two-Arm, Transparent Mode

To deploy a NetScaler appliance in two-arm, transparent mode, follow these steps:

1. Configure the NSIP and default gateway, as described in Configuring the NetScaler IP Address (NSIP).
2. Enable L2 mode, as described in Enabling and Disabling Layer 2 Mode.
3. Configure the default gateway of the managed servers as the MIP.
4. Connect the network interfaces to the appropriate ports on the switch.

**Set up common one-arm topologies**

The two basic variations of one-arm topology are with a single subnet and with multiple subnets.

**Set up a simple one-arm single subnet topology**

You can use a one-arm topology with a single subnet when the clients and servers reside on the same subnet. For example, consider a NetScaler appliance deployed in one-arm mode for managing servers S1, S2, and S3. A virtual server of type HTTP is configured on an ADC appliance, and HTTP services are running on the servers. As shown in the following figure, the NetScaler IP address (NSIP), the Mapped IP address (MIP), and the server IP addresses are on the same public subnet, 217.60.10.0/24.

Figure 3. Topology Diagram for One-Arm Mode, Single Subnet

To deploy a NetScaler appliance in one-arm mode with a single subnet, follow these steps:
1. Configure the NSIP and the default gateway, as described in Configuring the NetScaler IP Address (NSIP).

2. Configure the virtual server and the services, as described in Creating a Virtual Server section and Configuring Services section.

3. Connect one of the network interfaces to the switch.

**Set up a simple one-arm multiple subnet topology**

You can use a one-arm topology with multiple subnets when the clients and servers reside on the different subnets. For example, consider a NetScaler appliance deployed in one-arm mode for managing servers S1, S2, and S3, with the servers connected to switch SW1 on the network. A virtual server of type HTTP is configured on the appliance, and HTTP services are running on the servers. These three servers are on the private subnet, so a subnet IP address (SNIP) is configured to communicate with them. The Use Subnet IP address (USNIP) option must be enabled so that the appliance uses the SNIP instead of a MIP. As shown in the following figure, the virtual IP address (VIP) is on public subnet 217.60.10.0/24; the NSIP, SNIP, and the server IP addresses are on private subnet 192.168.100.0/24.

Figure 4. Topology Diagram for One-Arm Mode, Multiple Subnets

To deploy a NetScaler appliance in one-arm mode with multiple subnets, follow these steps:

1. Configure the NSIP and the default gateway, as described in Configuring the NetScaler IP Address (NSIP).

2. Configure the SNIP and enable the USNIP option, as described in Configuring Subnet IP Addresses.

3. Configure the virtual server and the services, as described in Creating a Virtual Server section and Configuring Services section.

4. Connect one of the network interfaces to the switch.

**System management settings**

December 18, 2018

Once your initial configuration is in place, you can configure settings to define the behavior of the NetScaler appliance and facilitate connection management. You have a number of options for handling HTTP requests and responses. Routing, bridging, and MAC based forwarding modes are available for handling packets not addressed to the NetScaler appliance. You can define the characteristics
of your network interfaces and can aggregate the interfaces. To prevent timing problems, you can syn-
chronize the Citrix clock with a Network Time Protocol (NTP) server. The NetScaler appliance can op-
erate in various DNS modes, including as an authoritative domain name server (ADNS). You can set up
SNMP for system management and customize syslog logging of system events. Before deployment,
verify that your configuration is complete and correct.

**System settings**

December 18, 2018

Configuration of system settings includes basic tasks such as configuring HTTP ports to enable con-
nection keep-alive and server offload, setting the maximum number of connections for each server,
and setting the maximum number of requests per connection. You can enable client IP address inser-
tion for situations in which a proxy IP address is not suitable, and you can change the HTTP cookie
version.

You can also configure a NetScaler appliance to open FTP connections on a controlled range of ports
instead of ephemeral ports for data connections. This improves security, because opening all ports
on the firewall is insecure. You can set the range anywhere from 1,024 to 64,000.

Before deployment, go through the verification checklists to verify your configuration. To configure
HTTP parameters and the FTP port range, use the NetScaler GUI.

You can modify the types of HTTP parameters described in the following table.

**Parameter Type:** HTTP Port Information

**Specifies:** The web server HTTP ports used by your managed servers. If you specify the ports, the
appliance performs request switching for any client request that has a destination port matching a
specified port.

Note: If an incoming client request is not destined for a service or a virtual server that is specif-
ically configured on the appliance, the destination port in the request must match one of the
globally configured HTTP ports. This allows the appliance to perform connection keep-alive and
server off-load.

**Parameter Type:** Limits

**Specifies:** The maximum number of connections to each managed server, and the maximum num-
ber of requests sent over each connection. For example, if you set Max Connections to 500, and the
appliance is managing three servers, it can open a maximum of 500 connections to each of the three
servers. By default, the appliance can create an unlimited number of connections to any of the servers
it manages. To specify an unlimited number of requests per connection, set Max Requests to 0.
Note: If you are using the Apache HTTP server, you must set Max Connections equal to the value of the MaxClients parameter in the Apache httpd.conf file. Setting this parameter is optional for other web servers.

**Parameter Type:** Client IP Insertion

**Specifies:** Enable/disable insertion of the client’s IP address into the HTTP request header. You can specify a name for the header field in the adjacent text box. When a web server managed by an appliance receives a mapped IP address or a subnet IP address, the server identifies it as the client’s IP address. Some applications need the client’s IP address for logging purposes or to dynamically determine the content to be served by the web server.

You can enable insertion of the actual client IP address into the HTTP header request sent from the client to one, some, or all servers managed by the appliance. You can then access the inserted address through a minor modification to the server (using an Apache module, ISAPI interface, or NSAPI interface).

**Parameter Type:** Cookie Version

**Specifies:** The HTTP cookie version to use when COOKIEINSERT persistence is configured on a virtual server. The default, version 0, is the most common type on the Internet. Alternatively, you can specify version 1.

**Parameter Type:** Requests/Responses

**Specifies:** Options for handling certain types of requests, and enable/disable logging of HTTP error responses.

**Parameter Type:** Server Header Insertion

**Specifies:** Insert a server header in NetScaler-generated HTTP responses.

To configure HTTP parameters by using the GUI, follow these steps:

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Settings, click Change HTTP parameters.
3. In the Configure HTTP parameters dialog box, specify values for some or all of the parameters that appear under the headings listed in the table above.
4. Click OK.

To set the FTP port range by using the GUI, follow these steps:

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Settings, click Change global system settings.
3. Under FTP Port Range, in the Start Port and End Port text boxes, type the lowest and highest port numbers, respectively, for the range you want to specify (for example, 5000 and 6000).
4. Click OK.
Packet forwarding modes

January 6, 2019

The NetScaler appliance can either route or bridge packets that are not destined for an IP address owned by the appliance (that is, the IP address is not the NSIP, a MIP, a SNIP, a configured service, or a configured virtual server). By default, L3 mode (routing) is enabled and L2 mode (bridging) is disabled, but you can change the configuration. The following flow chart shows how the appliance evaluates packets and either processes, routes, bridges, or drops them.

Figure 1. Interaction between Layer 2 and Layer 3 Modes

An appliance can use the following modes to forward the packets it receives:

- Layer 2 (L2) Mode
- Layer 3 (L3) Mode
- MAC-Based Forwarding Mode

Enable and disable layer 2 mode

Layer 2 mode controls the Layer 2 forwarding (bridging) function. You can use this mode to configure a NetScaler appliance to behave as a Layer 2 device and bridge the packets that are not destined for it. When this mode is enabled, packets are not forwarded to any of the MAC addresses, because the packets can arrive on any interface of the appliance and each interface has its own MAC address.

With Layer 2 mode disabled (which is the default), the appliance drops packets that are not destined for one of its MAC address. If another Layer 2 device is installed in parallel with the appliance, Layer 2 mode must be disabled to prevent bridging (Layer 2) loops. You can use the configuration utility or the command line to enable Layer 2 mode.

Note: The appliance does not support spanning tree protocol. To avoid loops, if you enable L2 mode, do not connect two interfaces on the appliance to the same broadcast domain.

To enable or disable Layer 2 mode by using the CLI

At the command prompt, type the following commands to enable/disable Layer 2 mode and verify that it has been enabled/disabled:

- enable ns mode <Mode>
- disable ns mode <Mode>
- show ns mode
Examples

> enable ns mode l2
Done
> show ns mode

Mode Acronym Status
——— ——- ——
1) Fast Ramp FR ON
2) Layer 2 mode L2 ON

> disable ns mode l2
Done
> show ns mode

Mode Acronym Status
——— ——- ——
1) Fast Ramp FR ON
2) Layer 2 mode L2 OFF

To enable or disable Layer 2 mode by using the GUI

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Modes and Features, click Configure modes.
3. In the Configure Modes dialog box, to enable Layer 2 mode, select the Layer 2 Mode check box.
   To disable Layer 2 mode, clear the check box.
4. Click OK. The Enable/Disable Mode(s)? message appears in the details pane.
5. Click Yes.

Enable and disable layer 3 mode

Layer 3 mode controls the Layer 3 forwarding function. You can use this mode to configure a NetScaler appliance to look at its routing table and forward packets that are not destined for it. With Layer 3
mode enabled (which is the default), the appliance performs route table lookups and forwards all packets that are not destined for any appliance-owned IP address. If you disable Layer 3 mode, the appliance drops these packets.

**To enable or disable Layer 3 mode by using the CLI**

At the command prompt, type the following commands to enable/disable Layer 3 mode and verify that it has been enabled/disabled:

- `enable ns mode <Mode>`
- `disable ns mode <Mode>`
- `show ns mode`

**Examples**

```
> enable ns mode l3
Done
> show ns mode

Mode Acronym Status
——- ——- ——
1) Fast Ramp FR ON
2) Layer 2 mode L2 OFF
.
.
.
9) Layer 3 mode (ip forwarding) L3 ON
.
.
.
Done
```

```
> disable ns mode l3
Done
> show ns mode

Mode Acronym Status
——- ——- ——
1) Fast Ramp FR ON
2) Layer 2 mode L2 OFF
.
```
To enable or disable Layer 3 mode by using the GUI

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Modes and Features, click Configure modes.
3. In the Configure Modes dialog box, to enable Layer 3 mode, select the Layer 3 Mode (IP Forwarding) check box. To disable Layer 3 mode, clear the check box.
4. Click OK. The Enable/Disable Mode(s)? message appears in the details pane.
5. Click Yes.

Enable and disable MAC based forwarding mode

You can use MAC-based forwarding to process traffic more efficiently and avoid multiple-route or ARP lookups when forwarding packets, because the NetScaler appliance remembers the MAC address of the source. To avoid multiple lookups, the appliance caches the source MAC address of every connection for which it performs an ARP lookup, and it returns the data to the same MAC address.

MAC-based forwarding is useful when you use VPN devices because the appliance ensures that all traffic flowing through a particular VPN passes through the same VPN device.

The following figure shows the process of MAC-based forwarding.

Figure 2. MAC-Based Forwarding Process

When MAC-based forwarding is enabled, the appliance caches the MAC address of:

- The source (a transmitting device such as router, firewall, or VPN device) of the inbound connection.
- The server that responds to the requests.

When a server responds through an appliance, the appliance sets the destination MAC address of the response packet to the cached address, ensuring that the traffic flows in a symmetric manner, and then forwards the response to the client. The process bypasses the route table lookup and ARP lookup functions. However, when an appliance initiates a connection, it uses the route and ARP tables for the lookup function. To enable MAC-based forwarding, use the configuration utility or the command line.
Some deployments require the incoming and outgoing paths to flow through different routers. In these situations, MAC-based forwarding breaks the topology design. For a global server load balancing (GSLB) site that requires the incoming and outgoing paths to flow through different routers, you must disable MAC-based forwarding and use the appliance’s default router as the outgoing router.

With MAC-based forwarding disabled and Layer 2 or Layer 3 connectivity enabled, a route table can specify separate routers for outgoing and incoming connections. To disable MAC-based forwarding, use the configuration utility or the command line.

**To enable or disable MAC-based forwarding by using the CLI**

At the command prompt, type the following commands to enable/disable MAC-based forwarding mode and verify that it has been enabled/disabled:

- `<enable ns mode <Mode>`
- `<disable ns mode <Mode>`
- `<show ns mode`

**Example**

```
    enable ns mode mbf
    Done
    show ns mode
```

<table>
<thead>
<tr>
<th>Mode</th>
<th>Acronym</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fast Ramp mode</td>
<td>FR</td>
<td>ON</td>
</tr>
<tr>
<td>Layer 2 mode</td>
<td>L2</td>
<td>OFF</td>
</tr>
<tr>
<td>MAC-based forwarding</td>
<td>MBF</td>
<td>ON</td>
</tr>
</tbody>
</table>

```
disable ns mode mbf
Done
show ns mode
```

<table>
<thead>
<tr>
<th>Mode</th>
<th>Acronym</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fast Ramp mode</td>
<td>FR</td>
<td>ON</td>
</tr>
<tr>
<td>Layer 2 mode</td>
<td>L2</td>
<td>OFF</td>
</tr>
<tr>
<td>MAC-based forwarding</td>
<td>MBF</td>
<td>OFF</td>
</tr>
</tbody>
</table>

To enable or disable MAC-based forwarding by using the GUI
1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Modes and Features** group, click **Configure modes**.
3. In the **Configure Modes** dialog box, to enable MAC-based forwarding mode, select the **MAC Based Forwarding** check box. To disable MAC-based forwarding mode, clear the check box.
4. Click **OK**. The Enable/Disable Mode(s)? message appears in the details pane.
5. Click **Yes**.

---

**Network interfaces**

December 18, 2018

The NetScaler interfaces are numbered in slot/port notation. In addition to modifying the characteristics of individual interfaces, you can configure virtual LANs to restrict traffic to specific groups of hosts. You can also aggregate links into high-speed channels.

**Virtual LANs**

The NetScaler appliance supports (Layer 2) port and IEEE802.1Q tagged virtual LANs (VLANs). VLAN configurations are useful when you need to restrict traffic to certain groups of stations. You can configure a network interface to belong to multiple VLANs by using IEEE 802.1q tagging.

You can bind your configured VLANs to IP subnets. The ADC appliance (if it is configured as the default router for the hosts on the subnets) then performs IP forwarding between these VLANs.

The NetScaler appliance supports the following types of VLANs.

- **Default VLAN**

  By default, the network interfaces on a NetScaler appliance are included in a single, port-based VLAN as untagged network interfaces. This default VLAN has a VID of 1 and exists permanently. It cannot be deleted, and its VID cannot be changed.

- **Port-Based VLANs**

  A set of network interfaces that share a common, exclusive, Layer 2 broadcast domain define the membership of a port-based VLAN. You can configure multiple port-based VLANs. When you add an interface to a new VLAN as an untagged member, it is automatically removed from the default VLAN.

- **Tagged VLAN**

  A network interface can be a tagged or untagged member of a VLAN. Each network interface is an untagged member of only one VLAN (its native VLAN). The untagged network interface forwards
the frames for the native VLAN as untagged frames. A tagged network interface can be a part of more than one VLAN. When you configure tagging, be sure that both ends of the link have matching VLAN settings. You can use the configuration utility to define a tagged VLAN (nsvlan) that can have any ports bound as tagged members of the VLAN. Configuring this VLAN requires a reboot of the ADC appliance and therefore must be done during initial network configuration.

**Link aggregate channels**

Link aggregation combines incoming data from multiple ports into a single high speed link. Configuring the link aggregate channel increases the capacity and availability of the communication channel between a NetScaler appliance and other connected devices. An aggregated link is also referred to as a channel.

When a network interface is bound to a channel, the channel parameters have precedence over the network interface parameters. A network interface can be bound to only one channel. Binding a network interface to a link aggregate channel changes the VLAN configuration. That is, binding network interfaces to a channel removes them from the VLANs that they originally belonged to and adds them to the default VLAN. However, you can bind the channel back to the old VLAN, or to a new one. For example, if you have bound network interfaces 1/2 and 1/3 to a VLAN with ID 2, and then you bind them to link aggregate channel LA/1, the network interfaces are moved to the default VLAN, but you can bind them to VLAN 2.

Note: You can also use Link Aggregation Control Protocol (LACP) to configure link aggregation. For more information, see Configuring Link Aggregation by Using the Link Aggregation Control Protocol.

**Clock synchronization**

December 18, 2018

You can configure your NetScaler appliance to synchronize its local clock with a Network Time Protocol (NTP) server. This ensures that its clock has the same date and time settings as the other servers on your network. NTP uses User Datagram Protocol (UDP) port 123 as its transport layer. You have to add NTP servers in the NTP configuration file so that the appliance periodically gets updates from these servers.

If you do not have a local NTP server, you can find a list of public, open access, NTP servers at the official NTP site at [http://www.ntp.org](http://www.ntp.org).

To configure clock synchronization on your appliance, follow these steps:

1. Log on to the command line and enter the shell command.
2. At the shell prompt, copy the ntp.conf file from the /etc directory to the /nsconfig directory. If the file already exists in the /nsconfig directory, make sure that you remove the following entries from the ntp.conf file:

   restrict localhost
   restrict 127.0.0.2

   These entries are required only if you want to run the device as a time server. However, this feature is not supported on the NetScaler appliance.

3. Edit /nsconfig/ntp.conf by typing the IP address for the desired NTP server under the file's server and restrict entries.

4. Create a file named rc.netscaler in the /nsconfig directory, if the file does not already exist in the directory.

5. Edit /nsconfig/rc.netscaler by adding the following entry: /usr/sbin/ntpd -c /nsconfig/ntp.conf -l /var/log/ntpd.log &

   This entry starts the ntpd service, checks the ntp.conf file, and logs messages in the /var/log directory.

   Note: If the time difference between the NetScaler appliance and the time server is more than 1000 sec, the ntpd service terminates with a message to the ADC log. To avoid this, you need to start ntpd with the -g option, which forcibly syncs the time. Add the following entry in /nsconfig/rc.netscaler:

   /usr/sbin/ntpd -g -c /nsconfig/ntp.conf -l /var/log/ntpd.log &

   If you do not want to forcibly sync the time when there is a large difference, you can set the date manually and then start ntpd again. You can check the time difference between the appliance and the time server by running the following command in the shell:

   ```
   ntpdate -q <IP address or domain name of the NTP server>
   ```

6. Reboot the appliance to enable clock synchronization.

   Note: If you want to start time synchronization before you restart the appliance, enter the following command (which you added to the rc.netscaler file in step 5) at the shell prompt:

   ```
   /usr/sbin/ntpd -c /nsconfig/ntp.conf -l /var/log/ntpd.log &
   ```
You can configure a NetScaler appliance to function as an Authoritative Domain Name Server (ADNS), DNS proxy server, End Resolver, or Forwarder. You can add DNS resource records such as SRV Records, AAAA Records, A Records, MX Records, NS Records, CNAME Records, PTR Records, and SOA Records. Also, the appliance can balance the load on external DNS servers.

A common practice is to configure an appliance as a forwarder. For this configuration, you need to add external name servers. After you have added the external servers, you should verify that your configuration is correct.

You can add, remove, enable, and disable external name servers. You can create a name server by specifying its IP address, or you can configure an existing virtual server as the name server.

When adding name servers, you can specify IP addresses or virtual IP addresses (VIPs). If you use IP addresses, the appliance load balances requests to the configured name servers in a round robin manner. If you use VIPs, you can specify any load balancing method.

**Add a name server by using the CLI**

At the command prompt, type the following commands to add a name server and verify the configuration:

- `<add dns nameServer <IP>`
- `<show dns nameServer <IP>`

**Example**

```
add dns nameServer 10.102.29.10
Done
show dns nameServer 10.102.29.10
1) 10.102.29.10 - State: DOWN
Done
```

**Add a name server by using the GUI**

1. Navigate to **Traffic Management > DNS > Name Servers**.
2. In the details pane, click **Add**.
3. In the **Create Name Server** dialog box, select **IP Address**.
4. In the **IP Address** text box, type the IP address of the name server (for example, 10.102.29.10). If you are adding an external name server, clear the **Local** check box.
5. Click **Create**, and then click **Close**.
6. Verify that the name server you added appears in the **Name Servers** pane.

**SNMP configuration**

January 6, 2019

The Simple Network Management Protocol (SNMP) network management application, running on an external computer, queries the SNMP agent on the NetScaler appliance. The agent searches the management information base (MIB) for data requested by the network management application and sends the data to the application.

SNMP monitoring uses traps messages and alarms. SNMP traps messages are asynchronous events that the agent generates to signal abnormal conditions, which are indicated by alarms. For example, if you want to be informed when CPU utilization is above 90 percent, you can set up an alarm for that condition. The following figure shows a network with a NetScaler appliance that has SNMP enabled and configured.

Figure 1. SNMP on the NetScaler appliance

The SNMP agent on a NetScaler appliance supports SNMP version 1 (SNMPv1), SNMP version 2 (SNMPv2), and SNMP version 3 (SNMPv3). Because it operates in bilingual mode, the agent can handle SNMPv2 queries, such as Get-Bulk, and SNMPv1 queries. The SNMP agent also sends traps compliant with SNMPv2 and supports SNMPv2 data types, such as counter64. SNMPv1 managers (programs on other servers that request SNMP information from the ADC appliance) use the NS-MIB-smiv1.mib file when processing SNMP queries. SNMPv2 managers use the NS-MIB-smiv2.mib file.

The NetScaler appliance supports the following enterprise-specific MIBs:

- A subset of standard MIB-2 groups
  - Provides MIB-2 groups SYSTEM, IF, ICMP, UDP, and SNMP.
- A system enterprise MIB
  - Provides system-specific configuration and statistics.

To configure SNMP, you specify which managers can query the SNMP agent, add SNMP trap listeners that will receive the SNMP trap messages, and configure SNMP Alarms.
Add SNMP managers

You can configure a workstation running a management application that complies with SNMP version 1, 2, or 3 to access an appliance. Such a workstation is called an SNMP manager. If you do not specify an SNMP manager on the appliance, the appliance accepts and responds to SNMP queries from all IP addresses on the network. If you configure one or more SNMP managers, the appliance accepts and responds to SNMP queries from only those specific IP addresses. When specifying the IP address of an SNMP manager, you can use the netmask parameter to grant access from entire subnets. You can add a maximum of 100 SNMP managers or networks. To add an SNMP manager by using the CLI

At the command prompt, type the following commands to add an SNMP manager and verify the configuration:
**add snmp manager <IPAddress> … [-netmask <netmask>] **
**show snmp manager** <IPAddress>

Example:
> add snmp manager 10.102.29.5 -netmask 255.255.255.255
Done
> show snmp manager 10.102.29.5
1) 10.102.29.5 255.255.255.255
Done
>
To add an SNMP manager by using the GUI:

1. In the navigation pane, expand System, expand SNMP, and then click Managers.
2. In the details pane, click Add.
3. In the Add SNMP Manager dialog box, in the IP Address text box, type the IP address of the workstation running the management application (for example, 10.102.29.5).
4. Click Create, and then click Close.
5. Verify that the SNMP manager you added appears in the Details section at the bottom of the pane.

Add SNMP traps listeners

After configuring the alarms, you need to specify the trap listener to which the appliance will send the trap messages. Apart from specifying parameters like IP address and the destination port of the trap listener, you can specify the type of trap (either generic or specific) and the SNMP version.

You can configure a maximum of 20 trap listeners for receiving either generic or specific traps.
To add an SNMP trap listener by using the CLI

At the command prompt, type the following command to add an SNMP trap and verify that it has been added:

- add snmp trap specific <IP>
- show snmp trap

**Example**

```
> add snmp trap specific 10.102.29.3
Done
> show snmp trap
```

To add an SNMP trap listener by using the GUI

1. In the navigation pane, expand System, expand SNMP, and then click Traps.
2. In the details pane, click Add.
3. In the Create SNMP Trap Destination dialog box, in the Destination IP Address text box, type the IP address (for example, 10.102.29.3).
4. Click Create and then click Close.
5. Verify that the SNMP trap you added appears in the Details section at the bottom of the pane.

Configure SNMP alarms

You configure alarms so that the appliance generates a trap message when an event corresponding to one of the alarms occurs. Configuring an alarm consists of enabling the alarm and setting the severity level at which a trap is generated. There are five severity levels: Critical, Major, Minor, Warning, and Informational. A trap is sent only when the severity of the alarm matches the severity specified for the trap.
Some alarms are enabled by default. If you disable an SNMP alarm, the appliance will not generate trap messages when corresponding events occur. For example, if you disable the Login-Failure SNMP alarm, the appliance will not generate a trap message when a login failure occurs.

**To enable or disable an alarm by using the CLI**

At the command prompt, type the following commands to enable or disable an alarm and verify that it has been enabled or disabled:

```
set snmp alarm <trapName> [-state ENABLED  DISABLED ]
```

- show snmp alarm <trapName>

**Example**

```
> set snmp alarm LOGIN-FAILURE -state ENABLED
Done
> show snmp alarm LOGIN-FAILURE
Alarm Alarm Threshold Normal Threshold Time State Severity Logging
--- --- --- --- --- --- --- --- --- ---
1) LOGIN-FAILURE N/A N/A N/A ENABLED - ENABLED
Done
>
```

**To set the severity of the alarm by using the CLI**

At the command prompt, type the following commands to set the severity of the alarm and verify that the severity has been set correctly:

- set snmp alarm <trapName> [ -severity <severity> ]
- show snmp alarm <trapName>

**Example**

```
> set snmp alarm LOGIN-FAILURE -severity Major
Done
> show snmp alarm LOGIN-FAILURE
Alarm Alarm Threshold Normal Threshold Time State Severity Logging
--- --- --- --- --- --- --- --- --- ---
1) LOGIN-FAILURE N/A N/A N/A ENABLED - ENABLED
```

© 1999-2018 Citrix Systems, Inc. All rights reserved.
To configure alarms by using the GUI

1. In the navigation pane, expand System, expand SNMP, and then click Alarms.
2. In the details pane, select an alarm (for example, LOGIN-FAILURE), and then click Open.
3. In the Configure SNMP Alarm dialog box, to enable the alarm, select Enabled in the State drop-down list. To disable the alarm, select Disabled.
4. In the Severity drop-down list, select a severity option (for example, Major).
5. Click OK, and then click Close.
6. Verify that the parameters for the SNMP alarm you configured are correctly configured by viewing the Details section at the bottom of the pane.

Verify configuration

December 18, 2018

After you've finished configuring your system, complete the following checklists to verify your configuration.

Configuration checklist

- The build running is:
- There are no incompatibility issues. (Incompatibility issues are documented in the build’s release notes.)
- The port settings (speed, duplex, flow control, monitoring) are the same as the switch's port.
- Enough mapped IP addresses have been configured to support all server-side connections during peak times.
  - The number of configured mapped IP addresses is:____
  - The expected number of simultaneous server connections is:
    [ ] 62,000 [ ] 124,000 [ ] Other____

Topology configuration checklist

The routes have been used to resolve servers on other subnets.

The routes entered are:
• If the NetScaler appliance is in a public-private topology, reverse NAT has been configured.

• The failover (high availability) settings configured on the ADC appliance resolve in a one arm or two-arm configuration. All unused network interfaces have been disabled:

• If the ADC appliance is placed behind an external load balancer, then the load balancing policy on the external load balancer is not “least connection.”

  The load balancing policy configured on the external load balancer is:

• If the ADC appliance is placed in front of a firewall, the session time-out on the firewall is set to a value greater than or equal to 300 seconds.

  Note: The TCP idle connection timeout on a NetScaler appliance is 360 seconds. If the timeout on the firewall is also set to 300 seconds or more, then the appliance can perform TCP connection multiplexing effectively because connections will not be closed earlier.

  The value configured for the session time-out is: ___________________

Server configuration checklist

• “Keep-alive” has been enabled on all the servers.

  The value configured for the keep-alive time-out is: ___________________

• The default gateway has been set to the correct value. (The default gateway should either be a NetScaler appliance or upstream router.) The default gateway is:

• The server port settings (speed, duplex, flow control, monitoring) are the same as the switch port settings.

• If the Microsoft® Internet Information Server is used, buffering is enabled on the server.

• If an Apache Server is used, the MaxConn (maximum number of connections) parameter is configured on the server and on the NetScaler appliance.

  The MaxConn (maximum number of connections) value that has been set is:

© 1999-2018 Citrix Systems, Inc. All rights reserved.
If a Netscape Enterprise Server is used, the maximum requests per connection parameter is set on the NetScaler appliance. The maximum requests per connection value that has been set is:

_________________________________________

**Software features configuration checklist**

- Does the Layer 2 mode feature need to be disabled? (Disable if another Layer 2 device is working in parallel with a NetScaler appliance.)
  
  Reason for enabling or disabling:
  
  _______________________________

- Does the MAC-based forwarding feature need to be disabled? (If the MAC address used by return traffic is different, it should be disabled.)
  
  Reason for enabling or disabling:
  
  _______________________________

- <Does host-based reuse need to be disabled? (Is there virtual hosting on the servers?)
  
  Reason for enabling or disabling:
  
  _______________________________

- Do the default settings of the surge protection feature need to be changed?
  
  Reason for changing or not changing:
  
  _______________________________

**Access checklist**

- The system IPs can be pinged from the client-side network.
- The system IPs can be pinged from the server-side network.
- The managed server(s) can be pinged through the NetScaler.
- Internet hosts can be pinged from the managed servers.
- The managed server(s) can be accessed through the browser.
- The Internet can be accessed from managed server(s) using the browser.
- The system can be accessed using SSH.
- Admin access to all managed server(s) is working.

Note: When you are using the ping utility, ensure that the pinged server has ICMP ECHO enabled, or your ping will not succeed.
Firewall checklist

The following firewall requirements have been met:

- UDP 161 (SNMP)
- UDP 162 (SNMP trap)
- TCP/UDP 3010 (GUI)
- HTTP 80 (GUI)
- TCP 22 (SSH)

Load balance traffic on a NetScaler appliance

January 6, 2019

The load balancing feature distributes client requests across multiple servers to optimize resource utilization. In a real-world scenario with a limited number of servers providing service to a large number of clients, a server can become overloaded and degrade the performance of the server farm. A NetScaler appliance uses load balancing criteria to prevent bottlenecks by forwarding each client request to the server best suited to handle the request when it arrives.

To configure load balancing, you define a virtual server to proxy multiple servers in a server farm and balance the load among them.

When a client initiates a connection to the server, a virtual server terminates the client connection and initiates a new connection with the selected server, or reuses an existing connection with the server, to perform load balancing. The load balancing feature provides traffic management from Layer 4 (TCP and UDP) through Layer 7 (FTP, HTTP, and HTTPS).

The NetScaler appliance uses a number of algorithms, called load balancing methods, to determine how to distribute the load among the servers. The default load balancing method is the Least Connections method.

A typical load balancing deployment consists of the entities described in the following figure.

Figure 1. Load Balancing Architecture

The entities function as follows:

- **Virtual server.** An entity that is represented by an IP address, a port, and a protocol. The virtual server IP address (VIP) is usually a public IP address. The client sends connection requests to this IP address. The virtual server represents a bank of servers.
- **Service.** A logical representation of a server or an application running on a server. Identifies the server’s IP address, a port, and a protocol. The services are bound to the virtual servers.
- **Server object.** An entity that is represented by an IP address. The server object is created when you create a service. The IP address of the service is taken as the name of the server object. You can also create a server object and then create services by using the server object.

- **Monitor.** An entity that tracks the health of the services. The appliance periodically probes the servers using the monitor bound to each service. If a server does not respond within a specified response timeout, and the specified number of probes fails, the service is marked DOWN. The appliance then performs load balancing among the remaining services.

---

**Load balancing**

January 6, 2019

To configure load balancing, you must first create services. Then, you create virtual servers and bind the services to the virtual servers. By default, the NetScaler appliance binds a monitor to each service. After binding the services, verify your configuration by making sure that all of the settings are correct.

Note: After you deploy the configuration, you can display statistics that show how the entities in the configuration are performing. Use the statistical utility or the `stat lb vserver <vservername>` command.

Optionally, you can assign weights to a service. The load balancing method then uses the assigned weight to select a service. For getting started, however, you can limit optional tasks to configuring some basic persistence settings, for sessions that must maintain a connection to a particular server, and some basic configuration-protection settings.

The following flow chart illustrates the sequence of the configuration tasks.

Figure 1. Sequence of Tasks to Configure Load Balancing

---

**Enable load balancing**

Before configuring load balancing, make sure that the load balancing feature is enabled.

**To enable load balancing by using the CLI**

At the command prompt, type the following commands to enable load balancing and verify that it is enabled:

- `enable feature lb`
To enable load balancing by using the GUI

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Modes and Features, click Change basic features.
3. In the Configure Basic Features dialog box, select the Load Balancing check box, and then click OK.
4. In the Enable/Disable Feature(s)? message, click Yes.

Configure services and a virtual server

When you have identified the services you want to load balance, you can implement your initial load balancing configuration by creating the service objects, creating a load balancing virtual server, and binding the service objects to the virtual server.

To implement the initial load balancing configuration by using the CLI

At the command prompt, type the following commands to implement and verify the initial configuration:

- `<add service <name> <IPaddress> <serviceType> <port>`
- `<add lb vserver <vServerName> <serviceType> [<IPaddress> <port>]`
- `<bind lb vserver <name> <serviceName>"
To implement the initial load balancing configuration by using the GUI

1. Navigate to Traffic Management > Load Balancing.
2. In the details pane, under Getting Started, click Load Balancing wizard, and follow the instructions to create a basic load balancing setup.
3. Return to the navigation pane, expand Load Balancing, and then click Virtual Servers.
4. Select the virtual server that you configured and verify that the parameters displayed at the bottom of the page are correctly configured.
5. Click Open.
6. Verify that each service is bound to the virtual server by confirming that the Active check box is selected for each service on the Services tab.

Persistence settings

December 18, 2018

You must configure persistence on a virtual server if you want to maintain the states of connections on the servers represented by that virtual server (for example, connections used in e-commerce). The appliance then uses the configured load balancing method for the initial selection of a server, but forwards to that same server all subsequent requests from the same client.

If persistence is configured, it overrides the load balancing methods once the server has been selected. If the configured persistence applies to a service that is down, the appliance uses the load balancing methods to select a new service, and the new service becomes persistent for subsequent requests.
from the client. If the selected service is in an Out Of Service state, it continues to serve the outstanding requests but does not accept new requests or connections. After the shutdown period elapses, the existing connections are closed. The following table lists the types of persistence that you can configure.

<table>
<thead>
<tr>
<th>Persistence Type</th>
<th>Persistent Connections</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source IP, SSL Session ID, Rule, DESTIP, SRCIPDESTIP</td>
<td>250K</td>
</tr>
<tr>
<td>CookieInsert, URL passive, Custom Server ID</td>
<td>Memory limit. In case of CookieInsert, if time out is not 0, any number of connections is allowed until limited by memory.</td>
</tr>
</tbody>
</table>

Table 1. Limitations on Number of Simultaneous Persistent Connections

If the configured persistence cannot be maintained because of a lack of resources on an appliance, the load balancing methods are used for server selection. Persistence is maintained for a configured period of time, depending on the persistence type. Some persistence types are specific to certain virtual servers. The following table shows the relationship.

<table>
<thead>
<tr>
<th>Persistence Type</th>
<th>HTTP</th>
<th>HTTPS</th>
<th>TCP</th>
<th>UDP/IP</th>
<th>SSL_Bridge</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>HTTP</td>
<td>HTTPS</td>
<td>TCP</td>
<td>UDP/IP</td>
<td>SSL_Bridge</td>
</tr>
<tr>
<td>Source IP</td>
<td>YES</td>
<td>YES</td>
<td>YES</td>
<td>YES</td>

<td>YES</td>
<td>N/A</td>
</tr>
<tr>
<td>DESTIP</td>
<td>N/A</td>
<td>N/A</td>
<td>YES</td>
<td>YES</td>
<td>N/A</td>
</tr>
</tbody>
</table>

Table 2. Persistence Types Available for Each Type of Virtual Server

You can also specify persistence for a group of virtual servers. When you enable persistence on the group, the client requests are directed to the same selected server regardless of which virtual server
in the group receives the client request. When the configured time for persistence elapses, any virtual
server in the group can be selected for incoming client requests.

Two commonly used persistence types are persistence based on cookies and persistence based on
server IDs in URLs.

**Configure persistence based on cookies**

When you enable persistence based on cookies, the NetScaler appliance adds an HTTP cookie into the Set-Cookie header field of the HTTP response. The cookie contains information about the service to which the HTTP requests must be sent. The client stores the cookie and includes it in all subsequent requests, and the ADC uses it to select the service for those requests. You can use this type of persistence on virtual servers of type HTTP or HTTPS.

The NetScaler appliance inserts the cookie `<NSC_XXXX>=<ServiceIP><ServicePort>`

where:

- `<NSC_XXXX>` is the virtual server ID that is derived from the virtual server name.
- `<ServiceIP>` is the hexadecimal value of the IP address of the service.
- `<ServicePort>` is the hexadecimal value of the port of the service.

The ADC encrypts ServiceIP and ServicePort when it inserts a cookie, and decrypts them when it receives a cookie.

**Note:** If the client is not allowed to store the HTTP cookie, the subsequent requests do not have the HTTP cookie, and persistence is not honored.

By default, the ADC appliance sends HTTP cookie version 0, in compliance with the Netscape specification. It can also send version 1, in compliance with RFC 2109.

You can configure a timeout value for persistence that is based on HTTP cookies. Note the following:

- If HTTP cookie version 0 is used, the NetScaler appliance inserts the absolute Coordinated Universal Time (GMT) of the cookie’s expiration (the expires attribute of the HTTP cookie), calculated as the sum of the current GMT time on an ADC appliance, and the timeout value.
- If an HTTP cookie version 1 is used, the ADC appliance inserts a relative expiration time (Max-Age attribute of the HTTP cookie). In this case, the client software calculates the actual expiration time.

**Note:** Most client software currently installed (Microsoft Internet Explorer and Netscape browsers) understand HTTP cookie version 0; however, some HTTP proxies understand HTTP cookie version 1.

If you set the timeout value to 0, the ADC appliance does not specify the expiration time, regardless of the HTTP cookie version used. The expiration time then depends on the client software, and such cookies are not valid if that software is shut down. This persistence type does not consume any system resources. Therefore, it can accommodate an unlimited number of persistent clients.
An administrator can change the HTTP cookie version.

**To change the HTTP cookie version by using the CLI**

At the command prompt, type;

```
set ns param [-cookieversion ( 0 | 1 )]
```

Example:

```
set ns param -cookieversion 1
```

**To change the HTTP cookie version by using the GUI**

1. Navigate to System > Settings.
2. In the details pane, click Change HTTP Parameters.
3. In the Configure HTTP Parameters dialog box, under Cookie, select Version 0 or Version 1.

Note: For information about the parameters, see *Configuring Persistence Based on Cookies*.

**To configure persistence based on cookies by using the CLI**

At the command prompt, type the following commands to configure persistence based on cookies and verify the configuration:

```
set lb vserver <name> -persistenceType COOKIEINSERT
```

```
show lb vserver <name>
```

Example:

```
set lb vserver vserver-LB-1 -persistenceType COOKIEINSERT
Done
show lb vserver vserver-LB-1
  vserver-LB-1 (10.102.29.60:80) - HTTP  Type: ADDRESS
  
Persistence: COOKIEINSERT (version 0)
  Persistence Timeout: 2 min
```
To configure persistence based on cookies by using the GUI

2. In the details pane, select the virtual server for which you want to configure persistence (for example, vserver-LB-1), and then click Open.
3. In the Configure Virtual Server (Load Balancing) dialog box, on the Method and Persistence tab, in the Persistence list, select COOKIEINSERT.
4. In the Time-out (min) text box, type the time-out value (for example, 2).
5. Click OK.
6. Verify that the virtual server for which you configured persistence is correctly configured by selecting the virtual server and viewing the Details section at the bottom of the pane.

Configure persistence based on server IDs in URLs

The NetScaler appliance can maintain persistence based on the server IDs in the URLs. In a technique called URL passive persistence, the ADC extracts the server ID from the server response and embeds it in the URL query of the client request. The server ID is an IP address and port specified as a hexadecimal number. The ADC extracts the server ID from subsequent client requests and uses it to select the server.

URL passive persistence requires configuring either a payload expression or a policy infrastructure expression specifying the location of the server ID in the client requests. For more information about expressions, see “Policy Configuration and Reference.”

Note: If the server ID cannot be extracted from the client requests, server selection is based on the load balancing method.

Example: Payload Expression

The expression, URLQUERY contains sid= configures the system to extract the server ID from the URL query of a client request, after matching token sid=. Thus, a request with the URL http://www.citrix.com/index.asp?\&sid;=c0a864100050 is directed to the server with the IP address 10.102.29.10 and port 80.

The timeout value does not affect this type of persistence, which is maintained as long as the server ID can be extracted from the client requests. This persistence type does not consume any system resources, so it can accommodate an unlimited number of persistent clients.
To configure persistence based on server IDs in URLs by using the CLI

At the command prompt, type the following commands to configure persistence based on server IDs in URLs and verify the configuration:

```
1  set lb vserver <name> -persistenceType URLPASSIVE
2  
3  show lb vserver <name>
```

Example:

```
1  set lb vserver vserver-LB-1 -persistenceType URLPASSIVE
2  Done
3  show lb vserver vserver-LB-1
4          vserver-LB-1 (10.102.29.60:80) - HTTP  Type: ADDRESS
5          .
6          .
7          .
8          Persistence: URLPASSIVE
9          Persistence Timeout: 2 min
10         .
11         .
12         .
13  Done
```

To configure persistence based on server IDs in URLs by using the GUI

2. In the details pane, select the virtual server for which you want to configure persistence (for example, vserver-LB-1), and then click Open.
3. In the Configure Virtual Server (Load Balancing) dialog box, on the Method and Persistence tab, in the Persistence list, select URLPASSIVE.
4. In the Time-out (min) text box, type the time-out value (for example, 2).
5. In the Rule text box, enter a valid expression. Alternatively, click Configure next to the Rule text box and use the Create Expression dialog box to create an expression.
6. Click OK.
7. Verify that the virtual server for which you configured persistence is correctly configured by selecting the virtual server and viewing the Details section at the bottom of the pane.
Configure features to protect the load balancing configuration

December 18, 2018

You can configure URL redirection to provide notifications of virtual server malfunctions, and you can configure backup virtual servers to take over if a primary virtual server becomes unavailable.

Configure URL redirection

You can configure a redirect URL to communicate the status of the appliance in the event that a virtual server of type HTTP or HTTPS is down or disabled. This URL can be a local or remote link. The appliance uses HTTP 302 redirect.

Redirects can be absolute URLs or relative URLs. If the configured redirect URL contains an absolute URL, the HTTP redirect is sent to the configured location, regardless of the URL specified in the incoming HTTP request. If the configured redirect URL contains only the domain name (relative URL), the HTTP redirect is sent to a location after appending the incoming URL to the domain configured in the redirect URL.

Note: If a load balancing virtual server is configured with both a backup virtual server and a redirect URL, the backup virtual server takes precedence over the redirect URL. In this case, a redirect is used when both the primary and backup virtual servers are down.

To configure a virtual server to redirect client requests to a URL by using the CLI

At the command prompt, type the following commands to configure a virtual server to redirect client requests to a URL and verify the configuration:

- `<set lb vserver <name> -redirectURL <URL>`
- `<show lb vserver <name>`

**Example**

```
    set lb vserver vserver-LB-1 -redirectURL http://www.newdomain.com/mysite/maintenance
    Done
    show lb vserver vserver-LB-1
    vserver-LB-1 (10.102.29.60:80) - HTTP Type: ADDRESS
    State: DOWN
    Last state change was at Wed Jun 17 08:56:34 2009 (+666 ms)

    ```
To configure a virtual server to redirect client requests to a URL by using the GUI

2. In the details pane, select the virtual server for which you want to configure URL redirection (for example, vserver-LB-1), and then click Open.
3. In the Configure Virtual Server (Load Balancing) dialog box, on the Advanced tab, in the Redirect URL text box, type the URL (for example, http://www.newdomain.com/mysite/maintenance), and then click OK.
4. Verify that the redirect URL you configured for the server appears in the Details section at the bottom of the pane.

Configure backup virtual servers

If the primary virtual server is down or disabled, the appliance can direct the connections or client requests to a backup virtual server that forwards the client traffic to the services. The appliance can also send a notification message to the client regarding the site outage or maintenance. The backup virtual server is a proxy and is transparent to the client.

You can configure a backup virtual server when you create a virtual server or when you change the optional parameters of an existing virtual server. You can also configure a backup virtual server for an existing backup virtual server, thus creating a cascaded backup virtual server. The maximum depth of cascading backup virtual servers is 10. The appliance searches for a backup virtual server that is up and accesses that virtual server to deliver the content.

You can configure URL redirection on the primary for use when the primary and the backup virtual servers are down or have reached their thresholds for handling requests.

Note: If no backup virtual server exists, an error message appears, unless the virtual server is configured with a redirect URL. If both a backup virtual server and a redirect URL are configured, the backup virtual server takes precedence.
To configure a backup virtual server by using the CLI

At the command prompt, type the following commands to configure a backup server and verify the configuration:

- `<set lb vserver <name> [-backupVserver <string>]`
- `<show lb vserver <name>`

**Example**

```
"" pre codeblock
set lb vserver vserver-LB-1 -backupVserver vserver-LB-2
Done
show lb vserver vserver-LB-1
vserver-LB-1 (10.102.29.60:80) - HTTP Type: ADDRESS
State: DOWN
Last state change was at Wed Jun 17 08:56:34 2009 (+661 ms)
.
.
.
Backup: vserver-LB-2
.
.
.
Done
""
```

To set up a backup virtual server by using the GUI

2. `<In the details pane, select the virtual server for which you want to configure the backup virtual server (for example, vserver-LB-1), and then click Open.`
3. `<In the Configure Virtual Server (Load Balancing) dialog box, on the Advanced tab, in the Backup Virtual Server list, select the backup virtual server (for example, vserver-LB-2, and then click OK.>`
4. `<Verify that the backup virtual server you configured appears in the Details section at the bottom of the pane.>`

Note: If the primary server goes down and then comes back up, and you want the backup virtual server to function as the primary server until you explicitly reestablish the primary virtual server, select the

Disable Primary When Down check box.
A typical load balancing scenario

January 6, 2019

In a load balancing setup, the NetScaler appliances are logically located between the client and the server farm, and they manage traffic flow to the servers.

The following figure shows the topology of a basic load balancing configuration.

Figure 1. Basic Load Balancing Topology

The virtual server selects the service and assigns it to serve client requests. Consider the scenario in the preceding figure, where the services service-HTTP-1 and service-HTTP-2 are created and bound to the virtual server named virtual server-LB-1. Virtual server-LB-1 forwards the client request to either service-HTTP-1 or service-HTTP-2. The system selects the service for each request by using the Least Connections load balancing method. The following table lists the names and values of the basic entities that must be configured on the system.

Table 1. LB Configuration Parameter Values

The following figure shows the load balancing sample values and required parameters that are described in the preceding table.

Figure 2. Load Balancing Entity Model

The following tables list the commands used to configure this load balancing setup by using the command line interface.

<table>
<thead>
<tr>
<th>Task</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>To enable load balancing</td>
<td>enable feature lb</td>
</tr>
<tr>
<td>To create a service named service-HTTP-1</td>
<td>add service-service-HTTP-1 10.102.29.5 HTTP 80</td>
</tr>
<tr>
<td>To create a service named service-HTTP-2</td>
<td>add service-service-HTTP-2 10.102.29.6 HTTP 80</td>
</tr>
<tr>
<td>To create a virtual server named vserver-LB-1</td>
<td>add lb vserver vserver-LB-1 HTTP 10.102.29.60 80</td>
</tr>
<tr>
<td>To bind a service named service-HTTP-1 to a virtual server named vserver-LB-1</td>
<td>bind lb vserver vserver-LB-1 service-HTTP-1</td>
</tr>
<tr>
<td>To bind a service named service-HTTP-2 to a virtual server named vserver-LB-1</td>
<td>bind lb vserver vserver-LB-1 service-HTTP-2</td>
</tr>
</tbody>
</table>

</tr>
</tbody>
</table>

Table 4. Customization Tasks

For more information about configuring persistence, see Choosing and Configuring Persistence Settings. For information about configuring a virtual server to redirect a client request to a URL and setting up a backup virtual server, see Configuring Features to Protect the Load Balancing Configuration.
Accelerate load balanced traffic by using compression

January 6, 2019

Compression is a popular means of optimizing bandwidth usage, and most web browsers support compressed data. If you enable the compression feature, the NetScaler appliance intercepts requests from clients and determines whether the client can accept compressed content. After receiving the HTTP response from the server, the appliance examines the content to determine whether it is compressible. If the content is compressible, the appliance compresses it, modifies the response header to indicate the type of compression performed, and forwards the compressed content to the client.

NetScaler compression is a policy-based feature. A policy filters requests and responses to identify responses to be compressed, and specifies the type of compression to apply to each response. The appliance provides several built-in policies to compress common MIME types such as text/html, text/plain, text/xml, text/css, text/rtf, application/msword, application/vnd.ms-excel, and application/vnd.ms-powerpoint. You can also create custom policies. The appliance does not compress compressed MIME types such as application/octet-stream, binary, bytes, and compressed image formats such as GIF and JPEG.

To configure compression, you must enable it globally and on each service that will provide responses that you want compressed. If you have configured virtual servers for load balancing or content switching, you should bind the policies to the virtual servers. Otherwise, the policies apply to all traffic that passes through the appliance.

Compression configuration task sequence

The following flow chart shows the sequence of tasks for configuring basic compression in a load balancing setup.

Figure 1. Sequence of Tasks to Configure Compression

Note: The steps in the above figure assume that load balancing has already been configured.

Enable compression

By default, compression is not enabled. You must enable the compression feature to allow compression of HTTP responses that are sent to the client.
To enable compression by using the CLI

At the command prompt, type the following commands to enable compression and verify the configuration:

- `enable ns feature CMP`
- `show ns feature`

```
> enable ns feature CMP

Done

> show ns feature

<table>
<thead>
<tr>

```

© 1999-2018 Citrix Systems, Inc. All rights reserved.
To enable compression by using the GUI

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Modes and Features, click Change basic features.
3. In the Configure Basic Features dialog box, select the Compression check box, and then click OK.
4. In the Enable/Disable Feature(s)? dialog box, click Yes.

Configure services to compress data

In addition to enabling compression globally, you must enable it on each service that will deliver files to be compressed.

To enable compression on a service by using the CLI

At the command prompt, type the following commands to enable compression on a service and verify the configuration:

- set service <name> -CMP YES
- show service <name>

```
> show service SVC_HTTP1

SVC_HTTP1 (10.102.29.18:80) - HTTP

State: UP

Last state change was at Tue Jun 16 06:19:14 2009 (+737 ms)
Time since last state change: 0 days, 03:03:37.200
Server Name: 10.102.29.18
Server ID : 0    Monitor Threshold : 0
```
Max Conn: 0  Max Req: 0  Max Bandwidth: 0 kbits

Use Source IP: NO

Client Keepalive(CKA): NO

Access Down Service: NO

TCP Buffering(TCPB): NO

HTTP Compression(CMP): YES

Client IP: DISABLED

Cacheable: NO

SC: OFF

SP: OFF

Down state flush: ENABLED

1)  Monitor Name: tcp-default

State: DOWN  Weight: 1
To enable compression on a service by using the GUI

1. Navigate to Traffic Management > Load Balancing > Services.
2. In the details pane, select the service for which you want to configure compression (for example, service-HTTP-1), and then click Open.
3. On the Advanced tab, under Settings, select the Compression check box, and then click OK.
4. Verify that, when the service is selected, HTTP Compression(CMP): ON appears in the Details section at the bottom of the pane.

Bind a compression policy to a virtual server

If you bind a policy to a virtual server, the policy is evaluated only by the services associated with that virtual server. You can bind compression policies to a virtual server either from the Configure Virtual Server (Load Balancing) dialog box or from the Compression Policy Manager dialog box. This topic includes instructions to bind compression policies to a load balancing virtual server by using the Configure Virtual Server (Load Balancing) dialog box. For information about how you can bind a compression policy to a load balancing virtual server by using the Compression Policy Manager dialog box, see Configuring and Binding Policies with the Policy Manager.

To bind or unbind a compression policy to a virtual server by using the command line

At the command prompt, type the following commands to bind or unbind a compression policy to a load balancing virtual server and verify the configuration:

```
(bind unbind) lb vserver <name> -policyName <string>
```
NetScaler 11.1

- show lb vserver <name>

**Example:**

```bash
1 bind lb vserver lbvip -policyName ns_cmp_msapp
2  Done
3  > show lb vserver lbvip
4  lbvip (8.7.6.6:80) - HTTP Type: ADDRESS
5  State: UP
6  Last state change was at Thu May 28 05:37:21 2009 (+685 ms)

27
28 1) Policy : ns_cmp_msapp Priority:0
29  Done
```

**To bind or unbind a compression policy to a load balancing virtual server by using the GUI**

2. In the details pane, select the virtual server to which you want to bind or unbind a compression policy (for example, Vserver-LB-1), and then click Open.
3. In the Configure Virtual Server (Load Balancing) dialog box, on the Policies tab, click Compression.
4. Do one of the following:
   • To bind a compression policy, click Insert Policy, and then select the policy you want to bind to the virtual server.
   • To unbind a compression policy, click the name of the policy you want to unbind from the virtual server, and then click Unbind Policy.

5. Click OK.

**Secure load balanced traffic by using SSL**

January 6, 2019

The NetScaler SSL offload feature transparently improves the performance of web sites that conduct SSL transactions. By offloading CPU-intensive SSL encryption and decryption tasks from the local web server to the appliance, SSL offloading ensures secure delivery of web applications without the performance penalty incurred when the server processes the SSL data. Once the SSL traffic is decrypted, it can be processed by all standard services. The SSL protocol works seamlessly with various types of HTTP and TCP data and provides a secure channel for transactions using such data.

To configure SSL, you must first enable it. Then, you configure HTTP or TCP services and an SSL virtual server on the appliance, and bind the services to the virtual server. You must also add a certificate-key pair and bind it to the SSL virtual server. If you use Outlook Web Access servers, you must create an action to enable SSL support and a policy to apply the action. An SSL virtual server intercepts incoming encrypted traffic and decrypts it by using a negotiated algorithm. The SSL virtual server then forwards the decrypted data to the other entities on the appliance for appropriate processing.

For detailed information about SSL offloading, see [SSL offload and acceleration](#).

**SSL configuration task sequence**

To configure SSL, you must first enable it. Then, you must create an SSL virtual server and HTTP or TCP services on the NetScaler appliance. Finally, you must bind a valid SSL certificate and the configured services to the SSL virtual server.

An SSL virtual server intercepts incoming encrypted traffic and decrypts it using a negotiated algorithm. The SSL virtual server then forwards the decrypted data to the other entities on the appliance for appropriate processing.

The following flow chart shows the sequence of tasks for configuring a basic SSL offload setup.

Figure 1. Sequence of Tasks to Configure SSL Offloading
Enable SSL offload

You should enable the SSL feature before configuring SSL offload. You can configure SSL-based entities on the appliance without enabling the SSL feature, but they will not work until you enable SSL.

Enable SSL by using the CLI

At the command prompt, type the following commands to enable SSL Offload and verify the configuration:

- `enable ns feature SSL`
- `show ns feature`

```
> enable ns feature ssl

Done

> show ns feature

Feature Acronym Status
-------- ------- -----
1) Web Logging WL ON
2) Surge Protection SP OFF
3) Load Balancing LB ON ...
9) SSL Offloading SSL ON
10) Global Server Load Balancing GSLB ON ..
```
Enable SSL by using the GUI

Follow these steps:

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Modes and Features, click Change basic features.
3. Select the SSL Offloading check box, and then click OK.
4. In the Enable/Disable Feature(s)? message box, click Yes.

Create HTTP services

A service on the appliance represents an application on a server. Once configured, services are in the disabled state until the appliance can reach the server on the network and monitor its status. This topic covers the steps to create an HTTP service.

Note: For TCP traffic, perform the procedures in this and the following topics, but create TCP services instead of HTTP services.

Add an HTTP service by using the CLI

At the command prompt, type the following commands to add a HTTP service and verify the configuration:

```
add service <name> (<IP> <serverName>) <serviceType> <port>
```

  •
  • show service <name>

Example:

```
1 > add service SVC_HTTP1 10.102.29.18 HTTP 80
2
3
4   Done
5
6
7 > show service SVC_HTTP1
8
```
SVC_HTTP1 (10.102.29.18:80) - HTTP

State: UP

Last state change was at Wed Jul 15 06:13:05 2009

Time since last state change: 0 days, 00:00:15.350

Server Name: 10.102.29.18

Server ID : 0  Monitor Threshold : 0

Max Conn: 0  Max Req: 0  Max Bandwidth: 0 kbits

Use Source IP: NO

Client Keepalive(CKA): NO

Access Down Service: NO

TCP Buffering(TCPB): NO

HTTP Compression(CMP): YES

Idle timeout: Client: 180 sec  Server: 360 sec

Client IP: DISABLED

Cacheable: NO
Add an HTTP service by using the GUI

Follow these steps:

1. Navigate to Traffic Management > SSL Offload > Services.
2. In details pane, click Add.
3. In the Create Service dialog box, in the Service Name, Server, and Port text boxes, type the name of the service, IP address, and port (for example, SVC_HTTP1, 10.102.29.18, and 80).
4. In the Protocol list, select the type of the service (for example, HTTP).
5. Click Create, and then click Close. The HTTP service you configured appears in the Services page.
6. Verify that the parameters you configured are correctly configured by selecting the service and viewing the Details section at the bottom of the pane.
Add an SSL based virtual server

In a basic SSL offloading setup, the SSL virtual server intercepts encrypted traffic, decrypts it, and sends the clear text messages to the services that are bound to the virtual server. Offloading CPU-intensive SSL processing to the appliance allows the back-end servers to process a greater number of requests.

Add an SSL-based virtual server by using the CLI

At the command prompt, type the following commands to create an SSL-based virtual server and verify the configuration:

- `add lb vserver <name> <serviceType> [IPAddress <port>]`
- `show lb vserver <name>`

Caution: To ensure secure connections, you must bind a valid SSL certificate to the SSL-based virtual server before you enable it.

Example:

```
> add lb vserver vserver-SSL-1 SSL 10.102.29.50 443

Done

> show lb vserver vserver-SSL-1

vserver-SSL-1 (10.102.29.50:443) - SSL Type: ADDRESS

State: DOWN[Certkey not bound] Last state change was at Tue Jun 16 06:33:08 2009 (+176 ms)

Time since last state change: 0 days, 00:03:44.120

Effective State: DOWN Client Idle Timeout: 180 sec

Down state flush: ENABLED
```
Add an SSL-based virtual server by using the GUI

Follow these steps:

1. Navigate to Traffic Management > SSL Offload > Virtual Servers.
2. In the details pane, click Add.
3. In the Create Virtual Server (SSL Offload) dialog box, in the Name, IP Address, and Port text boxes, type the name of the virtual server, IP address, and port (for example, Vserver-SSL-1, 10.102.29.50, and 443).
4. In the Protocol list, select the type of the virtual server, for example, SSL.
5. Click Create, and then click Close.
6. Verify that the parameters you configured are correctly configured by selecting the virtual server and viewing the Details section at the bottom of the pane. The virtual server is marked as DOWN because a certificate-key pair and services have not been bound to it.

Caution: To ensure secure connections, you must bind a valid SSL certificate to the SSL-based virtual server before you enable it.

Bind services to the SSL virtual server

After decrypting the incoming data, the SSL virtual server forwards the data to the services that you have bound to the virtual server.
Data transfer between the appliance and the servers can be encrypted or in clear text. If the data transfer between the appliance and the servers is encrypted, the entire transaction is secure from end to end. For more information about configuring the system for end-to-end security, see [SSL offload and acceleration].

**Bind a service to a virtual server by using the CLI**

At the command prompt, type the following commands to bind service to the SSL virtual server and verify the configuration:

- `bind lb vserver <name> <serviceName>`
- `show lb vserver <name>`

**Example:**

```plaintext
> bind lb vserver vserver-SSL-1 SVC_HTTP1

Done

> show lb vserver vserver-SSL-1 vserver-SSL-1 (10.102.29.50:443) -

SSL Type:

ADDRESS State: DOWN[Certkey not bound]

Last state change was at Tue Jun 16 06:33:08 2009 (+174 ms)

Time since last state change: 0 days, 00:31:53.70

Effective State: DOWN Client Idle

Timeout: 180 sec

Down state flush: ENABLED Disable Primary Vserver On Down :
```
**Bind a service to a virtual server by using the GUI**

1. Navigate to Traffic Management > SSL Offload > Virtual Servers.
2. In the details pane, select a virtual server, and then click Open.
3. On the Services tab, in the Active column, select the check boxes next to the services that you want to bind to the selected virtual server.
4. Click OK.
5. Verify that the Number of Bound Services counter in the Details section at the bottom of the pane is incremented by the number of services that you bound to the virtual server.

**Add a certificate key pair**

An SSL certificate is an integral element of the SSL Key-Exchange and encryption/decryption process. The certificate is used during SSL handshake to establish the identity of the SSL server. You can use a valid, existing SSL certificate that you have on the NetScaler appliance, or you can create your own SSL certificate. The appliance supports RSA/DSA certificates of up to 4096 bits.
Note: Citrix recommends that you use a valid SSL certificate that has been issued by a trusted certificate authority. Invalid certificates and self-created certificates are not compatible with all SSL clients.

Before a certificate can be used for SSL processing, you must pair it with its corresponding key. The certificate key pair is then bound to the virtual server and used for SSL processing.

**Add a certificate key pair by using the CLI**

At the command prompt, type the following commands to create a certificate key pair and verify the configuration:

- `add ssl certKey <certkeyName> -cert <string> [-key <string>]`
- `show sslcertkey <name>`

**Example:**

```
> add ssl certKey CertKey-SSL-1 -cert ns-root.cert -key ns-root.key
Done

> show sslcertkey CertKey-SSL-1

Name: CertKey-SSL-1 Status: Valid,

Days to expiration: 4811 Version: 3

Serial Number: 00 Signature Algorithm: md5WithRSAEncryption Issuer:
C=US,ST=California,L=San Jose,O=Citrix ANG,OU=NS Internal,CN=default

```
Add a certificate key pair by using the GUI

Follow these steps:

1. Navigate to Traffic Management > SSL > Certificates.
2. In the details pane, click Add.
3. In the Install Certificate dialog box, in the Certificate-Key Pair Name text box, type a name for the certificate key pair you want to add, for example, Certkey-SSL-1.
4. Under Details, in Certificate File Name, click Browse (Appliance) to locate the certificate. Both the certificate and the key are stored in the /nsconfig/ssl/ folder on the appliance. To use a certificate present on the local system, select Local.
5. Select the certificate you want to use, and then click Select.
6. In Private Key File Name, click Browse (Appliance) to locate the private key file. To use a private key present on the local system, select Local.
7. Select the key you want to use and click Select. To encrypt the key used in the certificate key pair, type the password to be used for encryption in the Password text box.
8. Click Install.
9. Double-click the certificate key pair and, in the Certificate Details window, verify that the parameters have been configured correctly and saved.

Bind an SSL certificate key pair to the virtual server

After you have paired an SSL certificate with its corresponding key, you must bind the certificate key pair to the SSL virtual server so that it can be used for SSL processing. Secure sessions require establishing a connection between the client computer and an SSL-based virtual server on the appliance. SSL processing is then carried out on the incoming traffic at the virtual server. Therefore, before enabling the SSL virtual server on the appliance, you need to bind a valid SSL certificate to the SSL virtual server.
Bind an SSL certificate key pair to a virtual server by using the CLI

At the command prompt, type the following commands to bind an SSL certificate key pair to a virtual server and verify the configuration:

- `bind ssl vserver <vServerName> -certkeyName <string>`
- `show ssl vserver <name>`

**Example:**

```
> bind ssl vserver Vserver-SSL-1 -certkeyName CertKey-SSL-1

Done

> show ssl vserver Vserver-SSL-1

Advanced SSL configuration for VServer Vserver-SSL-1:

- **DH:** DISABLED
- **Ephemeral RSA:** ENABLED Refresh Count: 0
- **Session Reuse:** ENABLED Timeout: 120 seconds
- **Cipher Redirect:** ENABLED
- **SSLv2 Redirect:** ENABLED
- **ClearText Port:** 0
- **Client Auth:** DISABLED
```
### Bind an SSL certificate key pair to a virtual server by using the GUI

Follow these steps:

1. Navigate to Traffic Management > SSL Offload > Virtual Servers.
2. Select the virtual server to which you want to bind the certificate key pair, for example, Vserver-SSL-1, and click Open.
3. In the Configure Virtual Server (SSL Offload) dialog box, on the SSL Settings tab, under Available, select the certificate key pair that you want to bind to the virtual server (for example, Certkey-SSL-1), and then click Add.
4. Click OK.
5. Verify that the certificate key pair that you selected appears in the Configured area.

### Configure support for Outlook web access

If you use Outlook Web Access (OWA) servers on your NetScaler appliance, you must configure the appliance to insert a special header field, FRONT-END-HTTPS: ON, in HTTP requests directed to the
OWA servers, so that the servers generate URL links as https:// instead of http://.

Note: You can enable OWA support for HTTP-based SSL virtual servers and services only. You cannot apply it for TCP-based SSL virtual servers and services.

To configure OWA support, do the following:

- Create an SSL action to enable OWA support.
- Create an SSL policy.
- Bind the policy to the SSL virtual server.

**Create an SSL action to enable OWA support**

Before you can enable Outlook Web Access (OWA) support, you must create an SSL action. SSL actions are bound to SSL policies and triggered when incoming data matches the rule specified by the policy.

**Create an SSL action to enable OWA support by using the CLI**

At the command prompt, type the following commands to create an SSL action to enable OWA support and verify the configuration:

- add ssl action <name> -OWASupport ENABLED
- show SSL action <name>

**Example:**

```plaintext
> add ssl action Action-SSL-OWA -OWASupport enabled

Done

> show SSL action Action-SSL-OWA

Name: Action-SSL-OWA

Data Insertion Action: OWA

Support: ENABLED
```
Create an SSL action to enable OWA support by using the GUI

Follow these steps:

1. Navigate to Traffic Management > SSL > Policies.
2. In the details pane, on the Actions tab, click Add.
3. In the Create SSL Action dialog box, in the Name text box, type Action-SSL-OWA.
5. Click Create, and then click Close.
6. Verify that Action-SSL-OWA appears in the SSL Actions page.

Create SSL policies

SSL policies are created by using the policy infrastructure. Each SSL policy has an SSL action bound to it, and the action is carried out when incoming traffic matches the rule that has been configured in the policy.

Create an SSL policy by using the CLI

At the command prompt, type the following commands to configure an SSL policy and verify the configuration:

- add ssl policy <name> -rule <expression> -reqAction <string>
- show ssl policy <name>

Example:

```
> add ssl policy Policy-SSL-1 -rule ns_true -reqaction Action-SSL-OWA
Done

> show ssl policy Policy-SSL-1
Name: Policy-SSL-1 Rule: ns_true
Action: Action-SSL-OWA Hits: 0
Policy is bound to following entities
```
Create an SSL policy by using the GUI

Follow these steps:

1. Navigate to Traffic Management > SSL > Policies.
2. In the details pane, click Add.
3. In the Create SSL Policy dialog box, in the Name text box, type the name of the SSL Policy (for example, Policy-SSL-1).
4. In Request Action, select the configured SSL action that you want to associate with this policy (for example, Action-SSL-OWA). The ns_true general expression applies the policy to all successful SSL handshake traffic. However, if you need to filter specific responses, you can create policies with a higher level of detail. For more information about configuring granular policy expressions, see [SSL actions and policies](/en-us/netscaler/11-1/ssl/ssl-actions-and-policies.html).
5. In Named Expressions, choose the built-in general expression ns_true and click Add Expression. The expression ns_true now appears in the Expression text box.
6. Click Create, and then click Close.
7. Verify that the policy is correctly configured by selecting the policy and viewing the Details section at the bottom of the pane.

Bind the SSL policy to the SSL virtual server

After you configure an SSL policy for Outlook Web Access, bind the policy to a virtual server that will intercept incoming Outlook traffic. If the incoming data matches any of the rules configured in the SSL policy, the policy is triggered and the action associated with it is carried out.

Bind an SSL policy to an SSL virtual server by using the CLI

At the command prompt, type the following commands to bind an SSL policy to an SSL virtual server and verify the configuration:

```
bind ssl vserver <vServerName> -policyName <string>
show ssl vserver <name>
```

Example:

```
1  > bind ssl vserver Vserver-SSL-1 -policyName Policy-SSL-1
2  
```
Done

> show ssl vserver Vserver-SSL-1

Advanced SSL configuration for VServer Vserver-SSL-1:

- DH: DISABLED
- Ephemeral RSA: ENABLED
- Refresh Count: 0
- Session Reuse: ENABLED
- Timeout: 120 seconds
- Cipher Redirect: ENABLED
- SSLv2 Redirect: ENABLED
- ClearText Port: 0
- Client Auth: DISABLED
- SSL Redirect: DISABLED
- Non FIPS Ciphers: DISABLED
- SSLv2: DISABLED SSLv3: ENABLED TLSv1: ENABLED

1) CertKey Name: CertKey-SSL-1 Server Certificate
1) Policy Name: Policy-SSL-1 Priority: 0
1) Cipher Name: DEFAULT Description: Predefined Cipher Alias

Done

Bind an SSL policy to an SSL virtual server by using the GUI

Follow these steps:

1. Navigate to Traffic Management > SSL Offload > Virtual Servers.
2. In the details pane, select the virtual server (for example, Vserver-SSL-1), and then click Open.
3. In the Configure Virtual Server (SSL Offload) dialog box, click Insert Policy, and then select the policy that you want to bind to the SSL virtual server. Optionally, you can double-click the Priority field and type a new priority level.
4. Click OK.

Features at a glance

December 18, 2018

NetScaler features can be configured independently or in combinations to address specific needs. Although some features fit more than one category, the numerous NetScaler features can generally be categorized as application switching and traffic management features, application acceleration features, and application security and firewall features, and an application visibility feature.

To understand the order in which the features perform their processing, see Processing Order of Features section.

Application switching and traffic management features

December 18, 2018

Below are the application switching and traffic management features.

SSL Offloading

Transparently offloads SSL encryption and decryption from web servers, freeing server resources to service content requests. SSL places a heavy burden on an application’s performance and can render many optimization measures ineffective. SSL offload and acceleration allow all the benefits of Citrix Request Switching technology to be applied to SSL traffic, ensuring secure delivery of web applications without degrading end-user performance.

For more information, see SSL offload and acceleration.

Access Control Lists

Compares incoming packets to Access Control Lists (ACLs). If a packet matches an ACL rule, the action specified in the rule is applied to the packet. Otherwise, the default action (ALLOW) is applied and the packet is processed normally. For the appliance to compare incoming packets to the ACLs, you
have to apply the ACLs. All ACLs are enabled by default, but you have to apply them in order for the
NetScaler appliance to compare incoming packets against them. If an ACL is not required to be a part
of the lookup table, but still needs to be retained in the configuration, it should be disabled before the
ACLs are applied. An ADC appliance does not compare incoming packets to disabled ACLs.

For more information, see Access Control List.

Load Balancing

Load balancing decisions are based on a variety of algorithms, including round robin, least connec-
tions, weighted least bandwidth, weighted least packets, minimum response time, and hashing based
on URL, domain source IP, or destination IP. Both the TCP and UDP protocols are supported, so the
NetScaler appliance can load balance all traffic that uses those protocols as the underlying carrier (for
example, HTTP, HTTPS, UDP, DNS, NNTP, and general firewall traffic). In addition, the ADC appliance
can maintain session persistence based on source IP, cookie, server, group, or SSL session. It allows
users to apply custom Extended Content Verification (ECV) to servers, caches, firewalls and other in-
frastructure devices to ensure that these systems are functioning properly and are providing the right
content to users. It can also perform health checks using ping, TCP, or HTTP URL, and the user can
create monitors based on Perl scripts.

To provide high-scale WAN optimization, the CloudBridge appliances deployed at data centers can be
load balanced through NetScaler appliances. The bandwidth and number of concurrent sessions can
be improved significantly.

For more information, see Load Balancing.

Traffic Domains

Traffic domains provide a way to create logical ADC partitions within a single NetScaler appliance.
They enable you to segment network traffic for different applications. You can use traffic domains
to create multiple isolated environments whose resources do not interact with each other. An appli-
cation belonging to a specific traffic domain communicates only with entities, and processes traffic,
within that domain. Traffic belonging to one traffic domain cannot cross the boundary of another traf-
fic domain. Therefore, you can use duplicate IP addresses on the appliance as long as an addresses is
not duplicated within the same domain.

For more information, see Traffic Domains.

Network Address Translation

Network address translation (NAT) involves modification of the source and/or destination IP ad-
dresses, and/or the TCP/UDP port numbers, of IP packets that pass through the NetScaler appliance.
Enabling NAT on the appliance enhances the security of your private network, and protects it from a public network such as the Internet, by modifying your network's source IP addresses when data passes through the NetScaler appliance.

The NetScaler appliance supports the following types of network address translation:

**INAT:** In Inbound NAT (INAT), an IP address (usually public) configured on the NetScaler appliance listens to connection requests on behalf of a server. For a request packet received by the appliance on a public IP address, the ADC replaces the destination IP address with the private IP address of the server. In other words, the appliance acts as a proxy between clients and the server. INAT configuration involves INAT rules, which define a 1:1 relationship between the IP address on the NetScaler appliance and the IP address of the server.

**RNAT:** In Reverse Network Address Translation (RNAT), for a session initiated by a server, the NetScaler appliance replaces the source IP address in the packets generated by the server with an IP address configured on the appliance. The appliance thereby prevents exposure of the server's IP address in any of the packets generated by the server. An RNAT configuration involves an RNAT rule, which specifies a condition. The appliance performs RNAT processing on those packets that match the condition.

**Stateless NAT46 Translation:** Stateless NAT46 enables communication between IPv4 and IPv6 networks, by way of IPv4 to IPv6 packet translation and vice versa, without maintaining any session information on the NetScaler appliance. A stateless NAT46 configuration involves an IPv4-IPv6 INAT rule and an NAT46 IPv6 prefix.

**Stateful NAT64 Translation:** The stateful NAT64 feature enables communication between IPv4 clients and IPv6 servers through IPv6 to IPv4 packet translation, and vice versa, while maintaining session information on the NetScaler appliance. A stateful NAT64 configuration involves an NAT64 rule and an NAT64 IPv6 prefix.

For more information, see Configuring Network Address Translation.

**Multipath TCP Support**

NetScaler appliances support Multipath TCP (MPTCP). MPTCP is a TCP/IP protocol extension that identifies and uses multiple paths available between hosts to maintain the TCP session. You must enable MPTCP on a TCP profile and bind it to a virtual server. When MPTCP is enabled, the virtual server functions as an MPTCP gateway and converts MPTCP connections with the clients to TCP connections that it maintains with the servers.

For more information, see MPTCP (Multi-Path TCP).
Content Switching

Determines the server to which to send the request on the basis of configured content switching policies. Policy rules can be based on the IP address, URL, and HTTP headers. This allows switching decisions to be based on user and device characteristics such as who the user is, what type of agent is being used, and what content the user requested.

For more information, see Content Switching.

Global Server Load Balancing (GSLB)

Extends the traffic management capabilities of a NetScaler to include distributed Internet sites and global enterprises. Whether installations are spread across multiple network locations or multiple clusters in a single location, the NetScaler maintains availability and distributes traffic across them. It makes intelligent DNS decisions to prevent users from being sent to a site that is down or overloaded. When the proximity-based GSLB method is enabled, the NetScaler can make load balancing decisions based on the proximity of the client's local DNS server (LDNS) in relation to different sites. The main benefit of the proximity-based GSLB method is faster response time resulting from the selection of the closest available site.

For more information, see Global Server Load Balancing.

Dynamic Routing

Enables routers to obtain topology information, routes, and IP addresses from neighboring routers automatically. When dynamic routing is enabled, the corresponding routing process listens to route updates and advertises routes. The routing processes can also be placed in passive mode. Routing protocols enable an upstream router to load balance traffic to identical virtual servers hosted on two standalone NetScaler units using the Equal Cost Multipath technique.

For more information, see Configuring Dynamic Routes.

Link Load Balancing

Load balances multiple WAN links and provides link failover, further optimizing network performance and ensuring business continuity. Ensures that network connections remain highly available, by applying intelligent traffic control and health checks to distribute traffic efficiently across upstream routers. Identifies the best WAN link to route both incoming and outbound traffic based on policies and network conditions, and protects applications against WAN or Internet link failure by providing rapid fault detection and failover.
TCP Optimization

You can use TCP profiles to optimize TCP traffic. TCP profiles define the way that NetScaler virtual servers process TCP traffic. Administrators can use the built-in TCP profiles or configure custom profiles. After defining a TCP profile, you can bind it to a single virtual server or to multiple virtual servers.

Some of the key optimization features that can be enabled by TCP profiles are:

- TCP keep-alive—Checks the operational status of the peers at specified time intervals to prevent the link from being broken.
- Selective Acknowledgment (SACK)—Improves the performance of data transmission, especially in long fat networks (LFNs).
- TCP window scaling—Allows efficient transfer of data over long fat networks (LFNs).

For more information on TCP Profiles, see Configuring TCP Profiles.

CloudBridge Connector

The Citrix NetScaler CloudBridge Connector feature, a fundamental part of the Citrix OpenCloud framework, is a tool used to build a cloud-extended data center. The OpenCloud Bridge enables you to connect one or more NetScaler appliances or NetScaler virtual appliances on the cloud-to your network without reconfiguring your network. Cloud hosted applications appear as though they are running on one contiguous enterprise network. The primary purpose of the OpenCloud Bridge is to enable companies to move their applications to the cloud while reducing costs and the risk of application failure. In addition, the OpenCloud Bridge increases network security in cloud environments. An OpenCloud Bridge is a Layer-2 network bridge that connects a NetScaler appliance or NetScaler virtual appliance on a cloud instance to a NetScaler appliance or NetScaler virtual appliance on your LAN. The connection is made through a tunnel that uses the Generic Routing Encapsulation (GRE) protocol. The GRE protocol provides a mechanism for encapsulating packets from a wide variety of network protocols to be forwarded over another protocol. Then Internet Protocol security (IPsec) protocol suite is used to secure the communication between the peers in the OpenCloud Bridge.

For more information, see CloudBridge.
DataStream

The NetScaler DataStream feature provides an intelligent mechanism for request switching at the database layer by distributing requests on the basis of the SQL query being sent.

When deployed in front of database servers, a NetScaler ensures optimal distribution of traffic from the application servers and Web servers. Administrators can segment traffic according to information in the SQL query and on the basis of database names, user names, character sets, and packet size.

You can configure load balancing to switch requests according to load balancing algorithms, or you can elaborate the switching criteria by configuring content switching to make a decision based on SQL query parameters, such as user name, database names, and command parameters. You can further configure monitors to track the states of database servers.

The advanced policy infrastructure on the NetScaler appliance includes expressions that you can use to evaluate and process the requests. The advanced expressions evaluate traffic associated with MySQL database servers. You can use request-based expressions (expressions that begin with MYSQL.CLIENT and MYSQL.REQ) in advanced policies to make request switching decisions at the content switching virtual server bind point and response-based expressions (expressions that begin with MYSQL.RES) to evaluate server responses to user-configured health monitors.

Note: DataStream is supported for MySQL and MS SQL databases.

For more information, see DataStream.

Application acceleration features

December 18, 2018

• AppCompress

Uses the gzip compression protocol to provide transparent compression for HTML and text files. The typical 4:1 compression ratio yields up to 50% reduction in bandwidth requirements out of the data center. It also results in significantly improved end-user response time, because it reduces the amount of data that must be delivered to the user's browser.

• Cache Redirection

Manages the flow of traffic to a reverse proxy, transparent proxy, or forward proxy cache farm. Inspects all requests, and identifies non-cacheable requests and sends them directly to the origin servers over persistent connections. By intelligently redirecting non-cacheable requests back to the origin web servers, the NetScaler appliance frees cache resources and increases cache hit rates while reducing overall bandwidth consumption and response delays for these requests.
For more information, see “Cache Redirection.”

- **AppCache**
  Helps optimize web content and application data delivery by providing a fast in-memory HTTP/1.1 and HTTP/1.0 compliant web caching for both static and dynamic content. This on-board cache stores the results of incoming application requests even when an incoming request is secured or the data compressed, and then reuses the data to fulfill subsequent requests for the same information. By serving data directly from the on-board cache, the appliance can reduce page regeneration times by eliminating the need to funnel static and dynamic content requests to the server.
  For more information, see “Integrated Caching.”

- **TCP Buffering**
  Buffers the server’s response and delivers it to the client at the client’s speed, thus offloading the server faster and thereby improving the performance of web sites.

### Application security and firewall features

December 18, 2018

Below are the security and firewall features.

**Denial of service (DoS) attack defense**

Detects and stops malicious distributed denial-of-service (DDoS) attacks and other types of malicious attacks before they reach your servers, preventing them from affecting network and application performance. The NetScaler appliance identifies legitimate clients and elevates their priority, leaving suspect clients unable to consume a disproportionate percentage of resources and cripple your site. The appliance provides application-level protection from the following types of malicious attacks:

- SYN flood attacks
- Pipeline attacks
- Teardrop attacks
- Land attacks
- Fraggle attacks
- Zombie connection attacks

The appliance aggressively defends against these types of attacks by preventing the allocation of server resources for these connections. This insulates servers from the overwhelming flood of packets associated with these events.

© 1999-2018 Citrix Systems, Inc. All rights reserved.
The appliance also protects network resources from ICMP based attacks by using ICMP rate limiting and aggressive ICMP packet inspection. It performs strong IP reassembly, drops a variety of suspicious and malformed packets, and applies Access Control Lists (ACLs) to site traffic for further protection.

For more information, see HTTP Denial-of-Service Protection.

**Content Filtering**

Provides protection from malicious attacks for web sites at the Layer 7 level. The appliance inspects each incoming request according to user-configured rules based on HTTP headers, and performs the action the user configured. Actions can include resetting the connection, dropping the request, or sending an error message to the user’s browser. This allows the appliance to screen unwanted requests and reduces your servers’ exposure to attacks.

This feature can also analyze HTTP GET and POST requests and filter out known bad signatures, allowing it to defend your servers against HTTP-based attacks.

For more information, see Content Filtering.

**Responder**

Functions like an advanced filter and can be used to generate responses from the appliance to the client. Some common uses of this feature are generation of redirect responses, user defined responses, and resets.

For more information, see Responder.

**Rewrite**

Modifies HTTP headers and body text. You can use the rewrite feature to add HTTP headers to an HTTP request or response, make modifications to individual HTTP headers, or delete HTTP headers. It also enables you to modify the HTTP body in requests and responses.

When the appliance receives a request or sends a response, it checks for rewrite rules, and if applicable rules exist, it applies them to the request or response before passing it on to the web server or client computer.

For more information, see Rewrite.

**Priority Queuing**

Prioritizes user requests to ensure that the most important traffic is serviced first during surges in request volume. You can establish priority based on request URLs, cookies, or a variety of other fac-
NetScaler 11.1

tors. The appliance places requests in a three-tier queue based on their configured priority, enabling business-critical transactions to flow smoothly even during surges or site attacks.

For more information, see *Priority Queuing*.

**Surge Protection**

Regulates the flow of user requests to servers and controls the number of users that can simultaneously access the resources on the servers, queuing any additional requests once your servers have reached their capacity. By controlling the rate at which connections can be established, the appliance blocks surges in requests from being passed on to your servers, thus preventing site overload.

For more information, see *Surge Protection*.

**Citrix Gateway**

1 Citrix Gateway is a secure application access solution that provides administrators granular application-level policy and action controls to secure access to applications and data while allowing users to work from anywhere. It gives IT administrators a single point of control and tools to help ensure compliance with regulations and the highest levels of information security across and outside the enterprise. At the same time, it empowers users with a single point of access—optimized for roles, devices, and networks—to the enterprise applications and data they need. This unique combination of capabilities helps maximize the productivity of today's mobile workforce.

2

3 For more information, see [Citrix Gateway](https://docs.citrix.com/en-us/netscaler-gateway.html).

**Application Firewall**

Protects applications from misuse by hackers and malware, such as cross site scripting attacks, buffer overflow attacks, SQL injection attacks, and forceful browsing, by filtering traffic between each protected web server and users that connect to any web site on that web server. The application firewall examines all traffic for evidence of attacks on web server security or misuse of web server resources, and takes the appropriate action to prevent these attacks from succeeding.

For more information, see *Application Firewall*.
Application visibility feature

December 18, 2018

• NetScaler Insight Center

NetScaler Insight Center is a high performance collector that provides end-to-end user experience visibility across Web and HDX (ICA) traffic. It collects HTTP and ICA AppFlow records generated by NetScaler ADC appliances and populates analytical reports covering Layer 3 to Layer 7 statistics. NetScaler Insight Center provides in-depth analysis for the last five minutes of real-time data, and for historical data collected for the last one hour, one day, one week, and one month.

HDX (ICA) analytic dashboard enables you to drill down from HDX Users, Applications, Desktops, and even from gateway-level information. Similarly, HTTP analytics provide a bird’s eye view of Web Applications, URLs Accessed, Client IP Addresses and Server IP Addresses, and other dashboards. The administrator can drill down and identify the pain points from any of these dashboards, as appropriate for the use case.

• EdgeSight for NetScaler

Support for application performance monitoring based on end user experience. This solution leverages the HTML injection feature to obtain various time values, which are used by EdgeSight server for analysis and report generation. EdgeSight for NetScaler provides a way to monitor the performance benefits of a NetScaler and determine potential bottlenecks in a network.

For more information, see “EdgeSight Monitoring for NetScaler.”

• Enhanced Application Visibility Using AppFlow

The NetScaler appliance is a central point of control for all application traffic in the data center. It collects flow and user-session level information valuable for application performance monitoring, analytics, and business intelligence applications. AppFlow transmits this information by using the Internet Protocol Flow Information eXport (IPFIX) format, which is an open Internet Engineering Task Force (IETF) standard defined in RFC 5101. IPFIX (the standardized version of Cisco’s NetFlow) is widely used to monitor network flow information. AppFlow defines new Information Elements to represent application-level information.

Using UDP as the transport protocol, AppFlow transmits the collected data, called flow records, to one or more IPv4 collectors. The collectors aggregate the flow records and generate real-time or historical reports.

AppFlow provides visibility at the transaction level for HTTP, SSL, TCP, and SSL_TCP flows. You can sample and filter the flow types that you want to monitor.
To limit the types of flows to monitor, by sampling and filtering the application traffic, you can enable AppFlow for a virtual server. AppFlow can also provide statistics for the virtual server.

You can also enable AppFlow for a specific service, representing an application server, and monitor the traffic to that application server.

For more information, see “AppFlow.”

- **Stream Analytics**

  The performance of your web site or application depends on how well you optimize the delivery of the most frequently requested content. Techniques such as caching and compression help accelerate the delivery of services to clients, but you need to be able to identify the resources that are requested most frequently, and then cache or compress those resources. You can identify the most frequently used resources by aggregating real-time statistics about website or application traffic. Statistics such as how frequently a resource is accessed relative to other resources and how much bandwidth is consumed by those resources help you determine whether those resources need to be cached or compressed to improve server performance and network utilization. Statistics such as response times and the number of concurrent connections to the application help you determine whether you must enhance server-side resources.

  If the web site or application does not change frequently, you can use products that collect statistical data, and then manually analyze the statistics and optimize the delivery of content. However, if you do not want to perform manual optimizations, or if your web site or application is dynamic in nature, you need infrastructure that can not only collect statistical data but can also automatically optimize the delivery of resources on the basis of the statistics. On the NetScaler appliance, this functionality is provided by the Stream Analytics feature. The feature operates on a single NetScaler appliance and collects run-time statistics on the basis of criteria that you define. When used with NetScaler policies, the feature also provides you with the infrastructure that you need for automatic, real-time traffic optimization.

  For more information, see “Action Analytics.”

**FAQs**

March 29, 2019

**This section provides the frequently asked questions on the following NetScaler features**

- **AppFlow**
AppFlow

January 16, 2019

- **Which build of NetScaler supports AppFlow?**
  AppFlow is supported on NetScaler appliances running version 9.3 and above with nCore build.

- **What is the format used by AppFlow to transmit data?**
  AppFlow transmits information in the Internet Protocol Flow Information eXport (IPFIX) format, which is an open Internet Engineering Task Force (IETF) standard defined in RFC 5101. IPFIX (the standardized version of Cisco’s NetFlow) is widely used to monitor network flow information.

- **What do AppFlow records contain?**
  AppFlow records contain standard NetFlow or IPFIX information, such as time stamps for the beginning and end of a flow, packet count, and byte count. AppFlow records also contain application-level information (such as HTTP URLs, HTTP request methods and response-status codes, server response time, and latency). IPFIX flow records are based on templates that must be sent before sending flow records.

- **After an upgrade to NetScaler Version 9.3 Build 48.6 Cl, why does an attempt to open a virtual server from the GUI result in the error message “The AppFlow feature is only available on Citrix Netscaler Ncore”?**
  AppFlow is supported only on nCore appliances. When you open the virtual server configuration tab, clear the **AppFlow** checkbox.

- **What does the transaction ID in an AppFlow records contain?**
A transaction ID is an unsigned 32-bit number identifying an application-level transaction. For HTTP, a transaction corresponds to a request and response pair. All flow records that correspond to this request and response pair have the same transaction ID. A typical transaction has four uniflow records. If the NetScaler generates the response by itself (served from the integrated cache or by a security policy), there might be only two flow records for the transaction.

- **What is an AppFlow action?**

An Appflow action is a set of collectors to which the flow records are sent if the associated AppFlow policy matches.

- **What commands can I run on the NetScaler appliance to verify that the AppFlow action is a hit?**

The show appflow action. For example:

```plaintext
> show appflow action
1) Name: aFL-act-collector-1
   Collectors: collector-1
   Hits: 0
   Action Reference Count: 2
2) Name: apfl-act-collector-2-and-3
   Collectors: collector-2, collector-3
   Hits: 0
   Action Reference Count: 1
3) Name: apfl-act-collector-1-and-3
   Collectors: collector-1, collector-3
   Hits: 0
   Action Reference Count: 1
```

- **What is an AppFlow collector?**

A collector receives flow records generated by the NetScaler appliance. To be able to send flow records, you must specify at least one collector. You can specify up to four. You can remove unused collectors.

- **What NetScaler version is required for using AppFlow?**

Use NetScaler version 9.3.49.5 or higher, and remember that AppFlow is available in only the nCore builds.

- **What transport protocol does AppFlow use?**

AppFlow uses UDP as the transport protocol.

- **What ports needs to be opened if I have a firewall in the network?**

Port 4739. It is the default UDP port the AppFlow collector uses for listening on IPFIX messages. If the user changes the default port, that port should be opened on the firewall.
• **How can I change the default port AppFlow uses?**

When you add an AppFlow collector by using the add appflowCollector command, you can specify the port to be used.

```
$> add appflowCollector coll1 -IPAddress 10.102.29.251 -port 8000
2 Done
```

• **What does setting clientTrafficOnly do?**

NetScaler generates AppFlow records only for client-side traffic.

• **How many collectors can be configured at a time?**

You can configure up to four AppFlow collectors at a time on the NetScaler appliance. Please note that the maximum number of collectors that can be configured on a NetScaler appliance is four.

---

**Call Home**

August 30, 2019

• **What is Call Home on a NetScaler appliance?**

Call Home monitors, and notifies critical events on a NetScaler appliance. By enabling Call Home, you can automate the error notification process. You not only avoid calling Citrix support, raise a service request, and upload system data before Citrix support can troubleshoot the issue, but also identify and resolve issues before it occurs.

• **Is Call Home enabled by default on a NetScaler appliance?**

Yes, Call Home is enabled by default on the appliance. If you upgrade to the latest software from an older version where Call Home was disabled by default, the upgrade process automatically enables the feature. If you later choose to disable it, the updated setting is remembered for all further upgrades. For information, see Call Home.

• **What are the pre-requisites for Call Home to work?**

Access to an Internet connection.

**Note:** If your NetScaler appliance does not have an Internet connectivity, you can configure a proxy server through which NetScaler can generate system logs and upload it to the Citrix Technical Support server (CIS).

• **What are the benefits of using Call Home?**

- Monitor hardware and software error conditions.
– Notify about the occurrence of critical events that impact your network.
– Send performance data and system logs to Citrix to:
  * Analyze and improve product quality.
  * Provide real-time troubleshooting information for proactive issue identification, and faster issue resolution.

• **Which release of NetScaler software supports Call Home?**

  NetScaler release 10.0 and later.

• **What NetScaler platform models support Call Home?**

  Call Home feature is enabled by default on all NetScaler platforms and all appliance models (MPX, VPX, and SDX).

  – NetScaler MPX: All MPX models.
  – NetScaler VPX: All VPX models. In addition, it is supported on VPX appliances that obtain their licenses from external or central licensing pools. However, the feature remains same as for a standard VPX appliance.
  – NetScaler SDX: Monitors the disk drive and assigned SSL chips for any errors or failures. The VPX instances, however, do not have access to the Power Supply Unit (PSU) and therefore their status is not monitored. In an SDX platform, you can configure Call Home either directly on an individual instance or through the SVM.

• **Should I configure SNMP alarm for Call Home to notify error conditions?**

  No, you need not configure SNMP for Call Home to monitor error conditions, because SNMP and Call Home uploads are independent of each other. If you want to be notified each time an error condition occurs, you can configure the CALLHOME-UPLOAD-EVENT SNMP alarm to generate an SNMP alert whenever a Call Home upload happens. The SNMP alert notifies the local administrator about the occurrences of critical events.

• **How do I contact a technical support?**

  For all critical hardware-related events, Call Home automatically creates a service request to Citrix. For other errors, after you review the system logs, you can contact the Citrix Technical Support team to open a service request for further investigation. For more information, see [http://support.citrix.com/article/CTX200021](http://support.citrix.com/article/CTX200021).

• **What error conditions does Call Home monitor in a NetScaler appliance?**

  Call Home supports monitoring of the following events in a NetScaler appliance:

  – Compact flash drive errors
  – Hard disk drive errors
  – Power supply unit failure
  – SSL card failure
- Warm restart
- Memory anomalies
- Rate limit drops

**Do you need a separate license for Call Home?**

No, Call Home does not require a separate license. You can enable it in all NetScaler platform licenses.

**What data does Call Home send to Citrix Support server and how frequently is it sent?**

Call Home collects and sends two types of data to CIS. They are:

- Basic System information (running NetScaler version, deployment mode (standalone, HA, cluster), hardware details and so on). It is sent at the time of Call Home registration and as part of periodic heartbeats. The heartbeat is sent once every 30 days, but you can configure this interval anywhere from 1 to 30 days. However, a value of less than 5 days is not recommended, because frequent uploads are usually not very useful.
- An abbreviated version of show tech support bundle when there is an error condition. It is sent upon the first occurrence of a particular error condition since the appliance was last started. That is, a reoccurrence of same error condition does not trigger another upload unless the appliance was rebooted after the previous occurrence.

**Can Call Home generate and upload system logs through a proxy server?**

Yes. If your NetScaler appliance does not have direct Internet connectivity, you can configure a proxy server and upload system logs to Citrix Technical Support server (CIS).

**Can I review Call Home data before it is sent to CIS?**

Unfortunately, you cannot review Call Home data before it is sent to CIS. Call Home does not collect any other data in addition to the data that you will provide when contacting Citrix support team.

**How secure and private are the Call Home uploads?**

Call Home provides data security and privacy in the following ways:

- Uses a secure SSL/TLS channel to transfer data to Citrix servers.
- Uploaded data is reviewed only by authorized personnel and is not shared with any third party.

---

**Clustering**

January 16, 2019

Click [here](#) for FAQs on clustering.
Connection Management

January 16, 2019

• **What is an admin connection?**
  
  An admin connection establishes a connection to the NetScaler IP (NSIP) address and allows administrators to configure and monitor the NetScaler appliance.

• **What are the types of admin connections?**
  
  There are two types of admin connections:
  
  – SSH connection – Admin users use an SSH client to logon through the NetScaler IP (NSIP) address.
  – NITRO API connection – Admin users use NITRO API’s to automate the logon process to NetScaler appliance.

  Note: Admin users can also log on through the NetScaler GUI to log on, by using a browser to connect to the NSIP address. The GUI internally opens a NITRO API connection. Therefore, a GUI session is equivalent to a NITRO API connection, and FAQs related to NITRO API apply to GUI.

• **How many concurrent admin connections are allowed on a NetScaler appliance?**
  
  The appliance allows up to 20 concurrent admin connections.

• **Which login credentials are required for an admin logon?**
  
  Admin logon requires a user name and a password.

  **Note:** An authentication key can be used instead of a password.

• **Which external authentication methods does a NetScaler appliance support?**
  
  The appliance supports the following external authentication methods:
  
  – RADIUS
  – LDAP
  – TACACS

• **What is a client?**
  
  A client is a device (laptop or desktop), used by admin user to open an admin connection.

• **What is a session token?**
  
  A session token is a unique identifier that the NetScaler appliance issues to a client that sends a NITRO API logon request.
- API clients can reuse the session token, if it has not expired, for subsequent API requests on new TCP connections
- GUI clients internally open NITRO API connections and keep the session token active for the duration of the GUI session.

**What is an active session on a NetScaler appliance?**

A CLI session is considered active if the session has not expired and has an open SSH connection with a NetScaler appliance.

A NITRO API session is considered active if the session token timeout has not expired on the NetScaler appliance.

**How does NetScaler enforce the concurrent connection limit?**

Every time the NetScaler appliance receives an admin connection request (SSH or NITRO API), it checks the number of admin connections it has open. If the number is lower than 20, a new connection is opened.

**Which counter reflects the number of admin connections on a NetScaler appliance?**

The connection counter (nsconfigd_cur_clients) reflects the number of active connections. This counter is incremented when a client opens new connection to the appliance, and is decremented when a connection is closed.

**Which counter reflects the number of active tokens on the NetScaler appliance?**

The `configd_cur_tokens` counter reflects the number of active tokens on NetScaler appliance.

**How does NetScaler appliance handle errors on a connection?**

The NetScaler appliance immediately closes the client (CLI, API, and GUI) connection if it encounters errors on a connection.

**Does a CLI or GUI session on a connection to the management address count against the admin connection limit?**

Yes, all CLI and GUI connections are TCP based connections, and every TCP connection to the management address counts against the admin connection limit.

**Does a NITRO session count against the admin connection limit?**

A NITRO session counts against the admin connection limit if there is an open TCP connection using the session token issued by the NetScaler appliance.

**What is the default timeout period for API, GUI, and CLI sessions on NetScaler appliance?**

The following table lists the default timeout period for API, GUI and CLI sessions on the NetScaler appliance:
How can you set the CLI session time out on a NetScaler appliance?

The CLI session timeout can be configured by executing the following command at the CLI prompt:

```
set cli mode -timeout <xx seconds>
```

How do you override the default timeout period when using the NITRO API?

You can override the default timeout period for a NITRO API by setting the timeout duration in the “timeout” field of the login object. If the session timeout is set to zero, the session token has an infinite timeout.

Note: An infinite timeout is not advisable, because sessions that do not time out continue to count against the admin connection count.

What happens if a user account is deleted from the NetScaler appliance after an admin session is created?

For internal system users, NetScaler appliance closes the existing CLI or NITRO API session.

For external system users, session remains active until it expires.

Can NITRO API clients use a single session token to open multiple admin connections on the NetScaler appliance?

Yes. Each such connection counts against the admin connection limit.

If management access is enabled for a MIP or SNIP address, do admin connections to that address count against the limit for the number of admin connections?

Yes, admin connections to management address (MIP or SNIP) count against the admin connection limit on NetScaler appliance.

Can a NetScaler admin log on to the NetScaler appliance after the maximum connections limit is reached?

Yes. One additional admin connection is allowed after the maximum connection limit is reached.

Can NITRO API endpoints open multiple admin connections on NetScaler the appliance?
Yes, NITRO API endpoints can open multiple admin connections and exhaust the concurrent admin connection limit on a NetScaler appliance. In such situations, an additional SSH/CLI connection is allowed and the admin can force closure of old API sessions, or reduce the session timeout duration for the existing API sessions.

- **Can same client open multiple API sessions on a NetScaler appliance?**

  Yes, a client can open multiple API session by repeatedly logging on. For example, the client might log back on after a reboot.

  Note: Repeated client logons count against the admin connection limit on NetScaler appliance.

- **Can API clients use the entire API session token limit?**

  Yes, API clients can use the entire API session token limit, provided by repeatedly logging on without using a previously issued token.

  Note: If a client’s session timeout is zero, the token is valid forever. Repeated logons using new session tokens can count against the limit for API session tokens.

- **Do CLI sessions count against the API session token limit?**

  No, CLI sessions are not counted against the API session token limit.

- **Can admin users use telnet to open a CLI session?**

  No. Only an SSH client can open a CLI session.

- **What is connection limit and API session limit applicable for various NetScaler releases?**

  The following table lists the maximum concurrent admin connection and active API session limits applicable for various NetScaler releases:

<table>
<thead>
<tr>
<th>NetScaler Releases</th>
<th>9.3</th>
<th>10.1 (Before 130.x)</th>
<th>10.1 (Before 130.10)</th>
<th>10.1 (From 130.10)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum number of concurrent admin connections</td>
<td>20</td>
<td>20</td>
<td>20</td>
<td>20</td>
</tr>
<tr>
<td>Maximum number of active API sessions*</td>
<td>1000</td>
<td>20</td>
<td>1000</td>
<td>1000</td>
</tr>
</tbody>
</table>

  Note:
  - API sessions are considered active if they have not timed out. For example, if 500 API
sessions were created but 100 have expired, 400 API sessions are active.
– An API session need not open a TCP connection to the NetScaler appliance.

Content Switching

January 16, 2019

- I have installed a non-NetScaler load balancing appliance on the network. However, I would like to use the content switching feature of the NetScaler appliance to direct the client requests to the load balancing appliance. Is it possible to use the Content switching feature of the NetScaler appliance with a non-NetScaler load balancing appliance?

Yes. You can use the Content switching feature of the NetScaler appliance with the load balancing feature of the NetScaler appliance or a non-NetScaler load balancing appliance. However, when using the non-NetScaler load balancing appliance, make sure that you create a load balancing virtual server on the NetScaler appliance and bind it to the non-NetScaler load balancing appliance as a service.

- How is a Content switching virtual server different from a load balancing virtual server?

A Content switching virtual server is capable only of sending the client requests to other virtual servers. It does not communicate with the servers.

A Load balancing virtual server balances the client load among servers and communicates with the servers. It monitors server availability and can be used to apply different load balancing algorithms to distribute the traffic load.

Content switching is a method used to direct client requests for specific types of content to targeted servers by way of load balancing virtual servers. You can direct the client requests to the servers best suited to handle them. This result in reduced overheads to process the client requests on the servers.

- I want to implement the Content switching feature of the NetScaler appliance to direct the client requests. What types of client request can I direct by using the Content switching feature?

You can direct only HTTP, HTTPS, FTP, TCP, Secure TCP, and RTSP client requests by using the Content switching feature. To direct HTTPS client requests, you must configure the SSL offload feature on the appliance.

- I want to create Content switching rules on the NetScaler appliance. What are the various elements of the client request on which I can create a content switching rule?

You can create the content switching rules based on the following elements and their values in the client request:
- URL
- URL tokens
- HTTP version
- HTTP Headers
- Source IP address of the client
- Client version
- Destination TCP port

• I understand that the content switching feature of the NetScaler appliance helps enhance the performance of the network. Is this correct?

Yes. You can direct the client requests you the servers best suited to handle them. The result is reduced overhead for processing the client requests on the servers.

• Which feature of the NetScaler appliance should I configure on the NetScaler appliance to enhance the site manageability and response time to the client requests?

You can configure the content switching feature of the NetScaler appliance to enhance the site manageability and response time to the client request. This feature enables you to create content groups within the same domain name and IP address. This approach is flexible, unlike the common approach of explicitly partitioning the content into different domain names and IP addresses, which are visible to the user.

Multiple partitions dividing a Web site into various domain names and IP addresses force the browser to create a separate connection for each domain it finds when rendering and fetching the content of a web page. These additional WAN connections degrade the response time for the web page.

• I have hosted a web site on a web server farm. What advantages does the NetScaler content switching feature offer for this type of setup?

The content switching feature provides the following advantages on a NetScaler appliance in a site that is based in a web server farm:

- Manage the site content by creating a content group within the same domain and IP address.
- Enhance the response time to client requests by using the content group within the same domain and IP address.
- Avoid the need for full content replication across domains.
- Enable application-specific content partitioning. For example, you can direct client requests to a server that handles only dynamic content or only static content, as appropriate for the request.
- Support multi-homing of multiple domains on the same server and use the same IP address.
- Reuse connections to the servers.
• I want to implement the content switching feature on the NetScaler appliance. I want to direct the client requests to the various servers after evaluating the various parameters of each request. What approach should I follow to implement this setup when configuring the content switching feature?

You can use policy expressions to create policies for the content switching feature. An expression is a condition evaluated by comparing the qualifiers of the client request to an operand by using an operator. You can use the following parameters of the client request to create an expression:

- **Method** - HTTP request method.
- **URL** - URL in the HTTP header.
- **URL TOKENS** - Special tokens in the URL.
- **VERSION** - HTTP request version.
- **URL QUERY** - Contains the URL Query LEN, URL LEN, and HTTP header.
- **SOURCEIP** - IP address of the client.

Following is a complete list of the operators that you can use to create an expression:

- `==` (equals)
- `!=` (not equals)
- `EXISTS`
- `NOT EXISTS`
- `CONTAINS`
- `NOT CONTAINS`
- `GT` (greater than)
- `LT` (less than)

You can also create various rules, which are logical aggregations of a set of expressions. You can combine multiple expressions to create rules. To combine expressions, you can use the `&&` (AND) and `||` (OR) operators. You can also use parenthesis to create nested and complex rules.

• I want to configure a rule based policy along with a URL based policy for the same content switching virtual server. Is it possible to create both types of policies for the same content switching virtual server?

Yes. You can create both type of policies for the same content switching virtual server. However, be sure to assign priorities to set an appropriate precedence for the policies.
• I want to create content switching policies that evaluate the domain name, along with a prefix and suffix of a URL, and direct the client requests accordingly. Which type of content switching policy should I create?

You can create a Domain and Exact URL policy. When this type of policy is evaluated, the NetScaler appliance selects a content group if the complete domain name and the URL in the client request match the ones configured. The client request must match the configured domain name and exactly match the prefix and suffix of the URL if they are configured.

• I want to create content switching policies that evaluate the domain name, along with a partial prefix and suffix of URL, and direct the client requests accordingly. Which type of content switching policy should I create?

You can create a Domain and Wildcard URL policy for the content switching virtual server. When this type of policy is evaluated, the NetScaler appliance selects a content group if the request matches the complete domain name and partially matches the URL prefix.

• What is a Wildcard URL policy?

You can use wildcards to evaluate partial URLs in client requests to the URL you have configured on the NetScaler appliance. You can use wildcards in the following types of URL-based policies:

  – Prefix only. For example, the /sports/* expression matches all URLs available under the /sports URL. Similarly, the /sports* expression matches all URLs whose prefix is /sports .
  – Suffix only. For example the /*.jsp expression matches all URLs with a file extension of jsp.
  – Prefix and Suffix. For example, the /sports/*.jsp expression matches all URLs under the /sports/ URL that also have the jsp file extension. Similarly, the /sports*.jsp expression matches all URLs with a prefix of /sports* and a file extension of jsp.

• What is a Domain and Rule policy?

When you create a Domain and Rule policy, the client request must match the complete domain and the rule configured on the NetScaler appliance.

• What is the default precedence set for evaluating policies?

By default, the rule based policies are evaluated first.

• If some of the content is the same for all client requests, what type of precedence should I use for evaluating policies?

If some of the content is same for all the users and different content should be served on the basis of client attributes, you can use URL-based precedence for policy evaluation.

• What policy expression syntaxes are supported in content switching?

Content switching supports two types of policy expressions:

  – **Classic Syntax**- Classic syntax in content switching starts with the keyword `REQ` and is more advanced than the default syntax. Classic policies cannot be bound to an action.
Therefore, the target load balancing virtual server can be added only after binding the content switching virtual server.

- **Default Syntax:** Default syntax generally starts with key word HTTP and is easier to configure. A target load balancing virtual server action can be bound to a Default Syntax policy, and the policy can be used on multiple content switching virtual servers.

**Can I bind a single content switching policy to multiple virtual servers?**

Yes. You can bind a single content switching policy to multiple virtual servers by using policies with defined actions. Content switching policies that use an action can be bound to multiple content switching virtual servers because the target load balancing virtual server is no longer specified in the content switching policy. The ability to bind a single policy to multiple content switching virtual servers helps to further reduce the size of the content switching configuration.

For more information, see the following Knowledge Center articles and eDocs topics:

- See CTX122918 - *How to Bind the Same Content Switching Policy to Two Content Switching vServers on a NetScaler Appliance.*
- See CTX122736 - *How to Bind the Same Advanced Policy to Multiple Content Switching Virtual Servers using Policy Labels.*
- Configuring a Content Switching Action.

**Can I create an action based policy using classic expressions?**

No. As of now NetScaler does not support policies using classic syntax expressions with actions. The target load balancing virtual server should be added when binding the policy instead of defining it in an action.

**Debugging**

January 16, 2019

**How can I determine the interface (CLI, GUI, or API) through which an operation was performed?**

The NetScaler keeps track of the interfaces through which operations are performed. You can view this information in syslogs (in the NetScaler GUI, navigate to Configuration > System > Auditing > Audit Messages > Syslog messages) or in the ns.log (located at the /var/log/ directory) file.

For example, operations that are performed through the API are flagged as “API CMD_EXECUTED.”
**High Availability**

January 16, 2019

- **What are the various ports used to exchange the HA-related information between the nodes in an HA configuration?**

  In an HA configuration, both nodes use the following ports to exchange HA related information:
  
  - UDP Port 3003, to exchange heartbeat packets
  - Port 3010, for synchronization and command propagation

- **What configurations are not synced or propagated in an HA configuration in either INC or non-INC mode?**

  Configurations implemented with the following commands are neither propagated nor synced to the secondary node:
  
  - All node specific HA configuration commands. For example, add ha node, set ha node, and bind ha node.
  - All Interface related configuration commands. For example, set interface and unset interface.
  - All channel related configuration commands. For example, add channel, set channel, and bind channel.

  For more information about HA Configuration in INC mode, see [Configuring High Availability Nodes in Different Subnets](#).

- **What configurations are not synced or propagated in an HA configuration in INC mode?**

  The following configurations are neither synced nor propagated. Each node has its own.
  
  - MIPs
  - SNIPs
  - VLANs
  - Routes (except LLB routes)
  - Route monitors
  - RNAT rules (except any RNAT rule with VIP as the NAT IP)
  - Dynamic routing configurations.

- **What are the conditions that trigger synchronization?**

  Synchronization is triggered by any of the following conditions:
  
  - The incarnation number of the primary node, received by the secondary, does not match that of the secondary node.
  
  Note: Both nodes in an HA configuration maintain a counter called
incarnation number, which counts the number of configurations in the node’s configuration file. Each node sends its incarnation number to each other node in the heartbeat messages. The incarnation number is not incremented for the following commands:

* All HA configuration related commands. For example, add ha node, set ha node, and bind ha node.
* All Interface related commands. For example, set interface and unset interface.
* All channel-related commands. For example, add channel, set channel, and bind channel.

  - The secondary node comes up after a restart.
  - The primary node becomes secondary after a failover.

• Does a configuration added to the secondary node get synchronized on the primary?

No, a configuration added to the secondary node is not synchronized to the primary.

• What could be the reason for both nodes claiming to be the primary in an HA configuration?

The most likely reason is that the primary and secondary nodes are both healthy but the secondary does not receive the heartbeat packets from the primary. The problem could be with the network between the nodes.

• Does an HA configuration run into any issues if you deploy the two nodes with different system clock settings?

Different system-clock settings on the two nodes can cause the following issues:

  - The time stamps in the log file entries do not match. This situation makes it difficult to analyze the log entries for any issues.
  - After a failover, you might have problems with any type of cookie based persistence for load balancing. A significant difference between the times can cause a cookie to expire sooner than expected, resulting in termination of the persistence session.
  - Similar considerations apply to any time related decisions on the nodes.

• What are the conditions for failure of the force HA sync command?

Forced synchronization fails in any of the following circumstances:

  - You force synchronization when synchronization is already in progress.
  - The secondary node is disabled.
  - HA synchronization is disabled on the current secondary node.
  - HA propagation is disabled on the current primary node and you force synchronization from the primary.

• What are the conditions for failure of the sync HA files command?

Synchronizing configuration files fail if the secondary node is disabled.
• **In an HA configuration, if the secondary node takes over as the primary, does it switch back to secondary status if the original primary comes back online?**

No. After the secondary node takes over as the primary, it remains as primary even if the original primary node comes back online again. To interchange the primary and secondary status of the nodes, run the `force failover` command.

• **What are the conditions for failure of the `force failover` command?**

A forced failover fails in any of the following circumstances:

– The secondary node is disabled.
– The secondary node is configured to remain secondary.
– The primary node is configured to remain primary.
– The state of the peer node is unknown.

**Integrated Caching**

January 16, 2019

**Content Groups**

• **How is a DEFAULT content group different from other content groups?**

The behavior of the DEFAULT content group is exactly the same as any other group. The only attribute that makes the DEFAULT content group special is that if an object is being cached and no content group has been created, the object is cached in the DEFAULT group.

• **What is the ‘cache-Control’ option of the content group level?**

You can send any cache-control header the browser. There is a content group level option, `-cacheControl`, which enables you to specify the cache-control header that you want to be inserted in the response to the browser.
What is the ‘Minhit’ option in content group level?

Minhit is an integer value specifying the minimum number of hits to a cache policy before the object is cached. This value is configurable at the content group level. Following is the syntax to configure this value from the NetScaler command line.

```
add/set cache contentGroup <Content_Group_Name> [-minHits <Integer>]
```

What is the use of the expireAtLastByte option?

The expireAtLastByte option enables the integrated cache to expire the object as soon as it has been downloaded. Only requests that are outstanding requests at that time are served from cache. any new requests are sent to the server. This setting is useful when the object is frequently modified, as in the case of stock quotes. This expiry mechanism works along with the Flash Cache feature. To configure expireAtLastByte option, run the following command from the NetScaler command line:

```
add cache contentGroup <Group_Name> –expireAtLastByte YES
```

Cache policy

What is a caching policy?

Policies determine which transactions are cacheable and which are not. Additionally, policies add or override the standard HTTP caching behavior. Policies determine an action, such as CACHE or NOCACHE, depending on the specific characteristics of the request or response. If a response matches policy rules, the object in the response is added to the content group configured in the policy. If you have not configured a content group, the object is added to the DEFAULT content group.

What is a policy hit?

A hit occurs when a request or response matches a cache policy.

What is a miss?

A miss occurs when a request or response does not match any cache policy. A miss can also occur if the request or response matches a cache policy but some override of RFC behavior prevents the object from being stored in the cache.

I have configured Integrated Caching feature of the NetScaler appliance. When adding the following policy, an error message appears. Is there any error in the command?

```
add cache policy image_caching -rule exp1 ns_ext_not_jpeg –action cache
```

> ERROR: No such command
In the preceding command, the expression should be within the quotation marks. Without quotation marks, the operator is considered to be the pipe operator.

**Memory Requirements**

- **What are the commands that I can run on the NetScaler appliance to check the memory allocated to cache?**

  To display the memory allocated for cache in the NetScaler appliance, run any of the following commands from the NetScaler command line:
  
  - `show cache parameter`
    
    In the output, check the value of the Memory usage limit parameter. This is the maximum memory allocated for cache.
  
  - `show cache <Content_Group_Name>`
    
    In the output, check the values of the Memory usage and Memory usage limit parameters indicating the memory used and allocated for the individual content group.

- **My NetScaler appliance has 2 GB of memory. Is there any recommended memory limit for cache?**

  For any model of the NetScaler appliance, you can allocate half of the memory to the cache. However, Citrix recommends allocating a little less than half of the memory, because of internal memory dependency. You can run the following command to allocate 1 GB of memory to cache:

  ```
  set cache parameter -memLimit 1024
  ```

- **Is it possible to allocate memory for individual content groups?**

  Yes. Even though you allocate memory for the integrated cache globally by running the `set cache parameter -memlimit<Integer>`, you can allocate memory to individual content groups by running the `set cache <Content_Group_Name> -memLimit <Integer>` command. The maximum memory you can allocate to content groups (combined) cannot exceed the memory you have allocated to the integrated cache.

- **What is the dependency of memory between integrated cache and TCP buffer?**

  If the NetScaler appliance has 2 GB memory, then the appliance reserves approximately 800 to 900 MB of memory and remaining is allocated to FreeBSD operating system. Therefore, you can allocate up to 512 MB of memory to integrated cache and the rest is allocated to TCP buffer.

- **Does it affect the caching process if I do not allocate global memory to the integrated cache?**
If you do not allocate memory to integrated cache, all requests are sent to the server. To make sure that you have allocated memory to the integrated cache, run the show cache parameter command. Actually no objects will be cached if global memory is 0, so this needs to be set first.

**Verification commands**

- **What are the options for displaying cache statistics?**
  
  You can use either of the following options to display the statistics for cache:
  
  - stat cache
    
    To display the summary of the cache statistics.
  
  - stat cache –detail
    
    To display the full details of the cache statistics.

- **What are the options for displaying the cached content?**
  
  To display the cached content, you can run the show cache object command.

- **What is the command that I can run to display the characteristics of an object stored in cache?**
  
  If the object stored in the cache is, for example, GET //10.102.16:80/index.html, you can display the details about the object by running the following command from the NetScaler command line of the appliance:
  
  `show cache object -url '/index.html' -host 10.102.3.96 -port 80`

- **Is it mandatory to specify the group name as a parameter to display the parameterized objects in cache?**
  
  Yes. It is mandatory to specify the group name as a parameter to display the parameterized objects in cache. For example, consider that you have added the following policies with the same rule:

  ```
  1  add cache policy p2 -rule ns_url_path_cgifbin -action CACHE -storeInGroup g1
  2  add cache policy p1 -rule ns_url_path_cgifbin -action CACHE -storeInGroup g2
  ```

  In this case, for the multiple requests, if policy p1 is evaluated, its hit counter is incremented and the policy stores the object in the g1 group, which has hit parameters. Therefore, you have to run the following command to display the objects from the cache:
show cache object -url "/cgi-bin/setCookie.pl" -host 10.102.18.152 groupName g1

Similarly, for another set of multiple requests, if policy p2 is evaluated, its hit counter is incre-mented and the policy stores the object in the g2 group, which does not have hit parameters. Therefore, you have to run the following command to display the objects from the cache:

show cache object -url "/cgi-bin/setCookie2.pl" -host 10.102.18.152

- **I notice that there are some blank entries in the output of the nscachemgr command. What are those entries?**

Consider the following sample output of the nscachemgr command. The blank entries in this output are highlighted in bold face for your reference:

```
1 root@ns# /netscaler/nscachemgr -a
2 //10.102.3.89:80/image8.gif
3 //10.102.3.97:80/staticdynamic.html
4 //10.102.3.97:80/
5 //10.102.3.89:80/image1.gif
6 //10.102.3.89:80/file5.html
7 //10.102.3.96:80/
8 //10.102.3.97:80/bg_logo_segue.gif
9 //10.102.3.89:80/file500.html
10 //10.102.3.92:80/
11 //10.102.3.96:80/cgi-bin/rfc/ccProxyReval.pl
12 Total URLs in IC = 10
```

The blank entries in the output are due to the default caching properties for GET / HTTP/1.1.

**Flushing Objects**

- **How can I flush a selective object from the cache?**

You can identify an object uniquely by its complete URL. To flush such object, you can perform any of the following tasks:

- Flush cache
- Flush content group
- Flush the specific object

To flush the specific object, you have to specify the query parameters. You specify the invalParam parameter to flush the object. This parameter applies only to a query.

- **Does any change in the cache configuration trigger flushing of cache?**

Yes. When you make any changes to the cache configuration, all the SET cache commands inherently flush the appropriate content groups.
I have updated the objects on the server. Do I need to flush the cached objects?

Yes. When you update objects on the server, you must flush the cached objects, or at least the relevant objects and content groups. The integrated cache is not affected by an update to the server. It continues to serve the cached objects until they expire.

Flash Cache

What is Flash Cache feature of the NetScaler appliance?

The phenomenon of Flash crowds occurs when a large number of clients access the same content. The result is a sudden surge in traffic toward the server. The Flash Cache feature enables the NetScaler appliance to improve performance in such situation by sending only one request to the server. All other requests are queued on the appliance and the single response is served to all of the requests. You can use either of the following commands to enable the Fast Cache feature:

- add cache contentGroup <Group_Name> -flashCache YES
- set cache contentGroup <Group_Name> -flashCache YES

What is the limit for Flash Cache clients?

The number of Flash Cache clients depends on the availability of resources on the NetScaler appliance.

Default Behaviour

Does the NetScaler appliance proactively receive objects upon expiry?

The NetScaler appliance never proactively receives objects on expiry. This is true even for the negative objects. The first access after expiry triggers a request to the server.

Does the integrated cache add clients to the queue for serving even before it starts receiving the response?

Yes. The integrated cache adds clients to the queue for serving even before it starts receiving the response.

What is the default value for the Verify cached object using parameter of the cache configuration?

HOSTNAME_AND_IP is the default value.

Does the NetScaler appliance create log entries in the log files?

Yes. The NetScaler appliance creates log entries in the log files.
• Are compressed objects stored in the cache?

Yes. Compressed objects are stored in the cache.

Interoperability with other features

• What happens to objects that are currently stored in cache and are being accessed through SSL VPN?

Objects stored in the cache and accessed regularly are served as cache hits when accessed through SSL VPN.

• What happens to objects stored in the cache when accessed through SSL VPN and later accessed through a regular connection?

The objects stored through the SSL VPN access are served as a hit when accessed through the regular connection.

• When using weblogging, how do I differentiate entries that indicate response served from cache from those served by the server?

For responses served from the integrated cache, the server log field contains the value IC. For responses served from a server, the server log field contains the value sent by the server. Following is a sample log entry for an integrated caching transaction:

“10.102.1.52 - “Mozilla/4.0 (compatible; MSIE 6.0; Windows NT 4.0; .NET CLR 1.0.3705)” “GET /” 200 0 “IC” 10.102.1.45”

Along with a client request, the response logged is the one sent to the client and not necessarily the one sent by the server.

Miscellaneous

• What do you mean by configuring relexpiry and absexpiry?

By configuring relexpiry and absexpiry, it means that you are overriding the header irrespective of what appears in the header. You can configure different expiry setting and the content group level. With relexpiry, expiration of the header is based on the time at which the object was received by the NetScaler. With absexpiry, expiration is based on the time configured on the NetScaler. Relexpiry is configured in terms of seconds. Absexpiry is a time of day.

• What do you mean by configuring weakpos and heuristic?

The weakpos and heuristic are like fall back values. If there is an expiry header, it is considered only if the last-modified header is present. The NetScaler appliance sets expiry on the basis of
the last-modified header and the heuristic parameter. The heuristic expiry calculation determines the time to expiry by checking the last-modified header. Some percentage of the duration since the object was last modified is used as time to expiry. The heuristic of an object that remains unmodified for longer periods of time and is likely to have longer expiry periods. The –heurExpiryParam specifies what percentage value to use in this calculation. Otherwise, the appliance uses the weakpos value.

- **What should I consider before configuring dynamic caching?**

If there is some parameter that is in name-value form and does not have the full URL query, or the appliance receives the parameter in a cookie header or POST body, consider configuring dynamic caching. To configure dynamic caching, you have to configure hitParams parameter.

- **How is hexadecimal encoding supported in the parameter names?**

On the NetScaler appliance, the %HEXHEX encoding is supported in the parameter names. In the names that you specify for hitParams or invalParams, you can specify a name that contains %HEXHEX encoding in the names. For example, name, nam%65, and n%61m%65 are equivalent.

- **What is the process for selecting a hitParam parameter?**

Consider the following excerpt of an HTTP header for a POST request:

```plaintext
POST /data2html.asp?param1=value1&param2=&param3&param4=value4
HTTP/1.1
Accept: image/gif, image/x-xbitmap, image/jpeg, image/pjpeg,
application/vnd.ms-powerpoint, application/vnd.ms-excel,
application/msword, application/x-shockwave-flash, */*
Referer: http://10.102.3.97/forms.html
Accept-Language: en-us
Content-Type: application/x-www-form-urlencoded
Accept-Encoding: gzip, deflate
User-Agent: Mozilla/4.0 (compatible; MSIE 6.0; Windows NT 5.1)
Host: 10.102.3.97
Content-Length: 153
Connection: Keep-Alive
Cache-Control: no-cache
Cookie: ASPSESSIONIDQGQGGRNY=NNLLKDADEENOAFLLCDGFDMO
S1=This+text+is+only+text%2C+not+more+and+not+less%2C+%0D%Ajust+
text+to+be+itself%2C+namely+%22Text%22+to+be+posted+as+text+
+%28what+else...%29&B1=Submit
```

In the above request, you can use S1 and B1, highlighted in bold face for your reference, as hitParams depending on your requirements. Additionally, if you use -matchCookies YES in the ASPSESSIONIDQGQGGRNY content group, then you can also use these parameters as
hitParams.

- **What happens to the queued clients if the response is not cacheable?**
  
  If the response is not cacheable, all of the clients in the queue receive the same response that the first client receives.

- **Can I enable the Poll every time (PET) and Flash Cache features on the same content group?**
  
  No. You cannot enable PET and Flash Cache on the same content group. The integrated cache does not perform AutoPET function on Flash Cache content groups. The PET feature ensures that the integrated cache does not serve a stored object without consulting the server. You can configure PET explicitly for a content group.

- **When are the log entries created for the queued clients?**
  
  The log entries are created for the queued clients soon after the appliance receives the response header. The log entries are created only if the response header does not make the object non-cacheable.

- **What is the meaning of the DNS, HOSTNAME, and HOSTNAME_AND_IP values of the Verify cached object using parameter of the cache configuration?**
  
  The meanings are as follows:
  
  - set cache parameter -verifyUsing HOSTNAME
    This ignores the destination IP address.
  
  - set cache parameter -verifyUsing HOSTNAME_AND_IP
    This matches the destination IP address.
  
  - set cache parameter -verifyUsing DNS
    This uses the DNS server.

- **I have set weakNegRelExpire to 600, which is 10 minutes. I noticed that 404 responses are not getting cached. What is the reason?**
  
  This completely depends on your configuration. By default, 404 responses are cached for 10 minutes. If you want all 404 responses to be fetched form the server, specify –weakNegRelExpire 0. You can fine tune the –weakNegRelExpire to a desired value, such as higher or lower to get the 404 responses cached appropriately. If you have configured –absExpire for positive responses, then it might not yield desired results.

- **When the user accesses the site by using the Mozilla Firefox browser, the updated content is served. However, when the user accesses the site by using the Microsoft Internet Explorer browser, stale content is served. What could be the reason?**
The Microsoft Internet Explorer browser might be taking the content from its local cache instead of the NetScaler integrated cache. The reason could be that the Microsoft Internet Explorer browser is not respecting the expiry related header in the response.

To resolve this issue, you can disable the local cache of the Internet Explorer and clear the offline content. After clearing the offline content, the browser should display the updated content.

• What if Hits are zero?

Check to see if the server time and NS time are in sync. And the weakPosrelexpiry limit set should bear the time difference between NS and server as shown below.

```
root@ns180# date
Tue May 15 18:53:52 IST 2012
```

• Why are policies getting hits but nothing is being cached?

Verify that memory is allocated to the integrated cache and that the allocation is greater than zero.

• Is it possible to zero the cache counters?

There is no command line or GUI option for setting the cache counters to zero, and flushing the cache does not do so either. Rebooting the box automatically sets these counters to zero.

Install, upgrade, and downgrade

January 16, 2019

This is section, you’ll find answers to the following questions. Scroll down to see the answers.

Install and upgrade

• What is the use of the zebos.conf file available in a NetScaler release?

• I want to change the SSH port (22) on the NetScaler appliance to some other port. Is it possible to change the SSH port on the appliance?

• I want to log on to the NetScaler appliance without entering the password. Is it possible to configure SSH on the appliance to allow that?

• What is the procedure to reset the NetScaler appliance BIOS? Under what circumstances should I reset the BIOS?

• I need to reset the NetScaler appliance to the factory defaults. What procedure should I follow?
• The appliance displays a message similar to the “Jun 21 12:20:18 ns /flash/ns-10.0-47.15: [1/2]dc0: NIC hang condition #663: TX 10000/10000, RX 0, HF 0” message on the console. What is the meaning of this message?

• After I upgraded the Citrix ADC release on the appliance, the appliance still displays the earlier release/build. What could be the reason?

• Since I upgraded the Citrix ADC release on the appliance, the LCD display on the front panel of the appliance displays the out of service message or does not display anything. How can I resolve this issue?

• I have upgraded the Citrix ADC release/build. However, after the upgrade process, the appliance fails to start. Can I downgrade the appliance’s software to the previous release/build?

• After upgrading the Citrix ADC release on the appliance, I accidently deleted the kernel file from the /flash directory. As a result, I am not able to start the appliance. Is there a method for starting the appliance in this situation?

• After upgrading the appliance software to Citrix ADC release 10.0, I am not able to log on to the appliance, and the following message is appears:

  login: nsroot Password: connect: No such file or directory nsnet_connect: No such file or directory
  Login incorrect

  I tried to resolve this issue by using the password recovery procedure, but I was not successful. Have I done something incorrectly?

• During an upgrade of a high availability pair, the following message appears repeatedly:

  ns sshd[5035]: error: Invalid username or password
  What could be the reason?

• I want to change the netmask of the NetScaler IP address on a Citrix ADC appliance. Can I do so without causing an outage?

• I have configured a High Availability pair of Citrix ADC appliances. After upgrading the software release from a beta release to a final release, I noticed that some of the appliance configurations are missing. Can I retrieve the lost configurations?

• Can I upgrade a Citrix ADC appliance directly from release 10.0 to 10.5, or should I upgrade to 10.1 first and then to 10.5?

• Can the primary appliance and secondary appliance have separate builds?

• Can both the appliances in an High Availability (HA) pair be upgraded at the same time?

• Does Citrix support firmware upgrades in the amazon AWS cloud?

• Can I upgrade the Citrix ADC instance independently of the SDX version?

• Can I use the FTP server to upgrade the Citrix ADC appliance?
Is the procedure for upgrading the Citrix ADC appliance with GSLB configurations different from an upgrade of an appliance that is not involved in GSLB?

**Downgrade**

- I have received a Citrix ADC appliance with the latest Citrix ADC release installed on it. However, I want to downgrade the software release. Can I do so?
- When downgrading the Citrix ADC release, I followed the instructions. However, the appliance displays the following message:

```bash
root@LBCOL03B# ./installns
installns version (10.0-47.7) kernel (ns-10.0-47.7.gz)
Note:
Installation may pause for up to 3 minutes while data is written to the flash.
Caution:
Do not interrupt the installation process.
Installation will proceed in 5 seconds, CTRL-C to abort
No Valid Netscaler Version Detected
root@LBCOL03B#
```

Am I doing something incorrectly?

- How is the rollback procedure performed on a Citrix ADC appliance?

**Install and upgrade**

- **What is the use of the zebos.conf file available in a NetScaler release?**

A NetScaler appliance uses Zebos as the routing suite. The zebos.conf file available in a NetScaler release is the configuration file for Zebos.

- **I want to change the SSH port (22) on the NetScaler appliance to some other port. Is it possible to change the SSH port on the appliance?**

Yes. You can change the SSH port on the NetScaler appliance by editing the sshd_config file in the /nsconfig directory. If the file does not exist in the /nsconfig directory, copy it from the /etc directory.

In the sshd_config file, edit the entry for Port 22 to Port <Number>, where <Number> is the target port number. If you do not want to restart the appliance and make the changes effective, terminate the ssdh process by using the kill command, and then restart the process.
The flash directory is missing from the NetScaler appliance. What procedure should I follow to mount the flash directory?

To mount the flash directory, do the following:

1. Start the NetScaler appliance in single-user mode.

   When the appliance starts, the following message appears:

   Hit [Enter] to boot immediately, or any other key for command prompt. Booting [kernel] in 10 seconds..." Hit space and you should see the following prompt:

   Type ‘?’ for a list of commands, ‘help’ for more detailed help.

2. Enter the following command to start FreeBSD in single-user mode:

   boot --s

   After the appliance starts, the following message appears:

   Enter full pathname of shell or RETURN for /bin/sh:

3. Press Enter to display the # prompt.

4. Run the following command to mount the flash directory:

   ```
   mount /dev/ad0s1a /flash
   ```

   Note: If the preceding command displays an error message about permissions, run the following command to check the disk for consistency:

   ```
   fsck /dev/ad0s1a
   ```

   Run the mount command again to mount the flash directory.

5. Restart the appliance.

6. From the shell prompt, run the following command to verify that the flash directory is mounted:

   ```
   df -kh
   ```

I want to log on to the NetScaler appliance without entering the password. Is it possible to configure SSH on the appliance to allow that?

Yes. You can configure SSH on the NetScaler appliance to log on without a password. However, you must provide your user name. To configure SSH for logging in without a password, do the following:

1. Run the following command to generate the public and private keys:
# ssh-keygen -t rsa

2. Run the following command to copy the id_rsa.pub file to the .ssh directory of the remote host that you want to log on to:
   
   ```bash
   # scp id_dsa.pub \<user>@\<remote_host>/.ssh/id_dsa.pub
   ```

3. Log on to the remote host.

4. Change to the .ssh directory.

5. Run the following commands to add the public key of the client to the known public keys:
   
   ```bash
   # cat id_dsa.pub >> authorized_keys2
   # chmod 640 authorized_keys2
   # rm id_dsa.pub
   ```

- **What is the procedure to reset the NetScaler appliance BIOS? Under what circumstances should I reset the BIOS?**

To reset BIOS of the NetScaler appliance, complete the following procedure:

1. Connect to the appliance through the serial port.

2. Start the appliance and press Delete as soon as the boot-up process starts. Pressing Delete during the POST process displays the appliance’s BIOS settings.

3. Activate the Exit page of the BIOS settings.

4. Select the Load Optimal Defaults option. The Load Optimal Settings message box appears.

5. Select OK.

6. Make the following changes to the BIOS settings on the various tabs:

   - Tab

7. Activate the Exit page of the BIOS settings.

8. Select Save changes and Exit.

9. Select OK to confirm.

10. Verify that the appliance starts cleanly and the serial console displays output after the appliance starts.
You need to reset BIOS when the serial console does not respond. This usually happens after you upgrade the appliance and the serial console is disabled. However, you can still access the appliance by using the telnet or SSH utility.

I need to reset the NetScaler appliance to the factory defaults. What procedure should I follow?

To reset the NetScaler appliance to the factory defaults, you need to reset two environments: the NetScaler application environment and the base FreeBSD environment. To reset the NetScaler application environment of the appliance to the factory defaults, do the following:

1. Make a backup of the appliance’s /nsconfig/ns.conf.
2. Delete the /nsconfig/ns.conf file.
3. Restart the appliance. To reset the FreeBSD environment of the appliance to the factory defaults, do the following:
   a) Install a fresh NetScaler code image on the appliance. This overwrites a number of FreeBSD-level configuration files with default values.
   b) Delete any users and groups that are added to the appliance, that is, all except the default users.
   c) Delete the /etc/resolv.conf file.
   d) Delete the entries that you have added to the /etc/hosts file.
   e) If the /etc/rc.netcaler file exists, delete it.
   f) Open the /etc/nsperm_group_suser file and make sure that all IOCTL entries are comment entries.
   g) Open the /etc/rc.conf file and make sure that the syslogd_enable=NO entry is not changed to syslogd_enable=YES.
   h) Open the /etc/syslog.conf file and make sure that there are no additional entries in the file.
   i) Delete the contents of the /var/nslog, /var/nstrace, and /var/crash files.
   j) If the syslog process is enabled on the appliance and the appliance creates log files locally, delete the contents of the log files listed in the /etc/syslog.conf file. The files are created in the /var/log directory. For example, if syslog process writes system events to the /var/log/events file, and sslvpn access events to the /var/log/sslvpnevents file, delete these files.

The appliance displays a message similar to the “Jun 21 12:20:18 ns /flash/ns-10.0-47.15: [1/2]dc0: NIC hang condition #663: TX 10000/10000, RX 0, HF 0” message on the console. What is the meaning of this message?

The message consists of the following components (shown here as examples):
- #663: Number of times this condition has occurred on the appliance.
- TX 10000/10000: Number of packets that the appliance attempted to transmit, and number of packets transmitted. If both numbers are the same, as in this example, the NIC transmitted all the packets that the appliance attempted to transmit.
- RX 0: Number of packets received. In this example, no packet was received.
- HF0: Number of hardware issues reported by the NIC. In this example, the NIC did not report any hardware issue.

If the appliance does not receive any packets, it reports a hang condition, because on a network it is very unlikely to not receive any packets. However, if the appliance is plugged into quite interface, you can ignore this error message.

• After I upgraded the NetScaler release on the appliance, the appliance still displays the earlier release/build. What could be the reason?

The appliance displays the software version number from the /flash/boot/loader.conf file. If the kernel entry for the current NetScaler release is missing from that file, the appliance displays the last NetScaler release version for which the entry was available.

To resolve this issue, do the following:

1. Verify that the kernel file exists in the /nsconfig directory.
2. Check the /flash/boot/loader.conf file for an entry for the kernel.
   (You can expect the entry for the kernel of the release/build that you just installed to be missing from the file.)
3. Open the loader.conf file in a text editor, such as the vi editor, and update the kernel entry for the new release/build.
4. Save and close the file.
5. Repeat step 2 through step 4 for the /flash/boot/loader.conf.local file.
6. Update the release/build entry in the ns.conf file.
7. Restart the appliance.

• Since I upgraded the NetScaler release on the appliance, the LCD display on the front panel of the appliance displays the out of service message or does not display anything. How can I resolve this issue?

Run the following command from the appliance’s shell prompt:

```
  /netscaler/nslcd -k
```

• I have upgraded the NetScaler release/build. However, after the upgrade process, the appliance fails to start. Can I downgrade the appliance’s software to the previous release/build?
Yes. You can start the appliance with the kernel.old kernel file. When you restart the appliance, press the F1 key as soon as the appliance console displays the Press F1 message. Type kernel.old and press Enter.

- **After upgrading the NetScaler release on the appliance, I accidentally deleted the kernel file from the /flash directory. As a result, I am not able to start the appliance. Is there a method for starting the appliance in this situation?**

Yes. You can start the appliance by using the kernel.GENERIC kernel file, as follows:

1. When you restart the appliance, press the F1 key as soon as the appliance console displays the Press F1 message.
2. Type kernel.GENERIC and press Enter.
3. Login as the root user.
4. Reinstall the NetScaler release.
5. Restart the appliance.

- **After upgrading the appliance software to NetScaler release 10.0, I am not able to log on to the appliance, and the following message is appears:**

```
1 login: nsroot
2 Password:
3 connect: No such file or directory
4 nsnet_connect: No such file or directory
5 Login incorrect
```

- **I tried to resolve this issue by using the password recovery procedure, but I was not successful. Have I done something incorrectly?**

You cannot resolve this issue by using the password recovery procedure. NetScaler releases 8.0 and later use the new licensing system, based on the Imgrd daemon, which runs during the startup procedure. For this daemon to work properly, the host name of NetScaler appliance, which is set in the /nsconfig/rc.conf file, must be resolved by a name server to the NetScaler IP address. Alternately, you can create a hosts file in the /nsconfig directory and add the 127.0.0.1 <Host_Name> entry in file.

Additionally, make sure that you have copied the license files to the /nsconfig/license/ directory.

- **During an upgrade of a high availability pair, the following message appears repeatedly:**

<auth.err> ns sshd[5035]: error: Invalid username or password

- **What could be the reason?**

This error message appears when the appliances involved in the high availability pairing have either a different NetScaler release or a different builds of the same release installed. The appliances can have different version installed if you have upgraded or downgraded one appliance but not the other.
• I want to change the netmask of the NetScaler IP address on a NetScaler appliance. Can I do so without causing an outage?

Changing the netmask of the NetScaler IP might result in a short outage. Make sure that you change the netmask on the secondary appliance, and then break the high availability pairing. Check the functionality of the appliance. If everything works as expected, rebuild the high availability pairing.

To change the netmask on the appliance, run the configs command from the CLI prompt, and then choose the second option in the menu.

• I have configured a High Availability pair of NetScaler appliances. After upgrading the software release from a beta release to a final release, I noticed that some of the appliance configurations are missing. Can I retrieve the lost configurations?

You can use the following procedure to restore the configuration:

1. Log on to the NetScaler command line of the primary appliance.
2. Run the following commands:

   ```
   1  save config
   2  shell
   3  cp /nsconfig/ns.conf /nsconfig/ns.conf.bkup
   4  The ns.conf.bkup file is a backup for the running configuration.
   ```
3. Upgrade software of both the appliances to the final release.
4. Log on to the NetScaler command line of the primary appliance.

• Can I upgrade a NetScaler appliance directly from release 10.0 to 10.5, or should I upgrade to 10.1 first and then to 10.5?

You can directly upgrade a NetScaler appliance regardless of the version or the build number.

• Can the primary appliance and secondary appliance have separate builds?

Recommended practice is to use the same version and build number on both the primary and the secondary appliance.

• Can both the appliances in an High Availability (HA) pair be upgraded at the same time?

No. In an HA pair, first upgrade the secondary node and then upgrade the primary node.

For details, refer Upgrading a High Availability Pair.
• Does Citrix support firmware upgrades in the amazon AWS cloud?
  Yes.

• Can I upgrade the NetScaler instance independently of the SDX version?
  It is not required to upgrade the SDX version when the NetScaler appliance is upgraded. However, some features might not work.

• Can I use the FTP server to upgrade the NetScaler appliance?
  No. You must first download the firmware from the Citrix download site, save it on your local computer and then upgrade the appliance.

• Is the procedure for upgrading the NetScaler appliance with GSLB configurations different from an upgrade of an appliance that is not involved in GSLB?
  No. The upgrade procedure is similar to the basic upgrade procedure. The only difference is that you can upgrade the standalone or HA appliances on different sites in a phased manner.

Downgrade

• I have received a NetScaler appliance with the latest NetScaler release installed on it. However, I want to downgrade the software release. Can I do so?
  No. If you attempt to downgrade the software release, the appliance might not work as expected, because the ns.conf file of the later release might not be compatible with the earlier release, and the appliance might restore to the factory settings.

• When downgrading the NetScaler release, I followed the instructions. However, the appliance displays the following message:

```bash
root@LBCOL03B# ./installns
installns version (10.0-47.7) kernel (ns-10.0-47.7.gz)
Note:
Installation may pause for up to 3 minutes while data is written to the flash.
Caution:
Do not interrupt the installation process.
Doing so may cause the system to become unusable.
Installation will proceed in 5 seconds, CTRL-C to abort
No Valid Netscaler Version Detected
root@LBCOL03B#
```

• How is the rollback procedure performed on a NetScaler appliance?
  The rollback procedure is similar to the basic upgrade procedure. Select the target build that you want to roll back to and perform the downgrade. Before rolling back to a different release,
Citrix recommends that you create a copy of your current configuration files. To downgrade from a release, see Downgrading a NetScaler Standalone Appliance.

Load Balancing

January 16, 2019

• What are the various load balancing policies I can create on the NetScaler appliance?

You can create the following types of load balancing policies on the NetScaler appliance:

– Least Connections
– Round Robin
– Least response time
– Least bandwidth
– Least packets
– URL hashing
– Domain name hashing
– Source IP address hashing
– Destination IP address hashing
– Source IP - Destination IP hashing
– Token
– LRTM

• Can I achieve the Web farm security by implementing load balancing using the NetScaler appliance?

Yes. You can achieve Web farm security by implementing load balancing using the NetScaler appliance. NetScaler appliance enables you to implement the following options of the load balancing feature:

– IP Address hiding: Enables you to install the actual servers to be on private IP address space for security reasons and for IP address conservation. This process is transparent to the end-user because the NetScaler appliance accepts requests on behalf of the server. While in the address hiding mode, the appliance completely isolates the two networks. Therefore, a client can access a service running on the private subnet, such as FTP or a Telnet server, through a different VIP on the appliance for that service.
– Port Mapping: Enables the actual TCP services to be hosted on non-standard ports for security reasons. This process is transparent to the end-user as the NetScaler appliance accepts requests on behalf of the server on the standard advertised IP address and port number.
• **What are various devices that I can use to load balance with a NetScaler appliance?**

You can load balance following devices with a NetScaler appliance:

- Server farms
- Caches or Reverse Proxies
- Firewall devices
- Intrusion detection systems
- SSL offload devices
- Compression devices
- Content Inspection servers

• **Why should I implement the load balancing feature for the website?**

You can implement the Load balancing feature for the website to take the following advantages:

- Reduce the response time: When you implement the load balancing feature for the website, one of the major benefits is the boost you can look forward to in load time. With two or more servers sharing the load of the web traffic, each of the servers runs less traffic load than a single server alone. This means there are more resources available to fulfill the client requests. This results in a faster website.

- Redundancy: Implementing the load balancing feature introduces a bit of redundancy. For example, if the website is balanced across three servers and one of them does not respond at all, the other two can keep running and the website visitors do not even notice any downtime. Any load balancing solution immediately stops sending traffic to the backend server that is not available.

• **Why do I need to disable the Mac Based Forwarding (MBF) option for Link Load Balancing (LLB)?**

- If you enable the MBF option, the NetScaler appliance considers that the incoming traffic from the client and the outgoing traffic to the same client flow through the same upstream router. However, the LLB feature requires that the best path be chosen for the return traffic. Enabling the MBF option breaks this topology design by sending the outgoing traffic through the router that forwarded the incoming client traffic.

• **What are the various persistence types available on the NetScaler appliance?**

The NetScaler appliance supports the following persistence types:

- Source IP
- Cookie insert
- SSL session ID
- URL passive
- Custom Server ID
- Rule
When I use Firefox to compare two NetScaler configurations, the browser seems to freeze? Firefox will eventually display the differences in the configurations, but the process takes a considerable amount of time if there are more than 1000 differences. Use Chrome for a faster response.

I am using a MAC Safari browser to upgrade a NetScaler appliance. On the upgrade wizard, when I click the Browse button to choose the build file from the appliance, the dialog box does not show any files or folders. Also, when I navigate back to the root folder, the dialog box displays the top level folder, but I cannot browse it. What should I do?

On the Safari browser, click the Settings icon and navigate to Preferences > Security > Manage Website Settings > Java, and then change value of the When visiting other websites setting to Run in unsafe mode.

What should I do before accessing the NetScaler GUI?

Before accessing a new version of the NetScaler software:
- Clear browser cache including cookies.
- Access GUI in browser incognito mode.
- Access GUI in some other browser.
- Uncheck ‘Use software acceleration’ option in setting and restart the browser.
- Access chrome: extensions, uncheck the ‘Enable’ box and restart Chrome browser.

I am using HTTP to access the NetScaler GUI. Which port should I open?

Open TCP port 80 when using HTTP to access the NetScaler GUI.

I am using HTTPS to access the NetScaler GUI. Which port should I open?

Open TCP port 443 when using HTTPS to access the NetScaler GUI.

With which browsers is the NetScaler GUI compatible for different operating systems?

The following table lists the compatible browsers:

<table>
<thead>
<tr>
<th>Operating System</th>
<th>Browser</th>
<th>Versions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows 7</td>
<td>Internet Explorer</td>
<td>8 and 9</td>
</tr>
<tr>
<td>Windows 7</td>
<td>Mozilla Firefox</td>
<td>3.6.25 and above</td>
</tr>
</tbody>
</table>

© 1999-2018 Citrix Systems, Inc. All rights reserved.
<table>
<thead>
<tr>
<th>Windows 7</th>
<th>Chrome</th>
<th>15 and above</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows 64 bit</td>
<td>Internet Explorer</td>
<td>8 and 9</td>
</tr>
<tr>
<td>Windows 64 bit</td>
<td>Chrome</td>
<td>15 and above</td>
</tr>
<tr>
<td>MAC OS</td>
<td>Mozilla Firefox</td>
<td>12 and above</td>
</tr>
<tr>
<td>MAC OS</td>
<td>Safari</td>
<td>5.1.3</td>
</tr>
</tbody>
</table>

**When I access the NetScaler GUI by using Internet Explorer version 8 or 9, the browser displays only a grey bar at the top of the screen. What should I do?**

The browser might be set in compatibility mode. To disable compatibility mode, go to Tools > Compatibility View Settings and clear the Display all websites in Compatibility View check box.

**Even after I disable compatibility mode in Internet Explorer version 8 or 9, the NetScaler GUI does not appear. What should I do?**

Make sure that the browser mode and document mode in the browser are set to the same version. To view the configuration, press F12. Set the values to either Internet Explorer 8 or Internet Explorer 9.

**After logging into the NetScaler appliance, the page appears blank. What should I do?**

Make sure you have disabled the Protected mode in your browser settings. If this is enabled, the JavaScript is causing the NetScaler user interface screen to appear blank.

To disable this option:

1. In your IE browser settings, go to Internet Options.
2. Go to Security tab settings, click Restricted sites zone to disable Enable Protected Mode check box.
3. Click Apply and OK.

**When I access the NetScaler GUI by using Internet Explorer version 9, the utility displays the following error message: “You are not logged in. Please login.” What should I do?**

Make sure that the cookies are not blocked in your Internet Explorer settings. Go to Tools > Internet Options. Click the Privacy tab, and then under Settings, make sure that the slider is set to Medium or any lower value.

**SSL**

January 16, 2019

Click here for FAQs about SSL.
Information and Communication Technology (ICT) is about bringing the Internet user closer to the apps and data. The latest datacenter technologies have enabled the user, apps and data to be located anywhere. A user can access apps and data from the office or from home, or from a location such as an airport. The apps and data can be located either on the enterprise’s premises, in a public or private cloud, or on a hybrid host. The result has been on only increased productivity, but also reduced costs of ownership and maintenance.

Service providers offer the core infrastructure needed for carrying the user’s apps and data over the network. Because the core infrastructure serves millions of subscribers and a wide variety of apps and data, requirements for scale and protocol support are very high. The core infrastructure handles two major types of traffic: data plane and control plane. Each of these planes has its own scale and protocol-support requirements.

The data plane is the part of the core infrastructure that carries user apps and data from end to end, that is, between end-user equipment and the application server. The number of users accessing apps and data is in the thousands of millions, so throughput and IP-addressing requirements are very high. Every user in the network must be uniquely identifiable. Only then can the service provider control the traffic, monitor network usage, deliver user-specific services, and log information correctly. Many of the today’s client devices and application servers support IPv6 natively. The core infrastructure must not only support a mix of IPv4 and IPv6 clients and servers, but also provide the technologies for cross-communication between IPv4 and IPv6. Finally, a service provider is measured by the quality of service (directly related to end-user experience) and the availability of service without disruptions. The data plane should be resilient enough to provide both quality and availability at the same time.

The control-plane infrastructure manages user traffic and maintains the business and network operations services. The most important of the many protocols that run in this plane are Diameter, Radius, and SMPP. Diameter is a base protocol over which several other function-specific protocols have been developed. For example:

- Gx interface between the Policy and Charging Enforcement Function (PCEF) and the Policy and Charging Rules Function (PCRF)
- Gy interface between the Online Charging System (OCS) and the Cisco Packet Data Network Gateway (PGW)/Policy and Charging Enforcement Function (PCEF)

The volume of control plane traffic is in direct proportion to user activity. To manage the control plane traffic, service providers use several ADC functionalities, such as load balancing and content switching. They need fine-grain control of control plane traffic, which equals data-plane traffic in complexity. Service providers must meet demanding service-level agreements (SLAs), and are scrutinized thor-
NetScaler 11.1

oughly by regulators for compliance. Adhering to requirements while managing the data and control plane traffic requires a service provider to keep its infrastructure nimble, within budget, easily upgradable, and flexible. As the most powerful and advanced ADCs in the market today, NetScaler ADC products are a natural fit for the service-provider environment.

Large Scale NAT

January 6, 2019

Note

This feature is available with a NetScaler enterprise or platinum edition license.

The Internet's phenomenal growth has resulted in a shortage of public IPv4 addresses. Large Scale NAT (LSN/CGNAT) provides a solution to this issue, maximizing the use of available public IPv4 addresses by sharing a few public IPv4 addresses among a large pool of Internet users.

LSN translates private IPv4 addresses into public IPv4 addresses. It includes network address and port translation methods to aggregate many private IP addresses into fewer public IPv4 addresses. LSN is designed to handle NAT on a large scale. The NetScaler LSN feature is very useful for Internet Service Providers (ISPs) and carriers providing millions of translations to support a large number of users (subscribers) and at very high throughput.

LSN Architecture

The LSN architecture of an ISP using Citrix products consists of subscribers (Internet users) in private address spaces accessing the Internet through a NetScaler appliance deployed in ISP’s core network. Subscribers are connected to the ISP through the ISP’s access network. Usually, subscribers for commercial use of the Internet are directly connected to the ISP’s access network. Serving those subscribers requires only one level of NAT (NAT44).

Noncommercial subscribers, however, are typically behind customer-premises equipment (CPE), such as routers and modems, that also implements NAT. These two levels of NAT create the NAT444 model. Deploying a NetScaler appliance in an ISP’s core network for LSN functionality is transparent to the subscribers and requires no configuration changes to subscribers or the CPEs.

The NetScaler appliance receives all subscriber packets destined to the Internet. The appliance is configured with a pool of pre-defined NAT IP addresses to use for LSN. The NetScaler appliance uses its LSN feature to translate the source IP address (private) and port of the packet to the NAT IP address (public) and NAT port, and then sends the packet to its destination on the Internet.
NetScaler 11.1

maintains a record of all active sessions that use the LSN feature. These sessions are called LSN sessions. The NetScaler appliance also maintains the mappings between subscriber IP address and port, and NAT IP address and port, for each session. These mappings are called LSN mappings. From LSN sessions and LSN mappings, the NetScaler appliance recognizes a response packet (received from the Internet) belonging to a particular session. The appliance translates the destination IP address and port of the response packet from NAT IP address:port to the subscriber IP address:port, and sends the translated packet to the subscriber.

**LSN Features Supported on NetScaler appliance**

The following describes some of the LSN features supported on NetScaler appliance:

**NAT Resource Allocation**

The NetScaler appliance allocates NAT IP addresses and ports, from its pre-defined NAT resource pool, to subscribers to translate their packets for transmission to external hosts (Internet). The NetScaler appliance supports the following types of NAT IP address and port allocation for subscribers:

- **Deterministic.** The NetScaler appliance allocates a NAT IP address and a block of ports to each subscriber. The appliance sequentially allocates NAT resources to these subscribers. It assigns the first block of ports on the beginning NAT IP address to the beginning subscriber IP address. The next range of ports is assigned to the next subscriber, and so on, until the NAT address does not have enough ports for the next subscriber. At that point, the first port block on the next NAT address is assigned to the subscriber, and so on.

  The NetScaler appliance logs the allocated NAT IP address and the port block for a subscriber. For a connection, a subscriber can be identified just by its mapped NAT IP address and port block. Because of this reason, the NetScaler appliance does not log any LSN session created or deleted. If the entire block of ports is being used, the NetScaler appliance drops any new connection from the subscriber.

- **Dynamic.** The NetScaler appliance allocates a random NAT IP address and a port from the LSN NAT pool for a subscriber’s connection. When port block allocation is enabled in the configuration, the appliance allocates a random NAT IP address and a block of ports for a subscriber when it initiates a connection for the first time. The NetScaler appliance then allocates this NAT IP address and one of the ports from the allocated block to each subsequent connection from this subscriber. If the entire block of ports is being used, the appliance allocates a new random port block to the subscriber when it initiates a new connection. One of the port in the new port block is allocated for the new connection.
IP Pooling

The following NAT resource allocation options are available for subsequent sessions of a subscriber who was allocated a random NAT IP address and port for an existing session.

- **Paired.** The NetScaler appliance allocates the same NAT IP address for all sessions associated with the same subscriber. When no more ports are available for that address, the appliance drops any new connections from the subscriber. This option is needed for proper functioning of certain applications that require creation of multiple sessions on the same source IP address (for example in peer-to-peer applications that use RTP or RTCP protocol.

- **Random.** The NetScaler appliance allocates random NAT IP addresses, from the pool, for different sessions associated with the same subscriber.

Reusing LSN Mappings

The NetScaler appliance can reuse an existing LSN map for new connections originating from the same subscriber IP address and port. The NetScaler LSN feature supports the following types of LSN mapping reuse:

1. **Endpoint Independent.** The NetScaler appliance reuses the LSN mapping for subsequent packets sent from the same subscriber IP address and port (X:x) to any external IP address and port. This type of LSN map reuse is useful for proper functioning of VOIP and peer-to-peer applications.

2. **Address dependent.** The NetScaler appliance reuses the LSN mapping for subsequent packets sent from the same subscriber IP address and port (X:x) to the same external IP address (Y), regardless of the external port.

3. **Address port dependent.** The NetScaler appliance reuses the LSN mapping for subsequent packets sent from the same internal IP address and port (X:x) to the same external IP address and port (Y:y) while the mapping is still active.

LSN Filtering

The NetScaler appliance can filter packets from external hosts based on the active LSN sessions and LSN mappings. Consider an example of an LSN mapping that includes the mapping of subscriber IP:port (X:x), NAT IP:port (N:n), and external host IP:port (Y:y). The NetScaler LSN feature supports the following types of filtering:

1. **Endpoint Independent.** The NetScaler appliance filters out only those packets that are not destined to NAT IP:port (N:n), which represents subscriber IP:port (X:x), regardless of the external host IP address and port source (Z:z). The NetScaler appliance forwards any packets destined
to X:x. In other words, sending packets from the subscriber to any external IP address is sufficient to allow packets from any external host to the subscriber. This type of filtering is useful for proper functioning of VOIP and peer-to-peer applications.

2. **Address dependent.** The NetScaler appliance filters out packets not destined to NAT IP:port (N:n), which represents subscriber IP:port (X:x). In addition, the appliance filters out packets from external host IP address and port (Y:y) destined for N:n if the subscriber has not previously sent packets to Y:anyp (external port independent). In other words, receiving packets from a specific external host requires that the subscriber first send packets to that specific external host's IP address.

3. **Address port dependent.** The NetScaler appliance filters out packets not destined to NAT IP:port (N:n), which represents subscriber IP:port (X:x). In addition, the appliance filters out packets from external host IP address and port (Y:y) destined for N:n if the subscriber has not previously sent packets to Y:y. In other words, receiving packets from a specific external host requires that the subscriber first send packets to that specific external IP address and port.

**Quotas**

The NetScaler appliance can limit the number of NAT ports and sessions for each subscriber to ensure fair distribution of resources among subscribers. The NetScaler appliance can also limit the number of session for a subscriber group to ensure fair distribution of resources among different subscriber groups.

- **Port quota.** The NetScaler appliance can limit the LSN NAT ports to be used at a time by each subscriber for a specified protocol. For example, you could limit each subscriber to a maximum of 500 TCP NAT ports. When the LSN NAT mappings for a subscriber reach the limit, the NetScaler appliance does not allocate additional NAT ports of the specified protocol to that subscriber.

- **Subscriber Session Limit.** The number of concurrent session for a subscriber can be more than it port quota. The NetScaler appliance can limit the LSN sessions allowed for each subscriber for a specified protocol. When the number of LSN sessions reaches the limit for a subscriber, the NetScaler appliance does not allow the subscriber to open additional sessions of the specified protocol.

- **Group Session Limit.** The NetScaler appliance can limit the total number of LSN sessions allowed for a subscriber group for a specified protocol. When the total number of LSN sessions reaches the limit for a group for a specified protocol, the NetScaler appliance does not allow any subscriber of the group to open additional sessions of the specified protocol. For example, You limit a group to a maximum of 10000 UDP sessions. When the total number of UDP sessions for this group reaches 10000, the NetScaler appliance does not allow any subscriber of the group to open additional UDP sessions.
Application Layer Gateways

For some Application layer protocols, the IP addresses and protocol port numbers are also communicated in the packet’s payload. Application Layer Gateway for a protocol parses the packet’s payload and does necessary changes to ensure that the protocol continues to work over LSN.

The NetScaler appliance supports ALG for the following protocols:

- FTP
- ICMP
- TFTP
- PPTP
- SIP
- RTSP

Hairpin Support

The NetScaler appliance supports communication between subscribers or internal hosts using NAT IP addresses. This type of communication between two subscribers using NAT IP addresses is called hairpin flow. Hairpin flow is enabled by default, and you cannot disable it.

Points to Consider before Configuring LSN

December 18, 2018

Consider the following points before configuring LSN on a NetScaler appliance:

- Make sure that you understand the different components of Large Scale NAT, described in RFCs 6888, 5382, 5508, and 4787.
- Endpoint independent mapping (EIM) and endpoint independent filtering (EIF) are disabled by default. These options must be enabled for proper functioning of VoIP and peer-to-peer (P2P) applications.
- **Logging LSN**: Following are the consideration points for logging LSN information:
  - Citrix recommends logging the LSN information on external log servers instead of on the NetScaler appliance. Logging on external servers facilitates optimal performance when the appliance creates large numbers of LSN log entries (in order of millions).
  - Citrix recommends using SYSLOG over TCP, or NSLOG. By default SYSLOG uses UDP, and NSLOG uses only TCP to transfer log information to the log servers. TCP is more reliable than UDP for transferring complete data.
  - The following limitations apply to SYSLOG over TCP:
* The Syslog over TCP solution does not provide authentication, integrity check, and privacy.
* The NetScaler appliance relies on the TCP protocol to provide confirmation of SYSLOG message delivery to external log servers.

- **High Availability**: Following are the consideration points for high availability of NetScaler appliances for LSN:
  - Citrix recommends configuring the LSN feature in a high availability deployment of two NetScaler appliances for uninterrupted and seamless operation of all LSN sessions.
  - In a high availability deployment, Citrix recommends:
    * Setting the SYNC VLAN parameter for dedicating a VLAN for all HA related communication.
    * Synchronizing the symmetric RSS key of the primary node to the secondary node for stateful synchronization of a large number of LSN mappings and sessions.
    * Binding the subnet of LSN IP addresses to a VLAN to avoid flooding of GARP broadcasts on all VLANs after a failover.
  - In a high availability deployment of NetScaler appliances, ALG-related sessions are not mirrored to the secondary appliance.

- **Application Layer Gateways (ALGs)**: Following are the consideration points related for ALGs on a NetScaler appliance:
  - The following are not supported for SIP ALG:
    * Multicast IP addresses
    * Encrypted SDP
    * SIP messages over TLS
    * FQDN translation in SIP messages
    * Authentication of SIP messages
    * Traffic domains, admin partitions, and NetScaler clusters.
    * SIP messages with multipart bodies.
  - The following are not supported for RTSP ALG:
    * Multicast RTSP sessions
    * RTSP session over UDP
    * NetScaler traffic domains, admin partitions, and NetScaler clusters.
  - The NetScaler appliance does not support ALG for the IPSec protocol.

- If you disable the LSN feature when some LSN sessions exist on the NetScaler appliance, these sessions continue to exist for the duration of the configured timeout interval.
- LSN takes precedence over RNAT. If a packet from a specified LSN subscriber also matches a RNAT rule, the packet is translated according to the LSN configuration.
- Forwarding of packets related only to the LSN sessions is based on the NetScaler appliance’s routing table.
- Unlike with subnet IP addresses, selection of an LSN NAT IP address for a subscriber’s connec-
tion is not based on the routing entry for the destination IP address.

- For inbound packets, static LSN mappings take precedence over dynamic LSN mappings.
- For outbound packets, LSN application profiles take precedence over static mapping.
- When a large number of LSN sessions (> 1 million) exist on the NetScaler appliance, Citrix recommends displaying selected LSN sessions instead of all of them. In the command line interface or the configuration utility, use the selection parameters for showing LSN session operation.
- LSN is not supported in a NetScaler cluster.
- To reduce the amount of active memory allocated to the LSN feature, you must warm restart the NetScaler appliance after changing the configured-memory setting. Without a warm restart, you can only increase the amount of active memory.

**Configuration Steps for LSN**

December 18, 2018

Configuring LSN on a NetScaler appliance consists of the following tasks:

1. **Set the global LSN parameters.** Global parameters include the amount of NetScaler memory reserved for the LSN feature and synchronization of LSN sessions in a high availability setup.

2. **Create an LSN client entity and bind subscribers to it.** An LSN client entity is a set of subscribers on whose traffic you want the NetScaler appliance to perform LSN. The client entity includes IPv4 addresses and extended ACL rules for identifying subscribers. An LSN client can be bound to only one LSN group. The command line interface has two commands for creating an LSN client entity and binding a subscriber to the LSN client entity. The configuration utility combines these two operations on a single screen.

3. **Create an LSN pool and bind NAT IP addresses to it.** An LSN pool defines a pool of NAT IP addresses to be used by the NetScaler appliance to perform LSN. The pool is assigned parameters, such as port block allocation and NAT type (Deterministic or Dynamic). An LSN pool bound to an LSN group applies to all subscribers of an LSN client entity bound to the same group. Only LSN Pools and LSN groups with the same NAT type settings can be bound together. Multiple LSN pools can be bound to an LSN group. For Dynamic NAT, an LSN pool can be bound to multiple LSN groups. For Deterministic NAT, pools bound to an LSN group cannot be bound to other LSN groups. The command line interface has two commands for creating an LSN pool and binding NAT IP addresses to the LSN pool. The configuration utility combines these two operations on a single screen.

4. **(Optional) Create an LSN Transport Profile for a specified protocol.** An LSN transport profile defines various timeouts and limits, such as maximum LSN sessions and maximum ports usage, that a subscriber can have for a given protocol. You bind an LSN transport profile for each protocol (TCP, UDP, and ICMP) to an LSN group. A profile can be bound to multiple LSN
groups. A profile bound to an LSN group applies to all subscribers of an LSN client bound to the same group. By default, one LSN transport profile with default settings for TCP, UDP, and ICMP protocols is bound to an LSN group during its creation. This profile is called default transport profile. An LSN transport profile that you bind to an LSN group overrides the default LSN transport profile for that protocol.

5. **(Optional) Create an LSN Application Profile for a specified protocol and bind a set of destination ports to it.** An LSN application profile defines the LSN mapping and LSN filtering controls of a group for a given protocol and for a set of destination ports. For a set of destination ports, you bind an LSN profile for each protocol (TCP, UDP, and ICMP) to an LSN group. A profile can be bound to multiple LSN groups. An LSN application profile bound to an LSN group applies to all subscribers of an LSN client bound to the same group. By default, one LSN application profile with default settings for TCP, UDP, and ICMP protocols for all destination ports is bound to an LSN group during its creation. This profile is called a default application profile. When you bind an LSN application profile, with a specified set of destination ports, to an LSN group, the bound profile overrides the default LSN application profile for that protocol at that set of destination ports. The command line interface has two commands for creating an LSN application profile and binding a set of destination ports to the LSN application profile. The configuration utility combines these two operations on a single screen.

6. **Create an LSN Group and bind LSN pools, (optional) LSN transport profiles, and (optional) LSN application profiles to the LSN group.** An LSN group is an entity consisting of an LSN client, LSN pool(s), LSN transport profile(s), and LSN application profile(s). A group is assigned parameters, such as port block size and logging of LSN sessions. The parameter settings apply to all the subscribers of an LSN client bound to the LSN group. Only LSN Pools and LSN groups with the same NAT type settings can be bound together. Multiple LSN pools can be bound to an LSN group. For Dynamic NAT, an LSN pool can be bound to multiple LSN groups. For Deterministic NAT, pools bound to an LSN group cannot be bound to other LSN groups. Only one LSN client entity can be bound to an LSN group, and an LSN client entity bound to an LSN group cannot be bound to other LSN groups. The command line interface has two commands for creating an LSN group and binding LSN pools, LSN transport profiles, LSN application profiles to the LSN group. The configuration utility combines these two operations in a single screen.

The following table lists the maximum numbers of different LSN entities and bindings that can be created on a NetScaler appliance. These limits are also subject to memory available on the NetScaler appliance.

### Configuration Using the Command Line Interface

**To create an LSN client by using the command line interface**

At the command prompt, type:

```bash
1 add lsn client <clientname>
2
3 show lsn client
```

**To bind a network address or an ACL rule to an LSN client by using the command line interface**

At the command prompt, type:

```bash
1 bind lsn client <clientname> ((-network <ip_addr> [-netmask <netmask>] [^-td<positive_integer>]) | -aclname <string>)
2
```
To create an LSN pool by using the command line interface

At the command prompt, type:

```bash
add lsn pool <poolname> [-nattype ( DYNAMIC | DETERMINISTIC ) ] [-portblockallocation ( ENABLED | DISABLED ) ] [-portrealloctimeout < secs>] [-maxPortReallocTmq <positive_integer>]
```

2
3 show lsn pool

To bind an IP address range to an LSN pool by using the command line interface

At the command prompt, type:

```bash
bind lsn pool <poolname> <lsnip>
```

2
3 show lsn pool

Note: For removing LSN IP addresses from an LSN pool, use the unbind lsn pool command.

To create an LSN transport profile by using the command line interface

At the command prompt, type:

```bash
add lsn transportprofile <transportprofilename> <transportprotocol> [-sessiontimeout <secs>] [-finrsttimeout <secs>] [-portquota < positive_integer>] [-sessionquota <positive_integer>] [-portpreserveparity ( ENABLED | DISABLED ) ] [-portpreserverange ( ENABLED | DISABLED ) ] [-syncheck ( ENABLED | DISABLED ) ]
```

2
3 show lsn transportprofile

To create an LSN application profile by using the command line interface

At the command prompt, type:

```bash
add lsn appsprofile <appsprofilename> <transportprotocol> [-ippooling ( PAIRED | RANDOM ) ] [-mapping <mapping>] [-filtering <filtering>] [-tcpproxy ( ENABLED | DISABLED ) ] [-td <positive_integer>]```
To bind an application protocol port range to an LSN application profile by using the command line interface

At the command prompt, type:

```
bind lsn appsprofile <appsprofilename> <lsnport>
```

To create an LSN group by using the command line interface

At the command prompt, type:

```
add lsn group <groupname> -clientname <string> [-nattype (DYNAMIC | DETERMINISTIC)] [-portblocksize <positive_integer>] [-logging (ENABLED | DISABLED)] [-sessionLogging (ENABLED | DISABLED)] [-sessionSync (ENABLED | DISABLED)] [-snmptraplimit <positive_integer>] [-ftp (ENABLED | DISABLED)]
```

To bind LSN profiles and LSN pools to an LSN group by using the command line interface

At the command prompt, type:

```
bind lsn group <groupname> (-poolname <string> | -transportprofilename <string> | -appsprofilename <string>)
```

Configuration Using the Configuration Utility

To configure an LSN client and bind an IPv4 network address or an ACL rule by using the configuration utility

Navigate to **System > Large Scale NAT > Clients**, and add a client and then bind an IPv4 network address or an ACL rule to the client.
To configure an LSN pool and bind NAT IP addresses by using the configuration utility

Navigate to System > Large Scale NAT > Pools, and add a pool and then bind an NAT IP address or a range of NAT IP addresses to the pool.

To configure an LSN transport profile by using the configuration utility

1. Navigate to System > Large Scale NAT > Profiles.
2. On the details pane, click Transport tab, and then add a transport profile.

To configure an LSN application profile by using the configuration utility

1. Navigate to System > Large Scale NAT > Profiles.
2. On the details pane, click Application tab, and then add an application profile.

To configure an LSN group and bind an LSN client, pools, transport profiles, and application profiles by using the configuration utility

Navigate to System > Large Scale NAT > Groups, and add a group and then bind an LSN client, pools, transport profiles, and application profiles to the group.

Parameter Descriptions (of commands listed in the CLI procedure)

- add lsn client
  - clientname

  Name for the LSN client entity. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN client is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “lsn client1” or ‘lsn client1’).

  This is a mandatory argument. Maximum Length: 127

Parameter Descriptions (of commands listed in the CLI procedure)

- bind lsn client
  - clientname

  Name for the LSN client entity. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN client is created. The following requirement applies only to the CLI: If the name
includes one or more spaces, enclose the name in double or single quotation marks (for example, “lsn client1” or ‘lsn client1’).

This is a mandatory argument. Maximum Length: 127

- network
  IPv4 address(es) of the LSN subscriber(s) or subscriber network(s) on whose traffic you want the NetScaler appliance to perform Large Scale NAT.

- netmask
  Subnet mask for the IPv4 address specified in the Network parameter.
  Default value: 255.255.255.255

- td
  ID of the traffic domain on which this subscriber or the subscriber network (as specified by the network parameter) belongs.
  If you do not specify an ID, the subscriber or the subscriber network becomes part of the default traffic domain.
  Default value: 0
  Minimum value: 0
  Maximum value: 4094

- aclname
  Name(s) of any configured extended ACL(s) whose action is ALLOW. The condition specified in the extended ACL rule identifies the traffic from an LSN subscriber for which the NetScaler appliance is to perform large scale NAT. Maximum Length: 127

**Parameter Descriptions (of commands listed in the CLI procedure)**

- add lsn pool
  - poolname
    Name for the LSN pool. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:) at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN pool is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “lsn pool1” or ‘lsn pool1’).
    This is a mandatory argument. Maximum Length: 127
- **nattype**

  Type of NAT IP address and port allocation (from the LSN pools bound to an LSN group) for subscribers (of the LSN client entity bound to the LSN group):

  Available options function as follows:

  * **Deterministic**—Allocate a NAT IP address and a block of ports to each subscriber (of the LSN client bound to the LSN group). The NetScaler appliance sequentially allocates NAT resources to these subscribers. The NetScaler appliance assigns the first block of ports (block size determined by the port block size parameter of the LSN group) on the beginning NAT IP address to the beginning subscriber IP address. The next range of ports is assigned to the next subscriber, and so on, until the NAT address does not have enough ports for the next subscriber. In this case, the first port block on the next NAT address is used for the subscriber, and so on. Because each subscriber now receives a deterministic NAT IP address and a block of ports, a subscriber can be identified without any need for logging. For a connection, a subscriber can be identified based only on the NAT IP address and port, and the destination IP address and port.

  * **Dynamic**—Allocate a random NAT IP address and a port from the LSN NAT pool for a subscribers connection. If port block allocation is enabled (in LSN pool) and a port block size is specified (in the LSN group), the NetScaler appliance allocates a random NAT IP address and a block of ports for a subscriber when it initiates a connection for the first time. The appliance allocates this NAT IP address and a port (from the allocated block of ports) for different connections from this subscriber. If all the ports are allocated (for different subscribers connections) from the subscribers allocated port block, the appliance allocates a new random port block for the subscriber. Only LSN Pools and LSN groups with the same NAT type settings can be bound together. Multiple LSN pools can be bound to an LSN group.

  Possible values: DYNAMIC, DETERMINISTIC

  Default value: DYNAMIC

- **portblockallocation**

  Allocate a random NAT port block, from the available NAT port pool of an NAT IP address, for each subscriber when the NAT allocation is set as Dynamic NAT. For any connection initiated from a subscriber, the NetScaler appliance allocates a NAT port from the subscribers allocated NAT port block to create the LSN session.

  You must set the port block size in the bound LSN group. For a subscriber, if all the ports are allocated from the subscribers allocated port block, the NetScaler appliance allocates a new random port block for the subscriber.
For Deterministic NAT, this parameter is enabled by default, and you cannot disable it.

Possible values: ENABLED, DISABLED

Default value: DISABLED

- **portrealloctimeout**

  The waiting time, in seconds, between deallocating LSN NAT ports (when an LSN mapping is removed) and reallocating them for a new LSN session. This parameter is necessary in order to prevent collisions between old and new mappings and sessions. It ensures that all established sessions are broken instead of redirected to a different subscriber. This is not applicable for ports used in:

  * Deterministic NAT
  * Address-Dependent filtering and Address-Port-Dependent filtering
  * Dynamic NAT with port block allocation

  In these cases, ports are immediately reallocated.

  Default value: 0
  
  Maximum value: 600

- **maxPortReallocTmq**

  Maximum number of ports for which the port reallocation timeout applies for each NAT IP address. In other words, the maximum deallocated-port queue size for which the reallocation timeout applies for each NAT IP address.

  When the queue size is full, the next port deallocated is reallocated immediately for a new LSN session.

  Default value: 65536
  
  Maximum value: 65536

**Parameter Descriptions (of commands listed in the CLI procedure)**

- **bind lsn pool**

  - **poolname**

    Name for the LSN pool. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN pool is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “lsn pool!” or ‘lsn pool!’).
This is a mandatory argument. Maximum Length: 127

- lsnip

IPv4 address or a range of IPv4 addresses to be used as NAT IP address(es) for LSN.

After the pool is created, these IPv4 addresses are added to the NetScaler appliance as NetScaler owned IP address of type LSN. An LSN IP address associated with an LSN pool cannot be shared with other LSN pools. IP addresses specified for this parameter must not already exist on the NetScaler appliance as any NetScaler owned IP addresses. In the command line interface, separate the range with a hyphen. For example: 10.102.29.30-10.102.29.189. You can later remove some or all the LSN IP addresses from the pool, and add IP addresses to the LSN pool.

Parameter Descriptions (of commands listed in the CLI procedure)

- add lsn transportprofile
  - transportprofilename

Name for the LSN transport profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN transport profile is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “lsn transport profile1” or ‘lsn transport profile1’).

This is a mandatory argument. Maximum Length: 127

- transportprotocol

Protocol for which to set the LSN transport profile parameters.

This is a mandatory argument.

Possible values: TCP, UDP, ICMP

- sessiontimeout

Timeout, in seconds, for an idle LSN session. If an LSN session is idle for a time that exceeds this value, the NetScaler appliance removes the session.

This timeout does not apply for a TCP LSN session when a FIN or RST message is received from either of the endpoints.

Default value: 120

Minimum value: 60
- finrsttimeout

Timeout, in seconds, for a TCP LSN session after a FIN or RST message is received from one of the endpoints.

If a TCP LSN session is idle (after the NetScaler appliance receives a FIN or RST message) for a time that exceeds this value, the NetScaler appliance removes the session.

Since the LSN feature of the NetScaler appliance does not maintain state information of any TCP LSN sessions, this timeout accommodates the transmission of the FIN or RST, and ACK messages from the other endpoint so that both endpoints can properly close the connection.

Default value: 30

- portquota

Maximum number of LSN NAT ports to be used at a time by each subscriber for the specified protocol. For example, each subscriber can be limited to a maximum of 500 TCP NAT ports. When the LSN NAT mappings for a subscriber reach the limit, the NetScaler appliance does not allocate additional NAT ports for that subscriber.

Default value: 0
Minimum value: 0
Maximum value: 65535

- sessionquota

Maximum number of concurrent LSN sessions allowed for each subscriber for the specified protocol. When the number of LSN sessions reaches the limit for a subscriber, the NetScaler appliance does not allow the subscriber to open additional sessions.

Default value: 0
Minimum value: 0
Maximum value: 65535

- portpreserveparity

Enable port parity between a subscriber port and its mapped LSN NAT port. For example, if a subscriber initiates a connection from an odd numbered port, the NetScaler appliance allocates an odd numbered LSN NAT port for this connection. You must set this parameter for proper functioning of protocols that require the source port to be even or odd numbered, for example, in peer-to-peer applications that use RTP or RTCP protocol.

Possible values: ENABLED, DISABLED

Default value: DISABLED
- portpreserverange
  If a subscriber initiates a connection from a well-known port (0-1023), allocate a NAT port
  from the well-known port range (0-1023) for this connection. For example, if a subscriber
  initiates a connection from port 80, the NetScaler appliance can allocate port 100 as the
  NAT port for this connection.

  This parameter applies to dynamic NAT without port block allocation. It also applies to
  Deterministic NAT if the range of ports allocated includes well-known ports.

  When all the well-known ports of all the available NAT IP addresses are used in different
  subscribers connections (LSN sessions), and a subscriber initiates a connection from a
  well-known port, the NetScaler appliance drops this connection.

  Possible values: ENABLED, DISABLED

  Default value: DISABLED

- syncheck
  Silently drop any non-SYN packets for connections for which there is no LSN-NAT session
  present on the NetScaler appliance.

  If you disable this parameter, the NetScaler appliance accepts any non-SYN packets and
  creates a new LSN session entry for this connection.

  Following are some reasons for the NetScaler appliance to receive such packets:

  * LSN session for a connection existed but the NetScaler appliance removed this ses-
    sion because the LSN session was idle for a time that exceeded the configured session
    timeout.
  * Such packets can be a part of a DoS attack.

  Possible values: ENABLED, DISABLED

  Default value: ENABLED

Parameter Descriptions (of commands listed in the CLI procedure)

- add lsn appsprofile

  - appsprofilename

  Name for the LSN application profile. Must begin with an ASCII alphanumeric or under-
  score (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), pe-
  riod (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed
  after the LSN application profile is created. The following requirement applies only to the
  CLI: If the name includes one or more spaces, enclose the name in double or single quota-
  tion marks (for example, “lsn application profile1” or ‘lsn application profile1’).
This is a mandatory argument. Maximum Length: 127

- transportprotocol
  Name of the protocol for which the parameters of this LSN application profile applies.
  This is a mandatory argument.
  Possible values: TCP, UDP, ICMP

- ippooling
  NAT IP address allocation options for sessions associated with the same subscriber.
  Available options function as follows:
  * Paired—The NetScaler appliance allocates the same NAT IP address for all sessions associated with the same subscriber. When all the ports of a NAT IP address are used in LSN sessions (for same or multiple subscribers), the NetScaler appliance drops any new connection from the subscriber.
  * Random—The NetScaler appliance allocates random NAT IP addresses, from the pool, for different sessions associated with the same subscriber.

  This parameter is applicable to dynamic NAT allocation only.
  Possible values: PAIRED, RANDOM
  Default value: RANDOM

- mapping
  Type of LSN mapping to apply to subsequent packets originating from the same subscriber IP address and port.

  Consider an example of an LSN mapping that includes the mapping of the subscriber IP:port (X:x), NAT IP:port (N:n), and external host IP:port (Y:y).
  Available options function as follows:
  * ENDPOINT-INDEPENDENT—Reuse the LSN mapping for subsequent packets sent from the same subscriber IP address and port (X:x) to any external IP address and port.
  * ADDRESS-DEPENDENT—Reuse the LSN mapping for subsequent packets sent from the same subscriber IP address and port (X:x) to the same external IP address (Y), regardless of the external port.
  * ADDRESS-PORT-DEPENDENT—Reuse the LSN mapping for subsequent packets sent from the same internal IP address and port (X:x) to the same external IP address and port (Y:y) while the mapping is still active.

  Possible values: ENDPOINT-INDEPENDENT, ADDRESS-DEPENDENT, ADDRESS-PORT-DEPENDENT
Default value: ADDRESS-PORT-DEPENDENT

- filtering

Type of filter to apply to packets originating from external hosts.

Consider an example of an LSN mapping that includes the mapping of subscriber IP:port (X:x), NAT IP:port (N:n), and external host IP:port (Y:y).

Available options function as follows:

* **ENDPOINT INDEPENDENT**—Filters out only packets not destined to the subscriber IP address and port X:x, regardless of the external host IP address and port source (Z:z). The NetScaler appliance forwards any packets destined to X:x. In other words, sending packets from the subscriber to any external IP address is sufficient to allow packets from any external hosts to the subscriber.

* **ADDRESS DEPENDENT**—Filters out packets not destined to subscriber IP address and port X:x. In addition, the appliance filters out packets from Y:y destined for the subscriber (X:x) if the client has not previously sent packets to Y:anyp (external port independent). In other words, receiving packets from a specific external host requires that the subscriber first send packets to that specific external host’s IP address.

* **ADDRESS PORT DEPENDENT** (the default)—Filters out packets not destined to subscriber IP address and port (X:x). In addition, the NetScaler appliance filters out packets from Y:y destined for the subscriber (X:x) if the subscriber has not previously sent packets to Y:y. In other words, receiving packets from a specific external host requires that the subscriber first send packets first to that external IP address and port.

Possible values: ENDPOINT-INDEPENDENT, ADDRESS-DEPENDENT, ADDRESS-PORT-DEPENDENT

Default value: ADDRESS-PORT-DEPENDENT

- tcp proxy

Enable TCP proxy, which enables the NetScaler appliance to optimize the TCP traffic by using Layer 4 features.

Possible values: ENABLED, DISABLED

Default value: DISABLED

- td

ID of the traffic domain through which the NetScaler appliance sends the outbound traffic after performing LSN.

If you do not specify an ID, the appliance sends the outbound traffic through the default traffic domain, which has an ID of 0.
Default value: 65535
Maximum value: 65535

Parameter Descriptions (of commands listed in the CLI procedure)

- bind lsn appsprofile
  - appsprofilename
  Name for the LSN application profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN application profile is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “lsn application profile1” or ‘lsn application profile1’).
  This is a mandatory argument. Maximum Length: 127

- lsnport
  Port numbers or range of port numbers to match against the destination port of the incoming packet from a subscriber. When the destination port is matched, the LSN application profile is applied for the LSN session. Separate a range of ports with a hyphen. For example, 40-90.

Parameter Descriptions (of commands listed in the CLI procedure)

- add lsn group
  - groupname
  Name for the LSN group. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN group is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “lsn group1” or ‘lsn group1’).
  This is a mandatory argument. Maximum Length: 127

- clientname
  Name of the LSN client entity to be associated with the LSN group. You can associate only one LSN client entity with an LSN group. You cannot remove this association or replace with another LSN client entity once the LSN group is created.
This is a mandatory argument. Maximum Length: 127

- nattype

Type of NAT IP address and port allocation (from the bound LSN pools) for subscribers:

Available options function as follows:

* **Deterministic**—Allocate a NAT IP address and a block of ports to each subscriber (of the LSN client bound to the LSN group). The NetScaler appliance sequentially allocates NAT resources to these subscribers. The NetScaler appliance assigns the first block of ports (block size determined by the port block size parameter of the LSN group) on the beginning NAT IP address to the beginning subscriber IP address. The next range of ports is assigned to the next subscriber, and so on, until the NAT address does not have enough ports for the next subscriber. In this case, the first port block on the next NAT address is used for the subscriber, and so on. Because each subscriber now receives a deterministic NAT IP address and a block of ports, a subscriber can be identified without any need for logging. For a connection, a subscriber can be identified based only on the NAT IP address and port, and the destination IP address and port.

* **Dynamic**—Allocate a random NAT IP address and a port from the LSN NAT pool for a subscriber's connection. If port block allocation is enabled (in LSN pool) and a port block size is specified (in the LSN group), the NetScaler appliance allocates a random NAT IP address and a block of ports for a subscriber when it initiates a connection for the first time. The appliance allocates this NAT IP address and a port (from the allocated block of ports) for different connections from this subscriber. If all the ports are allocated (for different subscribers connections) from the subscribers allocated port block, the appliance allocates a new random port block for the subscriber.

Possible values: DYNAMIC, DETERMINISTIC

Default value: DYNAMIC

- portblocksize

Size of the NAT port block to be allocated for each subscriber.

To set this parameter for Dynamic NAT, you must enable the port block allocation parameter in the bound LSN pool. For Deterministic NAT, the port block allocation parameter is always enabled, and you cannot disable it.

In Dynamic NAT, the NetScaler appliance allocates a random NAT port block, from the available NAT port pool of an NAT IP address, for each subscriber. For a subscriber, if all the ports are allocated from the subscribers allocated port block, the appliance allocates a new random port block for the subscriber.

- logging
Log mapping entries and sessions created or deleted for this LSN group. The NetScaler appliance logs LSN sessions for this LSN group only when both logging and session logging parameters are enabled.

The appliance uses its existing syslog and audit log framework to log LSN information. You must enable global level LSN logging by enabling the LSN parameter in the related NSLOG action and SYLOG action entities. When the Logging parameter is enabled, the NetScaler appliance generates log messages related to LSN mappings and LSN sessions of this LSN group. The appliance then sends these log messages to servers associated with the NSLOG action and SYSLOG actions entities.

A log message for an LSN mapping entry consists of the following information:

- NSIP address of the NetScaler appliance
- Time stamp
- Entry type (MAPPING or SESSION)
- Whether the LSN mapping entry is created or deleted
- Subscriber’s IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID might be present, depending on the following conditions:
  - Destination IP address and port are not logged for Endpoint-Independent mapping
  - Only Destination IP address (and not port) is logged for Address-Dependent mapping
  - Destination IP address and port are logged for Address-Port-Dependent mapping

Possible values: ENABLED, DISABLED
Default value: DISABLED

- sessionLogging

Log sessions created or deleted for the LSN group. The NetScaler appliance logs LSN sessions for this LSN group only when both logging and session logging parameters are enabled.

A log message for an LSN session consists of the following information:

- NSIP address of the NetScaler appliance
- Time stamp
- Entry type (MAPPING or SESSION)
- Whether the LSN session is created or removed
- Subscriber’s IP address, port, and traffic domain ID
* NAT IP address and port
* Protocol name
* Destination IP address, port, and traffic domain ID

Possible values: ENABLED, DISABLED
Default value: DISABLED

– sessionSync

In a high availability (HA) deployment, synchronize information of all LSN sessions related to this LSN group with the secondary node. After a failover, established TCP connections and UDP packet flows are kept active and resumed on the secondary node (new primary).

For this setting to work, you must enable the global session synchronization parameter.

Possible values: ENABLED, DISABLED
Default value: ENABLED

– snmptraplimit

Maximum number of SNMP Trap messages that can be generated for the LSN group in one minute.

Default value: 100
Minimum value: 0
Maximum value: 10000

– ftp

Enable Application Layer Gateway (ALG) for the FTP protocol. For some application-layer protocols, the IP addresses and protocol port numbers are usually communicated in the packets payload. When acting as an ALG, the appliance changes the packets payload to ensure that the protocol continues to work over LSN.

**Note:** The NetScaler appliance also includes ALG for ICMP and TFTP protocols. ALG for the ICMP protocol is enabled by default, and there is no provision to disable it. ALG for the TFTP protocol is disabled by default. ALG is enabled automatically for an LSN group when you bind a UDP LSN application profile, with endpoint-independent-mapping, endpoint-independent filtering, and destination port as 69 (well-known port for TFTP), to the LSN group.

Possible values: ENABLED, DISABLED
Default value: ENABLED
Parameter Descriptions (of commands listed in the CLI procedure)

- bind lsn group
  - groupname
  
  Name for the LSN group. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN group is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “lsn group1” or ‘lsn group1’).
  
  This is a mandatory argument. Maximum Length: 127

- poolname

  Name of the LSN pool to bind to the specified LSN group. Only LSN Pools and LSN groups with the same NAT type settings can be bound together. Multiples LSN pools can be bound to an LSN group.

  For Deterministic NAT, pools bound to an LSN group cannot be bound to other LSN groups. For Dynamic NAT, pools bound to an LSN group can be bound to multiple LSN groups.
  
  Maximum Length: 127

- transportprofilename

  Name of the LSN transport profile to bind to the specified LSN group. Bind a profile for each protocol for which you want to specify settings.

  By default, one LSN transport profile with default settings for TCP, UDP, and ICMP protocols is bound to an LSN group during its creation. This profile is called a default transport.

  An LSN transport profile that you bind to an LSN group overrides the default LSN transport profile for that protocol. Maximum Length: 127

- appsprofilename

  Name of the LSN application profile to bind to the specified LSN group. For each set of destination ports, bind a profile for each protocol for which you want to specify settings.

  By default, one LSN application profile with default settings for TCP, UDP, and ICMP protocols for all destination ports is bound to an LSN group during its creation. This profile is called a default application profile.

  When you bind an LSN application profile, with a specified set of destination ports, to an LSN group, the bound profile overrides the default LSN application profile for that protocol at that set of destination ports. Maximum Length: 127
Sample LSN Configurations

December 18, 2018

The following are examples of configuring LSN through command line interface.

Create a simple LSN configuration with a single subscriber network, single LSN NAT IP address, and default settings:

```
add lsn client LSN-CLIENT-1
Done
bind lsn client LSN-CLIENT-1 -network 192.0.2.0 -netmask 255.255.255.0
Done
add lsn pool LSN-POOL-1
Done
bind lsn pool LSN-POOL-1 203.0.113.3
Done
add lsn group LSN-GROUP-1 -clientname LSN-CLIENT-1
Done
bind lsn group LSN-GROUP-1 -poolname pool1 LSN-POOL-1
Done
```

Create an LSN configuration with an extended ACL for identifying LSN subscribers:

```
add ns acl LSN-ACL-2 ALLOW -srcIP 192.0.2.10-192.0.2.20
Done
apply acls
Done
add lsn client LSN-CLIENT-2
```
Create an LSN configuration with endpoint-independent mapping for HTTP protocol (port 80) and address-port dependent mapping for SSH protocol (port 22). Also, restrict each subscriber to use a maximum of 1000 NAT ports for TCP protocol and 100 NAT ports for UDP protocol. Restrict each subscriber to have a maximum of 2000 concurrent sessions for TCP protocol. Restrict the group to have a maximum of 30000 concurrent sessions for TCP protocol:
<table>
<thead>
<tr>
<th>Line</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>17</td>
<td><code>add lsn group LSN-GROUP-3 -clientname LSN-CLIENT-3</code></td>
</tr>
<tr>
<td>18</td>
<td><code>Done</code></td>
</tr>
<tr>
<td>19</td>
<td><code>bind lsn group LSN-GROUP-3 -poolname LSN-POOL-3</code></td>
</tr>
<tr>
<td>20</td>
<td><code>Done</code></td>
</tr>
<tr>
<td>21</td>
<td><code>add lsn appsprofile LSN-APPS-HTTPPROFILE-3 TCP -mapping ENDPOINT-INDEPENDENT</code></td>
</tr>
<tr>
<td>22</td>
<td><code>Done</code></td>
</tr>
<tr>
<td>23</td>
<td><code>bind lsn appsprofile LSN-APPS-HTTPPROFILE-3 80</code></td>
</tr>
<tr>
<td>24</td>
<td><code>Done</code></td>
</tr>
<tr>
<td>25</td>
<td><code>bind lsn group LSN-GROUP-3 -applicationprofilenname LSN-APPS-HTTPPROFILE-3</code></td>
</tr>
<tr>
<td>26</td>
<td><code>Done</code></td>
</tr>
<tr>
<td>27</td>
<td><code>add lsn appsprofile LSN-APPS-SSHPROFILE-3 TCP -mapping ADDRESS-PORT-DEPENDENT</code></td>
</tr>
<tr>
<td>28</td>
<td><code>Done</code></td>
</tr>
<tr>
<td>29</td>
<td><code>bind lsn appsprofile LSN-APPS-SSHPROFILE-3 22</code></td>
</tr>
<tr>
<td>30</td>
<td><code>Done</code></td>
</tr>
<tr>
<td>31</td>
<td><code>bind lsn group LSN-GROUP-3 -applicationprofilenname LSN-APPS-SSHPROFILE-3</code></td>
</tr>
<tr>
<td>32</td>
<td><code>Done</code></td>
</tr>
<tr>
<td>33</td>
<td><code>add lsn transportprofile LSN-TRANS-PROFILE-TCP-3 TCP -portquota 1000 -sessionquota 2000 -groupSessionLimit 30000</code></td>
</tr>
<tr>
<td>34</td>
<td><code>Done</code></td>
</tr>
<tr>
<td>35</td>
<td><code>bind lsn group LSN-GROUP-3 -transportprofilenname LSN-TRANS-PROFILE-TCP-3</code></td>
</tr>
<tr>
<td>36</td>
<td><code>Done</code></td>
</tr>
</tbody>
</table>
Create an LSN configuration for a large set of subscribers:

```
add lsn transportprofile LSN-TRANS-PROFILE-UDP-3 UDP -portquota 100
Done
bind lsn group LSN-GROUP-3 -transportprofilename LSN-TRANS-PROFILE-UDP-3
Done

add lsn client LSN-CLIENT-4
Done
bind lsn client LSN-CLIENT-4 -network 192.0.4.0 -netmask 255.255.255.0
Done
bind lsn client LSN-CLIENT-4 -network 192.0.5.0 -netmask 255.255.255.0
Done
bind lsn client LSN-CLIENT-4 -network 192.0.6.0 -netmask 255.255.255.0
Done
bind lsn client LSN-CLIENT-4 -network 192.0.7.0 -netmask 255.255.255.0
Done
bind lsn client LSN-CLIENT-4 -network 192.0.8.0 -netmask 255.255.255.0
Done
add lsn pool LSN-POOL-4
Done
bind lsn pool LSN-POOL-4 203.0.113.30-203.0.113.40
Done
bind lsn pool LSN-POOL-4 203.0.113.45-203.0.113.50
```
Create an LSN configuration with sharing of NAT resources among multiple LSN groups. In this example, LSN pool LSN-POOL-5 is shared with LSN groups LSN-GROUP-5 and LSN-GROUP-6:

```
add lsn client LSN-CLIENT-5
Done
bind lsn client LSN-CLIENT-5 -network 192.0.15.0 -netmask 255.255.255.0
Done
add lsn pool LSN-POOL-5
Done
bind lsn pool LSN-POOL-5 203.0.113.12-203.0.113.14
```
NetScaler 11.1

Create an LSN configuration with deterministic NAT resource allocation:

```plaintext
14
15  Done
16
17  add lsn group LSN-GROUP-5 -clientname LSN-CLIENT-5
18
19  Done
20
21  bind lsn group LSN-GROUP-5 -poolname LSN-POOL-5
22
23  Done
24
25  add lsn client LSN-CLIENT-6
26
27  Done
28
29  bind lsn client LSN-CLIENT-6 -network 192.0.16.0 -netmask 255.255.255.0
30
31  Done
32
33  add lsn pool LSN-POOL-6
34
35  Done
36
37  bind lsn pool LSN-POOL-6 203.0.113.15-203.0.113.18
38
39  Done
40
41  add lsn group LSN-GROUP-6 -clientname LSN-CLIENT-6
42
43  Done
44
45  bind lsn group LSN-GROUP-6 -poolname LSN-POOL-6
46
47  Done
48
49  bind lsn group LSN-GROUP-6 -poolname LSN-POOL-5
50
51  Done
```

© 1999-2018 Citrix Systems, Inc. All rights reserved.
Create an LSN configuration with multiple subscriber networks having the same network address but each network belonging to a different traffic domain. Also, restrict the outbound traffic related to HTTP protocol (port 80), sending it through a particular traffic domain (td 5):

```
add lsn client LSN-CLIENT-7 -network 192.0.17.0 -netmask 255.255.255.0
Done

add lsn pool LSN-POOL-7 -nattype DETERMINISTIC
Done

bind lsn pool LSN-POOL-7 203.0.113.19-203.0.113.23
Done

add lsn group LSN-GROUP-7 -clientname LSN-CLIENT-7 -nattype DETERMINISTIC -portblocksize 1024
Done

bind lsn group LSN-GROUP-7 -poolname LSN-POOL-7
Done
```

```
add lsn client LSN-CLIENT-8
Done

bind lsn client LSN-CLIENT-8 -network 192.0.18.0 -netmask 255.255.255.0 -td 1
Done

bind lsn client LSN-CLIENT-8 -network 192.0.18.0 -netmask 255.255.255.0 -td 2
Done

bind lsn client LSN-CLIENT-8 -network 192.0.18.0 -netmask 255.255.255.0 -td 3
Done

add lsn pool LSN-POOL-8
```
Create an LSN configuration that restricts the outbound traffic of a specific protocol (TCP), sending it through a particular traffic domain (td 5). With endpoint-independent filtering, receive inbound traffic related to this protocol (TCP) on any traffic domain:

```
add lsn client LSN-CLIENT-9
  Done
bind lsn client LSN-CLIENT-9 -network 192.0.9.0 -netmask 255.255.255.0 -td 1
  Done
add lsn pool LSN-POOL-9
  Done
```
Create an LSN configuration that restricts outbound HTTP (port 80) traffic, sending it through a particular traffic domain (td 10). With address-dependent filtering, receive inbound traffic related to this protocol (HTTP) on the specified traffic domain (td 10):

```plaintext
add lsn client LSN-CLIENT-10
Done
bind lsn client LSN-CLIENT-10 -network 192.0.10.0 -netmask 255.255.255.0 -td 1
Done
add lsn pool LSN-POOL-10
Done
bind lsn pool LSN-POOL-10 203.0.113.100
Done
add lsn group LSN-GROUP-10 -clientname LSN-CLIENT-10
Done
```
Configuring Static LSN Maps

December 18, 2018

The NetScaler appliance supports manual creation of a one-to-one LSN mapping between a subscriber IP address:port and a NAT IP address:port. Static LSN mappings are useful in cases where you want to ensure that the connections initiated to a NAT IP:Port maps to the subscriber IP address:Port. For example, Web servers located in the internal network.

To create a static LSN mapping by using the command line interface

At the command prompt, type:

```
add lsn static <name> <transportprotocol> <subscrIP> <subscrPort> [-td <positive_integer>] [natIP] [natPort] [-destIP <ip_addr> [-dsttd <positive_integer>]]
```

To create a static LSN mapping by using the configuration utility

Navigate to System > Large Scale NAT > Static, and add a new static mapping.
**Parameter Descriptions (of commands listed in the CLI procedure)**

**add lsn static name**

Name for the LSN static mapping entry. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN group is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “lsn static1” or ‘lsn static1’). This is a mandatory argument. Maximum Length: 127

**transportprotocol**

Protocol for the LSN mapping entry. This is a mandatory argument. Possible values: TCP, UDP, ICMP

**subscrIP**

IPv4 address of an LSN subscriber for the LSN mapping entry. This is a mandatory argument.

**subscrPort**

Port of the LSN subscriber for the LSN mapping entry. This is a mandatory argument. Maximum value: 65535

**td**

ID of the traffic domain to which the subscriber belongs. If you do not specify an ID, the subscriber is assumed to be a part of the default traffic domain. Default value: 0, Minimum value: 0, Maximum value: 4094

**natIP**

IPv4 address, already existing on the NetScaler appliance as type LSN, to be used as NAT IP address for this mapping entry.

**natPort**

NAT port for this LSN mapping entry.
destIP

Destination IP address for the LSN mapping entry.

dsttd

ID of the traffic domain through which the destination IP address for this LSN mapping entry is reachable from the NetScaler appliance. If you do not specify an ID, the destination IP address is assumed to be reachable through the default traffic domain, which has an ID of 0. Default value: 0, Minimum value: 0, Maximum value: 4094

Wildcard Port Static Maps

A static mapping entry is usually a one-to-one LSN mapping between a subscriber IP address:port and a NAT IP address:port. A one-to-one static LSN mapping entry exposes only one port of the subscriber to the Internet.

Some situations might require exposing all ports (64K) of a subscriber to the Internet (for example, a server hosted on an internal network and running a different service on each port). To make these internal services accessible through the Internet, you have to expose all the ports of the server to the Internet.

One way to meet this requirement is to add 64K one-to-one static mapping entries, one mapping entry for each port. Creating 64K entries is very cumbersome and a big task. Also, this large number of configuration entries might lead to performance issues in the NetScaler appliance.

Another simple method is to use wildcard ports in a static mapping entry. You just need to create one static mapping entry with NAT-port and subscriber-port parameters set to the wildcard character (*), and the protocol parameter set to ALL, to expose all the ports of a subscriber to the Internet. For a subscriber’s inbound or outbound connections matching a wildcard static mapping entry, the subscriber’s port does not change after the NAT operation.

When a subscriber-initiated connection to the Internet matches a wildcard static mapping entry, the NetScaler appliance assigns a NAT port that has the same number as the subscriber port from which the connection is initiated. Similarly, an Internet host gets connected to a subscriber’s port by connecting to the NAT port that has the same number as the subscriber’s port.

Configuring the NetScaler appliance to Provide Access to All Ports of an IPv4 Subscriber

To configure the NetScaler appliance to provide access to all ports of an IPv4 subscriber, create a wildcard static map with the following mandatory parameter settings:
In a wildcard static map, unlike in a one-to-one static map, setting the NAT IP parameter is mandatory. Also, the NAT IP address assigned to a wildcard static map cannot be used for any other subscribers.

To create a wildcard static map by using the command line interface:

At the command prompt, type:

```bash
1 add lsn static <name> ALL <subscrIP> * <natIP> * [-td <positive_integer>] [-destIP <ip_addr> [-dsttd <positive_integer>]]
2
3 show lsn static
```

Sample Configuration

In the following sample configuration of a wildcard static map, all ports of a subscriber whose IP address is 192.0.2.10 are made accessible through NAT IP 203.0.113.33.

Sample configuration:

```bash
1 add lsn static NAT44-WILDCARD-STATIC-1 ALL 192.0.2.10 * 203.0.113.33 *
2
3 Done
```

Configuring Application Layer Gateways

December 18, 2018

For some Application layer protocols, the IP addresses and protocol port numbers are also communicated in the packet’s payload. Application Layer Gateway for a protocol parses the packet’s payload and does necessary changes to ensure that the protocol continues to work over LSN.

The NetScaler appliance supports ALG for the following protocols:

- FTP
- ICMP
- TFTP
- PPTP
- SIP
- RTSP
Application Layer Gateway for FTP, ICMP, and TFTP Protocols

December 18, 2018

You can enable or disable ALG for the FTP protocol for an LSN configuration by enabling or disabling the FTP option of the LSN group of the LSN configuration.

ALG for the ICMP protocol is enabled by default, and there is no provision to disable it.

ALG for the TFTP protocol is disabled by default. TFTP ALG is enabled automatically for an LSN configuration when you bind a UDP LSN application profile, with endpoint-independent-mapping, endpoint-independent filtering, and destination port as 69 (well-known port for TFTP), to the LSN group.

**Sample LSN Configuration for FTP ALG:**
In the following sample LSN configuration, FTP ALG is enabled for subscribers that have IP address in the range 192.0.2.30-192.0.2.100.

```plaintext
1  add ns acl LSN-ACL-1 ALLOW -srcIP 192.0.2.30-192.0.2.100
2   Done
3
4  apply acls
5   Done
6
7  add lsn client LSN-CLIENT-1
8   Done
9
10 bind lsn client LSN-CLIENT-1 - aclname LSN-ACL
11   Done
12
13 add lsn pool LSN-POOL-1
14   Done
15
16 bind lsn pool LSN-POOL-1 203.0.113.10
17   Done
18
19 add lsn group LSN-GROUP-1 - clientname LSN-CLIENT-1 - FTP ENABLED
20   Done
21```
Sample LSN Configuration for TFTP ALG:

In the following sample LSN configuration, endpoint-independent mapping and endpoint-independent filtering are enabled for TFTP protocol (UDP port 69). The NetScaler appliance automatically enables TFTP ALG for this LSN configuration.

```
add lsn client LSN-CLIENT-2
Done
bind lsn client LSN-CLIENT-2 -network 198.51.100.0 -netmask 255.255.255.0
Done
add lsn pool LSN-POOL-2
Done
bind lsn pool LSN-POOL-2 203.0.113.10-203.0.113.11
Done
add lsn group LSN-GROUP-2 -clientname LSN-CLIENT-2
Done
bind lsn group LSN-GROUP-2 -poolname pool1 LSN-POOL-2
Done
add lsn appsprofile LSNAPPSPROFILE-TFTP-2 UDP -mapping ENDPOINT-INDEPENDENT -filtering ENDPOINT-INDEPENDENT
Done
bind lsn appsprofile LSNAPPSPROFILE-TFTP-2 69
Done
bind lsn group LSN-GROUP-1 -applicationprofilename LSNAPPSPROFILE-TFTP
```
Application Layer Gateway for PPTP Protocol

December 18, 2018

The NetScaler appliance supports Application Layer Gateways (ALGs) for the Point-to-Point Tunneling Protocol (PPTP).

PPTP is a network protocol that enables secure transfer of data from a remote client to an enterprise server by creating a tunnel across TCP/IP-based data networks. PPTP encapsulates PPP packets into IP packets for transmission over the Internet. PPTP establishes a tunnel for each communicating PPTP network server (PNS)-PPTP Access Concentrator (PAC) pair. After the tunnel is set up, enhanced generic routing encapsulation (GRE) is used to exchange PPP packets. A call ID in the GRE header indicates the session to which a particular PPP packet belongs.

The NetScaler appliance recognizes PPTP packets that arrive on the default TCP port, 1723. The appliance parses PPTP control packets, translates the call ID, and assigns a NAT IP address. For two-way data communication between the client and server, the NetScaler appliance creates an LSN session entry based on the server call ID, and an LSN session based on the client call ID. The appliance then parses the GRE data packets and translates call IDs on the basis of the two LSN session entries.

For PPTP protocol, the NetScaler appliance also includes timeout setting for any idle PPTP LSN sessions. If a PPTP LSN session is idle for a time that exceeds the timeout setting, the NetScaler appliance removes the session.

**Limitations:**

The following are the limitations of PPTP ALG on a NetScaler appliance:

- PPTP ALG is not supported for hairpin LSN flow.
- PPTP ALG is not supported to work with any RNAT configuration.
- PPTP ALG is not supported in NetScaler clusters.

**Configuring PPTP ALG**

Configuring PPTP ALG on the NetScaler appliance consist of the following tasks:

- Create an LSN configuration and enable PPTP ALG on it. In an LSN configuration, the LSN group includes the PPTP ALG setting. For instructions on creating an LSN configuration, see Configuration Steps for LSN.
NetScaler 11.1

- (Optional) Set the global timeout for idle PPTP LSN sessions.

To enable PPTP ALG for an LSN configuration by using the CLI

At the command prompt, type:

```
1 add lsn group <groupname> -clientname <string> [-pptp ( ENABLED | DISABLED )]
2
3 show lsn group
```

To set the global timeout for idle PPTP LSN sessions by using the CLI

At the command prompt, type:

```
1 set appAlgParam -pptpGreIdleTimeout <positive_integer>
2
3 show appAlgParam
```

Example:

In the following sample LSN configuration, PPTP ALG is enabled for subscribers in the 192.0.2.0/24 network.

Also idle PPTP LSN session timeout is set to 200 secs.

```
1 add lsn client LSN-CLIENT-1
2
3 Done
4
5 bind lsn client LSN-CLIENT-1 -network 192.0.2.0 -netmask 255.255.255.0
6
7 Done
8
9 add lsn pool LSN-POOL-1
10
11 Done
12
13 bind lsn pool LSN-POOL-1 203.0.113.3
14
15 Done
16
17 add lsn group LSN-GROUP-1 -clientname LSN-CLIENT-1 -pptp ENABLED
18
```

Using Large Scale NAT (LSN) with Session Initiation Protocol (SIP) is complicated, because SIP messages contain IP addresses in the SIP headers as well as in the SIP body. When LSN is used with SIP, the SIP headers contain information about the caller and the receiver, and the device translates this information to hide it from the outside network. The SIP body contains the Session Description Protocol (SDP) information, which includes IP addresses and port numbers for transmission of the media.

SIP ALG adheres to the following RFCs:

- RFC 3261
- RFC 3581
- RFC 4566
- RFC 4475

How SIP ALG Works

How IP address translation is performed depends on the type and direction of the message. A message can be any of the following:

- Inbound request
- Outbound response
- Outbound request
- Inbound response

For an outgoing message, the private IP address and port number of the SIP client are replaced with the NetScaler owned public IP address and port number, called the LSN pool IP address and port number, specified during LSN configuration. For an incoming message, the LSN pool IP address and the
NetScaler 11.1

Port number are replaced with the private address of the client. If the message contains any public IP addresses, the NetScaler SIP ALG retains them. Also, a pinhole is created on the:

- LSN pool IP address and port on behalf of the private client, so that the messages that arrive at this IP address and port from the public network are treated as SIP messages.
- Public IP address and port on behalf of the public clients, so that the messages that arrive at this IP address and port from the private network are treated as SIP messages.

When a SIP message is sent out across the network, the SIP Application Layer Gateway (ALG) collects information from the message and translates the IP addresses in the following headers into LSN pool IP addresses:

- Via
- Contact
- Route
- Record-Route

In the following sample SIP request message, LSN replaces the IP addresses in the header fields to hide them from the outside network.

```
INVITE adam@10.102.185.156 SIP/2.0 Via: SIP/2.0/UDP 192.170.1.161:62914 From: eve@10.120.210.3 To: adam@10.102.185.156 Call-ID: a12abcde@10.120.210.3 Contact: adam@10.102.185.156 Route: <sip:netscreen@10.150.20.3:5060> Record-Route: <sip:netscreen@10.150.20.3:5060>
```

When a message containing SDP information arrives, the SIP ALG collects information from the message and translates the IP addresses in the following fields into LSN pool IP addresses and port numbers:

- c= (connection information)

  This field can appear at the session or media level. It appears in the following format:

  ```
c=<network-type><address-type><connection-address>
```

  If the destination IP address is a unicast IP address, the SIP ALG creates pinholes by using the IP address and port numbers specified in the m= field.

- m= (media announcement)

  This field appears at the media level and contains the description of the media. It appears in the following format:

  ```
m=<media><port><transport><fmt_list>
```

- a= (information about the media field)

  This field can appear at the session or media level, in the following format:

  ```
a=<attribute>
```
The following excerpt from a sample SDP section shows the fields that are translated for resource allocation.

\[ a=<\text{attribute}>:\langle\text{value}\rangle \]

\begin{align*}
o &= \text{user} \ 2344234 \ 55234434 \ \text{IN IP4} \ 10.150.20.3 \\
c &= \text{IN IP4} \ 10.150.20.3 \\
m &= \text{audio} \ 43249 \ \text{RTP/AVP} \ 0
\end{align*}

The following table shows how SIP payload is translated.

**Limitations of SIP ALG**

A SIP ALG has the following limitations:

- Only SDP payload is supported.
- The following are not supported:
  - Multicast IP addresses
  - Encrypted SDP
  - SIP TLS
  - FQDN translation
  - SIP layer authentication
  - TD/partitioning/cluster
  - Multipart body
  - SIP messages over IPv6 network
  - Line folding

**Tested SIP Clients and Proxy Servers**

The following SIP clients and proxy server have been tested with SIP ALG:

- **SIP Clients:** X-Lite, Zoiper, Ekiga, Avaya
- **Proxy Server:** openSIPS

**LSN SIP Scenario: SIP Proxy Outside the Private Network (Public Network)**

**SIP Client Registration**

For a typical SIP call, SIP client must register with the SIP registrar by composing a REGISTER request and sending it to the SIP registrar. The NetScaler appliance’s SIP ALG intercepts the request, replaces the IP address and port number in the request with the LSN pool IP address and port number provided.
in the LSN configuration, and forwards the request to the SIP registrar. The SIP ALG then opens a pinhole in the NetScaler configuration to allow further SIP communication between the SIP client and the SIP registrar. The SIP registrar sends a 200 OK response to the SIP client over the LSN pool IP address and port number. The NetScaler appliance captures this response in the pinhole, and the SIP ALG replaces the SIP header, putting the original Contact, Via, Route, and Record-Route SIP fields back into the message. The SIP ALG then forwards the message to the SIP client. The following figure shows how SIP ALG uses LSN in a SIP call registration flow.

**Outgoing Calls**

A SIP call is initiated with a SIP INVITE message sent from the internal to the external network. The SIP ALG performs NAT on the IP addresses and port numbers in the Via, Contact, Route, and Record-Route SIP header fields, replacing them with the LSN pool IP address and port number. LSN stores these mappings for subsequent SIP messages in the SIP call. The SIP ALG then opens separate pinholes in the NetScaler configuration to allow SIP and media through the NetScaler appliance on the dynamically assigned ports specified in the SDP and SIP headers. When a 200 OK message arrives at the NetScaler, it is captured by one of the created pinholes. The SIP ALG replaces the SIP header, restoring the original Contact, Via, Route, and Record-Route SIP fields, and then forwards the message to the internal SIP client.

**Incoming Calls**

A SIP incoming call is initiated with a SIP INVITE message from the external client to the internal network. The SIP registrar forwards the INVITE message to the SIP client in the internal network, using the pinhole that was created when the Internal SIP client registered with the SIP registrar.

The SIP ALG performs NAT on the LSN IP addresses and port numbers in the Via, Contact, Route, and Record-Route SIP header fields, translating them to the IP address and port number of the internal SIP client, and forwards the request to the SIP client. When the 200 OK response message sent by the internal SIP client arrives at the NetScaler appliance, the SIP ALG performs NAT on the IP addresses and port numbers in the Via, Contact, Route, and Record-Route SIP header fields, translating them to the LSN pool IP address and port number, forwards the response message to the SIP registrar, and then opens a pinhole in the outbound direction for further SIP communication.

**Call Termination**

The BYE message terminates a call. When the device receives a BYE message, it translates the header fields in the message just as it does for any other message. But because a BYE message must be acknowledged by the receiver with a 200 OK, the ALG delays call teardown for 15 seconds to allow time for transmission of the 200 OK.
Call Between Clients in the Same Network

When both client A and client B in the same network initiate a call, the SIP messages are routed through the SIP proxy in the outside network. The SIP ALG processes the INVITE from client A as a normal outgoing call. Since client B is in the same network, the SIP proxy sends the INVITE back to the NetScaler appliance. The SIP ALG examines the INVITE message, determines that it contains the NAT IP address of client A, and replaces that address with the private IP address of client A before sending the message to client B. Once the call is established between the clients, the NetScaler is not involved in the media transmission between the clients.

More LSN SIP Scenarios: SIP Proxy Inside the Private Network

If you want to host the SIP Proxy server inside the private network, Citrix recommends that you do one of the following:

- Configure a static LSN Mapping for the private SIP proxy. For more information, see Configuring Static LSN Maps. Make sure that the NAT port is the same as the port configured in the SIP ALG profile.
- Configure the SIP Proxy server inside a demilitarized zone (DMZ).

Figure 1. SIP Call Registration

Figure 2. SIP Incoming Call Flow

Figures 1 and 2 show the following scenarios:

- Scenario 1—SIP client in the private network registers with the SIP proxy server in the same network. ALG operations are not performed, because the SIP client and SIP proxy server are in the same network.
- Scenario 2—SIP client in the public network registers with the SIP proxy server in the private network. The REGISTER message from the public SIP client is sent to the NetScaler appliance by using the static LSN mapping configured on the appliance, and the appliance creates a pinhole for further SIP operations.
- Scenario 3—SIP Incoming call flow. A SIP incoming call is initiated with a SIP INVITE message from the external to the internal network. The NetScaler appliance receives the INVITE message from SIP client C2, which is in the external network, through the static LSN maps configured on the NetScaler appliance. The appliance creates a pinhole and forwards the INVITE message to the SIP proxy. The SIP proxy then forwards the INVITE message to SIP client C1 in the internal network. SIP client C1 then sends 180 and 200 OK messages to the SIP proxy, which in turn forwards the message to SIP client C2 through the NetScaler appliance.

When the 200 OK response message sent by internal SIP client C1 arrives at the NetScaler, the SIP
ALG performs NAT on the IP addresses and port numbers in the Via, Contact, Route, and Record-Route SIP header fields, and in the SDP fields, replacing them with the LSN pool IP address and port number. The SIP ALG then forwards the response message to SIP client C2 and opens a pinhole in the outbound direction for further SIP communication.

Support for Audit Logs

You can log ALG information as part of LSN logging by enabling ALG in the LSN audit logging configuration. For more information on LSN logging, see Logging and Monitoring LSN. A log message for an ALG entry in the LSN log consists of the following information:

- Time stamp
- Type of SIP message (for example, SIP request)
- Source IP address and port of the SIP client
- Destination IP address and port of the SIP proxy
- NAT IP address and port
- SIP method
- Sequence number
- Whether or not the SIP client is registered
- Caller's user name and domain
- Receiver's user name and domain

Sample audit log:

Request:

```
07/19/2013:09:49:19 GMT Informational 0-PPE-0 : default ALG
ALG_SIP_INFO_PACKET_EVENT 169 0 : Infomsg: "SIP request" -Group: g2
```

Response:

```
07/19/2013:09:49:19 GMT Informational 0-PPE-0 : default ALG
```
Configuring SIP ALG

You need to configure the SIP ALG as part of the LSN configuration. For instructions on configuring LSN, see Configuration Steps for LSN. While configuring LSN, make sure that you:

• Set the following parameters while adding the LSN application profile:
  – IP Pooling = PAIRED
  – Address and Port Mapping = ENDPOINT-INDEPENDENT
  – Filtering = ENDPOINT-INDEPENDENT

Important: For the SIP ALG to work, a full cone NAT configuration is mandatory.

Example:

```
1 add lsn appsprofile app_tcp TCP -ippooling PAIRED -mapping ENDPOINT-INDEPENDENT -filtering ENDPOINT-INDEPENDENT
```

• Create a SIP ALG profile and make sure that you define either the source port range or destination port range.

Example:

```
1 add lsn sipalgprofile sipalgprofile_tcp -sipsrcportrange 1-65535 -sipdstportrange 5060 -openViaPinhole ENABLED -openRecordRoutePinhole ENABLED -sipTransportProtocol TCP
```

• Set SIP ALG = ENABLED, while creating the LSN group.

Example:

```
1 add lsn group g1 -clientname c1 -sipalg ENABLED
```

• Bind the SIP ALG profile to the LSN group.

Sample SIP ALG Configuration:

The following sample configuration shows how to create a simple LSN configuration with a single subscriber network, single LSN NAT IP address, SIP ALG specific setting, and configure SIP ALG:

```
1 add lsn pool p1
2
3 Done
```
NetScaler 11.1

```plaintext
bind lsn pool p1 10.102.185.190
Done

add lsn client c1
Done

bind lsn client c1 -network 192.170.1.0 -netmask 255.255.255.0
Done

add lsn appsprofile app_tcp TCP -ippooling PAIRED -mapping ENDPOINT-INDEPENDENT -filtering ENDPOINT-INDEPENDENT
Done

add lsn appsprofile app_udp UDP -ippooling PAIRED -mapping ENDPOINT-INDEPENDENT -filtering ENDPOINT-INDEPENDENT
Done

bind lsn appsprofile app_tcp 1-65535
Done

bind lsn appsprofile app_udp 1-65535
Done

add lsn sipalgprofile sipalgprofile_tcp -sipdstportrange 5060 -openViaPihole ENABLED -openRecordRoutePihole ENABLED -sipTransportProtocol TCP
Done

add lsn sipalgprofile sipalgprofile_udp -sipdstportrange 5060 -openViaPihole ENABLED -openRecordRoutePihole ENABLED -sipTransportProtocol UDP
Done

add lsn group g1 -clientname c1 -sipalg ENABLED
```
Application Layer Gateway for RTSP Protocol

January 6, 2019

Real Time Streaming Protocol (RTSP) is an application-level protocol for the transfer of real-time media data. Used for establishing and controlling media sessions between end points, RTSP is a control channel protocol between the media client and the media server. The typical communication is between a client and a streaming media server.

Streaming media from a private network to a public network requires translating IP addresses and port numbers over the network. NetScaler functionality includes an Application Layer Gateway (ALG) for RTSP, which can be used with Large Scale NAT (LSN) to parse the media stream and make any necessary changes to ensure that the protocol continues to work over the network.

How IP address translation is performed depends on the type and direction of the message, and the type of media supported by the client-server deployment. Messages are translated as follows:

- Outbound request—Private IP address to NetScaler owned public IP address called an LSN pool IP address.
- Inbound response—LSN pool IP address to private IP address.
NetScaler 11.1

- Inbound request—No translation.
- Outbound response—Private IP address to LSN pool IP address.

Limitations of RTSP ALG

The RTSP ALG does not support the following:

- Multicast RTSP sessions
- RTSP session over UDP
- TD/admin partitioning/cluster deployments
- RSTP Authentication
- HTTP tunneling

RTSP and LSN scenario

The following figure shows an RTSP SETUP request flow. Typically, a SETUP request specifies how a single media stream must be transported. The request contains the media stream URL and a transport specifier. This specifier typically includes one local port for receiving RTP data (audio or video), and another for receiving RTCP data (meta information). The server reply usually confirms the chosen parameters and fills in the missing parts, such as the server’s chosen ports. Each media stream must be configured by using the SETUP command before an aggregate play request can be sent.

In a typical RTSP communication, the media client in the public network sends a SETUP request to the media server in the private network. RSTP ALG intercepts the request and, in the media stream, replaces the public IP address and port number with the LSN pool IP address and LSN port number. The following figure shows the translation performed by a NetScaler appliance in the media stream for an outbound request:

The media server in the private network uses the LSN pool IP address and LSN port number to send a 200 OK response to the media client in the public network. The NetScaler RTSP ALG intercepts the response and replaces the LSN pool IP address and LSN port number with the public IP address and port number of the media client. The following figure shows the translation performed by a NetScaler appliance in the media stream for an inbound response:

Configuring RTSP ALG

Configure RTSP ALG as part of the LSN configuration. For instructions on configuring LSN, see Configuration Steps for LSN. While configuring LSN, make sure that you:

- Set the NAT Type as DETERMINSTIC or DYNAMIC while adding the LSN pool.
- Set the following parameters while adding the LSN application profile:
- IP Pooling = PAIRED
- Address and Port Mapping = ENDPOINT-INDEPENDENT
- Filtering = ENDPOINT-INDEPENDENT

• Create a RTSP ALG profile and bind the RTSP ALG profile to the LSN group

Sample RTSP ALG Configuration:

The following sample configuration shows how to create a simple LSN configuration with a single subscriber network, single LSN NAT IP address, and RTSP ALG settings:

```
1  enable ns feature WL SP LB CS LSN
2  Done
3  add lsn pool pool1 -nattype DETERMINISTIC
4  Done
5  bind lsn pool pool1 10.102.218.246
6  Done
7  add lsn client client1
8  Done
9  bind lsn client client1 -network 200.200.200.11 -netmask 255.255.255.0
10  Done
11  add lsn appsprofile app1 TCP -ippooling PAIRED -mapping ENDPOINT-INDEPENDENT -filtering ENDPOINT-INDEPENDENT
12  Done
13  add lsn appsprofile app2 UDP -ippooling PAIRED -mapping ENDPOINT-INDEPENDENT -filtering ENDPOINT-INDEPENDENT
14  Done
15  bind lsn appsprofile app1 1-65535
16  Done
17  bind lsn appsprofile app2 1-65535
```

Logging and Monitoring LSN

January 6, 2019

You can log LSN information to diagnose, troubleshoot problems, and to meet legal requirements. You can monitor the performance of the LSN feature by using LSN statistical counters and displaying current LSN sessions.

Logging LSN

Logging LSN information is one of the important functions required by the ISPs to meet legal requirements and for identifying the source of traffic at any given time.
A NetScaler appliance logs LSN mapping entries and the LSN sessions created or deleted for each LSN group. You can control logging of LSN information for an LSN group by using the logging and session logging parameters of the LSN group. These are group level parameters and are disabled by default. The NetScaler appliance logs LSN sessions for an LSN group only when both logging and session logging parameters are enabled.

The following table displays the logging behavior for an LSN group for various settings of logging and session logging parameters.

<table>
<thead>
<tr>
<th>Logging</th>
<th>Session Logging</th>
<th>Logging Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enabled</td>
<td>Enabled</td>
<td>Logs LSN mapping entries and LSN sessions.</td>
</tr>
<tr>
<td>Enabled</td>
<td>Disabled</td>
<td>Logs LSN mapping entries only.</td>
</tr>
<tr>
<td>Disabled</td>
<td>Enabled</td>
<td>Logs neither mapping entries nor LSN sessions.</td>
</tr>
</tbody>
</table>

A log message for an LSN mapping entry consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced.
- Time stamp
- Entry type (MAPPING)
- Whether the LSN mapping entry was created or deleted
- Subscriber’s IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID might be present, depending on the following conditions:
  - Destination IP address and port are not logged for Endpoint-Independent mapping.
  - Only the destination IP address is logged for Address-Dependent mapping. The port is not logged.
  - Destination IP address and port are logged for Address-Port-Dependent mapping.

A log message for an LSN session consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced.
- Time stamp
- Entry type (SESSION)
- Whether the LSN session is created or removed
• Subscriber’s IP address, port, and traffic domain ID
• NAT IP address and port
• Protocol name
• Destination IP address, port, and traffic domain ID

The appliance uses its existing syslog and audit log framework to log LSN information. You must enable global level LSN logging by enabling the LSN parameter in the related NSLOG action and SYLOG action entities. When the Logging parameter is enabled, the NetScaler appliance generates log messages related to LSN mappings and LSN sessions of this LSN group. The appliance then sends these log messages to servers associated with the NSLOG action and SYSLOG action entities.

For logging LSN information, Citrix recommends:

• Logging the LSN information on external log servers instead of on the NetScaler appliance. Logging on external servers facilitates optimal performance when the appliance creates large amounts of LSN log entries (in order of millions).

• Using SYSLOG over TCP, or NSLOG. By default SYSLOG uses UDP, and NSLOG uses only TCP to transfer log information to the log servers. TCP is more reliable than UDP for transferring complete data.

  **Note:**
  
  – The SYSLOG generated on NetScaler appliance are dynamically sent to the external log servers.
  – When using SYSLOG over TCP, if the TCP connection is down or the SYSLOG server is busy, then the NetScaler appliances stores the logs in buffer and send the data once the connection is active.

For more information about configuring logging, see [Audit Logging](#).

Configuring LSN logging consists of the following tasks:

• **Configuring the NetScaler appliance for logging.** This task involves creating and setting various entities and parameters of the NetScaler appliance:
  
  – **Create a SYSLOG or NSLOG audit logging configuration.** Creating an audit logging configuration involves the following tasks:
    * Create a NSLOG or SYSLOG audit action and enable the LSN parameter. Audit actions specify the IP addresses of log servers.
    * Create a SYSLOG or NSLOG audit policy and bind the audit action to the audit policy. Audit actions specify the IP addresses of log servers. Optionally, you can set the transport method for log messages that are sent to the external log servers. By default UDP is selected, you can set the transport method as TCP for a reliable transport mechanism. Bind the audit policy to system global.
    * Create a SYSLOG or NSLOG audit policy and bind the audit action to the audit policy.
* Bind the audit policy to system global.

**Note:** For an existing audit logging configuration, just enable the LSN parameter for logging LSN information in the server specified by the audit action.

- **Enable logging and session logging parameters.** Enable logging and session logging parameters either as you add LSN groups or after you have created the groups. The NetScaler appliance generates log messages related to these LSN groups and sends them to the server of those audit actions that have the LSN parameter enabled.

- **Configuring log servers.** This task involves installing SYSLOG or NSLOG packages on the desired servers. This task also involves specifying the NSIP address of the NetScaler appliance in the configuration file of SYSLOG or NSLOG. Specifying the NSIP address enables the server to identify the log information sent by the NetScaler appliance for storing them in a log file.

For more information about configuring logging, see Audit Logging.

**SYSLOG Configuration Using the Command Line Interface**

**To create a SYSLOG server action for LSN logging by using the command line interface**

At the command prompt, type:

```
add audit syslogAction <name> <serverIP> [-serverPort <port>] -logLevel <logLevel>... [-transport (TCP)] [-lsn ( ENABLED | DISABLED ]
```

**To create a SYSLOG server policy for LSN logging by using the command line interface**

At the command prompt, type:

```
add audit syslogPolicy <name> <rule> <action>
```

**To bind a SYSLOG server policy to system global for LSN logging by using the command line interface**

At the command prompt, type:

```
bind system global [ <policyName> [-priority <positive_integer>]]
```

**SYSLOG Configuration Using the Configuration Utility**

**To configure a SYSLOG server action for LSN logging by using the configuration utility**

1. Navigate to **Systems > Auditing > Syslog** and, on the Servers tab, add a new auditing server or edit an existing server.
2. To enable LSN logging, select the Large Scale NAT Logging option.
3. (Optional) To enable SYSLOG over TCP, select the TCP Logging option.

To configure a SYSLOG server policy for LSN logging by using the configuration utility
Navigate to Systems > Auditing > Syslog and, on the Policies tab, add a new policy or edit an existing policy.

To bind a SYSLOG server policy to system global for LSN logging by using the configuration utility

1. Navigate to Systems > Auditing > Syslog.
2. On the Policies tab, in the Action list, click Global Bindings to bind the audit global policies.

NSLOG Configuration Using the Command Line Interface

To create a NSLOG server action for LSN logging by using the command line interface
At the command prompt, type:

```
add audit nslogAction <name> <serverIP> [-serverPort <port>] -logLevel <logLevel> ... [-lsn ( ENABLED | DISABLED )]
```

To create a NSLOG server policy for LSN logging by using the command line interface
At the command prompt, type:

```
add audit nslogPolicy <name> <rule> <action>
```

To bind a NSLOG server policy to system global for LSN logging by using the command line interface
At the command prompt, type:

```
bind system global [<policyName>]
```

NSLOG Configuration Using the Configuration Utility

To configure a NSLOG server action for LSN logging by using the configuration utility
1. Navigate to **Systems > Auditing > Nslog** and, on the **Servers** tab, add a new auditing server or, edit an existing server.
2. To enable LSN logging, select the **Large Scale NAT Logging** option.

**To configure a NSLOG server policy for LSN logging by using the configuration utility**

Navigate to **Systems > Auditing > Nslog** and, on the **Policies** tab, add a new policy or edit an existing policy.

**To bind a NSLOG server policy to system global for LSN logging by using the configuration utility**

1. Navigate to **Systems > Auditing > Nslog**.
2. On the **Policies** tab, in the **Action** list, click **Global Bindings** to bind the audit global policies.

**Example**

The following configuration specifies two SYSLOG and two NSLOG servers for storing log entries including LSN logs. LSN Logging is configured for LSN groups LSN-GROUP-2 and LSN-GROUP-3.

The NetScaler appliance generates log messages related to LSN mappings and LSN sessions of these LSN groups, and sends them to the specified log servers.

```plaintext
1  add audit syslogAction SYS-ACTION-1 198.51.101.10 -logLevel ALL -lsn ENABLED
Done
3  add audit syslogPolicy SYSLOG-POLICY-1 ns_true SYS-ACTION-1
4  Done
5  bind system global SYSLOG-POLICY-1
6  Done
7
8  add audit syslogAction SYS-ACTION-2 198.51.101.20 -logLevel ALL -lsn ENABLED
9  Done
10 add audit syslogPolicy SYSLOG-POLICY-2 ns_true SYS-ACTION-2
11  Done
12 bind system global SYSLOG-POLICY-2
13  Done
14
15  add audit nslogAction NSLOG-ACTION-1 198.51.101.30 -logLevel ALL -lsn ENABLED
16  Done
17  add audit nslogPolicy NSLOG-POLICY-1 ns_true NSLOG-ACTION-1
18  Done
```
The following configuration specifies SYSLOG configuration for sending log messages to
the external SYSLOG server 192.0.2.10 using TCP.

The following table displays sample LSN log entries of each type stored on the configured log servers. These LSN log entries are generated by a NetScaler appliance whose NSIP address is 10.102.37.115.

<table>
<thead>
<tr>
<th>LSN Log Entry Type</th>

### Minimal Logging

Deterministic LSN configurations and Dynamic LSN configurations with port block significantly reduces the LSN log volume. For these two types of configuration, the NetScaler appliance allocates a NAT IP address and a block of ports to a subscriber. The NetScaler appliance generates a log message for a port block at the time of allocation to a subscriber. The NetScaler appliance also generates a log message when a NAT IP address and port block is freed. For a connection, a subscriber can be identified just by its mapped NAT IP address and port block. Because of this reason, the NetScaler appliance does not log any LSN session created or deleted. The appliance also neither logs any mapping entry created for a session nor when the mapping entry gets removed.

The minimal logging feature for deterministic LSN configurations and dynamic LSN configurations with port block is enabled by default and there is no provision to disable it. In other words, the NetScaler appliance automatically do minimal logging for deterministic LSN configurations and dynamic LSN configurations with port block. There is no option available for disabling this feature. The appliance sends the log messages to all the configured log servers.

A log message for each port block consists of the following information:

- NSIP address of the NetScaler appliance
- Time stamp
• Entry type as DETERMINISTIC or PORTBLOCK
• Whether a port block is allocated or is freed
• Subscriber’s IP address and the assigned NAT IP address and port block
• Protocol name

**Minimal Logging for Deterministic LSN Configuration**

Consider an example of a simple deterministic LSN configuration for four subscribers having the IP address 192.0.17.1, 192.0.17.2, 192.0.17.3, and 192.0.17.4.

In this LSN configuration, the port block size is set to 32768 and LSN NAT IP address pool has IP addresses in the range 203.0.113.19-203.0.113.23.

```plaintext
1  add lsn client LSN-CLIENT-7
2  Done
3  bind lsn client LSN-CLIENT-7 -network 192.0.17.0 -netmask 255.255.255.253
4  Done
5  add lsn pool LSN-POOL-7 -nattype DETERMINISTIC
6  Done
7  bind lsn pool LSN-POOL-7 203.0.113.19-203.0.113.23
8  Done
9  add lsn group LSN-GROUP-7 -clientname LSN-CLIENT-7 -nattype DETERMINISTIC -portblocksize 32768
10 Done
11 bind lsn group LSN-GROUP-7 -poolname LSN-POOL-7
12 Done
```

The NetScaler appliance sequentially preallocates, from the LSN NAT IP pool and on the basis of the set port block size, an LSN NAT IP address and a block of ports to each subscriber. It assigns the first block of ports (1024-33791) on the beginning NAT IP address (203.0.113.19) to the beginning subscriber IP address (192.0.17.1). The next range of ports is assigned to the next subscriber, and so on, until the NAT address does not have enough ports for the next subscriber. At that point, the first port block on the next NAT IP address is assigned to the subscriber, and so on. The appliance logs the NAT IP address and the block of ports allocated for each subscriber.

The NetScaler appliance does not log any LSN session created or deleted for these subscribers. The appliance generates the following log messages for the LSN configuration.

```plaintext
1  03/23/2015:00:30:56 GMT  Informational 0-PPE-0 : default LSN LSN_DETERMINISTIC 79201453 0 : Dtrstc ALLOC Client 12.0.0.241, NatInfo 50.0.0.2:59904 to 60415
2  03/23/2015:00:30:56 GMT  Informational 0-PPE-0 : default LSN LSN_DETERMINISTIC 79201454 0 : Dtrstc ALLOC Client 12.0.0.242,
```
When you remove the LSN configuration, the allocated NAT IP address and block of ports is freed from each subscriber. The appliance logs NAT IP address and block of ports freed from each subscriber. The appliance generates the following log messages for each subscriber when you remove the LSN configuration.

```
1) 03/23/2015:00:33:57 GMT Informational 0-PPE-0 : default LSN LSN_DETERMINISTIC 79201706 0 : Dtrstc FREE Client 12.0.0.238, NatInfo 50.0.0.2:58368 to 58879
2) 03/23/2015:00:33:57 GMT Informational 0-PPE-0 : default LSN LSN_DETERMINISTIC 79201707 0 : Dtrstc FREE Client 12.0.0.239, NatInfo 50.0.0.2:58880 to 59391
3) 03/23/2015:00:33:57 GMT Informational 0-PPE-0 : default LSN LSN_DETERMINISTIC 79201708 0 : Dtrstc FREE Client 12.0.0.240, NatInfo 50.0.0.2:59392 to 59903
```

### Minimal Logging for Dynamic LSN Configuration with Port Block

Consider an example of a simple dynamic LSN configuration with port block for any subscriber in the network 192.0.2.0/24. In this LSN configuration, the port block size is set to 1024 and LSN NAT IP address pool has IP addresses in the range 203.0.113.3-203.0.113.4.

```bash
set lsn parameter -memLimit 4000
Done
add lsn client LSN-CLIENT-1
Done
bind lsn client LSN-CLIENT-1 -network 192.0.2.0 -netmask 255.255.255.0
Done
add lsn pool LSN-POOL-1
Done
bind lsn pool LSN-POOL-1 203.0.113.3-203.0.113.4
Done
add lsn group LSN-GROUP-1 -clientname LSN-CLIENT-1 -portblocksize 1024
Done
bind lsn group LSN-GROUP-1 -poolname pool1 LSN-POOL-1
Done
```
The NetScaler appliance allocates a random NAT IP address and a block of ports, from the LSN NAT IP pool and on the basis of the set port block size, for a subscriber when it initiates a session for the first time. The NetScaler logs the NAT IP address and block of ports allocated to this subscriber. The appliance does not log any LSN session created or deleted for this subscriber. If all the ports are allocated (for different subscriber’s sessions) from the subscriber’s allocated port block, the appliance allocates a new random NAT IP address and port block for the subscriber for additional sessions. The NetScaler logs every NAT IP address and port block allocated to a subscriber.

The appliance generates the following log message when the subscriber, having the IP address 192.0.2.1, initiates a session. The log message shows that the appliance has allocated NAT IP address 203.0.113.3 and port block 1024-2047 to the subscriber.

03/23/2015:00:07:12 GMT Informational 0-PPE-3 : default LSN LSN_PORTBLOCK 106725793 0 : Port-block ALLOC Client 12.0.2.72, NatInfo 203.0.113.3:1024 to 2047, Proto:TCP

Once there are no more sessions left that is using the allocated NAT IP address and one of the ports in the allocated port block, the allocated NAT IP address and block of ports is freed from the subscriber. The NetScaler logs that the NAT IP address and the block of ports is freed from the subscriber. The appliance generates the following log messages for the subscriber, having the IP address 192.0.2.1, when no more sessions are left that is using the allocated NAT IP address (203.0.113.3) and a port from the allocated port block (1024-2047). The log message shows that the NAT IP address and port block are freed from the subscriber.

03/23/2015:00:11:09 GMT Informational 0-PPE-3 : default LSN LSN_PORTBLOCK 106814342 0 : Port-block FREE Client 12.0.3.122, NatInfo 203.0.113.3: 1024 to 2047, Proto:TCP

The NetScaler appliance send its SYSLOG events and messages to all the configured external log servers. This results in storing redundant messages and makes monitoring difficult for system administrators. To address this issue, the NetScaler appliance offers load balancing algorithms that can load balance the SYSLOG messages among the external log servers for better maintenance and performance. The supported load balancing algorithms include RoundRobin, LeastBandwidth, CustomLoad, LeastConnection, LeastPackets, and
### Load balancing of SYSLOG servers using the command line interface

Add a service and specify the service type as SYSLOGTCP or SYSLOGUDP.

```
add service (|) <serviceType (SYSLOGTCP | SYSLOGUDP)>
```

Add a load balancing virtual server, specify the service type as SYSLOGTCP or SYSLOGTCP, and load balancing method as AUDITLOGHASH.

```
add lb vserver <serviceType (SYSLOGTCP | SYSLOGUDP)> [-lbMethod ]
```

Bind the service to the load balancing virtual server.

### Bind lb vserver

Add a SYSLOG action and specify the load balancing server name that has SYSLOGTCP or SYSLOGUDP as service type.

```
add syslogaction [-lbVserverName] [-logLevel ]
```

Add a SYSLOG policy by specifying the rule and action.

```
add syslogpolicy
```

Bind the SYSLOG policy to the system global for the policy to take effect.

```
bind system global
```

### Load balancing of SYSLOG servers using the configuration utility

1. Add a service and specify the service type as SYSLOGTCP or SYSLOGUDP.
2. Navigate to Traffic Management > Services, click Add and select SYSLOGTCP or SYSLOGUDP as protocol.
3. Add a load balancing virtual server, specify the service type as SYSLOGTCP or SYSLOGTCP, and load balancing method as AUDITLOGHASH.
4. Navigate to Traffic Management > Virtual Servers, click Add and select SYSLOGTCP or SYSLOGUDP as protocol.
1. Bing the service to the load balancing virtual server to the service.

   Bing the service to the load balancing virtual server.

   Navigate to Traffic Management > Virtual Servers, select a virtual server and then select AUDITLOGHASH in the Load Balancing Method.

1. Add a SYSLOG action and specify the load balancing server name that has SYSLOGTCP or SYSLOGUDP as service type.

   Navigate to System > Auditing, click Servers and add a server by selecting LB Vserver option in Servers.

1. Add a SYSLOG policy by specifying the rule and action.

   Navigate to System > Syslog, click Policies and add a SYSLOG policy.

1. Bind the SYSLOG policy to the system global for the policy to take effect.

   Navigate to System > Syslog, select a SYSLOG policy and click Action, and then click Global Bindings and bind the policy to system global.

**Example:**

The following configuration specifies load balance of SYSLOG messages among the external log servers using the AUDITLOGHASH as load balancing method. The NetScaler appliance generates SYSLOG events and messages that are load balanced amongst the services, service1, service2, and service3.

```plaintext
add service service1 192.0.2.10 SYSLOGUDP 514
Done
add service service2 192.0.2.11 SYSLOGUDP 514
Done
add service service3 192.0.2.11 SYSLOGUDP 514
Done
add lb vserver lbvserver1 SYSLOGUDP -lbMethod AUDITLOGHASH
Done
```
bind lb vserver lbvserver1 service1
Done
bind lb vserver lbvserver1 service2
Done
bind lb vserver lbvserver1 service3
Done
add syslogaction sysaction1 -lbVserverName lbvserver1 -logLevel All
Done
add syslogpolicy syspol1 ns_true sysaction1
Done
bind system global syspol1
Done

### Logging HTTP Header Information

The NetScaler appliance can now log request header information of an HTTP connection that is using the LSN functionalty of the NetScaler. The following header information of an HTTP request packet can be logged:

- URL that the HTTP request is destined to.
- HTTP Method specified in the HTTP request.
- HTTP version used in the HTTP request.
- IP address of the subscriber that sent the HTTP request.

The HTTP header logs can be used by ISPs to see the trends related to the HTTP protocol among a set of subscribers. For example, an ISP can use this feature to find out the most popular websites among a set of subscribers.

An HTTP header log profile is a collection of HTTP header attributes (for example, URL and HTTP method) that can be enabled or disabled for logging. The HTTP header log profile is then bound to an LSN group. The NetScaler appliance then logs HTTP header attributes, which are enabled in the bound HTTP header log profile for logging, of any HTTP requests related to the LSN group. The appliance then sends the log messages to the configured log servers.

An HTTP header log profile can be bound to multiple LSN groups but an LSN group can have only one HTTP header log profile.
To create an HTTP header log profile by using the command line interface:

```
At the command prompt, type:
```

```
add lsn httphdrlogprofile [-logURL ( ENABLED | DISABLED )] [-logMethod ( ENABLED | DISABLED )] [-logVersion ( ENABLED | DISABLED )] [-logHost ( ENABLED | DISABLED )]
```

show lsn httphdrlogprofile

To bind an HTTP header log profile to an LSN group by using the command line interface:

```
At the command prompt, type:
```

```
bind lsn group -httphdrlogprofile <profile_name>
```

show lsn group

In the following example of an LSN configuration, HTTP header log profile HTTP-HEADER-LOG-1 is bound to LSN group LSN-GROUP-1. The log profile has all the HTTP attributes (URL, HTTP method, HTTP version, and HOST IP address) enabled for logging so that all these attributes are logged for any HTTP requests from subscribers (in the network 192.0.2.0/24) related to the LSN group.

```
add lsn httphdrlogprofile HTTP-HEADER-LOG-1
Done
```

```
set lsn parameter -memLimit 4000
Done
```

```
add lsn client LSN-CLIENT-1
Done
```

```
bind lsn client LSN-CLIENT-1 -network 192.0.2.0 -netmask 255.255.255.0
Done
```

```
add lsn pool LSN-POOL-1
Done
```

```
bind lsn pool LSN-POOL-1 203.0.113.3-203.0.113.4
Done
```

```
add lsn group LSN-GROUP-1 -clientname LSN-CLIENT-1 -portblocksize 1024
Done
```

© 1999-2018 Citrix Systems, Inc. All rights reserved.
bind lsn group LSN-GROUP-1 -poolname pool1 LSN-POOL-1
Done
bind lsn group LSN-GROUP-1 -httphdrlogprofname HTTP-HEADER-LOG-1
Done

The NetScaler generates the following HTTP header log message when one of the subscriber belonging to the LSN configuration example sends an HTTP request.

The log message tells us that a client having the IP address 192.0.2.33 sends an HTTP request to URL example.com using HTTP method GET and HTTP version 1.1.

03/19/2015:16:24:04 GMT Informational 0-PPE-1 : default LSN Message 59 0 : “LSN Client IP:TD 10.102.37.118:0 URL: example.com Host: 192.0.2.33 Version: HTTP1.1 Method: GET”

## Logging MSISDN Information

A Mobile Station Integrated Subscriber Directory Number (MSISDN) is a telephone number uniquely identifying a subscriber across multiple mobile networks. The MSISDN is associated with a country code and a national destination code identifying the subscriber’s operator.

You can configure a NetScaler appliance to include MSISDNs in LSN log entries for subscribers in mobile networks. The presence of MSISDNs in the LSN logs helps the administrator in faster and accurate back tracing of a mobile subscriber who has violated a policy or law, or whose information is required by lawful interception agencies.

The following sample LSN log entries include MSISDN information for a connection from a mobile subscriber in an LSN configuration. The log entries show that a mobile subscriber whose MSISDN is E164:5556543210 was connected to destination IP:port 23.0.0.1:80 through the NAT IP:port 203.0.113.3:45195.

<table>
<thead>
<tr>
<th>Log Entry Type</th>
<th>Sample Log Entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>LSN mapping creation</td>
<td>Oct 14 15:37:30 10.102.37.77 10/14/2015:10:08:14</td>
</tr>
</tbody>
</table>
### Perform the following tasks for including MSISDN information in LSN logs

- **Create an LSN log profile**. An LSN log profile includes the log subscriber ID parameter, which specifies whether to or not to include the MSISDN information in the LSN logs of an LSN configuration. Enable the log subscriber ID parameter when creating the LSN log profile.

- **Bind the LSN log profile to an LSN group of an LSN configuration**. Bind the created LSN log profile to an LSN group of an LSN configuration by setting the log profile name parameter to the created LSN log profile name. For instructions on configuring Large Scale NAT, see [Configuration Steps for LSN](/en-us/netscaler/11-1/netscaler-support-for-telecom-service-providers/lsn-introduction/configuration-steps-lsn.html).

### To create an LSN log profile by using the CLI

```
add lsn logprofile <logprofilename -logSubscriberID {ENABLED | DISABLED}
```

### To bind an LSN log profile to an LSN group of an LSN configuration by using the CLI

```
bind lsn group -logProfileName
```

© 1999-2018 Citrix Systems, Inc. All rights reserved.
**Sample Configuration:**

In this example of LSN configuration, the LSN log profile has the log subscriber ID parameter enabled. The profile is bound to LSN group LSN-GROUP-9. MSISDN information is included in the LSN session and LSN mapping logs for connections from mobile subscribers (in the network 192.0.2.0/24).

```
add lsn logprofile LOG-PROFILE-MSISDN-9 -logSubscriberID ENABLED
Done
add lsn client LSN-CLIENT-9
Done
bind lsn client LSN-CLIENT-9 -network 192.0.2.0 -netmask 255.255.255.0
Done
add lsn pool LSN-POOL-9
Done
bind lsn pool LSN-POOL-9 203.0.113.3-203.0.113.4
Done
add lsn group LSN-GROUP-9 -clientname LSN-CLIENT-9
Done
bind lsn group LSN-GROUP-9 -poolname LSN-POOL-9
Done
bind lsn group LSN-GROUP-9 -logprofilename LOG-PROFILE-MSISDN-9
Done
```

---

Displaying Current LSN Sessions

You can display the current LSN sessions for detecting any unwanted or inefficient LSN sessions on the NetScaler appliance. You can display all or some LSN sessions on the basis of selection parameters.

Note: When more than a million LSN sessions exist on the NetScaler appliance, Citrix recommends displaying selected LSN sessions instead of all by using the selection parameters.

---

Configuration Using the Command Line Interface

To display all LSN sessions by using the command line interface.
NetScaler 11.1

At the command prompt, type:

```
show lsn session
```

To display selective LSN sessions by using the command line interface

At the command prompt, type:

```
show lsn session [-clientname] [-network [-netmask] [-td]] [-natIP [-natPort]]
```

Example

To display all LSN sessions existing on a NetScaler

![lsn-session](/en-us/netscaler/media/show-lsn-session1.png)

To display all LSN sessions related to an LSN client entity LSN-CLIENT

```
lsn-session2[/en-us/netscaler/media/lsn-session-2.png]
```

Done

To display all LSN sessions that uses 203.0.113.5 as the NAT IP address

```
lsn-session3[/en-us/netscaler/media/lsn-session-3.png]
```

Configuration Using the Configuration Utility

To display all or selected LSN sessions by using the configuration utility

1. Navigate to System > Large Scale NAT > Sessions, and click the NAT44 tab.
1. For displaying LSN sessions on the basis of selection parameters, click Search.

Parameter Descriptions (of commands listed in the CLI procedure)

- show lsn session
- -
-      clientname
### Displaying LSN Statistics

You can display statistics related to the LSN feature for evaluating the performance of the LSN feature or to troubleshoot problems. You can display a summary of statistics of the LSN feature or of a particular LSN group. The statistical counters reflect events since the NetScaler appliance was last restarted. All these counters are reset to 0 when the NetScaler appliance is restarted.

```bash
## To display all LSN statistics by using the command line interface

At the command prompt, type:
```
stat lsn

### To display statistics for a specified LSN group by using the command line interface

At the command prompt, type:

```
stat lsn group []
```

### Example

stat lsn

Large Scale NAT statistics
Rate (/s) Total
LSN TCP Received Packets 0 40
LSN TCP Received Bytes 0 3026
LSN TCP Transmitted Packets 0 40
LSN TCP Transmitted Bytes 0 3026
LSN TCP Dropped Packets 0 0
LSN TCP Current Sessions 0 0
LSN UDP Received Packets 0 0
LSN UDP Received Bytes 0 0
LSN UDP Transmitted Packets 0 0
LSN UDP Transmitted Bytes 0 0
LSN UDP Dropped Packets 0 0
LSN UDP Current Sessions 0 0
LSN ICMP Received Packets 0 982
LSN ICMP Received Bytes 0 96236
LSN ICMP Transmitted Packets 0 0
LSN ICMP Transmitted Bytes 0 0
LSN ICMP Dropped Packets 0 982
LSN ICMP Current Sessions 0 0
LSN Subscribers 0 1

Done

stat lsn group LSN-GROUP-1

LSN Group Statistics
Rate (/s) Total
TCP Translated Pkts 0 40
TCP Translated Bytes 0 3026
TCP Dropped Pkts 0 0
TCP Current Sessions 0 0
UDP Translated Pkts 0 0
UDP Translated Bytes 0 0
UDP Dropped Pkts 0 0
UDP Current Sessions 0 0
ICMP Translated Pkts 0 0
ICMP Translated Bytes 0 0
ICMP Dropped Pkts 0 0
ICMP Current Sessions 0 0
Current Subscribers 0 1

Done

### Parameter Descriptions (of commands listed in the CLI procedure)

- **stat lsn group**
  - **groupname**
    - Name of the LSN Group. Maximum Length: 127
  - **detail**
    - Specifies detailed output (including more statistics). The output can be quite voluminous. Without this argument, the output will show only a summary.
  - **fullValues**
    - Specifies that numbers and strings should be displayed in their full form. Without this option, long strings are shortened and large numbers are abbreviated.
  - **ntimes**
    - The number of times, in intervals of seven seconds, the statistics should be displayed.

Default value: 1
The name of the log file to be used as input.

Clear the statistics / counters

Possible values: basic, full

## Compact Logging

Logging LSN information is one of the important functions needed by ISPs to meet legal requirements and be able to identify the source of traffic at any given time. This eventually results in a huge volume of log data, requiring the ISPs to make large investments to maintain the logging infrastructure.

Compact logging is a technique for reducing the log size by using a notational change involving short codes for event and protocol names. For example, C for client, SC for session created, and T for TCP. Compact logging results in an average of 40 percent reduction in log size.

The following examples of NAT44 mapping creation log entries show the advantage of compact logging.

```
| Compact logging format | 02/02/2016:01:14:57 GMT Info | 0-PE2:default LSN 87 0:A&PDMC|C-1.1.1.1:6500:0|N-8.8.8.9:51066|D-2.2.2.2:80:0|T |
```

## Configuration Steps

Perform the following tasks for logging LSN information in compact format:

- **Create an LSN log profile.** An LSN log profile includes the Log
Compact parameter, which specifies whether to or not to log information in compact format for an LSN configuration.

**Bind the LSN log profile to an LSN group of an LSN configuration.**

The NetScaler appliance supports sending information about LSN events in Internet Protocol Flow Information Export (IPFIX) format to the configured set of IPFIX collector(s). The appliance uses the existing AppFlow feature to send LSN events in IPFIX format to the IPFIX collectors.

IPFIX based logging is available for the following large scale NAT44 related events:

- Creation or deletion of an LSN session.
- Creation or deletion of an LSN mapping entry.
- Allocation or de-allocation of port blocks in the context of deterministic NAT.
- Allocation or de-allocation of port blocks in the context of dynamic NAT.
- Whenever subscriber session quota is exceeded.

### Points to Consider before you Configure IPFIX logging

Before you start configuring IPSec ALG, consider the following points:

- You must configure the AppFlow feature and IPFIX collector(s) on the NetScaler appliance. For instructions, see Configuring the AppFlow feature topic.

### Configuration Steps

Perform the following tasks for logging LSN information in IPFIX format:

- **Enable LSN logging in the AppFlow configuration**. Enable the LSN logging parameter as part of AppFlow configuration.
- **Create an LSN log profile**. An LSN log profile includes the IPFIX parameter that enables or disables the log information in IPFIX format.
- **Bind the LSN log profile to an LSN group of an LSN configuration**. Bind the LSN log profile to one or multiple LSN group(s). Events related to the bound LSN group will be logged in IPFIX format.

#### To enable LSN logging in the AppFlow configuration by using the CLI
At the command prompt, type:

```
set appflow param -lsnLogging ( ENABLED | DISABLED )
show appflow param
```

#### To create an LSN log profile by using the CLI
At the command prompt, type:

```
set lsn logprofile -logipfix ( ENABLED | DISABLED )
show lsn logprofile
```

#### To bind the LSN log profile to an LSN group of an LSN configuration by using the CLI
At the command prompt, type:

```
bind lsn group -logProfileName
show lsn group
```

To create an LSN log profile by using the GUI

Navigate to System > Large Scale NAT > Profiles, click Log tab, and then add a log profile.

To bind the LSN log profile to an LSN group of an LSN configuration by using the GUI

1. Navigate to System > Large Scale NAT > LSN Group, open the LSN group.
2. In Advanced Settings, click + Log Profile to bind the created Log profile to the LSN group.

**STUN Timeout**

December 18, 2018

STUN (Session Traversal Utilities for NAT) enables an end host operating behind a NAT device to discover its NAT IP address and NAT port allocated by the NAT device. Interactive communication applications (for example real-time voice, video, and messaging) running on these hosts use the STUN protocol for discovering NAT IP address and port information. This information is used by these applications to connect to their peer applications in the Internet. STUN protocol includes servers, known
as STUN servers, residing in the Internet. Using the STUN protocol, an application of an end host sends a request to a known STUN server, which in turn then embeds the NAT IP address and port in the payload of its response packet.

In an LSN deployment of a NetScaler appliance for an ISP, interactive communication applications (for example real-time voice, video, and messaging) running on a subscribers can use the STUN protocol to discover whether it is behind a NAT (NetScaler appliance) device or not. These applications send a request to a known STUN server. On receiving the request, the NetScaler allocates a NAT IP address and a port for this request, creates an LSN session and an LSN mapping entry, translates the packet with the allocated NAT IP address and port, and then forwards the packet to the STUN server. The STUN server embeds the allocated NAT IP address and port in the payload of its response packet. When the subscriber finally receives the packet, from the payload of the packet it learns that it is behind a NAT device, and the NAT IP address and port allocated for the session.

The application then notifies the peer applications that it is reachable at the NAT IP address and the port of the LSN mapping entry created for the STUN session. It notifies by embedding the NAT IP address and port in the payload of the packets sent to the peer applications. For making the application reachable at the same LSN mapping entry for any external application, full Cone NAT (endpoint Independent mapping and Endpoint Independent filtering) is enabled for the LSN configuration on the NetScaler appliance.

The NetScaler detects an LSN session of type STUN if the request packets are destined to TCP or UDP port 3478, and then marks the created mapping entry of type STUN. The NetScaler applies a timeout called, STUN timeout, to the created STUN LSN mapping entry. A STUN timeout is the maximum time that the NetScaler maintains an idle STUN LSN mapping entry since it was last used by any LSN session. If the STUN LSN mapping session is unused for a time that exceeds the STUN timeout, the NetScaler removes the mapping entry.

For an application on a subscriber that use STUN LSN mapping entry to stay available to other peer applications on the Internet, the application periodically sends keep-alive messages to the NetScaler appliance so that the STUN LSN mapping entry does not timeout. A higher frequency of keep-alive messages can have an affect on the performance a subscriber, especially, if the subscriber is a mobile device. A higher value of STUN timeout reduces the frequency of keep-alive messages from a subscriber.

ALGs on the NetScaler appliance do not apply to an LSN session that use a STUN LSN mapping entry because NAT IP address and NAT port are communicated in payload of the packets related to the session.

For subscribers' applications that use STUN protocol, the LSN configuration must have the following settings:

- STUN timeout. In an LSN configuration, the LSN group includes the STUN timeout setting.
- Endpoint-independent mapping and endpoint-independent filtering for STUN protocol ports.
For instructions on creating an LSN configuration, see Configuration Steps for LSN.

**Example:**

The following sample LSN configuration applies to applications that use STUN protocol over TCP or UDP. STUN timeout is set to 10 mins. Endpoint-independent mapping and endpoint-independent filtering is set for the STUN TCP port (3748) and the STUN UDP port (3748).

```plaintext
1  add lsn client LSN-CLIENT-1
2  Done
3
4  bind lsn client LSN-CLIENT-1 -network 192.0.2.0 -netmask 255.255.255.0
5  Done
6
7  add lsn pool LSN-POOL-1
8  Done
9
10  bind lsn pool LSN-POOL-1 203.0.113.3
11  Done
12
13  add lsn group LSN-GROUP-1 -clientname LSN-CLIENT-1 -stuntimeout 10
14  Done
15
16  bind lsn group LSN-GROUP-1 -poolname pool1 LSN-POOL-1
17  Done
18
19  add lsn appsprofile LSNAPPSPROFILE-TCP-STUN-1 TCP -mapping ENDPOINT-INDEPENDENT -filtering ENDPOINT-INDEPENDENT
20  Done
21
22  bind lsn appsprofile LSNAPPSPROFILE-TCP-STUN-1 3748
23  Done
24
25  bind lsn group LSN-GROUP-1 -applicationprofilename LSNAPPSPROFILE-TCP-STUN-1
26  Done
27
28
```

TCP SYN Idle Timeout

December 18, 2018

SYN idle timeout is the timeout for establishing TCP connections that use LSN on the NetScaler appliance. If a TCP session is not established within the configured timeout period, the NetScaler removes the session. SYN idle timeout is useful in providing protection against SYN flood attacks. In an LSN configuration, the LSN group entity includes the SYN idle timeout setting.

Example:

In the following sample LSN configuration, SYN idle timeout is set to 30 secs for TCP connections related to subscribers from the 192.0.2.0/24 network.
Overriding LSN configuration with Load Balancing Configuration

December 18, 2018

An LSN configuration takes precedence over any load balancing configuration by default. For overriding the large scale networking (LSN) configuration with the load balancing configuration for traffic matching both configurations, create a net profile with Override LSN parameter enabled and bind this profile to the virtual server of the load balancing configuration. USNIP or USIP settings of the load balancing configuration are applied to the traffic, instead of applying the LSN IP address of the LSN configuration.

This option is useful in an LSN deployment that includes NetScaler appliances and value added services, such as firewall and optimization devices. In this type of deployment, the ingress traffic on the NetScaler appliance is required to pass through these value-added services before an LSN configuration on the appliance is applied to the traffic. For the NetScaler appliance to send the ingress traffic to a value added service, a load balancing configuration is created and override LSN is enabled on the appliance. The load balancing configuration includes value added services, bound to a virtual server of type ANY. The virtual server is configured with listen policies for identifying the traffic to be sent to the value added service.

To enable override lsn in a net profile by using the CLI

To enable override lsn while adding a net profile, at the command prompt, type

```
add lsn group LSN-GROUP-1 -clientname LSN-CLIENT-1 -synidletimeout 30
```

Done

bind lsn group LSN-GROUP-1 -poolname pool1 LSN-POOL-1

Done
To enable override lsn in a net profile by using GUI

1. Navigate to System > Network > Net Profiles.
2. Set the Override LSN parameter while adding or modifying net profiles.

In the following sample configuration, net profile NETPROFILE-OVERRIDELSN-1 has override LSN option enabled and is bound to load balancing virtual server LBVS-1.

Sample configuration:

```
1 add netprofile NETPROFILE-OVERRIDELSN-1 -overrideLsn ENABLED
2 Done
3 set lb vserver LBVS-1 -netprofile NETPROFILE-OVERRIDELSN-1
4 Done
```

Clearing LSN Sessions

December 18, 2018

You can remove any unwanted or inefficient LSN sessions from the NetScaler appliance. The appliance immediately releases resources (such as NAT IP address, port, and memory) allocated for these sessions, making the resources available for new sessions. The appliance also drops all the subsequent packets related to these removed sessions. You can remove all or selected LSN sessions from the NetScaler appliance.

To clear all LSN sessions by using the command line interface

At the command prompt, type:

```
1 flush lsn session
2
3 show lsn session
```
To clear selective LSN sessions by using the command line interface

At the command prompt, type:

```plaintext
1 flush lsn session [-clientname <string>] [-network <ip_addr> [-netmask <netmask>] [-td <positive_integer>]] [-natIP <ip_addr> [-natPort <port>]]
2
3 show lsn session
```

Example

Clear all LSN sessions existing on a NetScaler

```plaintext
1 flush lsn session
2
3 Done
```

Clear all LSN sessions related to LSN client entity LSN-CLIENT-1

```plaintext
1 flush lsn session -clientname LSN-CLIENT-1
2
3 Done
```

Clear all LSN sessions related to a subscriber network (192.0.2.0) of LSN client entity LSN-CLIENT-2 belonging to traffic domain 100

```plaintext
1 flush lsn session -clientname LSN-CLIENT-2 - network 192.0.2.0 - netmask 255.255.255.0 - td 100
2
3 Done
```

To clear all LSN sessions by using the configuration utility

Navigate to System > Large Scale NAT > Sessions, and click Flush Sessions.

Parameter Descriptions (of commands listed in the CLI procedure)

- flush lsn session
  - clientname
    
    Name of the LSN Client entity. Maximum Length: 127
- network
  IP address or network address of subscriber(s).
- netmask
  Subnet mask for the IP address specified by the network parameter.
  Default value: 255.255.255.255
- td
  Traffic domain ID of the LSN client entity.
  Default value: 0
  Minimum value: 0
  Maximum value: 4094
- natIP
  Mapped NAT IP address used in LSN sessions.
- natPort
  Mapped NAT port used in the LSN sessions.

## Load Balancing SYSLOG Servers

### December 18, 2018

The NetScaler appliance send its SYSLOG events and messages to all the configured external log servers. This results in storing redundant messages and makes monitoring difficult for system administrators. To address this issue, the NetScaler appliance offers load balancing algorithms that can load balance the SYSLOG messages among the external log servers for better maintenance and performance. The supported load balancing algorithms include RoundRobin, LeastBandwidth, CustomLoad, LeastConnection, LeastPackets, and AuditlogHash.

### Load balancing of SYSLOG servers using the command line interface

At the command prompt, type:

```
add service <name>(<IP> | <servername>) <servicetype> (SYSLOGTCP | SYSLOGUDP) <port>
```

Add a load balancing virtual server, specify the service type as SYSLOGTCP or SYSLOGTCP, and load balancing method as AUDITLOGHASH.
Bind the service to the load balancing virtual server.

1. Add a SYSLOG action and specify the load balancing server name that has SYSLOGTCP or SYSLOGUDP as service type.

1. **add syslogaction** `<name> <serverIP> [-lbVserverName <string>] [-logLevel <logLevel>]`

Add a SYSLOG policy by specifying the rule and action.

1. **add syslogpolicy** `<name> <rule> <action>`

Bind the SYSLOG policy to the system global for the policy to take effect.

1. **bind system global** `<policyName>`

---

**Load balancing of SYSLOG servers using the configuration utility**

1. Add a service and specify the service type as SYSLOGTCP or SYSLOGUDP.
   
   Navigate to Traffic Management > Services, click Add and select SYLOGTCP or SYSLOGUDP as protocol.

2. Add a load balancing virtual server, specify the service type as SYSLOGTCP or SYSLOGTCP, and load balancing method as AUDITLOGHASH.
   
   Navigate to Traffic Management > Virtual Servers, click Add and select SYLOGTCP or SYSLOGUDP as protocol.

3. Bind the service to the load balancing virtual server to the service.
   
   Navigate to Traffic Management > Virtual Servers, select a virtual server and then select AUDITLOGHASH in the Load Balancing Method.

4. Add a SYSLOG action and specify the load balancing server name that has SYSLOGTCP or SYSLOGUDP as service type.
   
   Navigate to System > Auditing, click Servers and add a server by selecting LB Vserver option in Servers.
5. Add a SYSLOG policy by specifying the rule and action.
   Navigate to System > Syslog, click Policies and add a SYSLOG policy.

6. Bind the SYSLOG policy to the system global for the policy to take effect.
   Navigate to System > Syslog, select a SYSLOG policy and click Action, and then click Global Bindings and bind the policy to system global.

**Example:**

The following configuration specifies load balance of SYSLOG messages among the external log servers using the AUDITLOGHASH as load balancing method. The NetScaler appliance generates SYSLOG events and messages that are load balanced amongst the services, service1, service2, and service3.

```plaintext
1  add service service1 192.0.2.10 SYSLOGUDP 514
2  add service service2 192.0.2.11 SYSLOGUDP 514
3  add service service3 192.0.2.11 SYSLOGUDP 514
4  add lb vserver lbvserver1 SYSLOGUDP -lbMethod AUDITLOGHASH
5  bind lb vserver lbvserver1 service1
6  bind lb vserver lbvserver1 service2
7  bind lb vserver lbvserver1 service3
8  add syslogaction sysaction1 -lbVserverName lbvserver1 -logLevel All
9  add syslogpolicy syspol1 ns_true sysaction1
10 bind system global syspol1
```

**Limitations:**

The NetScaler appliance does not support an external load balancing virtual server load balancing the SYSLOG messages among the log servers.

**Port Control Protocol**

December 18, 2018
NetScaler appliances now support Port Control Protocol (PCP) for large scale NAT (LSN). Many of an ISP’s subscriber applications must be accessible from Internet (for example, Internet of Things (IOT) devices, such as an IP camera that provides surveillance over the Internet). One way to meet this requirement is to create static large scale NAT (LSN) maps. But for a very large number of subscribers, creating static LSN NAT maps is not a feasible solution.

Port Control Protocol (PCP) enables a subscriber to request specific LSN NAT mappings for itself and/or for other 3rd party devices. The large scale NAT device creates an LSN map and sends it to the subscriber. The subscriber sends the remote devices on the Internet the NAT IP address:NAT port at which they can connect to the subscriber.

Applications usually send frequent keep-alive messages to the large scale NAT device so that their LSN mappings do not time out. PCP helps reduce the frequency of such keep-alive messages by enabling the applications to learn the timeout settings of the LSN mappings. This helps reduce bandwidth consumption on the ISP’s access network and battery consumption on mobile devices.

PCP is a client-server model and runs over the UDP transport protocol. A NetScaler appliance implements the PCP server component and is compliant with RFC 6887.

**Configuration Steps**

Perform the following tasks for configuring PCP:

- (Optional) Create a PCP profile. A PCP profile includes settings for PCP related parameters (for example, to listen for mapping and peer PCP requests). A PCP profile can be bound to a PCP server. A PCP profile bound to a PCP server applies all its settings to the PCP server. A PCP profile can be bound to multiple PCP servers. By default, one PCP profile with default parameters settings is bound to all PCP servers. A PCP profile that you bind to a PCP server overrides the default PCP profile settings for that server. A default PCP profile has the following parameter settings:
  - Mapping: Enabled
  - Peer: Enabled
  - Minimum map life: 120 seconds
  - Maximum max life: 86400 seconds
  - Announce count: 10
  - Third Party: Disabled

- Create a PCP server and bind a PCP profile to it. Create a PCP server on the NetScaler appliance to listen for PCP related requests and messages from the subscribers. A Subnet IP (SNIP) address must be assigned to a PCP server to access it. By default, a PCP server listens on port 5351.

- Bind the PCP server to an LSN group of an LSN configuration. Bind the created PCP server to an LSN group of an LSN configuration by setting the PCP Server parameter to specify the created PCP server. The created PCP server can be accessed only by the subscribers of this LSN group.
Note
A PCP server for a large scale NAT configuration does not serve requests from subscribers that are identified from ACL rules.

To create a PCP profile by using the CLI

At the command prompt, type:

```
1 add pcp profile <name> [-mapping ( ENABLED | DISABLED )] [-peer ( ENABLED | DISABLED )] [-minMapLife <secs>] [-maxMapLife <secs>] [-announceMultiCount <positive_integer>] [-thirdParty ( ENABLED | DISABLED )]
2
3 show pcp profile <name>
```

To create a PCP server by using the CLI

At the command prompt, type:

```
1 add pcp server <name> <IPAddress> [-port <portNum|*>] [-pcpProfile <string>]
2
3 show pcp server <name>
```

Sample Configuration for NAT44

In the following sample configuration, PCP server PCP-SERVER-9, with default PCP settings, is bound to LSN group LSN-GROUP-9. PCP-SERVER-9 serves PCP requests from subscribers in network 192.0.2.0/24.

Sample configuration:

```
1 add pcp server PCP-SERVER-9 192.0.3.9
2
3 Done
4
5 add lsn client LSN-CLIENT-9
6
7 Done
8
9 bind lsn client LSN-CLIENT-9 -network 192.0.2.0 -netmask 255.255.255.0
```
Because of the shortage of IPv4 addresses, and the advantages of IPv6 over IPv4, many ISPs have started transitioning to IPv6 infrastructure. But during the transition, ISPs must continue to support IPv4 along with IPv6, because most of the public Internet still uses only IPv4, and many subscribers do not support IPv6.

Dual Stack Lite (DS-Lite) is an IPv6 transition solution for ISPs with IPv6 infrastructure to connect their IPv4 subscribers to the Internet. DS-Lite uses IPv4-in-IPv6 tunneling to send a subscriber’s IPv4 packet through a tunnel on the IPv6 access network to the ISP. The IPv6 packet is decapsulated to recover the subscriber’s IPv4 packet and is then sent to the Internet after NAT address and port translation and other LSN related processing. The response packets traverse through the same path to the subscriber.

The NetScaler appliance implements the AFTR component of a DS-Lite deployment and is compliant with RFC 6333.
NetScaler 11.1

Architecture

The Dual-Stack Lite architecture for an ISP consists of the following components:

- **Basic Bridging Broadband (B4).** Basic Bridging broadband, or B4, is a device or component that resides in the subscriber premises. Typically, B4 is a component in the CPE devices in the subscriber premises. IPv4 subscribers are connected to the IPv6-only ISP access network through the CPE device containing the B4 component. The main function of the B4 is to initiate an IPv6 tunnel between B4 and an address family transition router (AFTR) in order to send or receive subscriber IPv4 request or response packets over the tunnel. B4 includes an IPv6 address known as the B4 tunnel endpoint address. B4 uses this address to source IPv6 packets to AFTR and receive packets from AFTR.

- **Address family transition router (AFTR).** AFTR is a device or component residing in the ISP’s core network. AFTR terminates the IPv6 tunnel from the B4 device. In other words, the IPv6 tunnel is formed between B4 in the subscriber premise and AFTR in ISP core network. AFTR decapsulates IPv6 packets received from B4 to recover the subscribers’ original IPv4 packets. AFTR sends the IPv4 packets to the LSN device or component. LSN routes the IPv4 packets to their destination after performing NAT address and port translation (NAT 44) and other LSN related processing. AFTR includes an IPv6 address known as the AFTR tunnel endpoint address. AFTR uses this address to source IPv6 packets to B4 and receive IPv6 packets from B4. The NetScaler appliance implements the AFTR component.

- **Softwire.** The IPv6 tunnel created between B4 and AFTR is called a softwire.

The DS-Lite architecture of an ISP using a NetScaler appliance consists of subscribers in private address spaces accessing the Internet through a NetScaler appliance deployed in ISP’s core network. IPv4 subscribers are connected to a CPE device that includes the DS-Lite B4 functionality. The CPE device is connected to the ISP core network through ISP’s IPv6-only access network. The NetScaler appliance contains the DS-Lite AFTR and LSN functionality.

IPv4 subscribers connected to the CPE device are assigned private IPv4 addresses either manually or through DHCP server running on the CPE device. On the CPE device, the AFTR tunnel endpoint address is specified manually or through DHCPv6. Configuration of CPE devices is vendor specific and therefore outside the scope of this documentation.

Upon receiving a request packet that is from an IPv4 subscriber and destined to a location on the Internet, the B4 component of the CPE device encapsulates the IPv4 packet in an IPv6 packet and sends it to the NetScaler appliance in the ISP core network. The NetScaler appliance’s AFTR functionality decapsulates the IPv6 packet to recover the subscriber’s original IPv4 packet. The LSN functionality of the NetScaler appliance translates the source IP address and port of the IPv4 packet to an NAT IP address and NAT port selected from the configured NAT pool, and then sends the packet to its destination on the Internet.

The appliance maintains a record of all active sessions that use the AFTR and LSN functionalities.
These sessions are called DS-Lite sessions. The NetScaler appliance also maintains the mappings between B4 IPv6 address, subscriber IPv4 address and port, and NAT IPv4 address and port, for each DS-Lite session. These mappings are called DS-Lite LSN mappings. From DS-Lite session entries and DS-Lite LSN mapping entries, the NetScaler appliance recognizes a response packet (received from the Internet) as belonging to a particular DS-Lite session.

When the NetScaler appliance receives a response packet belonging to a particular DS-Lite session, the appliance's LSN functionality translates the destination IP address and port of the response packet from NAT IP address and port to the subscriber IP address and port, the AFTR functionality encapsulates the resulting packet in an IPv6 packet and sends it to the CPE device. The B4 functionality of the CPE device decapsulates the IPv6 packet to recover the IPv4 response packet, and then sends the IPv4 packet to the subscriber.

**Example**

Consider an example of a DS-Lite deployment consisting of NetScaler NS-1 in an ISP’s core network, CPE device B4-CPE-1 in a subscriber premise, and a single IPv4 subscriber SUB-1. B4-CPE-1 supports the B4 functionality of DS-Lite feature.

The following table lists the settings used in this example.

<table>
<thead>
<tr>
<th>Entity</th>
<th>Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>IPv4 address of subscriber</td>
<td>SUB-1</td>
<td>192.0.2.51</td>
</tr>
<tr>
<td>IPv6 address of softwire endpoint on the B4 device (B4-CPE-1)</td>
<td></td>
<td>2001:DB8::3:4</td>
</tr>
<tr>
<td>IPv6 address of the softwire endpoint on the AFTR device (NS-1)</td>
<td></td>
<td>2001:DB8::5:6</td>
</tr>
</tbody>
</table>

**Settings on NetScaler appliance NS-1:**

<table>
<thead>
<tr>
<th>Entity</th>
<th>Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>LSN client</td>
<td>LSN-DSDLITE-CLIENT-1</td>
<td>Network6 (Identifying traffic from B4 devices) = 2001:DB8::3:0/100</td>
</tr>
</tbody>
</table>
Following is the traffic flow in this example:

1. IPv4 subscriber SUB-1 sends a request to (http://www.example.com/). The IPv4 packet has:
   - Source IP address = 192.0.2.51
   - Source port = 2552
   - Destination IP address = 198.51.100.250
   - Destination port = 80

2. Upon receiving the IPv4 request packet, B4-CPE-1 encapsulates it in the payload of an IPv6 packet and then sends the IPv6 packet to NS-1. The IPv6 packet has:
   - Source IP address = 2001:DB8::3:4
   - Destination IP address = 2001:DB8::5:6

3. When NS-1 receives the IPv6 packet, the AFTR module decapsulates the packet by removing the IPv6 headers. The resulting packet is SUB-1’s original IPv4 request packet.

4. The LSN module of NS-1 translates the source IP address and port of the packet to an NAT IP address and NAT port selected from the configured NAT pool. The translated IPv4 packet has:
   - Source IP address = 203.0.113.61
   - Source port = 3002
   - Destination IP address = 198.51.100.250
   - Destination port = 80

5. The LSN module also creates an LSN mapping and session entry for this DS Lite session. The mapping includes the following information:
6. NS-1 sends the resulting IPv4 packet to its destination on the Internet.

7. The server for www.example.com processes the request packet and sends a response packet. The IPv4 response packet has:
   - Source IP address = 198.51.100.250
   - Source port = 80
   - Destination IP address = 203.0.113.61
   - Destination port = 3002

8. Upon receiving the IPv4 packet, NS-1 examines the LSN mapping and session entries and finds that the IPv4 response packet belongs to a DS Lite session. The LSN module of NS-1 translates the destination IP address and port. The IPv4 packet now has:
   - Source IP address = 198.51.100.250
   - Source port = 80
   - Destination IP address = 192.0.2.51
   - Destination port = 2552

9. The AFTR module of NS-1 encapsulates the IPv4 packet in an IPv6 packet and then sends the IPv6 packet to B4-CPE-1. The IPv6 packet has:
   - Source IP address = 2001:DB8::5:6
   - Destination IP address = 2001:DB8::3:4

10. Upon receiving the packet, B4-CPE-1 decapsualtes the IPv6 packet by removing the IPv6 headers, and then sends the resulting IPv4 packet to CL-1.

Points to Consider before Configuring DS-Lite

December 18, 2018

Consider the following points before configuring DS-Lite on a NetScaler appliance:

1. You must understand the different components of DS-Lite, described in RFC 6333.

2. A DS-lite configuration on a NetScaler appliance uses the LSN commands sets. In a DS-Lite configuration, the LSN client entity specifies the IPv6 address or IPv6 network address or ACL6 rules for identifying the traffic from the B4 device. A DS-Lite configuration also includes an IPv6 profile, which spec-
NetScaler 11.1

ifies the IPv6 address AFTR component on a NetScaler appliance. For more information on NetScaler LSN feature, see Large Scale NAT.

3. For a DS-Lite configuration, the NetScaler appliance supports LSN for IPv4 packets that belong to one of the following protocols only. The NetScaler appliance drops IPv4 packets belonging to other protocols:
   • TCP
   • UDP
   • ICMP

4. The NetScaler appliance supports the following ALGs DS-Lite:
   • ICMP
   • FTP
   • TFTP
   • Session Initiation Protocol (SIP)
   • Real Time Streaming Protocol (RTSP)

Configuring DS-Lite

December 18, 2018

A DS-lite configuration on a NetScaler appliance uses the LSN commands sets. In a DS-Lite configuration, the LSN client entity specifies the IPv6 address or IPv6 network address or ACL6 rules for identifying the traffic from the B4 device. For more information on the NetScaler LSN feature, see Large Scale NAT. A DS-Lite configuration also includes an IPv6 profile, which specifies the IPv6 address (of type SNIP6) of the DS-Lite AFTR component on a NetScaler appliance.

Configuring DS-Lite on a NetScaler appliance consists of the following tasks:

Set the global LSN parameters. Global parameters include the amount of NetScaler memory reserved for the LSN feature and synchronization of LSN sessions in a high availability setup.

- Create an LSN client entity for identifying traffic from B4 CPE devices. The LSN client entity refers to a set of DS-Lite B4 devices. The client entity includes IPv6 addresses or IPv6 network address or ACL6 rules for identifying the traffic from these B4 devices. An LSN client can be bound to only one LSN group. The command line interface has two commands for creating an LSN client entity and binding a subscriber to the LSN client entity. The configuration utility combines these two operations on a single screen.

- Create an LSN pool and bind NAT IP addresses to it. An LSN pool defines a pool of NAT IP addresses to be used by the NetScaler appliance to perform LSN. The command line interface
NetScaler 11.1

has two commands for creating an LSN pool and binding NAT IP addresses to the LSN pool. The configuration utility combines these two operations on a single screen.

- **Create an LSN IP6 profile.** An LSN IP6 profile defines the IPv6 address of the DS-Lite AFTR component on the NetScaler appliance. The IPv6 address must be one of the NetScaler owned IPv6 address of type SNIP6.

- **(Optional) Create an LSN Transport Profile for a specified protocol.** An LSN transport profile defines various timeouts and limits, such as maximum LSN sessions and maximum ports usage that a subscriber can have for a given protocol. You bind an LSN transport profile for each protocol (TCP, UDP, and ICMP) to an LSN group. A profile can be bound to multiple LSN groups. A profile bound to an LSN group applies to all subscribers of an LSN client bound to the same group. By default, one LSN transport profile with default settings for TCP, UDP, and ICMP protocols is bound to an LSN group during its creation. This profile is called the default transport profile. An LSN transport profile that you bind to an LSN group overrides the default LSN transport profile for that protocol.

- **(Optional) Create an LSN Application Profile for a specified protocol and bind a set of destination ports to it.** An LSN application profile defines the LSN mapping and LSN filtering controls of a group for a given protocol and for a set of destination ports. For a set of destination ports, you bind an LSN profile for each protocol (TCP, UDP, and ICMP) to an LSN group. A profile can be bound to multiple LSN groups. An LSN application profile bound to an LSN group applies to all subscribers of an LSN client bound to the same group. By default, one LSN application profile with default settings for TCP, UDP, and ICMP protocols for all destination ports is bound to an LSN group during its creation. This profile is called a default application profile. When you bind an LSN application profile, with a specified set of destination ports, to an LSN group, the bound profile overrides the default LSN application profile for that protocol at that set of destination ports. The command line interface has two commands for creating an LSN application profile and binding a set of destination ports to the LSN application profile. The configuration utility combines these two operations on a single screen.

- **Create an LSN Group and bind LSN pools, LSN IPv6 profile, (optional) LSN transport profiles, and (optional) LSN application profiles to the LSN group.** An LSN group is an entity consisting of an LSN client, an LSN IPv6 profile, LSN pool(s), LSN transport profile(s), and LSN application profile(s). A group is assigned parameters, such as port block size and logging of LSN sessions. The parameter settings apply to all the subscribers of an LSN client bound to the LSN group. Only one LSN IPv6 profile can be bound to an LSN group, and an LSN IPv6 profile bound to an LSN group cannot be bound to other LSN groups. Only LSN Pools and LSN groups with the same NAT type settings can be bound together. Multiples LSN pools can be bound to an LSN group. Only one LSN client entity can be bound to an LSN group, and an LSN client entity bound to an LSN group cannot be bound to other LSN groups. The command line interface has two commands for creating an LSN group and binding LSN pools, LSN transport profiles, and LSN application profiles to the LSN group. The configuration utility combines these two
Configuration by Using the Command Line

To create an LSN client by using the command line interface:

At the command prompt, type:

```
1  add lsn client <clientname>
2
3  show lsn client
```

To bind an IPv6 network or an ACL6 rule to an LSN client by using the command line interface:

At the command prompt, type:

```
1  bind lsn client <clientname> (-network6 <ipv6_addr|*>| -acl6name <
            string>)
2
3  show lsn client
```

To create an LSN pool by using the command line interface:

At the command prompt, type:

```
1  add lsn pool <poolname> [-nattype ( DYNAMIC )] [-portblockallocation ( 
            ENABLED | DISABLED )] [-portrealloctimeout <secs>] [-
            maxPortReallocTmq <positive_integer>]
2
3  show lsn pool
```

To bind an IP address range to an LSN pool by using the command line interface:

At the command prompt, type:

```
1  bind lsn pool <poolname> <lsnip>
2
3  show lsn pool
```

Note: For removing LSN IP addresses from an LSN pool, use the unbind lsn pool command.

To configure an LSN IPv6 profile by using the command line interface:

At the command prompt, type:

```
1  add lsn ip6profile <name> -type DS-Lite -network6 < ipv6_addr|*> 
2
3  show lsn ip6profile
```
To create an LSN transport profile by using the command line interface:

At the command prompt, type:

```bash
add lsn transportprofile <transportprofilename> <transportprotocol> [-sessiontimeout <secs>] [-finrsttimeout <secs>] [-portquota <positive_integer>] [-sessionquota <positive_integer>] [-portpreserveparity ( ENABLED | DISABLED )] [-portpreserverange ( ENABLED | DISABLED )] [-syncheck ( ENABLED | DISABLED )]
```

To create an LSN application profile by using the command line interface:

At the command prompt, type:

```bash
add lsn appsprofile <appsprofilename> <transportprotocol> [-ippooling ( PAIRED | RANDOM )] [-mapping <mapping>] [-filtering <filtering>] [-tcpproxy ( ENABLED | DISABLED )] [-td <positive_integer>]
```

To bind an application protocol port range to an LSN application profile by using the command line interface:

At the command prompt, type:

```bash
bind lsn appsprofile <appsprofilename> <lsnport>
```

To create an LSN group by using the command line interface:

At the command prompt, type:

```bash
add lsn group <groupname> -clientname <string> [-nattype ( DYNAMIC )] [-portblocksize <positive_integer>] [-logging (ENABLED | DISABLED )] [-sessionLogging ( ENABLED | DISABLED )] [-sessionSync ( ENABLED | DISABLED )] [-snmptraplimit<positive_integer>] [-ftp ( ENABLED | DISABLED )] [-pptp ( ENABLED |DISABLED )] [-sipalg ( ENABLED | DISABLED )] [-rtspalg ( ENABLED |DISABLED )] [-ip6profile <string>]
```

To bind LSN protocol profiles and LSN pools to an LSN group by using the command line interface:

At the command prompt, type:
### Configuration by Using the Configuration Utility

**To configure an LSN client and bind an IPv6 network address or an ACL6 rule by using the configuration utility:**

Navigate to **System** > **Large Scale NAT** > **Clients**, and add a client and then bind an IPv6 network address or an ACL6 rule to the client.

**To configure an LSN pool and bind NAT IP addresses by using the configuration utility:**

Navigate to **System** > **Large Scale NAT** > **Pools**, and add a pool and then bind an NAT IP address or a range of NAT IP addresses to the pool.

**To configure an LSN IPv6 profile by using the configuration utility:**

Navigate to **System** > **Large Scale NAT** > **Profiles**, click the **IPv6** tab, and assign an IPv6 address for DS-Lite AFTR.

**To configure an LSN transport profile by using the configuration utility:**

1. Navigate to **System** > **Large Scale NAT** > **Profiles**.
2. On the details pane, click **Transport**, and then add a transport profile.

**To configure an LSN application profile by using the configuration utility:**

1. Navigate to **System** > **Large Scale NAT** > **Profiles**.
2. On the details pane, click **Application**, and then add an application profile.

**To configure an LSN group and bind an LSN client, an LSN IPv6 profile, pools, transport profiles, and application profiles by using the configuration utility:**

Navigate to **System** > **Large Scale NAT** > **Groups**, and add a group and then bind an LSN client, an LSN IPv6 profile, pools, transport profiles, and application profiles to the group.

```bash
1  bind lsn group <groupname> (-poolname <string> | -transportprofilename <string> | -httphdrlogprofilename <string> | -appsprofilename <string> | -sipalgprofilename <string> | -rtspalgprofilename <string>)
2
3  show lsn group
```

```bash
1 > add lsn client LSN-DSLITE-CLIENT-1
2  Done
3 > bind lsn client LSN-DSLITE-CLIENT-1 -network6 2001:DB8::3:0/100
4  Done
5 > add lsn pool LSN-DSLITE-POOL-1
6  Done
7 > bind lsn pool LSN-DSLITE-POOL-1 203.0.113.61 - 203.0.113.70
```
Logging and Monitoring DS-Lite

You can log DS-Lite information to diagnose or troubleshoot problems, and to meet legal requirements. The NetScaler appliance supports all LSN logging features for logging DS-Lite information. For configuring DS-Lite logging, use the procedures for configuring LSN logging, described at Logging and Monitoring LSN.

A log message for a DS-Lite LSN mapping entry consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (MAPPING)
- Whether the DS-Lite LSN mapping entry was created or deleted
- IPv6 address of B4
- Subscriber’s IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID might be present, depending on the following conditions:
  - Destination IP address and port are not logged for Endpoint-Independent mapping.
  - Only the destination IP address is logged for Address-Dependent mapping. The port is not logged.
  - Destination IP address and port are logged for Address-Port-Dependent mapping.

A log message for a DS-Lite session consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (SESSION)
- Whether the DS-Lite session is created or removed
NetScaler 11.1

- IPv6 address of B4
- Subscriber’s IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID

The following table shows sample DS-Lite log entries of each type stored on the configured log servers. These log entries are generated by a NetScaler appliance whose NSIP address is 10.102.37.115. You can log DS-Lite information to diagnose or troubleshoot problems, and to meet legal requirements. The NetScaler appliance supports all LSN logging features for logging DS-Lite information. For configuring DS-Lite logging, use the procedures for configuring LSN logging, described at Logging and Monitoring LSN.

A log message for a DS-Lite LSN mapping entry consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (MAPPING)
- Whether the DS-Lite LSN mapping entry was created or deleted
- IPv6 address of B4
- Subscriber’s IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID might be present, depending on the following conditions:
  - Destination IP address and port are not logged for Endpoint-Independent mapping.
  - Only the destination IP address is logged for Address-Dependent mapping. The port is not logged.
  - Destination IP address and port are logged for Address-Port-Dependent mapping.

A log message for a DS-Lite session consists of the following information:

**Displaying Current DS-Lite Sessions**

You can display the current DS-Lite sessions for detecting any unwanted or inefficient sessions on the NetScaler appliance. You can display all or some DS-Lite sessions, on the basis of selection parameters.
Configuration by Using the Command Line Interface

To display all DS-Lite sessions by using the command line interface:

At the command prompt, type:

```
show lsn session - nattype DS-Lite
```

To display selected DS-Lite sessions by using the command line interface:

At the command prompt, type:

```
show lsn session - nattype DS-Lite [-clientname <string>] [-network <ip_addr> [-netmask <netmask>] [-td <positive_integer>]] [-natIP <ip_addr> [-natPort <port>]]
```

Example:

The following sample output displays all DS-Lite sessions existing on a NetScaler appliance:

```
show lsn session - nattype DS-Lite
B4-Address SubscrIP SubscrPort SubscrTD DstIP DstPort DstTD NatIP NatPort Proto Dir
1. 2001:DB8::3:4 192.0.2.51 2552 0 198.51.100.250 80 0 203.0.113.61 3002 TCP OUT
2. 2001:DB8::3:4 192.0.2.51 3551 0 198.51.100.300 80 0 203.0.113.61 52862 TCP OUT
3. 2001:DB8::3:4 192.0.2.100 4556 0 198.51.100.250 0 0 203.0.113.61 48116 ICMP OUT
4. 2001: DB8::190 192.0.2.150 3881 0 198.51.100.199 80 0 203.0.113.69 48305 TCP OUT
Done
```

Configuration Using the Configuration Utility

To display all or selected DS-Lite sessions by using the configuration utility

1. Navigate to System > Large Scale NAT > Sessions, and click the DS-Lite tab.
2. For displaying DS-Lite sessions on the basis of selection parameters, click Search.
Clearing DS-Lite Sessions

You can remove any unwanted or inefficient DS-Lite sessions from the NetScaler appliance. The appliance immediately releases the resources (such as NAT IP address, port, and memory) allocated for these sessions, making the resources available for new sessions. The appliance also drops all the subsequent packets related to these removed sessions. You can remove all or selected DS-Lite sessions from the NetScaler appliance.

To clear all DS-Lite sessions by using the command line interface:

At the command prompt, type:

```
flush lsn session –natype DS-Lite
show lsn session –natype DS-Lite
```

To clear selected DS-Lite sessions by using the command line interface:

At the command prompt, type:

```
flush lsn session - natype DS-Lite [-clientname <string>] [-network <ip_addr> [-netmask <netmask>] [-td <positive_integer>] [-natIP <ip_addr> [-natPort <port>]]
show lsn session - natype DS-Lite
```

To clear all or selected DS-Lite sessions by using the configuration utility:

1. Navigate to System > Large Scale NAT > Sessions, and click the DS-Lite tab.
2. Click Flush Sessions.

Configuring DS-Lite Static Maps

December 18, 2018

The NetScaler appliance supports manual creation of DS-Lite LSN mappings, which contain the mapping between the following information:

- Subscriber's IP address and port, and IPv6 address of B4 device or component
- NAT IP address and port

Static DS-Lite LSN mappings are useful in cases where you want to ensure that the connections initiated to a NAT IP address and port map to the subscriber IP address and port through the specified B4 device (for example, web servers located in the internal network).

Note: This feature is supported in release 11.0 build 64.x and later.
To create a DS-Lite static LSN mapping by using the command line

At the command prompt, type:

```
1   add lsn static <name> <transportprotocol> <subscrIP> <subscrPort> [-td <positive_integer>] [-network6 <B4_ADDR>] [<natIP> [<natPort>]] [-destIP<ip_addr> [-dsttd <positive_integer>]]
2
3   show lsn static
```

Parameter Descriptions

add lsn static

- **name**

  Name for the LSN static mapping entry. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN group is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “ds-lite lsn static1” or ‘ds-lite lsn static1’). This is a mandatory argument. Maximum Length: 127

  - transportprotocol

  Protocol for the DS-Lite LSN mapping entry.

  - **subscrIP**

    IPv4 address of a subscriber for the DS-Lite LSN mapping entry.

  - **subscrPort**

    Port of the subscriber for the DS-Lite LSN mapping entry.

  - **Network6**

    IPv6 address of the B4 device or component.

  - **td**

    ID of the traffic domain to which the B4 device belongs. The IPv6 address of the B4 device is specified in the network6 parameter. If you do not specify an ID, the B4 device is assumed to be a part of the default traffic domain.

  - **natIP**

    IPv4 address, already existing on the NetScaler appliance as type LSN, to be used as NAT IP address for this mapping entry.
NatPort

NAT port for this DS-Lite LSN mapping entry.

DestIP

Destination IP address for the DS-Lite LSN mapping entry.

Dsttd

ID of the traffic domain through which the destination IP address for this DS-Lite LSN mapping entry is reachable from the NetScaler appliance. If you do not specify an ID, the destination IP address is assumed to be reachable through the default traffic domain, which has an ID of 0.

To create a DS-Lite static LSN mapping by using the configuration utility

Navigate to System > Large Scale NAT > Static, and add a new DS-Lite static LSN mapping.

Configuring Deterministic NAT Allocation for DS-Lite

December 18, 2018

Deterministic NAT allocation for DS-Lite LSN deployments is a type of NAT resource allocation in which the NetScaler appliance pre-allocates, from the LSN NAT IP pool and on the basis of the specified port block size, an LSN NAT IP address and a block of ports to each subscriber (subscriber behind B4 device).

Note: This feature is supported in release 11.0 build 64.x and later.

The appliance sequentially allocates NAT resources to these subscribers. It assigns the first block of ports on the beginning NAT IP address to the beginning subscriber IP address. The next range of ports is assigned to the next subscriber, and so on, until the NAT address does not have enough ports for the next subscriber. At that point, the first port block on the next NAT address is assigned to the subscriber, and so on.

The NetScaler appliance logs the allocated NAT IP address and the port block for a subscriber. For a connection, a subscriber can be identified by just its mapped NAT IP address and port block. For this reason, the NetScaler appliance does not log the creation or deletion of an LSN session.

A DS-Lite subscriber can have only one deterministic port block. If the entire block of ports is being used, the NetScaler appliance drops any new connection from the subscriber.
**Example: Deterministic DS-Lite**

In this example, a deterministic DS-Lite configuration includes four subscribers with IP addresses 192.0.17.5, 192.0.17.6, 192.0.17.7, and 192.0.17.8. These ipv4 subscribers are behind a B4 device having the IPv6 address 2001:DB8::3:4. In this configuration, the port block size is set to 20480 and LSN NAT IP address pool has IP addresses in the range 203.0.113.41-203.0.113.42.

The NetScaler appliance sequentially pre-allocates, from the LSN NAT IP pool and on the basis of the set port block size, an LSN NAT IP address and a block of ports to each subscriber. It assigns the first block of ports (1024-21503) on the beginning NAT IP address (203.0.113.41) to the beginning subscriber IP address (192.0.17.5). The next range of ports is assigned to the next subscriber, and so on, until the NAT address does not have enough ports for the next subscriber. At that point, the first port block on the next NAT IP address is assigned to the subscriber, and so on. The NetScaler logs the NAT IP address and the block of ports allocated for each subscriber.

The NetScaler appliance does not log any LSN session created or deleted for these subscribers.

The following table lists the NAT IP address and blocks of ports allocated to each subscriber in this example:

<table>
<thead>
<tr>
<th>Subscriber IP address</th>
<th>Allocated NAT IP address</th>
<th>Allocated Block of Ports</th>
<th>IPv6 address of B4</th>
</tr>
</thead>
<tbody>
<tr>
<td>192.0.17.5</td>
<td>203.0.113.41</td>
<td>1024 - 21503</td>
<td>2001:DB8::3:4</td>
</tr>
<tr>
<td>192.0.17.6</td>
<td>203.0.113.41</td>
<td>21504 - 41983</td>
<td>2001:DB8::3:4</td>
</tr>
<tr>
<td>192.0.17.7</td>
<td>203.0.113.41</td>
<td>41984 - 62463</td>
<td>2001:DB8::3:4</td>
</tr>
<tr>
<td>192.0.17.8</td>
<td>203.0.113.42</td>
<td>1024 - 21503</td>
<td>2001:DB8::3:4</td>
</tr>
</tbody>
</table>

**Configuration Steps**

You need to configure deterministic NAT as part of the DS-Lite configuration. For instructions on configuring DS-Lite, see [Configuring DS-Lite](#).

While configuring DS-Lite, make sure that you:

- Set the NAT Type parameter to Deterministic when adding the LSN pool and the LSN group.
- Set the desired port block size parameter when adding the LSN group, unless you can accept the default value.
Points to Consider before Configuring Deterministic DS-Lite

Consider the following points before configuring deterministic DS-Lite:

- The complete IP address of each subscriber must be specified in a separate add lsn client command, by setting the Network and Netmask parameters. (Set Netmask to 255.255.255.255.) Also the IPv4 address of the B4 device specified in Network6 parameter must be complete (/128 prefix). In other words, Network and Network6 parameter do not accept addresses other than /32 bit mask and /128 prefix, respectively.
- The NetScaler appliance drops connections from subscribers that are not specified in any deterministic DS-Lite configuration but are behind B4 devices specified in a deterministic DS-lite configuration.
- The NetScaler appliance recognizes subscribers having the same IPv4 address as different subscribers if they are behind different B4 devices. A combination of subscriber IPv4 address and B4 device defines a unique subscriber in the LSN client entity of a DS-Lite configuration.

Sample Deterministic DS-Lite Configuration:

The following configuration uses the settings listed in section Example: Deterministic DS-Lite.

```
add lsn client LSN-DSLITE-CLIENT-10
Done
bind lsn client LSN-DSLITE-CLIENT-10 -network 192.0.17.5 -netmask 255.255.255.255 -network6 2001:DB8::3:4/128
Done
bind lsn client LSN-DSLITE-CLIENT-10 -network 192.0.17.6 -netmask 255.255.255.255 -network6 2001:DB8::3:4/128
Done
bind lsn client LSN-DSLITE-CLIENT-10 -network 192.0.17.7 -netmask 255.255.255.255 -network6 2001:DB8::3:4/128
Done
bind lsn client LSN-DSLITE-CLIENT-10 -network 192.0.17.8 -netmask 255.255.255.255 -network6 2001:DB8::3:4/128
Done
add lsn pool LSN-DSLITE-POOL-10 -nattype DETERMINISTIC
Done
bind lsn pool LSN-DSLITE-POOL-10 203.0.113.41-203.0.113.42
Done
```
Configuring Application Layer Gateways for DS-Lite

December 18, 2018

For some application layer protocols, the IP addresses and protocol port numbers are also communicated in the packet's payload. Application Layer Gateway (AGL) for a protocol parses the packet payload and does necessary changes to ensure that the protocol continues to work over DS-Lite.

The NetScaler appliance supports ALG for the following protocols for DS-Lite:

- FTP
- ICMP
- TFTP
- SIP
- RTSP

Application Layer Gateway for FTP, ICMP, and TFTP Protocols

December 18, 2018

You can enable or disable ALG for the FTP protocol for a DS-Lite configuration by enabling or disabling the FTP ALG option of the LSN group of the configuration.

ALG for the ICMP protocol is enabled by default, and there is no provision to disable it.

ALG for the TFTP protocol is disabled by default. TFTP ALG is enabled automatically for a DS-Lite configuration when you bind a UDP LSN application profile, with endpoint-independent-mapping,
endpoint-independent filtering, and destination port as 69 (well-known port for TFTP), to the LSN group.

**Application Layer Gateway for SIP Protocol**

December 18, 2018

Using DS-Lite with Session Initiation Protocol (SIP) is complicated, because SIP messages contain IP addresses in the SIP headers as well as in the SIP body. When LSN is used with SIP, the SIP headers contain information about the caller and the receiver, and the device translates this information to hide it from the outside network. The SIP body contains the Session Description Protocol (SDP) information, which includes IP addresses and port numbers for transmission of the media. SIP ALG for DS-Lite is compliant with RFC 3261, RFC 3581, RFC 4566, and RFC 4475.

**Limitations of SIP ALG**

SIP ALG for DS-Lite has the following limitations:

- Only SDP payload is supported.
- The following are not supported:
  - Multicast IP addresses
  - Encrypted SDP
  - SIP TLS
  - FQDN translation
  - SIP layer authentication
  - Admin partitions
  - NetScaler clusters
  - Multipart body
  - Line folding

**Configuring SIP ALG**

You need to configure the SIP ALG as part of the LSN configuration. For instructions on configuring LSN, see Configuring DS-Lite. While configuring LSN, make sure that you:

- Set the following parameters while adding an LSN application profile:
  - IP Pooling = PAIRED
  - Address and Port Mapping = ENDPOINT-INDEPENDENT
NetScaler 11.1

- Filtering = ENDPOINT-INDEPENDENT
  - Create a SIP ALG profile and make sure that you define either the source port range or destination port range. Bind the SIP ALG profile to the LSN group
  - Enable SIP ALG in the LSN group

To enable SIP ALG for an LSN configuration by using the CLI

At the command prompt, type:

1. `add lsn group <groupname> -clientname <string>[-sipalg ( ENABLED | DISABLED )]`

2. `show lsn group <groupname>`

To enable SIP ALG for an LSN configuration by using the CLI

At the command prompt, type:

1. `add lsn sipalgprofile <sipalgprofilename> [-dataSessionIdleTimeout<positive_integer>][-sipSessionTimeout<positive_integer>][-registrationTimeout<positive_integer>][-sipsrcportrange<port[-port]>][-sipdstportrange<port[-port]>][-openRegisterPinhole ( ENABLED | DISABLED )][-openContactPinhole ( ENABLED | DISABLED )][-openViaPinhole ( ENABLED | DISABLED )][-openRecordRoutePinhole ( ENABLED | DISABLED )][-sipTransportProtocol ( TCP | UDP )][-openRoutePinhole ( ENABLED | DISABLED )][-rport ( ENABLED | DISABLED )]

2. `show lsn sipalgprofile <sipalgprofilename>`

Sample Configuration

The following sample DS-Lite configuration, SIP ALG is enabled for TCP traffic from B4 devices in the network 2001:DB8::3:0/96.

1. `add lsn client LSN=DSLITE-CLIENT-1`
2. `Done`
3. `bind lsn client LSN=DSLITE-CLIENT-1 -network6 2001:DB8::3:0/96`
4. `Done`
5. `add lsn pool LSN=DSLITE-POOL-1`
6. `Done`
Application Layer Gateway for RTSP Protocol

December 18, 2018

Real Time Streaming Protocol (RTSP) is an application-level protocol for the transfer of real-time media data. Used for establishing and controlling media sessions between end points, RTSP is a control channel protocol between the media client and the media server. The typical communication is between a client and a streaming media server.

Streaming media from a private network to a public network requires translating IP addresses and port numbers over the network. NetScaler functionality includes an Application Layer Gateway (ALG) for RTSP, which can be used with Large Scale NAT (LSN) to parse the media stream and make any necessary changes to ensure that the protocol continues to work over the network.

How IP address translation is performed depends on the type and direction of the message, and the type of media supported by the client-server deployment. Messages are translated as follows:

- **Outbound request**—Private IP address to NetScaler owned public IP address called LSN IP address.
- **Inbound response**—LSN IP address to private IP address.

---

```
bind lsn pool LSN-DSLITE-POOL-1 203.0.113.61 - 203.0.113.70
Done
add lsn ip6profile LSN-DSLITE-PROFILE-1 -type DS-Lite -network6 2001:DB8::5:6
Done
add lsn appsprofile LSN-DSLITE-APPS-PROFILE-1 TCP -ippooling PAIRED -mapping ENDPOINT-INDEPENDENT -filtering ENDPOINT-INDEPENDENT
Done
add lsn sipalgprofile SIPALGPROFILE-1 sipTransportProtocol TCP -sipdstportrange 5060
Done
add lsn group LSN-DSLITE-GROUP-1 -clientname LSN-DSLITE-CLIENT-1 -portblocksize 1024 -ip6profile LSN-DSLITE-PROFILE-1 -sipalg ENABLED
Done
bind lsn group LSN-DSLITE-GROUP-1 -poolname LSN-DSLITE-POOL-1
Done
bind lsn group LSN-DSLITE-GROUP-1 -appsprofilename LSN-DSLITE-APPSPROFILE-1
Done
bind lsn group LSN-DSLITE-GROUP-1 -sipalgprofilename SIPALGPROFILE-1
Done
```
NetScaler 11.1

- Inbound request—No translation.
- Outbound response—Private IP address to LSN pool IP address.

Limitations of RTSP ALG

The RTSP ALG does not support the following:

- Multicast RTSP sessions
- RTSP session over UDP
- Admin partitions
- NetScaler clusters
- RTSP Authentication
- HTTP tunneling

Configuring RTSP ALG

Configure RTSP ALG as part of the LSN configuration. For instructions on configuring LSN, see Configuring DS-Lite. While configuring LSN, make sure that you:

- Set the following parameters while adding an LSN application profile:
  - IP Pooling = PAIRED
  - Address and Port Mapping = ENDPOINT-INDEPENDENT
  - Filtering = ENDPOINT-INDEPENDENT
- Enable RTSP ALG in the LSN group
- Create a RTSP ALG profile and bind the RTSP ALG profile to the LSN group

To enable RTSP ALG for an LSN configuration by using the CLI

At the command prompt, type:

```
1 add lsn group <groupname> -clientname <string> [-rtspalg ( ENABLED | DISABLED )]
2
3 show lsn group <groupname>
```

To enable RTSP ALG for an LSN configuration by using the CLI

At the command prompt, type:
NetScaler 11.1

```
1 add lsn rtspalgprofile <rtspalgprofilename> [-rtspIdleTimeout <positive_integer>] -rtspportrange <port[-port>] [-rtspTransportProtocol (TCP|UDP)]
2
3 show lsn rtspalgprofile <rtspalgprofilename>
```

Sample RTSP ALG Configuration

The following sample DS-Lite configuration, RTSP ALG is enabled for TCP traffic from B4 devices in the network 2001:DB8::4:0/96.

Sample RTSP ALG Configuration:

```
1 add lsn client LSN-DSLITE-CLIENT-5
2 Done
3 bind lsn client LSN-DSLITE-CLIENT-5 -network6 2001:DB8::4:0/96
4 Done
5 add lsn pool LSN-DSLITE-POOL-5
6 Done
7 bind lsn pool LSN-DSLITE-POOL-5 203.0.113.61 - 203.0.113.70
8 Done
9 add lsn ip6profile LSN-DSLITE-PROFILE-5 -type DS-Lite -network6 2001:DB8::5:6
10 Done
11 add lsn appsprofile LSN-DSLITE-APPS-PROFILE-5 TCP -ippooling PAIRED -mapping ENDPOINT-INDEPENDENT -filtering ENDPOINT-INDEPENDENT
12 Done
13 add lsn rtspalgprofile RTSPALGPROFILE-5 -rtspIdleTimeout 1000 -rtspportrange 554
14 Done
15 add lsn group LSN-DSLITE-GROUP-5 -clientname LSN-DSLITE-CLIENT-5 -portblocksize 1024 -ip6profile LSN-DSLITE-PROFILE-5 -rtspalg ENABLED
16 Done
17 bind lsn group LSN-DSLITE-GROUP-5 -poolname LSN-DSLITE-POOL-5
18 Done
19 bind lsn group LSN-DSLITE-GROUP-5 -appsprofilename LSN-DSLITE-APPSPROFILE-5
20 Done
21 bind lsn group LSN-DSLITE-GROUP-5 -rtspalgprofilename RTSPALGPROFILE-5
22 Done
```
Logging and Monitoring DS-Lite

You can log DS-Lite information to diagnose or troubleshoot problems, and to meet legal requirements. The NetScaler appliance supports all LSN logging features for logging DS-Lite information. For configuring DS-Lite logging, use the procedures for configuring LSN logging, described at Logging and Monitoring LSN.

A log message for a DS-Lite LSN mapping entry consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (MAPPING)
- Whether the DS-Lite LSN mapping entry was created or deleted
- IPv6 address of B4
- Subscriber's IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID might be present, depending on the following conditions:
  - Destination IP address and port are not logged for Endpoint-Independent mapping.
  - Only the destination IP address is logged for Address-Dependent mapping. The port is not logged.
  - Destination IP address and port are logged for Address-Port-Dependent mapping.

A log message for a DS-Lite session consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (SESSION)
- Whether the DS-Lite session is created or removed
- IPv6 address of B4
- Subscriber’s IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID

The following table shows sample DS-Lite log entries of each type stored on the configured log servers. These log entries are generated by a NetScaler appliance whose NSIP address is 10.102.37.115.

NetScaler 11.1

Displaying Current DS-Lite Sessions

You can display the current DS-Lite sessions for detecting any unwanted or inefficient sessions on the NetScaler appliance. You can display all or some DS-Lite sessions, on the basis of selection parameters.

To display all DS-Lite sessions by using the command line interface

At the command prompt, type:

```
1 show lsn session -nattype DS-Lite
```
To display selected DS-Lite sessions by using the command line interface

At the command prompt, type:

```
show lsn session -nattype DS-Lite [-clientname <string>] [-network <ip_addr> [-netmask <netmask>] [-td <positive_integer>]] [-natIP <ip_addr> [-natPort <port>]]
```

The following sample output displays all DS-Lite sessions existing on a NetScaler appliance:

```
show lsn session -nattype DS-Lite

1  B4-Address SubscrIP SubscrPort SubscrTD DstIP DstPort DstTD NatIP NatPort Proto Dir
    192.0.2.51 2552 0 198.51.100.250 80 0 203.0.113.61 3002 TCP OUT

2  192.0.2.51 3551 0 198.51.100.300 80 0 203.0.113.61 52862 TCP OUT

3  192.0.2.100 4556 0 198.51.100.250 0 0 203.0.113.61 48116 ICMP OUT

4  190 3881 0 198.51.100.199 80 0 203.0.113.69 48305 TCP OUT

Done
```

Configuration Using the Configuration Utility

To display all or selected DS-Lite sessions by using the configuration utility

1. Navigate to System > Large Scale NAT > Sessions, and click the DS-Lite tab.
2. For displaying DS-Lite sessions on the basis of selection parameters, click Search.

Clearing DS-Lite Sessions

You can remove any unwanted or inefficient DS-Lite sessions from the NetScaler appliance. The appliance immediately releases the resources (such as NAT IP address, port, and memory) allocated for these sessions, making the resources available for new sessions. The appliance also drops all the subsequent packets related to these removed sessions. You can remove all or selected DS-Lite sessions from the NetScaler appliance.
NetScaler 11.1

To clear all DS-Lite sessions by using the command line interface

At the command prompt, type:

```
1 flush lsn session - natype DS-Lite
2 show lsn session - natype DS-Lite
```

To clear selected DS-Lite sessions by using the command line interface

At the command prompt, type:

```
1 flush lsn session - natype DS-Lite [-clientname <string>] [-network <ip_addr> [-netmask <netmask>] [-td <positive_integer>] [-natIP <ip_addr> [-natPort <port>]]
2 show lsn session - natype DS-Lite
```

To clear all or selected DS-Lite sessions by using the configuration utility

1. Navigate to System > Large Scale NAT > Sessions, and click the DS-Lite tab.
2. Click Flush Sessions.

Logging HTTP Header Information

The NetScaler appliance can log request header information of an HTTP connection that is using the DS-Lite functionality. The following header information of an HTTP request packet can be logged:

- URL that the HTTP request is destined to
- HTTP Method specified in the HTTP request
- HTTP version used in the HTTP request
- IPv4 address of the subscriber that sent the HTTP request

The HTTP header logs can be used by ISPs to see the trends related to the HTTP protocol among a set of subscribers. For example, an ISP can use this feature to find out the most popular website among a set of subscribers.

Configuration Steps

Perform the following tasks for configuring the NetScaler appliance to log HTTP header information:
NetScaler 11.1

- **Create an HTTP header log profile.** An HTTP header log profile is a collection of HTTP header attributes (for example, URL and HTTP method) that can be enabled or disabled for logging.

- **Bind the HTTP header to an LSN group of a DS-Lite LSN configuration.** Bind the HTTP header log profile to an LSN group of an LSN configuration by setting the HTTP header log profile name parameter to the name of the created HTTP header log profile. The NetScaler appliance then logs HTTP header information of any HTTP requests related to the LSN group. An HTTP header log profile can be bound to multiple LSN groups, but an LSN group can have only one HTTP header log profile.

**To create an HTTP header log profile by using the command line interface**

At the command prompt, type:

```
1 add lsn httphdrlogprofile <httphdrlogprofilename> [-logURL ( ENABLED | DISABLED )] [-logMethod ( ENABLED | DISABLED )] [-logVersion ( ENABLED | DISABLED )] [-logHost ( ENABLED | DISABLED )]
2
3 show lsn httphdrlogprofile
```

**To bind an HTTP header log profile to an LSN group by using the command line interface**

At the command prompt, type:

```
1 bind lsn group <groupname> -httphdrlogprofilename <string>
2
3 show lsn group <groupname>
```

**Sample Configuration**

In the following DS-Lite LSN configuration, HTTP header log profile HTTP-HEADER-LOG-1 is bound to LSN group LSN-DSLITE-GROUP-1. The log profile has all the HTTP attributes (URL, HTTP method, HTTP version, and HOST IP address) enabled for logging, so that all these attributes are logged for any HTTP requests from B4 devices (in the network 2001:DB8:5001::/96).

**Sample Configuration:**

```
1 add lsn httphdrlogprofile HTTP-HEADER-LOG-1
2
3 Done
4
5 add lsn client LSN-DSLITE-CLIENT-1
6
```
### IPFIX Logging

The NetScaler appliance supports sending information about LSN events in Internet Protocol Flow Information Export (IPFIX) format to the configured set of IPFIX collector(s). The appliance uses the existing AppFlow feature to send LSN events in IPFIX format to the IPFIX collectors.

IPFIX based logging is available for the following DS_Lite related events:

- Creation or deletion of an LSN session.
- Creation or deletion of an LSN mapping entry.
- Allocation or de-allocation of port blocks in the context of deterministic NAT.
NetScaler 11.1

- Allocation or de-allocation of port blocks in the context of dynamic NAT.
- Whenever subscriber session quota is exceeded.

**Points to Consider before you Configure IPFIX logging**

Before you start configuring IPSec ALG, consider the following points:

- You must configure the AppFlow feature and IPFIX collector(s) on the NetScaler appliance. For instructions, see Configuring the AppFlow feature.

**Configuration Steps**

Perform the following tasks for logging LSN information in IPFIX format:

- **Enable LSN logging in the AppFlow configuration.** Enable the LSN logging parameter as part of AppFlow configuration.
- **Create an LSN log profile.** An LSN log profile includes the IPFIX parameter that enables or disables the log information in IPFIX format.
- **Bind the LSN log profile to an LSN group of an LSN configuration.** Bind the LSN log profile to one or multiple LSN group(s). Events related to the bound LSN group will be logged in IPFIX format.

**To enable LSN logging in the AppFlow configuration by using the CLI**

At the command prompt, type:

```
1 set appflow param -lsnLogging (ENABLED |DISABLED )
2 show appflow param
```

**To create an LSN log profile by using the CLI**

At the command prompt, type:

```
1 set lsn logprofile <logProfileName> -logipfix ( ENABLED | DISABLED )
2 show lsn logprofile
```

**To bind the LSN log profile to an LSN group of an LSN configuration by using the CLI**

At the command prompt, type:
To create an LSN log profile by using the GUI

Navigate to System > Large Scale NAT > Profiles, click Log tab, and then add a log profile.

To bind the LSN log profile to an LSN group of an LSN configuration by using the GUI

1. Navigate to System > Large Scale NAT > LSN Group, open the LSN group.
2. In Advanced Settings, click + Log Profile to bind the created Log profile to the LSN group.

Port Control Protocol for DS-Lite

December 18, 2018

NetScaler appliances now support Port Control Protocol (PCP) for large scale NAT (LSN). Many of an ISP’s subscriber applications must be accessible from Internet (for example, Internet of Things (IOT) devices, such as an IP camera that provides surveillance over the Internet). One way to meet this requirement is to create static large scale NAT (LSN) maps. But for a very large number of subscribers, creating static LSN NAT maps is not a feasible solution.

Port Control Protocol (PCP) enables a subscriber to request specific LSN NAT mappings for itself and/or for other 3rd party devices. The large scale NAT device creates an LSN map and sends it to the subscriber. The subscriber sends the remote devices on the Internet the NAT IP address:NAT port at which they can connect to the subscriber.

Applications usually send frequent keep-alive messages to the large scale NAT device so that their LSN mappings do not time out. PCP helps reduce the frequency of such keep-alive messages by enabling the applications to learn the timeout settings of the LSN mappings. This helps reduce bandwidth consumption on the ISP’s access network and battery consumption on mobile devices.

PCP is a client-server model and runs over the UDP transport protocol. A NetScaler appliance implements the PCP server component and is compliant with RFC 6887.

Configuration Steps

Perform the following tasks for configuring PCP:

```
1 bind lsn group <groupname> -logProfileName <lsnlogprofilename>
2 show lsn group
```
• (Optional) Create a PCP profile. A PCP profile includes settings for PCP related parameters (for example, to listen for mapping and peer PCP requests). A PCP profile can be bound to a PCP server. A PCP profile bound to a PCP server applies all its settings to the PCP server. A PCP profile can be bound to multiple PCP servers. By default, one PCP profile with default parameters settings is bound to all PCP servers. A PCP profile that you bind to a PCP server overrides the default PCP profile settings for that server. A default PCP profile has the following parameter settings:
  – Mapping: Enabled
  – Peer: Enabled
  – Minimum map life: 120 seconds
  – Maximum max life: 86400 seconds
  – Announce count: 10
  – Third Party: Disabled

• Create a PCP server and bind a PCP profile to it. Create a PCP server on the NetScaler appliance to listen for PCP related requests and messages from the subscribers. A Subnet IP (SNIP) address must be assigned to a PCP server to access it. By default, a PCP server listens on port 5351.

• Bind the PCP server to an LSN group of an LSN configuration. Bind the created PCP server to an LSN group of an LSN configuration by setting the PCP Server parameter to specify the created PCP server. The created PCP server can be accessed only by the subscribers of this LSN group. Note: A PCP server for a large scale NAT configuration does not serve requests from subscribers that are identified from ACL rules.

**To create a PCP profile by using the CLI**

At the command prompt, type:

```
1 add pcp profile <name> [-mapping ( ENABLED | DISABLED )] [-peer ( ENABLED | DISABLED )] [-minMapLife <secs>] [-maxMapLife <secs>] [-announceMultiCount <positive_integer>] [-thirdParty ( ENABLED | DISABLED )]
2
3 show pcp profile <name>
```

**To create a PCP server by using the CLI**

At the command prompt, type:

```
1 add pcp server <name> <IPAddress> [-port <portNum|*>] [-pcpProfile <string>]
2
```
Sample Configuration for DS-LITE

In the following sample configuration, PCP server PCP-SERVER-1, with PCP settings from PCP-DSLITE-PROFILE-1, is bound to LSN group LSN-DSLITE-GROUP-1. PCP-SERVER-9 serves PCP requests from IPv4 subscribers behind B4 devices from network 2001:DB8::3:0/100.

Sample configuration:

```
3 show pcp server <name>

Sample Configuration for DS-LITE

In the following sample configuration, PCP server PCP-SERVER-1, with PCP settings from PCP-DSLITE-PROFILE-1, is bound to LSN group LSN-DSLITE-GROUP-1. PCP-SERVER-9 serves PCP requests from IPv4 subscribers behind B4 devices from network 2001:DB8::3:0/100.

Sample configuration:

```

Large Scale NAT64

January 6, 2019

Because of the imminent exhaustion of IPv4 addresses, ISPs have started transitioning to IPv6 infrastructure. But during the transition, ISPs must continue to support IPv4 along with IPv6, because most of the public Internet still uses IPv4. Large scale NAT64 is an IPv6 transition solution for ISPs with IPv6

© 1999-2018 Citrix Systems, Inc. All rights reserved.
NetScaler 11.1

infrastructure to connect their IPv6-only subscribers to the IPv4 Internet. DNS64 is a solution for enabling discovery of IPv4-only domains by IPv6-only clients. DNS64 is used with large scale NAT64 to enable seamless communication between IPv6-only clients and IPv4-only servers.

A NetScaler appliance implements large scale NAT64 and DNS64 and is compliant with RFCs 6145, 6146, 6147, 6052, 3022, 2373, 2765, and 2464.

Architecture

The NAT64 architecture of an ISP using a NetScaler appliance consists of IPv6 subscribers accessing the IPv4 Internet through a NetScaler appliance deployed in the ISP’s core network. IPv6 subscribers are connected to the ISP core network through the ISP’s IPv6-only access network.

The large scale NAT64 functionality of a NetScaler appliance enables communication between IPv6 clients and IPv4 servers through IPv6-to-IPv4 packet translation, and vice versa, while maintaining session information on the NetScaler appliance. NetScaler DNS64 functionality represents IPv4-only domains to IPv6-subscribers by synthesizing DNS AAAA records for IPv4-only domains and sending them to the subscribers.

Large scale NAT64 has two main components: NAT64 prefix and NAT IPv4 pool. DNS64 has one main component, DNS64 prefix, which has the same value as NAT64 prefix.

Upon receiving an AAAA request from an IPv6-only subscriber for a domain name that is hosted on an IPv4-only web server on the Internet, the NetScaler DNS64 functionality synthesizes an AAAA record for the domain name and sends it to the subscriber. The AAAA record is synthesized by concatenating the DNS64 prefix (which is set to the NAT64 prefix) and the actual IPv4 address of the domain name.

The subscriber now has an IPv6 destination address that corresponds to the desired domain name. The subscriber sends the request to the synthesized IPv6 address. Upon receiving the IPv6 request, the large scale NetScaler NAT64 functionality translates the IPv6 request packet to an IPv4 request packet. Large scale NAT64 sets the IPv4 request’s destination address to the IPv4 address, which is extracted from the IPv6 request’s destination address by stripping the NAT64 prefix from the IPv6 address. The destination port is retained from the IPv6 request. Large Scale NAT64 also sets the source IP address:source port of the IPv4 packet to the NAT IP address:NAT port selected from the configured NAT pool.

The appliance maintains a record of all active sessions that use the large scale NAT64 functionality. These sessions are called large scale NAT64 sessions. The appliance also maintains the mappings between subscriber IPv6 address and port, and NAT IPv4 address and port, for each large scale NAT64 session. These mappings are called large scale NAT64 mappings. From large scale NAT64 session entries and large scale NAT64 mapping entries, the NetScaler appliance recognizes a response packet (received from the Internet) as belonging to a particular NAT64 session.

© 1999-2018 Citrix Systems, Inc. All rights reserved. 376
When the appliance receives an IPv4 response packet belonging to a particular NAT64 session, it uses the information stored in the NAT64 session to translate the IPv4 packet into an IPv6 packet, and then sends the IPv6 response packet to the subscriber.

**Example: Traffic Flow of NAT64 and DNS64 Deployment**

Consider an example of a large scale NAT64 and DNS64 deployment consisting of NetScaler appliance NS-1 and two local DNS servers, DNS-1 and DNS-2, in an ISP’s core network, and IPv6 subscriber SUB-1. SUB-1 is connected to NS-1 through the ISP’s IPv6 access network. NS-1 includes large scale NAT64 and DNS64 configurations for enabling the communication between IPv6 subscriber SUB-1 and IPv4 hosts (internal and external).

Large scale NAT64 configuration includes a NAT64 prefix (2001:DB8:300::/96) and NAT IPv4 pool for translation of IPv6 requests to IPv4 requests and IPv4 responses to IPv6 responses.

DNS64 configuration includes a DNS load balancing virtual server LBVS-DNS64-1 (2001:DB8:9999::99) and a DNS64 prefix (2001:DB8:300::/96). LBVS-DNS64-1 represents local DNS server DNS-1 and DNS-2 to ISP’s subscribers. The DNS64 prefix, which has the same value as the NAT64 prefix, is used for synthesizing DNS AAAA records from DNS A records received from DNS servers DNS-1 and DNS-2. NS-1 responds with a synthesized AAAA record to SUB-1 for a DNS request to resolve an IPv4 host.

**DNS64 Traffic Flow**

Traffic flows between IPv6 subscriber SUB-1 and site www.example.com, which resides on an IPv4-only web server on the Internet, as follows:

1. IPv6 subscriber SUB-1 sends a DNS AAAA request for www.example.com to its designated DNS server (2001:DB8:9999::99).
2. DNS load balancing virtual server LBVS-DNS64-1 (2001:DB8:9999::99) on NetScaler appliance NS1 receives the AAAA request. LBVS-DNS64-1’s load balancing algorithm selects DNS server DNS-1 and forwards the AAAA request to it.
3. DNS-1 returns an empty record or an error message, because there is no AAAA record available for www.example.com.
4. Because the DNS64 option is enabled on LBVS-DNS64-1 and the AAAA request from CL1 matches the condition specified in DNS64-Policy-1, NS1 sends a DNS A request to DNS-1 for the IPv4 address of www.example.com.
5. DNS-1 responds with the A record of 192.0.2.60 for www.example.com.
6. DNS64 module on NS1 synthesizes an AAAA record for www.example.com by concatenating the DNS64 Prefix (2001:DB8:300::/96) associated with LBVS-DNS64-1, and IPv4 address (192.0.2.60) for www.example.com = 2001:DB8:300::192.0.2.60
7. NS1 sends the synthesized AAAA record to IPv6 client CL1. NS1 also caches the A record into its memory. NS1 uses the cached A record to synthesize AAAA records for subsequent AAAA requests.

**NAT64 Traffic Flow**

1. IPv6 subscriber SUB-1 sends a request to 2001:DB8:5001:30 www.example.com. The IPv6 packet has:
   - Source IP address = 2001:DB8:5001:30
   - Source port = 2552
   - Destination IP address = 2001:DB8:300::/96
   - Destination port = 80

2. IPv6 subscriber SUB-1 sends a request to 2001:DB8:5001:30 www.example.com. The IPv6 packet has:
   - Source IP address = 2001:DB8:5001:30
   - Source port = 2552
   - Destination IP address = 2001:DB8:300::/96
   - Destination port = 80

3. When NS-1 receives the IPv6 packet, the large scale NAT64 module creates a translated IPv4 request packet with:
   - Source IP address = One of the IPv4 addresses available in the configured NAT pool (203.0.113.61)
   - Source port = One of ports available with the allocated NAT IPv4 address (3002)
   - Destination IP address = IPv4 address extracted from the IPv6 request’s destination address by stripping the NAT64 prefix (2001:DB8:300::/96) from the IPv6 address (192.0.2.60)
   - Destination port = IPv6 request’s destination port (80)

4. The large scale NAT64 module also creates mapping and session entries for this large scale NAT64 flow. The session and mapping entries include the following information:
   - Source IP address of the IPv6 packet = 2001:DB8:5001:30
   - Source port of the IPv6 packet = 2552
   - NAT IP address = 203.0.113.61
   - NAT port = 3002
   - NS-1 sends the resulting IPv4 packet to its destination on the Internet.

5. Upon receiving the request packet, the server for www.example.com processes the packet and sends a response packet to NS-1. The IPv4 response packet has:
   - Source IP address = 192.0.2.60
   - Source port = 80
6. Upon receiving the IPv4 response packet, NS-1 examines the large scale NAT64 mapping and session entries and finds that the IPv4 response packet belongs to a large scale NAT64 session. The large scale NAT64 module creates a translated IPv6 response packet:

- Source IP address = 2001:DB8:300::192.0.2.60
- Source port = 80
- Destination IP address = 2001:DB8:5001:30
- Destination port = 2552

7. NS-1 sends the translated IPv6 response to client SUB-1.

Large Scale NAT64 features Supported on NetScaler appliances

Large scale NAT64 on a NetScaler appliance supports the standard LSN feature set. For more information on these LSN features, see LSN Architecture.

Following are some of the large scale NAT64 features supported on NetScaler appliances:

- ALGs. Support of application Layer Gateway (ALG) for SIP, RTSP, FTP, ICMP, and TFTP protocols.
- Deterministic/Fixed NAT. Support for pre-allocation of blocks of ports to subscribers to minimize logging.
- Mapping. Support of Endpoint-independent mapping (EIM), Address-dependent mapping (ADM), and Address-Port dependent mapping (APDM).
- Filtering. Support of Endpoint-Independent Filtering (EIF), Address-Dependent Filtering (ADF), and Address-Port-Dependent Filtering (APDF).
- Quotas. Configurable limits on number of ports, sessions per subscriber, and sessions per LSN group.
- Static Mapping. Support for manually defining a large scale NAT64 mapping.
- Hairpin Flow. Support for communication between subscribers or internal hosts using NAT IP addresses.
- 464XLAT connections. Support for communication between IPv4-only applications on IPv6 subscriber hosts and IPv4 hosts on the Internet through IPv6 network.
- Variable length NAT64 and DNS64 prefixes. The NetScaler appliance supports defining NAT64 and DNS64 prefixes of lengths of 32, 40, 48, 56, 64, and 96.
- Multiple NAT64 and DNS64 prefix. The NetScaler appliance supports multiple NAT64 and DNS64 prefixes.
- LSN Clients. Support for specifying or identifying subscribers for large scale NAT64 by using IPv6 prefixes and extended ACL6 rules.
- Logging. Support for logging NAT64 sessions for law enforcement. In addition, the following are also supported for logging.
- **Reliable SYSLOG.** Support for sending SYSLOG messages over TCP to external log servers for a more reliable transport mechanism.
- **Load balancing of log servers.** Support for load balancing of external log servers for preventing storage of redundant log messages.
- **Minimal Logging.** Deterministic LSN configurations or Dynamic LSN configurations with port block significantly reduce the large scale NAT64 log volume.
- **Logging MSISDN information.** Support for including subscribers’ MSISDN information in large scale NAT64 logs to identify and track subscriber activity over the Internet.

### Points to Consider for Configuring Large Scale NAT64

December 18, 2018

Before you start configuring large scale NAT64 and DNS64, consider these points:

1. Make sure you understand the different components of large scale NAT64, described in RFCs.
2. The NetScaler appliance supports only the following ALGs for large Scale NAT64:
   - FTP
   - TFTP
   - ICMP
   - SIP
   - RTSP
3. In a high availability setup of two NetScaler appliances, large NAT64 session synchronization (connection mirroring) is not supported.

### Configuring DNS64

December 18, 2018

Creating the required entities for stateful NAT64 configuration on the NetScaler appliance involves the following procedures:

- Add DNS services. DNS services are logical representations of DNS servers for which the NetScaler appliance acts as a DNS proxy server. For more information on setting optional parameters of a service, see “Load Balancing”.
- Add DNS64 action and DNS64 policy and then bind the DNS64 action to the DNS64 policy. A DNS64 policy specifies conditions to be matched against traffic for DNS64 processing according to the settings in the associated DNS64 action. The DNS64 action specifies the mandatory DNS64 prefix and the optional exclude-rule and mapped-rule settings.
- Create a DNS load balancing virtual server and bind the DNS services and the DNS64 policy to it. The DNS load balancing virtual server acts as a DNS proxy server for DNS servers represented by the bound DNS services. Traffic arriving at the virtual server is matched against the bound DNS64 policy for DNS64 processing. For more information on setting optional parameters of a load balancing virtual server, see “Load Balancing.”

**Note**
The command line interface has separate commands for these two tasks, but the GUI combines them in a single dialog box.

- Enable caching of DNS records. Enable the global parameter for the NetScaler appliance to cache DNS records, which are obtained through DNS proxy operations. For more information on enabling caching of DNS records, see “Enabling Caching of DNS Records”.

**To create a service of type DNS by using the command line interface**

At the command prompt, type:

```
  1 add service <name> <IP> <serviceType> <port> …
```

**To create a DNS64 action by using the command line interface**

At the command prompt, type:

```
  1 add dns action64 <actionName> -Prefix <ipv6_addr> [mappedRule <expression>] [-excludeRule <expression>]
```

**To create a DNS64 policy by using the command line interface**

At the command prompt, type:

```
  1 add dns policy64 <name> -rule <expression> -action <string>
```

**To create a DNS load balancing virtual server by using the command line interface**

At the command prompt, type:

```
  1 add lb vserver <name> DNS <IPAddress> <port> -dns64 (ENABLED | DISABLED) [-bypassAAAA (YES | NO)] …
```
To bind the DNS services and the DNS64 policy to the DNS load balancing virtual server by using the command line interface

At the command prompt, type:

```shell
1 bind lb vserver <name> <serviceName> ...
2 bind lb vserver <name> -policyName <string> -priority <positive_integer> ...
```

Sample configuration:

```shell
1 add service SVC-DNS-1 203.0.113.50 DNS 53
2 Done
3 add service SVC-DNS-2 203.0.113.60 DNS 53
4 Done
5 add dns Action64 DNS64-Action-1 -Prefix 2001:DB8:300::/96
6 Done
7 add dns Policy64 DNS64-Policy-1 -rule "CLIENT.IPv6.SRC.IN_SUBNET(2001:DB8:5001::/64)" -action DNS64-Action-1
8 Done
9 add lb vserver LBVS-DNS64-1 DNS 2001:DB8:9999::99 53 -dns64 ENABLED
10 Done
11 bind lb vserver LBVS-DNS64-1 SVC-DNS-1
12 Done
13 bind lb vserver LBVS-DNS64-1 SVC-DNS-2
14 Done
15 bind lb vserver LBVS-DNS64-1 -policyName DNS64-Policy-1 -priority 2
16 Done
```

Configuring Large Scale NAT64

December 27, 2018

A large scale NAT64 configuration on a NetScaler appliance uses the LSN commands sets. In a large scale NAT64 configuration, the LSN client entity specifies the IPv6 address or IPv6 network address, or ACL6 rules, for identifying IPv6 subscribers. A NAT64 configuration also includes an IPv6 profile, which specifies a NAT64 prefix.

Configuring NAT64 on a NetScaler appliance consists of the following tasks:

- Set the global LSN parameters. Global parameters include the amount of NetScaler memory reserved for the LSN feature and synchronization of LSN sessions in a high availability setup.
• Create an LSN client entity for identifying traffic from IPv6 subscribers. The LSN client entity refers to a set of IPv6 subscribers. The client entity includes IPv6 addresses or IPv6 network prefixes, or ACL6 rules, for identifying the traffic from these subscribers. An LSN client can be bound to only one LSN group. The command line interface has two commands for creating an LSN client entity and binding a subscriber to the LSN client entity. The GUI combines these two operations on a single screen.

• Create an LSN pool and bind NAT IP addresses to it. An LSN pool defines a pool of NAT IP addresses to be used by the NetScaler appliance to perform large scale NAT64. The command line interface has two commands for creating an LSN pool and binding NAT IP addresses to the LSN pool. The GUI combines these two operations on a single screen.

• Create an LSN IP6 profile. An LSN IP6 profile defines the NAT64 prefix for a large scale NAT64 configuration.

• (Optional) Create an LSN Transport Profile for a specified protocol. An LSN transport profile defines various timeouts and limits, such as maximum large scale NAT64 sessions and maximum ports usage that a subscriber can have for a given protocol. You bind an LSN transport profile for each protocol (TCP, UDP, and ICMP) to an LSN group. A profile can be bound to multiple LSN groups. A profile bound to an LSN group applies to all subscribers of an LSN client bound to the same group. By default, one LSN transport profile with default settings for TCP, UDP, and ICMP protocols is bound to an LSN group during its creation. This profile is called the default transport profile. An LSN transport profile that you bind to an LSN group overrides the default LSN transport profile for that protocol.

• (Optional) Create an LSN Application Profile for a specified protocol and bind a set of destination ports to it. An LSN application profile defines the LSN mapping and LSN filtering controls of a group for a given protocol and for a set of destination ports. For a set of destination ports, you bind an LSN profile for each protocol (TCP, UDP, and ICMP) to an LSN group. A profile can be bound to multiple LSN groups. An LSN application profile bound to an LSN group applies to all subscribers of an LSN client bound to the same group. By default, one LSN application profile with default settings for TCP, UDP, and ICMP protocols for all destination ports is bound to an LSN group during its creation. This profile is called a default application profile. When you bind an LSN application profile, with a specified set of destination ports, to an LSN group, the bound profile overrides the default LSN application profile for that protocol at that set of destination ports. The command line interface has two commands for creating an LSN application profile and binding a set of destination ports to the LSN application profile. The GUI combines these two operations on a single screen.

• Create an LSN Group and bind LSN pools, LSN IPv6 profile, (optional) LSN transport profiles, and (optional) LSN application profiles to the LSN group. An LSN group is an entity consisting of an LSN client, an LSN IPv6 profile, LSN pool(s), LSN transport profile(s), and LSN application profile(s). A group is assigned parameters, such as port block size and logging of LSN sessions. The parameter settings apply to all the subscribers of an LSN client bound to the LSN group.
Only one LSN IPv6 profile can be bound to an LSN group, and an LSN IPv6 profile bound to an LSN group cannot be bound to other LSN groups. Only LSN Pools and LSN groups with the same NAT type settings can be bound together. Multiples LSN pools can be bound to an LSN group. Only one LSN client entity can be bound to an LSN group, and an LSN client entity bound to an LSN group cannot be bound to other LSN groups. The command line interface has two commands for creating an LSN group and binding LSN pools, LSN transport profiles, and LSN application profiles to the LSN group. The GUI combines these two operations in a single screen.

**Configuration Using the Command Line**

You can create different configurations using the command line interface. Follow the steps given below.

**To create an LSN client by using the command line interface**

At the command prompt, type:

```
1 add lsn client <clientname>
2
3 show lsn client
```

**To bind an IPv6 network or an ACL6 rule to an LSN client by using the command line interface**

At the command prompt, type:

```
1 bind lsn client <clientname> (-network6 <ipv6_addr>|*| -acl6name <string>)
2
3 show lsn client
```

**To create an LAN pool by using the command line interface**

At the command prompt, type:

```
1 add lsn pool <poolname>
2
3 show lsn pool <poolname>
```
To bind NAT IP addresses to an LSN pool by using the command line interface

At the command prompt, type:

```bash
1 bind lsn pool <poolname> <lsnip>
2
3 show lsn pool
```

**Note**

For removing NAT IP (LSN IP addresses) addresses from an LSN pool, use the unbind lsn pool command.

To configure an LSN IPv6 profile by using the command line interface

At the command prompt, type:

```bash
1 add lsn ip6profile <name> -type NAT64 -natprefix <ipv6_addr|*> 
2
3 show lsn ip6profile
```

To create an LSN transport profile by using the command line interface

At the command prompt, type:

```bash
1 add lsn transportprofile <transportprofilename> <transportprotocol> [-sessiontimeout <secs>] [-finrsttimeout <secs>] [-portquota <positive_integer>] [-sessionquota <positive_integer>] [-portpreserveparity ( ENABLED | DISABLED )] [-portpreserverange ( ENABLED | DISABLED )] [-syncheck ( ENABLED | DISABLED )] 
2
3 show lsn transportprofile
```

To create an LSN application profile by using the command line interface

At the command prompt, type:

```bash
1 add lsn appsprofile <appsprofilename> <transportprotocol> [-ippooling ( PAIRED | RANDOM )] [-mapping <mapping>] [-filtering <filtering>] [-tcpproxy ( ENABLED | DISABLED )]
2
3 show lsn appsprofile
```

© 1999-2018 Citrix Systems, Inc. All rights reserved.
To bind an application protocol port range to an LSN application profile by using the command line interface

At the command prompt, type:

```
1  bind lsn appsprofile <appsprofilename> <lsnport>
2  show lsn appsprofile
```

To create an LSN group by using the command line interface

At the command prompt, type:

```
1  add lsn group <groupname> [-hostname <string>] [-nattype ( DYNAMIC | DETERMINISTIC )] [-portblocksize <positive_integer>] [-logging( ENABLED | DISABLED )] [-sessionLogging ( ENABLED | DISABLED )][-sessionSync ( ENABLED | DISABLED )] [-snmptraplimit<positive_integer>] [-ftp ( ENABLED | DISABLED )] [-sipalp ( ENABLED | DISABLED )] [-rtspalg ( ENABLED |DISABLED )] [-ip6profile <string>]
2
3  show lsn group
```

To bind LSN protocol profiles and LSN pools to an LSN group by using the command line interface

At the command prompt, type:

```
1  bind lsn group <groupname> (-poolname <string> | -transportprofilename <string> | -httpdhdrofprofilename <string> | -appsprofilename < string> | -sipalpprofilename <string> | rtpspalpprofilename <string>)
2
3  show lsn group
```

Sample Large Scale NAT64 Configurations

Here are some sample configurations of large scale NAT64:

Simple large scale NAT64 configuration with default settings:

```
1  add lsn client LSN-NAT64-CLIENT-1
2
3  bind lsn client LSN-NAT64-CLIENT-1 -network6 2001:DB8:5001::/96
```
Simple large scale NAT64 configuration with an extended ACL6 rule for identifying subscribers:

```
1 add lsn acl6 LSN-NAT64-ACL-2 ALLOW - srcIPv6 = 2001:DB8:5002::20 - 2001:DB8:5002::200
2 apply acl6s
3 add lsn client LSN-NAT64-CLIENT-2
4 bind lsn client LSN-NAT64-CLIENT-2 - acl6name LSN-NAT64-ACL-2
5 add lsn pool LSN-NAT64-POOL-2
6 bind lsn pool LSN-NAT64-POOL-2 203.0.113.5-203.0.113.10
7 add lsn ip6profile LSN-NAT64-PROFILE-2 -type NAT64 -natprefix 2001:DB8:302::/96
8 add lsn group LSN-NAT64-GROUP-2 -clientname LSN-NAT64-CLIENT-2 - ip6profile LSN-NAT64-PROFILE-2
9 bind lsn group LSN-NAT64-GROUP-2 -poolname LSN-NAT64-POOL-2
```

Large scale NAT64 configuration with deterministic NAT resource allocation:

```
1 add lsn client LSN-NAT64-CLIENT-7
2 bind lsn client LSN-NAT64-CLIENT-7 -network6 2001:DB8:1002::7/128
3 add lsn pool LSN-NAT64-POOL-7 -nattype DETERMINISTIC
4 bind lsn pool LSN-NAT64-POOL-7 203.0.113.24-203.0.113.27
```
Configuring Application Layer Gateways for Large Scale NAT64

December 18, 2018

For some Application layer protocols, the IP addresses and protocol port numbers are also communicated in the packet payload. Application Layer Gateway for a protocol parses the packet’s payload and does necessary changes to ensure that the protocol continues to work over large scale NAT64.

The NetScaler appliance supports ALG for the following protocols for large scale NAT64:

- FTP
- ICMP
- TFTP
- SIP
- RTSP

Application Layer Gateway for FTP, ICMP, and TFTP Protocols

December 18, 2018

You can enable or disable ALG for the FTP protocol for an large scale NAT64 configuration by enabling or disabling the FTP ALG option of the LSN group of the configuration.

ALG for the ICMP protocol is enabled by default, and there is no provision to disable it.

ALG for the TFTP protocol is disabled by default. TFTP ALG is enabled automatically for an large scale NAT64 configuration when you bind a UDP LSN application profile, with endpoint-independent-mapping, endpoint-independent filtering, and destination port as 69 (well-known port for TFTP), to the LSN group.
Application Layer Gateway for SIP Protocol

December 18, 2018

Using Large Scale NAT64 with Session Initiation Protocol (SIP) is complicated, because SIP messages contain IP addresses in the SIP headers as well as in the SIP body. When LSN is used with SIP, the SIP headers contain information about the caller and the receiver, and the device translates this information to hide it from the outside network. The SIP body contains the Session Description Protocol (SDP) information, which includes IP addresses and port numbers for transmission of the media. SIP ALG for large scale NAT64 is compliant with RFC 3261, RFC 3581, RFC 4566, and RFC 4475.

Limitations of SIP ALG

SIP ALG for large scale NAT64 has the following limitations:

• Only SDP payload is supported.
• The following are not supported:
  – Multicast IP addresses
  – Encrypted SDP
  – SIP TLS
  – FQDN translation
  – SIP layer authentication
  – Traffic Domains
  – Admin partitions
  – NetScaler clusters
  – Multipart body
  – Line folding

Configuring SIP ALG

You need to configure the SIP ALG as part of the LSN configuration. For instructions on configuring LSN, see Configuration Large Scale NAT64. While configuring LSN, make sure that you:

• Set the following parameters while adding an LSN application profile:
  – IP Pooling = PAIRED
  – Address and Port Mapping = ENDPOINT-INDEPENDENT
  – Filtering = ENDPOINT-INDEPENDENT
• Create a SIP ALG profile and make sure that you define either the source port range or destination port range. Bind the SIP ALG profile to the LSN group.
• Enable SIP ALG in the LSN group.
To enable SIP ALG for an LSN configuration by using the CLI

At the command prompt, type:

```
1   add lsn group <groupname> -clientname <string> [-sipalg ( ENABLED | DISABLED )]
2
3   show lsn group <groupname>
```

To enable SIP ALG for an LSN configuration by using the CLI

At the command prompt, type:

```
1   add lsn sipalgprofile <sipalgprofilename>[-dataSessionIdleTimeout <positive_integer>] [-sipSessionTimeout <positive_integer>] [-registrationTimeout <positive_integer>] [-sipsrcportrange <port[-port]]] [-sipdstportrange <port[-port]>] [-openRegisterPinhole ( ENABLED | DISABLED )] [-openContactPinhole ( ENABLED | DISABLED )] [-openViaPinhole ( ENABLED | DISABLED )] [-openRecordRoutePinhole ( ENABLED | DISABLED )][-sipTransportProtocol ( TCP | UDP )][-openRoutePinhole ( ENABLED | DISABLED )] [-rport ( ENABLED | DISABLED )]
2
3   show lsn sipalgprofile <sipalgprofilename>
```

Sample Configuration

The following sample large scale NAT64 configuration, SIP ALG is enabled for TCP traffic from subscriber devices in the network 2001:DB8:1003::/96.

```
1   add lsn client LSN-NAT64-CLIENT-9
2
3   Done
4   bind lsn client LSN-NAT64-CLIENT-9 -network6 2001:DB8:1002::/96
5
6   Done
7   add lsn pool LSN-NAT64-POOL-9
8
9   Done
10  bind lsn pool LSN-NAT64-POOL-9 203.0.113.90
11
12  Done
```
NetScaler 11.1

**Application Layer Gateway for RTSP Protocol**

December 18, 2018

Real Time Streaming Protocol (RTSP) is an application-level protocol for the transfer of real-time media data. Used for establishing and controlling media sessions between end points, RTSP is a control channel protocol between the media client and the media server. The typical communication is between a client and a streaming media server.

Streaming media from a private network to a public network requires translating IP addresses and port numbers over the network. NetScaler functionality includes an Application Layer Gateway (ALG) for RTSP, which can be used with Large Scale NAT (LSN) to parse the media stream and make any necessary changes to ensure that the protocol continues to work over the network.

How IP address translation is performed depends on the type and direction of the message, and the type of media supported by the client-server deployment. Messages are translated as follows:

- **Outbound request**—Private IP address to NetScaler owned public IP address called LSN IP address.
- Inbound response—LSN IP address to private IP address.
- Inbound request—No translation.
- Outbound response—Private IP address to LSN pool IP address.

**Limitations of RTSP ALG**

The RTSP ALG does not support the following:

- Multicast RTSP sessions
- RTSP session over UDP
- Admin partitions
- NetScaler clusters
- RTSP Authentication
- HTTP tunneling

**Configuring RTSP ALG**

Configure RTSP ALG as part of the LSN configuration. For instructions on configuring LSN, see Configuring Large Scale NAT64. While configuring, make sure that you:

- Set the following parameters while adding an LSN application profile:
  - IP Pooling = PAIRED
  - Address and Port Mapping = ENDPOINT-INDEPENDENT
  - Filtering = ENDPOINT-INDEPENDENT
- Enable RTSP ALG in the LSN group
- Create a RTSP ALG profile and bind the RTSP ALG profile to the LSN group

**To enable RTSP ALG for an LSN configuration by using the CLI**

At the command prompt, type:

```
1 add lsn group <groupname> -clientname <string> [-rtspalg ( ENABLED | DISABLED )]
2
3 show lsn group <groupname>
```

**To enable RTSP ALG for an LSN configuration by using the CLI**

At the command prompt, type:
Sample RTSP ALG Configuration

The following sample large scale NAT64 configuration, RTSP ALG is enabled for TCP traffic from subscriber devices in the network 2001:DB8:1002::/96.

```bash
1 add lsn rtspalgprofile <rtspalgprofilename> [-rtspIdleTimeout <positive_integer>] -rtspportrange <port[-port]> [-rtspTransportProtocol (TCP|UDP)]
2 show lsn rtspalgprofile <rtspalgprofilename>

© 1999-2018 Citrix Systems, Inc. All rights reserved.
Configuring Static Large Scale NAT64 Maps

December 18, 2018

The NetScaler appliance supports manual creation of NAT64 mappings, which contain the mapping between the following information:

- Subscriber’s IP address and port
- NAT IP address and port

Static Large Scale NAT64 mappings are useful in cases where you want to ensure that the IPv4 connections initiated to a NAT IP address:port are IPv6 translated and mapped to the subscriber IP address:port (for example, web servers located in the internal network).

To create a Large Scale NAT64 mapping by using the command line

At the command prompt, type:

```
1  add lsn static <name> <transportprotocol> <subscrIP> <subscrPort> [<<natIP> [<natPort>]] [-destIP <ip_addr> [-dsttd <positive_integer>]]
2
3  show lsn static
```

Wildcard Port Static Large Scale NAT64 Maps

A static large scale NAT64 mapping entry is usually a one-to-one mapping between a subscriber IPv6 address:port and a NAT IPv4 address:port. A one-to-one static large scale NAT64 mapping entry exposes only one port of the subscriber IP address to the Internet.

Some situations might require exposing all ports (64K - limited to the maximum number of ports of a NAT IPv4 address) of a subscriber IP address to the Internet (for example, a server hosted on an internal network and running a different service on each port). To make these internal services accessible through the Internet, you have to expose all the ports of the server to the Internet.

One way to meet this requirement is to add 64 thousand one-to-one static mapping entries, one mapping entry for each port. Creating those entries is very cumbersome and a big task. Also, this large number of configuration entries might lead to performance issues in the NetScaler appliance.

A simpler method is to use wildcard ports in a static mapping entry. You just need to create one static mapping entry with NAT-port and subscriber-port parameters set to the wildcard character (*), and the protocol parameter set to ALL, to expose all the ports of a subscriber IP address for all protocols to the Internet.
For a subscriber’s inbound or outbound connections matching a wildcard static mapping entry, the subscriber’s port does not change after the NAT operation. When a subscriber-initiated connection to the Internet matches a wildcard static mapping entry, the NetScaler appliance assigns a NAT port that has the same number as the subscriber port from which the connection is initiated. Similarly, an Internet host gets connected to a subscriber’s port by connecting to the NAT port that has the same number as the subscriber’s port.

To configure the NetScaler appliance to provide access to all ports of a subscriber IPv6 address, create a wildcard static map with the following mandatory parameter settings:

- Protocol=ALL
- Subscriber port = *
- NAT port = *

In a wildcard static map, unlike in a one-to-one static map, setting the NAT IP parameter is mandatory. Also, the NAT IP address assigned to a wildcard static map cannot be used for any other subscribers.

To create a wildcard static map by using the command line interface

At the command prompt, type:

```
1 add lsn static <name> ALL <subscrIP> * <natIP> * [-td <positive_integer>] [-destIP <ip_addr>
2
3 show lsn static
```

In the following sample configuration of a wildcard static map, all ports of a subscriber whose IP address is 2001:DB8:5001::3 are made accessible through NAT IP 203.0.113.33.

```
1 add lsn static NAT64-WILDCARD-STATIC-1 ALL 2001:DB8:5001::3 * 203.0.113.33 *
2 Done
```

**Logging and Monitoring Large Scale NAT64**

December 18, 2018

You can log large scale NAT64 information to diagnose and troubleshoot problems, and to meet legal requirements. You can monitor the performance of the large scale NAT64 deployment by using statistical counters and displaying the related current sessions.
NetScaler 11.1

Logging Large Scale NAT64

Logging large scale NAT64 information is required for ISPs to meet legal requirements and identify the source of traffic at any given time.

A log message for a large scale NAT64 mapping entry consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced.
- Time stamp.
- Entry type (MAPPING).
- Whether the mapping entry was created or deleted.
- Subscriber’s IP address, port, and traffic domain ID.
- NAT IP address and port.
- Protocol name.
- Destination IP address, port, and traffic domain ID might be present, depending on the following conditions:
  - Destination IP address and port are not logged for endpoint-independent mapping.
  - Only the destination IP address is logged for address-dependent mapping. The port is not logged.
  - Destination IP address and port are logged for address-port-dependent mapping.

A log message for a large scale NAT64 session consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced.
- Time stamp.
- Entry type (SESSION).
- Whether the session is created or removed.
- Subscriber’s IP address, port, and traffic domain ID.
- NAT IP address and port.
- Protocol name.
- Destination IP address, port, and traffic domain ID.

The following table displays sample large scale NAT64 log entries of each type stored on the configured log servers. The log entries show that a subscriber whose IPv6 address is 2001:db8:5001::9 was connected to destination IP:port 23.0.0.1:80 through NAT IP:port 203.0.113.63:45195 on April 7, 2016, from 14:07:57 GMT to 14:10:59 GMT.
### Configuration Steps

You can configure logging of large scale NAT64 information for a large scale NAT64 configuration by setting the LSN group's logging and session logging parameters. These are group level parameters and are disabled by default. The NetScaler appliance logs large scale NAT64 sessions for an LSN group only when both logging and session logging parameters are enabled.

The following table displays the logging behavior for an LSN group for various settings of logging and session logging parameters.
### Logging

<table>
<thead>
<tr>
<th>Logging</th>
<th>Session Logging</th>
<th>Logging Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enabled</td>
<td>Enabled</td>
<td>Logs LSN mapping entries as well as LSN sessions</td>
</tr>
<tr>
<td>Enabled</td>
<td>Disabled</td>
<td>Logs LSN mapping entries but not LSN sessions</td>
</tr>
<tr>
<td>Disabled</td>
<td>Enabled</td>
<td>Logs neither mapping entries nor LSN sessions</td>
</tr>
</tbody>
</table>

**To log large scale NAT64 information by using the CLI**

To set the logging and session logging parameters while adding an LSN group, at the command prompt, type:

```bash
1 add lsn group <groupname> -clientname <string> [-logging (ENABLED|DISABLED)] [-sessionLogging (ENABLED|DISABLED)]
2
3 show lsn group
```

To set the logging and session logging parameters for an existing LSN group, at the command prompt, type:

```bash
1 set lsn group <groupname> [-logging (ENABLED|DISABLED)] [-sessionLogging (ENABLED|DISABLED)]
2
3 show lsn group
```

**Sample Configuration**

In this example of large scale NAT64 configuration, logging and session logging parameters are enabled for LSN group LSN-NAT64-GROUP-1.

The NetScaler appliance logs large scale NAT64 session and mapping information for connections from subscribers (in the network 2001:DB8:5001::/96).

**Sample configuration:**

```bash
1 add lsn client LSN-NAT64-CLIENT-1 Done
2 Done
3 bind lsn client LSN-NAT64-CLIENT-1 -network6 2001:DB8:5001::/96
4 Done
```
Logging MSISDN Information for Large Scale NAT64

A Mobile Station Integrated Subscriber Directory Number (MSISDN) is a telephone number uniquely identifying a subscriber across multiple mobile networks. The MSISDN is associated with a country code and a national destination code identifying the subscriber’s operator.

You can configure a NetScaler appliance to include MSISDNs in large scale NAT64 LSN log entries for subscribers in mobile networks. The presence of MSISDNs in the LSN logs facilitates faster and accurate back tracing of a mobile subscriber who has violated a policy or law, or whose information is required by lawful interception agencies.

The following sample LSN log entries include MSISDN information for a connection from a mobile subscriber in an LSN configuration. The log entries show that a mobile subscriber whose MSISDN is E164:5556543210 and IPv6 address is 2001:db8:5001::9 was connected to destination IP:port 23.0.0.1:80 through the NAT IP:port 203.0.113.63:45195 on April 7, 2016, from 14:07:57 GMT to 14:10:59 GMT.

<table>
<thead>
<tr>
<th>Log Entry Type</th>
<th>Sample Log Entry</th>
</tr>
</thead>
</table>
NetScaler 11.1

Log Entry Type | Sample Log Entry
--- | ---
Mapping Creation | 04/07/2016:14:07:57 GMT Informational
0-PPE-10 : default LSN LSN_ADDR_MAPPİNG 5533 0 : ADM CREATED **E164:5556543210**

Session Deletion | 04/07/2016:14:10:59 GMT 0-PPE-10 : default LSN LSN_SESSION 25012 0 : SESSION

Mapping Deletion | 04/07/2016:14:10:59 GMT 0-PPE-10 : default LSN LSN_ADDR_MAPPİNG 25013 0 : ADM

**Configuration Steps**

Perform the following tasks for including MSISDN information in LSN logs:

- **Create an LSN log profile.** An LSN log profile includes the log subscriber ID parameter, which specifies whether to or not to include the MSISDN information in the LSN logs of an LSN configuration.
- Bind the LSN log profile to an LSN group of an LSN configuration. Bind the created LSN log profile to an LSN group of an LSN configuration by setting the log profile name parameter to the created LSN log profile name. MSISDN information is included in all LSN logs related to mobile subscribers of this LSN group.

**To create an LSN log profile by using the CLI**

At the command prompt, type:

```
1 add lsn logprofile <logprofilename> -logSubscriberID ( ENABLED | DISABLED )
2```

© 1999-2018 Citrix Systems, Inc. All rights reserved.
To bind an LSN log profile to an LSN group of an NAT64 LSN configuration by using the CLI

At the command prompt, type:

```
bind lsn group <groupname> -logProfileName <lsnlogprofilename>
```

Sample Configuration

In this example of NAT64 LSN configuration, the LSN log profile LOG-PROFILE-MSISDN-1 has the log subscriber ID parameter enabled. LOG-PROFILE-MSISDN-1 is bound to LSN group LSN-NAT64-GROUP-1. MSISDN information is included in the LSN session and LSN mapping logs for connections from mobile subscribers (in network 2001:DB8:5001::/96).

```
add lsn logprofile LOG-PROFILE-MSISDN-1 -logSubscriberID ENABLED
add lsn client LSN-NAT64-CLIENT-1
bind lsn client LSN-NAT64-CLIENT-1 -network6 2001:DB8:5001::/96
add lsn pool LSN-NAT64-POOL-1
bind lsn pool LSN-NAT64-POOL-1 203.0.113.61 - 203.0.113.70
add lsn ip6profile LSN-NAT64-PROFILE-1 -type NAT64 -natprefix 2001:DB8:300::/96
add lsn group LSN-NAT64-GROUP-1 -clientname LSN-NAT64-CLIENT-1 -ip6profile LSN-NAT64-PROFILE-1
bind lsn group LSN-NAT64-GROUP-1 -poolname LSN-NAT64-POOL-1
bind lsn group LSN-NAT64-GROUP-1 -logprofilename LOG-PROFILE-MSISDN-1
```

Compact Logging for Large Scale NAT

Logging LSN information is one of the important functions needed by ISPs to meet legal requirements and be able to identify the source of traffic at any given time. This eventually results in a huge volume...
of log data, requiring the ISPs to make large investments to maintain the logging infrastructure.

Compact logging is a technique for reducing the log size by using a notational change involving short codes for event and protocol names. For example, C for client, SC for session created, and T for TCP. Compact logging results in an average of 40 percent reduction in log size.

**Configuration Steps**

Perform the following tasks for logging LSN information in compact format:

1. Create an LSN log profile. An LSN log profile includes the Log Compact parameter, which specifies whether to or not to log information in compact format for an LSN configuration.
2. Bind the LSN log profile to an LSN group of an LSN configuration. Bind the created LSN log profile to an LSN group of an LSN configuration by setting the Log Profile Name parameter to the created LSN log profile name. All sessions and mappings for this LSN group are logged in compact format.

**To create an LSN log profile by using the CLI**

At the command prompt, type:

```
1 add lsn logprofile <logprofilenname> -logCompact (ENABLED|DISABLED)
2 show lsn logprofile
```

**To bind an LSN log profile to an LSN group of an LSN configuration by using the CLI**

At the command prompt, type:

```
1 bind lsn group <groupname> -logProfileName <lsnlogprofilenname>
2 show lsn group
```

**Sample Configuration for NAT64:**

```
1 add lsn logprofile LOG-PROFILE-COMPACT-1 -logCompact ENABLED
2 Done
3 add lsn client LSN-NAT64-CLIENT-1
4 Done
5 bind lsn client LSN-NAT64-CLIENT-1 -network6 2001:DB8:5001::/96
6 Done
7 add lsn pool LSN-NAT64-POOL-1
8 Done
```
Logging HTTP Header Information

The NetScaler appliance can log request header information of an HTTP connection that is using the NetScaler large scale NAT64 functionality. The following header information of an HTTP request packet can be logged:

- URL that the HTTP request is destined to
- HTTP Method specified in the HTTP request
- HTTP version used in the HTTP request
- IPv6 address of the subscriber that sent the HTTP request

The HTTP header logs can be used by ISPs to see the trends related to the HTTP protocol among a set of subscribers. For example, an ISP can use this feature to find out the most popular website among a set of subscribers.

Configuration Steps

Perform the following tasks for configuring the NetScaler appliance to log HTTP header information:

- Create an HTTP header log profile. An HTTP header log profile is a collection of HTTP header attributes (for example, URL and HTTP method) that can be enabled or disabled for logging.
- Bind the HTTP header to an LSN group of a large scale NAT64 configuration. Bind the HTTP header log profile to an LSN group of an LSN configuration by setting the HTTP header log profile name parameter to the name of the created HTTP header log profile. The NetScaler appliance then logs HTTP header information of any HTTP requests related to the LSN group. An HTTP header log profile can be bound to multiple LSN groups, but an LSN group can have only one HTTP header log profile.
To create an HTTP header log profile by using the command line interface

At the command prompt, type:

```plaintext
1  add lsn httphdrlogprofile <httphdrlogprofilename> [-logURL ( ENABLED | DISABLED )] [-logMethod ( ENABLED | DISABLED )] [-logVersion ( ENABLED | DISABLED )] [-logHost ( ENABLED | DISABLED )]
2
3  show lsn httphdrlogprofile
```

To bind an HTTP header log profile to an LSN group by using the command line interface

At the command prompt, type:

```plaintext
1  bind lsn group <groupname> -httphdrlogprofilename <string>
2
3  show lsn group <groupname>
```

Sample Configuration

```plaintext
1  add lsn httphdrlogprofile HTTP-HEADER-LOG-1
2  Done
3  add lsn client LSN-NAT64-CLIENT-1 Done
4
5  bind lsn client LSN-NAT64-CLIENT-1 -network6 2001:DB8:5001::/96
6  Done
7  add lsn pool LSN-NAT64-POOL-1
8  Done
9  bind lsn pool LSN-NAT64-POOL-1 203.0.113.61 - 203.0.113.70
10  Done
11  add lsn ip6profile LSN-NAT64-PROFILE-1 -type NAT64 -natprefix 2001:DB8:300::/96
12  Done
13  add lsn group LSN-NAT64-GROUP-1 -clientname LSN-NAT64-CLIENT-1 -ip6profile LSN-NAT64-PROFILE-1
14  Done
15  bind lsn group LSN-NAT64-GROUP-1 -poolname LSN-NAT64-POOL-1
16  Done
17  bind lsn group LSN-NAT64-GROUP-1 -httphdrlogprofilename HTTP-HEADER-LOG-1
18  Done
```
Displaying Current Large Scale NAT64 Sessions

You can display the current large scale NAT64 sessions in order to detect any unwanted or inefficient sessions on the NetScaler appliance. You can display all or some large scale NAT64 sessions on the basis of selection parameters.

**Note**
When more than a million large scale NAT64 sessions exist on the NetScaler appliance, Citrix recommends using the selection parameters to display selected large scale NAT64 sessions instead of displaying all of them.

**To display all large scale NAT64 sessions by using the command line interface**

At the command prompt, type:
```
1 show lsn session - nattype NAT64
```

**To display selective large scale NAT64 sessions by using the command line interface**

At the command prompt, type:
```
1 show lsn session - nattype NAT64 [-network6 <ipv6_addr[*]>] [-clientname <string>] [-natIP <ip_addr> [-natPort <port>]]
```

Displaying Large Scale NAT64 Statistics

You can display statistics related to large scale NAT64 module, and evaluate its performance or troubleshoot problems. You can display a summary of statistics of all large scale NAT64 configurations or of a particular large scale NAT64 configuration. The statistical counters reflect events since the NetScaler appliance was last restarted. All these counters are reset to 0 when the NetScaler appliance is restarted.

**To display total statistics of large scale NAT64 by using the command line interface**

At the command prompt, type:
```
1 stat lsn nat64
```
To display statistics for a specified large scale NAT64 configuration by using the command line interface

At the command prompt, type:

```
1 stat lsn group <groupname>
```

### Clearing Large Scale NAT64 Sessions

You can remove any unwanted or inefficient large scale NAT64 sessions from the NetScaler appliance. The appliance immediately releases resources (such as NAT IP address, port, and memory) allocated for these sessions, making the resources available for new sessions. The appliance also drops all the subsequent packets related to these removed sessions. You can remove all or selected large scale NAT64 sessions from the NetScaler appliance.

**To clear all large scale NAT64 sessions by using the command line interface**

At the command prompt, type:

```
1 flush lsn session - nattype NAT64
2 show lsn session - nattype NAT64
```

**To clear selective large scale NAT64 sessions by using the command line interface**

At the command prompt, type:

```
1 flush lsn session - nattype NAT64 [-network6 <ipv6_addr|*>] [-clientname <string>] [-natIP <ip_addr> [-natPort <port>]]
2 show lsn session - nattype NAT64 [-network6 <ipv6_addr|*>] [-clientname <string>] [-natIP <ip_addr> [-natPort <port>]]
```

**Sample configuration:**

Clear all large scale NAT64 sessions existing on a NetScaler appliance

```
1 flush lsn session - nattype NAT64
2 Done
```

Clear all large scale NAT64 sessions related to client entity LSN-NAT64-CLIENT-1
Clear all large scale NAT64 sessions related to a subscriber network (2001:DB8:5001::/96) of LSN client entity LSN-NAT64-CLIENT-2

```
flush lsn session - nattype NAT64 -clientname LSN-NAT64-CLIENT-2
2 Done
```

Port Control Protocol for Large Scale NAT64

December 18, 2018

NetScaler appliances now support Port Control Protocol (PCP) for large scale NAT (LSN). Many of an ISP’s subscriber applications must be accessible from Internet (for example, Internet of Things (IOT) devices, such as an IP camera that provides surveillance over the Internet). One way to meet this requirement is to create static large scale NAT (LSN) maps. But for a very large number of subscribers, creating static LSN NAT maps is not a feasible solution.

Port Control Protocol (PCP) enables a subscriber to request specific LSN NAT mappings for itself and/or for other 3rd party devices. The large scale NAT device creates an LSN map and sends it to the subscriber. The subscriber sends the remote devices on the Internet the NAT IP address:NAT port at which they can connect to the subscriber.

Applications usually send frequent keep-alive messages to the large scale NAT device so that their LSN mappings do not time out. PCP helps reduce the frequency of such keep-alive messages by enabling the applications to learn the timeout settings of the LSN mappings. This helps reduce bandwidth consumption on the ISP’s access network and battery consumption on mobile devices.

PCP is a client-server model and runs over the UDP transport protocol. A NetScaler appliance implements the PCP server component and is compliant with RFC 6887.

Configuration Steps

Perform the following tasks for configuring PCP:

- **(Optional) Create a PCP profile.** A PCP profile includes settings for PCP related parameters (for example, to listen for mapping and peer PCP requests). A PCP profile can be bound to a PCP server. A PCP profile bound to a PCP server applies all its settings to the PCP server. A PCP profile...
can be bound to multiple PCP servers. By default, one PCP profile with default parameters settings is bound to all PCP servers. A PCP profile that you bind to a PCP server overrides the default PCP profile settings for that server. A default PCP profile has the following parameter settings:

- Mapping: Enabled
- Peer: Enabled
- Minimum map life: 120 seconds
- Maximum max life: 86400 seconds
- Announce count: 10
- Third Party: Disabled

• Create a PCP server and bind a PCP profile to it. Create a PCP server on the NetScaler appliance to listen for PCP related requests and messages from the subscribers. A Subnet IP (SNIP) or (SNIP6) address must be assigned to a PCP server to access it. By default, a PCP server listens on port 5351.

• Bind the PCP server to an LSN group of an LSN configuration. Bind the created PCP server to an LSN group of an LSN configuration by setting the PCP Server parameter to specify the created PCP server. The created PCP server can be accessed only by the subscribers of this LSN group.

**Note**

A PCP server for a large scale NAT configuration does not serve requests from subscribers that are identified from ACL rules.

**To create a PCP profile by using the CLI**

At the command prompt, type:

```
1 add pcp profile <name> [-mapping ( ENABLED | DISABLED )] [-peer ( ENABLED | DISABLED )] [-minMapLife <secs>] [-maxMapLife <secs>] [-announceMultiCount <positive_integer>] [-thirdParty ( ENABLED | DISABLED )]
```

```
2
3 show pcp profile <name>
```

**To create a PCP server by using the CLI**

At the command prompt, type:

```
1 add pcp server <name> <IPAddress> [-port <portNum|*>] [-pcpProfile <string>]
```

```
2
3 show pcp server <name>
```
Sample Configuration for NAT64

In the following sample configuration, PCP server PCP-SERVER-1, with PCP settings from PCP-
PROFILE-1, is bound to LSN group LSN-NAT64-GROUP-1. PCP-SERVER-1 serves PCP requests from IPv6
subscribers in network 2001:DB8:5001::/96.

Sample configuration:

```
1 add pcp profile PCP-PROFILE-1 -minMapLife 400
2 Done
3 add pcp server PCP-SERVER-1 2001:DB8:6001::90 -pcpProfile PCP-PROFILE-1
4 Done
5 add lsn client LSN-NAT64-CLIENT-1
6 Done
7 bind lsn client LSN-NAT64-CLIENT-1 -network6 2001:DB8:5001::/96
8 Done
9 add lsn pool LSN-NAT64-POOL-1
10 Done
11 bind lsn pool LSN-NAT64-POOL-1 203.0.113.61 - 203.0.113.70
12 Done
13 add lsn ip6profile LSN-NAT64-PROFILE-1 -type NAT64 -natprefix 2001:DB8:300::/96
14 Done
15 add lsn group LSN-NAT64-PROFILE-1 -clientname LSN-NAT64-CLIENT-1 -ip6profile LSN-NAT64-PROFILE-1
16 Done
17 bind lsn group LSN-NAT64-GROUP-1 -poolname LSN-NAT64-POOL-1
18 Done
19 bind lsn group LSN-NAT64-GROUP-1 -pcpServer PCP-NAT64-SERVER-1
20 Done
```

Telco subscriber management

January 6, 2019

The number of subscribers in a telco network is increasing at an unprecedented rate, and managing
them is becoming a challenge for service providers. Newer, faster, and smarter devices are placing
high demand on the network and the subscriber management systems. It is no longer feasible to
provide each subscriber the same standard of service, and the need for traffic processing on a per-
subscriber basis is imperative.
The NetScaler appliance provides the intelligence to profile subscribers on the basis of their information stored in the Policy and Charging Rules Function (PCRF). When a mobile subscriber connects to the Internet, the packet gateway associates an IP address with the subscriber and forwards the data packet to the appliance. The appliance receives the subscriber information dynamically, or you can configure static subscribers. This information enables the appliance to apply its rich traffic management capabilities, such as content switching, integrated caching, rewrite, and responder, on a per-subscriber basis to manage the traffic.

Before you configure the NetScaler appliance to manage subscribers, you must allocate memory to the module that stores subscriber sessions. For dynamic subscribers, you must configure an interface through which the appliance receives session information. Static subscribers must be assigned IDs, and you can associate them with policies.

You can also do the following:

- Subscriber policy enforcement and management.
- Configure the appliance to uniquely identify a subscriber by using only the IPv6 prefix instead of the complete IPv6 address.
- Use policies to optimize TCP traffic for both dynamic and static subscribers. These policies associate different TCP profiles with different types of users.
- Manage idle sessions on a NetScaler appliance.
- Enable logging to a log server.
- Remove LSN sessions for deleted subscriber sessions.

### Allocating memory for the subscriber session store module

Each subscriber session entry consumes 1 KB of memory. Storing 500,000 subscriber sessions at any point in time requires 500 MB of memory. This value must be added to the minimum memory requirement, which is shown as part of the output of the “show extendedmemoryparam” command. In the following example, the output is for a NetScaler VPX instance with 3 packet engines and 8 GB memory.

To store 500,000 subscriber sessions on this appliance, the configured memory must be $2058+500$ MB ($500,000 \times 1 \text{ KB} = 500 \text{ MB}$.)

**Note**

The configured memory must be in multiples of 2 MB and must not exceed the maximum memory usage limit. The appliance must be restarted for the changes to take effect.

**Example**

```
1 show extendedmemoryparam
```
Configure an interface for dynamic subscribers

The NetScaler appliance dynamically receives the subscriber information through any of the following types of interface:

- Gx Interface
- RADIUS Interface
- RADIUS and Gx Interface

**Note**

- In an HA setup, the subscriber sessions are continually synchronized on the secondary node. In the event of a failover, the subscriber information is still available on the secondary node.

**Gx interface**

A Gx interface (as specified in 3GPP 29.212) is a standard interface based on the Diameter protocol that allows exchange of policy control and charging rules between a PCRF and a Policy and Charging Enforcement Function (PCEF) entity in a Telco network.

As soon as an IP-CAN session is established, the packet gateway forwards the subscriber ID, such as the MSISDN, and Framed-IP address information about the subscriber to the PCRF as a Diameter message. When the data packet arrives at the appliance from packet gateway (PGW), the appliance uses
the subscriber IP address to query the PCRF to get the subscriber information. This is also known as secondary PCEF functionality.

The Policy and Charging Control (PCC) rules received by the appliance over the Gx interface are stored on the appliance for the duration of the subscriber session, that is, until the PCRF sends a Re-Authentication Request (RAR) message with a Session-Release-Cause AVP or the subscriber session is terminated from the CLI or the configuration utility. If there are any updates to an existing subscriber, the PCRF sends the updates in an RAR message. A subscriber session is initiated when a subscriber logs on to the network, and terminated when the subscriber logs off.

The following illustration shows the high-level traffic flow. It assumes that the data plane traffic is HTTP. The appliance sends a Credit Control Request (CCR) over a Gx interface to the PCRF server and, in the credit control answer (CCA), receives the PCC rules and, optionally, other information, such as the Radio Access Technology (RAT) type, that applies to the particular subscriber. PCC rules include one or more policy (rule) names and other parameters. The appliance uses this information to retrieve the predefined rules stored on the appliance, and to direct the flow of traffic. It also stores this information in the subscriber policy and enforcement management system for the duration of the subscriber session. After a subscriber session is terminated, the appliance discards all the information about the subscriber.

The following example shows the commands for configuring a Gx interface. The commands are in boldface.

**To set up a Gx interface, perform the following tasks**

Add a DIAMETER service for each Gx interface. For example:

```
1 add service pcrf-svc1 203.0.113.1 DIAMETER 3868
2 add service pcrf-svc2 203.0.113.2 DIAMETER 3868
```

Add a non-addressable DIAMETER load balancing virtual server and bind the services created in step 1 to this virtual server. For more than one service, specify a persistenceType and the persistAVPno so that specific sessions are handled by the same PCRF server. For example:

```
1 add lb vserver vdiam DIAMETER 0.0.0.0 0 -persistenceType DIAMETER - persistAVPno 263
2 bind lb vserver vdiam pcrf-svc1
3 bind lb vserver vdiam pcrf-svc2
```

Configure NetScaler diameter identity and realm. Identity and realm are used as Origin-Host and Origin-Realm AVPs in diameter messages sent by the Gx client. For example:
Configure the Gx interface to use the virtual server created in step 2 as the PCRF virtual server. Specify the PCRF realm to use as Destination-Realm AVP in diameters messages sent by the Gx client. For example:

```
set ns diameter -identity netScaler.com -realm com
```

Set the subscriber interface type to GxOnly. For example:

```
set subscriber param -interfaceType GxOnly
```

To see the Gx interface configuration and status, type:

```
show subscriber gxinterface
```

**Example**

```
show subscriber gxinterface
Gx Interface parameters:
  PCRF Vserver: v diam (UP)
  Gx Client Identity....: netScaler.com
  Gx Client Realm ........: com
  PCRF Realm: pcrf.com
  Hold Packets On Subscriber Absence: YES
  CCR Request Timeout: 10 Seconds
  CCR Request Retry Attempts: 3
  Revalidation Timeout: 1200 Seconds
  Negative TTL: 120 Seconds
  ServicePath AVP code: 262099 ServicePath AVP VendorID: 3845
  PCRF Connection State: Gx Connection Established with PCRF.
Done
```

**ARGUMENTS**

**vServer**

Name of the load balancing or content switching virtual server to which the Gx connections are established. The service type of the virtual server must be DIAMETER or SSL_DIAMETER. This parameter is mutually exclusive with the service parameter. Therefore, you cannot set both service and the virtual server in the Gx interface.
**Service**

Name of DIAMETER or SSL_DIAMETER service corresponding to PCRF to which the Gx connection is established. This parameter is mutually exclusive with the vserver parameter. Therefore, you cannot set both service and the virtual server in the Gx Interface.

**pcrfRealm**

The realm of PCRF to which the message is to be routed. This is the realm used in Destination-Realm AVP by NetScaler Gx client (as a Diameter node).

**holdOnSubscriberAbsence**

Set to Yes to hold packets until the subscriber session information is fetched from the PCRF server. If set to No, the default subscriber profile is applied until the subscriber session information is fetched from the PCRF server. If a default subscriber profile is not configured, an UNDEF is raised for expressions that use subscriber attributes.

**requestTimeout**

Time, in seconds, within which the Gx CCR request must complete. If the request does not complete within this time, the request is retransmitted for the number of times specified in the requestRetryAttempts parameter. If request is not complete even after retransmitting, then the default subscriber profile is applied to this subscriber. If a default subscriber profile is not configured, an UNDEF is raised for expressions that use subscriber attributes. Zero disables the timeout. Default value: 10

**requestRetryAttempts**

Specify the number of times a request must be retransmitted if the request does not complete within the value specified in the requestTimeout parameter. Default value: 3

**revalidationTimeout**

Time, in seconds, after which the Gx CCR-U request is sent after any PCRF activity on a session. Any RAR or CCA message resets the timer. Zero value disables the idle timeout.

**negativeTTL**

Time, in seconds, after which the Gx CCR-I request is resent for sessions that have not been resolved by PCRF because the server is down or there is no response or a failed response is received. Instead of polling the PCRF server constantly, a negative-TTL makes the appliance hold on to an unresolved session. For negative sessions, the appliance inherits the attributes from the default subscriber profile,
if one is configured and from the RADIUS accounting message, if one is received. Zero value disables the negative sessions. The appliance does not install negative sessions even if a subscriber session could not be fetched. Default value: 600

**servicePathAVP**

The AVP code in which PCRF sends the service path applicable to a subscriber.

**servicePathVendorid**

The vendor id of the AVP in which PCRF sends the service path applicable to a subscriber.

**To configure Gx interface by using the GUI**

1. Navigate to Traffic Management > Subscriber > Parameters.
2. Click Configure Subscriber Parameters.
3. In Interface Type, select **GxOnly**.
4. Specify the values for the all required parameters.
5. Click **OK**.

**RADIUS interface**

With a RADIUS interface, the packet gateway forwards the subscriber information in a RADIUS Accounting Start message to the appliance through the RADIUS interface as soon as an IP-CAN session is established. A service of type RADIUSListener processes RADIUS Accounting messages. Add a shared secret for the RADIUS client. If a shared secret is not configured, the RADIUS message is silently dropped. The following example shows the commands for configuring a RADIUS interface. The commands are in boldface.

To set up a RADIUS interface, perform the following tasks:

Create a RADIUS listener service at the SNIP address where the RADIUS messages are received. For example:

```
add service srad1 192.0.0.206 RADIUSLISTENER 1813
```

Configure the subscriber RADIUS interface to use this service. For example:

```
set subscriber radiusInterface -listeningService srad1
```

Set the subscriber interface type to RadiusOnly. For example:

```
set subscriber param -interfaceType RadiusOnly
```
Add a RADIUS client specifying a subnet and shared secret. For example:

```
add radius client 192.0.2.0/24 -radkey client123
```

A subnet of 0.0.0.0/0 implies that it is the default shared secret for all clients. To see the RADIUS interface configuration and status, type:

```
show subscriber radiusInterface
```

RADIUS Interface parameters:

Radius Listener Service: srad1(UP)

Done

**Example:**

```
add service pcrf-svc1 203.0.113.1 DIAMETER 3868
add service pcrf-svc2 203.0.113.2 DIAMETER 3868
```

**ARGUMENTS**

**ListeningService**

Name of the RADIUS listening service that will process the RADIUS accounting requests.

**svrState**

The state of the RADIUS listening service.

The following illustration shows the high-level traffic flow.

**To configure RadiusOnly interface by using the GUI**

1. Navigate to Traffic Management > Subscriber > Parameters.
2. Click Configure Subscriber Parameters.
3. In Interface Type, select RadiusOnly.
4. Specify the values for all required parameters.
5. Click OK.
RADIUS and Gx interface

With a RADIUS and Gx interface, as soon as an IP-CAN session is established, the packet gateway forwards the subscriber ID, such as the MSISDN, and Framed-IP address information about the subscriber to the appliance through the RADIUS interface. The appliance uses this subscriber ID to query the PCRF on the Gx interface to get the subscriber information. This is known as primary PCEF functionality. The following example shows the commands for configuring a RADIUS and Gx interface.

```bash
1 set subscriber param -interfaceType RadiusandGx
2 add service pcrf-svc 203.0.113.1 DIAMETER 3868
3 add lb vserver vdiam DIAMETER 0.0.0.0 0 -persistenceType DIAMETER - persistAVPno 263
4 bind lb vserver vdiam pcrf-svc
5 set subscriber gxInterface -vServer vdiam -pcrfRealm testrealm1.net - holdOnSubscriberAbsence YES -revalidationTimeout 60 -negativeTTL 120
6 add service srad1 192.0.0.206 RADIUSLISTENER 1813 set subscriber
radiusInterface -listeningService srad1
```

The following illustration shows the high-level traffic flow.

To configure RADIUSAndGx interface by using the GUI

1. Navigate to Traffic Management > Subscriber > Parameters.
2. Click Configure Subscriber Parameters.
3. In Interface Type, select RadiusAndGx.
4. Specify the values for the all required parameters.
5. Click OK.

Configure static subscribers

You can configure the subscribers manually on the NetScaler appliance by using the command line or the configuration utility. You create static subscribers by assigning a unique subscriber ID and optionally associating a policy with each subscriber. The following examples show the commands for configuring a static subscriber.

In the following examples, subscriptionIdvalue specifies the international telephone number, and subscriptionIdType (E164 in this example) specifies the general format for international telephone numbers.

```bash
1 add subscriber profile 203.0.113.6 -subscriberRules policy1 policy2 - subscriptionIdType E164 -subscriptionIdvalue 9876543211
2 add subscriber profile 2002::a66:e8d3/64 -subscriberRules policy1 policy3 -subscriptionIdType E164 -subscriptionIdvalue 9876543212
```
NetScaler 11.1

To view the configured subscriber profiles, type:

```
show subscriber profile
```

```
1) Subscriber IP: 2002::/64
   Profile Attributes:
   Active Rules: policy1, policy3
   Subscriber Id Type: E164
   Subscriber Id Value: 98767543212

2) Subscriber IP: 203.0.113.6
   Profile Attributes:
   Active Rules: policy1, policy2
   Subscriber Id Type: E164
   Subscriber Id Value: 98767543211
```

Done

**Default subscriber profile**

A default subscriber profile is used if the subscriber IP address is not found in the subscriber session store on the appliance. In the following example, a default subscriber profile is added with the subscriber rule policy1.

```
1 > add subscriber profile * -subscriberRules policy1
```

**View and clear subscriber sessions**

Use the following command to display all the static and dynamic subscriber sessions.

```
show subscriber sessions
```

```
1) Subscriber IP: 2002::/64
   Session Attributes:
   Active Rules: policy1, policy3
   Subscriber Id Type: E164
   Subscriber Id Value: 98767543212

2) Subscriber IP: *
   Session Attributes:
   Active Rules: policy1

3) Subscriber IP: 203.0.113.6
   Session Attributes:
   Active Rules: policy1, policy2
```
Use the following command to clear a single session or the complete session store. If you do not specify an IP address, the complete subscriber session store is cleared.

```bash
1 clear subscriber sessions <ip>
```

### Subscriber policy enforcement & management system

The NetScaler appliance uses the subscriber’s IP address as the key to the subscriber policy enforcement and management system.

You can add subscriber expressions to read the subscriber information available in the Subscriber Policy Enforcement & Management System. These expressions can be used with policy rules and actions that are configured for NetScaler features, such as integrated caching, rewrite, responder, and content switching.

The following commands are an example of adding a subscriber-based responder action and policy. The policy evaluates to true if the subscriber rule value is “pol1”.

```bash
1 add responder action error_msg respondwith ""HTTP/1.1 403 OK\r\n" + "You are not authorized to access Internet"
2 add responder policy no_internet_access "SUBSCRIBER.RULE_ACTIVE("pol1")" error_msg
```

The following example shows the commands to add a subscriber-based rewrite action and policy. The action inserts an HTTP header “X-Nokia-MSISDN” by using the value of AVP(45) in the subscriber session.
In the following example, two policies are configured on the appliance. When the appliance checks the subscriber information and the subscriber rule is cache_enable, it performs caching. If the subscriber rule is cache_disable, the appliance does not perform caching.

```
1 > add rewrite action AddHDR-act insert_http_header X-Nokia-MSISDN "SUBSCRIBER.AVP(45).VALUE"
2 > add rewrite policy AddHDR-pol "HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL).EQUALS_ANY("patset-test")" AddHDR-act
```

For a complete list of expressions starting with “SUBSCRIBER.” see the Policy Configuration Guide.

**IPv6 prefix based subscriber sessions**

A telco user is generally identified by the IPv6 prefix rather than the complete IPv6 address. The NetScaler appliance now uses the prefix instead of the complete IPv6 address (/128) to identify a subscriber in the database (subscriber store). For communicating with the PCRF server (for example, in a CCR-I message), the appliance now uses the framed-IPv6-Prefix AVP instead of the complete IPv6 address. The default prefix length is /64, but you can configure the appliance to use a different value.

**To configure the IPv6 prefix by using the command line**

```
set subscriber param [-ipv6PrefixLookupList ...
```

The first example command below sets a single prefix and the second example command sets multiple prefixes.

```
1 set subscriber param -ipv6PrefixLookupList 64
2 set subscriber param -ipv6PrefixLookupList 64 72 96
```

**To configure the IPv6 prefix by using the configuration utility**

1. Navigate to Traffic Management > Subscriber > Parameters.
2. In the details pane, under Settings, click Configure Subscriber Parameters and in IPv6 Prefix Lookup List, specify one or more prefixes.
Idle session management of subscriber sessions in a Telco network

Subscriber session cleanup on a NetScaler appliance is based on control plane events, such as a RADIUS Accounting Stop message, a Diameter RAR (session release) message, or a “clear subscriber session” command. In some deployments, the messages from a RADIUS client or a PCRF server might not reach the appliance. Additionally, during heavy traffic, the messages might be lost. A subscriber session that is idle for a long time continues to consume memory and IP resources on the NetScaler appliance. The idle session management feature provides configurable timers to identify idle sessions, and cleans up these sessions on the basis of the specified action.

A session is considered idle if no traffic from this subscriber is received on the data plane or the control plane. You can specify an update, terminate (inform PCRF and then delete the session), or delete (without informing PCRF) action. The action is taken only after the session is idle for the time specified in the idle timeout parameter.

To configure the idle session timeout and the associated action by using the command line

```sh
set subscriber param [-idleTTL <positive_integer>] [-idleAction <idleAction>]
```

Examples:

```
set subscriber param -idleTTL 3600 -idleAction ccrTerminate
set subscriber param -idleTTL 3600 -idleAction ccrUpdate
set subscriber param -idleTTL 3600 -idleAction delete
```

To disable the idle session timeout, set the idle timeout to zero.

```sh
set subscriber param -idleTTL 0
```

To configure the idle session timeout and the associated action by using the configuration utility

1. Navigate to Traffic Management > Subscriber > Parameters.
2. In the details pane, under Settings, click Configure Subscriber Parameters and specify an Idle Time and Idle Action.
**Subscriber session event logging**

If you enable subscriber logging, you can track the RADIUS and Gx control plane messages specific to a subscriber, and use the historical data to analyze subscriber activities. Some of the key attributes are MSISDN and time stamp. The following attributes are also logged:

- Session Event (Install, Update, Delete, Error)
- Gx Message Type (CCR-I, CCR-U, CCR-T, RAR)
- Radius Message Type (Start, Stop)
- Subscriber IP
- SubscriberID Type (MSISDN(E164), IMSI)
- SubscriberID value

By using these logs, you can track users by IP address and, if available, MSISDN.

You can enable subscriber session logging to a local or remote syslog or nslog server. The following example shows how to enable subscriber logging to a remote syslog server.

```bash
> add syslogAction sysact1 192.0.2.0 -loglevel EMERGENCY ALERT CRITICAL ERROR WARNING NOTICE INFORMATIONAL -subscriberlog enabled
```

From these logs, you can learn about any activity related to a user, such as the time when a session was updated, deleted, or created (installed). Additionally, error messages are also logged.

**Examples:**

1. The following log entries are examples of RADIUS and Gx session creation, session update, and session deletion.

   09/30/2015:16:29:18 GMT  Informational 0-PPE-0 : default SUBSCRIBER SESSION_EVENT 147 0 : Session Install, GX MsgType: CCR-I, RADIUS MsgType: Start, IP: 100.10.1.1, ID: E164 - 30000000001

   09/30/2015:16:30:18 GMT  Informational 0-PPE-0 : default SUBSCRIBER SESSION_EVENT 148 0 : Session Update, GX MsgType: CCR-U, IP: 100.10.1.1, ID: E164 - 30000000001

   09/30/2015:17:27:56 GMT  Informational 0-PPE-0 : default SUBSCRIBER SESSION_EVENT 185 0 : Session Delete, GX MsgType: CCR-T, RADIUS MsgType: Stop, IP: 100.10.1.1, ID: E164 - 30000000001

2. The following log entries are examples of failure messages, such as when a subscriber is not found on the PCRF server and when the appliance cannot connect to the PCRF server.

   09/30/2015:16:44:15 GMT  Error 0-PPE-0 : default SUBSCRIBER SESSION_FAILURE 169 0 : Failure Reason: PCRF failure response, GX MsgType: CCR-I, IP: 100.10.1.1

   Sep 30 13:03:01  09/30/2015:16:49:08 GMT  0-PPE-0 : default SUBSCRIBER SES-
Subscriber aware LSN session termination

In earlier releases, if a subscriber session is deleted when a RADIUS Accounting STOP or a PCRF-RAR message is received, or as a result of any other event, such as TTL expiry or flush, the corresponding LSN sessions of the subscriber are removed only after the configured LSN timeout period. LSN sessions that are kept open until this timeout expires continue to consume resources on the appliance.

From release 11.1, a new parameter (subscrSessionRemoval) is added. If this parameter is enabled, and the subscriber information is deleted from the subscriber database, LSN sessions corresponding to that subscriber are also removed. If this parameter is disabled, the subscriber sessions are timed out as specified by the LSN timeout settings.

To configure subscriber aware LSN session termination by using the CLI

At the command prompt, type:

```
set lsn parameter -subscrSessionRemoval ( ENABLED | DISABLED )
```

```
1 > set lsn parameter -subscrSessionRemoval ENABLED
2 Done
3 > sh lsn parameter
   LSN Global Configuration:
   Active Memory Usage: 0 MBytes
   Configured Memory Limit: 0 MBytes
   Maximum Memory Usage Limit: 912 MBytes
   Session synchronization: ENABLED
   Subscriber aware session removal: ENABLED
```

To configure subscriber aware LSN session termination by using the GUI

1. Navigate to System > Large Scale NAT.
2. In Getting started, click Set LSN Parameter.
3. Set the Subscriber Aware Session Removal parameter.
Troubleshooting

If your deployment is not working as expected, use the following commands to troubleshoot:

- show subscriber gxinterface
  This command’s output can include the following error messages (shown here with suggested responses):
  - Gx Interface Not Configured-Use set subscriber param command to configure the correct interface type.
  - PCRF not configured-Configure a Diameter vServer or Service on GxInterface-Use the set subscriber gx interface command to assign a Diameter virtual server or service to this interface.
  - PCRF is not ready-Check corresponding vserver/service for more details-Use the show LB vserver or show service command to check the state of the service.
  - NetScaler is waiting for CEA from PCRF-Capability negotiation between the PCRF and NetScaler might be failing. This could be an intermittent state. If it persists, check the DIAMETER settings on your PCRF server.
  - Memory is not configured to store subscriber sessions. Please use ‘set extendedmemoryparam -memlimit <‘-Use the set extendedmemoryparam command to configure extended memory.

- show subscriber radiusinterface
  If “Not Configured” is the output of this command, use the set subscriber radiusinterface command to specify a RADIUSListener service.

If subscriber logging is enabled, you can get more detailed information from the log files.

Subscriber aware traffic steering

January 6, 2019

Traffic steering directs subscriber traffic from one point to another. When a subscriber connects to the network, the packet gateway associates an IP address with the subscriber and forwards the data packet to the NetScaler appliance. The appliance communicates with the PCRF server over the Gx interface to get the policy information. Depending on the policy information, the appliance performs one of the following actions:

- Forward the data packet to another set of services (as shown in the following illustration).
- Drop the packet.
- Perform only Large Scale NAT (LSN), if LSN is configured on the appliance.
The values shown in the following figure are configured in the CLI procedure that follows the figure. A content switching virtual server on the NetScaler appliance directs requests to the value added services or skips them, depending on the defined rule, and then sends the packet out to the Internet after performing LSN.

**To configure traffic steering for the above deployment by using the CLI**

Add the appliance's subnet IP (SNIP) addresses.

**Example:**

```plaintext
1  add ns ip 192.168.10.1 255.255.255.0 -type snip
2  add ns ip 192.168.20.1 255.255.255.0 -type snip
3  add ns ip 100.100.100.1 255.0.0.0 -type snip
4  add ns ip 200.200.200.1 255.0.0.0 -type snip
5  add ns ip 100.1.1.1 255.0.0.0 -type snip
6  add ns ip 200.201.1.1 255.0.0.0 -type snip
```

Add the VLANs. VLANs help the appliance identify the source of the traffic. Bind the VLANs to the interfaces and subnet IP addresses.

**Example:**

```plaintext
1  add vlan 10
2  add vlan 20
3  add vlan 100
4  add vlan 200
5  bind vlan 10 -ifnum 1/4 -tagged -IPAddress 192.168.10.1 255.255.255.0
6  bind vlan 20 -ifnum 1/4 -tagged -IPAddress 192.168.20.1 255.255.255.0
7  bind vlan 100 -ifnum 1/2 -tagged -IPAddress 100.1.1.1 255.0.0.0
8  bind vlan 200 -ifnum 1/3 -tagged -IPAddress 200.1.1.1 255.0.0.0
```
Specify the VLAN on which the subscriber traffic arrives on the appliance. Specify the service path AVP that tells the appliance where to look for the service path name within the subscriber session. For primary PCEF functionality, specify the interfaceType as RadiusAndGx.

**Example:**

```plaintext
set ns param -servicePathIngressVLAN 100
set subscriber gxinterface -servicepathAVP 1001 1005 -
               servicepathVendorid 10415
set subscriber param -interfaceType RadiusAndGx
```

Configure a service and virtual server of type Diameter, and bind the service to the virtual server. Then, specify the PCRF realm and subscriber Gx interface parameters. For primary PCEF functionality, configure a RADIUS listener service and RADIUS interface.

**Example:**

```plaintext
add service sd1 10.102.232.200 DIAMETER 3868
add lb vserver vdiam DIAMETER 0.0.0.0 0 -persistenceType DIAMETER -
               persistAVPno 263
bind lb vserver vdiam sd1
set ns diameter -identity netscaler.sc1.net -realm pcrf1.net
set subscriber gxInterface -vServer vdiam -pcrfRealm pcrf1.net -
               holdOnSubscriberAbsence YES -idleTTL 1200 -negativeTTL 120
add service srad1 10.102.232.236 RADIUSListener 1813
set subscriber radiusInterface -listeningService srad1
```

Add service functions to associate a VAS with an ingress VLAN. Add a service path to define the chain, that is, specify the VAS that the packet must be sent to and the order in which it must go to that VAS. The service path name is usually sent by the PCRF. However, the service path of the default subscriber profile (*) applies if any of the following is true:

- PCRF does not have the subscriber information.
- The subscriber information does not include this AVP.
- The appliance is unable to query the PCRF. For example, the service representing the PCRF is DOWN.
The service path AVP that contains this name must already be configured as part of the global configuration. Bind the service function to the service path. The service index specifies the order in which the VAS is added to the chain. The highest number (255) indicates the beginning of the chain.

Example:

```plaintext
1  add ns servicefunction SF1 -ingressVLAN 20
2  add ns servicepath pol1
3  bind ns servicepath pol1 -servicefunction SF1 -index 255
4  add subscriber profile * -subscriberrules default_path
```

Add the LSN configuration. That is, define the NAT pool and identify the clients for which the appliance must perform LSN.

```plaintext
1  add lsn pool pool1
2  bind lsn pool pool1 200.201.1.1
3  add lsn client client1
4  bind lsn client client1 -network 100.0.0.0 -netmask 255.0.0.0
5  add lsn group group1 -clientname client1
6  bind lsn group group1 -poolname pool1
```

The appliance performs LSN by default. To override LSN, you must create a net profile with the over-rideLsn parameter enabled, and bind this profile to all the load balancing virtual servers that are configured for value added services (VASs).

Example:

```plaintext
1  add netprofile np1
2  set netprofile np1 -overrideLsn ENABLED
3  set lb vserver vs1 -netprofile np1
```

Configure the VAS on the appliance. This includes creating the services and virtual servers and then binding the services to the virtual servers.

```plaintext
1  add service vasi 192.168.10.2 ANY 80 -usip YES
```
Add the content switching (CS) configuration. This includes virtual servers, policies, and their associated actions. The traffic arrives at the CS virtual server and is then redirected to the appropriate load balancing virtual server. Define expressions that associate a virtual server with a service function.

**Example:**

```plaintext
1  add cs vserver cs1 ANY * 80 -l2Conn ON
2  add cs action csact1 -targetLBVserver vs1
3  add cs action csactint -targetLBVserver vint
4  add cs policy cspol1 -rule SUBSCRIBER.SERVICEPATH.IS_NEXT("SF1") && SYS.VSERVER("vs1").STATE.EQ(UP)" -action csact1
5  bind cs vserver cs1 -policyName cspol1 -priority 110
6  bind cs vserver cs1 -lbvserver vint
```

**To configure traffic steering on the appliance by using the GUI**

1. Navigate to **System** > **Network** > **IPs** and add the subnet IP addresses.
2. Navigate to System > Network > **VLANs** and add VLANs, Bind the VLANs to the interfaces and subnet IP addresses.
3. Navigate to **Traffic Management** > **Service Chaining** > **Configure Service Path Ingress VLAN** and specify an ingress VLAN.
4. Navigate to **Traffic Management** > **Subscriber** > **Parameters** > **Configure Subscriber Parameters** and specify the following:
   - Interface Type: Specify **RadiusAndGx**.
   - Configure a diameter virtual server, PCRF realm, and the subscriber GX interface parameters.
   - Specify the RADIUS interface parameters.
5. Navigate to **Traffic Management > Service Chaining > Service Function** and add service functions to associate a value-added service with an ingress VLAN.

6. Navigate to **System > Network > Large Scale NAT**. Click **Pools** and add a pool. Click **Clients** and add a client. Click **Groups** and add a group and specify the client. Edit the group and bind the pool to this group.

7. Navigate to **System > Network > Net Profiles** and add a net profile. Select **Override LSN**. Optionally, navigate to **System > Network > Settings > Configure Layer 3 Parameters** and verify that **Override LSN** is not selected.

8. Navigate to **Traffic Management > Load Balancing > Virtual Servers** and configure the virtual servers and value-added services on the appliance. Bind the services and the net profile to the virtual server.

9. Navigate to **Traffic Management > Content Switching > Virtual Servers** and configure a virtual server, policy, and action. Specify the target load balancing virtual server.

**To configure service chaining on the appliance by using the GUI**

1. Navigate to **System > Network > IPs** and add the subnet IP addresses.

2. Navigate to **System > Network > VLANs** and add VLANs. Bind the VLANs to the interfaces and subnet IP addresses.

3. Navigate to **Traffic Management > Service Chaining > Configure Service Path Ingress VLAN** and specify an ingress VLAN.

4. Navigate to **Traffic Management > Subscriber > Parameters > Configure Subscriber Parameters** and specify the following:
   - Interface Type: Specify **RadiusAndGx**.
   - Configure a diameter virtual server, PCRF realm, and the subscriber GX interface parameters.
   - Specify the RADIUS interface parameters.

5. Navigate to **Traffic Management > Service Chaining > Service Function** and add service functions to associate a value-added service with an ingress VLAN.

6. Navigate to **System > Network > Large Scale NAT**. Click **Pools** and add a pool. Click **Clients** and add a client. Click **Groups** and add a group and specify the client. Edit the group and bind the pool to this group.

7. Navigate to **System > Network > Net Profiles** and add a net profile. Select **Override LSN**. Optionally, navigate to **System > Network > Settings > Configure Layer 3 Parameters** and verify that **Override LSN** is not selected.

8. Navigate to **Traffic Management > Load Balancing > Virtual Servers** and configure the virtual servers and value-added services on the appliance. Bind the services and the net profile to the virtual server.

9. Navigate to **Traffic Management > Content Switching > Virtual Servers** and configure a virtual server, policy, and action. Specify the target load balancing virtual server.
server, policy, and action. Specify the target load balancing virtual server.

**Subscriber aware service chaining**

January 6, 2019

With the huge increase in the data traffic passing through telco networks, it is no longer feasible for service providers to steer all the traffic through all the value added services (VAS). A service provider should be able to optimize usage of VAS and intelligently steer traffic to improve the user experience. For example, video optimization is not required for traffic that does not include a video. Moreover, if a subscriber is connected to a 4G network, content can be streamed in high definition (HD), and video optimization might not be needed. However, video optimization improves the experience for a user in a 3G network. Similarly, caching provides a faster and better user experience and can be enabled depending on the subscriber plan. Another example of VAS is parental control. If parents provide a mobile handset to a minor child, they would like some kind of control over the websites that their child visits.

To do the above and more, service providers must be able to provide value-added services on a per-subscriber basis. In other words, entities in the service provider network must be capable of extracting the subscriber information and intelligently steering the packet on the basis of this information.

Service chaining determines the set of services through which the traffic from a subscriber must pass before going to the Internet. Instead of sending all the traffic to all the services, the NetScaler intelligently routes all requests from a subscriber to a specific set of services on the basis of the policy defined for that subscriber.

The following figure shows the entities involved in service chaining. The values shown are configured in the procedure that follows the figure. A content switching virtual server on the NetScaler appliance directs requests to the value added services or skips them, depending on the defined rule, and then sends the packet out to the Internet after performing LSN.

**To configure service chaining for the above deployment by using the CLI**

Add the appliance's subnet IP (SNIP) addresses.

**Example:**

```
1  add ns ip 192.168.10.1 255.255.255.0 -type snip
2  add ns ip 192.168.20.1 255.255.255.0 -type snip
3  add ns ip 192.168.30.1 255.255.255.0 -type snip
```
Add the VLANs. VLANs help the appliance identify the source of the traffic. Bind the VLANs to the interfaces and subnet IP addresses. Add an ingress and an egress VLAN for each VAS.

**Example:**

```plaintext
add vlan 10
add vlan 20
add vlan 30
add vlan 40
add vlan 50
add vlan 60
add vlan 100
add vlan 200
bind vlan 10 -ifnum 1/4 -tagged -IPAddress 192.168.10.1 255.255.255.0
bind vlan 20 -ifnum 1/4 -tagged -IPAddress 192.168.20.1 255.255.255.0
bind vlan 20 -ifnum 1/4 -tagged -IPAddress 192.168.30.1 255.255.255.0
bind vlan 20 -ifnum 1/4 -tagged -IPAddress 192.168.40.1 255.255.255.0
bind vlan 20 -ifnum 1/4 -tagged -IPAddress 192.168.50.1 255.255.255.0
bind vlan 20 -ifnum 1/4 -tagged -IPAddress 192.168.60.1 255.255.255.0
bind vlan 100 -ifnum 1/2 -tagged -IPAddress 100.1.1.1 255.0.0.0
```
Specify the VLAN on which the subscriber traffic arrives on the appliance. Specify the service path AVP that tells the appliance where to look for the service path name within the subscriber session. For primary PCEF functionality, specify the interfaceType as RadiusAndGx.

**Example:**

```
set ns param -servicePathIngressVLAN 100

set subscriber gxinterface -servicepathAVP 1001 1005 -
  servicepathVendorid 10415

set subscriber param -interfaceType RadiusAndGx
```

Configure a service and virtual server of type Diameter, and bind the service to the virtual server. Then, specify the PCRF realm and subscriber Gx interface parameters. For primary PCEF functionality, configure a RADIUS listener service and RADIUS interface.

**Example:**

```
add service sdl1 10.102.232.200 DIAMETER 3868

add lb vserver vdiam DIAMETER 0.0.0.0 0 -persistenceType DIAMETER -
  persistAVPno 263

bind lb vserver vdiam sdl1

set ns diameter -identity netscaler.sc1.net -realm pcrf1.net

set subscriber gxInterface -vServer vdiam -pcrfRealm pcrf1.net -
  holdOnSubscriberAbsence YES -idleTTL 1200 -negativeTTL 120

add service srad1 10.102.232.236 RADIUSListener 1813

set subscriber radiusInterface -listeningService srad1
```

Add service functions to associate a VAS with an ingress VLAN. Add a service path to define the chain, that is, specify the VAS that the packet must be sent to and the order in which it must go to that VAS. The service path name is usually sent by the PCRF. However, the service path of the default subscriber profile (*) applies if any of the following is true:

- PCRF does not have the subscriber information.
- The subscriber information does not include this AVP.
• The appliance is unable to query the PCRF. For example, the service representing the PCRF is DOWN.

The service path AVP that contains this name must be configured as part of the global configuration earlier. Bind the service function to the service path. The service index specifies the order in which the VAS is added to the chain. The highest number (255) indicates the beginning of the chain.

**Example:**

```plaintext
1. add ns servicefunction SF1 -ingressVLAN 20
2. add ns servicefunction SF2 -ingressVLAN 40
3. add ns servicefunction SF3 -ingressVLAN 60
4. add ns servicepath pol1
5. bind ns servicepath pol1 -servicefunction SF1 -index 255
6. bind ns servicepath pol1 -servicefunction SF2 -index 254
7. bind ns servicepath pol1 -servicefunction SF3 -index 253
8. add ns servicepath pol2
9. bind ns servicepath pol2 -servicefunction SF2 -index 255
10. add ns servicepath pol3
11. bind ns servicepath pol3 -servicefunction SF1 -index 255
12. add subscriber profile * -subscriberrules default_path
```

Add the LSN configuration. That is, define the NAT pool and identify the clients for which the appliance must perform LSN.

**Example:**

```plaintext
1. add lsn pool pool1
2. bind lsn pool pool1 200.201.1.1
3. add lsn client client1
4. bind lsn client client1 -network 100.0.0.0 -netmask 255.0.0.0
```
The appliance performs LSN by default. To override LSN, you must create a net profile with overrideLsn parameter enabled and bind this profile to all the load balancing virtual servers that are configured for value added services (VASs).

**Example:**

```plaintext
1 add netprofile np1
2 set netprofile np1 -overrideLsn ENABLED
3 set lb vserver vs1 -netprofile np1
```

Configure the VAS on the appliance. This includes creating the services and virtual servers and then binding the services to the virtual servers.

**Example:**

```plaintext
1 add service vas1 192.168.10.2 ANY 80 -usip YES
2 add service vas2 192.168.30.2 ANY 80 -usip YES
3 add service vas3 192.168.50.2 ANY 80 -usip YES
4 add service sint 200.10.1.10 ANY 80 -usip YES
5 add lb vserver vs1 ANY -m MAC -l2Conn ON
6 add lb vserver vs2 ANY -m MAC -l2Conn ON
7 add lb vserver vs3 ANY -m MAC -l2Conn ON
8 add lb vserver vint ANY -m MAC -l2Conn ON
9 bind lb vserver vs1 vas1
10 bind lb vserver vs2 vas2
11 bind lb vserver vs3 vas3
12 bind lb vserver vint sint
```
Add the content switching (CS) configuration. This includes virtual servers, policies, and their associated actions. The traffic arrives at the CS virtual server and is then redirected to the appropriate load balancing virtual server. Define expressions that associate a virtual server with a service function.

**Example:**

```plaintext
add cs vserver cs1 ANY * 80 -l2Conn ON
add cs action csact1 -targetLBVserver vs1
add cs action csact2 -targetLBVserver vs2
add cs action csact3 -targetLBVserver vs3
add cs action csactint -targetLBVserver vint
add cs policy cspol1 -rule "SUBSCRIBER.SERVICEPATH.IS_NEXT("SF1") && SYS.VSERVER("vs1").STATE.EQ(UP)" -action csact1
add cs policy cspol2 -rule "SUBSCRIBER.SERVICEPATH.IS_NEXT("SF2") && SYS.VSERVER("vs2").STATE.EQ(UP)" -action csact2
add cs policy cspol3 -rule "SUBSCRIBER.SERVICEPATH.IS_NEXT("SF3") && SYS.VSERVER("vs3").STATE.EQ(UP)" -action csact3
bind cs vserver cs1 -policyName cspol1 -priority 110
bind cs vserver cs1 -policyName cspol2 -priority 120
bind cs vserver cs1 -policyName cspol3 -priority 130
bind cs vserver cs1 -lbvserver vint
```

**To configure service chaining on the appliance by using the GUI**

1. Navigate to **System > Network > IPs** and add the subnet IP addresses.
2. Navigate to **System > Network > VLANs** and add VLANs, Bind the VLANs to the interfaces and subnet IP addresses.
3. Navigate to **Traffic Management > Service Chaining> Configure Service Path Ingress VLAN** and specify an ingress VLAN.
4. Navigate to **Traffic Management > Subscriber > Parameters > Configure Subscriber Parameters** and specify the following:
   - Interface Type: Specify **RadiusAndGx**.
- Configure a diameter virtual server, PCRF realm, and the subscriber GX interface parameters.
- Specify the RADIUS interface parameters.

5. Navigate to **Traffic Management > Service Chaining > Service Function** and add service functions to associate a value-added service with an ingress VLAN.

6. Navigate to **System > Network > Large Scale NAT**. Click **Pools** and add a pool. Click **Clients** and add a client. Click **Groups** and add a group and specify the client. Edit the group and bind the pool to this group.

7. Navigate to **System > Network > Net Profiles** and add a net profile. Select **Override LSN**. Optionally, navigate to **System > Network > Settings > Configure Layer 3 Parameters** and verify that **Override LSN** is not selected.

8. Navigate to **Traffic Management > Load Balancing > Virtual Servers** and configure the virtual servers and value-added services on the appliance. Bind the services and the net profile to the virtual server.

9. Navigate to **Traffic Management > Content Switching > Virtual Servers** and configure a virtual server, policy, and action. Specify the target load balancing virtual server.

### Policy based TCP profile selection

December 18, 2018

You can configure the NetScaler appliance to perform TCP optimization based on subscriber attributes. For example, the appliance can select different TCP profiles at run time, based on the network to which the user equipment (UE) is connected. As a result, you can improve a mobile user’s experience by setting some parameters in the TCP profiles and then using policies to select the appropriate profile.

Create separate TCP profiles for subscribers connecting through a 4G network and for users connecting through any other network. Define a policy rule that is selected on the basis of a subscriber parameter, such as RAT-type. In the following examples, if RAT-Type is EUTRAN, a TCP profile that supports a faster connection is selected (Example 1). For all other RAT-Type values, a different TCP profile is selected (Example 2).

**Note**

The RAT-Type AVP (AVP code 1032) is of type Enumerated and is used to identify the radio access technology that is serving the UE.

The value “1004” indicates that the RAT is EUTRAN. (RFC 29.212)

**Example1:**
Load Balance Control-Plane Traffic that is based on Diameter, SIP, and SMPP Protocols

December 18, 2018

With the increase in control-plane traffic, the servers can become a bottleneck because the traffic is not optimally distributed among the servers. Therefore, messages must be load balanced. The NetScaler appliance supports Diameter, SIP, and SMPP load balancing.

SIP

NetScaler enables you to load balance SIP messages over UDP or over TCP (including TLS) to a group of proxy servers. NetScaler also provides Call-ID based persistence and Call-ID hash load balancing.
method using which you direct packets for a particular SIP session to the same load balanced SIP server.

The NetScaler default expressions language contains a number of expressions that operate on Session Initiation Protocol (SIP) connections. These expressions are intended to be used in policies for SIP protocol that operates on a request/response basis. These expressions can be used in content switching, rate limiting, responder, and rewrite policies.

For more information, see Load Balancing a Group of SIP Servers.

**SMPP**

Millions of short messages are exchanged daily between individuals and value-added service providers, such as banks, advertisers, and directory services, by using the short message peer to peer (SMPP) protocol. Often, message delivery is delayed because servers are overloaded and traffic is not optimally distributed among the servers.

The NetScaler appliance provides optimal distribution of messages across your servers, preventing poor performance and outages. The NetScaler appliance:

- Load balances messages originating from the server and from the client
- Monitors the health of the message centers
- Provides content switching support for the message centers
- Handles concatenated messages

**Limitation**: Message IDs, from the message center, longer than 59 bytes are not supported. If the message ID length returned by the message center is more than 59 bytes, ancillary operations fail and the NetScaler appliance responds with an error message.

For more information, see SMPP Load Balancing.

**Diameter**

Diameter is a base protocol with more than 50 protocols (also called applications) built over it. Therefore, the diameter traffic generated in a Telco network is high. To optimally maintain this diameter traffic, the NetScaler appliance performs load balancing, content switching, and acts as a relay agent. Additionally, the appliance offers rewrite and responder functionality. The appliance supports rate limiting of Diameter messages.

For more information, see Configuring Diameter Load Balancing.
Provide DNS Infrastructure/Traffic Services, such as, Load Balancing, Caching, and Logging for Telecom Service Providers

December 18, 2018

Telecom service providers can configure the NetScaler appliance to function as a DNS proxy. Caching of DNS records, which is an important function of a DNS proxy, is enabled by default on the NetScaler appliance. This enables the NetScaler appliance to provide quick responses for repeated translations and hence enhances the customer experience and also saves the bandwidth. The caches responses from DNS name servers. When the appliance receives a DNS query, it checks for the queried domain in its cache. If the address for the queried domain is present in its cache, the NetScaler appliance returns the corresponding address to the client. Otherwise, it forwards the query to a DNS name server that checks for the availability of the address and returns it to the NetScaler appliance. The NetScaler appliance then returns the address to the client.

For requests for a domain that has been cached earlier, the NetScaler appliance serves the Address record of the domain from the cache without querying the configured DNS server and hence saves the bandwidth.

From 11.0 release onwards, NetScaler also logs the DNS requests that it receives and also the responses that it sends to the client. Telecom service providers can use this log to:

- Audit the DNS responses to the client
- Audit DNS clients
- Detect and prevent DNS attacks
- Troubleshooting

For more information, see Domain Name System.

Provide Subscriber Load Distribution Using GSLB Across Core-Networks of a Telecom Service Provider

December 18, 2018

Scalability, high availability and performance are critical to service provider deployments. While many service providers deploy their infrastructure at a single location or multiple location, these deployments are subject to a number of inherent limitations, such as:

- If the site loses connectivity to all or part of the public Internet, it will be inaccessible to users and customers, which can have significant impact on the business.
• Users accessing the site from geographically distant locations may experience large and highly variable delays, which are exacerbated by the large number of round trips that HTTP requires to transfer content.

NetScaler appliance’s Global Server Load Balancing (GSLB) overcomes these problems by distributing traffic among sites deployed in multiple geographic locations. By serving content from many different points in the Internet, GSLB alleviates the impact of network bandwidth bottlenecks and provides robustness in case of network failures at a particular site. Users can be automatically directed to the nearest or least loaded site at the time of the request, minimizing the likelihood of long download delays and/or service disruptions.

You can use NetScaler appliance’s global server load balancing for:

• Disaster recovery or high availability by configuring an Active-standby data center setup that consists of an active and a standby data center. When a failover occurs as a result of a disaster event, the standby data center becomes operational.
• High availability and speed by configuring an active-active data center setup that consists of multiple active data centers. Client requests are load balanced across active data centers.
• Directing client requests to the data center that is closest in geographical distance or network distance by configuring a proximity setup.
• Full-DNS resolutions, GSLB processes DNS queries of the A, AAAA and CNAME types, and the DNS function option can process DNS queries of all other types, such as MX and PTR. Also, if the recursive resolution is enabled, the appliance will forward DNS queries for domain names that are not configured on the NetScaler appliance.

For more information, see Global Server Load Balancing.

**Bandwidth Utilization Using Cache Redirection Functionality**

December 18, 2018

The volume of web traffic on the Internet is enormous and a large percentage of that traffic is redundant. Multiple clients ask web servers for the same content repeatedly leading to inefficient use of bandwidth. To relieve the origin web server of processing each request, Internet Service Providers (ISPs) can use the cache redirection feature of NetScaler appliance and serve the content from a cache server instead of from the origin server. The NetScaler appliance analyzes incoming requests, sends requests for cacheable data to cache servers, and sends non-cacheable requests and dynamic HTTP requests to origin servers. Cache redirection feature of NetScaler is policy-based, and by default, requests that match a policy are sent to the origin server, and all other requests are sent to a cache server. You can combine content switching with cache redirection to cache selective content and
serve content from specific cache servers for specific types of requested content.

For more information, see Cache Redirection.

**NetScaler TCP Optimization**

December 18, 2018

The NetScaler appliance provides advanced TCP tuning and optimization techniques and capabilities that are well suited to modern 3.5 and 4G networks, improving user experience and perceived download speeds significantly.

This section focuses on detailed instructions relevant to:

- Choosing and inserting an appropriate NetScaler T1000 Series model in a mobile network for TCP optimization
- Full configuration instructions related to not only TCP optimization but also for appropriate Layer-2 and Layer-3 configuration of the T1 device

**Getting Started**

January 6, 2019

**Hardware**

Citrix provides a wide breath of NetScaler models that might be loosely based on two factors:

- Capacity, currently ranging from hundreds of Mbps for the low-end VPX appliance to 160Gbps for the high-end 25000 MPX series appliance
- Telco grade, with the availability of the T1000 series for Telco datacenters.

Your Citrix Sales or Support representative can help you select the appropriate hardware for your demo, trial, or production needs.

The remainder of this section uses a NetScaler T1200 as a reference hardware. Note that putting aside superficial differences related to number and notation of available interfaces (see * in note) or well-documented limitations of NetScaler VPX (see ** in note) the instructions should apply mostly verbatim regardless of the NetScaler model selected.
Note

* For instance the T1010 model only has 12x1GbE typically marked as 1/1-1/12 rather than the 10/x notation used in this document.

** A NetScaler VPX instance typically doesn’t support LACP aggregation; it might also not support VLAN tagging.

Initial Setup

Through Serial Console

After a serial cable is connected, you can log on to the NetScaler appliance with the following credentials:

- Username: nsroot
- Password: nsroot

Once logged in, configure the basic details of the NetScaler appliance as shown in the screen capture below.

Example:

```
1 set ns config -IPAddress <ip_addr> -netmask <netmask>
2
3 saveconfig
4
5 reboot -warm
```

After you restart the appliance, you might use SSH for further configuration of the T1100 nodes.

Through LOM

Lights out Management (LOM) port on the front panel of the NetScaler appliance allows operator to remotely monitor and manage the appliance independently of the operating system. Operator can change the IP address, power cycle, and perform a code dump by connecting to the NetScaler appliance through the LOM port.

Default IP Address of LOM port is 192.168.1.3

**Figure.** Initial Configuration of LOM Module

Set a static IP on your laptop and plug it directly into the LOM interface with a crossover cable or into a switch in the same broadcast domain as the LOM interface.
NetScaler 11.1

For initial configuration, type the port’s default address: http://192.168.1.3 in a web browser and change the LOM port’s default IP address.

Refer to Configuration Guides for further details.

Software

The NetScaler TCP optimization for mobile networks is constantly evolving. The capabilities and tunings outlined in this document require a NetScaler Telco build. Here is an example showing the NetScaler Telco build.

Example:

```
1 show ver
2
3 NetScaler NS11.0: Build 64.957.nc, Date: Aug 26 2016, 02:00:23
```

If the T1000 has not shipped with the appropriate build revision, contact the NetScaler Customer Support.

---

**Important**

Both the appliances should have the same software image.

---

SSH Client

A NetScaler appliance can be configured by using either the CLI or the HTML5 GUI. However, this section provides only CLI-based instructions.

While the CLI is accessible through the NetScaler serial console, an SSH client is normally recommended to allow for remote NetScaler configuration.

Management Network

January 6, 2019

Connectivity

Most NetScaler devices offer redundant 1GbE OAM ports, notated as 0/1 and 0/2. To provide for redundancy in case of a switch failure, you should connect the relevant ports to different upstream switches.
A high-level overview of the recommended connectivity is outlined in the following diagram:

After the NetScaler appliance is connected to the management network, subsequent configuration steps can be performed remotely using SSH or web connectivity to the CLI and GUI respectively.

**Routing**

The add route command may be used to configure any routes appropriate to the management network. The relevant gateway should be reachable on the NSIP subnet, as shown below.

**Example:**

```plaintext
1  add route <network> <netmask> <gateway>
```

**Licensing**

December 18, 2018

A valid license file should be installed on the NetScaler appliance. The license should support at least as many Gbps as the expected maximum Gi-LAN throughput.

License files should be copied through an SCP client to the /nsconfig/license of the appliance, as shown in the screen capture below.

**Example:**

```plaintext
1  shell ls /nsconfig/license/
2
3  CNS_V3000_SERVER_PLT_Retail.lic ssl
```

Do a warm restart to apply the new license, as shown in the screen capture below.

**Example:**

```plaintext
1  reboot -warm
2
3  Are you sure you want to restart NetScaler (Y/N)? [N]:y
4
5  Done
```

After the restart completes, verify that the license has been properly applied, by using the show license CLI.

In the example below a 3Gbps Platinum license has been successfully installed.
**EXample:**

```
1 > show license
2
3 License status:
4
5 Web Logging: YES
6
7 ...
8
9 Model Number ID: 3000
10
11 License Type: Platinum License
12
13 Done
```

**High Availability**

January 6, 2019

High availability (HA) refers to an active-standby operational mode of a NetScaler device pair. Each device has its own dedicated management IP address. All other IP addresses are owned by the active device in the pair.

**Connectivity**

While there are multiple connectivity options for a NetScaler HA pair, the most recommended one is depicted in the following diagram:

In the above diagram, the N+1 red links between each T1000 and the respective switch imply N+1 redundancy - as explained in Connectivity. For instance, considering a 45 Gbps Gi-LAN N=5 is an appropriate value, with 6x10GbE LACP channels between each switch and the respective T1000 as well as between the two switches.

An extra pair of links is recommended between the NetScaler pair, to provide for HA communication isolation from the OAM network.
Gi-LAN Integration

January 6, 2019

Typically, a NetScaler appliance is inserted as a separate L3 inline node in the Gi-LAN, similarly to an L3 router.

Figure: A simple depiction of a Gi-LAN

Connectivity

A physical NetScaler connectivity to upstream switches is recommended to provide for sufficient redundancy. For example, assuming that a NetScaler appliance is inserted in a Gi-LAN that is handling a total (uplink+downlink) of 24Gbps, connectivity with 4x10GbE or more interfaces is recommended. This effectively provides for N+1 redundancy in case of a link failure.

The relevant ports on the upstream switch should be configured for LACP port aggregation. The relevant configuration on NetScaler is outlined below:

**Connectivity Configuration:**

```bash
1  set interface 10/1 - tagall ON - lacpMode ACTIVE - lacpKey 1
2  set interface 10/2 - tagall ON - lacpMode ACTIVE - lacpKey 1
3  set interface 10/3 - tagall ON - lacpMode ACTIVE - lacpKey 1
4  set interface 10/4 - tagall ON - lacpMode ACTIVE - lacpKey 1
```

You can verify the appropriate functionality of LACP using the “show interface” command:

**show interface:**

```bash
sh interface LA/1
```

```
1) Interface LA/1 (802.3ad Link Aggregate) #39

   flags=0x4100c020 <ENABLED, UP, AGGREGATE, UP, HAMON, 802.1q>

   MTU=1500, native vlan=1, MAC=02:e0:ed:33:88:b0, uptime 340h11m56s

   Requested: media NONE, speed AUTO, duplex NONE, fctl NONE,
```
throughput 0

Actual: throughput 4000

LLDP Mode: NONE,

RX: Pkts(918446) Bytes(110087414) Errs(0) Drops(795989) Stalls(0)

TX: Pkts(124113) Bytes(15255532) Errs(0) Drops(0) Stalls(0)

NIC: InDisc(0) OutDisc(0) Fctls(0) Stalls(0) Hangs(0) Muted(0)

Bandwidth thresholds are not set.

Disable the remaining unused interfaces and turn off the monitor.

set interface 10/5 –haMonitor OFF

Command:

```
set interface 10/24 –haMonitor OFF
disable interface 10/5
disable interface 10/24
```

Configuration of physical interfaces is not shared across the two NetScaler units. Hence, the above commands must be run across both NetScaler nodes in case of an HA pair deployment.

**HA Configuration**

All other configuration parameters are shared between the NetScaler nodes of an HA pair. Hence, HA sync should be enabled prior to any other configuration commands being run. Basic HA configuration involves the following steps:

1. Using the exact same NetScaler hardware, software, and license: HA pairs are not supported between different models (i.e. a T1100 and an MPX21550) or same models with different firmware levels. Refer to the appropriate instructions on upgrading an existing HA pair - Upgrading to Release 11.1.
2. Establishing the HA pair.

**Example:**

```
 netscaler-1> add HA node 1 <netscaler-2-NSIP>
```
3. Verify the HA pair establishment running the following command in either node; both nodes should be visible, one of them as Primary (active), the other as a Secondary (standby).

**Example:**

```
# show HA node
```

4. Enable failsafe mode and maxFlips. This ensures that in case of a route monitor failure on both nodes at least one node remains active without active/standby status constantly switching.

**Example:**

```
set HA node -failsafe ON
set HA node -maxFlips 3 -maxFlipTime 1200
```

5. Finally, enable HA sync to occur over the dedicated intra-NetScaler ports rather than the OAM network.

**Example:**

```
add vlan 4080 -aliasName syncVlan
set HA node -syncvlan 4080
```

> **Note**

> The VLAN 4080 in the commands in the above example shouldn’t be taken literally. Any unused VLAN-ID might be reserved.

## VLAN Configuration

After the physical interfaces have been appropriately configured, you might configure the appropriate Gi-LAN VLANS. For instance, consider a rather simple Gi-LAN environment with an ingress/egress VLAN pair with 100/101 VLAN-identifier respectively.

The following commands configure the relevant VLANS on top of the LACP channel created in the prior step.

```
add vlan 100
add vlan 101
```
bind vlan 100 –ifnum LA/1 –tagged
bind vlan 101 –ifnum LA/1 –tagged

---

## IPv4 Configuration

Typically, a NetScaler appliance requires one SNIP per VLAN. The example below assumes that the networks outlined in the Gi-LAN integration diagram, given in the beginning of this page, have a /24 subnet mask:

```
add ns ip 192.168.1.254 255.255.255.0 –vserver DISABLED –mgmtAccess DISABLED
add ns ip 192.168.2.254 255.255.255.0 –vserver DISABLED –mgmtAccess DISABLED
```

After the SNIPs have been configured they should be associated with the appropriate VLAN:

```
bind vlan 100 –IPAddress 192.168.1.254 255.255.255.0
bind vlan 101 –IPAddress 192.168.2.254 255.255.255.0
```

---

## IPv4 Static Routing

The example outlined in the [Management Network](/en-us/netscaler/11-1/netscaler-support-for-telecom-service-providers/NS_TCP_optimization/NS_TCP_opt_mgmt_network.html) section calls for only a couple of static routing rules:

```
add route 0.0.0.0 0.0.0.0 192.168.2.1
add route 10.0.0.0 255.0.0.0 192.168.1.1
```

---

## IPv4 Policy-Based (VLAN – VLAN) routing

A NetScaler appliance allows for policy-based routing instead of static routing, with routing decisions usually keyed against the incoming interface and/or VLAN rather than destination IP. Policy-based routing is either a convenient alternative, in case the client source IP address range is subject to periodic changes, or a mandatory consideration, in case a packet’s destination IP address is not sufficient by itself to reach a routing decision (i.e. in case of overlapping client IP addresses across multiple VLANs).
**Example:**

```
add ns pbr fromWirelessToInternet ALLOW –nextHop 192.168.2.1 –vlan 100 –priority 10
Done
add ns pbr fromInternetToWireless ALLOW –nextHop 192.168.1.1 –vlan 200 –priority 20
Done
apply ns pbrs
```

---

## IPv6 Configuration

The following commands assign IPv6 SNIP per vlan. The example below assumes that the networks outlined in the Figure: A simple depiction of a Gi-LAN in *this* page have a /64 subnet mask:

```
add ns ip6 fd00:192:168:1::254/64 -vServer DISABLED –mgmtAccess DISABLED
add ns ip6 fd00:192:168:2::254/64 -vServer DISABLED –mgmtAccess DISABLED
bind vlan 100 -IPAddress fd00:192:168:1::254/64
bind vlan 200 -IPAddress fd00:192:168:2::254/64
```

---

## IPv6 Routing

After IPv6 addressing is complete, IPv6 static routing might be configured:

```
- A *fd00:10::/64* static route to the clients via the ingress router
- A default route to the internet via the egress router
```

**Example:**

```
add route6 fd00:10::/64 fd00:192:168:1::1
add route6 ::/0 fd00:192:168:2::1
```

Or using policy-based routing:

```
add ns pbr6 fromWirelessToInternetv6 ALLOW -vlan 100 -priority 10 -nextHop fd00:192:168:2::1
add ns pbr6 fromInternetToWirelessv6 ALLOW -vlan 200 -priority 20 -nextHop fd00:192:168:1::1
apply ns pbr6
```
## LACP Redundancy and Failover

In case of an HA configuration, it’s recommended to leverage the throughput option to configure a low threshold for the LACP channel. For instance, consider a 25Gbps Gi-LAN and a 4x10GbE channel between each NetScaler appliance in the HA pair and the upstream switch to provide N+1 link redundancy:

**Example:**

```
set interface LA/1 –haMonitor ON –throughput 29000
```

In case of a double-link failure between the primary appliance and the upstream switch the maximum Gi-LAN throughput that can be supported would fall to 20Gbps. A 29Gbps low threshold per the example above would result in a redundancy switchover event to the secondary appliance (which has not suffered similar link failures) so that Gi-LAN traffic is not affected.

### Route Monitors

In addition to LACP redundancy, route monitor checks might be configured and associated with the HA pair configuration. Route monitor checks can be useful to detect failures between the NetScaler appliance and the next-hop routers, especially if said routers are not directly connected but through an upstream switch.

A typical HA route monitor configuration per the sample Gi-LAN in section 2.5.1 is outlined below:

```
add route 192.168.1.0 255.255.255.0 192.168.1.1 -msr ENABLED -monitor arp
add route 192.168.2.0 255.255.255.0 192.168.2.1 -msr ENABLED -monitor arp
bind HA node -routeMonitor 192.168.1.0 255.255.255.0
bind HA node -routeMonitor 192.168.2.0 255.255.255.0
```

---

**TCP Optimization Configuration**

January 6, 2019

Before configuring TCP optimization, apply the following basic configuration settings on the NetScaler
NetScaler 11.1

appliance:

**Initial configuration:**

1. enable ns feature LB IPv6PT
2. enable ns mode FR L3 USIP MBF Edge USNIP PMTUD
3. disable ns feature SP
4. disable ns mode TCPB
5. set lb parameter -preferDirectRoute NO
6. set lb parameter -vServerSpecificMac ENABLED
7. set l4param -l2ConnMethod Vlan
8. set rsskeytype -rsstype SYMMETRIC
9. set ns param -useproxyport DISABLED

**Note**

Restart the NetScaler appliance if you change the rsskeytype system parameter.

**TCP Termination**

For NetScaler T1 to apply TCP optimization it needs to first terminate incoming TCP traffic. Towards this end, a wildcard TCP vserver should be created and configured to intercept ingress traffic and then forward it to the Internet router.

**Static/Dynamic Routing Environment**

For environments with static or dynamic routing in place, vserver can rely on routing table info to forward packets towards internet router. Default route must point to the internet router and also routing entries for client subnets towards wireless router should be in place:

**Example:**

1. add lb vserver vsrv-wireless TCP * * -persistenceType NONE -Listenpolicy "CLIENT.VLAN.ID.EQ(100) && SYS.VSERVER("vsrv-wireless "):STATE.EQ(UP)" -m IP -cltTimeout 9000
2. add route 0.0.0.0 0.0.0.0 192.168.2.1
3. add route 10.0.0.0 255.0.0.0 192.168.1.1

**VLAN-to-VLAN (PBR) Environment**

There are customer environments where subscriber traffic is segmented to multiple flows and needs to be forwarded to different routers based on incoming traffic parameters. Policy Based Routing (PBR)
NetScaler 11.1

can be used to route packets based on incoming packet parameters, such as VLAN, MAC address, Interface, source IP, source port, destination IP address, and destination port.

**Example:**

```
1 add lb vserver vsrv-wireless TCP ** -m IP -l2Conn ON -listenpolicy "CLIENT.VLAN.ID.EQ(100) || CLIENT.VLAN.ID.EQ(101) || CLIENT.VLAN.ID.EQ(102)"
2
3 add ns pbr pbr-vlan100-to-vlan200 ALLOW -vlan 100 -nexthop 172.16.200.1
4
5 add ns pbr pbr-vlan101-to-vlan201 ALLOW -vlan 101 -nexthop 172.16.201.1
6
7 add ns pbr pbr-vlan102-to-vlan202 ALLOW -vlan 102 -nexthop 172.16.202.1
```

Using Policy Based Routing to route TCP optimized traffic is a new feature added in release 11.1 50.10. For previous releases, having multiple “mode MAC” vserver entities per VLAN is an alternative solution for multi-VLAN environments. Each vserver has a bound service representing the internet router for the particular flow.

**Example:**

```
1 add server internet_router_1 172.16.200.1
2
3 add server internet_router_2 172.16.201.1
4
5 add server internet_router_3 172.16.202.1
6
7 add service svc-internet-1 internet_router_1 TCP * -usip YES -useproxyport NO
8
9 add service svc-internet-2 internet_router_2 TCP * -usip YES -useproxyport NO
10
11 add service svc-internet-3 internet_router_3 TCP * -usip YES -useproxyport NO
12
13 bind service svc-internet-1 -monitorName arp
14
15 bind service svc-internet-2 -monitorName arp
16
17 bind service svc-internet-3 -monitorName arp
18
19 add lb vserver vsrv-wireless-1 TCP ** -Listenpolicy "CLIENT.VLAN.ID.EQ(100) && SYS.VSERVER("vsrv-wireless-1").STATE.EQ(UP)" -m MAC -l2Conn ON
```
add lb vserver vsrv-wireless-2 TCP * * -Listenpolicy "CLIENT.VLAN.ID.EQ (101) & & SYS.VSERVER("vsrv-wireless-2").STATE.EQ(UP)" -m MAC - l2Conn ON

add lb vserver vsrv-wireless-3 TCP * * -Listenpolicy "CLIENT.VLAN.ID.EQ (102) & & SYS.VSERVER("vsrv-wireless-3").STATE.EQ(UP)" -m MAC - l2Conn ON

bind lb vserver vsrv-wireless-1 svc-internet-1
bind lb vserver vsrv-wireless-2 svc-internet-2
bind lb vserver vsrv-wireless-3 svc-internet-3

Note
The vserver mode is MAC in contrast to previous examples where it is mode IP. This is required to retain the destination IP information when we have service(s) bound to vserver. Also, the additional PBR configuration need to route non-optimized traffic.

TCP Optimization

Out-of-the-box NetScaler TCP termination is configured for TCP pass-through functionality. TCP pass-through essentially means that NetScaler T1 may transparently intercept a client-server TCP stream but does not retain separate client/server buffers or otherwise apply any optimization techniques.

To enable TCP optimization a TCP profile, named as nstcpprofile, is used to specify TCP configurations that is used if no TCP configurations are provided at the service or virtual server level and it should be modified as follows:

Command:

```
add ns tcpProfile nstcpprofile -WS ENABLED -SACK ENABLED -WSVal 8 -mss 1460 -maxBurst 30 -initialCwnd 16 -oooQSize 15000 -minRTO 800 -bufferSize 4000000 -flavor BIC -dynamicReceiveBuffering ENABLED -KA ENABLED -sendBufferSize 4000000 -rstWindowAttenuate ENABLED -spoofSynDrop ENABLED -ecn ENABLED -frto ENABLED -maxcwnd 1000000 -fack ENABLED -rstMaxAck enabled -tcpmode ENDPOINT
```

Note
If there is not any profile explicitly created and bound to vserver and service, the profile nstcp_default_profile is bound by default.
In case of multiple TCP profiles requirement, extra TCP profiles can be created and associated with the appropriate virtual server.

**Command:**

```
1 add ns tcpProfile custom_profile -WS ENABLED -SACK ENABLED -WSVal 8 -mss 1460 -maxBurst 30 -initialCwnd 16 -oooQSize 15000 -minRTO 800 -BufferSize 4000000 -flavor BIC -dynamicReceiveBuffering ENABLED -KA ENABLED -sendBufferSize 4000000 -rstWindowAttenuate ENABLED -spoofSynDrop ENABLED -ecn ENABLED -frto ENABLED -maxcwnd 1000000 -fack ENABLED -rstMaxAck enabled -tcpmode ENDPOINT
2
3 set lb vserver vsrv-wireless -tcpProfileName custom_profile
```

**Note**

For deployments with vserver -m MAC and service, same profile should be associated with service.

```
1 set service svc-internet -tcpProfileName custom_profile
```

**TCP Optimization Capabilities**

Most of the relevant TCP optimization capabilities of a NetScaler appliance are exposed through a corresponding TCP profile. Typical CLI parameters that should be considered when creating a TCP profile are the following:

1. **Window Scaling (WS):** TCP Window scaling allows increasing the TCP receive window size beyond 65535 bytes. It helps improving TCP performance overall and specially in high bandwidth and long delay networks. It helps with reducing latency and improving response time over TCP.

2. **Selective acknowledgment (SACK):** TCP SACK addresses the problem of multiple packet loss which reduces the overall throughput capacity. With selective acknowledgement the receiver can inform the sender about all the segments which are received successfully, enabling sender to only retransmit the segments which were lost. This technique helps T1 improve overall throughput and reduce the connection latency.

3. **Window Scaling Factor (WSVal):** Factor used to calculate the new window size. It must be configured with a high value in order to allow the advertised window by NS to be at least equal to the buffer size.

4. **Maximum Segment Size (MSS):** MSS of a single TCP segment. This value depends on the MTU setting on intermediate routers and end clients. A value of 1460 corresponds to an MTU of 1500.

5. **maxBurst:** Maximum number of TCP segments allowed in a burst.

6. **Initial Congestion Window size (initialCwnd):** TCP initial congestion window size determines the number of bytes which can be outstanding in beginning of the transaction. It enables T1 to
send those many bytes without bothering for congestion on the wire.

7. **Maximum OOO packet queue size**(ooqQSize): TCP maintains Out Of Order queue to keep the OOO packets in the TCP communication. This setting impacts system memory if the queue size is long as the packets need to be kept in runtime memory. Thus this needs to be kept at optimized level based on the kind of network and application characteristics.

8. **Minimum RTO**(minRTO): The TCP retransmission timeout is calculated on each received ACK based on internal implementation logic. The default retransmission timeout happens at 1 second to start with and this can be tweaked with this setting. For second retransmission of these packets RTO will be calculated by \( N \times 2 \) and then \( N \times 4 \) ... \( N \times 8 \) ... goes on till last retransmission attempt.

9. **bufferSize** / **sendBuffsize**: these refer to the maximum amount of data that the T1 may receive from the server and buffer internally without sending to the client. They should be set to a value larger (at least double) than the Bandwidth Delay Product of the underlying transmission channel.

10. **flavor**: this refers to the TCP congestion control algorithm. Valid values are Default, BIC, CUBIC, Westwood and Nile.

11. **Dynamic receive buffering**: allows the receive buffer to be adjusted dynamically based on memory and network conditions. It will fill up the buffer as much as it's required to keep the client's download pipe full instead of filling up, by reading ahead from server, a fixed size buffer, as latter is specified in TCP profile and typically based on criteria such as \( 2 \times BDP \), for a connection. NetScaler T1 monitors the network conditions to the client and estimates how much it should read ahead from the server.

12. **Keep-Alive (KA)**: Send periodic TCP keep-alive (KA) probes to check if peer is still up.

13. **rstWindowAttenuate**: Defending TCP against spoofing attacks. It will reply with corrective ACK when a sequence number is invalid.

14. **rstMaxAck**: Enable or disable acceptance of RST that is out of window yet echoes highest ACK sequence number.

15. **spoofSynDrop**: Drop of invalid SYN packets to protect against spoofing.

16. **Explicit Congestion Notification**(ecn): It sends notification of the network congestion status to the sender of the data and takes corrective measures for data congestion or data corruption.

17. **Forward RTO-Recovery**: In case of spurious retransmissions, the congestion control configurations are reverted to their original state.

18. **TCP maximum congestion window**(maxcwnd): TCP maximum congestion window size that is user configurable.

19. **Forward acknowledgment** (FACK): To avoid TCP congestion by explicitly measuring the total number of data bytes outstanding in the network, and helping the sender (either T1 or a client) control the amount of data injected into the network during retransmission timeouts.

20. **tcpmode**: TCP optimization modes for specific profile.

For the above parameters please consult [1] for guidance on picking the appropriate values. For the
remaining ones, the values outlined in TCP Optimization should apply to most cases.

Analytics and Reporting

December 18, 2018

The TCP Speed Reporting is a NetScaler feature which extracts TCP connection statistics, as a measure of TCP download and upload performance, and is utilized in TCP Insight reports of the Citrix Application Delivery Management (ADM). To achieve this, NetScaler monitors each TCP connection, locates packet bursts on an idle time-out basis and reports key metrics (such as byte count, retransmitted byte count and duration) for the identified maximum burst. TCP Speed Reporting feature is enabled by default, support both TCP and HTTP vServers and depends on the Appflow/ULFD reporting infrastructure.

Real-time Statistics

December 18, 2018

The stat command might be used to verify that TCP optimization is properly applied:

Command:

```
> stat lb vserver vsrv-wireless
Virtual Server Summary
actSvcs vsvrIP port Protocol State Health
vsrv...eless * 0 TCP UP 100

inactSvcs
vsrv...eless 0

Virtual Server Statistics
Rate (/s)
Total
Vserver hits 0
Requests 0
Responses 0

The Total counters should constantly increase for an operational system. In addition, the Rate counters should be non-zero.

**Note**
The preceding output is from an operational yet idle lab system, explaining the zero rate.

---

**SNMP**

December 18, 2018

SNMP agent can be queried for system specific information from a remote device (SNMP Manager). Based on the query, the agent searches for the equal object identifier (OID) in the management information base (MIB) for the data requested and sends the information to the SNMP Manager. The following are the most useful SNMP OIDs for Telco deployments:

**Memory**

- **resMemUsage** (1.3.6.1.4.1.5951.4.1.1.41.2)
  
  Percentage of memory utilization on NetScaler.

**Packet Engine CPU**

- **resCpuUsage** (1.3.6.1.4.1.5951.4.1.1.41.1)
  
  CPU utilization percentage.

- **nsCPUTable** (1.3.6.1.4.1.5951.4.1.1.41.6)
  
  This table contains information about each CPU in NetScaler.

  Indexed on: nsCPUname

  - **nsCPUname** (1.3.6.1.4.1.5951.4.1.1.41.6.1.1)
    
    The name of the CPU.

- **nsCPUusage** (1.3.6.1.4.1.5951.4.1.1.41.6.1.2)
  
  CPU utilization percentage.
Throughput

- allNicTotRxMbits (1.3.6.1.4.1.5951.4.1.1.71.1)
  Number of megabits received by the NetScaler appliance.
- allNicTotTxMbits (1.3.6.1.4.1.5951.4.1.1.71.2)
  Number of megabits transmitted by the NetScaler appliance.
- ipTotRxPkts (1.3.6.1.4.1.5951.4.1.1.43.25)
  IP packets received.
- ipTotRxMbits (1.3.6.1.4.1.5951.4.1.1.43.27)
  Megabits of IP data received.
- ipTotTxPkts (1.3.6.1.4.1.5951.4.1.1.43.28)
  IP packets transmitted.
- ipTotTxMbits (1.3.6.1.4.1.5951.4.1.1.43.30)
  Megabits of IP data transmitted.

Connections

Active connections:
- tcpActiveServerConn (1.3.6.1.4.1.5951.4.1.1.46.8)
  Connections to a server currently responding to requests.

Total connections:
- tcpCurServerConn (1.3.6.1.4.1.5951.4.1.1.46.1)
  Server connections, including connections in the Opening, Established, and Closing state.
- tcpCurClientConn (1.3.6.1.4.1.5951.4.1.1.46.2)
  Client connections, including connections in the Opening, Established, and Closing state.

Note: Because of SYN-Cookie, this doesn’t include Client in Opening state
- tcpTotZombieCltConnFlushed (1.3.6.1.4.1.5951.4.1.1.46.26)
  Client connections that are flushed because the client has been idle for some time.
- tcpTotZombieSvrConnFlushed (1.3.6.1.4.1.5951.4.1.1.46.27)
  Server connections that are flushed because there have been no client requests in the queue for some time.
Errors

- tcpErrSynGiveUp (1.3.6.1.4.1.5951.4.1.1.46.37)
  Attempts to establish a connection on the NetScaler that timed out.

- tcpErrRetransmitGiveUp (1.3.6.1.4.1.5951.4.1.1.46.60)
  Number of times NetScaler terminates a connection after retransmitting the packet seven times on
  that connection. Retransmission happens when receiving end doesn’t acknowledges the packet.

- ifInDiscards (1.3.6.1.2.1.2.2.1.13)
  The number of inbound packets which were chosen to be discarded even though no errors had been
detected to prevent their being deliverable to a higher-layer protocol. One possible reason for discarding
such a packet could be to free up buffer space.

- ifOutDiscards (1.3.6.1.2.1.2.2.1.19)
  The number of outbound packets which were chosen to be discarded even though no errors had been
detected to prevent their being transmitted. One possible reason for discarding such a packet could be
to free up buffer space.

- ifErrTxOverflow (1.3.6.1.4.1.5951.4.1.1.54.1.36)
  Number of packets that have passed through the overflow queues, during transmission on the speci-
  fied interface, since the NetScaler appliance was started or the interface statistics were cleared. This
  gets incremented only on congested ports.

Optimized/Bypass connections

- tcpOptimizationEnabled (1.3.6.1.4.1.5951.4.1.1.46.131)
  Total number of connections enabled with TCP optimization.

- tcpOptimizationBypassed (1.3.6.1.4.1.5951.4.1.1.46.132)
  Total number of connections bypassed TCP Optimization.

Technical Recipes

December 18, 2018

The NetScaler T1 models provide advanced features and a powerful policy configuration language that
allow for evaluation of complex decision in runtime.
While it is not possible to evaluate all capabilities that are potentially unlocked by the T1000 features and policy configuration guide, technical receipes consider implementation of various requirements brought in by Telco operators. Feel free to re-use the “recipes” as is or adapt to your environment.

Per-user Connection Limit

The NetScaler T1 model can be configured to limit the number of connections per unique subscriber IP. With the below configuration, N concurrent TCP connections per IP (CLIENT.IP.SRC) is allowed. For every attempt for connection beyond the configured threshold, T1 sends an RST. For maximum 2 concurrent connections per user:

**Command:**

```bash
1 add stream selector streamSel_usrlimit CLIENT.IP.SRC
2 add ns limitIdentifier limitId_usrlimit -threshold 2 -mode CONNECTION -selectorName streamSel_usrlimit
3 add responder policy respPol_usrlimit "SYS.CHECK_LIMIT(" limitId_usrlimit")" RESET
4 bind lb vserver vsrv-wireless -policyName respPol_usrlimit -priority 1 -gotoPriorityExpression END
```

Smooth Insertion/Deletion of Vserver

Many operators concern about TCP connections disruption when the NetScaler T1 model is activated inline for TCP optimization or when it is disabled for maintenance purposes. To avoid breaking existing connections when vserver is introduced, the following configuration needs to be applied before configuring or activating vserver for TCP optimization:

**Command:**

```bash
1 add ns acl acl-ingress ALLOW -vlan 100
2 add forwardingSession fwd-ingress -aclname acl-ingress
3 apply ns acls
```

Forwarding sessions are effective on top of routing (either static or dynamic or PBR) and create session entries for traffic that is routed (L3 mode). Any existing connection is handled by forwarding session due to corresponding sessions, and upon vserver introduction it starts capturing only new TCP connections.

ACLs can be configured to capture only specific ports like vserver, in order to avoid creating sessions for unnecessary traffic, which is memory consuming. Another option is to remove specific configuration after vserver activation.
For maintenance purposes, vserver should be disabled and its state appears as OUT OF SERVICE. When this happens, the vserver terminates all connections immediately by default. To make vserver to still serve the existing connections and not accept new, the following configuration should be applied:

**Command:**

```
set lb vserver vsrv-wireless -downStateFlush DISABLED
```

New connections go through the routing table, and corresponding session entries are created due to forwarding sessions.

**Policy-Based TCP Profiling**

Policy-based TCP Profile selection allows operators to configure TCP profile dynamically for clients coming from different traffic domains (i.e. 3G or 4G). Some of the QoS metrics are different for these traffic domains, and in order to achieve better performance, you need to change some of the TCP parameter dynamically. Consider a case where clients coming from 3G and 4G hit same vserver and use same TCP profile, which have negative impact on some client's performance. AppQoE functionality can classify these clients and dynamically change TCP profile on vserv.

**Example:**

```
1 enable feature AppQoE
2
3 add ns tcpProfile nstcpprofile1 -WS ENABLED -SACK ENABLED -WSVal 8 -mss 1460 -maxBurst 30 -initialCwnd 16 -oooQSize 15000 -minRTO 800 -slowStartIncr 1 -bufferSize 4000000 -flavor BIC -KA ENABLED -sendBufSize 4000000 -rstWindowAttenuate ENABLED -spoofSynDrop ENABLED -frto ENABLED -maxcwnd 1000000 -fack ENABLED -tcpmode ENDPOINT
4
5 add ns tcpProfile nstcpprofile2 -WS ENABLED -SACK ENABLED -WSVal 8 -mss 1460 -maxBurst 15 -initialCwnd 16 -oooQSize 15000 -minRTO 800 -slowStartIncr 1 -bufferSize 128000 -flavor BIC -KA ENABLED -sendBufSize 6000000 -rstWindowAttenuate ENABLED -spoofSynDrop ENABLED -frto ENABLED -maxcwnd 64000 -fack ENABLED -tcpmode ENDPOINT
6
7 add appqoe action action_1 -priority HIGH -tcpprofile nstcpprofile1
8
9 add appqoe action action_2 -priority HIGH -tcpprofile nstcpprofile2
10
11 add appqoe policy appqoe_4G -rule "CLIENT.VLAN.ID.EQ(100)" -action action_1
```
The NetScaler T1 model is capable to receive the subscriber information dynamically through Gx or Radius or Radius and Gx interface and apply different TCP profile on a per-subscriber basis.

**Command:**

```
12  add appqoe policy appqoe_3G -rule "CLIENT.VLAN.ID.EQ(200)" -action action_2
15  bind lb vserver vsrv-wireless -policyName appqoe_4G -priority 100
17  bind lb vserver vsrv-wireless -policyName appqoe_3G -priority 110
```

For integration of the NetScaler T1 model with operator control-plane network, see Telco Subscriber Management.

**Scalability**

January 6, 2019

Because TCP optimization is resource intensive, a single NetScaler appliance, even a high end appliance, might not be able to sustain high Gi-LAN throughputs. To expand the capacity of your network, you can deploy NetScaler appliances in an N+1 cluster formation. In a cluster deployment, the NetScaler appliances work together as a single system image. The client traffic is distributed across the cluster nodes with the help of external switch device.

**Topology**

Figure 1 is an example of a cluster consisting of four T1300-40G nodes.

The setup shown in Figure 1 has the following properties:
1. All cluster nodes belong to the same network (also known as an L2 cluster).
2. Data plane and backplane traffic are handled by different switches.
3. Assuming Gi-LAN throughput is 200 Gbps and that a T1300-40G appliance can sustain 80Gbps of throughput, we need three T1300-40G appliances. To provide redundancy in case of single cluster node failure, we deploy four appliances in total.
4. Each node will receive up to 67Gbps of traffic (50Gbps in normal operating conditions and 67Gbps in case of single cluster node failure), so it needs 2x40Gbps connections to the upstream switch. To provide redundancy in case of switch failure, we deploy a couple of upstream switches and double the number of connections.
5. Cluster Link Aggregation (CLAG) is used to distribute traffic across cluster nodes. A single CLAG handles both client and server traffic. Link Redundancy is enabled on the CLAG, so only one “subchannel” is selected at any given time and handles the traffic. If some link fails or throughput falls below specified threshold, the other subchannel is selected.
6. The upstream switch performs symmetric port-channel load balancing (for example, source-dest-ip-only algorithm of Cisco IOS 7.0(8) N1(1)) so that forward and reverse traffic flows are handled by the same cluster node. This property is desirable because it eliminates packet re-ordering, which would degrade TCP performance.
7. Fifty percent of data traffic is expected to be steered to backplane, which means each node will steer up to 34Gbps to other cluster nodes (25Gbps in normal operating conditions and 34Gbps in case of single cluster node failure). Thus, each node needs at least 4x10G connections to the backplane switch. To provide redundancy in case of switch failure, we deploy a couple of backplane switches and double the number of connections. Link redundancy is not currently supported for backplane, so Cisco VPC or equivalent technology is desired to achieve switch-level redundancy.
8. MTU size of steered packets is 1578 bytes, so backplane switches must support an MTU more than 1500 bytes.

**Note:** The design depicted in Figure 1 is also applicable to T1120 and T1310 appliances. For T1310 we would use 40GbE interfaces for the backplane connections, since it lacks 10GbE ports.

**Note:** While this document uses Cisco VPC as an example, if working with non-Cisco switches alternate equivalent solutions could be used, such as Juniper’s MLAG.

**Note:** While other topologies such as ECMP instead of CLAG are possible, they are not currently supported for this particular use case.

### Configuring TCP Optimization in a NetScaler T1000 Cluster

After physical installation, physical connectivity, software installation, and licensing are completed, you can proceed with the actual cluster configuration. The configurations described below apply to the cluster depicted in Figure 1.
Assume that the four T1300 nodes in Figure 1 have the following NSIP addresses:

**Four T1300 nodes with NSIP address:**

1. T1300-40-1: 10.102.29.60
2. T1300-40-2: 10.102.29.70
3. T1300-40-3: 10.102.29.80
4. T1300-40-4: 10.102.29.90

The cluster will be managed through the cluster IP (CLIP) address, which is assumed to be 10.78.16.61.

### Setting Up the Cluster

To begin configuring the cluster shown in Figure 1, log on to the first appliance that you want to add to the cluster (for example, T1300-40-1) and do the following.

1. At the command prompt, enter the following commands:

   **Command:**
   
   ```
   1 > add cluster instance 1
   2 > add cluster node 0 10.102.29.60 -state ACTIVE
   3 > add ns ip 10.102.29.61 255.255.255.255 -type clip
   4 > enable cluster instance 1
   5 > save ns config
   6 > reboot - warm
   ```

2. After the appliance restarts, connect to the Cluster IP (CLIP) address and add the rest of the nodes to the cluster:

   **Command:**
   
   ```
   1 > add cluster node 1 10.102.29.70 -state ACTIVE
   2 > add cluster node 2 10.102.29.80 -state ACTIVE
   3 > add cluster node 3 10.102.29.90 -state ACTIVE
   4 > save ns config
   ```

3. Connect to the NSIP address of each of the newly added nodes and join the cluster:

   **Command:**
   
   ```
   1 > join cluster -clip 10.102.29.61 -password nsroot
   2 > save ns config
   3 > reboot - warm
   ```
4. After the nodes restart, proceed with backplane configuration. On the cluster IP address, enter the following commands to create an LACP channel for the backplane link of each cluster node:

**Command:**

```
1 > set interface 0/10/[1-8] -lacpkey 1 -lacpmode ACTIVE
2 > set interface 1/10/[1-8] -lacpkey 2 -lacpmode ACTIVE
3 > set interface 2/10/[1-8] -lacpkey 3 -lacpmode ACTIVE
4 > set interface 3/10/[1-8] -lacpkey 4 -lacpmode ACTIVE
```

5. Similarly, configure dynamic LA and VPC on the backplane switches. Make sure the MTU of the backplane switch interfaces is at least 1578 bytes.

6. Verify the channels are operational:

**Command:**

```
1 > show channel 0/LA/1
2 > show channel 1/LA/2
3 > show channel 2/LA/3
4 > show channel 3/LA/4
```

7. Configure the cluster node backplane interfaces.

**Command:**

```
1 > set cluster node 0 -backplane 0/LA/1
2 > set cluster node 1 -backplane 1/LA/2
3 > set cluster node 2 -backplane 2/LA/3
4 > set cluster node 3 -backplane 3/LA/4
```

8. Check the cluster status and verify that the cluster is operational:

```
1 > show cluster instance
2 > show cluster node
```

For more information on cluster setup, see “Setting up a NetScaler cluster”

**Distributing Traffic Across Cluster Nodes**

After you have formed the NetScaler cluster, deploy Cluster Link Aggregation (CLAG) to distribute traffic across cluster nodes. A single CLAG link will handle both client and server traffic.

On the cluster IP address, execute the following commands to create the Cluster Link Aggregation (CLAG) group shown in Figure 1:

**Command:**

```
1 > set cluster node 0 -backplane 0/LA/1
2 > set cluster node 1 -backplane 1/LA/2
3 > set cluster node 2 -backplane 2/LA/3
4 > set cluster node 3 -backplane 3/LA/4
```
Configure dynamic link aggregation on the external switches.

Then, enable Link Redundancy as follows:

**Code:**

```
1 > set channel CLA/1 -linkRedundancy ON -lrMinThroughput 240000
```

Finally, check the channel status by entering:

**Command:**

```
1 > show channel CLA/1
```

The channel should be UP and the actual throughput should be 320000.

For more information about cluster link aggregation, see the following topics:

- Dynamic Cluster Link Aggregation
- Link Redundancy in a Cluster with LACP

Because we will be using MAC-based forwarding (MBF), configure a linkset and bind it to the CLAG group as follows:

**Command:**

```
1 > add linkset LS/1
2 > bind linkset LS/1 -ifnum CLA/1
```

More information about linksets, see the following topics:

- Configuring Linksets
- Using Cluster LA Channel with Linksets

### Configuring VLAN and IP Addresses

We will be using striped IP configuration, which means that IP addresses are active on all nodes (default setting). See “Striped, Partially Striped, and Spotted Configurations” for more information about this topic.

1. Add the ingress and egress SNIPs:
**NetScaler 11.1**

**Command:**

```
1 > add ns ip 172.16.30.254 255.255.255.0 - type SNIP
2 > add ns ip 172.16.31.254 255.255.255.0 - type SNIP
3 > add ns ip6 fd00:172:16:30::254/112 - type SNIP
4 > add ns ip6 fd00:172:16:31::254/112 - type SNIP
```

2. Add the corresponding ingress and egress VLANs:

**Command:**

```
1 > add vlan 30 -aliasName wireless
2 > add vlan 31 -aliasName internet
```

3. Bind VLANs with IPs and linkset:

**Command:**

```
1 > bind vlan 31 -ifnum LS/1 -tagged
2 > bind vlan 30 -ifnum LS/1 -tagged
3 > bind vlan 30 -IPAddress 172.16.30.254 255.255.255.0
4 > bind vlan 31 -IPAddress 172.16.31.254 255.255.255.0
5 > bind vlan 30 -IPAddress fd00:172:16:30::254/112
6 > bind vlan 31 -IPAddress fd00:172:16:31::254/112
```

More ingress and egress VLANs can be added if needed.

**Configuring TCP Optimization**

At this point, we have applied all cluster specific commands. To complete the configuration, follow the steps described in *TCP optimization configuration*. 

**Configuring Dynamic Routing**

A NetScaler cluster can be integrated into the dynamic routing environment of the customer’s network. Following is an example of dynamic routing configuration using BGP routing protocol (OSPF is also supported).

1. From the CLIP address, enable BGP and dynamic routing on ingress and egress IP addresses:

**Command:**

```
1 > enable ns feature bgp
2 > set ns ip 172.16.30.254 -dynamicRouting ENABLED
3 > set ns ip 172.16.31.254 -dynamicRouting ENABLED
```
2. Open vtysh and configure BGP for the egress side:

**Code:**

```bash
1 > shell
2 root@ns# vtysh
3 ns# configure terminal
4 ns(config)# router bgp 65531
5 ns(config-router)# network 10.0.0.0/24
6 ns(config-router)# neighbor 172.16.31.100 remote-as 65530
7 ns(config-router)# neighbor 172.16.31.100 update-source 172.16.31.254
8 ns(config-router)# exit
9 ns(config)# ns route-install propagate
10 ns(config)# ns route-install default
11 ns(config)# ns route-install bgp
12 ns(config)# exit
```

3. Configure the egress-side BGP peer to advertise the default route to the NetScaler cluster. For example:

**Command:**

```bash
1 router bgp 65530
2 bgp router-id 172.16.31.100
3 network 0.0.0.0/0
4 neighbor 172.16.31.254 remote-as 65531
```

4. Follow similar steps to configure the ingress side.

5. From vtysh verify that configuration is propagated to all cluster nodes, by entering:

**Command:**

```bash
1 ns# show running-config
```

6. Finally, log on to NSIP address of each cluster node and verify routes advertised from BGP peer:

**Command:**

```bash
1 > show route | grep BGP
```

---

**Optimizing TCP Performance using TCP Nile**

December 18, 2018
TCP uses the following optimization techniques and congestion control strategies (or algorithms) to avoid network congestion in data transmission.

**Congestion Control Strategies**

The Transmission Control Protocol (TCP) has long been used to establish and manage Internet connections, handle transmission errors, and smoothly connect web applications with client devices. But network traffic has become more difficult to control, because packet loss does not depend only on the congestion in the network, and congestion does not necessarily cause packet loss. Therefore, to measure congestion, a TCP algorithm should focus on both packet loss and bandwidth.

**NILE Algorithm**

Citrix Systems has developed a new congestion-control algorithm, NILE, a TCP optimization algorithm designed for high-speed networks such as LTE, LTE advanced and 3G. Nile addresses unique challenges caused by fading, random or congestive losses, link layer retransmissions and carrier aggregation.

The NILE algorithm:

- Bases queue-latency estimates on round-trip time measurements.
- Uses a congestion-window-increase function that is inversely proportional to the measured queue latency. This method results in approaching the network congestion point more slowly than does the standard TCP method, and reduces the packet losses during congestion.
- Can distinguish between random loss and congestion based loss on the network by using the estimated queue latency.

The telecom service providers can use the NILE algorithm in their TCP infrastructure to:

- Optimize mobile and long-distance networks— The NILE algorithm achieves higher throughput compared to standard TCP. This feature is especially important for mobile and long-distance networks.
- Decrease application perceived latency and enhance subscriber experience— The Nile algorithm uses packet loss information to determine whether the transmission-window size should be increased or decreased, and uses queuing delay information to determine the size of the increment or decrement. This dynamic setting of transmission-window size decreases the application latency on the network.

**To configure NILE support using the command line interface**

At the command prompt, type the following:
Configuring NILE support using the configuration utility

1. Navigate to System> Profiles> TCP Profiles and click TCP profiles.
2. From the TCP Flavor drop-down list, select NILE.

Example:

```bash
set ns tcpProfile <name> [-flavor NILE]
```

Proportional Rate Recovery (PRR) Algorithm

TCP Fast Recovery mechanisms reduce web latency caused by packet losses. The new Proportional Rate Recovery (PRR) algorithm is a fast recovery algorithm that evaluates TCP data during a loss recovery. It is patterned after Rate-Halving, by using the fraction that is appropriate for the target window chosen by the congestion control algorithm. It minimizes window adjustment, and the actual window size at the end of recovery is close to the Slow-Start threshold (ssthresh).

TCP Fast Open (TFO)

TCP Fast Open (TFO) is a TCP mechanism that enables speedy and safe data exchange between a client and a server during TCP’s initial handshake. This feature is available as a TCP option in the TCP profile bound to a virtual server of a NetScaler appliance. TFO uses a TCP Fast Open Cookie (a security cookie) that the NetScaler appliance generates to validate and authenticate the client initiating a TFO connection to the virtual server. By using the TFO mechanism, you can reduce an application’s network latency by the time required for one full round trip, which significantly reduces the delay experienced in short TCP transfers.

How TFO works

When a client tries to establish a TFO connection, it includes a TCP Fast Open Cookie with the initial SYN segment to authenticate itself. If authentication is successful, the virtual server on the NetScaler appliance can include data in the SYN-ACK segment even though it has not received the final ACK segment of the three-way handshake. This saves up to one full round-trip compared to a normal TCP connection, which requires a three-way handshake before any data can be exchanged.

A client and a backend server perform the following steps to establish a TFO connection and exchange data securely during the initial TCP handshake.
1. If the client does not have a TCP Fast Open Cookie to authenticate itself, it sends a Fast Open Cookie request in the SYN packet to the virtual server on the NetScaler appliance.
2. If the TFO option is enabled in the TCP profile bound to the virtual server, the appliance generates a cookie (by encrypting the client’s IP address under a secret key) and responds to the client with a SYN-ACK that includes the generated Fast Open Cookie in a TCP option field.
3. The client caches the cookie for future TFO connections to the same virtual server on the appliance.
4. When the client tries to establish a TFO connection to the same virtual server, it sends SYN that includes the cached Fast Open Cookie (as a TCP option) along with HTTP data.
5. The NetScaler appliance validates the cookie, and if the authentication is successful, the server accepts the data in the SYN packet and acknowledges the event with a SYN-ACK, TFO Cookie, and HTTP Response.

**Note:** If the client authentication fails, the server drops the data and acknowledges the event only with a SYN indicating a session timeout.

1. On the server side, if the TFO option is enabled in a TCP profile bound to a service, the NetScaler appliance determines whether the TCP Fast Open Cookie is present in the service to which it is trying to connect.
2. If the TCP Fast Open Cookie is not present, the appliance sends a cookie request in the SYN packet.
3. When the backend server sends the Cookie, the appliance stores the cookie in the server information cache.
4. If the appliance already has a cookie for the given destination IP pair, it replaces the old cookie with the new one.
5. If the cookie is available in the server information cache when the virtual server tries to reconnect to the same backend server by using the same SNIP address, the appliance combines the data in SYN packet with the cookie and sends it to the backend server.
6. The backend server acknowledges the event with both data and a SYN.

**Note:** If the server acknowledges the event with only a SYN segment, the NetScaler appliance immediately resends the data packet after removing the SYN segment and the TCP options from the original packet.

**Configuring TCP Fast Open**

To use the TCP Fast Open (TFO) feature, enable the TCP Fast Open option in the relevant TCP profile and set the TFO Cookie Timeout parameter to a value that suits the security requirement for that profile.

**To enable or disable TFO by using the command line**
At the command prompt, type one of the following commands to enable or disable TFO in a new or existing profile.

**Note:** The default value is DISABLED.

<table>
<thead>
<tr>
<th></th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>`add tcpprofile &lt;TCP Profile Name&gt; - tcpFastOpen ENABLED</td>
</tr>
<tr>
<td>2</td>
<td>`set tcpprofile &lt;TCP Profile Name&gt; - tcpFastOpen ENABLED</td>
</tr>
<tr>
<td>3</td>
<td><code>unset tcpprofile &lt;TCP Profile Name&gt; - tcpFastOpen</code></td>
</tr>
</tbody>
</table>

**Examples:**

- `add tcpprofile Profile1 – tcpFastOpen`  
- `set tcpprofile Profile1 – tcpFastOpen Enabled`  
- `unset tcpprofile Profile1 – tcpFastOpen`

**To set TCP Fast Open cookie timeout value by using the command line interface**

At the command prompt, type:

```
set tcpparam -tcpfastOpenCookieTimeout <Timeout Value>
```

**Example:**

```
set tcpprofile -tcpfastOpenCookieTimeout 30 secs
```

**To configure the TCP Fast Open by using the GUI**

1. Navigate to Configuration > System > Profiles > and then click Edit to modify a TCP profile.  
2. On the Configure TCP Profile page, select the TCP Fast Open checkbox.  
3. Click OK and then Done.

**To Configure the TCP Fast Cookie timeout value by using the GUI**

Navigate to Configuration > System > Settings > Change TCP Parameters and then Configure TCP Parameters page to set the TCP Fast Open Cookie timeout value.

**TCP Hystart**

A new TCP profile parameter, hystart, enables the Hystart algorithm, which is a slow-start algorithm that dynamically determines a safe point at which to terminate (ssthresh). It enables a transition to congestion avoidance without heavy packet losses. This new parameter is disabled by default.
If congestion is detected, Hystart enters a congestion avoidance phase. Enabling it gives you better throughput in high-speed networks with high packet loss. This algorithm helps maintain close to maximum bandwidth while processing transactions. It can therefore improve throughput.

**Configuring TCP Hystart**

To use the Hystart feature, enable the Cubic Hystart option in the relevant TCP profile.

**To configure Hystart by using the command line interface (CLI)**

At the command prompt, type one of the following commands to enable or disable Hystart in a new or existing TCP profile.

1. `add tcpprofile <profileName> -hystart ENABLED`
2. `set tcpprofile <profileName> -hystart ENABLED`
3. `unset tcpprofile <profileName> -hystart`

**Examples:**

1. `add tcpprofile Profile1 - tcpFastOpen`
2. `set tcpprofile Profile1 - tcpFastOpen Enabled`
3. `unset tcpprofile Profile1 - tcpFastOpen`

**To configure Hystart support by using the GUI**

1. Navigate to **Configuration** > **System** > **Profiles** and click **Edit** to modify a TCP profile.
2. On the **Configure TCP Profile** page, select the **Cubic Hystart** check box.
3. Click **OK** and then **Done**.

**Optimization Techniques**

TCP uses the following optimization techniques and methods for optimized flow controls.

**Policy based TCP Profile Selection**

Network traffic today is more diverse and bandwidth-intensive than ever before. With the increased traffic, the effect that Quality of Service (QoS) has on TCP performance is significant. To enhance QoS, you can now configure AppQoE policies with different TCP profiles for different classes of network traffic. The AppQoE policy classifies a virtual server’s traffic to associate a TCP profile optimized for a particular type of traffic, such as 3G, 4G, LAN, or WAN.
To use this feature, create a policy action for each TCP profile, associate an action with AppQoE policies, and bind the policies to the load balancing virtual servers.

**Configuring Policy Based TCP Profile Selection**

Configuring policy based TCP profile selection consists of the following tasks:

- **Enabling AppQoE.** Before configuring the TCP profile feature, you must enable the AppQoE feature.
- **Adding AppQoE Action.** After enabling the AppQoE feature, configure an AppQoE action with a TCP profile.
- **Configuring AppQoE based TCP Profile Selection.** To implement TCP profile selection for different classes of traffic, you must configure AppQoE policies with which your NetScaler appliance can distinguish the connections and bind the correct AppQoE action to each policy.
- **Binding AppQoE Policy to Virtual Server.** Once you have configured the AppQoE policies, you must bind them to one or more load balancing, content switching, or cache redirection virtual servers.

**Configuring using the command line interface**

To enable AppQoE by using the command line interface:

At the command prompt, type the following commands to enable the feature and verify that it is enabled:

```
1 enable ns feature appqoe
2 show ns feature
```

To bind a TCP profile while creating an AppQoE action using the command line interface

At the command prompt, type the following AppQoE action command with tcpprofiletobind option.

**Binding a TCP Profile:**

```
1 add appqoe action <name> [-priority <priority>] [-respondWith ( ACS | NS ) [CustomFile]] [-altContentSvcName <string>] [-altContentPath <string>] [-maxConn <positive_integer>] [-delay <usecs>] [-polqDepth <positive_integer>] [-priqDepth <positive_integer>] [-dosTrigExpression <expression>] [-dosAction ( SimpleResponse | HICResponse )] [-tcpprofiletobind <string>]
2 show appqoe action
```
NetScaler 11.1

To configure an AppQoE policy by using the command line interface

At the command prompt, type:

```
1 add appqoe policy <name> -rule <expression> -action <string>
```

To bind an AppQoE policy to load balancing, cache redirection or content switching virtual servers by using the command line interface

At the command prompt, type:

```
1 bind cs vserver cs1 -policyName <appqoe_policy_name> -priority <priority>
2 bind lb vserver <name> - policyName <appqoe_policy_name> -priority <priority>
3 bind cr vserver <name> -policyName <appqoe_policy_name> -priority <priority>
```

Example:

```
1 add ns tcpProfile tcp1 -WS ENABLED -SACK ENABLED -WSVal 8 -nagle ENABLED -maxBurst 30 -initialCwnd 16 -oooQSize 15000 -minRTO 500 -slowStartIncr 1 -bufferSize 4194304 -flavor BIC -KA ENABLED -sendBuffsize 4194304 -rstWindowAttenuate ENABLED -spoofSynDrop ENABLED -dsack enabled -frto ENABLED -maxcwnd 4000000 -fack ENABLED -tcpmode ENDPOINT
2
3 add appqoe action appact1 -priority HIGH -tcpprofile tcp1
4
5 add appqoe policy apppoll -rule "client.ip.src.eq(10.102.71.31)" -action appact1
6
7 bind lb vserver lb2 -policyName apppoll -priority 1 -gotoPriorityExpression END -type REQUEST
8
9 bind cs vserver cs1 -policyName apppoll -priority 1 -gotoPriorityExpression END -type REQUEST
```

Configuring Policy based TCP Profiling using the GUI

To enable AppQoE by using the GUI

1. Navigate to **System> Settings.**
2. In the details pane, click **Configure Advanced Features**.
3. In the **Configure Advanced Features** dialog box, select the **AppQoE** check box.
4. Click **OK**.

**To configure AppQoE policy by using the GUI**

1. Navigate to **App-Expert > AppQoE > Actions**.
2. In the details pane, do one of the following:
3. To create a new action, click **Add**.
4. To modify an existing action, select the action, and then click **Edit**.
5. In the **Create AppQoE Action** or the **Configure AppQoE Action** screen, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in “Parameters for configuring the AppQoE Action” as follows (asterisk indicates a required parameter):
   a) **Name**—name
   b) **Action type**—respondWith
   c) **Priority**—priority
   d) **Policy Queue Depth**—polqDepth
   e) **Queue Depth**—priqDepth
   f) **DOS Action**—dosAction
6. Click **Create**.

**To bind AppQoE policy by using the GUI**

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**, select a server and then click **Edit**.
2. In the **Policies** section and click (+) to bind an AppQoE policy.
3. In the **Policies** slider, do the following:
   a) Select a policy type as AppQoE from the drop-down list.
   b) Select a traffic type from the drop-down list.
4. In the **Policy Binding** section, do the following:
   a) Click **New** to create a new AppQoE policy.
   b) Click **Existing Policy** to select an AppQoE policy from the drop-down list.
5. Set the binding priority and click **Bind** to the policy to the virtual server.
6. Click **Done**.
SACK Block Generation

TCP performance slows down when multiple packets are lost in one window of data. In such a scenario, a Selective Acknowledgement (SACK) mechanism combined with a selective repeat retransmission policy overcomes this limitation. For every incoming out-of-order packet, you must generate a SACK block.

If the out-of-order packet fits in the reassembly queue block, insert packet info in the block, and set the complete block info as SACK-0. If an out-of-order packet does not fit into reassembly block, send the packet as SACK-0 and repeat the earlier SACK blocks. If an out-of-order packet is a duplicate and packet info is set as SACK-0 then D-SACK the block.

Note: A packet is considered as D-SACK if it is an acknowledged packet, or an out of order packet which is already received.

Client Reneging

A NetScaler appliance can handle client reneging during SACK based recovery.

Memory checks for marking end_point on PCB is not considering total available memory

In a NetScaler appliance, if the memory usage threshold is set to 75 percent instead of using the total available memory, it causes new TCP connections to bypass TCP optimization.

Unnecessary retransmissions due to missing SACK blocks

In a non-endpoint mode, when you send DUPACKS, if SACK blocks are missing for few out of order packets, triggers additional retransmissions from the server.

SNMP for number of connections bypassed optimization because of overload

The following SNMP ids have been added to a NetScaler appliance to track number of connections bypassed TCP optimization due to overload.

1. 1.3.6.1.4.1.5951.4.1.1.46.13 (tcpOptimizationEnabled). To track the total number of connections enabled with TCP optimization.
2. 1.3.6.1.4.1.5951.4.1.1.46.132 (tcpOptimizationBypassed). To track the total number of connections bypassed TCP Optimization.
**Dynamic Receive Buffer**

To maximize TCP performance, a NetScaler appliance can now dynamically adjust the TCP receive buffer size.

**Troubleshooting Guidelines**

January 6, 2019

**Technical Support**

All troubleshooting and escalation queries require a recent NetScaler techsupport bundle, which captures current configuration, firmware version installed, log files, outstanding cores, and others.

**Example:**

```
1  show techsupport
2  showtechsupport data collector tool - $Revision: #5 $!
3  ...
4  All the data will be collected under
5      /var/tmp/support/collector_P_192.168.121.117_18Jun2015_09_53
6  ...
7  Archiving all the data into ”/var/tmp/support/collector_P_192
   .168.121.117_18Jun2015_09_53.tar.gz” ....
8  Created a symbolic link for the archive with /var/tmp/support/support.
   tgz
9      /var/tmp/support/support.tgz ---- points to ---
10     /var/tmp/support/collector_P_192.168.121.117_18Jun2015_09_53.tar.gz
11
12  After a techsupport bundle has been generated, it might be copied using
    SCP.
```

**Traces**

NetScaler TCP optimization issues normally require NetScaler traces to troubleshoot properly. Note that one should try to capture traces under similar conditions, i.e. on the same cell, during the same time of day, using the same user equipment and application, and others.

The start nstrace and stop nstrace commands might be used to capture traces:
• It's strongly recommended that the appropriate filter is used to avoid capturing extraneous, unnecessary packets on the trace. For instance use start nstrace -filter ‘IP == 10.20.30.40’ to only capture packets being sent to or received from IP address 10.20.30.40, which is the user equipment IP address.

• Do not use the -tcpdump option, since it strips the nstrace headers which are required for debugging.

Trace Analysis

After a NetScaler trace has been captured, it might be viewed with Wireshark 1.12 or later. Verify that the captured traces include the appropriate NetScaler Packet Trace headers, as shown in the screen capture below:

The additional debug headers are also visible per the illustration below:

Connection Table

When the issue is related to TCP optimization and it can be reproduced or it's on-going, it is best to get also the connection table when the issue occurs from the primary T1 node.

To get the table you shall need to switch to the BSD shell and run the following command:

```
1 shell
2 ...
3 nscli -U 127.0.0.1:nsroot:nsroot show connectiontable -detail full link > /var/tmp/contable.log
```

Note

The command might be executed for a longer time and management CPU might be stressed at that time (depends on the number of connection table entries), but it’s not service affecting.

Frequently Asked Questions

December 18, 2018

Timeouts
The following is a list of different idle connection timeouts that can be set on NetScaler T1 virtual servers and services. Idle timeout set for client or server connections at the vserver or service level are applicable only for the connections in TCP ESTABLISHED state and are idle.

- Load Balancing virtual server cltTimeout parameter specifies the time in seconds that a connection from a client to a Load Balancing virtual server must be idle, before the appliance closes the connection.
- Service svrTimeout parameter specifies the time in seconds that a connection from the appliance to a service or server must be idle, before the appliance closes the connection.
- Service cltTimeout parameter specifies the time in seconds that a connection from a client to a service must be idle, before the appliance closes the connection.

When a service is bound to a Load Balancing virtual server, then the cltTimeout for the Load Balancing virtual server takes precedence, and the service cltTimeout for service is ignored.

In case of there is not service bound to Load Balancing virtual server, global idle timeout, namely tcpServer, is used for server side connections. It can be configured as follows:

**Command:**

```
1 set ns timeout -tcpServer 9000
```

Connections in other state have different timeout values:

- Half open connections idle timeout: 120 seconds (hardcoded value)
- TIME_WAIT connections idle timeout: 40 seconds (hardcoded value)
- Half close connections idle timeout. By default it is 10s and can be configured between 1s and 600s using the snippet

**Command:**

```
1 set ns timeout -halfclose 10
```

When half-close timeout is triggered, connection is moved to zombie state. When zombie timeout expires, zombie cleanup kicks in and T1 sends RST on both client and server side for given connection by default.

- Zombie timeout: Interval at which the zombie cleanup process must run to clean up inactive TCP connections. Default timeout value is 120s and can be configured between 1s and 600s.

**Command:**

```
1 set ns timeout -zombie 120
```
Maximum Segment Size Table

A NetScaler T1 appliance defends against SYN flood attacks by using SYN cookies instead of maintaining half-open connections on the system memory stack. The appliance sends a cookie to each client that requests a TCP connection, but it does not maintain the states of half-open connections. Instead, the appliance allocates system memory for a connection only upon receiving the final ACK packet, or, for HTTP traffic, upon receiving an HTTP request. This prevents SYN attacks and allows normal TCP communications with legitimate clients to continue uninterrupted. Specific function is enabled by default without option to disable.

However, there is caveat as standard SYN cookies limit connections to the use of only eight Maximum Segment Size (MSS) values. If connection MMS does not match with any predefined value, it will pick up the next available lower value towards both client and server side.

The predefined TCP Maximum Segment Size (MSS) values are the following and can be configured through a new nsapimgr knob.

<table>
<thead>
<tr>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>1460</td>
</tr>
<tr>
<td>1440</td>
</tr>
<tr>
<td>1330</td>
</tr>
<tr>
<td>1220</td>
</tr>
<tr>
<td>956</td>
</tr>
<tr>
<td>536</td>
</tr>
<tr>
<td>384</td>
</tr>
<tr>
<td>128</td>
</tr>
</tbody>
</table>

The new MSS table:

- Need not contain Jumbo-Frame support. Even though by default 8 values are reserved in the MSS table for jumbo frames, the table settings can be modified to include standard Ethernet-sized frames only.
- Should have 16 values
- Should have values in descending order
- Should include 128 as the last value

If the new MSS table is valid, the table is stored and the old values are switched out at the SYN-cookie rotation time. Otherwise the new table returns an error. Changes are applied to new connections while existing connections preserve the old MSS table until the connections expire or are terminated.

To display the current MSS table in a NetScaler appliance, type the following command.

Command:

```
1 >shell
2
3 #nsapimgr -d mss_table
```

Example:
To change the mss table, type the following command:

**Command:**

```bash
>shell

# nsapimgr -s mss_table=<16 comma separated values>
```

**Example:**

```bash
# nsapimgr -ys mss_table
    =9176,9156,8192,7168,6144,4196,3072,2048,1460,1440,1330,1212,956,536,384,128

# nsapimgr -d mss_table

MSS table

{ 9176,9156,8192,7168,6144,4196,3072,2048,1460,1440,1330,1212,956,536,384,128 }

Done.
```

An example using standard Ethernet-sized values is depicted below:

**Example:**

```bash
# nsapimgr -ys mss_table
    =1460,1440,1420,1400,1380,1360,1340,1320,1300,1280,1260,1212,956,536,384,128

# nsapimgr -d mss_table
```
To make this change permanent even after the NetScaler appliance restarts, include the command 
“#nsapimgr -ys mss_table=<16 comma seperated values>” in the “/nsconfig/rc.netscaler” file. If the “rc.netscaler” file doesn’t exist, create it under the “/nsconfig” folder, and then append the command.

**Memory Overload Protection**

A NetScaler Packet Processing Engine (PPE) starts bypassing connections from TCP optimization if the memory in use by that one PPE is more than a specified high watermark value. If a PPE memory utilization goes above ~2.6GB, then it starts bypassing *any new* connections from optimization. The existing connections (ones admitted for optimization previously) continues getting optimization. This watermark value has been purposefully selected and is not recommended for tuning.

**Note**

If you believe that there is a good reason to change that watermark value, contact Customer Support.

**Support for Happy Eyeballs Clients**

If the NetScaler appliance receives a SYN for a destination for which the state is unknown, the appliance first checks the reachability of the server and then acknowledges the client. This probing mechanism enables clients with dual IP stacks to discover the reachability of dual-stack internet servers. If the client discovers that both IPv6 and IPv4 access are available, it establishes a connection to the server that responds more quickly, and resets the other. For the connection for the NetScaler appliance receives a reset, it will reset the corresponding server side connection.

**Note:** This feature has no user configurable TCP settings to be disabled/enabled on the NetScaler appliance.

For more information on Happy Eyeballs support, see RFC 6555.
NetScaler Solutions

January 11, 2019

NetScaler solutions simplify the task of setting up frequently deployed configurations.

This section includes the following solutions

- Setting Up NetScaler for XenApp/XenDesktop
- RISE Integration: NetScaler ADC and Cisco Nexus 7000 Series Switch
- Global Server Load Balancing (GSLB) Powered Zone Preference
- NetScaler in a Private Cloud Managed by Microsoft Windows Azure Pack and Cisco ACI

Setting up NetScaler for Citrix Virtual Apps and Desktops

January 14, 2019

A NetScaler appliance can provide load balanced, secure remote access to your Citrix Virtual Apps and Desktops applications. You can use the NetScaler load balancing feature to distribute traffic across the Citrix Virtual Apps and Desktops server, and the Citrix Gateway feature to provide secure remote access to the servers. NetScaler can also accelerate and optimize the traffic flow and offer visibility features that are useful for Citrix Virtual Apps and Desktops deployments.

Figure 1. NetScaler appliance in Citrix Virtual Apps and Desktops setup

The above figure shows the components involved in this deployment:

- **NetScaler Gateway.** Provides the URL for user access, and provides security by authenticating the users.
- **NetScaler load balancing virtual server.** Load balances the traffic for the Web Interface or StoreFront servers. You can also deploy a load balancing virtual server in front of the Citrix Virtual Apps and Desktop servers to load balance key components such as XML Broker and Desktop Delivery Controller (DDC) server.
- **Web Interface or StoreFront or Web Interface on NetScaler.** Provides the interface through which you can access the applications.
  
  Note: Web Interface on NetScaler (WIonNS) is a customization of the Web Interface product, hosted on the NetScaler appliance.
- **Citrix Virtual Apps and Desktops.** Provides the applications that your users want to access.
To set up the NetScaler for Citrix Virtual Apps and Desktops by using the NetScaler GUI

**Prerequisites**

- Citrix Virtual Apps and Desktop servers are configured and available.
- Web Interface, StoreFront, or Web Interface on NetScaler servers are configured and available.
- You have a working knowledge of Citrix Gateway, NetScaler, Citrix Virtual Apps and Desktops, and StoreFront/Web Interface/Web Interface on NetScaler.
- Make sure that you have configured a virtual server and a service and bound the service to the virtual server.

**Procedure:**

1. Log on to the NetScaler appliance and on the **Configuration** tab click **XenApp and XenDesktop**.
2. On the **Details** pane, click **Get Started**. If the setup exists on the NetScaler, click the **Edit** link corresponding to each of the section that you want to modify.
3. Select the product (StoreFront, Web Interface, or Web Interface on NetScaler) that in your deployment provides the interface for access to the Citrix Virtual Apps and Desktops applications.
4. Set up secure remote access.
   a) In the NetScaler Gateway Settings** section, specify the details for the VPN virtual server and click **Continue**.
   b) In the **Server Certificate** section, choose an existing certificate or install a new certificate and click **Continue**.
   c) In the **Authentication** section, configure the primary authentication mechanism to be used and specify the server details or use an existing server and click **Continue**.
   d) In the **StoreFront** section, specify the details of the server that provides the interface for accessing the applications and click **Continue**.
   e) You can use one of the following as your StoreFront server.
      i. LB vserver pointing to multiple SF servers.
      ii. Web Interface or StoreFront server directly reachable from the NetScaler appliance.
      iii. Web Interface on NetScaler.
5. Click **Done** to complete the configuration.

**Global Server Load Balancing (GSLB) Powered Zone Preference**

January 14, 2019

GSLB powered zone preference is a feature that integrates Citrix Virtual Apps and Desktops, StoreFront, and NetScaler to provide clients access to the most optimized data center on the basis of the client location.
In a distributed Citrix Virtual Apps and Desktops deployment, StoreFront might not select an optimal datacenter when multiple equivalent resources are available from multiple datacenters. In such cases, StoreFront randomly selects a datacenter. It can send the request to any of the Citrix Virtual Apps and Desktops servers in any datacenter, regardless of proximity to the client making the request.

With this enhancement, the client IP address is examined when an HTTP request arrives at the Citrix Gateway appliance, and the real client IP address is used to create the datacenter preference list that is forwarded to StoreFront. If the NetScaler appliance is configured to insert the zone preference header, StoreFront 3.5 or later can use the information provided by the appliance to reorder the list of delivery controllers and connect to an optimal delivery controller in the same zone as the client. StoreFront selects the optimal gateway VPN virtual server for the selected datacenter zone, adds this information to the ICA file with appropriate IP addresses, and sends it to the client. StoreFront then tries to launch applications hosted on the preferred datacenter’s delivery controllers before trying to contact equivalent controllers in other datacenters.

For more information about configuring this solution, click here.

For a video overview about GSLB powered zone preference solution, click https://www.youtube.com/watch?v=Y8DELum0Xp0.

NetScaler in a Private Cloud Managed by Microsoft Windows Azure Pack and Cisco ACI

January 14, 2019

You can use a NetScaler appliance for load balancing in a private cloud that is managed through Microsoft Windows Azure Pack. The network for the private cloud is automated by using Cisco ACI and NetScaler.

This solution involves many integration points, such as Windows Azure Pack (WAP) to Cisco APIC, Cisco APIC to System Center Virtual Machine Manager (SCVMM), and Cisco APIC to NetScaler. As a tenant in the private cloud, you can enable NAT, provision network services, and add a load balancer.

WAP supports tenant and administrator portals where an administrator can perform administrative tasks such as ACI registration, VIP range, NetScaler device association with virtual machine cloud, tenant user account creation, and so on. Tenants can log on to the WAP Tenant Portal and configure the network, bridge domains, and Virtual Routing and Forwarding (VRFs), and make use of the NetScaler load balancing and RNAT features.

Important

- In this solution, the NetScaler appliance provides only basic load balancing.
• Tenants can deploy multiple VIP addresses with different ports for the same network, but must ensure that the IP and port combination is unique.
• The NetScaler device package supports only single-context deployment. Each Tenant gets a dedicated NetScaler instance.
• WAP supports NetScaler MPX appliances and NetScaler VPX virtual appliances, including NetScaler VPX instances deployed on the NetScaler SDX platform.

The following illustration provides an overview of the solution:

Prerequisites

Make sure that:

• You have conceptual knowledge of Cisco ACI components and NetScalers.
  – For more information about the NetScalers, see the NetScaler product documentation at http://docs.citrix.com/.
• All the required components of Cisco ACI, including Cisco APIC in the datacenter, are set up and configured. For more information about Cisco ACI and its components, see the product documentation at: http://www.cisco.com/c/en/us/support/cloud-systems-management/application-policy-infrastructure-controller-apic/tsd-products-support-series-home.html.
• You have conceptual knowledge of Microsoft Windows Azure Pack. See the product documentation at: https://www.microsoft.com/en-in/cloud-platform/windows-azure-pack.
• You have installed NetScaler software release 11.1 or later.
• You configure NetScalers in Cisco ACI, so that they can be managed by using Cisco APIC.
• From Cisco APIC, make sure that:
  – Management connectivity of Cisco APIC to NetScaler are established.
  – You upload the NetScaler device package version 11.1-52.3 and register the NetScaler device in Cisco ACI by using Cisco APIC.
  – You configure the NetScaler appliance in Cisco APIC’s common tenant and make sure that there are no faults in Cisco APIC.
  – You have configured all the APIC specific configurations such as, VLAN pool, L3OutServicesDom, L3ExtOut, resource pool, and so on. For more information, see Cisco documentation.
Creating a NetScaler Load Balancer in a Plan in the Service Management Portal (Admin Portal)

January 14, 2019

The Service Management Portal in WAP allows an administrator to register Cisco APIC with WAP and also create a hosting plan. As part of the plan, you can specify the VIP range, associate the NetScaler load balancer with the plan, create tenant user accounts, and so on.

To create a NetScaler Load Balancer in a Plan in the Admin Portal:

2. In the Navigation pane, select PLANS.
3. In the plans pane, select the plan that you want to add a load balancer.
4. In the selected plan’s pane, select Networking (ACI).
5. On the Networking (ACI) pane, in the L4-L7 SERVICE POOL drop-down list, select the L4-L7 resource pool that you had created in Cisco APIC.
6. Create a tenant user account and associate the user with the plan you have created.

Configuring a NetScaler Load Balancer by Using the Service Management Portal (Tenant Portal)

September 6, 2019

In WAP, once the Tenant creates the Bridge Domain (BD), VRF, and a Network, the Tenant can configure NetScaler Load Balancer through the Service Management Portal (Tenant Portal).

To configure NetScaler Load Balancer in Service Management Portal (Tenant Portal):

2. Create a bridge domain and VRF, as follows:
   a. In the navigation pane, select ACI.
   b. Click NEW.
   c. In the NEW pane, select BRIDGE DOMAIN.
   d. In the BRIDGE DOMAIN field, enter the bridge domain name (for example, BD01).
e. (Optional) In the **SUBNET’S GATEWAY** field, enter the subnet’s gateway (for example, 192.168.1.1/24).

f. In the **VRF** field, select a VRF that is already part of the subscription or select **Create One** to create a VRF.

g. Click **CREATE**.

3. Create a network and associate it with the bridge domain that you created. Do the following:

a. In the navigation pane, select **ACI**.

b. Click **NEW**.

c. In the **NEW** pane, select **NETWORK**.

d. In the **NETWORKNAME** field, enter the network name (for example, S01).

e. In the **BRIDGE DOMAIN** drop-down list, select the bridge domain you have created. (for example, BD01).

f. In the subnet’s **GATEWAY** field, enter the subnet’s gateway address (for example, 172.23.2.1/24).

g. (Optional) In the **DNSSERVERIP/IPS** field, enter the DNS server details.

h. Click **CREATE**.

4. In the **ACI** pane, select **NETWORKS**.

5. Double-click the network that you have created. Then, in the network pane, select **Enable load balancer (public)**. In the **IP ADDRESS** field, a VIP is automatically assigned from the VIP Range that the administrator configured in the Admin Portal. For more information, see [Creating a NetScaler Load Balancer to a Plan in Service Management Portal (Admin Portal)](#).

6. Double-click the network that you have created. Then, in the network pane, select **Enable load balancer (public)**. In the **IP ADDRESS** field, a VIP is automatically assigned from the VIP Range that the administrator configured in the Admin Portal. For more information, see [Creating a NetScaler Load Balancer to a Plan in Service Management Portal (Admin Portal)](#)

6. In the network pane, select the **Load Balancers** tab, and click **ADD**.

7. In the **ADD NETWORK LOAD BALANCER** pane, do the following:

a. In the **NAME** field, enter the name for the load balancer.

b. Optionally, in the **VIRTUAL IP ADDRESS** field, assign the load balancer a VIP address from the VIP range that you defined earlier.

c. Optionally, in the **PROTOCOL** field, select **TCP**.

d. In the **PORT** field, enter the port number.

8. Click **CREATE**.
The NetScaler Load Balancer is displayed in the **LOAD BALANCERS** tab and the NetScaler Load Balancer is data path ready.

**Deleting a NetScaler Load Balancer from the Network**

January 14, 2019

Using Service Management Portal (Tenant Portal), from the Network, you can delete the NetScaler load balancer that you created.

**To delete a NetScaler load balancer from the Network:**

2. In the navigation pane, select **ACI**.
3. In the **ACI** pane, on the **NETWORKS** tab, click the network that you created.
4. In the selected network’s pane, select the NetScaler load balancer and click **DELETE**.
5. Click **OK** to delete the NetScaler load balancer.

**Deploying Citrix NetScaler VPX**

March 7, 2019

The NetScaler VPX product is a virtual appliance that can be hosted on a wide variety of hypervisors and cloud platforms.

For more information, see the [VPX datas sheet](#).

For more information about provisioning a Citrix ADC VPX instance on an SDX appliance, see [Provisioning Citrix ADC instances](#).

**Support matrix and usage guidelines**

July 10, 2019

This document lists the different hypervisors and features supported on a NetScaler VPX instance, and their usage guidelines and limitations.

- Table 1-6 list the different supported hypervisors.
- Table 7 lists the different VPX features and limitations for the different hypervisors supported on a NetScaler VPX instance.
- Table 8 lists the supported web browsers that allow you access the GUI and Dashboard.

<table>
<thead>
<tr>
<th>Table 1. VPX instance on XenServer</th>
</tr>
</thead>
<tbody>
<tr>
<td>XenServer version</td>
</tr>
<tr>
<td>6.2, 6.5</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Table 7. VPX feature matrix

*Clustering support is available on SRIOV for client- and server-facing interfaces and not for the backplane.

**Interface DOWN events are not recorded in NetScaler VPX instances.

For Static LA, traffic might still be sent on the interface whose physical status is DOWN.

For LACP, peer device knows interface DOWN event based on LACP timeout mechanism.

Short timeout: 3 seconds

Long timeout: 90 seconds

For LACP, interfaces must not be shared across VMs.

For Dynamic routing, convergence time depends on the Routing Protocol since link events are not detected.

Monitored static Route functionality fails if monitors are not bound to static routes since Route state depends on the VLAN status. The VLAN status depends on the link status.

Partial failure detection does not happen in high availability if there is link failure. High availability-split brain condition might happen if there is link failure.
When any link event (disable/enable, reset) is generated from a VPX instance, the physical status of the link does not change. For static LA, any traffic initiated by the peer gets dropped on the instance. For LACP, peer device knows interface DOWN event based on LACP timeout mechanism.

Short timeout: 3 seconds

Long timeout: 90 seconds

For LACP, interfaces should not be shared across VMs.

- For the VLAN tagging feature to work, do the following:

On the VMware ESX, set the port group’s VLAN ID to 1 - 4095 on the vSwitch of VMware ESX server. For more information about setting a VLAN ID on the vSwitch of VMware ESX server, see pdf.

### Table 8. Supported browsers

</tr>
<tr>
<td>MAC</td>
<td>Mozilla Firefox - 12 and above; Safari - 5.1.3; Google Chrome - 15 and above</td>
</tr>
</tbody>
</table>

### Usage guidelines

Follow these usage guidelines:

- See the VMware ESXi CPU Considerations section in the document Performance Best Practices for VMware vSphere 6.5. Here’s an extract:

  It is not recommended that virtual machines with high CPU/Memory demand sit on a Host/Cluster that is overcommitted.
  In most environments ESXi allows significant levels of CPU overcommitment (that is, running more vCPUs on a host than the total number of physical processor cores in that host) without impacting virtual machine performance.
  If an ESXi host becomes CPU saturated (that is, the virtual machines and other loads on the host demand
all the CPU resources the host has), latency-sensitive workloads might not perform well. In this case you might want to reduce the CPU load, for example by powering off some virtual machines or migrating them to a different host (or allowing DRS to migrate them automatically).

- The Citrix ADC VPX is a latency-sensitive, high-performance virtual appliance. To deliver its expected performance, the appliance requires vCPU reservation, memory reservation, vCPU pinning on the host. Also, hyper threading must be disabled on the host. If the host does not meet these requirements, issues such as high-availability failover, CPU spike within the VPX instance, sluggishness in accessing the VPX CLI, pitboss daemon crash, packet drops, and low throughput occur.

- A hypervisor is considered over-provisioned if one of the following two conditions is met:
  - The total number of virtual cores (vCPU) provisioned on the host is greater than the total number of physical cores (pCPUs).
  - The total number of provisioned VMs consume more vCPUs than the total number of pCPUs.

  At times, if an instance is over-provisioned, the hypervisor might not be able to guarantee the resources reserved (such as CPU, memory, and others) for the instance due to hypervisor scheduling overheads or bugs or limitations with the hypervisor. This can cause lack of CPU resource for Citrix ADC and might lead to issues mentioned in the first point under Usage guidelines. As administrators, you’re recommended to reduce the tenancy on the host so that the total number of vCPUs provisioned on the host is lesser or equal to the total number of pCPUs.

  Example
  For ESX hypervisor, if the `%RDY%` parameter of a VPX vCPU is greater than 0 in the `esxtop` command output, the ESX host is said to be having scheduling overheads, which can cause latency related issues for the VPX instance.

  In such a situation, reduce the tenancy on the host so that `%RDY%` returns to 0 always. Alternatively, contact the hypervisor vendor to triage the reason for not honoring the resource reservation done.

Install a NetScaler VPX instance on XenServer

May 3, 2019

To install VPX instances on Citrix XenServer, you must first install XenServer on a machine with adequate system resources. To perform the NetScaler VPX instance installation, you use Citrix XenCenter,
which must be installed on a remote machine that can connect to the XenServer host through the network.

For more information about XenServer, see XenServer documentation.

The following figure shows the bare-metal solution architecture of NetScaler VPX instance on XenServer.

**Figure.** A NetScaler VPX instance on XenServer

### Prerequisites for installing a NetScaler VPX instance on XenServer

Before you begin installing a virtual appliance, do the following:

- Install XenServer version 6.0 or later on hardware that meets the minimum requirements.
- Install XenCenter on a management workstation that meets the minimum system requirements.
- Obtain virtual appliance license files. For more information about virtual appliance licenses, see the NetScaler VPX Licensing Guide at [http://support.citrix.com/article/ctx122426](http://support.citrix.com/article/ctx122426).

### XenServer hardware requirements

The following table describes the minimum hardware requirements for a XenServer platform running a NetScaler VPX instance.

**Table 1.** Minimum system requirements for XenServer running a nCore VPX instance

<table>
<thead>
<tr>
<th>Component</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>CPU</td>
<td>2 or more 64-bit x86 CPUs with virtualization assist (Intel-VT) enabled. Note: To run NetScaler VPX instance, hardware support for virtualization must be enabled on the XenServer host. Make sure that the BIOS option for virtualization support is not disabled. Consult your BIOS documentation for more details.</td>
</tr>
<tr>
<td>RAM</td>
<td>3 GB</td>
</tr>
<tr>
<td>Disk space</td>
<td>Locally attached storage (PATA, SATA, SCSI) with 40 GB of disk space. Note: XenServer installation creates a 4 GB partition for the XenServer host control domain; the remaining space is available for NetScaler VPX instance and other virtual machines.</td>
</tr>
</tbody>
</table>
NetScaler 11.1

Component Requirement
NIC One 1-Gbps NIC; recommended: two 1-Gbps NICs

For information about installing XenServer, see the XenServer documentation at http://support.citrix.com/product/xens/.

The following table lists the virtual computing resources that XenServer must provide for each nCore VPX virtual appliance.

Table 2. Minimum virtual computing resources required for running a ncore VPX instance

<table>
<thead>
<tr>
<th>Component</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Memory</td>
<td>2 GB</td>
</tr>
<tr>
<td>Virtual CPU (VCPU)</td>
<td>2</td>
</tr>
<tr>
<td>Virtual network interfaces</td>
<td>2</td>
</tr>
</tbody>
</table>

Note: For production use of NetScaler VPX instance, Citrix recommends that CPU priority (in virtual machine properties) be set to the highest level, in order to improve scheduling behavior and network latency.

**XenCenter system requirements**

XenCenter is a Windows client application. It cannot run on the same machine as the XenServer host. For more information about minimum system requirements and installing XenCenter, see the following XenServer documents:

- System requirements
- Install

**Install NetScaler VPX instances on XenServer by using XenCenter**

After you have installed and configured XenServer and XenCenter, you can use XenCenter to install virtual appliances on XenServer. The number of virtual appliances that you can install depends on the amount of memory available on the hardware that is running XenServer.

After you have used XenCenter to install the initial NetScaler VPX instance (.xva image) on XenServer,
To install NetScaler VPX instances on XenServer by using XenCenter, follow these steps:

1. Start XenCenter on your workstation.
2. On the Server menu, click Add.
3. In the Add New Server dialog box, in the Hostname text box, type the IP address or DNS name of the XenServer that you want to connect to.
4. In the User Name and Password text boxes, type the administrator credentials, and then click Connect. The XenServer name appears in the navigation pane with a green circle, which indicates that the XenServer is connected.
5. In the navigation pane, click the name of the XenServer on which you want to install NetScaler VPX instance.
6. On the VM menu, click Import.
7. In the Import dialog box, in Import file name, browse to the location at which you saved the NetScaler VPX instance .xva image file. Make sure that the Exported VM option is selected, and then click Next.
8. Select the XenServer on which you want to install the virtual appliance, and then click Next.
9. Select the local storage repository in which to store the virtual appliance, and then click Import to begin the import process.
10. You can add, modify, or delete virtual network interfaces as required. When finished, click Next.
11. Click Finish to complete the import process.
   
   **Note:** To view the status of the import process, click the Log tab.
12. If you want to install another virtual appliance, repeat steps 5 through 11.

**Configure VPX instances to use single root I/O virtualization (SR-IOV) network interfaces**

December 18, 2018

After you have installed and configured a NetScaler VPX instance on XenServer, you can configure the virtual appliance to use SR-IOV network interfaces.
Limitations

XenServer does not support the following features on SRIOV interfaces:

- L2 mode switching
- Clustering
- Admin partitioning [Shared VLAN mode]
- High Availability [Active - Active mode]
- Jumbo frames
- IPv6 protocol in Cluster environment

Prerequisites

On the XenServer host, ensure that you:

- Add the Intel 82599 Network Interface Card (NIC) to the host.
- Blacklist the ixgbevf driver by adding the following entry to the `/etc/modprobe.d/blacklist.conf` file:
  ```
  blacklist ixgbevf
  ```
- Enable SR-IOV Virtual Functions (VFs) by adding the following entry to the `/etc/modprobe.d/ixgbe` file:
  ```
  options ixgbe max_vfs=<number_of_VFs>
  ```
  where `<number_VFs>` is the number of SR-IOV VFs that you want to create.
- Verify that SR-IOV is enabled in BIOS.

IXGBE driver version 3.22.3 is recommended.

Assign SR-IOV VFs to the VPX instance by using the XenServer host

To assign SR-IOV network interfaces to NetScaler VPX instance, follow these steps:

1. On the XenServer host, use the following command to assign the SR-IOV VFs to the NetScaler VPX instance:
   ```
   xe host-call-plugin plugin=iovirt host-uuid=<Xen host UUID> fn=assign_free_vf args:uuid=<Netcaler VM UUID> args:ethdev=<interface name> args:mac=<mac addr>
   ```

   Where:
   - `<Xen host UUID>` is the UUID of the XenServer host.
   - `<Netcaler VM UUID>` is the UUID of the NetScaler VPX instance.
   - `<interface name>` is the interface for the SR-IOV VFs.
   - `<mac addr>` is the mac address of the SR-IOV VF.
NetScaler 11.1

Note
Specify the mac address that you want use in the args:mac= parameter, if not specified, the iovirt script randomly generates and assigns a mac address. Also, if you want use the SR-IOV VFs in Link Aggregation mode, make sure that you specify the mac address as 00:00:00:00:00:00.

2. Boot the NetScaler VPX instance.

Unassign SR-IOV VFs to the VPX instance by using the XenServer host

If you have assigned an incorrect SR-IOV VFs or if you want modify the assigned SR-IOV VFs, you need to unassign and reassign the SR-IOV VFs to the NetScaler VPX instance.

To unassign SR-IOV network interface assigned to a NetScaler VPX instance, follow these steps:

1. On the XenServer host, use the following command to assign the SR-IOV VFs to the NetScaler VPX instance and reboot the NetScaler VPX instance:

   ```
   xehost-call-plugin plugin=iovirt host-uuid=<Xen_host_UUID> fn=unassign_all args:uuid=<Netscalar_VM_UUID>
   ```

   Where:
   - `<Xen_host_UUID>` - The UUID of the XenServer host.
   - `<Netscalar_VM_UUID>` - The UUID of the NetScaler VPX instance

2. Boot the NetScaler VPX instance.

Configuring VLAN on the SR-IOV Interface

Important
While you are assigning the SR-IOV VFs to the NetScaler VPX instance, make sure that you specify MAC address 00:00:00:00:00:00 for the VFs.

To use the SR-IOV virtual functions in link aggregation mode, you need to disable spoof checking for virtual functions that you have created. On the XenServer host, use the following command to disable spoof checking:

```
ip link set <interface_name> vf <VF_id> spoofchk off
```

Where:
- `<interface_name>` is the interface name.
- `<VF_id>` is the virtual function ID.

After disabling spoof checking for all the Virtual Function that you have created, restart the NetScaler VPX instance and configure link aggregation. For instructions, see Configure link aggregation.
Configure VLAN on the SR-IOV interface

You can configure VLAN on the SR-IOV Virtual Functions, for instructions, see Configuring a VLAN.

Important
Make sure that the XenServer host does not contain VLAN settings for the VF interface.

Install a NetScaler VPX instance on VMware ESX

March 11, 2019

Before installing NetScaler VPX instances on VMware ESX, make sure that VMware ESX Server is installed on a machine with adequate system resources. To install a NetScaler VPX instance on VMware ESXi, you use VMware vSphere client. The client or tool must be installed on a remote machine that can connect to VMware ESX through the network.

Important
You cannot install standard VMware Tools or upgrade the VMware Tools version available on a NetScaler VPX instance. VMware Tools for a NetScaler VPX instance are delivered as part of the NetScaler software release.

Prerequisites

Before you begin installing a virtual appliance, do the following:

- Install VMware ESX on hardware that meets the minimum requirements.
- Install VMware Client on a management workstation that meets the minimum system requirements.
- Download the NetScaler VPX appliance setup files.
- Label the physical network ports of VMware ESX.
- Obtain VPX license files. For more information about NetScaler VPX instance licenses, see the NetScaler VPX Licensing Guide at http://support.citrix.com/article/ctx131110.

VMware ESX hardware requirements

The following table describes the minimum system requirements for VMware ESX servers running NetScaler VPX ncore virtual appliance.

Table 1. Minimum system requirements for a VMware ESX server running a NetScaler VPX instance
2 or more 64-bit x86 CPUs with virtualization assist (Intel-VT) enabled. Note that to run NetScaler VPX instance, hardware support for virtualization must be enabled on the VMware ESX host. Make sure that the BIOS option for virtualization support is not disabled. For more information, see your BIOS documentation.

RAM

<table>
<thead>
<tr>
<th>Component</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAM</td>
<td>3 GB</td>
</tr>
</tbody>
</table>

Disk space

<table>
<thead>
<tr>
<th>Component</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disk space</td>
<td>40 GB of disk space available</td>
</tr>
</tbody>
</table>

Network

<table>
<thead>
<tr>
<th>Component</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Network</td>
<td>One 1-Gbps NIC; Two 1-Gbps NICs recommended (The network interfaces must be Intel E1000.)</td>
</tr>
</tbody>
</table>

For information about installing VMware ESX, see [http://www.vmware.com/](http://www.vmware.com/).

The following table lists the virtual computing resources that the VMware ESX server must provide for each VPX ncore virtual appliance.

**Table 2. Minimum virtual computing resources required for running a NetScaler VPX instance**

<table>
<thead>
<tr>
<th>Component</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Memory</td>
<td>2 GB</td>
</tr>
<tr>
<td>Virtual CPU (VCPU)</td>
<td>2</td>
</tr>
<tr>
<td>Virtual network interfaces</td>
<td>1. Note that with ESX, you can install a maximum of 10 virtual network interfaces if the VPX hardware is upgraded version to 7 or higher.</td>
</tr>
<tr>
<td>Disk space</td>
<td>20 GB</td>
</tr>
</tbody>
</table>

Note that this is in addition to any disk requirements for the hypervisor.

For production use of VPX virtual appliance, the full memory allocation must be reserved. CPU cycles (in MHz) equal to at least the speed of one CPU core of the ESX should also be reserved.
VMware vSphere client system requirements

VMware vSphere is a client application that can run on Windows and Linux operating systems. It cannot run on the same machine as the VMware ESX server. The following table describes the minimum system requirements.

Table 3. Minimum system requirements for VMware vSphere client installation

<table>
<thead>
<tr>
<th>Component</th>
<th>Requirement</th>

</tbody>
</table>

**Downloading the NetScaler VPX setup files**

The NetScaler VPX instance setup package for VMware ESX follows the Open Virtual Machine (OVF) format standard. You can download the files from MyCitrix.com. You need a My Citrix account to log on. If you do not have a My Citrix account, access the home page at [http://www.mycitrix.com](http://www.mycitrix.com), click the New Users link, and follow the instructions to create a new My Citrix account.

Once logged on, navigate the following path from the My Citrix home page:

MyCitrix.com > Downloads > NetScaler > Virtual Appliances.

Copy the following files to a workstation on the same network as the ESX server. Copy all three files into the same folder.

- NSVPX-ESX-<release number>-<build number>-disk1.vmdk (for example, NSVPX-ESX-9.3-39.8-disk1.vmdk)
- NSVPX-ESX-<release number>-<build number>.ovf (for example, NSVPX-ESX-9.3-39.8.ovf)
- NSVPX-ESX-<release number>-<build number>.mf (for example, NSVPX-ESX-9.3-39.8.mf)

**Label the physical network ports of VMware ESX**

Before installing a VPX virtual appliance, label of all the interfaces that you plan to assign to virtual appliances, in a unique format, for example, NS_NIC_1_1, NS_NIC_1_2, and so on. In large deployments, labeling in a unique format helps in quickly identifying the interfaces that are allocated to the VPX virtual appliance among other interfaces used by other virtual machines, such as Windows and Linux. Such labeling is especially important when different types of virtual machines share the same interfaces.

To label the physical network ports of VMware ESX server, follow these steps:

1. Log on to the VMware ESX server by using the vSphere client.
2. On the vSphere client, select the Configuration tab, and then click Networking.
3. At the top-right corner, click Add Networking.
4. In the Add Network Wizard, for **Connection Type**, select **Virtual Machine**, and then click Next.
5. Scroll through the list of vSwitch physical adapters, and choose the physical port that will map to interface 1/1 on the virtual appliances.
6. Enter the label of the interface, for example, **NS_NIC_1_1** as the name of the vSwitch that will be associated with interface 1/1 of the virtual appliances.
7. Click Next to finish the vSwitch creation. Repeat the procedure, beginning with step 2, to add any additional interfaces to be used by your virtual appliances. Label the interfaces sequentially, in the correct format (for example, NS_NIC_1_2).
Install a NetScaler VPX instance on VMware ESX

After you have installed and configured VMware ESX, you can use the VMware vSphere client to install virtual appliances on the VMware ESX server. The number of virtual appliances that you can install depends on the amount of memory available on the hardware that is running VMware ESX.

To install NetScaler VPX instances on VMware ESX by using VMware vSphere Client, follow these steps:

1. Start the VMware vSphere client on your workstation.
2. In the IP address / Name text box, type the IP address of the VMware ESX server that you want to connect to.
3. In the User Name and Password text boxes, type the administrator credentials, and then click Login.
4. On the File menu, click Deploy OVF Template.
5. In the Deploy OVF Template dialog box, in Deploy from file, browse to the location at which you saved the NetScaler VPX instance setup files, select the .ovf file, and click Next.
6. Map the networks shown in the virtual appliance OVF template to the networks that you configured on the ESX host. Click Next to start installing a virtual appliance on VMware ESX. When installation is complete, a pop-up window informs you of the successful installation.
7. You are now ready to start the NetScaler VPX instance. In the navigation pane, select the NetScaler VPX instance that you have just installed and, from the right-click menu, select Power On. Click the Console tab to emulate a console port.
8. If you want to install another virtual appliance, repeat steps 4 through 6.

Note
By default, the NetScaler VPX instance uses E1000 network interfaces.

After the installation, you can use vSphere client or vSphere Web Client to manage virtual appliances on VMware ESX.

Note
For the VLAN tagging feature to work, on the VMware ESX, set the port group’s VLAN ID to 1 - 4095 on the VSwitch of VMware ESX server. For more information about setting a VLAN ID on the VSwitch of VMware ESX server, see http://www.vmware.com/pdf/esx3_vlan_wp.pdf.

Configure a NetScaler VPX instance to use VMXNET3 network interface

January 6, 2019

After you have installed and configured the NetScaler VPX instance on the VMware ESX, you can use the VMware vSphere web client to configure the virtual appliance to use VMXNET3 network interfaces.
To configure NetScaler VPX instances to use VMXNET3 network interfaces by using the VMware vSphere Web Client:

1. In the vSphere Web Client, select Hosts and Clusters.

2. Upgrade the Compatibility setting of the NetScaler VPX instance to ESX, as follows:
   a. Power off the NetScaler VPX instance.
   b. Right-click the NetScaler VPX instance and select Compatibility > Upgrade VM Compatibility.
   c. In the Configure VM Compatibility dialog box, select ESXi 5.5 and later from the Compatible with drop-down list and click OK.

3. Right-click on the NetScaler VPX instance and click Edit Settings.

4. In the `<virtual_appliance> - Edit Settings` dialog box, click the CPU section.

5. In the CPU section, update the following:
   - Number of CPUs
   - Number of Sockets
   - Reservations
   - Limit
   - Shares

Set the values as follows:
   a. In the CPU drop-down list, select the number of CPUs to assign to the virtual appliance.
   b. In the Cores per Socket drop-down list, select the number of sockets.
   c. (Optional) In the CPU Hot Plug field, select or unselect the Enable CPU Hot Add checkbox.
      Note: Citrix recommends accepting the default (disabled).
   d. In the Reservation drop-down list, select the number that is shown as the maximum value.
   e. In the Limit drop-down list, select the number that is shown as the maximum value.
   f. In the Shares drop-down lists, select Custom and the number that is shown as the maximum value.

6. In the Memory section, update the following:
   - Size of RAM
   - Reservations
   - Limit
   - Shares

Set the values as follows:
a. In the RAM drop-down list, select the size of the RAM. It should be number of vCPUs x 2 GB. For example, if the number of vCPUs is 4, the RAM should be 4 x 2 GB = 8 GB.

Note: For an Enterprise or Platinum edition of the NetScaler VPX appliance, make sure that you allocate 4 GB of RAM to each vCPU. For example, if the number of vCPU is 4 then RAM = 4 x 4 GB = 16 GB.

b. In the Reservation drop-down list, enter the value for the memory reservation, and select the Reserve all guest memory (All locked) checkbox. The memory reservation should be the number of vCPUs x 2 GB. For example, if the number of vCPUs is 4, the memory reservation should be 4 x 2 GB = 8 GB.

Note: For an Enterprise or Platinum edition of the NetScaler VPX appliance, make sure that you allocate 4 GB of RAM to each vCPU. For example, if the number of vCPU is 4 then RAM = 4 x 4 GB = 16 GB.

c. In the Limit drop-down list, select the number that is shown as the maximum value.

d. In the Shares drop-down lists, select Custom and the number that is shown as the maximum value.

7. Add a VMXNET3 network interface. From the New device drop-down list, select Network and click Add.

8. In the New Network section, from the drop-down list, select the network interface, and do the following:

a. In the Adapter Type drop-down list, select VMXNET3.

**Important**

The default E1000 network interface and VMXNET3 cannot coexist, make sure that you remove the E1000 network interface and use VMXNET3 (0/1) as the management interface.

9. Click OK.

11. Once the NetScaler VPX instance powers on, you can use the following command to verify the configuration:

```
  1 > show interface summary
```

The output should show all the interfaces that you configured:

```
  1 > show interface summary
  2  Interface   MTU   MAC   Suffix
  3  Interface   MTU   MAC   Suffix
  4  Interface   MTU   MAC   Suffix
```
Configure a NetScaler VPX instance to use SR-IOV network interface

January 6, 2019

After you have installed and configured the NetScaler VPX instance on VMware ESX, you can use the VMware vSphere web client to configure the virtual appliance to use single root I/O virtualization (SR-IOV) network interfaces.

Limitations

A NetScaler VPX configured with SR-IOV network interface has the following limitations:

- The following features are not supported on SR-IOV interfaces using Intel 82599 10G NIC on ESX VPX:
  - L2 mode switching
  - Static Link Aggregation and LACP
  - Clustering
  - Admin partitioning [Shared VLAN mode]
  - High Availability [Active - Active mode]
  - Jumbo frames
  - IPv6
- The following features are not supported for on SR-IOV interface with an Intel 82599 10G NIC on KVM VPX:

NetScaler 11.1

<p>| | | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>1</td>
<td>0/1</td>
<td>VMXNET3</td>
<td>1500</td>
</tr>
<tr>
<td>6</td>
<td>2</td>
<td>1/1</td>
<td>VMXNET3</td>
<td>9000</td>
</tr>
<tr>
<td>7</td>
<td>3</td>
<td>1/2</td>
<td>VMXNET3</td>
<td>9000</td>
</tr>
<tr>
<td>8</td>
<td>4</td>
<td>LO/1</td>
<td>Interface</td>
<td>9000</td>
</tr>
</tbody>
</table>

Note

After you add a VMXNET3 interface and restart the NetScaler VPX appliance, the VMware ESX hypervisor might change the order in which the NIC is presented to the VPX appliance. So, network adapter 1 might not always remain 0/1, resulting in loss of management connectivity to the VPX appliance. To avoid this issue, change the virtual network of the network adapter accordingly.

This is a VMware ESX hypervisor limitation.
Prerequisite

Make sure that you:
- Add the Intel 82599 Network Interface Card (NIC) to the ESX Host. IXGBE driver version 3.7.13.7.14iov is recommended.
- Enable SR-IOV on the host physical adapter, as follows:
  1. In the vSphere Web Client, navigate to the Host.
  2. On the Manage > Networking tab, select Physical adapters. The SR-IOV Status field shows whether a physical adapter supports SR-IOV.
  3. Select the physical adapter, and then click the pencil icon to open the Edit Settings dialog box.
  4. Under SR-IOV, select Enabled from the Status drop-down list.
  5. In the Number of virtual functions field, enter the number of virtual functions that you want to configure for the adapter.
  6. Click OK.
  7. Restart the host.
- Create a Distributed Virtual Switch (DVS) and Portgroups. For instructions, see the VMware Documentation.

Note
Citrix has qualified the SR-IOV configuration on DVS and Portgroups only.

To configure NetScaler VPX instances to use SR-IOV network interface by using VMware vSphere Web Client:

1. In the vSphere Web Client, select Hosts and Clusters.
2. Upgrade the Compatibility setting of the NetScaler VPX instance to ESX 5.5 or later, as follows:
   a. Power off the NetScaler VPX instance.
b. Right-click the NetScaler VPX instance and select Compatibility > Upgrade VM Compatibility.

c. In the Configure VM Compatibility dialog box, select ESXi 5.5 and later from the Compatible with drop-down list and click OK.

3. Right-click on the NetScaler VPX instance and click Edit Settings.

4. In the <virtual_appliance>- Edit Settings dialog box, click the CPU section.

5. In the CPU section, update the following settings:

   - Number of CPUs
   - Number of Sockets
   - Reservations
   - Limit
   - Shares

   Set the values as follows:

   a. In the CPU drop-down list, select the number of CPUs to assign to the virtual appliance.
   b. In the Cores per Socket drop-down list, select the number of sockets.
   c. (Optional) In the CPU Hot Plug field, select or clear the Enable CPU Hot Add check box.

   **Note:** Citrix recommends accepting the default (disabled).

   d. In the Reservation drop-down list, select the number that is shown as the maximum value.
   e. In the Limit drop-down list, select the number that is shown as the maximum value.
   f. In the Shares drop-down lists, select Custom and the number that is shown as the maximum value.

6. In the Memory section, update the following settings:

   - Size of RAM
   - Reservations
   - Limit
   - Shares

   Set the values as follows:

   a. In the RAM drop-down list, select the size of the RAM. It should be number of vCPUs x 2 GB. For example, if the number of vCPU is 4 then RAM = 4 x 2 GB = 8 GB.

   **Note:** For Enterprise or Platinum edition of the NetScaler VPX appliance, make sure that you allocate 4 GB of RAM to each vCPU. For example, if the number of vCPU is 4 then RAM = 4 x 4 GB = 16 GB.
b. In the **Reservation** drop-down list, enter the value for the memory reservation, and select the **Reserve all guest memory (All locked)** check box. The memory reservation should be number of vCPUs x 2 GB. For example, if the number of vCPUs is 4, the memory reservation should be 4 x 2 GB = 8 GB.

**Note:** For Enterprise or Platinum edition of the NetScaler VPX appliance, make sure that you allocate 4 GB of RAM to each vCPU. For example, if the number of vCPU is 4 then RAM = 4 x 4 GB = 16 GB.

c. In the **Limit** drop-down list, select the number that is shown as the maximum value.

d. In the **Shares** drop-down lists, select **Custom**, and select the number that is shown as the maximum value.

7. Add an SR-IOV network interface. From the **New device** drop-down list, select **Network** and click **Add**.

8. In the **New Network** section. From the drop-down list, select the Portgroup that you created, and do the following:

   a. In the **Adapter Type** drop-down list, select **SR-IOV passthrough**.

   b. In the **Physical function** drop-down list, select the physical adapter mapped with the Portgroup.

   c. In the **Guest OS MTU Change** drop-down list, select **Disallow**.

9. In the `<virtual_appliance> - Edit Settings` dialog box, click the **VM Options** tab.

10. On the **VM Options** tab, select the **Advanced** section. From the **Latency Sensitivity** drop-down list, select **High**.

11. Click **OK**.

13. Once the NetScaler VPX instance powers on, you can use the following command to verify the configuration:

```
> show interface summary
```

The output should show all the interfaces that you configured:

```
1 > show interface summary
2 -------------------------------------------------------------------------------------------------
3            Interface  MTU         MAC                Suffix
4 -------------------------------------------------------------------------------------------------
5 1         0/1         1500    00:0c:29:1b:81:0b     NetScaler Virtual Interface
```
**Migrating the NetScaler VPX from E1000 to SR-IOV or VMXNET3 Network Interfaces**

December 18, 2018

You can configure your exiting NetScaler VPX instances that use E1000 network interfaces to use SR-IOV or VMXNET3 network interfaces.

To configure an existing NetScaler VPX instance to use SR-IOV network interfaces, see Configuring NetScaler VPX instances to use Single Root I/O Virtualization (SR-IOV) Network Interface.

To configure an existing NetScaler VPX instance to use VMXNET3 network interfaces, see Configuring...
NetScaler VPX instances to use VMXNET3 Network Interface.

Configure a NetScaler VPX instance to use PCI passthrough network interface

January 6, 2019

Overview

After you have installed and configured a NetScaler VPX instance on VMware ESX Server, you can use the vSphere Web Client to configure the virtual appliance to use PCI passthrough network interfaces. The PCI passthrough feature allows a guest virtual machine to directly access physical PCI and PCIe devices connected to a host.

Prerequisites

- The firmware version of the Intel XL710 NIC on the host is 5.04.
- A PCI passthrough device connected to and configured on the host
- Supported NICs:
  - Intel X710 10G NIC
  - Intel XL710 Dual Port 40G NIC
  - Intel XL710 Single Port 40G NIC

Configure passthrough devices on a host

Before configuring a passthrough PCI device on a virtual machine, you should configure it on the host machine. Follow these steps to configure passthrough devices on a host.

1. Select the host from the Navigator panel of the vSphere Web Client.
2. Click Manage > Settings > PCI Devices. All available passthrough devices are displayed.
3. Right-click the device that you want to configure and click Edit.
4. The Edit PCI Device Availability window appears.
5. Select the devices to be used for passthrough and click OK.
6. Restart the host machine.
NetScaler 11.1

Configure passthrough devices on a NetScaler VPX instance

Follow these steps to configure a passthrough PCI device on a NetScaler VPX instance.

1. Power off the virtual machine.
2. Right-click the virtual machine and select **Edit Settings**.
3. On the **Virtual Hardware** tab, select **PCI Device** from the **New Device** drop-down menu, and click **Add**.
4. Expand **New PCI device** and select the passthrough device to connect to the virtual machine from the drop-down list and click **OK**.

**Note**
VMXNET3 network interface and PCI Passthrough Network Interface cannot coexist.

6. Power on the guest virtual machine.

You have completed the steps to configuring NetScaler VPX to use PCI passthrough network interfaces.

Install a NetScaler VPX instance on Microsoft Hyper-V server

March 4, 2019

To install Citrix
NetScaler VPX instances on Microsoft Windows Server, you must first install Windows Server, with the Hyper-V role enabled, on a machine with adequate system resources. While installing the Hyper-V role, be sure to specify the network interface cards (NICs) on the server that Hyper-V will use to create the virtual networks. You can reserve some NICs for the host. Use Hyper-V Manager to perform the NetScaler VPX instance installation.

NetScaler VPX instance for Hyper-V is delivered in virtual hard disk (VHD) format. It includes the default configuration for elements such as CPU, network interfaces, and hard-disk size and format. After you install NetScaler VPX instance, you can configure the network adapters on virtual appliance, add virtual NICs, and then assign the NetScaler IP address, subnet mask, and gateway, and complete the basic configuration of the virtual appliance.

After the initial configuration of the VPX instance, if you want to upgrade the appliance to the latest software release, see **Upgrade a NetScaler VPX standalone appliance**

**Note**
Intermediate System-to-Intermediate System (ISIS) protocol is not supported on the NetScaler VPX virtual appliance hosted on the Hyper-V-2012 platform.
Prerequisites for installing NetScaler VPX instance on Microsoft servers

Before you begin installing a virtual appliance, do the following:

- Download the virtual appliance setup files.
- Obtain NetScaler VPX instance license files. For more information about NetScaler VPX instance licenses, see the *NetScaler VPX Licensing Guide* at [http://support.citrix.com/article/ctx131110](http://support.citrix.com/article/ctx131110).

Microsoft server hardware requirements

The following table describes the minimum system requirements for Microsoft Servers.

Table 1. Minimum system requirements for Microsoft servers

<table>
<thead>
<tr>
<th>Component</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>CPU</td>
<td>1.4 GHz 64-bit processor</td>
</tr>
<tr>
<td>RAM</td>

Download the NetScaler VPX setup files

NetScaler VPX instance for Hyper-V is delivered in virtual hard disk (VHD) format. You can download the files from MyCitrix.com. You will need a My Citrix account to log on. If you do not have a My Citrix account, access the home page at [http://www.mycitrix.com](http://www.mycitrix.com), click the New Users link, and follow the...
instructions to create a new My Citrix account.

To download the NetScaler VPX instance setup files, follow these steps:

2. Type your user name and password.
3. Click Downloads.
4. In Search Downloads by Product, select NetScaler.
5. Under Virtual Appliances, click NetScaler VPX.
6. Copy the compressed file to your server.

**Install the NetScaler VPX instance on Microsoft servers**

After you have enabled the Hyper-V role on Microsoft Server and extracted the virtual appliance files, you can use Hyper-V Manager to install NetScaler VPX instance. After you import the virtual machine, you need to configure the virtual NICs by associating them to the virtual networks created by Hyper-V.

You can configure a maximum of eight virtual NICs. Even if the physical NIC is DOWN, the virtual appliance assumes that the virtual NIC is UP, because it can still communicate with the other virtual appliances on the same host (server).

**Note**

You cannot change any settings while the virtual appliance is running. Shut down the virtual appliance and then make changes.

**To install NetScaler VPX instance on Microsoft Server by using Hyper-V Manager:**

1. To start Hyper-V Manager, click **Start**, point to **Administrative Tools**, and then click **Hyper-V Manager**.
2. In the navigation pane, under **Hyper-V Manager**, select the server on which you want to install NetScaler VPX instance.
3. On the **Action** menu, click **Import Virtual Machine**.
4. In the **Import Virtual Machine** dialog box, in **Location**, specify the path of the folder that contains the NetScaler VPX instance software files, and then select **Copy the virtual machine (create a new unique ID)**. This folder is the parent folder that contains the Snapshots, Virtual Hard Disks, and Virtual Machines folders.
5. Note: If you received a compressed file, make sure that you extract the files into a folder before you specify the path to the folder.
6. Click **Import**.
7. Verify that the virtual appliance that you imported is listed under **Virtual Machines**.
8. To install another virtual appliance, repeat steps 2 through 6.
Auto-provision a NetScaler VPX instance on Hyper-V

Auto-provisioning of NetScaler VPX instance is optional. If auto-provisioning is not done, the virtual appliance provides an option to configure the IP address and so on.

To auto-provision NetScaler VPX instance on Hyper-V, follow these steps.

1. Create an ISO9660 compliant ISO image using the xml file as depicted in the example. Make sure that the name of the xml file is `userdata`.

```xml
<?xml version="1.0" encoding="UTF-8" standalone="no"?>
<Environment xmlns:oe="http://schemas.dmtf.org/ovf/environment/1"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xmlns="http://schemas.dmtf.org/ovf/environment/1">
  <PlatformSection>
    <Kind>HYPER-V</Kind>
    <Version>2013.1</Version>
    <Vendor>CISCO</Vendor>
    <Locale>en</Locale>
  </PlatformSection>
  <PropertySection>
    <Property oe:key="com.citrix.netscaler.ovf.version" oe:value="1.0"/>
    <Property oe:key="com.citrix.netscaler.platform" oe:value="NS1000V"/>
    <Property oe:key="com.citrix.netscaler.orch_env" oe:value="cisco-orch-env"/>
    <Property oe:key="com.citrix.netscaler.mgmt.ip" oe:value="10.102.100.122"/>
    <Property oe:key="com.citrix.netscaler.mgmt.netmask" oe:value="255.255.255.128"/>
    <Property oe:key="com.citrix.netscaler.mgmt.gateway" oe:value="10.102.100.67"/></PropertySection>
</Environment>
```

2. Copy the ISO image to hyper-v server.
3. Select the virtual appliance that you imported, and then on the Action menu, select Settings. You can also select the virtual appliance and then right click and select Settings. The Settings window for the selected virtual appliance is displayed.

4. In the Settings window, under the hardware section, click on IDE Controller.

5. In the right window pane, select DVD Drive and click on Add. The DVD Drive is added under the IDE Controller section in the left window pane.

6. Select the DVD Drive added in step 5. In the right window pane, select the Image file radio button and click on Browse and select the ISO image that you copied on Hyper-V server, in step 2.

7. Click Apply.

Note

The virtual appliance instance comes up in the default IP address, when:

- The DVD drive is attached and the ISO file is not provided.
- The ISO file does not inculde the userdata file.
- The userdata file name or format is not correct.

To configure virtual NICs on the NetScaler VPX instance, follow these steps:

1. Select the virtual appliance that you imported, and then on the Action menu, select Settings.
2. In the Settings for <virtual appliance name> dialog box, click Add Hardware in the left pane.
3. In the right pane, from the list of devices, select Network Adapter.
4. Click Add.
5. Verify that Network Adapter (not connected) appears in the left pane.
6. Select the network adapter in the left pane.
7. In the right pane, from the Network drop-down list, select the virtual network to connect the adapter to.
8. To select the virtual network for additional network adapters that you want to use, repeat steps 6 and 7.
9. Click Apply, and then click OK.

To configure the NetScaler VPX instance:

1. Right-click the virtual appliance that you previously installed, and then select Start.
2. Access the console by double-clicking the virtual appliance.
3. Type the NetScaler IP address, subnet mask, and gateway for your virtual appliance.

You have completed the basic configuration of your virtual appliance. Type the IP address in a Web browser to access the virtual appliance.
Install a NetScaler VPX instance on Linux-KVM platform

December 18, 2018

To set up a NetScaler VPX for the Linux-KVM platform, you can use the graphical Virtual Machine Manager (Virt-Manager) application. If you prefer the Linux-KVM command line, you can use the virsh program.

The host Linux operating system must be installed on suitable hardware by using virtualization tools such as KVM Module and QEMU. The number of virtual machines (VMs) that can be deployed on the hypervisor depends on the application requirement and the chosen hardware.

After you provision a NetScaler VPX instance, you can add additional interfaces.

Limitations and usage guidelines

General recommendations

To avoid unpredictable behavior, apply the following recommendations:

- Do not change the MTU of the vnet interface associated with the VPX VM. Shut down the VPX VM before modifying any configuration parameters, such as Interface modes or CPU.
- Do not force a shutdown of the VPX VM. That is, do not use the Force off command.
- Any configurations done on the host Linux might or might not be persistent, depending on your Linux distribution settings. You can choose to make these configurations persistent to ensure consistent behavior across reboots of host Linux operating system.
- The NetScaler package has to be unique for each of the NetScaler VPX instance provisioned.

Limitations

- Live migration of a VPX instance that runs on KVM is not supported.
Prerequisites for installing a NetScaler VPX instance on Linux-KVM platform

June 12, 2019

Check the minimum system requirements for a Linux-KVM serves running a NetScaler VPX instance.

**CPU requirement:**
- 64-bit x86 processors with the hardware virtualization features included in the AMD-V and Intel VT-X processors.

To test whether your CPU supports Linux host, enter the following command at the host Linux shell prompt:

```bash
* egrep '^flags.*\(vmx|svm\)'/proc/cpuinfo*
```

If the BIOS settings for the above extension are disabled, you must enable them in BIOS.
- Provide at least 2 CPU cores to Host Linux.
- There is no specific recommendation for processor speed, but higher the speed, the better the performance of the VM application.

**Memory (RAM) requirement:**
Minimum 4 GB for the host Linux kernel. Add additional memory as required by the VMs.

**Hard disk requirement:**
Calculate the space for Host Linux kernel and VM requirements. A single NetScaler VPX VM requires 20 GB of disk space.

**Software requirements**

The Host kernel used must be a 64-bit Linux kernel, release 2.6.20 or later, with all virtualization tools. Citrix recommends newer kernels, such as 3.6.11-4 and later.

Many Linux distributions such as Red Hat, Centos, and Fedora, have tested kernel versions and associated virtualization tools.

**Guest VM hardware requirements**

NetScaler VPX supports IDE and virtIO hard disk type. The Hard Disk Type has been configured in the XML file, which is a part of the NetScaler package.
Networking requirements

NetScaler VPX supports virtIO para-virtualized, SR-IOV, and PCI Passthrough network interfaces.

For more information about the supported network interfaces, see:

- Provision the NetScaler VPX instance by using the Virtual Machine Manager
- Configure a NetScaler VPX instance to use SR-IOV network interfaces
- Configure a NetScaler VPX instance to use PCI passthrough network interfaces

Source Interface and Modes

The source device type can be either Bridge or MacVTap. In case of MacVTap, four modes are possible - VEPA, Bridge, Private and Pass-through.

Check the types of interfaces that you can use and the supported traffic types, as given below.

Bridge:

- Linux Bridge.
- `iptables` and `iptables` settings on host Linux might filter the traffic on the bridge if you do not choose the correct setting or disable `iptables` services.

MacVTap (VEPA mode):

- Better performance than a bridge.
- Interfaces from the same lower device can be shared across the VMs.
- Inter-VM communication using the same lower device is possible only if upstream or downstream switch supports VEPA mode.

MacVTap (private mode):

- Better performance than a bridge.
- Interfaces from the same lower device can be shared across the VMs.
- Inter-VM communication using the same lower device is not possible.

MacVTap (bridge mode):

- Better as compared to bridge.
- Interfaces out of same lower device can be shared across the VMs.
- Inter-VM communication using the same lower device is possible, if lower device link is UP.

MacVTap (Pass-through mode):

- Better as compared to bridge.
- Interfaces out of same lower device cannot be shared across the VMs.
- Only one VM can use the lower device.
Note: For best performance by the VPX instance, ensure that the gro and lro capabilities are switched off on the source interfaces.

Properties of source interfaces

Make sure that you switch off the generic-receive-offload (gro) and large-receive-offload (lro) capabilities of the source interfaces. To switch off the gro and lro capabilities, run the following commands at the host Linux shell prompt.

```
ethtool -K eth6 gro off
ethool -K eth6 lro off
```

Example:

```bash
[root@localhost ~]# ethtool -K eth6

          Offload parameters for eth6:
           rx-checksumming: on
           tx-checksumming: on
           scatter-gather: on
           tcp-segmentation-offload: on
           udp-fragmentation-offload: off
           generic-segmentation-offload: on
           generic-receive-offload: off
           large-receive-offload: off
           rx-vlan-offload: on
           tx-vlan-offload: on
           ntuple-filters: off
           receive-hashing: on

[root@localhost ~]#
```
Example:

If the host Linux bridge is used as a source device, as in the following example, gro and lro capabilities must be switched off on the vnet interfaces, which are the virtual interfaces connecting the host to the guest VMs.

```
[root@localhost ~]# brctl show eth6_br
bridge name  bridge id            STP enabled  interfaces
eth6_br      8000.00e0ed1861ae    no           eth6
              vnet0
              vnet2
[root@localhost ~]#
```

In the above example, the two virtual interfaces are derived from the eth6_br and are represented as vnet0 and vnet2. Run the following commands to switch off gro and lro capabilities on these interfaces.

```
ethtool -K vnet0 gro off
ethtool -K vnet2 gro off
ethtool -K vnet0 lro off
ethtool -K vnet2 lro off
```

Promiscuous mode

The promiscuos mode has to be enabled for the following features to work:

- L2 mode
- Multicast traffic processing
- Broadcast
- IPV6 traffic
- Virtual MAC
- Dynamic routing

Use the following command to enable the promicuous mode.

```
[root@localhost ~]# ifconfig eth6 promisc
[root@localhost ~]# ifconfig eth6
eth6            Link encap:Ethernet  HWaddr 78:2b:cb:51:54:a3
    inet6 addr: fe80::7a2b:cbff:fe51:54a3/64 Scope:Link
```
Module required

For better network performance, make sure the vhost_net module is present in the Linux host. To check the existence of vhost_net module, run the following command on the Linux host:

```
lsmod | grep "vhost\_net"
```

If vhost_net is not yet running, enter the following command to run it:

```
modprobe vhost\_net
```

Provision the NetScaler VPX instance by using OpenStack

January 6, 2019

You can provision a NetScaler VPX instance in an Openstack environment either by using the Nova boot command (OpenStack CLI) or Horizon (OpenStack dashboard).

Provisioning a VPX instance, optionally involves using data from the config drive. Config drive is a special configuration drive that attaches to the instance as a CD-ROM device when it boots. This configuration drive can be used to pass networking configuration such as management IP address, network mask, default gateway, and to inject customer scripts.

In a NetScaler appliance, the default authentication mechanism is password based. Now, SSH key-pair authentication mechanism is supported for NetScaler VPX instances on OpenStack environment.

The key-pair (public key and private key) needs to be generated before using Public Key Cryptography mechanism. You can use different mechanisms, such as Horizon, Puttygen.exe for Windows, and ssh-keygen for Linux environment, to generate the key pair. Refer to online documentation of respective mechanisms for more information about generating key pair.

Once a key pair is available, copy the private key to a secure location to which authorized persons will have access. In OpenStack, public key can be deployed on a VPX instance by using Horizon or
NetScaler 11.1

Nova boot command. When a VPX instance is provisioned by using OpenStack, it first detects that the instance is booting in an OpenStack environment by reading a specific BIOS string. This string is “OpenStack Foundation” and for Red Hat Linux distributions it is stored in /etc/nova/release. This is a standard mechanism that is available in all OpenStack implementations based on KVM hypervisor platform. The drive should have a specific OpenStack label.

If the config drive is detected, the instance attempts to read the network configuration, custom scripts, and SSH key pair if provided.

**Userdata file**

The NetScaler VPX instance uses a customized OVF file, also known as userdata file, to inject network configuration, custom scripts. This file is provided as part of config drive. Here is an example of a customized OVF file.

```xml
<?xml version="1.0" encoding="UTF-8" standalone="no"?>
<Environment xmlns:oe="http://schemas.dmtf.org/ovf/environment/1"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
oe:id="" xmlns="http://schemas.dmtf.org/ovf/environment/1"
xmlns:cs="http://schemas.citrix.com/openstack">
  <PlatformSection>
    <Kind></Kind>
    <Version>2016.1</Version>
    <Vendor>VPX</Vendor>
    <Locale>en</Locale>
  </PlatformSection>
  <PropertySection>
    <Property oe:key="com.citrix.netscaler.ovf.version" oe:value="1.0"/>
    <Property oe:key="com.citrix.netscaler.platform" oe:value="NSVPX"/>
    <Property oe:key="com.citrix.netscaler.orch_env" oe:value="openstack-orch-env"/>
    <Property oe:key="com.citrix.netscaler.mgmt.ip" oe:value="10.1.2.22"/>
    <Property oe:key="com.citrix.netscaler.mgmt.netmask" oe:value="255.255.255.0"/>
    <Property oe:key="com.citrix.netscaler.mgmt.gateway" oe:value="10.1.2.1"/>
  </PropertySection>
  <cs:ScriptSection>
    <cs:Version>1.0</cs:Version>
    <ScriptSettingSection xmlns="http://schemas.citrix.com/openstack"
xmlns:i="http://www.w3.org/2001/XMLSchema-instance">
      <Scripts>
        <Script>
```
In the OVF file above “PropertySection” is used for NetScaler networking configuration while `<cs:ScriptSection>` is used to enclose all scripts. `<Scripts></Scripts>` tags are used to bundle all scripts together. Each script is defined in between `<Script> </Script>` tags. Each script tag has following fields/tags:

a) `<Type>`: Specifies value for script type. Possible values: Shell/Perl/Python/NSLCI (for NetScaler CLI
NetScaler 11.1

scripts)
b) <Parameter>: Provides parameters to the script. Each script can have multiple <Parameter> tags.
c) <BootScript>: Specifies script execution point. Possible values for this tag: before/after. “before” specifies script will be executed before PE comes up. “after” specifies that the script will be executed after PE comes up.
d) <Text>: Pastes content of a script.

Note
Currently the VPX instance does not take care of sanitization of scripts. As an administrator, you should check the validity of the script.

Not all sections need to be present. Use an empty “PropertySection” to only define scripts to execute on first boot or an empty <cs:ScriptSection> to only define networking configuration.

After the required sections of the OVF file (userdata file) are populated, use that file to provision the VPX instance.

Network configuration

As part of network configuration, the VPX instance reads:

- Management IP address
- Network mask
- Default gateway

After the parameters are successfully read, they are populated in the NetScaler configuration, to allow managing the instance remotely. If the parameters are not read successfully or the config drive is not available, the instance transitions to the default behavior, which is:

- The instance attempts to retrieve the IP address information from DHCP.
- If DHCP fails or times-out, the instance comes up with default network configuration (192.168.100.1/16).

Customer script

The VPX instance allows to execute a custom script during initial provisioning. The appliance supports script of type Shell, Perl, Python, and NetScaler CLI commands.

SSH key pair authentication

The VPX instance copies public key, available within the configuration drive as part of instance meta data, into its “authorized_keys” file. This allows the user to access the instance with private key.
NetScaler 11.1

**Note**

When an SSH key is provided, the default credentials (nsroot/nsroot) no longer work. If password-based access is needed, log on with the respective SSH private key and manually set a password.

**Before you begin**

Before you provision a VPX instance on OpenStack environment, extract the .qcow2 file from the .tgz file and build an OpenStack image from the qcow2 image. Follow these steps:

1. Extract the .qcow2 file from the .tgz file by typing the following command.

   ```
   tar xvzf <TAR file>
   tar xvzf <NSVPX-KVM-12.0-26.2_nc.tgz>
   NSVPX-KVM.xml
   NSVPX-KVM-12.0-26.2_nc.qcow2
   ```

2. Build an OpenStack image using the .qcow2 file extracted in step 1 by typing the following command.

   ```
   openstack image create --container-format bare --property hw_disk_bus=ide --disk-format qcow2 --file <path to qcow2 file> --public <name of the OpenStack image>
   glance image-create --name="NS-VPX-12.0-26.2" --property hw_disk_bus=ide --ispublic=true --container-format=bare --disk-format=qcow2< NSVPX-KVM-12.0-26.2_nc.qcow2
   ```

   **Figure 1:** The following illustration provides a sample output for the glance image-create command.

**Provisioning the VPX instance**

You can provision a VPX instance in two ways by using one of the options:

- Horizon (OpenStack dashboard)
- Nova boot command (OpenStack CLI)

**Provision a VPX instance by using the OpenStack dashboard**

Follow these steps to provision the VPX instance by using Horizon:
1. Log on to the OpenStack dashboard.
2. In the Project panel on the left hand side of the dashboard, select **Instances**.
3. In the Instances panel, click **Launch Instance** to open the Instance Launching wizard.

4. In the Launch Instance wizard, fill in the details, like:
   1. Instance Name
   2. Instance Flavor
   3. Instance Count
   4. Instance Boot Source
   5. Image Name

5. Deploy a new key pair or an existing key pair through Horizon by completing the following steps:
   a) If you don’t have an existing key pair, create the key by using any existing mechanisms. If you’ve an existing key, skip this step.
   b) Copy the content of public key.
   c) Go to **Horizon > Instances > Create New Instances**.
   d) Click **Access & Security**.
   e) Click the + sign next to the **Key Pair** drop-down menu and provide values for shown parameters.
   f) Paste public key content in **Public key** box, give a name to the key and click **Import Key Pair**.

6. Click the **Post Creation** tab in the wizard. In Customization Script, add the content of the userdata file. The userdata file contains the IP address, Netmask and Gateway details, and customer scripts of the VPX instance.

7. After a key pair is selected or imported, check config-drive option and click **Launch**.

**Provision the VPX instance by using OpenStack CLI**

Follow these steps to provision a VPX instance by using OpenStack CLI.

1. To create an image from qcow2, type the following command:

   ```bash
   openstack image create --container-format bare --property hw_disk_bus=ide --diskformat qcow2 --file NSVPX-OpenStack.qcow2 --public VPX-ToT-Image
   ```

2. To select an image for creating an instance, type the following command:

   ```bash
   openstack image list | more
   ```

3. To create an instance of a particular flavor, type the following command to choose a flavor ID/Name of from a list:
To attach a NIC to a particular network, type the following command to choose a network ID from a network list:

```
openstack network list
```

To create an instance, type the following command:

```
openstack server create --flavor FLAVOR_ID --image IMAGE_ID --key-name KEY_NAME
--user-data USER_DATA_FILE_PATH --config-drive True --nic net-id=net-uuid
```

5. To create an instance, type the following command:

```
openstack server create --image VPX-ToT-Image --flavor m1.medium --user-data
ovf.xml --config-drive True --nic net-id=2734911b-ee2b-48d0-a1b6-3efd44b761b9
```

```
VPX-ToT
```

**Figure 2:** The following illustration provides a sample output.

**Provisioning the NetScaler Virtual Appliance by using the Virtual Machine Manager**

February 27, 2019

The Virtual Machine Manager is a desktop tool for managing VM Guests. It enables you to create new VM Guests and various types of storage, and manage virtual networks. You can access the graphical console of VM Guests with the built-in VNC viewer and view performance statistics, either locally or remotely.

After installing your preferred Linux distribution, with KVM virtualization enabled, you can proceed with provisioning virtual machines.

**Provisioning the NetScaler Virtual Appliance using the RAW Image**

Using the Virtual Machine Manager, you can provision the NetScaler VPX using the RAW image.

To provision a NetScaler VPX by using Virtual Machine Manager, follow these steps.
1. Open the Virtual Machine Manager (Application > System Tools > Virtual Machine Manager) and enter the logon credentials in the Authenticate window.

2. Click the icon or right-click localhost (QEMU) to create a new NetScaler VPX instance.

3. In the Name text box, enter a name for the new VM (for example, NetScaler-VPX).

4. In the New VM window, under “Choose how you would like to install the operating system,” select Import existing disk image, and then and click Forward.

5. In the Provide the existing storage path field, navigate the path to the image. Choose the OS type as UNIX and Version as FreeBSD 6.x. Then, click Forward.

6. Under “Choose Memory and CPU settings,” select the following settings, and then click Forward:
   - Memory (RAM)— 2048 MB
   - CPUs— 2

7. Select the Customize configuration before install check box. Optionally, under “Advanced options,” you can customize the MAC address. Make sure the Virt Type selected is kvm and the Architecture selected is x86_64. Click Finish.

8. Select a NIC and provide the following configuration:
   - Source device— ethX macvtap or Bridge
   - Device model— virtio
   - Source mode— Bridge

9. Click Apply, and then click Begin Installation. After you have provisioned the NetScaler VPX on KVM, you can add additional interfaces.

**Provisioning the NetScaler Virtual Appliance by using the QCOW2 Image**

Using the Virtual Machine Manager, you can provision the NetScaler VPX using the QCOW2 image.

**Note:** You can also convert the NetScaler VPX RAW image to QCOW2 image and provision the NetScaler VPX. For instructions to convert the RAW image to QCOW2, see Converting the RAW Image Format to a QCOW2 Image Format.

To provision the NetScaler VPX using QCOW2 image:

1. Follow step 1 to step 8 in Provisioning the NetScaler Virtual Appliance by using the RAW Image. **Note:** Make sure that you select qcow2 image** in step 5.

2. Select Disk 1 and click Advanced options. Select qcow2 from the Storage format drop-down list.

3. Click Apply, and then click Begin Installation. After you have provisioned the NetScaler VPX on KVM, you can add additional interfaces.
Adding Additional Interfaces to NetScaler VPX by using Virtual Machine Manager

After you have provisioned the NetScaler VPX on KVM, you can add additional interfaces.

To add additional interfaces, follow these steps:

1. Shut down the NetScaler VPX instance running on the KVM.
2. Right-click the VPX instance and choose Open from the pop-up menu.
3. Click the following icon in the header to view the virtual hardware details.
4. Click Add Hardware. In the Add New Virtual Hardware window, select Network from the navigation menu.

5. In Host Device field, select the physical interface type. The host device type can be either Bridge or MacVTap. In case of MacVTap, four modes possible are VEPA, Bridge, Private and Pass-through.

© 1999-2018 Citrix Systems, Inc. All rights reserved.
4. Select the newly added NIC and select the Source mode for this NIC. The available modes are VEPA, Bridge, Private, and Passthrough. For more details on the interface and modes, see Source Interface and Modes.

5. Click Apply.

6. Start the NetScaler VPX VM.

**Important**

Limitation: Interface parameter configurations such as speed, duplex, and autonegotiation are not supported.

**Converting the RAW Image Format to a QCOW2 Image Format**

You can convert the NetScaler VPX RAW image to QCOW2 image and provision the NetScaler VPX. To convert the RAW image to QCOW2 image. At the command prompt, enter the following command:

```
qemu-img convert -O qcow2 original-image.raw image-converted.qcow
```

**For example:**

```
qemu-img convert -O qcow2 NSVPX-KVM-11.1-12.5_nc.raw NSVPX-KVM-11.1-12.5_nc.qcow
```

**Configure a NetScaler VPX instance to use SR-IOV network interfaces**

**January 6, 2019**

You can use the Virtual Machine Manager to configure a NetScaler VPX instance running on Linux-KVM to use single root I/O virtualization (SR-IOV) network interfaces with Intel 82599 10G NIC and X710 10G and XL710 40G NICs.

This section describes how to:

- Configure a NetScaler VPX Instance to Use SR-IOV Network Interface
- Configure Static LA/LACP on the SR-IOV Interface
- Configure VLAN on the SR-IOV Interface

**Limitations**

Keep the limitations in mind while using Intel 82599, X710, XL710 NICs. The following features not supported.
Limitations for Intel 82599 NICs:

- L2 mode switching
- Admin partitioning (shared VLAN mode)
- High availability (active-active mode)
- Jumbo Frames.
- IPv6: You can configure only up to 30 unique IPv6 addresses in a VPX instance if you’ve atleast one SR-IOV interface.
- VLAN configuration on Hypervisor for SRIOV VF interface through “ip link” command is not supported.
- Interface parameter configurations such as speed, duplex, and autonegotiations are not supported.

Limitations for X710 10G and XL710 40G NICs:

- L2 mode switching.
- In a cluster, Jumbo Frames are not supported when the XL710 NIC is used as a data interface.
- Interface list re-orders when interfaces are disconnected and reconnected.
- Interface parameter configurations such as speed, duplex, and auto negotiations are not supported.
- Interface name is 40/X for both XL710 and X710 NICs
- Up to 16 Intel XL710/X710 SRIOV or PCI Passthrough interfaces can be supported on a VPX instance.

Note: For IPv6 to work with X710 10G and XL710 40G NICs, you need to enable trust mode on the Virtual Functions (VFs) by typing the following command on the KVM host:

```
## ip link set <PNIC> <VF> trust on
```

For example:

```
## ip link set ens785f1 vf 0 trust on
```

Prerequisites

Before you configure a NetScaler VPX instance to use SR-IOV network interfaces, complete the following prerequisite tasks. See the NIC column for details about about how to complete the corresponding tasks.

<table>
<thead>
<tr>
<th>Task</th>
<th>82599 NIC</th>
<th>X710 and XL710 NICs</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Add the NIC to the KVM host.</td>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>Task</td>
<td>82599 NIC</td>
<td>X710 and XL710 NICs</td>
</tr>
<tr>
<td>------</td>
<td>-----------</td>
<td>---------------------</td>
</tr>
<tr>
<td>2. Download and install the latest Intel driver.</td>
<td>IXGBE driver</td>
<td>I40E driver</td>
</tr>
<tr>
<td>3. Blacklist the driver on the KVM host.</td>
<td>Add the following entry in the <code>/etc/modprobe.d/blacklist.conf</code> file: <code>blacklist ixgbev</code> Use IXGBE driver version 4.3.15 (recommended).</td>
<td>Add the following entry in the <code>/etc/modprobe.d/blacklist.conf</code> file: <code>blacklist i40ev</code>. Use i40e driver version 2.0.26 (recommended).</td>
</tr>
<tr>
<td>4. Enable SR-IOV Virtual Functions (VFs) on the KVM host. In both the commands in the next two columns: <code>number_of_VFs</code> = the number of Virtual VFs that you want to create. <code>device_name</code> = the interface name.</td>
<td>If you are using earlier version of kernel 3.8, then add the following entry to the `/etc/modprobe.d/ixgbe file and restart the KVM host: <em>options ixgbe max_vfs=</em> . If you are using kernel 3.8 version or later, create VFs using the following command: <em>echo &gt; /sys/class/net//device/s-riov_numvfs</em>. See example in figure 1.</td>
<td>If you are using earlier version of kernel 3.8, then add the following entry to the `/etc/modprobe.d/i40e.conf file and restart the KVM host:<em>options i40e max_vfs=</em> . If you are using kernel 3.8 version or later, create VFs using the following command: <em>echo &gt; /sys/class/net//device/s-riov_numvfs</em>. See example in figure 2.</td>
</tr>
<tr>
<td>5. Make the VFs persistent by adding the commands that you used to create VFs, to the <code>rc.local</code> file.</td>
<td>See example in figure 3.</td>
<td>See example in figure 3.</td>
</tr>
</tbody>
</table>

**Important**

When you are create the SR-IOV VFs, ensure that you do not assign MAC addresses to the VFs.

**Figure 1**: Enable SR-IOV VFs on the KVM host for 82599 10G NIC.

**Figure 2**: Enable SR-IOV VFs on the KVM host for X710 10G and XL710 40G NICs.

**Figure 3**: Make the VFs persistent.
NetScaler 11.1

Configure a NetScaler VPX instance to use SR-IOV network interface

To configure NetScaler VPX instance to use SR-IOV network interface by using Virtual Machine Manager, complete these steps:

1. Power off the NetScaler VPX instance.
2. Select the NetScaler VPX instance and then select Open.
   1. In the <virtual_machine on KVM> window, select the icon.
   1. Select Add Hardware.
   5. In the Add New Virtual Hardware dialog box, do the following:
      1. Select PCI Host Device.
      2. In the Host Device section, select the VF you have created and click Finish.

Figure 4: VF for 82599 10G NIC

Figure 5: VF for XL710 NIC

6. Repeat Step 4 and 5 to add the VFs that you have created.
7. Power on the NetScaler VPX instance.
8. After the NetScaler VPX instance powers on, use the following command to verify the configuration:

   > show interface summary

The output shows all the interfaces that you configured.

Figure 6: output summary for 82599.

Figure 7. Output summary for X710 and XL710 NICs.

Configure static LA/LACP on the SR-IOV interface

Important

When you are creating the SR-IOV VFs, ensure that you do not assign MAC addresses to the VFs.

To use the SR-IOV VFs in link aggregation mode, disable spoof checking for VFs that you have created. On the KVM host, use the following command to disable spoof checking:

*ip link set <interface\_name> vf <VF\_id> spoofchk off*

Where:

- Interface_name – is the interface name.
VF_id – is the Virtual Function id.

For example:

After you disable spoof checking for all the VFs that you have created. Restart the NetScaler VPX instance and configure link aggregation. For detailed instructions, see Configure Link Aggregation.

Configuring VLAN on the SR-IOV Interface

You can configure VLAN on SR-IOV VFs. For detailed instructions, see Configuring a VLAN.

Important

Ensure that the KVM host does not contain VLAN settings for the VF interface.

Configure a NetScaler VPX instance to use PCI passthrough network interfaces

January 6, 2019

After you have installed and configured a NetScaler VPX instance on the Linux-KVM platform, you can use the Virtual Machine Manager to configure the virtual appliance to use PCI passthrough network interfaces.

Prerequisites

- The firmware version of the Intel XL710 Network Interface Card (NIC) on the KVM Host is 5.04.
- The KVM Host supports input–output memory management unit (IOMMU) and Intel VT-d, and they are enabled in the BIOS of the KVM Host. On the KVM Host, to enable IOMMU, add the following entry to the /boot/grub2/grub.cfg file:
  intel_iommu=1
- Execute the following command and reboot the KVM Host:
  Grub2-mkconfig –o /boot/grub2/grub.cfg

To configure NetScaler VPX instances to use PCI passthrough network interfaces by using the Virtual Machine Manager:

1. Power off the NetScaler VPX instance.
2. Select the NetScaler VPX instance and click Open.
3. In the <virtual_machine on KVM> window, click the i icon.
4. Click **Add Hardware**.

5. In the **Add New Virtual Hardware** dialog box, do the following:
   a. Select **PCI Host Device**.
   b. In the **Host Device** section, select the Intel XL710 physical function.
   c. Click **Finish**.

6. Repeat steps 4 and 5 to add any additional Intel XL710 physical functions.

7. Power on the NetScaler VPX instance.

8. Once the NetScaler VPX instance powers on, you can use the following command to verify the configuration:

   The output should show all the interfaces that you configured:

---

**Provision the NetScaler VPX instance by using the virsh program**

December 18, 2018

The virsh program is a command line tool for managing VM Guests. Its functionality is similar to that of Virtual Machine Manager. It enables you to change a VM Guest’s status (start, stop, pause, and so on), to set up new Guests and devices, and to edit existing configurations. The virsh program is also useful for scripting VM Guest management operations.

To provision NetScaler VPX by using the virsh program, follow these steps:

1. Use the tar command to untar the the NetScaler VPX package. The NSVPX-KVM-*_nc.tgz package contains following components:
   - The Domain XML file specifying VPX attributes [NSVPX-KVM-*_nc.xml]
   - Check sum of NS-VM Disk Image [Checksum.txt]
   - NS-VM Disk Image [NSVPX-KVM-*_nc.raw]

   Example:

   ```
   1 tar -xvzf NSVPX-KVM-10.1-117_nc.tgz
   2 NSVPX-KVM-10.1-117_nc.xml
   3 NSVPX-KVM-10.1-117_nc.raw
   4 checksum.txt
   ```

2. Copy the NSVPX-KVM-*_nc.xml XML file to a file named `<DomainName>-NSVPX-KVM-*_nc.xml`. The `<DomainName>` is also the name of the virtual machine. Example:
3. Edit the `<DomainName>-NSVPX-KVM-*_nc.xml` file to specify the following parameters:

- **name**— Specify the name.
- **mac**— Specify the MAC address.
  Note: The domain name and the MAC address have to be unique.
- **sourcefile**— Specify the absolute disk-image source path. The file path has to be absolute. You can specify the path of the RAW image file or a QCOW2 image file.
  If you want to specify a RAW image file, specify the disk image source path as shown in the following example:

  Example:
  
  ```xml
  <name>NetScaler-VPX</name>
  <mac address='52:54:00:29:74:b3'/>
  <source file='/root/NSVPX-KVM-10.1-117_nc.raw'/>
  ```

  Specify the absolute QCOW2 disk-image source path and define the driver type as `qcow2`, as shown in the following example:

  Example:
  
  ```xml
  <name>NetScaler-VPX</name>
  <mac address='52:54:00:29:74:b3'/>
  <driver name='qemu'type='qcow2'/>
  <source file='/root/NSVPX-KVM-10.1-117_nc.qcow'/>
  ```

4. Edit the `<DomainName>-NSVPX-KVM-*_nc.xml` file to configure the networking details:

- **source dev**— specify the interface.
- **mode**— specify the mode. The default interface is Macvtap Bridge.

Example: Mode: MacVTap Bridge Set target interface as ethx and mode as bridge Model type as virtio

```xml
  <interface type='direct'>
    <mac address='52:54:00:29:74:b3'/>
    <source dev='eth0' mode='bridge'/>
    <target dev='macvtap0'/>
    <model type='virtio'/>
    <alias name='net0'/>
    <address type='pci' domain='0x0000' bus='0x00' slot='0x03' function='0x0'/>
  </interface>
```
Here, eth0 is the physical interface attached to the VM.

5. Define the VM attributes in the `<DomainName>-NSVPX-KVM-*._nc.xml` file by using the following command: `virsh define <DomainName>-NSVPX-KVM-*._nc.xml` Example:

```
1 virsh define NS-VPX-NSVPX-KVM-10.1-117._nc.xml
```

Start the VM by entering following command: `<DomainName> <DomainUUID>` Example:

```
1 virsh start NetScaler-VPX
```

Connect the Guest VM through the console virsh `console [ <DomainName> ] <DomainUUID> <DomainID>` Example:

```
1 virsh console NetScaler-VPX
```

Add additional interfaces to NetScaler VPX instance using virsh program

After you have provisioned the NetScaler VPX on KVM, you can add additional interfaces.

To add additional interfaces, follow these steps:

1. Shut down the NetScaler VPX instance running on the KVM.

```
Edit the `<DomainName>-NSVPX-KVM-*.nc.xml `<DomainUUID>` file using the command: `virsh edit [ <DomainName> ]`
```

2.

3. In the `<DomainName>-NSVPX-KVM-*.nc.xml` file, append the following parameters:

   a) **For MacVTap**

   - Interface type— Specify the interface type as ‘direct’.
   - Mac address— Specify the Mac address and make sure the MAC address is unique across the interfaces.
NetScaler 11.1

- source dev— Specify the interface name.
- mode— Specify the mode; the modes supported are - Bridge, VEPA, Private, and Pass-through
- model type— Specify the model type as virtio

Example:

Mode: MacVTap Pass-through

Set target interface as ethx, Mode as bridge, and model type as virtio

```
<interface type='direct'>
  <mac address='52:54:00:29:74:b3'/>
<source dev='eth1' mode='passthrough'/>
<model type='virtio'>
</interface>
```

Here eth1 is the physical interface attached to the VM.

b) **For Bridge Mode**

Note: Make sure that you have configured a Linux bridge in the KVM host, bound the physical interface to the bridge, and put the bridge in the UP state.

- Interface type— Specify the interface type as 'bridge'.
- Mac address— Specify the Mac address and make sure the MAC address is unique across the interfaces.
- source bridge— Specify the bridge name.
- model type— Specify the model type as virtio

Example: Bridge Mode

```
<interface type='bridge'>
  <mac address='52:54:00:2d:43:a4'/>
  <source bridge='br0'/>
  <model type='virtio'/>
</interface>
```

**Manage the NetScaler VPX guest VMs**

January 6, 2019
You can use the Virtual Machine Manager and the virsh program to perform management tasks such as starting or stopping a VM Guest, setting up new guests and devices, editing existing configurations, and connecting to the graphical console through Virtual Network Computing (VNC).

**Manage the VPX guest VMs by using Virtual Machine Manager**

- **List the VM guests**
  The main Window of the Virtual Machine Manager displays a list of all the VM Guests for each VM host server it is connected to. Each VM Guest entry contains the virtual machine’s name, along with its status (Running, Paused, or Shutoff) displayed as icon.

- **Open a graphical console**
  Opening a Graphical Console to a VM Guest enables you to interact with the machine like you would with a physical host through a VNC connection. To open the graphical console in the Virtual Machine Manager, right-click the VM Guest entry and select the Open option from the pop-up menu.

- **Start and shut down a guest**
  You can start or stop a VM Guest from the Virtual Machine Manager. To change the state of the VM, right-click the VM Guest entry and select Run or one of the Shut Down options from the pop-up menu.

- **Reboot a guest**
  You can reboot a VM Guest from the Virtual Machine Manager. To reboot the VM, right-click the VM Guest entry, and then select Shut Down > Reboot from the pop-up menu.

- **Delete a guest**
  Deleting a VM Guest removes its XML configuration by default. You can also delete a guest’s storage files. Doing so completely erases the guest.
  1. In the Virtual Machine Manager, right-click the VM Guest entry.
  2. Select Delete from the pop-up menu. A confirmation window opens.
  3. Click Delete.
  4. To completely erase the guest, delete the associated .raw file by selecting the Delete Associated Storage Files check box.

**Manage the NetScaler VPX guest VMs using the virsh program**

- **List the VM Guests and their current states.**
To use virsh to display information about the Guests

```
virsh list --all
```

The command output displays all domains with their states.

Example output:

<table>
<thead>
<tr>
<th>Id</th>
<th>Name</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Domain-0</td>
<td>running</td>
</tr>
<tr>
<td>1</td>
<td>Domain-1</td>
<td>paused</td>
</tr>
<tr>
<td>2</td>
<td>Domain-2</td>
<td>inactive</td>
</tr>
<tr>
<td>3</td>
<td>Domain-3</td>
<td>crashed</td>
</tr>
</tbody>
</table>

- Open a virsh console.

Connect the Guest VM through the console

```
virsh console [<DomainID> | <DomainName> | <DomainUUID>]
```

Example:

```
virsh console NetScaler-VPX
```

- Start and shut down a guest.

Guests can be started using the DomainName or Domain-UUID.

```
virsh start [<DomainName> | <DomainUUID>]
```

Example

```
virsh start NetScaler-VPX
```

**To shut down a guest:**

```
virsh shutdown [<DomainID> | <DomainName> | <DomainUUID>]
```

Example:

```
virsh shutdown NetScaler-VPX
```

- Reboot a guest

```
virsh reboot [<DomainID> | <DomainName> | <DomainUUID>]
```

Example:

```
virsh reboot NetScaler-VPX
```

Delete a guest

To delete a Guest VM you need to shut-down the Guest and un-define the

```
<DomainName>NSVPX-KVM-*_nc.xml
```

before you run the delete command.

```
1 virsh shutdown [<DomainID> | <DomainName> | <DomainUUID>]
2 virsh undefine [<DomainName> | <DomainUUID>]
```

Example:
Deploy a NetScaler VPX instance on AWS

January 6, 2019

You can launch a Citrix NetScaler VPX instance on Amazon Web Services (AWS). The NetScaler VPX appliance is available as an Amazon Machine Image (AMI) in AWS marketplace. A NetScaler VPX instance on AWS enables customer like you to leverage AWS Cloud computing capabilities and use NetScaler load balancing and traffic management features for their business needs. The VPX instance supports all the traffic management features of a physical NetScaler appliance, and they can be deployed as standalone instances or in HA pairs.

This section includes the following topics:

- AWS terminology
- How a NetScaler VPX instance on AWS works
- Supported instance type, ENI, and IP addresses

AWS terminology

Here is a brief description of the terms used in this document. For more information, see AWS Glossary.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amazon Machine Image (AMI)</td>
<td>A machine image, which provides the information required to launch an instance, which is a virtual server in the cloud.</td>
</tr>
<tr>
<td>Elastic Block Store</td>
<td>Provides persistent block storage volumes for use with Amazon EC2 instances in the AWS Cloud.</td>
</tr>
<tr>
<td>Simple Storage Service (S3)</td>
<td>Storage for the Internet. It is designed to make web-scale computing easier for developers.</td>
</tr>
<tr>
<td>Term</td>
<td>Definition</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Elastic Compute Cloud (EC2)</td>
<td>A web service that provides secure, resizable compute capacity in the cloud. It is designed to make web-scale cloud computing easier for developers.</td>
</tr>
<tr>
<td>Elastic Load Balancing (ELB)</td>
<td>Distributes incoming application traffic across multiple EC2 instances, in multiple Availability Zones. This increases the fault tolerance of your applications.</td>
</tr>
<tr>
<td>Elastic network interface (ENI)</td>
<td>A virtual network interface that you can attach to an instance in a VPC.</td>
</tr>
<tr>
<td>Elastic IP (EIP) address</td>
<td>A static, public IPv4 address that you have allocated in Amazon EC2 or Amazon VPC and then attached to an instance. Elastic IP addresses are associated with your account, not a specific instance. They are elastic because you can easily allocate, attach, detach, and free them as your needs change.</td>
</tr>
<tr>
<td>Instance type</td>
<td>Amazon EC2 provides a wide selection of instance types optimized to fit different use cases. Instance types comprise varying combinations of CPU, memory, storage, and networking capacity and give you the flexibility to choose the appropriate mix of resources for your applications.</td>
</tr>
<tr>
<td>Identity and Access Management (IAM)</td>
<td>An AWS identity with permission policies that determine what the identity can and cannot do in AWS. You can use an IAM role to enable applications running on an EC2 instance to securely access your AWS resources. IAM role is required for deploying VPX instances in a high-availability setup.</td>
</tr>
<tr>
<td>Internet Gateway</td>
<td>Connects a network to the Internet. You can route traffic for IP addresses outside your VPC to the Internet gateway.</td>
</tr>
</tbody>
</table>
### Term Definitions

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Key pair</strong></td>
<td>A set of security credentials that you use to prove your identity electronically. A key pair consists of a private key and a public key.</td>
</tr>
<tr>
<td><strong>Route tables</strong></td>
<td>A set of routing rules that controls the traffic leaving any subnet that is associated with the route table. You can associate multiple subnets with a single route table, but a subnet can be associated with only one route table at a time.</td>
</tr>
<tr>
<td><strong>Security groups</strong></td>
<td>A named set of allowed inbound network connections for an instance.</td>
</tr>
<tr>
<td><strong>Subnets</strong></td>
<td>A segment of the IP address range of a VPC that EC2 instances can be attached to. You can create subnets to group instances according to security and operational needs.</td>
</tr>
<tr>
<td><strong>Virtual Private Cloud (VPC)</strong></td>
<td>A web service for provisioning a logically isolated section of the AWS cloud where you can launch AWS resources in a virtual network that you define.</td>
</tr>
<tr>
<td><strong>Auto Scaling</strong></td>
<td>A web service to launch or terminate Amazon EC2 instances automatically based on user-defined policies, schedules, and health checks.</td>
</tr>
<tr>
<td><strong>CloudFormation</strong></td>
<td>A service for writing or changing templates that create and delete related AWS resources together as a unit.</td>
</tr>
</tbody>
</table>

### How a NetScaler VPX instance on AWS works

The NetScaler VPX instance is available as an AMI in AWS marketplace, and it can be launched as an EC2 instance within an AWS VPC. The NetScaler VPX AMI instance requires a minimum of 2 virtual CPUs and 2 GB of memory. An EC2 instance launched within an AWS VPC can also provide the multiple interfaces, multiple IP addresses per interface, and public and private IP addresses needed for VPX configuration. Each VPX instance requires at least three IP subnets:

- A management subnet
- A client-facing subnet (VIP)
NetScaler 11.1

- A back-end facing subnet (SNIP, MIP, etc.)

Citrix recommends three network interfaces for a standard VPX instance on AWS installation.

AWS currently makes multi-IP functionality available only to instances running within an AWS VPC. A VPX instance in a VPC can be used to load balance servers running in EC2 instances. An Amazon VPC allows you to create and control a virtual networking environment, including your own IP address range, subnets, route tables, and network gateways.

Note: By default, you can create up to 5 VPC instances per AWS region for each AWS account. You can request higher VPC limits by submitting Amazon’s request form [http://aws.amazon.com/contact-us/vpc-request](http://aws.amazon.com/contact-us/vpc-request).

**Figure 1.** A Sample NetScaler VPX Instance Deployment on AWS Architecture

Figure 1 shows a simple topology of an AWS VPC with a NetScaler VPX deployment. The AWS VPC has:

1. A single Internet gateway to route traffic in and out of the VPC.
2. Network connectivity between the Internet gateway and the Internet.
3. Three subnets, one each for management, client, and server.
4. Network connectivity between the Internet gateway and the two subnets (management and client).
5. A standalone NetScaler VPX instance deployed within the VPC. The VPX instance has three ENIs, one attached to each subnet.

**Supported instance type, ENI, and IP addresses**

For more information about Amazon EC2 instances and IP addresses supported per NIC per instance type:

- **Instance types**
- **IP addresses per network interface per instance type**

For higher bandwidth, Citrix recommends the following instance types:

<table>
<thead>
<tr>
<th>Instance type</th>
<th>Bandwidth</th>
<th>Enhanced networking (SR-IOV)</th>
</tr>
</thead>
<tbody>
<tr>
<td>M4.10x large</td>
<td>3 Gbps and 5 Gbps</td>
<td>Yes</td>
</tr>
<tr>
<td>C4.8x large</td>
<td>3 Gbps and 5 Gbps</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Limitations and usage guidelines

September 10, 2019

The following limitations and usage guidelines apply when deploying a NetScaler VPX instance on AWS:

- Before you start, read the AWS terminology section in Deploy a NetScaler VPX instance on AWS.
- The clustering feature is not supported for VPX.
- For the high availability setup to work effectively, associate a dedicated NAT device to management Interface or associate EIP to NSIP. For more information on NAT, in the AWS documentation, see NAT Instances.
- Data traffic and management traffic must be segregated with ENIs belonging to different subnets.
- Only the NSIP address should be present on the management ENI.
- If a NAT instance is used for security instead of assigning an EIP to the NSIP, appropriate VPC level routing changes are required. For instructions on making VPC level routing changes, in the AWS documentation, see Scenario 2: VPC with Public and Private Subnets.
- A VPX instance can be moved from one EC2 instance type to another (for example, from m3.large to an m3.xlarge).
- For storage options for VPX on AWS, Citrix recommends EBS, because it is durable and the data is available even after it is detached from instance.
- Dynamic addition of ENIs to VPX is not supported. You have to restart the VPX instance to apply the update. Citrix recommends you to stop the standalone or HA instance, attach the new ENI, and then restart the instance.
- You can assign multiple IP addresses to an ENI. The maximum number of IP addresses per ENI is determined by the EC2 instance type, see the section “IP Addresses Per Network Interface Per Instance Type” in Elastic Network Interfaces. You must allocate the IP addresses in AWS before you assign them to ENIs. For more information, see Elastic Network Interfaces.
- Citrix recommends that you avoid using the enable and disable interface commands on NetScaler VPX interfaces.
- The NetScaler “set ha node <NODE_ID> -haStatus STAYPRIMARY” and “set ha node <NODE_ID> -haStatus STAYSECONDARY” commands are disabled by default.
- Due to Amazon AWS limitations, these features are not supported:
  - IPV6
- Gratuitous ARP (GARP)
- L2 mode
- Tagged VLAN
- Dynamic Routing
- Virtual MAC

• For RNAT to work, ensure **Source/Destination Check is disabled.** For more information, see “Changing the Source/Destination Checking” in *Elastic Network Interfaces*.  

• In a NetScaler VPX deployment on AWS, in some AWS regions, the AWS infrastructure might not be able to resolve AWS API calls. This happens if the API calls are issued through a nonmanagement interface on the NetScaler VPX instance. As a workaround, restrict the API calls to the management interface only. To do that, create a nsvlan on the VPX instance and bind the management interface to the nsvlan by using the appropriate command.  
  For example:  
  ```
  set ns config -nsvlan <vlan id> -ifnum 1/1 -tagged NO
  save config
  ```
  Restart the VPX instance at the prompt. For more information about configuring nsvlan, see *Configuring NSVLAN*.  

• In the AWS console, the vCPU usage shown for a VPX instance under the **Monitoring** tab might be very high (up to 100 percent), even when the actual usage is much lower. To see the actual vCPU usage, use the VPX GUI or CLI. 

### Deploy a NetScaler VPX standalone instance on AWS

May 29, 2019

You can deploy a Citrix NetScaler VPX standalone instance on AWS by using the following options:  

1. AWS web console  
2. Citrix-authored CloudFormation template  
3. AWS CLI

This topic describes the procedure for deploying a NetScaler VPX instance on AWS.  

Before you start your deployment, read the following topics:

- **Prerequisites**
- **Limitation and usage guidelines**
Deploy a NetScaler VPX instance on AWS by using the AWS web console

You can deploy a NetScaler VPX instance on AWS through the AWS web console. The deployment process includes the following steps:

1. Create a Key Pair
2. Create a Virtual Private Cloud (VPC)
3. Add additional subnets
4. Create security groups and security rules
5. Add route tables
6. Create an internet gateway
7. Create a NetScaler VPX instance
8. Create and attach additional network interfaces
9. Attach elastic IPs to the management NIC
10. Connect to the VPX instance

Step 1: Create a key pair.

Amazon EC2 uses a key pair to encrypt and decrypt logon information. To log on to your instance, you must create a key pair, specify the name of the key pair when you launch the instance, and provide the private key when you connect to the instance.

When you review and launch an instance by using the AWS Launch Instance wizard, you are prompted to use an existing key pair or create a new key pair. More information about how to create a key pair, see Amazon EC2 Key Pairs.

Step 2: Create a VPC.

A NetScaler VPC instance is deployed inside an AWS VPC. A VPC allows you to define virtual network dedicated to your AWS account. For more information about AWS VPC, see Getting Started With Amazon VPC.

While creating a VPC for your NetScaler VPX instance, keep the following points in mind.

- Use the VPC with a Single Public Subnet Only option to create a new AWS VPC in an AWS availability zone.
- Citrix recommends that you create at least three subnets, of the following types:
  - One subnet for management traffic. You place the management IP (NSIP) on this subnet. By default elastic network interface (ENI) eth0 is used for management IP.
  - One or more subnets for client-access (user-to-NetScaler VPX) traffic, through which clients connect to one or more virtual IP (VIP) addresses assigned to NetScaler load balancing virtual servers.
  - One or more subnets for the server-access (VPX-to-server) traffic, through which your servers connect to VPX-owned subnet IP (SNIP) addresses. For more information about
NetScaler load balancing and virtual servers, virtual IP addresses (VIPS), and subnet IP addresses (SNIPS), see:
- All subnets must be in the same availability zone.

**Step 3: Add subnets.**

When you used the VPC wizard, only one subnet was created. Depending on your requirement, you might want to create additional subnets. For more information about how to create additional subnets, see *Adding a Subnet to Your VPC*.

**Step 4: Create security groups and security rules.**

To control inbound and outbound traffic, create security groups and add rules to the groups. For more information how to create groups and add rules, see *Security Groups for Your VPC*.

For NetScaler VPX instances, the EC2 wizard gives default security groups, which are generated by AWS Marketplace and is based on recommended settings by Citrix. However, you can create additional security groups based on your requirements.

*Note*

Port 22, 80, 443 to be opened on the Security group for SSH, HTTP, and HTTPS access respectively.

**Step 5: Add route tables.**

Route table contains a set of rules, called routes, that are used to determine where network traffic is directed. Each subnet in your VPC must be associated with a route table. For more information about how to create a route table, see *Route Tables*.

**Step 6: Create an internet gateway.**

An internet gateway serves two purposes: to provide a target in your VPC route tables for internet-routable traffic, and to perform network address translation (NAT) for instances that have been assigned public IPv4 addresses.

Create an internet gateway for internet traffic. For more information about how to create an Internet Gateway, see the section *Attaching an Internet Gateway*.

**Step 7: Create a NetScaler VPX instance by using the AWS EC2 service.**

To create a NetScaler VPX instance by using the AWS EC2 service, complete the following steps.

1. From the AWS dashboard, go to Compute > EC2 > Launch Instance > AWS Marketplace.

Before you click *Launch Instance*, ensure your region is correct by checking the note that appears under Launch Instance.

2. In the Search AWS Marketplace bar, search with the keyword NetScaler VPX.

3. Select the version you want to deploy and then click *Select*. For the NetScaler VPX version, you the following options:
• A licensed version
• NetScaler VPX Express appliance (This is a free virtual appliance, which is available from NetScaler 12.0 56.20.)
• Bring your own device

The Launch Instance wizard starts. Follow the wizard to create an instance. The wizard prompts you to:

• Choose Instance Type
• Configure Instance
• Add Storage
• Add Tags
• Configure Security Group
• Review

**Step 8: Create and attach additional network interfaces.**

Create two additional network interfaces for VIP and SNIP. For more information about how to create additional network interfaces, see the Creating a Network Interface section.

After you’ve created the network interfaces, you must attach them to the VPX instance. Before attaching the interface, shut down the VPX instance, attach the interface, and power on the instance. For more information about how to attach network interfaces, see the Attaching a Network Interface When Launching an Instance section.

**Step 9: Allocate and associate elastic IPs.**

If you assign a public IP address to an EC2 instance, it remains assigned only until the instance is stopped. After that, the address is released back to the pool. When you restart the instance, a new public IP address is assigned.

In contrast, an elastic IP (EIP) address remains assigned until the address is disassociated from an instance.

Allocate and associate an elastic IP for the management NIC. For more information about how to allocate and associate elastic IP addresses, see these topics:

• Allocating an Elastic IP Address
• Associating an Elastic IP Address with a Running Instance

These steps complete the procedure to create a NetScaler VPX instance on AWS. It can take a few minutes for the instance to be ready. Check that your instance has passed its status checks. You can view this information in the Status Checks column on the Instances page.

**Step 10: Connect to the VPX instance.**

After you’ve created the VPX instance, you connect the instance by using the GUI and an SSH client.

• GUI
The following are the default administrator credentials to access a NetScaler VPX instance

User name: nsroot

Password: The default password for the nsroot account is set to the AWS instance-ID of the NetScaler VPX instance.
  - SSH client

From the AWS management console, select the NetScaler VPX instance and click Connect. Follow the instructions given on the Connect to Your Instance page.

For more information about how to deploy a NetScaler VPX standalone instance on AWS by using the AWS web console, see:
  - Scenario: standalone instance
  - How to configure a Citrix NetScaler VPX instance on AWS by using Citrix CloudFormation template

Configure a NetScaler VPX instance by using the Citrix CloudFormation template

You can use the Citrix-provided CloudFormation template to automate VPX instance launch. The template provides functionality to launch a single NetScaler VPX instance, or to create a high availability environment with a pair of NetScaler VPX instances.

You can launch the template from AWS Marketplace or GitHub.

The CloudFormation template requires an existing VPC environment, and it launches a VPX instance with three elastic network interfaces (ENIs). Before you start the CloudFormation template, ensure that you complete the following requirements:
  - An AWS virtual private cloud (VPC)
  - Three subnets within the VPC: one for management, one for client traffic, and one for back-end servers
  - An EC2 key pair to enable SSH access to the instance
  - A security group with UDP 3003, TCP 3009-3010, HTTP, SSH ports open

See the “Deploy a NetScaler VPX Instance on AWS by Using the AWS Web Console” section or AWS documentation for more information about how to complete the prerequisites.

Watch this video to learn about how to configure and launch a NetScaler VPX standalone instance by using the Citrix CloudFormation template available in the AWS Marketplace.

Further, you configure and launch a NetScaler VPX Express standalone instance by using the Citrix CloudFormation template available in GitHub:

https://github.com/citrix/netscaler-aws-cloudformation/tree/master/templates/express_single_nic
An IAM role is not mandatory for a standalone deployment. However, Citrix recommends that you create and attach an IAM role with the required privileges to the instance, for future need. The IAM role ensures that the standalone instance is easily converted to a high availability node with SR-IOV, when required.

For more information about the required privileges, see Configuring NetScaler VPX instances to Use SR-IOV Network Interface.

**Configure a NetScaler VPX instance by using the AWS CLI**

You can use the AWS CLI to launch instances. For more information, see the AWS Command Line Interface Documentation.

**Download a NetScaler VPX license**

December 18, 2018

After the initial instance launch, NetScaler VPX for AWS requires a license. If you are bringing your own license (BYOL), see the VPX Licensing Guide at http://support.citrix.com/article/CTX122426

You have to:

1. Use the licensing portal within MyCitrix to generate a valid license.
2. Upload the license to the instance.

If this is a paid marketplace instance, then you do not need to install a license. The correct feature set and performance will activate automatically.

If you use a NetScaler VPX instance with a model number higher than VPX 5000, the network throughput might not be the same as specified by the instance’s license. However, other features, such as SSL throughput and SSL transactions per second, might improve.

5 Gbps network bandwidth is observed in c4.8xlarge instance type.

**Load balancing servers in different availability zones**

December 18, 2018

A VPX instance can be used to load balance servers running in the same availability zone, or in:

- A different availability zone (AZ) in the same AWS VPC
To enable a VPX instance to load balance servers running outside the AWS VPC that the VPX instance is in, configure the instance to use EIPs to route traffic through the Internet gateway, as follows:

1. Configure a SNIP on the NetScaler VPX instance by using the NetScaler CLI or the GUI.
2. Enable traffic to be routed out of the AZ, by creating a public facing subnet for the server-side traffic.
3. Add an Internet gateway route to the routing table, using the AWS GUI console.
4. Associate the routing table you just updated with the server-side subnet.
5. Associate an EIP with the server-side private IP address that is mapped to a NetScaler SNIP address.

Deploy a high availability pair on AWS

January 6, 2019

You can configure two NetScaler VPX instances on AWS as a high availability active-passive pair. With one instance configured as the primary node and the other as the secondary node, the primary node accepts connections and manages servers while the secondary node monitors the primary. If, for any reason, the primary node is unable to accept connections, the secondary node takes over.

For more information on HA, see High availability.

Before you start your deployment, read the following topics:

- Prerequisites for the required IAM role privileges.
- Limitations and usage guidelines

The following figure shows an example of the HA deployment architecture for NetScaler VPX instances on AWS.

Figure 1. A NetScaler VPX HA Pair on AWS

To deploy HA for two VPX instances on AWS, you either create the instances with IAM Role manually by using the AWS Management Console and then configure HA on them, or you can automate the HA deployment by using the Citrix CloudFormation template.

The CloudFormation template significantly decreases the number of steps involved for creating an HA pair, and it automatically creates an IAM Role. This section shows how to deploy a NetScaler VPX HA (active-passive) pair by using the Citrix CloudFormation template.

Keep the following points in mind while deploying two NetScaler VPX instances as an HA pair.
Points to note

- HA on AWS requires the primary node to have at least two ENIs (one for management and the other for data traffic), and the secondary node to have one management ENI. However, for security purposes, create three ENIs on the primary node, because this setup allows you to segregate private and public network (recommended).
- The secondary node always has one ENI interface (for management) and the primary node can have up to four ENIs.
- The NSIP addresses for each VPX instance in a high availability pair must be configured on the default ENI of the instance.
- Because Amazon does not allow any broadcast/multicast packets in AWS, HA is implemented by migrating data-plane ENIs from the primary to the secondary (new primary) VPX instance when the primary VPX instance fails.
- Because the default (management) ENI cannot be moved to another VPX instance, do not use the default ENI for client and server traffic (data-plane traffic).
- The message AWSConfig IOCTL NSAPI_HOTPLUG_intf success output 0 in the /var/log/ns.log indicates that the two data ENIs have successfully attached to the secondary instance (the new primary).
- Failover might take up to 20 seconds due to the AWS detach/attach ENI mechanism.
- Upon failover, the failed instance always restarts.
- The heartbeat packets are received only on the management interface.
- The configuration file of the primary and secondary VPX instances is synchronized, including the nsroot password. The nsroot password of the secondary node is set to that of the primary node after the HA configuration synchronization.
- To have access to the AWS API servers, either the VPX instance must have a public IP address assigned or routing must be set up correctly at VPC subnet level pointing to internet gateway of the VPC.
- Nameservers/DNS servers are configured at VPC level using DHCP options.
- The Citrix CloudFormation template does not create an HA setup between different availability zones.
- The Citrix CloudFormation template does not create an INC mode.
- The AWS debug messages are available in the log file, /var/log/ns.log, on the VPX instance.

Deploy a high availability pair by using the Citrix CloudFormation template

Before start the CloudFormation template, ensure that you complete the following requirements:

- A VPC
- Three subnets within the VPC
- A security group with UDP 3003, TCP 3009-3010, HTTP, SSH ports open
- A key pair

**Note**

The Citrix CloudFormation template automatically creates an IAM Role. The template has no option to select an existing IAM Role.

**To launch the Citrix CloudFormation template:**

1. Log on to the [AWS marketplace](https://aws.amazon.com/marketplace/) by using your AWS credentials.
2. In the search field, type **NetScaler VPX** to search for the NetScaler AMI, and click **Go**.
3. On the search result page, click the desired NetScaler VPX offering.
4. Under **For Region**, select your region.
5. Select the **Delivery Methods** as **NetScaler AWS-VPX Cluster** and click **Continue**.
6. On the **Launch on EC2** page, under **Version**, select the correct NetScaler. Ensure that the **Region** and **Deployment Options** are correct. Check pricing details.
7. Click **Launch with CloudFormation Console** to launch the Citrix CloudFormation template.
8. The **Select Template** page appears. Click **Next**.
9. The **Specify Details** appears. Enter the following details.
   a. Type a **Stack name**. The name must be within 25 characters.
   b. Under **High Availability Configuration**, Select **Yes** from the menu for **Create HA pair?**
   c. Under **Virtual Private Network Configuration**, Select the VPC that you’ve already created for **VPC ID**.
      Type **Remote SSH CIDR IP**.
      Type **Remote HTTP CIDR IP**.
      Type **Remote HTTPS CIDR IP**.
      Select the key pair that you’ve already created from the drop-down menu for **Key Pair**.
   d. Under **Network Interface Configuration**, Select **Management Subnetwork**, **Client Subnetwork**, and **Server Subnetwork**. Ensure that you select the correct subnetworks you created within the VPC that you selected under VPC ID in step c.
      **Add Primary Management IP**, **Secondary Management IP**, **Client IP**, and **Server IP**. The IP addresses must belong to the same subnets of the respective subnetworks. Alternatively, you can let the template assign the IP addresses automatically.
   e. Under **Other Parameters**, Select **m4.large** for **Instant Type**.
Select **default** for **Tenancy Type**.

f. Click **Next**.

8. The **Options** page appears. (This is an optional page.). Click **Next**.

9. The **Review** page appears. Take a moment to review the settings and make necessary changes if necessary.

10. Select the **I acknowledge that AWS CloudFormation might create IAM resources**. check box, and then click **Create**.

11. The **CREATE-IN-PROGRESS** status appears. Wait until the status is **CREATE-COMPLETE**. If the status does not change to “COMPLETE,” check the **Events** tab for the reason of failure and recreate the instance with proper configurations.

11. After an IAM resource is created, go to **EC2 Management Console > Instances**. You should notice two VPX instances created with IAM role. The primary node is created with three private IP addresses and three network interfaces.

The secondary node is created with one private IP address and one network interface.

**Note**

The secondary node is created with one interface by default in AWS. During failover, the interface from the primary node gets attached to the secondary node (the new primary node) and gets detached from the original primary node (the new secondary node).

13. Log on to the primary node with user name nsroot and the instance ID as the password. From the GUI, go to **System > High Availability**. The NetScaler VPX HA pair appears.

Next, configure the HA pairing on both the instances. Configure the instance with three ENIs before configuring HA on the instance with one ENI). Use the add HA node command, from within the VPX CLI, or from the GUI.

```
add HA node <private IP of the first instance>
add HA node <private IP of the second instance>
```

After you run the “add HA node” commands, the two nodes form an HA pair, and configuration information is synchronized between the two VPX instances.

**Configuring SR-IOV on a high availability setup**

Support for SR-IOV interfaces in a high availability setup is available from NetScaler release 12.0 57.19 onwards. For more information about how to configure SR-IOV, see Configuring NetScaler VPX instances to Use SR-IOV Network Interface.
Upgrade a NetScaler VPX instance on AWS

December 18, 2018

You can upgrade the EC2 instance type, throughput, software edition, and the system software of a NetScaler VPX running on AWS. For certain types of upgrades, Citrix recommends using the High Availability Configuration method to minimize downtime.

Note:
- NetScaler software release 10.1.e-124.1308.e or later for a NetScaler VPX AMI (including both utility license and customer license) does not support the M1 and M2 instance families.
- Because of changes in VPX instance support, downgrading from 10.1.e-124 or a later release to 10.1.123.x or an earlier release is not supported.
- Most of the upgrades do not require the launch of a new AMI, and the upgrade can be done on the current NetScaler AMI instance. If you do want to upgrade to a new NetScaler AMI instance, use the high availability configuration method.

Change the EC2 instance type of a NetScaler VPX instance on AWS

If your NetScaler VPX instances are running release 10.1.e-124.1308.e or later, you can change the EC2 instance type from the AWS console as follows:

1. Stop the VPX instance.
2. Change the EC2 instance type from the AWS console.
3. Start the instance.

You can also use the above procedure to change the EC2 instance type for a release, earlier than 10.1.e-124.1308.e, unless you want to change the instance type to M3. In that case, you must first follow the standard NetScaler upgrade procedure, at , to upgrade the NetScaler software to 10.1.e-124 or a later release, and then follow the above steps.

Upgrade the throughput or software edition of a NetScaler VPX instance on AWS

To upgrade the software edition (for example, to upgrade from Standard to Platinum edition) or throughput (for example, to upgrade from 200 mbps to 1000mbps), the method depends on the instance’s license.
Using a customer license (Bring-Your-Own-License)

If you are using a customer license, you can purchase and download the new license from the Citrix Licensing portal (MyCitrix), and then install the license on the VPX instance. For more information about downloading and installing a license from the MyCitrix portal, see the VPX Licensing Guide.

Using a utility license (Utility license with hourly fee)

AWS does not support direct upgrades for fee-based instances. To upgrade the software edition or throughput of a fee based NetScaler VPX instance, launch a new AMI with the desired license and capacity and migrate the older instance configuration to the new instance. This can be achieved by using a NetScaler high availability configuration as described in Upgrade to a new NetScaler AMI instance by using a NetScaler high availability configuration subsection in this page.

Upgrade the system software of a NetScaler VPX instance on AWS

If you need to upgrade a VPX instance running 10.1.e-124.1308.e or a later release, follow the standard NetScaler upgrade procedure at .

If you need to upgrade a VPX instance running a release older than 10.1.e-124.1308.e to 10.1.e-124.1308.e or a later release, first upgrade the system software, and then change the instance type to M3 as follows:

1. Stop the VPX instance.
2. Change the EC2 instance type from the AWS console.
3. Start the instance.

Upgrade to a new NetScaler AMI instance by using a NetScaler high availability configuration

To use the high availability method of upgrading to a new NetScaler AMI instance, perform the following tasks:

- Create a new instance with the desired EC2 instance type, software edition, throughput, or software release from the AWS marketplace.
- Configure high availability between the old instance (to be upgraded) and the new instance. After high availability is configured between the old and the new instance, configuration from the old instance is synchronized to the new instance.
- Force an HA failover from the old instance to the new instance. As a result, the new instance becomes primary and starts receiving traffic.
- Stop, and reconfigure or remove the old instance from AWS.
Prerequisites and points to consider

- Ensure you understand how high availability works between two NetScaler VPX instances on AWS. For more information about high availability configuration between two NetScaler VPX instances on AWS, see Deploy a high availability pair on AWS.
- You must create the new instance in the same availability zone as the old instance, having the exact same security group and subnet.
- High availability setup requires access and secret keys associated with the user’s AWS Identity and Access Management (IAM) account for both instances. If the correct key information is not used when creating VPX instances, the HA setup fails. For more information about creating an IAM account for a VPX instance, see Prerequisites.
  - You must use the EC2 console to create the new instance. You cannot use the AWS 1-click launch, because it does not accept the access and secret keys as the input.
  - The new instance should have only one ENI interface.

To upgrade a NetScaler VPX Instance by using a high availability configuration, follow these steps:

1. Configure high availability between the old and the new instance. To configure high availability between two NetScaler VPX instances, at the command prompt of each instance, type:
   - add ha node <nodeID> <IPaddress of the node to be added>
   - save config

Example:

At the command prompt of the old instance, type:

```
1 add ha node  30 192.0.2.30
2 Done
```

At the command prompt of the new instance, type:

```
1 add ha node 10 192.0.2.10
2 Done
```

Note the following:

- In the HA setup, the old instance is the primary node and the new instance is the secondary node.
- The NSIP IP address is not copied from the old instance to the new instance. Therefore, after the upgrade, your new instance has a different management IP address from the previous one.
- The nsroot account password of the new instance is set to that of the old instance after HA synchronization.

For more information about high availability configuration between two NetScaler VPX instances on AWS, see Deploy a high availability pair on AWS.
2. Force an HA failover. To force a failover in a high availability configuration, at the command prompt of either of the instances, type:

```
force HA failover
```

As the result of forcing a failover, the ENIs of the old instance are migrated to the new instance and traffic flows through the new instance (the new primary node). The old instance (the new secondary node) restarts.

If the following warning message appears, type N to abort the operation:

```
[WARNING]: Force Failover may cause configuration loss, peer health not optimum. Reason(s):
1. HA version mismatch
2. HA heartbeats not seen on some interfaces
3. Please confirm whether you want force-failover (Y/N)?
```

The warning message appears because the system software of the two VPX instances is not HA compatible. As a result, the configuration of the old instance cannot be automatically synced to the new instance during a forced failover.

Following is the workaround for this issue:

1. At the NetScaler shell prompt of the old instance, type the following command to create a backup of the configuration file (ns.conf):
   
   `copy /nsconfig/ns.conf to /nsconfig/ns.conf.bkp`

2. Remove the following line from the backup configuration file (ns.conf.bkp):
   
   ```
   set ns config -IPAddress <IP> -netmask <MASK>
   ```
   For example, set ns config -IPAddress 192.0.2.10 -netmask 255.255.255.0

3. Copy the old instance’s backup configuration file (ns.conf.bkp) to the /nsconfig directory of the new instance.

4. At the NetScaler shell prompt of the new instance, type the following command to load the old instance’s configuration file (ns.conf.bkp) on the new instance:
   
   ```
   batch -f /nsconfig/ns.conf.bkp
   ```

5. Save the configuration on the new instance.
   
   ```
   Save config
   ```

6. At the command prompt of either of the nodes, type the following command to force a failover, and then type Y for the warning message to confirm the force failover operation:
   
   ```
   force ha failover
   ```

**Example:**
WARNING: Force Failover may cause configuration loss, peer health not optimum.

Reason(s):
- HA version mismatch
- HA heartbeats not seen on some interfaces

Please confirm whether you want force-failover (Y/N)? Y

3. Remove the HA configuration, so that the two instances are no longer in an HA configuration. First remove the HA configuration from the secondary node and then remove the HA configuration from the primary node.

To remove an HA configuration between two NetScaler VPX instances, at the command prompt of each instance, type:

```
> remove ha node <nodeID>
> save config
```

For more information about high availability configuration between two VPX instances on AWS, see Deploy a high availability pair on AWS.

**Example:**

At the command prompt of the old instance (new secondary node), type:

```
> remove ha node 30
Done
> save config
Done
```

At the command prompt of the new instance (new primary node), type:

```
> remove ha node 10
Done
> save config
Done
```

**Troubleshoot a VPX instance on AWS**

January 6, 2019
Amazon does not provide console access to a NetScaler VPX instance. To troubleshoot, you have to use the AWS GUI to view the activity log. You can debug only if the network is connected. To view an instance’s system log, right-click the instance and select system log.

Citrix provides support for fee based NetScaler VPX instances (utility license with hourly fee) on AWS. To file a support case, find your AWS account number and support PIN code, and call Citrix support. You will also be asked for your name and email address. To find the support PIN, log on to the VPX GUI and navigate to the System page.

Here is an example of a system page showing the support PIN.

### Deploying Citrix NetScaler VPX on Microsoft Azure

**June 12, 2019**

Microsoft Azure Resource Manager (ARM) is a management framework that allows administrators to deploy, manage and monitor Azure resources. Azure Resource Manager can handle these tasks as a group, rather than individually, in a single operation.

The NetScaler VPX virtual appliance is available as an image in the Microsoft Azure Marketplace. When you deploy NetScaler VPX on Microsoft Azure Resource Manager (ARM), you can leverage the Azure cloud computing capabilities and use NetScaler load balancing and traffic management features for your business needs. You can deploy NetScaler VPX instances on Azure Resource Manager either as standalone instances or as high availability pairs in active-active or active-standby modes.

**Note**

This document describes how NetScaler VPX works when deployed with Azure Resource Manager (ARM). For information about NetScaler VPX deployment and architecture in Azure Cloud Services, see the details provided in Deploying NetScaler VPX on Azure 10.5 release.

This document assumes that you are familiar with Azure terminology and network details. For information about Microsoft Azure services, see Microsoft Azure Documentation Center.

This document also assumes that you have basic knowledge of a NetScaler appliance. For detailed information about NetScaler appliances, see:

- NetScaler
- NetScaler Gateway

This document provides information about:
Network Architecture

In ARM, a NetScaler VPX virtual machine (VM) resides in a virtual network. A virtual Network Interface Card (NIC) is created on each NetScaler VM. The network security group (NSG) configured in the virtual network is bound to the NIC, and together they control the traffic flowing into the VM and out of the VM.

The NSG forwards the requests to the NetScaler VPX instance, and the VPX instance sends them to the servers. The response from a server follows the same path in reverse. The NSG can be configured to control a single VPX VM, or, with subnets and virtual networks, can control traffic in multiple VPX VM deployment.

The NIC contains network configuration details such as the virtual network, subnets, internal IP address, and Public IP address.

While on ARM, it is good to know the following IP addresses used to access the VMs:

- Public IP (PIP) address is the Internet-facing IP address configured directly on the virtual NIC of the NetScaler VM. This allows you to directly access a VM from the external network without the need to configure inbound and outbound rules on the NSG.
- NetScaler IP (NSIP) address is internal IP address configured on the VM. It is non-routable.
- Virtual IP address (VIP) is configured by using the NSIP and a port number. Clients access NetScaler services through the PIP address, and when the request reaches the NIC of the NetScaler VPX VM or the Azure load balancer, the VIP gets translated to internal IP (NSIP) and internal port number.
- Internal IP address is the private internal IP address of the VM from the virtual network's address space pool. This IP address cannot be reached from the external network. This IP address is by default dynamic unless you set it to static. Traffic from the internet is routed to this address.
NetScaler 11.1

according to the rules created on the NSG. The NSG works with the NIC to selectively send the right type of traffic to the right port on the NIC, which depends on the services configured on the VM.

The following figure shows how traffic flows from a client to a server through a NetScaler VPX instance provisioned in ARM.

**How NetScaler VPX Works on Azure**

In an on-premises deployment, a NetScaler VPX instance requires at least three IP addresses:

- Management IP address, called the NetScaler IP (NSIP) address
- Subnet IP (SNIP) address for communicating with the server farm
- Virtual server IP (VIP) address for accepting client requests

In an Azure deployment, you can provision a NetScaler VPX instance in Azure in two ways:

- With a multi-NIC, multi-IP architecture
- With a single-IP architecture

**Note**

VPX virtual appliances can be deployed on any instance type that has two or more cores and more than 2GB memory.

The following image illustrates how multiple IP addresses are used to perform the functions of NSIP, SNIP, and VIP, with a single NIC in a standalone deployment. According to your requirement, you can configure multiple NICs with different IP addresses.

For more information about NetScaler multi-NIC, multi-IP deployment on Azure, see the following links:

- Configuring Multiple IPs for a NetScaler VPX Appliance in Standalone Mode
- Configuring Multiple Azure NICs and IPs in NetScaler VPX in an HA Mode

In single IP mode the three IP functions of a NetScaler appliance are multiplexed onto one IP address. This single IP address is assigned to an instance during provisioning through DHCP, and it is a private (internal) address and it uses different port numbers to function as the NSIP, SNIP, and VIP.

The following image illustrates how a single IP address is used to perform the functions of NSIP, SNIP, and VIP.

**Note**

The single IP mode is available only in Azure deployments. This mode is not available for a NetScaler VPX instance on your premises, on AWS, or in other type of deployment.
Traffic Flow through Port Address Translation

In an Azure deployment, when you provision the NetScaler VPX instance as a virtual machine (VM), Azure assigns a public IP (PIP) address and an internal IP address (non-routable) to the NetScaler virtual machine. Inbound and Outbound rules are defined on the NSG for the NetScaler instance, along with a public port and a private port for each rule defined. The NetScaler instance listens on the internal IP address and private port.

Any external request is received on the NetScaler VPX VM’s virtual NIC. The NIC is bound to the NSG, which specifies the private IP and private port combination into which to translate the request’s destination address and port (the public IP address and port). ARM performs port address translation (PAT) to map the Public IP address and port to the internal IP address and private port of the NetScaler virtual machine, and forwards the traffic to the virtual machine.

The following figure shows how Azure performs port address translation to direct traffic to the NetScaler internal IP address and private port.

In this example, the Public IP address assigned to the VM is 140.x.x.x, and the internal IP address is 10.x.x.x. When the inbound and outbound rules are defined, public HTTP port 80 is defined as the port on which the client requests are received, and a corresponding private port, 10080, is defined as the port on which the NetScaler virtual machine listens. The client request is received on the Public IP address 140.x.x.x at port 80. Azure performs port address translation to map this address and port to internal IP address 10.x.x.x on private port 10080 and forwards the client request.

For information about port usage guidelines while, see Port Usage Guidelines.

For information about NSG and access control lists, see What is a Network Security Group?

Traffic Flow Through Network Address Translation

You can also request a Public IP (PIP) address for your NetScaler virtual machine (instance level). If you use this direct PIP at the VM level, you need not define inbound and outbound rules to intercept the network traffic. The incoming request from the Internet is received on the VM directly. Azure performs network address translation (NAT) and forwards the traffic to the internal IP address of the NetScaler instance.

The following figure shows how Azure performs network address translation to map the NetScaler internal IP address.

In this example, the Public IP assigned to the NSG is 140.x.x.x and the internal IP address is 10.x.x.x. When the inbound and outbound rules are defined, public HTTP port 80 is defined as the port on which the client requests are received, and a corresponding private port, 10080, is defined as the port on which the NetScaler virtual machine listens. The client request is received on the Public IP ad-
NetScaler 11.1

dress (140.x.x.x). Azure performs network address translation to map the PIP to the internal IP address 10.x.x.x on port 10080, and forwards the client request.

Note

NetScaler VPX VMs in high availability are controlled by external or internal load balancers that have inbound rules defined on them to control the load balancing traffic. The external traffic is first intercepted by these load balancers and the traffic is diverted according to the load balancing rules configured, which has backend pools, NAT rules, and health probes defined on the load balancers.

Port Usage Guidelines

You can configure additional inbound and outbound rules in NSG while creating the NetScaler virtual machine or after the virtual machine is provisioned. Each inbound and outbound rule is associated with a public port and a private port.

Before configuring NSG rules, note the following guidelines regarding the port numbers you can use:

1. The following ports are reserved by the NetScaler virtual machine. You cannot define these as private ports when using the Public IP address for requests from the Internet.
   Ports 21, 22, 80, 443, 8080, 67, 161, 179, 500, 520, 3003, 3008, 3009, 3010, 3011, 4001, 5061, 9000, 7000.
   However, if you want Internet-facing services such as the VIP to use a standard port (for example, port 443) you have to create port mapping by using the NSG. The standard port is then mapped to a different port that is configured on the NetScaler for this VIP service.
   For example, a VIP service might be running on port 8443 on the NetScaler instance but be mapped to public port 443. So, when the user accesses port 443 through the Public IP, the request is actually directed to private port 8443. However, if you want Internet-facing services such as the VIP to use a standard port (for example, port 443) you have to create port mapping by using the NSG. The standard port is then mapped to a different port that is configured on the NetScaler for this VIP service.
   **Note:** If you access the NetScaler instance in Network Access mode (Full SSL VPN), you need to map the private port 8443 to the public port 8443.

2. Public IP address does not support protocols in which port mapping is opened dynamically, such as passive FTP or ALG.

3. High availability does not work for traffic that uses a public IP address (PIP) associated with a VPX instance, instead of a PIP configured on the Azure load balancer. For more information about configuring NetScaler VPX HA in ARM, see Configuring NetScaler VPX in High Availability Mode in Azure Resource Manager and Configuring Multiple Azure NICs and IP Addresses for NetScaler VPX Instances in HA Mode.

© 1999-2018 Citrix Systems, Inc. All rights reserved. 569
4. In a NetScaler Gateway deployment, you need not configure a SNIP address, because the NSIP can be used as a SNIP when no SNIP is configured.
   You must configure the VIP address by using the NSIP address and some nonstandard port number. For call-back configuration on the backend server, the VIP port number has to be specified along with the VIP URL (for example, url:port).

Note

In Azure Resource Manager, a NetScaler VPX instance is associated with two IP addresses - a public IP address (PIP) and an internal IP address. While the external traffic connects to the PIP, the internal IP address or the NSIP is non-routable. To configure VIP in VPX, use the internal IP address (NSIP) and any of the free ports available. Do not use the PIP to configure VIP.

Example: If NSIP of a NetScaler VPX is 10.1.0.3 and an available free port is 10022, then you can configure VIP by providing the 10.1.0.3:10022 (NSIP address+port) combination.

Limitations

Running the NetScaler VPX load balancing solution on ARM imposes the following limitations:

1. The Azure architecture does not accommodate support for the following NetScaler features:
   Clustering
   IPv6
   Gratuitous ARP (GARP)
   L2 Mode
   Tagged VLAN
   Dynamic Routing
   Virtual MAC
   USIP
   CloudBridge Connector

2. If you expect that you might have to shut down and temporarily deallocate the NetScaler VPX virtual machine at any time, assign a static Internal IP address while creating the virtual machine. If you do not assign a static internal IP address, Azure might assign the virtual machine a different IP address each time it restarts, and the virtual machine might become inaccessible.

3. In an Azure deployment, only the following NetScaler VPX models are supported: VPX 10, VPX 25, VPX 200, VPX 1000, and VPX 3000. For for information, see the NetScaler VPX Data Sheet. If you use a NetScaler VPX instance with a model number higher than VPX 3000, the network
throughput might not be the same as specified by the instance's license. However, other features, such as SSL throughput and SSL transactions per second, might improve.

4. The “deployment ID” that is generated by Azure during virtual machine provisioning is not visible to the user in ARM. You cannot use the deployment ID to deploy NetScaler VPX appliance on ARM.

5. Active-passive or active-standby HA mode is not supported for VPX configured with multiple NICs and multiple IP addresses.

6. The NetScaler VPX appliance supports 5 Mb/s throughput and standard edition features when it’s initialized.

7. For a XenApp and XenDesktop deployment, a VPN virtual server on a NetScaler appliance can be configured in the following modes:
   • Basic mode, where the ICAOnly VPN virtual server parameter is set to ON. The Basic mode works fully on an unlicensed NetScaler VPX instance.
   • Smart-Access mode, where the ICAOnly VPN virtual server parameter is set to OFF. The Smart-Access mode works for only 5 AAA session users on an unlicensed NetScaler VPX instance.

   **Note**
   To configure the Smart Control feature, you must apply a platinum license to the NetScaler VPX instance.

**Configure a NetScaler VPX standalone instance**

January 18, 2019

You can provision a single NetScaler VPX instance in Azure Resource Manager (ARM) portal in a standalone mode by creating the virtual machine and configuring other resources.

**Before you begin**

Make sure that you have the following:

- A Microsoft Azure user account
- Access to Microsoft Azure Resource Manager
- Microsoft Azure SDK
- Microsoft Azure PowerShell

On the **Microsoft Azure Portal** page, log on to the Azure Resource Manager portal by providing your user name and password.
NetScaler 11.1

Note
In ARM portal, clicking an option in one pane opens a new pane to the right. Navigate from one pane to another to configure your device.

Summary of configuration steps

1. Configure a resource group
2. Configure a network security group
3. Configure virtual network and its subnets
4. Configure a storage account
5. Configure an availability set
6. Configure a NetScaler VPX instance

Configure a resource group

Create a new resource group that is a container for all your resources. Use the resource group to deploy, manage, and monitor your resources as a group.

1. Click New > Management > Resource group.
2. In the Resource group pane, enter the following details:
   • Resource group name
   • Resource group location
3. Click Create.

Configure a network security group

Create a network security group (NSG) to assign inbound and outbound rules to control the incoming and outgoing traffic within the virtual network. NSG allows you to define security rules for a single virtual machine and also to define security rules for a virtual network subnet.

1. Click New > Networking > Network security group.
2. In the Create network security group pane, enter the following details, and then click Create.
   • Name - type a name for the security group
   • Resource group - select the resource group from the drop-down list

Note
Ensure that you have selected the correct location. The list of resources that appear in the drop-down list is different for different locations.
Configure a virtual network and subnets

Virtual networks in ARM provide a layer of security and isolation to your services. VMs and services that are part of the same virtual network can access each other.

For these steps to create a virtual network and subnets.

1. Click **New > Networking > Virtual Network**.
2. In the **Virtual Network** pane, ensure the deployment mode is **Resource Manager** and click **Create**.
3. In the **Create virtual network** pane, enter the following values, and then click **Create**.
   - Name of the virtual network
   - Address space - type the reserved IP address block for the virtual network
   - Subnet - type the name of the first subnet (you will create the second subnet later in this step)
   - Subnet address range - type the reserved IP address block of the subnet
   - Resource group - select the resource group created earlier from the drop-down list

Configure the second subnet

1. Select the newly created virtual network from **All resources** pane and in the **Settings** pane, click **Subnets**.
2. Click **+Subnet** and create the second subnet by entering the following details.
   - Name of the second subnet
   - Address range - type the reserved IP address block of the second subnet
   - Network security group - select the NSG from the drop-down list
3. Click **Create**.

Configure a storage account

The ARM IaaS infrastructure storage includes all services where we can store data in the form of blobs, tables, queues, and files. You can also create applications using these forms of storage data in ARM.

Create a storage account to store all your data.

1. Click **+New > Data + Storage > Storage account**.
2. In the **Create storage account** pane, enter the following details:
   - Name of the account
   - Deployment mode - make sure to select **Resource Manager**
   - Account kind - select **General purpose** from the drop-down list
   - Replication - select **Locally redundant storage** from the drop-down list
   - Resource group - select the newly created resource group from the drop-down list
3. Click **Create**.

### Configure an availability set

An availability set guarantees that at least one VM is kept up and running in case of planned or unplanned maintenance. Two or more VMs under the same ‘availability set’ are placed on different fault domains to achieve redundant services.

1. Click **+New**.
2. Click **See all** in the MARKETPLACE pane and click **Virtual Machines**.
3. Search for availability set, and then select **Availability set** entity from the list displayed.
4. Click **Create**, and in the **Create availability set** pane, enter the following details:
   - Name of the set
   - Resource group - select the newly created resource group from the drop-down list
5. Click **Create**.

### Configure a NetScaler VPX instance

Create an instance of NetScaler VPX in the virtual network. Obtain the NetScaler VPX image from the Azure marketplace, and then use the Azure Resource Manager portal to create a NetScaler VPX instance.

Before you begin creating the NetScaler VPX instance, make sure that you have created a virtual network with required subnets in which the instance will reside. You can create virtual networks during VM provisioning, but without the flexibility to create different subnets. For information about creating virtual networks, see [http://azure.microsoft.com/en-us/documentation/articles/create-virtual-network/](http://azure.microsoft.com/en-us/documentation/articles/create-virtual-network/).

Optionally, configure DNS server and VPN connectivity that allows a virtual machine to access Internet resources.

**Note**

Citrix recommends that you create resource group, network security group, virtual network, and other entities before you provision the NetScaler VPX VM, so that the network information is available during provisioning.

1. Click **+New > Networking**.
2. Click **See All** and in the Networking pane, click **Citrix NetScaler VPX Bring Your Own License**.

As a quick way to find any entity on ARM portal, you can also type the name of the entity in the Azure Marketplace search box and press <Enter>. Type NetScaler in the search box to find the Citrix NetScaler images.
3. On the NetScaler VPX Bring Your Own License page, from the drop-down list, select Resource Manager and click Create.

4. In the Create virtual machine pane, specify the required values in each section to create a virtual machine. Click OK in each section to save your configuration.

**Basic**

- Name - specify a name for the NetScaler VPX instance
- VM disk type - select SSD (default value) or HDD from the drop-down menu
- User name and Password - specify a user name and password to access the resources in the resource group that you have created
- Authentication Type - select SSH Public Key or Password
- Resource group - select the resource group you have created from the drop-down list

You can create a resource group here, but Citrix recommends that you create a resource group from Resource groups in Azure Resource Manager and then select the group from the drop-down list.

**Size**

Depending on the VM disk type, SDD or HDD, you selected in Basic settings, the disk sizes are displayed.

- Select a disk size according to your requirement and click Select.

**Settings**

- Select the default (Standard) disk type
- Storage account - select the storage account
- Virtual network - select the virtual network
- Subnet - set the subnet address
- Public IP address - select the type of IP address assignment
- Network security group - select the security group that you have created. Ensure that inbound and outbound rules are configured in the security group.
- Availability Set - select the availability set from the drop-down box

**Summary**

The configuration settings are validated and the Summary page displays the result of the validation. If the validation fails, the Summary page displays the reason of the failure. Go back to the particular section and make changes as required. If the validation passes, click OK.
Review the offer details and legal terms on the Purchase page and click **Purchase**.

For high availability deployment, create two independent instances of NetScaler VPX in the same availability set and in the same resource group to deploy them in active-standby and active-active configuration.

**Configure multiple IP addresses for a NetScaler VPX standalone instance**

January 6, 2019

This section explains how to configure a standalone NetScaler VPX instance with multiple IP addresses, in Azure Resource Manager (ARM). The VPX instance can have one or more NIC attached to it, and each NIC can have one or more static or dynamic public and private IP addresses assigned to it. You can assign multiple IP addresses as NSIP, VIP, SNIP, and so on.

In a NetScaler instance on Azure, you can assign multiple IP addresses as NSIP, VIP, SNIP, and so on.

For more information, see the Azure documentation [Assign multiple IP addresses to virtual machines using the Azure portal](#).

If you want to use PowerShell commands, see [Configure multiple IP addresses for a NetScaler VPX instance in standalone mode by using PowerShell commands](#).

**Use Case**

In this use case, a standalone NetScaler VPX appliance is configured with a single NIC that is connected to a virtual network (VNET). The NIC is associated with three IP configurations (ipconfig), each servers a different purpose - as shown in the table.

<table>
<thead>
<tr>
<th>IPConfig</th>
<th>Associated with</th>
</tr>
</thead>
<tbody>
<tr>
<td>IPConfig-1</td>
<td>Static public IP address; static private IP address</td>
</tr>
<tr>
<td>IPConfig-2</td>
<td>Static public IP address; static private address</td>
</tr>
<tr>
<td>IPConfig-3</td>
<td>Static private IP address</td>
</tr>
</tbody>
</table>

**Note**

IPConfig-3 is not associated with any public IP address.

**Diagram**: Topology
Here is the visual representation of the use case.

**Note**

In a multi-NIC, multi-IP Azure NetScaler VPX deployment, the private IP associated with the primary (first) IPConfig of the primary (first) NIC is automatically added as the management NSIP of the appliance. The remaining private IP addresses associated with IPConfigs need to be added in the NetScaler appliance as a VIP or SNIP by using the “add ns ip” command, according to your requirement.

**Before you begin**

Before you begin, create a VPX instance by following the steps given at this link:

Configure a NetScaler VPX standalone instance

For this use case, the NSDoc0330VM NetScaler instance is created.

**Procedure to configure multiple IP addresses for a NetScaler VPX instance in standalone mode.**

For configuring multiple IP addresses for a NetScaler VPX appliance in standalone mode:

1. Add IP addresses to the VM
2. Configure NetScaler-owned IP addresses

**Step 1:** Add IP addresses to the VM

1. In the portal, click More services > type virtual machines in the filter box, and then click Virtual machines.

2. In the Virtual machines blade, click the VM you want to add IP addresses to. Click Network interfaces in the virtual machine blade that appears, and then select the network interface.

In the blade that appears for the NIC you selected, click IP configurations. The existing IP configuration that was assigned when you created the VM, ipconfig1, is displayed. For this use case, make sure the IP addresses associated with ipconfig1 are static. Next, create two more IP configurations: ipconfig2 (VIP) and ipconfig3 (SNIP).

To create additional ipconfigs, create Add.

In the Add IP configuration window, enter a Name, specify allocation method as Static, enter an IP address (192.0.0.5 for this use case), and enable Public IP address.

**Note**

Before adding a static private IP address, check for IP address availability and make sure the IP address belongs to the same subnet to which the NIC is attached.

Next, click Configure required settings to create a static public IP address for ipconfig2.
By default, public IPs are dynamic. To make sure that the VM always uses the same public IP address, create a static Public IP.

In the Create public IP address blade, add a Name, under Assignment click **Static**. And then click **OK**.

**Note**

Even when you set the allocation method to static, you cannot specify the actual IP address assigned to the public IP resource. Instead, it gets allocated from a pool of available IP addresses in the Azure location the resource is created in.

Follow the steps to add one more IP configuration for ipconfig3. Public IP is not mandatory.

**Step 2: Configure NetScaler-owned IP addresses**

Configure the NetScaler-owned IP addresses by using the NetScaler GUI or the command “add ns ip.” For more information, see https://docs.citrix.com/en-us/netscaler/11-1/networking/ip-addressing/configuring-netscaler-owned-ip-addresses.html

You’ve now configured multiple IP addresses for a NetScaler VPX instance in standalone mode.

**Configure a high-availability setup with a single IP address and a single NIC**

January 25, 2019

In a Microsoft Azure deployment, a high availability configuration of two NetScaler virtual machines is achieved by using the Azure load balancer, which distributes the client traffic across the virtual servers configured on both the NetScaler instances.

**Note**

For a NetScaler HA deployment on Azure cloud to work, you need a floating public IP (PIP) that can be moved between the two NetScaler HA nodes. The Azure Load Balancer (ALB) provides that floating PIP, which is moved to the second node automatically in the event of a failover.

Two types of Azure load balancers are available for high availability:

- **Azure external load balancer**: If the client traffic originates from the Internet, you have to deploy the external load balancer between the Internet and the NetScaler VPX instances to distribute client traffic.
- **Azure internal load balancer**: If the client traffic originates from within the virtual network, or is forwarded by a gateway or firewall within the virtual network, you have to deploy the internal load balancer to distribute client traffic.
To achieve high availability on Azure, you must add the two NetScaler VMs as a load balanced set and configure the NSG.

When two NetScaler VPX instances are configured in active-active mode, both instances must have the same configuration. The client traffic is distributed across the virtual servers in both the instances by the Azure load balancer. The VIP addresses in both the instances are different and should match the NSIP of that VPX instance.

The active-passive mode provides failover capability. In this mode, the VPX instances synchronize their configuration states. When the primary instance fails, the secondary instance takes over.

For information about high availability in NetScaler appliance, see High Availability.

Before You Begin

Note the following before you begin configuring the NetScaler instances in high availability mode in the Azure virtual network.

- The two NetScaler virtual machines that you want to add to a load balanced set should be provisioned in the same virtual network.
- A load balanced set applies only to a VM’s default NIC. Therefore the VIP has to be configured on the VPX's default NIC.
- In an active-passive deployment, the Azure load balancer monitors both the primary and the secondary NetScaler VM by sending them TCP probes. These TCP probes are sent on port 9000.

Summary of Steps to Configure NetScaler VPX in a High Availability Mode

1. Configure a resource group
2. Configure a network security group
3. Configure virtual network and its subnets
4. Configure a storage account
5. Configure an availability set
6. Configure a NetScaler VPX instance
7. Configure internal and external load balancers
8. Configure health probes
9. Configure backend pools
10. Configure NAT rules
11. Configure load balancing rules

After configuring all the resources, you can configure the VMs in high availability mode with either an external load balancer or with an internal load balancer.
This article provides procedures to configure resources specific to high availability mode. For procedures to configure the other resources, see Configuring NetScaler VPX in a Standalone Mode in Azure Resource Manager.

You need to set up two NetScaler VPX instances for high availability mode. To set up a NetScaler VPX instance, see Configuring a NetScaler VPX Instance.

**Configuring Internal and External Load Balancers**

Create a load balancer to distribute traffic between the virtual machines that are part of the same virtual network. The load balancing features can load balance level 4 traffic and support only TCP and UDP traffic.

**Configuring an Internal Load Balancer**

2. In the Create load balancer pane, enter the following details:
   - Name of the load balancer
   - Scheme - select Internal to configure an internal load balancer
   - Virtual network - select the newly created virtual network from the drop-down list
   - Subnet - select the associated subnet
   - IP address assignment - select Static
   - Private IP address - assign a private IP address for the internal load balancer
   - Resource group - select the newly created resource group from the drop-down list
3. Click Create.

**Configuring an External Load Balancer**

1. To create an external load balancer, follow similar steps as creating an internal load balancer with the following differences:
   - Schema - select Public
   - Public IP address - assign a public IP address to the external load balancer
2. Click Create.

**Configuring a Health Probe on a Load Balancer**

Create custom TCP or HTTP probes to monitor the health of the various server instances. When the VM fails to respond to the probe for three consecutive times, the Azure load balancer will not send the traffic to the nonresponsive VM.
1. Click **All resources** and search for the load balancer that you created by typing the name in the search box.
2. In the Settings pane, click **Probes**.
3. Click **+Add** and in the **Add probe** pane, enter the following details:
   - Name of the health probe
   - Protocol - select TCP
   - Port - type 9000
   - Set the Interval and Unhealthy threshold limits
4. Click **OK**.

### Configuring a Backend Pool on a Load Balancer

Create backend pools, that is, a pool of IP addresses associated with the virtual machine Network Interface Cards (NIC) to which the load is distributed.

1. Click **All resources** and search for the load balancer that you have created by typing the name in the search box.
2. In the Settings pane, select **Backend pools**.
3. Click **+Add** and in the **Add backend pool** pane, enter the following details:
   - Name of the backend pool
   - Availability set - select the availability set created earlier
   - Virtual machines - select the NetScaler VPX instances that are in high availability deployment. Press `<Ctrl>` to select multiple instances.
4. Click **OK**.

### Configuring a NAT rule on a load balancer

Create custom NAT rules on LB to define the inbound traffic flowing through the front end IP address and distributed to the back end IP address. Make sure that no two NAT rules has the combination of same service and same target port.

**Note**

A front end IP address is the external IP address on the load balancer that faces the incoming traffic and a back end IP address is the VM facing IP address that receives the traffic from the load balancer.

1. Click **All resources** and search for the load balancer that you have created by typing the name in the search box.
2. In the Settings pane, select **Inbound NAT rules**.
3. Click +Add and in the Add inbound NAT rule pane, add a NAT rule for each type of request. You can add multiple NAT rules.

4. Enter the following details, and then click OK.
   - Name of the rule
   - Service - select the required service from the drop-down list
   - Port - type the correct port number
   - Target - select the NetScaler VPX that will be the target of this rule
   - Target port - the target port is automatically populated depending on the service selected

Note

Citrix recommends TCP services for the NetScaler VPX VM on port 9000.

Configuring a Load Balancing Rule on a Load Balancer

By creating a load balancer rule, you can define a combination of a front end IP address and port, and back end IP address and port associated with VMs.

For example, create a rule so that all HTTP requests coming on the public IP will be forwarded to the availability set on their port 80.

1. Click All resources and search for the load balancer that you have created by typing the name in the search box.
2. In the Settings pane, select Load balancing rules.
3. Click +Add and in the Add load balancing rules pane, create load balancing rules for each type of incoming network traffic.
4. Enter the following details:
   - Name of the rule
   - Protocol - select the protocol
   - Port - type the port number based on the port selected
   - Backend pool - select the backend pool from the drop-down list
   - Probe - select the health probe from the drop-down list
5. Click OK.

Configuring NetScaler high availability with the Azure external load balancer

If your client traffic originates from the Internet, you have to deploy the external load balancer to create a high availability configuration of NetScaler virtual machines in a load-balanced set.

The following figure shows how high availability is achieved in active-active mode by using the external load balancer. The two NetScaler VMs are in a load-balanced set that accepts client traffic from
the Internet over port 15000. The Azure external load balancer load balances these client requests between the two virtual machines.

Before you begin configuring the load-balanced set through the Azure portal, do one of the following:

- For an active-passive deployment, configure the NetScaler virtual machines as primary and secondary nodes by using the following command: `add ha node <ID> <IP address>`.
- For an active-active deployment, configure the required services on the two NetScaler virtual machines.

**Configuring NetScaler high availability with the Azure internal load balancer**

If your client traffic originates from within the virtual network with a regional scope, you have to deploy the internal load balancer to achieve high availability of NetScaler virtual machines added to a load-balanced set.

The following figure shows how high availability is achieved in an active-active mode by using the internal load balancer. The two NetScaler virtual machines are in a load-balanced set that accepts client traffic from the Internet at port 15001. The Azure internal load balancer load balances these client requests between the two virtual machines.

Before you begin configuring the load-balanced set by using Azure PowerShell, do one of the following:

- For an active-passive deployment, configure the NetScaler virtual machines as primary and secondary nodes by using the following command: `add ha node <ID> <IP address>`.
- For an active-active deployment, configure the required services on the two NetScaler virtual machines.

You can configure the load-balanced set only by using Azure PowerShell.

**Accessing the NetScaler VPX Virtual Machine**

You can access the NetScaler instance either through its graphical user interface (GUI) or through the command line interface (CLI). You can use the PIP to access the NetScaler virtual machine instance.

To log on to the virtual machine, use your username and password specified while creating the virtual machine.

You can change the password after you log on to the instance.
To access the NetScaler instance through the GUI

In a browser’s address field, type the virtual network public IP address provided by Azure during virtual machine provisioning, or type the PIP address.

Note
Make sure you have created NSG inbound or outbound rules to allow access to the private port 80 or 443 when accessing the GUI by using the virtual network IP.

To access the NetScaler instance through the CLI

Use any command line access tool (for example, Putty). Specify either the virtual network public IP address provided by Azure during NetScaler VPX provisioning, or specify the PIP address. Use SSH protocol with port 22.

Note
Make sure that you have created NSG inbound or outbound rules to allow access to private port 22 when accessing the CLI by using the virtual network IP.

For information about getting started with a NetScaler appliance, see the Getting Started guide.

CConfigure GSLB on NetScaler VPX instances

January 18, 2019

NetScaler appliances configured for global server load balancing (GSLB) provide disaster recovery and continuous availability of applications by protecting against points of failure in a wide area network (WAN). GSLB can balance the load across data centers by directing client requests to the closest or best performing data center, or to surviving data centers in case of an outage.

This section describes how to enable GSLB on VPX instances on two sites in a Microsoft Azure environment, by using Windows PowerShell commands.

Note
For more information about GSLB, see Global Server Load Balancing.

You can configure GSLB on a NetScaler VPX instances on Azure, in two steps:

1. Create a VPX instance with multiple NICs and multiple IP addresses, on each site.
2. Enable GSLB on the VPX instances.
Use Case

This use case includes two sites - Site 1 and Site 2. Each site has a VM (VM1 and VM2) configured with multiple NICs, multiple IP addresses, and GSLB.

**Figure.** GSLB setup implemented across two sites - Site 1 and Site 2.

In this use case, each VM has three NICs - NIC 0/1, 1/1, and 1/2. Each NIC can have multiple private and public IP addresses. The NICs are configured for the following purposes.

- NIC 0/1: to serve management traffic
- NIC 1/1: to serve client-side traffic
- NIC 1/2: to communicate with back-end servers

For information about the IP addresses configured on each NIC in this use case, see the [IP Configuration Details](#) section.

Parameters

Following are sample parameters settings for this use case in this document. You can use different settings if you wish.

```bash
$location="West Central US"
$vnetName="NSVPX-vnet"
$RGName="multiIP-RG"
$prmStorageAccountName="multiipstorageacctn"
$avSetName="MultiIP-avset"
$vmSize="Standard_DS3_V2"
```

**Note:** The minimum requirement for a VPX instance is 2 vCPUs and 2GB RAM.

```bash
$publisher="citrix"
$offer="netscalervpx111"
$sku="netscalerbyol"
```
$version="latest"
$vmNamePrefix="MultiIPVPX"
$nicNamePrefix="MultiipVPX"
$osDiskSuffix="osdiskdb"
$numberOfVMs=1
$ipAddressPrefix="10.0.0."
$ipAddressPrefix1="10.0.1."
$ipAddressPrefix2="10.0.2."
$pubIPName1="MultiIP-pip1"
$pubIPName2="MultiIP-pip2"
$IpConfigName1="IPConfig1"
$IPConfigName2="IPConfig-2"
$IPConfigName3="IPConfig-3"
$IPConfigName4="IPConfig-4"
$frontendSubnetName="default"
$backendSubnetName1="subnet_1"
$backendSubnetName2="subnet_2"
$suffixNumber=10

1. Create a multi-NIC, multi-IP VM by Using PowerShell commands

Follow steps 1-10 to create VM1 with multiple NICs and multi IP addresses, by using PowerShell commands:
1. Create resource group
2. Create storage account
3. Create availability set
4. Create virtual network
5. Create public IP address
6. Create NICs
7. Create VM config object
8. Get credentials and set OS properties for the VM
9. Add NICs
10. Specify OS disk and create VM

After you complete all the steps and commands to create VM1, repeat these steps to create VM2 with parameters specific to it.

**Create Resource Group**

```
New-AzureRMResourceGroup -Name $RGName -Location $location
```

**Create Storage Account**

```
$prmStorageAccount = New-AzureRMStorageAccount -Name $prmStorageAccountName -ResourceGroupName $RGName -Type Standard_LRS -Location $location
```

**Create Availability Set**

```
$avSet = New-AzureRMAvailabilitySet -Name $avSetName -ResourceGroupName $RGName -Location $location
```

**Create Virtual Network**

1. Add subnets.

```
$subnet1 = New-AzureRmVirtualNetworkSubnetConfig -Name $frontendSubnetName -AddressPrefix "10.0.0.0/24"
2 $subnet2 = New-AzureRmVirtualNetworkSubnetConfig -Name $backendSubnetName1 -AddressPrefix "10.0.1.0/24"
3 $subnet3 = New-AzureRmVirtualNetworkSubnetConfig -Name $backendSubnetName2 -AddressPrefix "10.0.2.0/24"
```

2. Add virtual network object.

```
$vnet = New-AzureRmVirtualNetwork -Name $vnetName -ResourceGroupName $RGName -Location $location -AddressPrefix 10.0.0.0/16 -Subnet $subnet1, $subnet2, $subnet3
```
3. Retrieve subnets.

```plaintext
$frontendSubnet=$vnet.Subnets|?{
  $_.Name -eq $frontendSubnetName }
$backendSubnet1=$vnet.Subnets|?{
  $_.Name -eq $backendSubnetName1 }
$backendSubnet2=$vnet.Subnets|?{
  $_.Name -eq $backendSubnetName2 }
```

Create Public IP Address

```plaintext
$pip1=New-AzureRmPublicIpAddress -Name $pubIPName1 -ResourceGroupName $RGName -Location $location -AllocationMethod Dynamic
$pip2=New-AzureRmPublicIpAddress -Name $pubIPName2 -ResourceGroupName $RGName -Location $location -AllocationMethod Dynamic
```

Create NICs

NIC 0/1

```plaintext
$nic1Name=$nicNamePrefix + $suffixNumber + "-Mgmt"
$ipAddress1=$ipAddressPrefix + $suffixNumber
$IPConfig1=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName1 -SubnetId $frontendSubnet.Id -PublicIpAddress $pip1 -PrivateIpAddress $ipAddress1 -Primary
$nic1=New-AzureRMNetworkInterface -Name $nic1Name -ResourceGroupName $RGName -Location $location -IpConfiguration $IpConfig1
```

NIC 1/1

```plaintext
$nic2Name =$nicNamePrefix + $suffixNumber + "-frontend"
$ipAddress2=$ipAddressPrefix1 + ($suffixNumber)
$ipAddress3=$ipAddressPrefix1 + ($suffixNumber + 1)
$IPConfig2=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName2 -PublicIpAddress $pip2 -SubnetId $backendSubnet1.Id -PrivateIpAddress $ipAddress2 -Primary
$IPConfig3=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName3 -SubnetId $backendSubnet1.Id -PrivateIpAddress $ipAddress3
$nic2=New-AzureRMNetworkInterface -Name $nic2Name -ResourceGroupName $RGName -Location $location -IpConfiguration $IpConfig2, $IpConfig3
```
NIC 1/2

1 $nic3Name=$nicNamePrefix + $suffixNumber + "/backend"
2 $ipAddress4=$ipAddressPrefix2 + ($suffixNumber)
3 $IPConfig4=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName4 -SubnetId $backendSubnet2.Id -PrivateIpAddress $ipAddress4 -Primary
4 $nic3=New-AzureRmNetworkInterface -Name $nicNamePrefix -ResourceGroupName $RGName -Location $location -IpConfiguration $IPConfig4

Create VM config object

1 $vmName=$vmNamePrefix
2 $vmConfig=New-AzureRmVMConfig -VMName $vmName -VMSize $vmSize -AvailabilitySetId $avSet.Id

Get credentials and set OS properties for the VM

1 $cred=Get-Credential -Message "Type the name and password for VPX login ."
2 $vmConfig=Set-AzureRmVMOperatingSystem -VM $vmConfig -Linux -ComputerName $vmName -Credential $cred
3 $vmConfig=Set-AzureRmVMSourceImage -VM $vmConfig -PublisherName $publisher -Offer $offer -Sku $sku -Version $version

Add NICs

1 $vmConfig=Add-AzureRmVMNetworkInterface -VM $vmConfig -Id $nic1.Id -Primary
2 $vmConfig=Add-AzureRmVMNetworkInterface -VM $vmConfig -Id $nic2.Id
3 $vmConfig=Add-AzureRmVMNetworkInterface -VM $vmConfig -Id $nic3.Id

Specify OS disk and create VM

1 $osDiskName=$vmName + "/" + $osDiskSuffix
2 $osVhdUri=$prmStorageAccount.PrimaryEndpoints.Blob.ToString() + "/vhds/" + $osDiskName + "/vhd"
3 $vmConfig=Set-AzureRmVMOSDisk -VM $vmConfig -Name $osDiskName -VhdUri $osVhdUri -CreateOption fromImage
4. `Set-AzureRmVMPlan -VM $vmConfig -Publisher $publisher -Product $offer -Name $sku`  
5. `New-AzureRMVM -VM $vmConfig -ResourceGroupName $RGName -Location $location`  

**Note**  
Repeat steps 1-10 listed in “Create Multi-NIC VMs by Using PowerShell Commands” to create VM2 with parameters specific to VM2.

**IP Configuration details**

In this use case, the following IP addresses are used.

**Table 1. IP addresses used in VM1**

<table>
<thead>
<tr>
<th>NIC</th>
<th>Private IP</th>
<th>Public IP (PIP)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0/1</td>
<td>10.0.0.10</td>
<td>PIP1</td>
<td>Configured as NSIP (management IP)</td>
</tr>
<tr>
<td>1/1</td>
<td>10.0.1.10</td>
<td>PIP2</td>
<td>Configured as SNIP/GSLB Site IP</td>
</tr>
<tr>
<td>1/1</td>
<td>10.0.1.11</td>
<td></td>
<td>Configured as LB server IP; public IP is not mandatory</td>
</tr>
<tr>
<td>1/2</td>
<td>10.0.2.10</td>
<td></td>
<td>Configured as SNIP for sending monitor probes to services; public IP is not mandatory</td>
</tr>
</tbody>
</table>

**Table 2. IP addresses used in VM2**

<table>
<thead>
<tr>
<th>NIC</th>
<th>Private IP</th>
<th>Public IP (PIP)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0/1</td>
<td>20.0.0.10</td>
<td>PIP4</td>
<td>Configured as NSIP (management IP)</td>
</tr>
<tr>
<td>1/1</td>
<td>20.0.1.10</td>
<td>PIP5</td>
<td>Configured as SNIP/GSLB Site IP</td>
</tr>
<tr>
<td>1/1</td>
<td>20.0.1.11</td>
<td></td>
<td>Configured as LB server IP; public IP is not mandatory</td>
</tr>
<tr>
<td>1/2</td>
<td>20.0.2.10</td>
<td></td>
<td>Configured as SNIP for sending monitor probes to services; public IP is not mandatory</td>
</tr>
</tbody>
</table>

Here are sample configurations for this use case, showing the IP addresses and initial LB configurations as created through the NetScaler CLI for VM1 and VM2.
2. Configure GSLB sites and other necessary GSLB settings

Perform the tasks described in the following topic to configure the two GSLB sites and other necessary settings:

**Configuring Global Server Load Balancing (GSLB)**

For more information, see this support article:

https://support.citrix.com/article/CTX110348

Here is a sample GSLB configuration for this use case.

```plaintext
1 add ns ip 10.0.1.10 255.255.255.0 -mgmtAccess ENABLED
2 Add nsip 10.0.2.10 255.255.255.0
3 add service svc1 10.0.1.10 ADNS 53
4 add lb vserver v1 HTTP 10.0.1.11 80
5 add service s1 10.0.2.120 http 80
6 Add service s2 10.0.2.121 http 80
7 Bind lb vs v1 s[1-2]
8
9 add ns ip 20.0.1.10 255.255.255.0 -mgmtAccess ENABLED
10 Add nsip 20.0.2.10 255.255.255.0
11 add service svc1 20.0.1.10 ADNS 53
12 add lb vserver v1 HTTP 20.0.1.11 80
13 Add service s1 20.0.2.90 http 80
14 Add service s2 20.0.2.91 http 80
15 Bind lb vs v1 s[1-2]

You've configured GSLB on NetScaler VPX instances running on Azure. For additional information about how to configure GSLB on NetScaler VPX instances, see the Configuring Citrix NetScaler GSLB in Microsoft Azure video.
Configure address pools (IIP) for a Citrix Gateway appliance

January 18, 2019

In some situations, users who connect with the NetScaler Gateway Plug-in need a unique IP address for NetScaler Gateway. When you enable address pools (also known as IP pooling) for a group, NetScaler Gateway can assign a unique IP address alias to each user. You configure address pools by using intranet IP (IIP) addresses.

You can configure address pools on a NetScaler Gateway deployed on Azure by following this two-step procedure:

- Registering the private IP addresses that will be used in the address pool, in Azure
- Configuring address pools in the NetScaler Gateway appliance

Register a private IP address in the Azure portal

In Azure, you can deploy a NetScaler virtual instance with multiple IP addresses. You can add IP addresses to a VPX instance in two ways:

a. While provisioning a VPX instance

For more information about how to add multiple IP addresses while provisioning a VPX instance, see Configuring Multiple IP Addresses for a NetScaler VPX Appliance in Azure Resource Manager. To add IP addresses by using PowerShell commands while provisioning a VPX instance, see Configuring Multiple IP Addresses for a NetScaler VPX Instance in Standalone Mode.

b. After provisioning a VPX instance.

After you’ve provisioned a VPX instance, follow these steps to register a private IP address in the Azure portal, which you configure as an address pool in the NetScaler Gateway appliance.

1. From Azure Resource Manager (ARM), go to the already created NetScaler VPX instance > Network interfaces. Choose the network interface which is bound to a subnet to which the IIP that you want to register belongs.
2. Click IP Configurations, and then click Add.
3. Provide the required details as shown in the example below and click OK.

Configure address pools in the Citrix Gateway appliance

For more information about how to configure address pools on the NetScaler Gateway, see this page.

Limitation: You can not bind a range of IIP addresses to users. Every IIP address that is used in an address pool should be registered.
Configure multiple IP addresses for a NetScaler VPX instance in standalone mode by using PowerShell commands

January 6, 2019

Overview

In an Azure environment, a NetScaler VPX virtual appliance can be deployed with multiple NICs. Each NIC can have multiple IP addresses. This section describes how to deploy a Netscaler VPX instance with a single NIC and multiple IP addresses, by using PowerShell commands. You can use the same script for multi-NIC and multi-IP deployment.

Note

In this document, IP-Config refers to a pair of IP addresses, public IP and private IP, that is associated with an individual NIC. For more information, see the Azure Resource Manager Terminology section.

Use case

In this use case, a single NIC is connected to a virtual network (VNET). The NIC is associated with three IP configurations, as shown in the following table.

<table>
<thead>
<tr>
<th>IPConfig</th>
<th>Associated with</th>
</tr>
</thead>
<tbody>
<tr>
<td>IPConfig-1</td>
<td>Static public IP address; static private IP address</td>
</tr>
<tr>
<td>IPConfig-2</td>
<td>Static public IP address; static private address</td>
</tr>
<tr>
<td>IPConfig-3</td>
<td>Static private IP address</td>
</tr>
</tbody>
</table>

Note

IPConfig-3 is not associated with any public IP address.

Diagram: Topology

Here is the visual representation of the use case.
**Note**

In a multi-NIC, multi-IP Azure NetScaler VPX deployment, the private IP address associated with the primary (first) IPConfig of the primary (first) NIC is automatically added as the management NSIP address of the appliance. The remaining private IP addresses associated with IPConfigs must be added in the NetScaler appliance as VIPs or SNIPs by using the “add ns ip” command, as determined by your requirements.

Here is the summary of the steps required for configuring multiple IP addresses for a NetScaler VPX virtual appliance in standalone mode:

1. Create Resource Group
2. Create Storage Account
3. Create Availability Set
4. Create NSG
5. Create Virtual Network
6. Create Public IP Address
7. Assign IP Configuration
8. Create NIC
9. Create NetScaler VPX Instance
10. Check NIC Configurations
11. Check VPX-side Configurations

**Script**

**Parameters**

Following are sample parameters settings for the use case in this document. You can use different settings if you wish.

\$locName="westcentralus"
\$rgName="Azure-MultiIP"
\$nicName1="VM1-NIC1"
\$vNetName="Azure-MultiIP-vnet"
\$vNetAddressRange="11.6.0.0/16"
\$frontEndSubnetName="frontEndSubnet"
\$frontEndSubnetRange="11.6.1.0/24"
\$prmStorageAccountName="multiipstorage"
\$avSetName="multiip-avSet"
NetScaler 11.1

$vmsize="Standard_DS4_V2" (This parameter creates a VM with up to four NICs.)

**Note:** The minimum requirement for a VPX instance is 2 vCPUs and 2GB RAM.

$publisher="citrix"

$offer="netscalervpx110-6531" (You can use different offers.)

$sku="netscalerbyol" (According to your offer, the SKU can be different.)

$version="latest"

$pubIPName1="PIP1"

$pubIPName2="PIP2"

$domName1="multiipvpx1"

$domName2="multiipvpx2"

$vmNamePrefix="VPXMutiIP"

$osDiskSuffix="osmultiipalbdiskdb1"

Network Security Group (NSG)-related information:

$nsgroupName="NSG-MultiIP"

$rule1Name="Inbound-HTTP"

$rule2Name="Inbound-HTTPS"

$rule3Name="Inbound-SSH"

$ipconfigName1="IPConfig1"

$ipconfigName2="IPConfig-2"

$ipconfigName3="IPConfig-3"

1. **Create Resource Group**

```
New-AzureRmResourceGroup -Name $rgName -Location $locName
```

2. **Create Storage Account**

```
$prmStorageAccount = New-AzureRMStorageAccount -Name $prmStorageAccountName -ResourceGroupName $rgName -Type Standard_LRS -Location $locName
```
NetScaler 11.1

3. Create Availability Set

```powershell
$avSet = New-AzureRMAvailabilitySet -Name $avSetName -ResourceGroupName $rgName -Location $locName
```

4. Create Network Security Group (NSG)

1. Add rules. You must add a rule to the NSG for any port that serves traffic.

```powershell
$rule1 = New-AzureRmNetworkSecurityRuleConfig -Name $rule1Name - Description "Allow HTTP" -Access Allow -Protocol Tcp -Direction Inbound -Priority 101 -SourceAddressPrefix Internet - SourcePortRange * -DestinationAddressPrefix * -DestinationPortRange 80
$rule2 = New-AzureRmNetworkSecurityRuleConfig -Name $rule2Name - Description "Allow HTTPS" -Access Allow -Protocol Tcp -Direction Inbound -Priority 110 -SourceAddressPrefix Internet - SourcePortRange * -DestinationAddressPrefix * -DestinationPortRange 443
$rule3 = New-AzureRmNetworkSecurityRuleConfig -Name $rule3Name - Description "Allow SSH" -Access Allow -Protocol Tcp -Direction Inbound -Priority 120 -SourceAddressPrefix Internet -SourcePortRange * -DestinationAddressPrefix * -DestinationPortRange 22
```

2. Create NSG object.

```powershell
$nsg = New-AzureRmNetworkSecurityGroup -ResourceGroupName $rgName -Location $locName -Name $nsgName -SecurityRules $rule1,$rule2,$rule3
```

5. Create Virtual Network

1. Add subnets.

```powershell
$frontendSubnet = New-AzureRmVirtualNetworkSubnetConfig -Name $frontEndSubnetName -AddressPrefix $frontEndSubnetRange
```

2. Add virtual network object.

```powershell
$vnet = New-AzureRmVirtualNetwork -Name $vNetName -ResourceGroupName $rgName -Location $locName -AddressPrefix $vNetAddressRange -Subnet $frontendSubnet
```
3. Retrieve subnets.

```powershell
$subnetName="frontEndSubnet"
$subnet1=$vnet.Subnets|?
$_.Name -eq $subnetName 
```

6. Create Public IP Address

```powershell
$pip1=New-AzureRmPublicIpAddress -Name $pubIPName1 -ResourceGroupName $rgName -DomainNameLabel $domName1 -Location $locName -AllocationMethod Static
$pip2=New-AzureRmPublicIpAddress -Name $pubIPName2 -ResourceGroupName $rgName -DomainNameLabel $domName2 -Location $locName -AllocationMethod Static
```

**Note**

Check availability of domain names before using.
Allocation method for IP addresses can be dynamic or static.

7. Assign IP Configuration

In this use case, consider the following points before assigning IP addresses:

- IPConfig-1 belongs to subnet1 of VPX1.
- IPConfig-2 belongs to subnet 1 of VPX1.
- IPConfig-3 belongs to subnet 1 of VPX1.

**Note**

When you assign multiple IP configurations to a NIC, one configuration must be assigned as primary.

```powershell
$IPAddress1="11.6.1.27"
$IPConfig1=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName1 -Subnet $subnet1 -PrivateIpAddress $IPAddress1 -PublicIpAddress $pip1 -Primary
$IPAddress2="11.6.1.28"
$IPConfig2=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName2 -Subnet $subnet1 -PrivateIpAddress $IPAddress2 -PublicIpAddress $pip2
$IPAddress3="11.6.1.29"
$IPConfig3=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName3 -Subnet $subnet1 -PrivateIpAddress $IPAddress3 -Primary Use a valid
IP address that meets your subnet requirements and check its availability.

8. Create NIC

```bash
$nic1 = New-AzureRmNetworkInterface -Name $nicName1 -ResourceGroupName $rgName -Location $locName -IpConfiguration $IpConfig1,$IpConfig2,$IpConfig3 -NetworkSecurityGroupId $nsg.Id
```

9. Create NetScaler VPX Instance

1. Initialize variables.

```bash
$suffixNumber = 1
$vmName = $vmNamePrefix + $suffixNumber
```

2. Create VM config object.

```bash
$vmConfig = New-AzureRMVMConfig -VMName $vmName -VMSize $vmSize -AvailabilitySetId $avSet.Id
```

3. Set credentials, OS, and image.

```bash
$cred = Get-Credential -Message "Type the name and password for VPX login ."
$vmConfig = Set-AzureRMVMOperatingSystem -VM $vmConfig -Linux -ComputerName $vmName -Credential $cred
$vmConfig = Set-AzureRMVMSourceImage -VM $vmConfig -PublisherName $publisher -Offer $offer -Skus $sku -Version $version
```

4. Add NIC.

```bash
$vmConfig = Add-AzureRMVMNetworkInterface -VM $vmConfig -Id $nic1.Id -Primary
```

**Note**

In a multi-NIC VPX deployment, one NIC should be primary. So, “-Primary” needs to be appended while adding that NIC to the VPX instance.

5. Specify OS disk and create VM.
10. Check NIC Configurations

After the VPX instance starts, you can check the IP addresses allocated to IPConfigs of the VPX NIC by using the following command.

```bash
$nic.IPConfig
```

11. Check VPX-side Configurations

When the Netscaler VPX instance starts, a private IP address associated with primary IPconfig of the primary NIC is added as the NSIP address. The remaining private IP addresses must be added as VIP or SNIP addresses, as determined by your requirements. Use the following command.

```bash
add nsip <Private IPAddress><netmask> -type VIP/SNIP
```

You've now configured multiple IP addresses for a NetScaler VPX instance in standalone mode. For additional information about how to configure multiple IP addresses for a NetScaler VPX instance in standalone mode, see the Citrix NetScaler deployments in Microsoft Azure video.

Configure multiple Azure VIPs for a standalone or high availability VPX instance

January 10, 2019

In Azure Resource Manager (ARM), configure multiple public virtual IP addresses (VIPs) for both single NetScaler VPX deployment, and also for high availability (HA) deployment.

Note: Multiple VIPs can be configured for external load balancers only.
For deploying NetScaler VPX instances in both single mode and high availability mode, you have to use PowerShell commands alone, as you can create multiple front-end IP addresses (FIP) through PowerShell only.

**Deploy a NetScaler VPX in standalone mode**

This section provides PowerShell commands to deploy a NetScaler VPX in a standalone mode with multiple front-end IPs mapped to a single back-end pool.

Configure multiple FIPs, back-end pools, LB rules, and inbound NAT rules as part of configuring Azure load balancer.

Make sure that the following conditions are met in a single NetScaler VPX deployment:

1. A back-end pool contains only one NetScaler VPX instance.
2. Two load balancer rules are defined and are mapped to the following two VIPs:
   a) VIP1:80 > Back-end Pool 1:10080
   b) VIP2:80 > Back-end Pool 1:10081
3. A load balancer rule is defined to map VIP1:10080 > Back-end Pool 1:80, to access NetScaler VPX user interface.
4. An inbound NAT rule is defined to map VIP1:22 > Back-end Pool 1:22 to access NetScaler VPX through SSH.

The following image illustrates how you can configure multiple cloud service IP addresses on Azure Resource Manager for NetScaler virtual servers.

Run the following PowerShell commands to deploy a NetScaler VPX instance in a standalone mode:

### 1. Create Resource Group

```
$rgName = "<resource group name>"
$locName = "<location name, such as West US>"

Command:

New-AzureRmResourceGroup -Name $rgName -Location $locName

For example:

$rgName = "ARM-LB-NS"

$locName = "East Asia"

New-AzureRmResourceGroup -Name $rgName -Location $locName
```
2. Create Storage Account

You must select a globally unique name for your storage account that contains only lowercase letters and numbers.

$saName="<storage account name>"

$saType="<storage account type, specify one: Standard_LRS, Standard_GRS, Standard_RAGRS, or Premium_LRS>"

Command:

New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -Type $saType -Location $locName

For example:

$saName="vpxstorage"

$saType="Standard_LRS"

New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -Type $saType -Location $locName

3. Create Availability Set

$avName="<availability set name>"

Command:

New-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName -Location $locName

For example:

$avName="avNSSet"

4. Create Virtual Network and Subnet

Add new virtual network with at least one subnet, if it is not created previously.

$vnetName = “LBVnet”

Commands:

Create subnets

$frontendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name frontendSubnet -AddressPrefix 10.0.1.0/24
(Configure this parameter value as per your requirement)

$backendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name backendSubnet -AddressPrefix 10.0.2.0/24

**Create Virtual Network:**

New-AzureRmVirtualNetwork -Name $vnetName -ResourceGroupName $rgName -Location $location -AddressPrefix 10.0.0.0/16 -Subnet $frontendSubnet,$backendSubnet

5. **Create Public IP Address**

The number of public IPs created should be equal to number of External VIPs required.

- Before using, check for the availability of the value for DomainNameLabel.
- Create two VIPs.

*Commands:*

$pubName1="PublicIp1"
$dnsName1="nsvpx1"
$pubName2="PublicIp2"
$dnsName2="nsvpx2"

$publicIP1 = New-AzureRmPublicIpAddress -Name $pubName1 -ResourceGroupName $rgName -Location $location -AllocationMethod Static -DomainNameLabel $dnsName1
$publicIP2 = New-AzureRmPublicIpAddress -Name $pubName2 -ResourceGroupName $rgName -Location $location -AllocationMethod Static -DomainNameLabel $dnsName2

6. **Create Front-end IP for Specified Public IP Addresses**

$FIPName1="VIP1"
$FIPName2="VIP2"

*Commands:*

$frontendIP1 = New-AzureRmLoadBalancerFrontendIpConfig -Name $FIPName1 -PublicIpAddress $publicIP1
$frontendIP2 = New-AzureRmLoadBalancerFrontendIpConfig -Name $FIPName2 -PublicIpAddress $publicIP2
7. Create Back-end Pool

$BEPool1 = “backend-Pool1”

Command:
$beaddresspool1= New-AzureRmLoadBalancerBackendAddressPoolConfig -Name $BEPool1

8. Create Health Probe

Create TCP health probe with port 9000 and interval 5 seconds.

Command:
$healthProbe = New-AzureRmLoadBalancerProbeConfig -Name HealthProbe -Protocol Tcp -Port 9000 -IntervalInSeconds 5 -ProbeCount 2

9. Create Load Balancer Rule

For each front end IP and service, we need to create lbRule.

Here back-end address pool can contain set of virtual machines. For single VPX deployment only single VPX instance will be part of this pool.

Note: Combined values for front-end IP configuration, back-end address pool, front-end port, back-end port parameters should not be same for any two rules.

For example, every FIP/VIP access, and HTTP service uses front-end port 80. As back-end pool is same, back-end port needs to be used differently for each load balancer rule.

Commands:
$lbrule1 = New-AzureRmLoadBalancerRuleConfig -Name “HTTP1” -FrontendIpConfiguration $frontendIP1 -BackendAddressPool $beAddressPool1 -Probe $healthProbe -Protocol Tcp -FrontendPort 80 -BackendPort 10080
$lbrule2 = New-AzureRmLoadBalancerRuleConfig -Name “HTTP2” -FrontendIpConfiguration $frontendIP2 -BackendAddressPool $beAddressPool1 -Probe $healthProbe -Protocol Tcp -FrontendPort 80 -BackendPort 10081

LB rule to access http service of NS can be added in the following way:

Command:
$lbrule3 = New-AzureRmLoadBalancerRuleConfig -Name “HTTPNS” -FrontendIpConfiguration $frontendIP1 -BackendAddressPool $beAddressPool1 -Probe $healthProbe -Protocol Tcp -FrontendPort 10080 -BackendPort 80
10. Create Inbound NAT Rules

Create NAT rules for services that does not require to be load balanced.

For example, create an ssh access to VPX instance.

Protocol - FrontEndPort - BackendPort triplet should not be same for two NAT rules belonging to same front-end IP.

Command:

```
$inboundNATRule1 = New-AzureRmLoadBalancerInboundNatRuleConfig -Name SSH1 -FrontendIpConfiguration $frontendIP1 -Protocol TCP -FrontendPort 22 -BackendPort 22
```

11. Create Load Balancer

Create load balancer with all of the above defined rules, front-end IPs, and a back-end pool.

Command:

```
$lbName = “NSALB”
$NRPLB = New-AzureRmLoadBalancer -ResourceGroupName $rgName -Name $lbName -Location $locName -InboundNatRule $inboundNATRule1 -FrontendIpConfiguration $frontendIP1, $frontendIP2 -LoadBalancingRule $lbrule1, $lbrule2, $lbrule3 -BackendAddressPool $beAddressPool1 -Probe $healthProbe
```

12. Create NIC

Create a NIC and associate it with the NetScaler VPX instance.

Commands:

```
$nicName=”NIC1”
$lbName=”NSALB”
$bePoolIndex=0
$natRuleIndex=0
$subnetIndex=0 ß Frontend subnet index
$lb=Get-AzureRmLoadBalancer -Name $lbName -ResourceGroupName $rgName
```

© 1999-2018 Citrix Systems, Inc. All rights reserved. 604
13. Create NetScaler VPX Instance

Create NetScaler VPX instance from MarketPlace image and attach the NIC to the virtual instance.

Commands:
$vmName="VPX1"
$vmSize="Standard_A3" / "Standard_DS4"
$pubName="citrix"
$skuName = "netscalerbyol"
$offerName="netscalervpx110-6531"
$avSet=Get-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName
$vm1=New-AzureRmVMConfig -VMName $vmName -VMSize $vmSize -AvailabilitySetId $avset.Id
$cred=Get-Credential -Message “Type Credentials which will be used to login to VPX instance”
$vm1=Set-AzureRmVMOperatingSystem -VM $vm1 -Linux -ComputerName $vmName -Credential $cred -Verbose
$vm1=Set-AzureRmVMSourceImage -VM $vm1 -PublisherName $pubName -Offer $offerName -Skus $skuName -Version “latest”
$vm1=Add-AzureRmVMNetworkInterface -VM $vm1 -Id $nic1.Id
$diskName="dynamic"
$storageAcc=Get-AzureRmStorageAccount -ResourceGroupName $rgName -Name $saName
$osDiskUri1=$storageAcc.PrimaryEndpoints.Blob.ToString() + “vhds1/” + $diskName + “.vhd”
$vm1=Set-AzureRmVMVMOSDisk -VM $vm1 -Name $diskName -VhdUri $osDiskUri1 -CreateOption fromImage
Set-AzureRmVMPlan -VM $vm1 -Publisher $pubName -Product $offerName -Name $skuName
New-AzureRmVM -ResourceGroupName $rgName -Location $locName -VM $vm1

The above commands creates a NetScaler VPX instance, then add virtual servers to the NetScaler VPX instance for the specified front end services.

Deploying NetScaler VPX in High Availability Mode

This section provides PowerShell commands to deploy a NetScaler VPX in HA deployment with multiple front-end IPs mapped to a single back-end pool.

Configure multiple FIPs, backend pools, load balance rules, and inbound NAT rules as part of the Azure load balancer.
Make sure that the following conditions are met in HA deployment of NetScaler VPX instances:

1. A back-end pool contains two NetScaler VPX instances, which are part of HA.
2. Two load balancer rules are defined and are mapped to following two VIPs:
   a) VIP1:80 > Back-end Pool 1:10080
   b) VIP2:80 > Back-end Pool 1:10081
3. A load balancer rule is defined, which maps VIP1:10080 > Back-end Pool 1:80, to access NetScaler VPX GUI.
4. Two inbound NAT rules are defined to map the following two VIPs:
   a) VIP1:22 > Back-end Pool 1:22 to access NetScaler VPX Primary
   b) VIP1:10022 > Back-end Pool-1:22 to access NetScaler VPX Secondary through SSH

All services that are defined as part of Azure load balancer rules will get load balanced. That is, if the primary VPX fails, the secondary VPX will take care of all of the services in Active-Passive HA deployment.

The following image illustrates how you can configure multiple cloud service IP addresses on Azure Resource Manager for NetScaler virtual servers in HA mode.

1. Create Resource Group

   $rgName="<resource group name>"
   $locName="<location name, such as West US>"

   **Commands:**
   New-AzureRmResourceGroup -Name $rgName -Location $locName

   **For example:**
   $rgName = “ARM-Mult-VIP-HA”
   $locName = “East Asia”
   New-AzureRmResourceGroup -Name $rgName -Location $locName

2. Create Storage Account

   You must select a globally unique name for your storage account that contains only lowercase letters and numbers.

   $saName="<storage account name>"
   $saType="<storage account type, specify one: Standard_LRS, Standard_GRS, Standard_RAGRS, or Premium_LRS>"
NetScaler 11.1

**Commands:**

```
New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -Type $saType -Location $locName
```

**For example:**

```
$saName="vpxstorage1"
$saType="Standard_LRS"
New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -Type $saType -Location $locName
```

3. **Create Availability Set**

```
$avName="<availability set name>"
```

**Command:**

```
New-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName -Location $locName
```

**For example:**

```
$avName="avNSSetARM"
```

4. **Create Virtual Network and Subnet**

Add new virtual network with at least one subnet if it is not created previously.

```
$vnetName = "LBVnet"
```

**Commands:**

**Create subnets:**

```
$frontendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name frontendSubnet -AddressPrefix 10.0.7.0/24 B (this parameter value should be as per your requirement)
```

```
$backendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name backendSubnet -AddressPrefix 10.0.8.0/24
```

**Create Virtual Network:**

```
New-AzureRmVirtualNetwork -Name $vnetName -ResourceGroupName $rgName -Location $locName -AddressPrefix 10.0.0.0/16 -Subnet $frontendSubnet,$backendSubnet
```
5. Create Public IP Address

The number of public IP addresses created should be equal to the number of external VIPs required.

- Before using, check for the availability of the value for Domain.Name.Label.
- Create two VIPs.

**Commands:**

```powershell
$pubName1 = "PublicIp1"
$dnsName1 = "nsvpx1"
$pubName2 = "PublicIp2"
$dnsName2 = "nsvpx2"

$publicIP1 = New-AzureRmPublicIpAddress -Name $pubName1 -ResourceGroupName $rgName -Location $locName -AllocationMethod Static -DomainNameLabel $dnsName1
$publicIP2 = New-AzureRmPublicIpAddress -Name $pubName2 -ResourceGroupName $rgName -Location $locName -AllocationMethod Static -DomainNameLabel $dnsName2
```

6. Create Front-end IP Addresses

```powershell
$FIPName1 = "VIP1"
$FIPName2 = "VIP2"

**Commands:**

```powershell
$frontendIP1 = New-AzureRmLoadBalancerFrontendIpConfig -Name $FIPName1 -PublicIpAddress $publicIP1
$frontendIP2 = New-AzureRmLoadBalancerFrontendIpConfig -Name $FIPName2 -PublicIpAddress $publicIP2
```

7. Create Back-end Pool

```powershell
$BEPool1 = "backend-Pool1"

**Command:**

```powershell
$beaddresspool1 = New-AzureRmLoadBalancerBackendAddressPoolConfig -Name $BEPool1
```
8. Create Health Probe

Create TCP health probe with port 9000 and interval 5 seconds.

Command:

```
$healthProbe = New-AzureRmLoadBalancerProbeConfig -Name HealthProbe -Protocol Tcp -Port 9000 -IntervalInSeconds 5 -ProbeCount 2
```

9. Create Load Balancer Rules

For each frontend IP and service, you have to create a separate load balancer rule.

Back-end address pool can contain set of virtual machines. For a single NetScaler VPX deployment, only single NetScaler VPX instance will be part of this pool.

**Note:** Combined values for front-end IP configuration, back-end address pool, front-end port, back-end port parameters should not be the same for any two rules.

**Examples:**

Each FIP/VIP access and HTTP service uses front-end port 80. As back-end pool is same, back-end port has to be used differently for each load balancer rule.

Command:

```
$lbrule1 = New-AzureRmLoadBalancerRuleConfig -Name “HTTP1” -FrontendIpConfiguration $frontendIP1 -BackendAddressPool $beAddressPool1 -Probe $healthProbe -Protocol Tcp -FrontendPort 80 -BackendPort 10080
$lbrule2 = New-AzureRmLoadBalancerRuleConfig -Name “HTTP2” -FrontendIpConfiguration $frontendIP2 -BackendAddressPool $beAddressPool1 -Probe $healthProbe -Protocol Tcp -FrontendPort 80 -BackendPort 10081
```

Load balancer configuration rule to access the HTTP service of a netScaler can be added in the following way:

Command:

```
$lbrule3 = New-AzureRmLoadBalancerRuleConfig -Name “HTTPNS” -FrontendIpConfiguration $frontendIP1 -BackendAddressPool $beAddressPool1 -Probe $healthProbe -Protocol Tcp -FrontendPort 10080 -BackendPort 80
```

10. Create Inbound NAT Rules

Create NAT rules for services that does not require to be load balanced.

For example, create an ssh access to VPX instance.
NetScaler 11.1

**Note:** Protocol - Front-end Port - Back-end Port triplet should not be the same for two NAT rules belonging to the same front-end IP address.

**Commands:**

```
$inboundNATRule1= New-AzureRmLoadBalancerInboundNatRuleConfig -Name SSH1 -FrontendIpConfiguration $frontendIP1 -Protocol TCP -FrontendPort 22 -BackendPort 22
$inboundNATRule2= New-AzureRmLoadBalancerInboundNatRuleConfig -Name SSH2 -FrontendIpConfiguration $frontendIP1 -Protocol TCP -FrontendPort 10022 -BackendPort 22
```

11. Create Load Balancer

Create load balancer with all of the above defined rules, front-end IPs, and a back-end pool.

**Command:**

```
$lbName ="NSALB"
$NRPLB = New-AzureRmLoadBalancer -ResourceGroupName $rgName -Name $lbName -Location $locName -InboundNatRule $inboundNATRule1, $inboundNATRule2 -FrontendIpConfiguration $frontendIP1, $frontendIP2 -LoadBalancingRule $lbrule1, $lbrule2, $lbrule3 -BackendAddressPool $beAddressPool1 -Probe $healthProbe
```

12. Create NIC

Create a NIC and associate it with the NetScaler VPX instance.

**Commands:**

```
$nicName="NIC1"
$lbName="NSALB"
$bePoolIndex=0
$natRuleIndex=0
$subnetIndex=0 ß Frontend subnet index
$lb=Get-AzureRmLoadBalancer -Name $lbName -ResourceGroupName $rgName
$nicName="NIC2"
$lbName="NSALB"
```
$bePoolIndex=0
$natRuleIndex=182

SSH rule

$subnetIndex=0

13. Create NetScaler VPX Instances

Create a NetScaler VPX instance from MarketPlace image and attach a NIC to it.

Commands:

$vmName="VPX1"
$vmSize="Standard_A3"
$pubName="citrix"
$skuName = "netscalerbyol"
$offerName="netscalervpx110-6531"
$avSet=Get-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName
$vm1=New-AzureRmVMConfig -VMName $vmName -VMSize $vmSize -AvailabilitySetId $avset.Id
$cred=Get-Credential -Message "Type Credentials which will be used to login to VPX instance"
$vm1=Set-AzureRmVMOperatingSystem -VM $vm1 -Linux -ComputerName $vmName -Credential $cred -Verbose
$vm1=Set-AzureRmVMSourceImage -VM $vm1 -PublisherName $pubName -Offer $offerName -Skus $skuName -Version “latest”
$vm1=Add-AzureRmVMNetworkInterface -VM $vm1 -Id $nic1.Id
$diskName="dynamic"
$storageAcc=Get-AzureRmStorageAccount -ResourceGroupName $rgName -Name $saName
$osDiskUri1=$storageAcc.PrimaryEndpoints.Blob.ToString() + “vhds1/” + $diskName + “.vhd”
$vm1=Set-AzureRmVMOSDisk -VM $vm1 -Name $diskName -VhdUri $osDiskUri1 -CreateOption fromImage
Set-AzureRmVMPlan -VM $vm1 -Publisher $pubName -Product $offerName -Name $skuName
New-AzureRmVM -ResourceGroupName $rgName -Location $locName -VM $vm1
$vmName="VPX2"
NetScaler 11.1

$vmSize="Standard_A3"
$pubName="citrix"
$skuName = “netscalerbyol”
$offerName="netscalervpx110-6531”
$avSet=Get-AzureRmAvailabilitySet –Name $avName –ResourceGroupName $rgName
$vm2=New-AzureRmVMConfig -VMName $vmName -VMSize $vmSize -AvailabilitySetId $avset.Id
$cred=Get-Credential -Message “Type Credentials which will be used to login to VPX instance”
$vm2=Set-AzureRmVMOperatingSystem -VM $vm2 -Linux -ComputerName $vmName -Credential $cred -Verbose
$vm2=Set-AzureRmVMSourceImage -VM $vm2 -PublisherName $pubName -Offer $offerName -Skus $skuName -Version “latest”
$vm2=Add-AzureRmVMNetworkInterface -VM $vm2 -Id $nic2.Id
$diskName="dynamic"
$storageAcc=Get-AzureRmStorageAccount -ResourceGroupName $rgName -Name $saName
$osDiskUri2=$storageAcc.PrimaryEndpoints.Blob.ToString() + “vhds2/” + $diskName + “.vhd”
$vm1=Set-AzureRmVMOSDisk -VM $vm2 -Name $diskName -VhdUri $osDiskUri2 -CreateOption fromImage
Set-AzureRmVMPlan -VM $vm2 -Publisher $pubName -Product $offerName -Name $skuName
New-AzureRmVM -ResourceGroupName $rgName -Location $locName -VM $vm2

14. Create High Availability

When both NetScaler VPX instances are running, connect to both VPX instances through SSH to configure the virtual machines.

1. To configure Active-Passive HA, run “add HA node #nodeID” command on both nodes, and then run configuration commands on Primary VPX instance.

2. To configure Active-Active HA, run same set of configuration commands on both nodes.

Azure ARM Components

This table lists those of the Azure Resource Manager (ARM) components that can be created using PowerShell, and those that can be created using the Azure Resource Manager portal.
<table>
<thead>
<tr>
<th></th>

**PowerShell scripts for Azure deployment**

December 18, 2018

This topic provides the PowerShell cmdlets with which you can perform the following configurations
in Azure PowerShell:

- Provision NetScaler VPX in Standalone Mode
- Configure NetScaler VPX HA with Azure External Load Balancer
- Configure NetScaler VPX HA with Azure Internal Load Balance

**Provision NetScaler VPX in Standalone Mode**

1. **Creating a resource group**

The resource group can include all the resources for the solution, or only those resources that you want to manage as a group. The location specified here is the default location for resources in that resource group. Make sure all commands to create a load balancer use the same resource group.

```powershell
$rgName = "<resource group name>
$locName = "<location name, such as West US>
New-AzureRmResourceGroup -Name $rgName -Location $locName
```

*For example:*

```powershell
$rgName = "ARM-VPX"
$locName = "West US"
New-AzureRmResourceGroup -Name $rgName -Location $locName
```

2. **Creating a storage account**

Choose a unique name for your storage account that contains only lowercase letters and numbers.

```powershell
$saName = "<storage account name>
$saType = "<storage account type, specify one: Standard_LRS, Standard_GRS, Standard_RAGRS, or Premium_LRS>
New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -Type $saType -Location $locName
```

*For example:*

```powershell
$saName = "vpxstorage"
$saType = "Standard_LRS"
New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -Type $saType -Location $locName
```

3. **Creating an availability set**
Availability set helps to keep your virtual machines available during downtime, such as during maintenance. A load balancer configured with an availability set ensures that your application is always available.

```
$avName="<availability set name>"
New-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName -Location $locName
```

### 4. Creating a virtual network

Add a new virtual network with at least one subnet, if the subnet was not created previously.

```
$FrontendAddressPrefix="10.0.1.0/24"
$BackendAddressPrefix="10.0.2.0/24"
$vnetAddressPrefix="10.0.0.0/16"
$frontendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name frontendSubnet -AddressPrefix $FrontendAddressPrefix
$backendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name backendSubnet -AddressPrefix $BackendAddressPrefix
New-AzureRmVirtualNetwork -Name TestNet -ResourceGroupName $rgName -Location $locName -AddressPrefix $vnetAddressPrefix -Subnet $frontendSubnet,$backendSubnet
```

*For example:*

```
$frontendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name frontendSubnet -AddressPrefix $FrontendAddressPrefix
$backendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name backendSubnet -AddressPrefix $BackendAddressPrefix
New-AzureRmVirtualNetwork -Name TestNet -ResourceGroupName $rgName -Location $locName -AddressPrefix $vnetAddressPrefix -Subnet $frontendSubnet,$backendSubnet
```

### 5. Creating a NIC

Create a NIC and associate the NIC with the NetScaler VPX instance. The front end Subnet created in the above procedure is indexed at 0 and the back end Subnet is indexed at 1. Now create NIC in one of the three following ways:

**a) NIC with Public IP address**

```
$nicName="<name of the NIC of the VM>"
$pip = New-AzureRmPublicIpAddress -Name $nicName -ResourceGroupName $rgName -Location $locName -AllocationMethod Dynamic
$nic = New-AzureRmNetworkInterface -Name $nicName -ResourceGroupName $rgName -Location $locName -SubnetId $vnet.Subnets[$subnetIndex].Id -PublicIpAddressId $pip.Id
```
NetScaler 11.1

b) **NIC with Public IP and DNS label**

$nicName="<name of the NIC of the VM>"
$domName="<domain name label>"

$pip = New-AzureRmPublicIpAddress -Name $nicName -ResourceGroupName $rgName -DomainNameLabel $domName -Location $locName -AllocationMethod Dynamic

Before assigning $domName, check it is available or not by using command:

Test-AzureRmDnsAvailability -DomainQualifiedName $domName -Location $locName

$nic = New-AzureRmNetworkInterface -Name $nicName -ResourceGroupName $rgName -Location $locName -SubnetId $vnet.Subnets[$subnetIndex].Id -PublicIpAddressId $pip.Id

For example:

$nicName="frontendNIC"
$domName="vpxazure"

$pip = New-AzureRmPublicIpAddress -Name $nicName -ResourceGroupName $rgName -DomainNameLabel $domName -Location $locName -AllocationMethod Dynamic

$nic = New-AzureRmNetworkInterface -Name $nicName -ResourceGroupName $rgName -Location $locName -SubnetId $vnet.Subnets[0].Id -PublicIpAddressId $pip.Id

c) **NIC with Dynamic Public Address and Static Private IP address**

Make sure that the private (static) IP address you add to the VM should be the same range as that of the subnet specified.

$nicName="<name of the NIC of the VM>"
$staticIP="<available static IP address on the subnet>"

$pip = New-AzureRmPublicIpAddress -Name $nicName -ResourceGroupName $rgName -Location $locName -AllocationMethod Dynamic

$nic = New-AzureRmNetworkInterface -Name $nicName -ResourceGroupName $rgName -Location $locName -SubnetId $vnet.Subnets[$subnetIndex].Id -PublicIpAddressId $pip.Id -PrivateIpAddress $staticIP

6. **Creating a virtual object**

$vmName="<VM name>"
$vmSize="<VM size string>"

$avSet=Get-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName

$vm=New-AzureRmVMConfig -VMName $vmName -VMSize $vmSize -AvailabilitySetId $avset.Id
7. **Getting the NetScaler VPX image**

$pubName=<Image publisher name>

$offerName=<Image offer name>

$schemaName=<Image SKU name>

$cred=Get-Credential -Message “Type the name and password of the local administrator account.”

Provide your credentials that is used to login into VPX

$vm=Set-AzureRmVMOperatingSystem -VM $vm -Linux -ComputerName $vmName -Credential $cred -Verbose

$vm=Set-AzureRmVMSourceImage -VM $vm -PublisherName $pubName -Offer $offerName -Skus $skuName -Version “latest”

$vm=Add-AzureRmVMNetworkInterface -VM $vm -Id $nic.Id

*For example:*

$pubName="citrix"

The following command is used for displaying all offers from Citrix:

```
Get-AzureRmVMImageOffer -Location $locName -Publisher $pubName
```

$offerName="netscalervpx110-6531"

The following command is used to know sku offered by publisher for specific offer name:

```
Get-AzureRmVMImageSku -Location $locName -Publisher $pubName -Offer $offerName
```

8. **Creating a virtual machine**

$diskName=<name identifier for the disk in Azure storage, such as OSDisk>

*For example:*

$diskName="dynamic"

$pubName="citrix"

$offerName="netscalervpx110-6531"

$schemaName="netscalerbyol"

$storageAcc=Get-AzureRmStorageAccount -ResourceGroupName $rgName -Name $saName
NetScaler 11.1

```powershell
$osDiskUri=$storageAcc.PrimaryEndpoints.Blob.ToString() + "vhds/" + $diskName + ".vhd"
$vm=Set-AzureRmVMOSDisk -VM $vm -Name $diskName -VhdUri $osDiskUri -CreateOption fromImage
When you create VM from Images present in marketplace, use the following command to specify the VM plan:
Set-AzureRmVMPlan -VM $vm -Publisher $pubName -Product $offerName -Name $skuName
New-AzureRmVM -ResourceGroupName $rgName -Location $locName -VM $vm

Provision NetScaler VPX in HA with Azure External Load Balancer

Log on to AzureRmAccount using your Azure user credentials.

1) Creating a resource group

The location specified here is the default location for resources in that resource group. Make sure that all commands used to create a load balancer use the same resource group.

$rgName="<resource group name>"
$locName="<location name, such as West US>"
New-AzureRmResourceGroup -Name $rgName -Location $locName

For example:
$rgName = “ARM-LB-NS”
$locName = “West US”
New-AzureRmResourceGroup -Name $rgName -Location $locName

2) Creating a storage account

Choose a unique name for your storage account that contains only lowercase letters and numbers.

$saName="<storage account name>"
$saType="<storage account type, specify one: Standard_LRS, Standard_GRS, Standard_RAGRS, or Premium_LRS>"
New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -Type $saType -Location $locName

For example:
$saName="vpxstorage"
$saType="Standard_LRS"
```
New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -Type $saType -Location $locName

3) **Creating an availability set**
A load balancer configured with an availability set ensures that your application is always available.

$avName=“<availability set name>”
New-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName -Location $locName

4) **Creating a virtual network**
Add a new virtual network with at least one subnet, if the subnet was not created previously.

$vnetName = “LBVnet”
$FrontendAddressPrefix=”10.0.1.0/24”
$BackendAddressPrefix=”10.0.2.0/24”
$vnetAddressPrefix=”10.0.0.0/16”
$frontendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name frontendSubnet -AddressPrefix $FrontendAddressPrefix
$backendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name backendSubnet -AddressPrefix $BackendAddressPrefix
$vnet=New-AzureRmVirtualNetwork -Name $vnetName -ResourceGroupName $rgName -Location $locName -AddressPrefix $vnetAddressPrefix -Subnet $frontendSubnet,$backendSubnet’

**Note:** Choose the AddressPrefix parameter value as per your requirement.

Assign front end and back end subnet to the virtual network that you created earlier in this step.

If the front end subnet is the first element of array vnet, subnetId should be $vnet.Subnets[0].Id.
If the front end subnet is the second element in the array, the subnetId should be $vnet.Subnets[1].Id, and so on..

5) **Configuring front end IP address and creating back end address pool**
Configure a front end IP address for the incoming load balancer network traffic and create a back end address pool to receive the load balanced traffic.

$pubName=”PublicIp1”

$publicIP1 = New-AzureRmPublicIpAddress -Name $pubName -ResourceGroupName $rgName -Location $locName -AllocationMethod Static -DomainNameLabel nsvpx

**Note:** Check for the availability of the value for DomainNameLabel.

$FIPName = “ELBFIP”
Creating a health probe

Create a TCP health probe with port 9000 and interval 5 seconds.

```powershell
$healthProbe = New-AzureRmLoadBalancerProbeConfig -Name HealthProbe -Protocol Tcp -Port 9000 -IntervalInSeconds 5 -ProbeCount 2
```

Creating a load balancing rule

Create a LB rule for each service that you are load balancing.

For example:

You can use the following example to load balance http service.

```powershell
$lbrule1 = New-AzureRmLoadBalancerRuleConfig -Name "HTTP-LB" -FrontendIpConfiguration $frontendIP1 -BackendAddressPool $beAddressPool1 -Probe $healthProbe -Protocol Tcp -FrontendPort 80 -BackendPort 80
```

Creating inbound NAT rules

Create NAT rules for services that you are not load balancing.

For example, when creating a SSH access to a NetScaler VPX instance.

**Note:** Protocol-FrontEndPort-BackendPort triplet should not be the same for two NAT rules.

```powershell
$inboundNATRule1= New-AzureRmLoadBalancerInboundNatRuleConfig -Name SSH1 -FrontendIpConfiguration $frontendIP1 -Protocol TCP -FrontendPort 22 -BackendPort 22
$inboundNATRule2= New-AzureRmLoadBalancerInboundNatRuleConfig -Name SSH2 -FrontendIpConfiguration $frontendIP1 -Protocol TCP -FrontendPort 10022 -BackendPort 22
```

Creating a load balancer entity

Create the load balancer adding all objects (NAT rules, load balancer rules, probe configurations) together.

```powershell
$lbName="ELB"
$NRPLB = New-AzureRmLoadBalancer -ResourceGroupName $rgName -Name $lbName -Location $locName -InboundNatRule $inboundNATRule1, $inboundNATRule2 -FrontendIpConfiguration $frontendIP1 -LoadBalancingRule $lbrule1 -BackendAddressPool $beAddressPool1 -Probe $healthProbe
```

Creating a NIC
Create two NICs and associate each NIC with each VPX instance

a) NIC1 with VPX1

For example:

```powershell
$nicName="NIC1"
$lbName="ELB"
$bePoolIndex=0
* Rule indexes starts from 0.
$natRuleIndex=0
$subnetIndex=0
* Frontend subnet index

$lb=Get-AzureRmLoadBalancer -Name $lbName -ResourceGroupName $rgName
```

b) NIC2 with VPX2

For example:

```powershell
$nicName="NIC2"
$lbName="ELB"
$bePoolIndex=0
$natRuleIndex=1
* Second Inbound NAT (SSH) rule we need to use
$subnetIndex=0
* Frontend subnet index

$lb=Get-AzureRmLoadBalancer -Name $lbName -ResourceGroupName $rgName
```

13) **Creating NetScaler VPX instances**

Create two NetScaler VPX instances as part of the same resource group and availability set, and attach it to the external load balancer.

a) NetScaler VPX instance 1
For example:

```
$vmName="VPX1"
$vmSize="Standard_A3"
$pubName="citrix"
$offerName="netscalervpx110-6531"
$skuName="netscalerbyol"
$avSet=Get-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName
$vm1=New-AzureRmVMConfig -VMName $vmName -VMSize $vmSize -AvailabilitySetId $avset.Id
$cred=Get-Credential -Message "Type Credentials which will be used to login to VPX instance"
$vm1=Set-AzureRmVMOperatingSystem -VM $vm1 -Linux -ComputerName $vmName -Credential $cred -Verbose
$vm1=Set-AzureRmVMSourceImage -VM $vm1 -PublisherName $pubName -Offer $offerName -Skus $skuName -Version "latest"
$vm1=Add-AzureRmVMNetworkInterface -VM $vm1 -Id $nic1.Id
$diskName="dynamic"
$storageAcc=Get-AzureRmStorageAccount -ResourceGroupName $rgName -Name $saName
/osDiskUri1=$storageAcc.PrimaryEndpoints.Blob.ToString() + "vhds1/" + $diskName + ".vhd"
$vm1=Set-AzureRmVMOSDisk -VM $vm1 -Name $diskName -VhdUri $osDiskUri1 -CreateOption fromImage
Set-AzureRmVMPin -VM $vm1 -Publisher $pubName -Product $offerName -Name $skuName
New-AzureRmVM -ResourceGroupName $rgName -Location $locName -VM $vm1
```

b) NetScaler VPX instance 2

For example:

```
$vmName="VPX2"
$vmSize="Standard_A3"
$avSet=Get-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName
$vm2=New-AzureRmVMConfig -VMName $vmName -VMSize $vmSize -AvailabilitySetId $avset.Id
$cred=Get-Credential -Message "Type Credentials which will be used to login to VPX instance"
$vm2=Set-AzureRmVMOperatingSystem -VM $vm2 -Linux -ComputerName $vmName -Credential $cred -Verbose
```
NetScaler 11.1

$vm2=Set-AzureRmVMSourceImage -VM $vm2 -PublisherName $pubName -Offer $offerName -Skus $skuName -Version “latest”

$vm2=Add-AzureRmVMNetworkInterface -VM $vm2 -Id $nic2.Id

$diskName="dynamic"

$storageAcc=Get-AzureRmStorageAccount -ResourceGroupName $rgName -Name $saName

$osDiskUri1=$storageAcc.PrimaryEndpoints.Blob.ToString() + “vhds2/” + $diskName + “.vhd”

$vm2=Set-AzureRmVMOSDisk -VM $vm2 -Name $diskName -VhdUri $osDiskUri1 -CreateOption fromImage

Set-AzureRmVMPlan -VM $vm2 -Publisher $pubName -Product $offerName -Name $skuName

New-AzureRmVM -ResourceGroupName $rgName -Location $locName -VM $vm2

14) **Configuring the virtual machines**

When both the NetScaler VPX instances start, then connect to both NetScaler VPX instances using the SSH protocol to configure the virtual machines.

a) **Active-Active:** Run the same set of configuration commands on the command line of both the NetScaler VPX instances.

b) **Active-Passive:** Run this command on the command line of both the NetScaler VPX instances.

    add ha node #nodeID <nsip of other NetScaler VPX>

    In Active-Passive mode, run configuration commands on the primary node only.

**Provision NetScaler VPX in HA with Azure Internal Load Balancer**

Log on to AzureRmAccount using your Azure user credentials.

1) **Creating a resource group**

The location specified here is the default location for resources in that resource group. Make sure all commands to create a load balancer use the same resource group.

$rgName=”<resource group name>”

$locName=”<location name, such as West US>”

New-AzureRmResourceGroup -Name $rgName -Location $locName

*For example:*

$rgName = “ARM-LB-NS”

$locName = “West US”
New-AzureRmResourceGroup -Name $rgName -Location $locName

2) **Creating a storage account**

Choose a unique name for your storage account that contains only lowercase letters and numbers.

```
$saName="<storage account name>"
$saType="<storage account type, specify one: Standard_LRS, Standard_GRS, Standard_RAGRS, or Premium_LRS>"
New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -Type $saType -Location $locName
```

*For example:*

```
$saName="vpxstorage"
$saType="Standard_LRS"
New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -Type $saType -Location $locName
```

3) **Creating an availability set**

A load balancer configured with an availability set ensures that your application is always available.

```
$avName="<availability set name>"
New-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName -Location $locName
```

4) **Creating a virtual network**

Add a new virtual network with at least one subnet, if the subnet was not created previously.

```
$vnetName = "LBVnet"
$vnetAddressPrefix="10.0.0.0/16"
$FrontendAddressPrefix="10.0.1.0/24"
$BackendAddressPrefix="10.0.2.0/24"
$vnet=New-AzureRmVirtualNetwork -Name $vnetName -ResourceGroupName $rgName -Location $locName -AddressPrefix $vnetAddressPrefix -Subnet $frontendSubnet,$backendSubnet
$frontendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name frontendSubnet -AddressPrefix $FrontendAddressPrefix
$backendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name backendSubnet -AddressPrefix $BackendAddressPrefix
```

**Note:** Choose the AddressPrefix parameter value as per your requirement.

Assign front end and back end subnet to the virtual network that you created earlier in this step.
If the front end subnet is the first element of array vnet, subnetId should be $vnet.Subnets[0].Id.
If the front end subnet is the second element in the array, the subnetId should be $vnet.Subnets[1].Id, and so on..

5) **Creating an back end address pool**

   $beaddresspool= New-AzureRmLoadBalancerBackendAddressPoolConfig -Name “LB-backend”

6) **Creating NAT rules**

   Create NAT rules for services that you are not load balancing.

   $inboundNATRule1= New-AzureRmLoadBalancerInboundNatRuleConfig -Name “Inboundnatrule1” -FrontendIpConfiguration $frontendIP -Protocol TCP -FrontendPort 3441 -BackendPort 3389
   $inboundNATRule2= New-AzureRmLoadBalancerInboundNatRuleConfig -Name “RDP2” -FrontendIpConfiguration $frontendIP -Protocol TCP -FrontendPort 3442 -BackendPort 3389

   Use front end and back end ports as per your requirement.

7) **Creating a health probe**

   Create a TCP health probe with port 9000 and interval 5 seconds.

   $healthProbe = New-AzureRmLoadBalancerProbeConfig -Name “HealthProbe” -Protocol tcp -Port 9000 -IntervalInSeconds 5 -ProbeCount 2

8) **Creating a load balancing rule**

   Create a LB rule for each service that you are load balancing.

   For example:

   You can use the following example to load balance http service.

   $lbrule = New-AzureRmLoadBalancerRuleConfig -Name “lbrule1” -FrontendIpConfiguration $frontendIP -BackendAddressPool $beAddressPool -Probe $healthProbe -Protocol Tcp -FrontendPort 80 -BackendPort 80

   Use front end and back end ports as per your requirement.

9) **Creating a load balancer entity**

   Create the load balancer adding all objects (NAT rules, load balancer rules, probe configurations) together.

   $NRPLB = New-AzureRmLoadBalancer -ResourceGroupName $rgname -Name “InternalLB” -Location $locName -FrontendIpConfiguration $frontendIP -InboundNatRule $inboundNATRule1,$inboundNATRule2 -LoadBalancingRule $lbrule -BackendAddressPool $beAddressPool -Probe $healthProbe

10) **Creating a NIC**
NetScaler 11.1

Create two NICs and associate each NIC with each NetScaler VPX instance

$backendnic1= New-AzureRmNetworkInterface -ResourceGroupName $rgName -Name lb-nic1-be -Location $locName -PrivateIpAddress 10.0.2.6 -Subnet $backendSubnet -LoadBalancerBackendAddressPool $nrplb.BackendAddressPools[0] -LoadBalancerInboundNatRule $nrplb.InboundNatRules[0]

This NIC is for NetScaler VPX 1. The Private IP should be in same subnet as that of subnet added.

This NIC is for NetScaler VPX 2. The parameter Private IPAddress can have any private IP as per your requirement.

11) Creating NetScaler VPX instances

Create two VPX instances part of same resource group and availability set and attach it to the internal load balancer.

a) NetScaler VPX instance 1

*For example:*

$vmName="VPX1"

$vmSize="Standard_A3"

$avSet=Get-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName

$vm1=New-AzureRmVMConfig -VMName $vmName -VMSize $vmSize -AvailabilitySetId $avset.Id

$cred=Get-Credential -Message “Type Credentials which will be used to login to VPX instance”

$vm1=Set-AzureRmVMOperatingSystem -VM $vm1 -Linux -ComputerName $vmName -Credential $cred -Verbose

$vm1=Set-AzureRmVMSourceImage -VM $vm1 -PublisherName $pubName -Offer $offerName -Skus $skuName -Version “latest”

$vm1=Add-AzureRmVMNetworkInterface -VM $vm1 -Id $backendnic1.Id

$diskName="dynamic"

$storageAcc=Get-AzureRmStorageAccount -ResourceGroupName $rgName -Name $saName

$osDiskUri1=$storageAcc.PrimaryEndpoints.Blob.ToString() + “vhds1/” + $diskName + “.vhd"

$vm1=Set-AzureRmVMOSDisk -VM $vm1 -Name $diskName -VhdUri $osDiskUri1 -CreateOption fromImage

Set-AzureRmVMPlan -VM $vm1 -Publisher $pubName -Product $offerName -Name $skuName

New-AzureRmVM -ResourceGroupName $rgName -Location $locName -VM $vm1

© 1999-2018 Citrix Systems, Inc. All rights reserved. 626
b) NetScaler VPX instance 2

For example:

```powershell
$vmName="VPX2"
$vmSize="Standard_A3"
$avSet=Get-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName
$vm2=New-AzureRmVMConfig -VMName $vmName -VMSize $vmSize -AvailabilitySetId $avset.Id
$cred=Get-Credential -Message " Type Credentials which will be used to login to VPX instance "
$vm2=Set-AzureRmVMOperatingSystem -VM $vm2 -Linux -ComputerName $vmName -Credential $cred -Verbose
$vm2=Set-AzureRmVMSourceImage -VM $vm2 -PublisherName $pubName -Offer $offerName -Skus $skuName -Version "latest"
$vm2=Add-AzureRmVMNetworkInterface -VM $vm2 -Id $backendnic2.Id
$diskName="dynamic"
$storageAcc=Get-AzureRmStorageAccount -ResourceGroupName $rgName -Name $saName
$osDiskUri1=$storageAcc.PrimaryEndpoints.Blob.ToString() + "vhds2/" + $diskName + ".vhd"
$vm2=Set-AzureRmVMSOSDisk -VM $vm2 -Name $diskName -VhdUri $osDiskUri1 -CreateOption fromImage
Set-AzureRmVMPlan -VM $vm2 -Publisher $pubName -Product $offerName -Name $skuName
New-AzureRmVM -ResourceGroupName $rgName -Location $locName -VM $vm2
```

12) Configuring the virtual machines

When both the NetScaler VPX instances start, then connect to both NetScaler VPX instances using the SSH protocol to configure the virtual machines.

a) Active-Active: Run the same set of configuration commands on the command line of both the NetScaler VPX instances.

b) Active-Passive: Run this command on the command line of both the NetScaler VPX instances.

```powershell
add ha node #nodeID <nsip of other NetScaler VPX>
```

In Active-Passive mode, run configuration commands on the primary node only.

Azure terminology

January 6, 2019
Some of the new terms used in Azure Resource Manager are listed below. This list helps you relate to the terms and concepts used in Azure Service Management or classical mode of deployment.

1. **Azure Load Balancer** – Azure load balancer is a resource that distributes incoming traffic among computers in a network. Traffic is distributed among virtual machines defined in a load-balancer set. A load balancer can be external or internet-facing, or it can be internal.

2. **Azure Resource Manager (ARM)** – ARM is the new management framework for services in Azure. Azure Load Balancer is managed using ARM-based APIs and tools.

3. **Back-End Address Pool** – These are IP addresses associated with the virtual machine Network Interface Card (NIC) to which load will be distributed.

4. **BLOB - Binary Large Object** – Any binary object like a file or an image that can be stored in Azure storage.

5. **Front-End IP Configuration** – An Azure Load balancer can include one or more front-end IP addresses, also known as a virtual IPs (VIPs). These IP addresses serve as ingress for the traffic.

6. **Instance Level Public IP (ILPIP)** – An ILPIP is a public IP address that you can assign directly to your virtual machine or role instance, rather than to the cloud service that your virtual machine or role instance resides in. This does not take the place of the VIP (virtual IP) that is assigned to your cloud service. Rather, it’s an additional IP address that you can use to connect directly to your virtual machine or role instance.

   **Note:** In the past, an ILPIP was referred to as a PIP, which stands for public IP.

7. **Inbound NAT Rules** – This contains rules mapping a public port on the load balancer to a port for a specific virtual machine in the back end address pool.

8. **IP-Config** - It can be defined as an IP address pair (public IP and private IP) associated with an individual NIC. In an IP-Config, the public IP address can be NULL. Each NIC can have multiple IP-Config associated with it, which can be up to 255.

9. **Load Balancing Rules** – A rule property that maps a given front-end IP and port combination to a set of back-end IP addresses and port combination. With a single definition of a load balancer resource, you can define multiple load balancing rules, each rule reflecting a combination of a front end IP and port and back end IP and port associated with virtual machines.

10. **Network Security Group (NSG)** – NSG contains a list of Access Control List (ACL) rules that allow or deny network traffic to your virtual machine instances in a virtual network. NSGs can be associated with either subnets or individual virtual machine instances within that subnet. When a NSG is associated with a subnet, the ACL rules apply to all the virtual machine instances in that subnet. In addition, traffic to an individual virtual machine can be restricted further by associating a NSG directly to that virtual machine.

11. **Private IP addresses** – Used for communication within an Azure virtual network, and your on-premises network when you use a VPN gateway to extend your network to Azure. Private IP addresses
allow Azure resources to communicate with other resources in a virtual network or an on-premises network through a VPN gateway or ExpressRoute circuit, without using an Internet-reachable IP address. In the Azure Resource Manager deployment model, a private IP address is associated with the following types of Azure resources – virtual machines, internal load balancers (ILBs), and application gateways.

12. Probes – This contains health probes used to check availability of virtual machines instances in the back end address pool. If a particular virtual machine does not respond to health probes for some time, then it is taken out of traffic serving. Probes enable you to keep track of the health of virtual instances. If a health probe fails, the virtual instance will be taken out of rotation automatically.

13. Public IP Addresses (PIP) – PIP is used for communication with the Internet, including Azure public-facing services and is associated with virtual machines, Internet-facing load balancers, VPN gateways, and application gateways.

14. Region - An area within a geography that does not cross national borders and that contains one or more datacenters. Pricing, regional services, and offer types are exposed at the region level. A region is typically paired with another region, which can be up to several hundred miles away, to form a regional pair. Regional pairs can be used as a mechanism for disaster recovery and high availability scenarios. Also referred to generally as location.

15. Resource Group - A container in Resource Manager holds related resources for an application. The resource group can include all of the resources for an application, or only those resources that are logically grouped together.

16. Storage Account – An Azure storage account gives you access to the Azure blob, queue, table, and file services in Azure Storage. Your storage account provides the unique namespace for your Azure storage data objects.

17. Virtual Machine – The software implementation of a physical computer that runs an operating system. Multiple virtual machines can run simultaneously on the same hardware. In Azure, virtual machines are available in a variety of sizes.

18. Virtual Network - An Azure virtual network is a representation of your own network in the cloud. It is a logical isolation of the Azure cloud dedicated to your subscription. You can fully control the IP address blocks, DNS settings, security policies, and route tables within this network. You can also further segment your VNet into subnets and launch Azure IaaS virtual machines and cloud services (PaaS role instances). Additionally, you can connect the virtual network to your on-premises network using one of the connectivity options available in Azure. In essence, you can expand your network to Azure, with complete control on IP address blocks with the benefit of enterprise scale Azure provides.
Deploy a NetScaler VPX instance on Oracle Public Cloud

January 17, 2019

Important

NetScaler VPX instance on Oracle is in Limited Availability. If you’d like to participate, contact your local sales team or request a call at https://www.citrix.com/products/netscaler-adc/form/inquiry/.

The NetScaler VPX virtual appliance (release 11.1 build 52.126) is available as a downloadable image with which you can create an instance in Oracle Public Cloud (OPC) environment. NetScaler VPX in OPC enables you to leverage cloud computing capabilities of OPC and use NetScaler load balancing and traffic management features for your business needs. You can deploy NetScaler VPX instances in OPC as standalone instances.

This section includes the following topics:

- Supported Features
- Hardware Requirements
- The Create Instance Wizard
- Terminology
- Limitations

Supported Features

A NetScaler VPX instance running in an Oracle Public Cloud deployment supports the following NetScaler features:

- Load Balancing
- ICA Proxy
- Content Switching
- AAA
- Rewrite
- Responder
- RDP Proxy
- nFactor
- LDAP
- VPN (CVPN/Full)
- GSLB
**Hardware Requirements**

VPX virtual appliances can be deployed in OPC as any instance type that has two or more cores and more than 2GB memory.

**The Create Instance Wizard**

You can create an instance on Oracle Public Cloud by using the *Create Instance* wizard.

Figure 1: The Oracle Create Instance wizard

The wizard takes you through these pages. Use the forward and back button to move between pages or click the required page.

- Image: choose a template of a virtual hard disk of a specific size with an installed operating system. You can use images to create virtual machine instances in Oracle Compute Cloud Service.
- Shape: specify the OCPU and memory for your instance.
- Instance: enter details of your instance such as name, label, description, tags, customer attributes, and add SSH public key.
- Network: configure network settings for your instance such as IP networks, security lists, and so on.
- Storage: attach existing storage volumes, or create and attach a storage volume to the instance.
- Review: verify the settings for the new instance.

**Terminology**

This section describes the key terms that are used in this section.

- **Instance**: A virtual machine in Oracle Compute Cloud Service, created by using a specific machine image, with CPU and memory resources defined by a shape.

- **IP Network**: An IP subnet in your account. The address range of the IP network is determined by the IP address prefix that you specify while creating the IP network. These IP addresses aren’t part of the common pool of Oracle-provided IP addresses used by the shared network. When you add an instance to an IP network, the instance is assigned an IP address in that subnet. You can assign IP addresses to instances either statically or dynamically, depending on your business needs. So you have complete control over the IP addresses assigned to your instances.

- **Security Protocol**: A protocol with which you can specify a transport protocol and the source and destination ports to use with the specified protocol. When you create a security rule, you can specify the security protocols that you want to use to permit traffic. Traffic is enabled by a security rule when the protocol in the packet matches the protocol specified here. If no protocol is specified, all protocols are allowed.
• Security Rule: A firewall rule that you can define to control network access to Oracle Compute Cloud Service instances through a specified security application.

For more information, see Oracle Compute Cloud Service Terminology.

Limitations

• You can’t upgrade or downgrade a NetScaler VPX instance running on OPC.
• Only two-arm topology is supported.

Prerequisites

December 18, 2018

Important

NetScaler VPX instance on Oracle is in Limited Availability. If you’d like to participate, contact your local sales team or request a call at https://www.citrix.com/products/netscaler-adc/form/inquiry/.

Before attempting to create a NetScaler instance in OPC, make sure you have the following:

• An Oracle Cloud Account
• An SSH key pair

Take the following steps to meet the above requirements:

1. Create and configure your account on Oracle Cloud.

You must have an Oracle.com account to request a trial or purchase a subscription to an Oracle Cloud service. For more information about setting up your Oracle account see Overview of Subscribing to an Oracle Cloud Service Trial.

2. Create an SSH key pair

Before you create an instance in Oracle Public Cloud, you need to create and configure at least one SSH key pair, because after your instance is created, SSH key exchange is the first and only method of accessing the instance.

a. Generate an SSH key pair by following the procedure described Generating an SSH Key Pair.

Following is an example of creating an SSH key pair in RSA format.

ssh-keygen -b 2048 -t rsa
b. Upload the public key to the Oracle Public Cloud interface by following procedure described at Uploading the SSH Public Key. Once uploaded, you can assign the SSH key to any instance. You can also upload the key later while creating the instance.

Configure a NetScaler VPX standalone instance on Oracle Public Cloud

January 18, 2019

NetScaler VPX configuration on Oracle Public Cloud involves the following tasks:

1. Upload a NetScaler VPX Image and Associate It with the Oracle Cloud Web Console.
2. Configure the VPX instance.
3. Configure NetScaler owned IP Addresses and an LB vServer.

Note
Before you start configuring a NetScaler instance, see the Prerequisites.

Upload a NetScaler VPX image and associate it with the Oracle Cloud Web console

After obtaining the raw.tar.gz file image from Citrix, associate it with the Oracle Web console as follows:

1. Launch cloud.oracle.com and click Sign In in the upper-right corner.
2. From the Cloud Account drop-down menu, select the appropriate data center and click My Services.
3. In the Enter your Identity Domain field, enter the identity domain that Oracle assigned to your account, and click Go.
4. Enter your user name and password and click Sign In.
5. From the Dashboard, click Compute > Open Service Console.
6. Click Images.
7. The Private Images page appears.
8. Click Upload Image.
9. Enter your password, and then click Continue.
10. The Upload Image page appears in a new tab.
11. In the Image File field, browse to select the raw.tar.gz image file that you want to upload.
12. In the Target Object field, enter the name of the object that the image file should be stored as in Oracle Storage Cloud Service.
13. Click **Upload**.
14. After the image is uploaded, it appears under **Private Images**.
15. Click the image and click **Associate Image**.
16. The **Associate Image** window appears.
17. Specify a name and description for the image that is being created.
18. Click **Select File** to select the file.
19. Click **OK** to associate the new image with the file.

For more information about uploading image files to Oracle cloud, see:

**Configure a NetScaler instance**

Complete these steps to a VPX instance.

1. Launch the Create Instance wizard to create instances. Select and enter the details in the **Shape** and **Instance** pages. For more information about how to create an instance, see Creating an Instance from the Instances Page.

2. In the **Network** page, clear the **Shared Network** check box and click **Configure Interface > Create IP Network** to create an IP network for the management IP (NIC 1/1) and click **Create**. Specify the other details in the **Configure IP Network Interface** window and click **Save**. Repeat the steps for NIC 1/2 and NIC 1/3. For more information, see IP Network Options at this page: Creating an Instance from the Instances Page.

   **Note**

   In **Configure IP Network Interface**, select the Default Gateway check box.

   Set Public IP Address to **Auto Generated** for NIC 1/1 and 1/2 and specify private IP addresses for all three NICs.

3. On the **Storage** page, you can attach existing storage volumes to your instance, if necessary, or create storage volumes and attach them to the instance. In this example, select the default storage.

4. On the **Review** page, verify the information that you’ve entered, and then click **Create**.

   Monitor the status of the instance. When the status is shown as “Running,” the instance is ready

5. Create an **IP Address Prefix Set**. For more information about how to create an IP address prefix set, see Creating an IP Address Prefix Set.

6. Create **Security Protocols**. For more information about how to create a security protocol, see Creating a Security Protocol for IP Networks.
7. Create **Security Rules**. For more information about how to create a security rule for IP networks, see Creating a Security Rule for IP Networks.

**Configure NetScaler owned IP addresses and an LB vServer**

1. Configure the NetScaler owned IP addresses by using the NetScaler GUI or the command “add ns ip.” For more information, see Configuring NetScaler-Owned IP Addresses.
2. Configure the NetScaler instance as a load balancing virtual server (LB vServer). For more information, see Set up basic load balancing.

**Scenario**

**January 18, 2019**

**Important**

NetScaler VPX instance on Oracle is in Limited Availability. If you’d like to participate, contact your local sales team or request a call at https://www.citrix.com/products/netscaler-adc/form/inquiry/.

This scenario illustrates how to deploy a NetScaler VPX standalone instance in Oracle Public Cloud (OPC). The user creates a standalone VPX instance with multiple NICs. The instance, which is configured as a load balancing virtual server, communicates with back-end servers (the server farm). For this configuration, you have to set up the required communication routes between the instance and the back-end servers, and between the instance and the external hosts on the public Internet.

This scenario illustrates how to deploy a NetScaler VPX standalone instance in Oracle Public Cloud (OPC). As a user, create a standalone VPX instance with multiple NICs. The instance, which is configured as a load balancing virtual server, communicates with back-end servers (the server farm). For this configuration, you have to set up the required communication routes:

You create three NICs. Each NIC can be configured with a pair of IP addresses (public and private). The NICs serve the following purposes:

<table>
<thead>
<tr>
<th>NIC</th>
<th>Purpose</th>
<th>Associated with</th>
</tr>
</thead>
<tbody>
<tr>
<td>NIC 1/1</td>
<td>Serves management traffic (NSIP)</td>
<td>Public IP address and private IP address</td>
</tr>
<tr>
<td>NIC 1/2</td>
<td>Serves client-side traffic (VIP)</td>
<td>Public IP address and private IP address</td>
</tr>
</tbody>
</table>
The following public IP addresses are used in this example.

<table>
<thead>
<tr>
<th>Entity</th>
<th>Public IP address</th>
</tr>
</thead>
<tbody>
<tr>
<td>NSIP</td>
<td>192.168.30.2</td>
</tr>
<tr>
<td>VIP</td>
<td>192.168.10.2</td>
</tr>
<tr>
<td>SNIP</td>
<td>192.168.20.2</td>
</tr>
<tr>
<td>Back-end server1</td>
<td>192.168.20.10</td>
</tr>
<tr>
<td>Back-end server2</td>
<td>192.168.20.11</td>
</tr>
</tbody>
</table>

**Note**

Oracle assigns a static public IP address and a dynamic private IP. For more information, see Network Settings.

To create the required instances and set up the required security rules for this scenario, complete the following tasks:

1. From the Oracle Web Console, click **Create Instance** and click **Private Images**.

2. Select the required image and click **Review and Create**. The Create Instance wizard starts, displaying the default settings.

**Note**

If you click Create without going through the pages in the wizard, an image with the default settings is created. No SSH keys are associated with it. So make sure you enter the necessary details on each page of the wizard.

While deploying a NetScaler VPX instance on Oracle Public Cloud, an SSH key pair is mandatory. However, the user cannot use the key pair to log on to the VPX instance. The user must use nsroot as the user name and as the password to log on.

3. On the **Shape** page, select the shape that you want to use. The shape specifies the OCPU and memory resources to be allocated to the instance. Click the arrow next to the Review and Create tab on the upper right corner to go to the Instance page. In this scenario, you create an instance with 1 OCPU.
4. On the Instance page, select or enter the following, and then go to the next page:

- High Availability Policy: Active
- Name: `<Instance name>`
- Label: default value
- Description: None
- Tags: None
- SSH Keys: Add the SSH key that you created in the Prerequisites section.
- Custom Attributes: None

5. On the Network page, clear the Shared Network check box and click Configure Interface.

6. In the Configure IP Network Interface window, click Create IP Network to create an IP network for the management IP (NSIP). Add an IP Address Prefix (192.168.30.0/24), a name, and a description. Click Create

7. In the Configure IP Network Interface window, select the IP Network that you've just created, add a static IP address, and select an auto-generated public IP address. Make sure the Default Gateway check box is selected.

8. Similarly create IP networks for NIC 1/2 and NIC 1/3 as follows.

NIC 1/2
- Name: IPConfig1 (for NIC 1/2)
- IP Address Prefix: 192/168.10.0/24

NIC 1/3
- Name: IPConfig2 (for NIC 1/3)
- IP Address Prefix: 192.168.20.0/24

9. Configure IP Network Interface as follows:

NIC 1/2
- Interface: eth1
- IP Network: IPConfig1
- Static IP Addresses: 192.168.10.2
- Public IP Address: Auto Generated

NIC 1/3
- Interface: eth2
- IP Network: IPConfig2
- Static IP Addresses: 192.168.20.2

Next, click the arrow to go to the Storage page.
8. On the Storage page, you can attach existing storage volumes to your instance, if necessary, or create storage volumes and attach them to the instance. In this example, select the default storage.

9. On the Review page, verify the information that you’ve entered, and then click Create.

10. Monitor the status of the instance. When the status is shown as “Running,” the instance is ready. Follow the same steps to create two back-end servers.

11. From the Oracle web console, click IP Network > IP Address Prefix Sets > Create IP Network. Specify the name and the IP Address Prefix Set.

12. Create a security protocol with which to create security rules. You’ll create a security protocol for HTTP.

13. Create a security rule to allow external traffic to access the NetScaler Instance. For this scenario, create a rule to allow HTTP requests from external traffic to the NetScaler instance.

Now you can log on to your instance by using either GUI or SSH and complete the initial configuration. To find the oracle-assigned NetScaler management IP address, in the Oracle web console, click Instances. To find the NetScaler management IP address pair, click the instance details icon for the instance that you created.

You can use SSH to log on to your instance as an nsroot user, by using the following command:

```bash
ssh -i ./<private key> nsroot@<ip address>
```

When prompted, type the password nsroot.

Next, configure the NetScaler-owned IP addresses and the NetScaler instance as a load balancing virtual server:

- Configure the NetScaler-owned IP addresses by using the NetScaler GUI or the command “add ns ip.” For more information, see https://docs.citrix.com/en-us/netscaler/11-1/networking/ip-addressing/configuring-netscaler-owned-ip-addresses.html
- Configure the NetScaler instance as a load balancing virtual server. For more information, see https://docs.citrix.com/en-us/netscaler/11-1/load-balancing/load-balancing-setup.html.

**Example:** Here’s a sample LB configuration done by using the NetScaler CLI.

```bash
Add nsip 192.168.20.2 255.255.255.0
Add lb vs v1 http 192.168.10.2 80
Bind lb vs v1 s[1-2]
```
The preceding configuration is based on the following assumptions:

<table>
<thead>
<tr>
<th>Entity</th>
<th>Private IP address</th>
</tr>
</thead>
<tbody>
<tr>
<td>VIP</td>
<td>192.168.10.2</td>
</tr>
<tr>
<td>SNIP</td>
<td>192.168.20.2</td>
</tr>
<tr>
<td>Back-end server1</td>
<td>192.168.20.10</td>
</tr>
<tr>
<td>Back-end server2</td>
<td>192.168.20.11</td>
</tr>
</tbody>
</table>

**Deploy a NetScaler VPX Instance on Cisco CSP 2100**

January 18, 2019

You can deploy an SR-IOV-enabled NetScaler VPX instance on Cisco Cloud Services Platform (CSP) 2100 to configure network functions virtualization (NFV) for your environment. The Cisco CSP 2100 is a turnkey, open, x86 Linux Kernel-based virtual machine (KVM) software and hardware platform for data center NFV.

This section describes how to deploy a NetScaler VPX instance on Cisco CSP 2100 and enable SR-IOV on the instance.

**Points to Note**

- Supported NetScaler version: From release 11.1 56.x and later
- Qualified on CSP version 2.2.3 build 32

**Deploy a NetScaler VPX Instance on Cisco CSP 2100**

Deploy a NetScaler VPX instance on Cisco CSP 2100 is a 2-step process:

1. Upload the NetScaler VPX qcow image.
2. Enable SR-IOV on the VPX instance.

Complete the following steps:
1. Download the NetScaler VPX 11.1.56.x qcow image from the Citrix download site.
2. Log on to Cisco CSP 2100 with your logon credentials.
3. From the dashboard, select **Configuration > Repository**.
4. From the Repository window, select the plus sign.
5. Select **Browse** to browse to the downloaded NetScaler VPX qcow image.
6. Select **Upload** to upload the VPX image to CSP 2100.

Next, provision the VPX instance and add SR-IOV interfaces to it.

1. From the CSP dashboard, select **Configuration > Services**
2. Select the plus sign. The **Create Service** template appears. Enter the following specifications:
   - Name
   - Target Host Name
   - Image Name: qcow image that you’ve already downloaded
   - Number of cores: minimum two
   - Disk Space: Minimum 20 GB
   - RAM: Minimum 2,048 GB
3. To add an SR-IOV interface, select the plus sign next to VNIC. The **VNIC Configuration** window appears.
4. For **Interface Type**, select **Passthrough**.
5. Specify the VLAN range.
6. For **Passthrough Mode**, select **SR-IOV**.
7. For **Network Name**, select an SR-IOV supported NIC. Click **Submit**.
8. Click **Deploy** to complement the process. It might take a moment for the NetScaler VPX instance to be deployed on Cisco CSP 2100.
9. Next, log on to the NetScaler VPX instance to complete the initial configuration.

**Limitations**

The following are CSP 2100-related limitations:

- If you power off the NetScaler VPX instance by using the CSP 2100 GUI, the NetScaler VPX configuration might get lost.
- In host VLAN mode, the VPX Niantic SR-IOV interfaces must be configured to 9k MTU size.
- Due to vCPU scheduling issues on the CSP 2100 platform, latency, transmit stall, and transmit queue overflow might be observed on the NetScaler VPX instance.
- The “Tag-all” command is not supported on a VPX Niantic SR-IOV interface.
- The LACP feature is not supported on a VPX Niantic SR-IOV interface.

**Jumbo frames on NetScaler VPX instances**

December 18, 2018

NetScaler VPX appliances support receiving and transmitting jumbo frames containing up to 9216 bytes of IP data. Jumbo frames can transfer large files more efficiently than it is possible with the standard IP MTU size of 1500 bytes.

A NetScaler appliance can use jumbo frames in the following deployment scenarios:
- Jumbo to Jumbo. The appliance receives data as jumbo frames and sends it as jumbo frames.
- Non-Jumbo to Jumbo. The appliance receives data as regular frames and sends it as jumbo frames.
- Jumbo to Non-Jumbo. The appliance receives data as jumbo frames and sends it as regular frames.

For more information, see [Configuring Jumbo Frames Support on a NetScaler Appliance](#).

Jumbo Frames support is available on NetScaler VPX appliances running on the following virtualization platforms:
- VMware ESX
- Linux-KVM Platform
- Citrix XenServer
- Amazon Web Services (AWS)

Jumbo frames on VPX appliances works similar to Jumbo frames on MPX appliances. For more information on Jumbo Frames and its use cases, see [Configuring Jumbo Frames on MPX appliances](#). The use cases of Jumbo Frames on MPX appliances also apply to VPX appliances.

**Configure jumbo frames for a VPX instance running on VMware ESX**

Perform the following tasks for configuring Jumbo Frames on a NetScaler VPX appliance running on VMware ESX server:

1. Set the MTU of the interface or channel of the VPX appliance to a value in the range 1501-9000.
   Use the CLI or GUI to set the MTU size. Note that NetScaler VPX appliances running on VMware ESX support receiving and transmitting jumbo frames containing up to only 9000 bytes of IP data.
2. Set the same MTU size on the corresponding physical interfaces of the VMware ESX server by using its management applications. For more information about setting the MTU size on the physical interfaces of VMware ESX, see [http://vmware.com/](http://vmware.com/).

**Configure jumbo frames for a VPX instance running on Linux-KVM server**

Perform the following tasks for configuring Jumbo Frames on a NetScaler VPX appliance running on a Linux-KVM Server:

1. Set the MTU of the interface or channel of the VPX appliance to a value in the range 1501-9216. Use the NetScaler VPX CLI or GUI to set the MTU size.
2. Set the same MTU size on the corresponding physical interfaces of a Linux-KVM Server by using its management applications. For more information about setting the MTU size on the physical interfaces of Linux-KVM, see [http://www.linux-kvm.org/](http://www.linux-kvm.org/).

**Configure jumbo frames for a VPX instance running on Citrix XenServer**

Perform the following tasks for configuring Jumbo Frames on a NetScaler VPX appliance running on Citrix XenServer:

1. On the **Networking** tab, select the network - network 0/1/2.
2. Select **Properties** and edit MTU. The drop-down selection menu for MTU is unavailable unless all the VPXs that use the network are shutdown.

**Configure jumbo frames for a VPX instance running on AWS**

Host-level configuration is not required for VPX on Azure. To configure Jumbo Frames on VPX, follow the steps given in Configuring Jumbo Frames Support on a NetScaler Appliance.

**Hardware Installation**

December 18, 2018

**Note**

For the latest content, see NetScaler MPX.

The following sections describe the hardware installation and initial configuration for all NetScaler hardware platforms.
### Hardware Platforms
Describes the NetScaler hardware platforms and provides detailed information about each platform and its components.

### Preparing for Installation
Describes how to unpack the NetScaler appliance and prepare the site and rack for installing the appliance. Lists the cautions and warnings that you should review before you install the appliance.

### Installing the Hardware
Describes the steps to install the rails, mount the hardware, connect the cables, and turn on the appliance.

### Initial Configuration
Describes how to perform initial configuration of your NetScaler appliance and assign management and network IP addresses.

### Lights Out Management Port of the NetScaler Appliance
Describes the different operations you can perform on your NetScaler appliance by using the Lights Out Management Port.

---

For information about NetScaler hardware and software compatibility and the supported upgrade and downgrade paths, see [http://support.citrix.com/article/CTX113357](http://support.citrix.com/article/CTX113357).

---

## Licensing

December 18, 2018

The following topics describe the migration instructions for setting up a new version of a NetScaler appliance with a list of all new and deprecated commands, parameters, and SNMP OIDs.

This document includes the following information:

- NetScaler Licensing Overview
- NetScaler Gateway Universal License
NetScaler licensing overview

March 6, 2019

The process of allocating your NetScaler licenses has been greatly simplified. The new licensing framework allows you to focus on getting maximum value from Citrix products.

In the NetScaler GUI, you can use your hardware serial number (HSN) or your license access code to allocate your licenses. Alternatively, if a license is already present on your local computer, you can upload it to the appliance.

For all other functionality, such as returning or reallocating your license, you must use the licensing portal. Optionally, you can still use the licensing portal for license allocation. For more information about the licensing portal, see http://support.citrix.com/article/CTX131110.

**Note:** Purchase separate licenses for each appliance in a high availability pair. Ensure that the same types of licenses are installed on both the appliances. For example, if you purchase a platinum license for one appliance, you must purchase another platinum license for the other appliance.

**Prerequisites**

To use the hardware serial number or license access code to allocate your licenses:

- You must be able to access public domains through the appliance. For example, the appliance should be able to access www.citrix.com. The license allocation software internally accesses the Citrix licensing portal for your license. To access a public domain:
  - Use a proxy server or set up a DNS server.
  - Configure a NetScaler IP (NSIP) address or a subnet IP (SNIP) address on your NetScaler appliance.

- Your license must be linked to your hardware, or you must have a valid license access code. Citrix sends your license access code by email when you purchase a license.

**Allocate a license by using the GUI**

If your license is already linked to your hardware, the license allocation process can use the hardware serial number. Otherwise, you must type the license access code.

You can partially allocate licenses as required for your deployment. For example, if your license file contains 10 licenses, but your current requirement is for only six licenses, you can allocate six licenses now, and allocate more licenses later. You cannot allocate more than the total number of licenses present in your license file.
To allocate your license

1. In a web browser, type the IP address of the NetScaler appliance (for example, http://192.168.100.1).

2. In User Name and Password, type the administrator credentials.

3. On the Configuration tab, navigate to System \ Licenses.

4. In the details pane, click Manage Licenses, click Add New License, and then select one of the following options:
   - **Use Serial Number.** The software internally fetches the serial number of your appliance and uses this number to display your licenses.
   - **Use license access code.** Citrix emails the license access code for the license that you purchased. Enter the license access code in the text box.

   If you do not want to configure internet connectivity on the NetScaler appliance, you can use a proxy server. Select the Connect through Proxy Server check box and specify the IP address and port of your proxy server.

5. Click Get Licenses. Depending on the option that you selected, one of the following dialog boxes appears.
   - The following dialog box appears if you selected Hardware Serial Number.
   - The following dialog box appears if you selected license access code.

6. Select the license file that you want to use to allocate your licenses.

7. In the Allocate column, enter the number of licenses to be allocated. Then click Get.
   - If you selected **Hardware Serial Number**, enter the number of licenses, as shown in the following screenshot.
   - If you selected **license access code**, enter the number of licenses, as shown in the following screenshot.

8. Click restart for the license to take effect.

9. In the restart dialog box, click OK to proceed with the changes, or click Close to cancel the changes.

Install a license

If you downloaded your license file to your local computer by accessing the licensing portal, you must upload the license to the appliance.
To install a license file by using the GUI

1. In a web browser, type the IP address of the NetScaler appliance (for example, http://192.168.100.1).
2. In User Name and Password, type the administrator credentials.
3. On the Configuration tab, navigate to System Licenses.
4. In the details pane, click Manage Licenses.
5. Click Add New License, then select Upload license files from a local computer.
6. Click Browse. Navigate to the location of the license files, select the license file, and then click Open.
7. Click restart to apply the license.
8. In the restart dialog box, click OK to proceed with the changes, or click Close to cancel the changes.

To install the licenses by using the CLI:

1. Open an SSH connection to the ADC appliance by using an SSH client, such as PuTTY.
2. Log on to the ADC appliance by using the administrator credentials.
3. Switch to the shell prompt, create a license subdirectory in the nsconfig directory, if it does not exist, and copy one or more new license files to this directory.

   Example

   ```
   1 login: nsroot
   2 Password: nsroot
   3 Last login: Mon Aug  4 03:37:27 2008 from 10.102.29.9
   4 Done
   5 >
   6 Last login: Mon Aug  4 03:51:42 2008 from 10.103.25.64
   7 root@ns# mkdir /nsconfig/license
   8 root@ns# cd /nsconfig/license
   ```

   Copy one or more new license files to this directory.

   Note: The NetScaler appliance does not prompt for a reboot option when you use the command line interface to install the licenses. Run the reboot -w command to warm restart the system, or run the restart command to restart the system normally.

Verify licensed features

Before using a feature, ensure that your license supports the feature.
To verify the licensed features by using the CLI

1. Open an SSH connection to the ADC appliance by using an SSH client, such as PuTTY.
2. Log on to the ADC appliance by using the administrator credentials.
3. At the command prompt, enter the sh ns license command to display the features supported by the license.

Example

```
1  sh ns license
2      License status:
3          Web Logging: YES
4          Surge Protection: YES
5          .......
6
7          HTML Injection: YES
8  Done
```

To verify the licensed features by using the GUI

1. In a web browser, type the IP address of the ADC appliance, such as http://192.168.100.1.
2. In User Name and Password, type the administrator credentials.
3. Provide the User name and Password and click Login.
4. In the navigation pane, expand System, and then click Licenses. You see a green check mark next to the licensed features.

Enable or disable a feature

When you use the NetScaler appliance for the first time, you must enable a feature before you can use its functionality. If you configure a feature before it is enabled, a warning message appears. The configuration is saved but it applies only after the feature is enabled.

To enable a feature by using the CLI

At the command prompt, type the following commands to enable a feature and verify the configuration:

- enable feature <FeatureName>
- show feature

Example
enable feature lb cs
done
> show feature

<table>
<thead>
<tr>
<th>Feature</th>
<th>Acronym</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>1) Web Logging</td>
<td>WL</td>
<td>OFF</td>
</tr>
<tr>
<td>2) Surge Protection</td>
<td>SP</td>
<td>ON</td>
</tr>
<tr>
<td>3) Load Balancing</td>
<td>LB</td>
<td>ON</td>
</tr>
<tr>
<td>4) Content Switching</td>
<td>CS</td>
<td>ON</td>
</tr>
<tr>
<td>5) Cache Redirection</td>
<td>CR</td>
<td>ON</td>
</tr>
<tr>
<td>24) NetScaler Push</td>
<td>push</td>
<td>OFF</td>
</tr>
</tbody>
</table>

The example shows how to enable load balancing (lb) and content switching (cs).

If the license key is not available for a particular feature, the following error message appears for that feature:

ERROR: feature(s) not licensed

Note: To enable an optional feature, you must have a feature-specific license. For example, you have purchased and installed the Citrix NetScaler Enterprise Edition license. However, to enable the Integrated Caching feature, you must purchase and install the AppCache license.

**To disable a feature by using the CLI**

At the command prompt, type the following commands to disable a feature and verify the configuration:

- disable feature <FeatureName>
- show feature

**Example**

The following example shows how to disable load balancing (LB).

> disable feature lb
Done
> show feature
### Citrix Gateway Universal License

July 19, 2019

The Citrix Gateway universal license limits the number of concurrent user sessions to the number of licenses purchased. If you purchase 100 licenses, you can have 100 concurrent sessions at any time. When a user ends a session, that license is released for the next user. A user who logs on to the Citrix Gateway from more than one computer occupies a license for each session.

If all licenses are occupied, no additional connections can be opened until a user ends a session or the administrator terminates the session using the configuration utility. When a connection is closed, the license is released and can be used for a new user.

### Obtaining the Universal License

You need the following information before going to the Citrix Web site for the universal license.

- Your user ID and password for My Citrix
  
  Register at My Citrix (www.mycitrix.com) to receive your user ID and password.
  
  Note: If you cannot locate either the license code or your user ID and password, contact Citrix Customer Service.

- The host name of the Citrix Gateway

---

<table>
<thead>
<tr>
<th>Feature</th>
<th>Acronym</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Web Logging</td>
<td>WL</td>
<td>OFF</td>
</tr>
<tr>
<td>Surge Protection</td>
<td>SP</td>
<td>ON</td>
</tr>
<tr>
<td>Load Balancing</td>
<td>LB</td>
<td>OFF</td>
</tr>
<tr>
<td>Content Switching</td>
<td>CS</td>
<td>ON</td>
</tr>
<tr>
<td>NetScaler Push</td>
<td>push</td>
<td>OFF</td>
</tr>
</tbody>
</table>

Done

>
The entry field for this name on My Citrix is case-sensitive, so make sure that you copy the host name exactly as it is configured on the NetScaler appliance.

- The number of licenses you want to include in the license file

You do not have to download all of the licenses you are entitled to at once. For example, if your company purchased 100 licenses, you can choose to download 50. You can allocate the rest in another license file at a later time. Multiple license files can be installed on the Citrix Gateway.

**Note:** Before obtaining your licenses, make sure you configure the host name of the NetScaler appliance using the Setup Wizard and then restart the appliance.

**To obtain your universal license**

1. In a Web browser, go to http://www.citrix.com/ and click My Citrix.
2. Enter your user name and password. If this is the first time you are logging on to the site, you are asked for additional background information.
3. Under My Tools, point to Choose a toolbox, and click Activation System/Manage Assets.
4. In the Current Tool drop-down menu, select Activate/Allocate and follow the directions to obtain your license file.

**Installing the Universal License**

To install the license, see “Installing the License”. After installation, verify that the license was installed correctly.

**Verifying Installation of the Universal License**

Before proceeding, verify that your universal license is installed correctly.

**To verify installation of the universal license by using the command line interface**

1. Open an SSH connection to the NetScaler appliance by using an SSH client, such as PuTTY.
2. Log on to the NetScaler appliance by using the administrator credentials.
3. Use the show license command to verify that “SSL VPN = YES” and that Maximum Users has increased from 5 to the expected number of concurrent users.
To verify installation of the universal license by using the configuration utility

1. In a Web browser, type the IP address of the NetScaler appliance, such as http://192.168.100.1.
2. In User Name and Password, type the administrator credentials.
3. In the navigation pane, expand System, and then click Licenses.
4. In the Licenses pane, you will see a green check mark next to NetScaler Gateway. The field Maximum Citrix Gateway Users Allowed displays the number of concurrent user sessions licensed on the NetScaler appliance.

NetScaler Pooled Capacity

December 18, 2018

NetScaler pooled capacity is a licensing framework that comprises a common bandwidth and instance pool that is hosted on and served by Citrix Application Delivery Management.

For complete information, see NetScaler Pooled Capacity “NetScaler Pooled Capacity”.

Upgrade and downgrade a NetScaler appliance

May 29, 2019

NetScaler 11.1 offers new and updated features with increased functionality. A comprehensive list of enhancements is documented in the release notes accompanying the release announcement. Read the release notes before you upgrade your software.

This section provides information about upgrading and downgrading a NetScaler appliance (MPX and VPX) firmware. For information about upgrading a NetScaler SDX appliance, see Single Bundle Upgrade.

Note: For upgrading or downgrading the nodes in a cluster setup, see Upgrading or Downgrading the Cluster Software.

Upgrading from release 10.1 build 121.10 or any earlier releases to release 10.1 build 122.17 and later involves some location changes of user monitor script files. For details, see the Directory locations of script files for user monitors section in Upgrade a Citrix NetScaler standalone appliance.
NetScaler 11.1

Note
For best practices for upgrading NetScaler appliances, read the article CTX126793.

Before you begin

December 19, 2018

Before you start the upgrade or downgrade process, make sure you check the following:

• The licensing framework and types of licenses. A software edition upgrade might require new licenses, such as upgrading from the standard edition to the enterprise edition, the standard edition to the platinum edition, or the enterprise edition to the platinum edition. Existing Citrix NetScaler licenses continue to work when you upgrade to version 11.1. For more information, see Licensing.

• Check for New and deprecated commands, parameters, and SNMP OIDs.

• Check for Citrix NetScaler Hardware and Software Compatibility Matrix.

• If the Citrix NetScaler Gateway logon page is customized, then make sure that the UI theme is set to default.

• Review the LOM Firmware Upgrade page, if you are upgrading LOM.

• Download the Citrix NetScaler firmware from the download page. For the detailed steps to download the Citrix NetScaler firmware, see the “How to download and update the NetScaler Firmware” section in this article CTX205476.

• Perform a back up of the configuration file, customization file, certificates, monitor scripts, license files, and so on either manually or refer to the following documentation for back up using Citrix NetScaler CLI or GUI - Backup and restore.

• Validate the integrity of the Citrix NetScaler and check available space before performing an upgrade. For more information about how to free up storage space, see https://support.citrix.com/article/CTX133588.

• Check the Citrix ADC VPX Support matrix and usage guidelines.

• Check the FAQ section.

For more information about prerequisites for upgrading or downgrading the Citrix NetScaler firmware, see these support articles:

• CTX126793: Best Practices for Upgrading Citrix NetScaler or Citrix NetScaler Gateway Appliances

• CTX220371: Must Read Articles Before and After Upgrading Citrix NetScaler
Upgrade a Citrix NetScaler standalone appliance

May 29, 2019

Before upgrading the system software, ensure that you read the Before you begin section. Also, complete the prerequisites such as backing up the necessary files and downloading the Citrix NetScaler firmware.

When upgrading from 10.0 and higher releases, you can use the GUI or the CLI.

You cannot upgrade to release 11.1 from the following builds by using the GUI Upgrade Wizard:

- All builds of release 10.1
- Any build before Build 57.x of release 10.5

If your Citrix NetScaler runs any 9.x or lower release, visit the Product Matrix site for more information.

Upgrade a Citrix NetScaler standalone appliance by using the GUI

Follow these steps to upgrade a standalone Citrix NetScaler instance by using the GUI:

1. In a web browser, type the IP address of the Citrix NetScaler, for example http://10.102.29.50.
2. In User Name and Password, type the administrator credentials (nsroot/nsroot) and then click Log On.
3. From the GUI, click System Upgrade.
4. From the Choose File menu choose the appropriate option: Local or Appliance. If you want to use the Appliance option, the firmware needs to be uploaded to the Citrix NetScaler first. You can use any file transfer method such as WinSCP to upload the Citrix NetScaler firmware to the appliance.
5. Select the correct file and click Upgrade.
6. Follow the instructions to upgrade the software.
7. When prompted, select Reboot.

After the upgrade, close all browser instances and clear your computer’s cache before accessing the appliance.

Upgrade a Citrix NetScaler standalone appliance by using the CLI

Follow these steps to upgrade a standalone Citrix NetScaler instance by using the CLI:
In the following procedure, `<release>` and `<releasenumber>` represent the release version you are upgrading to, and `<targetbuildnumber>` represents the build number that you are upgrading to. The procedure includes optional steps to avoid losing any updates that are pushed to the /etc directory during the upgrade.

1. Use an SSH client, such as PuTTy, to open an SSH connection to the appliance.
2. Log on to the appliance by using the administrator credentials. Save the running configuration. At the prompt, type: `save config`
3. Create a copy of the ns.conf file. At the shell prompt, type:
   a) `cd /nsconfig`
   b) `cp ns.conf ns.conf.NS<currentreleasenumber><currentbuildnumber>`
   You should backup the configuration file to another computer.
4. (Optional) If you have modified some of the following files in the /etc directory, and copied them to /nsconfig to maintain persistency, any updates that are pushed to the /etc directory during the upgrade might be lost:
   ```
   • ttys
   • resolv.conf
   • sshd\_config
   • host.conf
   • newsyslog.conf
   • host.conf
   • httpd.conf
   • rc.conf
   • syslog.conf
   • crontab
   • monitrc
   ```
   To avoid losing these updates, create a `/var/nsconfig_backup` directory, and move the customized files to this directory. That is, move any files that you modified in /etc directory and copied to /nsconfig by running the following command:
   ```
   cp /nsconfig/\<filename\> /var/nsconfig\_backup
   ```
   Example:
   ```
   cp /nsconfig/syslog.conf /var/nsconfig_backup
   ```
5. Create a location for the installation package. At the shell prompt type:
   ```
   • cd /var/nsinstall
   • mkdir \<releasenumber\>nsinstall
   • cd \<releasenumber\>nsinstall
   ```

© 1999-2018 Citrix Systems, Inc. All rights reserved.
6. Copy the already downloaded Citrix NetScaler firmware to the directory that you created for it in step 5, by using any file transferring method such as WinSCP. See the Before You Begin section for more information about downloading the Citrix NetScaler firmware.

7. Extract the contents of the installation package. Example:

   `tar -xvzf build-11.1-47.1_nc.tgz`

8. Run the `install ns` script to install the new version of the system software. The script updates the `/etc` directory. Example: `./installns`

9. When prompted, restart the Citrix NetScaler.

10. (Optionally) If you've created a copy of the `ns.conf` file in the Before You Begin section, do the following:

    1. Manually compare the files in `/var/nsconfig_backup` and `/etc` and make appropriate changes in `/etc`.
    2. To maintain persistency, move the updated files in `/etc` to `/nsconfig`.
    3. Restart the appliance to put the changes into effect.

Following is an example of Citrix NetScaler firmware upgrade.

```
login: nsroot
Password: nsroot
Last login: Thu Jun 23 15:05:05 2016 from 10.252.243.134

Done

> save config
> shell

Last login: Thu Jun 23 15:05:05 2016 from 10.252.243.134
root@NSnnn# cd /var/nsinstall
```
NetScaler 11.1

root@NSnnn# cd 11.1nsinstall

root@NSnnn# mkdir build_47.10

root@NSnnn# cd build_47.10

root@NSnnn# ftp <FTP server IP address>

ftp> mget build-11.1-47.10_nc.tgz

ftp> bye

root@NSnnn# tar xzvf build-11.1-47.10_nc.tgz

root@NSnnn# ./installns

installns version (11.1-47.10) kernel (ns-11.1-47.10_nc.gz)

...
Installation has completed.

Reboot NOW? [Y/N] Y

Upgrade a Citrix NetScaler standalone appliance by using NITRO API

To use NITRO API to upgrade or downgrade a Citrix NetScaler, see Automate Citrix NetScaler Upgrade and Downgrade with a Single API.

Directory locations of script files for user monitors

In release 10.1 build 122.17, the script files for user monitors are at a new location. If you upgrade an appliance or virtual appliance to release 10.1 build 122.17 or later, the changes are as follows:

- A new directory named conflicts is created in /nsconfig/monitors/ and all the built-in scripts of the previous builds are moved to this directory.
- All new built-in scripts are available in the /netscaler/monitors/ directory. All custom scripts are available in the /nsconfig/monitors/ directory.
- You must save a new custom script in the /nsconfig/monitors/ directory.
- After the upgrade is completed, if a custom script is created and saved in the /nsconfig/monitors/ directory with the same name as that of a built-in script, the script in the /netscaler/monitors/ directory takes priority. That is, the custom script is not run.

If you provision a virtual appliance running release 10.1 build 122.17 or later, the changes are as follows:

- All built-in scripts are available in the /netscaler/monitors/ directory
- The directory /nsconfig/monitors/ is empty.
- If you create a custom script, you must save it in the /nsconfig/monitors/ directory.

For more information about user monitors, see Understanding user monitors.

Check and install a Citrix NetScaler software update

Update the Citrix NetScaler software when an update is available, for a better performance. A Citrix NetScaler update can include feature improvements, performance fixes, or enhancements. Make sure you read the release notes to see what fixes and enhancements are available in the update. To check and install a software update, do the following.
1. In the Citrix NetScaler home page, click **Check for Update** from the **nsroot** menu at the top right corner of the page.

2. In the **Latest System Software Updates Available** page, check the available software update that you can install.

3. Click **Download** to download the installation package from the Citrix download website.

4. After you have downloaded the software package, install the update through either CLI or GUI procedure.

**Note**

The **Check for Update** link is accessible only if you log into the GUI through the HTTP protocol and not through the HTTPS protocol.

---

**Downgrade a Citrix NetScaler standalone appliance**

January 6, 2019

You can downgrade to any earlier release on a standalone Citrix NetScaler by using the CLI. Downgrading using the GUI is not supported.

**Note**

Loss in configuration might occur when downgrading. You should compare the configurations before and after the downgrade, and then manually reenter any missing entries.

---

**Procedure to downgrade a standalone Citrix NetScaler**

Follow the steps given below to downgrade a Citrix NetScaler standalone appliance running release 11.1 to an earlier release.

In this procedure, `<release>` and `<releasenumber>` represent the release version you are downgrading to, and `<targetbuildnumber>` represents the build number that you are downgrading to.

1. Open an SSH connection to the Citrix NetScaler by using an SSH client, such as PuTTY.

2. Log on to the Citrix NetScaler by using the administrator credentials. Save the running configuration. At the prompt, type:

   ```
   save config
   ```

3. Create a copy of the `ns.conf` file. At the shell prompt, type:

   ```
   a) cd /nsconfig
   b) cp ns.conf ns.conf.NS<currentbuildnumber>
   ```
You should backup a copy of the configuration file on another computer.

4. Copy the `<releasenumber>` configuration file (ns.conf.NS<releasenumber>) to ns.conf. At the shell prompt, type:

   ```bash
cp ns.conf.NS<releasenumber> ns.conf
   ```

   Note: ns.conf.NS<releasenumber> is the backup configuration file that is automatically created when the system software is upgraded from release version `<releasenumber>` to the current release version. There may be some loss in configuration when downgrading. After the appliance restarts, compare the configuration saved in step 3 with the running configuration, and make any adjustments for features and entities configured before the downgrade. Save the running configuration after making the changes.

   Important: If routing is enabled, perform step 5. Otherwise, skip to step 6.

5. If routing is enabled, the ZebOS.conf file will contain the configuration. At the shell prompt, type:

   a) cd /nsconfig
   b) cp ZebOS.conf ZebOS.conf.NS
   c) cp ZebOS.conf.NS<targetreleasenumber> ZebOS.conf

6. Change directory to `/var/nsinstall/<releasenumber>nsinstall`, or create one if it does not exist.

7. Change directory to `build_<targetbuildnumber>`, or create one if it does not exist.

8. Download or copy the installation package (build-<release>-<targetbuildnumber>.tgz) to this directory and extract the contents of the installation package.

9. Run the installns script to install the new version of the system software. The script updates the `/etc` directory.

   If the configuration file for the build that you are downgrading to exists on the appliance, you are prompted to load that configuration, as shown in the following figure.

   Figure 1. Downgrade menu if configuration file exists

   If the free space available on the flash drive is insufficient to install the new build, the Citrix NetScaler aborts the installation. Manually clean up the flash drive and restart the installation.

**Example:**

```
1 login: nsroot
2
3 Password: nsroot
4
5 Last login: Mon Apr 24 02:06:52 2017 from 10.102.29.9
6
7 Done
```
```
> save config
> shell
root@NSnnn# cp ns.conf.NS10.5 ns.conf
root@NSnnn# cd /var/nsinstall
root@NSnnn# mkdir 10.5nsinstall
root@NSnnn# cd 10.5nsinstall
root@NSnnn# mkdir build_57
root@NSnnn# cd build_57
root@NSnnn# ftp 10.102.1.1
ftp> mget build-10.5-57_nc.tgz
ftp> bye
root@NSnnn# tar -xzvf build-10.1-125_nc.tgz
root@NSnnn# ./installns
installns version (10.5-57) kernel (ns-10.5-57.gz)
...
...
...
Copying ns-10.5-57.gz to /flash/ns-10.5-57_nc.gz ...
Changing /flash/boot/loader.conf for ns-10.5-57 ...
Installation has completed.
```
Upgrade a high availability pair

June 19, 2019

One of the requirements of Citrix NetScaler appliances in a high availability setup is to install the same Citrix NetScaler software release on both appliances of the setup. Therefore, when software on one appliance is upgraded, ensure that the software is upgraded on both the appliances.

You can follow the same procedure to upgrade a standalone appliance or each appliance in a high availability pair, although additional considerations apply to upgrading a high availability pair.

Before you start a Citrix NetScaler firmware upgrade on an HA pair, read the prerequisites mentioned in the Before you begin section. Also, you need to consider a few HA-specific points.

Points to note

- First upgrade the secondary node, and then the primary node. Upgrading software on the secondary appliance before the primary appliance ensures that the upgrade process is completed without any issues.

- If the two nodes in an HA configuration are running different Citrix NetScaler software releases, the following information does not get synchronized on the primary and secondary nodes:
  - Configuration propagation and synchronization
  - States of the services
  - Connection failover sessions
  - Persistence sessions

- The above information might not get synchronized on the primary and secondary nodes if the two nodes are running different builds of the same release. Refer to the Known Issues section of the release notes to check if your Citrix NetScaler build has this issue.

- Synchronization of the files in the All mode of the Sync HA files command works successfully if the two nodes in an HA configuration are running different Citrix NetScaler software releases, or the two nodes are running different builds of the same release. For more information, see Synchronising Configuration Files in High Availability Setup.

Figure. Upgrade a high availability pair

You can upgrade using the Citrix NetScaler CLI or GUI.
Upgrade a high availability pair by using the CLI

The upgrade process includes the following steps:

1. Upgrade software on the secondary appliance
2. Upgrade software on the upgrade appliance
3. Synchronize secondary appliance

Upgrade software on the secondary appliance

The following illustration depicts the procedure to upgrade software on the secondary appliance:

1. Log on to the secondary NetScaler appliance using an SSH utility, such as PuTTY and specifying the NetScaler IP (NSIP). Use the nsroot credentials to log on to the appliance.
2. From the command line interface of the appliance, type the following command to save the existing configuration: save config
3. Switch to the shell prompt.

```
1 login as: username
2 Using keyboard-interactive authentication.
3 Password:
5 Done
6 > shell
7 Copyright (c) 1992-20
```

4. Run the following command to change to the default installation directory: # cd /var/nsinstall
5. Run the following command to create a temporary subdirectory of the nsinstall directory: # mkdir x_xnsinstall

Note: The text x_x is used to name the NetScaler version for future configurations. For example, the directory for the installation files of NetScaler 9.3 us called 9_3nsinstall. Do not use a period (.) in the folder name, it can cause failed upgrades.

6. Change to the x_xnsinstall directory.

7. Download the required installation package and documentation bundle, such as “ns-x.0.xx.x-doc.tgz,” to the temporary directory created in Step 4.

Notes:

- Some builds do not have a documentation bundle as it does not have to be installed.
- Click the Documentation tab from the GUI to access the documentation.
8. Before you run the install script, the files must be extracted and placed on the appliance. Use the following command to uncompress the bundle downloaded from Citrix website: `tar -zxvf ns-x.0-xx.x-doc.tgz`. The following is a quick explanation of the parameters used.

- x: Extract files
- v: Print the file names as they are extracted one by one
- z: The file is a “gzipped” file
- f: Use the following tar archive for the operation

9. Run the following command to install the downloaded software: `# ./installns`

Note: If the appliance does not have sufficient disk space to install the new kernel files, the installation process performs an automatic cleanup of the flash drive.

10. After the installation process is complete, the process prompts to restart the appliance. Press y to restart the appliance.

11. Log on to the appliance Command Line Interface using the nsroot credentials.

12. Run the following command from to display the state of the NetScaler appliance: `> show ha node` The output of the preceding command should indicate that the appliance is a secondary node and synchronization is disabled.

13. Run the following command to disable synchronization on the appliance if synchronization is not disabled: `> set ha node -hasync disabled`

14. Ensure that the configuration is complete and as expected.

15. Run the following command to perform a force failover and takeover as primary appliance: `> force failover`

Here’s a sample configuration in the new primary node.

```
1 login: nsroot
  2 Password: nsroot
  3 Last login: Monday Apr 17 08:37:26 2017 from 10.102.29.9
  4 Done
  5 show ha node
  6   2 nodes:
  7     Node ID:   0
  8     IP:       10.0.4.2
  9     Node State: UP
 10    Master State: Primary
 11     ...
 12    Sync State: AUTO DISABLED
 13    Propagation: AUTO DISABLED
 14     ...
```
Upgrade software on the primary appliance

The following illustration depicts the procedure to upgrade software on the primary appliance:

1. Log on to the secondary NetScaler appliance using an SSH utility, such as PuTTY. Use the nsroot credentials to log on to the appliance. Follow the same steps as mentioned in the above section to complete the installation process. We have to follow the same steps as mentioned in step 2 to step 9 in the previous section (Upgrade software of the secondary appliance).
2. After the installation process is complete, the process prompts to restart the appliance. Press y to restart the appliance.
3. Log on to the appliance Command Line Interface using the nsroot credentials.
4. Run the following command to display the state of the NetScaler appliance: `show ha node`.
   The output of the preceding command should indicate that the appliance is a primary node and the status of the node state is marked as UP.
5. If the appliance is not a primary appliance, run the following command to perform a force failover to ensure that the appliance is a primary appliance: `force failover`.
6. Verify that the appliance is a primary appliance.

Enable synchronization on the secondary appliance

To enable synchronization on the secondary appliance, complete the following procedure:

1. Run the following command to verify that the appliance is a secondary appliance: `show node`
2. Run the following command to enable synchronization on the appliance: `set ha node -hasync enabled`
3. Run the following command to verify that the configuration of the secondary appliance is synchronized with that of the primary appliance: `show ns runningconfig`

Here’s an example configuration of the new primary node and the new secondary node.
Upgrade a high availability pair by using the GUI

Follow these steps to upgrade a Citrix NetScaler pair in a high availability setup, by using the GUI:

1. Log on to the secondary node and perform the upgrade as described in the section “Upgrade a Citrix NetScaler standalone appliance by using the GUI” in Upgrade a Citrix NetScaler standalone appliance.

2. Log on to the primary node and perform the upgrade as described in the section “Upgrade a Citrix NetScaler standalone appliance by using the GUI” in Upgrade a Citrix NetScaler standalone appliance.
Downgrade a high availability pair

June 19, 2019

You can downgrade to any release on a high availability pair by using the command line interface. The GUI does not support the downgrade process.

To downgrade the system software on a Citrix NetScaler pair in a high availability pair, you need to downgraide the software first on the secondary node and then on the primary node. For instructions on downgrading each node separately, see Downgrade a Citrix NetScaler standalone appliance.

Important

Loss in configuration might occur when downgrading. You should compare the configurations before and after the downgrade, and then manually re-enter any missing entries.

Troubleshooting

June 12, 2019

If the appliance does not work as expected after you complete the installation, upgrade, or downgrade process, the first thing to do is to check for the most common causes of the problem.

Resources for troubleshooting

For best results, use the following resources to troubleshoot an issue related to installing, upgrading, or downgrading a Citrix NetScaler:

- The configuration files from the appliance. In case of a High Availability pair, the configuration files from both appliances.
- The following files from the appliance(s):
  - The relevant newnslog files.
  - The ns.log file.
  - The messages file.
- A network topology diagram.
**Troubleshooting issues related to the installation, upgrade, and downgrade processes**

Following are the most common installation, upgrade, and downgrade issues, and tips for resolving them:

- **Issue**
  The Citrix NetScaler is not accessible after the software downgrade

  **Cause**
  During the software downgrade process, if the configuration file of the existing release and build does not match the configuration file of the earlier release and build, the appliance cannot load the configuration, and the default IP address is assigned to the appliance.

  **Resolution**
  - Verify that the appliance is accessible from the console.
  - Verify the NSIP address and the routes on the appliance.
    * If the IP address has changed to the default 192.168.100.1 IP address, change the IP address as required.
    * Verify that the appliance is accessible.

- **Issue**
  Configuration of the appliance is lost after you upgrade the software across multiple releases.

  **Cause**
  Some migration commands are built in for upgrading to the next release. Such commands might not be available across releases.

  **Resolution**
  - Verify the path of the upgrade process. Citrix recommends upgrading by one release at a time. For example, if the software needs to be upgraded from Citrix NetScaler (previously NetScaler) release 9.2 to release 10.1, the following is the recommended path for the upgrade:
    * Release 9.2 to release 9.3
    * Release 9.3 to release 10
    * Release 10 to release 10.1
  - Verify that the appliance has appropriate license files.
  - Verifying the configuration at each step of the upgrade process can give you pointers to the issue.

- **Issue**
  During an upgrade, if I run the command for synchronizing, the following message appears:
  Command failed on the secondary node but succeeded on the primary node.
**Resolution**

Do not run any dependent commands (set /unset /bind /unbind) when High Availability (HA) synchronization is in progress.

**Issue**

During an upgrade process, traffic does not pass through the new primary node when you run the force failover command.

**Resolution**

- Check for problems with the network topology and the switch configurations.
- Run the set L2param -garpreply ENABLED command to enable the GARP reply.
- Try using virtual MAC if not already used.
- Run the sendarp –a command from the primary node.

**Issue**

In an HA pair, after you run the force HA failover command the devices keep rebooting. The secondary device does not come up after an upgrade.

**Resolution**

Check to see if the /var directory is full. If so, remove the old installation files. Run the df –h command to show the available disk space.

**Issue**

After upgrading an HA pair, one of the nodes is listed as state UNKNOWN.

**Resolution**

- Check to see if both nodes are running the same build. If the builds are not same and HA nodes have a version mismatch, some of the fields are shown as UNKNOWN when you run the show ha node command.
- Check to see if the secondary appliance is reachable.

**Issue**

After you upgrade the Citrix NetScaler, the interface shows most of the load balancing virtual servers and services are DOWN.

**Resolution**

Verify that the SNIP address is active on the secondary appliance. Also, type the show service command to see if the service is running.

**Issue**

After performing an upgrade, all virtual servers are down on the secondary appliance.

**Resolution**
Enable the HA state and HA synchronization by running the following commands:

- `set node hastate enable`
- `set node hasync enable`

Disabling HA is not recommended.

**Issue**

After performing a downgrade, the Citrix NetScaler does not boot up properly.

**Resolution**

Check to see if the correct license has been installed.

**Issue**

In an HA pair, some features do not get synchronized after an upgrade is performed.

**Resolution**

Run the `sync ha file misc` command to synchronize the configurations files from the primary node to secondary node.

**Issue**

During reboot, the following error message appears:

One or more commands in `ns.conf` failed

What should I do?

**Resolution**

Make sure that no command in the `ns.conf` file exceeds the 255 byte limit. In commands that create policies that are too long for the 255-byte limit, you can use pattern sets to shorten the policies.

Example:

```
"" pre codeblock
add cs policy p11-rule 'HTTP.REQ.URL.ENDSWITH_ANY("ctx_file_extensions")'
```

Done

Note: Patsets are supported only in release 9.3 or later.
• **Issue**

When upgrading a Citrix NetScaler VPX appliance, I am told to free up space in /var. What files do I remove?

**Resolution**

Remove the old installation files from /var/tmp/ directory. Also remove unwanted files from /flash.

• **Issue**

There is no connectivity to the graphical user interface (GUI) when you run the force HA failover command on the secondary appliance.

**Resolution**

Log on to the secondary appliance using the command line interface and enable the access to GUI by running the set ns ip <IP> -gui enabled command.

• **Issue**

After performing an upgrade, and when I click on any link on the GUI that has to load a java applet (Upgrade Wizard or license Wizard), the following error message appears: **GUI version does not match with the kernel version. Please close this instance, clear java plug-in cache and reopen.**

**Resolution**

– Log on to the Citrix NetScaler using the GUI.
– Navigate to Citrix NetScaler Gateway > Global Settings.
– Click Change Global Settings under Settings.
– In the details pane, under Client Experience, select Default from the UI theme list.
– Click OK.

**Note**

These troubleshooting steps also apply to issues with configuration loss when downgrading the software across multiple releases.

For any other issue, see the release notes, Knowledge Center articles, and FAQs.

**FAQs**

June 19, 2019

For answers to the questions that you might have about upgrading the Citrix NetScaler firmware, see the **Installing, Upgrading, and Downgrading FAQs.**
New and Deprecated Commands, Parameters, and SNMP OIDs

May 24, 2019

Jun 17, 2016

This section lists the new and deprecated commands, parameters, and SNMP OIDs.

New Commands

The following table lists the new commands in release 11.1.

<table>
<thead>
<tr>
<th>Command Group</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Appflow</td>
<td>set appflow collector</td>
</tr>
<tr>
<td>Network</td>
<td>set vrlD6, set netbridge, bind netProfile,</td>
</tr>
<tr>
<td></td>
<td>unbind netProfile</td>
</tr>
<tr>
<td>NS</td>
<td>flush ns sourceroutecachetable</td>
</tr>
<tr>
<td>Protocol</td>
<td>clear protocol httpBand</td>
</tr>
<tr>
<td>Router</td>
<td>config router dynamicRouting</td>
</tr>
<tr>
<td>SSL</td>
<td>stat ssl vserver</td>
</tr>
<tr>
<td>Reputation</td>
<td>set reputation settings, show reputation</td>
</tr>
<tr>
<td></td>
<td>settings</td>
</tr>
</tbody>
</table>

New Parameters

The following table lists the new parameters in release 11.1.

Command group: Basic

Commands:

- `rm server [-removeGSLBSvcOnly]`
- `add service [-monConnectionClose]`
- `show service [-monConnectionClose]`
- `add serviceGroup [-monConnectionClose]`
- `show serviceGroup [-monConnectionClose]`
• start nstrace [-skipLocalSSH]
• start nstrace [-capsslkeys]
• show nstrace [-skipLocalSSH]
• show nstrace [-capsslkeys]

Command group: AAA

Commands:
• show aaa session [-aaaUserConnInfo]
• set aaa radiusParams [-authsrvRetry]
• show aaa radiusParams [-authsrvRetry]
• set aaa parameter [-aaaSessionLoglevel]
• show aaa parameter [-aaaSessionLoglevel]

Command group: AppFlow

Commands:
• add appflow action [-pageTracking]
• add appflow action [-securityInsight]
• set appflow action [-pageTracking]
• set appflow action [-securityInsight]
• show appflow action [-pageTracking]
• show appflow action [-securityInsight]
• set appflow param [-SecurityInsightRecordInterval]
• set appflow param [-subscriberAwareness]
• set appflow param [-SecurityInsightTraffic]
• set appflow param [-cacheInsight]
• show appflow param [-SecurityInsightRecordInterval]
• show appflow param [-SecurityInsightTraffic]
• show appflow param [-subscriberAwareness]
• show appflow param [-cacheInsight]

Command group: Audit

Commands:
• add audit syslogAction [-serverDomainName]
• set audit syslogAction [-serverDomainName]
• set audit syslogAction [-domainResolveRetry]
• set audit syslogAction [-domainResolveNow]
• show audit syslogAction [-serverDomainName]
• show audit syslogAction [-IP]
• show audit syslogAction [-domainResolveRetry]
• add audit nslogAction [-serverDomainName]
• set audit nslogAction [-serverDomainName]
• set audit nslogAction [-domainResolveRetry]
• set audit nslogAction [-domainResolveNow]
• show audit nslogAction [-serverDomainName]
• show audit nslogAction [-domainResolveRetry]
• show audit nslogAction [-IP]

**Command group: Authentication**

**Commands:**

• add authentication radiusAction [-authservRetry]
• set authentication radiusAction [-authservRetry]
• show authentication radiusAction [-authservRetry]
• add authentication negotiateAction [-NTLMPath]
• set authentication negotiateAction [-NTLMPath]
• show authentication negotiateAction [-NTLMPath]
• add authentication samlAction [-skewTime]
• set authentication samlAction [-skewTime]
• show authentication samlAction [-skewTime]
• bind authentication vserver [-portaltheme]
• unbind authentication vserver [-portaltheme]
• show authentication vserver [-portaltheme]
• add authentication samlIdPProfile [-samlBinding]
• add authentication samlIdPProfile [-skewTime]
• add authentication samlIdPProfile [-signAssertion]
• add authentication samlIdPProfile [-keyTransportAlg]
• set authentication samlIdPProfile [-samlBinding]
• set authentication samlIdPProfile [-skewTime]
• set authentication samlIdPProfile [-signAssertion]
• set authentication samlIdPProfile [-keyTransportAlg]
• show authentication samlIdPProfile [-samlBinding]
• show authentication samlIdPProfile [-skewTime]
• show authentication samlIdPProfile [-signAssertion]
• show authentication samlIdPProfile [-keyTransportAlg]
• add authentication loginSchema [-builtin]
• show authentication loginSchema [-builtin]

**Command group: Cluster**

**Commands:**

• show cluster instance [-validMtu]
• show cluster node [-routeMonitor]
• show cluster node [-routeMonState]
• show cluster node [-netmask]
• bind cluster node [-routeMonitor]
• unbind cluster node [-routeMonitor]

**Command group: DNS**

**Command:**

• show dns naptrRec [-vServerName]

**Command group: GSLB**

**Commands:**

• add gslb site [-naptrReplacementSuffix]
• set gslb site [-naptrReplacementSuffix]
• show gslb site [-naptrReplacementSuffix]
- add gslb service [-naptrReplacement]
- add gslb service [-naptrOrder]
- add gslb service [-naptrServices]
- add gslb service [-naptrDomainTTL]
- add gslb service [-naptrPreference]
- set gslb service [-naptrOrder]
- set gslb service [-naptrPreference]
- set gslb service [-naptrServices]
- set gslb service [-naptrReplacement]
- show gslb service [-lastresponse]
- show gslb service [-naptrOrder]
- show gslb service [-naptrPreference]
- show gslb service [-naptrServices]
- show gslb service [-naptrReplacement]
- show gslb service [-naptrDomainTTL]
- add gslb vserver [-ECS]
- add gslb vserver [-ecsAddrValidation]
- set gslb vserver [-ECS]
- set gslb vserver [-ecsAddrValidation]
- show gslb vserver [-ECS]
- show gslb vserver [-ecsAddrValidation]

Command group: HA

Command:
- show HA node [-haHeartbeatfaces]
**Command group:** IPsec

**Commands:**

- add ipsec profile [-responderOnly]
- show ipsec profile [-responderOnly]
- set ipsec parameter [-responderOnly]
- unset ipsec parameter [-responderOnly]
- show ipsec parameter [-responderOnly]

**Command group:** Load balancing

**Commands:**

- add lb monitor [-builtin]
- add lb monitor [-sslProfile]
- set lb monitor [-sslProfile]
- unset lb monitor [-sslProfile]
- bind lb monitor [-certKeyName]
- unbind lb monitor [-certKeyName]
- show lb monitor [-builtin]
- show lb monitor [-sslProfile]
- show lb monitor [-certKeyName]
- show lb monitor [-CA]
- show lb monitor [-crlCheck]
- show lb monitor [-ocspCheck]
- add lb vserver [-lbprofilename]
- add lb vserver [-redirectFromPort]
- add lb vserver [-httpsRedirectUrl]
- set lb vserver [-lbprofilename]
- set lb vserver [-redirectFromPort]
- set lb vserver [-httpsRedirectUrl]
- unset lb vserver [-lbprofilename]
- unset lb vserver [-redirectFromPort]
- unset lb vserver [-httpsRedirectUrl]
NetScaler 11.1

- show lb vserver [-backupLBMethod]
- show lb vserver [-preferredLocation]
- show lb vserver [-lbprofilename]
- show lb vserver [-redirectFromPort]
- show lb vserver [-httpsRedirectUrl]
- set lb parameter [-AllowBoundSvcRemoval]
- set lb parameter [-retainservicestate]
- show lb parameter [-AllowBoundSvcRemoval]
- show lb parameter [-retainservicestate]

Command group: LSN

Commands:

- bind lsn group [-pcpServer]
- bind lsn group [-logProfileName]
- unbind lsn group [-pcpServer]
- unbind lsn group [-logProfileName]
- show lsn group [-pcpServer]
- show lsn group [-logProfileName]
- add lsn logprofile [-logCompact]
- set lsn logprofile [-logCompact]
- show lsn logprofile [-logCompact]
- set lsn parameter [-subscrSessionRemoval]
- show lsn parameter [-subscrSessionRemoval]
- show lsn session [-IPv6Address]
- show lsn deterministicNat [-network6]
- show lsn deterministicNat [-natprefix]
- show lsn deterministicNat [-nattype]

Command group: Network

Commands:

- add channel [-haHeartbeat]
- set channel [-haHeartbeat]
• show channel [-haHeartbeat]
• add vrID [-preemptiondelaytimer]
• show vrID [-preemptiondelaytimer]
• add vrID6 [-priority]
• add vrID6 [-preemption]
• add vrID6 [-sharing]
• add vrID6 [-preemptiondelaytimer]
• add vrID6 [-trackifNumPriority]
• bind vrID6 [-trackifNum]
• unbind vrID6 [-trackifNum]
• show vrID6 [-preemption]
• show vrID6 [-sharing]
• show vrID6 [-preemptiondelaytimer]
• show vrID6 [-trackifNum]
• show vrID6 [-trackifNumPriority]
• show vrID6 [-effectivePriority]
• add inat [-tcpproxy]
• add inat [-ftp]
• add inat [-tftp]
• add inat [-usip]
• add inat [-usnip]
• add inat [-proxyIP]

AAA application traffic

December 21, 2018

Many companies restrict web site access to valid users only, and control the level of access permitted to each user. The AAA feature allows a site administrator to manage access controls with the NetScaler appliance instead of managing these controls separately for each application. Doing authentication on the appliance also permits sharing this information across all web sites within the same domain that are protected by the appliance.

The AAA feature supports authentication, authorization, and auditing for all application traffic. To use AAA, you must configure authentication virtual servers to handle the authentication process and traffic management virtual servers to handle the traffic to web applications that require authentication. You also configure your DNS to assign FQDNs to each virtual server. After configuring the virtual servers, you configure a user account for each user that will authenticate via the NetScaler appliance, and optionally you create groups and assign user accounts to groups. After creating user accounts and groups, you configure policies that tell the appliance how to authenticate users, which resources to allow users to access, and how to log user sessions. To put the policies into effect, you bind each policy globally, to a specific virtual server, or to the appropriate user accounts or groups. After configuring your policies, you customize user sessions by configuring session settings and binding your session policies to the traffic management virtual server. Finally, if your intranet uses client certs, you set up the client certificate configuration.

Before configuring AAA, you should be familiar with and understand how to configure load balancing, content switching, and SSL on the NetScaler appliance.

How AAA works

January 6, 2019

AAA provides security for a distributed internet environment by allowing any client with the proper credentials to connect securely to protected application servers from anywhere on the Internet. This feature incorporates the three security features of AAA. Authentication enables the NetScaler appliance to verify the client’s credentials, either locally or with a third-party authentication server, and allow only approved users to access protected servers. Authorization enables the ADC to verify which content on a protected server it should allow each user to access. Auditing enables the ADC to keep a record of each user’s activity on a protected server.

To understand how AAA works in a distributed environment, consider an organization with an intranet that its employees access in the office, at home, and when traveling. The content on the intranet is
confidential and requires secure access. Any user who wants to access the intranet must have a valid user name and password. To meet these requirements, the ADC does the following:

- Redirects the user to the login page if the user accesses the intranet without having logged in.
- Collects the user’s credentials, delivers them to the authentication server, and caches them in a directory that is accessible through LDAP.
- Verifies that the user is authorized to access specific intranet content before delivering the user’s request to the application server.
- Maintains a session timeout after which users must authenticate again to regain access to the intranet. (You can configure the timeout.)
- Logs the user accesses, including invalid login attempts, in an audit log.

Authentication requires that several entities: the client, the NetScaler appliance, the external authentication server if one is used, and the application server, respond to each other when prompted by performing a complex series of tasks in the correct order. If you are using an external authentication server, this process can be broken down into the following fifteen steps.

1. The client sends a GET request for a URL on the application server.
2. The NetScaler appliance’s traffic management virtual server redirects the request to the application server.
3. The application server determines that the client has not been authenticated, and therefore sends an HTTP 200 OK response via the TM vserver to the client. The response contains a hidden script that causes the client to issue a POST request for /cgi/tm.
4. The client sends a POST request for /cgi/tm.
5. The NetScaler appliance’s authentication virtual server redirects the request to the authentication server.
6. The authentication server creates an authentication session, sets and caches a cookie that consists of the initial URL and the domain of the traffic management virtual server, and then sends an HTTP 302 response via the authentication virtual server, redirecting the client to /vpn/index.html.
7. The client sends a GET request for /vpn/index.html.
8. The authentication virtual server redirects the client to the authentication server login page.
9. The client sends a GET request for the login page, enters credentials, and then sends a POST request with the credentials back to the login page.
10. The authentication virtual server redirects the POST request to the authentication server.
11. If the credentials are correct, the authentication server tells the authentication virtual server to log the client in and redirect the client to the URL that was in the initial GET request.
12. The authentication virtual server logs the client in and sends an HTTP 302 response that directs the client to the initially requested URL.
13. The client sends a GET request for their initial URL.
14. The traffic management virtual server redirects the GET request to the application server.
15. The application server responds via the traffic management virtual server with the initial URL. If you use local authentication, the process is similar, but the authentication virtual server handles all authentication tasks instead of forwarding connections to an external authentication server. The following figure illustrates the authentication process.

Figure 1. Authentication Process Traffic Flow

When an authenticated client requests a resource, the ADC, before sending the request to the application server, checks the user and group policies associated with the client account, to verify that the client is authorized to access that resource. The ADC handles all authorization on protected application servers. You do not need to do any special configuration of your protected application servers.

AAA traffic management handles password changes for users by using the protocol-specific method for the authentication server. For most protocols, neither the user nor the administrator needs to do anything different than they would without AAA traffic management. Even when an LDAP authentication server is in use, and that server is part of a distributed network of LDAP servers with a single designated domain administration server, password changes are usually handled seamlessly. When an authenticated client of an LDAP server changes his or her password, the client sends a credential modify request to AAA traffic management, which forwards it to the LDAP server. If the user’s LDAP server is also the domain administration server, that server responds appropriately and AAA traffic management then performs the requested password change. Otherwise, the LDAP server sends AAA traffic management an LDAP_REFERRAL response to the domain administration server. AAA traffic management follows the referral to the indicated domain administration server, authenticates to that server, and performs the password change on that server.

When configuring AAA traffic management with an LDAP authentication server, the system administrator must keep the following conditions and limitations in mind:

- AAA traffic management assumes that the domain administration server in the referral accepts the same bind credentials as the original server.
- AAA traffic management only follows LDAP referrals for password change operations. In other cases AAA traffic management refuses to follow the referral.
- AAA traffic management only follows one level of LDAP referrals. If the second LDAP server also returns a referral, AAA traffic management refuses to follow the second referral.

The ADC supports auditing of all states and status information, so you can see the details of what each user did while logged on, in chronological order. To provide this information, the appliance logs each event, as it occurs, either to a designated audit log file on the appliance or to a syslog server. Auditing requires configuring the appliance and any syslog server that you use.
Enabling AAA

December 13, 2018

To use the AAA - Application Traffic feature, you must enable it. You can configure AAA entities—such as the authentication and traffic management virtual servers—before you enable the AAA feature, but the entities will not function until the feature is enabled.

To enable AAA by using the command line interface

At the command prompt, type the following commands to enable AAA and verify the configuration:

- `enable ns feature AAA`
- `show ns feature`

**Example**

- `enable feature AAA`
  
  Done
- `show ns feature`

<table>
<thead>
<tr>
<th>Feature</th>
<th>Acronym</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>1) Web Logging</td>
<td>WL</td>
<td>OFF</td>
</tr>
<tr>
<td>2) Surge Protection</td>
<td>SP</td>
<td>ON</td>
</tr>
<tr>
<td>AAA</td>
<td>AAA</td>
<td>ON</td>
</tr>
<tr>
<td>HTML Injection</td>
<td>HTMLInjection</td>
<td>ON</td>
</tr>
<tr>
<td>NetScaler Push</td>
<td>push</td>
<td>OFF</td>
</tr>
</tbody>
</table>

To enable AAA by using the configuration utility

1. Navigate to **System > Settings**.
2. In the details pane, under Modes and Features, click Change basic features.
3. In the Configure Basic Features dialog box, select the Authentication, Authorization and Auditing check box.
NetScaler 11.1

4. Click OK.

Setting up an authentication virtual server

December 13, 2018

All authentication requests are redirected by the traffic management virtual server (load balancing or content switching) to the authentication virtual server. This virtual server processes the associated authentication policies and accordingly provides access to the application.

**To set up an authentication virtual server by using the CLI**

1. Enable the AAA feature.
   
   ```
   ns-cli-prompt>enable ns feature AAA
   ```

2. Configure an authentication virtual server. It must be of type SSL and make sure to bind SSL certificate-key pair to the virtual server.
   
   ```
   ns-cli-prompt> add authentication vserver <name> SSL <ipaddress> <port>
   ns-cli-prompt> bind ssl certkey <auth-vserver-name> <certkey>
   ```

3. Specify the FQDN of the domain for the authentication virtual server.
   
   ```
   ns-cli-prompt> set authentication vserver <name> -authenticationDomain <FQDN>
   ```

4. Associate the authentication virtual server to the relevant traffic management virtual server.

**Note:**

The FQDN of the traffic management virtual server must be in the same domain as the FQDN of the authentication virtual server for the domain session cookie to function correctly.

On the traffic management virtual server:

- Enable authentication.
- Specify the FQDN of the authentication virtual server as the authentication host of the traffic management virtual server.
- [Optional] Specify the authentication domain on the traffic management virtual server.

**Note:**

If you do not configure the authentication domain, the appliance assigns an FQDN that consists of the FQDN of the authentication virtual server without the hostname portion. For example, if domain name of the authentication virtual server is `tm.xyz.bar.com`, the appliance
assigns xyz.bar.com as the authentication domain.

For load balancing:

```bash
ns-cli-prompt> set lb vserver <name> -authentication ON -authenticationhost <FQDN> [-authenticationdomain <authdomain>]
```

For content switching:

```bash
ns-cli-prompt> set cs vserver <name> <protocol> <IPAddress> <port>
```

1. Verify that both the virtual servers are UP and configure correctly.

```bash
ns-cli-prompt> show authentication vserver <name>
```

To set up an authentication virtual server by using the GUI

1. Enable the AAA feature.
   
   Navigate to System > Settings, click Configure Basic features, and enable Authentication, Authorization and Auditing.

2. Configure the authentication virtual server.
   
   Navigate to Security > AAA - Application Traffic > Virtual Servers, and configure as required (refer to the configurations provided in the CLI procedure provided above).

3. Configure the traffic management virtual server for authentication.

   For load balancing:
   
   Navigate to Traffic Management > Load Balancing > Virtual Servers, and configure the virtual server as required (refer to the configurations provided in the CLI procedure provided above).

   For content switching:
   
   Navigate to Traffic Management > Content Switching > Virtual Servers, and configure the virtual server as required (refer to the configurations provided in the CLI procedure provided above).

4. Verify the authentication setup.
   
   Navigate to Security > AAA - Application Traffic > Virtual Servers, and check the details of the relevant authentication virtual server.

Configuring the authentication virtual server

December 13, 2018
To configure AAA, first configure an authentication virtual server to handle authentication traffic. Next, bind an SSL certificate-key pair to the virtual server to enable it to handle SSL connections.

For additional information about configuring SSL and creating a certificate-key pair, see SSL certificates.

**To configure an authentication virtual server by using the command line interface**

To configure an authentication virtual server and verify the configuration, at the command prompt type the following commands in the order shown:

- `add authentication vserver <name> ssl <ipaddress>`
- `show authentication vserver <name>`
- `bind ssl certkey <certkeyName>`
- `show authentication vserver <name>`
- `set authentication vserver <name> -authenticationDomain <FQDN>`
- `show authentication vserver <name>`

**Example**

```
> add authentication vserver Auth-Vserver-2 SSL 10.102.29.77 443
Done
> show authentication vserver Auth-Vserver-2
  Auth-Vserver-2 (10.102.29.77:443) - SSL Type: CONTENT
  State: DOWN[Certkey not bound]
  Client Idle Timeout: 180 sec
  Down state flush: DISABLED
  Disable Primary Vserver On Down : DISABLED
  Authentication : ON
  Current AAA Users: 0
Done
> bind ssl certkey Auth-Vserver-2 Auth-Cert-1
Done
> show authentication vserver Auth-Vserver-2
  Auth-Vserver-2 (10.102.29.77:443) - SSL Type: CONTENT
  State: UP
  Client Idle Timeout: 180 sec
  Down state flush: DISABLED
  Disable Primary Vserver On Down : DISABLED
  Authentication : ON
  Current AAA Users: 0
  Authentication Domain: myCompany.employee.com
Done
```
To configure an authentication virtual server by using the configuration utility

2. In the details pane, do one of the following:
   - To create a new authentication virtual server, click Add.
   - To modify an existing authentication virtual server, select the virtual server, and then click Edit. The Configuration dialog opens with the Basic Settings area expanded.

3. Specify values for the parameters as follows (asterisk indicates a required parameter):
   - Name*—name (Cannot be changed for a previously created virtual server)
   - IP Address*—ipaddress
   - Domain*—authenticationDomain
   - Failed login timeout—failedLoginTimeout (Seconds allowed before login fails and user must start login process again.)
   - Max login attempts—maxLoginAttempts (Number of login attempts allowed before user is locked out)

   Note: The authentication virtual server uses only the SSL protocol and port 443, so those options are greyed out. Any options that are not mentioned are not relevant and should be ignored.

4. Click Continue to display the Certificates area.

5. In the Certificates area, configure any SSL certificates you want to use with this virtual server.
   - To configure a CA certificate, click the arrow on the right of CA Certificate to display the CA Cert Key dialog box, select the certificate you want to bind to this virtual server, and click Save.
To configure a server certificate, click the arrow on the right of Server Certificate, and follow the same process as for CA certificate.

6. Click **Continue** to display the **Advanced Authentication Policies** area.

7. If you want to bind an advanced authentication policy to the virtual server, click the arrow on the right side of the line to display the **Authentication Policy** dialog box, choose the policy that you want to bind to the server, set the priority, and then click **OK**.

8. Click **Continue** to display the **Basic Authentication Policies** area.

9. If you want to create a basic authentication policy and bind it to the virtual server, click the plus sign to display the **Policies** dialog box, and follow the prompts to configure the policy and bind it to this virtual server.

10. Click **Continue** to display the **401-Based Virtual Servers** area.

11. In the **401-Based Virtual Servers** area, configure any load balancing or content switching virtual servers that you want to bind to this virtual server.

   - To bind a load balancing virtual server, click the arrow to the right of LB virtual server to display the LB Virtual Servers dialog box, and follow the prompts.
   - To bind a content switching virtual server, click the arrow to the right of CS virtual server to display the CS Virtual Servers dialog box, and follow the same process as to bind an LB virtual server.

12. If you want to create or configure a group, in the Groups area click the arrow to display the Groups dialog box, and follow the prompts.

13. Review your settings, and when you are finished, click **Done**. The dialog box closes. If you created a new authentication virtual server, it now appears in the **Configuration** window list.

### Configuring a traffic management virtual server

December 13, 2018

After you have created and configured your authentication virtual server, you next create or configure a traffic management virtual server and associate your authentication virtual server with it. You can use either a load balancing or content switching virtual server for a traffic management virtual server. For more information about creating and configuring either type of virtual server, see the *Citrix Traffic Management Guide* at **Traffic Management**.

**Note**

The FQDN of the traffic management virtual server must be in the same domain as the FQDN of
the authentication virtual server for the domain session cookie to function correctly.

You configure a traffic management virtual server for AAA by enabling authentication and then assigning the FQDN of the authentication server to the traffic management virtual server. You can also configure the authentication domain on the traffic management virtual server at this time. If you do not configure this option, the NetScaler appliance assigns the traffic management virtual server an FQDN that consists of the FQDN of the authentication virtual server without the hostname portion. For example, if domain name of the authentication virtual server is tm.xyz.bar.com, the appliance assigns xyz.bar.com as the authentication domain.

To configure a TM virtual server for AAA by using the command line interface

At the command prompt, type one of the following sets of commands to configure a TM virtual server and verify the configuration:

- `set lb vserver <name> -authentication ON -authenticationhost <FQDN> [-authenticationdomain <authdomain>]`
- `show lb vserver <name>`
- `set cs vserver <name> -authentication ON -authenticationhost <FQDN> [-authenticationdomain <authdomain>]`
- `show cs vserver <name>`

Example

```
1 > set lb vserver vs-cont-sw -Authentication ON -AuthenticationHost mywiki.index.com
2   Done
3 > show lb vserver vs-cont-sw
4   vs-cont-sw (0.0.0.0:0) - TCP   Type: ADDRESS
5   State: DOWN
6   Last state change was at Wed Aug 19 10:03:15 2009 (+410 ms)
7   Time since last state change: 5 days, 20:00:40.290
8   Effective State: DOWN
9   Client Idle Timeout: 9000 sec
10  Down state flush: ENABLED
11  Disable Primary Vserver On Down : DISABLED
12  No. of Bound Services : 0 (Total) 0 (Active)
13  Configured Method: LEASTCONNECTION
14  Mode: IP
15  Persistence: NONE
16  Connection Failover: DISABLED
17  Authentication: ON   Host: mywiki.index.com
18   Done
```
To configure a TM virtual server for AAA by using the configuration utility

1. In the navigation pane, do one of the following.
   - Navigate to Traffic Management > Load Balancing > Virtual Servers.
   - Navigate to Traffic Management > Content Switching > Virtual Servers.
   - In the details pane, select the virtual server on which you want to enable authentication, and then click Edit.
   - In the Domain text box, type the authentication domain.
   - In the Advanced menu on the right, select Authentication.
   - Choose either Form Based Authentication or 401 Based Authentication, and fill in the Authentication information.
     - For Form Based Authentication, enter the Authentication FQDN (the fully-qualified domain name of the authentication server), the Authentication VServer (the IP address of the authentication virtual server), and the Authentication Profile (the profile to use for authentication).
     - For 401 Based Authentication, enter the Authentication VServer and the Authentication Profile only.
   - Click OK. A message appears in the status bar, stating that the vserver has been configured successfully.

Simplified login protocol support for AAA

The login protocol between AAA traffic management virtual servers and AAA virtual servers is simplified to use internal mechanisms as opposed to sending the encrypted data through query parameters. By leveraging this feature, the replay of requests is prevented.

Configuring DNS

December 13, 2018

For the domain session cookie used in the authentication process to function correctly, you must configure DNS to assign both the authentication and the traffic management virtual servers to FQDNs in the same domain. For information about how to configure DNS address records, see Domain Name System.
Verifying your setup for AAA

After you configure authentication and traffic management virtual servers and before you create user accounts, you should verify that both virtual servers are configured correctly and are in the UP state.

To verify authentication virtual server setup by using the command line interface

At the command prompt, type the following command:

```
show authentication vserver <name>
```

```
1   > show authentication vserver Auth-Vserver-2
2    Auth-Vserver-2 (10.102.29.77:443) - SSL Type: CONTENT
3       State: UP
4       Client Idle Timeout: 180 sec
5       Down state flush: DISABLED
6       Disable Primary Vserver On Down : DISABLED
7       Authentication : ON
8       Current AAA Users: 0
9       Authentication Domain: myCompany.employee.com
10   Done
```

To verify your AAA virtual server setup by using the configuration utility

2. Review the information in the AAA Virtual Servers pane to verify that your configuration is correct and your authentication virtual server is accepting traffic. You can select a specific virtual server to view detailed information in the details pane.

Creating an authentication profile

When you want the same authentication settings to be used by multiple traffic management virtual servers, you can create an authentication profile which specifies the authentication virtual server, the authentication host, the authentication domain, and authentication level.

This authentication profile can be associated with the relevant traffic management virtual servers.
To configure an authentication profile by using the CLI

- Create the authentication profile and set the required parameters.
  
  For example, to create a profile with an authentication virtual server named “authVS”.

  ```
  ns-cli-prompt> add authentication authnProfile authProfile1 -authnVsName authVS -authenticationHost authnVS.example.com -authenticationDomain example.com -authenticationLevel
  ```

  Note:
  
  The authentication weight or level will depend on the virtual server to which the traffic will bind. A session that is created by authenticating against traffic management virtual server at given level cannot be used to access traffic management virtual server at a higher level.

- Bind the authentication profile to the relevant traffic management virtual servers.
  
  For example, to bind authProfile1 to a load balancing virtual server named “vserver1”.

  ```
  ns-cli-prompt> set lb vserver vserver1 -authnProfile authProfile1
  ```

To configure an authentication profile by using the GUI

In the **Configuration** tab, navigate to **Security > AAA - Application Traffic > Authentication Profile**, and configure the authentication profile as required.

Configuring users and groups

December 13, 2018

After configuring the AAA basic setup, you create users and groups. You first create a user account for each person who will authenticate via the NetScaler appliance. If you are using local authentication controlled by the NetScaler appliance itself, you create local user accounts and assign passwords to each of those accounts.

You also create user accounts on the NetScaler appliance if you are using an external authentication server. In this case, however, each user account must exactly match an account for that user on the external authentication server, and you do not assign passwords to the user accounts that you create on the NetScaler appliance. The external authentication server manages the passwords for users that authenticate with the external authentication server.

If you are using an external authentication server, you can still create local user accounts on the NetScaler appliance if, for example, you want to allow temporary users (such as visitors) to log in but
do not want to create entries for those users on the authentication server. You assign a password to each local user account, just as you would if you were using local authentication for all user accounts. Each user account must be bound to policies for authentication and authorization. To simplify this task, you can create one or more groups and assign user accounts to them. You can then bind policies to groups instead of individual user accounts.

To create a local AAA user account by using the command line interface

At the command prompt, type the following commands to create a local AAA user account and verify the configuration:

- `add aaa user <username> [-password <password>]`
- `show aaa user`

**Example**

```
1 > add aaa user user-2 -password emptybag
2    Done
3 > show aaa user
4    1) UserName: user-1
5        2) UserName: user-2
6    Done
```

To change the password for an existing AAA local user account by using the command line interface

At the command prompt, type the following command and, when prompted, type the new password:

```
set aaa user <username>
```

**Example**

```
1 > set aaa user user-2
2    Enter password:
3    Done
```

To configure AAA local users by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic > Users**
2. In the details pane, do one of the following:
To create a new user account, click Add.
To modify an existing user account, select the user account, and then click Open.

3. In the Create AAA User dialog box, in the User Name text box, type a name for the user.
4. If creating a locally authenticated user account, clear the External Authentication check box and provide a local password that the user will use to log on.
5. Click Create or OK, and then click Close. A message appears in the status bar, stating that the user has been configured successfully.

To create AAA local groups and add users to them by using the command line interface

At the command prompt, type the following commands. Type the first command one time, and type the second command once for each user:

- add aaa group <groupname>
- show aaa group

Example

```
1> add aaa group group-2
2 Done
3> show aaa group
4   1) GroupName: group-1
5   2) GroupName: group-2
6 Done
```

- bind aaa group <groupname> -username <username>

Example

```
1> bind aaa group group-2 -username user-2
2 Done
3> show aaa group group-2
4   GroupName: group-2
5
6   UserName: user-2
7 Done
```

To remove users from an AAA group by using the command line interface

At the command prompt, unbind users from the group by typing the following command once for each user account that is bound to the group:
To remove an AAA group by using the command line interface

First remove all users from the group. Then, at the command prompt, type the following command to remove an AAA group and verify the configuration:

- `rm aaa group <groupname>`
- `show aaa group`

Example

```
1    rm aaa group group-hr
2    Done
3    show aaa group
4    1)  GroupName:  group-1
5    2)  GroupName:  group-finance
6    Done
```

To configure AAA local groups and add users to them by using the configuration utility

1. Navigate to Security > AAA - Application Traffic > Groups
2. In the details pane, do one of the following:
   - To create a new group, click Add.
   - To modify an existing group, select the group, and then click Edit.
3. If you are creating a new group, in the Create AAA Group dialog box, in the Group Name text box, type a name for the group.
4. In the Advanced area to the right, click AAA Users.
   - To add a user to the group, select the user, and then click Add.
   - To remove a user from the group, select the user, and then click Remove.
   - To create a new user account and add it to the group, click the Plus icon, and then follow the instructions in “To configure AAA local users by using the configuration utility.”
5. Click Create or OK. The group that you created appears in the AAA Groups page.
Configuring AAA policies

December 13, 2018

After you set up your users and groups, you next configure authentication policies, authorization policies, and audit policies to define which users are allowed to access your intranet, which resources each user or group is allowed to access, and what level of detail AAA will preserve in the audit logs. An authentication policy defines the type of authentication to apply when a user attempts to log on. If external authentication is used, the policy also specifies the external authentication server. Authorization policies specify the network resources that users and groups can access after they log on. Auditing policies define the audit log type and location.

You must bind each policy to put it into effect. You bind authentication policies to authentication virtual servers, authorization policies to one or more user accounts or groups, and auditing policies both globally and to one or more user accounts or groups.

When you bind a policy, you assign a priority to it. The priority determines the order in which the policies you define are evaluated. You can set the priority to any positive integer. In the NetScaler appliance operating system, policy priorities work in reverse order: the higher the number, the lower the priority. For example, if you have three policies with priorities of 10, 100, and 1000, the policy assigned a priority of 10 is performed first, then the policy assigned a priority of 100, and finally the policy assigned an order of 1000. The AAA feature implements only the first of each type of policy that a request matches, not any additional policies of that type that a request might also match, so policy priority is important for getting the results you intend.

You can leave yourself plenty of room to add other policies in any order, and still set them to evaluate in the order you want, by setting priorities with intervals of 50 or 100 between each policy when you bind the policies. You can then add additional policies at any time without having to reassign the priority of an existing policy.

For additional information about binding policies on the NetScaler appliance, see the Citrix Traffic Management Guide at Traffic Management.

Authentication policies

December 13, 2018

The NetScaler appliance can authenticate users with local user accounts or by using an external authentication server. The appliance supports the following authentication types:

- LOCAL
Authenticates to the NetScaler appliance by using a password, without reference to an external authentication server. User data is stored locally on the NetScaler appliance.

- **RADIUS**
  Authenticate to an external Radius server.

- **LDAP**
  Authenticates to an external LDAP authentication server.

- **TACACS**
  Authenticates to an external Terminal Access Controller Access-Control System (TACACS) authentication server.

  After a user authenticates to a TACACS server, the NetScaler appliance connects to the same TACACS server for all subsequent authorizations. When a primary TACACS server is unavailable, this feature prevents delays while the ADC waits for the first TACACS server to time out before resending the authorization request to the second TACACS server.

  **Note**
  When authenticating through a TACACS server, AAA traffic management logs only successfully executed TACACS commands, to prevent the logs from showing TACACS commands that were entered by users who were not authorized to execute them.

Starting from NetScaler 12.0 Build 57.x, the Terminal Access Controller Access-Control System (TACACS) is not blocking the AAA daemon while sending the TACACS request. The AAA daemon allows LDAP, and RADIUS authentication to proceed with the request. The TACACS authentication request resumes once TACACS server acknowledges the TACACS request.

- **CERT**
  Authenticates to the NetScaler appliance by using a client certificate, without reference to an external authentication server.

- **NEGOTIATE**
  Authenticates to a Kerberos authentication server. If there is an error in Kerberos authentication, NetScaler appliance uses NTLM authentication.

- **SAML**
  Authenticates to a server that supports the Security Assertion Markup Language (SAML).

- **SAML IDP**
  Configures the NetScaler appliance to serve as a Security Assertion Markup Language (SAML) Identity Provider (IdP).
• WEB

NetScaler 11.1

Authenticates to a web server, providing the credentials that the web server requires in an HTTP request and analyzing the web server response to determine that user authentication was successful.

An authentication policy is comprised of an expression and an action. Authentication policies use NetScaler appliance expressions.

After creating an authentication action and an authentication policy, bind it to an authentication virtual server and assign a priority to it. When binding it, also designate it as either a primary or a secondary policy. Primary policies are evaluated before secondary policies. In configurations that use both types of policy, primary policies are normally more specific policies while secondary policies are normally more general policies intended to handle authentication for any user accounts that do not meet the more specific criteria.

To add an authentication action by using the command line interface

If you do not use LOCAL authentication, you need to add an explicit authentication action. To do this, at the command prompt, type the following command:

add authentication tacacsAction <name> -server ip <IP> [-serverPort <port>] [-authTimeout <positive_integer>] [ ... ]

Example

2  Done

To configure an authentication action by using the command line interface

To configure an existing authentication action, at the command prompt, type the following command:

set authentication tacacsAction <name> -server ip <IP> [-serverPort <port>] [-authTimeout <positive_integer>] [ ... ]

Example

To remove an authentication action by using the command line interface

To remove an existing RADIUS action, at the command prompt, type the following command:

```
rm authentication radiusAction <name>
```

Example

```
1 > rm authentication tacacsaction Authn-Act-1
2 Done
```

To configure an authentication server by using the configuration utility

Note

In the configuration utility, the term server is used instead of action, but refers to the same task.

2. In the details pane, on the Servers tab, do one of the following:
   - To create a new authentication server, click Add.
   - To modify an existing authentication server, select the server, and then click Open.
3. In the Create Authentication Server or Configure Authentication Server dialog box, type or select values for the parameters.
   - Name*—radiusActionName (Cannot be changed for a previously configured action)
   - Authentication Type*—authtype (Set to RADIUS, cannot be changed)
   - IP Address*—serverip </IP>
   - IPV6*—Select the checkbox if the server IP is an IPv6 IP. (No command line equivalent.)
   - Port*—serverPort
   - Time-out (seconds)*—authTimeout
4. Click Create or OK, and then click Close. The policy that you created appears in the Authentication Policies and Servers page.

To create and bind an authentication policy by using the command line interface

At the command prompt, type the following commands in the order shown to create and bind an authentication policy and verify the configuration:

- `add authentication negotiatePolicy <name> <rule> <reqAction>`
- ““show authentication localPolicy
- ““bind authentication vserver -policy [-priority ][-secondary]"
To modify an existing authentication policy by using the command line interface

At the command prompt, type the following commands to modify an existing authentication policy:

```
set authentication localPolicy <name> <rule> [-reqaction <action>]
```

Example

```
1 > set authentication localPolicy Authn-Pol-1 'ns_true' Done
```

To remove an authentication policy by using the command line interface

At the command prompt, type the following command to remove an authentication policy:

```m authentication localPolicy <name>
```

Example

```
1 > rm authentication localPolicy Authn-Pol-1
2 Done
```

To configure and bind authentication policies by using the configuration utility

1. Navigate to Security > AAA - Application Traffic > Policies > Authentication, and then select the type of policy that you want to create.
2. In the details pane, on the **Policies** tab, do one of the following:
   - To create a new policy, click **Add**.
   - To modify an existing policy, select the action, and then click **Edit**.

3. In the Create Authentication Policy or Configure Authentication Policy dialog, type or select values for the parameters.
   - **Name**—policyname (Cannot be changed for a previously configured action)
   - **Authentication Type**—authtype
   - **Server**—authVsName
   - **Expression**—rule (You enter expressions by first choosing the type of expression in the leftmost drop-down list beneath the Expression window, and then by typing your expression directly into the expression text area, or by clicking Add to open the Add Expression dialog box and using the drop-down lists in it to construct your expression.)

4. Click **Create** or **OK**. The policy that you created appears in the Policies page.

5. Click the **Servers** tab, and in the details pane do one of the following:
   - To use an existing server, select it, and then click .
   - To create a new server, click Add, and follow the instructions.

6. If you want to designate this policy as a secondary authentication policy, on the Authentication tab, click Secondary. If you want to designate this policy as a primary authentication policy, skip this step.

7. Click **Insert Policy**.

8. Choose the policy you want to bind to the authentication virtual server from the drop-down list.

9. In the **Priority** column to the left, modify the default priority as needed to ensure that the policy is evaluated in the proper order.

10. Click **OK**. A message appears in the status bar, stating that the policy has been configured successfully.

## LDAP authentication policies

December 13, 2018

As with other types of authentication policies, a Lightweight Directory Access Protocol (LDAP) authentication policy is comprised of an expression and an action. After creating an authentication policy, you bind it to an authentication virtual server and assign a priority to it. When binding it, you also designate it as either a primary or a secondary policy. In addition to standard authentication functions, LDAP can search other active directory (AD) servers for user accounts for users that do not exist locally. This function is called referral support or referral chasing.

Normally you configure the NetScaler appliance to use the IP address of the authentication server during authentication. With LDAP authentication servers, you can also configure the ADC to use the FQDN
of the LDAP server instead of its IP address to authenticate users. Using an FQDN can simplify an otherwise much more complex AAA configuration in environments where the authentication server might be at any of several IP addresses, but always uses a single FQDN. To configure authentication by using a server’s FQDN instead of its IP address, you follow the normal configuration process except when creating the authentication action. When creating the action, you use the serverName parameter instead of the serverIP parameter, and substitute the server’s FQDN for its IP address.

Before you decide whether to configure the ADC to use the IP or the FQDN of your LDAP server to authenticate users, consider that configuring AAA to authenticate to an FQDN instead of an IP address adds an extra step to the authentication process. Each time the ADC authenticates a user, it must resolve the FQDN. If a great many users attempt to authenticate simultaneously, the resulting DNS lookups might slow the authentication process.

LDAP referral support is disabled by default and cannot be enabled globally. It must be explicitly enabled for each LDAP action. You must also make sure that the AD server accepts the same binddn credentials that are used with the referring (GC) server. To enable referral support, you configure an LDAP action to follow referrals, and specify the maximum number of referrals to follow.

If referral support is enabled, and the NetScaler appliance receives an LDAP_REFERRAL response to a request, AAA follows the referral to the active directory (AD) server contained in the referral and performs the update on that server. First, AAA looks up the referral server in DNS, and connects to that server. If the referral policy requires SSL/TLS, it connects via SSL/TLS. It then binds to the new server with the binddn credentials that it used with the previous server, and performs the operation which generated the referral. This feature is transparent to the user.

Note
These instructions assume that you are already familiar with the LDAP protocol and have already configured your chosen LDAP authentication server.

For more information about setting up authentication policies in general, see Authentication Policies. For more information about NetScaler appliance expressions, which are used in the policy rule, see Policies and Expressions.

To enable LDAP referral support by using the command line interface

At the command prompt, type the following commands:

- set authentication ldapAction <name> -followReferrals ON
- set authentication ldapAction <name> -maxLDAPReferrals <integer>

Example

```
1 > set authentication ldapAction ldapAction-1 -followReferrals ON
2 > set authentication ldapAction ldapAction-1 -maxLDAPReferrals 2
```
To enable LDAP referral support by using the configuration utility

Note

In the configuration utility, the term server is used instead of action, but refers to the same task.

1. Navigate to Security > AAA - Application Traffic > Policies > LDAP.
2. In the details pane, on the Servers tab, select the LDAP server that you want to configure, and then click Edit.
3. In the Configure Authentication Server dialog, scroll down to the Referrals check box, and select it.
4. In the Maximum Referral Level text box, type the maximum number of referrals to allow.
5. Click OK, and then click Close.

Negotiate authentication policies

December 13, 2018

As with other types of authentication policies, a Negotiate authentication policy is comprised of an expression and an action. After creating an authentication policy, you bind it to an authentication virtual server and assign a priority to it. When binding it, you also designate it as either a primary or a secondary policy.

In addition to standard authentication functions, the Negotiate Action command can now extract user information from a keytab file instead of requiring you to enter that information manually. If a keytab has more than one SPN, AAA selects the correct SPN. You can configure this feature at the command line, or by using the configuration utility.

Note: These instructions assume that you are already familiar with the LDAP protocol and have already configured your chosen LDAP authentication server.

To configure AAA to extract user information from a keytab file by using the command line interface

At the command prompt, type the appropriate command:

- add authentication negotiateAction <name> [-keytab <string>]
- set authentication negotiateAction <name> [-keytab <string>]

Example

```
1 > set authentication negotiateAction negotiateAction-1 -keytab keytab-1
```
To configure AAA to extract user information from a keytab file by using the configuration utility

Note

In the configuration utility, the term server is used instead of action, but refers to the same task.

2. In the details pane, on the Servers tab, do one of the following:
   • If you want to create a new Negotiate action, click Add.
   • If you want to modify an existing Negotiate action, in the data pane select the action, and then click Edit.
3. If you are creating a new Negotiate action, in the Name text box, type a name for your new action. The name can be from one to 127 characters in length and can consist of upper- and lowercase letters, numbers, and the hyphen (-) and underscore (_) characters. If you are modifying an existing Negotiate action, skip this step. The name is read-only; you cannot change it.
4. Under Negotiate, if the Use Keytab file check box is not already checked, check it.
5. In the Keytab file path text box, type the full path and filename of the keytab file that you want to use.
6. In the Default authentication group text box, type the authentication group that you want to set as default for this user.
7. Click Create or OK to save your changes.

RADIUS authentication policies

December 13, 2018

As with other types of authentication policies, a Remote Authentication Dial In User Service (RADIUS) authentication policy is comprised of an expression and an action. After creating an authentication policy, you bind it to an authentication virtual server and assign a priority to it. When binding it, you also designate it as either a primary or a secondary policy. However, setting up a RADIUS authentication policy has certain special requirements that are described below.

Normally you configure the NetScaler appliance to use the IP address of the authentication server during authentication. With RADIUS authentication servers, you can now configure the ADC to use the FQDN of the RADIUS server instead of its IP address to authenticate users. Using an FQDN can simplify an otherwise much more complex AAA configuration in environments where the authentication server might be at any of several IP addresses, but always uses a single FQDN. To configure authentication by using a server’s FQDN instead of its IP address, you follow the normal configuration process except when creating the authentication action. When creating the action, you substitute the serverName parameter for the serverIP parameter.
Before you decide whether to configure the NetScaler appliance to use the IP or the FQDN of your RADIUS server to authenticate users, consider that configurations AAA to authenticate to an FQDN instead of an IP address adds an extra step to the authentication process. Each time the ADC authenticates a user, it must resolve the FQDN. If a great many users attempt to authenticate simultaneously, the resulting DNS lookups might slow the authentication process.

Note
These instructions assume that you are already familiar with the RADIUS protocol and have already configured your chosen RADIUS authentication server.

For more information about setting up authentication policies in general, see Authentication Policies. For more information about NetScaler appliance expressions, which are used in the policy rule, see Policies and Expressions.

To add an authentication action for a RADIUS server by using the command line interface

If you authenticate to a RADIUS server, you need to add an explicit authentication action. To do this, at the command prompt, type the following command:

```
```

The following example adds a RADIUS authentication action named Authn-Act-1, with the server IP 10.218.24.65, the server port 1812, the authentication timeout 15 minutes, the radius key WareTheLorax, NAS IP disabled, and NAS ID NAS1.

```
  1 > add authentication radiusAction Authn-Act-1 -serverip 10.218.24.65 -serverport 1812 -authtimeout 15 -radkey WareTheLorax -radNASip DISABLED -radNASid NAS1
  2 Done
```

The following example adds the same RADIUS authentication action, but using the server FQDN rad01.example.com instead of the IP.
To configure an authentication action for an external RADIUS server by using the command line

To configure an existing RADIUS action, at the command prompt, type the following command:

```
set authentication radiusAction <name> [-serverName <FQDN>] [-serverPort <port>] [-authTimeout <positive_integer>] { -radKey } [-radNASip ( ENABLED | DISABLED )][-radNASid <positive_integer>][-radVendorID <positive_integer>][-radAttributeType <positive_integer>][-radGroupsPrefix <string>] [-radGroupSeparator <string>][-passEncoding <passEncoding>][-ipVendorID <positive_integer>] [-ipAttributeType <positive_integer>][-accounting ( ON | OFF )][-pwdVendorID <positive_integer>][-pwdAttributeType <positive_integer>]) [-defaultAuthenticationGroup <string>][ -callingstationid ( ENABLED | DISABLED )]
```

To remove an authentication action for an external RADIUS server by using the command line interface

To remove an existing RADIUS action, at the command prompt, type the following command:

```
rm authentication radiusAction <name>
```

Example

```
1 > rm authentication radiusaction Authn-Act-1
2 Done
```

To configure a RADIUS server by using the configuration utility

Note

In the configuration utility, the term server is used instead of action, but refers to the same task.

1. Navigate to **Security > AAA - Application Traffic > Policies > Authentication > Radius**
2. In the details pane, on the **Servers** tab, do one of the following:
   - To create a new RADIUS server, click **Add**.
   - To modify an existing RADIUS server, select the server, and then click **Edit**.
3. In the Create Authentication RADIUS Server or Configure Authentication RADIUS Server dialog, type or select values for the parameters. To fill out parameters that appear beneath Send Calling Station ID, expand Details.
   - Name*—radiusActionName (Cannot be changed for a previously configured action)
   - Authentication Type*—authtype (Set to RADIUS, cannot be changed)
   - Server Name / IP Address*—Choose either Server Name or Server IP
     - Server Name*—servername <FQDN>
     - IP Address*—serverIp <IP> If the server is assigned an IPv6 IP address, select the IPv6 check box.
   - Port*—serverPort
   - Time-out (seconds)*—authTimeout
   - Secret Key*—radKey (RADIUS shared secret.)
   - Confirm Secret Key*—Type the RADIUS shared secret a second time. (No command line equivalent.)
   - Send Calling Station ID—callingstationid
   - Group Vendor Identifier—radVendorID
   - Group Attribute Type—radAttributeType
   - IP Address Vendor Identifier—ipVendorID
   - pwdVendorID—pwdVendorID
   - Password Encoding—passEncoding
   - Default Authentication Group—defaultAuthenticationGroup
   - NAS ID—radNASid
   - Enable NAS IP address extraction—radNASip
   - Group Prefix—radGroupsPrefix
   - Group Separator—radGroupSeparator
   - IP Address Attribute Type—ipAttributeType
   - Password Attribute Type—pwdAttributeType
   - Accounting—accounting

4. Click Create or OK. The policy that you created appears in the Servers page.

SAML authentication policies

December 13, 2018

For information on NetScaler appliance as a SAML SP and IdP, see SAML Authentication.
Web authentication policies

December 13, 2018

AAA is now able to authenticate a user to a web server, providing the credentials that the web server requires in an HTTP request and analyzing the web server response to determine that user authentication was successful. As with other types of authentication policies, a Web authentication policy is comprised of an expression and an action. After creating an authentication policy, you bind it to an authentication virtual server and assign a priority to it. When binding it, you also designate it as either a primary or a secondary policy.

To set up web-based authentication with a specific web server, first you create a web authentication action. Since authentication to web servers does not use a rigid format, you must specify exactly which information the web server requires and in which format when creating the action. To do this, you create an expression in NetScaler appliance default syntax that contains the following items:

- **Server IP**—The IP address of the authentication Web server.
- **Server Port**—The port of the authentication Web server.
- **Authentication Rule**—An expression in NetScaler appliance default syntax that contains the user’s credentials in the format that the Web server expects.
- **Scheme**—HTTP (for unencrypted web authentication) or HTTPS (for encrypted web authentication).
- **Success Rule**—An expression in NetScaler appliance default syntax that matches the web server response string that signifies that the user authenticated successfully.

For all other parameters, follow the normal rules for the add authentication action command.

Next you create a policy associated with that action. The policy is similar to an LDAP policy, and like LDAP policies uses NetScaler appliance syntax.

**Note**

These instructions assume that you are already familiar with the authentication requirements of the web server(s) to which you want to authenticate, and have already configured the web authentication server.

**To configure a Web authentication action by using the command line interface**

To create a web authentication action at the command line, at the command line type the following command:

```
add authentication webAuthAction <name> -serverIP <ip_addr|ipv6_addr|*> -serverPort <port|*> [-fullReqExpr <string>] -scheme ( http | https )
```

© 1999-2018 Citrix Systems, Inc. All rights reserved.

Example

1 > add authentication webAuthAction webauth1 -serverIP 10.214.56.31 -serverPort 80 -

**To configure a Web authentication action by using the configuration utility**

**Note**

In the configuration utility, the term server is used instead of action, but refers to the same task.

1. Navigate to **Security > AAA - Application Traffic > Policies > LDAP**.
2. In the details pane, on the **Servers** tab, do one of the following:
   - If you want to create a new web authentication action, click **Add**.
   - If you want to modify an existing web authentication action, in the data pane select the action, and then click **Edit**.
3. If you are creating a new web authentication action, in the **Create Authentication Web** server dialog box, **Name** text box, type a name for the new web authentication action. The name can be from one to 127 characters in length, and can consist of upper- and lowercase letters, numbers, and the hyphen (-) and underscore (_) characters. If you are modifying an existing web authentication action, skip this step. The name is read-only; you cannot change it.
4. In the **Web Server IP Address** text box, type the IPv4 or IPv6 IP address of the authentication web server. If the address is an IPv6 IP address, select the IPv6 check box first.
5. In the Port text box, type the port number on which the web server accepts connections.
6. Select **HTTP** or **HTTPS** in the **Protocol** drop-down list.
7. In the HTTP Request Expression text area, type a PCRE-format regular expression that creates the web server request that contains the user’s credentials in the exact format expected by the authentication web server.
8. In the Expression to validate the Authentication text area, type a NetScaler appliance default syntax expression that describes the information in the web server response that indicates that user authentication was successful.
9. Fill out the remaining fields as described in the general authentication action documentation.
10. Click **OK**.
Configuring advanced authentication policies

December 13, 2018

If you know exactly how you want an authentication policy to be configured, you can use the advanced authentication policy dialog to create the policy quickly.

To configure an advanced authentication policy by using the configuration utility

2. In the details pane do one of the following:
   - To create a new policy, click Add.
   - To modify an existing policy, select the policy, and then click Edit.
3. In the Create Authentication Policy or Configure Authentication Policy dialog box, type or select values for the parameters.
   - Name*—The policy name. Cannot be changed for a previously configured policy.
   - Action Type*—The policy type: Cert, Negotiate, LDAP, RADIUS, SAML, SAMLIDP, TACACS, or WEBAUTH.
   - Action*—The authentication action (profile) to associate with the policy. You can choose an existing authentication action, or click the plus and create a new action of the proper type.
   - Log Action—The audit action to associate with the policy. You can choose an existing audit action, or click the plus and create a new action.
   - Expression*—The rule that selects connections to which you want to apply the action that you specified. The rule can be simple (“true” selects all traffic) or complex. You enter expressions by first choosing the type of expression in the leftmost drop-down list beneath the Expression window, and then by typing your expression directly into the expression text area, or by clicking Add to open Add Expression dialog box and using the drop-down lists in it to construct your expression.)
   - Comment—You can type a comment that describes the type of traffic that this authentication policy will apply to. Optional.
4. Click Create or OK, and then click Close. If you created a policy, that policy appears in the Authentication Policies and Servers page.
Authorizing user access to application resources

December 13, 2018

You can control the resources that an authenticated user can access within an application. To do this, associate an authorization policy to each of the users, either individually or by associating the policy to a group of users. The authorization policy must specify the following:

- **Rule.** The resource to which access must be authorized. This can be specified by using basic or advanced expressions.
- **Action.** Whether access to the resource must be allowed or denied.

By default, access to all resources within an application is **DENIED** to all users. However, you can change this default authorization action to **ALLOW** access to all users (by setting the session parameters in session profile or by setting the global session parameters).

**Warning**

For optimum security, Citrix recommends that you do not to change the default authorization action from **DENY** to **ALLOW**. Instead, it is advised to create specific authorization policies for users who need access to specific resources.

**To configure authorization by using the CLI**

1. Configure the authorization policy.
   
   `ns-cli-prompt> add authorization policy <name> <rule> <action>`

2. Associate the policy with the appropriate user or group.
   
   - Bind the policy to a specific user.
     
     `ns-cli-prompt> bind aaa user <username> -policy <policyname>`
   
   - Bind the policy to a specific group.
     
     `ns-cli-prompt> bind aaa group <groupName> -policy <policyname>`

**To configure authorization by using the GUI (Configuration tab)**

1. Create the authorization policy.
   
   Navigate to **Security > AAA - Application Traffic > Policies > Authorization**, click **Add** and then define the policy as required.
2. Associate the policy with the appropriate user or group.

Navigate to **Security > AAA - Application Traffic > Users** or **Groups**, and edit the relevant user or group to associate it with the authorization policy.

**Sample authorization configurations**

Here are some example configurations to authorize user access to some application resources. Note that these are CLI commands. You can do similar configurations using the GUI, although you must not enclose the expression within quotes ("").

- add authorization policy authzpol1 "HTTP.REQ.URL.SUFFIX.EQ("gif")" ALLOW
- bind aaa user user1 -policy authzpol1
- add authorization policy authzpol2 "HTTP.REQ.URL.SUFFIX.EQ("png")" DENY
- bind aaa group group1 -policy authzpol2

**Auditing authenticated sessions**

December 13, 2018

You can configure the NetScaler appliance to keep a log of all the events that are triggered in an authenticated session. Using this information, you can audit state and status information, to see the history for users in chronological order.

To do this, define an audit policy that specifies the following:

- **Log type.** The logs can be stored remotely (syslog) or locally on the NetScaler appliance (nslog).
- **Rule.** The conditions on which the logs are stored.
- **Action.** Details of the log server and other details for creating the log entries.

This audit policy can be configured at different levels: user-level, group-level, AAA virtual server, and global system level. The policies configured at the user-level have the highest priority.

**Note**

This topic details steps for using syslog. Make necessary changes to use nslog.
**To configure syslog auditing by using the CLI**

1. Configure the audit server with the relevant log settings.

   \[ ns-cli-prompt > \textbf{add audit syslogAction } <\text{name}> \text{<serverIP}> \ldots \]

2. Configure the audit policy by associating the audit server.

   \[ ns-cli-prompt > \textbf{add audit syslogPolicy } <\text{name}> \text{<rule}> \text{<action>} \]

3. Associate the audit policy with one of the following entities:
   - Bind the policy to a specific user.
     \[ ns-cli-prompt > \textbf{bind aaa user } <\text{userName}> \text{-policy } <\text{policyname}> \ldots \]
   - Bind the policy to a specific group.
     \[ ns-cli-prompt > \textbf{bind aaa group } <\text{groupName}> \text{-policy } <\text{policyname}> \ldots \]
   - Bind the policy to a AAA virtual server.
     \[ ns-cli-prompt > \textbf{bind authentication vserver } <\text{name}> \text{-policy } <\text{policyname}> \ldots \]
   - Bind the policy globally to the NetScaler appliance.
     \[ ns-cli-prompt > \textbf{bind tm global } \text{-policyName } <\text{policyname}> \ldots \]

---

**To configure syslog auditing by using the GUI (Configuration tab)**

1. Configure the audit server and policy.

   Navigate to \textbf{Security > AAA - Application Traffic > Policies > Auditing > Syslog}, and configure the server and the policy in the relevant tabs.

2. Associate the policy with one of the following:
   - Bind the policy to a specific user.
     Navigate to \textbf{Security > AAA - Application Traffic > Users}, and associate the authorization policy with the relevant user.
   - Bind the policy to a specific group.
     Navigate to \textbf{Security > AAA - Application Traffic > Groups}, and associate the authorization policy with the relevant group.
   - Bind the policy to a AAA virtual server.
     Navigate to \textbf{Security > AAA - Application Traffic > Virtual Servers}, and associate the authorization policy with the relevant virtual server.
• Bind the policy globally to the NetScaler appliance.

Navigate to Security > AAA - Application Traffic > Policies > Auditing > Syslog or Nslog, select the authorization policy, and click Action > Global Bindings to bind the policy globally.

Session settings

December 13, 2018

After you configure your AAA profiles, you configure session settings to customize your user sessions. The session settings are:

• **The session timeout.**

  Controls the period after which the user is automatically disconnected and must authenticate again to access your intranet.

• **The default authorization setting.**

  Determines whether the NetScaler appliance will by default allow or deny access to content for which there is no specific authorization policy.

• **The single sign-on setting.**

  Determines whether the NetScaler appliance will log users onto all web applications automatically after they authenticate, or will pass users to the web application logon page to authenticate for each application.

• **The credential index setting.**

  Determines whether the NetScaler appliance will use primary or the secondary authentication credentials for single signon.

To configure the session settings, you can take one of two approaches. If you want different settings for different user accounts or groups, you create a profile for each user account or group for which you want to configure custom sessions settings. You also create policies to select the connections to which to apply particular profiles, and you bind the policies to users or groups. You can also bind a policy to the authentication virtual server that handles the traffic to which you want to apply the profile.

If you want the same settings for all sessions, or if you want to customize the default settings for sessions that do not have specific profiles and policies configured, you can simply configure the global session settings.
To customize your user sessions, you first create a session profile. The session profile allows you to override global settings for any of the session parameters.

**Note**

The terms “session profile” and “session action” mean the same thing.

**To create a session profile by using the command line interface**

At the command prompt, type the following commands to create a session profile and verify the configuration:

- `add tm sessionAction <name> [-sessTimeout <mins>] [-defaultAuthorizationAction (ALLOW | DENY)[-SSO (ON | OFF)][-ssoCredential (PRIMARY | SECONDARY)][-ssoDomain <string>][-httpOnlyCookie (YES | NO)][-persistentCookie (ENABLED | DISABLED)][-persistentCookieValidity <minutes>]
- `show tm sessionAction <name>`

**Example**

```
1  > add tm sessionAction session-profile -sessTimeout 30 -
    defaultAuthorization ALLOW
2  Done
3  > show tm sessionAction session-profile
4  1) Name: session-profile
5       Authorization action : ALLOW
6       Session timeout: 30 minutes
7  Done
```

**To modify a session profile by using the command line interface**

At the command prompt, type the following commands to modify a session profile and verify the configuration:

- `set tm sessionAction <name> [-sessTimeout <mins>] [-defaultAuthorizationAction (ALLOW | DENY)][-SSO (ON | OFF)][-ssoCredential (PRIMARY | SECONDARY)][-ssoDomain <string>][-httpOnlyCookie (YES | NO)] [-
**persistentCookie** (ENABLED | DISABLED) [persistentCookieValidity < minutes]

- show tm sessionAction

**Example**

```
1 > set tm sessionAction session-profile -sessTimeout 30 -
   defaultAuthorization ALLOW
2 Done
3 > show tm sessionAction session-profile
4 1) Name: session-profile
5 Authorization action: ALLOW
6 Session timeout: 30 minutes
7 Done
```

**To remove a session profile by using the command line interface**

At the command prompt, type the following command to remove a session profile:

```
rm tm sessionAction <name>
```

**To configure session profiles by using the configuration utility**

3. In the details pane, click the **Profiles** tab.
4. On the **Profiles** tab, do one of the following:
   - To create a new session profile, click **Add**.
   - To modify an existing session profile, select the profile, and then click **Edit**.
5. In the Create TM Session Profile or Configure TM Session Profile dialog, type or select values for the parameters:
   - Name*—actionname (Cannot be changed for a previously configured session action.)
   - Session Time-out—sesstimeout
   - Single Signon to Web Applications—sso
   - Credential Index—ssocredential
   - Single Sign-on Domain—ssoDomain
   - HTTPOnly Cookie—httpOnlyCookie
   - Enable Persistent Cookie—persistentCookie
   - Persistent Cookie Validity—persistentCookieValidity
6. Click Create or OK. The session profile that you created appears in the Session Policies and Profiles pane.

**Session policies**

December 13, 2018

After you create one or more session profiles, you create session policies and then bind the policies globally or to an authentication virtual server to put them into effect.

**To create a session policy by using the command line interface**

At the command prompt, type the following commands to create a session policy and verify the configuration:

```
1 - add tm sessionPolicy <name> <rule> <action>
2 - show tm sessionPolicy <name>
```

Example

```
1 > add tm sessionPolicy session-pol "URL == /*.gif" session-profile
2 Done
3 > show tm sessionPolicy session-pol
4 1) Name: session-pol Rule: URL == '/*.gif'
5       Action: session-profile
6 Done
```

**To modify a session policy by using the command line interface**

At the command prompt, type the following commands to modify a session policy and verify the configuration:

```
1 - set tm sessionPolicy <name> [-rule <expression>] [-action <action>]
2 - show tm sessionPolicy <name>
```

Example

```
1 > set tm sessionPolicy session-pol "URL == /*.gif" session-profile
2 Done
3 > show tm sessionPolicy session-pol
```
To globally bind a session policy by using the command line interface

At the command prompt, type the following commands to globally bind a session policy and verify the configuration:

```
bind tm global -policyName <policyname> [-priority <priority>]
```

Example

```
1 > bind tm global -policyName session-pol
2   Done
3
4 > show tm sessionPolicy session-pol
5 1) Name: session-pol  Rule: URL == '/*.gif'
6     Action: session-profile
7   Policy is bound to following entities
8     1) TM GLOBAL  PRIORITY : 0
9   Done
```

To bind a session policy to an authentication virtual server by using the command line interface

At the command prompt, type the following command to bind a session policy to an authentication virtual and verify the configuration:

```
bind authentication vserver <name> -policy <policyname> [-priority <priority>]
```

Example

```
1 > bind authentication vserver auth-vserver-1 -policyName Session-Pol-1
   -priority 1000
2   Done
```

To unbind a session policy from an authentication virtual server by using the command line interface

At the command prompt, type the following commands to unbind a session policy from an authentication virtual server and verify the configuration:
unbind authentication vserver <name> -policy <policyname>

Example

```
1 > unbind authentication vserver auth-vserver-1 -policyName Session-Pol-1
2  Done
```

To unbind a globally bound session policy by using the command line interface

At the command prompt, type the following commands to unbind a globally-bound session policy:

unbind tm global -policyName <policyname>

Example

```
1 > unbind tm global -policyName Session-Pol-1
2  Done
```

To remove a session policy by using the command line interface

First unbind the session policy from global, and then, at the command prompt, type the following commands to remove a session policy and verify the configuration:

rm tm sessionPolicy <name>

Example

```
1 > rm tm sessionPolicy Session-Pol-1
2  Done
```

To configure and bind session policies by using the configuration utility

3. In the details pane, on the Policies tab, do one of the following:
   - To create a new session policy, click Add.
   - To modify an existing session policy, select the policy, and then click Edit.
4. In the Create Session Policy or Configure Session Policy dialog, type or select values for the parameters.
   - Name*—policyname (Cannot be changed for a previously configured session policy.)
   - Request Profile*—actionname
• Expression*—rule (You enter expressions by first choosing the type of expression in the leftmost drop-down list beneath the Expression text area and then typing your expression directly into the expression text area, or by clicking Add to open the Add Expression dialog box and using the drop-down lists in it to construct your expression.)

5. Click Create or OK. The policy that you created appears in the details pane of the Session Policies and Profiles page.

6. To globally bind a session policy, in the details pane, select Global Bindings from the Action drop-down list, and fill in the dialog.
   • Select the name of the session policy you want to globally bind.
   • Click OK.

7. To bind a session policy to an authentication virtual server, in the navigation pane, click Virtual Servers, and add that policy to the policies list.
   • In the details pane, select the virtual server, and then click Edit.
   • In the Advanced Selections to the right of the detail area, click Policies.
   • Select a policy, or click the plus icon to add a policy.
   • In the Priority column to the left, modify the default priority as needed to ensure that the policy is evaluated in the proper order.
   • Click OK.
   A message appears in the status bar, stating that the policy has been configured successfully.

Global session settings

December 13, 2018

In addition to or instead of creating session profiles and policies, you can configure global session settings. These settings control the session configuration when there is no explicit policy overriding them.

To configure the session settings by using the command line interface

At the command prompt, type the following commands to configure the global session settings and verify the configuration:

```
set tm sessionParameter [-sessTimeout <mins>] [-defaultAuthorizationAction (ALLOW | DENY)] [-SSO (ON | OFF)] [-ssoCredential (PRIMARY | SECONDARY)] [-ssoDomain <string>] [-httpOnlyCookie (YES | NO)] [-persistentCookie (ENABLED | DISABLED)] [-persistentCookieValidity <minutes>]
```

Example
To configure the session settings by using the configuration utility

1. Navigate to Security > AAA - Application Traffic
2. In the details pane, under Settings, click Change global settings.
3. In the Global Session Settings dialog, type or select values for the parameters.
   - Session Time-out—sessTimeout
   - Single Sign-on to Web Applications—sso
   - Credential Index—ssoCredential
   - Single Sign-on Domain—ssoDomain
   - HTTPOnly Cookie—httpOnlyCookie
   - Enable Persistent Cookie—persistentCookie
   - Persistent Cookie Validity (minutes)—persistentCookieValidity
   - Home Page—homepage
4. Click OK.

Traffic Settings

December 13, 2018

If you use forms-based or SAML single sign-on (SSO) for your protected applications, you configure that feature in the Traffic settings. SSO enables your users to log on once to access all protected applications, rather than requiring them to log on separately to access each one.

Forms-based SSO allows you to use a web form of your own design as the sign-on method instead of a generic pop-up window. You can therefore put your company logo and other information you might want your users to see on the logon form. SAML SSO allows you to configure one NetScaler appliance or virtual appliance instance to authenticate to another NetScaler appliance on behalf of users who have authenticated with the first appliance.
To configure either type of SSO, you first create a forms or SAML SSO profile. Next, you create a traffic profile and link it to the SSO profile you created. Next, you create a policy, link it to the traffic profile. Finally, you bind the policy globally or to an authentication virtual server to put your configuration into effect.

**Traffic profiles**

December 13, 2018

After creating at least one forms or SAML sso profile, you must next create a traffic profile.

**Note**

In this feature, the terms “profile” and “action” mean the same thing.

To create a traffic profile by using the command line interface

At the command prompt, type:

```
add tm trafficAction <name> [-appTimeout <mins>] [-SSO ( ON | OFF )][-formSSOAction <string>][-persistentCookie ( ENABLED | DISABLED )][-InitiateLogout ( ON | OFF )]
```

**Example**

```
add tm trafficAction Traffic-Prof-1 -appTimeout 10 -SSO ON -formSSOAction SSO-Prof-1
```

To modify a session profile by using the command line interface

At the command prompt, type:

```
set tm trafficAction <name> [-appTimeout <mins>] [-SSO ( ON | OFF )][-formSSOAction <string>][-persistentCookie ( ENABLED | DISABLED )][-InitiateLogout ( ON | OFF )]
```

**Example**
To remove a session profile by using the command line interface

At the command prompt, type:

```
rm tm trafficAction <name>
```

Example

```
rm tm trafficAction Traffic-Prof-1
```

To configure traffic profiles by using the configuration utility

3. In the details pane, click the Profiles tab.
4. On the Profiles tab, do one of the following:
   - To create a new traffic profile, click Add.
   - To modify an existing traffic profile, select the profile, and then click Edit.
5. In the Create Traffic Profile or Configure Traffic Profile dialog box, specify values for the parameters.
   - Name*—name (Cannot be changed for a previously configured session action.)
   - AppTimeout—appTimeout
   - Single Sign-On—SSO
   - Form SSO Action—formSSOAction
   - SAML SSO Action—samlSSOAction
   - Enable Persistent Cookie—persistentCookie
   - Initiate Logout—InitiateLogout
6. Click Create or OK. The traffic profile that you created appears in the Traffic Policies, Profiles, and either the Form SSO Profiles or SAML SSO Profiles pane, as appropriate.

Traffic policies

December 13, 2018
After you create one or more form SSO and traffic profiles, you create traffic policies and then bind the policies, either globally or to a traffic management virtual server, to put them into effect.

To create a traffic policy by using the command line interface

At the command prompt, type:

```
add tm trafficPolicy <name> <rule> <action>
```

**Example**

```bash
add tm trafficPolicy Traffic-Pol-1 "HTTP.REQ.HEADER("Cookie").CONTAINS("login=true")" Traffic-Prof-1
```

To modify a traffic policy by using the command line interface

At the command prompt, type:

```
set tm trafficPolicy <name> <rule> <action>
```

**Example**

```bash
set tm trafficPolicy Traffic-Pol-1 "HTTP.REQ.HEADER("Cookie").CONTAINS("login=true")" Traffic-Prof-1
```

To globally bind a traffic policy by using the command line interface

At the command prompt, type:

```
bind tm global -policyName <string> [-priority <priority>]
```

**Example**

```bash
bind tm global -policyName Traffic-Pol-1
```
To bind a traffic policy to a load balancing or content switching virtual server by using the command line interface

At the command prompt, type one of the following commands:

- `bind lb vserver <name> -policy <policyName> [-priority <priority>]`
- `bind cs vserver <name> -policy <policyName> [-priority <priority>]`

Example

```
bind authentication vserver auth-vserver-1 -policyName Traffic-Pol-1 -priority 1000
```

To unbind a globally bound traffic policy by using the command line interface

At the command prompt, type:

`unbind tm global -policyName <policynname>`

Example

```
unbind tm global -policyName Traffic-Pol-1
```

To unbind a traffic policy from a load balancing or content switching virtual server by using the command line interface

At the command prompt, type one of the following commands:

- `unbind lb vserver <name> -policy <policynname>`
- `unbind cs vserver <name> -policy <policynname>`

Example

```
unbind authentication vserver auth-vserver-1 -policyName Traffic-Pol-1
```
To remove a traffic policy by using the command line interface

First unbind the session policy from global, and then, at the command prompt, type:

```
rm tm trafficPolicy <name>
```

Example

```
1 rm tm trafficPolicy Traffic-Pol-1
```

To configure and bind traffic policies by using the configuration utility

3. In the details pane, do one of the following:
   - To create a new session policy, click Add.
   - To modify an existing session policy, select the policy, and then click Edit.
4. In the Create Traffic Policy or Configure Traffic Policy dialog, specify values for the parameters.
   - Name*—policyName (Cannot be changed for a previously configured session policy.)
   - Profile*—actionName
   - Expression—rule (You enter expressions by first choosing the type of expression in the leftmost drop-down list beneath the Expression text area and then typing your expression directly into the expression text area, or by clicking Add to open the Add Expression dialog box and using the drop-down lists in it to construct your expression.)
5. Click Create or OK. The policy that you created appears in the details pane of the Session Policies and Profiles page.

Form SSO profiles

December 13, 2018

To enable and configure forms-based SSO, you first create an SSO profile.

Note

- Forms-based single sign-on does not work if the form is customized to include Javascript.
- In this feature, the terms “profile” and “action” mean the same thing.
To create a form SSO profile by using the command line interface

At the command prompt, type:

- add tm formSSOAction <name> -actionURL <URL> -userField <string> -passwdField <string> -ssoSuccessRule <expression> [-nameValuePair <string>] [-responsesize <positive_integer>][-nvtype ( STATIC | DYNAMIC )][-submitMethod ( GET | POST )]
- show tm formSSOAction [<name>]

Example

```
1 add tm formSSOAction SSO-Prof-1 -actionURL "/logon.php"
2 -userField "loginID" -passwdField "passwd"
3 -nameValuePair "loginID passwd" -responsesize "9096"
4 -ssoSuccessRule "HTTP.RES.HEADER("Set-Cookie").CONTAINS("LogonID")"
5 -nvtype STATIC -submitMethod GET
6 - sessTimeout 10 -defaultAuthorizationAction ALLOW
```

To modify a form SSO by using the command line interface

At the command prompt, type:

```
set tm formSSOAction <name> -actionURL <URL> -userField <string> -passwdField <string> -ssoSuccessRule <expression> [-nameValuePair <string>] [-responsesize <positive_integer>][-nvtype ( STATIC | DYNAMIC )][-submitMethod ( GET | POST )]
```

Example

```
1 set tm formSSOAction SSO-Prof-1 -actionURL "/logon.php"
2 -userField "loginID" -passwdField "passwd"
3 -ssoSuccessRule "HTTP.RES.HEADER("Set-Cookie").CONTAINS("LogonID")"
4 -nameValuePair "loginID passwd" -responsesize "9096"
5 -nvtype STATIC -submitMethod GET
6 - sessTimeout 10 -defaultAuthorizationAction ALLOW
```

To remove a form SSO profile by using the command line interface

At the command prompt, type:
rm tm formSSOAction <name>

Example

```
rm tm sessionAction SSO-Prof-1
```

To configure form SSO profiles by using the configuration utility

2. In the details pane, click the Form SSO Profiles tab.
3. On the Form SSO Profiles tab, do one of the following:
   - To create a new form SSO profile, click Add.
   - To modify an existing form SSO profile, select the profile, and then click Edit.
4. In the Create Form SSO Profile or Configure Form SSO Profile dialog, specify values for the parameters:
   - Name*—name (Cannot be changed for a previously configured session action.)
   - Action URL*—actionURL
   - User Name Field*—userField
   - Password Field*—passField
   - Expression*—ssoSuccessRule
   - Name Value Pair—nameValuePair
   - Response Size—responseSize
   - Extraction—nvtype
   - Submit Method—submitMethod
5. Click Create or OK, and then click Close. The form SSO profile that you created appears in the Traffic Policies, Profiles, and Form SSO Profiles pane.

SAML SSO profiles

December 13, 2018

To enable and configure SAML-based SSO, you first create a SAML SSO profile.

To create a SAML SSO profile by using the command line interface

At the command prompt, type:
NetScaler 11.1

add tm samlSSOProfile <name> -samlSigningCertName <string> -assertionConsumerServiceURL <URL> -relaystateRule <expression> -sendPassword (ON | OFF)[-samlIssuerName <string>]

Example

```
add tm samlSSOProfile saml-SSO-Prof-1 -samlSigningCertName "Example, Inc." -assertionConsumerServiceURL "https://service.example.com" -relaystateRule "true" -sendPassword "ON" -samlIssuerName "Example, Inc."
```

To modify a SAML SSO by using the command line interface

At the command prompt, type:

```
set tm samlSSOProfile <name> -samlSigningCertName <string> -assertionConsumerServiceURL <URL> -relaystateRule <expression> -sendPassword (ON | OFF)[-samlIssuerName <string>]
```

Example

```
set tm samlSSOProfile saml-SSO-Prof-1 -samlSigningCertName "Example, Inc." -assertionConsumerServiceURL "https://service.example.com" -relaystateRule "true" -sendPassword "ON" -samlIssuerName "Example, Inc."
```

To remove a SAML SSO profile by using the command line interface

At the command prompt, type:

```
rm tm samlSSOProfile <name>
```

Example

```
rm tm sessionAction saml-SSO-Prof-1
```
To configure a SAML SSO profile by using the configuration utility

2. In the details pane, click the SAML SSO Profiles tab.
3. On the SAML SSO Profiles tab, do one of the following:
   • To create a new SAML SSO profile, click Add.
   • To modify an existing SAML SSO profile, select the profile, and then click OpenEdit.
4. In the Create SAML SSO Profiles or the Configure SAML SSO Profiles dialog box, set the following parameters:
   • Name*
   • Signing Certificate Name*
   • ACS URL*
   • Relay State Rule*
   • Send Password
   • Issuer Name
5. Click Create or OK, and then click Close. The SAML SSO profile that you created appears in the Traffic Policies, Profiles, and SAML SSO Profiles pane.

Session timeout for OWA 2010

December 13, 2018

You can now force OWA 2010 connections to time out after a specified period of inactivity. OWA sends repeated keepalive requests to the server to prevent timeouts. Keeping the connections open can interfere with single sign-on.

To force OWA 2010 to timeout after a specified period by using the command line interface

At the command prompt, type the following commands:

```
add tm trafficAction <actname> [-forcedTimeout <forcedTimeout> -forcedTimeoutVal <mins>]
```

For <actname>, substitute a name for your traffic policy. For <mins>, substitute the number of minutes after which to initiate a forced timeout. For <forcedTimeout>, substitute one of the following values:

- **START**—Starts the timer for forced timeout if a timer has not already been started. If a running timer exists, has no effect.
- **STOP**—Stops a running timer. If no running timer is found, has no effect.
- **RESET**—Restarts a running timer. If no running timer is found, starts a timer just as if the START option had been used.

- **add tm trafficPolicy** `<polname>` `<rule>` `<actname>`

  For `<polname>`, substitute a name for your traffic policy. For `<rule>`, substitute a rule in NetScaler appliance default syntax.

- **bind lb vserver** `<vservername>` `-policyName` `<name>` `-priority` `<number>`

  For `<vservername>`, substitute the name of the AAA traffic management virtual server. For `<priority>`, substitute an integer that designates the policy's priority.

**Example**

```
1  add tm trafficAction act-owa2010timeout -forcedTimeout RESET -forcedTimeoutVal 10
2  add tm trafficPolicy pol-owa2010timeout true act-owa2010timeout
3  bind lb vserver vs-owa2010 -policyName pol-owa2010timeout -priority 10
```

**Authenticating with client certificates**

December 13, 2018

Web sites that contain sensitive content, such as online banking websites or websites with employee personal information, sometimes require client certificates for authentication. To configure AAA to authenticate users on the basis of client-side certificate attributes, you first enable client authentication on the traffic management virtual server and bind the root certificate to the authentication virtual server. Then, you implement one of two options. You can configure the default authentication type on the authentication virtual server as CERT, or you can create a certificate action that defines what the NetScaler appliance must do to authenticate users on the basis of a client certificate. In either case, your authentication server must support CRLs. You configure the ADC to extract the user name from the SubjectCN field or another specified field in the client certificate.

When the user tries to log on to an authentication virtual server for which an authentication policy is not configured, and a global cascade is not configured, the user name information is extracted from the specified field of the certificate. If the required field is extracted, the authentication succeeds. If the user does not provide a valid certificate during the SSL handshake, or if the user name extraction fails, authentication fails. After it validates the client certificate, the ADC presents a logon page to the user.
The following procedures assume that you have already created a functioning AAA configuration, and therefore they explain only how to enable authentication by using client certificates. These procedures also assume that you have obtained your root certificate and client certificates and have placed them on the ADC in the /nsconfig/ssl directory.

To configure the AAA client certificate parameters by using the command line interface

At the command prompt, type the following commands, in the order shown, to configure the certificate and verify the configuration:

- `add ssl certKey <certkeyName> -cert <certFile> -key <keyFile> -password -inform <inform> -expiryMonitor <expiryMonitor> -notificationPeriod <notificationPeriod>
- `bind ssl certKey <certkeyName> -vServer <certkeyName> -CA -crlCheck Mandatory
- `show ssl certKey [<certkeyName>]
- `set aaa parameter -defaultAuthType CERT
- `show aaa parameter
- `set aaa certParams -userNameField "Subject:CN"
- `show aaa certParams

To configure the AAA client certificate parameters by using the configuration utility

2. In the details pane, select the virtual server that you want to configure to handle client certificate authentication, and then click Edit.
3. On the Configuration page, under Certificates, click the right arrow (>) to open the CA Cert Key installation dialog.
4. In the CA Cert Key dialog box, click Insert.
5. In the CA Cert Key - SSL Certificates dialog box, click Install.
6. In the Install Certificate dialog box, set the following parameters, whose names correspond to the CLI parameter names as shown:
   - Certificate-Key Pair Name*—certkeyName
   - Certificate File Name—certFile
   - Key File Name—keyFile
   - Certificate Format—inform
   - Password—password
   - Certificate Bundle—bundle
Support to notify number of unsuccessful login attempts

The NetScaler appliance can now log the number of unsuccessful login attempts made from the last successful log on. The feature works only if the persistentLoginAttempts option is enabled on the appliance. By default, the option is disabled on the NetScaler appliance.

A NetScaler administrator can use this information to verify if any unauthorized attempts have occurred on a secured external user account.

To use this feature, at the NetScaler appliance command prompt, type:

```
set aaa parameter [-maxloginAttempts <value> [-failedLoginTimeout <value>]] -persistentLoginAttempts (ENABLED | DISABLED)
```

Example:

```
set aaa parameter -maxLoginAttempts 4 -failedLoginTimeout 3 -persistentLoginAttempts ENABLED
```

Client certificate pass-through

December 13, 2018

The NetScaler appliance can now be configured to pass client certificates through to protected applications that require client certificates for user authentication. The ADC first authenticates the user, then inserts the client certificate into the request and sends it to the application. This feature is configured by adding appropriate SSL policies.
The exact behavior of this feature when a user presents a client certificate depends upon the configuration of the VPN virtual server.

- If the VPN virtual server is configured to accept client certificates but not require them, the ADC inserts the certificate into the request and then forwards the request to the protected application.
- If the VPN virtual server has client certificate authentication disabled, the ADC renegotiates the authentication protocol and reauthenticates the user before it inserts the client certificate in the header and forwards the request to the protected application.
- If the VPN virtual server is configured to require client certificate authentication, the ADC uses the client certificate to authenticate the user, then inserts the certificate in the header and forwards the request to the protected application.

In all of these cases, you configure client certificate pass-through as follows.

**To create and configure client certificate pass-through by using the command line interface**

At the command prompt, type the following commands:

- `add vpn vserver <name> SSL <IP> 443`
  
  For `<name>`, substitute a name for the virtual server. The name must contain from one to 127 ASCII characters, beginning with a letter or underscore (_), and containing only letters, numbers, and the underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. For `<IP>`, substitute the IP address assigned to the virtual server.

- `set ssl vserver <name> -clientAuth ENABLED -clientCert <clientcert>`
  
  For `<name>`, substitute the name of the virtual server that you just created. For `<clientCert>`, substitute one of the following values:
  
  - `disabled`—disables client certificate authentication on the VPN virtual server.
  - `mandatory`—configures the VPN virtual server to require client certificates to authenticate.
  - `optional`—configures the VPN virtual server to allow client certificate authentication, but not to require it.

- `bind vpn vserver \<name\> -policy local`
  
  For `<name>`, substitute the name of the VPN virtual server that you created.

- `bind vpn vserver \<name\> -policy cert`
  
  For `<name>`, substitute the name of the VPN virtual server that you created.

- `bind ssl vserver \<name\> -certkeyName \<certkeyname>`
  
  For `<name>`, substitute the name of the virtual server that you created. For `<certkeyName>`, substitute the client certificate key.
- `bind ssl vserver \<name> -certkeyName \<cacertkeyname> -CA -ocspCheck Optional`
  For `<name>`, substitute the name of the virtual server that you created. For `<cacertkeyName>`, substitute the CA certificate key.

- `add ssl action \<actname> -clientCert ENABLED -certHeader CLIENT-CERT`
  For `<actname>`, substitute a name for the SSL action.

- `add ssl policy \<polname> -rule true -action \<actname>`
  For `<polname>`, substitute a name for your new SSL policy. For `<actname>`, substitute the name of the SSL action that you just created.

- `bind ssl vserver \<name> -policyName \<polname> -priority 10`
  For `<name>`, substitute the name of the VPN virtual server.

**Example**

```
1  add vpn vserver vs-certpassthru SSL 10.121.250.75 443
2  set ssl vserver vs-certpassthru -clientAuth ENABLED -clientCert optional
3  bind vpn vserver vs-certpassthru -policy local
4  bind vpn vserver vs-certpassthru -policy cert
5  bind ssl vserver vs-certpassthru -certkeyName mycertKey
6  bind ssl vserver vs-certpassthru -certkeyName mycertKey -CA -ocspCheck Optional
7  add ssl action act-certpassthru -clientCert ENABLED -certHeader CLIENT-CERT
8  add ssl policy pol-certpassthru -rule true -action act-certpassthru
9  bind ssl vserver vs-certpassthru -policyName pol-certpassthru -priority 10
```

**Configuring AAA with commonly used protocols**

December 13, 2018

Configuring the NetScaler appliance for AAA needs a specific setup on the NetScaler appliance and clients’ browsers. The configuration varies with the protocol used for AAA.

For more information about configuring the NetScaler appliance for Kerberos authentication, see Handling Authentication, Authorization and Auditing with Kerberos/NTLM.
Handling authentication, authorization and auditing with Kerberos/NTLM

January 6, 2019

Kerberos, a computer network authentication protocol, provides secure communication over the Internet. Designed primarily for client-server applications, it provides for mutual authentication by which the client and server can each ensure the other’s authenticity. Kerberos uses a trusted third party, referred to as Key Distribution Center (KDC). A KDC consists of an Authentication Server (AS), which authenticates a user, and a Ticket Granting Server (TGS).

Each entity on the network (client or server) has a secret key that is known only to itself and the KDC. The knowledge of this key implies authenticity of the entity. For communication between two entities on the network, the KDC generates a session key, referred to as the Kerberos ticket or service ticket. The client makes a request to the AS for credentials for a specific server. The client then receives a ticket, referred to as Ticket Granting Ticket (TGT). The client then contacts the TGS, using the TGT it received from the AS to prove its identity, and asks for a service. If the client is eligible for the service, the TGS issues a Kerberos ticket to the client. The client then contacts the server hosting the service (referred to as the service server), using the Kerberos ticket to prove that it is authorized to receive the service. The Kerberos ticket has a configurable lifetime. The client authenticates itself with the AS only once. If it contacts the physical server multiple times, it reuses the AS ticket.

The following figure shows the basic functioning of the Kerberos protocol.

Figure 1. Functioning of Kerberos

Kerberos authentication has the following advantages:

- Faster authentication. When a physical server gets a Kerberos ticket from a client, the server has enough information to authenticate the client directly. It does not have to contact a domain controller for client authentication, and therefore the authentication process is faster.
- Mutual authentication. When the KDC issues a Kerberos ticket to a client and the client uses the ticket to access a service, only authenticated servers can decrypt the Kerberos ticket. If the virtual server on the NetScaler appliance is able to decrypt the Kerberos ticket, you can conclude that both the virtual server and client are authenticated. Thus, the authentication of the server happens along with the authentication of the client.
- Single sign-on between Windows and other operating systems that support Kerberos.

Kerberos authentication may have the following disadvantages:

- Kerberos has strict time requirements; the clocks of the involved hosts must be synchronized with the Kerberos server clock to ensure that the authentication does not fail. You can mitigate this disadvantage by using the Network Time Protocol daemons to keep the host clocks synchronized. Kerberos tickets have an availability period, which you can configure.
• Kerberos needs the central server to be available continuously. When the Kerberos server is down, no one can log on. You can mitigate this risk by using multiple Kerberos servers and fallback authentication mechanisms.

• Because all the authentication is controlled by a centralized KDC, any compromise in this infrastructure, such as the user’s password for a local workstation being stolen, can allow an attacker to impersonate any user. You can mitigate this risk to some extent by using only a desktop machine or laptop that you trust, or by enforcing preauthentication by means of a hardware-token.

To use Kerberos authentication, you must configure it on the NetScaler appliance and on each client.

**Optimizing Kerberos authentication on AAA**

The NetScaler appliance now optimizes and improves the system performance while Kerberos authentication. The AAA daemon remembers the outstanding Kerberos request for the same user to avoid load on Key Distribution Center (KDC), which will avoid duplicate requests.

**How NetScaler appliance implements Kerberos for client authentication**

January 6, 2019

**Important**

Kerberos/NTLM authentication is supported only in the NetScaler 9.3 nCore release or later, and it can be used only for AAA traffic management virtual servers.

NetScaler appliance handles the components involved in Kerberos authentication in the following way:

**Key Distribution Center (KDC)**

In the Windows 2000 Server or later versions, the Domain Controller and KDC are part of the Windows Server. If the Windows Server is UP and running, it indicates that the Domain Controller and KDC are configured. The KDC is also the Active Directory server.

**Note**

All Kerberos interactions are validated with the Windows Kerberos Domain Controller.
NetScaler 11.1

Authentication service and protocol negotiation

A NetScaler appliance supports Kerberos authentication on the AAA traffic management authentication virtual servers. If the Kerberos authentication fails, the NetScaler appliance uses the NTLM authentication.

By default, Windows 2000 Server and later Windows Server versions use Kerberos for AAA. If you create an authentication policy with NEGOTIATE as the authentication type, the NetScaler appliance attempts to use the Kerberos protocol for AAA and if the client’s browser fails to receive a Kerberos ticket, the NetScaler appliance uses the NTLM authentication. This process is referred to as negotiation.

The client may fail to receive a Kerberos ticket in any of the following cases:

- Kerberos is not supported on the client.
- Kerberos is not enabled on the client.
- The client is in a domain other than that of the KDC.
- The Access Directory on the KDC is not accessible to the client.

For Kerberos/NTLM authentication, the NetScaler appliance does not use the data that is present locally on the NetScaler appliance.

Authorization

The traffic management virtual server can be a load balancing virtual server or a content switching virtual server.

Auditing

The NetScaler appliance supports auditing of Kerberos authentication with the following audit logging:

- Complete audit trail of the traffic management end-user activity
- SYSLOG and high performance TCP logging
- Complete audit trail of system administrators
- All system events
- Scriptable log format

Supported Environment

Kerberos authentication does not need any specific environment on the NetScaler appliance. The client (browser) must provide support for Kerberos authentication.
High Availability

In a high availability setup, only the active NetScaler appliance joins the domain. In case of a failover, the NetScaler appliance lwagent daemon joins the secondary NetScaler appliance to the domain. No specific configuration is required for this functionality.

Kerberos authentication process

The following figure shows a typical process for Kerberos authentication in the NetScaler appliance environment.

Figure 1. Kerberos Authentication Process on NetScaler appliance

The Kerberos authentication occurs in the following stages:

Client authenticates itself to the KDC

1. The NetScaler appliance receives a request from a client.
2. The traffic management (load balancing or content switching) virtual server on the NetScaler appliance sends a challenge to the client.
3. To respond to the challenge, the client gets a Kerberos ticket.
   - The client sends the Authentication Server of the KDC a request for a ticket-granting ticket (TGT) and receives the TGT. (See 3, 4 in the figure, Kerberos Authentication Process.)
   - The client sends the TGT to the Ticket Granting Server of the KDC and receives a Kerberos ticket. (See 5, 6 in the figure, Kerberos Authentication Process.)

Note

The above authentication process is not necessary if the client already has a Kerberos ticket whose lifetime has not expired. In addition, clients such as Web Services, .NET, or J2EE, which support SPNEGO, get a Kerberos ticket for the target server, create an SPNEGO token, and insert the token in the HTTP header when they send an HTTP request. They do not go through the client authentication process.

Client requests a service.

1. The client sends the Kerberos ticket containing the SPNEGO token and the HTTP request to the traffic management virtual server on the NetScaler appliance. The SPNEGO token has the necessary GSSAPI data.
2. The NetScaler appliance establishes a security context between the client and the NetScaler appliance. If the NetScaler appliance cannot accept the data provided in the Kerberos ticket, the client is asked to get a different ticket. This cycle repeats till the GSSAPI data is acceptable.
and the security context is established. The traffic management virtual server on the NetScaler appliance acts as an HTTP proxy between the client and the physical server.

NetScaler appliance completes the authentication.

1. After the security context is complete, the traffic management virtual server validates the SPNEGO token.
2. From the valid SPNEGO token, the virtual server extracts the user ID and GSS credentials, and passes them to the authentication daemon.
3. A successful authentication completes the Kerberos authentication.

Configuring kerberos authentication on the NetScaler appliance

December 13, 2018

This topic provides the detailed steps to configure Kerberos authentication on the NetScaler appliance by using the CLI and the GUI.

Configuring Kerberos authentication on the CLI

1. Enable the AAA feature to ensure the authentication of traffic on the appliance.

   ns-cli-prompt> enable ns feature AAA

2. Add the keytab file to the NetScaler appliance. A keytab file is necessary for decrypting the secret received from the client during Kerberos authentication. A single keytab file contains authentication details for all the services that are bound to the traffic management virtual server on the NetScaler appliance.

   First generate the keytab file on the Active Directory server and then transfer it to the NetScaler appliance.

   a) Log on to the Active Directory server and add a user for Kerberos authentication. For example, to add a user named “Kerb-SVC-Account”:

      net user Kerb-SVC-Account freebsd!@#456 /add

      Note

      In the User Properties section, ensure that the “Change password at next logon option” is not selected and the “Password does not expire” option is selected.

   b) Map the HTTP service to the above user and export the keytab file. For example, run the following command on the Active Directory server:
**Note**

You can map more than one service if authentication is required for more than one service. If you want to map more services, repeat the above command for every service. You can give the same name or different names for the output file.

c) Transfer the keytab file to the NetScaler appliance by using the unix `ftp` command or any other file transfer utility of your choice.

d) Log on to the NetScaler appliance, and run the `ktutil` utility to verify the keytab file. The keytab file has an entry for the HTTP service after it is imported.

The `ktutil` interactions are as follows:

```
root@ns# ktutil
ktutil: rkt /var/keytabfile
ktutil: list

slot KVNO Principal
--------------------------------------------------------

ktutil: wkt /etc/krb5.keytab
ktutil: list

slot KVNO Principal
--- --- ---------------------------------
1 2 HTTP/owa.newacp.com@NEWACP.COM

ktutil: quit
```

3. The NetScaler appliance must obtain the IP address of the domain controller from the fully qualified domain name (FQDN). Therefore, Citrix recommends configuring the NetScaler appliance with a DNS server.

```
ns-cli-prompt> add dns nameserver <ip-address>
```

**Note**

Alternatively, you can add static host entries or use any other means so that the NetScaler appliance can resolve the FQDN name of the domain controller to an IP address.

4. Configure the authentication action and then associate it to an authentication policy.

   a) Configure the negotiate action.

```
ns-cli-prompt> add authentication negotiateAction <name> -domain <domainName> -domainUser <domainUsername> -domainUserPasswd <domainUserPassword>
```
b) Configure the negotiate policy and associate the negotiate action to this policy.

\textit{ns-cli-prompt> add authentication negotiatePolicy} <name> <rule> <reqAction>

5. Create an authentication virtual server and associate the negotiate policy with it.

a) Create an authentication virtual server.

\textit{ns-cli-prompt> add authentication vserver} <name> SSL <ipAuthVserver> 443 -
authenticationDomain <domainName>

b) Bind the negotiate policy to the authentication virtual server.

\textit{ns-cli-prompt> bind authentication vserver} <name> -policy <negotiatePolicyName>

6. Associate the authentication virtual server with the traffic management (load balancing or content switching) virtual server.

\textit{ns-cli-prompt> set lb vserver} <name> -authn401 ON -authnVsName <string>

\textbf{Note}

Similar configurations can also be done on the content switching virtual server.

7. Verify the configurations by doing the following:

a) Access the traffic management virtual server, using the FQDN. For example, Sample

b) View the details of the session on the CLI.

\textit{ns-cli-prompt> show aaa session}

\textbf{Configuring Kerberos authentication on the GUI}

1. Enable the AAA feature.

Navigate to \textit{System > Settings}, click \textit{Configure Basic Features} and enable the AAA feature.

2. Add the keytab file as detailed in step 2 of the CLI procedure mentioned above.

3. Add a DNS server.

Navigate to \textit{Traffic Management > DNS > Name Servers}, and specify the IP address for the DNS server.

4. Configure the \textit{Negotiate} action and policy.

5. Bind the negotiate policy to the authentication virtual server.

Navigate to \textit{Security > AAA - Application Traffic > Virtual Servers}, and associate the \textit{Negotiate} policy with the authentication virtual server.
6. Associate the authentication virtual server with the traffic management (load balancing or content switching) virtual server.

Navigate to Traffic Management > Load Balancing > Virtual Servers, and specify the relevant authentication settings.

Note
Similar configurations can also be done on the content switching virtual server.

7. Verify the configurations as detailed in step 7 of the CLI procedure mentioned above.

Configuring kerberos authentication on a client

December 13, 2018

Kerberos support must be configured on the browser to use Kerberos for authentication. You can use any Kerberos-compliant browser. Instructions for configuring Kerberos support on Internet Explorer and Mozilla Firefox follow. For other browsers, see the documentation of the browser.

To configure Internet Explorer for Kerberos authentication

1. In the Tools menu select Internet Options.
2. On the Security tab, click Local Intranet, and then click Sites.
3. In the Local Intranet dialog box, make sure that the Automatically detect intranet network option is selected, and then click Advanced.
4. In the Local Intranet dialog box, add the web sites of the domains of the traffic management virtual server on the NetScaler appliance. The specified sites become local intranet sites.
5. Click Close or OK to close the dialog boxes.

To configure Mozilla Firefox for Kerberos authentication

1. Make sure that you have Kerberos properly configured on your computer.
2. Type about:config in the URL bar.
3. In the filter text box, type network.negotiate.
4. Change network.negotiate-auth.delegation-uris to the domain that you want to add.
5. Change network.negotiate-auth.trusted-uris to the domain that you want to add.
Note: If you are running Windows, you also need to enter sspi in the filter text box and change the network.auth.use-sspi option to False.

Offloading Kerberos authentication from physical servers

January 6, 2019

The NetScaler appliance can offload authentication tasks from servers. Instead of the physical servers authenticating the requests from clients, the NetScaler appliance authenticates all the client requests before it forwards them to any of the physical servers bound to it. The user authentication is based on Active Directory tokens.

There is no authentication between the NetScaler appliance and the physical server, and the authentication offload is transparent to the end users. After the initial logon to a Windows computer, the end user does not have to enter any additional authentication information in a pop-up or on a logon page.

In the current NetScaler appliance release, Kerberos authentication is available only for AAA traffic management virtual servers. Kerberos authentication is not supported for SSL VPN in the Citrix Gateway Enterprise Edition appliance or for NetScaler appliance management.

Kerberos authentication requires configuration on the NetScaler appliance and on client browsers.

To configure Kerberos authentication on the NetScaler appliance

1. Create a user account on Active Directory. When creating a user account, verify the following options in the User Properties section:
   • Make sure that you do not select the Change password at next logon option.
   • Be sure to select the Password does not expire option.

2. On the AD server, at the CLI command prompt, type:
   • ktpass -princ HTTP/kerberos.create.lab.net@crete.lab.net -ptype KRB5_NT_PRINCIPAL -mapuser kerbuser@crete.lab.net -mapop set -pass Citrix1 -out C:\kerbtabfile.txt

   Note
   Be sure to type the above command on a single line. The output of the above command is written into the C:\kerbtabfile.txt file.

3. Upload the kerbtabfile.txt file to the /etc directory of the NetScaler appliance by using a Secure Copy (SCP) client.

4. Run the following command to add a DNS server to the NetScaler appliance.
• add dns nameserver 1.2.3.4

The NetScaler appliance cannot process Kerberos requests without the DNS server. Be sure to use the same DNS server that is used in the Microsoft Windows domain.

5. Switch to the shell prompt and run the following commands from the shell prompt:
   • ktutil # rkt /etc/kerbtabfile.txt
   • # wkt /etc/krb5.keytab
   • # list

   The list command displays the user account details that you created in the Active Directory. A sample screen of the output of the list command is shown below.

   Figure 1. Sample Output of the list Command

6. Switch to the command line interface of NetScaler appliance.

7. Run the following command to create a Kerberos authentication server:
   • add authentication negotiateAction KerberosServer -domain "crete.lab.net" -domainUser kerbuser -domainUserPasswd Citrix1

8. Run the following command to create a negotiation policy:
   • add authentication negotiatePolicy Kerberos-Policy "REQ.IP.DESTIP == 192.168.17.200"KerberosServer

9. Run the following command to create an authentication virtual server.
   • add authentication vserver Kerb-Auth SSL 192.168.17.201 443 -AuthenticationDomain crete.example.com

10. Run the following command to bind the Kerberos policy to the authentication virtual server:
    • bind authentication vserver Kerb-Auth -policy Kerberos-Policy -priority 100

11. Run the following command to bind an SSL certificate to the authentication virtual server. You can use one of the test certificates, which you can install from the GUI NetScaler appliance. Run the following command to use the ServerTestCert sample certificate.
    • bind ssl vserver Kerb-Auth -certKeyName ServerTestCert

12. Create an HTTP load balancing virtual server with the IP address, 192.168.17.200.
    Ensure that you create a virtual server from the command line interface for NetScaler 9.3 releases if they are older than 9.3.47.8.

13. Run the following command to configure an authentication virtual server:
    • set lb vserver <name>-authn401 ON -authnVsName Kerb-Auth
14. Enter the host name Example in the address bar of the Web browser.

The Web browser displays an authentication dialog box because the Kerberos authentication is not set up in the browser.

Note
Kerberos authentication requires a specific configuration on the client. Ensure that the client can resolve the hostname, which results in the Web browser connecting to an HTTP virtual server.

15. Configure Kerberos on the Web browser of the client computer.

- For configuring on Internet Explorer, see Configuring Internet Explorer for Kerberos authentication.
- For configuring on Mozilla Firefox, see Configuring Internet Explorer for Kerberos authentication.

16. Verify whether you can access the backend physical server without authentication.

To configure Internet Explorer for Kerberos authentication

1. Select Internet Options from the Tools menu.
3. Select Local Intranet from the Select a zone to view change security settings section.
4. Click Sites.
5. Click Advanced.
6. Specify the URL, Example and click Add.
7. Restart Internet Explorer.

To configure Mozilla Firefox for Kerberos authentication

1. Enter about:config in the address bar of the browser.
2. Click the warning disclaimer.
3. Type Network.Negotiate-auth.trusted-uris in the Filter box.
5. In the Enter String Value dialog box, specify www.create.example.com.
6. Restart Firefox.
NetScaler appliance kerberos single sign-on

December 13, 2018

NetScaler appliances now support single sign-on (SSO) using the Kerberos 5 protocol. Users log on to a proxy, the Application Delivery Controller (ADC), which then provides access to protected resources.

The NetScaler appliance Kerberos SSO implementation requires the user’s password for SSO methods that rely on basic, NTLM, or forms-based authentication. The user’s password is not required for Kerberos SSO, although if Kerberos SSO fails and the NetScaler appliance has the user’s password, it uses the password to attempt NTLM SSO.

If the user’s password is available, the KCD account is configured with a realm, and no delegated user information is present, the NetScaler AD Kerberos SSO engine impersonates the user to obtain access to authorized resources. Impersonation is also called unconstrained delegation.

The NetScaler appliance Kerberos SSO engine can also be configured to use a delegated account to obtain access to protected resources on the user’s behalf. This configuration requires delegated user credentials, a keytab, or a delegated user certificate and matching CA certificate. Configuration that uses a delegated account is called constrained delegation.

An overview of NetScaler appliance kerberos SSO

January 6, 2019

To use the NetScaler appliance Kerberos SSO feature, users first authenticate with Kerberos or a supported third-party authentication server. Once authenticated, the user requests access to a protected web application. The web server responds with a request for proof that the user is authorized to access that web application. The user’s browser contacts the Kerberos server, which verifies that the user is authorized to access that resource, and then provides the user’s browser with a service ticket that provides proof. The browser resends the user’s request to the web application server with the service ticket attached. The web application server verifies the service ticket, and then allows the user to access the application.

AAA traffic management implements this process as shown in the following diagram. The diagram illustrates the flow of information through the NetScaler appliance and AAA traffic management, on a secure network with LDAP authentication and Kerberos authorization. AAA traffic management environments that use other types of authentication have essentially the same information flow, although they might differ in some details.

Figure 1. A Secure Network with LDAP and Kerberos

© 1999-2018 Citrix Systems, Inc. All rights reserved.
The AAA traffic management with authentication and authorization in a Kerberos environment requires that the following actions take place.

1. The client sends a request for a resource to the traffic management virtual server on the NetScaler appliance.
2. The traffic management virtual server passes the request to the authentication virtual server, which authenticates the client and then passes the request back to the traffic management virtual server.
3. The traffic management virtual server sends the client’s request to the web application server.
4. The web application server responds to the traffic management virtual server with a 401 Unauthorized message that requests Kerberos authentication, with fallback to NTLM authentication if the client does not support Kerberos.
5. The traffic management virtual server contacts the Kerberos SSO daemon.
6. The Kerberos SSO daemon contacts the Kerberos server and obtains a ticket-granting ticket (TGT) allowing it to request service tickets authorizing access to protected applications.
7. The Kerberos SSO daemon obtains a service ticket for the user and sends that ticket to the traffic management virtual server.
8. The traffic management virtual server attaches the ticket to the user’s initial request and sends the modified request back to the web application server.
9. The web application server responds with a 200 OK message.

These steps are transparent to the client, which just sends a request and receives the requested resource.

**Integration of NetScaler appliance Kerberos SSO with authentication methods**

All AAA traffic management authentication mechanisms support NetScaler appliance Kerberos SSO. AAA traffic management supports the Kerberos SSO mechanism with the Kerberos, CAC (Smart Card) and SAML authentication mechanisms with any form of client authentication to the NetScaler appliance. It also supports the HTTP-Basic, HTTP-Digest, Forms-based, and NTLM (versions 1 and 2) SSO mechanisms if the client uses either HTTP-Basic or Forms-Based authentication to log on to the NetScaler appliance.

The following table shows each supported client-side authentication method, and the supported server-side authentication method for that client-side method.

**Table 1. Supported Authentication Methods**

Setting up NetScaler appliance SSO

December 13, 2018

You can configure NetScaler appliance SSO to work in one of two ways: by impersonation or by delegation. SSO by impersonation is a simpler configuration than SSO by delegation, and is therefore usually preferable when your configuration allows it. To configure NetScaler appliance SSO by impersonation, you must have the user’s user name and password.

To configure NetScaler appliance SSO by delegation, you must have the delegated user’s credentials in one of the following formats: the user’s user name and password, the keytab configuration that includes the user name and an encrypted password, or the delegated user certificate and the matching CA certificate.

Prerequisites

December 13, 2018

Before you configure NetScaler appliance SSO, you need to have your NetScaler appliance fully configured to manage traffic to and authentication for your web application servers. Therefore, you must
configure either load balancing or content switching, and then AAA, for these web application servers. You should also verify routing between the appliance, your LDAP server, and your Kerberos server.

If your network is not already configured in this manner, perform the following configuration tasks:

- Configure a server and service for each web application server.
- Configure a traffic management virtual server to handle traffic to and from your web application server.

Following are brief instructions and examples for performing each of these tasks from the NetScaler appliance command line. For further assistance, see Setting up an Authentication Virtual Server.

**To create a server and service by using the command line**

For NetScaler appliance SSO to obtain a TGS (service ticket) for a service, either the FQDN assigned to the server entity on the NetScaler appliance must match the FQDN of the web application server, or the server entity name must match the NetBios name of the web application server. You can take either of the following approaches:

- Configure the NetScaler appliance server entity by specifying the FQDN of the web application server.
- Configure the NetScaler appliance server entity by specifying the IP address of the web application server, and assign the server entity the same name as the NetBios name of the web application server.

At the command prompt, type the following commands:

```
1 - add server name <serverFQDN>
2
3 - add service name serverName serviceType port
```

For the variables, substitute the following values:

- **serverName.** A name for the NetScaler appliance to use to refer to this server.
- **serverFQDN.** The FQDN of the server. If the server has no domain assigned to it, use the server’s IP address and make sure that the server entity name matches the NetBios name of the web application server.
- **serviceName.** A name for the NetScaler appliance to use to refer to this service.
- **type.** The protocol used by the service, either HTTP or MSSQLSVC.
- **port.** The port on which the service listens. HTTP services normally listen on port 80. Secure HTTPS services normally listen on port 443.
**Example**

The following examples add server and service entries on the NetScaler appliance for the web application server was1.example.com. The first example uses the FQDN of the web application server; the second uses the IP address.

To add the server and service using the web application server FQDN, was1.example.com, you would type the following commands:

```
1  add server was1 was1.example.com
2  add service was1service was1 HTTP 80
```

To add the server and service using the web application server IP and NetBios name, where the web application server IP is 10.237.64.87 and its NetBios name is WAS1, you would type the following commands:

```
1  add server WAS1 10.237.64.87
2  add service was1service WAS1 HTTP 8
```

**To create a traffic management virtual server by using the command line**

The traffic management virtual server manages traffic between the client and the web application server. You can use either a load balancing or a content switching virtual server as the traffic management server. The SSO configuration is the same for either type.

To create a load balancing virtual server, at the command prompt, type the following command:

```
add lb vserver <vservername> <type> <IP> <port>
```

For the variables, substitute the following values:

- **vservername**—A name for the NetScaler appliance to use to refer to this virtual server.
- **type**—The protocol used by the service, either HTTP or MSSQLSVC.
- **IP**—The IP address assigned to the virtual server. This would normally be an IANA-reserved, non-public IP address on your LAN.
- **port**—The port on which the service listens. HTTP services normally listen on port 80. Secure HTTPS services normally listen on port 443.

**Example**

To add a load balancing virtual server called tmvserver1 to a configuration that manages HTTP traffic on port 80, assigning it a LAN IP address of 10.217.28.20 and then binding the load balancing virtual server to the wasservicel service, you would type the following commands:
To create an authentication virtual server by using the command line

The authentication virtual server manages authentication traffic between the client and the authentication (LDAP) server. To create an authentication virtual server, at the command prompt type the following commands:

1. add authentication vserver <authvservername> SSL <IP> 443
2. set authentication vserver <authvservername> -authenticationdomain <domain>

For the variables, substitute the following values:

- **authvservername** — A name for the NetScaler appliance to use to refer to this authentication virtual server. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.), pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Can be changed after the authentication virtual server is added by using the rename authentication vserver command.

- **IP** — The IP address assigned to the authentication virtual server. As with the traffic management virtual server, this address would normally be an IANA-reserved, non-public IP on your LAN.

- **domain** — The domain assigned to the virtual server. This would usually be the domain of your network. It is customary, though not required, to enter the domain in all capitals when configuring the authentication virtual server.

**Example**

To add an authentication virtual server called authverver1 to your configuration and assign it the LAN IP 10.217.28.21 and the domain EXAMPLE.COM, you would type the following commands:

1. add authentication vserver authverver1 SSL 10.217.28.21 443
2. set authentication vserver authverver1 -authenticationdomain EXAMPLE.COM

To configure a traffic management virtual server to use an authentication profile

The authentication virtual server can be configured to handle authentication for a single domain or for multiple domains. If it is configured to support authentication for multiple domains, you must
also specify the domain for NetScaler appliance SSO by creating an authentication profile, and then configuring the traffic management virtual server to use that authentication profile.

Note

The traffic management virtual server can be either a load balancing (lb) or content switching (cs) virtual server. The following instructions assume that you are using a load balancing virtual server. To configure a content switching virtual server, simply substitute set cs vserver for set lb vserver. The procedure is otherwise the same.

To create the authentication profile, and then configure the authentication profile on a traffic management virtual server, type the following commands:

```
1 - add authentication authnProfile <authnProfileName> {
2   -authvserverName <string> }
3   {
4   -authenticationHost <string> }
5   {
6   -authenticationDomain <string> }
7
8 - set lb vserver \<vserverName\> -authnProfile <authnprofileName>
```

For the variables, substitute the following values:

- **authnprofileName**—A name for the authentication profile. Must begin with a letter, number, or the underscore character (_), and must consist of from one to thirty-one alphanumeric or hyphen (-), period (.), pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters.
- **authvserverName**—The name of the authentication virtual server that this profile uses for authentication.
- **authenticationHost**—Host name of the authentication virtual server.
- **authenticationDomain**—Domain for which NetScaler appliance SSO handles authentication. Required if the authentication virtual server performs authentication for more than one domain, so that the correct domain is included when the NetScaler appliance sets the traffic management virtual server cookie.

Example

To create an authentication profile named authnProfile1 for authentication of the example.com domain, and to configure the load balancing virtual server vserver1 to use the authentication profile authnProfile1, you would type the following commands:

```
1 add authentication authnProfile authnProfile1 -authvserverName authvserver1
```
Configuring SSO

December 13, 2018

Configuring NetScaler appliance SSO to authenticate by impersonation is simpler than configuring than SSO to authenticate by delegation, and is therefore usually preferable when your configuration allows it. You just create a KCD account. You can use the user’s password.

If you do not have the user’s password, you can configure NetScaler appliance SSO to authenticate by delegation. Although somewhat more complex than configuring SSO to authenticate by impersonation, the delegation method provides flexibility in that a user’s credentials might not be available to the NetScaler appliance in all circumstances.

For either impersonation or delegation, you must also enable integrated authentication on the web application server.

Enabling integrated authentication on the web application server

December 13, 2018

To set up NetScaler appliance Kerberos SSO on each web application server that Kerberos SSO will manage, use the configuration interface on that server to configure the server to require authentication. Select Kerberos (negotiate) authentication by preference, with fallback to NTLM for clients that do not support Kerberos.

Following are instructions for configuring Microsoft Internet Information Server (IIS) to require authentication. If your web application server uses software other than IIS, consult the documentation for that web server software for instructions.

To configure Microsoft IIS to use integrated authentication

1. Log on to the IIS server and open Internet Information Services Manager.
2. Select the web site for which you want to enable integrated authentication. To enable integrated authentication for all IIS web servers managed by IISM, configure authentication settings

<table>
<thead>
<tr>
<th>Line</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>set lb vserver vserver1 -authProfile authProfile1</td>
</tr>
<tr>
<td>3</td>
<td>-authenticationHost authvserver1 -authenticationDomain example.com</td>
</tr>
</tbody>
</table>
for the Default Web Site. To enable integrated authentication for individual services (such as Exchange, Exadmin, ExchWeb, and Public), configure these authentication settings for each service individually.

3. Open the Properties dialog box for the default web site or for the individual service, and click the Directory Security tab.
5. Disable anonymous access.
6. Enable Integrated Windows authentication (only). Enabling integrated Windows authentication should automatically set protocol negotiation for the web server to Negotiate, NTLM, which specifies Kerberos authentication with fallback to NTLM for non-Kerberos capable devices. If this option is not automatically selected, manually set protocol negotiation to Negotiate, NTLM.

Setting up SSO by impersonation

December 13, 2018

You can configure the KCD account for NetScaler appliance SSO by impersonation. In this configuration, the NetScaler appliance obtains the user’s username and password when the user authenticates to the authentication server and uses those credentials to impersonate the user to obtain a ticket-granting ticket (TGT). If the user’s name is in UPN format, the appliance obtains the user’s realm from UPN. Otherwise, it obtains the user’s name and realm by extracting it from the SSO domain used during initial authentication, or from the session profile.

When configuring the KCD account, you must set the realm parameter to the realm of the service that the user is accessing. The same realm is also used as the user’s realm if the user’s realm cannot be obtained from authentication with the NetScaler appliance or from the session profile.

To create the KCD account for SSO by impersonation with a password

At the command prompt, type the following command:

```
add aaa kcdaccount <accountname> -realmStr <realm>
```

For the variables, substitute the following values:

- **accountname**: The KCD account name.
- **realm**: The domain assigned to NetScaler appliance SSO.
Example

To add a KCD account named kcdaccount1, and use the keytab named kcdvserver.keytab, you would type the following command:

```
add aaa kcdAccount kcdaccount1 -keytab kcdvserver.keytab
```

For information on configuring Kerberos impersonation through NetScaler GUI, see Citrix Support.

Configuring SSO by Delegation

December 13, 2018

To configure SSO by Delegation, you need to perform the following tasks:

- If you are configuring delegation by delegated user certificate, install the matching CA certificates on the NetScaler appliance and add them to the NetScaler appliance configuration.
- Create the KCD account on the appliance. The appliance uses this account to obtain service tickets for your protected applications.
- Configure the Active Directory server.

Installing the client CA certificate on the NetScaler appliance

If you are configuring NetScaler appliance SSO with a client certificate, you must copy the matching CA certificate for the client certificate domain (the client CA certificate) to the NetScaler appliance, and then install the CA certificate. To copy the client CA certificate, use the file transfer program of your choice to transfer the certificate and private-key file to the NetScaler appliance, and store the files in /nsconfig/ssl.

To install the client CA certificate on the NetScaler appliance

At the command prompt, type the following command:

```
add ssl certKey <certkeyName> -cert <cert> [[-key <key> [-password]]] [-fipsKey <fipsKey>] [-inform (DER | PEM)] [-expiryMonitor (ENABLED | DISABLED | UNSET)] [-notificationPeriod <positive_integer>] [-bundle (YES | NO )]
```

For the variables, substitute the following values:
- **certkeyName.** A name for the client CA certificate. Must begin with an ASCII alphanumeric or underscore (_) character, and must consist of from one to thirty-one characters. Allowed characters include the ASCII alphanumerics, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the certificate-key pair is created. If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “my cert” or ‘my cert’).

- **cert.** Full path name and file name of the X509 certificate file used to form the certificate-key pair. The certificate file must be stored on the NetScaler appliance, in the /nsconfig/ssl/ directory.

- **key.** Full path name and file name of the file that contains the private key to the X509 certificate file. The key file must be stored on the NetScaler appliance in the /nsconfig/ssl/ directory.

- **password.** If a private key is specified, the passphrase used to encrypt the private key. Use this option to load encrypted private keys in PEM format.

- **fipsKey.** Name of the FIPS key that was created inside the Hardware Security Module (HSM) of a FIPS appliance, or a key that was imported into the HSM.

  **Note**
  
  You can specify either a key or a fipsKey, but not both.

- **inform.** Format of the certificate and private-key files, either PEM or DER.

- **passplain.** Pass phrase used to encrypt the private key. Required when adding an encrypted private-key in PEM format.

- **expiryMonitor.** Configure the NetScaler appliance to issue an alert when the certificate is about to expire. Possible values: ENABLED, DISABLED, UNSET.

- **notificationPeriod.** If expiryMonitor is ENABLED, number of days before the certificate expires to issue an alert.

- **bundle.** Parse the certificate chain as a single file after linking the server certificate to its issuer’s certificate within the file. Possible values: YES, NO.

**Example**

The following example adds the specified delegated user certificate customer-cert.pem to the NetScaler appliance configuration along with the key customer-key.pem, and sets the password, certificate format, expiration monitor, and notification period.

To add the delegated user certificate, you would type the following commands:

```
add ssl certKey customer -cert "/nsconfig/ssl/customer-cert.pem"
```
Creating the KCD account

If you are configuring NetScaler appliance SSO by delegation, you can configure the KCD account to use the user’s log-on name and password, to use the user’s log-on name and keytab, or to use the user’s client certificate. If you configure SSO with user name and password, the NetScaler appliance uses the delegated user account to obtain a Ticket Granting Ticket (TGT), and then uses the TGT to obtain service tickets for the specific services that each user requests. If you configure SSO with keytab file, the NetScaler appliance uses the delegated user account and keytab information. If you configure SSO with a delegated user certificate, the NetScaler appliance uses the delegated user certificate.

To create the KCD account for SSO by delegation with a password

At the command prompt, type the following commands:

```
add aaa kcdaccount <accountname> -delegatedUser root -kcdPassword <password> -realmStr <realm>
```

For the variables, substitute the following values:

- **accountname.** A name for the KCD account.
- **password.** A password for the KCD account.
- **realm.** The realm of the KCD account, usually the domain for which SSO is active.

Example (UPN Format)

To add a KCD account named kcdaccount1 to the NetScaler appliance configuration with a password of password1 and a realm of EXAMPLE.COM, specifying the delegated user account in UPN format (as root), you would type the following commands:

```
1 add aaa kcdaccount kcdaccount1 -delegatedUser root
2 -kcdPassword password1 -realmStr EXAMPLE.COM
```

Example (SPN Format)

To add a KCD account named kcdaccount1 to the NetScaler appliance configuration with a password of password1 and a realm of EXAMPLE.COM, specifying the delegated user account in SPN format, you would type the following commands:
Creating the KCD account for SSO by delegation with a keytab

If you plan to use a keytab file for authentication, first create the keytab. You can create the keytab file manually by logging onto the AD server and using the ktpass utility, or you can use the NetScaler appliance configuration utility to create a batch script, and then run that script on the AD server to generate the keytab file. Next, use FTP or another file transfer program to transfer the keytab file to the NetScaler appliance and place it in the /nsconfig/krb directory. Finally, configure the KCD account for NetScaler appliance SSO by delegation and provide the path and file name of the keytab file to the NetScaler appliance.

To create the keytab file manually

Log on to the AD server command line and, at the command prompt, type the following command:

```
ktpass princ <SPN> ptype KRB5_NT_PRINCIPAL mapuser <DOMAIN><username> pass <password> -out <File_Path>
```

For the variables, substitute the following values:

- **SPN.** The service principal name for the KCD service account.
- **DOMAIN.** The domain of the Active Directory server.
- **username.** The KSA account username.
- **password.** The KSA account password.
- **path.** The full path name of the directory in which to store the keytab file after it is generated.

To use the NetScaler appliance configuration utility to create a script to generate the keytab file

2. In the data pane, under Kerberos Constrained Delegation, click Batch file to generate Keytab.
3. In the Generate KCD (Kerberos Constrained Delegation) Keytab Script dialog box, set the following parameters:
   - **Domain User Name.** The KSA account username.
   - **Domain Password.** The KSA account password.
   - **Service Principal.** The service principal name for the KSA.
   - **Output File Name.** The full path and file name to which to save the keytab file on the AD server.
4. Clear the Create Domain User Account check box.
5. Click **Generate Script**.
6. Log on to the Active Directory server and open a command line window.
7. Copy the script from the **Generated Script** window and paste it directly into the Active Directory server command-line window. The keytab is generated and stored in the directory under the file name that you specified as **Output File Name**.
8. Use the file transfer utility of your choice to copy the keytab file from the Active Directory server to the NetScaler appliance and place it in the /nsconfig/krb directory.

**To create the KCD account**

At the command prompt, type the following command:

```
add aaa kcdaccount <accountname> -keytab <keytab>
```

**Example**

To add a KCD account named kcdaccount1, and use the keytab named kcdvserver.keytab, you would type the following commands:

```
add aaa kcdaccount kcdaccount1 -keytab kcdvserver.keytab
```

**To create the KCD account for SSO by delegation with a delegated user cert**

At the command prompt, type the following command:

```
add aaa kcdaccount <accountname> -realmStr <realm> -delegatedUser <user_nameSPN> -usercert <cert> -cacert <cacert>
```

For the variables, substitute the following values:

- **accountname**. A name for the KCD account.
- **realmStr**. The realm for the KCD account, usually the domain for which SSO is configured.
- **delegatedUser**. The delegated user name, in SPN format.
- **usercert**. The full path and name of the delegated user certificate file on the NetScaler appliance. The delegated user certificate must contain both the client certificate and the private key, and must be in PEM format. If you use smart card authentication, you might need to create a smart card certificate template to allow certificates to be imported with the private key.
- **cacert**. The full path to and name of the CA certificate file on the NetScaler appliance.

**Example**

To add a KCD account named kcdaccount1, and use the keytab named kcdvserver.keytab, you would type the following command:
Setting up Active Directory for NetScaler appliance SSO

When you configure SSO by delegation, in addition to creating the KCDAccount on the NetScaler appliance, you must also create a matching Kerberos Service Account (KSA) on your LDAP active directory server, and configure the server for SSO. To create the KSA, use the account creation process on the active directory server. To configure SSO on the active directory server, open the properties window for the KSA. In the Delegation tab, enable the following options: Trust this user for delegation to specified services only and Use any Authentication protocol. (The Kerberos only option does not work, because it does not enable protocol transition or constrained delegation.) Finally, add the services that NetScaler appliance SSO will manage.

Note
If the Delegation tab is not visible in the KSA account properties dialog box, before you can configure the KSA as described, you must use the Microsoft setspn command-line tool to configure the active directory server so that the tab is visible.

To configure delegation for the Kerberos service account

1. In the LDAP account configuration dialog box for the Kerberos service account that you created, click the Delegation tab.
2. Choose “Trust this user for delegation to the specified services only”.
3. Under “Trust this user for delegation to the specified services only,” choose “Use any authentication protocol”.
4. Under “Services to which this account can present delegated credentials,” click Add.
5. In the Add Services dialog box, click Users or Computers, choose the server that hosts the resources to be assigned to the service account, and then click OK.

Note
Constrained delegation does not support services hosted in domains other than the domain assigned to the account, even though Kerberos might have a trust relationship with other domains.

```
1 add aaa kcdaccount kcdaccount1 -realmStr EXAMPLE.COM
2 -delegatedUser "host/kcdvserver.example.com" -usertcert /certs/usercert
3 -cacert /cacerts/cacert
```
6. Back in the **Add Services** dialog box, in the **Available Services** list, choose the services assigned to the service account. NetScaler appliance SSO supports the HTTP and MSSQLSVC services.

7. Click **OK**.

---

## Generating the KCD keytab script

**December 13, 2018**

The KCD Keytab Script dialog box generates the keytab script, which in turn generates the keytab file necessary to configure KCD on the NetScaler appliance.

### To generate the KCD keytab script by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic**.
2. In the details pane, under **Kerberos Constrained Delegation**, click Batch file to generate keytab.
3. In the Generate KCD (Kerberos Constrained Delegation) **Keytab Script** dialog box, fill out the fields as described below.
   - **Domain UserName**: The name of the domain user.
   - **Domain Password**: The password for the domain user.
   - **Service Principal**: The service principal.
   - **Output File Name**: A filename for the KCD script file.
   - **Create Domain User Account**: Select this check box to create the specified domain user account.
4. Click **Generate Script** to generate the script. The script is generated, and appears in the **Generated Script** text box below the **Generate Script** button.
5. Copy the script, and save it as a file on your AD domain controller. You must now run this script on the domain controller to generate the keytab file, and then copy the keytab file to the `/nsconfig/krb/` directory on the NetScaler appliance.
6. Click **OK**.

---

## SAML authentication

**January 6, 2019**

Security Assertion Markup Language (SAML) is an XML-based authentication mechanism that provides single sign-on capability and is defined by the OASIS Security Services Technical Committee.
Why SAML?

Consider a scenario in which a service provider (LargeProvider) hosts a number of applications for a customer (BigCompany). BigCompany has users that must seamlessly access these applications. In a traditional setup, LargeProvider would need to maintain a database of users of BigCompany. This raises some concerns for each of the following stakeholders:

- LargeProvider must ensure security of user data.
- BigCompany must validate the users and keep the user data up-to-date, not just in its own database, but also in the user database maintained by LargeProvider. For example, a user removed from the BigCompany database must also be removed from the LargeProvider database.
- A user has to log on individually to each of the hosted applications.

The SAML authentication mechanism provides an alternative approach. The following deployment diagram shows how SAML works.

The concerns raised by traditional authentication mechanisms are resolved as follows:

- LargeProvider does not have to maintain a database for BigCompany users. Freed from identity management, LargeProvider can concentrate on providing better services.
- BigCompany does not bear the burden of making sure the LargeProvider user database is kept in sync with its own user database.
- A user can log on once, to one application hosted on LargeProvider, and be automatically logged on to the other applications that are hosted there.

The NetScaler appliance can be deployed as a SAML Service Provider (SP) and a SAML Identity Provider (IdP). Read through the relevant topics to understand the configurations that must be performed on the NetScaler appliance.

A NetScaler appliance configured as a SAML service provider can now enforce an audience restriction check. The audience restriction condition evaluates to “Valid” only if the SAML replying party is a member of at least one of the specified audiences.

You can configure a NetScaler appliance to parse attributes in SAML assertions as group attributes. Parsing them as group attributes enables the appliance to bind policies to the groups.

**Note**

A NetScaler appliance MPX FIPS appliance used as a SAML service provider now supports encrypted assertions. Also, a NetScaler appliance MPX FIPS appliance functioning as a SAML service provider or a SAML identity provider can now be configured to use the SHA2 algorithms on FIPS hardware.

**Configuring FIPS offload support using the command line interface:**

1. Add SSL FIPS

   ```bash
   add ssf fipsKey fips-key
   ```
2. Create a CSR and use it at CA server to generate a certificate. You can then copy the certificate in /nsconfig/ssl. Let's assume that the file is fips3cert.cer.

   add ssl certKey fips-cert -cert fips3cert.cer -fipsKey fips-key

3. Specify this certificate in the SAML action for SAML SP module

   set samlAction <name> -samlSigningCertName fips-cert

4. Use the certificate in samlIdpProfile for SAML IDP module

   set samlidpprofile fipstest -samlIdpCertName fips-cert

The following table lists some articles that are specific to deployments where the NetScaler appliance is used as a SAML SP or a SAML IdP.

**NetScaler appliance as a SAML SP**

**December 13, 2018**

The SAML Service Provider (SP) is a SAML entity that is deployed by the service provider. When a user tries to access a protected application, the SP evaluates the client request. If the client is unauthenticated (does not have a valid NSC_TMAA or NSC_TMAS cookie), the SP redirects the request to the SAML Identity Provider (IdP).

The SP also validates SAML assertions that are received from the IdP.

When the NetScaler appliance is configured as an SP, all user requests are received by a traffic management virtual server (load balancing or content switching) that is associated with the relevant SAML action.
The NetScaler appliance also supports POST and Redirect bindings during logout.

**Note**

A NetScaler appliance can be used as a SAML SP in a deployment where the SAML IdP is configured either on the appliance or on any external SAML IdP.

When used as a SAML SP, a NetScaler appliance:

- Can extract the user information (attributes) from the SAML token. This information can then be used in the policies that are configured on the NetScaler appliance. For example, if you want to extract the GroupMember and emailaddress attributes, in the SAMLAction, specify the **Attribute2** parameter as GroupMember and the **Attribute3** parameter as emailaddress.

  **Note**

  Default attributes such as username, password, and logout URL must not be extracted in attributes 1 to 16, because they as are implicitly parsed and stored in the session.

- Can extract attribute names of up to 127 bytes from an incoming SAML assertion. The previous limit was 63 bytes. Support introduced in NetScaler 11.0 Build 64.x.

- Supports post, redirect, and artifact bindings. Support for redirect and artifact bindings is introduced in NetScaler 11.0 Build 55.x.

  **Note**

  Redirect binding should not be used for large amount of data, when the assertion after inflate or decoding is greater than 10K.

- Can decrypt assertions. Support introduced in NetScaler 11.0 Build 55.x.

- Can extract multi-valued attributes from a SAML assertion. These attributes are sent is nested XML tags such as:

  `<AttributeValue> <AttributeValue>Value1</AttributeValue> <AttributeValue>Value2</AttributeValue> </AttributeValue>`

  When presented with above XML, the NetScaler appliance can extract both Value1 and Value2 as values of a given attribute, as opposed to the old firmware that extracts only Value1.

  **Note**

  Support introduced in NetScaler 11.0 Build 64.x.

- Can specify the validity of a SAML assertion.

  If the system time on NetScaler appliance SAML IdP and the peer SAML SP is not in sync, the messages might get invalidated by either party. To avoid such cases, you can now configure the time duration for which the assertions will be valid.
This duration, called the “skew time,” specifies the number of minutes for which the message should be accepted. The skew time can be configured on the SAML SP and the SAML IdP.

**Note**

Support introduced in NetScaler 11.0 Build 64.x.

- Can send additional attribute called ‘ForceAuth’ in the authentication request to external IDP (Identity Provider). By default, the ForceAuthn is set to ‘False’. It can be set to ‘True’ to suggest IDP to force authentication despite existing authentication context. Additionally, NetScaler appliance SP does authentication request in query parameter when configured with artifact binding.

**To configure the NetScaler appliance as a SAML SP by using the command line interface**

1. Configure a SAML SP action.

   **Example**

   The following command adds a SAML action that redirects unauthenticated user requests.

   ```
   add authentication samlAction SamlSPAct1 -samlIdPCertName nssp -samlRedirectUrl https://auth1.example.com
   ```

2. Configure the SAML policy.

   **Example**

   The following command defines a SAML policy that applies the above defined SAML action to all traffic.

   ```
   add authentication samlPolicy SamlSPPol1 ns_true SamlSPAct1
   ```

3. Bind the SAML policy to the authentication virtual server.

   **Example**

   The following command binds the SAML policy to a authentication virtual server named “av_saml”.

   ```
   bind authentication vserver av_saml -policy SamlSPPol1
   ```

4. Bind the authentication virtual server to the appropriate traffic management virtual server.

   **Example**

   The following command adds a load balancing virtual server named “lb1_ssl” and associates the authentication virtual server named “av_saml” to the load balancing virtual server.

   ```
   add lb vserver lb1_ssl SSL 10.217.28.224 443 -persistenceType NONE -cltTimeout 180 -AuthenticationHost auth1.example.com -Authentication ON -authnVsName av_saml
   ```
To configure a NetScaler appliance as a SAML SP by using the graphical user interface

1. Configure the SAML action and policy.
   Navigate to Security > AAA - Application Traffic > Policies > Authentication > Advanced Policies > Policy, create a policy with SAML as the action type, and associate the required SAML action with the policy.

2. Associate the SAML policy with an authentication virtual server.
   Navigate to Security > AAA - Application Traffic > Virtual Servers, and associate the SAML policy with the authentication virtual server.

3. Associate the authentication server with the appropriate traffic management virtual server.
   Navigate to Traffic Management > Load Balancing (or Content Switching) > Virtual Servers, select the virtual server, and associate the authentication virtual server with it.

NetScaler appliance as a SAML IdP

December 13, 2018

The SAML IdP (Identity Provider) is a SAML entity that is deployed on the customer network. The IdP receives requests from the SAML SP and redirects users to a logon page, where they must enter their credentials. The IdP authenticates these credentials with the user directory (external authentication server, such as LDAP) and then generates a SAML assertion that is sent to the SP.

The SP validates the token, and the user is then granted access to the requested protected application.

When the NetScaler appliance is configured as an IdP, all requests are received by an authentication virtual server that is associated with the relevant SAML IdP profile.

**Note**

A NetScaler appliance can be used as an IdP in a deployment where the SAML SP is configured either on the appliance or on any external SAML SP.

When used as a SAML IdP, a NetScaler appliance:

- Supports all authentication methods that it supports for traditional logons.
- Digitally signs assertions. Support for the SHA256 algorithm is introduced in NetScaler 11.0 Build 55.x.
- Supports single-factor and two-factor authentication. SAML must not be configured as the secondary authentication mechanism.
• Can encrypt assertions by using the public key of the SAML SP. This is recommended when the assertion includes sensitive information. Support introduced in NetScaler 11.0 Build 55.x.

• Can be configured to accept only digitally signed requests from the SAML SP. Support introduced in NetScaler 11.0 Build 55.x.

• Can log on to the SAML IdP by using the following 401-based authentication mechanisms: Negotiate, NTLM, and Certificate. Support introduced in NetScaler 11.0 Build 55.x.

• Can be configured to send 16 attributes in addition to the NameId attribute. The attributes must be extracted from the appropriate authentication server. For each of them, you can specify the name, the expression, the format, and a friendly name in the SAML IdP profile. Support introduced in NetScaler 11.0 Build 55.x.

• If the NetScaler appliance is configured as a SAML IdP for multiple SAML SP, a user can gain access to applications on the different SPs without explicitly authenticating every time. The NetScaler appliance creates a session cookie for the first authentication, and every subsequent request uses this cookie for authentication. Support introduced in NetScaler 11.0 Build 55.x.

• Can send multi-valued attributes in a SAML assertion. Support introduced in NetScaler 11.0 Build 64.x.

• Supports post and redirect bindings. Support for redirect bindings is introduced in NetScaler 11.0 Build 64.x.

• Can specify the validity of a SAML assertion.

  If the system time on NetScaler appliance SAML IdP and the peer SAML SP is not in sync, the messages might get invalidated by either party. To avoid such cases, you can now configure the time duration for which the assertions will be valid.

  This duration, called the “skew time,” specifies the number of minutes for which the message should be accepted. The skew time can be configured on the SAML SP and the SAML IdP.

  Note
  Support introduced in NetScaler 11.0 Build 64.x.

• Can be configured to serve assertions only to SAML SPs that are pre-configured on or trusted by the IdP. For this configuration, the SAML IdP must have the service provider ID (or issuer name) of the relevant SAML SPs. Support introduced in NetScaler 11.0 Build 64.x.

  Note
  Before proceeding, make sure that you have an authentication virtual server that is linked to an LDAP authentication server.
**To configure a NetScaler appliance as a SAML IdP by using the command line interface**

1. Configure a SAML IdP profile.

   **Example**

   Adding NetScaler appliance as an IdP with SiteMinder as the SP.

   ```
   add authentication samlIdPProfile samlIDPProf1 -samlSPCertName siteminder -cert -encryptAssertion ON -samlPCertName ns-cert -assertionConsumerServiceURL http://sm-proxy.nsi-test.com:8080/affwebservices/public/saml2assertionconsumer -rejectUnsignedRequests ON -signatureAlg RSA-SHA256 -digestMethod SHA256
   ```

2. Configure the SAML authentication policy and associate the SAML IdP profile as the action of the policy.

   ```
   add authentication samlIdPPolicy samlIDPPol1 -rule ns\_true -action samlIDPProf1
   ```

3. Bind the policy to the authentication virtual server.

   ```
   bind authentication vserver saml-auth-vserver -policy samlIDPPol1 -priority 100
   ```

**To configure a NetScaler appliance as a SAML IdP by using the graphical user interface**

1. Configure the SAML IdP profile and policy.

   Navigate to **Security > AAA - Application Traffic > Policies > Authentication > Advanced Policies > Policy**, and create a policy with SAML IdP as the action type, and associate the required SAML IdP profile with the policy.

2. Associate the SAML IdP policy with an authentication virtual server.

   Navigate to **Security > AAA - Application Traffic > Virtual Servers**, and associate the SAML IdP policy with the authentication virtual server.

**Configuring SAML single sign-on**

December 13, 2018

To provide single sign-on capabilities across applications that are hosted on the service provider, you can configure SAML single sign-on on the SAML SP.
NetScaler 11.1

Configuring SAML single sign-on by using the command line interface

1. Configure the SAML SSO profile.

   **Example**

   In the following command, Example is the load balancing virtual server that has a web link from
   the SharePoint portal. Nssp.example.com is the Traffic Management virtual server that is load
   balancing the SharePoint server.

   ```
   add tm samlSSOProfile tm-saml-sso -samlSigningCertName nssp -assertionConsumerServiceURL "https://nssp2.example.com/cgi/samlauth"-relaystateRule "https://nssp2.example.com/samlsso.html" -sendPassword ON -samlIssuerName nssp.example.com
   ```

2. Associate the SAML SSO profile with the traffic action.

   **Example**

   The following command enables SSO and binds the SAML SSO profile created above to a traffic
   action.

   ```
   add tm trafficAction html\_act -SSO ON -samlSSOProfile tm-saml-sso
   ```

3. Configure the traffic policy that specifies when the action must be executed.

   **Example**

   The following command associates the traffic action with a traffic policy.

   ```
   add tm trafficPolicy html_pol ”HTTP.REQ.URL.CONTAINS(”\"abc.html\"”)” html_act
   ```

4. Bind the traffic policy created above to a traffic management virtual server (load balancing or
   content switching). Alternatively, the traffic policy can be associated globally.

   **Note**

   This traffic management virtual server must be associated with the relevant authentication
   virtual sever that is associated with the SAML action.

   ```
   bind lb vserver lb1_ssl -policyName html_pol -priority 100 -gotoPriorityExpression END -type REQUEST
   ```

Configuring SAML single sign-on by using the graphical user interface

1. Define the SAML SSO profile, the traffic profile, and the traffic policy.

   Navigate to Security > AAA - Application Traffic > Policies > Traffic, select the appropriate tab,
   and configure the settings.
2. Bind the traffic policy to a traffic management virtual server or globally to the NetScaler appliance.

OAuth authentication

December 13, 2018

The AAA traffic management feature now supports OAuth and OpenID-Connect mechanisms for authenticating and authorizing users to applications that are hosted on applications such as Google, Facebook, and Twitter.

The authentication mechanism facilitates the inline verification of OpenID tokens. The NetScaler appliance can be configured to obtain certificates and verify signatures on the token.

A major advantage of using the OAuth and OpenID-Connect mechanisms is that the user information is not sent to the hosted applications and therefore the risk of identity theft is considerably reduced.

The NetScaler appliance configured for AAA now accepts incoming tokens that are signed using HMAC HS256 algorithm. In addition, the public keys of the SAML Identity Provider (IdP) are read from a file, instead of learning from an URL endpoint.

In the NetScaler appliance implementation, the application to be accessed is represented by the AAA traffic management virtual server. So, to configure OAuth, you must configure an OAuth policy which must then be associated with a AAA traffic management virtual server.

Note

OAuth on NetScaler appliance is currently qualified for all SAML IdPs that are compliant with “OpenID connect 2.0”.

To configure OAuth by using the configuration utility:

1. Configure the OAuth action and policy.
   
   Navigate to Security > AAA - Application Traffic > Policies > Authentication > Advanced Policies > Policy, and create a policy with OAuth as the action type, and associate the required OAuth action with the policy.

2. Associate the OAuth policy with an authentication virtual server.
   
   Navigate to Security > AAA - Application Traffic > Virtual Servers, and associate the OAuth policy with the authentication virtual server.

Note
Attributes (1 to 16) can be extracted in the OAuth response. Currently these attributes are not evaluated. They are added for the future reference.

**To configure OAuth by using the command line interface:**

1. Define an OAuth action.
   ```
   add authentication OAuthAction <name> -authorizationEndpoint <URL>
   -tokenEndpoint <URL> [-idtokenDecryptEndpoint <URL>] -clientID <string>
   -clientSecret <string> [-defaultAuthenticationGroup <string>]
   -tenantID <string> [-GraphEndpoint <string>][-refreshInterval <positive_integer>]
   [-CertEndpoint <string>] [-audience <string>] [-userNameField <string>]
   [-skewTime <mins>] [-issuer <string>] [-Attribute1 <string>]
   [-Attribute2 <string>] [-Attribute3 <string>]...
   ```

2. Associate the action with an advanced authentication policy.
   ```
   add authentication Policy** <name> -rule <expression> -action <string>
   ```

   **Example**
   ```
   preblock add authentication oauthAction a -authorizationEndpoint https://example.com/
   -tokenEndpoint https://example.com/ -clientiD sadf -clientsecret df
   ```

   For more information on authentication OAuthAction parameters, see “authentication OAuthAction”.

   **Note**
   When a certEndpoint is specified, the NetScaler appliance polls that endpoint at the configured frequency to learn the keys. To configure a NetScaler appliance to read the local file and parse keys from that file, a new configuration option is introduced as follows.
   ```
   set authentication OAuthAction <> -**CertFilePath** <path to local file with jwks>
   ```

**Multi-Factor (nFactor) authentication**

December 13, 2018

**Important**
Supported from NetScaler 11.0 Build 62.x onwards.

Multi-factor authentication enhances the security of an application by requiring users to provide multiple proofs of identity to gain access. The NetScaler appliance provides an extensible and flexible approach to configuring multi-factor authentication. This approach is called nFactor authentication.

With nFactor authentication you can:
- Configure any number of authentication factors.
- Base the selection of the next factor on the result of executing the previous factor.
- Customize the login interface. For example, you can customize the label names, error messages, and help text.
- Extract user group information without doing authentication.
- Configure pass-through for an authentication factor. This means that no explicit login interaction is required for that factor.
- Configure the order in which different types of authentication are applied. Any of the authentication mechanisms that are supported on the NetScaler appliance can be configured as any factor of the nFactor authentication setup. These factors are executed in the order in which they are configured.
- Configure the NetScaler appliance to proceed to an authentication factor that must be executed when authentication fails. To do so, you configure another authentication policy with the exact same condition, but with the next highest priority and with the action set to “NO_AUTH”. You must also configure the next factor, which must specify the alternative authentication mechanism to apply.

For a nFactor benefit, see One Public IP for AAA-TM Deployments on NetScaler.

Sample deployments using nFactor authentication:

- Getting two passwords up-front, pass-through in next factor. Read
- Group extraction followed by certificate or LDAP authentication, based on group membership. Read
- SAML followed by LDAP or certificate authentication, based on attributes extracted during SAML. Read
- SAML in first factor, followed by group extraction, and then LDAP or certificate authentication, based on groups extracted. Read
- Prefilling user name from certificate. Read
- Certificate authentication followed by group extraction for 401 enabled traffic management virtual servers. Read
- Username and 2 passwords with group extraction in third factor. Read
- Certificate fallback to LDAP in same cascade; one virtual server for both certificate and LDAP authentication. Read
- LDAP in first factor and WebAuth in second factor. Read
- Domain drop down in first factor, then different policy evaluations based on group. Read

How to configure nFactor authentication

January 6, 2019
The primary entity used for nFactor authentication is called a login schema.

A login schema specifies an authentication schema XML file that defines the manner in which the login form will be rendered. Considering the interaction that the user must have when logging in to the application, you can create a single file for multiple factors or different files for different factors. View sample XML file.

- **Single file for multiple factors.** User will be provided a single form in which to provide credentials for multiple authentication factors.
- **Different files for different factors.** User will be provided a different form for each authentication factor.

Next, you must associate the XML file(s) with login schema(s). You can also specify expressions to extract the user name and the password from the login form.

**Tip**

You can configure an authentication factor to be pass-through. This means that the user is not required to provide credentials explicitly and there is no login form for that factor. The credentials are either taken from the previous factor or the user name and/or password are dynamically extracted by using the username/password expressions that are configured for that login schema. You must set the login schema to “NOSCHEMA”, instead of an XML file.

Now that the login schemas are configured, you must specify the manner in which they must be invoked. A login schema can be invoked by using either a login schema policy or an authentication policy label. The decision depends on the following:

- **Login schema policy.**
  - Specifies the condition on which the login form must be presented to the user.
  - Must be bound to an authentication virtual server.
  - In an authentication virtual server that has multiple login schema policies, the policy with the highest priority that evaluates to true is executed. That is, the login form associated with that policy is presented to the user.
  - The login schema policy is only used to present the first login form.

- **Authentication policy label.**
  - Specifies a collection of authentication policies for a particular factor. Each policy label corresponds to a single factor.
  - Specifies the login form that must be presented to the user.
  - Must be bound as the next factor of an authentication policy or of another authentication policy label.
  - Typically, a policy label includes authentication policies for a specific authentication mechanism. However, you can also have a policy label that has authentication policies for different authentication mechanisms.
To summarize, the configurations you must perform to set up nFactor authentication are as follows:

1. Create the authentication schema XML files.
2. Associate each XML file with a login schema.
3. Associate each login schema with a login schema policy or authentication policy label.
4. Bind login schema policy to an authentication virtual server.
5. Bind authentication policy label, as next factor, to an authentication policy.

How nFactor authentication works

December 13, 2018

Imagine a user requesting access to an application that requires user credentials. As is the case in NetScaler appliance deployments, the request arrives at the NetScaler appliance through a traffic management virtual server (in this case, a load balancing virtual server). Since the user must provide authentication credentials, the load balancing virtual server redirects the request to the authentication virtual server, which does the following:

1. Checks to determine whether any login schema policies are associated with the authentication virtual server.
   - If yes, the user is presented the login form associated with the login schema policy with the highest priority that evaluates to true.
   - If no, the default login form is presented to the user.

   Note
   The default login schema files are available in the /nsconfig/loginschema/LoginSchema/ directory of the NetScaler appliance. Citrix recommends that you copy these files to the /nsconfig/loginschema/ directory before using them, so that changes made to the files are preserved post reboot.

2. The authentication policies that are associated with the authentication virtual server are evaluated. For the policies that are evaluated to true, the actions are executed in order of priority until one of the actions succeeds.

3. The policy label that is associated as the next factor is invoked.

4. The authentication policies that are associated with the authentication policy label are evaluated. For the policies that are evaluated to true, the actions are executed in order of priority until one of the actions succeeds.

5. The policy label that is associated as the next factor is invoked.

6. Steps 4 and 5 are performed repetitively till all the configured next factors are executed.
Configuring nFactor authentication

June 3, 2019

The following diagram illustrates the high-level steps involved in nfactor configuration.

To understand the step-wise configurations for nFactor authentication, let us consider a 2-factor authentication deployment where the 1st factor is LDAP authentication and the 2nd factor is RADIUS authentication.

This sample deployment requires the user to login to both factors using a single login form. Therefore, we define a single login form that accepts two passwords. The first password is used for LDAP authentication and the other for RADIUS authentication. View XML file.

Here are the configurations that are performed.

1. Configure the load balancing virtual server for authentication

   add lb vserver lbvss5 HTTP 1.217.193.55 80 -AuthenticationHost auth56.aaatm.com -Authentication ON

2. Configure the authentication virtual server.

   add authentication vserver auth56 SSL 1.217.193.56 443 -AuthenticationDomain aaatm.com

3. Configure the login schema for the login form and bind it to a login schema policy.

   add authentication loginSchema login1 -authenticationSchema login-2passwd.xml -userCredentialIndex 1 -passwordCredentialIndex 2

   add authentication loginSchemaPolicy login1 -rule true -action login1

4. Configure a login schema for the pass-through and bind it to a policy label

   add authentication loginSchema login2 -authenticationSchema noschema

   add authentication policylabel label1 -loginSchema login2

5. Configure the LDAP and RADIUS policies.

   add authentication ldapAction ldapAct1 -serverIP 1.217.28.180 -ldapBase “dc=aaatm, dc=com” -ldapBindDn administrator@aaatm.com -ldapBindDnPassword 71ca2b11ad800ce2787fb7de54842875b8f3c -encrypted -encryptmethod ENCMTHD_3 -ldapLoginName samAccountName -groupAttrName memberOf -subAttributeName CN

   add authentication Policy ldap -rule true -action ldapAct1

   add authentication radiusAction radius -serverIP 1.217.22.20 -radKey a740d6a0aeb3288fa0a6fbed9323d29ad -encrypted -encryptmethod ENCMTHD_3 -radNASip ENABLED -radNASid NS28.50 -radAttributeType 11 -ipAttributeType 8
add authentication Policy radius -rule true -action radius

6. Bind the login schema policy to the authentication virtual server

bind authentication vserver auth56 -policy login1 -priority 1 -gotoPriorityExpression END

7. Bind the LDAP policy (first factor) to the authentication virtual server.

bind authentication vserver auth56 -policy ldap -priority 1 -nextFactor label1 -gotoPriorityExpression next

8. Bind the RADIUS policy (second factor) to the authentication policy label.

bind authentication policylabel label1 -policyName radius -priority 2 -gotoPriorityExpression end

Admin Partitioning

January 6, 2019

A NetScaler appliance can be partitioned into logical entities called admin partitions, where each partition can be configured and used as a separate NetScaler appliance. The following figure shows the partitions of a NetScaler being used by different customers and departments:

A partitioned NetScaler appliance has a single default partition and one or more admin partitions. The following table provides further details on the two partition types:

| Note |
| In a partitioned appliance, the mode BridgeBPDUs can be enabled only in the default partition and not in the administrative partitions. |

Default Partition

Admin Partitions

Availability:

The NetScaler appliance ships with a single partition, which is called a default partition. The default partition is retained even after the NetScaler appliance is partitioned.

Must be explicitly created as described in Configure admin partitions.

Number of Partitions:

One

A NetScaler appliance can have one or more (maximum of 512) admin partitions.

User Access and Roles:
The default partition can be accessed and configured by all NetScaler users who are not associated with a partition-specific command policy. As always, the operations that a user can perform are restricted by the associated command policy.

Can be created only by NetScaler superusers who also specify the users for that partition. Only superusers and associated users of the partition can access and configure the admin partition.

Note: Partition users do not have shell access.

**File Structure:**

All files in a default partition are stored in the default NetScaler file structure.

For example, the NetScaler configuration file is stored in the /nsconfig directory and NetScaler logs are stored in the /var/log directory.

All files in an admin partition are stored in directory paths that have the name of the admin partition.

For example, the NetScaler configuration file (ns.conf) is stored in the /nsconfig/partitions/<partitionName> directory. Other partition-specific files are stored in the /var/partitions/<partitionName> directories.

Some other paths in an admin partition:

- Downloaded files: /var/partitions/<partitionName>/download/
- Log files: /var/partitions/<partitionName>/log/

**Note:** Currently, logging is not supported at partition-level. Therefore, this directory is empty and all logs are stored in the /var/log directory.

- SSL CRL certificate related files: /var/partitions/<partitionName>/netscaler/ssl

**Resources Available:**

All NetScaler resources.

NetScaler resources that are explicitly assigned to the admin partition.

**User access and roles**

In authenticating and authorizing a partitioned NetScaler appliance, a root administrator can assign a partition administrator to one or more partitions. The partition administrator can authorize users to that partition without affecting other partitions. These are partition users and they are authorized to access only that partition using SNIP address. Both the root administrator and the partition administrator can configure role based access (RBA) by authorizing users to access different applications.

Administrators and user roles can be described as follows:

**Root Administrator.** Accesses the partitioned appliance through its NSIP address and can grant user access to one or more partitions. The administrator can also assign partition administrators to one or more partitions. The administrator can create a partition administrator from the default partition
using a NSIP address or switch to a partition and then create a user and assign partition admin access using a SNIP address.

**Partition Administrator.** Accesses the specified partition through a NSIP address assigned by the root administrator. The administrator can assign role-based access to partition user access to that partition and also configure external server authentication using partition specific configuration.

**System User.** Accesses partitions through the NSIP address. Has access to the partitions and resources specified by the root administrator.

**Partition User.** Accesses a partition through a SNIP address. This user account is created by the partition administrator and the user has access to resources, only within the partition.

**Points to remember**

Following are some points to remember when providing role-based access in a partition.

1. NetScaler users accessing the GUI through NSIP address will use default partition authentication configuration to log on to the appliance.
2. Partition system users accessing the GUI through partition SNIP address will use partition specific authentication configuration to log on to the appliance.
3. Partition user created in a partition cannot login using NSIP address.
4. NetScaler user bound to a partition cannot login using partition SNIP address.
5. External users accessing a partition through external server configuration as LDAP, Radius, or TACACS added in the partition. The user must access using SNIP address to directly log onto the partition.

**Use case for managing role Based access in an partitioned setup**

Consider a scenario where an enterprise organization, www.example.com has multiple business units and a centralized administrator who manages all instances in their network. However, they want to provide exclusive user privileges and environment for each business unit.

Following are the administrators and users managed by default partition authentication configuration and partition specific configuration in a partitioned appliance.

John: Root Administrator

George: Partition Administrator

Adam: System User

Jane: Partition User

John, is the root administrator of a partitioned NetScaler appliance. John manages all user accounts and administrative user accounts across partitions (for example, P1, P2, P3, P4, and P5) within the
appliance. He provides granular role-based access to entities from the default partition of the appliance. John creates user accounts and assigns partition access to each account. George being a network engineer within the organization prefers to have a role-based access to few applications running on partition P2. Based on user management, John creates a partition administrator role for George and associates his user account with partition-admin command policy in P2 partition. Adam being another network engineer prefers to access an application running on P2. John creates a system user account for Adam and associates his user account to P2 partition. Once his account is created, Adam can log into the appliance to access the NetScaler Management interface through NSIP address and can switch to partition P2 based on user/group binding.

Suppose, Jane who is another network engineer wants to directly access an application running only on partition P2, George (partition administrator) can create a partition user account for her and associate her account with command policies for authorization privileges. Jane's user account created within the partition is now directly associated with P2. Now Jane can access the NetScaler Management interface through SNIP address and cannot switch to any other partition.

**Note**

If Jane's user account is created by a partition administrator in partition P2, she can access the NetScaler Management interface only through SNIP address (created within the partition) and not permitted to access the interface through NSIP address. Similarly, if Adam's user account is created by a root administrator in the default partition and is bound to P2 partition, he can access the NetScaler Management interface only through NSIP address or SNIP address created in the default partition (with management access enabled) and not permitted to access the partition interface through SNIP address created in the administrative partition.

**Configure roles and responsibilities for partition administrators**

Following are the configurations performed by a root administrator in a default partition.

Creating administrative partitions and system users – A root administrator creates administrative partitions and system users in the default partition of the appliance. The administrator then associates the users to different partitions. If you are bound to one or more partitions, you can switch from one partition to another based on user bindings. Also, your access to one or more bound partitions is authorized only by the root administrator.

Authorizing system user as partition administrator for a specific partition – Once a user account is created, the root administrator switches to a specific partition and authorizes the user as the partition administrator. This is done by assigning partition-admin command policy to the user account. Now, the user can access the partition as partition administrator and manage entities within the partition.

Following are the configurations perform by a partition administrator in an administrative partition.
Configuring SNIP address in an administrative partition- The partition administrator logs on to the partition and creates a SNIP address and provides management access to the address.

Creating and Binding a Partition System User with Partition Command Policy -The partition administrator creates partition users and defines the scope of user access. This is done by binding the user account to partition command policies.

Creating and Binding a Partition System User Groups with Partition Command Policy -The partition administrator creates partition user groups and defines the scope of user group access. This is done by binding the user group account to partition command policies.

Configuring External Server authentication for external users (optional)-This configuration is done for authenticating external TACACS users accessing the partition using SNIP address.

Following are the tasks performed in configuring role-based access for partition users in an Administrative Partition.

1. Creating an Administrative Partition – Before you create partition users in an administrative partition, you must first create the partition. As a root administrator, you can create a partition from the default partition using the configuration utility or a command line interface.

2. Switching user access from default partition to partition P2 – If you are partition administrator accessing the appliance from the default partition, you can switch from default partition to a specific partition (for example, partition P2) based on user binding.

3. Adding SNIP address to the Partition user account with Management access enabled-Once you have switched your access to an administration partition, you must create a SNIP address and provide management access to the address.

4. Creating and Binding a Partition System User with Partition Command Policy-If you are a partition administrator, you can create partition users and define the scope of user access. This is done by binding the user account to partition command policies.

5. Creating and Binding Partition user group with Partition Command Policy-If you are a partition administrator, you can create partition user groups and define the scope of user access control. This is done by bind the user group account to partition command policies.

Configuring External Server authentication for external users (optional)-This configuration is done for authenticating external TACACS users accessing the partition using SNIP address.

**Benefits of using admin partitions**

You can avail the following benefits by using admin partitions for your deployment:

- Allows delegation of administrative ownership of an application to the customer.
- Reduces the cost of ADC ownership without compromising on performance and ease-of-use.
- Safeguards from unwarranted configuration changes. In a non-partitioned NetScaler appliance, authorized users of other application could intentionally or unintentionally change configura-
tions that are required for your application. This could lead to undesirable behavior. This pos-
sibility is reduced in a partitioned NetScaler appliance.
• Isolates traffic between different applications by the use of dedicated VLANs for each partition.
• Accelerates and allows to scale application deployments.
• Allows application-level or localized management and reporting.

Let us analyze a couple of cases to understand the scenarios in which you can use admin partitions.

User case 1: How Admin partition is used in an enterprise network

Let us consider a scenario faced by a company named **Foo.com**.

- **Foo.com** has a single NetScaler.
- There are five departments and each department has one application that requires to be de-
deployed with the NetScaler.
- Each application must be managed independently by a different set of users or administrators.
- Other users must be restricted from accessing the configurations.
- The application or back-end must be able to share resources like IP addresses.
- The global IT department must be able to control NetScaler-level settings which must be com-
  mon to all partitions.
- Applications must be independent of one another. An error in configuration of one application
  must not affect the other.

A non-partitioned NetScaler would not be able to satisfy these requirements. However, you can
achieve all these requirements by partitioning a NetScaler.

Simply create a partition for each of the applications, assign the required users to the partitions, spec-
ify a VLAN for each partition, and define global settings on the default partition.

Use case 2: How an admin partition is used by a service provider

Let us consider a scenario faced by a service provider named **BigProvider**:

- **BigProvider** has 5 customers: 3 small enterprises and 2 large enterprises.
- **SmallBiz**, **SmallerBiz**, and **StartupBiz** need only the most basic NetScaler functionality.
- **BigBiz** and **LargeBiz** are larger enterprises and have applications that attract a lot of traffic.
  They would like to use some of the more complex NetScaler functionality.

In a non-partitioned approach, the NetScaler administrator would typically use a NetScaler SDX ap-
pliance and provision a NetScaler instance for each customer.

This solution suits **BigBiz** and **LargeBiz** because their applications need the undiminished power of
the entire non-partitioned NetScaler appliance. However, this solution might not be as cost effective
for servicing **SmallBiz, SmallerBiz**, and **StartupBiz**.
Therefore, **BigProvider** decides on the following solution:

- Using a NetScaler SDX appliance to bring up dedicated NetScaler instances for **Big-Biz** and **LargeBiz**.
- Using a single NetScaler which is partitioned into three partitions, one each for **SmallBiz**, **SmallerBiz**, and **StartupBiz**.

The NetScaler administrator (superuser) creates an admin partition for each of these customers, specifies the users for the partitions, specifies the NetScaler resources for the partitions, and specifies the VLAN to be used by the traffic that is destined for each of the partitions.

## Supported NetScaler configurations

January 6, 2019

Depending on the NetScaler configuration and the partition in which the configuration is performed, NetScaler configurations can be categorized into three types of configurations as given below.

### Note

- Admin partitions cannot be set up on a NetScaler cluster. This means that a NetScaler cluster cannot be partitioned.
- Admin partitions cannot be set up on a NetScaler MPX-FIPS appliance.
- **Case 3** lists the NetScaler features that are not supported in admin partitions.

### Case 1 (global configurations)

Configurations that can be performed ONLY in the default partition and which are available or impact all the admin partitions.

- Updates to built-in entities for monitors, TCP profiles, HTTP profiles, and so on.
- Updates to global parameters for syslog, nslog, weblog, content switching, IPSEC, SIP, DHCP, Surge protection, TCP buffering, and system collection.
- High availability (HA) configurations
- Interface and VLAN changes
- User configurations

### Case 2 (partition-specific configurations)

Configurations that can be performed independently in default and admin partitions. These configurations are applicable only to the partition in which they are performed.
• Getting traffic level statistics for a partition.
• Partition admin can update IP bindings for VLAN which is bound to that partition. But cannot update the interface bindings.
• Clearing NetScaler configurations.
• Feature-specific parameters for the following features: AppFlow, AppQoE, HTTP compression, DNS, TCP, HTTP, encryption, responder, rewrite, and SSL.
• Feature-specific configurations such as virtual servers, services, monitors, and so on.

**Case 3**

Configurations that cannot be performed on admin partitions. These features can be configured in the default partition, but there is no impact on admin partitions.

**Note**

Configurations that are supported on admin partitions for a particular release are marked as **Yes**.

### Configure admin partitions

**Important**
- Only superusers are authorized to create and configure admin partitions.
- Unless specified otherwise, configurations to set up an admin partition must be done from the default partition.

By partitioning a NetScaler appliance, you are in-effect creating multiple instances of a single NetScaler appliance. Each instance has its own configurations and the traffic of each of these partitions is isolated from the other by assigning each partition a dedicated VLAN or a shared VLAN.

A partitioned NetScaler has one default partition and the admin partitions that are created. To set up an admin partition, you must first create a partition with the relevant resources (memory, maximum bandwidth, and connections). Then, specify the users that can access the partition and the level of authorization for each of the users on the partition.

Accessing a partitioned NetScaler is the same as accessing a non-partitioned NetScaler: through the NSIP address or any other management IP address. As a user, after you provide your valid logon credentials, you are taken to the partition to which you are bound. Any configurations that you create are saved to that partition. If you are associated with more than one partition, you are taken to the first partition with which you were associated. If you want to configure entities on one of your other partitions, you must explicitly switch to that partition.

After accessing the appropriate partition, configurations that you perform are saved to that partition and are specific to that partition.

**Note**
- NetScaler superusers and other non-partition users are taken to the default partition.
- Users of all the 512 partitions can log in simultaneously.
**Tip**

To access a partitioned NetScaler appliance over HTTPS by using the SNIP (with management access enabled), make sure that each partition has the certificate of its partition administrator. Within the partition, the partition admin must do the following:

1. Add the certificate to the NetScaler.
   ```
   add ssl certKey ns-server-certificate -cert ns-server.cert -key ns-server.key
   ```

2. Bind it to a service named “nskrpcs-<SNIP>-3009”, where <SNIP> must be replaced with the SNIP address, in this case 100.10.10.1.
   ```
   bind ssl service nskrpcs-100.10.10.1-3009 -certKeyName ns-server-certificate
   ```

**Partition resource limiting**

In a partitioned NetScaler appliance, a network administrator can create a partition with partition resources such as memory, bandwidth, and connection limit configured as unlimited. This is done by specifying Zero as the partition resource value, where Zero indicates the resource is unlimited on the partition and it can be consumed up to system limits. Partition resource configuration is useful when you migrate a traffic domain deployment to an administrative partition or if you do not know about resource allocation limit for a partition in a given deployment.

Resource limit for an administrative partition is as follows:

1. **Partition memory.** This is the maximum allocated memory for a partition. You must make sure to specify the values when creating a partition.

   ```
   Note
   From NetScaler 12.0 onwards, when you create a partition, you can set the memory limit to Zero. If a partition is already created with a specific memory limit, you can reduce the limit to any value or set the limit as Zero.
   ```

   Parameter: maxMemLimit

   Maximum memory is allocated in megabytes in a partition. A zero value indicates the memory is unlimited on the partition and it can consume up to the system limits.

   Default value: 10

2. **Partition bandwidth.** Maximum allocated bandwidth for a partition. If you specify a limit, make sure it is within the appliance’s licensed throughput. Otherwise, you are not limiting the bandwidth that can be used by the partition. The specified limit is accountable for the bandwidth that the application requires. If the application bandwidth exceeds the specified limit, packets are dropped.
Note

From NetScaler 12.0 onwards, when you can create a partition, you can set the partition bandwidth limit to Zero. If a partition is already created with a specific bandwidth, you can reduce the bandwidth or set the limit as Zero.

Parameter: maxBandwidth

Maximum bandwidth is allocated in Kbps in a partition. A zero value indicates the bandwidth is unrestricted. That is, the partition can consume up to the system limits.

Default value: 10240

Maximum Value: 4294967295

3. Partition connection. Maximum number of concurrent connections that can be open in a partition. The value must accommodate the maximum simultaneous flow expected within the partition. The partition connections are accounted from the partition quota memory. Previously, the connections were accounted from the default partition quota memory. It is configured only on the client-side, not on the back-end server-side TCP connections. New connections cannot be established beyond this configured value.

Note

From NetScaler 12.0 onwards, you can create a partition with number of open connections set to Zero. If you have already created a partition with a specific number of open connections, you can reduce the connection limit or set the limit as Zero.

Parameter: maxConnections

Maximum number of concurrent connections that can be open in the partition. A zero value indicates no limit on number of open connections.

Default value: 1024

Minimum value: 0

Maximum Value: 4294967295

Configure an admin partition

To configure an admin partition, complete the following tasks.

Access an admin partition

To access in an admin partition by using the command line interface

1. Log on to the NetScaler appliance.
2. Check if you are in the correct partition. The command prompt displays the name of the currently selected partition.

3. If yes, skip to the next step.

4. If no, get a list of the partitions with which you are associated and switch over to the appropriate partition.
   - `show system user <username>`
   - `switch ns partition <partitionName>`

5. Now, you can perform the required configurations just as a non-partitioned NetScaler.

To access an admin partition by using the configuration utility

1. Log on to the NetScaler appliance.

2. Check if you are in the correct partition. The top bar of the graphical user interface displays the name of the currently selected partition.
   - If yes, skip to the next step.
   - If no, navigate to `Configuration > System > Administrative Partitions > Partitions`, right-click the partition to which you want to switch, and select `Switch`.

3. Now, you can perform the required configurations just as a non-partitioned NetScaler.

Add an admin partition

The root administrator adds an administrative partition from the default partition and binds the partition with VLAN 2.

To create an administrative partition by using the command line interface

At the command prompt, type:

```
1 add partition <partitionname>
```

Switch user access from default partition to an admin partition

Now switch user access from default partition to partition Par1.

To switch a user account from default partition to an admin partition by using the command line interface:

At the command prompt, type:
Adding SNIP address to a partition user account with management access enabled

In the partition, create SNIP address with management access enabled.

To add SNIP address to the partition user account with management access enabled by using the command line interface:

At the command prompt, type:

```
1 > add ns ip <ip address> <subnet mask> -mgmtAccess enabled
```

Create and Bind a partition user with partition command policy

In partition, create a partition system user and bind the user with partition-admin command policies.

To create and bind a partition system user with partition command policy by using the command line interface:

At the command prompt, type:

```
1 > add system user <username> <password>
2  Done
```

Creating and binding partition user group with partition command policy

In Partition Par1, create a partition system user group and bind the group with partition command policy such as partition admin, partition read-only, partition-operator, or partition-network.

To create and bind a partition user group with partition command policy by using the command line interface:

```
1 > add system group <groupName>
2 > bind system group <groupName> (-userName | -policyName <cmdpolicy> <priority> | -partitionName)
```

Configuring external server authentication for external users

In partition Par1 you can configure an external server authentication to authenticate external TACACS users accessing the partition through SNIP address.
To configure external server authentication for external users by using the command line interface:

At the command prompt, type:

```plaintext
1 add authentication tacacsaction <name> -serverip <IP> -tacacsSecret <secret key> -authorization ON -accounting ON
2 add authentication policy <policname> -rule true -action <name>
3 bind system global <policynname> -priority <value>1
```

Configure a Partition System User Accounts in a Partition by using the GUI

To configure a partition user account in an administrative partition, you must create a partition user or a partition user group and bind it partition command policies. Also, you can configure the external server authentication for an external user.

To create a partition user account in a partition by using the GUI

Navigate to System > User Administration, click Users to add a partition system user and bind the user to command policies (partitionadmin/partitionread-only/partition-operator/partition-network).

To create a partition user group account in a partition by using the GUI

Navigate to System > User Administration, click Groups to add a partition system user group and bind the user group to command policies (partitionadmin/partitionread-only/partition-operator/partition-network).

To configure External server authentication for external users by using the GUI

Navigate to System > Authentication > Basic Actions and click TACACS to configure TACACS server for authenticating external users accessing the partition.

Sample Configuration

The following configuration shows how to create a partition user or a partition user group and bind it partition command policies. Also, how to configure the external server authentication for authenticating an external user.

```plaintext
1 add partition Par1
2 switch ns partition Par1
3 > add ns ip 10.102.29.203 255.255.255.0 -mgmtAccessenabled
4 > add system user John Password
5 > bind system user Jane partition-read-only -priority 1
```

Configure an LACP ethernet channel on the default admin partition

With Link Aggregation Control Protocol (LACP), you can combine multiple ports into a single, high-speed link (also called a channel). An LACP-enabled appliance exchanges LACP Data Units (LACPDU) over the channel.

There are three LACP configuration modes that you can enable in the default partition of a NetScaler appliance:
1. **Active.** A port in active mode sends LACPDUs. Link aggregation is formed if the other end of the Ethernet link is in the LACP active or passive mode.

2. **Passive.** A port in passive mode sends LACPDUs only when it receives LACPDUs. The link aggregation is formed if the other end of the Ethernet link is in the LACP active mode.

3. **Disable.** Link aggregation is not formed.

---

**Note**

By default, the link aggregation is disabled in the default partition of the appliance.

LACP exchanges LACPDU between devices connected by an Ethernet link. These devices are typically referred as an actor or partner.

A LACPDU data unit contains the following parameters:

- **LACP Mode.** Active, passive or disable.
- **LACP timeout.** The waiting period before timing out the partner or actor. Possible values: Long and Short. Default: Long.
- **Port Key.** To distinguish between the different channel. When key is 1, LA/1 is created. When key is 2, LA/2 is created. Possible values: Integer from 1 through 8. 4 through 8 is for cluster CLAG.
- **System Priority.** Uses this priority along with system MAC to form the system ID to uniquely identify the system during LACP negotiation with the partner. Sets system priority from 1 and 65535. The default value is set to 32768.
- **Interface.** Supports 8 interfaces per channel on NetScaler 10.1 appliance and supports 16 interfaces per channel on NetScaler 10.5 and 11.0 appliances.

After exchanging LACPDUs, the actor and partner negotiate the settings and decide whether to add the ports to the aggregation.

---

**Configure and verify LACP**

**To configure and verify LACP on a NetScaler appliance by using the command line**

1. Enable LACP on each interface.

   At the command prompt, type:

   ```
   set interface <Interface_ID> -lacpMode PASSIVE -lacpKey 1
   ```

   When you enable LACP on an interface, the channels are dynamically created. Additionally, when you enable LACP on an interface and set lacpKey to 1, the interface is automatically bound to channel LA/1.
Note

When you bind an interface to a channel, the channel parameters take precedence over the interface parameters, so the interface parameters are ignored. If a channel was created dynamically by LACP, you cannot perform add, bind, unbind, or remove operations on the channel. A channel dynamically created by LACP is automatically deleted when you disable LACP on all interfaces of the channel.

2. Set the system priority.

At the command prompt, type:

```
set lacp -sysPriority <Positive_Integer>
```

3. Verify that LACP is working as expected.

```
show interface <Interface_ID>
show channel
show LACP
```

Note

In some versions of Cisco IOS, running the switchport trunk native vlan <VLAN_ID> command causes the Cisco switch to tag LACP PDUs. This causes the LACP channel between the Cisco switch and the NetScaler appliance to fail. However, this issue does not affect the static link aggregation channels configured in the above procedure.

**SNMP support for admin partitions**

December 13, 2018

A partitioned NetScaler appliance uses SNMP infrastructure for partition rate limiting and for monitoring partition resource utilization details.

**SNMP traps for admin partition rate limiting**

On a partitioned NetScaler appliance, a PARTITION-RATE-LIMIT alarm can generate nine SNMP traps for notifying a partition resource (such as bandwidth, connection, or memory) has reached its limit or returned to normal.

The following nine SNMP traps are generated when:

- **partitionCONNThresholdReached.** The number of active connections for a partition exceeds its high threshold percentage.
• **partitionCONNThresholdNormal.** The number of active connections is less than or equal to the normal threshold percentage.

• **partitionBWThresholdReached.** The partition's bandwidth usage reaches its high threshold percentage.

• **partitionMEMThresholdReached.** The current memory usage of the partition exceeds its high threshold percentage.

• **partitionMEMThresholdNormal.** The current memory usage of the partition becomes less than or equal to the normal threshold percentage.

• **partitionMEMLimitExceeded.** The current memory usage of the partition exceeds its memory limit percentage.

• **partitionCONNLimitExceeded.** The number of active connections for a partition exceeds its configured limit and new connections are being dropped.

• **partitionCONNLimitNormal.** The number of active connections for a partition goes below its configured limit and the partition can now accept a new connection.

• **partitionBWLimitExceeded.** The current bandwidth usage for a partition has exceeded its configured limit.

The threshold values for the SNMP traps are non-configurable and are as follows are:

• High threshold = 80% (applicable for all partition rate limit traps)
• Low threshold = 60% (applicable for all partition rate limit traps)
• Memory limit = 95% (applicable only for partition memory traps)

### Configuring PARTITION-RATE-LIMIT alarm

To configure PARTITION-RATE-LIMIT alarm in a specific partition and enable generation of the SNMP trap messages.

1. Enable PARTITION-RATE-LIMIT Alarm
2. Configure PARTITION-RATE-LIMIT Alarm
3. Configure SNMP Trap Destination

### To enable PARTITION-RATE-LIMIT alarm by using the NetScaler CLI

At the command prompt, type the following commands:

```
1 enable snmp alarm PARTITION-RATE-LIMIT
2
3 show snmp alarm PARTITION-RATE-LIMIT
```
To configure PARTITION-RATE-LIMIT Alarm by using the NetScaler CLI

At the command prompt, type the following command:

```
set snmp alarm PARTITION-RATE-LIMIT [-state ( ENABLED | DISABLED )] [-severity <severity>] [-logging ( ENABLED | DISABLED )]
```

To configure SNMP trap destination by using the NetScaler CLI

At the command prompt, type the following command:

```
add snmp trap <trapClass> <trapDestination> [-version <version>] [-td <positive_integer>] [-destPort <port>] [-communityName <string>] [-srcIP <ip_addr|ipv6_addr>] [-severity <severity>] [-allPartitions ( ENABLED | DISABLED )]
```

To configure PARTITION-Rate-Limit alarm by using the NetScaler GUI

Navigate to System > SNMP > Alarms, select PARTITION-RATE-LIMIT alarm and configure the alarm parameters.

To configure SNMP trap destination by using the NetScaler GUI

Navigate to System > SNMP > Trap, specify the IP address of the destination device.

**SNMP monitoring for partition resource utilization**

Using SNMP, you can monitor a partition’s resource (such as bandwidth, connection, and memory) utilization details at real time on a NetScaler appliance. This is done by sending a SNMP request (such as SNMP GET, SNMP GET BULK, SNMP GETNEXT, or SNMP WALK) from the SNMP Manager.

**Note**

In order to monitor partition resources, you must configure the SNMP community in the default partition. Wherein, the `partitionTable` is maintained in the default partition, and the SNMP communication is done through the NSIP address of the appliance.

Consider a scenario where a NetScaler administrator wants to know the bandwidth usage of partition P1 on the appliance. The SNMP Manager retrieves this information by sending an SNMP GET request on the corresponding OID (partitionCurrentBandwidth) to the NSIP address of the appliance. The SNMP agent on the default partition retrieves and sends the current bandwidth usage of P1 to the SNMP Manager through the NSIP address.

The following table lists the SNMP counters which are part of `partitionTable` and its description:
<table>
<thead>
<tr>
<th>SNMP Parameter</th>
<th>SNMP OID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>partitionName</td>
<td>1.3.6.1.4.1.5951.4.1.1.88.1.1</td>
<td>Partition name</td>
</tr>
<tr>
<td>partitionCurrentBandwidth</td>
<td>1.3.6.1.4.1.5951.4.1.1.88.1.2</td>
<td>Current bandwidth usage of the partition.</td>
</tr>
<tr>
<td>partitionCurrentConnections</td>
<td>1.3.6.1.4.1.5951.4.1.1.88.1.3</td>
<td>Current number of active connections of the partition.</td>
</tr>
<tr>
<td>partitionMemoryUsagePcnt</td>
<td>1.3.6.1.4.1.5951.4.1.1.88.1.4</td>
<td>Current Memory usage (in percentage) of the partition.</td>
</tr>
</tbody>
</table>

**AppExpert**

December 13, 2018

The following topics provide a conceptual reference and configuration instructions for the AppExpert and other features of the NetScaler appliance.

**Note**

For information about policy extensions, see [Policy Extensions](#).

- **Action Analytics**: Collects run-time statistics on the basis of pre-defined criteria. When used with policies, the feature also provides you with the infrastructure for automatic, real-time traffic optimization.

- **AppExpert Applications and Templates**: Simplify configuration steps for the Citrix® NetScaler® appliance by using applications, application templates, Citrix Gateway applications, and entity templates.

- **AppQoE**: Application level Quality of Experience (AppQoE) integrates several existing policy-based security features of the NetScaler appliance into a single integrated feature that takes advantage of a new queuing mechanism, fair queuing.

- **Entity Template**: Describes how to use entity templates to set up and configure individual NetScaler entities, such as a policy or virtual server. An entity template provides a specification and a set of defaults for the object.

- **HTTP Callouts**: An HTTP request that the NetScaler appliance generates and sends to an external application when certain criteria are met during policy evaluation.

- **Pattern Sets**: Allow string matching during the evaluation of a default syntax policy.
- **Policies and Expressions**: Rules that determine the operations that the NetScaler appliance must perform.
- **Rate Limiting**: Defines the maximum load for a given network entity or virtual entity on the NetScaler appliance.
- **Responder**: Bases responses on who sends the request, where it is sent from, and other criteria with security and system management implications.
- **Rewrite**: Rewrites information in the requests or responses handled by the NetScaler appliance.
- **String Maps**: Perform pattern matching in all NetScaler features that use the default policy syntax.

**Action analytics**

December 10, 2018

The performance of your website or application depends on how well you optimize the delivery of the most frequently requested content. Techniques such as caching and compression help accelerate the delivery of services to clients, but you need to be able to identify the resources that are requested most frequently, and then cache or compress those resources. You can identify the most frequently used resources by aggregating real-time statistics about website or application traffic. Statistics such as how frequently a resource is accessed relative to other resources and how much bandwidth is consumed by those resources help you determine whether those resources need to be cached or compressed to improve server performance and network utilization. Statistics such as response times and the number of concurrent connections to the application help you determine whether you must enhance server-side resources.

If the website or application does not change frequently, you can use products that collect statistical data, and then manually analyze the statistics and optimize the delivery of content. However, if you do not want to perform manual optimizations, or if your website or application is dynamic in nature, you need infrastructure that can not only collect statistical data but can also automatically optimize the delivery of resources on the basis of the statistics. On the NetScaler appliance, this functionality is provided by the action analytics feature. The feature operates on a single NetScaler appliance and collects run-time statistics on the basis of criteria that you define. When used with NetScaler policies, the feature also provides you with the infrastructure that you need for automatic, real-time traffic optimization.

When configuring the action analytics feature, you specify the request attributes for which you want to collect statistical data, for example, URLs and HTTP methods by configuring default syntax expressions in an entity called a selector. Then, you configure an identifier to configure settings such as the
sampling interval and sample count. You also configure a policy that enables the appliance to evaluate traffic as specified by the selector-identifier pair. Finally, you bind the policy to a bind point to begin collecting statistics.

The appliance also provides you with a set of built-in selectors, identifiers, and responder policies that you can use to get started with the feature.

The appliance aggregates the following statistics:

- The number of requests.
- The bandwidth consumed by the requests.
- The response time.
- The number of concurrent connections.

You can configure the feature to perform run-time sorting of the records on an attribute of your choice. You can view the statistical data by using either the command-line interface or the Stream Sessions tool in the GUI.

**Configure a selector**

January 6, 2019

A selector is a filter for identifying requests. It consists of up to five individual default syntax expressions that identify request attributes such as the client IP address and the URL in the request. Each expression is a non-compound default syntax expression and is considered to be in an AND relationship with the other expressions. Following are some examples of selector expressions:

- `HTTP.REQ.URL`
- `CLIENT.IP.SRC`
- `HTTP.RES.BODY(1000).AFTER_STR("<string>").BEFORE_STR("<string>")`
- `CLIENT.IP.SRC.SUBNET(24)`

Selectors are used in rate limiting and action analytics configurations. A selector is optional in a rate limiting configuration but is required in an action analytics configuration.

The order in which you specify parameters is significant. For example, if you configure an IP address and a domain (in that order) in one selector, and then specify the domain and the IP address (in the reverse order) in another selector, the NetScaler considers these values to be unique. This can lead to the same transaction being counted twice. Also, if multiple policies invoke the same selector, the NetScaler, again, can count the same transaction more than once.

If you modify an expression in a selector, you may get an error if any policy that invokes it is bound to a new policy label or bind point. For example, suppose that you create a selector named myLimitSelector1, invoke it from myLimitID1, and invoke the identifier from a DNS policy named dnsRateLimit1.
If you change the expression in myLimitSelector1, you might receive an error when binding dnsRate-Limit1 to a new bind point. The workaround is to modify these expressions before creating the policies that invoke them.

The NetScaler appliance provides built-in selectors for some of the most common use cases. Refer to the pdf.

You can also configure a selector with expressions that identify the request attributes of your choice. For example, you might want to create a record for a request that arrives with a specific header. To evaluate the header, you can add HTTP.REQ.HEADER(“”) to the selector that you intend to use.

**To configure a selector by using the command line interface:**

At the command prompt, type the following commands to configure a selector and verify the configuration:

- add stream selector <name> <rule> ...
- show stream selector

**Example**

```plaintext
  > add stream selector myselector HTTP.REQ.URL CLIENT.IP.SRC
  Done
  > show stream selector myselector
  Name: myselector
  Expressions:
    1) HTTP.REQ.URL
    2) CLIENT.IP.SRC
  Done
  >
```

**To modify or remove a selector by using the command line interface:**

- To modify a selector, type the set stream selector command, the name of the selector, and the rule parameter with the expressions. Enter the existing expressions that you want to retain, along with the new expressions that you want to add.
- To remove a selector, type the rm stream selector command and the name of the selector.

**To configure a selector by using the GUI:**

2. In the details pane, do one of the following:
   - To create a selector, click Add.
   - To modify a selector, select the selector, and then click Edit.
3. In the Create Selector or Configure Selector page, set the following parameters:
• Name
• Expressions
  To add the expression to the selector configuration, click Add. To remove an expression from the selector configuration, in the Expression box, select the expression, and then click Delete.

Note: In the Expressions box, enter a valid parameter. For example, enter HTTP. Then, enter a period after this parameter. A drop-down menu appears. The contents of this menu provide the keywords that can follow the initial keyword that you entered. To select the next keyword in this expression prefix, double-click the selection in the drop-down menu. The Expressions text box displays both the first and second keywords for the expression prefix, for example, HTTP.REQ. Continue adding expression components until the complete expression is formed.

4. Click Add.
5. Continue adding up to five non-compound expressions.
6. Click OK and then Close.

Configure a stream identifier

December 18, 2018

You configure a stream identifier to specify parameters for collecting statistical data from requests identified by a given selector. An identifier specifies the selector to be used, the statistics collection interval, the sample count, and the field on which the records are to be sorted.

The NetScaler appliance includes the following built-in stream identifiers for common use cases. All the built-in identifiers specify a sample count of 1 and an interval of 1 minute. Additionally, they sort the data on the REQUESTS attribute. They differ only in being associated with different built-in selectors. Each built-in identifier is associated with a built-in selector of the same name (for example, the built in identifier Top_URL is associated with the built-in selector Top_URL). Following are the built-in identifiers:

• Top_URL
• Top_CLIENTS
• Top_URL_CLIENTS_LBVSERVER
• Top_URL_CLIENTS_CSVSERVER
• Top_MSSQL_QUERY_DB_LBVSERVER
• Top_MYSQL_QUERY_DB_LBVSERVER

For more information about the built-in selectors, see Configuring a Selector.

Note:

The maximum length for storing string results of selectors (for example, HTTP.REQ.URL) is 60 characters. If the string (for example, URL) is 1000 characters long, of which 50 characters are enough to uniquely identify a string, use an expression to extract only the required 50 characters.

You cannot modify a built-in identifier’s configuration. However, you can create an identifier with a configuration of your choice.

To configure a stream identifier by using the command line interface

At the command prompt, type the following commands to configure a stream identifier and verify the configuration:

- add stream identifier <name> <selectorName> [-interval <positive_integer>] [-SampleCount <positive_integer>] [-sort <sort>]
- show stream identifier <name>

Example

1 > add stream identifier myidentifier Top_URL -interval 10 -sampleCount 100
2 Done

To configure a stream identifier by using the GUI

2. In the details pane, do one of the following:
   - To create a stream identifier, click Add.
   - To modify a stream identifier, select the identifier, and then click Edit.
3. In the Configure Stream Identifier page, set the following parameters:
   - Name
   - Selector
   - Interval
   - Sample Count
   - Sort
4. Click OK, and then click Close.
View statistics

December 18, 2018

You can view the collected statistics in tabular format in the command-line interface and in graphical format in the GUI.

The following table describes the collected statistics:

<table>
<thead>
<tr>
<th>Statistics</th>
<th>stat stream identifier</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of requests</td>
<td>&lt;identifier name&gt; Req</td>
<td>The number of requests for which records were created in the last &lt;interval&gt; number of minutes.</td>
</tr>
<tr>
<td>Bandwidth consumed</td>
<td>BandW</td>
<td>The total bandwidth consumed by the requests that were received in the last &lt;interval&gt; number of minutes. The total bandwidth of a request is the bandwidth consumed by the request and its response. The value is rounded off to the next higher or next lower integer value. Consequently, it might differ slightly from the expected value. For example, if a request's total bandwidth consumption is 2.2 KB, one instance of the request might be shown as having consumed 2 KB and two instances might be shown as having consumed 4 KB, but three instances might be shown as having consumed 7 KB.</td>
</tr>
</tbody>
</table>
### stat stream identifier

<identifier name>

<table>
<thead>
<tr>
<th>Statistics</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Response time</td>
<td>RspTime</td>
<td>The average response time for all the requests received in the last &lt;interval&gt; number of minutes.</td>
</tr>
<tr>
<td>Concurrent connections</td>
<td>Conn</td>
<td>The total number of concurrent connections that are currently open.</td>
</tr>
</tbody>
</table>

To view the statistical data collected for a stream identifier by using the command line

At the command prompt, type:

```
stat stream identifier <name> [<pattern> ...] [-detail] [-fullValues] [-ntimes <positive_integer>] [-logFile input_filename] [-sortBy <sortBy> [<sortOrder>]]
```

**Examples**

Example 1 show how to sort the output on the BandW column, in the descending order. Example 2 sorts the output in Example 1, on the Req column, and in the ascending order

**Example 1:**

```
> stat stream identifier myidentifier -sortBy BandW Descending -fullValues
Stream Session statistics
Req          BandW
User1        508          125924
User2        5020         12692
User3        2025         4316

RspTime Conn
User1       5694          0
User2       109           0
User3       3             0
```

**Example 2:**
To view the statistical data collected for a stream identifier by using the GUI

1. Navigate to **AppExpert > Action Analytics > Stream Identifiers**.
2. Select the stream identifier whose sessions you want to view, and then click Statistics For information about how you can group the output on the basis of the values collected for various selector expressions.

### Grouping records on attribute values

December 18, 2018

Statistical information such as the number of times a particular URL has been accessed overall and per client, and the total number of GET and POST requests per client can provide valuable insights into whether any of your resources need to be expanded to meet the demand or be optimized for delivery. To obtain such statistics, you must use an appropriate set of selector expressions, and then use the pattern parameter in the stat stream identifier command. The grouping is based on the pattern that is specified in the command. Grouping can be performed concurrently on the values of multiple expressions.

In the command-line interface, you can group the output by using patterns of your choice. In the GUI, the pattern depends on the choices you make when drilling down through the values of various selector expressions. For example, consider a selector that has the expressions HTTP.REQ.URL, CLIENT.IP.SRC, and HTTP.REQ.LB_VSERVER.NAME, in that order. The statistics home page displays icons for each of these expressions. If you click the icon for CLIENT.IP.SRC, the output is based on the patterns `. The output displays statistics for each client IP address. If you click an IP address, the output is based on the patterns `*<IP address>` and `?<IP address>`. The output displays statistics for each client IP address.
To group the records on the values of selector expressions by using the command line interface

At the command prompt, enter the following command to group the records on the basis of a selector expression:

```
stat stream identifier <name> [ <pattern> ... ]
```

Examples

Each example uses a different pattern to demonstrate the effect of the pattern on the output of the stat stream identifier command. The selector expressions are HTTP.REQ.URL and HTTP.REQ.HEADER(“UserHeader”), in that order. The requests contain a custom header whose name is UserHeader. Note that in the examples, a given statistical value changes as determined by the grouping, but the sum total of the values for a given field remains the same.

Example 1

In the following command, the pattern used is ? ?. The appliance groups the output on the values collected for both selector expressions. The row headers consist of the expression values separated by a question mark (?). The row with the header /mysite/mypage1.html?Ed displays statistics for requests made by user Ed for the URL /mysite/mypage1.html.

```
1 > stat stream identifier myidentifier ? ? -fullValues
2 Stream Session statistics
3 Req       BandW
4 /mysite/mypage2.html?Grace    1    2553
5 /mysite/mypage1.html?Grace    2    4
6 /mysite/mypage1.html?Ed       8    16
7 /mysite/mypage2.html?Joe      1    2554
8 /mysite/mypage1.html?Joe      5    10
9 /mysite/?Joe                  1    4
10
11 RspTime Conn
12 /mysite/mypage2.html?Grace   0    0
13 /mysite/mypage1.html?Grace   0    0
14 /mysite/mypage1.html?Ed      0    0
15 /mysite/mypage2.html?Joe     0    0
16 /mysite/mypage1.html?Joe     0    0
17 /mysite/?Joe                 6    0
18 Done
```
Example 2

In the following command, the pattern used is * ?. The appliance groups the output on the values accumulated for the second expression HTTP.REQ.HEADER(“UserHeader”). The rows display statistics for all requests made by users Grace, Ed, and Joe.

```
> stat stream identifier myidentifier * ?
Stream Session statistics
Grace   3  2557   0   0
Ed      8  16    0   0
Joe     7  2568   6   0
Done
```

Example 3

In the following command, the pattern used is ? *, which is the default pattern. The output is grouped on the values collected for the first selector expression. Each row displays statistics for one URL.

```
> stat stream identifier myidentifier ? * -fullValues
Stream Session statistics
/mysite/mypage2.html  2  5107
/mysite/mypage1.html  15  30
/mysite/                1  4
RspTime    Conn
/mysite/mypage2.html  0   0
/mysite/mypage1.html  0   0
/mysite/                6   0
Done
```

Example 4

In the following command, the pattern used is * *. The appliance displays one set of collective statistics for all the requests received, with no row title.

```
> stat stream identifier myidentifier **
Stream Session statistics
Req  BandW  RspTime  Conn
18  5141   6   0
Done
```

Example 5

In the following command, the pattern is /mysite/mypage1.html *. The appliance displays one
set of collective statistics for all the requests received for the URL /mysite/mypage1.html, with no row title.

```
1  > stat stream identifier myidentifier /mysite/mypage1.html *
2  Stream Session statistics
3
4   Req  BandW  RspTime  Conn
5   15    30     0        0
6   Done
```

To group the records on the values of selector expressions by using the GUI

2. In the details pane, click the stream identifier for which you want to view statistics, and then click Stream Sessions.
3. On the Home page, click the icon for the stream selector by which you want to group the output.
4. To return to the Home page from the statistics page for a selector expression, click Home.
5. To view statistics for the value of a given selector expression, click the value. You can repeat this step for a selector expression value in each subsequent output until you obtain the statistics you want.

Clearing a stream session

March 22, 2019

You can flush all the records that have been accumulated for a stream identifier.

To clear a stream session by using the command line interface

At the command prompt, enter the following commands to clear a stream session and verify the results:

git commit -m “test”
• clear stream session
• stat stream identifier
• one more
Example

This example uses the stat stream identifier command first, so that a comparison can be made with the stat stream identifier command that is used for verifying the result of the clear stream session command.

```
1 >stat stream identifier myidentifier
2 Stream Session statistics
3 | Req | BandW | RspTime | Conn |
4 | /aed....html | 2 | 0 | 0 | 0 |
5 | / | 636 | 303 | 12 | 0 |
6 Done
7 >clear stream session myidentifier
8 Done
9 >stat stream identifier myidentifier
10 Done
```

To clear a stream session by using the GUI

2. Select the stream identifier whose sessions you want to clear, and then click Clear Sessions.

Configure policy for optimizing traffic

March 22, 2019

To put the selector-identifier pair in your action analytics configuration into effect, you must associate the pair with the point in the traffic flow at which you want to collect statistics. You can do so by configuring a default syntax policy and referencing the stream identifier from the policy rule. You can use compression policies, caching policies, rewrite policies, application firewall policies, responder policies, and any other policies whose action is based on a Boolean expression.

The action analytics feature introduces a set of default syntax expressions and functions for collecting and evaluating data. The expression `ANALYTICS.STREAM(<identifier_name>)` is used for referencing the identifier that you want to use. The expression `COLLECT_STATS` is used to collect statistical data. Functions such as `IS_TOP(<uint>)` and `IS_TOP_FREQUENTS(<uint>)` are used for making automatic, real-time traffic optimization decisions.

- `IS_TOP(<number>)`. Finds if a given object is in the top `<number>` of elements. For example, is the element among the top 10 elements. When multiple elements have the count, they are
considered to be similar in nature. The sort function must be turned on to avoid an undef condition.

- **IS_TOP_FREQUENTS(<frequency>).** Finds if a given object is in the top <frequency> of the elements that are in the top elements. For example, is the element among the top 50% of all the top elements maintained. Elements having the same values are considered similar in nature. The sort function must be turned on to avoid an undef condition.

It is your policy configuration that determines whether the NetScaler appliance must only collect data from traffic or also perform an action. If the appliance must only collect statistical data, you can configure a policy with the rule `ANALYTICS.STREAM(<identifier_name>).COLLECT_STATS` and the action NOOP. The NOOP policy must be the policy with the highest priority at the bind point. This policy is sufficient if you are only collecting statistics. Traffic optimization decisions, such as what to compress or cache, must be based on manual, periodic evaluation of the statistical data.

If, in addition to collecting statistics, the appliance must also perform an action on the traffic, you must configure the `gotoPriorityExpression` parameter of the NOOP policy such that another policy that has the desired rule and action is evaluated subsequently. This second policy must have a rule that begins with the `ANALYTICS.STREAM(<identifier_name>)` prefix and a function that evaluates the data.

Following is an example of two responder policies that are configured and bound globally. The policy `responder_stat_collection` enables the appliance to collect statistics based on the identifier, `myidentifier`. The policy `responder_notify` evaluates the data that is collected.

**Example**

```
1 > add responder action send_notification respondwith "You are in the Top 10 list for bandwidth consumption"
2   Done
3 > add responder policy responder_stat_collection 'ANALYTICS.STREAM("myidentifier").COLLECT_STATS' NOOP
4   Done
5 > add responder policy responder_notify 'ANALYTICS.STREAM("myidentifier").BANDWIDTH.IS_TOP(10)' send_notification
6   Done
7 > bind responder global responder_stat_collection 10 NEXT
8   Done
9 > bind responder global responder_notify 20 END
10  Done
```
How to limit bandwidth consumption for user or client device

December 10, 2018

Your web site, application, or file hosting service has finite network and server resources available to it to serve all its users. One of the most important resources is bandwidth. Substantial bandwidth consumption by only a subset of the user base can result in network congestion and reduced resource availability to other users. To prevent network congestion, you might have to limit a client's bandwidth consumption by using temporary service denial techniques such as responding to a client request with an HTML page if it has exceeded a preconfigured bandwidth value over a fixed time period leading up to the request.

In general, you can regulate bandwidth consumption either per client device or per user. This use case demonstrates how you can limit bandwidth consumption per client to 100 MB over a time period of one hour. The use case also demonstrates how you can regulate bandwidth consumption per user to 100 MB over a time period of one hour, by using a custom header that provides the user name. In both cases, the tracking of bandwidth consumption over a moving time period of one hour is achieved by setting the interval parameter in the stream identifier to 60 minutes. The use cases also demonstrate how you can import an HTML page to send to a client that has exceeded the limit. Importing an HTML page not only simplifies the configuration of the responder action in these use cases, but also simplifies the configuration of all responder actions that need the same response.

To limit bandwidth consumption per user or client device by using the command line interface

In the command-line interface, perform the following tasks to configure action analytics for limiting a client’s or user’s bandwidth consumption. Each step includes sample commands and their output.

1. **Set up your load balancing configuration.** Configure load balancing virtual server mysitevip, and then configure all the services that you need. Bind the services to the virtual server. The following example creates ten services and binds the services to mysitevip.

```bash
1 > add lb vserver mysitevip HTTP 192.0.2.17 80
2   Done
3 > add service service[1-10] 192.0.2.[240-249] HTTP 80
4   service ”service1” added
5   service ”service2” added
6   service ”service3” added
7   .
8   .
9   .
10  service ”service10” added
11  Done
12 > bind lb vserver vserver1 service[1-10]
13  service ”service1” bound
```
2. **Configure the stream selector.** Configure one of the following stream selectors:

- To limit bandwidth consumption per client, configure a stream selector that identifies the client IP address.

  ```
  > add stream selector myselector CLIENT.IP.SRC
  Done
  ```

- To limit bandwidth consumption per user on the basis of the value of a request header that provides the user name, configure a stream selector that identifies the header. In the following example, the name of the header is UserHeader.

  ```
  > add stream selector myselector HTTP.REQ.HEADER("UserHeader")
  Done
  ```

3. **Configure a stream identifier.** Configure a stream identifier that uses the stream selector. Set the interval parameter to 60 minutes.

  ```
  > add stream identifier myidentifier myselector -interval 60 -sampleCount 1 -sort BANDWIDTH
  Done
  ```

4. **Configure the responder action.** Import the HTML page that you want to send to users or clients that have exceeded the bandwidth consumption limit, and then use the page in responder action crossed_limits.

  ```
  > import responder htmlpage http://192.0.2.20:80/stdpages/wait.html crossed-limits.html
  This operation may take some time, Please wait...
  Done
  > add responder action crossed_limits respondwithhtmlpage crossed-limits.html
  Done
  ```
5. **Configure the responder policies.** Configure responder policy myrespol1 with the rule ANALYTICS.STREAM("myidentifier").COLLECT_STATS and the action NOOP. Then, configure policy myrespol2 for determining whether a client or user has crossed the 100 MB limit. The policy myrespol2 is configured with the responder action crossed_limits.

   ```
   1 > add responder policy myrespol1 'ANALYTICS.STREAM("myidentifier") .COLLECT_STATS' NOOP
   2   Done
   3 > add responder policy myrespol2 'ANALYTICS.STREAM("myidentifier") .BANDWIDTH.GT(1048576)' crossed_limits
   4   Done
   ```

6. **Bind the responder policies to the load balancing virtual server.** The policy myrespol1, which only collects statistical data, must have the higher priority and a GOTO expression of NEXT.

   ```
   1 > bind lb vserver mysitevip -policyName myrespol1 -priority 1 - gotoPriorityExpression NEXT
   2   Done
   3 > bind lb vserver mysitevip -policyName myrespol2 -priority 2 - gotoPriorityExpression END
   4   Done
   ```

7. **Test the configuration.** Test the configuration by sending test HTTP requests, from multiple clients or users, to the load balancing virtual server and using the stat stream identifier command to view the statistics that are collected for the specified identifier. The following output displays statistics for clients.

   ```
   1 > stat stream identifier myidentifier -sortBy BandW - fullValues
   2   Stream Session statistics
   3   Req    BandW
   4   192.0.2.30    5000   3761
   5   192.0.2.31    29     2602
   6   192.0.2.32    25     51

AppExpert applications and templates

December 13, 2018

An AppExpert application is a collection of configuration information that you set up on the NetScaler appliance for securing and optimizing traffic for a Web application, such as Microsoft SharePoint. Managing AppExpert applications is simplified by a graphical user interface (GUI) that allows you to specify application traffic subsets and a distinct set of security and optimization policies for processing each traffic subset. Additionally, it consolidates all deployment tasks in one view, so you can quickly configure target IP addresses for clients and specify host servers.

Prebuilt application templates for widely used Web applications, such as Microsoft Outlook Web Access and Microsoft SharePoint, are available on the AppExpert Templates page of the Citrix Community website at “http://community.citrix.com/display/ns/AppExpert+Templates.”

Each prebuilt template provides you with an initial configuration for managing the associated Web application. You can customize prebuilt application templates for your organization. If a prebuilt application template does not suit your requirements, you can create a custom application without using a template.

Regardless of whether you use a prebuilt application template or you create a custom application, you can export the configuration to a template file. You can then share the template with other administrators or import the template to other NetScaler appliances that require a similar AppExpert application configuration.

To get started with an AppExpert application, you must first obtain the appropriate application template and import the template to the NetScaler appliance. After the AppExpert application is set up, you must verify that the application is working correctly. If required, you can customize the configuration to suit your requirements.

Periodically, you can verify and monitor the configuration by viewing the hit counters for various application components, statistics, and the Application Visualizer. You can also configure authentication, authorization, and auditing (AAA) policies for the application.

AppExpert application terminology

Following are the terms used in the AppExpert applications feature and the descriptions of the entities for which the terms are used:

Public endpoint. The IP address and port combination at which the NetScaler appliance receives client requests for the associated web application. A public endpoint can be configured to receive either HTTP or secure HTTP (HTTPS) traffic. All client requests for the web application must be sent
to a public endpoint. An AppExpert application can be assigned multiple endpoints. You configure public endpoints after you import a template.

**Application unit.** An AppExpert application entity that processes a subset of web application traffic and load balances a set of services that host the associated content. The subset of traffic that an application unit must manage is defined by a rule. Each application unit also defines its own set of traffic optimization and security policies for the requests and responses that it manages. The NetScaler services associated with these policies are Compression, Caching, Rewrite, Responder, and application firewall.

By default, every AppExpert application with at least one application unit includes a default application unit, which cannot be deleted. The default application unit is not associated with a rule for identifying requests and is always placed last in the order of application units. It defines a set of policies for processing any request that does not match the rules that are configured for the other application units, thereby ensuring that all client requests are processed.

Application units and their associated rules, policies, and actions are included in AppExpert application templates.

**Service.** The combination of the IP address of the server that hosts the web application instance and the port to which the application is mapped on the server, in the format <IP address>:<Port>. A web application that serves a large number of requests is usually hosted on multiple servers. Each server is said to host an instance of the web application, and each such instance of the web application is represented by a service on the NetScaler appliance. Services are deployment-specific and are therefore not included in templates. You must configure services after you import a template.

**Application unit rule.** Either a classic expression or a default syntax expression that defines the characteristics of a traffic subset for an application unit. The following example rule is a default syntax expression that identifies a traffic subset that consists of four image types:

```
HTTP.REQ.URL.SUFFIX.EQ("bmp")
HTTP.REQ.URL.SUFFIX.EQ("gif")
HTTP.REQ.URL.SUFFIX.EQ("png")
HTTP.REQ.URL.SUFFIX.EQ("jpg")
```

For more information about default syntax expressions and classic policy expressions, see Policies and Expressions.

**Traffic Subset.** A set of client requests that require a common set of traffic optimization and security policies. A traffic subset is managed by an application unit and is defined by a rule.

## How AppExpert Application Works

January 6, 2019
When the endpoint receives a client request, the NetScaler appliance evaluates the request against the rule that is configured for the topmost application unit. If the request satisfies this rule, the request is processed by the policies that are configured for the application unit, and then forwarded to a service. The choice of service depends on which services are configured for the application, and on settings such as the load balancing algorithm and persistence method configured for the application unit.

If the request does not satisfy the rule, the request is evaluated against the rule for the next topmost application unit. In this order, the request is evaluated against each application unit rule until the request satisfies a rule. If the request does not satisfy any of the configured rules, it is processed by the default application unit, which is always the last application unit.

You can configure multiple public endpoints for an AppExpert application. In such a configuration, by default, each application unit processes requests received by all the public endpoints and load balances all the services that are configured for the application. However, you can specify that an application unit processes traffic from only a subset of the public endpoints and load balances only a subset of the services that are configured for the AppExpert application.

The following flow diagram illustrates the AppExpert Application flow sequence for using a built-in application template.

If you prefer to create a customized application without using a template, do the following:

1. Create a custom application.
2. Configure application and deployment settings.
3. Export the configuration to new template files (optional).
4. Import the template files to other NetScaler appliances that require a similar AppExpert application configuration

Get started with AppExpert

December 10, 2018

To get started with an AppExpert application, you must first obtain an application template and import the template to a NetScaler appliance. After the AppExpert application is set up, you must verify that the application is working correctly. If required, you can customize the configuration to suit your requirements.

Periodically, you can verify and monitor the configuration by viewing the hit counters for various application components. You can also configure authentication, authorization, and auditing (AAA) policies for the application.

The process of setting up an application can be done in two ways:

- Using a prebuilt application template
• Creating a custom application without using a template.

If you prefer to set up the application by using a prebuilt application template, do the following:

1. Download an application template.
2. Import template files to NetScaler appliance.
3. Verify application setup.
4. Configure application and deployment settings.
5. Export the configuration to new template files (optional).
6. Import the template files to other NetScaler appliances that require a similar AppExpert application configuration.

NetScaler’s video tutorials enable you to understand NetScaler features in easy and simple way. Watch https://www.youtube.com/watch?v=aqayflvCR_0 video to learn how to set up an application using AppExpert Application template.

**Downloading an Application Template**

December 18, 2018

AppExpert application setup begins with downloading an application template from the Citrix Community Website at <http://community.citrix.com/display/ns/AppExpert+Templates> to your local computer or NetScaler appliance. The application templates are designed to be imported and exported, so that you can easily share application-specific configurations within an organization or across organizations. An application template includes the following set of entities:

1. Application components (for example, web pages, files, archives, and web services)
2. Traffic management entities (for example, virtual server IP addresses and associated load-balancing algorithms, and SSL offload settings) for the application components.
3. NetScaler policies used for optimizing the application traffic.

**Note:**

Application templates are available in different versions for configuring different types of NetScaler appliances.

**Importing an Application Template**

December 13, 2018
For NetScaler software version 9.3 or later, each AppExpert template has two XML files: a Template file and a Deployment file. You must import both files from your local computer to a NetScaler appliance. You can either import the template files from your computer to the AppExpert application templates directory in NetScaler appliance or upload files to a NetScaler appliance and then import them from the appliance.

**Note:** When you import a template from an appliance, you have to provide the variable value available in the template. By default, the pre-configured value is display [https://docs.citrix.com/en-us/netscaler//11/appexpert/appexpert-application-templates/creating-managing-templates/netscaler-application-template-deployment-files.html](https://docs.citrix.com/en-us/netscaler//11/appexpert/appexpert-application-templates/creating-managing-templates/netscaler-application-template-deployment-files.html)

After you import the template files, the application-configuration and deployment information populates the target application automatically. The appliance imports all the configuration from the template files through the NITRO API. If you do not import the deployment file, the system generates an application populated with content switching virtual server configuration. For more information about the format of application templates and deployment files, see [Understanding NetScaler Application Templates and Deployment Files](https://docs.citrix.com/en-us/netscaler//11/appexpert/appexpert-application-templates/creating-managing-templates/netscaler-application-template-deployment-files.html).

When you import a template, if you do not include a deployment file, you have to configure the public endpoints in the application that the system automatically generates from the template. One endpoint for HTTP and another endpoint for HTTPS. When configuring a public endpoint of type HTTPS, make sure you enable the SSL feature, bind the server certificate, and include the server-certificate and certificate-key files.

To import AppExpert application template files to a NetScaler appliance by using the GUI:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, click **Import Template**.
3. On the **Import** page, set the following parameters:
   a) Application Name (mandatory)
   b) Template File (mandatory)
   c) Use deployment file
4. Click **Continue** to auto populate application-configuration and deployment information into an application.

NetScaler’s video tutorials enable you to understand NetScaler features in an easy and simply way. Watch [https://www.youtube.com/watch?v=AR9TwSD9uJM](https://www.youtube.com/watch?v=AR9TwSD9uJM) video to learn how to import an application template.
Verifying and Testing Application Configuration

January 6, 2019

The GUI includes icons that indicate the states of the entities in the AppExpert application. These icons are displayed for applications and application units and are based on the health checks that the NetScaler appliance performs periodically on services and entities. The following table lists the icons and describes their meanings.

<table>
<thead>
<tr>
<th>Icon</th>
<th>Entity</th>
<th>Indicates that</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application</td>
<td>At least one public endpoint is up. The application will accept client requests from the public endpoints that are up.</td>
<td></td>
</tr>
<tr>
<td>Application unit</td>
<td>The application unit is up. The application unit is up when at least one service or service group is up.</td>
<td></td>
</tr>
<tr>
<td>Application</td>
<td>The public endpoint is out of service (disabled). This indicator is displayed when only one public endpoint is configured for the AppExpert application.</td>
<td></td>
</tr>
<tr>
<td>Application</td>
<td>All the endpoints that are configured for the application are out of service. This indicator is displayed only when multiple endpoints are configured for the application.</td>
<td></td>
</tr>
<tr>
<td>Application unit</td>
<td>All the services configured for the application unit are down.</td>
<td></td>
</tr>
</tbody>
</table>

You must ensure that the icons for each application and its application units are green at all times. If the icon that is displayed for an application is not green, verify that you have configured the public
endpoints correctly. If the icon that is displayed for an application unit is not green, verify that the
services are configured correctly. However, note that a green indicator does not mean that the state
of all associated entities is UP. It only means that the application has sufficient resources (endpoints
and services) to serve client requests. To verify that the state of all associated entities is UP, check the
health of all the entities on the statistics page for the application.

Customizing the configuration

December 13, 2018

After you verify that the AppExpert application is working correctly, you can customize the configura-
tion to suit your requirements.

After you verify that the AppExpert application configuration is working correctly, you can configure
the application and the deployment settings to suit your requirements. When you import an applica-
tion template and deployment file, the system automatically populates the target application with the
available configuration settings (such as application units, application unit rules, policies, persistence
settings, load balancing methods, profiles, and traffic settings). In this application, you can configure
deployment settings such as public endpoints, services, and service groups for each traffic subset. If
you want the AppExpert application to manage a traffic subset that is not included in the template,
you can either add an application unit for a traffic subset or modify the existing application unit. After
you customize the configuration, you can also specify the order of evaluation for each traffic subset
that the application manages.

Configuring an AppExpert application consists of the following steps:

1. Configuring Public Endpoints
2. Configuring Application Units
3. Specifying the Order of Evaluation
4. Viewing Application Configuration using Visualizer

Also, you can configure the policies that the template provided. If the AppExpert application template
does not include policies for a particular NetScaler feature, such as Rewrite or application firewall, you
can configure your own policies.

Configure public endpoints

December 13, 2018
If you did not specify a public endpoint when importing an AppExpert application, you can specify public endpoints after you create the application. You can configure one public endpoint of type HTTP and one public endpoint of type HTTPS for your AppExpert application.

If endpoints are already configured for the application, you can dissociate endpoints from the AppExpert application and delete any endpoints that you no longer need. Note that when you dissociate a public endpoint from the AppExpert application, the endpoint is automatically unbound from the associated application unit, but it is not deleted from the system.

To configure public endpoints for an AppExpert application:

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click the application for which you want to configure public endpoints, and then click Edit.
3. In the Applications page, go to Public Endpoint section and click the pencil icon.
4. In the Public Endpoint slider, set the following parameters.
   a) Public endpoint type. Select the radio button to define the endpoint type.
   b) Name. Name of the public endpoint.
   c) IP address. IP address of the public endpoint.
   d) Port. Port number of the public endpoint.
   e) Protocol. Select a protocol type as HTTP or HTTPS.
5. Click Continue.
6. In the Application Units section, select an application unit from the list.
7. Click Continue to set the policy and server details.
8. Click OK and then Done.
9. Click Close.

For more information about the parameters in the Configure Public Endpoint dialog box, see Content Switching.

Configure services and service groups for an application unit

December 10, 2018

When you configure a service or service group, you either modify an existing service or service group, or add new services to the AppExpert application. You add services or service groups if you did not specify them when you imported the application template. You also add services and service groups when you increase the number of servers that host instances of the application. You can configure a service and service group for an application unit only after you configure the service or service group for the AppExpert application.

To configure a service or service group for the AppExpert application:
1. Navigate to **AppExpert > Applications**.
2. In the details pane, right-click the application and then click **Edit**.
3. In the **Applications** page, select an application unit and then click **Continue**.
4. In the **Services and Service Groups** section, do the following:
   a) In the Service Binding slider, set the following parameters.
      i. **Service**. Select a load balancing service from the list or create a new service.
      ii. **Weight**. Provide a weight value for the service.
   b) Click **Bind** and then **Done**.
   c) In the ServiceGroup Binding slider, set the following parameters:
      i. **Service Group Name**. Select a load balancing service group or create a new service group.
      ii. Click **Bind** and then **Done**.
   d) Click **Done**.
5. Click **Continue** to set other configurations.

---

**Create application units**

December 10, 2018

You might need to add application units for traffic subsets that are either specific to your web application implementation or not defined in the template. When creating an application unit, you must configure a rule for the application unit.

To create an application unit for the AppExpert application:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, right-click the application for which you want to add an application unit, and then click **Add**.
3. In the **Applications** page, go to **Application Units** section and click the **pencil** icon.

To configure policy expressions for an application unit:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, right-click the application for which you want to add an application unit, and then click **Add**.
3. In the **Applications** page, go to Application Units section and click the **pencil** icon to create a unit and add policy expressions.
4. To specify the format of the new expression, do one of the following:
   a) To specify that you want to configure a classic expression in the Rule box, click Classic Syntax.
To specify that you want to configure an advanced expression in the Rule box, click Default Syntax.

b) In the Rule box, configure the expression.

c) Click OK.

Configuring application unit rules

December 10, 2018

You might want to configure an application unit rule to include or exclude certain types of traffic. When you configure the rule, you can also define the syntax of the expression.

To configure an application unit rule:

1. In the navigation pane of the GUI, expand AppExpert, and then click Applications.
2. In the details pane, right-click the application unit for which you want to modify the rule, and then click Open.
3. In the Configure Application Unit dialog box, do the following:
   a) To specify the format of the new expression, do one of the following:
      • To specify that you want to configure a classic expression in the Rule box, click Classic Syntax.
      • To specify that you want to configure an advanced expression in the Rule box, click Default Syntax.
   b) In the Rule box, configure the expression.
4. Click OK.

Configuring policies for application units

December 18, 2018

For an AppExpert application, you can configure policies for Compression, Caching, Rewrite, Responder, and Application Firewall. The templates that you download from the Citrix Community web site provide you with a set of policies that fulfill the most common application management requirements. You might want to fine-tune or customize these policies. If the set of policies provided for a given application unit does not include policies for a particular feature, you can create and bind your own policies for that feature.

If you create an AppExpert application without using a template, you must configure all the policies that the web application needs.
The GUI uses various icons to indicate whether or not policies are configured for a feature. For an application unit, if a policy is configured for a given feature, an icon that represents the feature is displayed. For example, if a compression policy is configured for an application unit, a compression icon is displayed in the Compression column for the application unit. For features for which no policy is configured, an icon depicting a plus sign (+) is displayed.

**Note:**
When configuring policies for application units, you might need to configure policies and expressions that are either in the classic or default syntax. Additionally, when you configure default syntax policies, you might need to specify parameters such as Goto expressions and invoke policy banks.
For information about configuring policies and expressions in both formats, see Policies and Expressions.

### Configuring compression policies

You can use either classic policies or advanced policies to configure compression, but you cannot bind compression policies of both types to the same application unit.

To configure a compression policy for an application unit:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Compression column.
3. In the Configure Compression Policies dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
   - Click Switch to Default Syntax if you want to configure a default syntax compression policy. If you want to bind or configure classic compression policies, and if you are in the default syntax view, you can click Switch to Classic Syntax to return to the classic policy view and begin modifying bound classic policies or create and bind new classic compression policies.
     Important: This setting also determines what policies are displayed when you want to insert a policy. For example, if you are in the default syntax view, when you click Insert Policy, the list that appears in the Policy Name column will include only default syntax policies. You cannot bind policies of both types to an application unit.
   - If you want to configure classic policies, click either Request or Response, depending on whether you want the policy to be evaluated at request-time or at response-time.
You can configure both request-time and response-time classic compression policies for an application unit. After evaluating all of the request-time policies, if no match is found, the appliance evaluates response-time policies.

- To modify a compression policy that is already bound to the application unit, click the name of the policy, and then click Modify Policy. Then, in the Configure Compression Policy dialog box, modify the policy, and then click OK.
  For information about modifying a compression policy, see Compression.
- To unbind a policy, click the name of the policy, and then click Unbind Policy.
- To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
- To regenerate assigned priorities, click Regenerate Priorities.
- To insert a new policy, click Insert Policy and, in the list that is displayed in the Policy Name column, click New Policy. Then, in the Create Compression Policy dialog box, configure the policy, and then click Create.
  For information about modifying a compression policy, see Compression.
- If you are configuring a default syntax expression, do the following:
  - In the Goto Expression column, select a Goto expression.
  - In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.

4. Click Apply Changes, and then click Close.

Configuring Caching Policies

You can use only default syntax policies and expressions to configure Caching policies.

To configure Caching policies for an application unit:

1. Navigate to AppExpert > Applications.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Caching column.
3. In the Configure Cache Policies dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
   - Click either Request or Response, depending on whether you want the policy to be evaluated at request-time or at response-time.
   - You can configure both request-time and response-time Caching policies for an application unit. After evaluating all of the request-time policies, if no match is found, the appliance evaluates response-time policies.
   - To modify a Caching policy that is already bound to the application unit, click the name of the policy, and then click Modify Policy. Then, in the Configure Cache Policy dialog box, modify the policy, and then click OK.
  For information about modifying a Caching policy, see Integrated Caching.
To unbind a policy, click the name of the policy, and then click **Unbind Policy**.

To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.

To regenerate assigned priorities, click **Regenerate Priorities**.

To insert a new policy, click **Insert Policy** and, in the list that is displayed in the Policy Name column, click **New Policy**. Then, in the **Create Cache Policy** dialog box, configure the policy, and then click **Create**.

For information about modifying a Caching policy, see [Integrated Caching](#).

• In the Goto Expression column, select a Goto expression.

• In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.

4. Click **Apply Changes**, and then click **Close**.

### Configuring Rewrite policies

You can use only default syntax policies and expressions to configure Rewrite policies.

To configure Rewrite policies for an application unit:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Rewrite column.
3. In the **Configure Rewrite Policies** dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
   • Click either Request or Response, depending on whether you want the policy to be evaluated at request-time or at response-time.
     You can configure both request-time and response-time Rewrite policies for an application unit. After evaluating all of the request-time policies, if no match is found, the appliance evaluates response-time policies.
   • To modify a Rewrite policy that is already bound to the application unit, click the name of the policy, and then click Modify Policy. Then, in the Configure Rewrite Policy dialog box, modify the policy, and then click OK.
     For information about modifying a Rewrite policy, see [Rewrite](#).
   • To unbind a policy, click the name of the policy, and then click **Unbind Policy**.
   • To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
   • To regenerate assigned priorities, click **Regenerate Priorities**.
   • To insert a new policy, click **Insert Policy** and, in the list that is displayed in the Policy Name column, click **New Policy**. Then, in the **Create Rewrite Policy** dialog box, configure the policy, and then click **Create**.
     For information about modifying a Rewrite policy, see [Rewrite](#).
• In the Goto Expression column, select a Goto expression.
• In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.

4. Click **Apply Changes**, and then click **Close**.

**Configuring Responder policies**

You can use only default syntax policies and expressions to configure Responder policies.

To configure Responder policies for an application unit:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Responder column.
3. In the **Configure Responder Policies** dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
   • To modify a Filter policy that is already bound to the application unit, click the name of the policy, and then click **Modify Policy**. Then, in the **Configure Responder Policy** dialog box, modify the policy, and then click **OK**.
     For information about modifying a Responder policy, see **Responder**.
   • To unbind a policy, click the name of the policy, and then click **Unbind Policy**.
   • To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
   • To regenerate assigned priorities, click **Regenerate Priorities**.
   • To insert a new policy, click **Insert Policy** and, in the list that is displayed in the **Policy Name column**, click **New Policy**. Then, in the **Create Responder Policy** dialog box, configure the policy, and then click **Create**.
     For information about modifying a Responder policy, see **Responder**.
   • In the Goto Expression column, select a Goto expression.
   • In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.
4. Click **Apply Changes**, and then click **Close**.

**Configuring Application Firewall policies**

You can configure both classic and default syntax policies and expressions for Application Firewall. However, if a policy of one type is already bound globally or to a virtual server that is configured on the appliance, you cannot bind a policy of the other type to an application unit. For example, if a default syntax policy is already bound either globally or to a virtual server, you cannot bind a classic policy to an application unit.
To configure Application Firewall policies for an application unit:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Application Firewall column.
3. In the **Configure Application Firewall Policies** dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
   - Click either Classic Expression or Advanced Expression depending on the type of expression you want to configure for the Application Firewall policy.
     **Important:** This setting also determines what policies are displayed when you want to insert a policy. For example, if you select Advanced Expression, when you click Insert Policy, the list that appears in the Policy Name column will include only default syntax policies. You cannot bind policies of both types to an application unit. This option is not available if a policy of either type is already bound either globally or to a virtual server.
   - To modify an application firewall policy that is already bound to the application unit, click the name of the policy, and then click **Modify Policy**. Then, in the Configure Application Firewall Policy dialog box, modify the policy, and then click OK. For information about modifying a application firewall policy, see **Policies**.
   - To unbind a policy, click the name of the policy, and then click **Unbind Policy**.
   - To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
   - To regenerate assigned priorities, click **Regenerate Priorities**.
   - To insert a new policy, click **Insert Policy** and, in the list that is displayed in the Policy Name column, click **New Policy**. Then, in the **Create Application Firewall Policy** dialog box, configure the policy, and then click **Create**. For information about modifying a application firewall policy, see **Policies**.
4. Click **Apply Changes**, and then click **Close**.

**Configuring Application Units**

December 10, 2018

To configure an application unit by using the GUI:

1. Navigate to **AppExpert > Applications > Application Unit** section and then click the plus icon to add a new application unit for a traffic subset.
2. In the Application Unit slider, set the following parameters:
   • Name
   • Expression

You can insert an expression either by adding the expression components manually or by using the Expression Editor link. To manually add an expression, enter a selector component and then type a period (.) to display a list from which you can select the next component. For example, type HTTP and then type a period. A drop-down menu appears. The contents of this menu provide the keywords that can follow the initial keyword that you entered. Select a component from the drop-down menu. The Expression* text box now displays the components that you have added to the expression (for example, HTTP.REQ). Continue adding components until the complete expression is formed.

If you prefer assistance to form the expression, you can use the Expression Editor link. On the Expression Editor page, you can form an expression by selecting components from the drop-down boxes. Select the components and click Done to insert the expression on the Application Unit page.

3. Click Continue to bind services and service groups.

4. Click the Service section to select or add a virtual service and bind it to the application unit.

5. Click Continue and click the Service Group section to select or add a virtual service group and bind it to the application unit.

6. Click Bind and Continue to configure Advanced Settings (such as Policies, Method, Persistence, Protection, Profiles, Push, Authentication, and Traffic Settings) for the application unit.

7. Click the plus icon in each section to set the configuration parameters.

8. Click OK and then Done.

To edit an application unit for an application by using the GUI:

Navigate to AppExpert > Applications, select an application and click Edit. In the Application Unit section, select an entity, click the edit icon and modify the application unit settings.

Note: You cannot modify the name and rule expression for an existing application unit.

NetScaler’s video tutorials enable you to understand NetScaler features in an easy and simple way. Watch <https://www.youtube.com/watch?v=bJ5_i8fV2hc> video to learn how configure an application unit.

Configuring public endpoints for an application

December 10, 2018
To configure public endpoints for an application by using the GUI:

1. Navigate to AppExpert > Applications, select an application entity, and then click Edit.
2. In the Public Endpoint section, click + to configure a new public endpoint.
3. In the Public Endpoint slider, do one of the following:
   a) Click New to create a new endpoint.
   b) Click Existing Public Endpoint to select an endpoint from the drop-down list.
4. Set the following endpoint parameters:
   a) Name
   b) IP address
   c) Protocol
   d) Port
5. Click Continue to configure additional settings such as application units, GSLB server bindings, policies, profiles, push, traffic settings, and authentication.
6. Click OK and then Done.
7. Click Continue and then Done.

To edit a public endpoint for an application by using the GUI:

Navigate to AppExpert > Applications, select an application, and click Edit. In the Public Endpoint section, select an endpoint, click the pen icon, and modify the endpoint settings.

To delete a public endpoint for an application by using the GUI:

Navigate to AppExpert > Applications > Public Endpoint, click the pen icon to view the delete icon next to the entity.

NetScaler’s video tutorials enable you to understand NetScaler features in an easy and simply way. Watch <https://www.youtube.com/watch?v=z4v-edQiVpw> video to learn how to configure a public endpoint.

### Specifying the Order of Evaluation of Application Units

December 10, 2018

Application unit rules are evaluated in the order in which they are placed in the GUI. The rule that is configured for the topmost application unit is always configured first, followed by the rule that is configured for the second topmost application unit, and so on. The default application unit is always evaluated last.

When a request matches the rule that is configured for an application unit, the request is processed by the application unit, and no further matching is performed. Therefore, the order of evaluation of application units becomes an important factor if the traffic subsets for two or more application units
overlap. If the traffic subsets for two or more application units overlap, you must specify the order in which an incoming request is matched against the application unit rules.

To specify the order of evaluation of application units:

1. Navigate to **AppExpert > Applications**, select an application and click **Edit**. In the **Application Unit** section, click the **Pencil** icon and then hover the cursor over the check box to the left of the name of the application unit. Click the icon that appears next to the check box and hold down the mouse to drag the application up or down to a new location in the priority list.

## Configuring Persistency Groups for Application Units

**December 10, 2018**

You can configure a persistency group for the application units in an AppExpert application. In the context of an AppExpert application, a persistency group is a group of application units that you can treat as a single entity for the purpose of applying common persistence settings. When the application is exported to an application template file, the persistency group settings are included, and they are automatically applied to the application units when you import the AppExpert application.

To configure a persistency group for an application by using the GUI:

1. Navigate to **AppExpert > Applications**.
2. In the **Applications View** dialog box, click the name of the application for whose application units you want to configure a persistency group, and then click **Configure Persistency Groups**.
3. In the **Configure Persistency Groups** dialog box, do one of the following:
   • To add a persistency group, click **Add**.
   • To modify a persistency group, click **Open**.
4. In the **Create Persistency Group** or **Configure Persistency Group** dialog box, set the following parameters:
   • Group Name—Name of the persistency group. For the NetScaler appliance to recognize the persistency group as part of the application’s configuration, the name of the AppExpert application must be included in the name of the persistency group, as a prefix. Therefore, by default, the appliance displays the prefix in the Group Name box, and you cannot remove that prefix. Enter a name of your choice after the prefix.
   • Persistence—Type of persistence for the virtual server. If you select SOURCEIP, in the IPv4 Netmask box, enter a network mask that specifies the number of bits that the appliance must consider when creating persistence sessions. If you select COOKIEINSERT, in the Cookie Domain and Cookie Name boxes, specify a domain attribute to send in the Set-Cookie directive, and a name for the cookie, respectively.
   • Timeout—Time period for which a persistence session is in effect.
- Backup Persistence—Type of backup persistence for the group.
- Backup Timeout—Time period, in minutes, for which backup persistence is in effect.
- Application Units—To add an application unit to the persistency group, in the Available Application Units box, click the application unit, and then click Add. To remove an application unit from the persistency group, in the Configured Application Units box, click the application unit, and then click Remove.

5. Click OK.

Viewing AppExpert Applications and Configuring Entities by Using the Application Visualizer

December 10, 2018

The Visualizer feature shows you a graphical representation of an application’s configuration. It includes the name of the public endpoint, application units assigned to the public endpoint, and the number of policies and services bound to the application. You can use the Visualizer to obtain a visual overview of an AppExpert application’s configuration and configure some of the displayed entities. By default, the Visualizer displays application units, services, and monitors for the selected application.

To view an AppExpert application by using the Application Visualizer:

1. Navigate to AppExpert > Applications, select an application entity, and click Visualizer.

Configuring User Authentication, Authorization, and Auditing

December 10, 2018

You can configure authorization for users and groups to enable them to access an AppExpert application. If the AAA user or group for which you want to configure permissions has not already been created, you can create it from AppExpert and then configure permissions for application access.

To configure AAA users and AAA user groups for an application by using the configuring utility

1. Navigate to AppExpert > Applications, select an application entity, and then click Edit.
2. In the Advanced Settings section, click Authorization, and configure authorized users and user groups.
3. Click the AAA user section to bind authorized users to the application.
4. In the AAA User slider, set the parameters.
5. Click Continue, and then click Authorization Policies in the Advanced Settings section.
6. In the **Authorization Policy** slider, bind an authorization policy to the application.
7. Click **Continue**, and then click the **Authorization Group** section in the **Advanced Settings** section.
8. In the **AAA Group Binding** slider, bind an authorization user group to the application.
9. Click **Continue**, and then click **Policies** in the **Advanced Settings** section.
10. In the **Policies** **slider**, bind an **Audit Syslog** or **Audit NSlog** policy to the application.
11. Click **Continue** and then **Done**.

To edit AAA users and AAA user groups for an application by using the GUI:

Navigate to **AppExpert > Applications > Advanced Settings** and click **Authorization**. Then click the edit icon and specify values for user or user-group authorization settings.

To delete AAA users and AAA user groups by using the GUI:

Navigate to **AppExpert > Applications**, select an application and click **Edit**. In the **Applications** page, click **Advanced Settings** and click **Authorization**. Click the delete icon next to the entity.

### Monitoring a NetScaler Application

December 13, 2018

After you customize the AppExpert application, you can view application statistics to make sure that the application and all its entities are working correctly. You can also use the Application Visualizer to monitor statistics associated with certain entities such as policies and virtual servers.

You can also view the hit counters for various entities at regular intervals to make sure that counters are being updated.

### Viewing Application Statistics

In the **Applications** node, you can select an application and view the Statistics page for the application. On the Statistics page, you can monitor the health and states of public endpoints and application units, and view the following statistical information:

- Requests and responses per second for each of the public endpoints and application units.
- Bytes per second, at each endpoint, for incoming and outgoing traffic.
- Application unit hit counters and the number of client and server connections for each application unit.
- Statistics for the services that are bound to the application units.

On the Statistics page, you can also view CPU usage, memory usage, and system logs.

To view statistics for an application:
1. Navigate to **AppExpert > Applications**.
2. In the details pane, click the application for which you want to view statistics, and then click **Statistics**.

**Monitoring an Application by Using the Application Visualizer**

You can use the Application Visualizer to monitor the number of requests received per second at a given point in time by the vservers and the number of hits per second at a given point in time for Rewrite, Responder, and Cache policies.

To view statistical information for vservers, Rewrite policies, Responder policies, and Cache policies in the Visualizer:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, select the application for which you want to view statistical information, and then click **Visualizer**.
3. In the **Application Visualizer** window, do the following:
   - To view the statistics, click **Show Stats**. The statistical information is displayed on the respective nodes in the Visualizer. This information is not updated in real time and has to be refreshed manually.
   - To refresh the statistical information, click **Refresh Stats**.

**Viewing Hits**

The hit counters that are provided for various AppExpert application entities enable you to monitor the functioning of public endpoints and application units. For an application, the Hits dialog box displays the total number of requests received by each configured public endpoint. For an application unit, the Hits dialog box displays the number of requests that the application unit processed from each of the public endpoints and the total hit count. For instructions on viewing hit counters, see Verifying and Testing the Configuration.

**Deleting an Application**

December 10, 2018

If you no longer need an application and its application units, you can delete it. When you delete an AppExpert application, backend services are not deleted, and any public endpoints that the application used become available for use by other applications.
When deleting an application, you are also prompted to specify whether you want to delete any bound policies and actions that are not used elsewhere.

To delete an application unit for an application by using the GUI:

Navigate to **AppExpert > Applications**, select an application and click **Edit**. In the **Application Unit** section, click the delete icon next to the entity

### Configure application authentication, authorization, and auditing

December 13, 2018

You can configure Authentication, Authorization, and Auditing (AAA) for the applications that you configure on the appliance. An authentication policy that is configured for an application defines the type of authentication to apply when a user or group attempts to access the application. If external authentication is used, the policy also specifies the external authentication server. Authorization policies configured for an application specify whether a particular user or group can access the application. Auditing policies define the audit log type, the level at which logging is performed, and other audit server settings. Authentication and auditing policies use the classic policy format.

Authentication policies, authorization policies, and auditing policies can be configured in any order. However, before you configure AAA for an application, you must configure a public endpoint for the application.

Configuring authentication for an application involves specifying an authentication FQDN, an authentication virtual server, a server certificate, and authentication and session policies. Authentication policies are automatically bound to the authentication virtual server specified for the application.

To configure authentication for an AppExpert application:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, do one of the following:
   a) Click Add to add an authentication for a new application.
   b) Click Edit to modify an existing application.
3. In the **Applications** page, select an Application Unit.
4. In the **Application Unit** slider page, click Authentication from the **Advanced Settings** section.
5. In the **Authentication** section, select the authentication type as follows:
   a) Form based authentication
   b) 401 based authentication
   c) None
6. Click **OK** and then click **Done**.
Configure application authorization

You can configure authorization for users and groups to enable them to access an AppExpert application. If the AAA user or group for which you want to configure permissions has not already been created, you can create it from AppExpert and then configure permissions for application access.

To configure permissions for a AAA user or group to access an AppExpert application:

1. Navigate to AppExpert > Applications.
2. In the details pane, click the AppExpert application for which you want to configure a user or group access.
3. In the Applications page, and then click Authorization. from the Advanced Settings section.
4. Do one of the following:
   - If the AAA user or group for which you want to configure permissions are already in the Groups/Users tree, drag the user or group from the Groups/Users tree to the Users or Groups node in the application tree. Then, right-click the user or group and click Allow.
   - If the AAA user or group for which you want to configure permissions is not configured on the appliance, in the application tree, right-click Users or Groups, and then click Add. In the Create AAA Group or Create AAA User dialog box, fill in the values, click Create, and then click Close. The user or group is created with the permission set to Allow. To change the permission setting, right-click the group or user, and then click the permission setting.
5. Click Done and then click Close.

Configure application auditing

When you configure auditing policies for an application, you must specify the server to which the log messages must be directed, the format of the messages logged, and the log level. Optionally, you can configure other settings, such as the log facility and date format. Auditing policies are automatically bound to all the AppExpert application’s public endpoints.

To configure auditing policies for an application:

1. Navigate to AppExpert > Applications.
2. In the details pane, click the application for which you want to configure auditing policies.
3. In the Application Unit slider page, click + icon in the Policies section to configure the auditing policies.
4. In the Policies slider page, select policy type as Syslog auditing or Nslog auditing and click Continue.
5. In the Policy binding section, set the following parameters.
   a) Select a policy for binding. If you do not have a policy for binding, click + to create a new policy.
b) To create a new auditing policy, under Policy Name, click **New Policy**, and then, in the **Policy** page do the following:
   i. In the Name box, type a name for the policy.
   ii. The Name box already contains the string that is required at the beginning of the server name. You cannot modify the string.
   iii. From the Auditing Type list, select the auditing type (either SYSLOG or NSLOG).
   iv. If the audit server you want to specify is already listed in the Server list, select the server from the list, and then, if you want to modify the server settings, click **Modify**. In the **Configure Auditing Server** dialog box, modify the settings as appropriate, and then click **OK**. For more information about the settings in the **Configure Auditing Server** dialog box, see **Auditing Authenticated Sessions**.
   v. If you want to configure a new audit server, click **New**, and then, in the **Create Auditing Server** dialog box, type a name for the server, specify the server IP address, port number, and other settings as appropriate. When finished, click **OK**.
   vi. Click **Create**.

c) To change the priorities for the new auditing policies you created, under Priority, for each policy for which you want to change the priority, double-click the priority value and type new priority value.

d) To regenerate priorities, click **Regenerate Priorities**.

e) To unbind a policy, click the policy, and then click **Unbind Policy**.

f) To modify a policy, click the policy, and then click **Modify Policy**.

6. Click **Apply Changes**, and then click **Close**.

**Disabling AAA for an Application**

After you configure AAA for an application, you can disable the AAA configuration for that application. When you disable AAA for an application, the configuration is not lost. You can enable AAA for the application when you want to reapply the configuration.

To enable or disable AAA for an application:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, click the application for which you want to enable or disable AAA, and then do one of the following:
3. To disable AAA for the application, click **Turn Off AAA**.
4. To enable AAA for the application, click **Turn On AAA**.
Setting Up a Custom NetScaler Application

December 13, 2018

If an AppExpert application template is not available for the Web application that you want to manage through the NetScaler appliance, or if available AppExpert application templates do not suit your requirements, you can create an AppExpert application without a template.

To create an AppExpert application without a template, you must first create an application and application units. Then, you configure public endpoints, services, and service groups. Finally, you configure the policies that determine how application traffic is evaluated and processed.

After you create the application and application units and configure policies, you must verify the configuration and test it to make sure that it is working correctly, just as you would when you configure an application by using a prebuilt AppExpert application template. Then, you must monitor the application to make sure that the application and its entities are working correctly.

Creating an Application

When you create an AppExpert application, the appliance creates a container to which you can add application units. The default application unit is not created until you create the first application unit.

To create an AppExpert application by using the GUI:

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click Applications, and then click Add.
3. In the Create Application dialog box, in Name, enter a name for the application, and then click OK.

Creating Application Units

For each subset of traffic associated with your web application, you must create an application unit.

To create an application unit for the AppExpert application by using the GUI:

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click the application for which you want to add an application unit, and then click Add.
3. Click Create.
**Configuring Public Endpoints for an AppExpert Application**

After you have created all the application units that you require, you must configure one or more public endpoints to enable clients to access the web application through the NetScaler appliance.

To configure public endpoints for an AppExpert application by using the GUI:

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click the application for which you want to configure public endpoints, and then click Configure Public Endpoints.
3. In the Choose Public Endpoints dialog box for the application, do one of the following:
   - If the endpoints you want are listed in the dialog box, click the corresponding check boxes.
   - If you want to specify all the public endpoints, click Activate All.
   - If you want to dissociate endpoints from the AppExpert application, clear the corresponding check boxes.
   - If you want to create a new public endpoint, click Add. Then, in the Create public endpoint dialog box, configure endpoint settings, and then click OK.
   
   In the Create public endpoint dialog box, you can specify only the name, IP address, port, and protocol for the endpoint. You can specify additional endpoint settings after you create the public endpoint. To specify additional endpoint settings, after you create the endpoint, in the Choose Public Endpoints dialog box, click the endpoint, and then click Open. Then, in the Configure Public Endpoint dialog box, provide additional settings, and then click OK.
   
   For more information about the parameters in the Create public endpoint and Configure Public Endpoint dialog boxes, see [Content Switching](#).
   - If you want to modify a public endpoint, click the endpoint, and then click Open. Then, in the Configure Public Endpoint dialog box, modify settings for the endpoint, and then click OK.
   
   For more information about the parameters in the Configure Public Endpoint dialog box, see [Content Switching](#).
4. Click Close.

**Configuring Public Endpoints for an Application Unit**

For an application unit, you specify public endpoints in the same way as you would specify public endpoints for an application that is created from an AppExpert application template. For more information about specifying a subset of the endpoints for an application unit, see [Configuring Endpoints for an Application Unit](#).

To configure endpoints for an application unit by using the GUI:

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click the application unit for which you want to specify public endpoints, and then click **Configure Public Endpoints**.

3. In the **Choose Public Endpoints** dialog box for the application unit, do one of the following:
   - If you are specifying endpoints for the application unit for the first time, clear the check boxes that correspond to the endpoints that you do not want to be bound to the application unit.
   - If you want to specify endpoints that are listed in the dialog box but not currently bound to the application unit, click the corresponding check boxes.

4. Click **OK**.

### Configuring Services and Service Groups for an AppExpert Application

Services and service groups are available for application units only after you configure the services and service groups for the AppExpert application. Therefore, you must configure services and service groups for the AppExpert application before you configure the services for the application units. All the services and service groups that you configure for an AppExpert application must use the same protocol (either HTTP or HTTPS). The procedure for configuring services and service groups for an AppExpert application that is not created from a template is the same as that for an application created from a template.

To configure a service or service group for the AppExpert application by using the GUI:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, right-click the application for which you want to configure services or service groups, and then click **Configure Backend Services**.
3. In the **Configure Backend Services** dialog box, do one of the following:
   - To configure services, click the **Services** tab.
   - To configure service groups, click the **Service Groups** tab.
4. On the Service or **Service Groups** tab, do one of the following:
   - If the services or service groups that you want are listed on the tab, click the corresponding check boxes.
   - If you want to specify all the services or service groups, click **Activate All**.
   - If you want to create a new service or service group, click **Add**. Then, in the **Create Service** dialog box or **Create Service Group** dialog box, configure settings for the service or service group, respectively, and then click **Create**.
   - If you want to modify a service, click the service, and then click **Open**. Then, in the Configure Service dialog box or Create Service Group dialog box, configure settings for the service or service group, respectively, and then click **OK**.

For information about the settings in the Create Service, Configure Service, and Create Service Group dialog boxes, see **Load Balancing**.
Configuring services and service groups for an application Unit

After you configure services and service groups, you must configure services and service groups for each application unit. However, this step is not necessary if each backend service hosts all the content associated with the web application. You configure services and service groups for an application unit if the content associated with the application unit is hosted on only a subset of the backend servers.

To configure services or service groups for an application unit by using the GUI:

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click the application unit for which you want to configure a service or service group, and then click Configure Backend Services.
3. In the Configure Backend Services dialog box, do one of the following:
   • To configure services, click the Services tab.
   • To configure service groups, click the Service Groups tab.
4. In the Services or Service Groups tab, do one of the following:
   • Clear the check boxes that correspond to the services or service groups that you do not want configured for the application unit. Make sure that the check boxes that correspond to the services or service groups that you want configured for the application unit are selected. Then, in the Weight column, specify the weight that you want to assign to each configured service.
   • To specify all services or service groups, click Activate All.
5. On the Method and Persistence and Advanced tabs, specify the desired parameters.
6. Click OK.

Configuring Policies

The procedures for configuring policies for an AppExpert application that is created without using a template are the same as those for an AppExpert application that was created from a template. For more information, see Configuring Policies for Application Units.

Creating and managing template files

December 10, 2018

After you set up an AppExpert application and customize it to suit your requirements, you can create a template from the configuration and then share the template with other administrators. Or, you can create a template and then import the template to other NetScaler appliances that require a similar AppExpert application configuration. This simplifies and expedites the process of setting up similar applications on other appliances.
AppExpert application template files can be exported either to the template directory on the NetScaler appliance or to a folder on your local computer. You can then upload and download the templates to and from the NetScaler appliance and rename the templates that are stored in the AppExpert application templates directory on your appliance.

Exporting an appExpert application to a template file

December 10, 2018

When you export an appExpert application, all application-configuration information is exported to a template file, and all deployment-specific information is exported to a deployment file. The string _deployment is automatically appended to the name of the template file to create the name of the deployment file. Both files are in XML format. If you choose to export the application template file to the NetScaler appliance, the template file is stored in the /nsconfig/nstemplates/applications directory and the deployment file is stored in the /nsconfig/nstemplates/applications/deployment_files/ directory. If you have configured a NetScaler Gateway application, you can choose to include the NetScaler Gateway policies in the template.

To export an AppExpert application to a template file by using the GUI:

1. Navigate to AppExpert > Application, select an application entity, and then click Edit.
2. On the Applications page, click the Export as a Template link to export the application configuration and deployment settings as a template.
3. In the Export Application slider, set the following parameters:
   a) Template Filename
   b) Deployment Filename
4. Click Continue and Done.
5. Navigate to AppExpert > Application and click Manage Templates to show the exported configuration as files on the Template File and Deployment File tabs.
Exporting a Content Switching Virtual Server Configuration to a Template File

December 13, 2018

You can also export a content switching configuration as an application template. You can export a content switching virtual server configuration to an application template either from the Content Switching Virtual Servers pane or from the Content Switching Visualizer. Configuration information, which includes the content switching virtual server, all associated load balancing virtual servers, services, service groups, and policies, is exported to a template file and all deployment-specific information is exported to a deployment file. The string “_deployment” is automatically appended to the name of the template file to create the name of the deployment file. Both files are in XML format. If you choose to export the application template file to the NetScaler appliance, the template file is stored in the /nsconfig/nstemplates/applications directory on the NetScaler appliance and the deployment file is stored in the /nsconfig/nstemplates/applications/deployment_files/ directory.

For more information about the format of application templates and deployment files, see Understanding NetScaler Application Templates and Deployment Files. The configuration information that is exported includes the content switching virtual server, all associated load balancing virtual servers, services, service groups, and policies.

However, if the content switching virtual server is already configured as the public endpoint for an AppExpert application, you cannot export the configuration to a template file. In this scenario, you must export the associated AppExpert application to a template.

For more information about exporting an AppExpert application to a template file, see Exporting an AppExpert Application to a Template File.

To export a content switching configuration to an application template file from the Content Switching Visualizer by using the GUI:

1. Navigate to Traffic Management > Content Switching > Virtual Servers.
2. In the details pane, click the name of the content switching virtual server whose configuration you want to export as a template file, and then click Visualizer.
3. In the Content Switching Visualizer, click the icon for the content switching vserver, click Related Tasks, and then click Create Template.
4. In the Export…as Template dialog box, enter a name for the template file, and then do one of the following:
   • To export the template file to the appliance, make sure that Browse (Appliance) is displayed.
   • To export the template file to your computer, click the Browse (Appliance) drop-down menu, click Local, browse to the location to which you want to save the file, and then
click Save.

5. Provide the following information:

- **Introduction Description**—Any text that introduces the AppExpert application template during import. This text is displayed on the Specify Application Name page of the AppExpert Template Wizard when the template is imported.
- **Summary Description**—Any summary that you might want to display on the Summary page of the AppExpert Template Wizard when the template is imported.
- **Author**—The name of the author of the template.
- **Major**—The major version number of the template.
- **Minor**—The minor version number of the template. This number is appended to the major version number and displayed on the Summary page of the AppExpert Template Wizard, during import, in the format Major.Minor.

6. Click OK.

To export a content switching configuration to an application template file from the Content Switching Virtual Servers pane by using the GUI:

1. Navigate to Traffic Management > Content Switching > Virtual Servers.
2. In the details pane, click the name of the content switching virtual server whose configuration you want to export as a template file, and then click Create AppExpert Template.
3. Perform steps 4 through 6 described in To export a content switching configuration to an application template file from the Content Switching Visualizer procedure.

### Creating Variables in Application Templates

January 6, 2019

Application templates support the declaration of variables in the policy expressions and actions that are configured for an application. The ability to declare variables in policy expressions and actions enables you to replace preconfigured values in expressions (for example, configurable parameters such as the host name of a server or the target for a Rewrite action) with values that suit the environment into which you are importing the template. If variables have been configured for an AppExpert application template, the AppExpert Template Wizard, which appears when you import an AppExpert application template, includes a Specify Variable Values page on which you can specify appropriate values for the variables that are configured for the template.

As an example, consider the following policy expression that is configured to evaluate the value of the Host header in an HTTP request:

```plaintext
1 HTTP.REQ.HEADER("Host").CONTAINS("server1")
```
If you want the server name to be configurable at import time, you can specify the string “server1” as a variable. When importing the template, you can specify a new value for the variable on the Variables tab.

After you create a variable, you can do the following:

• Assign additional strings to an existing variable. After you create a variable for a string, you can select and assign other parts of the same or different expression to the variable. The strings you assign to a variable need not be the same. At import time, all the strings that are assigned to the variable are replaced with the value that you provide.
• View the string or strings that are assigned to the variable.
• View a list of all the entities and parameters that use the variable.

In the export application template wizard, you can define variables in certain fields (fields with an adjacent button) for the following entities:

• Cache policies
• Rewrite policies
• Rewrite actions
• Responder policies
• Responder actions

To configure a variable in a policy expression or action by using the GUI:

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click the application that you want to export to a template file, and then click Export.
3. In the Export…as Template dialog box, modify the default template file name if required, specify the location where you want to save the template, and then click Configure Variables.
4. In the Configure Variables dialog box, click the tab that lists the policy expression or action for which you want to configure a variable, select the expression, and then click Configure Variables.
5. In the Variables dialog box, click the button next to the expression or value in which you want to create a variable.
6. In the Variables dialog box, do the following:

   • To create a variable, in the text box that displays the configured expression or value, select the string that you want to be configurable at import time, and then click Add. In the Add Variable dialog box, specify a name and a description for the variable, and then click Create.

   • The name of the variable, its value, and the description you provided appear in the Available Variables listing in the dialog box. The name you provide will be the name of the
associated field in the template import wizard, and the description will appear as alt text when the user positions the mouse pointer over the field.

- To modify a variable, in the Available Variables list, click the variable, and then click Open. In the Add Variable dialog box, modify the value and the description, and then click OK.
- To view all the strings that are assigned to a given variable, in the Available Variables listing, click the name of the variable. The strings that are assigned to the variable are highlighted.
- To view a list of all the entities and parameters in which the variable is used, in the Available Variables listing, click the variable whose references you want to view, and then click Show References.
- To assign a string to an existing variable, in the text box that displays the expression you configured, select the string you want to assign to an existing variable, right-click the selection, click Use Existing Selection, and then click the name of the variable to which you want to assign the string.

If a variable has multiple strings assigned to it, when you specify a new value for the variable during import, all strings assigned to the variable are replaced with the new value.

7. Click Close.

## Uploading and downloading template files

December 10, 2018

Template files can be uploaded from your local computer to the NetScaler appliance or downloaded from the appliance to your local computer. On the appliance, AppExpert application templates are always stored in the AppExpert application templates directory, which is `/nsconfig/nstemplates/applications/`.

To upload an AppExpert application template from your local computer to the NetScaler appliance:

1. Navigate to **AppExpert > Templates**.
2. In the details pane, click **Manage Templates**.
3. In the **Manage Application Templates** dialog box, click **Application Templates**, and then click **Upload**.
4. In the **Upload Application Template** dialog box, browse to the directory in which the template file is stored, click the template file, and then click **Select**.

The template file is uploaded to the AppExpert application template directory on the appliance.

To download an AppExpert application template from the NetScaler appliance to your local computer:
1. Navigate to **AppExpert > Templates**.
2. In the details pane, click **Manage Templates**.
3. In the **Manage Application Templates** dialog box, click the AppExpert application template that you want to download, and click **Download**.
4. In the **Download Application Template** dialog box, browse to the location to which you want to save the file, and then click **Save**.

## Understanding NetScaler application templates and deployment files

December 10, 2018

When you export a NetScaler application, the following two files are automatically created:

- **NetScaler application template file.** Contains application-configuration information such as application units, rules, and configured policies.
- **Deployment file.** Contains deployment-specific information such as public endpoints, services, associated IP addresses, and configured variables.

In a template file or deployment file, each unit of application-configuration information is encapsulated in a specific XML element that is meant for that unit type. For example, each public endpoint and associated endpoint details are encapsulated within the `<appendpoint>` and `<appendpoint>` tags, and all the endpoint elements are encapsulated within the `<appendpoint_list>` and `<appendpoint_list>` tags.

**Note:** After you export a NetScaler application, you can add elements, remove elements, and modify existing elements before importing the application to a NetScaler appliance.

### Example of a NetScaler Application Template

Following is an example of a template file that was created from a NetScaler application called **SharePoint_Team_Site**:

```
1  <?xml version="1.0" encoding="UTF-8" ?>
2  <template>
3    <template_info>
4      <application_name>SharePoint_Team_Site</application_name>
5      <templateversion_major>1</templateversion_major>
6      <templateversion_minor>1</templateversion_minor>
7      <author>Ed</author>
8      <introduction>An application for managing a SharePoint team site with images, reports, and, XML content.</introduction>
9      <summary>This template includes variables</summary>
```
<version_major>9</version_major>
<version_minor>3</version_minor>
<build_number>38</build_number>
</template_info>
<apptemplate>
<rewrite>
  <rewriteaction_list>
    <rewriteaction>
      <name>Rw_name</name>
      <type>replace</type>
      <target>HTTP.REQ.BODY(10000).AFTER_REGEXP(re/number/).
      BEFORE_REGEXP(re/address/)</target>
    <stringbuilderexpr>"NA"</stringbuilderexpr>
         <allow Unsafe_pi1>NO</allow Unsafe_pi1>
    </rewriteaction>
  </rewriteaction_list>
</rewrite>
<rewritepolicy_list>
  <rewritepolicy>
    <name>Rw_number_NA</name>
    <rule>HTTP.REQ.BODY(100000).CONTAINS("admin")</rule>
    <action>Rw_name</action>
  </rewritepolicy>
  <rewritepolicy>
    <rule/>
  </rewritepolicy>
  <rewritepolicy>
    <rule/>
  </rewritepolicy>
  <rewritepolicy>
    <rule/>
  </rewritepolicy>
</rewritepolicy_list>
</apptemplate>
<appunit_list>
  <appunit>
    <name>SharePoint_Team_Sitedefault</name>
    <rule/>
  <expression_type>PE</expression_type>
<servicetype>HTTP</servicetype>
<ipv46>0.0.0.0</ipv46>
<ipmask>*</ipmask>
<port>0</port>
<range>1</range>
<persistencetype>NONE</persistencetype>
<timeout>2</timeout>
<persistencebackup>NONE</persistencebackup>
<backuppersistencetimeout>2</backuppersistencetimeout>
<lbmethod>LEASTCONNECTION</lbmethod>
<persistmask>255.255.255.255</persistmask>
<v6persistmasklen>128</v6persistmasklen>
<pq>OFF</pq>
<sc>OFF</sc>
<m>IP</m>
<dataoffset>0</dataoffset>
<sessionless>DISABLED</sessionless>
<state>ENABLED</state>
<connfailover>DISABLED</connfailover>
<clttimeout>180</clttimeout>
<somethod>NONE</somethod>
<sopersistence>DISABLED</sopersistence>
<redirectportrewrite>DISABLED</redirectportrewrite>
<downstateflush>DISABLED</downstateflush>
<gt2gb>DISABLED</gt2gb>
<ipmapping>0.0.0.0</ipmapping>
<disableprimaryondown>DISABLED</disableprimaryondown>
<insertvserveripport>OFF</insertvserveripport>
<authentication>OFF</authentication>
<authn401>OFF</authn401>
<push>DISABLED</push>
<pushlabel>none</pushlabel>
<l2conn>OFF</l2conn>
</appunit>
<appunit>
.
.
.
</appunit>
<br>
<br>
<br>
</appunit_list>
</apptemplate>
Example of a deployment file

Following is the deployment file associated with the SharePoint_Team_Site application in the preceding example:

```xml
<?xml version="1.0" encoding="UTF8" ?>
<template_deployment>
  <template_info>
    <application_name>SharePoint_Team_Site</application_name>
    <templateversion_major>1</templateversion_major>
    <templateversion_minor>1</templateversion_minor>
    <author>Ed</author>
    <introduction>An application for managing a SharePoint team site with images, reports, and, XML content.</introduction>
    <summary>This template includes variables</summary>
    <version_major>9</version_major>
    <version_minor>3</version_minor>
  </template_info>
</template_deployment>
```
<build_number>38</build_number>
</template_info>
<appendpoint_list>
<appendpoint>
<ipv46>10.111.111.1</ipv46>
<port>80</port>
<servicetype>HTTP</servicetype>
</appendpoint>
</appendpoint_list>
<service_list>
<service>
<ip>10.102.29.5</ip>
<port>80</port>
<servicetype>HTTP</servicetype>
</service>
<service>
.
.
.
</service>
.
.
.
</service_list>
<variable_list>
<variable>
<name>body_size</name>
<description>Evaluation Scope</description>
<value>10000</value>
</variable>
<variable>
.
.
.
</variable>
.
.
.
</variable_list>
</template_deployment>
NetScaler Gateway Applications

When you configure an AppExpert application to manage a web application through the Citrix® NetScaler® appliance, you also create a set of application units and configure a set of traffic optimization and security policies for each unit. The policies that you configure for each application unit (policies for features such as Compression, Caching, and Rewrite) evaluate traffic that is meant only for that unit. In addition to these policies, you might want to configure Access Gateway policies for the application as a whole to optimize the application traffic when accessed through the Access Gateway. The Access Gateway Applications feature enables you to configure Access Gateway policies (Authorization, Traffic, Clientless Access, and TCP Compression) for an AppExpert application. After you configure NetScaler Gateway policies for AppExpert applications, you can include the policy configuration in the AppExpert application templates that you create.

You can also configure NetScaler Gateway policies for intranet subnets, file shares, and other network resources. Finally, you can create bookmarks for AppExpert applications and certain resources if you want users to be able to access them from the NetScaler Gateway home page.

You can configure the entities in the NetScaler Gateway Applications feature only by using the GUI.

How an NetScaler Gateway Application Works

When you create an AppExpert application in the Applications node in the GUI, a corresponding Access Gateway application is automatically created in the Access Gateway Applications node. Additionally, a rule that uses the AppExpert application’s configured public endpoint is automatically created for the
Access Gateway application entry. If multiple endpoints are configured for the AppExpert application, the rule includes all the configured public endpoints. The NetScaler appliance uses this rule to apply any configured Access Gateway policies to the traffic received at the AppExpert application’s public endpoint. Traffic received at the AppExpert application’s public endpoint is first evaluated against the NetScaler Gateway policies and then evaluated against the policies configured for AppExpert application’s application units.

The rule that is created for the Clientless Access policies for an Access Gateway application is an advanced expression that also uses the public endpoint that is configured for the AppExpert application. Therefore, before you configure NetScaler Gateway policies for an AppExpert application, you must configure public endpoints for the AppExpert application.

When you include the NetScaler Gateway configuration in an application template, deployment-specific information, such as IP address and port information, and the rule that is created from this information are not included in the template.

How a NetScaler Configuration for a File Share Works

On the NetScaler appliance, you can configure Authorization policies for a file share that is hosted on your organization’s network.

When you create a file share, you specify a name for the file share and the network path to the file share. In the network path, you can specify either the name of the server or the server IP address. A rule that uses the components of the file share path is automatically created for the file share. This rule enables the appliance to identify requests for files hosted on the file share server. Any Authorization policies that are configured for the file share are applied to incoming requests.

The NetScaler configuration for a file share cannot be saved in AppExpert application templates.

How a NetScaler Configuration for an Intranet Subnet Works

For the intranet subnets that form a part of your network, you can configure policies for Authorization, Traffic, and TCP Compression on the NetScaler appliance. When adding an intranet subnet, you specify the IP address and the netmask of the intranet subnet. A rule that uses these two parameters is automatically created for the intranet subnet. The appliance applies the configured policies to any request that has a destination IP address and netmask set to the subnet’s IP address and netmask, respectively.

The NetScaler configuration for an intranet subnet cannot be saved in AppExpert application templates.
**How the Other Resources Category Works**

The Other Resources category enables you to configure Access Gateway policies for any network resource by using a rule of your choice. When you configure the NetScaler appliance to process requests for the network resource, you configure a classic expression to identify the requests that are associated with the network resource. You can configure Authorization, Traffic, Clientless Access, and TCP Compression policies for a network resource in Other Resources. The NetScaler appliance applies the configured NetScaler Gateway policies to any requests that match the configured rule.

The NetScaler configuration for a network resource in Other Resources cannot be saved in AppExpert application templates.

**Entity Naming Conventions**

The NetScaler Gateway Applications feature enforces a naming convention for some of the entities that you create in this feature. For example, the names of the profiles that you create for Traffic policies for an intranet subnet always begin with a string that consists of the name of the intranet subnet followed by an underscore (_). The name that you provide for the entity is appended to this string. If the name of a subnet is “subnet1,” the name of the profile begins with “subnet1_.” When such a naming convention is required (in the text box in which you type the name of an entity, for example), the user interface automatically inserts the string with which the name of the entity must begin and does not allow you to modify it.

**Adding Intranet Subnets**

December 10, 2018

You can specify authorization and Traffic policies for traffic that is bound for the intranet subnets that are configured in your network. The rules for these policies are automatically created by using the parameters you specify for the subnet.

To configure an intranet subnet by using the GUI:

1. In the navigation pane of the GUI, expand AppExpert, and then click Access Gateway Applications.
2. In the details pane, do one of the following:
   - To add an intranet subnet, click Intranet Subnets, and then click Add.
   - To modify an intranet subnet, click an intranet subnet, and then click Open.
3. In the Create Intranet Subnet or Configure Intranet Subnet dialog box, do the following:
a) In the Name box, type a name for the intranet subnet you are adding. This parameter cannot be changed for an existing intranet subnet.
b) In the IP Address box, type the IP address of the intranet subnet.
c) In the Netmask box, type the netmask that will be used for the intranet subnet.
d) Click Create or OK, and then click Close.

Adding Other Resources

December 10, 2018

For a network resource that you add to Other Resources, you must configure a classic expression that identifies the subset of traffic associated with the resource. For more information about configuring a classic expression, see the...

To configure a resource in Other Resources by using the GUI:

1. In the navigation pane of the GUI, expand AppExpert, and then click Access Gateway Applications.
2. In the details pane, do one of the following:
   • To add a resource, click Other Resources, and then click Add.
   • To modify a resource, click a resource, and then click Open.
3. In the Create Resource or Configure Resource dialog box, do the following:
   a) In the Name box, type a name for the resource you are adding. This parameter cannot be changed for an existing resource.
   b) In the Rule box, type the rule that will identify the subset of traffic that is associated with the resource you are adding.
      Alternatively, click Configure, and then create the rule in the Create Expression dialog box.
   c) Click Create or OK, and then click Close.

Configuring Authorization Policies

December 10, 2018

You can configure NetScaler Gateway authorization policies for AAA users and groups to access a resource.

To configure permissions for a AAA user or group to access a resource by using the GUI:

1. In the navigation pane of the GUI, expand AppExpert, and then click Access Gateway Applications.
2. In the details pane, in the Authorization column, click the icon for the application, file share, intranet subnet, or resource for which you want to configure authorization policies for AAA users and groups.

3. Do one of the following:
   • If the AAA user or group for which you want to configure permissions is already in the Groups/Users tree, drag the user or group from the Groups/Users tree to the Users or Groups node in the <application name> tree. Then, right-click the user or group and click Allow.
   • If the AAA user or group for which you want to configure permissions is not configured on the appliance, in the <application name> tree, right-click Users or Groups, and then click Add. In the Create AAA Group or Create AAA User dialog box, fill in the values, click Create, and then click Close. The user or group is created with the permission set to Allow. To change the permission setting, right-click the group or user, and then click the permission setting.

4. Click Close.

Configuring Traffic Policies

December 10, 2018

The traffic policies that you configure for the resources in the NetScaler Gateway Applications node control client connections to the application. You do not have to configure a rule for the resource. The rule created automatically when you create the resource. You only need to associate a request profile with the traffic policy. In the traffic profile, you specify parameters such as the protocol, application time-out, and file type association.

To configure traffic policies for a resource

1. In the navigation pane of the GUI, expand AppExpert, and then click Access Gateway Applications.
2. In the details pane, in the Traffic column, click the icon provided for the application, file share, intranet subnet, or resource for which you want to configure traffic policies.
3. In the Configure Traffic Policies dialog box, do the following:
   • To specify an existing traffic policy, click Insert Policy, and then, in the Policy Name column, click the name of the policy.
   • To configure a new policy, click Insert Policy, and then, in the Policy Name column, click New Policy. In the Create Traffic Policy dialog box, in the Name box, after the underscore (_), type a name for the policy. Then, in Request Profile, either select an existing request profile or click New to configure a new request profile. You can also select an existing profile and then click Modify to modify the profile.
For more information about configuring a traffic policy or profile, see NetScaler Gateway.

- To modify a policy that you have inserted, in the Policy Name column, click the policy name, and then click Modify Policy. To modify only the associated profile, in the Profile column, click the name of the profile, and then click Modify Profile.
- To regenerate the priorities assigned to the policies, click Regenerate Priorities.
- To specify a new priority value for a policy, in the Priority column, double-click the assigned priority, and then enter the value you want.
- To unbind a policy, click the policy, and then click Unbind Policy.

4. Click **Apply Changes**, and then click **Close**.

## Configuring Clientless Access Policies

December 10, 2018

Clientless access, when configured for a resource on the NetScaler appliance, allows end-users to access the resource without using the NetScaler Gateway client software. Users can use web browsers to access resources such as Outlook Web Access. You configure clientless access for a resource by configuring a clientless access policy that is associated with a clientless access profile.

To configure a clientless access policy for a resource in the NetScaler Gateway Applications node:

1. In the navigation pane of the GUI, expand **AppExpert**, and then click **Access Gateway Applications**.
2. In the details pane, in the **Clientless Access** column, click the icon for the application, file share, intranet subnet, or resource for which you want to configure a clientless access policy.
3. In the **Configure Clientless Access Policies** dialog box, do the following:
   - To specify an existing clientless access policy, click **Insert Policy**, and then, in the Policy Name column, click the name of the policy.
   - To configure a new clientless access policy, click Insert Policy, and then, in the Policy Name column, click New Policy. In the Create Clientless Access Policy dialog box, in the Name box, after the underscore (_), type a name for the policy. Then, in Profile, either select an existing profile or click New to configure a new profile. You can also select an existing profile and then click Modify to modify the profile. For more information about configuring a clientless access policy or profile, see NetScaler Gateway.
   - To modify a policy that you have inserted, in the Policy Name column, click the policy name, and then click Modify Policy. To modify only the associated profile, in the Profile column, click the name of the profile, and then click Modify Profile.
   - To specify a new priority value for a policy, in the Priority column, double-click the assigned priority, and then enter the value you want.
To unbind a policy, click the policy, and then click **Unbind Policy**.

4. Click **Apply Changes**, and then click **Close**.

## Configuring TCP Compression Policies

December 10, 2018

You can configure TCP compression policies for an application to increase the performance of the application. TCP compression reduces network latency, reduces bandwidth requirements, and increases the speed of transmission. When configuring a TCP compression policy, you associate a compression action with the policy. The compression action specifies either Compress, GZIP, Deflate, or NoCompress as the compression type. For more information about the compression policies, and compression actions, see NetScaler Gateway.

To configure a TCP compression policy for a resource in the NetScaler Gateway Applications node

1. In the navigation pane of the GUI, expand AppExpert, and then click Access Gateway Applications.
2. In the details pane, in the TCP Compression column, click the icon for the application, file share, intranet subnet, or resource for which you want to configure a TCP compression policy.
3. In the Configure TCP Compression Policies dialog box, do the following:
   - To specify an existing TCP compression policy, click **Insert Policy**, and then, in the **Policy Name** column, click the name of the policy.
   - To create a new TCP compression policy, click **Insert Policy**, and then, in the Policy Name column, click **New Policy**. In the Create TCP Compression Policy dialog box, in the Policy Name box, after the underscore (“_”), type a name for the policy. Then, in Action, either select an existing action or click **New** and configure a new action. You can also click **View** to view the configured compression type.
     For more information about configuring a TCP compression policy or action, see NetScaler Gateway, Enterprise Edition at NetScaler Gateway.
   - To modify a policy that you have inserted, in the Policy Name column, click the policy name, and then click **Modify Policy**.
   - To regenerate the priorities assigned to the policies, click **Regenerate Priorities**.
   - To specify a new priority value for a policy, in the Priority column, double-click the assigned priority, and then enter the value you want.
   - To unbind a policy, click the policy, and then click **Unbind Policy**.

4. Click **Apply Changes**, and then click **Close**.
Configuring Bookmarks

December 10, 2018

You can configure bookmarks for an application or for a resource that you configure in the Other Resources category if you want the application or resource to be accessible from the NetScaler Gateway home page.

To configure a bookmark for a NetScaler Gateway application or a resource in the Other Resources category:

1. In the navigation pane of the GUI, expand AppExpert, and then click Access Gateway Applications.
2. In the details pane, click the application or resource for which you want to configure a bookmark, and then click Configure Bookmark.
3. In the Create Bookmark dialog box, configure values for the parameters.
   For more information about the parameters in the Create Bookmark dialog box, see NetScaler Gateway.
4. Click Create, and then click Close.

Customizing the configuration

December 13, 2018

After you verify that the AppExpert application is working correctly, you can customize the configuration to suit your requirements.

After you verify that the AppExpert application configuration is working correctly, you can configure the application and the deployment settings to suit your requirements. When you import an application template and deployment file, the system automatically populates the target application with the available configuration settings (such as application units, application unit rules, policies, persistence settings, load balancing methods, profiles, and traffic settings). In this application, you can configure deployment settings such as public endpoints, services, and service groups for each traffic subset. If you want the AppExpert application to manage a traffic subset that is not included in the template, you can either add an application unit for a traffic subset or modify the existing application unit. After you customize the configuration, you can also specify the order of evaluation for each traffic subset that the application manages.

Configuring an AppExpert application consists of the following steps:
Configuring Public Endpoints

Configuring Application Units

Specifying the Order of Evaluation

Viewing Application Configuration using Visualizer

Also, you can configure the policies that the template provided. If the AppExpert application template does not include policies for a particular NetScaler feature, such as Rewrite or application firewall, you can configure your own policies.

Configure public endpoints

December 13, 2018

If you did not specify a public endpoint when importing an AppExpert application, you can specify public endpoints after you create the application. You can configure one public endpoint of type HTTP and one public endpoint of type HTTPS for your AppExpert application.

If endpoints are already configured for the application, you can dissociate endpoints from the AppExpert application and delete any endpoints that you no longer need. Note that when you dissociate a public endpoint from the AppExpert application, the endpoint is automatically unbound from the associated application unit, but it is not deleted from the system.

To configure public endpoints for an AppExpert application:

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click the application for which you want to configure public endpoints, and then click Edit.
3. In the Applications page, go to Public Endpoint section and click the pencil icon.
4. In the Public Endpoint slider, set the following parameters.
   a) Public endpoint type. Select the radio button to define the endpoint type.
   b) Name. Name of the public endpoint.
   c) IP address. IP address of the public endpoint.
   d) Port. Port number of the public endpoint.
   e) Protocol. Select a protocol type as HTTP or HTTPS.
5. Click Continue.
6. In the Application Units section, select an application unit from the list.
7. Click Continue to set the policy and server details.
8. Click OK and then Done.
9. Click Close.

For more information about the parameters in the Configure Public Endpoint dialog box, see Content Switching.
Configuring Endpoints for an Application Unit

December 10, 2018

When you configure multiple public endpoints for an AppExpert application, by default, all endpoints are bound to each application unit, and each application unit processes the requests received by all the endpoints. However, you can specify that a given application unit manages the traffic that is received by only a subset of the endpoints that are configured for the AppExpert application.

To configure endpoints for an application unit:

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click the application unit for which you want to specify public endpoints, and then click Configure Public Endpoints.
3. In the Choose Public Endpoints dialog box for the application unit, do one of the following:
   • If you are specifying endpoints for the application unit for the first time, clear the check boxes that correspond to the endpoints that you do not want to be bound to the application unit.
   • If you want to specify endpoints that are listed in the dialog box but not currently bound to the application unit, click the corresponding check boxes.
4. Click OK.

Configure services and service groups for an application unit

December 10, 2018

When you configure a service or service group, you either modify an existing service or service group, or add new services to the AppExpert application. You add services or service groups if you did not specify them when you imported the application template. You also add services and service groups when you increase the number of servers that host instances of the application. You can configure a service and service group for an application unit only after you configure the service or service group for the AppExpert application.

To configure a service or service group for the AppExpert application:

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click the application and then click Edit.
3. In the Applications page, select an application unit and then click Continue.
4. In the Services and Service Groups section, do the following:
   a) In the Service Binding slider, set the following parameters.
Configuring services, service groups, and load balancing parameters for an application unit

December 13, 2018

When you configure services and service groups for an AppExpert application, by default, all the services and service groups are bound to each application unit. However, depending on how you have configured your web application, the application resources that are managed by an application unit might be hosted on only some of the servers that are configured as services for the AppExpert application. Or, a set of servers might host content that is meant for the requests received at one or more specific public endpoints. In such scenarios, if all the services and service groups that are configured for the AppExpert application are associated with the application unit, a request that is forwarded to a server that does not host the requested content might not be served or might be served incorrect content. Therefore, you must ensure that each application unit is configured to manage only those services that can serve the requested content.

When configuring services and service groups for an application unit, you might choose to specify load balancing settings such as the weights that services must be assigned and the desired load balancing, persistence, and spillover methods. For more information about these settings, see Load Balancing.

To configure services or service groups for an application unit

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click the application unit for which you want to configure a service or service group, and then click Configure Backend Services.
3. In the Configure Backend Services dialog box, do one of the following:
   - To configure services, click the Services tab.
   - To configure service groups, click the Service Groups tab.
4. In the Services or Service Groups tab, do one of the following:
• Clear the check boxes that correspond to the services or service groups that you do not want configured for the application unit. Make sure that the check boxes that correspond to the services or service groups that you want configured for the application unit are selected. Then, in the Weight column, specify the weight that you want to assign to each configured service.

• To specify all services or service groups, click **Activate All**.

5. On the **Method** and **Persistence** and **Advanced** tabs, specify the desired parameters.

6. Click **OK**.

### Create application units

December 10, 2018

You might need to add application units for traffic subsets that are either specific to your web application implementation or not defined in the template. When creating an application unit, you must configure a rule for the application unit.

To create an application unit for the AppExpert application:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, right-click the application for which you want to add an application unit, and then click **Add**.
3. In the **Applications** page, go to **Application Units** section and click the **pencil** icon.

To configure policy expressions for an application unit:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, right-click the application for which you want to add an application unit, and then click **Add**.
3. In the **Applications** page, go to **Application Units** section and click the **+** icon to create a unit and add policy expressions.
4. To specify the format of the new expression, do one of the following:
   - a) To specify that you want to configure a classic expression in the Rule box, click **Classic Syntax**.
   - b) To specify that you want to configure an advanced expression in the Rule box, click **Default Syntax**.
   - c) In the Rule box, configure the expression.
5. Click **OK**.
Configuring application unit rules

December 10, 2018

You might want to configure an application unit rule to include or exclude certain types of traffic. When you configure the rule, you can also define the syntax of the expression.

To configure an application unit rule:

1. In the navigation pane of the GUI, expand **AppExpert**, and then click **Applications**.
2. In the details pane, right-click the application unit for which you want to modify the rule, and then click **Open**.
3. In the **Configure Application Unit** dialog box, do the following:
   a) To specify the format of the new expression, do one of the following:
      • To specify that you want to configure a classic expression in the Rule box, click **Classic Syntax**.
      • To specify that you want to configure an advanced expression in the Rule box, click **Default Syntax**.
   b) In the Rule box, configure the expression.
4. Click **OK**.

Configuring policies for application units

December 18, 2018

For an AppExpert application, you can configure policies for Compression, Caching, Rewrite, Responder, and Application Firewall. The templates that you download from the Citrix Community web site provide you with a set of policies that fulfill the most common application management requirements. You might want to fine-tune or customize these policies. If the set of policies provided for a given application unit does not include policies for a particular feature, you can create and bind your own policies for that feature.

If you create an AppExpert application without using a template, you must configure all the policies that the web application needs.

The GUI uses various icons to indicate whether or not policies are configured for a feature. For an application unit, if a policy is configured for a given feature, an icon that represents the feature is displayed. For example, if a compression policy is configured for an application unit, a compression icon is displayed in the Compression column for the application unit. For features for which no policy is configured, an icon depicting a plus sign (+) is displayed.
Note:
When configuring policies for application units, you might need to configure policies and expressions that are either in the classic or default syntax. Additionally, when you configure default syntax policies, you might need to specify parameters such as Goto expressions and invoke policy banks.
For information about configuring policies and expressions in both formats, see Policies and Expressions.

Configuring compression policies

You can use either classic policies or advanced policies to configure compression, but you cannot bind compression policies of both types to the same application unit.

To configure a compression policy for an application unit:

1. Navigate to AppExpert > Applications.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Compression column.
3. In the Configure Compression Policies dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
   - Click Switch to Default Syntax if you want to configure a default syntax compression policy. If you want to bind or configure classic compression policies, and if you are in the default syntax view, you can click Switch to Classic Syntax to return to the classic policy view and begin modifying bound classic policies or create and bind new classic compression policies.
     Important: This setting also determines what policies are displayed when you want to insert a policy. For example, if you are in the default syntax view, when you click Insert Policy, the list that appears in the Policy Name column will include only default syntax policies. You cannot bind policies of both types to an application unit.
   - If you want to configure classic policies, click either Request or Response, depending on whether you want the policy to be evaluated at request-time or at response-time.
     You can configure both request-time and response-time classic compression policies for an application unit. After evaluating all of the request-time policies, if no match is found, the appliance evaluates response-time policies.
   - To modify a compression policy that is already bound to the application unit, click the name of the policy, and then click Modify Policy. Then, in the Configure Compression Policy dialog box, modify the policy, and then click OK.
For information about modifying a compression policy, see Compression.

- To unbind a policy, click the name of the policy, and then click **Unbind Policy**.
- To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
- To regenerate assigned priorities, click **Regenerate Priorities**.
- To insert a new policy, click **Insert Policy** and, in the list that is displayed in the Policy Name column, click **New Policy**. Then, in the Create Compression Policy dialog box, configure the policy, and then click **Create**.

For information about modifying a compression policy, see Compression.

- If you are configuring a default syntax expression, do the following:
  - In the Goto Expression column, select a Goto expression.
  - In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.

4. Click **Apply Changes**, and then click **Close**.

### Configuring Caching Policies

You can use only default syntax policies and expressions to configure Caching policies.

To configure Caching policies for an application unit:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Caching column.
3. In the **Configure Cache Policies** dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
   - Click either Request or Response, depending on whether you want the policy to be evaluated at request-time or at response-time.
   - You can configure both request-time and response-time Caching policies for an application unit. After evaluating all of the request-time policies, if no match is found, the appliance evaluates response-time policies.
   - To modify a Caching policy that is already bound to the application unit, click the name of the policy, and then click **Modify Policy**. Then, in the Configure Cache Policy dialog box, modify the policy, and then click **OK**.
   - For information about modifying a Caching policy, see Integrated Caching.
   - To unbind a policy, click the name of the policy, and then click **Unbind Policy**.
   - To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
   - To regenerate assigned priorities, click **Regenerate Priorities**.
   - To insert a new policy, click **Insert Policy** and, in the list that is displayed in the Policy Name column, click **New Policy**. Then, in the Create Cache Policy dialog box, configure
the policy, and then click Create.
For information about modifying a Caching policy, see Integrated Caching.
• In the Goto Expression column, select a Goto expression.
• In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.

4. Click Apply Changes, and then click Close.

Configuring Rewrite policies

You can use only default syntax policies and expressions to configure Rewrite policies.

To configure Rewrite policies for an application unit:

1. Navigate to AppExpert > Applications.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Rewrite column.
3. In the Configure Rewrite Policies dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
   • Click either Request or Response, depending on whether you want the policy to be evaluated at request-time or at response-time.
     You can configure both request-time and response-time Rewrite policies for an application unit. After evaluating all of the request-time policies, if no match is found, the appliance evaluates response-time policies.
   • To modify a Rewrite policy that is already bound to the application unit, click the name of the policy, and then click Modify Policy. Then, in the Configure Rewrite Policy dialog box, modify the policy, and then click OK.
     For information about modifying a Rewrite policy, see Rewrite.
   • To unbind a policy, click the name of the policy, and then click Unbind Policy.
   • To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
   • To regenerate assigned priorities, click Regenerate Priorities.
   • To insert a new policy, click Insert Policy and, in the list that is displayed in the Policy Name column, click New Policy. Then, in the Create Rewrite Policy dialog box, configure the policy, and then click Create.
     For information about modifying a Rewrite policy, see Rewrite.
   • In the Goto Expression column, select a Goto expression.
   • In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.
4. Click Apply Changes, and then click Close.
Configuring Responder policies

You can use only default syntax policies and expressions to configure Responder policies.

To configure Responder policies for an application unit:

1. Navigate to AppExpert > Applications.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Responder column.
3. In the Configure Responder Policies dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
   - To modify a Filter policy that is already bound to the application unit, click Modify Policy. Then, in the Configure Responder Policy dialog box, modify the policy, and then click OK.
     For information about modifying a Responder policy, see Responder.
   - To unbind a policy, click the name of the policy, and then click Unbind Policy.
   - To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
   - To regenerate assigned priorities, click Regenerate Priorities.
   - To insert a new policy, click Insert Policy and, in the list that is displayed in the Policy Name column, click New Policy. Then, in the Create Responder Policy dialog box, configure the policy, and then click Create.
     For information about modifying a Responder policy, see Responder.
   - In the Goto Expression column, select a Goto expression.
   - In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.
4. Click Apply Changes, and then click Close.

Configuring Application Firewall policies

You can configure both classic and default syntax policies and expressions for Application Firewall. However, if a policy of one type is already bound globally or to a virtual server that is configured on the appliance, you cannot bind a policy of the other type to an application unit. For example, if a default syntax policy is already bound either globally or to a virtual server, you cannot bind a classic policy to an application unit.

To configure Application Firewall policies for an application unit:

1. Navigate to AppExpert > Applications.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Application Firewall column.
3. In the **Configure Application Firewall Policies** dialog box, do one or more of the following, depending on the configuration tasks you want to perform:

   • Click either Classic Expression or Advanced Expression depending on the type of expression you want to configure for the Application Firewall policy.

     **Important**: This setting also determines what policies are displayed when you want to insert a policy. For example, if you select Advanced Expression, when you click Insert Policy, the list that appears in the Policy Name column will include only default syntax policies. You cannot bind policies of both types to an application unit. This option is not available if a policy of either type is already bound either globally or to a virtual server.

   • To modify an application firewall policy that is already bound to the application unit, click the name of the policy, and then click **Modify Policy**. Then, in the Configure Application Firewall Policy dialog box, modify the policy, and then click OK.

     For information about modifying a application firewall policy, see **Policies**.

   • To unbind a policy, click the name of the policy, and then click **Unbind Policy**.

   • To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.

   • To regenerate assigned priorities, click **Regenerate Priorities**.

   • To insert a new policy, click **Insert Policy** and, in the list that is displayed in the Policy Name column, click **New Policy**. Then, in the Create Application Firewall Policy dialog box, configure the policy, and then click **Create**.

     For information about modifying a application firewall policy, see **Policies**.

4. Click **Apply Changes**, and then click **Close**.

**Create application units**

December 10, 2018

You might need to add application units for traffic subsets that are either specific to your web application implementation or not defined in the template. When creating an application unit, you must configure a rule for the application unit.

To create an application unit for the AppExpert application:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, right-click the application for which you want to add an application unit, and then click **Add**.
3. In the **Applications** page, go to **Application Units** section and click the pencil icon.
To configure policy expressions for an application unit:

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click the application for which you want to add an application unit, and then click Add.
3. In the Applications page, go to Application Units section and click the + icon to create a unit and add policy expressions.
4. To specify the format of the new expression, do one of the following:
   a) To specify that you want to configure a classic expression in the Rule box, click Classic Syntax.
   b) To specify that you want to configure an advanced expression in the Rule box, click Default Syntax.
   c) In the Rule box, configure the expression.
5. Click OK.

Configuring public endpoints for an application

December 10, 2018

To configure public endpoints for an application by using the GUI:

1. Navigate to AppExpert > Applications, select an application entity, and then click Edit.
2. In the Public Endpoint section, click + to configure a new public endpoint.
3. In the Public Endpoint slider, do one of the following:
   a) Click New to create a new endpoint.
   b) Click Existing Public Endpoint to select an endpoint from the drop-down list.
4. Set the following endpoint parameters:
   a) Name
   b) IP address
   c) Protocol
   d) Port
5. Click Continue to configure additional settings such as application units, GSLB server bindings, policies, profiles, push, traffic settings, and authentication.
6. Click OK and then Done.
7. Click Continue and then Done.

To edit a public endpoint for an application by using the GUI:

Navigate to AppExpert > Applications, select an application, and click Edit. In the Public Endpoint section, select an endpoint, click the pen icon, and modify the endpoint settings.

To delete a public endpoint for an application by using the GUI:
Navigate to **AppExpert > Applications > Public Endpoint**, click the pen icon to view the delete icon next to the entity.

NetScaler’s video tutorials enable you to understand NetScaler features in an easy and simply way. Watch <https://www.youtube.com/watch?v=z4v-edQiVpw> video to learn how to configure a public endpoint.

## Specifying the Order of Evaluation of Application Units

December 10, 2018

Application unit rules are evaluated in the order in which they are placed in the GUI. The rule that is configured for the topmost application unit is always configured first, followed by the rule that is configured for the second topmost application unit, and so on. The default application unit is always evaluated last.

When a request matches the rule that is configured for an application unit, the request is processed by the application unit, and no further matching is performed. Therefore, the order of evaluation of application units becomes an important factor if the traffic subsets for two or more application units overlap. If the traffic subsets for two or more application units overlap, you must specify the order in which an incoming request is matched against the application unit rules.

To specify the order of evaluation of application units:

1. Navigate to **AppExpert > Applications**, select an application and click **Edit**. In the **Application Unit** section, click the **Pencil** icon and then hover the cursor over the check box to the left of the name of the application unit. Click the icon that appears next to the check box and hold down the mouse to drag the application up or down to a new location in the priority list.

## Configuring Persistency Groups for Application Units

December 10, 2018

You can configure a persistency group for the application units in an AppExpert application. In the context of an AppExpert application, a persistency group is a group of application units that you can treat as a single entity for the purpose of applying common persistence settings. When the application is exported to an application template file, the persistency group settings are included, and they are automatically applied to the application units when you import the AppExpert application.

To configure a persistency group for an application by using the GUI:
1. Navigate to **AppExpert > Applications**.

2. In the **Applications View** dialog box, click the name of the application for whose application units you want to configure a persistency group, and then click **Configure Persistency Groups**.

3. In the **Configure Persistency Groups** dialog box, do one of the following:
   - To add a persistency group, click **Add**.
   - To modify a persistency group, click **Open**.

4. In the **Create Persistency Group** or **Configure Persistency Group** dialog box, set the following parameters:
   - **Group Name**—Name of the persistency group. For the NetScaler appliance to recognize the persistency group as part of the application's configuration, the name of the AppExpert application must be included in the name of the persistency group, as a prefix. Therefore, by default, the appliance displays the prefix in the Group Name box, and you cannot remove that prefix. Enter a name of your choice after the prefix.
   - **Persistence**—Type of persistence for the virtual server. If you select **SOURCEIP**, in the IPv4 Netmask box, enter a network mask that specifies the number of bits that the appliance must consider when creating persistence sessions. If you select **COOKIEINSERT**, in the Cookie Domain and Cookie Name boxes, specify a domain attribute to send in the Set-Cookie directive, and a name for the cookie, respectively.
   - **Timeout**—Time period for which a persistence session is in effect.
   - **Backup Persistence**—Type of backup persistence for the group.
   - **Backup Timeout**—Time period, in minutes, for which backup persistence is in effect.
   - **Application Units**—To add an application unit to the persistency group, in the Available Application Units box, click the application unit, and then click **Add**. To remove an application unit from the persistency group, in the Configured Application Units box, click the application unit, and then click **Remove**.

5. Click **OK**.

**Viewing AppExpert Applications and Configuring Entities by Using the Application Visualizer**

December 10, 2018

The Visualizer feature shows you a graphical representation of an application's configuration. It includes the name of the public endpoint, application units assigned to the public endpoint, and the number of policies and services bound to the application. You can use the Visualizer to obtain a visual overview of an AppExpert application's configuration and configure some of the displayed entities. By default, the Visualizer displays application units, services, and monitors for the selected application.

To view an AppExpert application by using the Application Visualizer:
1. Navigate to **AppExpert > Applications**, select an application entity, and click **Visualizer**.

**AppQoE**

December 10, 2018

Application level Quality of Experience (AppQoE) integrates several existing policy-based security features of the NetScaler appliance into a single integrated feature that takes advantage of a new queuing mechanism, fair queuing. Fair queuing manages requests to load-balanced web servers and applications at the virtual server level instead of at the service level, allowing it to handle queuing of all requests to a web site or application as one group before load balancing, instead of as separate streams after load balancing.

The features that are integrated into AppQoE are HTTP Denial-of-Service Protection (HDOSP), Priority Queuing (PQ), and SureConnect. Collectively these services provide protection against a number of problems:

- **Simple overload.** Any server, no matter how robust, can accept only a limited number of connections at one time. When a protected web site or application receives too many requests at once, the Surge Protection feature detects the overload and queues the excess connections till the server can accept them. The Priority Queuing feature ensures that whoever most needs access to a resource is provided access without having to wait behind other lower-priority requests. The SureConnect feature displays an alternate web page that notifies users that the resource that they requested is not available.

- **Denial-of-Service (DOS) attacks.** Any public-facing resource is vulnerable to attacks whose purpose is to bring that service down and deny legitimate users access to it. The Surge Protection, Priority Queuing, and SureConnect features help manage DOS attacks as well as other types of high load. In addition, the HTTP Denial-of-Service Protection feature targets DOS attacks against your web sites, sending challenges to suspected attackers and dropping connections if the clients do not send an appropriate response.

Until the current version of the NetScaler operating system, these features were implemented at the service level, which means that each service was assigned its own queues. While service-level queues work, they also have some disadvantages, most of which are due to the NetScaler appliance having to load balance requests before implementing any of the protection features that rely on queuing. Implementing protection features before queuing has a number of advantages, some of which are listed below:

- Absolute priority of connections as configured in the priority queuing feature can be maintained.
- Connections are not flushed if a service transitions state, as they are in a service-level queue.
• During periods of high load, such as a denial-of-service attack, HTTP DoS and SureConnect come into play before load balancing, allowing these features to detect and divert unwanted or lower-priority traffic from the load balancer before the load balancer must cope with it.

In addition to implementing fair queuing, AppQoE integrates a set of features that each provide a different set of tools to achieve a common goal: protecting your networked resources from excessive or inappropriate demand. Putting these features into a common framework enables you to configure and implement them more easily.

**Enabling AppQoE**

December 10, 2018

To configure AppQoE, you must first enable the feature.

**To enable AppQoE by using the command line**

At the command prompt, type the following commands:

- `enable ns feature appqoe`
- `show ns feature`

**Example:**

```
1 > enable ns feature appqoe
2 Done
3 > show ns feature

<table>
<thead>
<tr>
<th>Feature</th>
<th>Acronym</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>1) Web Logging</td>
<td>WL</td>
<td>ON</td>
</tr>
<tr>
<td>2) Surge Protection</td>
<td>SP</td>
<td>ON</td>
</tr>
<tr>
<td>3) Load Balancing</td>
<td>LB</td>
<td>ON</td>
</tr>
<tr>
<td>...</td>
<td></td>
<td></td>
</tr>
<tr>
<td>1) AppQoE</td>
<td>AppQoE</td>
<td>ON</td>
</tr>
</tbody>
</table>
```

**To enable AppQoE by using the GUI**

1. Navigate to **System > Settings**.
2. In the details pane, click **Configure Advanced Features**.
3. In the **Configure Advanced Features** dialog box, select the **AppQoE** check box.
4. Click **OK**.

**AppQoE actions**

December 10, 2018

After enabling the AppQoE feature, you must configure one or more actions for handling requests.

**Important**: No specific individual parameters are required to create an action, but you must include at least one parameter or you cannot create the action.

**To configure an AppQoE action by using the command line**

At the command prompt, type the following commands:

- `show appqoe action`

**Example**

To configure priority queuing with policy queue depths of 10 and 1000 for medium and lowest priority queues, respectively:

```plaintext
1 > add appqoe action appqoe-act-basic-prhigh -priority HIGH
  Done

2 > add appqoe action appqoe-act-basic-prmedium -priority MEDIUM
   -polqDepth 10
  Done

3 > add appqoe action appqoe-act-basic-prlow -priority LOW -polqDepth
   1000
  Done

4 > show appqoe action
  1) Name: appqoe-act-basic-prhigh
    ActionType: PRIORITY_QUEUING
    Priority: HIGH

© 1999-2018 Citrix Systems, Inc. All rights reserved.
To modify an existing AppQoE action by using the command line

At the command prompt, type the following commands:

- show appqoe action

To remove an AppQoE action by using the command line

At the command prompt, type the following commands:

- rm appqoe action <name>
- show appqoe action

Parameters for configuring an AppQoE action

- name

A name for the new action, or the name of the existing action that you want to modify. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to letters, numbers, and the hyphen (‐), period (.), pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols.
• priority

The priority queue to which the request is assigned. When a protected web server or application is heavily loaded and cannot accept additional requests, specifies the order in which waiting requests are to be fulfilled when resources are available. The choices are:

1. **HIGH**. Fulfills the request as soon as resources are available.
2. **MEDIUM**. Fulfills the request after it has fulfilled all requests in the HIGH priority queue.
3. **LOW**. Fulfills the request after it has fulfilled all requests in the HIGH and MEDIUM priority queues.
4. **LOWEST**. Fulfills the request only after it has fulfilled all requests in higher-priority queues.

If priority is not configured, then the NetScaler appliance assigns the request to the LOWEST priority queue by default.

• respondWith

Configures the NetScaler to take the specified Responder action when the specified threshold is reached. Must be used with one of the following settings:

- **ACS**: Serves content from an alternate content service. Threshold: maxConn (maximum connections) or delay.
- **NS**: Serves a built-in response from the NetScaler. Threshold: maxConn (maximum connections) or delay.
- **NO ACTION**: Serves no alternative content. Assigns connections to the LOWEST priority queue if the maxConn (maximum connections) or delay threshold is reached.

• altContentSvcName

If
- respondWith ACS is specified, the name of the alternative content service, usually an absolute URL to the web server that hosts the alternate content.

• altContentPath

If
- respondWith (ACS | NS) is specified, the path to the alternative content.

• polqDepth

Policy queue depth threshold value for the policy queue associated with this action. When the number of connections in the policy queue associated with this action increases to the specified number, subsequent requests are assigned to the LOWEST policy queue. Minimum value: 1 Maximum value: 4,294,967,294

• priqDepth

Policy queue depth threshold value for the specified priority queue. If the number of requests in the specified queue on the virtual server to which the policy associated with the current action
is bound increases to the specified number, subsequent requests are assigned to the LOWEST priority queue. Minimum value: 1 Maximum value: 4,294,967,294

- **maxConn**
  
The maximum number of connections that can be open for requests that match the policy rule. Minimum value: 1 Maximum value: 4,294,967,294

- **delay**
  
The delay threshold, in microseconds, for requests that match the policy rule. If a matching request has been delayed for longer than the threshold, the NetScaler appliance performs the specified action. If NO ACTION is specified, then the appliance assigns requests to the LOWEST priority queue. Minimum value: 1 Maximum value: 599999,999

- **dosTrigExpression**
  
  Adds an optional second-level check to trigger DoS actions.

- **dosAction**
  
  Action to take when the ADC determines that it or a protected server is under DoS attack. Possible values: SimpleResponse, HICResponse.

These values specify HTTP challenge-response methods for validating the authenticity of incoming requests to mitigate an HTTP-DDoS attack.

In the HTTP challenge-response generation and validation process, AppQoE uses cookies to validate the client’s response and verify that the client seems to be genuine. When sending a challenge, a NetScaler appliance generates two cookies:

- **Header cookie (_DOSQ)**. Contains client-specific information, so that the NetScaler appliance can verify the response.
- **Body cookie (_DOSH)**. Information used to validate the client machine. The client’s browser (or the user, in the case of HIC) computes a value for this cookie. The NetScaler appliance compares that value with the expected value to verify the client.

The information that the appliance sends to the client for computing the _DOSH value is based on the DoS Action configuration.

1. **SimpleResponse**: In this case, a NetScaler appliance splits the value and generates a JavaScript code to combine the final value. A client machine capable of computing the original value is considered genuine.

2. **HICResponse**: In this case, a NetScaler appliance generates two single-digit numbers and generates images for those numbers. Then, using a backpatch framework, the appliance inserts those images as base64 strings.

**Limitations:**
1. This is not a trivial CAPTCHA implementation, which is why that term not used.

2. The validation number is based on a NetScaler-generated number that does not change for 120s. This number should be dynamic or client specific.

**To configure an AppQoE action by using the GUI**

1. Navigate to App-Expert > AppQoE > Actions.
2. In the details pane, do one of the following:
   - To create a new action, click **Add**.
   - To modify an existing action, select the action, and then click **Edit**.
3. In the **Create AppQoE Action** or the **Configure AppQoE Action** screen, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in “Parameters for configuring the AppQoE Action” as follows (asterisk indicates a required parameter):
   - Name—name
   - Action type—respondWith
   - Priority—priority
   - Policy Queue Depth—polqDepth
   - Queue Depth—priqDepth
   - DOS Action—dosAction
4. Click **Create** or **OK**.

**AppQoE parameters**

December 10, 2018

In the AppQoE parameters, you configure the session life of an AppQoE session, the file name of the file containing the customized response, and the number of client connections that can be placed in a queue.

**To configure the AppQoE parameter settings by using the command line**

At the command prompt, type the following commands:

- `set appqoe parameter [-sessionLife <secs>] [-avgwaitingclient <positive_integer>] [-MaxAltRespBandWidth <positive_integer>] [-dosAttackThresh <positive_integer>]`
- `show appqoe parameter`
Parameters for configuring the AppQoE parameters

- **sessionLife**
  Number of seconds to wait after displaying alternate content before the ADC displays the same content again. Default value: 300 Maximum Minimum value: 1 Maximum value: 4,294,967,294

- **avgwaitingclient**
  The average number of client requests that can be in the service waiting queue. Default value: 1000000 Maximum value: 4,294,967,294

- **MaxAltRespBandWidth**
  The maximum bandwidth to consume when sending alternate responses. If the maximum is reached, the ADC quits sending the alternate content til bandwidth consumption drops. Default value: 100 Minimum value: 1 Maximum value: 4,294,967,294

- **dosAtckThresh**
  The denial-of-service attack threshold. The number of connections that must be waiting in queues before the ADC responds with DoS protection measures. Default value: 2000 Minimum value: 0 Maximum value: 4,294,967,294

To configure the AppQoE parameter settings by using the GUI

1. Navigate to **AppExpert > AppQoE**.
2. In the details pane, click **Configure AppQoE Parameters**.
3. In the **Configure AppQoE params** screen, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in “Parameters for configuring the AppQoE Parameters” as follows (asterisk indicates a required parameter):
   - Session Life (secs) — sessionLife
   - Average waiting client — avgwaitingclient
   - Alternate Response Bandwidth Limit (Mbps) — MaxAltRespBandWidth
   - DOS Attack Threshold — dosAttackThresh
4. Click **OK**.

AppQoE Policies

December 10, 2018
To implement AppQoE, you must configure at least one policy to tell your NetScaler how to distinguish the connections to be queued in a specific queue.

To configure an AppQoE policy by using the command line

At the command prompt, type the following command:

```
add appqoe policy <name> -rule <expression> -action <string>
```

Example:

The following example selects requests with a User-Agent header that contains “Android”, and assigns them to the medium priority queue. These requests come from smartphones and tablets that run the Google Android operating system.

```
1 > add appqoe action appqoe-act-primd -priority MEDIUM
2 Done
3 > add appqoe policy appqoe-pol-primd -rule "HTTP.REQ.HEADER("User-Agent ") CONTAINS("Android")" -action appqoe-act-primd
4 Done
5 > sh appqoe policy appqoe-pol-primd
6   Name: appqoe-pol-primd
7   Rule: HTTP.REQ.HEADER("User-Agent ").CONTAINS("Android")
8   Action: appqoe-act-primd
9   Hits: 0
10
11 Done
```

Parameters for configuring an AppQoE policy

- **name**
  
  A name for the AppQoE policy. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.), pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. You should chose a name that helps identify the type of action.

- **rule**
  
  A NetScaler expression that tells the appliance which connections it should handle. For complete information about policy expressions, see the *NetScaler Policy Configuration and Reference Guide* at .
• action

The AppQoE action to perform when a connection matches the policy.

To configure an AppQoE policy by using the GUI

1. Navigate to **App-Expert > AppQoE > Policies**.

2. In the details pane, do one of the following:
   - To create a new policy, click **Add**.
   - To modify an existing policy, select the policy, and then click **Edit**.

3. If you are creating a new policy, in the **Create AppQoE Policy** dialog, in the Name text box, type a name for your new policy.

   The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. You should choose a name that helps identify the purpose and effect of this policy.

   If you are modifying an existing policy, skip this step. You cannot change the name of an existing policy.

4. In the **Action** drop-down list, choose the AppQoE action to perform when the policy matches a connection. Click the plus (+) to open the **Add AppQoE Action** dialog and add a new action.

5. In the **Rule** text box, either enter the policy expression directly, or click New to create a policy expression. If you click New, perform the following steps:

   a) In the **Create Expression** dialog box, click **Add**.

   b) In the Add Expression dialog box, select a common expression from the Frequently Used Expressions drop-down list, or use the Construct Expression drop-down lists to create the expression that defines which traffic to filter.

      If you choose to create your own expression, you start by selecting the first term from the first drop-down list on the left side of the Construct Expression area. The choices in that list are:

      • HTTP: All traffic to port 80 and port 443.
      • SYS:
      • CLIENT:
      • SERVER:
      • ANALYTICS:
      • TEXT:
The default choice is HTTP. After you make a choice in the first drop-down list (or accept the default), you can choose the next term in your expression from the drop-down list to the right of it. The terms in that list and other lists that follow change depending on your previous choices; the lists offer only terms that are valid choices. Continue to select terms until you have finished the expression.

Use the Help and Preview Expression areas for assistance when creating the expression. For a complete description of the available choices, see the NetScaler Policy Configuration and Reference Guide at.

c) When you have created the expression that you want, click OK. The expression is added in the Expression text box.

6. Click Create. The expression appears in the Rule text box.

**Entity templates**

December 13, 2018

An entity template is a collection of configuration information for an individual entity on a NetScaler® appliance. It provides a specification and a set of defaults for a configurable NetScaler entity, such as a policy, virtual server, service, or action. By using a template that defines a set of defaults, you can quickly configure multiple entities that require a similar configuration while eliminating several configuration steps.

Entity templates are available only in the GUI. You use the NetScaler GUI to create, manage, and use any type of entity template. You can share entity templates with other administrators and manage local folders that contain the templates. You can also import entity templates from and export entity templates to your local computer.

Before creating a template, you should be familiar with the configuration of the entity.

Note: You use entity templates to configure individual entities. To configure multiple entities related to a particular Web application, you must use an application template. For more information, see "AppExpert Applications and Templates."

**How Entity Templates Work:**

When you create a template for a NetScaler entity, you specify default values for the entity. You specify what values must be read-only, what values must not be displayed, and what values users can configure. You also configure the pages that compose the template import wizard. All the information and settings you provide are stored in the template file.

When a user imports the entity template to a NetScaler appliance, a wizard guides the user through the various pages that you configured for the template. The wizard displays the read-only parameter
values and prompts the user to specify values for the configurable parameters. After the user follows
the instructions in the wizard, the appliance creates the entity with the configured values.

For example, you can create an entity template for HTTP services that provides a text box for a service
name and assigns preset values for the service protocol, timeouts, thresholds, and monitors. Later,
when you use the template to create new HTTP services, a wizard prompts you for a service name and
supplies the preset values that you would otherwise have configured manually.

The procedure for creating entity templates for load balancing virtual servers is different than the App-
Expert procedure for creating other entity templates. For more information, see “Creating an Entity
Template.”

In addition, the procedure for using the template to create the load balancing virtual server entity is
different. For more information, see “Creating an Entity from a Template.”

Configuring an entity template

December 10, 2018

You can create or modify an entity template either from the AppExpert feature node or from the asso-
ciated NetScaler feature node for the entity. For example, you can create a content switching virtual
server entity template in either the AppExpert feature node or the content switching feature node in
the GUI.

If you create a template that is not based on an existing entity, you can specify the following options
and settings for the template:

- The default value of a parameter.
- Whether the default values are visible to users.
- Whether the default values can be changed by users.
- The number of pages in the entity import wizard, including the page names, text, and available
  parameters.
- The entities that must be bound to the entity for which the template is being created.

For example, when you are creating a cache redirection virtual server template, you can specify
the policies that you want to bind to the cache redirection virtual servers that you create from
the template. However, only binding information is included in the template. The bound en-
tities are not included. If the entity template is imported to another NetScaler appliance, the
bound entities must exist on the appliance at import time for the binding to succeed. If none of
the bound entities exist on the target appliance, the entity (for which the template was configured) is created without any bindings. If only a subset of the bound entities exist on the target appliance, they are bound to the entity that is created from the template.

When you create a template based on an existing entity, the configuration settings of the entity appear in the template. All bound entities are selected by default, but you can modify bindings as necessary. As in the case of a template that is not based on an existing entity, only binding information is included and not the entities. You can either save the template with the existing configuration settings or use the settings as a basis for creating a new configuration for a template.

**Configuring variables in load balancing virtual server templates**

January 6, 2019

Load balancing virtual server templates support the declaration of variables in the configured load balancing parameters and in bound policies and actions. The ability to declare variables enables you to replace preconfigured values with values that suit the environment into which you are importing the template. The Entity Template Wizard, which appears when you import a template, includes a Specify Variable Values page on which you can specify appropriate values for the variables that are configured for the entity template. This wizard page appears only when you import a template that is configured with existing variables.

As an example, consider the following expression configured for a policy that is bound to a load balancing virtual server for which you are creating a template. The expression evaluates the value of the Accept-Language header in an HTTP request.

```plaintext
HTTP.REQ.HEADER("Accept-Language").CONTAINS("en-us")
```

If you want the value of the header to be configurable at import time, you can specify the string en-us as a variable. When importing the template, you can specify a new value for the variable on the Specify Variable Values page.

After you create a variable, you can do the following:

- Assign additional strings to an existing variable. After you create a variable for a string, you can select and assign other parts of the same or different expression to the variable. The strings you assign to a variable need not be the same. At import time, all the strings that are assigned to the variable are replaced with the value that you provide.
- View the string or strings that are assigned to the variable.
- View a list of all the entities and parameters that use the variable.
To configure variables in a load balancing virtual server template

1. Navigate to Traffic Management > Load Balancing > Virtual Servers

2. In the details pane, right-click the virtual server that you want to export to a template file, and then click Create Template.

3. In the Create Template dialog box, modify the default template file name if required, specify the location where you want to save the template, and then click Configure Variables.

4. In the Configure Variables dialog box, click the tab that lists the entity for which you want to configure a variable, select the entity, and then click Configure Variables.

5. In the Variables for Entity Type: Entity Name dialog box, click the button next to the parameter value or expression in which you want to create a variable.

6. In the variables for Field Name dialog box, do the following:
   - To create a variable, in the text box that displays the configured expression or value, select the string that you want to be configurable at import time, and then click Add. In the Create Variable dialog box, specify a name and a description for the variable, and then click Create.
     
     The name of the variable, its value, and the description you provided appear in the Available Variables listing in the dialog box. The name you provide will be the name of the associated field in the template import wizard, and the description will appear as alt text when the user positions the mouse pointer over the field.
   
   - To modify a variable, in the Available Variables list, click the variable, and then click Open. In the Create Variable dialog box, modify the value and the description, and then click OK.
     
     The new value that you specify will not replace the text selected in the text box that displays the configured expression or value. However, when you import the template, the new value will be displayed as the default value for the variable in the template import wizard.
   
   - To view all the strings that are assigned to a given variable, in the Available Variables listing, click the name of the variable. The strings that are assigned to the variable are highlighted.
   
   - To view a list of all the parameters, expressions, and actions in which the variable is used, in the Available Variables listing, click the variable whose references you want to view, and then click Show References.
   
   - To assign a string to an existing variable, in the text box that displays the expression you configured, select the string you want to assign to an existing variable, right-click the selection, click Use existing Variable, and then click the name of the variable to which you want to assign the string.
If a variable has multiple strings assigned to it, when you specify a new value for the variable during import, all strings assigned to the variable are replaced with the new value.

7. Click **Close**.

### Modifying an entity template

December 10, 2018

You can modify only the parameters, bindings, and pages configured for a template. The name and location of the template specified when the template was created cannot be changed. The NetScaler appliance does not provide you with the option of modifying a load balancing virtual server template.

**To modify an entity template by using the AppExpert feature node**

1. Navigate to **AppExpert > Templates**.
2. In the details pane, on the **Entity Templates** tab, select the template you want to change, and then click **Open**.
3. In the **Modify…Template** dialog box, follow the instructions to modify a template.
4. Click **Finish**, and then click **Exit**.

**To modify an entity template by using its corresponding feature node**

1. Navigate to **Traffic Management**, select the feature (for example, Content Switching), and then select the entity (for example, Virtual Servers) for which you want to modify the entity template.
2. At the top of the details pane, click **Entity Templates**, and then click **Manage Template**.
3. In the **Manage <feature entity name> Entity Templates** dialog box, select the template that you want to modify, and then click **Modify**.
4. In the **Modify <template name> Template** dialog box, follow the instructions to modify a template.
5. Click **Finish**, and then click **Exit**.
6. Click **Close**.

### Deleting an entity template

December 10, 2018
Deleting an entity template does not affect any objects that have been created by using the template. You can delete a load balancing virtual server template only from the AppExpert feature node.

**To delete an entity template by using the AppExpert feature node**

1. Navigate to AppExpert > Templates.
2. In the details pane, on the Entity Templates tab, click the template you want to delete, and then click Remove.

**To delete an entity template by using its corresponding feature node**

1. Navigate to Traffic Management, and select the feature (for example, Content Switching) and then select the entity (for example, Virtual Servers), for which you want to delete the entity template.
2. At the top of the details pane, click Entity Templates, and then click Manage Template.
3. In the Manage…Entity Templates dialog box, select the template that you want to delete, and then click Delete.

**Creating an entity from a template**

December 13, 2018

You can create an entity from an entity template either from the AppExpert feature node in the NetScaler GUI or from the NetScaler feature node that corresponds to the type of entity that you want to create. For example, you can create a content switching virtual server from a template with either the AppExpert feature node or the content switching feature node in the GUI.

The procedure for creating a load balancing virtual server from a template is different than the AppExpert procedure for creating other entities from templates.

After you create an instance of an entity using an entity template, you can configure it in the same way that you would any other object of that type, such as by using the GUI or the command line.

**To create an entity from a template by using the AppExpert feature node**

1. Navigate to AppExpert > Templates.
2. In the details pane, do one of the following:
   a) To create any entity other than a load balancing virtual server from a template, on the Entity Templates tab, click the template that you want to use, and then click Use Template.
To create a load balancing virtual server from a template, on the LB Templates tab, click
the template that you want to use, and then click **Use Template**.

3. In the `<Entity Template Name>` wizard, follow the instructions to create the entity on the
NetScaler.

4. Click **Finish**, and then click **Exit**.

**To create an entity from a template by using its corresponding feature node**

1. Navigate to **Traffic Management**, and expand a feature node (for example, Content Switching),
and then click an entity subnode (for example, Virtual Servers).

2. At the top of the details pane, click **Entity Templates**, and then click **Use Template**.

3. Click the name of the template that you want to use.

4. In the Use `<template name>` Template wizard, follow the instructions to create the entity.
   Only templates that match the current context are displayed. For example, in the details pane
   for content switching virtual servers, only entity templates for content switching virtual servers
   appear, if configured.

5. Click **Finish**, and then click **Exit**.

**To create a load balancing virtual server by using a load balancing virtual server
template**

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.

2. In the details pane, click Use **Template**.

3. In the **Entity Template Wizard**, follow the instructions to create a load balancing virtual server
on the NetScaler.
   Only templates that match the current context are displayed. For example, when you click
Browse (Appliance), only entity templates for load balancing virtual servers appear, if config-
ured.

4. Click **Finish**, and then click **Exit**.

   **Note:** The **Entity Template Wizard** includes a **Specify Variable Values** page on which you
can specify new values for variables. For more information about configuring variables in
load balancing virtual server templates, see **Configuring Variables in Load Balancing Vir-
tual Server Templates**.”
Managing entity template folders

December 13, 2018

You can organize only load balancing virtual server template folders.

To organize load balancing virtual server template folders

1. Navigate to AppExpert > Templates > LB Templates.
2. In the Manage LB Templates dialog box do one of the following:
   • To change the name of a folder, select the folder and click Rename.
     You can also click the folder that you want to rename, and then press F2. You cannot re-name the top-level default folder.
   • To remove the folder, select the folder and click Delete.
     You can also click the folder that you want to remove, and then press the Delete key. You cannot remove the top-level default folder.
3. Click Close.

Uploading and downloading entity templates

December 10, 2018

You can import the entity templates that are stored on your local computer. You can also download entity templates from the NetScaler appliance to your local computer and then import them to other NetScaler appliances.

To upload an entity template to the NetScaler appliance

1. Navigate to Traffic Management, and expand a feature node (for example, Content Switching), and then click a subnode (for example, Virtual Servers) for which you want to upload an entity template.
2. At the top of the details pane, click Entity Templates, and then click Manage Template.
3. In the Manage…Entity Templates dialog box, click the top-level folder, and then click Upload.
4. In the Upload Entity Template dialog box, navigate to the template file that you want to upload, and then click Select.
5. Click Close.
To download an entity template from the NetScaler appliance

1. Navigate to Traffic Management, and expand a feature node (for example, Content Switching), and then click a subnode (for example, Virtual Servers) for which you want to upload an entity template.
2. At the top of the details pane, click Entity Templates, and then click Manage Template.
3. In the Manage...Entity Templates dialog box, click the template that you want to download, and then click Download.
4. In the Download Entity Template dialog box, navigate to the location at which you want to save the template on your local computer, enter a file name, and then click Save.
5. Click Close.

Understanding load balancing entity templates and deployment files

December 10, 2018

Load balancing entity templates are created in the same way that NetScaler application templates are created. When you export a load balancing virtual server to a template file, the following two files are automatically created:

- **Load balancing virtual server template file.** Contains XML elements that store the values of the parameters that are configured for the load balancing virtual server. The file also contains XML elements for storing information about bound policies.
- **Deployment file.** Contains XML elements that store deployment-specific information such as services, service groups, and configured variables.

In the template and deployment files, each unit of configuration information is encapsulated in a specific XML element that is meant for that unit type. For example, the load balancing method parameter, lbMethod, is encapsulated within the `<lbmethod>` and `</lbmethod>` tags.

Note: After you export a load balancing virtual server, you can add elements, remove elements, and modify existing elements before importing the configuration information to a NetScaler appliance.

Example of a load balancing virtual server template

Following is an example of a template file that was created from a load balancing virtual server called “Lbvip”:
<?xml version="1.0" encoding="UTF-8" ?>
<template>
  <template_info>
    <entity_name>Lbvip</entity_name>
    <version_major>10</version_major>
    <version_minor>0</version_minor>
    <build_number>40.406</build_number>
  </template_info>
  <entitytemplate>
    <lbvserver_list>
      <lbvserver>
        <name>Lbvip</name>
        <servicetype>HTTP</servicetype>
        <ipv46>0.0.0.0</ipv46>
        <ipmask>**</ipmask>
        <port>0</port>
        <range>1</range>
        <persistencetype>NONE</persistencetype>
        <timeout>2</timeout>
        <persistencebackup>NONE</persistencebackup>
        <backuppersistencetimeout>2</backuppersistencetimeout>
        <lbmethod>LEASTCONNECTION</lbmethod>
        <persistmask>255.255.255.255</persistmask>
        <v6persistmasklen>128</v6persistmasklen>
        <pq>OFF</pq>
        <sc>OFF</sc>
        <m>IP</m>
        <datalength>0</datalength>
        <dataoffset>0</dataoffset>
        <sessionless>DISABLED</sessionless>
        <state>ENABLED</state>
        <connfailover>DISABLED</connfailover>
        <clttimeout>180</clttimeout>
        <somethod>NONE</somethod>
        <sopersistence>DISABLED</sopersistence>
        <sopersistencetimeout>2</sopersistencetimeout>
        <redirectportrewrite>DISABLED</redirectportrewrite>
        <downstateflush>DISABLED</downstateflush>
        <gt2gb>DISABLED</gt2gb>
        <ipmapping>0.0.0.0</ipmapping>
        <disableprimaryondown>DISABLED</disableprimaryondown>
        <insertvserveripport>OFF</insertvserveripport>
        <authentication>OFF</authentication>
        <authn401>OFF</authn401>
      </lbvserver>
    </lbvserver_list>
  </entitytemplate>
</template>
Example of a deployment file

Following is the deployment file associated with the virtual server in the preceding example:
HTTP callouts

December 10, 2018

For certain types of requests, or when certain criteria are met during policy evaluation, you might want to stall policy evaluation briefly, retrieve information from a server, and then perform a specific action that depends on the information that is retrieved. At other times, when you receive certain types of requests, you might want to update a database or the content hosted on a Web server. HTTP callouts enable you to perform all these tasks.

An HTTP callout is an HTTP or HTTPS request that the NetScaler appliance generates and sends to an external application when certain criteria are met during policy evaluation. The information that is retrieved from the server can be analyzed by default syntax policy expressions, and an appropriate action can be performed. You can configure HTTP callouts for HTTP content switching, TCP content switching, rewrite, responder, and for the token-based method of load balancing.

Before you configure an HTTP callout, you must set up an application on the server to which the callout will be sent. The application, which is called the HTTP callout agent, must be configured to respond to the HTTP callout request with the required information. The HTTP callout agent can also be a Web server that serves the data for which the NetScaler appliance sends the callout. You must make sure that the format of the response to an HTTP callout does not change from one invocation.
After you set up the HTTP callout agent, you configure the HTTP callout on the NetScaler appliance. Finally, to invoke the callout, you include the callout in a default syntax policy in the appropriate NetScaler feature and then bind the policy to the bind point at which you want the policy to be evaluated.

After you have configured the HTTP callout, you must verify the configuration to make sure that the callout is working correctly.

How an HTTP callout works

January 6, 2019

When the NetScaler appliance receives a client request, the appliance evaluates the request against the policies bound to various bind points. During this evaluation, if the appliance encounters the HTTP callout expression, SYS.HTTP_CALLOUT(<name>), it stalls policy evaluation briefly and sends a request to the HTTP callout agent by using the parameters configured for the specified HTTP callout. Upon receiving the response, the appliance inspects the specified portion of the response, and then either performs an action or evaluates the next policy, depending on whether the evaluation of the response from the HTTP callout agent evaluates to TRUE or FALSE, respectively. For example, if the HTTP callout is included in a responder policy, if the evaluation of the response evaluates to TRUE, the appliance performs the action associated with the responder policy.

If the HTTP callout configuration is incorrect or incomplete, or if the callout invokes itself recursively, the appliance raises an UNDEF condition, and updates the undefined hits counter.

The following figure illustrates the working of an HTTP callout that is invoked from a globally bound responder policy. The HTTP callout is configured to include the IP address of the client that is associated with an incoming request. When the NetScaler appliance receives a request from a client, the appliance generates the callout request and sends it to the callout server, which hosts a database of blacklisted IP addresses and an HTTP callout agent that checks whether the client’s IP address is listed in the database. The HTTP callout agent receives the callout request, checks whether the client’s IP address is listed, and sends a response that the NetScaler appliance evaluates. If the response indicates that the client’s IP address is not blacklisted, the appliance forwards the response to the configured service. If the client’s IP address is blacklisted, the appliance resets the client connection.

Figure 1. HTTP Callout Entity Model
Notes on the format of HTTP requests and responses

December 10, 2018

The NetScaler appliance does not check for the validity of the HTTP callout request. Therefore, before you configure HTTP callouts, you must know the format of an HTTP request. You must also know the format of an HTTP response, because configuring an HTTP callout involves configuring expressions that evaluate the response from the HTTP callout agent.

This section includes the following sections:

- Format of an HTTP Request
- Format of an HTTP Response

**Format of an HTTP request**

An HTTP request contains a series of lines that each end with a carriage return and a line feed, represented as either `<CR><LF>` or `
`.

The first line of a request (the *message line*) contains the HTTP method and target. For example, a message line for a GET request contains the keyword GET and a string that represents the object that is to be fetched, as shown in the following example:

```
1 GET /mysite/mydirectory/index.html HTTP/1.1
```

The rest of the request contains HTTP headers, including a required Host header and, if applicable, a message body.

The request ends with a blank line (an extra `<CR><LF>` or `
`).

Following is an example of a request:

```
1 Get /mysite/index.html HTTP/1.1
2 Host: 10.101.101.10
3 Accept: */*
4 
```

**Format of an HTTP Response**

An HTTP response contains a status message, response HTTP headers, and the requested object or, if the requested object cannot be served, an error message.

Following is an example of a response:
Configuring an HTTP callout

December 18, 2018

When configuring an HTTP callout, you specify the type of request (HTTP or HTTPS), destination and format of the request, the expected format of the response, and, finally, the portion of the response that you want to analyze.

For the destination, you either specify the IP address and port of the HTTP callout agent or engage a load balancing, content switching, or cache redirection virtual server to manage the HTTP callout requests. In the first case, the HTTP callout requests will be sent directly to the HTTP callout agent. In the second case, the HTTP callout requests will be sent to the virtual IP address (VIP) of the specified virtual server. The virtual server will then process the request in the same way as it processes a client request. For example, if you expect a large number of callouts to be generated, you can configure instances of the HTTP callout agent on multiple servers, bind these instances (as services) to a load balancing virtual server, and then specify the load balancing virtual server in the HTTP callout configuration. The load balancing virtual server then balances the load on those configured instances as determined by the load balancing algorithm.

For the format of the HTTP callout request, you can specify the individual attributes of the HTTP callout request (an attribute-based HTTP callout), or you can specify the entire HTTP callout request as a default syntax expression (an expression-based HTTP callout).

Note:

The appliance does not check for the validity of the request. You must make sure that the request is a valid request. An incorrect or incomplete HTTP callout configuration results in a runtime UNDEF condition that is not associated with an action. The UNDEF condition merely updates the Undefined Hits counter, which enables you to troubleshoot an incorrectly configured HTTP callout. However, the appliance parses the HTTP callout request to enable you to configure certain
Finally, regardless of whether you use HTTP request attributes or an expression to define the format of the HTTP callout request, you must specify the format of the response from the HTTP callout agent and the portion of the response that you want to evaluate. The response can be a Boolean value, a number, or text. The portion of the response that you want to evaluate is specified by an expression. For example, if you specify that the response contains text, you can use HTTP.RES.BODY(<unit>) to specify that the appliance must evaluate only the first <unit> bytes of the response from the callout agent.

At the command line, you first create an HTTP callout by using the add command. When you add a callout, all parameters are set to a default value of NONE, except the HTTP method, which is set to a default value of GET. You then configure the callout’s parameters by using the set command. The set command is used to configure both types of callouts (attribute-based and expression-based). The difference lies in the parameters that are used for configuring the two types of callouts. Accordingly, the command-line instructions that follow include a set command for configuring an attribute-based callout and a set command for configuring an expression-based callout. In the GUI, all of these configuration tasks are performed in a single dialog box.

**Note:** Before you put an HTTP callout into a policy, you can modify all configured parameters except the return type. Once an HTTP callout is in a policy, you cannot completely modify an expression that is configured in the callout. For example, you cannot change

```plaintext
1. HTTP.REQ HEADER("myval")
2. CLIENT.IP.SRC. However, you can modify the operators and arguments that are passed to the expression. For example, you can change
3. HTTP.REQ HEADER("myVal1")
4. HTTP.REQ HEADER("myVal2"), or
5. HTTP.REQ HEADER("myVal")
6. HTTP.REQ HEADER("myVal").AFTER_STR(<string>). If the set command fails, create a new HTTP callout.
```

HTTP callout configuration involves configuring default syntax expressions.

**To configure an HTTP callout by using the command line interface**

At the command prompt, do the following:

1. Create a HTTP callout.
add policy httpCallout <name>

Example:

1 add policy httpCallout mycallout

1. Configure the details of the HTTP callout.

- To configure an attribute-based HTTP callout, type:

```
set policy httpCallout <name> [-IPAddress <ip_addr|ipv6_addr|*>] [-port <port|*>] [-vServer <string>] [-returnType <returnType>] [-httpMethod ( GET | POST )] [-hostExpr <string>] [-urlStemExpr <string>] [-headers <name(value)> ...] [-parameters <name(value)> ...] [-resultExpr <string>]
```

Example:

```
> set policy httpCallout mycallout -vserver lbv1 -returnType num -httpMethod GET -hostExpr 'http.req.header("Host")'
2 -urlStemExpr "http.req.url" -parameters Name("My Name") -headers Name("MyHeader")
3 -resultExpr "http.res.body(10000).length"
```

To configure an expression-based HTTP callout, type:

```
set policy httpCallout <name> [-vServer <string>] [-returnType <returnType>] [-httpMethod ( GET | POST )] [-fullReqExpr <string>] [-resultExpr <string>]
```

Example:

```
> set policy httpCallout mycallout1 -vserver lbv1 -returnType num -httpMethod GET
2 -fullReqExpr q{
3 "GET " + http.req.url + "HTTP/" + http.req.version.major + "." + http.req.version.minor.sub(1)+
4 "Host:10.101.10.10\nAccept: */*
```

3. Verify the configurations of the HTTP callout.

```
show policy httpCallout <name>
```
To configure an HTTP callout by using the GUI

1. Navigate to AppExpert > HTTP Callouts.
2. In the details pane, click Add.
3. In the Create HTTP Callout dialog box, configure the parameters of the HTTP callout. For a description of the parameter, hover the mouse cursor over the check box.
4. Click Create and then click Close.

Verifying the Configuration

January 6, 2019

For an HTTP callout to work correctly, all the HTTP callout parameters and the entities associated with the callout must be configured correctly. While the NetScaler appliance does not check the validity of the HTTP callout parameters, it indicates the state of the bound entities, namely the server or virtual server to which the HTTP callout is sent. The following table lists the icons and describes the conditions under which the icons are displayed.

<table>
<thead>
<tr>
<th>Icon</th>
<th>Indicates that</th>
</tr>
</thead>
<tbody>
<tr>
<td>![Icon 1]</td>
<td>The state of the server that hosts the HTTP callout agent, or the load balancing, content switching, or cache redirection virtual server to which the HTTP callout is sent is UP.</td>
</tr>
<tr>
<td>![Icon 2]</td>
<td>The state of the server that hosts the HTTP callout agent, or the load balancing, content switching, or cache redirection virtual server to which the HTTP callout is sent is OUT OF SERVICE.</td>
</tr>
<tr>
<td>![Icon 3]</td>
<td>The state of the server that hosts the HTTP callout agent, or the load balancing, content switching, or cache redirection virtual server to which the HTTP callout is sent is DOWN.</td>
</tr>
</tbody>
</table>

For an HTTP callout to function correctly, the icon must be green at all times. If the icon is not green, check the state of the callout server or virtual server to which the HTTP callout is sent. If the HTTP callout is not working as expected even though the icon is green, check the parameters configured for the callout.
You can also verify the configuration by sending test requests that match the policy from which the HTTP callout is invoked, checking the hits counter for the policy and the HTTP callout, and verifying the responses that the NetScaler appliance sends to the client.

Note:

An HTTP callout can sometimes invoke itself recursively a second time. If this happens, the hits counter is incremented by two counts for each callout that is generated by the appliance. For the hits counter to display the correct value, you must configure the HTTP callout in such a way that it does not invoke itself a second time. For more information about how you can avoid HTTP callout recursion, see Avoiding HTTP Callout Recursion.

To view the hits counter for an HTTP callout

1. Navigate to AppExpert > HTTP Callouts.
2. In the details pane, click the HTTP callout for which you want to view the hits counter, and then view the hits in the Details area.

Invoking an HTTP Callout

December 10, 2018

After you configure an HTTP callout, you invoke the callout by including the `SYS.HTTP_CALLOUT(<name>)` expression in a default syntax policy rule. In this expression, `<name>` is the name of the HTTP callout that you want to invoke.

You can use default syntax expression operators with the callout expression to process the response and then perform an appropriate action. The return type of the response from the HTTP callout agent determines the set of operators that you can use on the response. If the part of the response that you want to analyze is text, you can use a text operator to analyze the response. For example, you can use the CONTAINS(<string>) operator to check whether the specified portion of the response contains a particular string, as in the following example:

```
SYS.HTTP_CALLOUT(mycallout).contains("Good IP address")
```

If you use the preceding expression in a responder policy, you can configure an appropriate responder action.

Similarly, if the part of the response that you want to evaluate is a number, you can use a numeric operator such as GT(int). If the response contains a Boolean value, you can use a Boolean operator.
NetScaler 11.1

Note: An HTTP callout can invoke itself recursively. HTTP callout recursion can be avoided by combining the HTTP callout expression with a default syntax expression that prevents recursion. For information about how you can avoid HTTP callout recursion, see Avoiding HTTP Callout Recursion.

You can also cascade HTTP callouts by configuring policies that each invoke a callout after evaluating previously generated callouts. In this scenario, after one policy invokes a callout, when the NetScaler appliance is parsing the callout before sending the callout to the callout server, a second set of policies can evaluate the callout and invoke additional callouts, which can in turn be evaluated by a third set of policies, and so on. Such an implementation is described in the following example.

First, you could configure an HTTP callout called myCallout1, and then configure a responder policy, Pol1, to invoke myCallout1. Then, you could configure a second HTTP callout, myCallout2, and a responder policy, Pol2. You configure Pol2 to evaluate myCallout1 and invoke myCallout2. You bind both responder policies globally.

To avoid HTTP callout recursion, myCallout1 is configured with a unique custom HTTP header called “Request1.” Pol1 is configured to avoid HTTP callout recursion by using the default syntax expression, HTTP.REQ.HEADER("Request1").EQ("Callout Request").NOT.

Pol2 uses the same default syntax expression, but excludes the .NOT operator so that the policy evaluates myCallout1 when the NetScaler appliance is parsing it. Note that myCallout2 identifies its own unique header called “Request2,” and Pol2 includes a default syntax expression to prevent myCallout2 from invoking itself recursively.

Example:

```
1  > add policy httpCallout myCallout1
2       Done
3  > set policy httpCallout myCallout1 -IPAddress 10.102.3.95 -port 80 -
4       returnType TEXT -hostExpr "10.102.3.95" -urlStemExpr "\cgi-bin/check_clnt_from_database.pl" -
5       headers Request1 ("Callout Request") -parameters cip(CLIENT.IP.SRC) -resultExpr "HTTP.
6       RES.BODY(100)"
7       Done
8  > add responder policy Pol1 "HTTP.REQ.HEADER("Request1")".EQ("Callout Request")
9       .NOT &
10       SYS.HTTP_CALLOUT(myCallout1).CONTAINS("IP Matched")"  RESET
```
Avoiding HTTP callout recursion

December 18, 2018

Even though the NetScaler appliance does not check for the validity of the HTTP callout request, it parses the request once before it sends the request to the HTTP callout agent. This parsing allows the appliance to treat the callout request as any other incoming request, which in turn allows you to configure several useful NetScaler features (such as integrated caching, SureConnect, and Priority Queuing) to work on the callout request.

However, during this parsing, the HTTP callout request can hit the same policy and therefore invoke
itself recursively. The appliance detects the recursive invocation and raises an undefined (UNDEF) condition. However, the recursive invocation results in the policy and HTTP callout hit counters being incremented by two counts each instead of one count each.

To prevent a callout from invoking itself, you must identify at least one unique characteristic of the HTTP callout request, and then exclude all requests with this characteristic from being processed by the policy rule that invokes the callout. You can do so by including another default syntax expression in the policy rule. The expression must precede the \SYS.HTTP\_CALLOUT(\name\) expression so that it is evaluated before the callout expression is evaluated. For example:

```
Expression that prevents callout recursion \&\& SYS.HTTP_CALLOUT(name)
```

When you configure a policy rule in this way, when the appliance generates the request and parses it, the compound rule evaluates to FALSE, the callout is not generated a second time, and the hit counters are incremented correctly.

One way by which you can assign a unique characteristic to an HTTP callout request is to include a unique custom HTTP header when you configure the callout. Following is an example of an HTTP callout called “myCallout.” The callout generates an HTTP request that checks whether a client’s IP address is present in a database of blacklisted IP addresses. The callout includes a custom header called “Request,” which is set to the value “Callout Request.” A globally bound responder policy, “Pol1,” invokes the HTTP callout but excludes all requests whose Request header is set to this value, thus preventing a second invocation of myCallout. The expression that prevents a second invocation is HTTP.REQ.HEADER("Request").EQ("Callout Request").NOT.

**Example:**

```
> add policy httpCallout myCallout
  Done

> set policy httpCallout myCallout -IPAddress 10.102.3.95 -port 80 -
  returnType TEXT -hostExpr "10.102.3.95" -urlStemExpr "/cgi-bin/check_clnt_from_database.pl" -headers Request("Callout Request")
  -parameters cip(CLIENT.IP.SRC) -resultExpr "HTTP.RES.BODY(100)"
  Done

> add responder policy Pol1 "HTTP.REQ.HEADER("Request").EQ("Callout Request")\).NOT \&\& SYS.HTTP_CALLOUT(myCallout).CONTAINS("IP Matched")" RESET
  Done

> bind responder global Pol1 100 END -type OVERRIDE
  Done
```
Note:
You can also configure an expression to check whether the URL of the request includes the URL stem expression that is configured for the HTTP callout. If you want to implement this scenario, make sure that the HTTP callout agent is dedicated to respond only to HTTP callouts and not to other client requests directed through the appliance. If the HTTP callout agent is an application or Web server that serves other client requests, such an expression will prevent the appliance from processing those client requests. Instead, use a unique custom header as described earlier.

Caching HTTP Callout Responses

December 10, 2018

For improved performance while using callouts, you can use the integrated caching feature to cache callout responses. The responses are stored in an integrated caching content group named callout-ContentGroup for a specified time duration.

Note: To cache callout responses, make sure that the integrated caching feature is enabled.

To set the cache duration by using the command line interface

At the command prompt, type:

```
set policy httpCallout <name> -cacheForSecs <secs>
```

Example:

```
$ set httpcallout httpcallout1 -cacheForSecs 120
```

To set the cache duration by using the GUI

1. Navigate to AppExpert > **HTTP Callouts.
2. In the details pane, select the HTTP callout for which you want to set the cache duration and click Open.
3. In the Configure HTTP Callout dialog box, specify the Cache Expiration Time.
4. Verify that you have entered the correct time duration, and then click OK.
Use Case: Filtering Clients by Using an IP Blacklist

January 6, 2019

HTTP callouts can be used to block requests from clients that are blacklisted by the administrator. The list of clients can be a publicly known blacklist, a blacklist that you maintain for your organization, or a combination of both.

The NetScaler appliance checks the IP address of the client against the pre-configured blacklist and blocks the transaction if the IP address has been blacklisted. If the IP address is not in the list, the appliance processes the transaction.

To implement this configuration, you must perform the following tasks:

1. Enable responder on the NetScaler appliance.
2. Create an HTTP callout on the NetScaler appliance and configure it with details about the external server and other required parameters.
3. Configure a responder policy to analyze the response to the HTTP callout, and then bind the policy globally.
4. Create an HTTP callout agent on the remote server.

Enabling Responder

You must enable responder before you can use it.

To enable responder by using the GUI

1. Make sure that you have installed the responder license.
2. In the GUI, expand AppExpert, and right-click Responder, and then click Enable Responder feature.

Creating an HTTP Callout on the NetScaler Appliance

Create an HTTP callout, HTTP_Callout, with the parameter settings shown in the following table. For more information about creating an HTTP callout, see Configuring an HTTP Callout pdf.

Configuring a Responder Policy and Binding it Globally

After you configure the HTTP callout, verify the callout configuration, and then configure a responder policy to invoke the callout. While you can create a responder policy in the
To create a responder policy and bind it globally by using the GUI

1. Navigate to AppExpert > Responder.
2. In the details pane, under Policy Manager, click Policy Manager.
3. In the Responder Policy Manager dialog box, click Override Global.
4. Click Insert Policy, and then, under Policy Name, click **New Policy.
5. In the Create Responder Policy dialog box, do the following:
   a) In Name, type Policy-Responder-1.
   b) In Action, select RESET.
   c) In Undefined-Result Action, select Global undefined-result action.
   d) In Expression, type the following default syntax expression:

   ```
   "HTTP.REQ.HEADER("Request")\.EQ("Callout Request\")\.NOT \&\&
   SYS.HTTP_CALLOUT(HTTP_Callout).CONTAINS("IP Matched")"
   ```
   e) Click Create, and then click Close.
6. Click Apply Changes, and then click Close.

Creating an HTTP Callout Agent on the Remote Server

You must now create an HTTP callout agent on the remote callout server that will receive callout requests from the NetScaler appliance and respond appropriately. The HTTP callout agent is a script that is different for each deployment and must be written with the server specifications in mind, such as the type of database and the scripting language supported.

Following is a sample callout agent that verifies whether the given IP address is part of an IP blacklist. The agent has been written in the Perl scripting language and uses a MYSQL database.

The following CGI script checks for a given IP address on the callout server.

```
my $db_user_name = 'dbuser' ;

# Database password to connect with
my $db_password = 'dbpassword';
my ($id, $password);

# Connecting to the database
my $dbh = DBI->connect($dsn, $db_user_name, $db_password);
my $sth = $dbh->prepare("select * from bad_clnt");

$sth->execute();

while (my ($ip_in_database) = $sth->fetchrow_array()) {
  chomp($ip_in_database);

  # Check for IP match
  if ($ip_in_database eq $ip_to_check) {

    print "\n IP Matched\n";
    $sth->finish();
    exit;
  }
}

print "\n IP Failed\n";
$sth->finish();
exit;

---

**Use Case: ESI Support for Fetching and Updating Content Dynamically**

January 6, 2019

Edge Side Includes (ESI) is a markup language for edge-level dynamic Web content assembly. It helps in accelerating dynamic Web-based applications by defining a simple markup language to describe cacheable and non-cacheable Web page components that can be aggregated, assembled, and delivered at the network edge. By using HTTP callouts on the NetScaler appliance, you can read through the ESI constructs and aggregate or assemble content dynamically.

To implement this configuration, you must perform the following tasks:

1. Enable rewrite on the NetScaler appliance.
2. Create an HTTP callout on the appliance and configure it with details about the external server and other required parameters.
3. Configure a rewrite action to replace the ESI content with the callout response body.
4. Configure a rewrite policy to specify the conditions under which the action is performed, and then bind the rewrite policy globally.

**Enabling Rewrite**

Rewrite must be enabled before it is used on the NetScaler appliance. The following procedure describes the steps to enable the rewrite feature.

**To enable rewrite by using the GUI**

1. Make sure that you have installed the rewrite license.
2. In the GUI, expand AppExpert, and right-click Rewrite, and then click Enable Rewrite feature.

**Creating an HTTP Callout on the NetScaler Appliance**

For more information about creating an HTTP callout, see Configuring an HTTP Callout.
For more information about the parameter values, see Parameters and Values for HTTP-Callout-2 pdf.

**Configuring the rewrite action**

Create a rewrite action, Action-Rewrite-1, to replace the ESI content with the callout response body. Use the parameter settings shown in the following table.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Action-Rewrite-1</td>
</tr>
<tr>
<td>Type</td>
<td>Replace</td>
</tr>
<tr>
<td>Expression to choose target text reference</td>
<td>“HTTP.RES.BODY(500).AFTER_STR (&quot; \n&lt;example&gt;&quot;).BEFORE_STR (&quot;&lt;/example&gt;&quot;)”</td>
</tr>
<tr>
<td>String expression for replacement text</td>
<td>“SYS.HTTP_CALLOUT(HTTP-Callout-2)”</td>
</tr>
</tbody>
</table>

**To configure the rewrite action by using the GUI**

1. Navigate to **AppExpert > Rewrite > Actions**.
2. In the details pane, click **Add**.

3. In the **Create Rewrite Action** dialog box, in **Name**, type **Action-Rewrite-1**.

4. In **Type**, select **REPLACE**.

5. In **Expression** to choose target text reference, type the following default syntax expression:

   ```
   "HTTP.REQ.BODY(500).AFTER_STR("<example>").BEFORE_STR("</example>")"
   ```

1. In the **String expression for replacement text**, type the following string expression:

   ```
   "SYS.HTTP_CALLOUT(HTTP-Callout-2)"
   ```

1. Click **Create**, and then click **Close**.

### Creating the rewrite policy and binding it globally

Create a rewrite policy, **Policy-Rewrite-1**, with the parameter settings shown in the following table. You can create a rewrite policy in the Policies subnode and then bind it globally by using the Rewrite Policy Manager. Alternatively, you can use the Rewrite Policy Manager to perform both these tasks simultaneously. This demonstration uses the Rewrite Policy Manager to perform both tasks.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Policy-Rewrite-1</td>
</tr>
<tr>
<td>Action</td>
<td>Action_Rewrite-1</td>
</tr>
<tr>
<td>Undefined Result Action</td>
<td>-Global undefined-result action-</td>
</tr>
<tr>
<td>Expression</td>
<td>“HTTP.REQ.HEADER(&quot;Name&quot;).CONTAINS (&quot;Callout&quot;).NOT”</td>
</tr>
</tbody>
</table>

Table 3. Parameters and Values for Policy-Rewrite-1

### To configure a rewrite policy and bind it globally by using the GUI

1. Navigate to **AppExpert > Rewrite**.
2. In the details pane, under **Policy Manager**, click **Rewrite Policy Manager**.
3. In the **Rewrite Policy Manager** dialog box, click **Override Global**.
4. Click Insert Policy, and then, in the Policy Name column, click New Policy.

5. In the Create Rewrite Policy dialog box, do the following:
   1. In Name, type Policy-Rewrite-1.
      a) In Action, select Action-Rewrite-1.
      b) In Undefined-Result Action, select Global undefined-result action.
      c) In Expression, type the following default syntax expression:

         "HTTP.REQ.HEADER("Name")\nCONTAINS("Callout") NOT"

5. Click Create, and then click Close.

6. Click Apply Changes, and then click Close.

Use Case: Access control and authentication

January 6, 2019

In high security zones, it is mandatory to externally authenticate the user before a resource is accessed by clients. On the NetScaler appliance, you can use HTTP callouts to externally authenticate the user by evaluating the credentials supplied. In this example, the assumption is that the client is sending the user name and password through HTTP headers in the request. However, the same information could be fetched from the URL or the HTTP body.

To implement this configuration, you must perform the following tasks:

1. Enable the responder feature on the NetScaler appliance.
2. Create an HTTP callout on the appliance and configure it with details about the external server and other required parameters.
3. Configure a responder policy to analyze the response, and then bind the policy globally.
4. Create a callout agent on the remote server.

Enabling responder

The responder feature must be enabled before it is used on the NetScaler appliance.

To enable responder by using the GUI

1. Make sure that the responder license is installed.
2. In the GUI, expand AppExpert, and right-click Responder, and then click Enable Responder feature.
Creating an HTTP Callout on the NetScaler Appliance

Create an HTTP callout, HTTPCallout, with the parameter settings shown in the following table. For more information about creating an HTTP callout, see Configuring an HTTP Callout.

Refer to HTTP callout table, for more information about its parameters and values.

Creating a Responder policy to analyze the response

Create a responder policy, Policy-Responder-3, that will check the response from the callout server and RESET the connection if the source IP address has been blacklisted. Create the policy with the parameters settings shown in the following table. While you can create a responder policy in the Policies subnode and then bind it globally by using the Responder Policy Manager, this demonstration uses the Responder Policy Manager to create the responder policy and bind the policy globally.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Policy-Responder-3</td>
</tr>
<tr>
<td>Action</td>
<td>RESET</td>
</tr>
<tr>
<td>Undefined-Result-Action</td>
<td>-Global undefined-result action-</td>
</tr>
<tr>
<td>Expression</td>
<td>“HTTP.REQ.HEADER(&quot;Request&quot;).EQ(&quot;Callout Request&quot;).NOT &amp;&amp; SYS.HTTP_CALLOUT(HTTP-Callout-3).CONTAINS(&quot;Authentication Failed&quot;)”</td>
</tr>
</tbody>
</table>

Table 2. Parameters and Values for Policy-Responder-3

To create a responder policy and bind it globally by using the GUI

1. Navigate to AppExpert > Responder.
2. In the details pane, under Policy Manager, click Responder Policy Manager.
3. In the Responder Policy Manager dialog box, click Override Global.
4. Click Insert Policy, and then, in the Policy Name column, click New Policy.
5. In the Create Responder Policy dialog box, do the following:
   a) In Name, type Policy-Responder-3.
   b) In Action, select RESET.
   c) In Undefined-RESULT Action, select Global undefined-result action.
   d) In the Expression text box, type:
e) Click **Create**, and then click **Close**.

6. Click **Apply Changes**, and then click **Close**.

### Creating an HTTP Callout agent on the remote server

You now need to create an HTTP callout agent on the remote callout server. The HTTP callout agent receives callout requests from the NetScaler appliance and responds appropriately. The callout agent is a script that is different for each deployment and must be written with server specifications in mind, such as the type of database and the scripting language supported.

Following is sample callout agent pseudo-code that verifies whether the supplied user name and password are valid. The agent can be implemented in any programming language of your choice. The pseudo-code is to be used only as a guideline for developing the callout agent. You can build additional functionality into the program.

#### To verify the supplied user name and password by using pseudo-code

1. Accept the user name and password supplied in the request and format them appropriately.
2. Connect to the database that contains all the valid user names and passwords.
3. Check the supplied credentials against your database.
4. Format the response as required by the HTTP callout.
5. Send the response to the NetScaler appliance.

### Use Case: OWA-Based Spam Filtering

January 6, 2019

Spam filtering is the ability to dynamically block emails that are not from a known or trusted source or that have inappropriate content. Spam filtering requires an associated business logic that indicates that a particular kind of message is spam. When the NetScaler appliance processes Outlook Web Access (OWA) messages based on the HTTP protocol, HTTP callouts can be used to filter spam.

You can use HTTP callouts to extract any portion of the incoming message and check with an external callout server that has been configured with rules that are meant for determining whether a message...
is legitimate or spam. In case of spam email, for security reasons, the NetScaler appliance does not notify the sender that the email is marked as spam.

The following example conducts a very basic check for various listed keywords in the email subject. These checks can be more complex in a production environment.

To implement this configuration, you must perform the following tasks:

1. Enable the responder feature on the NetScaler appliance.
2. Create an HTTP callout on the NetScaler appliance and configure it with details about the external server and other required parameters.
3. Create a responder policy to analyze the response, and then bind the policy globally.
4. Create a callout agent on the remote server.

**Enabling Responder**

The responder feature must be enabled before it can be used on the NetScaler appliance.

**To enable responder by using the GUI**

1. Make sure that the responder license is installed.
2. In the GUI, expand AppExpert, and right-click Responder, and then click **Enable Responder** feature.

**Creating an HTTP Callout on the NetScaler Appliance**

Create an HTTP callout, HTTPCallout, with the parameter settings shown in the following table. For more information about creating an HTTP callout, see [Configuring an HTTP Callout](#).

For more information, see [Parameters and Values for HTTCallout](#).pdf.

**Creating a Responder Action**

Create a responder action, Action-Responder-4. Create the action with the parameter settings shown in the following table.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Action-Responder-4</td>
</tr>
<tr>
<td>Type</td>
<td>Respond with</td>
</tr>
</tbody>
</table>
To create a responder action by using the GUI

1. Navigate to **AppExpert** > **Responder** > **Actions**.
2. In the details pane, click **Add**.
3. In the **Create Responder Action** dialog box, in Name, type **Action-Responder-4**.
4. In Type, click **Respond with**.
5. In Target, type:

```
""HTTP/1.1 200 OK\n\nServer: Microsoft-IIS/6.0\nX-Powered-By: ASP.NET\nContent-Length: 0\n\nMS-WebStorage: 6.5.6944\n\nCache-Control: no-cache\n\n"
```

1. Click **Create**, and then click **Close**.

Creating a Responder Policy to Invoke the HTTP Callout

Create a responder policy, **Policy-Responder-4**, that will check the request body and, if the body contains the word “subject,” invoke the HTTP callout to verify the email. Create the policy with the parameter settings shown in the following table. While you can create a responder policy in the Policies subnode and then bind it globally by using the Responder Policy Manager, this demonstration uses the Responder Policy Manager to create the responder policy and bind it globally.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Policy-Responder-4</td>
</tr>
</tbody>
</table>

Table 2. Parameters and Values for Action-Responder-4
To create a responder policy by using the GUI

1. Navigate to **AppExpert > Responder**.
2. In the details pane, under **Policy Manager**, click **Responder policy manager**.
3. In the **Responder Policy Manager** dialog box, click **Override Global**.
4. Click **Insert Policy**, and then, in the **Policy Name** column, click **New Policy**.
5. In the **Create Responder Policy** dialog box, do the following:
   a) In Name, type **Policy-Responder-4**.
   b) In Action, click **Action-Responder-4**.
   c) In Undefined-Result Action, click **Global undefined-result** action.
   d) In the **Expression** text box, type:
      
      ```
      "HTTP.REQ.BODY(1000).CONTAINS("urn:schemas:httpmail:subject")
      && SYS.HTTP_CALLOUT(HTTP-Callout-4)"
      ```
   e) Click **Create**, and then click **Close**.
6. Click **Apply Changes**, and then click **Close**.

Creating an HTTP Callout Agent on the Remote Server

You will now need to create an HTTP callout agent on the remote callout server. The HTTP callout agent receives callout requests from the NetScaler appliance and responds accordingly. The callout agent is a script that is different for each deployment and must be written with server specifications in mind, such as the type of database and the scripting language supported.

The following pseudo-code provides instructions for creating a callout agent that checks a list of words that are generally understood to indicate spam mails. The agent can be implemented in any programming language of your choice. The pseudo-code is to be used only as a guideline for developing the callout agent. You can build additional functionality into the program.

To identify spam email by using pseudo-code

1. Accept the email subject provided by the NetScaler appliance.
2. Connect to the database that contains all the terms against which the email subject is checked.
3. Check the words in the email subject against the spam word list.
4. Format the response as required by the HTTP callout.
5. Send the response to the NetScaler appliance.

Use Case: Dynamic Content Switching

December 18, 2018

This use case provides dynamic content switching by using an HTTP callout to get the name of the load balancing virtual server to which the request is forwarded.

1. Add a content switching virtual server.

   ```
   ! > add cs_vserver cs_vserver1 HTTP 10.102.29.196 80
   ```

2. Create an HTTP callout.

   ```
   ! > add policy httpCallout http_callout1
   ```

3. Configure the HTTP callout to respond with the name of the load balancing virtual server from a request that contains the client IP address in the HTTP header “X-CLIENT-IP”.

   ```
   ```

4. Configure the content switching action to retrieve the callout response.

   ```
   ! > add cs_action cs_action1 -targetVserverExpr 'SYS.HTTP_CALLOUT(http_callout1)'
   ```

   Note: You must bind a load balancing virtual server to the content switching virtual server to account for:

   - The non-availability of the load balancing virtual server that the callout resolves to.
   - A UNDEF condition that results from the execution of the callout.

   ```
   ! > bind cs_vserver cs_vserver1 -lbvserver default_lbvip
   ```

5. Configure the content switching policy.
6. Binding the content switching policy to the content switching virtual server.

```
> add cs policy cs_policy1 -rule true -action cs_action1
```

**Pattern sets and data sets**

December 10, 2018

Policy expressions for string matching operations on a large set of string patterns tend to become long and complex. Resources consumed by the evaluation of such complex expressions are significant in terms of processing cycles, memory, and configuration size. You can create simpler, less resource-intensive expressions by using pattern matching.

Depending on the type of patterns that you want to match, you can use one of the following features to implement pattern matching:

- A pattern set is an array of indexed patterns used for string matching during default syntax policy evaluation. Example of a pattern set: `imagetypes {svg, bmp, png, gif, tiff, jpg}`.
- A data set is a specialized form of pattern set. It is an array of patterns of types number (integer), IPv4 address, or IPv6 address.

In many cases, you can use either pattern sets or data sets. However, in cases where you want specific matches for numerical data or IPv4 and IPv6 addresses, you must use data sets.

*Note:*

Pattern sets and data sets can be used only in default syntax policies.

To use pattern sets or data sets, first create the pattern set or data set and bind patterns to it. Then, when you configure a policy for comparing a string in a packet, use an appropriate operator and pass the name of the pattern set or data set as an argument.

**How string matching works with pattern sets and data sets**

January 6, 2019

A pattern set or data set contains a set of patterns, and each pattern is assigned a unique index. When a policy is applied to a packet, an expression identifies a string to be evaluated, and the operator
compares the string to the patterns defined in the pattern set or data set until a match is found or all patterns have been compared. Then, depending on its function, the operator returns either a boolean value that indicates whether or not a matching pattern was found or the index of the pattern that matches the string.

Note: This topic explains the working of a pattern set. Data sets work the same way. The only difference between pattern sets and data sets is the type of patterns defined in the set.

Consider the following use case to understand how patterns can be used for string matching.

You want to determine whether the URL suffix (target text) contains any of the image file extensions. Without using pattern sets, you would have to define a complex expression, as follows:

```plaintext
1 HTTP.REQ.URL.SUFFIX.CONTAINS("svg") || HTTP.REQ.URL.SUFFIX.CONTAINS("bmp") || HTTP.REQ.URL.SUFFIX.CONTAINS("png")
2 HTTP.REQ.URL.SUFFIX.CONTAINS("gif") || HTTP.REQ.URL.SUFFIX.CONTAINS("tiff") || HTTP.REQ.URL.SUFFIX.CONTAINS("jpg")
```

If the URL has a suffix of “jpg,” with the above compound expression, the Citrix ADC appliance has to iterate through the entire compound expression sequentially, from one sub expression to the next, to determine that the request refers to a jpg image. The following figure shows the steps in the process.

When a compound expression includes hundreds of sub expressions, the above process is resource intensive. A better alternative is an expression that invokes a pattern set, as shown in the following figure.

During policy evaluation as shown above, the operator (CONTAINS_ANY) compares the string identified in the request with the patterns defined in the pattern set until a match is found. With the Sample_Patset expression, the multiple iterations through six sub expressions are reduced to just one.

By eliminating the need to configure compound expressions that perform string matching with multiple OR operations, pattern sets or data sets simplify configuration and accelerate processing of requests and responses.

## Configuring a Pattern Set

December 10, 2018

To configure a pattern set, you must specify the strings that are to serve as patterns. You can manually assign a unique index value to each of these patterns, or you can allow the index values to be assigned automatically.

Note: Pattern sets are case sensitive (unless you specify the expression to ignore case). Therefore, the string pattern “product1,” for example, is not the same as the string pattern “Product1.”
Points to remember about index values:

- You cannot bind the same index value to more than one pattern.
- An automatically assigned index value is one number larger than the highest index value of the existing patterns within the pattern set. For example, if the highest index value of existing patterns in a pattern set is 104, the next automatically assigned index value will be 105.
- If you do not specify an index for the first pattern, index value 1 is automatically assigned to that pattern.
- Index values are not regenerated automatically if one or more patterns are deleted or modified. For example, if the set contains five patterns, with indexes from 1 through 5, and if the pattern with an index of 3 is deleted, the other index values in the pattern set are not automatically regenerated to produce values from 1 through 4.
- The maximum index value that can be assigned to a pattern is 4294967290. If that value is already assigned to a pattern in the set, you must manually assign index values to any newly added patterns. An unused index value that is lower than a currently used value cannot be assigned automatically.

To configure a pattern set by using the command line interface

At the command prompt, do the following:

1. Create a pattern set.
   
   add policy patset <name>

   Example:

   \[
   1 > add policy patset samplepatset
   \]

2. Bind patterns to the pattern set.
   
   bind policy patset <name> <string> [-index <positive_integer>]

   Example:

   \[
   1 > bind policy patset samplepatset product1 -index 1
   \]

   Note: Repeat this step for all the patterns you want to bind to the pattern set.

3. Verify the configuration.
   
   show policy patset <name>

To configure a pattern set by using the configuration utility

1. Navigate to AppExpert > Pattern Sets.
2. In the details pane, click **Add** to open the **Create Pattern Set** dialog box.
3. Specify a name for the pattern set in the Name text box.
4. Under Specify Pattern, type the first pattern and, optionally, specify values for the following parameters:
   - Treat back slash as escape character—Select this check box to specify that any backslash characters that you might include in the pattern are to be treated as escape characters.
   - Index—A user assigned index value, from 1 through 4294967290.
5. Verify that you have entered the correct characters, and then click **Add**.
6. Repeat steps 4 and 5 to add additional patterns, and then click **Create**.

**Configuring a data set**

December 18, 2018

To configure a data set, you must specify the strings that are to serve as patterns, and assign a type (number, IPv4 address, or IPv6 address) to each pattern. You can manually assign a unique index value to each of these patterns, or you can allow the index values to be assigned automatically. Dataset is not related to HTTP or any 7 layer protocol. It works only on text/string. There are different types of dataset such as num, ulong, ipv4, and ipv6. To use a dataset on IP, we have to convert the input into text/string.

Note: Data sets are case sensitive (unless you specify the expression to ignore case). Therefore, the string pattern “product1,” for example, is not the same as the string pattern “Product1.”

The rules applied for index values of data sets are the same as those applied for pattern sets. For information about index values, see **Configuring a Pattern Set**.

**To configure a data set by using the command line interface**

At the command prompt, do the following:

1. Create a data set.

```
add policy dataset <name> <type>
```

**Example:**

```
1 >
2 add policy dataset sampledataset ipv4
3 >
```
1. Bind patterns to the data set.

   \texttt{bind policy dataset <name> <value> [-index <positive_integer>]} 

Example:

```
1 ''
2 > bind policy dataset sampledataset 10.102.29.1 -index 1
3 ''
```

Note:
Repeat this step for all the patterns you want to bind to the data set.

1. add policy expression sampleexpression client.ip.src.typecast_text_t.equals_any("sampledataset")
2. Verify the configuration.
   
   \texttt{show policy dataset <name>}

To configure a data set by using the configuration utility

Navigate to \texttt{AppExpert > Data Sets}, click \texttt{Add} and specify the relevant details.

Using pattern sets and data sets

January 6, 2019

Default syntax policy expressions that take pattern sets or data sets as an argument can be used to perform string matching operations.

The usage is as follows:

```
1 <text>.<operator>("<name>")
```

where,

- \texttt{<text>} is the expression that identifies a string in a packet. Example: \texttt{HTTP.REQ.HEADER("Host")}.
- \texttt{<operator>} is one of the operators described in the \texttt{Pattern Set Types table} pdf.

For sample usage, see \texttt{Sample Usage}. 

Sample usage

December 10, 2018

To understand the usage of pattern sets in expressions, consider the example of a pattern set named “imagetypes.”

<table>
<thead>
<tr>
<th>Patterns</th>
<th>Index value</th>
</tr>
</thead>
<tbody>
<tr>
<td>svg</td>
<td>1</td>
</tr>
<tr>
<td>bmp</td>
<td>2</td>
</tr>
<tr>
<td>png</td>
<td>3</td>
</tr>
<tr>
<td>gif</td>
<td>4</td>
</tr>
<tr>
<td>tiff</td>
<td>5</td>
</tr>
<tr>
<td>jpg</td>
<td>6</td>
</tr>
</tbody>
</table>

Table 1. Pattern set “imagetypes”

Example 1: Determine whether the suffix of an HTTP request is one of the file extensions defined in the “imagetypes” pattern set.

- Expression. HTTP.REQ.URL.SUFFIX.EQUALS_ANY("imagetypes")
- Sample URL. http://www.example.com/homepageicon.jpg
- Result. TRUE

Example 2: Determine whether the suffix of an HTTP request is one of the file extensions defined in the “imagetypes” pattern set, and return the index of that pattern.

- Expression. HTTP.REQ.URL.SUFFIX.EQUALS_INDEX("imagetypes")
- Sample URL. http://www.example.com/mylogo.gif
- Result. 4 (The index value of the pattern “gif”)

Example 3: Use the index value of a pattern to determine whether the URL suffix is within a specified index-value range.

- Expression. HTTP.REQ.URL.SUFFIX.EQUALS_INDEX("imagetypes").GE(3) && HTTP.REQ.URL.SUFFIX.EQUALS_INDEX("imagetypes").LE(5)
- Sample URL. http://www.example.com/mylogo.gif
- Result. TRUE (The index value of gif file types is 4.)

Example 4: Implement one set of policies for file extensions bmp, jpg, and png, and a different set of policies for gif, tiff, and svg files.
An expression that returns the index of a matched pattern can be used to define traffic subsets for a web application. The following two expressions could be used in content switching policies for a content switching virtual server:

- HTTP.REQ.URL.SUFFIX.EQUALS_INDEX(“imagetypes”).LE(3)
- HTTP.REQ.URL.SUFFIX.EQUALS_INDEX(“imagetypes”).GE(4)

Variables

December 10, 2018

Variables are named objects that store information in the form of tokens. These tokens are used within and across different transactions on the NetScaler Appliance for internal computation and policy processing.

The NetScaler appliance supports creation of variables of the following types:

- **Singleton variables.** Can have a single value of one of the following types: ulong and text (max-size). The ulong type is an unsigned 64-bit integer, the text type is a sequence of bytes, and max-size is the maximum number of bytes in the sequence.
- **Map variables.** Maps hold values associated with keys: each key-value pair is called a map entry. The key for each entry is unique within the map. Maps are specified as follows:

  map (key_type, value_type, max-values).

  where,

  - *key_type* is the data type of the key. It is of type text (max-size).
  - *value_type* is the data type of the values of the map. It can be of type ulong or text (max-size).
  - *max-values* is the maximum number of entries that the map can contain. It is of type ulong.

Values for these variables are set using assignments which must be invoked on policy actions.

- **Note:** Variables are not yet supported in a high-availability setup or in a cluster.

Variables Scope

A map variable or a singleton variable can have a global scope. Alternatively, the scope of a singleton variable can be limited to a single transaction.
• **Global Scope Variable** - A variable with global scope (the default) has only one instance, and that instance has the same value(s) across all cores of a NetScaler appliance and across all nodes of a cluster or HA configuration. Global variable values exist until they are explicitly deleted, until they expire, or until a standalone appliance is restarted or all nodes of a cluster or HA configuration are restarted.

• **Transaction Scope Variable** - A variable with transaction scope has a separate instance, with its own value, for each transaction processed by the NetScaler appliance. When the transaction processing is complete, the transaction variable value is deleted.

**Note**: Transaction scope variables are available in NetScaler release 10.5.e or later.

### Configuring and using Variables

December 10, 2018

You must first create a variable and then assign a value or specify the operation that must be performed on the variable. After performing these operations, you can use the assignment as a policy action.

Note: Once configured, a variable's settings cannot be modified or reset. If the variable needs to be changed, the variable and all references to the variable (expressions and assignments) must be deleted. The variable can then be re-added with new settings, and the references (expressions and assignments) can be re-added.

### To configure variables by using the command line interface

1. Create a variable.

```
add ns variable <name> -type <string> [-scope global] [-ifFull ( undef | lru )] [-ifValueTooBig ( undef | truncate )] [-ifNoValue ( undef | init )] [-init <string>] [-expires <positive_integer>] [-comment <string>]
```

**Note**: Refer to the man page “man add ns variable” for description of the command parameters.

Example 1: Create a ulong variable named “my_counter” and initialize it to 1.

```
add ns variable my_counter -type ulong -init 1
```

Example 2: Create a map named “user_privilege_map”. The map will contain keys of maximum length 15 characters and text values of maximum length 10 characters, with a maximum of 10000 entries.
NetScaler 11.1

```
add ns variable user_privilege_map -type map(text(15),text(10),10000)
```

**Note:** If the map contains 10000 unexpired entries, assignments for new keys reuse one of the least recently used entries. By default, an expression trying to get a value for a non-existent key will initialize an empty text value.

Assign the value or specify the operation to be performed on the variable. This is done by creating an assignment.

```
add ns assignment <name> -variable <expression> [-set <expression> | -add <expression> | -sub <expression> | -append <expression> | -clear ] [-comment <string>]
```

Note: A variable is referenced by using the variable selector ($). Therefore, $variable1 is used to refer to text or ulong variables. Similarly, $variable2[key-expression] is used to refer to map variables.

Example 1: Define an assignment named “inc_my_counter” that automatically adds 1 to the “my_counter” variable.

```
add ns assignment inc_my_counter -variable $my_counter -add 1
```

Example 2: Define an assignment named “set_user_privilege” that adds to the “user_privilege_map” variable an entry for the client’s IP address with the value returned by the “get_user_privilege” HTTP callout.

```
add ns assignment set_user_privilege -variable $user_privilege_map[client.ip.src.typcast_text_t] -set sys.http.callout(get_user_privilege)
```

**Note:** If an entry for that key already exists, the value will be replaced. Otherwise a new entry for the key and value will be added. Based on the previous declaration for user_privilege_map, if the map already has 10000 entries, one of the least recently used entries will be reused for the new key and value.

1. Invoke the variable assignment in a policy.

There are two functions that can operate on map variables.

- **$name.valueExists(key-expression).** Returns true if there is a value in the map selected by the key-expression. Otherwise returns false. This function will update the expiration and LRU information if the map entry exists, but will not create a new map entry if the value does not exist.
NetScaler 11.1

- **$name.valueCount.** Returns the number of values currently held by the variable. This is the number of entries in a map. For a singleton variable, this is 0 if the variable is uninitialized or 1 otherwise.

**Example:** Invoke the assignment named “set_user_privilege” with a compression policy.

```plaintext
1 add cmp policy set_user_privilege_pol -rule $user_privilege_map.
   valueExists(client.ip.src.typecast_text_t).not -resAction
   set_user_privilege
```

**Use Case to insert HTTP header in the response side**

The following example shows an example of a singleton variable.

Add a singleton variable of type text. This variable can hold maximum 100 Bytes data.

```plaintext
1 add ns variable http_req_data -type text(100) -scope transaction
```

Add an assignment action, which will be used to store the HTTP request data into the variable.

```plaintext
   req.body(100)
```

Add a rewrite action to insert HTTP header, whose value will be fetched from the variable.

```plaintext
1 add rewrite action act_ins_header insert_http_header user_name
    $http_req_data.after_str("user_name").before_str("password")
```

Add a rewrite policy which will evaluate in the request time, and take assignment action to store data. When we hit this policy, we'll take assignment action and store the data into the ns variable (http_req_data)

```plaintext
1 add rewrite policy pol_set_variable true set_http_req_data
   2 3 bind rewrite global pol_set_variable 10 -type req_dFAULT
```

Add a rewrite policy which will evaluate in the response time, and add an HTTP header in the response.

```plaintext
1 add rewrite policy pol_ins_header true act_ins_header
   2 3 bind rewrite global pol_ins_header 10 -type res_dFAULT
```
To configure variables by using the GUI

1. Navigate to **AppExpert > NS Variables**, to create a variable.
2. Navigate to **AppExpert > NS Assignments**, to assign value(s) to the variable.
3. Navigate to the appropriate feature area where you want to configure the assignment as an action.

**Use Case: Caching User Privileges**

December 10, 2018

In this use case, user privileges (“GOLD”, “SILVER”, and so on) must be retrieved from an external web service.

**To achieve this use case, perform the following operations**

Create an HTTP callout to fetch the user privileges from the external web service.

```
1 add policy httpcallout <name> [-IPAddress <ip_addr|ipv6_addr>] [-port <port>] [-vServer <string>] [-returnType <returnType>] [-httpMethod (GET | POST)] [-hostExpr <string>] [-urlStemExpr <string>] [-headers <name(value)> ...] [-parameters <name(value)> ...] [-bodyExpr <string>] [-fullReqExpr <string>] [-scheme (http | https)] [-resultExpr <string>] [-cacheForSecs <secs>] [-comment <string>]
```

```
2 add policy httpcallout get_user_privilege -ipaddress 10.217.193.84 -port 80 -returnType text -httpMethod GET -hostExpr '/get_user_privilege' -resultExpr 'http.res.body(5)'
```

Store the privileges in a variable.

```
1 add ns variable <name> -type <string> [-scope (global | transaction)] [-ifFull (undef | lru)] [-ifValueTooBig (undef | truncate)] [-ifNoValue (undef | init)] [-init <string>] [-expires <positive_integer>] [-comment <string>]
```

```
2 add ns variable user_privilege_map -type map(text(15),text(10),10000) -expires 1200
```

```
4 add ns assignment set_user_privilege -variable $user_privilege_map[client.ip.src] -set sys.http_callout(get_user_privilege)
```
Create a policy to check if there is already a cached entry for the client’s IP address; if not, it calls the HTTP callout to set a map entry for the client.

```
1  add cmp policy <name> -rule <expression> -resAction <string>
2 3  add cmp policy set_user_privilege_pol -rule $user_privilege_map.
   valueExists(client.ip.src).not -resAction set_user_privilege
```

Create a policy that compresses if the cached privilege entry for the client is “GOLD”.

```
1  add cmp policy <name> -rule <expression> -resAction <string>
2 3  add cmp policy compress_if_gold_privilege_pol -rule '$user_privilege_map[client.ip.src].eq("GOLD")' -resAction compress
```

Bind the compression policies globally.

```
1  bind cmp global <policyName> [-priority <positive_integer>] [-state (ENABLED | DISABLED)] [-gotoPriorityExpression <expression>] [-type <type>] [-invoke (<labelType> <labelName>)]
2 3  bind cmp global set_user_privilege_pol -priority 10 NEXT
4 5  bind cmp global compress_if_gold_privilege_pol -priority 20 END
```

**Use Case: Limiting the Number of Sessions**

December 10, 2018

In this use case, the requirement is to limit the number of active backend sessions. In the deployment, each session login has login in the URL and each session logout has logout in the URL. On successful login, the backend sets a sessionid cookie with a unique 10 character value.

**To achieve this use case, perform the following operations:**

1. Create a map variable that can store each active session. The key of the map is the sessionid. The expiry time for the variable is set to 600 seconds (10 minutes).

   ```
   > add ns variable session_map -type map(text(10),ulong,100) - expires 600
   ```

2. Create the following assignments for the map variable:
• Create an entry for the sessionid and set that value to 1 (this value is not actually used).

```
1 > add ns assignment add_session -variable '${session_map[http.req.cookie.value("sessionid")]}'-set 1
```

• Deallocate the entry for a session ID, which implicitly decrements the value count for session_map.

```
1 > add ns assignment delete_session -variable '${session_map[http.req.cookie.value("sessionid")]}'-clear
```

3. Create responder policies for the following:

• To check if a map entry exists for that sessionid in the HTTP request. The add_session assignment is executed if the map entry does not exist.

```
1 > add responder policy add_session_pol 'http.req.url.contains("twbkwbis.P_SabanciLogin") || $session_map.valueExists(http.req.cookie.value("netsuis"))' add_session
```

Note: The valueExists() function in the add_session_pol policy counts as a reference to the session’s map entry, so each request resets the expiration timeout for its session. If no requests for a session are received after 10 minutes, the session’s entry will be deallocated.

• To check when the session is logged out. The delete_session assignment is executed.

```
1 add responder policy delete_session_pol "http.req.url.contains("Logout")" delete_session
```

• To check for login requests and if the number of active sessions exceed 100. If these conditions are satisfied, in order to limit the number of sessions, the user is redirected to a page that indicates that the server is busy.

```
1 add responder action redirect_too_busy redirect "/too_busy.html"
2 add responder policy check_login_pol "http.req.url.contains("twbkwbis.P_SabanciLogin")" && $session_map.valueCount > 100" redirect_too_busy
```

4. Bind the responder policies globally.
Policies and expressions

December 10, 2018

The following topics provide the conceptual and reference information that you require for configuring advanced policies on the Citrix® NetScaler® appliance.

You can also download a list of all the expressions supported on the NetScaler appliance and the hierarchical order in which they can be invoked. The reference is in a zip file which you can download from:

- For more information, see Citrix support article CTX137705
- For NetScaler 10.1, see Citrix support article CTX137705

Introduction to policies and expressions

December 13, 2018

For many NetScaler features, policies control how a feature evaluates data, which ultimately determines what the feature does with the data. A policy uses a logical expression, also called a rule, to evaluate requests, responses, or other data, and applies one or more actions determined by the outcome of the evaluation. Alternatively, a policy can apply a profile, which defines a complex action.

Some NetScaler features use default syntax policies, which provide greater capabilities than do the older, classic, policies. If you migrated to a newer release of the NetScaler software and have configured classic policies for features that now use default syntax policies, you might have to manually migrate policies to the default syntax.

This document contains the following details:

- Classic and Default Syntax Policies
- Classic and Default Syntax Expressions
- Converting Classic Expressions to the Newer Default Expression Syntax
- Before You Proceed

Classic and advanced policies

December 13, 2018

Warning

Classic policy expressions are no longer supported from NetScaler 12.0 build 56.20 onwards and as an alternative, Citrix recommends you to use Advanced policies. For more information, see Advanced Policies

Classic policies evaluate basic characteristics of traffic and other data. For example, classic policies can identify whether an HTTP request or response contains a particular type of header or URL.

Advanced policies can perform the same type of evaluations as classic policies. In addition, default syntax policies enable you to analyze more data (for example, the body of an HTTP request) and to configure more operations in the policy rule (for example, transforming data in the body of a request into an HTTP header).

In addition to assigning a policy an action or profile, you bind the policy to a particular point in the processing associated with the NetScaler features. The bind point is one factor that determines when the policy will be evaluated.
**Benefits of using advanced policies**

Default syntax policies use a powerful expression language that is built on a class-object model, and they offer several options that enhance your ability to configure the behavior of various NetScaler features. With default syntax policies, you can do the following:

- Perform fine-grained analyses of network traffic from layers 2 through 7.
- Evaluate any part of the header or body of an HTTP or HTTPS request or response.
- Bind policies to the multiple bind points that the default syntax policy infrastructure supports at the default, override, and virtual server levels.
- Use goto expressions to transfer control to other policies and bind points, as determined by the result of expression evaluation.
- Use special tools such as pattern sets, policy labels, rate limit identifiers, and HTTP callouts, which enable you to configure policies effectively for complex use cases.

Additionally, the GUI extends robust graphical user interface support for default syntax policies and expressions and enables users who have limited knowledge of networking protocols to configure policies quickly and easily. The GUI also includes a policy evaluation feature for default syntax policies. You can use this feature to evaluate a default syntax policy and test its behavior before you commit it, thus reducing the risk of configuration errors.

**Basic components of an advanced policy**

Following are a few characteristics of an Advanced policy:

- **Name.**
  
  Each policy has a unique name.

- **Rule.**
  
  The rule is a logical expression that enables the NetScaler feature to evaluate a piece of traffic or another object.

  For example, a rule can enable the NetScaler to determine whether an HTTP request originated from a particular IP address, or whether a Cache-Control header in an HTTP request has the value “No-Cache.”

  Advanced policies can use all of the expressions that are available in a classic policy, with the exception of classic expressions for the SSL VPN client. In addition, Advanced policies enable you to configure more complex expressions.

- **Bindings.**
  
  To ensure that the NetScaler can invoke a policy when it is needed, you associate the policy, or bind it, to one or more bind points.
You can bind a policy globally or to a virtual server. For more information, see “About policy bindings.”

- An associated action.

An action is a separate entity from a policy. Policy evaluation ultimately results in the NetScaler performing an action.

For example, a policy in the integrated cache can identify HTTP requests for .gif or .jpeg files. An action that you associate with this policy determines that the responses to these types of requests are served from the cache.

For some features, you configure actions as part of a more complex set of instructions known as a profile.

**How different NetScaler features use policies**

The NetScaler supports a variety of features that rely on policies for operation. The following table summarizes how the NetScaler features use policies.

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Policy Type</th>
<th>How You Use Policies in the Feature</th>
</tr>
</thead>
<tbody>
<tr>
<td>System</td>
<td>Classic</td>
<td>For the Authentication function, policies contain authentication schemes for different authentication methods. For example, you can configure LDAP and certificate-based authentication schemes. You also configure policies in the Auditing function.</td>
</tr>
<tr>
<td>DNS</td>
<td>Advanced</td>
<td>To determine how to perform DNS resolution for requests.</td>
</tr>
<tr>
<td>Feature Name</td>
<td>Policy Type</td>
<td>How You Use Policies in the Feature</td>
</tr>
<tr>
<td>----------------------</td>
<td>------------------</td>
<td>-------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SSL</td>
<td>Classic and Advanced</td>
<td>To determine when to apply an encryption function and add certificate information to clear text. To provide end-to-end security, after a message is decrypted, the SSL feature re-encrypts clear text and uses SSL to communicate with Web servers.</td>
</tr>
<tr>
<td>Compression</td>
<td>Classic and Advanced</td>
<td>To determine what type of traffic is compressed.</td>
</tr>
<tr>
<td>Integrated Caching</td>
<td>Advanced</td>
<td>To determine whether HTTP responses are cacheable.</td>
</tr>
<tr>
<td>Responder</td>
<td>Advanced</td>
<td>To configure the behavior of the Responder function.</td>
</tr>
<tr>
<td>Protection Features</td>
<td>Classic</td>
<td>To configure the behavior of the Filter, SureConnect, and Priority Queuing functions.</td>
</tr>
<tr>
<td>Content Switching</td>
<td>Classic and Advanced</td>
<td>To determine what server or group of servers is responsible for serving responses, based on characteristics of an incoming request. Request characteristics include device type, language, cookies, HTTP method, content type, and associated cache server.</td>
</tr>
<tr>
<td>Feature Name</td>
<td>Policy Type</td>
<td>How You Use Policies in the Feature</td>
</tr>
<tr>
<td>------------------------------</td>
<td>----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>AAA - Traffic Management</td>
<td>Classic. Exceptions: Traffic policies support only default syntax policies and authorization policies support both classic and default syntax policies.</td>
<td>To check for client-side security before users log in and establish a session. Traffic policies, which determine whether single sign-on (SSO) is required, use only the default syntax. Authorization policies authorize users and groups that access intranet resources through the appliance.</td>
</tr>
<tr>
<td>Cache Redirection</td>
<td>Classic</td>
<td>To determine whether responses are served from a cache or from an origin server.</td>
</tr>
<tr>
<td>Rewrite</td>
<td>Advanced</td>
<td>To identify HTTP data that you want to modify before serving. The policies provide rules for modifying the data. For example, you can modify HTTP data to redirect a request to a new home page, or a new server, or a selected server based on the address of the incoming request, or you can modify the data to mask server information in a response for security purposes. The URL Transformer function identifies URLs in HTTP transactions and text files for the purpose of evaluating whether a URL should be transformed.</td>
</tr>
</tbody>
</table>
**NetScaler 11.1**

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Policy Type</th>
<th>How You Use Policies in the Feature</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application Firewall</td>
<td>Classic and Advanced</td>
<td>To identify characteristics of traffic and data that should or should not be admitted through the firewall.</td>
</tr>
<tr>
<td>NetScaler Gateway, Clientless Access function</td>
<td>Advanced</td>
<td>To define rewrite rules for general Web access using the NetScaler Gateway.</td>
</tr>
<tr>
<td>NetScaler Gateway</td>
<td>Classic</td>
<td>To determine how the NetScaler Gateway performs authentication, authorization, auditing, and other functions.</td>
</tr>
</tbody>
</table>

**About actions and profiles**

Policies do not themselves take action on data. Policies provide read-only logic for evaluating traffic. To enable a feature to perform an operation based on a policy evaluation, you configure actions or profiles and associate them with policies.

**Note:** Actions and profiles are specific to particular features. For information about assigning actions and profiles to features, see the documentation for the individual features.

**About actions**

Actions are steps that the NetScaler takes, depending on the evaluation of the expression in the policy. For example, if an expression in a policy matches a particular source IP address in a request, the action that is associated with this policy determines whether the connection is permitted.

The types of actions that the NetScaler can take are feature specific. For example, in Rewrite, actions can replace text in a request, change the destination URL for a request, and so on. In Integrated Caching, actions determine whether HTTP responses are served from the cache or an origin server.

In some NetScaler features actions are predefined, and in others they are configurable. In some cases, (for example, Rewrite), you configure the actions using the same types of expressions that you use to configure the associated policy rule.
About profiles

Some NetScaler features enable you to associate profiles, or both actions and profiles, with a policy. A profile is a collection of settings that enable the feature to perform a complex function. For example, in the application firewall, a profile for XML data can perform multiple screening operations, such as examining the data for illegal XML syntax or evidence of SQL injection.

Use of actions and profiles in particular features

The following table summarizes the use of actions and profiles in different NetScaler features. The table is not exhaustive. For more information about specific uses of actions and profiles for a feature, see the documentation for the feature.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Use of an Action</th>
<th>Use of a Profile</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application firewall</td>
<td>Synonymous with a profile</td>
<td>All application firewall features use profiles to define complex behaviors, including pattern-based learning. You add these profiles to policies.</td>
</tr>
<tr>
<td>NetScaler Gateway</td>
<td>The following features of the NetScaler Gateway use actions: Pre-Authentication. Uses Allow and Deny actions. You add these actions to a profile.</td>
<td>The following features use a profile: Pre-Authentication, Session, Traffic, and Clientless Access. After configuring the profiles, you add them to policies.</td>
</tr>
<tr>
<td>Rewrite</td>
<td>You configure URL rewrite actions and add them to a policy.</td>
<td>Not used.</td>
</tr>
<tr>
<td>Integrated Caching</td>
<td>You configure caching and invalidation actions within a policy</td>
<td>Not used.</td>
</tr>
<tr>
<td>Feature</td>
<td>Use of an Action</td>
<td>Use of a Profile</td>
</tr>
<tr>
<td>-------------------------</td>
<td>----------------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>AAA - Traffic Management</td>
<td>You select an authentication type, set an authorization action of ALLOW or DENY, or set auditing to SYSLOG or NSLOG.</td>
<td>You can configure session profiles with a default timeout and authorization action.</td>
</tr>
<tr>
<td>Protection Features</td>
<td>You configure actions within policies for the following functions: Filter, Compression, Responder, and SureConnect.</td>
<td>Not used.</td>
</tr>
<tr>
<td>SSL</td>
<td>You configure actions within SSL policies</td>
<td>Not used.</td>
</tr>
<tr>
<td>System</td>
<td>The action is implied. For the Authentication function, it is either Allow or Deny. For Auditing, it is Auditing On or Auditing Off.</td>
<td>Not used.</td>
</tr>
<tr>
<td>DNS</td>
<td>The action is implied. It is either Drop Packets or the location of a DNS server.</td>
<td>Not used.</td>
</tr>
<tr>
<td>SSL Offload</td>
<td>The action is implied. It is based on a policy that you associate with an SSL virtual server or a service.</td>
<td>Not used.</td>
</tr>
<tr>
<td>Compression</td>
<td>Determine the type of compression to apply to the data</td>
<td>Not used.</td>
</tr>
<tr>
<td>Content Switching</td>
<td>The action is implied. If a request matches the policy, the request is directed to the virtual server associated with the policy.</td>
<td>Not used.</td>
</tr>
</tbody>
</table>
About policy bindings

A policy is associated with, or bound to, an entity that enables the policy to be invoked. For example, you can bind a policy to request-time evaluation that applies to all virtual servers. A collection of policies that are bound to a particular bind point constitutes a policy bank.

Following is an overview of different types of bind points for a policy:

- **Request time global.**
  A policy can be available to all components in a feature at request time.

- **Response time global.**
  A policy can be available to all components in a feature at response time.

- **Request time, virtual server-specific.**
  A policy can be bound to request-time processing for a particular virtual server. For example, you can bind a request-time policy to a cache redirection virtual server to ensure that particular requests are forwarded to a load balancing virtual server for the cache, and other requests are sent to a load balancing virtual server for the origin.

- **Response time, virtual server-specific.**
  A policy can also be bound to response-time processing for a particular virtual server.

- **User-defined policy label.**
  For default syntax policies, you can configure custom groupings of policies (policy banks) by defining a policy label and collecting a set of related policies under the policy label.

- **Other bind points.**
  The availability of additional bind points depends on type of policy (classic or default syntax), and specifics of the relevant NetScaler feature. For example, classic policies that you configure for the NetScaler Gateway have user and group bind points.
For additional information about default syntax policy bindings, see “Bind policies that use the default syntax” and Configure a policy bank for a virtual server. For additional information about classic policy bindings, see “Configure a classic policy.”

About evaluation order of policies

For classic policies, policy groups and policies within a group are evaluated in a particular order, depending on the following:

- The bind point for the policy, for example, whether the policy is bound to request-time processing for a virtual server or global response-time processing. For example, at request time, the NetScaler evaluates all request-time classic policies before evaluating any virtual server-specific policies.
- The priority level for the policy. For each point in the evaluation process, a priority level that is assigned to a policy determines the order of evaluation relative to other policies that share the same bind point. For example, when the NetScaler evaluates a bank of request-time, virtual server-specific policies, it starts with the policy that is assigned to the lowest priority value. In classic policies, priority levels must be unique across all bind points.

For Advanced policies, as with classic policies, the NetScaler selects a grouping, or bank, of policies at a particular point in overall processing. Following is the order of evaluation of the basic groupings, or banks, of Advanced policies:

1. Request-time global override
2. Request-time, virtual server-specific (one bind point per virtual server)
3. Request-time global default
4. Response-time global override
5. Response-time virtual server-specific
6. Response-time global default

However, within any of the preceding banks of policies, the order of evaluation is more flexible than in classic policies. Within a policy bank, you can point to the next policy to be evaluated regardless of the priority level, and you can invoke policy banks that belong to other bind points and user-defined policy banks.

Order of evaluation based on traffic flow

As traffic flows through the NetScaler and is processed by various features, each feature performs policy evaluation. Whenever a policy matches the traffic, the NetScaler stores the action and continues processing until the data is about to leave the NetScaler. At that point, the NetScaler typically applies all matching actions. Integrated Caching, which only applies a final Cache or NoCache action, is an exception.
Some policies affect the outcome of other policies. Following are examples:

- If a response is served from the integrated cache, some other NetScaler features do not process the response or the request that initiated it.
- If the Content Filtering feature prevents a response from being served, no subsequent features evaluate the response.

If the application firewall rejects an incoming request, no other features can process it.

**Classic and advanced policy expressions**

December 13, 2018

One of the most fundamental components of a policy is its rule. A policy rule is a logical expression that enables the policy to analyze traffic. Most of the policy’s functionality is derived from its expression.

An expression matches characteristics of traffic or other data with one or more parameters and values. For example, an expression can enable the NetScaler to accomplish the following:

- Determine whether a request contains a certificate.
- Determine the IP address of a client that sent a TCP request.
- Identify the data that an HTTP request contains (for example, a popular spreadsheet or word processing application).
- Calculate the length of an HTTP request.

**About classic expressions**

Classic expressions enable you to evaluate basic characteristics of data. They have a structured syntax that performs string matching and other operations.

Following are a few simple examples of classic expressions:

- An HTTP response contains a particular type of Cache Control header.
  res.http.header Cache-Control contains public
- An HTTP response contains image data.
  res.http.header Content-Type contains image/
- An SSL request contains a certificate.
  req.ssl.client.cert exists
About advanced policy expressions

Any feature that uses default syntax policies also uses Advanced expressions. For information about which features use Advanced policies, see the table NetScaler Feature, Policy Type, and Policy Usage.

Advanced policy expressions have a few other uses. In addition to configuring Advanced expressions in policy rules, you configure Advanced expressions in the following situations:

- **Integrated Caching:**
  You use Advanced policy expressions to configure a selector for a content group in the integrated cache.

- **Load Balancing:**
  You use Advanced policy expressions to configure token extraction for a load balancing virtual server that uses the TOKEN method for load balancing.

- **Rewrite:**
  You use Advanced policy expressions to configure rewrite actions.

- **Rate-based policies:**
  You use Advanced policy expressions to configure limit selectors when configuring a policy to control the rate of traffic to various servers.

Following are a few simple examples of Advanced policy expressions:

- An HTTP request URL contains no more than 500 characters.

  \[
  \text{http.req.url.length } \leq 500
  \]

- An HTTP request contains a cookie that has fewer than 500 characters.

  \[
  \text{http.req.cookie.length } < 500
  \]

- An HTTP request URL contains a particular text string.

  \[
  \text{http.req.url.contains(".html")}
  \]

Converting policy expressions using NSPEPI tool

December 10, 2018

You can convert a classic expression to the Advanced policy expression by using the nspepi conversion tool. You can also use the tool to convert all the classic expressions in the NetScaler configuration.
to the Advanced policy (with the exception of NetScaler entities that currently support only classic expressions).

The conversion tool does not convert policies configured for the following features because the features currently support only classic policies:

- Authentication, Pre-authentication
- SSL
- Cache redirection
- VPN (session, traffic, and tunnel traffic)
- Content filtering (The responder feature not only provides you with functionality that is equivalent to that provided by the content filtering feature but also surpasses the content filtering feature in the use cases that it supports. Additionally, responder supports the more powerful default syntax for policy expressions.)

The following NetScaler features support both classic and Advanced policy expression and, therefore, support the conversion of classic expressions to Advanced policy expressions:

- Application firewall policies
- Authorization policies
- Named expressions
- Compression policies
- Content switching policies
- User-defined, rule-based tokens/persistency (the –rule parameter value that is specified for a load balancing virtual server)

**About the conversion process**

When parsing a NetScaler configuration file, the conversion tool performs the following actions:

1. In commands that create classic named expressions, the conversion tool replaces the names of the classic expressions with Advanced policy expression.
2. In commands that support only the classic policy, if classic named expressions are used, the conversion tool replaces the names of the classic expressions with the actual classic expressions they represent. This action ensures that the names of expressions in classic-only features do not reference the Advanced policy expression created from Step 1.
3. In commands associated with entities that support both the classic syntax and the Advanced policies, the conversion tool replaces all classic expressions in commands with Advanced policy expressions.

**Example:**

Consider the following sample configuration commands:
In the commands that create the classic named expressions ne_c1 and ne_c2, the tool replaces the names of the expressions with actual Advanced policy expression. This action, which corresponds to Step 1 described earlier, results in the following commands:

```
1 add policy expression ne_c1 "METHOD == GET"
2 add policy expression ne_c2 "ne_c1 || URL == /\*.htm"
3 add filter policy pol1 -rule "ne_c2" -reqAction YES
4 add cmp policy pol2 -rule "REQ.HTTP.HEADER Accept CONTAINS \'text/html"
   "" -resAction COMPRESS
5 add cmp policy pol3 -rule "ne_c1 || ne_c2" -resAction GZIP
```

The filter policy command supports only the classic syntax. Therefore, the conversion tool replaces the classic named expression ne_c1 with the actual classic expression it represents. Note that the tool replaces ne_c1 in the expression for ne_c2, and then replaces ne_c2 in the filter policy with the classic expression. This action, which corresponds to Step 2 described earlier, results in the following command:

```
1 add policy expression ne_c2 "HTTP.REQ.METHOD.EQ("\"GET\")"
2
3 add policy expression ne_c1 "HTTP.REQ.URL.SUFFIX.EQ("\"htm\")"
```

The compression feature supports both classic and Advanced policy expression. Therefore, in the command that creates the compression policy pol2, the conversion tool replaces the expression with Advanced policy expression. This action, which corresponds to Step 3 described earlier, results in the following command:

```
add cmp policy pol2 -rule "HTTP.REQ.HEADER("\"Accept\")\.AFTER_STR("\"text/html\")\.LENGTH.GT(0)" -resAction COMPRESS
```

The command that creates the compression policy pol3 is unaffected because, after the conversion process is complete, ne_c1 and ne_c2 reference the Advanced policy expression that results from Step 1.

Client security messages are not supported in the newer default policy format and, therefore, are lost. The SYS.EVAL_CLASSIC_EXPR function is replaced with a Advanced policy expression. The following entities support the SYS.EVAL_CLASSIC_EXPR function:

- DNS policies
- Rate limit selectors
NetScaler 11.1

- Cache selectors
- Cache policies
- Content switching policies
- Rewrite policies
- URL transformation policies
- Responder policies
- Application firewall policies
- Authorization policies
- Compression policies
- CVPN access policies

After performing the conversion, the tool saves the changes in a new configuration file. The new configuration file is created in the directory in which the input file exists. The name of the new configuration file is the same as the name of the input configuration file except for the string new_ used as a prefix. Conversion warnings are reported in a warning line at the end of the screen output. Additionally, a warning file is created in the directory in which the input configuration file resides. For more information about the warning file and the types of warnings that are reported, see “Conversion warnings.”

**Convert expressions**

You can use the nspepi tool to convert a single classic expression to the Advanced policy expression. The nspepi tool must be run from the shell prompt on the NetScaler appliance.

**Convert a classic expression to the Advanced policy by using the CLI**

At the shell prompt, type:

```
nspepi -e "<classic expression>"
```

**Example:**

```
1 root@NS# nspepi -e "REQ.HTTP.URL == /*.htm"
2 "HTTP.REQ.URL.REGEX_MATCH(re#/(.*)\.htm#)"
```

**Convert a NetScaler configuration file**

You can use the nspepi tool to convert all the classic expressions in a NetScaler configuration file to the Advanced policy (except for those commands that do not support the Advanced policy). The nspepi tool must be run from the shell prompt on the NetScaler appliance.
Convert all the classic expressions in a NetScaler configuration file to the default syntax by using the CLI

At the shell prompt, type:

nspepi -f "<ns config file>" -v

Example:

```
1 root@NS# nspepi -f ns.conf
2 OUTPUT: New configuration file created: new_ns.conf
3 OUTPUT: New warning file created: warn_ns.conf
4 WARNINGS: Total number of warnings due to bind commands: 18
5 WARNINGS: Line numbers which has bind command issues: 305, 306, 706, 707, 708, 709, 710, 711, 712, 713, 714, 715, 767, 768, 774, 775, 776, 777
6 root@NS#
```

Conversion warnings

When classic expressions that are included in CLI commands are upgraded to the Advanced policy, the number of characters in the expression might exceed the 1499-character limit. The commands that include expressions longer than 1499 characters fail when the configuration is being applied. You must manually update these commands.

In addition, multiple classic policies can be bound to a given bind point with priority 0 or with equal priority, but the Advanced policy infrastructure does not support a priority value of 0 or policies with the same priority at a given bind point. These commands fail when the configuration is being applied. The commands must be updated manually with the correct priority values.

The line numbers of lines that threw a warning during conversion are listed at the end of the output in a warning line. In addition, a warning file is created in the same directory as the one in which the old and new configuration files reside. The name of the warning file is the same as the name of the input configuration file except that the string warn_ is added as a prefix.

Before you proceed

December 10, 2018

Before configuring expressions and policies, be sure you understand the relevant NetScaler feature and the structure of your data, as follows:
• Read the documentation on the relevant feature.
• Look at the data stream for the type of data that you want to configure.

You may want to run a trace on the type of traffic or content that you want to configure. This will give you an idea of the parameters and values, and operations on these parameters and values, that you need to specify in an expression.

**Note:** The NetScaler supports either classic or Advanced policy within a feature. You cannot have both types in the same feature. Over the past few releases, some NetScaler features have migrated from using classic policies and expressions to Advanced policy and expressions. If a feature of interest to you has changed to the Advanced policy format, you may have to manually migrate the older information. Following are guidelines for deciding if you need to migrate your policies:

- If you configured classic policies in a version of the Integrated Caching feature prior to release 9.0 and then upgrade to version 9.0 or later, there is no impact. All legacy policies are migrated to the Advanced policy format.
- For other features, you need to manually migrate classic policies and expressions to the Advanced syntax if the feature has migrated to the Advanced policy.

**Configure advanced policy infrastructure**

December 10, 2018

You can create advanced policies for various NetScaler features, including DNS, Rewrite, Responder, and Integrated Caching, and the clientless access function in the NetScaler Gateway. Policies control the behavior of these features.

When you create a policy, you assign it a name, a rule (an expression), feature-specific attributes, and an action that is taken when data matches the policy. After creating the policy, you determine when it is invoked by binding it globally or to either request-time or response-time processing for a virtual server.

Policies that share the same bind point are known as a policy bank. For example, all policies that are bound to a virtual server constitute the policy bank for the virtual server. When binding the policy, you assign it a priority level to specify when it is invoked relative to other policies in the bank. In addition to assigning a priority level, you can configure an arbitrary evaluation order for policies in a bank by specifying Goto expressions.

In addition to policy banks that are associated with a built-in bind point or a virtual server, you can configure policy labels. A policy label is a policy bank that is identified by an arbitrary name. You invoke a policy label, and the policies in it, from a global or virtual-server-specific policy bank. A policy label or a virtual-server policy bank can be invoked from multiple policy banks.
For some features, you can use the policy manager to configure and bind policies.

**Rules for names in identifiers used in policies**

December 18, 2018

The names of identifiers in the named expression, HTTP callout, pattern set, and rate limiting features must begin with an ASCII alphabet or an underscore (_). *The remaining characters can be ASCII alphanumeric characters or underscores._

The names of these identifiers must not begin with the following reserved words:

- The words ALT, TRUE, or FALSE or the Q or S one-character identifier.
- The special-syntax indicator RE (for regular expressions) or XP (for XPath expressions).
- Expression prefixes, which currently are the following:
  - CLIENT
  - EXTEND
  - HTTP
  - SERVER
  - SYS
  - TARGET
  - TEXT
  - URL
  - MYSQL
  - MSSQL

Additionally, the names of these identifiers cannot be the same as the names of enumeration constants used in the policy infrastructure. For example, the name of an identifier cannot be IGNORE-CASE, YEAR, or LATIN2_CZECH_CS (a MySQL character set).

**Note:** The NetScaler appliance performs a case-insensitive comparison of identifiers with these words and enumeration constants. For example, names of the identifiers cannot begin with TRUE, True, or true.
Create or modify a policy

December 13, 2018

All policies have some common elements. Creating a policy consists, at minimum, of naming the policy and configuring a rule. The policy configuration tools for the various features have areas of overlap, but also differences. For the details of configuring a policy for a particular feature, including associating an action with the policy, see the documentation for the feature.

To create a policy, begin by determining the purpose of the policy. For example, you may want to define a policy that identifies HTTP requests for image files, or client requests that contain an SSL certificate. In addition to knowing the type of information that you want the policy to work with, you need to know the format of the data that the policy is analyzing.

Next, determine whether the policy is globally applicable, or if it pertains to a particular virtual server. Also consider the effect that the order in which your policies are evaluated (which will be determined by how you bind the policies) will have on the policy that you are about to configure.

Create a policy by using the CLI

At the command prompt, type the following commands to create a policy and verify the configuration:

```sh
1 - add responder|dns|cs|rewrite|cache policy <policyName> -rule <expression> [<feature-specific information>]
2
3 - show rewrite policy <name>
```

**Example 1:**

```
add rewrite policy "pol_remove-ae" true "act_remove-ae"
Done
> show rewrite policy pol_remove-ae
   Name: pol_remove-ae
   Rule: true
   RewriteAction: act_remove-ae
   UndefAction: Use Global
   Hits: 0
   Undef Hits: 0
   Bound to: GLOBAL RES_OVERRIDE
   Priority: 90
   GotoPriorityExpression: END
Done
```
Example 2:

```
1  add cache policy BranchReportsCachePolicy -rule q{
2    http.req.url.query.value("actionoverride").contains("branchReports")
3      -action cache
4  }
5  done
6  show cache policy BranchReportsCachePolicy
7    Name: BranchReportsCachePolicy
8    Rule: http.req.url.query.value("actionoverride").contains("branchReports")
9    CacheAction: CACHE
10   Stored in group: DEFAULT
11   UndefAction: Use Global
12    Hits: 0
13   Undef Hits: 0
14  done
```

**Note:** At the command line, quote marks within a policy rule (the expression) must be escaped or delimited with the q delimiter. For more information, see [Configure advanced policy expressions: Get started](#).

### Create or modify a policy by using the GUI

1. In the navigation pane, expand the name of the feature for which you want to configure a policy, and then click Policies. For example, you can select Content Switching, Integrated Caching, DNS, Rewrite, or Responder.
2. In the details pane, click Add, or select an existing policy and click Open. A policy configuration dialog box appears.
3. Specify values for the following parameters. (An asterisk indicates a required parameter. For a term in parentheses, see the corresponding parameter in “Parameters for creating or modifying a policy.”)
4. Click Create, and then click Close.
5. Click Save. A policy is added.

**Note:** After you create a policy, you can view the policy's details by clicking the policy entry in the configuration pane. Details that are highlighted and underlined are links to the corresponding entity (for example, a named expression).
Policy configuration examples

December 13, 2018

These examples show how policies and their associated actions are entered at the command line interface. In the GUI, the expressions would appear in the Expression window of the feature-configuration dialog box for the integrated caching or rewrite feature.

Following is an example of creating a caching policy. Note that actions for caching policies are built in, so you do not need to configure them separately from the policy.

```
1  add cache policy BranchReportsCachePolicy -rule q{
2  http.req.url.query.value("actionoverride").contains("branchReports") }
3  -action cache
```

Following is an example of a rewrite policy and action:

```
1  add rewrite action myAction1 INSERT_HTTP_HEADER "myHeader" "valueForMyHeader"
2  add rewrite policy myPolicy1 "http.req.url.contains("myURLstring")" myAction1
```

Note: At the command line, quote marks within a policy rule (the expression) must be escaped or delimited with the q delimiter. For more information, see Configure advanced policy expressions: Get started.

Bind policies using advanced policy

December 10, 2018

After defining a policy, you indicate when the policy is to be invoked by binding the policy to a bind point and specifying a priority level. You can bind a policy to only one bind point. A bind point can be global, that is, it can apply to all virtual servers that you have configured. Or, a bind point can be specific to a particular virtual server, which can be either a load balancing or a content switching virtual server. Not all bind points are available for all features.

The order in which policies are evaluated determines the order in which they are applied, and features typically evaluate the various policy banks in a particular order. Sometimes, however, other features can affect the order of evaluation. Within a policy bank, the order of evaluation depends on the values of parameters configured in the policies. Most features apply all of the actions associated with policies
whose evaluation results in a match with the data that is being processed. The integrated caching feature is an exception.

**Feature-specific differences in policy bindings**

You can bind policies to built-in, global bind points (or banks), to virtual servers, or to policy labels. However, the NetScaler features differ in terms of the types of bindings that are available. The following table summarizes how you use policy bindings in various NetScaler features that use policies.

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Virtual Servers Configured in the Feature</th>
<th>Policies Configured in the Feature</th>
<th>Bind Points Configured for the Policies</th>
<th>Use of Policies in the Feature</th>
</tr>
</thead>
<tbody>
<tr>
<td>DNS</td>
<td>none</td>
<td>DNS policies</td>
<td>Global</td>
<td>To determine how to perform DNS resolution for requests.</td>
</tr>
<tr>
<td>Content Switching</td>
<td>Content Switching (CS)</td>
<td>Content Switching policies</td>
<td>Content switching or cache redirection virtual server; Policy label</td>
<td>To determine what server or group of servers is responsible for serving responses, based on characteristics of an incoming request. Request characteristics include device type, language, cookies, HTTP method, content type, and associated cache server.</td>
</tr>
</tbody>
</table>

(Note: This feature can support either or classic or Advanced policies, but not both.)
<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Virtual Servers Configured in the Feature</th>
<th>Policies Configured in the Feature</th>
<th>Bind Points Configured for the Policies</th>
<th>Use of Policies in the Feature</th>
</tr>
</thead>
<tbody>
<tr>
<td>Integrated Caching</td>

</tr>
<tr>
<td><strong>Rewrite</strong></td>
<td>none</td>
<td>Rewrite policies</td>
<td>Global override, Global default, Policy label, load balancing, content switching, or SSL offload virtual server</td>
<td>To identify HTTP data that you want to modify before serving. The policies provide rules for modifying the data. For example, you can modify HTTP data to redirect a request to a selected server based on the address of the incoming request, or to mask server information in a response for security purposes.</td>
</tr>
<tr>
<td><strong>URL Transform function in the Rewrite feature</strong></td>
<td>none</td>
<td>Transformation policies</td>
<td>Global override, Global default, Policy label</td>
<td>To identify URLs in HTTP transactions and text files for the purpose of evaluating whether a URL should be altered.</td>
</tr>
</tbody>
</table>
**Bind points and order of evaluation**

For a policy to take effect, you must ensure that the policy is invoked at some point during processing. To do so, you associate the policy with a bind point. The collection of policies that is bound to a bind point is known as a policy bank.

Following are the bind points that the NetScaler evaluates, listed in the typical order of evaluation within a policy bank:

1. **Request-time override.** When a request flows through a feature, the NetScaler first evaluates request-time override policies for the feature.
2. **Request-time Load Balancing virtual server.** If policy evaluation cannot be completed after all the request-time override policies have been evaluated, the NetScaler processes request-time policies for load balancing virtual servers.
3. **Request-time Content Switching virtual server.** If policy evaluation cannot be completed after all the request-time policies for load balancing virtual servers have been evaluated, the NetScaler processes request-time policies for content switching virtual servers.
4. **Request-time default.** If policy evaluation cannot be completed after all request-time, virtual server-specific policies have been evaluated, the NetScaler processes request-time Advanced policies.

---

© 1999-2018 Citrix Systems, Inc. All rights reserved.
5. **Response-time override.** At response time, the NetScaler starts with policies that are bound to the response-time override bind point.

6. **Response-time Load Balancing virtual server.** If policy evaluation cannot be completed after all response-time override policies have been evaluated, the NetScaler process the response-time policies for load balancing virtual servers.

7. **Response-time Content Switching virtual server.** If policy evaluation cannot be completed after all policies have been evaluated for load balancing virtual servers, the NetScaler process the response-time policies for content switching virtual servers.

8. **Response-time default.** If policy evaluation cannot be completed after all response-time, virtual-server-specific policies have been evaluated, the NetScaler processes response-time Advanced policies.

**Policy evaluation across features**

In addition to attending to evaluation of policies within a feature, if you have bound policies to a content switching virtual server, note that these policies are evaluated before other policies. Binding a policy to a content switching vserver produces a different result in NetScaler versions 9.0.x and later than in 8.x versions. In NetScaler 9.0 and later versions, evaluation occurs as follows:

- Content switching policies are evaluated before other policies. If a content switching policy evaluates to TRUE, the target load balancing vserver is selected.
- If all content switching policies evaluate to FALSE, the default load balancing vserver under the content switching VIP is selected.

After a target load balancing vserver is selected by the content switching process, policies are evaluated in the following order:

1. Policies that are bound to the global override bind point.
2. Policies that are bound to the default load balancing vserver.
3. Policies that are bound to the target content switching vserver.
4. Policies that are bound to the global default bind point.

To be sure that the policies are evaluated in the intended order, follow these guidelines:

- Make sure that the default load balancing vserver is not directly reachable from the outside; for example, the vserver IP address can be 0.0.0.0.
- To prevent exposing internal data on the load balancing default vserver, configure a policy to respond with a “503 Service Unavailable” status and bind it to the default load balancing vserver.

**Entries in a policy bank**

Each entry in a policy bank has, at minimum, a policy and a priority level. You can also configure entries that change the priority-based evaluation order, and you can configure entries that invoke
external policy banks.

The following table summarizes each entry in a policy bank.

<table>
<thead>
<tr>
<th>Policy Name</th>
<th>Priority</th>
<th>Goto Expression</th>
<th>Invocation Type</th>
<th>Policy Bank to Be Invoked</th>
</tr>
</thead>
<tbody>
<tr>
<td>The policy name, or a “dummy” policy named NOPOLICY. The NOPOLICY entry controls evaluation flow without processing a rule.</td>
<td>An integer.</td>
<td>Optional. Identifies the next policy in the bank to evaluate, or ends any further evaluation</td>
<td>Optional. Indicates that an external policy bank will be invoked. This field restricts the choices to a global policy label or a virtual server.</td>
<td>Optional. Used with Invocation Type. This is the label for a policy bank or a virtual server name. The NetScaler returns to the current bank after processing the external bank.</td>
</tr>
</tbody>
</table>

If the policy evaluates to TRUE, the NetScaler stores the action that is associated with the policy. If the policy evaluates to FALSE, the NetScaler evaluates the next policy. If the policy is neither TRUE nor FALSE, the NetScaler uses the associated Undef (undefined) action.

**Evaluation order within a policy bank**

Within a policy bank, the evaluation order depends on the following items:

- **A priority.**
  
  The most minimal amount of information about evaluation order is a numeric priority level. The lower the number, the higher the priority.

- **A Goto expression.**
  
  If supplied, the Goto expression indicates the next policy to be evaluated, typically within the same policy bank. Goto expressions can only proceed forward in a bank. To prevent looping, a policy bank configuration is not valid if a Goto statement points backwards in the bank.

- **Invocation of other policy banks.**
  
  Any entry can invoke an external policy bank. The NetScaler provides a built-in entity named NOPOLICY that does not have a rule. You can add a NOPOLICY entry in a policy bank when you
want to invoke another policy bank, but do not want to process any other rules prior to the invocation. You can have multiple NOPOLICY entries in multiple policy banks.

Values for a Goto expression are as follows:

- **NEXT.**
  
  This keyword selects the policy with the next higher priority level in the current policy bank.

- **An integer.**
  
  If you supply an integer, it must match the priority level of another policy in the current policy bank.

- **END.**
  
  This keyword stops evaluation after processing the current policy, and no additional policies in this bank are processed.

- **Blank.**
  
  If the Goto expression is empty, it is the same as specifying END.

- **A numeric expression.**
  
  This is an advanced policy expression that resolves to a priority number for another policy in the current bank.

- **USE_INVOCATION_RESULT.**
  
  This phrase can be used only if you are invoking an external policy bank. Entering this phrase causes the NetScaler to perform one of the following actions:
  
  - If the final Goto in the invoked policy bank has a value of END or is empty, the invocation result is END, and evaluation stops.
  - If the final Goto expression in the invoked policy bank is anything other than END, the NetScaler performs a NEXT.

The following table illustrates a policy bank that uses Goto statements and policy bank invocations.

<table>
<thead>
<tr>
<th>Policy Name</th>
<th>Priority</th>
<th>Goto</th>
<th>Invocation</th>
<th>Policy Bank to Be Invoked</th>
</tr>
</thead>
<tbody>

<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 3. Example of a Policy Bank That Uses Gotos and External Bank Invocations

### How policy evaluation ends

Evaluation of a policy bank ends when one of the following takes place:

- A policy evaluates to TRUE and its Goto statement value is END.
  
  No further policies or policy banks in this feature are evaluated.

- An external policy bank is invoked, its evaluation returns an END, and the Goto statement uses a value of USE_INVOCATION_RESULT or END.
  
  Evaluation continues with the next policy bank for this feature. For example, if the current bank is the request-time override bank, the NetScaler next evaluates request-time policy banks for the virtual servers.

- The NetScaler has walked through all the policy banks in this feature, but has not encountered an END.
  
  If this is the last entry to be evaluated in this policy bank, the NetScaler proceeds to the next feature.

© 1999-2018 Citrix Systems, Inc. All rights reserved.
How features use actions after policy evaluation

After evaluating all relevant policies for a particular data point (for example, an HTTP request), the NetScaler stores all the actions that are associated with any policy that matched the data.

For most features, all the actions from matching policies are applied to a traffic packet as it leaves the NetScaler. The Integrated Caching feature only applies one action: CACHE or NOCACHE. This action is associated with the policy with the lowest priority value in the “highest priority” policy bank (for example, request-time override policies are applied before virtual server-specific policies).

Bind a policy globally

December 10, 2018

The following binding procedures are typical. However, refer to the documentation for the feature of interest to you for complete instructions.

Bind an integrated caching policy globally by using the CLI

At the command prompt, type the following commands to bind an Integrated Caching policy and verify the configuration:

```
1 - bind cache global <policy> -priority <positiveInteger> [-type REQ_OVERRIDE | REQ_DEFAULT | RES_OVERRIDE | RES_DEFAULT]
2
3 - show cache global
```

Example:

```
1 > bind cache global _nonPostReq -priority 100 -type req_default
2   Done
3 > show cache global
4 1) Global bindpoint: REQ_DEFAULT
5     Number of bound policies: 2
6 2) Global bindpoint: RES_DEFAULT
7     Number of bound policies: 1
8   Done
```

The type argument is optional to maintain backward compatibility. If you omit the type, the policy is bound to REQ_DEFAULT or RES_DEFAULT, depending on whether the policy rule is a response-time or a request-time expression.
**Bind a rewrite policy globally by using the CLI**

At the command prompt, type the following commands to bind a Rewrite policy and verify the configuration:

```bash
1 - bind rewrite global <policyName> <priority> [-type REQ_OVERRIDE | REQ_DEFAULT | RES_OVERRIDE | RES_DEFAULT]
2
3 - show rewrite global
```

**Example:**

```bash
1 bind rewrite global pol_remove-pdf 100
2 Done
3 > show rewrite global
4 1) Global bindpoint: REQ_DEFAULT
5 Number of bound policies: 1
6
7 2) Global bindpoint: REQ_OVERRIDE
8 Number of bound policies: 1
9
10 Done
```

The type argument is optional for globally bound policies, to maintain backward compatibility. If you omit the type, the policy is bound to REQ_DEFAULT or RES_DEFAULT, depending on whether the policy rule is a response-time or a request-time expression.

**Bind a compression policy globally by using the CLI**

At the command prompt, type the following commands to bind a compression policy and verify the configuration:

```bash
1 - bind cmp global <policyName> -priority <positiveInteger> [-type REQ_OVERRIDE | REQ_DEFAULT | RES_OVERRIDE | RES_DEFAULT]
2
3 - show cmp global
```

**Example:**

```bash
1 > bind cmp global cmp_pol_1 -priority 100
2 Done
3 > show cmp policy cmp_pol_1
4    Name: cmp_pol_1
5    Rule: HTTP.REQ.URL.SUFFIX.EQ("BMP")
```
Bind a responder policy globally by using the CLI

At the command prompt, type the following commands to bind a Responder policy and verify the configuration:

```
1 - bind responder global <policyName> <priority> [-type OVERRIDE | DEFAULT ]
2
3 - show responder global
```

**Example:**

```
1 bind responder global pol404Error1 200
2 Done
3 > show responder global
4 1) Global bindpoint: REQ_DEFAULT
5 Number of bound policies: 1
6
7 Done
```

Bind a DNS policy globally by using the CLI

At the command prompt, type the following commands to bind a DNS policy and verify the configuration:

```
1 - bind dns global <policyName> <priority>
2
3 - show dns global
```

**Example:**

```
1 > bind dns global pol_ddos_drop1 150
2 Done
```
Bind an integrated caching, responder, rewrite, or compression policy globally by using the GUI

1. In the navigation pane, click the name of the feature for which you want to bind the policy.
2. In the details pane, click <Feature Name> policy manager.
3. In the Policy Manager dialog box, select the bind point to which you want to bind the policy (for example, for Integrated Caching, Rewrite, or Compression, you could select Request and Default Global). The Responder does not differentiate between request-time and response-time policies.
4. Click Insert Policy and, from the Policy Name pop-up menu, select the policy name. A priority is assigned automatically to the policy, but you can click the cell in the Priority column and drag it anywhere within the dialog box if you want the policy to be evaluated after other policies in this bank. The priority is automatically reset. Note that priority values within a policy bank must be unique.
5. Click Apply Changes.
6. Click Close. A message in the status bar indicates that the policy is bound successfully.

Bind a DNS policy globally by using the GUI

1. Navigate to Traffic Management > DNS > Policies.
2. In the details pane, click Global Bindings.
3. In the global bindings dialog box, click Insert Policy, and select the policy that you want to bind globally.
4. Click in the Priority field and enter the priority level.
5. Click OK. A message in the status bar indicates that the policy is bound successfully.

Bind a policy to a virtual server

December 10, 2018
A globally bound policy applies to all load balancing and content switching virtual servers.

Note that when binding a policy to a virtual server, you must identify it as a request-time or a response-time policy.

**Bind a policy to a load balancing or content switching virtual server by using the CLI**

At the command prompt, type the following commands to bind a policy to a load balancing or content switching virtual server and verify the configuration:

```
1  bind lb|cs vserver <virtualServerName> -policyName <policyName> -priority <positiveInteger> -type REQUEST|RESPONSE
2  show lb vserver <name>
```

**Example:**

```
1  > bind lb vserver lbvip -policyName ns_cmp_msapp -priority 50
2   Done
3  > show lb vserver lbvip
4      lbvip (8.7.6.6:80) - HTTP       Type: ADDRESS
5         State: DOWN
6      Last state change was at Wed Jul 15 05:54:24 2009 (+226 ms)
7      Time since last state change: 28 days, 01:57:26.350
8      Effective State: DOWN
9      Client Idle Timeout: 180 sec
10     Down state flush: ENABLED
11     Disable Primary Vserver On Down : DISABLED
12     Port Rewrite : DISABLED
13     No. of Bound Services : 0 (Total) 0 (Active)
14    Configured Method: LEASTCONNECTION
15     Mode: IP
16     Persistence: NONE
17     Vserver IP and Port insertion: OFF
18     Push: DISABLED   Push VServer:
19     Push Multi Clients: NO
20     Push Label Rule: none
21
22  1)  Policy : ns_cmp_msapp Priority:50
23  2)  Policy : cf-pol Priority:1       Inherited
24   Done
```
Bind a policy to an SSL offload virtual server by using the CLI

At the command prompt, type the following commands to bind a policy to an SSL offload virtual server and verify the configuration:

```
bind ssl vserver <vServerName>@ -policyName <policyName> -priority <positiveInteger>
```

Bind a policy to a virtual server by using the GUI

1. In the navigation pane, expand Traffic Management > Load Balancing, Traffic Management > Content Switching, Traffic Management > SSL Offload, Security > AAA- Application Traffic, or NetScaler Gateway, and then click Virtual Servers.
2. In the details pane, double-click the virtual server to which you want to bind the policy, and then click Open.
3. On the Policies tab, click the icon for the type of policy that you want to bind (the choices are feature-specific), and then click the name of the policy. Note that for some features, you can bind both classic policies and policies that use the default syntax to the virtual server.
4. If you are binding a policy to a Content Switching virtual server, in the Target field select a load balancing virtual server to which traffic that matches the policy is sent.
5. Click OK. A message in the status bar indicates that the policy is bound successfully.

Display policy bindings

December 10, 2018

You can display policy bindings to verify that they are correct.

Display policy bindings by using the CLI

At the command prompt, type the following commands to display policy bindings and verify the configuration:

```
show rewrite policy <name>
```

Example:

```
1 > show rewrite policy pol_remove-pdf
2     Name: pol_remove-pdf
3     Rule: http.req.url.contains(".pdf")
4     RewriteAction: act_remove-ae
```
Display global policy bindings for integrated caching, rewrite, or responder by using the GUI

1. In the navigation pane, expand the feature that contains the policy that you want to view, and then click Policies.
2. In the details pane, click the policy. Bound policies have a check mark next to them.
3. At the bottom of the page, under Details, next to Bound to, view the entity to which the policy is bound.

Display global policy bindings for DNS or clientless access in the NetScaler Gateway by using the GUI

1. Navigate to Traffic Management > DNS > Policies.
2. In the details pane, click Global Bindings.

Display global policy bindings for content switching by using the GUI

1. Navigate to Traffic Management > Content Switching > Policies.
2. In detailed pane, select policy.
3. In the details pane, click Show Bindings.

Unbind a policy

December 10, 2018

If you want to re-assign a policy or delete it, you must first remove its binding.
Unbind an integrated caching, rewrite, or compression advanced policy globally by using the CLI

At the command prompt, type the following commands to unbind an integrated caching, rewrite, or compression Advanced policy globally and verify the configuration:

```
1 - unbind cache|rewrite|cmp global <policyName> [-type req_override|req_default|res_override|res_default] [-priority <positiveInteger>]
2
3 - show cache|rewrite|cmp global
```

Example:

```
1 > unbind cache global_nonPostReq
2 Done
3 > show cache global
4   1) Global bindpoint: REQ_DEFAULT
5       Number of bound policies: 1
6
7   2) Global bindpoint: RES_DEFAULT
8       Number of bound policies: 1
9
10 Done
```

The priority is required only for the “dummy” policy named NOPOLICY.

Unbind a responder policy globally by using the CLI

At the command prompt, type the following commands to unbind a responder policy globally and verify the configuration:

```
1 - unbind responder global <policyName> [-type override|default] [-priority <positiveInteger>]
2
3 - show responder global
```

Example:

```
1 > unbind responder global pol404Error
2 Done
3 > show responder global
4   1) Global bindpoint: REQ_DEFAULT
5       Number of bound policies: 1
6 Done
```
The priority is required only for the “dummy” policy named NOPOLICY.

**Unbind a DNS policy globally by using the CLI**

At the command prompt, type the following commands to unbind a DNS policy globally and verify the configuration:

```
1 - unbind responder global <policyName>
2
3 - unbind responder global
```

**Example:**

```
1 unbind dns global dfgdfg
2 Done
3 show dns global
4   Policy name : dfgdfggfhg
5     Priority : 100
6     Goto expression : END
7 Done
```

**Unbind an advanced policy from a virtual server by using the CLI**

At the command prompt, type the following commands to unbind an Advanced policy from a virtual server and verify the configuration:

```
1 - unbind cs vserver <name> -policyName <policyName> [-priority <positiveInteger>] [-type REQUEST|RESPONSE]
2
3 - show lb vserver <name>
```

**Example:**

```
1 unbind cs vserver vs-cont-switch -policyName poll
2 Done
3 > show cs vserver vs-cont-switch
4   vs-cont-switch (10.102.29.10:80) - HTTP Type: CONTENT
5   State: UP
6   Last state change was at Wed Aug 19 08:56:55 2009 (+18 ms)
7   Time since last state change: 0 days, 02:47:55.750
8   Client Idle Timeout: 180 sec
9   Down state flush: ENABLED
10  Disable Primary Vserver On Down : DISABLED
```
| 11 | Port Rewrite: DISABLED |
| 12 | State Update: DISABLED |
| 13 | Default: Content Precedence: RULE |
| 14 | Vserver IP and Port insertion: OFF |
| 15 | Case Sensitivity: ON |
| 16 | Push: DISABLED Push VServer: |
| 17 | Push Label Rule: none |
| 18 | Done |

The priority is required only for the “dummy” policy named NOPOLICY.

**Unbind an integrated caching, responder, rewrite, or compression Advanced policy globally by using the GUI**

1. In the navigation pane, click the feature with the policy that you want to unbind (for example, Integrated Caching).
2. In the details pane, click <Feature Name> policy manager.
3. In the Policy Manager dialog box, select the bind point with the policy that you want to unbind, for example, Advanced Global.
4. Click the policy name that you want to unbind, and then click Unbind Policy.
5. Click Apply Changes.
6. Click Close. A message in the status bar indicates that the policy is unbound successfully.

**Unbind a DNS policy globally by using the GUI**

1. Navigate to Traffic Management > DNS > Policies.
2. In the details pane, click Global Bindings.
3. In the Global Bindings dialog box, select policy and click unbind policy.
4. Click OK. A message in the status bar indicates that the policy is unbound successfully.

**Unbind an advanced policy from a load balancing or content switching virtual server by using the GUI**

1. Navigate to Traffic Management, and expand Load Balancing or Content Switching, and then click Virtual Servers.
2. In the details pane, double-click the virtual server from which you want to unbind the policy.
3. On the Policies tab, in the Active column, clear the check box next to the policy that you want to unbind.
4. Click OK. A message in the status bar indicates that the policy is unbound successfully.
Create policy labels

December 10, 2018

In addition to the built-in bind points where you set up policy banks, you can also configure user-defined policy labels and associate policies with them.

Within a policy label, you bind policies and specify the order of evaluation of each policy relative to others in the bank of policies for the policy label. The NetScaler also permits you to define an arbitrary evaluation order as follows:

- You can use “goto” expressions to point to the next entry in the bank to be evaluated after the current one.
- You can use an entry in a policy bank to invoke another bank.

Each feature determines the type of policy that you can bind to a policy label, the type of load balancing virtual server that you can bind the label to, and the type of content switching virtual server from which the label can be invoked. For example, a TCP policy label can only be bound to a TCP load balancing virtual server. You cannot bind HTTP policies to a policy label of this type. And you can invoke a TCP policy label only from a TCP content switching virtual server.

After configuring a new policy label, you can invoke it from one or more banks for the built-in bind points.

Create a caching policy label by using the CLI

At the command prompt, type the following commands to create a Caching policy label and verify the configuration:

```
1 - add cache policylabel <labelName> -evaluates req|res
2
3 - show cache policylabel<labelName>
```

Example:

```
1 > add cache policylabel lbl-cache-pol -evaluates req
2 Done
3
4 > show cache policylabel lbl-cache-pol
5     Label Name: lbl-cache-pol
6     Evaluates: REQ
7     Number of bound policies: 0
8     Number of times invoked: 0
9 Done
```
Create a content switching policy label by using the CLI

At the command prompt, type the following commands to create a Content Switching policy label and verify the configuration:

```
1 - add cs policylabel <labelName> http|tcp|rtsp|ssl
2
3 - show cs policylabel <labelName>
```

Example:

```
1 > add cs policylabel lbl-cs-pol http
2 Done
3 > show cs policylabel lbl-cs-pol
   Label Name: lbl-cs-pol
   Label Type: HTTP
   Number of bound policies: 0
   Number of times invoked: 0
8 Done
```

Create a rewrite policy label by using the CLI

At the command prompt, type the following commands to create a Rewrite policy label and verify the configuration:

```
1 - add rewrite policylabel <labelName> http_req|http_res|url|text|
   clientless_vpn_req|clientless_vpn_res
2
3 - show rewrite policylabel <labelName>
```

Example:

```
1 > add rewrite policylabel lbl-rewrt-pol http_req
2 Done
3
4 > show rewrite policylabel lbl-rewrt-pol
   Label Name: lbl-rewrt-pol
   Transform Name: http_req
   Number of bound policies: 0
   Number of times invoked: 0
8 Done
```
Create a responder policy label by using the CLI

At the command prompt, type the following commands to create a Responder policy label and verify the configuration:

```
1 - add responder policylabel <labelName>
2
3 - show responder policylabel <labelName>
```

Example:

```
1 > add responder policylabel lbl-respndr-pol
2 Done
3
4 > show responder policylabel lbl-respndr-pol
   Label Name: lbl-respndr-pol
   Number of bound policies: 0
   Number of times invoked: 0
5
6 Done
```

Note: Invoke this policy label from a policy bank. For more information, see the “Binding a Policy to a Policy Label” section.

Create a policy label by using the GUI

1. In the navigation pane, expand the feature for which you want to create a policy label, and then click Policy Labels. The choices are Integrated Caching, Rewrite, Content Switching, or Responder.
2. In the details pane, click Add.
3. In the Name box, enter a unique name for this policy label.
4. Enter feature-specific information for the policy label. For example, for Integrated Caching, in the Evaluates drop-down menu, you would select REQ if you want this policy label to contain request-time policies, or select RES if you want this policy label to contain response-time policies. For Rewrite, you would select a Transform name.
5. Click Create.
6. Configure one of the built-in policy banks to invoke this policy label. For more information, see the “Binding a Policy to a Policy Label” section. A message in the status bar indicates that the policy label is created successfully.
Bind a policy to a policy label

As with policy banks that are bound to the built-in bind points, each entry in a policy label is a policy that is bound to the policy label. As with policies that are bound globally or to a vserver, each policy that is bound to the policy label can also invoke a policy bank or a policy label that is evaluated after the current entry has been processed. The following table summarizes the entries in a policy label.

- **Name**: The name of a policy, or, to invoke another policy bank without evaluating a policy, the “dummy” policy name NOPOLICY.
  
  You can specify NOPOLICY more than once in a policy bank, but you can specify a named policy only once.

- **Priority**: An integer. This setting can work with the Goto expression.

- **Goto Expression**: Determines the next policy to evaluate in this bank. You can provide one of the following values:
  
  - **NEXT**: Go to the policy with the next higher priority.
  - **END**: Stop evaluation.
  - **USE_INVOCATION_RESULT**: Applicable if this entry invokes another policy bank. If the final Goto in the invoked bank has a value of END, evaluation stops. If the final Goto is anything other than END, the current policy bank performs a NEXT.
  - **Positive number**: The priority number of the next policy to be evaluated.
  - **Numeric expression**: An expression that produces the priority number of the next policy to be evaluated.

  The Goto can only proceed forward in a policy bank.

  If you omit the Goto expression, it is the same as specifying END.

- **Invocation Type**: Designates a policy bank type. The value can be one of the following:
  
  - **Request Vserver**: Invokes request-time policies that are associated with a virtual server.
  - **Response Vserver**: Invokes response-time policies that are associated with a virtual server.
  - **Policy label**: Invokes another policy bank, as identified by the policy label for the bank.

- **Invocation Name**: The name of a virtual server or a policy label, depending on the value that you specified for the Invocation Type.

Configure a policy label or virtual server policy bank

December 13, 2018
After you have created policies, and created policy banks by binding the policies, you can perform additional configuration of policies within a label or policy bank. For example, before you configure invocation of an external policy bank, you might want to wait until you have configured that policy bank.

This topic includes the following sections:

- Configure a policy label
- Configure a policy bank for a virtual server

**Configure a policy label**

A policy label consists of a set of policies and invocations of other policy labels and virtual server-specific policy banks. An Invoke parameter enables you to invoke a policy label or a virtual server-specific policy bank from any other policy bank. A special-purpose NoPolicy entry enables you to invoke an external bank without processing an expression (a rule). The NoPolicy entry is a “dummy” policy that does not contain a rule.

For configuring policy labels from the NetScaler command line, note the following elaborations of the command syntax:

- gotoPriorityExpression is configured as described in Table 2. Format of Each Entry in a Policy Bank of the section “Entries in a Policy Bank” in Bind policies using advanced policy.
- The type argument is required. This is unlike binding a conventional policy, where this argument is optional.
- You can invoke the bank of policies that are bound to a virtual server by using the same method as you use for invoking a policy label.

**Configure a policy label by using the CLI**

At the command prompt, type the following commands to configure a policy label and verify the configuration:

```bash
1 - bind cache|rewrite|responder policylabel <policylabelName> -policyName <policyName> -priority <priority> [-gotoPriorityExpression <gotopriorityExpression>] [-invoke reqvserver|resvserver|policylabel <policyLabelName>|<vserverName>]
2
3 - show cache|rewrite|responder policylabel <policylabelName>
```

**Example:**

```bash
1 bind cache policylabel _reqBuiltinDefaults -policyName _nonGetReq -priority 100
```
Invoke a policy label from a rewrite policy bank with a NOPOLICY entry by using the CLI

At the command prompt, type the following commands to invoke a policy label from a Rewrite policy bank with a NOPOLICY entry and verify the configuration:

```
1 - bind rewrite global <policyName> <priority> <gotoPriorityExpression>
   -type REQ_OVERRIDE|REQ_DEFAULT|RES_OVERRIDE|RES_DEFAULT -invoke
   reqvserver|resvserver|policylabel <policyLabelName>|<vserverName>
2
3 - show rewrite global
```

Example:

```
1 > bind rewrite global NOPOLICY 100 -type REQ_DEFAULT -invoke
   policylabel lbl-rewrt-pol
2 Done
3 > show rewrite global
4  1) Global bindpoint: REQ_DEFAULT
5     Number of bound policies: 1
6
7  2) Global bindpoint: REQ_OVERRIDE
8     Number of bound policies: 1
9 Done
```
Invoke a policy label from an Integrated Caching policy bank by using the CLI

At the command prompt, type the following commands to invoke a policy label from an Integrated Caching policy bank and verify the configuration:

```
1 - bind cache global NOPOLICY -priority <priority> -
gotoPriorityExpression <gotoPriorityExpression> -type REQ_OVERRIDE|
REQ_DEFAULT|RES_OVERRIDE|RES_DEFAULT -invoke reqvserver|resvserver|
policylabel <policyLabelName>|<vserverName>
2
3 - show cache global
```

Example:

```
1 bind cache global NOPOLICY -priority 100 -gotoPriorityExpression END -
type REQ_DEFAULT -invoke policylabel lbl-cache-pol
2 Done
3 > show cache global
4 1) Global bindpoint: REQ_DEFAULT
  Number of bound policies: 2
5 2) Global bindpoint: RES_DEFAULT
  Number of bound policies: 1
6
9
10 Done
```

Invoke a policy label from a Responder policy bank by using the CLI

At the command prompt, type the following commands to invoke a policy label from a Responder policy bank and verify the configuration:

```
1 - bind responder global NOPOLICY <priority> <gotoPriorityExpression> -
type OVERRIDE|DEFAULT -invoke vserver|policylabel <policyLabelName>
>vserverName>
2
3 - show responder global
```

Example:

```
1 > bind responder global NOPOLICY 100 NEXT -type DEFAULT -invoke
   policylabel lbl-respndr-pol
2 Done
3 > show responder global
4 1) Global bindpoint: REQ_DEFAULT
```
Configure a policy label by using the GUI

1. In the navigation pane, expand the feature for which you want to configure a policy label, and then click Policy Labels. The choices are Integrated Caching, Rewrite, or Responder.

2. In the details pane, double-click the label that you want to configure.

3. If you are adding a new policy to this policy label, click Insert Policy, and in the Policy Name field, select New Policy. For more information about adding a policy, see Create or modify a policy. Note that if you are invoking a policy bank, and do not want a rule to be evaluated prior to the invocation, click Insert Policy, and in the Policy Name field select NOPOLICY.

4. For each entry in this policy label, configure the following:
   - **Policy Name:**
     This is already determined by the Policy Name, new policy, or NOPOLICY entry that you inserted in this bank.
   - **Priority:**
     A numeric value that determines either an absolute order of evaluation within the bank, or is used in conjunction with a Goto expression.
   - **Expression:**
     The policy rule. Policy expressions are described in detail in the following chapters. For an introduction, see Configure advanced policy expressions: Get started.
   - **Action:**
     The action to be taken if this policy evaluates to TRUE.
   - **Goto Expression:**
     Optional. Used to augment the Priority level to determine the next policy or policy bank to evaluate. For more information on possible values for a Goto expression, see Table 2. Format of Each Entry in a Policy Bank of the section “Entries in a Policy Bank” in Bind policies using advanced policy.
   - **Invoke:**
     Optional. Invokes another policy bank.

5. Click OK. A message in the status bar indicates that the policy label is configured successfully.
Configure a policy bank for a virtual server

You can configure a bank of policies for a virtual server. The policy bank can contain individual policies, and each entry in the policy bank can optionally invoke a policy label or a bank of policies that you configured for another virtual server. If you invoke a policy label or policy bank, you can do so without triggering an expression (a rule) by selecting a NOPOLICY “dummy” entry instead of a policy name.

Add policies to a virtual server policy bank by using the CLI

At the command prompt, type the following commands to add policies to a virtual server policy bank and verify the configuration:

1. `bind lb|cs vserver <virtualServerName> <serviceType> [-policyName <policyName>] [-priority <positiveInteger>] [-gotoPriorityExpression <expression>] [-type REQUEST|RESPONSE]

Example:

1. `add lb vserver vs-cont-sw TCP`
2. `Done`
3. `show lb vserver vs-cont-sw`

<table>
<thead>
<tr>
<th>vs-cont-sw (0.0.0.0:0) - TCP</th>
<th>Type: ADDRESS</th>
</tr>
</thead>
<tbody>
<tr>
<td>State: DOWN</td>
<td></td>
</tr>
<tr>
<td>Last state change was at Wed Aug 19 10:04:02 2009 (+279 ms)</td>
<td></td>
</tr>
<tr>
<td>Time since last state change: 0 days, 00:02:14.420</td>
<td></td>
</tr>
<tr>
<td>Effective State: DOWN</td>
<td></td>
</tr>
<tr>
<td>Client Idle Timeout: 9000 sec</td>
<td></td>
</tr>
<tr>
<td>Down state flush: ENABLED</td>
<td></td>
</tr>
<tr>
<td>Disable Primary Vserver On Down: DISABLED</td>
<td></td>
</tr>
<tr>
<td>No. of Bound Services: 0 (Total) 0 (Active)</td>
<td></td>
</tr>
<tr>
<td>Configured Method: LEASTCONNECTION</td>
<td></td>
</tr>
<tr>
<td>Mode: IP</td>
<td></td>
</tr>
<tr>
<td>Persistence: NONE</td>
<td></td>
</tr>
<tr>
<td>Connection Failover: DISABLED</td>
<td></td>
</tr>
</tbody>
</table>
4. `Done`

Invoke a policy label from a virtual server policy bank with a NOPOLICY entry by using the CLI

At the command prompt, type the following commands to invoke a policy label from a virtual server policy bank with a NOPOLICY entry and verify the configuration:
NetScaler 11.1

```
1 - bind lb|cs vserver <virtualServerName> -policyName NOPOLICY_REWRITE
   NOPOLICY_CACHE|NOPOLICY_RESPONDER -priority <integer> -type REQUEST
   RESPONSE -gotoPriorityExpression <gotopriorityExpression> -invoke
   reqVserver|resVserver|policyLabel <vserverName>|<labelName>
2
3 - show lb vserver
```

Example:

```
1 > bind lb vserver vs-cont-sw -policyName NOPOLICY-REWRITE -priority 200
   -type REQUEST -gotoPriorityExpression NEXT -invoke policyLabel lbl-
   rewrt-pol
2 Done
```

Configure a virtual server policy bank by using the GUI

1. In the left navigation pane, expand **Traffic Management > Load Balancing, Traffic Management > Content Switching, Traffic Management > SSL Offload, Security > AAA - Application Traffic, or NetScaler Gateway**, as appropriate, and then click Virtual Servers.
2. In the details pane, select the virtual server that you want to configure, and then click Open.
3. In the Configure Virtual Server dialog box click the Policies tab.
4. To create a new policy in this bank, click the icon for the type of policy or policy label that you want to add to the virtual server’s bank of policies, click Insert Policy. Note that if you want to invoke a policy label without evaluating a policy rule, select the NOPOLICY “dummy” policy.
5. To configure an existing entry in this policy bank, enter the following:
   - **Priority:**
     A numeric value that determines either an absolute order of evaluation within the bank or is used in conjunction with a Goto expression.
   - **Expression:**
     The policy rule. Policy expressions are described in detail in the following chapters. For an introduction, see Configuring Advanced Policy Expressions: Getting Started.
   - **Action:**
     The action to be taken if this policy evaluates to TRUE.
   - **Goto Expression:**
     Optional. Determines the next policy or policy bank evaluate. For more information on possible values for a Goto expression, see the section “Entries in a Policy Bank” in Bind policies using advanced policy.
   - **Invoke:**
Optional. To invoke another policy bank, select the name of the policy label or virtual server policy bank that you want to invoke.

6. Click **OK**. A message in the status bar indicates that the policy is configured successfully.

**Invoke or remove a policy label or virtual server policy bank**

December 13, 2018

Unlike a policy, which can only be bound once, you can use a policy label or a virtual server’s policy bank any number of times by invoking it. Invocation can be performed from two places:

- From the binding for a named policy in a policy bank.
- From the binding for a NOPOLICY “dummy” entry in a policy bank.

Typically, the policy label must be of the same type as the policy from which it is invoked. For example, you would invoke a responder policy label from a responder policy.

Note: When binding or unbinding a global NOPOLICY entry in a policy bank at the command line, you specify a priority to distinguish one NOPOLICY entry from another.

**Invoke a rewrite or integrated caching policy label by using the CLI**

At the command prompt, type the one of the following commands to invoke a rewrite or integrated caching policy label and verify the configuration:

```plaintext
1 - bind cache global <policy> -priority <positive_integer> [-gotoPriorityExpression <expression>] -type REQ_OVERRIDE|REQ_DEFAULT|RES_OVERRIDE|RES_DEFAULT] -invoke reqvserver|resvserver|policylabel <label_name>
2
3 - bind rewrite global <policy> -priority <positive_integer> [-gotoPriorityExpression <expression>] -type REQ_OVERRIDE|REQ_DEFAULT|RES_OVERRIDE|RES_DEFAULT] -invoke reqvserver|resvserver|policylabel <label_name>
4
5 - show cache global|show rewrite global
```

**Example:**

```
1 > bind cache global _nonPostReq2 -priority 100 -type req_override -invoke
2    policylabel lbl-cache-pol
3 Done
```
Invoke a responder policy label by using the CLI

At the command prompt, type the following commands to invoke a responder policy label and verify the configuration:

```
1 - bind responder global <policy_Name> <priority_as_positive_integer>
   [<-gotoPriorityExpression>] -type REQ OVERRIDE|REQ_DEFAULT|OVERRIDE|
   DEFAULT -invoke vserver|policylabel <label_name>
```

Example:

```
1 > bind responder global pol404Error1 300 -invoke policylabel lbl-respndr-pol
2 Done
3 > show responder global
1) Global bindpoint: REQ_DEFAULT
   Number of bound policies: 2

Done
```

Invoke a virtual server policy bank by using the CLI

At the command prompt, type the following commands to invoke a Virtual Server Policy Bank and verify the configuration:

```
1 - bind lb vserver <vserver_name> -policyName <policy_Name> -priority <positive_integer> [-gotoPriorityExpression <expression>] -type REQUEST|RESPONSE -invoke reqvserver|resvserver|policylabel <policy_Label_Name>
```
Example:

```
$ bind lb vserver lbvip -policyName ns_cmp_msapp -priority 100
```

```
$ show lb vserver lbvip
lbvip (8.7.6.6:80) - HTTP          Type: ADDRESS
State: DOWN
Last state change was at Wed Jul 15 05:54:24 2009 (+166 ms)
Time since last state change: 28 days, 06:37:49.250
Effective State: DOWN
Client Idle Timeout: 180 sec
Down state flush: ENABLED
Disable Primary Vserver On Down : DISABLED
Port Rewrite : DISABLED
No. of Bound Services : 0 (Total)    0 (Active)
Configured Method: LEASTCONNECTION
Mode: IP
Persistence: NONE
Vserver IP and Port insertion: OFF
Push: DISABLED   Push VServer:
Push Multi Clients: NO
Push Label Rule: none

1) CSPolicy: pol-cont-sw CSVserver: vs-cont-sw Priority: 100 Hits: 0
2) Policy : pol-ssl Priority:0
3) Policy : ns_cmp_msapp Priority:100
4) Policy : cf-pol Priority:1 Inherited
```

Remove a rewrite or integrated caching policy label by using the CLI

At the command prompt, type one of the following commands to remove a rewrite or integrated caching policy label and verify the configuration:

```
$ unbind rewrite global <policyName> -priority <positiveInteger> -type {REQ_OVERRIDE,REQ_DEFAULT,RES_OVERRIDE,RES_DEFAULT} 
```
NetScaler 11.1

3 - unbind cache global <policyName> -priority <positiveInteger> -type REQ_OVERRIDE|REQ_DEFAULT|RES_OVERRIDE|RES_DEFAULT
4
5 - show rewrite global|show cache global

Example:

1 > unbind rewrite global NOPOLICY -priority 100 -type REQ_OVERRIDE
2 > show rewrite global
3 Done
4 1) Global bindpoint: REQ_DEFAULT
5 Number of bound policies: 1
6
7 Done

Remove a responder policy label by using the CLI

At the command prompt, type the following commands to remove a responder policy label and verify the configuration:

1 - unbind responder global <policyName> -priority <positiveInteger> -type OVERRIDE|DEFAULT
2
3 - show responder global

Example:

1 > unbind responder global NOPOLICY -priority 100 -type REQ_DEFAULT
2 Done
3 > show responder global
4 1) Global bindpoint: REQ_DEFAULT
5 Number of bound policies: 1
6
7 Done

Remove a virtual server policy label by using the CLI

At the command prompt, type one of the following commands to remove a Virtual Server policy label and verify the configuration:

1 - unbind lb vserver <virtualServerName> -policyName NOPOLICY-REWRITE|NOPOLICY-RESPONSER|NOPOLICY-CACHE -type REQUEST|RESPONSE -priority <positiveInteger>
NetScaler 11.1

```
- unbind cs vserver <virtualServerName> -policyName NOPOLICY-REWRITE|NOPOLICY-RESPONDER|NOPOLICY-CACHE -type REQUEST|RESPONSE -priority <positiveInteger>

- show lb vserver|show cs vserver
```

**Example:**

```
> unbind lb vserver lbvip -policyName ns_cmp_msapp -priority 200
Done
> show lb vserver lbvip

lbvip (8.7.6.6:80) - HTTP       Type: ADDRESS
  State: DOWN
  Last state change was at Wed Jul 15 05:54:24 2009 (+161 ms)
  Time since last state change: 28 days, 06:47:54.600
  Effective State: DOWN
  Client Idle Timeout: 180 sec
  Down state flush: ENABLED
  Disable Primary Vserver On Down: DISABLED
  Port Rewrite: DISABLED
  No. of Bound Services: 0 (Total) 0 (Active)
  Configured Method: LEASTCONNECTION
  Mode: IP
  Persistence: NONE
  Vserver IP and Port insertion: OFF
  Push: DISABLED  Push VServer: Push Multi Clients: NO
  Push Label Rule: none

  1) CSPolicy: pol-cont-sw  CSVserver: vs-cont-sw  Priority: 100  Hits: 0

  1) Policy: pol-ssl Priority:0
  2) Policy: cf-pol Priority:1  Inherited

Done
```

**Invoke a policy label or virtual server policy bank by using the GUI**

1. Bind a policy, as described in Bind a policy globally, Bind a policy to a virtual server, or Bind a policy to a policy label. Alternatively, you can enter a NOPOLICY “dummy” entry instead of a policy name. You do this if you do not want to evaluate a policy before evaluating the policy bank.
2. In the Invoke field, select the name of the policy label or virtual server policy bank that you want to evaluate if traffic matches the bound policy. A message in the status bar indicates that the policy label or virtual server policy bank is invoked successfully.

Remove a policy label invocation by using the GUI

1. Open the policy and clear the Invoke field. Unbinding the policy also removes the invocation of the label. A message in the status bar indicates that the policy label is removed successfully.

Configure and bind policies with the policy manager

December 13, 2018

Warning:
Classic policy expressions are no longer supported from NetScaler 12.0 build 56.20 onwards and as an alternative, Citrix recommends you to use Advanced policies. For more information, see Advanced Policies.

Some applications provide a specialized Policy Manager in the NetScaler GUI to simplify configuring policy banks. It also lets you find and delete policies and actions that are not being used.

The Policy Manager is currently available for the Rewrite, Integrated Caching, Responder, and Compression features.

The following are keyboard equivalents for the procedures in this section:

• For editing a cell in the Policy Manager, you can tab to the cell and click F2 or press the SPACE bar on the keyboard.
• To select an entry in a drop-down menu, you can tab to the entry, press the space bar to view the drop-down menu, use the UP and DOWN ARROW keys to navigate to the entry that you want, and press the space bar again to select the entry.
• To cancel a selection in a drop-down menu, press the Escape key.
• To insert a policy, tab to the row above the insertion point and press Control + Insert, or click Insert Policy.
• To remove a policy, tab to the row that contains the policy and press Delete.

Note: Note that when you delete the policy, the NetScaler searches the Goto Expression values of other policies in the bank. If any of these Goto Expression values match the priority level of the deleted policy, they are removed.
Configure policy bindings by using the policy manager

1. In the navigation pane, click the feature for which you want to configure policies. The choices are Responder, Integrated Caching, Rewrite or Compression.

2. In the details pane, click Policy Manager.

3. If you are configuring classic policy bindings for compression, in the Compression Policy Manager dialog box, click Switch to Classic Syntax. The dialog box switches to the classic syntax view and displays the Switch to Advanced Policy button. At any time before you complete configuring policy bindings, if you want to configure bindings for policies that use the Advanced Policy click the Switch to Advanced Policy button.

4. For features other than Responder, to specify the bind point, click Request or Response, and then click one of the request-time or response-time bind points. The options are Override Global, LB Virtual Server, CS Virtual Server, Default Global, or Policy Label. If you are configuring the Responder, the Request and Response flow types are not available.

5. To bind a policy to this bind point, click Insert Policy, and select a previously configured policy, a NOPOLICY label, or the New policy option. Depending on the option that you select, you have the following choices:
   - **New policy**: Create the policy as described in “Create or modify a policy,” and then configure the priority level, GoTo expression, and policy invocation as described in the table, “Format of each entry in a policy bank.”
   - **Existing policy, NOPOLICY, or NOPOLICY<feature name>**: Configure the priority level, GoTo expression, and policy invocation as described in the table, “Format of each entry in a policy bank.” The NOPOLICY or NOPOLICY<feature name> options are available only for policies that use Advanced Policies.

6. Repeat the preceding steps to add entries to this policy bank.

7. To modify the priority level for an entry, you can do any of the following:
   - Double-click the Priority field for an entry and edit the value.
   - Click and drag a policy to another row in the table.
   - Click Regenerate Priorities.

   In all three cases, priority levels of all other policies are modified as needed to accommodate the new value. Goto Expressions with integer values are also updated automatically. For example, if you change a priority value of 10 to 100, all policies with a Goto Expression value of 10 are updated to the value 100.

8. To change the policy, action, or policy bank invocation for an row in the table, click the down arrow to the right of the entry and do one of the following:
To change the policy, select another policy name or select New Policy and follow the steps in Create or modify a policy.

To change the Goto Expression, select Next, End, USE_INVOCATION_RESULT, or select more and enter an expression whose result returns the priority level of another entry in this policy bank.

To modify an invocation, select an existing policy bank, or click New Policy Label and follow the steps in Bind a policy to a policy label.

9. To unbind a policy or a policy label invocation from this bank, click any field in the row that contains the policy or policy label, and then click Unbind Policy.

10. When you are done, click Apply Changes. A message in the status bar indicates that the policy is bound successfully.

Remove unused policies by using the policy manager

1. In the navigation pane, click the feature for which you want to configure the policy bank. The choices are Responder, Integrated Caching, or Rewrite.
2. In the details pane, click <Feature Name> policy manager.
3. In the <Feature Name> Policy Manager dialog box, click Cleanup Configuration.
4. In the Cleanup Configuration dialog box, select the items that you want to delete, and then click Remove.
5. In the Remove dialog box, click Yes.
6. Click Close. A message in the status bar indicates that the policy is removed successfully.

Configuring advanced policy expression: getting started

December 10, 2018

Advanced policies evaluate data on the basis of information that you supply in Advanced policy expressions. An Advanced policy expression analyzes data elements (for example, HTTP headers, source IP addresses, the NetScaler system time, and POST body data). In addition to configuring an Advanced policy expression in a policy, in some NetScaler features, you configure Advanced policy expression outside of the context of a policy.

To create an Advanced policy expression, you select a prefix that identifies a piece of data that you want to analyze, and then you specify an operation to perform on the data. For example, an operation can match a piece of data with a text string that you specify, or it can transform a text string into an HTTP header. Other operations match a returned string with a set of strings or a string pattern.
You configure compound expressions by specifying Boolean and arithmetic operators, and by using parentheses to control the order of evaluation.

Advanced policy expression can also contain classic expressions. You can assign a name to a frequently used expression to avoid having to build the expression repeatedly.

Policies and a few other entities include rules that the NetScaler uses to evaluate a packet in the traffic flowing through it, to extract data from the NetScaler system itself, to send a request (a “callout”) to an external application, or to analyze another piece of data. A rule takes the form of a logical expression that is compared against traffic and ultimately returns values of TRUE or FALSE.

The elements of the rule can themselves return TRUE or FALSE, string, or numeric values.

Before configuring an Advanced policy expression, you need to understand the characteristics of the data that the policy or other entity is to evaluate. For example, when working with the Integrated Caching feature, a policy determines what data can be stored in the cache. With Integrated Caching, you need to know the URLs, headers, and other data in the HTTP requests and responses that the NetScaler receives. With this knowledge, you can configure policies that match the actual data and enable the NetScaler to manage caching for HTTP traffic. This information helps you determine the type of expression that you need to configure in the policy.

### Basic elements of an advanced policy expression

An Advanced policy expression consists of, at a minimum, a prefix (or a single element used in place of a prefix). Most expressions also specify an operation to be performed on the data that the prefix identifies. You format an expression of up to 1,499 characters as follows:

```
<prefix>.<operation> [<compound-operator> <prefix>.<operation>. . .]
```

where

- `<prefix>`
  is an anchor point for starting an expression.
  The prefix is a period-delimited key that identifies a unit of data. For example, the following prefix examines HTTP requests for the presence of a header named Content-Type:
  ```
  http.req.header("Content-Type")
  ```
  Prefixes can also be used on their own to return the value of the object that the prefix identifies.

- `<operation>`
  identifies an evaluation that is to be performed on the data identified by the prefix.
For example, consider the following expression:

http.req.header("Content-Type").eq("text/html")

In this expression, the following is the operator component:

eq("text/html")

This operator causes the NetScaler to evaluate any HTTP requests that contain a Content-Type header, and in particular, to determine if the value of this header is equal to the string "text/html." For more information, see Operations.

- `<compound-operator>`

is a Boolean or arithmetic operator that forms a compound expression from multiple prefix or prefix.operation elements.

For example, consider the following expression:

http.req.header("Content-Type").eq("text/html") && http.req.url.contains(".html")

### Prefixes

An expression prefix represents a discrete piece of data. For example, an expression prefix can represent an HTTP URL, an HTTP Cookie header, or a string in the body of an HTTP POST request. An expression prefix can identify and return a wide variety of data types, including the following:

- A client IP address in a TCP/IP packet
- NetScaler system time
- An external callout over HTTP
- A TCP or UDP record type

In most cases, an expression prefix begins with one of the following keywords:

- **CLIENT:**
  - Identifies a characteristic of the client that is either sending a request or receiving a response, as in the following examples:
  - The prefix client.ip.dst designates the destination IP address in the request or response.
  - The prefix client.ip.src designates the source IP address.

- **HTTP:**
  - Identifies an element in an HTTP request or a response, as in the following examples:
  - The prefix http.req.body(integer) designates the body of the HTTP request as a multiline text object, up to the character position designated in integer.
  - The prefix http.req.header("header_name") designates an HTTP header, as specified in header_name.
The prefix http.req.url designates an HTTP URL in URL-encoded format.

- **SERVER:**
  Identifies an element in the server that is either processing a request or sending a response.

- **SYS:**
  Identifies a characteristic of the NetScaler that is processing the traffic.

  **Note:** Note that DNS policies support only SYS, CLIENT, and SERVER objects.

In addition, in the NetScaler Gateway, the Clientless VPN function can use the following types of prefixes:

- **TEXT:**
  Identifies any text element in a request or a response.

- **TARGET:**
  Identifies the target of a connection.

- **URL:**
  Identifies an element in the URL portion of an HTTP request or response.

As a general rule of thumb, any expression prefix can be a self-contained expression. For example, the following prefix is a complete expression that returns the contents of the HTTP header specified in the string argument (enclosed in quotation marks):

```
http.res.header.("myheader")
```

Or you can combine prefixes with simple operations to determine TRUE and FALSE values. For example, the following returns a value of TRUE or FALSE:

```
http.res.header.("myheader").exists
```

You can also use complex operations on individual prefixes and multiple prefixes within an expression, as in the following example:

```
http.req.url.length + http.req.cookie.length <= 500
```

Which expression prefixes you can specify depends on the NetScaler feature. The following table describes the expression prefixes that are of interest on a per-feature basis:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Types of Expression Prefix Used in the Feature</th>
</tr>
</thead>
<tbody>
<tr>
<td>DNS</td>

Table 1. Permitted Types of Expression Prefixes in Various NetScaler Features

**Note:** For details on the permitted expression prefixes in a feature, see the documentation for that feature.

### Single-element expressions

The simplest type of Advanced policy expression contains a single element. This element can be one of the following:

- **true.** An Advanced policy expression can consist simply of the value true. This type of expression always returns a value of TRUE. It is useful for chaining policy actions and triggering Goto expressions.
- **false.** An Advanced policy expression can consist simply of the value false. This type of expression always returns a value of FALSE.
- **A prefix for a compound expression.** For example, the prefix HTTP.REQ.HOSTNAME is a complete expression that returns a host name and HTTP.REQ.URL is a complete expression that returns a URL. The prefix could also be used in conjunction with operations and additional prefixes to form a compound expression.

### Operations

In most expressions, you also specify an operation on the data that the prefix identifies. For example, suppose that you specify the following prefix:

**http.req.url**

This prefix extracts URLs in HTTP requests. This expression prefix does not require any operators to be used in an expression. However, when you configure an expression that processes HTTP request URLs, you can specify operations that analyze particular characteristics of the URL. Following are a few possibilities:

- Search for a particular host name in the URL.
• Search for a particular path in the URL.
• Evaluate the length of the URL.
• Search for a string in the URL that indicates a time stamp and convert it to GMT.

The following is an example of a prefix that identifies an HTTP header named Server and an operation that searches for the string IIS in the header value:

```
http.res.header("Server").contains("IIS")
```

Following is an example of a prefix that identifies host names and an operation that searches for the string “www.mycompany.com” as the value of the name:

```
http.req.hostname.eq("www.mycompany.com")
```

**Basic operations on expression prefixes**

The following table describes a few of the basic operations that can be performed on expression prefixes.

<table>
<thead>
<tr>
<th>Operation</th>
<th>Determines Whether or Not</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONTAINS(&lt;string&gt;)</td>
<td>The object matches &lt;string&gt;. Following is an example: http.req.header(&quot;Cache-Control&quot;).contains(&quot;no-cache&quot;)</td>
</tr>
<tr>
<td>EXISTS</td>
<td>A particular item is present in an object. Following is an example: http.res.header(&quot;MyHdr&quot;).exists</td>
</tr>
<tr>
<td>EQ(&lt;text&gt;)</td>
<td>A particular non-numeric value is present in an object. Following is an example: http.req.method.eq(post)</td>
</tr>
<tr>
<td>EQ(&lt;integer&gt;)</td>
<td>A particular numeric value is present in an object. Following is an example: client.ip.dst.eq(10.100.10.100)</td>
</tr>
<tr>
<td>LT(&lt;integer&gt;)</td>
<td>An object’s value is less than a particular value. Following is an example: http.req.content_length.lt(5000)</td>
</tr>
<tr>
<td>GT(&lt;integer&gt;)</td>
<td>An object’s value is greater than a particular value. Following is an example: http.req.content_length.gt(5)</td>
</tr>
</tbody>
</table>

The following table summarizes a few of the available types of operations.
### Operation Type Description

<table>
<thead>
<tr>
<th>Operation Type</th>
<th>Description</th>

## Compound advanced policy expressions

December 13, 2018

You can configure an Advanced policy expression that contains Boolean or arithmetic operators and multiple atomic operations. The following compound expression contains a boolean AND:

```
http.req.hostname.eq("mycompany.com") && http.req.method.eq(post)
```

The following expression adds the value of two targets, and compares the result to a third value:

```
http.req.url.length + http.req.cookie.length <= 500
```

A compound expression can contain any number of logical and arithmetic operators. The following expression evaluates the length of an HTTP request on the basis of its URL and cookie, evaluates text in the header, and performs a Boolean AND on these two results:

```
http.req.url.length + http.req.cookie.length <= 500 && http.req.header.contains("some text")
```

You can use parentheses to control the order of evaluation in a compound expression.
Booleans in compound expressions

You configure compound expressions with the following operators:

• `&&`.

This operator is a logical AND. For the expression to evaluate to TRUE, all components that are joined by the And must evaluate to TRUE. Following is an example:

```
http.req.url.hostname.eq("myHost") && http.req.header("myHeader").exists
```

• This operator is a logical OR. If any component of the expression that is joined by the OR evaluates to TRUE, the entire expression is TRUE.

• `!`.

Performs a logical NOT on the expression.

In some cases, the NetScaler GUI offers AND, NOT, and OR operators in the Add Expression dialog box. However, these are of limited use. Citrix recommends that you use the operators `&&`, `||`, and `!` to configure compound expressions that use Boolean logic.

Parentheses in compound expressions

You can use parentheses to control the order of evaluation of an expression. The following is an example:

```
http.req.url.contains("myCompany.com") || (http.req.url.hostname.eq("myHost") && http.req.header("myHeader").exists)
```

The following is another example:

```
(http.req.header("Content-Type").exists && http.req.header("Content-Type").eq("text/html")) || (http.req.header("Transfer-Encoding").exists || http.req.header("Content-Length").exists)
```
## Compound operations for strings

The following table describes operators that you can use to configure compound operations on string data.

<table>
<thead>
<tr>
<th>Operations that produce a string value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>str + str</code></td>
<td>Concatenates the value of the expression on the left of the operator with the value on the right. Following is an example: <code>http.req.hostname + http.req.url.protocol</code></td>
</tr>
<tr>
<td><code>str + num</code></td>
<td>Concatenates the value of the expression on the left of the operator with a numeric value on the right. Following is an example: <code>http.req.hostname + http.req.url.content_length</code></td>
</tr>
<tr>
<td><code>num + str</code></td>
<td>Concatenates the numeric value of the expression on the left side of the operator with a string value on the right. Following is an example: <code>http.req.url.content_length + http.req.url.hostname</code></td>
</tr>
<tr>
<td><code>str + ip</code></td>
<td>Concatenates the string value of the expression on the left side of the operator with an IP address value on the right. Following is an example: <code>http.req.hostname + 10.00.000.00</code></td>
</tr>
<tr>

</tbody>
</table>
Compound operations for numbers

You can configure compound numeric expressions. For example, the following expression returns a numeric value that is the sum of an HTTP header length and a URL length:

\[ \text{http.req.header.length} + \text{http.req.url.length} \]

The following tables describes operators that you can use to configure compound expressions for numeric data.

<table>
<thead>
<tr>
<th>Arithmetic operations on numbers</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>num + num</td>
<td>Add the value of the expression on the left of the operator to the value of the expression on the right. Following is an example: http.req.content_length + http.req.url.length</td>
</tr>
<tr>
<td>num – num</td>
<td>Subtract the value of the expression on the right of the operator from the value of the expression on the left.</td>
</tr>
<tr>
<td>num * num</td>
<td>Multiply the value of the expression on the left of the operator with the value of the expression on the right. Following is an example: client.interface.rxthroughput * 9</td>
</tr>
<tr>
<td>num / num</td>
<td>Divide the value of the expression on the left of the operator by the value of the expression on the right.</td>
</tr>
</tbody>
</table>
### Arithmetic operations on numbers

<table>
<thead>
<tr>
<th>Description</th>
</tr>

</table>
### Functions for data types in the policy infrastructure

The NetScaler policy infrastructure supports the following numeric data types:

- Integer (32 bits)
- Unsigned long (64 bits)
- Double (64 bits)

Simple expressions can return all of these data types. Therefore, you can create compound expressions that use arithmetic operators and logical operators to evaluate or return values of these data types. Additionally, you can use all of these values in policy expressions. Literal constants of type unsigned long can be specified by appending the string ul to the number. Literal constants of type double contain a period (.), an exponent, or both.

### Arithmetic Operators, Logical Operators, and Type Promotion

In compound expressions, the following standard arithmetic and logical operators can be used for the double and unsigned long data types:

- +, -, *, and /
NetScaler 11.1

%, ~, ^, &, , <<, and >> (do not apply to double)

•

• ==, !=, >, <, >=, and <=

All of these operators have the same meaning as in the C programming language.

In all cases of mixed operations between operands of type integer, unsigned long, and double, type promotion is performed so that the operation can be performed on operands of the same type. A type of lower precedence is automatically promoted to the type of the operand with the highest precedence involved in the operation. The order of precedence (higher to lower) is as follows:

• Double
• Unsigned long
• Integer

Therefore, an operation that returns a numeric result returns a result of the highest type involved in the operation.

For example, if the operands are of type integer and unsigned long, the integer operand is automatically converted to type unsigned long. This type conversion is performed even in simple expressions in which the type of data identified by the expression prefix does not match the type of data that is passed as the argument to the function. To illustrate such an example, in the operation HTTP.REQ.CONTENT_LENGTH.DIV(3ul), the integer returned by the prefix HTTP.REQ.CONTENT_LENGTH is automatically converted to unsigned long (the type of the data passed as the argument to the DIV() function), and an unsigned long division is performed. Similarly, the argument can be promoted in an expression. For example, HTTP.REQ.HEADER("myHeader").TYPECAST_DOUBLE_AT.DIV(5) promotes the integer 5 to type double and performs double-precision division.

For information about expressions for casting data of one type to data of another type, see Typecasting data.

Specify the character set in expressions

December 10, 2018

The policy infrastructure on the Citrix® NetScaler® appliance supports the ASCII and UTF-8 character sets. The default character set is ASCII. If the traffic for which you are configuring an expression consists of only ASCII characters, you need not specify the character set in the expression. However, you
must specify the character set in every simple expression that is meant for UTF-8 traffic. To specify the UTF-8 character set in a simple expression, you must include the SET_CHAR_SET(<charset>) function, with <charset> specified as UTF_8, as shown in the following examples:

```
1 HTTP.REQ.BODY(10).SET_CHAR_SET(UTF_8).CONTAINS("ß")
2 HTTP.RES.BODY(100).SET_CHAR_SET(UTF_8).BEFORE_STR("Bücher").AFTER_STR("Wörterbuch")
```

In an expression, the SET_CHAR_SET() function must be introduced at the point in the expression after which data processing must be carried out in the specified character set. For example, in the expression HTTP.REQ.BODY(1000).AFTER_REGEXP(re/following example/).BEFORE_REGEXP(re/In the preceding example/).CONTAINS_ANY("Greek_ alphabet"), if the strings stored in the pattern set “Greek_alphabet” are in UTF-8, you must include the SET_CHAR_SET(UTF_8) function immediately before the CONTAINS_ANY("<string>") function, as follows:

```
HTTP.REQ.BODY(1000).AFTER_REGEXP(re/following example/).BEFORE_REGEXP(re/In the preceding example/).SET_CHAR_SET(UTF_8).CONTAINS_ANY("Greek_ alphabet")
```

The SET_CHAR_SET() function sets the character set for all further processing (that is, for all subsequent functions) in the expression unless it is overridden later in the expression by another SET_CHAR_SET() function that changes the character set. Therefore, if all the functions in a given simple expression are intended for UTF-8, you can include the SET_CHAR_SET(UTF_8) function immediately after functions that identify text (for example, the HEADER("<name>") or BODY(<int>) functions). In the second example that follows the first paragraph above, if the ASCII arguments passed to the AFTER_REGEXP() and BEFORE_REGEXP() functions are changed to UTF-8 strings, you can include the SET_CHAR_SET(UTF_8) function immediately after the BODY(1000) function, as follows:

```
HTTP.REQ.BODY(1000).SET_CHAR_SET(UTF_8).AFTER_REGEXP(re/Bücher/).BEFORE_REGEXP(re/Wörterbuch/).CONTAINS_ANY("Greek_alphabet")
```

The UTF-8 character set is a superset of the ASCII character set, so expressions configured for the ASCII character set continue to work as expected if you change the character set to UTF-8.

### Compound expressions with different character sets

In a compound expression, if one subset of expressions is configured to work with data in the ASCII character set and the rest of the expressions are configured to work with data in the UTF-8 character set, the character set specified for each individual expression is considered when the expressions are evaluated individually. However, when processing the compound expression, just before processing the operators, the appliance promotes the character set of the returned ASCII values to UTF-8. For example, in the following compound expression, the first simple expression evaluates data in the ASCII character set while the second simple expression evaluates data in the UTF-8 character set:
HTTP.REQ.HEADER("MyHeader") == HTTP.REQ.BODY(10).SET_CHAR_SET(UTF_8)

However, when processing the compound expression, just before evaluating the “is equal to” Boolean operator, the NetScaler appliance promotes the character set of the value returned by HTTP.REQ.HEADER("MyHeader") to UTF-8.

The first simple expression in the following example evaluates data in the ASCII character set. However, when the NetScaler appliance processes the compound expression, just before concatenating the results of the two simple expressions, the appliance promotes the character set of the value returned by HTTP.REQ.BODY(10) to UTF-8.

HTTP.REQ.BODY(10) + HTTP.REQ.HEADER("MyHeader").SET_CHAR_SET(UTF_8)

Consequently, the compound expression returns data in the UTF-8 character set.

Specify the character set based on the character set of traffic

You can set the character set to UTF-8 on the basis of traffic characteristics. If you are not sure whether the character set of the traffic being evaluated is UTF-8, you can configure a compound expression in which the first expression checks for UTF-8 traffic and subsequent expressions set the character set to UTF-8. Following is an example of a compound expression that first checks the value of “charset” in the request’s Content-Type header for “UTF-8” before checking whether the first 1000 bytes in the request contain the UTF-8 string Bücher:

HTTP.REQ.HEADER("Content-Type").SET_TEXT_MODE(IGNORECASE).TYPECAST_NVLIST_T ("=").VALUE("charset").EQ("UTF-8") && HTTP.REQ.BODY(1000).SET_CHAR_SET(UTF_8).CONTAINS("Bücher")

If you are sure that the character set of the traffic being evaluated is UTF-8, the second expression in the example is sufficient.

Character and string literals in expressions

During expression evaluation, even if the current character set is ASCII, character literals and string literals, which are enclosed in single quotation marks (') and quotation marks (""), respectively, are considered to be literals in the UTF-8 character set. In a given expression, if a function is operating on character or string literals in the ASCII character set and you include a non-ASCII character in the literal, an error is returned.

Values in hexadecimal and octal formats

When configuring an expression, you can enter values in octal and hexadecimal formats. However, each hexadecimal or octal byte is considered a UTF-8 byte. Invalid UTF-8 bytes result in errors regard-
NetScaler 11.1

less of whether the value is entered manually or pasted from the clipboard. For example, “\xc8\x20” is an invalid UTF-8 character because “c8” cannot be followed by “20” (each byte in a multi-byte UTF-8 string must have the high bit set). Another example of an invalid UTF-8 character is “\xc8 \xa9,” since the hexadecimal characters are separated by a white-space character.

Functions that return UTF-8 strings

Only the <text>.XPATH and <text>.XPATH_JSON functions always return UTF-8 strings. The following MYSQL routines determine at runtime which character set to return, depending on the data in the protocol:

- MYSQL_CLIENT_T.USER
- MYSQL_CLIENT_T.DATABASE
- MYSQL_REQ_QUERY_T.COMMAND
- MYSQL_REQ_QUERY_T.TEXT
- MYSQL_REQ_QUERY_T.TEXT(<unsigned int>)
- MYSQL_RES_ERROR_T.SQLSTATE
- MYSQL_RES_ERROR_T.MESSAGE
- MYSQL_RES_FIELD_T.CATALOG
- MYSQL_RES_FIELD_T.DB
- MYSQL_RES_FIELD_T.TABLE
- MYSQL_RES_FIELD_T.ORIGINAL_TABLE
- MYSQL_RES_FIELD_T.NAME
- MYSQL_RES_FIELD_T.ORIGINAL_NAME
- MYSQL_RES_OK_T.MESSAGE
- MYSQL_RES_ROW_T.TEXT_ELEM(<unsigned int>)

Terminal connection settings for UTF-8

When you set up a connection to the NetScaler appliance by using a terminal connection (by using PuTTY, for example), you must set the character set for transmission of data to UTF-8.

Classic expressions in advanced policy expressions

December 13, 2018
Warning

Classic policy expressions are no longer supported from NetScaler 12.0 build 56.20 onwards and as an alternative, Citrix recommends you to use Advanced policies. For more information, see [Configure advanced policy expressions: Get started](#).

Classic expressions describe basic characteristics of traffic. In some cases, you may want to use a classic expression in an Advanced policy expression are no longer supported from NetScaler 12.0 build 56.20 onwards and as an alternative, Citrix recommends you to use Advanced policies. For more information, see Advanced Policies topic. You can do so with the Advanced policy expression configuration tool. This can be helpful when manually migrating the older classic expressions to the Advanced policy.

Note that when you upgrade the NetScaler to version 9.0 or higher, Integrated Caching policies are automatically upgraded to Advanced policies, and the expressions in these policies are upgraded to the Advanced policies.

The following is the syntax for all Advanced policy expressions that use a classic expression:

```plaintext
SYS.EVAL_CLASSIC_EXPR("expression")
```

**Note**

The syntax and the metadata for the SYS.EVAL_CLASSIC_EXPR expression is getting deprecated. You can manually convert or use nspepi tool to convert the Classic expression to advanced expression.

Following are examples of the SYS.EVAL_CLASSIC_EXPR("expression") expression:

```plaintext
1 sys.eval_classic_expr("req.ssl.client.cipher.bits > 1000")
2 sys.eval_classic_expr("url contains abc")
3 sys.eval_classic_expr("req.ip.sourceip == 10.102.1.61 -netmask 255.255.255.255")
4 sys.eval_classic_expr("time >= *:30:00GMT")
5 sys.eval_classic_expr("e1 || e2")
6 sys.eval_classic_expr("req.http.urllen > 50")
7 sys.eval_classic_expr("dayofweek == wedGMT")
```

Configure advanced policy expressions in a policy

December 10, 2018

You can configure an Advanced policy expression of up to 1,499 characters in a policy. The user interface for Advanced policy expressions depends to some extent on the feature for which you are con-
figuring the expression, and on whether you are configuring an expression for a policy or for another use.

When configuring expressions on the command line, you delimit the expression by using quotation marks (" . . " or `. . .`). Within an expression, you escape additional quotation marks by using a back-slash (\). For example, the following are standard methods for escaping quotation marks in an expression:

"\"abc\"

'\"abc\''

You must also use a backslash to escape question marks and other backslashes on the command line. For example, the expression http.req.url.contains("?") requires a backslash so that the question mark is parsed. Note that the backslash character will not appear on the command line after you type the question mark. On the other hand, if you escape a backslash (for example, in the expression 'http.req.url.contains("\\http")'), the escape characters are echoed on the command line.

To make an entry more readable, you can escape the quotation marks for an entire expression. At the start of the expression you enter the escape sequence “q” plus one of the following special characters: /{<

| 1 | q@http.req.url.contains("sometext") &amp; http.req.cookie.exists@ |
| 2 | &lt;  |
| 3 | q~http.req.url.contains("sometext") &amp; http.req.cookie.exists~ |

You enter only the special character at the end of the expression, as follows:

Note that an expression that uses the { delimiter is closed with }.

For some features (for example, Integrated Caching and Responder), the policy configuration dialog box provides a secondary dialog box for configuring expressions. This dialog enables you to choose from drop-down lists that show the available choices at each point during expression configuration. You cannot use arithmetic operators when using these configuration dialogs, but most other advanced policy expression features are available. To use arithmetic operators, write your expressions in free-form format.

### Configure an Advanced policy syntax rule by using the CLI
Note:
Default syntax policy is now renamed as Advanced policy.

At the command prompt, type the following commands to configure a default syntax rule and verify the configuration:

1. `add cache|dns|rewrite|cs policy policyName **-rule** expression featureSpecificParameters **-action**`
2. `show cache|dns|rewrite|cs policy policyName`

Following is an example of configuring a caching policy:

Example:

```
1 > add cache policy pol-cache -rule http.req.content_length.le(5) -action INVAL
2   Done
3
4 > show cache policy pol-cache
5   Name: pol-cache
6   Rule: http.req.content_length.le(5)
7   CacheAction: INVAL
8   Invalidate groups: DEFAULT
9   UndefAction: Use Global
10  Hits: 0
11  Undef Hits: 0
12
13   Done
```

Configure a default syntax policy expression by using the GUI

1. In the navigation pane, click the name of the feature where you want to configure a policy, for example, you can select Integrated Caching, Responder, DNS, Rewrite, or Content Switching, and then click Policies.
2. Click Add.
3. For most features, click in the Expression field. For content switching, click Configure.
4. Click the Prefix icon (the house) and select the first expression prefix from the drop-down list. For example, in Responder, the options are HTTP, SYS, and CLIENT. The next set of applicable options appear in a drop-down list.
5. Double-click the next option to select it, and then type a period (.). Again, a set of applicable options appears in another drop-down list.
6. Continue selecting options until an entry field (signalled by parentheses) appears. When you see an entry field, enter an appropriate value in the parentheses. For example, if you select GT(int) (greater-than, integer format), you specify an integer in the parentheses. Text strings are delimited by quotation marks. Following is an example:

```
HTTP.REQ.BODY(1000).BETWEEN("this","that")
```

To insert an operator between two parts of a compound expression, click the Operators icon (the sigma), and select the operator type. Following is an example of a configured expression with a Boolean OR (signalled by double vertical bars):

```
HTTP.REQ.URL.EQ("www.mycompany.com") || HTTP.REQ.BODY(1000).BETWEEN("this","that")
```

7. To insert a named expression, click the down arrow next to the Add icon (the plus sign) and select a named expression.

8. To configure an expression using drop-down menus, and to insert built-in expressions, click the Add icon (the plus sign). The Add Expression dialog box works in a similar way to the main dialog box, but it provides drop-down lists for selecting options, and it provides text fields for data entry instead of parentheses. This dialog box also provides a Frequently Used Expressions drop-down list that inserts commonly used expressions. When you are done adding the expression, click OK.

9. When finished, click Create. A message in the status bar indicates that the policy expression is configured successfully.

**Test a default syntax expression by using the GUI**

1. In the navigation pane, click the name of the feature for which you want to configure a policy (for example, you can select Integrated Caching, Responder, DNS, Rewrite, or Content Switching), and then click Policies.
2. Select a policy and click Open.
3. To test the expression, click the Evaluate icon (the check mark).
4. In the expression evaluator dialog box, select the Flow Type that matches the expression.
5. In the **HTTPRequest Data** or **HTTP Response Data** field, paste the HTTP request or response that you want to parse with the expression, and click **Evaluate**. Note that you must supply a complete HTTP request or response, and the header and body should be separated by blank line. Some programs that trap HTTP headers do not also trap the response. If you are copying and pasting only the header, insert a blank line at the end of the header to form a complete HTTP request or response.

6. Click **Close** to close this dialog box.

### Configure named advanced policy expressions

**December 13, 2018**

Instead of retyping the same expression multiple times in multiple policies, you can configure a named expression and refer to the name any time you want to use the expression in a policy. For example, you could create the following named expressions:

- **ThisExpression:**
  
  ```
  http.req.body(100).contains("this")
  ```

- **ThatExpression:**
  
  ```
  http.req.body(100).contains("that")
  ```

You can then use these named expressions in a policy expression. For example, the following is a legal expression based on the preceding examples:

<table>
<thead>
<tr>
<th>ThisExpression</th>
<th>ThatExpression</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

You can use the name of an advanced policy expression as the prefix to a function. The named expression can be either a simple expression or a compound expression. The function must be one that can operate on the type of data that is returned by the named expression.

### Example 1: Simple Named Expression as a Prefix

The following simple named expression, which identifies a text string, can be used as a prefix to the `AFTER_STR("<string>")` function, which works with text data:

```
HTTP.REQ.BODY(1000)
```

If the name of the expression is `top1KB`, you can use `top1KB.AFTER_STR("username")` instead of `HTTP.REQ.BODY(1000).AFTER_STR("username")`. 
Example 2: Compound named expression as a prefix

You can create a compound named expression called basic_header_value to concatenate the user name in a request, a colon (:), and the user’s password, as follows:

```plaintext
add policy expression basic_header_value "HTTP.REQ.USER.NAME + ":" + HTTP.REQ.USER.PASSWD"
```

You can then use the name of the expression in a rewrite action, as shown in the following example:

```plaintext
add rewrite action insert_b64encoded_authorization insert_http_header authorization '"Basic " + basic_header_value.b64encode'-bypassSafetyCheck
```

In the example, in the expression that is used to construct the value of the custom header, the B64 encoding algorithm is applied to the string returned by the compound named expression.

You can also use a named expression (either by itself or as a prefix to a function) to create the text expression for the replacement target in a rewrite.

Configure a named default syntax expression by using the CLI

At the command prompt, type the following commands to configure a named expression and verify the configuration:

```
1 - add policy expression \<name\>\<value\>
2
3 - show policy expression \<name\>
```

**Example:**

```
1 > add policy expression myExp "http.req.body(100).contains("the other ")"
```

```
1) Name: myExp  Expr: "http.req.body(100).contains("the other")"
```

```
1 Done
```

The expression can be up to 1,499 characters.

Configure a named expression by using the GUI

1. In the navigation pane, expand AppExpert, and then click Expressions.
2. Click **Advanced Expressions**.
3. Click **Add**.
4. Enter a name and a description for the expression.
5. Configure the expression by using the process described in Configure advanced policy expression. A message in the status bar indicates that the policy expression is configured successfully.

**Configure advanced policy expressions outside the context of a policy**

December 13, 2018

A number of functions, including the following, can require an advanced policy expression that is not part of a policy:

- Integrated Caching selectors:
  
  You define multiple non-compound expressions (selectlets) in the definition of the selector. Each selectlet is in an implicit logical AND relationship with the others.

- Load Balancing:
  
  You configure an expression for the TOKEN method of load balancing for a load balancing virtual server.

- Rewrite actions:
  
  Expressions define the location of the rewrite action and the type of rewriting to be performed, depending on the type of rewrite action that you are configuring. For example, a DELETE action only uses a target expression. A REPLACE action uses a target expression and an expression to configure the replacement text.

- Rate-based policies:
  
  You use advanced policy expressions to configure Limit Selectors. You can use these selectors when configuring policies to throttle the rate of traffic to various servers. You define up to five non-compound expressions (selectlets) in the definition of the selector. Each selectlet is in an implicit logical AND with the others.

**Configure an advanced policy expression outside a policy by using the CLI (cache selector example)**

At the command prompt, type the following commands to configure an advanced policy expression outside a policy and verify the configuration:
Example:

```
1 > add cache selector mainpageSelector "http.req.cookie.value("ABC_def")"
2   "http.req.url.query.value("_ghi")" selector "mainpageSelector"
3    added
4 Done
5 > show cache selector mainpageSelector
6   Name: mainpageSelector
7   Expressions:
8      1) http.req.cookie.value("ABC_def")
9      2) http.req.url.query.value("_ghi")
10 Done
```

Following is an equivalent command that uses the more readable q delimiter, as described in Configure advanced policy expressions in a policy:

```
1 > add cache selector mainpageSelector2 q=http.req.cookie.value("ABC_def")
2   q=http.req.url.query.value("_ghi") selector "mainpageSelector2"
3    added
4 Done
5 > show cache selector mainpageSelector2
6   Name: mainpageSelector2
7   Expressions:
8      1) http.req.cookie.value("ABC_def")
9      2) http.req.url.query.value("_ghi")
10 Done
```

**Advanced policy expressions: evaluating text**

December 10, 2018

You can configure a policy with an advanced policy expression that evaluates text in a request or response. Advanced policy text expressions can range from simple expressions that perform string matching in HTTP headers to complex expressions that encode and decode text. You can configure text expressions to be case sensitive or case insensitive and to use or ignore spaces. You can also configure complex text expressions by combining text expressions with Boolean operators.
You can use expression prefixes and operators for evaluating HTTP requests, HTTP responses, and VPN and Clientless VPN data. However, text expression prefixes are not restricted to evaluating these elements of your traffic.

### About text expressions

December 13, 2018

You can configure various expressions for working with text that flows through the NetScaler appliance. Following are some examples of how you can parse text by using a default syntax expression:

- **Determine that a particular HTTP header exists.**
  
  For example, you may want to identify HTTP requests that contain a particular Accept-Language header for the purpose of directing the request to a particular server.

- **Determine that a particular HTTP URL contains a particular string.**
  
  For example, you may want to block requests for particular URLs. Note that the string can occur at the beginning, middle, or end of another string.

- **Identify a POST request that is directed to a particular application.**
  
  For example, you may want to identify all POST requests that are directed to a database application for the purpose of refreshing cached application data.

Note that there are specialized tools for viewing the data stream for HTTP requests and responses. For example, from the following URL, you can download a Firefox Web browser plug-in that displays HTTP request and response headers:

```
```

The following plug-in displays headers, query strings, POST data, and other information:

```
```

After you download these plug-ins, they are accessible from the Firefox Tools menu.

### About operations on text

A text-based expression consists of at least one prefix to identify an element of data and usually (although not always) an operation on that prefix. Text-based operations can apply to any part of a request or a response. Basic operations on text include various types of string matches.

For example, the following expression compares a header value with a string:
http.req.header("myHeader").contains("some-text")

Following expressions are examples of matching a file type in a request:

http.req.url.suffix.contains("jpeg")
http.req.url.suffix.eq("jpeg")

In the preceding examples, the contains operator permits a partial match and the eq operator looks for an exact match.

Other operations are available to format the string before evaluating it. For example, you can use text operations to strip out quotes and white spaces, to convert the string to all lowercase, or to concatenate strings.

Note: Complex operations are available to perform matching based on patterns or to convert one type of text format to another type.

For more information, see the following topics:

- Pattern sets and data sets.
- Regular expressions.
- Typecasting data.

**Compounding and precedence in text expressions**

You can apply various operators to combine text prefixes or expressions. For example, the following expression concatenates the returned values of each prefix:

http.req.hostname + http.req.url

Following is an example of a compound text expression that uses a logical AND. Both components of this expression must be TRUE for a request to match the expression:

http.req.method.eq(post)&& http.req.body(1024).startswith("destination=")

Note: For more information on operators for compounding, see Compound default syntax expressions.

**Categories of text expressions**

The primary categories of text expressions that you can configure are:

- Information in HTTP headers, HTTP URLs, and the POST body in HTTP requests.
  For more information, see Expression prefixes for text in HTTP requests and responses.
- Information regarding a VPN or a clientless VPN.
  For more information, see Expression prefixes for VPNs and clientless VPNs.
• TCP payload information.
  For more information about TCP payload expressions, see Default syntax expressions: Parsing HTTP, TCP, and UDP data.

• Text in a Secure Sockets Layer (SSL) certificate.
  For information about text expressions for SSL and SSL certificate data, see Default syntax expressions: Parsing SSL certificates and Expressions for SSL certificate dates.

**Guidelines for text expressions**

From a performance standpoint, it typically is best to use protocol-aware functions in an expression. For example, the following expression makes use of a protocol-aware function:

```
HTTP.REQ.URL.QUERY
```

The previous expression performs better than the following equivalent expression, which is based on string parsing:

```
HTTP.REQ.URL.AFTER_STR("?")
```

In the first case, the expression looks specifically at the URL query. In the second case, the expression scans the data for the first occurrence of a question mark.

There is also a performance benefit from structured parsing of text, as in the following expression:

```
HTTP.REQ.HEADER("Example").TYPECAST_LIST_T(",",').GET(1)
```

(For more information on typecasting, see Typecasting data. The typecasting expression, which collects comma-delimited data and structures it into a list, typically would perform better than the following unstructured equivalent:

```
HTTP.REQ.HEADER("Example").AFTER_STR(",",').BEFORE_STR("",")
```

Finally, unstructured text expressions typically have better performance than regular expressions. For example, the following is an unstructured text expression:

```
HTTP.REQ.HEADER("Example").AFTER_STR("more")
```

The previous expression would generally provide better performance than the following equivalent, which uses a regular expression:

```
HTTP.REQ.HEADER("Example").AFTER_REGEX(re/more/)
```

For more information on regular expressions, see Regular expressions.
Expression prefixes for text in HTTP requests and responses

January 6, 2019

An HTTP request or response typically contains text, such as in the form of headers, header values, URLs, and POST body text. You can configure expressions to operate on one or more of these text-based items in an HTTP request or response.

Refer to the Prefix Expression table to configure and extract text from different parts of an HTTP request or response.

Expression prefixes for VPNs and clientless VPNs

December 13, 2018

The Advanced policy engine provides prefixes that are specific to parsing VPN or Clientless VPN data. This data includes the following:

- Host names, domains, and URLs in VPN traffic.
- Protocols in the VPN traffic.
- Queries in the VPN traffic.

These text elements are often URLs and components of URLs. In addition to applying the text-based operations on these elements, you can parse these elements by using operations that are specific to parsing URLs. For more information, see Expressions for extracting segments of URLs.

The following table describes the expression prefixes for this type of data.

<table>
<thead>
<tr>
<th>VPN and Clientless VPN Expression</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VPN.BASEURL.CVPN_DECODE</td>
<td>Extracts the original URL from a clientless VPN URL.</td>
</tr>
<tr>
<td>VPN.BASEURL.CVPN_ENCODE</td>
<td>Converts a URL to clientless VPN format.</td>
</tr>
<tr>
<td>VPN.BASEURL.HOSTNAME</td>
<td>Extracts the HTTP host name from the host name in the URL. This prefix cannot be used in bidirectional policies.</td>
</tr>
<tr>
<td>VPN and Clientless VPN Expression</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>VPN.BASEURL.HOSTNAME.DOMAIN</td>
<td>Extracts the domain name from the host name. For example, if the host name is <a href="http://www.mycompany.com">www.mycompany.com</a> or <a href="http://www.mycompany.com:8080">www.mycompany.com:8080</a>, this prefix extracts mycompany.com. This prefix returns incorrect results if the host name is an IP address. For information on expressions for IP addresses, see “Default Syntax Expressions: IP and MAC Addresses, Throughput, VLAN IDs.” All text operations after this prefix are case insensitive.</td>
</tr>
<tr>
<td>VPN.BASEURL.HOSTNAME.EQ (&lt;hostname &gt;)</td>
<td>Returns a Boolean TRUE if the host name matches &lt;hostname &gt;. The comparison is case insensitive. For example, if the host name is <a href="http://www.mycompany.com">www.mycompany.com</a>, the following returns TRUE: vpn.baseurl.hostname.eq(&quot;www.mycompany.com&quot;). If the text mode is URLENCODED, the host name is decoded before comparison. For more information, see “Operations for HTTP, HTML, and XML Encoding and “Safe” Characters.”</td>
</tr>
<tr>
<td>VPN.BASEURL.HOSTNAME.SERVER</td>
<td>Evaluates the server portion of the host name. For example, if the host name is <a href="http://www.mycompany.com">www.mycompany.com</a> or <a href="http://www.mycompany.com:8080">www.mycompany.com:8080</a>, the server is <a href="http://www.mycompany.com">www.mycompany.com</a>. All text operations after this prefix are case insensitive.</td>
</tr>
<tr>
<td>VPN.BASEURL.PATH</td>
<td>Extracts a slash- (/) separated list from the path component of the URL. For example, this prefix extracts /a/b/c/mypage.html from the following URL: <a href="http://www.mycompany.com/a/b/c/mypage.html?a=1">http://www.mycompany.com/a/b/c/mypage.html?a=1</a>. The following expression selects just the “a”: http.req.url.path.get(1). For more information on the GET operation, see “Expressions for Extracting Segments of URLs.”</td>
</tr>
<tr>
<td>VPN and Clientless VPN Expression</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>VPN.BASEURL.PATH.IGNORE_EMPTY_ELEMENTS</td>
<td>This prefix ignores the elements in a list. For example, the following comma-separated list has an empty element after “a=10”: a=10,,b=11,,c=89. The element following b=11 contains a space, and by default, is not considered an empty element. Consider the following HTTP header: Cust_Header : 123,,15. The following expression returns a count of 4 when evaluating this header: <code>http.req.header(&quot;Cust_Header&quot;).typecase_list_t(,).ignore_empty_elements.count</code>. The following expression returns a count of 5 when evaluating this header: <code>http.req.header(&quot;Cust_Header&quot;).typecase_list_t(,).count</code></td>
</tr>
<tr>
<td>VPN.BASEURL.PATH_AND_QUERY</td>
<td>Evaluates the text in the URL that follows the host name. For example, if the URL is <code>&lt;http://www.mycompany.com/a/b/c/mypage.html?a=1&gt;</code>, this prefix evaluates /a/b/c/mypage.html?a=1.</td>
</tr>
<tr>
<td>VPN.BASEURL.PROTOCOL</td>
<td>Evaluates the protocol in the URL. Do not use this prefix in bidirectional policies.</td>
</tr>
<tr>
<td>VPN.BASEURL.QUERY</td>
<td>Extracts a name-value list, using the “=” and “&amp;” delimiters from the query string in a URL.</td>
</tr>
<tr>
<td>VPN.BASEURL.QUERY.IGNORE_EMPTY_ELEMENTS</td>
<td>This method ignores the empty elements in a name-value list. For example, in the following name-value list, there is an empty element following “a=10”: a=10;;b=11;;c=89. The element following b=11 contains a space and is not considered an empty element. Consider the following HTTP header: Cust_Header : a=1;;b=2;;c=3. The following expression produces a count of 4 after evaluating this header: <code>http.req.header(&quot;Cust_Header&quot;).typecast_nvlist_t(=,).ignore_empty_elements.count</code>. The following expression produces a count of 5 after evaluating the header: <code>http.req.header(&quot;Cust_Header&quot;).typecast_nvlist_t(=,).count</code></td>
</tr>
<tr>
<td>VPN and Clientless VPN Expression</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>VPN.BASEURL.SUFFIX</td>
<td>Evaluates the file name suffix in a URL. For example, if the path is /a/b/c/my.page.html, this operation selects “html.”</td>
</tr>
<tr>
<td>VPN.CLIENTLESS_BASEURL</td>
<td>Evaluates the clientless VPN base URL.</td>
</tr>
<tr>
<td>VPN.CLIENTLESS_BASEURL.CVPN_DECODE</td>
<td>Extracts the original URL from the clientless VPN formatted URL.</td>
</tr>
<tr>
<td>VPN.CLIENTLESS_BASEURL.CVPN_ENCODE</td>
<td>Converts a URL to the clientless VPN format.</td>
</tr>
<tr>
<td>VPN.CLIENTLESS_BASEURL.HOSTNAME</td>
<td>Evaluates the host name in the URL. Do not use this prefix in bidirectional policies.</td>
</tr>
<tr>
<td>VPN.CLIENTLESS_BASEURL.HOSTNAME.DOMAIN</td>
<td>Evaluates the domain name part of the host name. For example, if the host name is <a href="http://www.mycompany.com">www.mycompany.com</a> or <a href="http://www.mycompany.com:8080">www.mycompany.com:8080</a>, the domain is mycompany.com. This operation returns incorrect results if the host name is an IP address. For information on expressions for IP addresses, see “Default Syntax Expressions: IP and MAC Addresses, Throughput, VLAN IDs..” All text operations after this prefix are case insensitive.</td>
</tr>
<tr>
<td>VPN.CLIENTLESS_BASEURL.HOSTNAME.EQ(&lt;hostname&gt;)</td>
<td>Returns a Boolean TRUE if the host name matches &lt;hostname&gt;. For example, if the host name is <a href="http://www.mycompany.com">www.mycompany.com</a> or <a href="http://www.mycompany.com:8080">www.mycompany.com:8080</a>, the following is true: vpn.clientless_baseurl.hostname.eq(&quot;www.mycompany.com&quot;) The comparison is case insensitive. If the textmode is URLENCODED, the host name is decoded before comparison. For more information, see “Operations for HTTP, HTML, and XML Encoding and “Safe” Characters.”</td>
</tr>
</tbody>
</table>
### VPN and Clientless VPN Expression Overview

<table>
<thead>
<tr>
<th>Expression</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VPN.CLIENTLESS_BASEURL.HOSTNAME.SERVER</strong></td>
<td>Evaluates the server part of a host name. For example, if the host name is <a href="http://www.mycompany.com">www.mycompany.com</a> or <a href="http://www.mycompany.com:8080">www.mycompany.com:8080</a>, the server is <a href="http://www.mycompany.com">www.mycompany.com</a>. All text operations after this prefix are case insensitive.</td>
</tr>
<tr>
<td><strong>VPN.CLIENTLESS_BASEURL.PATH</strong></td>
<td>Evaluates a slash- (/) separated list in the URL path. For example, this prefix selects /a/b/c/mypage.html from the following URL: <a href="http://www.mycompany.com/a/b/c/mypage.html?a=1">http://www.mycompany.com/a/b/c/mypage.html?a=1</a>. The following expression selects “a” from the preceding URL: http.req.url.path.get(1). For more information on the GET operation, see “Expressions for Extracting Segments of URLs.”</td>
</tr>
<tr>
<td><strong>VPN.CLIENTLESS_BASEURL.PATH.IGNORE_EMPTY_ELEMENTS</strong></td>
<td>Ignores empty elements in a list. For example, if the list delimiter is a comma (,) the following list has an empty element following “a=10”: a=10,b=11,,c=89. The element following b=11 contains a space and is not considered an empty element. Consider the following HTTP header: Cust_Header : 123,24,,15. The following expression returns a value of 4 after evaluating this header: http.req.header(“Cust_Header”).typecast_list_t(‘,’).ignore_empty_elements.count. The following expression returns a value of 5 after evaluating this header: http.req.header(“Cust_Header”).typecast_list_t(‘,’).</td>
</tr>
<tr>
<td><strong>VPN.CLIENTLESS_BASEURL.PATH_AND_QUERY</strong></td>
<td>Evaluates the text following the host name in a URL. For example, this prefix selects /a/b/c/mypage.html?a=1 from the following URL: <a href="http://www.mycompany.com/a/b/c/mypage.html?a=1">http://www.mycompany.com/a/b/c/mypage.html?a=1</a></td>
</tr>
<tr>
<td><strong>VPN.CLIENTLESS_BASEURL.PROTOCOL</strong></td>
<td>Evaluates the protocol in the URL. Do not use this prefix in bidirectional policies.</td>
</tr>
<tr>
<td>VPN and Clientless VPN Expression</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>VPN.CLIENTLESS_BASEURL.QUERY</td>
<td>Extracts a name-value list that uses the delimiters “=” and “&amp;” from a URL query string.</td>
</tr>
<tr>
<td>VPN.CLIENTLESS_BASEURL.QUERY.IGNORE_EMPTY_ELEMENTS</td>
<td>Ignores empty elements in a name-value list. For example, the following list contains an empty element after “a=10”: a=10;;b=11;;c=89. The element following b=11 contains a space and is not considered an empty element. As another example, consider the following http header: Cust_Header : a=1;;b=2;;c=3. The following expression returns a value of 4 after evaluating the preceding header: http.req.header(“Cust_Header”).typecast_nvlist_t(‘=’, ‘;’).ignore_empty_elements.count. The following expression returns a value of 5 after evaluating the preceding header: http.req.header(“Cust_Header”).typecast_nvlist_t(‘=’, ‘;’).ignore_empty_elements.count.</td>
</tr>
<tr>
<td>VPN.CLIENTLESS_BASEURL.SUFFIX</td>
<td>Evaluates the file suffix in a URL. For example, if the URL path is /a/b/c/mypage.html then this operation selects html.</td>
</tr>
<tr>
<td>VPN.CLIENTLESS_HOSTURL</td>
<td>Selects the clientless VPN host URL.</td>
</tr>
<tr>
<td>VPN.CLIENTLESS_HOSTURL.CVVPN_DECODE</td>
<td>Selects the original URL from the clientless VPN formatted URL.</td>
</tr>
<tr>
<td>VPN.CLIENTLESS_HOSTURL.CVVPN_ENCODE</td>
<td>Converts a URL to clientless VPN format.</td>
</tr>
<tr>
<td>VPN.CLIENTLESS_HOSTURL.HOSTNAME</td>
<td>Extracts the host name in the URL. Do not use this prefix in bidirectional policies.</td>
</tr>
<tr>
<td>VPN.CLIENTLESS_HOSTURL.HOSTNAME.DOMAIN</td>
<td>Extracts the domain name from the host name. For example, if the host name is <a href="http://www.mycompany.com">www.mycompany.com</a> or <a href="http://www.mycompany.com:8080">www.mycompany.com:8080</a>, the domain is mycompany.com. This operation returns incorrect results if the host name contains an IP address. For information on expressions for IP addresses, see “Default Syntax Expressions: IP and MAC Addresses, Throughput, VLAN IDs.” All text operations after this prefix are case insensitive.</td>
</tr>
<tr>
<td>VPN and Clientless VPN Expression</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>VPN.CLIENTLESS_HOSTURL.HOSTNAME.EQ(hostname)</td>
<td>Results in Boolean TRUE if the host name matches the <code>&lt;hostname&gt;</code> argument. The comparison is case insensitive. For example, if the host name is <code>www.mycompany.com</code> or <code>www.mycompany.com:8080</code>, the server is <code>www.mycompany.com</code>. The comparison is case insensitive, and all text operations after this method are case insensitive.</td>
</tr>
<tr>
<td>VPN.CLIENTLESS_HOSTURL.HOSTNAME.SERVER</td>
<td>Evaluates the server part of the host name. For example, if the host name is <code>www.mycompany.com</code> or <code>www.mycompany.com:8080</code>, the server is <code>www.mycompany.com</code>. The comparison is case insensitive, and all text operations after this method are case insensitive.</td>
</tr>
<tr>
<td>VPN.CLIENTLESS_HOSTURL.PATH</td>
<td>Evaluates a slash- (/) separated list on the path component of the URL. For example, consider the following URL: <code>&lt;http://www.mycompany.com/a/b/c/mypage.html?a=1&gt;</code>. This prefix selects <code>a/b/c/mypage.html</code> from the preceding URL.</td>
</tr>
</tbody>
</table>
### VPN and Clientless VPN Expression

<table>
<thead>
<tr>
<th>Expression</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VPN.CLIENTLESS_HOSTURL.ROOT</td>
<td>Evaluates the protocol in the URL. Do not use this prefix in bidirectional policies.</td>
</tr>
<tr>
<td>VPN.CLIENTLESS_HOSTURL.PATH_AND_QUERY</td>
<td>Evaluates the portion of the URL that follows the host name. For example, consider the following URL: <code>&lt;http://www.mycompany.com/a/b/c/mypage.html?a=1&gt;</code>. This prefix returns <code>/a/b/c/mypage.html?a=1</code> from the preceding URL.</td>
</tr>
<tr>
<td>VPN.CLIENTLESS_HOSTURL.PROTOCOL</td>
<td>Evaluates the protocol in the URL. Do not use this prefix in bidirectional policies.</td>
</tr>
<tr>
<td>VPN.CLIENTLESS_HOSTURL.QUERY</td>
<td>Extracts a name-value list, using the “=” and “&amp;” delimiters from a URL query string.</td>
</tr>
<tr>
<td>VPN.CLIENTLESS_HOSTURL.HTTPS</td>
<td>Evaluates the protocol in the URL. Do not use this prefix in bidirectional policies.</td>
</tr>
<tr>
<td>VPN.CLIENTLESS_HOSTURL.HOST</td>
<td>Evaluates the host name in the URL. Do not use this prefix in bidirectional policies.</td>
</tr>
</tbody>
</table>

**VPN.CLIENTLESS_HOSTURL.PATH.IGNORE_EMPTY_ELEMENTS**

Ignores the empty elements in a list. For example, if the delimiter in a list is “,” the following list contains an empty element after the entry “a=10”: a=10,b=11,,c=89. The element following b=11 contains a space and is not considered an empty element. Consider the following header: Cust_Header : 123,24,,15. The following expression returns a value of 4 for this header: `http.req.header("Cust_Header").typecast_list_t(,).ignore_empty_elements.count`. The following expression returns a value of 5 for the same header: `http.req.header("Cust_Header").typecast_list_t(,).ignore_empty_elements.count`. 

**VPN.CLIENTLESS_HOSTURL.PATH**

Evaluates the portion of the URL that follows the host name. For example, consider the following URL: `<http://www.mycompany.com/a/b/c/mypage.html?a=1>`. This prefix returns `/a/b/c/mypage.html?a=1` from the preceding URL.
<table>
<thead>

</table>
Basic operations on text

December 13, 2018

Basic operations on text include operations for string matching, calculating the length of a string, and controlling case sensitivity. You can include white space in a string that is passed as an argument to an expression, but the string cannot exceed 255 characters.

String comparison functions

The following table lists basic string matching operations in which the functions return a Boolean TRUE or FALSE.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;text&gt;.CONTAINS(&lt;string&gt;)</td>
<td>Returns a Boolean TRUE value if the target contains &lt;string&gt;. Example: http.req.url.contains(&quot;.jpeg&quot;)</td>
</tr>
<tr>
<td>Function</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><code>&lt;text&gt;.EQ(&lt;string&gt;)</code></td>
<td>Returns a Boolean TRUE value if the target is an exact match with <code>&lt;string&gt;</code>. For example, the following expression returns a Boolean TRUE for a URL with a host name of “myhostabc”: <code>http.req.url.hostname.eq(&quot;myhostabc&quot;)</code></td>
</tr>
<tr>
<td><code>&lt;text&gt;.STARTSWITH(&lt;string&gt;)</code></td>
<td>Returns a Boolean TRUE value if the target begins with <code>&lt;string&gt;</code>. For example, the following expression returns a Boolean TRUE for a URL with a host name of “myhostabc”: <code>http.req.url.hostname.startswith(&quot;myhost&quot;)</code></td>
</tr>
<tr>
<td><code>&lt;text&gt;.ENDSWITH(&lt;string&gt;)</code></td>
<td>Returns a Boolean TRUE value if the target ends with <code>&lt;string&gt;</code>. For example, the following expression returns a Boolean TRUE for a URL with a host name of “myhostabc”: <code>http.req.url.hostname.endswith(&quot;abc&quot;)</code></td>
</tr>
<tr>
<td><code>&lt;text&gt;.NE(&lt;string&gt;)</code></td>
<td>Returns a Boolean TRUE value if the prefix is not equal to the string argument. If the prefix returns a non-string value, the function argument is compared to the string representation of the value returned by the prefix. You can use the functions with <code>SET_TEXT_MODE(IGNORECASE)</code> or <code>SET_TEXT_MODE(NOIGNORECASE)</code>, and with both ASCII and UTF-8 character sets.</td>
</tr>
<tr>
<td><code>&lt;text&gt;.GT(&lt;string&gt;)</code></td>
<td>Returns a Boolean TRUE value if the prefix is alphabetically greater than the string argument. If the prefix returns a non-string value, the function argument is compared to the string representation of the value returned by the prefix. You can use the functions with <code>SET_TEXT_MODE(IGNORECASE)</code> or <code>SET_TEXT_MODE(NOIGNORECASE)</code>, and with both ASCII and UTF-8 character sets.</td>
</tr>
</tbody>
</table>
### Function Description

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;text&gt;.GE(&lt;string&gt;)</code></td>
<td>Returns a Boolean TRUE value if the prefix is alphabetically greater than or equal to the string argument. If the prefix returns a non-string value, the function argument is compared to the string representation of the value returned by the prefix. You can use the functions with SET_TEXT_MODE(IGNORECASE) or SET_TEXT_MODE(NOIGNORECASE), and with both ASCII and UTF-8 character sets.</td>
</tr>
<tr>
<td><code>&lt;text&gt;.LT(&lt;string&gt;)</code></td>
<td>Returns a Boolean TRUE value if the prefix is alphabetically lesser than the string argument. If the prefix returns a non-string value, the function argument is compared to the string representation of the value returned by the prefix. You can use the functions with SET_TEXT_MODE(IGNORECASE) or SET_TEXT_MODE(NOIGNORECASE), and with both ASCII and UTF-8 character sets.</td>
</tr>
<tr>
<td><code>&lt;text&gt;.LE(&lt;string&gt;)</code></td>
<td>Returns a Boolean TRUE value if the prefix is alphabetically lesser than or equal to the string argument. If the prefix returns a non-string value, the function argument is compared to the string representation of the value returned by the prefix. You can use the functions with SET_TEXT_MODE(IGNORECASE) or SET_TEXT_MODE(NOIGNORECASE), and with both ASCII and UTF-8 character sets.</td>
</tr>
</tbody>
</table>

### Calculate the length of a string

The `<text>.LENGTH` operation returns a numeric value that is equal to the number of characters (not bytes) in a string:

```
<text>.LENGTH
```

For example, you may want to identify request URLs that exceed a particular length. Following is an expression that implements this example:
After taking a count of the characters or elements in a string, you can apply numeric operations to them. For more information, see Default Syntax Expressions: Working with Dates, Times, and Numbers.

Consider, ignore, and change text case

The following functions operate on the case (upper-case or lower-case) of the characters in the string.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;text&gt;.SET_TEXT_MODE(IGNORECASE)</code></td>
<td>This function turns case sensitivity on or off for all text operations.</td>
</tr>
<tr>
<td><code>&lt;text&gt;.TO_LOWER</code></td>
<td>Converts the target to lowercase for a text block of up to 2 kilobyte (KB). Returns UNDEF if the target exceeds 2 KB. For example, the string “ABCd:” is converted to “abcd:”.</td>
</tr>
<tr>
<td><code>&lt;text&gt;.TO_UPPER</code></td>
<td>Converts the target to uppercase. Returns UNDEF if the target exceeds 2 KB. For example, the string “abcD:” is converted to “ABCD:”.</td>
</tr>
</tbody>
</table>

Strip specific characters from a string

You can use the STRIP_CHARS(<string>) function to remove specific characters from the text that is returned by a default syntax expression prefix (the input string). All instances of the characters that you specify in the argument are stripped from the input string. You can use any text method on the resulting string, including the methods used for matching the string with a pattern set.

For example, in the expression CLIENT.UDP.DNS.DOMAIN.STRIP_CHARS(".-_"), the STRIP_CHARS(<string>) function strips all periods (.), hyphens (-), and underscores (_) from the domain name returned by the prefix CLIENT.UDP.DNS.DOMAIN. If the domain name that is returned is “a.dom_ai_n-name”, the function returns the string “adomainname”.

© 1999-2018 Citrix Systems, Inc. All rights reserved.
In the following example, the resulting string is compared with a pattern set called “listofdomains”:

```
CLIENT.UDP.DNS.DOMAIN.STRIPE_CHARS(“.-_”).CONTAINS_ANY(“listofdomains”)
```

**Note:** You cannot perform a rewrite on the string that is returned by the STRIP_CHARS(<string>) function.

The following functions strip matching characters from the beginning and end of a given string input.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;text&gt;.STRIP_START_CHARS(s)</code></td>
<td>Strips matching characters from the beginning of the input string until the first non-matching character is found and returns the remainder of the string. You must specify the characters that you want to strip as a single string within quotation marks. For example, if the name of a header is TestLang and ://en_us:is its value, HTTP.RES.HEADER(“TestLang”).STRIP_START_CHARS(“://”), the specified characters from the beginning of the value of the header until the first non-matching character e is found and returns en_us as a string.</td>
</tr>
<tr>
<td><code>&lt;text&gt;.STRIP_END_CHARS(s)</code></td>
<td>Strips matching characters from the end of the input string to the first non-matching character is found and returns the remainder of the string. You must specify the characters that you want to strip as a single string within quotation marks. For example, if the name of a header is TestLang and ://en_us:is its value, HTTP.RES.HEADER(“TestLang”).STRIP_START_CHARS(“://”), the specified characters from the end of the value of the header until the first non-matching character s is found and returns://_en_us as a string.</td>
</tr>
</tbody>
</table>

**Append a string to another string**

You can use the APPEND() function to append the string representation of the argument to the string representation of the value returned by the preceding function. The preceding function can be one that returns a number, unsigned long, double, time value, IPv4 address, or IPv6 address. The argu-
ment can be a text string, number, unsigned long, double, time value, IPv4 address, or IPv6 address. The resulting string value is the same string value that is obtained by using the + operator.

Complex operations on text

January 6, 2019

In addition to performing simple string matching, you can configure expressions that examine more complex aspects of text, including examining the length of a string and looking within a text block for patterns rather than specific strings.

Be aware of the following for any text-based operation:

- For any operation that takes a string argument, the string cannot exceed 255 characters.
- You can include white space when you specify a string in an expression.

Operations on the length of a string

The following operations extract strings on the basis of a character count.

<table>
<thead>
<tr>
<th>Character Count Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;text&gt;.TRUNCATE(&lt;count&gt;)</td>
<td>Returns a string after truncating the end of the target by the number of characters in . If the entire string is shorter than , nothing is returned.</td>
</tr>
<tr>
<td>&lt;text&gt;.TRUNCATE(&lt;character&gt;, &lt;count&gt;)</td>
<td>Returns a string after truncating the text after by the number of characters specified in .</td>
</tr>
<tr>
<td>&lt;text&gt;.PREFIX(&lt;character&gt;, &lt;count&gt;)</td>
<td>Selects the longest prefix in the target that has at most occurrences of .</td>
</tr>
<tr>
<td>&lt;text&gt;.SUFFIX(&lt;character&gt;, &lt;count&gt;)</td>
<td>Selects the longest suffix in the target that has at most occurrences of . For example, consider the following response body: JLEwx. The following expression returns a value of “JLEwx” : http.res.body(100).suffix(‘L’,1) The following expression returns “LLEwx” : http.res.body(100).suffix(‘L’,2)</td>
</tr>
<tr>
<td>Character Count Operation</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td><code>&lt;text&gt;.SUBSTR(&lt;starting_offset&gt;, &lt;length&gt;)</code></td>
<td>Select a string with number of characters from the target object. Begin extracting the string after the <code>. If the number of characters after the offset are fewer than the value of the </code>argument, select all the remaining characters.</td>
</tr>
<tr>
<td><code>&lt;text&gt;.SKIP(&lt;character&gt;, &lt;count&gt;)</code></td>
<td>Select a string from the target after skipping over the longest prefix that has at most occurrences of .</td>
</tr>
</tbody>
</table>

**Operations on a portion of a string**

Refer to the String operations table to know how to extract a subset of a larger string by using one of the operations.

**Operations for comparing the alphanumeric order of two strings**

The COMPARE operation examines the first nonmatching character of two different strings. This operation is based on lexicographic order, which is the method used when ordering terms in dictionaries. This operation returns the arithmetic difference between the ASCII values of the first nonmatching characters in the compared strings. The following differences are examples:

- The difference between “abc” and “abd” is -1 (based on the third pair-wise character comparison).
- The difference between “@” and “abc” is -33.
- The difference between “1” and “abc” is -47.

Following is the syntax for the COMPARE operation.

`<text>.COMPARE(<string>)`

**Extract an integer from a string of bytes that represent text**

Refer to the Integer extraction table to know how to treat a string of bytes that represent text as a sequence of bytes, extract 8, 16, or 32 bits from the sequence, and then convert the extracted bits to an integer.
NetScaler 11.1

Convert text to a hash value

You can convert a text string to a hash value by using the HASH function. This function returns a 31-bit positive integer as a result of the operation. Following is the format of the expression:

<text>.HASH

This function ignores case and white spaces. For example, after the operation, the two strings Ab c and a bc would produce the same hash value.

Encode and decode text by applying the Base64 encoding algorithm

The following two functions encode and decode a text string by applying the Base64 encoding algorithm

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>text.B64ENCODE</td>
<td>Encodes the text string (designated by text) by applying the Base64 encoding algorithm.</td>
</tr>
<tr>
<td>text.B64DECODE</td>
<td>Decodes the Base64-encoded string (designated by text) by applying the Base64 decoding algorithm. The operation raises an UNDEF if text is not in B64-encoded format.</td>
</tr>
</tbody>
</table>

Refine the search in a rewrite action by using the EXTEND function

The EXTEND function is used in rewrite actions that specify patterns or pattern sets and target the bodies of HTTP packets. When a pattern match is found, the EXTEND function extends the scope of the search by a predefined number of bytes on both sides of the matching string. A regular expression can then be used to perform a rewrite on matches in this extended region. Rewrite actions that are configured with the EXTEND function perform rewrites faster than rewrite actions that evaluate entire HTTP bodies using only regular expressions.

The format of the EXTEND function is EXTEND(m,n), where m and n are the number of bytes by which the scope of the search is extended before and after the matching pattern, respectively. When a match is found, the new search scope comprises m bytes that immediately precede the matching string, the string itself, and the n bytes that follow the string. A regular expression can then be used to perform a rewrite on a portion of this new string.

The EXTEND function can be used only if the rewrite action in which it is used fulfills the following requirements:
The search is performed by using patterns or patterns sets (not regular expressions)

The rewrite action evaluates only the bodies of HTTP packets.

Additionally, the EXTEND function can be used only with the following types of rewrite actions:

- replace_all
- insert_after_all
- delete_all
- insert_before_all

For example, you might want to delete all instances of "<http://exampleurl.com/>" and "<http://exampleurl.au/>" in the first 1000 bytes of the body. To do this, you can configure a rewrite action to search for all instances of the string exampleurl, extend the scope of the search on both sides of the string when a match is found, and then use a regular expression to perform the rewrite in the extended region. The following example extends the scope of the search by 20 bytes to the left and 50 bytes to the right of the matching string:

```
add rewrite action delurl_example delete_all 'HTTP.REQ.BODY(1000)'-pattern exampleurl -refineSearch 'extend(20,50).regex_select(re##http://exampleurl.(com|au)##)
```

### Convert text to hexadecimal format

The following function converts text to hexadecimal format and extracts the resulting string:

```
<text>.BLOB_TO_HEX(<string>)
```

For example, this function converts the byte string “abc” to “61:62:63”.

### Encrypt and decrypt text

In default syntax expressions, you can use the ENCRYPT and DECRYPT functions to encrypt and decrypt text. Data encrypted by the ENCRYPT function on a given NetScaler appliance or high availability (HA) pair is intended for decryption by the DECRYPT function on the same NetScaler appliance or HA pair. The appliance supports the RC4, DES3, AES128, AES192, and AES256 encryption methods. The key value that is required for encryption is not user-specifiable. When an encryption method is set, the appliance automatically generates a random key value that is appropriate for the specified method. The default method is AES256 encryption, which is the most secure encryption method and the one that Citrix recommends.

You do not need to configure encryption unless you want to change the encryption method or you want the appliance to generate a new key value for the current encryption method.

**Note:** You can also encrypt and decrypt XML payloads. For information about the functions for encrypting and decrypting XML payloads, see [Encrypt and decrypt XML payloads](#).
NetScaler 11.1

Configure encryption

During startup, the appliance runs the `set ns encryptionParams` command with, by default, the AES256 encryption method, and uses a randomly generated key value that is appropriate for AES256 encryption. The appliance also encrypts the key value and saves the command, with the encrypted key value, to the NetScaler configuration file. Consequently, the AES256 encryption method is enabled for the ENCRYPT and DECRYPT functions by default. The key value that is saved in the configuration file persists across reboots even though the appliance runs the command each time you restart it.

You can run the `set ns encryptionParams` command manually, or use the GUI, if you want to change the encryption method or if you want the appliance to generate a new key value for the current encryption method. To use the CLI to change the encryption method, set only the method parameter, as shown in “Example 1: Changing the Encryption Method.” If you want the appliance to generate a new key value for the current encryption method, set the method parameter to the current encryption method and the `keyValue` parameter to an empty string (“”), as shown in “Example 2: Generating a New Key Value for the Current Encryption Method.” After you generate a new key value, you must save the configuration. If you do not save the configuration, the appliance uses the newly generated key value only until the next restart, after which it reverts to the key value in the saved configuration.

Configure encryption by using the GUI

1. Navigate to System > Settings.
2. In the Settings area, click Change Encryption parameters.
3. In the Change Encryption Parameters dialog box, do one of the following:
   - To change the encryption method, in the Method list, select the encryption method that you want.
   - To generate a new key value for the current encryption method, click Generate a new key for the selected method.
4. Click OK.

Use the ENCRYPT and DECRYPT functions

You can use the ENCRYPT and DECRYPT functions with any expression prefix that returns text. For example, you can use the ENCRYPT and DECRYPT functions in rewrite policies for cookie encryption. In the following example, the rewrite actions encrypt a cookie named MyCookie, which is set by a back-end service, and decrypt the same cookie when it is returned by a client:

```
add rewrite action my-cookie-encrypt-action replace "HTTP.RES.SET_COOKIE.COOKIE("MyCookie").VALUE(0)"
"HTTP.RES.SET_COOKIE.COOKIE("MyCookie").VALUE(0).ENCRYPT"-bypassSafetyCheck YES
```
add rewrite action my-cookie-decrypt-action replace "HTTP.REQ.COOKIE.VALUE( "MyCookie")" HTTP.REQ.COOKIE.VALUE("MyCookie").DECRYPT"-bypassSafetyCheck YES

After you configure policies for encryption and decryption, save the configuration to bring the policies into effect.

**Configure encryption key for third-party encryption**

In default syntax expressions, you can use ENCRYPT and DECRYPT functions for encrypting and decrypting text in a request or response. The data encrypted by the ENCRYPT function on an appliance (standalone, high availability or cluster) is intended to be decrypted by the DECRYPT function by the same appliance. The appliance supports RC4, DES, Triple-DES, AES92, and AES256 encryption methods and each of these methods use a secret key for both encryption and decryption of data. You can use any of these methods to encrypt and decrypt data in two ways - self-encryption and third-party encryption.

The self-encryption feature in an appliance (standalone, high availability or cluster) encrypts and then decrypts data by evaluating the header value. One example to understand this is the HTTP Cookie encryption. The expression evaluates the header, encrypts the HTTP cookie value in the Set-Cookie header in the outgoing response and then decrypts the cookie value when it is returned in the cookie header of a subsequent incoming request from the client. The key value is not user configurable, instead when an encryption method is configured in the set ns encryptionParams command, the appliance automatically generates a random key value for the configured method. By default, the command uses the AES256 encryption method, which is the highly secured method and Citrix recommends this method.

The third-party encryption feature encrypts or decrypts data with a third-party application. For example, a client may encrypt data in a request and the appliance decrypts the data before sending it the back-end server or vice versa. To perform this, the appliance and the third party application must share a secret key. On the appliance, you can directly configure the secret key using an encryption key object and key value is automatically generated by the appliance for a stronger encryption. The same key is manually configured on the third-party appliance so that both appliance and third-party application can use the same key for encrypting and decryption data.

**Note:**

Using third-party encryption, you can also encrypt and decrypt XML payloads. For information about the functions for encrypting and decrypting XML payloads, see “Encrypting and Decrypting XML Payloads.”
Cipher methods

A cipher method provides two functions: an encryption function that transforms a plaintext byte sequence into a ciphertext byte sequence, and a decryption function that transforms the ciphertext back to the plaintext. Cipher methods use byte sequences called keys to perform encryption and decryption. Cipher methods that use the same key for encryption and decryption are called symmetric. Cipher methods that use different keys for encryption and decryption are asymmetric. The most notable examples of asymmetric ciphers are in public key cryptography, which uses a public key available to anyone for encryption and a private key known only to the decryptor.

A good cipher method makes it infeasible to decrypt ("crack") ciphertext if you don't possess the key. "Infeasible" really means that cracking the cyphertext would take more time and computing resources than it is worth. As computers become more powerful and cheaper, ciphers that were formerly infeasible to crack become more feasible. Also, over time, flaws are found in cipher methods (or their implementations), making cracking easier. Newer cipher methods are therefore preferred over older ones. In general, longer length keys provide better security than shorter keys, at the cost of longer encryption and decryption times.

A cipher method can use stream ciphers or block ciphers. RC4 is the mostly secured stream ciphers and it is used only for legacy application. Block ciphers can include padding.

Stream ciphers

A stream cipher method operates on individual bytes. Only one stream cipher is available on NetScaler- appliances: RC4, which uses a 128 bit (16 byte) key length. For a given key, RC4 generates a pseudo-random sequence of bytes, call a keystream, which is X-ORed with the plaintext to produce the ciphertext. RC4 is no longer considered secure and should be used only if required by legacy applications.

Block ciphers

A block cipher method operates on a fixed block of bytes. A NetScaler appliance provides two block ciphers: Data Encryption Standard (DES) and the Advanced Encryption Standard (AES). DES uses a block size of 8 bytes and (on a NetScaler appliance) two choices for key length: 64 bits (8 bytes), of which 56 bits are data and 8 bits are parity, and Triple-DES, a 192 bit (24 byte) key length. AES has a block size of 16 bytes and (on NetScaler) three choices for key length: 128 bits (16 bytes), 192 bits (24 bytes) and 256 bits (32 bytes).
Padding

If the plaintext for a block cipher is not an integral number of blocks, padding with additional bytes might be required. For example, suppose the plaintext is “xyzzy” (hex 78797a7a79). For an 8-byte Triple-DES block, this value would have to be padded to create 8 bytes. The padding scheme must allow the decryption function to determine the length of the original plaintext after decryption. Following are some padding schemes currently in use (n is the number of bytes added):

- **PKCS7**: Adds n bytes of value n each. For example, 78797a7a79030303. This is the padding scheme used by OpenSSL and ENCRYPT() policy function. The PKCS5 padding scheme is the same as PKCS7.
- **ANSI X.923**: Adds n-1 zero bytes and a final byte of value n. For example, 78797a7a79000003.
- **ISO 10126**: Adds n-1 random bytes and a final byte of value n. For example, 78797a7a79xxxx03, where xx can be any byte value. The DECRYPT() policy function accepts this padding scheme, which also allows it to accept the PKCS7 and ANSI X.923 schemes.
- **ISO/IEC 7816-4**: Adds a 0x80 byte and n-1 zero bytes. For example, 78797a7a79800000. This is also call OneAndZeros padding.
- **Zero**: Adds n zero bytes. Example: 78797a7a79000000. This can only be used with plaintext that does not include NUL bytes.

If padding is used and the plaintext is an integral number of blocks, an additional block is typically added so that the decryption function can unambiguously determine the original plaintext length. For PKCS7 and 8 byte block, this would be 0808080808080808.

Modes of operation

There are a number of different modes of operation for block ciphers, which specify how multiple blocks of plaintext are encrypted. Some modes use an initialization vector (IV), a block of data apart from the plaintext that is used to start the encryption process. It is a good practice to use a different IV for each encryption, so that the same plaintext produces different ciphertext. The IV does not need to be secret, and so is usually prepended to the ciphertext. Modes include:

- **Electronic Codebook (ECB)**: Each block of plaintext is encrypted independently. An IV is not used. Padding is required if the plaintext is not a multiple of the cipher block size. The same plaintext and key always produces the same ciphertext. Because of this, ECB is considered less secure than other modes and should only be used for legacy applications.
- **Cipher Block Chaining (CBC)**: Each block of plaintext is XORed with the previous ciphertext block, or the IV for the first block, before being encrypted. Padding is required if the plaintext is not a multiple of the cipher block size. This is the mode used with the NetScaler encryptionParams method.
- **Cipher Feedback (CFB)**: The previous ciphertext block, or the IV for the first block, is encrypted and the output is XORed with the current plaintext block to create the current ciphertext block.
The feedback can be 1 bit, 8 bits, or 128 bits. Since the plaintext is XORed with the cipher text, padding is not required.

- Output Feedback (OFB): A keystream is generated by applying the cipher successively to the IV and XORing the keystream blocks with the plaintext. Padding is not required.

**Configure encryption keys for third-party encryption**

Following are the configuration tasks performed in configuring encryption key.

1. Adding an encryption key. Configures an encryption key for a specified cipher method with a specified key value.
2. Modifying an encryption key. You can edit parameters for a configured encryption key.
3. Unsetting an encryption key. Sets parameters for a configured encryption key to their default values. An encryptionKey value with the name must exist. Sets padding to DEFAULT (determined by the method), Deletes an existing IV, which causes ENCRYPT() to generate a random IV. Deletes an existing comment. The method and key value cannot be reset.
4. Removing an encryption key. Deletes a configured encryption key. The key cannot have any references.
5. Show an encryption key. Displays parameters for the configured encryption key or all configured keys. If the name is omitted, the key value is not displayed.

**Add an encryption key by using the CLI**

At the command prompt, type:

```
add ns encryptionKey <name> -method <method> [-keyValue <hexstring>] [-padding (OFF | ON)] [-iv <hexstring>] [-comment <string>]
```

Where,

```
<method> = ( NONE | RC4 | DES3 | AES128 | AES192 | AES256 | DES | DES-CBC | DES-CFB | DES-OFB | DES-ECB | DES3-CBC | DES3-CFB | DES3-OFB | DES3-ECB | AES128-CBC | AES128-CFB | AES128-OFB | AES128-ECB | AES192-CBC | AES192-CFB | AES192-OFB | AES192-ECB | AES256-CBC | AES256-CFB | AES256-OFB | AES256-ECB ) <hexstring> = hex-encoded byte sequence
```

The above encryption methods specify the operation mode with CBC as the default mode of operation. Therefore, DES, DES2, AES128, AES192, and AES256 methods are equivalent to DES-CBC, DES3-CBC, AES128-CBC, AES192-CBC, and AES256-CBC methods.

**Modify an encryption key by using the CLI**
At the command prompt, type:

```
set ns encryptionKey <name> [-method <method>] [-keyValue <hexstring>] [-padding ( OFF | ON )] [-iv <string>] [-comment <string>]
```

**Unset an encryption key by using the CLI**

At the command prompt, type:

```
unset ns encryptionKey <name> [-padding] [-iv] [-comment]
```

**Remove an encryption key by using the CLI**

At the command prompt, type:

```
rm ns encryptionKey <name>
```

**Show an encryption key by using the CLI**

At the command prompt, type:

```
Example:
```

```
1 show ns encryptionKey [<name>]
2 add ns encryptionKey my_key -method aes256 -keyValue 26
   ea5537b7e0746089476e5658f9327c0b10c3b4778c673a5b38cee182874711 -iv
c2bf0b2e15c15004d6b14bc8c75e365
3 set ns encryptionKey my_key -keyValue
   b8742b163abcf62d639b37bbe63cf95842d82d00f4e6548831d2bd1d93476
4 unset ns encryptionKey my_key -iv
5 rm ns encryptionKey my_key
6 show ns encryptionKey my_key
7 Name: my_key
8 Method: AES256
9 Padding: DEFAULT
10 Key Value: (not disclosed)
```

**Add an encryption key by using the GUI**

Navigate to **System > Encryption Keys** and click **Add** to create an encryption key.

**Modify an encryption key by using the GUI**

Navigate to **System > Encryption Keys** and click **Edit** to modify parameters for a configured encryption key.
NetScaler 11.1

Remove an encryption key by using the GUI

Navigate to **System > Encryption keys** and click **Delete**.

**ENCRIPT and DECRYPT functions for third-party encryption**

Following is the `ENCRIPT` function used for third-part encryption.

```
ENCRIPT (encryptionKey, out_encoding)
```

Where,

**Input data for the appliance** is the text to be encrypted

**encryptionKey**: An optional string parameter that specifies the configured encryption key object to provide the encryption method, secret key value and other encryption parameters. If omitted, the method uses the automatically generated key value associated with the set ns encryptionParamS command.

**out_encoding**: This value specifies how the output is encoded. If omitted, BASE64 encoding is used.

**Input**:

1. **BASE64**: original PEM base64-encoding: 6 bits (0..63) encoded as one ASCII character:
   ```
   0..23 = 'A'..'Z', 24..51 = 'a'..'z', 52..61 = '0'..'9
   , 62 = '+', 63 = '/', '=' = pad byte.
   ```

2. **BASE64URL**: URL and Filename safe base64-encoding: same as BASE64 except 62 = '-', 63 = '_'

3. **HEX_UPPER**: Hexadecimal with 0..9 = '0'..'9' and 10..15 = 'A'..'F

4. **HEX_LOWER**: Hexadecimal with 0..9 = '0'..'9' and 10..15 = 'a'..'f

5. **HEX_COLONS**: Hexadecimal with 0..9 = '0'..'9' and 10..15 = 'A'..'F
   ; ':' between each hex byte. Matches BLOB_TO_HEX() output format

6. **HEX**: For input, accepts HEX_UPPER, HEX_LOWER, and HEX_COLONS format. For output, produces HEX_LOWER format

**Output**: The output is a text encrypted using the specified method and key and encoded using a specified output encoding. It inserts a generated IV before the encrypted text for block methods and modes that require an IV, and either no IV is specified for the encryptionKey or the encryptionKey is omitted.

Following is the `DECRYPT` function used for third-part decryption.

```
DECRYPT (encryptionKey, in_encoding)
```

Where,
Input data is an encrypted text using the specified method and key encoded using the specified input encoding. This text is expected to include a generated IV before the encrypted text for block methods and modes that require an IV, and either no IV is specified for the encryptionKey or the encryptionKey is omitted.

encryptionKey—An optional string parameter that specifies the configured encryptionKey object to provide the encryption method, secret key and other encryption parameters. If omitted, the method and automatically generated key associated with the encryptionParams setting will be used.

in_encoding—An optional enumeration parameter that specifies how the input is expected to be encoded. The values are the same as the out_encoding of ENCRYPT. If omitted, BASE64 encoding will be expected.

The output data is an unencoded decrypted text.

**Variants and optional parameters**

Following are the variants of these functions with the optional parameters:

<table>
<thead>
<tr>
<th>Variant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENCRYPT</td>
<td>Use encryptionParams command and BASE64 output encoding parameter.</td>
</tr>
<tr>
<td>ENCRYPT(out_encoding)</td>
<td>Use encryptionParams and specified output encoding parameter.</td>
</tr>
<tr>
<td>ENCRYPT(encryptionKey)</td>
<td>Use the specified encryptionKey and BASE64 output encoding parameter.</td>
</tr>
<tr>
<td>ENCRYPT(encryptionKey, out_encoding)</td>
<td>Use the specified encryptionKey and output encoding parameter.</td>
</tr>
<tr>
<td>DECRYPT</td>
<td>Use encryptionParams command and BASE64 input encoding parameter.</td>
</tr>
<tr>
<td>DECRYPT(out_encoding)</td>
<td>Use encryptionParams command and the specified input encoding parameter.</td>
</tr>
<tr>
<td>DECRYPT(encryptionKey)</td>
<td>Use the specified encryptionKey and BASE64 input encoding parameter.</td>
</tr>
<tr>
<td>DECRYPT(encryptionKey, out_encoding)</td>
<td>Use the specified encryptionKey and input encoding parameter.</td>
</tr>
</tbody>
</table>
## Configure HMAC keys

NetScaler appliances support a Hashed Message Authentication Code (HMAC) function that calculates a digest method or hash of input text by using a secret key shared between a message sender and message receiver. The digest method (derived from an RFC 2104 technique) authenticates the sender and verifies that the message content has not been altered. For example, when a client sends a message with the shared HMAC key to a NetScaler appliance, advanced (PI) policy expressions use the HMAC function to compute the hash-based code on the selected text. Then, when the receiver receives the message with the secret key, it recomputes the HMAC by comparing it with the original HMAC to determine whether the message has been altered. The HMAC function is supported by standalone appliances and by appliances in a high availability configuration or in a cluster. Using it is similar to configuring an encryption key.

The add ns hmackey and set ns hmackey commands include a parameter that specifies the digest method and the shared secret key to use for the HMAC computation.

To configure a HMAC key, you must perform the following:

1. Adding an HMAC key. Configures an HMAC key with a specified key value.
2. Modifying an HMAC key. Modifies parameters for a configured HMAC key. The digest method can be changed without changing the key value, since the key value length is not determined by the digest. However, it is advisable to specify a new key when changing the digest.
3. Unsetting an HMAC key. Sets parameters for a configured HMAC key to their default values. An hmacKey object with the name must exist. The only parameter that can be unset is the comment, which is deleted.
4. Removing an HMAC key. Deletes a configured key. The key cannot have any references.
5. Show an HMAC key. Displays parameters for the configured HMAC ac key or all configured keys. If the name is omitted, the key value is not displayed.

### Add an HMAC key by using the CLI

At the command prompt, type:

```
add ns hmacKey <name> -digest <digest> -keyValue <hexstring> [-comment <string>]
```

Where,

- `<digest>` = (MD2 | MD4 | MD5 | SHA1 | SHA224 | SHA256 | SHA384 | SHA512)

This command configures a key for the HMAC () function with the specified digest and key value and also validates the following:

- Name syntax is correct and does not duplicate the name of an existing key.
Key value is valid hex. As specified by RFC 2104, the key can any length. On a NetScaler appliance, the key value can range from 0 to 255 bytes (0 to 510 hex characters). If the key is shorter than the digest block size, a warning is issued and the key is padded with zeroes. If the key is longer than the block size, it is run through the digest to produce an effective key that is the same length as the block.

**Example:**

```
add ns hmacKey my_hmac_key -digest sha1 -keyValue 0c753c6c5ef859189cacdf95b506d02c1797407d
```

The above encryption methods specify the operation mode with CBC as the default mode of operation. Therefore, DES, DES2, AES128, AES192, and AES256 methods are equivalent to DES-CBC, DES3-CBC, AES128-CBC, AES192-CBC, and AES256-CBC methods.

**Modify an HMAC key by using the CLI**

This command modifies the parameters configured for a HMAC key. You can change the digest without changing the key value, since the key value length is not determined by the digest. However, it is advisable to specify a new key when changing the digest. At the command prompt, type:

```
set ns hmacKey <name> [-digest <digest>] [-keyValue <hexvalue>] [-comment <string>]
```

**Unset an HMAC key by using the CLI**

This command sets parameters configured for a HMAC key with their default values. An hmacKey object with the name must exist. The only parameter that you can unset is the comment option, which is deleted. At the command prompt, type:

```
unset ns hmacKey <name> -comment
```

**Remove an HMAC key by using the CLI**

This command deletes the configured hmac key. The key cannot have references. At the command prompt, type:

```
rm ns hmacKey <name>
```

**Show an HMAC key by using the CLI**

At the command prompt, type:
Advanced policy expressions: working with dates, times, and numbers

December 13, 2018

Most numeric data that the NetScaler appliance processes consists of dates and times. In addition to working with dates and times, the appliance processes other numeric data, such as the lengths of HTTP requests and responses. To process this data, you can configure advanced policy expressions that process numbers.

A numeric expression consists of an expression prefix that returns a number and sometimes, but not always, an operator that can perform an operation on the number. Examples of expression prefixes that return numbers are SYS.TIME.DAY, HTTP.REQ.CONTENT_LENGTH, and HTTP.RESP.BODY.LENGTH. Numeric operators can work with any prefix expression that returns data in numeric format. The GT(<int>) operator, for example, can be used with any prefix expression, such as HTTP.REQ.CONTENT_LENGTH, that returns an integer. Numeric expression prefixes and operators are also covered in Compound Operations for Numbers and Advanced Policy Expressions: Parsing HTTP, TCP, and UDP Data.

Format of dates and times in an expression

December 10, 2018

When configuring an advanced policy expression in a policy that works with dates and times (for example, the NetScaler system time or a date in an SSL certificate), you specify a time format as follows:

```
GMT | LOCAL  [ <yyyy> ] [ <month> ] [ <d> ] [ <h> ] [ <m> ] [ <s> ]
```
Where:

- `<yyyy>` is a four-digit year after GMT or LOCAL.
- `<month>` is a three-character abbreviation for the month, for example, Jan, Dec.
- `<d>` is a day of the week or an integer for the date.

You cannot specify the day as Monday, Tuesday, and so on. You specify either an integer for a specific day of the month, or you specify a date as the first, second, third weekday of the month, and so on. Following are examples of specifying a day of the week:

- `Sun_1` is the first Sunday of the month.
- `Sun_3` is the third Sunday of the month.
- `Wed_3` is the third Wednesday of the month.
- `30` is an example of an exact date in a month.

- `<h>` is the hour, for example, 10h.
- `<s>` is the number of seconds, for example, 30s.

The following example expression is true if the date is between 2008 Jan and 2009 Jan, based on GMT:

```
http.req.date.between(GMT 2008 Jan, GMT 2009 Jan)
```

The following example expression is true for March and all months that follow March in the calendar year, based on GMT:

```
sys.time.ge(GMT 2008 Mar)
```

When you specify a date and time, note that the format is case sensitive and must preserve the exact number of blank spaces between entries.

```
**Note:**

In an expression that requires two time values, both must use GMT or both must use LOCAL. You cannot mix the two in an expression.

Unlike when you use the SYS.TIME prefix in an advanced policy expression, if you specify SYS.TIME in a rewrite action, the NetScaler returns a string in conventional date format (for example, Sun, 06 Nov 1994 08:49:37 GMT). For example, the following rewrite action replaces the http.res.date header with the NetScaler system time in a conventional date format:

```
add rewrite action sync_date replace http.res.date sys.time
```
Expressions for the NetScaler system time

December 10, 2018

The SYS.TIME expression prefix extracts the NetScaler system time. You can configure expressions that establish whether a particular event occurred at a particular time or within a particular time range according to the NetScaler system time.

The following table describes the expressions that you can create by using the SYS.TIME prefix.

- **SYS.TIME.BETWEEN(<time1>, <time2>):**
  
  Returns a Boolean TRUE if the returned value is later than <time1> and earlier than <time2>.

  You format the <time1>, <time2> arguments as follows:
  
  - They must both be GMT or both LOCAL.
  - <time2> must be later than <time1>.

  For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following:
  
  - sys.time.between(GMT 2004, GMT 2006)
  - sys.time.between(GMT 2004 Jan, GMT 2006 Nov)
  - sys.time.between(GMT 2004 Jan, GMT 2006)
  - sys.time.between(GMT 2005 May Sun_1, GMT 2005 May Sun_3)
  - sys.time.between(GMT 2005 May 1, GMT May 2005 1)
  - sys.time.between(LOCAL 2005 May 1, LOCAL May 2005 1)

- **SYS.TIME.DAY:**
  
  Returns the current day of the month as a number from 1 through 31.

- **SYS.TIME.EQ(<time>):**
  
  Returns a Boolean TRUE if the current time is equal to the <time> argument.

  For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following (evaluation results are shown in parentheses):
  
  - sys.time(eq(GMT 2005) (TRUE in this example.)
  - sys.time.eq(GMT 2005 Dec) (FALSE in this example.)
  - sys.time.eq(LOCAL 2005 May) (Evaluates to TRUE or FALSE in this example, depending on the current time zone.)
  - sys.time.eq(GMT 10h) (TRUE in this example.)
  - sys.time.eq(GMT 10h 30s) (TRUE in this example.)
  - sys.time.eq(GMT May 10h) (TRUE in this example.)
-  `sys.time.eq(GMT Sun)` (TRUE in this example.)
-  `sys.time.eq(GMT May Sun_1)` (TRUE in this example.)

**SYS.TIME.NE(<time>):**

Returns a Boolean TRUE if the current time is not equal to the `<time>` argument.

**SYS.TIME.GE(<time>):**

Returns a Boolean TRUE if the current time is later than or equal to `<time>`.

For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following (evaluation results are shown in parentheses):

-  `sys.time.ge(GMT 2004)` (TRUE in this example.)
-  `sys.time.ge(GMT 2005 Jan)` (TRUE in this example.)
-  `sys.time.ge(LOCAL 2005 May)` (TRUE or FALSE in this example, depending on the current time zone.)
-  `sys.time.ge(GMT 8h)` (TRUE in this example.)
-  `sys.time.ge(GMT 30m)` (FALSE in this example.)
-  `sys.time.ge(GMT May 10h)` (TRUE in this example.)
-  `sys.time.ge(GMT May 10h 0m)` (TRUE in this example.)
-  `sys.time.ge(GMT Sun)` (TRUE in this example.)
-  `sys.time.ge(GMT May Sun_1)` (TRUE in this example.)

**SYS.TIME.GT(<time>):**

Returns a Boolean TRUE if the time value is later than the `<time>` argument.

For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following (evaluation results are shown in parentheses):

-  `sys.time.gt(GMT 2004)` (TRUE in this example.)
-  `sys.time.gt(GMT 2005 Jan)` (TRUE in this example.)
-  `sys.time.gt(LOCAL 2005 May)` (TRUE or FALSE, depending on the current time zone.)
-  `sys.time.gt(GMT 8h)` (TRUE in this example.)
-  `sys.time.gt(GMT 30m)` (FALSE in this example.)
-  `sys.time.gt(GMT May 10h)` (FALSE in this example.)
-  `sys.time.gt(GMT May 10h 0m)` (TRUE in this example.)
-  `sys.time.gt(GMT Sun)` (FALSE in this example.)
-  `sys.time.gt(GMT May Sun_1)` (FALSE in this example.)

**SYS.TIME.HOURS:**

Returns the current hour as an integer from 0 to 23.

**SYS.TIME.LE(<time>):**

Returns a Boolean TRUE if the current time value precedes or is equal to the `<time>` argument.
For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following (evaluation results are shown in parentheses):

- `sys.time.le(GMT 2006)` (TRUE in this example.)
- `sys.time.le(GMT 2005 Dec)` (TRUE in this example.)
- `sys.time.le(LOCAL 2005 May)` (TRUE or FALSE depending on the current timezone.)
- `sys.time.le(GMT 8h)` (FALSE in this example.)
- `sys.time.le(GMT 30m)` (TRUE in this example.)
- `sys.time.le(GMT May 10h)` (TRUE in this example.)
- `sys.time.le(GMT Jun 11h)` (TRUE in this example.)
- `sys.time.le(GMT Wed)` (TRUE in this example.)
- `sys.time.le(GMT May Sun_1)` (TRUE in this example.)

**SYS.TIME.LE(<time>):**

Returns a Boolean TRUE if the current time value precedes the `<time>` argument.

For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following (evaluation results are shown in parentheses):

- `sys.time.lt(GMT 2006)` (TRUE in this example.)
- `sys.time.lt(GMT 2005 Dec)` (TRUE in this example.)
- `sys.time.lt(LOCAL 2005 May)` (TRUE or FALSE depending on the current time zone.)
- `sys.time.lt(GMT 8h)` (FALSE in this example.)
- `sys.time.lt(GMT 30m)` (TRUE in this example.)
- `sys.time.lt(GMT May 10h)` (FALSE in this example.)
- `sys.time.lt(GMT Jun 11h)` (TRUE in this example.)
- `sys.time.lt(GMT Wed)` (TRUE in this example.)
- `sys.time.lt(GMT May Sun_1)` (FALSE in this example.)

**SYS.TIME.MINUTES:**

Returns the current minute as an integer from 0 to 59.

**SYS.TIME.MONTH:**

Extracts the current month and returns an integer from 1 (January) to 12 (December).

**SYS.TIME.RELATIVE_BOOT:**

Calculates the number of seconds to the closest previous or scheduled reboot, and returns an integer.

If the closest boot time is in the past, the integer is negative. If it is in the future, the integer is positive.

**SYS.TIME.RELATIVE_NOW:**
Calculates the number of seconds between the current NetScaler system time and the specified
time, and returns an integer showing the difference.
If the designated time is in the past, the integer is negative; if it is in the future, the integer is
positive.

- **SYS.TIME.SECONDS:**
  Extracts the seconds from the current NetScaler system time, and returns that value as an inte-
ger from 0 to 59.

- **SYS.TIME.WEEKDAY:**
  Returns the current weekday as a value from 0 (Sunday) to 6 (Saturday).

- **SYS.TIME.WITHIN (<time1>,<time2>):**
  If you omit an element of time in <time1>, for example, the day or hour, it is assumed to have the
  lowest value in its range. If you omit an element in <time2>, it is assumed to have the highest
  value of its range.

  The ranges for the elements of time are as follows: month 1-12, day 1-31, weekday 0-6, hour 0-
  23, minutes 0-59 and seconds 0-59. If you specify the year, you must do so in both <time1> and
  <time2>.

  For example, if the time is GMT 2005 May 10 10h 15m 30s, and it is the second Tuesday of the
  month, you can specify the following (evaluation results are shown in parentheses):
  - sys.time.within(GMT 2004, GMT 2006) (TRUE in this example.)
  - sys.time.within(GMT 2004 Jan, GMT 2006 Mar) (FALSE, May is not in the range of January
to March.)
  - sys.time.within(GMT Feb, GMT) (TRUE, May is in the range of February to December.)
  - sys.time.within(GMT Sun_1, GMT Sun_3) (TRUE, the second Tuesday is between the first
    Sunday and the third Sunday.)
  - sys.time.within(GMT 2005 May 1 10h, GMT May 2005 1 17h) (TRUE in this example.)
  - sys.time.within(LOCAL 2005 May 1, LOCAL May 2005 1) (TRUE or FALSE, depending on the
    NetScaler system time zone.)

- **SYS.TIME.YEAR:**
  Extracts the year from the current system time and returns that value as a four-digit integer.

**Expressions for SSL certificate dates**

December 10, 2018
You can determine the validity period for SSL certificates by configuring an expression that contains the following prefix:

`CLIENT.SSL.CLIENT_CERT`

The following example expression matches a particular time for expiration with the information in the certificate:

`client.ssl.client_cert.valid_not_after.eq(GMT 2009)`

The following table describes time-based operations on SSL certificates. To obtain the expression you want, replace `certificate` in the expression in the first column with the prefix expression, “CLIENT.SSL.CLIENT_CERT”.

- `<certificate>.VALID_NOT_AFTER:`
  Returns the last day before certificate expiration. The return format is the number of seconds since GMT January 1, 1970 (0 hours, 0 minutes, 0 seconds).

- `<certificate>.VALID_NOT_AFTER.BETWEEN(<time1>, <time2>):`
  Returns a Boolean TRUE value if the certificate validity is between the `<time1>` and `<time2>` arguments. Both `<time1>` and `<time2>` must be fully specified. Following are examples:
  GMT 1995 Jan is fully specified.
  GMT Jan is not fully specified
  GMT 1995 20 is not fully specified.
  GMT Jan Mon_2 is not fully specified.
  The `<time1>` and `<time2>` arguments must be both GMT or both LOCAL, and `<time2>` must be greater than `<time1>`.
  For example, if it is GMT 2005 May 1 10h 15m 30s, and the first Sunday of the month, you can specify the following (evaluation results are in parentheses).
  - . .between(GMT 2004, GMT 2006) (TRUE)
  - . .between(GMT 2004 Jan, GMT 2006 Nov) (TRUE)
  - . .between(GMT 2004 Jan, GMT 2006) (TRUE)
  - . .between(GMT 2005 May Sun_1, GMT 2005 May Sun_3) (TRUE)
  - . .between(GMT 2005 May 1, GMT May 2005 1) (TRUE)
  - . .between(LOCAL 2005 May 1, LOCAL May 2005 1) (TRUE or FALSE, depending on the NetScaler system time zone.)

- `<certificate>.VALID_NOT_AFTER.DAY:`
  Extracts the last day of the month that the certificate is valid, and returns a number from 1 through 31, as appropriate for the date.
• `<certificate>.VALID_NOT_AFTER.EQ(<time>):`

Returns a Boolean TRUE if the time is equal to the `<time>` argument.

For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following (evaluation results for this example are in parentheses):

- . . .eq(GMT 2005) (TRUE)
- . . .eq(GMT 2005 Dec) (FALSE)
- . . .eq(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone)
- . . .eq(GMT 10h) (TRUE)
- . . .eq(GMT 10h 30s) (TRUE)
- . . .eq(GMT May 10h) (TRUE)
- . . .eq(GMT Sun) (TRUE)
- . . .eq(GMT May Sun_1) (TRUE)

• `<certificate>.VALID_NOT_AFTER.GE(<time>):`

Returns a Boolean TRUE if the time value is greater than or equal to the argument `<time>`.

For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):

- . . .ge(GMT 2004) (TRUE)
- . . .ge(GMT 2005 Jan) (TRUE)
- . . .ge(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
- . . .ge(GMT 8h) (TRUE)
- . . .ge(GMT 30m) (FALSE)
- . . .ge(GMT May 10h) (TRUE)
- . . .ge(GMT May 10h 0m) (TRUE)
- . . .ge(GMT Sun) (TRUE)
- . . .ge(GMT May Sun_1) (TRUE)

• `<certificate>.VALID_NOT_AFTER.GT(<time>):`

Returns a Boolean TRUE if the time value is greater than the argument `<time>`.

For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):

- . . .gt(GMT 2004) (TRUE)
- . . .gt(GMT 2005 Jan) (TRUE)
- . . .gt(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
- . . .gt(GMT 8h) (TRUE)
- . . .gt(GMT 30m) (FALSE)
- . . . .gt(GMT May 10h) (FALSE)
- . . . .gt(GMT Sun) (FALSE)
- . . . .gt(GMT May Sun_1) (FALSE)

- <certificate>.VALID_NOT_AFTER.HOURS:
  Extracts the last hour that the certificate is valid and returns that value as an integer from 0 to 23.

- <certificate>.VALID_NOT_AFTER.LE(<time>):
  Returns a Boolean TRUE if the time precedes or is equal to the <time> argument.

  For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):
  - . . . .le(GMT 2006) (TRUE)
  - . . . .le(GMT 2005 Dec) (TRUE)
  - . . . .le(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
  - . . . .le(GMT 8h) (FALSE)
  - . . . .le(GMT 30m) (TRUE)
  - . . . .le(GMT May 10h) (TRUE)
  - . . . .le(GMT Jun 11h) (TRUE)
  - . . . .le(GMT Wed) (TRUE)
  - . . . .le(GMT May Sun_1) (TRUE)

- <certificate>.VALID_NOT_AFTER.LT(<time>):
  Returns a Boolean TRUE if the time precedes the <time> argument.

  For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following:
  - . . . .lt(GMT 2006) (TRUE)
  - . . . .lt(GMT 2005 Dec) (TRUE)
  - . . . .lt(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
  - . . . .lt(GMT 8h) (FALSE)
  - . . . .lt(GMT 30m) (TRUE)
  - . . . .lt(GMT May 10h) (FALSE)
  - . . . .lt(GMT Jun 11h) (TRUE)
  - . . . .lt(GMT Wed) (TRUE)
  - . . . .lt(GMT May Sun_1) (FALSE)

- <certificate>.VALID_NOT_AFTER.MINUTES:
  Extracts the last minute that the certificate is valid and returns that value as an integer from 0 to 59.
• `<certificate>.VALID_NOT_AFTER.MONTH`:
  Extracts the last month that the certificate is valid and returns that value as an integer from 1 (January) to 12 (December).

• `<certificate>.VALID_NOT_AFTER.RELATIVE_BOOT`:
  Calculates the number of seconds to the closest previous or scheduled reboot and returns an integer. If the closest boot time is in the past, the integer is negative. If it is in the future, the integer is positive.

• `<certificate>.VALID_NOT_AFTER.RELATIVE_NOW`:
  Calculates the number of seconds between the current system time and the specified time and returns an integer. If the time is in the past, the integer is negative; if it is in the future, the integer is positive.

• `<certificate>.VALID_NOT_AFTER.SECONDS`:
  Extracts the last second that the certificate is valid and returns that value as an integer from 0 to 59.

• `<certificate>.VALID_NOT_AFTER.WEEKDAY`:
  Extracts the last weekday that the certificate is valid. Returns a number between 0 (Sunday) and 6 (Saturday) to give the weekday in the time value.

• `<certificate>.VALID_NOT_AFTER.WITHIN(⟨time1⟩, ⟨time2⟩)`:
  Returns a Boolean TRUE if the time lies within all the ranges defined by the elements in ⟨time1⟩ and ⟨time2⟩.
  If you omit an element of time from ⟨time1⟩, it is assumed to have the lowest value in its range. If you omit an element from ⟨time2⟩, it is assumed to have the highest value of its range. If you specify a year in ⟨time1⟩, you must specify it in ⟨time2⟩.

  The ranges for elements of time are as follows: month 1-12, day 1-31, weekday 0-6, hour 0-23, minutes 0-59 and seconds 0-59. For the result to be TRUE, each element in the time must exist in the corresponding range that you specify in ⟨time1⟩, ⟨time2⟩.

  For example, if time is GMT 2005 May 10 10h 15m 30s, and it is the second Tuesday of the month, you can specify the following (evaluation results are in parentheses):

  - . . .within(GMT 2004, GMT 2006) (TRUE)
  - . . .within(GMT 2004 Jan, GMT 2006 Mar) (FALSE, May is not in the range of January to March.)
  - . . .within(GMT Feb, GMT) (TRUE, May is in the range for February to December)
  - . . .within(GMT Sun_1, GMT Sun_3) (TRUE, the second Tuesday lies within the range of the first Sunday through the third Sunday)
- . . .within(GMT 2005 May 1 10h, GMT May 2005 1 17h) (TRUE)
- . . .within(LOCAL 2005 May 1, LOCAL May 2005 1) (TRUE or FALSE, depending on the NetScaler system time zone)

- `<certificate>.VALID_NOT_AFTER.YEAR`:
  Extracts the last year that the certificate is valid and returns a four-digit integer.

- `<certificate>.VALID_NOT_BEFORE`:
  Returns the date that the client certificate becomes valid.
  The return format is the number of seconds since GMT January 1, 1970 (0 hours, 0 minutes, 0 seconds).

- `<certificate>.VALID_NOT_BEFORE.BETWEEN(<time1>, <time2>)`:
  Returns a Boolean TRUE if the time value is between the two time arguments. Both `<time1>` and `<time2>` arguments must be fully specified.
  
  Following are examples:
  GMT 1995 Jan is fully specified.
  GMT Jan is not fully specified.
  GMT 1995 20 is not fully specified.
  GMT Jan Mon_2 is not fully specified.
  The time arguments must be both GMT or both LOCAL, and `<time2>` must be greater than `<time1>`.
  
  For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):
  - . . .between(GMT 2004, GMT 2006) (TRUE)
  - . . .between(GMT 2004 Jan, GMT 2006 Nov) (TRUE)
  - . . .between(GMT 2004 Jan, GMT 2006) (TRUE)
  - . . .between(GMT 2005 May Sun_1, GMT 2005 May Sun_3) (TRUE)
  - . . .between(GMT 2005 May 1, GMT May 2005 1) (TRUE)
  - . . .between(LOCAL 2005 May 1, LOCAL May 2005 1) (TRUE or FALSE, depending on the NetScaler system time zone.)

- `<certificate>.VALID_NOT_BEFORE.DAY`:
  Extracts the last day of the month that the certificate is valid and returns that value as a number from 1 through 31 representing that day.

- `<certificate>.VALID_NOT_BEFORE.EQ(<time>)`:
  Returns a Boolean TRUE if the time is equal to the `<time>` argument.
For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):

- \ldots \text{eq(GMT 2005)} \ (\text{TRUE})
- \ldots \text{eq(GMT 2005 Dec)} \ (\text{FALSE})
- \ldots \text{eq(LOCAL 2005 May)} \ (\text{TRUE or FALSE, depending on the current time zone.})
- \ldots \text{eq(GMT 10h)} \ (\text{TRUE})
- \ldots \text{eq(GMT 10h 30s)} \ (\text{TRUE})
- \ldots \text{eq(GMT May 10h)} \ (\text{TRUE})
- \ldots \text{eq(GMT Sun)} \ (\text{TRUE})
- \ldots \text{eq(GMT May Sun}_{-1}) \ (\text{TRUE})

• \text{<certificate>.VALID\_NOT\_BEFORE.GE(<time>):}

Returns a Boolean TRUE if the time is greater than (after) or equal to the <time> argument.

For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results are in parentheses):

- \ldots \text{ge(GMT 2004)} \ (\text{TRUE})
- \ldots \text{ge(GMT 2005 Jan)} \ (\text{TRUE})
- \ldots \text{ge(LOCAL 2005 May)} \ (\text{TRUE or FALSE, depending on the current time zone.})
- \ldots \text{ge(GMT 8h)} \ (\text{TRUE})
- \ldots \text{ge(GMT 30m)} \ (\text{FALSE})
- \ldots \text{ge(GMT May 10h)} \ (\text{TRUE})
- \ldots \text{ge(GMT May 10h 0m)} \ (\text{TRUE})
- \ldots \text{ge(GMT Sun)} \ (\text{TRUE})
- \ldots \text{ge(GMT May Sun}_{-1}) \ (\text{TRUE})

• \text{<certificate>.VALID\_NOT\_BEFORE.GT(<time>):}

Returns a Boolean TRUE if the time occurs after the <time> argument.

For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results are in parentheses):

- \ldots \text{gt(GMT 2004)} \ (\text{TRUE})
- \ldots \text{gt(GMT 2005 Jan)} \ (\text{TRUE})
- \ldots \text{gt(LOCAL 2005 May)} \ (\text{TRUE or FALSE, depending on the current time zone.})
- \ldots \text{gt(GMT 8h)} \ (\text{TRUE})
- \ldots \text{gt(GMT 30m)} \ (\text{FALSE})
- \ldots \text{gt(GMT May 10h)} \ (\text{FALSE})
- \ldots \text{gt(GMT May 10h 0m)} \ (\text{TRUE})
- \ldots \text{gt(GMT Sun)} \ (\text{FALSE})
- \( \text{gt(GMT May Sun\_1)} \) (FALSE)

- **<certificate>.VALID_NOT_BEFORE.HOURS:**

  Extracts the last hour that the certificate is valid and returns that value as an integer from 0 to 23.

- **<certificate>.VALID_NOT_BEFORE.LE(<time>):**

  Returns a Boolean TRUE if the time precedes or is equal to the <time> argument.

  For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):

  - \( \text{le(GMT 2006)} \) (TRUE)
  - \( \text{le(GMT 2005 Dec)} \) (TRUE)
  - \( \text{le(LOCAL 2005 May)} \) (TRUE or FALSE, depending on the current time zone.)
  - \( \text{le(GMT 8h)} \) (FALSE)
  - \( \text{le(GMT 30m)} \) (TRUE)
  - \( \text{le(GMT May 10h)} \) (TRUE)
  - \( \text{le(GMT Jun 11h)} \) (TRUE)
  - \( \text{le(GMT Wed)} \) (TRUE)
  - \( \text{le(GMT May Sun\_1)} \) (TRUE)

- **<certificate>.VALID_NOT_BEFORE.LT(<time>):**

  Returns a Boolean TRUE if the time precedes the <time> argument.

  For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):

  - \( \text{lt(GMT 2006)} \) (TRUE)
  - \( \text{lt(GMT 2005 Dec)} \) (TRUE)
  - \( \text{lt(LOCAL 2005 May)} \) (TRUE or FALSE, depending on the current time zone.)
  - \( \text{lt(GMT 8h)} \) (FALSE)
  - \( \text{lt(GMT 30m)} \) (TRUE)
  - \( \text{lt(GMT May 10h)} \) (FALSE)
  - \( \text{lt(GMT Jun 11h)} \) (TRUE)
  - \( \text{lt(GMT Wed)} \) (TRUE)
  - \( \text{lt(GMT May Sun\_1)} \) (FALSE)

- **<certificate>.VALID_NOT_BEFORE.MINUTES:**

  Extracts the last minute that the certificate is valid. Returns the current minute as an integer from 0 to 59.
• `<certificate>.VALID_NOT_BEFORE.MONTH`:
  Extracts the last month that the certificate is valid. Returns the current month as an integer from 1 (January) to 12 (December).

• `<certificate>.VALID_NOT_BEFORE.RELATIVE_BOOT`:
  Calculates the number of seconds to the closest previous or scheduled NetScaler reboot and returns an integer. If the closest boot time is in the past, the integer is negative; if it is in the future, the integer is positive.

• `<certificate>.VALID_NOT_BEFORE.RELATIVE_NOW`:
  Returns the number of seconds between the current NetScaler system time and the specified time as an integer. If the designated time is in the past, the integer is negative. If it is in the future, the integer is positive.

• `<certificate>.VALID_NOT_BEFORE.SECONDS`:
  Extracts the last second that the certificate is valid. Returns the current second as an integer from 0 to 59.

• `<certificate>.VALID_NOT_BEFORE.WEEKDAY`:
  Extracts the last weekday that the certificate is valid. Returns the weekday as a number between 0 (Sunday) and 6 (Saturday).

• `<certificate>.VALID_NOT_BEFORE.WITHIN(<time1>, <time2>)`:
  Returns a Boolean TRUE if each element of time exists within the range defined in the `<time1>`, `<time2>` arguments.
  If you omit an element of time from `<time1>`, it is assumed to have the lowest value in its range. If you omit an element of time from `<time2>`, it is assumed to have the highest value in its range. If you specify a year in `<time1>`, it must be specified in `<time2>`. The ranges for elements of time are as follows: month 1-12, day 1-31, weekday 0-6, hour 0-23, minutes 0-59 and seconds 0-59.

  For example, if the time is GMT 2005 May 10 10h 15m 30s, and it is the second Tuesday of the month, you can specify the following (evaluation results are in parentheses):
  - . . .within(GMT 2004, GMT 2006) (TRUE)
  - . . .within(GMT 2004 Jan, GMT 2006 Mar) (FALSE, May is not in the range of January to March.)
  - . . .within(GMT Feb, GMT) (TRUE, May is in the range of February to December.)
  - . . .within(GMT Sun_1, GMT Sun_3) (TRUE, the second Tuesday is between the first Sunday and the third Sunday.)
  - . . .within(GMT 2005 May 1 10h, GMT May 2005 117h) (TRUE)
  - . . .within(LOCAL 2005 May 1, LOCAL May 2005 1) (TRUE or FALSE, depending on the NetScaler system time zone)
• `<certificate>.VALID_NOT_BEFORE.YEAR`:
  Extracts the last year that the certificate is valid. Returns the current year as a four-digit integer.

### Expressions for HTTP request and response dates

December 13, 2018

The following expression prefixes return the contents of the HTTP Date header as text or as a date object. These values can be evaluated as follows:

- **As a number.** The numeric value of an HTTP Date header is returned in the form of the number of seconds since Jan 1, 1970.

  For example, the expression `http.req.date.mod(86400)` returns the number of seconds since the beginning of the day. These values can be evaluated using the same operations as other non-date-related numeric data. For more information, see [Expression prefixes for numeric data other than date and time](#).

- **As an HTTP header.** Date headers can be evaluated using the same operations as other HTTP headers.

  For more information, see [Default syntax expressions: Parsing HTTP, TCP, and UDP data](#).

- **As text.** Date headers can be evaluated using the same operations as other strings.

  For more information, see [Advanced Policy Expressions: Evaluating Text](#).

<table>
<thead>
<tr>
<th>Prefix</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTTP.REQ.DATE</td>
<td>Returns the contents of the HTTP Date header as text or as a date object. The date formats recognized are: RFC822. Sun, 06 Jan 1980 08:49:37 GMT, RFC850. Sunday, 06-Jan-80 09:49:37 GMT, and ASCTIME. Sun Jan 6 08:49:37 1980.</td>
</tr>
<tr>
<td>HTTP.RES.DATE</td>
<td>Returns the contents of the HTTP Date header as text or as a date object. The date formats recognized are: RFC822. Sun, 06 Jan 1980 8:49:37 GMT, RFC850. Sunday, 06-Jan-80 9:49:37 GMT, and ASCTIME. Sun Jan 6 08:49:37 1980.</td>
</tr>
</tbody>
</table>
**Generate the day of the week, as a string, in short and long formats**

December 10, 2018

The functions, `WEEKDAY_STRING_SHORT` and `WEEKDAY_STRING`, generate the day of the week, as a string, in short and long formats, respectively. The strings that are returned are always in English. The prefix used with these functions must return the day of the week in integer format and the acceptable range for the value returned by the prefix is 0-6. Therefore, you can use any prefix that returns an integer in the acceptable range. An UNDEF condition is raised if the returned value is not in this range or if memory allocation fails.

Following are the descriptions of the functions:

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;prefix&gt;.WEEKDAY_STRING_SHORT</code></td>
<td>Returns the day of the week in short format. The short form is always 3 characters long with an initial capital and the remaining characters in lower case. For example, <code>SYS.TIME.WEEKDAY.WEEKDAY_STRING_SHORT</code> returns Sun if the value returned by the <code>WEEKDAY</code> function is 0 and Sat if the value returned by the prefix is 6.</td>
</tr>
<tr>
<td><code>&lt;prefix&gt;.WEEKDAY_STRING</code></td>
<td>Returns the day of the week in long format. The long form always has an initial capital, with the remaining characters in lower case. For example, <code>SYS.TIME.WEEKDAY.WEEKDAY_STRING</code> returns Sunday if the value returned by the <code>WEEKDAY</code> function is 0 and Saturday if the value returned by the prefix is 6.</td>
</tr>
</tbody>
</table>

**Expression prefixes for numeric data other than date and time**

December 13, 2018

In addition to configuring expressions that operate on time, you can configure expressions for the following types of numeric data:
- The length of HTTP requests, the number of HTTP headers in a request, and so on.
  For more information, see Expressions for numeric HTTP payload data other than dates.
- IP and MAC addresses.
  For more information, see Expressions for IP addresses and IP subnets.
- Client and server data in regard to interface IDs and transaction throughput rate.
  For more information, see Expressions for numeric client and server data.
- Numeric data in client certificates other than dates.
  For information on these prefixes, including the number of days until certificate expiration and the encryption key size, see Prefixes for numeric data in SSL certificates.

### Converting numbers to text

**December 13, 2018**

The following functions produce binary strings from a number returned by an expression prefix. These functions are particularly useful in the TCP rewrite feature as replacement strings for binary data. For more information about the TCP rewrite feature, see Rewrite.

All the functions return a value of type text. The endianness that some of the functions accept as a parameter is either LITTLE_ENDIAN or BIG_ENDIAN.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;number&gt;.SIGNED8_STRING</code></td>
<td>Produces an 8-bit signed binary string representing the number. If the value is out of range, an undef condition is raised. Example: HTTP.REQ.BODY(100).GET_SIGNED8(16).SUB(3).SIGNED8_STRING</td>
</tr>
<tr>
<td><code>&lt;number&gt;.UNSIGNED8_STRING</code></td>
<td>Produces an 8-bit unsigned binary string representing the number. If the value is out of range, an undef condition is raised. Example: HTTP.REQ.BODY(100).GET_UNSIGNED8(31).ADD(3).UNSIGNED8_STRING</td>
</tr>
<tr>
<td><code>&lt;number&gt;.SIGNED16_STRING(&lt;endianness&gt;)</code></td>
<td>Produces a 16-bit signed binary string representing the number. If the value is out of range, an undef condition is raised. Example: HTTP.REQ.BODY(100).SKIP(12).GET_SIGNED16(0, BIG_ENDIAN).SUB(4).SIGNED16_STRING(BIG_ENDIAN)</td>
</tr>
</tbody>
</table>
### Function Description

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;number&gt;.UNSIGNED16_STRING(&lt;endianness&gt;)</code></td>
<td>Produces a 16-bit unsigned binary string representing the number. If the value is out of range, an undef condition is raised. Example: HTTP.REQ.BODY(100).GET_UNSIGNED16(47, LITTLE_ENDIAN).ADD(7).UNSIGNED16_STRING(LITTLE_ENDIAN)</td>
</tr>
<tr>
<td><code>&lt;number&gt;.SIGNED32_STRING(&lt;endianness&gt;)</code></td>
<td>Produces a 32-bit signed binary string representing the number. Example: HTTP.REQ.BODY(100).AFTER_STR(&quot;delim&quot;).GET_SIGNED32(0, BIG_ENDIAN).SUB(1).SIGNED32_STRING(BIG_ENDIAN)</td>
</tr>
<tr>
<td><code>&lt;unsigned_long_number&gt;.UNSIGNED8_STRING</code></td>
<td>Produces an 8-bit unsigned binary string representing the number. If the value is out of range, an undef condition is raised. Example: HTTP.REQ.BODY(100).GET_UNSIGNED8(24).TYPECAST_UNSIGNED_LONG_AT .ADD(12).UNSIGNED8_STRING</td>
</tr>
<tr>
<td><code>&lt;unsigned_long_number&gt;.UNSIGNED16_STRING(&lt;endianness&gt;)</code></td>
<td>Produces a 16-bit unsigned binary string representing the number. If the value is out of range, an undef condition is raised. Example: HTTP.REQ.BODY(100).GET_UNSIGNED16(23, LITTLE_ENDIAN).TYPECAST_UNSIGNED_LONG_AT .ADD(10).UNSIGNED16_STRING(LITTLE_ENDIAN)</td>
</tr>
<tr>
<td><code>&lt;unsigned_long_number&gt;.UNSIGNED32_STRING(&lt;endianness&gt;)</code></td>
<td>Produces a 32-bit unsigned binary string representing the number. If the value is out of range, an undef condition is raised. Example: HTTP.REQ.BODY(100).AFTER_STR(&quot;delim2&quot;).GET_UNSIGNED32(0, BIG_ENDIAN).ADD(2).UNSIGNED32_STRING(BIG_ENDIAN)</td>
</tr>
</tbody>
</table>

### Virtual server based expressions

December 10, 2018

The `SYS.VSERVER("<vserver-name>")` expression prefix enables you to identify a virtual server. You can use the following functions with this prefix to retrieve information related to the specified virtual server:

- **THROUGHPUT.** Returns the throughput of the virtual server in Mbps (Megabits per second). The value returned is an unsigned long number.
Usage: SYS.VSERVER("vserver").THROUGHPUT

- **CONNECTIONS.** Returns the number of connections being managed by the virtual server. The value returned is an unsigned long number.

Usage: SYS.VSERVER("vserver").CONNECTIONS

- **STATE.** Returns the state of the virtual server. The value returned is UP, DOWN, or OUT_OF_SERVICE. One of these values can therefore be passed as an argument to the EQ() operator to perform a comparison that results in a Boolean TRUE or FALSE.

Usage: SYS.VSERVER("vserver").STATE

- **HEALTH.** Returns the percentage of services in an UP state for the specified virtual server. The value returned is an integer.

Usage: SYS.VSERVER("vserver").HEALTH

- **RESPTIME.** Returns the response time as an integer representing the number of microseconds. Response time is the average TTFB (Time To First Byte) from all the services bound to the virtual server.

Usage: SYS.VSERVER("vserver").RESPTIME

- **SURGECOUNT.** Returns the number of requests in the surge queue of the virtual server. The value returned is an integer.

Usage: SYS.VSERVER("vserver").SURGECOUNT

**Example 1:**
The following rewrite policy aborts rewrite processing if the number of connections at the load balancing virtual server LBvserver exceeds 10000:

```
add rewrite policy norewrite_pol sys.vserver("LBvserver").connections.gt(10000) norewrite
```

**Example 2:**
The following rewrite action inserts a custom header, TP, whose value is the throughout at the virtual server LBvserver:

```
add rewrite action tp_header insert_http_header TP SYS.VSERVER("LBvserver") .THROUGHPUT
```

**Example 3:**
The following audit log message action writes the average TTFB of the services bound to a virtual server, to the newnslog log file:

```
add audit messageaction log_vserver_resptime_act INFORMATIONAL "\"NS Response Time to Servers:\" + sys.vserver("ssllb").resptime + " millisec \"\"-logtoNewnslog YES -bypassSafetyCheck YES
```
Advanced policy expressions: Parsing HTTP, TCP, and UDP data

December 13, 2018

You can configure Advanced policy expressions to evaluate and process the payload in HTTP requests and responses. The payload associated with an HTTP connection includes the various HTTP headers (both standard and custom headers), the body, and other connection information such as the URL. Additionally, you can evaluate and process the payload in a TCP or UDP packet. For HTTP connections, for example, you can check whether a particular HTTP header is present or if the URL includes a particular query parameter.

You can configure expressions to transform the URL encoding and apply HTML or XML “safe” coding for subsequent evaluation. You can also use XPATH and JSON prefixes to evaluate date in XML and JSON files, respectively.

You can also use text-based and numeric Advanced policy expressions to evaluate HTTP request and response data. For more information, see Advanced policy expressions: Evaluating text. and Default Syntax Expressions: Working with Dates, Times, and Numbers.

About evaluating HTTP and TCP payload

December 13, 2018

The payload of an HTTP request or response consists of HTTP protocol information such as headers, a URL, body content, and version and status information. When you configure a default syntax expression to evaluate HTTP payload, you use a default syntax expression prefix and, if necessary, an operator.

For example, you use the following expression, which includes the http.req.header("<header_name>") prefix and the exists operator, if you want to determine whether an HTTP connection includes a custom header named “myHeader”:

http.req.header("myHeader").exists

You can also combine multiple Advanced policy expressions with Boolean and arithmetic operators. For example, the following compound expression could be useful with various NetScaler features, such as Integrated Caching, Rewrite, and Responder. This expression first uses the && Boolean operator to determine whether an HTTP connection includes the Content-Type header with a value of “text/html.” If that operation returns a value of FALSE, the expression determines whether the HTTP connection includes a “Transfer-Encoding” or “Content-Length” header.
The payload of a TCP or UDP packet is the data portion of the packet. You can configure Advanced policy expressions to examine features of a TCP or UDP packet, including the following:

- Source and destination domains
- Source and destination ports
- The text in the payload
- Record types

The following expression prefixes extract text from the body of the payload:

- HTTP.REQ.BODY(integer). Returns the body of an HTTP request as a multiline text object, up to the character position designated in the integer argument. If there are fewer characters in the body than is specified in the argument, the entire body is returned.
- HTTP.RES.BODY(integer). Returns a portion of the HTTP response body. The length of the returned text is equal to the number in the integer argument. If there are fewer characters in the body than is specified in integer, the entire body is returned.
- CLIENT.TCP.PAYLOAD(integer). Returns TCP payload data as a string, starting with the first character in the payload and continuing for the number of characters in the integer argument.

Following is an example that evaluates to TRUE if a response body of 1024 bytes contains the string “https”, and this string occurs after the string “start string” and before the string “end string”:

\[
\text{http.res.body(1024).after_str("start_string").before_str("end_string").contains("https")}
\]

**Note:** You can apply any text operation to the payload body. For information on operations that you can apply to text, see Advanced policy expressions: Evaluating text.

### Expressions for identifying the protocol in an incoming IP packet

December 10, 2018

The following table lists the expressions that you can use to identify the protocol in an incoming packet.

---

© 1999-2018 Citrix Systems, Inc. All rights reserved.
Expression Description

CLIENT.IP.PROTOCOL Identifies the protocol in IPv4 packets sent by clients.

CLIENT.IPV6.PROTOCOL Identifies the protocol in IPv6 packets sent by clients.

SERVER.IP.PROTOCOL Identifies the protocol in IPv4 packets sent by servers.

SERVER.IPV6.PROTOCOL Identifies the protocol in IPv6 packets sent by servers.

**Arguments to the PROTOCOL function**

You can pass the Internet Assigned Numbers Authority (IANA) protocol number to the PROTOCOL function. For example, if you want to determine whether the protocol in an incoming packet is TCP, you can use CLIENT.IP.PROTOCOL.EQ(6), where 6 is the IANA-assigned protocol number for TCP. For some protocols, you can pass an enumeration value instead of the protocol number. For example, instead of CLIENT.IP.PROTOCOL.EQ(6), you can use CLIENT.IP.PROTOCOL.EQ(TCP). The following table lists the protocols for which you can use enumeration values, and the corresponding enumeration values for use with the PROTOCOL function.

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Enumeration value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transmission Control Protocol (TCP)</td>
<td>TCP</td>
</tr>
<tr>
<td>User Datagram Protocol (UDP)</td>
<td>UDP</td>
</tr>
<tr>
<td>Internet Control Message Protocol (ICMP)</td>
<td>ICMP</td>
</tr>
<tr>
<td>IP Authentication Header (AH), for providing authentication services in IPv4 and IPv6</td>
<td>AH</td>
</tr>
<tr>
<td>Encapsulating Security Payload (ESP) protocol</td>
<td>ESP</td>
</tr>
<tr>
<td>General Routing Encapsulation (GRE)</td>
<td>GRE</td>
</tr>
<tr>
<td>IP-within-IP Encapsulation Protocol</td>
<td>IPIP</td>
</tr>
<tr>
<td>Internet Control Message Protocol for IPv6 (ICMPv6)</td>
<td>ICMPv6</td>
</tr>
<tr>
<td>Fragment Header for IPv6</td>
<td>FRAGMENT</td>
</tr>
</tbody>
</table>
Use case scenarios

The protocol expressions can be used in both request-based and response-based policies. You can use the expressions in various NetScaler features, such as load balancing, WAN optimization, content switching, rewrite, and listen policies. You can use the expressions with functions such as EQ() and NE(), to identify the protocol in a policy and perform an action.

Following are some use cases for the expressions:

- In Branch Repeater load balancing configurations, you can use the expressions in a listen policy for the wildcard virtual server. For example, you can configure the wildcard virtual server with the listen policy CLIENT.IP.PROTOCOL.EQ(TCP) so that the virtual server processes only TCP traffic and simply bridges all non-TCP traffic. Even though you can use an Access Control List instead of the listen policy, the listen policy provides better control over what traffic is processed.
- For content switching virtual servers of type ANY, you can configure content switching policies that switch requests on the basis of the protocol in incoming packets. For example, you can configure content switching policies to direct all TCP traffic to one load balancing virtual server and all non-TCP traffic to another load balancing virtual server.
- You can use the client-based expressions to configure persistence based on the protocol. For example, you can use CLIENT.IP.PROTOCOL to configure persistence on the basis of the protocols in incoming IPv4 packets.

Expressions for HTTP and cache-control headers

December 13, 2018

One common method of evaluating HTTP traffic is to examine the headers in a request or a response. A header can perform a number of functions, including the following:

- Provide cookies that contain data about the sender.
- Identify the type of data that is being transmitted.
- Identify the route that the data has traveled (the Via header).

Note

If an operation is used to evaluate both header and text data, the header-based operation always overrides the text-based operation. For example, the AFTER_STR operation, when applied to a header, overrides text-based AFTER_STR operations for all instances of the current header type.

Prefixes for HTTP headers

The following table describes expression prefixes that extract HTTP headers.
<table>
<thead>
<tr>
<th>HTTP Header Prefix</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTTP.REQ.HEADER(&quot;&quot;)</td>
<td>Returns the contents of the HTTP header specified by the argument. The header name cannot exceed 32 characters. Note that this prefix returns the value from the Host header by default. To use this value as a hostname you need to typecast it as follows: <code>http.req.header(&quot;&quot;</code> more information on typecasting, see <a href="/en-us/netscaler/11-1/appexpert/policies-and-expressions/ns-typecasting-data-wrapper-con.html">Typecasting data</a>.</td>
</tr>
<tr>
<td>HTTP.REQ.FULL_HEADER</td>
<td>Returns the contents of the complete set of HTTP header fields including the request line (for example, “GET /brochures/index.html HTTP/1.1”) and the terminating <code>\r\n\r\n</code> sequence.</td>
</tr>
<tr>
<td>HTTP Header Prefix</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>HTTP.REQ.DATE</td>
<td>Returns the contents of the HTTP Date header. The following date formats are recognized: RFC822. Sun, 06 Jan 1980 8:49:37 GMT, RFC850. Sunday, 06-Jan-80 9:49:37 GMT, ASCII TIME. Sun Jan 6 08:49:37 1980. To evaluate a Date header as a date object, see Default Syntax Expressions: Working with Dates, Times, and Numbers.</td>
</tr>
<tr>
<td>HTTP.REQ.COOKIE</td>
<td>(Name/Value List) Returns the contents of the HTTP Cookie header.</td>
</tr>
<tr>
<td>HTTP.REQ.TXID</td>
<td>Returns the HTTP transaction ID. The value is a function of an internal transaction number, system boot time and system MAC address.</td>
</tr>
<tr>
<td>HTTP.RES.HEADER(&quot;&quot;&quot;)</td>
<td>Returns the contents of the HTTP header specified by the argument. The header name cannot exceed 32 characters.</td>
</tr>
<tr>
<td>HTTP Header Prefix</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| HTTP.RES.FULL_HEADER | Returns the contents of the complete set of HTTP header fields including the status line (for example, “HTTP/1.1 200 OK”) and the terminating 

sequence. |
<p>| HTTP.RES.SET_COOKIE or HTTP.RES.SET_COOKIE2 | Set-Cookie header object in a response. |
| HTTP.RES.SET_COOKIE(&lt;name&gt;) or HTTP.RES.SET_COOKIE2(&lt;name&gt;) | Returns the cookie of the specified name if it is present. If it is not present, returns a text object of length 0. Returns UNDEF if more than 15 Set-Cookie headers are present and the specified cookie was not found in these headers. |</p>
<table>
<thead>
<tr>
<th>HTTP Header Prefix</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTTP.RES.SET_COOKIE(&lt;name&gt;).DOMAIN</td>
<td>Returns the first Domain field in the cookie. For example, if the cookie is Set-Cookie: Customer = &quot;ABC&quot;; DOMAIN=&quot;.abc.com&quot;; DOMAIN=.xyz.com, the following expression returns .abc.com: http.res.set_cookie.cookie(&quot;customer&quot;).domain. A string of zero length is returned if the Domain field or its value is absent.</td>
</tr>
<tr>
<td>HTTP.RES.SET_COOKIE.EXISTS(&lt;name&gt;)</td>
<td>Returns a Boolean TRUE if a Cookie with the name specified in the &lt;name&gt; argument exists in the Set-Cookie header. This prefix returns UNDEF if more than 15 Set-Cookie headers are present and the named cookie is not in the first 15 headers.</td>
</tr>
<tr>
<td>HTTP Header Prefix</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>HTTP.RES.SET_COOKIE.COOKIE.&lt;name&gt;.EXPIRES</td>
<td>Returns the Expires field of the cookie. This is a date string that can be evaluated as a number, as a time object, or as text. If multiple Expires fields are present, the first one is returned. If the Expires field is absent, a text object of length zero is returned. To evaluate the returned value as a time object, see Default Syntax Expressions: Working with Dates, Times, and Numbers.</td>
</tr>
<tr>
<td>HTTP.RES.SET_COOKIE_PATH.GET(n)</td>
<td></td>
</tr>
<tr>
<td>HTTP Header Prefix</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>HTTP.RES_SET_COOKIE2.COOKIE(&lt;name&gt;).PATH</td>
<td>Returns the value of Path field of the cookie as a slash- (&quot;/&quot;) separated list. Multiple instances of a slash are treated as single slash. If multiple Path fields are present, the value of the first instance is returned. For example, the following is a cookie with two path fields: Set-Cookie: Customer = &quot;ABC&quot;; PATH=&quot;/a//b/c&quot;; PATH=&quot;/x/y/z&quot;. The following expression returns /a//b/c from this cookie: http.res.set_cookie.cookie(&quot;Customer&quot;).path. The following expression returns b: http.res.set_cookie.cookie(&quot;Customer&quot;).path.get(2). Quotes are stripped from the returned value. A string of zero length is returned if the Path field or its value is absent.</td>
</tr>
<tr>
<td>HTTP Header Prefix</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>HTTP.RES.SET_COOKIE.COOKIE</td>
<td>Ignores the empty elements in the list. For example, in the list <code>a=10,b=11,,c=89</code>, the element delimiter in the list is <code>,</code> and the list has an empty element following <code>a=10</code>. The element following <code>b=11</code> is not considered an empty element. As another example, in the following expression, if a request contains <code>Cust_Header : 123,,24,15</code> the following expression returns a value of 4: <code>http.req.header(&quot;Cust_Header&quot;).typecast_list_t(', ').ignore_empty_elements.count</code>. The following expression returns a value of 5: <code>http.req.header(&quot;Cust_Header&quot;).typecast_list_t(', ').count</code>.</td>
</tr>
<tr>
<td>HTTP Header Prefix</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>HTTP.RES.SET_COOKIE.COOKIE(&lt;name&gt;).PORT or HTTP.RES.SET_COOKIE2.COOKIE(&lt;name&gt;).PORT</td>
<td>Port field of the cookie. Operate as a comma-separated list. For example, the following expression returns 80, 2580 from Set-Cookie: Customer = “ABC”; PATH=”/a/b/c”; PORT= “80, 2580”: http.res.set_cookie.cookie(“ABC”).port. A string of zero length is returned if the Port field or value is absent.</td>
</tr>
<tr>
<td>HTTP Header Prefix</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>HTTP.RES.SET_COOKIE</td>
<td>Ignores the empty elements in the list.</td>
</tr>
<tr>
<td></td>
<td>For example, in the list a=10,b=11,,c=89,</td>
</tr>
<tr>
<td></td>
<td>the element delimiter in the list is ,, and the list has an empty element</td>
</tr>
<tr>
<td></td>
<td>following a=10. The element following b=11 is not considered an empty</td>
</tr>
<tr>
<td></td>
<td>element. As another example, in the following expression,</td>
</tr>
<tr>
<td></td>
<td>if a request contains Cust_Header : 123,,24,</td>
</tr>
<tr>
<td></td>
<td>,15 the following expression returns a value of 4: http.req.header(&quot;Cust</td>
</tr>
<tr>
<td></td>
<td>following expression returns a value of 5: http.req.header(&quot;Cust</td>
</tr>
<tr>
<td></td>
<td>+&quot; header(&quot;Cust_Header&quot;).typecast_list_t(', ').ignore_empty_elements.</td>
</tr>
<tr>
<td></td>
<td>count.</td>
</tr>
<tr>
<td>HTTP.RES.SET_COOKIE2</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>HTTP Header Prefix</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>HTTP.RES.SET_COOKIE.COOKIE(&lt;name&gt;).VERSION or HTTP.RES.SET_COOKIE2.COOKIE(&lt;name&gt;).VERSION</td>
<td>Returns the value of the first Version field in the cookie as a decimal integer. For example, the following expression returns 1 from the cookie Set-Cookie: Customer = &quot;ABC&quot;; VERSION = &quot;1&quot;; VERSION = &quot;0&quot;; http.res.set_cookie.cookie(&quot;CUSTOMER&quot;).version. A zero is returned if the Version field or its value is absent or if the value is not a decimal number.</td>
</tr>
<tr>
<td>HTTP.RES.SET_COOKIE.&lt;integer&gt;) or HTTP.RES. &lt;integer&gt;)</td>
<td>Returns the nth instance (0-based) of the cookie with the specified name. If the cookie is absent, returns a text object of length 0. Returns UNDEF if more than 15 Set-Cookie headers are present and the cookie is not found.</td>
</tr>
<tr>
<td>HTTP Header Prefix</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>HTTP .RES.SET_COOKIE.COOKIE(&lt;name&gt;,&lt;integer&gt;).DOMAIN or HTTP .RES.SET_COOKIE2.COOKIE(&lt;name&gt;,&lt;integer&gt;).DOMAIN</td>
<td>Returns the value of the Domain field of the first cookie with the specified name. For example, the following expression returns a value of abc.com from the cookie Set-Cookie: Customer = “ABC”; DOMAIN=“.abc.com”; DO-MAIN=.xyz.com: http.res.set_cookie.cookie(“CUSTOMER”).domain. A string of zero length is returned if the Domain field or its value is absent.</td>
</tr>
<tr>
<td>HTTP.RES.SET_COOKIE.&lt;integer&gt;.EXPIRES or HTTP.RES_SET_COOKIE2.&lt;integer&gt;.EXPIRES</td>
<td>Returns the nth instance (0-based) of the Expires field of the cookie with the specified name as a date string. The value can be operated upon as a time object that supports a number of date formats. If the Expires attribute is absent a string of length zero is returned.</td>
</tr>
</tbody>
</table>
## HTTP Header Prefix Description

<table>
<thead>
<tr>
<th>Prefix</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTTP.RES.SET_COOKIE.COOKIE(&lt;name&gt;, &lt;integer&gt;).PATH</td>
<td>Returns the value of the Path field of the nth cookie, as a ‘/’ separated list. Multiple /s are treated as a single /. For example, the following expression returns /a//b/c from the cookie Set-Cookie: Customer = “ABC”; PATH=’/a//b/c’; PATH=’/x/y/z’: http.res.set_cookie.cookie(“CUSTOMER”).path. The following returns b: http.res.set_cookie.cookie(“CUSTOMER”).path.get(2). A string of zero length is returned if the Path field or its value is absent.</td>
</tr>
<tr>
<td>HTTP Header Prefix</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>HTTP.RES.SET_COOKIE.&lt;integer&gt;).PATH.IGNORE_EMPTY_ELEMENTS</td>
<td>Ignores the empty elements in the list. For example, in the list a=10,b=11,.c=89, the element delimiter in the list is , and the list has an empty element following a=10. The element following b=11 is not considered an empty element. As another example, in the following expression, if a request contains Cust_Header : 123.,24, ,15 the following expression returns a value of 4: http.req.header(&quot;Cust_Header&quot;)</td>
</tr>
</tbody>
</table>
### HTTP Header Prefix Description

<table>
<thead>
<tr>
<th>HTTP Header Prefix</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTTP RES.SET_COOKIE.COOKIE(&lt;name&gt;, &lt;integer&gt;).PORT or HTTP RES.SET_COOKIE2.COOKIE(&lt;name&gt;, &lt;integer&gt;).PORT</td>
<td>Returns the value or values of the Port field of the named cookie as a ',' separated list. For example, the following expression returns 80, 2580 from the cookie Set-Cookie : Customer = &quot;ABC&quot;; PATH=&quot;/a/b/c&quot;; PORT= &quot;80, 2580&quot;: http.res.set_cookie.cookie(&quot;ABC&quot;).port. A string of zero length is returned if the Port field or its value is absent.</td>
</tr>
<tr>
<td>HTTP Header Prefix</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>HTTP.RES.SET_COOKIE.COOKIE(&lt;name&gt;,</td>
<td>Ignores the empty elements in the list.</td>
</tr>
<tr>
<td>&lt;integer&gt;).PORT.IGNORE Empty Elements</td>
<td></td>
</tr>
<tr>
<td>HTTP.RES.SET_COOKIE2.COOKIE(&lt;name&gt;,</td>
<td></td>
</tr>
<tr>
<td>&lt;integer&gt;).PORT.IGNORE Empty Elements</td>
<td></td>
</tr>
</tbody>
</table>

For example, in the list a=10, b=11, c=89, the element delimiter in the list is , and the list has an empty element following a=10. The element following b=11 is not considered an empty element. As another example, in the following expression, if a request contains Cust_Header : 123, 24, 15 the following expression returns a value of 4: http.req.header("Cust_Header").typecast_list_t(', ').ignore_empty_elements.count. The following expression returns a value of 5: http.req.header("Cust_Header").count.

<table>
<thead>
<tr>
<th>HTTP.RES.SET_COOKIE.VERSION or HTTP</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES_SETCOOKIE2.COOKIE(&lt;name&gt;,</td>
</tr>
<tr>
<td>&lt;integer&gt;).VERSION</td>
</tr>
</tbody>
</table>

Returns the value of the nth cookie as a decimal integer. A string of zero length is returned if the Port field or its value is absent.
### HTTP Header Prefix Description

<table>
<thead>
<tr>
<th>HTTP Header Prefix</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTTP.RES.TXID</td>
<td>Returns the HTTP transaction ID. The value is a function of an internal transaction number, system boot time and system MAC address.</td>
</tr>
</tbody>
</table>

#### Operations for HTTP headers

The following table describes operations that you can specify with the prefixes for HTTP headers.

<table>
<thead>
<tr>
<th>HTTP Header Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>http header .EXISTS</td>
<td>Returns a Boolean TRUE if an instance of the specified header type exists. Following is an example: http.req.header(&quot;Cache-Control&quot;).exists</td>
</tr>
<tr>
<td>http header.CONTAINS&quot; http</td>
<td>Returns a Boolean TRUE if the &lt;string&gt; argument appears in any instance of the header value. Note: This operation overrides any text-based Contains operations on all instances of the current header type.</td>
</tr>
<tr>
<td>header.CONTAINS(&lt;string&gt;)</td>
<td></td>
</tr>
<tr>
<td>http header .COUNT</td>
<td>Returns the number of headers in a request or response, to a maximum of 15 headers of the same type. The result is undefined if there are more than 15 instances of the header.</td>
</tr>
<tr>
<td>http header.AFTER_STR(&lt;string&gt;)</td>
<td>Extracts the text that follows the first occurrence of the &lt;string&gt; argument. The headers are evaluated from the last instance to the first.</td>
</tr>
<tr>
<td>http header.BEFORE_STR(&lt;string&gt;)</td>
<td>Extracts the text that appears prior to the first occurrence of the input &lt;string&gt; argument. The headers are evaluated from the last instance to the first.</td>
</tr>
</tbody>
</table>
## HTTP Header Operation Description

<table>
<thead>
<tr>
<th>HTTP Header Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>http header.INSTANCE(&lt;instance number&gt;)</code></td>
<td>An HTTP header can occur multiple times in a request or a response. This operation returns the header that occurs <code>&lt;instance number&gt;</code> of places before the final instance. For example, <code>instance(0)</code> selects the last instance of the current type, <code>instance(1)</code> selects the next-to-last instance, and so on. This prefix cannot be used in bidirectional policies.</td>
</tr>
<tr>
<td><code>http header.SUBSTR(&lt;string&gt;)</code></td>
<td>Extracts the text that matches the <code>&lt;string&gt;</code> argument. The headers are evaluated from the last instance to the first.</td>
</tr>
<tr>
<td><code>http header.VALUE(&lt;instance number&gt;)</code></td>
<td>An HTTP header can occur multiple times in a request or a response. <code>VALUE(0)</code> selects the value in the last instance, <code>VALUE(1)</code> selects the value in the next-to-last instance, and so on. The <code>&lt;instance number&gt;</code> argument cannot exceed 14.</td>
</tr>
</tbody>
</table>

### Prefixes for cache-control headers

The following prefixes apply specifically to Cache-Control headers.

<table>
<thead>
<tr>
<th>HTTP Header Prefix</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>HTTP.REQ.CACHE_CONTROL</code></td>
<td>Returns a Cache-Control header in an HTTP request.</td>
</tr>
<tr>
<td><code>HTTP.RES.CACHE_CONTROL</code></td>
<td>Returns a Cache-Control header in an HTTP response.</td>
</tr>
</tbody>
</table>

### Operations for cache-control headers

You can apply any of the operations for HTTP headers to Cache-Control headers. For more information, see [Operations for HTTP headers](#).

In addition, the following operations identify specific types of Cache-Control headers. See RFC 2616 for information about these header types.
<table>
<thead>
<tr>
<th>HTTP Header Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cache-Control header.NAME(&lt;integer&gt;)</td>
<td>Returns as a text value the name of the Cache-Control header that corresponds to the nth component in a name-value list, as specified by &lt;integer&gt;. The index of the name-value component is 0-based. If the &lt;integer&gt; that is specified by the integer argument is greater than the number of components in the list, a zero-length text object is returned. Following is an example: http.req.cache_control.name(3).contains(“some_text”)</td>
</tr>
<tr>
<td>Cache-Control header.IS_INVALID</td>
<td>Returns a Boolean TRUE if the Cache-Control header is not present in the request or response. Following is an example: http.req.cache_control.is_invalid</td>
</tr>
<tr>
<td>Cache-Control header.IS_PRIVATE</td>
<td>Returns a Boolean TRUE if the Cache-Control header has the value Private. Following is an example: http.req.cache_control.is_private</td>
</tr>
<tr>
<td>Cache-Control header.IS_PUBLIC</td>
<td>Returns a Boolean TRUE if the Cache-Control header has the value Private. Following is an example: http.req.cache_control.is_public</td>
</tr>
<tr>
<td>Cache-Control header.IS_NO_STORE</td>
<td>Returns a Boolean TRUE if the Cache-Control header has the value No-Store. Following is an example: http.req.cache_control.is_no_store</td>
</tr>
<tr>
<td>Cache-Control header.IS_NO_CACHE</td>
<td>Returns a Boolean TRUE if the Cache-Control header has the value No-Cache. Following is an example: http.req.cache_control.is_no_cache</td>
</tr>
<tr>
<td>Cache-Control header.IS_MAX_AGE</td>
<td>Returns a Boolean TRUE if the Cache-Control header has the value Max-Age. Following is an example: http.req.cache_control.is_max_age</td>
</tr>
<tr>
<td>Cache-Control header.IS_MIN_FRESH</td>
<td>Returns a Boolean TRUE if the Cache-Control header has the value Min-Fresh. Following is an example: http.req.cache_control.is_min_fresh</td>
</tr>
<tr>
<td>Cache-Control header.IS_MAX_STALE</td>
<td>Returns a Boolean TRUE if the Cache-Control header has the value Max-Stale. Following is an example: http.req.cache_control.is_max_stale</td>
</tr>
<tr>
<td>HTTP Header Operation</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Cache-Control header.IS_MUST_REVALIDATE</td>
<td>Returns a Boolean TRUE if the Cache-Control header has the value Must-Revalidate. Following is an example: http.req.cache_control.is_must_revalidate</td>
</tr>
<tr>
<td>Cache-Control header.IS_NO_TRANSFORM</td>
<td>Returns a Boolean TRUE if the Cache-Control header has the value No-Transform. Following is an example: http.req.cache_control.is_no_transform</td>
</tr>
<tr>
<td>Cache-Control header.IS_ONLY_IF_CACHED</td>
<td>Returns a Boolean TRUE if the Cache-Control header has the value Only-If-Cached. Following is an example: http.req.cache_control.is_only_if_cached</td>
</tr>
<tr>
<td>Cache-Control header.IS_PROXY_REVALIDATE</td>
<td>Returns a Boolean TRUE if the Cache-Control header has the value Proxy-Revalidate. Following is an example: http.req.cache_control.is_proxy_revalidate</td>
</tr>
<tr>
<td>Cache-Control header.IS_S_MAXAGE</td>
<td>Returns a Boolean TRUE if the Cache-Control header has the value S-Maxage. Following is an example: http.req.cache_control.is_s_maxage</td>
</tr>
<tr>
<td>Cache-Control header.IS_UNKNOWN</td>
<td>Returns a Boolean TRUE if the Cache-Control header is of an unknown type. Following is an example: http.req.cache_control.is_unknown</td>
</tr>
<tr>
<td>Cache-Control header.MAX_AGE</td>
<td>Returns the value of the Cache-Control header Max-Age. If this header is absent or invalid, 0 is returned. Following is an example: http.req.cache_control.max_age.le(3)</td>
</tr>
<tr>
<td>Cache-Control header.MAX_STALE</td>
<td>Returns the value of the Cache-Control header Max-Stale. If this header is absent or invalid, 0 is returned. Following is an example: http.req.cache_control.max_stale.le(3)</td>
</tr>
<tr>
<td>Cache-Control header.MIN_FRESH</td>
<td>Returns the value of the Cache-Control header Min-Fresh. If this header is absent or invalid, 0 is returned. Following is an example: http.req.cache_control.min_fresh.le(3)</td>
</tr>
</tbody>
</table>
### HTTP Header Operation

<table>
<thead>
<tr>
<th>HTTP Header Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cache-Control header.S_MAXAGE</td>
<td>Returns the value of the Cache-Control header S-Maxage. If this header is absent or invalid, 0 is returned. Following is an example: <code>http.req.cache_control.s_maxage.eq(2)</code></td>
</tr>
</tbody>
</table>

### Expressions for extracting segments of URLs

December 13, 2018

You can extract URLs and portions of URLs, such as the host name, or a segment of the URL path. For example, the following expression identifies HTTP requests for image files by extracting image file suffixes from the URL:

```
http.req.url.suffix.eq("jpeg") || http.req.url.suffix.eq("gif")
```

Most expressions for URLs operate on text and are described in [Expression Prefixes for Text in HTTP Requests and Responses](#). This section discusses the GET operation. The GET operation extracts text when used with the following prefixes:

- HTTP.REQ.URL.PATH
- VPN.BASEURL.PATH
- VPN.CLIENTLESS_BASEURL.PATH

The following table describes prefixes for HTTP URLs.

<table>
<thead>
<tr>
<th>URL Prefix</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTTP.REQ.URL.PATH.GET(&lt;n&gt;)</td>
<td>Returns a slash- (&quot;/&quot;) separated list from the URL path. For example, consider the following URL: <code>http://www.mycompany.com/dir1/dir2/dir3/index.html?a=1</code>. The following expression returns <code>dir1</code> from this URL: <code>&lt;http.req.url.path.get(1)&gt;</code>. The following expression returns <code>dir2</code>: <code>http.req.url.path.get(2)</code></td>
</tr>
</tbody>
</table>
NetScaler 11.1

<table>
<thead>
<tr>
<th>URL Prefix</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTTP.REQ.URL_PATH.GET_REVERSE(&lt;n&gt;)</td>
<td>Returns a slash- (“/”) separated list from the URL path, starting from the end of the path. For example, consider the following URL: <a href="http://www.mycompany.com/dir1/dir2/dir3/index.html?a=1">http://www.mycompany.com/dir1/dir2/dir3/index.html?a=1</a>. The following expression returns index.html from this URL: &lt;http.req.url.path.get_reverse(0)&gt;. The following expression returns dir3: http.req.url.path.get_reverse(1)</td>
</tr>

</table>

Expressions for HTTP status codes and numeric HTTP payload data other than dates

December 10, 2018

The following table describes prefixes for numeric values in HTTP data other than dates.

<table>
<thead>
<tr>
<th>Prefix</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTTP.REQ.CONTENT_LENGTH</td>
<td>Returns the length of an HTTP request as a number. Following is an example: http.req.content_length &lt; 500</td>
</tr>
<tr>
<td>HTTP.RES.CONTENT_LENGTH</td>
<td>Returns the length of the HTTP response as a number. Following is an example: http.res.content_length &lt;= 1000</td>
</tr>
<tr>
<td>HTTP.RES.STATUS</td>
<td>Returns the response status code</td>
</tr>
<tr>
<td>HTTP.RES.IS_REDIRECT</td>
<td>Returns a Boolean TRUE if the response code is associated with a redirect. Following are the redirect response codes: 300 (Multiple Choices), 301 (Moved Permanently), 302 (Found), 303 (See Other), 305 (Use Proxy), and 307 (Temporary Redirect). Note: Status code 304 is not considered a redirect HTTP response status code. Status code 306 is unused.</td>
</tr>
</tbody>
</table>
SIP expressions

December 10, 2018

The NetScaler Advanced policy expressions language contains a number of expressions that operate on Session Initiation Protocol (SIP) connections. These expressions are intended to be used in policies for any supported protocol that operates on a request/response basis. These expressions can be used in content switching, rate limiting, responder, and rewrite policies.

Certain limitations apply to SIP expressions used with responder policies. Only the DROP, NOOP or RESPONDWITH actions are allowed on a SIP load balancing virtual server. Responder policies can be bound to a load balancing virtual server, an override global bind point, a default global bind point, or a sip_udp policy label.

The header format used by the SIP protocol is similar to that used by the HTTP protocol, so many of the new expressions look and function much like their HTTP analogs. Each SIP header consists of a line that includes the SIP method, the URL, and the version, followed by a series of name-value pairs that look like HTTP headers.

Following is a sample SIP header that is referred to in the expressions tables beneath it:

```
1 INVITE sip:16@www.sip.com:5060;transport=udp SIP/2.0
2 Record-Route: <sip:200.200.100.22;lr=on>
3 Via: SIP/2.0/UDP 200.200.100.22;branch=z9hG4bK444b.c8e103d1.0;rport=5060;
4          received=10.102.84.18
5 Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;
6          received=10.102.84.160
7 From: "12" <sip:12@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185
8 To: "16" <sip:16@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185
9 Call-ID: 00127f54-ec850017-0e46f5b9-5ec149c2@10.102.84.180
10 Max-Forwards: 69CSeq: 101 INVITE
11 User-Agent: Cisco-CP7940G/8.0
12 Contact: <sip:12@10.102.84.180:5060;transport=udp>
13 Expires: 180
14 Accept: application/sdp
15 Allow: ACK,BYE,CANCEL,INVITE,NOTIFY,OPTIONS,REFER,REGISTER,UPDATE
16 Supported: replaces,join,norefersub
17 Content-Length: 277
18 Content-Type: application/sdp
19 Content-Disposition: session;handling=optional
```
SIP reference tables

The following tables contain lists of expressions that operate on SIP headers. The first table contains expressions that apply to request headers. Most response-based expressions are nearly the same as the corresponding request-based expressions. To create a response expression from the corresponding request expression, you change the first two sections of the expression from SIP.REQ to SIP.RES, and make other obvious adjustments. The second table contains those response expressions that are unique to responses and have no request equivalents. You can use any element in the following tables as a complete expression on its own, or you can use various operators to combine these expression elements with others to form more complex expressions.

SIP request expressions

<table>
<thead>
<tr>
<th>Expression</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SIP.REQ.METHOD</td>
<td>Operates on the method of the SIP request. The supported SIP request methods are ACK, BYE, CANCEL, INFO, INVITE, MESSAGE, NOTIFY, OPTIONS, PRACK, PUBLISH, REFER, REGISTER, SUBSCRIBE, and UPDATE. This expression is a derivative of the text class, so all operations that are applicable to text are applicable to this method. For example, for a SIP request of INVITE sip:16@10.102.84.181:5060;transport=udp SIP/2.0, this expression returns INVITE.</td>
</tr>
<tr>
<td>SIP.REQ.URL</td>
<td>Operates on the SIP request URL. This expression is a derivative of the text class, so all operations that are applicable to text are applicable to this method. For example, for a SIP request of INVITE sip:16@10.102.84.181:5060;transport=udp SIP/2.0, this expression returns sip:16@10.102.84.181:5060;transport=udp.</td>
</tr>
<tr>
<td>SIP.REQ.URL.PROTOCOL</td>
<td>Returns the URL protocol. For example, for a SIP URL of sip:<a href="mailto:16@www.sip.com">16@www.sip.com</a>:5060;transport=udp, this expression returns sip.</td>
</tr>
<tr>
<td>Expression</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SIP.REQ.URL.HOSTNAME</td>
<td>Returns the hostname portion of the SIP URL. For example, for a SIP URL of sip:<a href="mailto:16@www.sip.com">16@www.sip.com</a>:5060;transport=udp, this expression returns <a href="http://www.sip.com:5060">www.sip.com:5060</a>.</td>
</tr>
<tr>
<td>SIP.REQ.URL.HOSTNAME.PORT</td>
<td>Returns the port portion of the SIP URL hostname. If no port is specified, this expression returns the default SIP port, 5060. For example, for a SIP hostname of <a href="http://www.sip.com:5060">www.sip.com:5060</a>, this expression returns 5060.</td>
</tr>
<tr>
<td>SIP.REQ.URL.HOSTNAME.DOMAIN</td>
<td>Returns the domain name portion of the SIP URL hostname. If the host is an IP address, then this expression returns an incorrect result. For example, for a SIP hostname of <a href="http://www.sip.com:5060">www.sip.com:5060</a>, this expression returns sip.com. For a SIP hostname of 192.168.43.15:5060, this expression returns an error.</td>
</tr>
<tr>
<td>SIP.REQ.URL.HOSTNAME.SERVER</td>
<td>Returns the server portion of the host. For example, for a SIP hostname of <a href="http://www.sip.com:5060">www.sip.com:5060</a>, this expression returns www.</td>
</tr>
<tr>
<td>SIP.REQ.URL.USERNAME</td>
<td>Returns the username that precedes the @ character. For example, for a SIP URL of sip:<a href="mailto:16@www.sip.com">16@www.sip.com</a>:5060;transport=udp, this expression returns 16.</td>
</tr>
<tr>
<td>SIP.REQ.VERSION</td>
<td>Returns the SIP version number in the request. For example, for a SIP request of INVITE sip:16@10.102.84.181:5060;transport=udp SIP/2.0, this expression returns SIP/2.0.</td>
</tr>
<tr>
<td>SIP.REQ.VERSION.MAJOR</td>
<td>Returns the major version number (the number to the left of the period). For example, for a SIP version number of SIP/2.0, this expression returns 2.</td>
</tr>
<tr>
<td>Expression</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SIP.REQ.VERSION.MINOR</td>
<td>Returns the minor version number (the number to the right of the period). For example, for a SIP version number of SIP/2.0, this expression returns 0.</td>
</tr>
<tr>
<td>SIP.REQ.CONTENT_LENGTH</td>
<td>Returns the contents of the Content-Length header. This expression is a derivative of the sip_header_t class, so all operations that are available for SIP headers can be used. For example, for a SIP Content-Length header of Content-Length: 277, this expression returns 277.</td>
</tr>
<tr>
<td>SIP.REQ.TO</td>
<td>Returns the contents of the To header. For example, for a SIP To header of To: “16” <a href="">sip:16@sip_example.com</a>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns “16” <a href="">sip:16@sip_example.com</a>;tag=00127f54ec85a6d90cc14f45-53cc0185.</td>
</tr>
<tr>
<td>SIP.REQ.TO.ADDRESS</td>
<td>Returns the SIP URI, which is found in the sip_url object. All operations that are available for SIP URIs can be used. For example, for a SIP To header of To: “16” <a href="">sip:16@sip_example.com</a>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns sip:<a href="mailto:16@sip_example.com">16@sip_example.com</a>.</td>
</tr>
<tr>
<td>SIP.REQ.TO.DISPLAY_NAME</td>
<td>Returns the display name portion of the To header. For example, for a SIP To header of To: “16” <a href="">sip:16@sip_example.com</a>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns 16.</td>
</tr>
<tr>
<td>SIP.REQ.TO.TAG</td>
<td>Returns the “tag” vale from the “tag” name value pair in the TO header. For example, for a SIP To header of To: “16” <a href="">sip:16@sip_example.com</a>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns 00127f54ec85a6d90cc14f45-53cc0185.</td>
</tr>
<tr>
<td>Expression</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SIP.REQ.FROM</td>
<td>Returns the contents of the From header. For example, for a SIP From header of From: “12” <a href="">sip:12@sip_example.com</a>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns sip:<a href="mailto:12@sip_example.com">12@sip_example.com</a>.</td>
</tr>
<tr>
<td>SIP.REQ.FROM.ADDRESS</td>
<td>Returns the SIP URI, which is found in the sip_url object. All operations that are available for SIP URIs can be used. For example, for a SIP From header of From: “12” <a href="">sip:12@sip_example.com</a>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns sip:<a href="mailto:12@sip_example.com">12@sip_example.com</a>.</td>
</tr>
<tr>
<td>SIP.REQ.FROM.DISPLAY_NAME</td>
<td>Returns the display name portion of the To header. For example, for a SIP From header of From: “12” <a href="">sip:12@sip_example.com</a>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns 12.</td>
</tr>
<tr>
<td>SIP.REQ.FROM.TAG</td>
<td>Returns the “tag” value from the “tag” name/value pair in the TO header. For example, for a SIP From header of From: “12” <a href="">sip:12@sip_example.com</a>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns 00127f54ec85a6d90cc14f45-53cc0185.</td>
</tr>
</tbody>
</table>
| SIP.REQ.VIA          | Returns the complete Via header. If there are multiple Via headers in the request, returns the last Via header. For example, for the two Via headers in the sample SIP header, this expression returns Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;re 
| SIP.REQ.VIA.SENTBY_ADDRESS | Returns the address that sent the request. For example, for the Via header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;re this expression returns 10.102.84.180. |
### Expression Description

<table>
<thead>
<tr>
<th>Expression</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SIP.REQ.VIA.SENTBY_PORT</td>
<td>Returns the port that sent the request. For example, for the Via header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;received=10.102.84.160, this expression returns 5060.</td>
</tr>
<tr>
<td>SIP.REQ.VIA.RPORT</td>
<td>Returns the value from the rport name/value pair. For example, for the Via header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;received=10.102.84.160, this expression returns 5060.</td>
</tr>
<tr>
<td>SIP.REQ.VIA.BRANCH</td>
<td>Returns the value from the branch name/value pair. For example, for the Via header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;received=10.102.84.160, this expression returns z9hG4bK03e76d0b.</td>
</tr>
<tr>
<td>SIP.REQ.VIA.RECEIVED</td>
<td>Returns the value from the received name/value pair. For example, for the Via header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;received=10.102.84.160, this expression returns 10.102.84.160.</td>
</tr>
<tr>
<td>SIP.REQ.CALLID</td>
<td>Returns the contents of the Callid header. This expression is a derivative of the sip_header_t class, so all operations that are available for SIP headers can be used. For example, for a SIP Callid header of Call-ID: 00127f54-ec850017-0e46f5b9-5ec149c2@10.102.84.180, this expression returns 00127f54-ec850017-0e46f5b9-5ec149c2@10.102.84.180.</td>
</tr>
<tr>
<td>SIP.REQ.CSEQ</td>
<td>Returns the CSEQ number from the CSEQ, as an integer. For example, for a SIP CSEQ header of CSeq: 101 INVITE, this expression returns 101.</td>
</tr>
<tr>
<td>SIP.REQ.HEADER(&lt;header_name&gt;)</td>
<td>Returns the specified SIP header. For example, to return the SIP From header, you would type SIP.REQ.HEADER(&quot;From&quot;).</td>
</tr>
<tr>
<td>Expression</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------</td>
</tr>
<tr>
<td>SIP.REQ.HEADER(&lt;header_name&gt;).INSTANCE()</td>
<td>Returns the specified instance of the specified SIP header. Multiple instances of the same SIP header can occur. Where you want a specific instance of such a SIP header (for example, a specific Via header), you can specify that header by typing a number as the . Header instances are matched from last (0) to first. In other words, SIP.REQ.HEADER(&quot;Via&quot;).INSTANCE(0) returns the last instance of the Via header, while SIP.REQ.HEADER(&quot;Via&quot;).INSTANCE(1) returns the last instance but one of the Via header, and so on. For example, if used on the example SIP header, SIP.REQ.HEADER(&quot;Via&quot;).INSTANCE(1) returns Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060.</td>
</tr>
<tr>
<td>SIP.REQ.HEADER(&lt;header_name&gt;).VALUE()</td>
<td>Returns the contents of the specified instance of the specified SIP header. The usage is nearly the same as the previous expression. For example, if used on the SIP header example in the preceding table entry, SIP.REQ.HEADER(&quot;Via&quot;).VALUE(1) returns SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060.</td>
</tr>
<tr>
<td>SIP.REQ.HEADER(&lt;header_name&gt;).COUNT</td>
<td>Returns the number of instances of a particular header as an integer. For example, if used on the SIP header example above, SIP.REQ.HEADER(&quot;Via&quot;).COUNT returns 2.</td>
</tr>
<tr>
<td>Expression</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SIP.REQ.HEADER(&lt;header_name&gt;).EXISTS</td>
<td>Returns a boolean value of true or false, depending upon whether the specified header exists or not. For example, if used on the SIP header example above, SIP.REQ.HEADER(“Expires”).EXISTS returns true, while SIP.REQ.HEADER(“Caller-ID”).EXISTS returns false.</td>
</tr>
<tr>
<td>SIP.REQ.HEADER(&lt;header_name&gt;).LIST</td>
<td>Returns the comma-separated parameter list in the specified header. For example, if used on the SIP header example above, SIP.REQ.HEADER(“Allow”).LIST returns ACK,BYE,CANCEL,INVITE,NOTIFY,OPTIONS,REFER,REGISTER,UPDATE. You can append the string .GET() to select a specific list item. For example, to get the first item (ACK) from the above list, you would type SIP.REQ.HEADER(“Allow”).LIST.GET(0). To extract the second item (BYE), you would type SIP.REQ.HEADER(“Allow”).LIST.GET(1). Note: If the specified header contains a list of name/value pairs, the entire name/value pair is returned.</td>
</tr>
<tr>
<td>SIP.REQ.HEADER(&lt;header_name&gt;).TYPECAST_SIP_HEADER_T(“”)</td>
<td>Typecasts to . Any text can be typecasted to the sip_header_t class, after which all header-based operations can be used. After you perform this operation, you can apply all operations that can be used with . For example, the expression SIP.REQ.CONTENT_LENGTH.TYPECAST_SIP_HEADER_T typecasts all instances of the Content-Length header. After you perform this operation, you can apply all header operations to all instances of the specified header.</td>
</tr>
<tr>
<td>Expression</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------</td>
</tr>
<tr>
<td>SIP.REQ.HEADER(&lt;header_name&gt;).CONTAINS(&lt;string&gt;)</td>
<td>Returns boolean true if the specified text string is present in any instance of the specified header. Operates on all the instances of the specified header. Header instances are matched from last (0) to first.</td>
</tr>
<tr>
<td>SIP.REQ.HEADER(&lt;header_name&gt;).EQUALS_ANY(&lt;patset&gt;)</td>
<td>Returns boolean true if any pattern associated with &lt;patset&gt; matches any content in any instance of the specified header. Operates on all the instances of the specified header. Header instances are matched from last (0) to first.</td>
</tr>
<tr>
<td>SIP.REQ.HEADER(&lt;header_name&gt;).CONTAINS_ANY(&lt;patset&gt;)</td>
<td>Returns boolean true if any pattern associated with &lt;patset&gt; matches any content in any instance of the specified header. Operates on all the instances of the specified header. Header instances are matched from last (0) to first.</td>
</tr>
<tr>
<td>SIP.REQ.HEADER(&lt;header_name&gt;).CONTAINS_INDEX(&lt;patset&gt;)</td>
<td>Returns the index of the matching pattern associated with &lt;patset&gt; if that pattern matches any content in any instance of the specified header. Operates on all the instances of the specified header. Header instances are matched from last (0) to first.</td>
</tr>
<tr>
<td>SIP.REQ.HEADER(&lt;header_name&gt;).EQUALS_INDEX(&lt;patset&gt;)</td>
<td>Returns the index of the matching pattern associated with &lt;patset&gt; if that pattern matches any instance of the specified header. Operates on all the instances of the specified header. Header instances are matched from last (0) to first.</td>
</tr>
</tbody>
</table>
### Expression Description

<table>
<thead>
<tr>
<th>Expression</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SIP.REQ.HEADER(&lt;header_name&gt;).SUBSTR(&lt;string&gt;)</td>
<td>If the specified string is present in any instance of the specified header, this expression returns that string. For example, for the SIP header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;returns “rport=5060”. SIP.REQ.HEADER(“Via”).SUBSTR(“rport=“) returns an empty string.</td>
</tr>
<tr>
<td>SIP.REQ.HEADER(&lt;header_name&gt;).AFTER_STR(&lt;string&gt;)</td>
<td>If the specified string is present in any instance of the specified header, this expression returns the string immediately after that string. For example, for the SIP header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;returns “rport=5060”. SIP.REQ.HEADER(“Via”).AFTER_STR(“rport=“) returns 5060.</td>
</tr>
<tr>
