# Contents

**NetScaler Release Notes**  
3

**Getting started with NetScaler**  
3
  - Understanding the NetScaler  
  - Switching features  
  - Security and protection features  
  - Optimization features  
  - Understanding policies and expressions  
  - Processing order of features  

**Where does a NetScaler appliance fit in the network?**  
5
  - Physical deployment modes  
  - NetScaler as an L2 device  
  - NetScaler as a packet forwarding device  

**How a NetScaler appliance communicates with clients and servers**  
7
  - Understanding NetScaler-owned IP addresses  
  - How Traffic flows are managed  
  - Traffic management building blocks  
  - A simple load balancing configuration  
  - Understanding virtual servers  
  - Understanding services  

**Introduction to the NetScaler product line**  
12
  - NetScaler Hardware Platforms  
  - NetScaler Editions  
  - Supported releases on NetScaler hardware  
  - Supported browsers  

**Install the hardware**  
13

**Access a NetScaler**  
14
  - Command line interface  
  - NetScaler GUI  

**Configure the ADC for the first time**  
18
  - NITRO API  

**Configure high availability**  
18
  - Add a Node  

© 1999-2018 Citrix Systems, Inc. All rights reserved.
Disable high availability monitoring for unused interfaces .......................... 20

**Configure a FIPS appliance for the first time** 22  
Configure secure HTTPS by using the CLI .................................................. 22  
Configure secure HTTPS by using the GUI ............................................... 22  
Configure secure RPC by using the CLI .................................................... 23  
Configure secure RPC by using the GUI .................................................... 24

**Common network topologies** 25  
Set up a common two-arm topology ....................................................... 25  
Set up common one-arm topologies .......................................................... 26

**System management settings** 27

**System settings** 27

**Packet forwarding modes** 29  
Enable and disable layer 2 mode .............................................................. 30  
Enable and disable layer 3 mode .............................................................. 31  
Enable and disable MAC based forwarding mode ....................................... 33

**Network interfaces** 34  
Virtual LANs ............................................................................................ 35  
Link aggregate channels .......................................................................... 35

**Clock synchronization** 36

**DNS configuration** 37  
Add a name server by using the CLI ......................................................... 38  
Add a name server by using the GUI ........................................................ 38

**SNMP configuration** 38  
Add SNMP managers ................................................................................ 39  
Add SNMP traps listeners ......................................................................... 40  
Configure SNMP alarms ........................................................................... 41

**Verify configuration** 42  
Configuration checklist ............................................................................. 43  
Topology configuration checklist ............................................................. 43  
Server configuration checklist ................................................................ 44  
Software features configuration checklist ............................................... 44  
Access checklist ........................................................................................ 45  
Firewall checklist ...................................................................................... 45

Load balance traffic on a NetScaler appliance

Load balancing
  Enable load balancing .................................................. 47
  Configure services and a virtual server ............................... 48

Persistence settings
  Configure persistence based on cookies ................................ 50
  Configure persistence based on server IDs in URLs .................. 52

Configure features to protect the load balancing configuration
  Configure URL redirection ............................................... 54
  Configure backup virtual servers ...................................... 55

A typical load balancing scenario

Accelerate load balanced traffic by using compression
  Compression configuration task sequence ................................ 60
  Enable compression .......................................................... 60
  Configure services to compress data .................................... 61
  Bind a compression policy to a virtual server ......................... 64

Secure load balanced traffic by using SSL
  SSL configuration task sequence ........................................ 66
  Enable SSL offload .......................................................... 66
  Create HTTP services ....................................................... 67
  Add an SSL based virtual server ......................................... 70
  Bind services to the SSL virtual server ................................ 72
  Add a certificate key pair .................................................. 74
  Bind an SSL certificate key pair to the virtual server ............... 76
  Configure support for Outlook web access .............................. 78
  Create an SSL action to enable OWA support ............................ 78
  Create SSL policies ........................................................... 79
  Bind the SSL policy to the SSL virtual server ......................... 81

Features at a glance

Application switching and traffic management features
  SSL Offloading ............................................................... 83
  Access Control Lists ........................................................ 83
  Load Balancing ............................................................... 83
  Traffic Domains ............................................................... 84
NetScaler 11.1

Network Address Translation ........................................ 84
Multipath TCP Support .................................................. 85
Content Switching ......................................................... 85
Global Server Load Balancing (GSLB) ............................... 85
Dynamic Routing ........................................................... 85
Link Load Balancing ....................................................... 86
TCP Optimization .......................................................... 86
CloudBridge Connector .................................................... 86
DataStream ................................................................. 87

Application acceleration features ................................. 87

Application security and firewall features ......................... 88
Denial of service (DoS) attack defense ......................... 88
Content Filtering .......................................................... 89
Responder ................................................................. 89
Rewrite ................................................................. 89
Priority Queuing ........................................................... 90
Surge Protection ............................................................ 90
Citrix Gateway ............................................................ 90
Application Firewall ....................................................... 91

Application visibility feature ........................................ 91

FAQs ........................................................................ 93

Solutions for Telecom Service Providers ....................... 93

Large Scale NAT .......................................................... 94
LSN Architecture .......................................................... 95
LSN Features Supported on NetScaler appliance ............... 95

Points to Consider before Configuring LSN ..................... 98

Configuration Steps for LSN ........................................ 100
Configuration Using the Command Line Interface ............... 103
Configuration Using the Configuration Utility ..................... 105
Parameter Descriptions (of commands listed in the CLI procedure) ................. 105
Parameter Descriptions (of commands listed in the CLI procedure) ................. 106
Parameter Descriptions (of commands listed in the CLI procedure) ................. 107
Parameter Descriptions (of commands listed in the CLI procedure) ................. 109
Parameter Descriptions (of commands listed in the CLI procedure) ................. 109

Configuring Static Large Scale NAT64 Maps ......................................................... 238
To create a Large Scale NAT64 mapping by using the command line .................... 238
Wildcard Port Static Large Scale NAT64 Maps ..................................................... 238

Logging and Monitoring Large Scale NAT64 ....................................................... 239
Logging Large Scale NAT64 .................................................................................. 240
Logging MSISDN Information for Large Scale NAT64 ....................................... 243
Compact Logging for Large Scale NAT ................................................................. 245
Logging HTTP Header Information ..................................................................... 247
Displaying Current Large Scale NAT64 Sessions ............................................... 249
Displaying Large Scale NAT64 Statistics ............................................................. 249
Clearing Large Scale NAT64 Sessions ................................................................. 250

Port Control Protocol for Large Scale NAT64 ...................................................... 251
Configuration Steps ............................................................................................. 251

Telco subscriber management ................................................................................. 253
Allocating memory for the subscriber session store module ................................. 254
Configure an interface for dynamic subscribers .................................................. 255
Configure static subscribers .................................................................................. 261
Default subscriber profile .................................................................................... 262
View and clear subscriber sessions ....................................................................... 262
Subscriber policy enforcement & management system ..................................... 263
IPv6 prefix based subscriber sessions .................................................................. 264
Idle session management of subscriber sessions in a Telco network .................. 265
Subscriber session event logging ........................................................................ 266
Subscriber aware LSN session termination ......................................................... 267
Troubleshooting .................................................................................................... 268

Subscriber aware traffic steering .......................................................................... 268
To configure traffic steering for the above deployment by using the CLI ............... 269
To configure traffic steering on the appliance by using the GUI ......................... 272
To configure service chaining on the appliance by using the GUI ....................... 273

Subscriber aware service chaining ....................................................................... 274
To configure service chaining for the above deployment by using the CLI .......... 274
To configure service chaining on the appliance by using the GUI ....................... 279

Policy based TCP profile selection ...................................................................... 280

Load Balance Control-Plane Traffic that is based on Diameter, SIP, and SMPP Protocols ................................................................. 281
SIP ......................................................................................................................... 281
Provide DNS Infrastructure/Traffic Services, such as, Load Balancing, Caching, and Logging for Telecom Service Providers 282

Provide Subscriber Load Distribution Using GSLB Across Core-Networks of a Telecom Service Provider 283

Bandwidth Utilization Using Cache Redirection Functionality 284

NetScaler TCP Optimization 284

Getting Started 285
  Hardware 285
  Initial Setup 285

  Routing 287

Licensing 287

High Availability 288
  Connectivity 289

Gi-LAN Integration 289
  Connectivity 289
  HA Configuration 291

TCP Optimization Configuration 295
  TCP Termination 295
  TCP Optimization 297

Analytics and Reporting 300

Real-time Statistics 300

SNMP 302
  Memory 302
  Packet Engine CPU 302
  Throughput 303
NetScaler 11.1

Memory Overload Protection .................................................. 328
Support for Happy Eyeballs Clients ............................................ 328

NetScaler Solutions .................................................................. 329
This section includes the following solutions .......................... 329

Setting up NetScaler for Citrix Virtual Apps and Desktops ............. 329
Prerequisites .............................................................................. 330

Global Server Load Balancing (GSLB) Powered Zone Preference ......... 330

NetScaler in a Private Cloud Managed by Microsoft Windows Azure Pack and Cisco ACI 331
Prerequisites .............................................................................. 332

Creating a NetScaler Load Balancer in a Plan in the Service Management Portal (Admin Portal) .... 333

Configuring a NetScaler Load Balancer by Using the Service Management Portal (Tenant Portal) .... 333

Deleting a NetScaler Load Balancer from the Network .................... 335

Support matrix and usage guidelines ........................................ 335

Install a NetScaler VPX instance on XenServer ......................... 338
Prerequisites for installing a NetScaler VPX instance on XenServer .......... 338
Install NetScaler VPX instances on XenServer by using XenCenter ............. 340

Configure VPX instances to use single root I/O virtualization (SR-IOV) network interfaces 341
Limitations .................................................................................. 341
Prerequisites .............................................................................. 341
Assign SR-IOV VFs to the VPX instance by using the XenServer host ............. 342
Unassign SR-IOV VFs to the VPX instance by using the XenServer host ............. 342
Configuring VLAN on the SR-IOV Interface ............................... 343
Configure VLAN on the SR-IOV interface .................................. 343

Install a NetScaler VPX instance on VMware ESX ....................... 344
Prerequisites .............................................................................. 344
Install a NetScaler VPX instance on VMware ESX .......................... 347

Configure a NetScaler VPX instance to use VMXNET3 network interface 348

Configure a NetScaler VPX instance to use SR-IOV network interface .... 350
Limitations .................................................................................. 351

© 1999-2018 Citrix Systems, Inc. All rights reserved.
Migrating the NetScaler VPX from E1000 to SR-IOV or VMXNET3 Network Interfaces 355

Configure a NetScaler VPX instance to use PCI passthrough network interface 355
  Overview ................................................................. 355
  Prerequisites ............................................................ 355
  Configure passthrough devices on a host ............................ 356
  Configure passthrough devices on a NetScaler VPX instance .......... 356

Install a NetScaler VPX instance on Microsoft Hyper-V server 356
  Prerequisites for installing NetScaler VPX instance on Microsoft servers ... 357
  Install the NetScaler VPX instance on Microsoft servers .............. 358
  Auto-provision a NetScaler VPX instance on Hyper-V .................. 359

Install a NetScaler VPX instance on Linux-KVM platform 361
  Limitations and usage guidelines ...................................... 361
  Prerequisites for installing a NetScaler VPX instance on Linux-KVM platform 362
    Software requirements ................................................. 362
    Guest VM hardware requirements .................................... 363
    Networking requirements .............................................. 363
    Properties of source interfaces .................................... 364
    Module required ....................................................... 366

Provision the NetScaler VPX instance by using OpenStack 366
  Userdata file ............................................................ 367
  Network configuration .................................................. 369
  Customer script ......................................................... 369
  SSH key pair authentication .......................................... 370
  Before you begin ....................................................... 370
  Provisioning the VPX instance ........................................ 370

Configure a NetScaler VPX instance to use SR-IOV network interfaces 372
  Limitations .............................................................. 373
  Prerequisites ............................................................ 373
  Configure a NetScaler VPX instance to use SR-IOV network interface ..... 375
  Configure static LA/LACP on the SR-IOV interface ..................... 375
  Configuring VLAN on the SR-IOV Interface ............................ 376

Configure a NetScaler VPX instance to use PCI passthrough network interfaces 376
  Prerequisites ............................................................ 376
Provision the NetScaler VPX instance by using the virsh program 377
  Add additional interfaces to NetScaler VPX instance using virsh program 379

Manage the NetScaler VPX guest VMs 380
  Manage the VPX guest VMs by using Virtual Machine Manager 381
  Manage the NetScaler VPX guest VMs using the virsh program 381

Deploying Citrix NetScaler VPX on Microsoft Azure 383
  Network Architecture 384
  How NetScaler VPX Works on Azure 384
  Traffic Flow through Port Address Translation 385
  Traffic Flow Through Network Address Translation 386
  Port Usage Guidelines 386
  Limitations 388

Configure a NetScaler VPX standalone instance 389
  Before you begin 389
  Summary of configuration steps 389
  Configure a resource group 390
  Configure a network security group 390
  Configure a virtual network and subnets 390
  Configure a storage account 391
  Configure an availability set 391
  Configure a NetScaler VPX instance 392

Configure multiple IP addresses for a NetScaler VPX standalone instance 393
  Use Case 394
  Before you begin 394

Configure a high-availability setup with a single IP address and a single NIC 396
  Before You Begin 396
  Summary of Steps to Configure NetScaler VPX in a High Availability Mode 397
  Configuring Internal and External Load Balancers 397
  Configuring a Health Probe on a Load Balancer 398
  Configuring a Backend Pool on a Load Balancer 398
  Configuring a NAT rule on a load balancer 399
  Configuring a Load Balancing Rule on a Load Balancer 399
  Configuring NetScaler high availability with the Azure external load balancer 400
  Configuring NetScaler high availability with the Azure internal load balancer 400
  Accessing the NetScaler VPX Virtual Machine 401
Configure GSLB on NetScaler VPX instances 402

Use Case ................................................. 402
Parameters ............................................... 403
1. Create a multi-NIC, multi-IP VM by Using PowerShell commands ........................................ 404
   IP Configuration details .................................. 407
2. Configure GSLB sites and other necessary GSLB settings .................................................. 408

Configure address pools (IIP) for a Citrix Gateway appliance 409
Register a private IP address in the Azure portal ...................................................... 409
Configure address pools in the Citrix Gateway appliance ........................................ 410

Configure multiple IP addresses for a NetScaler VPX instance in standalone mode by using PowerShell commands 410
Overview .................................................. 410
Use case .................................................. 411
Script ...................................................... 412

Configure multiple Azure VIPs for a standalone or high availability VPX instance 417
Deploy a NetScaler VPX in standalone mode .............................................................. 417
Deploying NetScaler VPX in High Availability Mode .................................................. 423
Azure ARM Components ........................................ 430

PowerShell scripts for Azure deployment 431
Provision NetScaler VPX in Standalone Mode .............................................................. 431
Provision NetScaler VPX in HA with Azure External Load Balancer ................................. 435
Provision NetScaler VPX in HA with Azure Internal Load Balancer .................................. 440

Azure terminology 445

Deploy a NetScaler VPX instance on Oracle Public Cloud 447
Supported Features ........................................ 447
Hardware Requirements ...................................... 448
The Create Instance Wizard .................................. 448
Terminology ............................................... 448
Limitations .................................................. 449

Prerequisites 449

Configure a NetScaler VPX standalone instance on Oracle Public Cloud 450
Upload a NetScaler VPX image and associate it with the Oracle Cloud Web console ........ 450
Configure a NetScaler instance ........................................ 451
Configure NetScaler owned IP addresses and an LB vServer ........................................ 452
Scenario 452

Deploy a NetScaler VPX Instance on Cisco CSP 2100 456
  Points to Note ........................................................... 456
  Deploy a NetScaler VPX Instance on Cisco CSP 2100 ............ 456
  Limitations ................................................................. 457

Jumbo frames on NetScaler VPX instances 458
  Configure jumbo frames for a VPX instance running on VMware ESX . 458
  Configure jumbo frames for a VPX instance running on Linux-KVM server .... 459
  Configure jumbo frames for a VPX instance running on Citrix XenServer .......... 459
  Configure jumbo frames for a VPX instance running on AWS ................. 459

Hardware Installation 459

Licensing 460

NetScaler licensing overview 460
  Prerequisites ............................................................ 461
  Allocate a license by using the GUI .................................. 461
  Install a license ........................................................ 462
  Verify licensed features .............................................. 463
  Enable or disable a feature .......................................... 464
  Check license expiration information ................................ 466
  NetScaler VPX Express license ....................................... 466

Citrix Gateway Universal License 466
  Obtaining the Universal License ..................................... 467
  Installing the Universal License .................................... 468
  Verifying Installation of the Universal License .................... 468

NetScaler Pooled Capacity 468

Upgrade and downgrade a NetScaler appliance 468

AAA application traffic 469

How AAA works 470

Enabling AAA 472
  To enable AAA by using the command line interface ............... 472
  To enable AAA by using the configuration utility ................... 473
Setting up an authentication virtual server 473
   To set up an authentication virtual server by using the CLI .......................... 473
   To set up an authentication virtual server by using the GUI .......................... 474

Configuring the authentication virtual server 475
   To configure an authentication virtual server by using the command line interface .... 475
   To configure an authentication virtual server by using the configuration utility .... 476

Configuring a traffic management virtual server 478
   To configure a TM virtual server for AAA by using the command line interface .......... 478
   To configure a TM virtual server for AAA by using the configuration utility .......... 479
   Simplified login protocol support for AAA ............................................. 480

Configuring DNS 480

Verifying your setup for AAA 480
   To verify authentication virtual server setup by using the command line interface ..... 480
   To verify your AAA virtual server setup by using the configuration utility ............ 481

Creating an authentication profile 481
   To configure an authentication profile by using the CLI .................................. 481
   To configure an authentication profile by using the GUI .................................. 481

Configuring users and groups 482
   To create a local AAA user account by using the command line interface ............. 482
   To change the password for an existing AAA local user account by using the command line interface .................. 483
   To configure AAA local users by using the configuration utility .................... 483
   To create AAA local groups and add users to them by using the command line interface ... 483
   To remove users from an AAA group by using the command line interface .......... 484
   To remove an AAA group by using the command line interface .................... 484
   To configure AAA local groups and add users to them by using the configuration utility .... 485

Configuring AAA policies 485

Authentication policies 486
   To add an authentication action by using the command line interface ............... 487
   To configure an authentication action by using the command line interface ........... 488
   To remove an authentication action by using the command line interface ............ 488
   To configure an authentication server by using the configuration utility ............ 488
   To create and bind an authentication policy by using the command line interface ...... 489
   To modify an existing authentication policy by using the command line interface .... 489

An overview of NetScaler appliance kerberos SSO
Integration of NetScaler appliance Kerberos SSO with authentication methods

Setting up NetScaler appliance SSO

Prerequisites
To create a server and service by using the command line
Example
To create a traffic management virtual server by using the command line
Example
To create an authentication virtual server by using the command line
Example
To configure a traffic management virtual server to use an authentication profile
Example

Configuring SSO

Enabling integrated authentication on the web application server
To configure Microsoft IIS to use integrated authentication

Setting up SSO by impersonation
To create the KCD account for SSO by impersonation with a password

Configuring SSO by Delegation
Installing the client CA certificate on the NetScaler appliance
Creating the KCD account
Setting up Active Directory for NetScaler appliance SSO

Generating the KCD keytab script
To generate the KCD keytab script by using the configuration utility

SAML authentication

NetScaler appliance as a SAML SP
To configure the NetScaler appliance as a SAML SP by using the command line interface
To configure a NetScaler appliance as a SAML SP by using the graphical user interface

NetScaler appliance as a SAML IdP
To configure a NetScaler appliance as a SAML IdP by using the command line interface
To configure a NetScaler appliance as a SAML IdP by using the graphical user interface

Configuring SAML single sign-on
Configuring SAML single sign-on by using the command line interface

Grouping records on attribute values 594
To group the records on the values of selector expressions by using the command line interface 594
To group the records on the values of selector expressions by using the GUI 596

Clearing a stream session 597
To clear a stream session by using the command line interface 597
To clear a stream session by using the GUI 597

Configure policy for optimizing traffic 598
Example 598

How to limit bandwidth consumption for user or client device 599

AppExpert applications and templates 602
AppExpert application terminology 603

How AppExpert Application Works 604
Get started with AppExpert 604

Downloading an Application Template 605
Importing an Application Template 606

Verifying and Testing Application Configuration 607

Customizing the configuration 608

Configure public endpoints 609

Configure services and service groups for an application unit 609

Create application units 610

Configuring application unit rules 611

Configuring policies for application units 611
Configuring compression policies 612
Configuring Caching Policies 613
Configuring Rewrite policies 614
Configuring Responder policies 615
Configuring Application Firewall policies 615

Configuring Application Units 616
Configuring public endpoints for an application 617
Specifying the Order of Evaluation of Application Units 618
Configuring Persistency Groups for Application Units 619
Viewing AppExpert Applications and Configuring Entities by Using the Application Visualizer 620
Configuring User Authentication, Authorization, and Auditing 620
Monitoring a NetScaler Application 621
  Viewing Application Statistics 621
  Monitoring an Application by Using the Application Visualizer 622
  Viewing Hits 622
Deleting an Application 622
Configure application authentication, authorization, and auditing 623
  Configure application authorization 623
  Configure application auditing 624
  Disabling AAA for an Application 625
Setting Up a Custom NetScaler Application 625
  Creating an Application 626
  Creating Application Units 626
  Configuring Public Endpoints for an AppExpert Application 626
  Configuring Public Endpoints for an Application Unit 627
  Configuring Services and Service Groups for an AppExpert Application 627
  Configuring services and service groups for an application Unit 628
  Configuring Policies 629
Creating and managing template files 629
Exporting an appExpert application to a template file 629
Exporting a Content Switching Virtual Server Configuration to a Template File 630
Creating Variables in Application Templates 632
Uploading and downloading template files 633
Understanding NetScaler application templates and deployment files 634
  Example of a NetScaler Application Template 635
  Example of a deployment file 638

NetScaler 11.1

Deleting a Template File 639

NetScaler Gateway Applications 639
  How an NetScaler Gateway Application Works .................................. 640
  How a NetScaler Configuration for a File Share Works .......................... 640
  How a NetScaler Configuration for an Intranet Subnet Works .................. 641
  How the Other Resources Category Works ......................................... 641
  Entity Naming Conventions ............................................................. 641

Adding Intranet Subnets 641

Adding Other Resources 642

Configuring Authorization Policies 643

Configuring Traffic Policies 643

Configuring Clientless Access Policies 644

Configuring TCP Compression Policies 645

Configuring Bookmarks 646

AppQoE 646

Enabling AppQoE 647
  To enable AppQoE by using the command line ..................................... 648
  To enable AppQoE by using the GUI ................................................. 648

AppQoE actions 648
  To configure an AppQoE action by using the command line ...................... 648
  To modify an existing AppQoE action by using the command line .............. 650
  To remove an AppQoE action by using the command line ........................ 650
  Parameters for configuring an AppQoE action .................................... 650
  To configure an AppQoE action by using the GUI .................................. 652

AppQoE parameters 653
  To configure the AppQoE parameter settings by using the command line ...... 653
  Parameters for configuring the AppQoE parameters ................................ 653
  To configure the AppQoE parameter settings by using the GUI ................. 654

AppQoE Policies 654
  To configure an AppQoE policy by using the command line ...................... 654
  Parameters for configuring an AppQoE policy ...................................... 655
To configure an AppQoE policy by using the GUI ................................. 655

Entity templates ................................................................. 657

Configuring an entity template ............................................. 658

Configuring variables in load balancing virtual server templates 658
To configure variables in a load balancing virtual server template .......... 659

Modifying an entity template .................................................... 660
To modify an entity template by using the AppExpert feature node ........ 660
To modify an entity template by using its corresponding feature node .... 661

Deleting an entity template ......................................................... 661
To delete an entity template by using the AppExpert feature node ........ 661
To delete an entity template by using its corresponding feature node .... 661

Creating an entity from a template ............................................ 662
To create an entity from a template by using the AppExpert feature node 662
To create an entity from a template by using its corresponding feature node 662
To create a load balancing virtual server by using a load balancing virtual server template 663

Managing entity template folders ............................................ 663
To organize load balancing virtual server template folders ................. 663

Uploading and downloading entity templates ................................ 664
To upload an entity template to the NetScaler appliance .................... 664
To download an entity template from the NetScaler appliance ............. 664

Understanding load balancing entity templates and deployment files .... 664
Example of a load balancing virtual server template ......................... 665
Example of a deployment file .................................................. 666

HTTP callouts ................................................................. 667

How an HTTP callout works ................................................... 668

Notes on the format of HTTP requests and responses ......................... 669
Format of an HTTP request .................................................. 669
Format of an HTTP Response ................................................ 670

Configuring an HTTP callout ........................................................ 670
To configure an HTTP callout by using the command line interface ....... 672
To configure an HTTP callout by using the GUI ............................ 673
Verifying the Configuration 673
To view the hits counter for an HTTP callout 674

Invoking an HTTP Callout 674

Avoiding HTTP callout recursion 677

Caching HTTP Callout Responses 678
To set the cache duration by using the command line interface 678
To set the cache duration by using the GUI 679

Use Case: Filtering Clients by Using an IP Blacklist 679
Enabling Responder 679
Creating an HTTP Callout on the NetScaler Appliance 680
Configuring a Responder Policy and Binding it Globally 680
Creating an HTTP Callout Agent on the Remote Server 680

Use Case: ESI Support for Fetching and Updating Content Dynamically 681
Enabling Rewrite 682
Creating an HTTP Callout on the NetScaler Appliance 682
Configuring the rewrite action 682
Creating the rewrite policy and binding it globally 683

Use Case: Access control and authentication 684
Enabling responder 685
Creating an HTTP Callout on the NetScaler Appliance 685
Creating a Responder policy to analyze the response 685
Creating an HTTP Callout agent on the remote server 686

Use Case: OWA-Based Spam Filtering 687
Enabling Responder 687
Creating an HTTP Callout on the NetScaler Appliance 687
Creating a Responder Action 688
Creating a Responder Policy to Invoke the HTTP Callout 688
Creating an HTTP Callout Agent on the Remote Server 689

Use Case: Dynamic Content Switching 690

Pattern sets and data sets 691

How string matching works with pattern sets and data sets 692
Configuring a Pattern Set 692
To configure a pattern set by using the command line interface 693
To configure a pattern set by using the configuration utility 694

Configuring a data set 694
To configure a data set by using the command line interface 694
To configure a data set by using the configuration utility 695

Using pattern sets and data sets 695

Sample usage 696

Variables 697
Variables Scope 697

Configuring and using Variables 698
To configure variables by using the command line interface 698
Use Case to insert HTTP header in the response side 700
To configure variables by using the GUI 700

Use Case: Caching User Privileges 701
To achieve this use case, perform the following operations 701

Use Case: Limiting the Number of Sessions 702

Policies and expressions 703

Introduction to policies and expressions 705

Classic and advanced policies 706
Benefits of using advanced policies 706
Basic components of an advanced policy 707
How different NetScaler features use policies 708
About actions and profiles 711
About policy bindings 713
About evaluation order of policies 714
Order of evaluation based on traffic flow 715

Classic and advanced policy expressions 715
About classic expressions 716
About advanced policy expressions 716
Converting policy expressions using NSPEPI tool

- About the conversion process .............................................................................. 718
- Convert expressions ................................................................................................. 719
- Convert a NetScaler configuration file ..................................................................... 720
- Conversion warnings ............................................................................................... 720

Before you proceed .................................................................................................... 721

Configure advanced policy infrastructure .................................................................. 721

Rules for names in identifiers used in policies .............................................................. 722

Create or modify a policy ............................................................................................ 723
- Create a policy by using the CLI .............................................................................. 723
- Create or modify a policy by using the GUI ............................................................... 724

Policy configuration examples ..................................................................................... 725

Bind policies using advanced policy ............................................................................ 725
- Feature-specific differences in policy bindings ......................................................... 726
- Bind points and order of evaluation ......................................................................... 729
- Policy evaluation across features ............................................................................ 730
- Entries in a policy bank ............................................................................................. 730
- Evaluation order within a policy bank ....................................................................... 731
- How policy evaluation ends ..................................................................................... 733
- How features use actions after policy evaluation ...................................................... 734

Bind a policy globally .................................................................................................... 734
- Bind an integrated caching policy globally by using the CLI ..................................... 734
- Bind a rewrite policy globally by using the CLI ......................................................... 735
- Bind a compression policy globally by using the CLI ............................................... 735
- Bind a responder policy globally by using the CLI .................................................... 736
- Bind a DNS policy globally by using the CLI ............................................................ 736
- Bind an integrated caching, responder, rewrite, or compression policy globally by using the
  GUI ................................................................................................................................ 737
- Bind a DNS policy globally by using the GUI ............................................................ 737

Bind a policy to a virtual server ..................................................................................... 737
- Bind a policy to a load balancing or content switching virtual server by using the CLI . 738
- Bind a policy to an SSL offload virtual server by using the CLI ................................. 739
- Bind a policy to a virtual server by using the GUI ..................................................... 739
Display policy bindings 739
Display policy bindings by using the CLI .................................................. 739
Display global policy bindings for integrated caching, rewrite, or responder by using the GUI 740
Display global policy bindings for DNS or clientless access in the NetScaler Gateway by using the GUI ................................................................. 740
Display global policy bindings for content switching by using the GUI .............. 740

Unbind a policy 740
Unbind an integrated caching, rewrite, or compression advanced policy globally by using the CLI .............................................................. 741
Unbind a responder policy globally by using the CLI .................................... 741
Unbind a DNS policy globally by using the CLI ........................................... 742
Unbind an advanced policy from a virtual server by using the CLI .................. 742
Unbind an integrated caching, responder, rewrite, or compression Advanced policy globally by using the GUI ......................................................... 743
Unbind a DNS policy globally by using the GUI ........................................... 743
Unbind an advanced policy from a load balancing or content switching virtual server by using the GUI ................................................................. 743

Create policy labels 744
Create a caching policy label by using the CLI ............................................ 744
Create a content switching policy label by using the CLI ............................ 745
Create a rewrite policy label by using the CLI ........................................... 745
Create a responder policy label by using the CLI ....................................... 746
Create a policy label by using the GUI ....................................................... 746
Bind a policy to a policy label ...................................................................... 747

Configure a policy label or virtual server policy bank 747
Configure a policy label .................................................................................. 748
Configure a policy bank for a virtual server ................................................ 752

Invoke or remove a policy label or virtual server policy bank 754
Invoke a rewrite or integrated caching policy label by using the CLI ............... 754
Invoke a responder policy label by using the CLI ....................................... 755
Invoke a virtual server policy bank by using the CLI .................................. 755
Remove a rewrite or integrated caching policy label by using the CLI .......... 756
Remove a responder policy label by using the CLI .................................... 757
Remove a virtual server policy label by using the CLI ................................. 757
Invoke a policy label or virtual server policy bank by using the GUI ............ 758
Remove a policy label invocation by using the GUI ..................................... 759
## Configure and bind policies with the policy manager

Configure policy bindings by using the policy manager .................................................. 760
Remove unused policies by using the policy manager ..................................................... 761

## Configuring advanced policy expression: getting started

### Basic elements of an advanced policy expression

Prefixes .......................................................................................................................... 763
Single-element expressions ......................................................................................... 765
Operations ...................................................................................................................... 765
Basic operations on expression prefixes ...................................................................... 766

### Compound advanced policy expressions

Booleans in compound expressions ............................................................................ 768
Parentheses in compound expressions ......................................................................... 768
Compound operations for strings .................................................................................. 769
Compound operations for numbers ................................................................................ 772

### Specify the character set in expressions

Compound expressions with different character sets ..................................................... 781
Specify the character set based on the character set of traffic ..................................... 782
Character and string literals in expressions ................................................................... 782
Values in hexadecimal and octal formats ....................................................................... 782
Functions that return UTF-8 strings .............................................................................. 783
Terminal connection settings for UTF-8 ....................................................................... 783

### Classic expressions in advanced policy expressions

### Configure advanced policy expressions in a policy

Configure an Advanced policy syntax rule by using the CLI ......................................... 785
Configure a default syntax policy expression by using the GUI ..................................... 786
Test a default syntax expression by using the GUI ......................................................... 787

### Configure named advanced policy expressions

Example 1: Simple Named Expression as a Prefix ......................................................... 788
Example 2: Compound named expression as a prefix .................................................... 788
Configure a named default syntax expression by using the CLI ..................................... 789
Configure a named expression by using the GUI ............................................................ 789

### Configure advanced policy expressions outside the context of a policy

Configure an advanced policy expression outside a policy by using the CLI (cache selector example) ................................................................. 790

© 1999-2018 Citrix Systems, Inc. All rights reserved.
Advanced policy expressions: evaluating text  

About text expressions  
  About operations on text  
  Compounding and precedence in text expressions  
  Categories of text expressions  
  Guidelines for text expressions  

Expression prefixes for text in HTTP requests and responses  

Expression prefixes for VPNs and clientless VPNs  

Basic operations on text  
  String comparison functions  
  Calculate the length of a string  
  Consider, ignore, and change text case  
  Strip specific characters from a string  
  Append a string to another string  

Complex operations on text  
  Operations on the length of a string  
  Operations on a portion of a string  
  Operations for comparing the alphanumeric order of two strings  
  Extract an integer from a string of bytes that represent text  
  Convert text to a hash value  
  Encode and decode text by applying the Base64 encoding algorithm  
  Refine the search in a rewrite action by using the EXTEND function  
  Convert text to hexadecimal format  
  Encrypt and decrypt text  
  Configure encryption key for third-party encryption  
  Configure HMAC keys  
  Show an HMAC key by using the CLI  

Advanced policy expressions: working with dates, times, and numbers  

Format of dates and times in an expression  

Expressions for the NetScaler system time  

Expressions for SSL certificate dates  

Expressions for HTTP request and response dates  

© 1999-2018 Citrix Systems, Inc. All rights reserved.
Generate the day of the week, as a string, in short and long formats 837
Expression prefixes for numeric data other than date and time 838
Converting numbers to text 839
Virtual server based expressions 840
Advanced policy expressions: Parsing HTTP, TCP, and UDP data 841
About evaluating HTTP and TCP payload 842
Expressions for identifying the protocol in an incoming IP packet 843
Arguments to the PROTOCOL function 844
Use case scenarios 844
Expressions for HTTP and cache-control headers 845
Prefixes for HTTP headers 845
Operations for HTTP headers 861
Prefixes for cache-control headers 862
Operations for cache-control headers 862
Expressions for extracting segments of URLs 865
Expressions for HTTP status codes and numeric HTTP payload data other than dates 866
SIP expressions 867
SIP reference tables 868
Operations for HTTP, HTML, and XML encoding and “safe” characters 879
Expressions for TCP, UDP, and VLAN data 881
Expressions for evaluating a DNS message and identifying its carrier protocol 886
XPath and HTML, XML, or JSON expressions 888
Encrypt and decrypt XML payloads 891
Use the XML_ENCRYPT() and XML_DECRYPT() functions in expressions 892
Advanced policy expressions: parsing SSL 894
Parse SSL certificates 894
Prefixes for text-based SSL and certificate data 895
Prefixes for numeric data in SSL certificates 895
Expressions for SSL certificates 896
Advanced policy expressions: IP and MAC addresses, throughput, VLAN IDs 897
Expressions for IP Addresses and IP Subnets 898
Expressions for MAC addresses 903
Expressions for Numeric Client and Server Data 904

Advanced policy expressions: stream analytics functions 905

Advanced policy expressions: DataStream 906
Expressions for the MySQL protocol 906
Expressions for evaluating Microsoft SQL server connections 914

Typecasting data 918

Regular Expressions 919

Basic characteristics of regular expressions 920

Operations for regular expressions 920

Configuring classic policies and expressions 922

Configure a classic policy 923
Create a classic policy by using the CLI 923
Create a policy with classic expressions by using the GUI 924

Configure a classic expression 925
Create a classic policy expression by using the CLI 925
Add an expression for a classic policy by using the GUI 926

Bind a classic policy 928
Bind a classic policy globally by using the CLI 928
Bind a classic policy to a virtual server by using the CLI 929
Bind a classic policy globally by using the GUI 930
Bind a classic policy to a virtual server by using the GUI 930

View classic policies 931
View a classic policy and its binding information by using the CLI 931
View classic policies and policy bindings by using the GUI 932

Create named classic expressions 932
Create a named classic expression by using the CLI 932
Create a named classic expression by using the GUI 933

Expressions reference-advanced policy expressions 934

Q: What is the recommended workflow for App Firewall deployment? .......................... 1089

Introduction .................................................................................................................. 1091

Web application security ............................................................................................ 1092
   Known web attacks ......................................................................................... 1093
   Unknown web attacks ..................................................................................... 1094

How App Firewall works ......................................................................................... 1096
   App Firewall features ...................................................................................... 1097

The App Firewall configuration interfaces ............................................................... 1098

Configuring the App Firewall ................................................................................. 1098
   The App Firewall wizard .............................................................................. 1099
   NetScaler app interface appExpert template ................................................. 1100
   The NetScaler GUI ...................................................................................... 1101
   The NetScaler command line interface .......................................................... 1101

Enabling App Firewall ............................................................................................. 1102
   To enable the App Firewall by using the command line interface ................. 1102
   To enable the App Firewall by using the GUI ................................................. 1102

The App Firewall wizard ......................................................................................... 1103
   Opening the Wizard ....................................................................................... 1103
   The Wizard screens ....................................................................................... 1103
   Create a New Configuration ........................................................................... 1107
   Modify an Existing Configuration ................................................................... 1107
   Create a New Configuration without Signatures .......................................... 1108
   Configure a Custom Policy Expression ......................................................... 1108

Manual configuration ............................................................................................... 1109
   Replicating configuration ............................................................................... 1109

Manual configuration by using the GUI ................................................................. 1110
   To create and configure a signatures object .................................................... 1110
   To create an App Firewall profile by using the GUI ..................................... 1111
   To configure an App Firewall profile by using the GUI ............................... 1111
   Configuring an App Firewall rule or relaxation ............................................ 1113
   To configure the Learning feature by using the GUI .................................... 1115
   To create and configure a policy by using the GUI ........................................ 1116
   To create or configure an App Firewall rule (expression) ............................ 1117
To add a firewall rule (expression) by using the Add Expression dialog box ...................................................... 1119
To bind an App Firewall policy by using the GUI ................................................................................................. 1120

**Manual configuration By using the command line interface** ................................................................. 1121
To create a profile by using the command line interface ....................................................................................... 1122
To configure a profile by using the command line interface ................................................................................... 1122
To create and configure a policy ......................................................................................................................... 1123
To bind an App Firewall policy ........................................................................................................................... 1123
To configure session limit per PE ......................................................................................................................... 1124

**Signatures** .................................................................................................................................................. 1124
Protection options for your application .................................................................................................................. 1125
Getting started .................................................................................................................................................. 1126
Highlights ......................................................................................................................................................... 1127

**Manually configuring the signatures feature** ........................................................................................................ 1128

**Adding or removing a signatures object** ........................................................................................................ 1128
To create a signatures object from a template ....................................................................................................... 1128
To create a signatures object by importing a file ................................................................................................... 1129
To create a signatures object by importing a file by using the command line ....................................................... 1129
To remove a signatures object by using the GUI ................................................................................................... 1130
To remove a signatures object by using the command line .................................................................................. 1130

**Configuring or modifying a signatures object** ................................................................................................ 1130
To configure or modify a signatures object ........................................................................................................... 1130

**Protecting JSON applications using signatures** ............................................................................................ 1133
Using the NetScaler App Firewall signatures to protect JSON applications ...................................................... 1134
To add or remove JSON content-type by using the command line interface ...................................................... 1134
To managing JSON content types by using the GUI ............................................................................................ 1135
Configuring signature protection to detect attacks in JSON payload ................................................................. 1135
Example of a signature to detect XSS in JSON payload ......................................................................................... 1135
Example of the payload ....................................................................................................................................... 1136
Example of the log message ................................................................................................................................. 1137
Highlights .......................................................................................................................................................... 1137

**Updating a signatures object** .......................................................................................................................... 1137
To update the App Firewall signatures from the source by using the command line ....................................... 1138
Updating a signatures object from a Citrix format file ......................................................................................... 1139
Updating a signatures object from a supported vulnerability scanning tool ..................................................... 1139
Cookie consistency check

App Firewall support for Google web toolkit

What is GWT

How a GWT request works

App Firewall protection for GWT applications

Data leak prevention checks

Credit card check

Using the command line to configure the credit card check

Using the GUI to configure the credit card check

Using the learn feature with the credit card check

Using the log feature with the credit card check

Statistics for the credit card violations

Highlights

Safe object check

Advanced form protection checks

Field formats check

Using the command line to configure the field format check

Using the GUI to Configure the field formats security check

Using the learn feature with the Field Formats Check

Using the log feature with the field formats check

Statistics for the field formats violations

Deployment tip

Highlights

Form field consistency check

CSRF form tagging check

Managing CSRF form tagging check relaxations

To configure a CSRF form tagging check relaxation by using the GUI

URL protection checks

Start URL check
### Policy labels
- To create an App Firewall policy label by using the command line: 1282
- To bind a policy to a policy label by using the command line: 1283
- To configure an App Firewall policy label by using the GUI: 1283

### Policies
1284

### App Firewall Policies
1285

#### Creating and configuring App Firewall policies
- To create and configure a policy by using the command line interface: 1286
- To create and configure a policy by using the GUI: 1287
- To create or configure an App Firewall rule: 1288
- To add a firewall rule (expression) by using the Add Expression dialog box: 1290

#### Binding App Firewall policies
- To bind an App Firewall policy by using the command line interface: 1291
- To bind an App Firewall policy by using the GUI: 1292

#### Viewing a policy bindings
- To view bindings for an App Firewall policy: 1293

### Supplemental information about App Firewall policies
1294

- Correct but unexpected behavior: 1294

### Auditing policies
1294

- To create an auditing server by using the command line interface: 1294
- To modify or remove an auditing server by using the command line interface: 1295
- To create or configure an auditing server by using the GUI: 1295
- To create an auditing policy by using the command line interface: 1296
- To configure an auditing policy by using the command line interface: 1296
- To configure an auditing policy by using the GUI: 1297

### Imports
1297

- HTML error object: 1297
- XML error object: 1299
- XML Schema: 1300
- WSDL: 1300

### Importing and exporting files
1300

- To import a file by using the command line interface: 1300
- To import a file by using the GUI: 1301
To export a file by using the GUI .............................................. 1302
To edit an HTML or XML Error Object in the GUI ......................... 1302

Global configuration 1302

Engine settings 1303
To configure engine settings by using the command line interface ........ 1305
To configure engine settings by using the GUI .......................... 1305

Confidential fields 1306
To add a confidential field by using the command line interface ........ 1307
To modify a confidential field by using the command line interface ........ 1307
To remove a confidential field by using the command line interface ........ 1308
To configure a confidential field by using the GUI ...................... 1308

Field types 1310
To add a field type by using the command line interface .................. 1310
To modify a field type by using the command line interface .............. 1311
To remove a field type by using the command line interface .............. 1311
To configure a field type by using the GUI .................................. 1312

XML content types 1312
To add an XML content type pattern by using the command line interface ........ 1313
To remove an XML content type pattern by using the command line interface ........ 1313
To configure the XML content type list by using the GUI ................. 1313

JSON content types 1314
To add a JSON content type pattern by using the command line interface ........ 1314
To configure the JSON content type list by using the GUI .................. 1315

Statistics and reports 1315
The App Firewall statistics .................................................. 1315
The App Firewall reports .................................................. 1316

App Firewall logs 1318
NetScaler (Native) format logs ............................................... 1318
Common Event Format (CEF) Logs ....................................... 1319
Logging geolocation in the App Firewall violation messages ............. 1321
Using the command line to configure the log action and other log parameters .... 1322
Configuring Syslog policy to segregate App Firewall logs .................. 1324
Viewing the App Firewall Logs .......................................... 1325
Highlights ..................................................................... 1327

Bind/unbind a service to/from a load balancing virtual server 1371
Bind a service to a load balancing virtual server by using the CLI .......................... 1371
Unbind a service from a load balancing virtual server by using the CLI .................. 1372
Bind/unbind a service from a load balancing virtual server by using the CLI ........ 1372

Disable the use the proxy port setting for transparent caching 1372

Assign a port range to the NetScaler appliance 1373
Assign a source port range to a NetScaler appliance by using the CLI .................... 1373
Assign a source port range to a NetScaler appliance by using the appliance GUI .......... 1373

Enable load balancing virtual servers to redirect requests to cache 1373
Enable load balancing virtual servers to redirect requests to the cache by using the CLI .. 1374
Turn off caching for a load balancing virtual server by using the CLI ....................... 1375
Enable or disable load balancing virtual servers to redirect requests to the cache by using
the GUI ......................................................... 1375

Configure forward proxy redirection 1375

Create a DNS service 1376
Create a DNS service by using the CLI ................................................................. 1376
Add a DNS service by using the GUI ................................................................. 1377

Create a DNS load balancing virtual server 1378
Create a DNS load balancing virtual server by using the CLI ................................. 1378
Create a DNS load balancing virtual server by using the GUI ................................. 1378

Bind the DNS service to the virtual server 1379
Bind the DNS service to the load balancing virtual server by using the CLI ............... 1379
Unbind a DNS service from the load balancing virtual server by using the CLI .......... 1379
Bind/Unbind a DNS service to/from a load balancing virtual server by using the GUI . . 1380

Configure a client web browser to use a forward proxy 1380

Configure reverse proxy redirection 1380
Configure mapping policies ..................................................................................... 1381

Selective cache redirection 1384

Enable content switching 1385
Enable content switching by using the CLI ............................................................ 1385
Enable cache redirection and load balancing by using the GUI ............................ 1386
Configure a load balancing virtual server for the cache

Configure a cache redirection policy for a specific type of content ........................................ 1387

Configure policies for content switching

Create a content switching policy by using the command CLI ............................................. 1388
Create a URL-based content switching policy by using the GUI .......................................... 1388
Create a rule-based content switching policy by using the GUI .......................................... 1389
Bind the content switching policy to a cache redirection virtual server by using the CLI .... 1389
Bind the content switching policy to a cache redirection virtual server by using the GUI .... 1390

Configure precedence for policy evaluation

Configure precedence for policy evaluation by using the CLI ............................................. 1391
Configure precedence for policy evaluation by using the GUI .......................................... 1392

Administer a cache redirection virtual server

View cache redirection virtual server statistics

View statistics for a cache redirection virtual server by using the CLI ................................ 1392
View statistics for a cache redirection virtual server by using the GUI ................................ 1393
View the statistics of a cache redirection virtual server by using the monitoring and dashboard utilities .......................................................... 1393

Enable or disable a cache redirection virtual server

Enable or disable a cache redirection virtual server by using the CLI ................................ 1394
Enable or disable a cache redirection virtual server by using the GUI ................................ 1395

Direct policy hits to the cache instead of the origin

Change the destination for a policy hit to the origin or the cache by using the CLI ........ 1396
Change the destination for a policy hit to the origin or the cache by using the GUI ........ 1396

Back up a cache redirection virtual server

Specify a backup cache redirection virtual server by using the CLI ................................ 1397
Specify a backup cache redirection virtual server by using the GUI ................................ 1397

Manage client connections for a virtual server

Configure client timeout ........................................................................................................ 1398
Insert Via headers in the requests ...................................................................................... 1399
Reuse TCP connections ..................................................................................................... 1401
Configure delayed connection cleanup ............................................................................ 1402

N-Tier cache redirection

How N-tier cache redirection is implemented ................................................................. 1403
Setup necessary for configuring N-Tier CRD .................................................. 1404
How N-tier cache redirection works during a cache hit ....................................... 1405
How N-tier cache redirection works during a cache bypass ............................... 1405
How N-tier cache redirection works during a cache miss .................................. 1406

**Configure the upper-tier NetScaler appliances** .................................................. 1407
Configure an upper-tier appliance for n-tier cache redirection by using the command CLI ... 1407
Configure an upper-tier appliance for n-tier cache redirection by using the GUI ........ 1407

**Configure the lower-tier NetScaler appliances** .................................................. 1408
Configure a lower-tier appliance for n-tier cache redirection by using the CLI ........ 1408
Configure a lower-tier appliance for n-tier cache redirection by using the GUI ........ 1409

**Clustering** .......................................................................................... 1410

**NetScaler appliance configuration support in a cluster** ................................... 1410
NetScaler appliance configurations supported from NetScaler 10 onwards ............ 1416

**Prerequisites for cluster nodes** .................................................................... 1417

**Cluster overview** ................................................................................... 1418

**Synchronization across cluster nodes** ......................................................... 1418

**Striped, partially striped, and spotted configurations** ...................................... 1420

**Communication in a cluster setup** ................................................................. 1421

**Traffic distribution in a cluster setup** ............................................................. 1422

**Cluster nodegroups** .................................................................................... 1423

**Cluster and node states** ............................................................................... 1423

**Routing in a cluster** .................................................................................... 1424

**Setting up a NetScaler cluster** ....................................................................... 1425

**Setting up inter-node communication** ............................................................ 1426
To set up the cluster backplane, do the following for every node ......................... 1426

**Creating a NetScaler cluster** ......................................................................... 1427
To create a cluster by using the command line interface .................................... 1428
To create a cluster by using the configuration utility ........................................... 1430

Adding a node to the cluster

To add a node to the cluster by using the command line interface ........................................ 1430
To add a node to the cluster by using the configuration utility ............................................. 1431
To join a previously added node to the cluster by using the configuration utility ..................... 1432

Viewing the details of a cluster

To view details of a cluster instance by using the command line interface ............................ 1433
To view details of a cluster node by using the command line interface .................................. 1433
To view details of a cluster instance by using the configuration utility .................................. 1433
To view details of a cluster node by using the configuration utility ....................................... 1434

Distributing traffic across cluster nodes

Using Equal Cost Multiple Path (ECMP)

To configure ECMP on the cluster by using the command line interface ............................ 1434

Use Case: ECMP with BGP routing

Using cluster link aggregation

Static cluster link aggregation

To configure a static cluster LA channel by using the command line interface .................... 1435

Dynamic cluster link aggregation

To configure a dynamic cluster LA channel by using the command line interface .............. 1436

Link redundancy in a cluster with LACP

Managing the NetScaler cluster

Configuring linksets

To configure a linkset by using the command line interface ............................................. 1437
To configure a linkset by using the configuration utility ................................................... 1437

Nodegroups for spotted and partially-striped configurations

Behavior of nodegroups

General behavior of a cluster nodegroup ................................................................................. 1438
Backing up nodes in a nodegroup ......................................................................................... 1439

Configuring nodegroups for spotted and partially-striped configurations

To configure a nodegroup by using the command line interface ....................................... 1439
To configure a nodegroup by using the configuration utility ............................................. 1440
## Configuring redundancy for nodegroups

Configuring redundancy for nodegroups .......................................................... 1451

## Disabling steering on the cluster backplane

Disabling steering on the cluster backplane ...................................................... 1452

## Synchronizing cluster configurations

Synchronizing cluster configurations .............................................................. 1453
To synchronize cluster configurations by using the command line interface ...... 1453
To synchronize cluster configurations by using the configuration utility ......... 1453

## Synchronizing time across cluster nodes

Synchronizing time across cluster nodes ......................................................... 1453
To enable/disable PTP by using the command line interface ......................... 1454
To enable/disable PTP by using the configuration utility ............................... 1454

## Synchronizing cluster files

Synchronizing cluster files .............................................................................. 1454
To synchronize cluster files by using the command line interface .............. 1455
To synchronize cluster files by using the configuration utility .................... 1455

## Viewing the statistics of a cluster

Viewing the statistics of a cluster ..................................................................... 1455
To view the statistics of a cluster instance by using the command line interface . 1456
To view the statistics of a cluster instance by using the configuration utility .... 1456
To view the statistics of a cluster node by using the configuration utility ....... 1456

## Discovering NetScaler appliances

Discovering NetScaler appliances .................................................................... 1456
To discover appliances by using the configuration utility .............................. 1457

## Disabling a cluster node

Disabling a cluster node .................................................................................. 1457
To disable a cluster node by using the command line interface ................... 1458
To disable a cluster node by using the configuration utility ........................... 1458

## Removing a cluster node

Removing a cluster node .................................................................................. 1458
To remove a cluster node by using the command line interface .................... 1459
To remove a cluster node by using the configuration utility ........................... 1459

## Removing a node from a cluster deployed using cluster link aggregation

Removing a node from a cluster deployed using cluster link aggregation ........ 1460
To remove a node from a cluster that uses cluster link aggregation as the traffic distribution mechanism .................................................. 1460

## Monitoring cluster setup using SNMP MIB with SNMP link

Monitoring cluster setup using SNMP MIB with SNMP link ......................... 1460
Configuring SNMP MIB on CLIP ................................................................. 1461

## Cluster setup and usage scenarios

Cluster setup and usage scenarios .................................................................... 1462
Creating a two-node cluster 1462

Migrating an HA setup to a cluster setup 1462
To convert a HA setup to cluster setup (without any downtime) by using the command line interface .................................................. 1463

Transitioning between a L2 and L3 Cluster 1466
Transitioning a cluster from L2 to L3 ........................................... 1466
Transitioning a cluster from L3 to L2 ........................................... 1467

Setting up GSLB in a cluster 1467

Using cache redirection in a cluster 1469

Using L2 mode in a cluster setup 1469

Using cluster LA channel with linksets 1470
To configure cluster LA channel and linksets by using the NetScaler appliance command line 1470

Backplane on LA channel 1470
To deploy a cluster with the backplane interfaces as LA channels .................................................. 1471

Common interfaces for client and server and dedicated interfaces for backplane 1471

Common switch for client, server, and backplane 1473

Common switch for client and server and dedicated switch for backplane 1475

Different switch for every node 1477

Sample cluster configurations 1477

Upgrading or downgrading the NetScaler cluster 1480
Points to note before upgrading or downgrading the cluster .................................................. 1481
To upgrade or downgrade the software of the cluster nodes .................................................. 1482

Operations supported on individual cluster nodes 1482

FAQs 1484

Troubleshooting the NetScaler cluster 1491

Tracing the packets of a NetScaler cluster 1491
To trace packets of a standalone appliance .................................................. 1492
To trace packets of a cluster .................................................. 1492
NetScaler 11.1

Merge multiple trace files ........................................ 1492
Examples ......................................................... 1493
Capturing SSL Session Keys During a Trace ....................... 1493

Troubleshooting common issues ................................. 1495

Configuring basic content switching ...................... 1498

Enabling content switching ................................... 1499
To enable content switching by using the command line interface .......... 1499
To enable content switching by using the configuration utility .......... 1500

Creating content switching virtual servers .................. 1500
To create a virtual server by using the command line interface .......... 1500
To add a content switching virtual server by using the configuration utility .......... 1500

Configuring a load balancing setup for content switching ............ 1501

Configuring a content switching action ....................... 1501
Configuring an Action that Specifies the Name of the Target Load Balancing Virtual Server .. 1502
Configuring an Action that Specifies an Expression for Selecting the Target at Run Time ... 1503

Configuring content switching policies ..................... 1504
To create a content switching policy by using the command line interface .......... 1505
To rename a content switching policy by using the command line interface .......... 1506
To rename a content switching policy by using the configuration utility .......... 1506
To create a content switching policy by using the configuration utility .......... 1506

Configuring content switching policy labels .................. 1506
To create a content switching policy label by using the command line interface .......... 1507
To rename a content switching policy label by using the command line interface .......... 1507
To rename a content switching policy label by using the configuration utility .......... 1507
To bind a policy to a content switching policy label by using the command line interface .......... 1508
To unbind a policy from a policy label by using the command line interface .......... 1508
To remove a policy label by using the command line interface .......... 1509
To manage a content switching policy label by using the configuration utility .......... 1509

Binding policies to a content switching virtual server ............ 1509
To bind a policy to a content switching virtual server and select a target load balancing virtual server by using the command line interface .......... 1509
To bind a policy to a content switching virtual server and select a target load balancing virtual server by using the configuration utility .......... 1510

© 1999-2018 Citrix Systems, Inc. All rights reserved. 58
Configuring policy based logging for content switching 1510
To configure policy based logging for a content switching policy by using the command line interface ........................................ 1511
To configure policy based logging for a content switching policy by using the configuration utility ........................................ 1511

Verifying the configuration 1512
Viewing the Properties of Content Switching Virtual Servers ........................................ 1512
Viewing Content Switching Policies ........................................................................... 1514
Viewing a Content Switching Virtual Server Configuration by Using the Visualizer .......... 1515

Customizing the basic content switching configuration 1516
Configuring case sensitivity for policy evaluation ....................................................... 1517
Setting the precedence for policy evaluation ............................................................ 1517
Support for multiple ports for HTTP and SSL type content switching virtual servers ...... 1519
Configuring per-VLAN Wildcarded virtual servers ................................................. 1520
Configuring the Microsoft SQL server version setting .............................................. 1521

Content switching for diameter protocol 1521
Sample Configuration .............................................................................................. 1522

Protecting the content switching setup against failure 1523
Configuring a Backup Virtual Server ........................................................................ 1523
Diverting Excess Traffic to a Backup Virtual Server .............................................. 1524
Configuring a Redirection URL ............................................................................. 1525
Configuring the State Update Option ..................................................................... 1526
Flushing the Surge Queue ...................................................................................... 1527

Managing a content switching setup 1529
Unbinding Policies from the Content Switching Virtual Server ............................... 1529
Removing Content Switching Virtual Servers ....................................................... 1530
Disabling and Re-Enabling Content Switching Virtual Servers ............................ 1530
Renaming Content Switching Virtual Servers ....................................................... 1531
Managing Content Switching Policies .................................................................... 1531

Managing client connections 1532
Redirecting Client Requests to a Cache .................................................................... 1533
Enabling Delayed Cleanup of Virtual Server Connections ..................................... 1534
Rewriting Ports and Protocols for Redirection ...................................................... 1534
Inserting the IP Address and Port of a Virtual Server in the Request Header .......... 1535
Setting a Time-out Value for Idle Client Connections ............................................ 1536

Identifying Connections with the 4-tuple and Layer 2 Connection Parameters ........................................ 1536

Troubleshooting ........................................................................................................................................ 1537
Resources for Troubleshooting Content Switching ..................................................................................... 1537
Troubleshooting Content Switching Issues .................................................................................................. 1538

Configuring Database Users ......................................................................................................................... 1539
To add a database user by using the command line interface ....................................................................... 1539
To add a database user by using the configuration utility .............................................................................. 1540
To reset the password of a database user by using the command line interface ........................................ 1540
To reset the password of database users by using the configuration utility ............................................... 1540
To remove a database user by using the configuration utility ...................................................................... 1541

Configuring a Database Profile .................................................................................................................... 1541
To create a database profile by using the command line interface .............................................................. 1541
To create a database profile by using the configuration utility ..................................................................... 1541
To bind a database profile to a load balancing or content switching virtual server by using the command line interface ........................................................................................................................................ 1542
To bind a database profile to a load balancing or content switching virtual server by using the configuration utility ................................................................................................................................. 1542

Configuring Load Balancing for DataStream ............................................................................................. 1542
Parameter values specific to DataStream .................................................................................................... 1542

Configuring Content Switching for DataStream .......................................................................................... 1544
Parameter values specific to DataStream .................................................................................................... 1544

Configuring Monitors for DataStream ......................................................................................................... 1545

Use Case 1: Configuring DataStream for a Master/Slave Database Architecture ........................................ 1547
To configure DataStream for a master/slave database setup by using the command line interface ............ 1548

Use Case 2: Configuring the Token Method of Load Balancing for DataStream ........................................ 1549
To configure this example by using the command line interface ................................................................ 1550
To configure this example by using the configuration utility ..................................................................... 1550

Use Case 3: Logging MSSQL Transactions in Transparent Mode ................................................................. 1550
Summary of Configuration Tasks .................................................................................................................. 1551
Configuring Transparent Mode by Using a Wildcard Virtual Server ......................................................... 1551
Configuring Transparent Mode by Using MSSQL Services ..................................................................... 1553
Use Case 4: Database Specific Load Balancing

How Database Specific Load Balancing Works ........................................... 1554
Enabling Load Balancing .............................................................................. 1555
Configuring a Load Balancing Virtual Server for Database Specific Load Balancing ............................................. 1556
To configure a load balancing virtual server for database specific load balancing ............................................. 1556
Configuring Services .................................................................................... 1556
Configuring Database Users ......................................................................... 1556
Configuring a Monitor to Retrieve the Names of Active Databases ............... 1558
Availability Groups Deployment Support for MSSQL ................................. 1559
Configuration examples for MSSQL virtual server ..................................... 1562
Configuration examples for MySQL virtual server ..................................... 1563

Data Stream Reference

Supported Database Versions, Protocols, and Authentication Methods .......... 1564
Character Sets ............................................................................................... 1565
Transactions ................................................................................................. 1565
Special Queries ............................................................................................. 1565
Audit Log Message Support ......................................................................... 1566

Domain Name System

How DNS Works on the NetScaler ................................................................ 1567
Round Robin DNS ......................................................................................... 1569

Configure DNS resource records

Create SRV records for a service .................................................................. 1572
Add an SRV record by using the CLI .............................................................. 1572
Modify or remove an SRV record by using the CLI ...................................... 1573
Configure an SRV record by using the GUI .................................................. 1573

Creating AAAA Records for a Domain Name ............................................... 1573
Add an AAAA record by using the CLI ........................................................ 1573
Add an AAAA record by using the GUI ........................................................ 1574

Creating address records for a Domain Name ............................................. 1574
Add an Address record by using the CLI ....................................................... 1574
Add an Address record by using the GUI .................................................... 1575

Create MX records for a mail exchange server .......................................... 1575
Add an MX record by using the CLI .............................................................. 1575
Modify or remove an MX record by using the CLI ...................................... 1576
Add an MX record by using the GUI ............................................................ 1576

Changing the password of an RPC node ...................................................................... 1704
Encrypt the exchange of site metrics ............................................................................. 1705
Configure source IP address for an RPC node .............................................................. 1706

Customize your GSLB configuration .............................................................................. 1707
Modify maximum connections or maximum bandwidth for a GSLB service .......... 1707
Create CNAME-based GSLB services .......................................................................... 1708
Configure transition Out-Of-Service State (TROFS) in GSLB ...................................... 1710
Configure dynamic weights for services ...................................................................... 1710

Changing the GSLB methods ......................................................................................... 1711
Specifying a GSLB method other than static proximity or dynamic RTT ................. 1712

Configuring Static Proximity .......................................................................................... 1713
Add a location file to create a static proximity database .............................................. 1713
To add a static location file by using the CLI ............................................................... 1715
To add a static location file by using the GUI ............................................................... 1715
To view a static location file by using the GUI ............................................................. 1715
To convert a location file into the NetScaler format ..................................................... 1715

Add custom entries to a static proximity database ...................................................... 1716
To add custom entries by using the command line interface ........................................ 1716
Parameters for adding custom entries .......................................................................... 1716
To add custom entries by using the configuration utility ............................................. 1717

Set location qualifiers ..................................................................................................... 1717
To set the location qualifiers by using the command line interface ............................ 1718
To set the location qualifiers by using the configuration utility ...................................... 1718

Specify proximity method 1719
To specify static proximity by using the command line interface .................................. 1719
To specify static proximity by using the configuration utility ...................................... 1719

Synchronize GSLB static proximity database 1719

Configuring the Dynamic Method (RTT) 1720
Configure a GSLB virtual server for dynamic RTT ......................................................... 1721
Set the probing interval of local DNS servers ............................................................ 1722

Configure persistent connections 1722
Configure persistence based on source IP address ...................................................... 1723
Configure persistence based on HTTP cookies ......................................................... 1724

Override static proximity behavior by configuring preferred locations 1726
Example ....................................................................................................................... 1728

Monitoring GSLB Services 1729
Configure monitor trigger ............................................................................................ 1730
Add or remove monitors ............................................................................................. 1730
Bind monitors to a GSLB service .............................................................................. 1731

Monitoring GSLB Sites 1732
To configure monitor triggering by using the command line interface ......................... 1732
To configure monitor triggering by using the configuration utility .............................. 1732

Protecting the GSLB Setup Against Failure 1733
Configuring a Backup GSLB Virtual Server ............................................................... 1733
Configuring a GSLB Setup to Respond with Multiple IP Addresses ......................... 1734
Configuring a GSLB Virtual Server to Respond with an Empty Address Record When DOWN ........................................................................................................ 1735
Configuring a Backup IP Address for a GSLB Domain ........................................... 1735
Diverting Excess Traffic to a Backup Virtual Server .............................................. 1736

Managing Client Connections 1738
Enabling Delayed Cleanup of Virtual Server Connections ........................................ 1738
Managing Local DNS Traffic by Using DNS Policies .............................................. 1739
Adding DNS Views .................................................................................................... 1746

Configuring GSLB for Disaster Recovery 1747
Configuring GSLB for Disaster Recovery in an Active-Standby Data Center Setup .......... 1748
Configuring for Disaster Recovery in an Active-Active Data Center Setup .................. 1749
Configuring GSLB for Proximity 1752
  Configuring Dynamic Method (RTT) 1753
  Configuring Static Proximity 1753
  Configuring Static Proximity and Dynamic RTT 1754

Example of a Complete Parent-Child Configuration Using the Metrics Exchange Protocol 1754
  site1 1755
  site1_child1 1756
  site1_child2 1756
  site2 1757
  site2_child1 1758
  site2_child2 1758

Configuring GSLB Service Selection Using Content Switching 1759
  Sample Configuration 1760

Configuring Global Server Load Balancing for DNS Queries with NAPTR records 1761
  NAPTR Record Format 1762
  Configuration procedure 1763
  Sample configuration 1763

Using the EDNS0 Client Subnet Option for Global Server Load Balancing 1765
  Address validation 1766

Link load balancing 1768

Configuring a Basic LLB Setup 1768
  Configure services 1769
  Configure an LLB virtual server and bind a service 1770
  Configure the LLB method and persistence 1772
  Configure an LLB route 1773
  Create and bind a transparent monitor 1774

Configuring RNAT with LLB 1777
  To configure RNAT by using the command line interface 1777
  To add SNIPs for ISP routers by using the command line interface 1778
  To configure RNAT by using the configuration utility 1778
  To enable Use Subnet IP mode by using the command line interface 1779
To enable Use Subnet IP mode by using the configuration utility .......................... 1779

Configuring a Backup Route .......................... 1779
To set the secondary virtual server as the backup virtual server by using the command line interface .................................................. 1780
To set the secondary virtual server as the backup virtual server by using the configuration utility .................................................. 1781

Resilient LLB Deployment Scenario .................. 1781

Monitoring an LLB Setup .......................... 1781
Viewing the Statistics of a Virtual Server ................. 1782
Viewing the Statistics of a Service ..................... 1783

Load Balancing .......................... 1783

How load balancing works .......................... 1784
Load balancing basics .................................. 1784
Understanding the topology .......................... 1785
Use of wildcards instead of IP addresses and ports ............... 1786
Configuring global HTTP ports .......................... 1790

Set up basic load balancing .......................... 1792
Enabling Load Balancing .......................... 1792
Configuring a Server Object .......................... 1793
Configuring Services .................................. 1794
Creating a Service .................................. 1794
Creating a Virtual Server .......................... 1798
Binding Services to the Virtual Server .......................... 1799
Verifying the Configuration .......................... 1800

Load balance virtual server and service states ............... 1803

Support for load balancing profile .......................... 1804
To create an LB profile by using the CLI .................. 1805
To create an LB profile by using the GUI .................. 1806
To associate an LB profile with an LB virtual server by using the CLI .................. 1806
To associate an LB profile with an LB virtual server by using the GUI .................. 1807

Load balancing algorithms .......................... 1807
To set the startup round-robin factor by using the CLI .................. 1810
To set the startup round-robin factor by using the GUI .................. 1810

Configuring Virtual Servers ........................................ 1859
Configuring Services ............................................... 1860
Binding Virtual Servers to Services ............................... 1860
Configuring a Persistency Group for Radius ..................... 1860

View persistence sessions ........................................ 1861
To view a persistence session by using the command line interface . 1861
To view persistence sessions by using the configuration utility .... 1861

Clear persistence sessions ......................................... 1862
To clear a persistence session by using the command line interface . 1862
To clear persistence sessions by using the configuration utility . . 1863

Override persistence settings for overloaded services ........... 1863
To override persistence settings for overloaded services by using the command line interface 1864
To override persistence settings for overloaded services by using the configuration utility . . 1865

Troubleshooting ...................................................... 1865

Customize a load balancing configuration .......................... 1866

Customize the hash algorithm for persistence across virtual servers 1867
To change the use-port-number global setting by using the CLI .... 1868
To change the use-port-number global setting by using the GUI .... 1868
To create a new service and specify a hash identifier for a service by using the CLI ... 1868
To specify a hash identifier for an existing service by using the CLI ... 1869
To specify a hash identifier while adding a service group member ... 1869
To specify a hash identifier for a service by using the GUI ........... 1870
To specify a hash identifier for an already configured service group member by using the GUI 1870

Configure the redirection mode .................................... 1870
To configure the redirection mode by using the CLI ................ 1871
To configure the redirection mode by using the GUI ............... 1871

Configure per-VLAN wildcarded virtual servers ................. 1871
To configure a wildcarded virtual server that listens to a specific VLAN by using the CLI ... 1871
To configure a wildcarded virtual server that listens to a specific VLAN by using the GUI .. 1872

Assign weights to services ........................................ 1872
To configure a virtual server to assign weights to services by using the CLI ................. 1873
To configure a virtual server to assign weights to services by using the GUI ............... 1874
Configure the MySQL and Microsoft SQL server version setting 1874
To set the Microsoft SQL server version parameter by using the CLI .......................... 1874
To set the MySQL server version parameter by using the CLI ................................. 1875
To set the MySQL or Microsoft SQL server version parameter by using the GUI ........ 1875

Configure diameter load balancing 1875
How diameter load balancing works ................................................................. 1877
Load balancing diameter traffic ................................................................. 1877
Disconnect a session ................................................................................. 1877
Configure load balancing for diameter traffic ............................................. 1878

Configure FIX load balancing 1880
How FIX load balancing works ................................................................. 1881
Configure and monitor load balancing for FIX traffic ................................. 1881
To display FIX persistent sessions by using the command line interface ........ 1883
To configure FIX load balancing virtual server by using the GUI ................. 1884
To edit a FIX load balancing virtual server by using the GUI .................... 1884
To delete a FIX load balancing virtual server by using the GUI ............... 1884
To configure FIX Load Balancing Virtual Service by using the GUI ........... 1884
To display FIX load balancing server statistics ........................................ 1885
To display Persistent sessions for a FIX server by using the GUI .............. 1885
To clear Persistent sessions for a FIX server by using the GUI ................ 1885

Protect a load balancing configuration against failure 1885

Redirect client requests to an alternate URL 1886
To configure a virtual server to redirect the client request to a URL by using the CLI .................. 1886
To configure a virtual server to redirect the client request to a URL by using the GUI .................. 1886

Configure a backup load balancing virtual server 1887
To set a backup virtual server by using the CLI ........................................... 1887
To set a backup virtual server by using the GUI ........................................ 1888

Configure spillover 1888
Configure a predefined spillover method ................................................... 1889
Configure policy based spillover ............................................................... 1890

Connection failover 1895
How connection failover works on NetScaler appliances .......................... 1895
Supported setup ....................................................................................... 1896
Features affected by connection failover .................................................. 1897
Flush the surge queue 1899
To flush a surge queue by using the CLI 1900
To flush a surge queue by using the GUI 1900

Manage a load balancing setup 1901

Manage server objects 1901
To enable a server by using the CLI 1901
To enable or disable a server object by using the GUI 1902
To disable a server object by using the CLI 1902
To remove a server object by using the CLI 1902
To remove a server object by using the GUI 1902

Manage services 1902
To enable or disable a service by using the command line interface 1903
To enable or disable a service by using the configuration utility 1903

Manage a load balancing virtual server 1903
To enable or disable a virtual server by using the command line interface 1903
To enable or disable a virtual server by using the configuration utility 1904
To unbind a service from a virtual server by using the command line interface 1904
To unbind a service from a virtual server by using the configuration utility 1904

Load balancing visualizer 1904
To view load balancing virtual server properties by using the Visualizer 1905
To view configuration details for services, service groups, and monitors by using the Visualizer 1906
To view configuration details for policies and policy labels by using the Visualizer in the configuration utility 1906
To view statistical information by using the Visualizer 1907
To save configuration properties for any entity by using the Visualizer 1907
To bind a resource to a load balancing configuration by using the Visualizer 1907
To unbind a resource by using the Visualizer 1908
To modify a resource in a load balancing configuration by using the Visualizer 1908
To add, remove, or disable a resource in a load balancing configuration by using the Visualizer 1909

Manage client traffic 1909

Configure sessionless load balancing virtual servers 1910
Supported setup 1910
Limitations 1911
To add a sessionless virtual server by using the CLI 1911
To configure a sessionless virtual server by using the GUI 1912
Redirect HTTP requests to a cache 1913
To configure cache redirection on a virtual server by using the CLI 1913
To configure cache redirection on a virtual server by using the GUI 1913

Direct requests according to priority 1913
To configure priority queuing on a virtual server by using the CLI 1914
To configure priority queuing on a virtual server by using the GUI 1914

Direct requests to a custom web page 1914
To enable SureConnect on a virtual server by using the CLI 1914
To enable SureConnect on a virtual server by using the GUI 1915

Enable cleanup of virtual server connections 1915
To configure the down state flush setting on a virtual server by using the CLI 1917
To configure the down state flush setting on a virtual server by using the GUI 1917

Rewrite ports and protocols for HTTP redirection 1917
To configure HTTP redirection on a virtual server by using the CLI 1921
To configure HTTP redirection on a virtual server by using the GUI 1921
To configure SSL Redirect on an SSL virtual server or service by using the CLI 1921
To configure SSL redirection and SSL port rewrite on an SSL virtual server or service by using the GUI 1922

Insert IP address and port of a virtual server in the request header 1922
To insert the IP address and port of the virtual server in the client requests by using the CLI 1922
To insert the IP address and port of the virtual server in the client requests by using the GUI 1923

Use a specified source IP for backend communication 1923
Usage of a net profile for sending traffic 1924
Manage net profiles 1924
Create an IP set 1925
Create a net profile 1927
Bind a net profile to a NetScaler entity 1927

Set a time-out value for idle client connections 1929
To set a time-out value for idle client connections by using the CLI 1930
To set a time-out value for idle client connections by using the GUI 1930

Manage RTSP connections 1930
To configure RTSP NAT by using the CLI 1930
To configure RTSP NAT by using the GUI 1931
Manage client traffic on the basis of traffic rate 1931

Identify a connection with layer 2 parameters 1931
   To configure the L2 connection option by using the CLI 1932
   To configure the L2 connection option by using the GUI 1932

Configure the prefer direct route option 1932
   To set the prefer direct route option by using the CLI 1933
   To set the prefer direct route option by using the GUI 1933

Use a source port from a specified port range for backend communication 1933
   To specify a source port range or ranges by using the CLI 1934
   To specify a source port range or ranges by using the GUI 1934

Configure source IP persistency for backend communication 1934
   To enable source IP persistency in a net profile by using the CLI 1935
   To enable source IP persistency in a net profile by using the GUI 1935
   Example 1935

Advanced load balancing settings 1936

Gradually stepping up the load on a new service with virtual server-level slow start 1937
   Manual slow start 1938
   Automated slow start 1939
   Set the slow start parameters 1941

The no-monitor option for services 1942
   To set the no-monitor option for a new service by using the CLI 1943
   To set the no-monitor option for an existing service by using the CLI 1943
   To set the no-monitor option for a service by using the GUI 1945

Protect applications on protected servers against traffic surges 1945
   To set surge protection on the service by using the CLI 1945
   To set surge protection on the service by using the GUI 1945

Enable cleanup of virtual server and service connections 1946
   To set down state flush on the service by using the CLI 1947
   To set down state flush on the service by using the GUI 1947
   To set down state flush on the virtual server by using the CLI 1948
   To set down state flush on the virtual server by using the GUI 1948

Graceful shutdown of services 1948
   Adding a TROFS Code or String 1948
Disabling a Service .......................................................... 1950
To configure graceful shutdown for a service by using the command line interface .... 1951
To configure graceful shutdown for a service by using the configuration utility ..... 1952

Direct requests to a custom web page 1952
To set SureConnect on the service by using the CLI ........................................ 1952
To set SureConnect on the service by using the GUI ..................................... 1952

Enable access to services when down 1952
To enable access down on a service by using the CLI .................................... 1953
To enable access down on a service by using the GUI ................................... 1953

Enable TCP buffering of responses 1953
To enable TCP Buffering on a service by using the CLI .................................. 1953
To enable TCP Buffering on a service by using the GUI ................................ 1954

Enable compression 1954
To enable compression on a service by using the CLI .................................... 1954
To enable compression on a service by using the GUI ................................... 1954

Maintain client connection for multiple client requests 1954
To enable client keep-alive on a service by using the CLI ............................... 1955
To enable client keep-alive on a service by using the GUI .............................. 1955

Insert the IP address of the client in the request header 1955
To insert client IP address in the client request by using the CLI .................... 1956
To insert client IP address in the client request by using the GUI .................... 1956

Use source IP address of the client when connecting to the server 1956
To enable USIP mode for a service by using the CLI .................................... 1956
To enable USIP mode for a service by using the GUI ................................... 1956

Configure the source port for server-side connections 1957
Configure the use proxy port setting on a service ......................................... 1957
Configure the use proxy port setting globally .............................................. 1958

Set a limit on the number of client connections 1959
To set a limit to the number of client connections by using the CLI ................ 1959
To set a limit to the number of client connections by using the GUI .............. 1959

Set a limit on number of requests per connection to the server 1960
To limit the number of client requests per connection by using the CLI ........ 1960
To limit the number of client requests per connection by using the GUI ......... 1960

© 1999-2018 Citrix Systems, Inc. All rights reserved.
Set a threshold value for the monitors bound to a service 1960
To set the monitor threshold value on a service by using the CLI 1961
To set the monitor threshold value on a service by using the GUI 1961

Set a timeout value for idle client connections 1961
To set a timeout value for idle client connections by using the CLI 1961
To set a timeout value for idle client connections by using the GUI 1962

Set a timeout value for idle server connections 1962
To set a timeout value for idle server connections by using the CLI 1962
To set a timeout value for idle server connections by using the GUI 1962

Set a limit on the bandwidth usage by clients 1962
To set a maximum bandwidth limit on a service by using the CLI 1963
To set a maximum bandwidth limit on a service by using the GUI 1963

Redirect client requests to a cache 1963
To set cache redirection on a service by using the CLI 1963
To set cache redirection on a service by using the GUI 1963

Retain the VLAN identifier for VLAN transparency 1964
To configure a load balancing virtual server to retain the client VLAN ID by using the CLI 1964
To configure a load balancing virtual server to retain the client VLAN ID by using the GUI 1964

Configure automatic state transition based on percentage health of bound services 1964
To configure percentage based automatic state transition by using the CLI 1965
To configure percentage based automatic state transition by using the GUI 1965
To enable the ENTITY-STATE alarm by using the CLI 1965
To enable the ENTITY-STATE alarm by using the GUI 1965

Built-in monitors 1965

TCP-based application monitoring 1966

SSL service monitoring 1968

FTP service monitoring 1969
To send secure FTP probes to FTP services by using the CLI 1970
To send secure FTP probes to FTP services by using the GUI 1970

Secure monitoring of servers by using SFTP 1970
To configure secure monitoring using SFTP by using the CLI 1970
To configure secure monitoring using SFTP by using the GUI 1971
NetScaler 11.1

**Set SSL parameters on a secure monitor**  1971
  Monitor Types that Support SSL Profiles .............................................. 1972

**SIP service monitoring**  1972

**RADIUS service monitoring**  1973

**Monitor accounting information delivery from a RADIUS server**  1974
  To configure a RADIUS accounting monitor by using the CLI .................. 1975

**DNS and DNS-TCP service monitoring**  1975

**LDAP service monitoring**  1976

**MySQL service monitoring**  1977

**SNMP service monitoring**  1977

**NNTP service monitoring**  1978

**POP3 service monitoring**  1979

**SMTP service monitoring**  1979

**RTSP service monitoring**  1980

**XML broker service monitoring**  1982

**ARP request monitoring**  1983

**XenDesktop Delivery Controller service monitoring**  1983
  To add an XD-DDC monitor with the validate credentials option by using the command line interface .......................................................... 1984
  To specify the validate credentials option on an XD-DDC monitor by using the command line interface ......................................................... 1985
  To configure an XD-DDC monitor with the validate credentials option by using the configuration utility .......................................................... 1985

**Web interface service monitoring**  1985
  To add a WI monitor by using the command line interface .......................... 1986
  To add a WI monitor by using the configuration utility .............................. 1987

**Citrix StoreFront stores monitoring**  1987
  To create a StoreFront monitor by using the command line interface ............ 1988
  To create a StoreFront monitor by using the configuration utility ............... 1988

© 1999-2018 Citrix Systems, Inc. All rights reserved.
Custom monitors  1988

Configure HTTP-inline monitors  1989

Understand user monitors  1989

How to use a user monitor to check web sites  1995

Understand the internal dispatcher  1996

Configure a custom user monitor  1996
  To configure a user monitor by using the command line interface  1997

Understand load monitors  1997

Configure load monitors  1998
  To create a metric table by using the command line interface  1999
  To create a metric table and bind metrics to it by using the configuration utility  1999

Unbind metrics from a metrics table  1999
  To unbind metrics from a metric table by using the command line interface  1999
  To unbind metrics from a metric table by using the configuration utility  1999

Configure reverse monitoring for a service  2000
  Configuring HTTP Reverse Monitoring for a Service  2000
  Configuring ICMP Reverse Monitoring for a Service  2001
  Configuring TCP Reverse Monitoring for a Service  2001

Configure monitors in a load balancing setup  2002

Create monitors  2002
  To create a monitor by using the CLI  2003
  To create a monitor by using the GUI  2003

Bind monitors to services  2003
  To bind a monitor to a service by using the command line interface  2003
  To bind a monitor to a service by using the configuration utility  2004

Modify monitors  2004
  To modify an existing monitor by using the command line interface  2004
  To modify an existing monitor by using the configuration utility  2004

Enable and disable monitors  2004
  To enable a monitor by using the command line interface  2005
To enable a monitor by using the configuration utility .......................... 2005
To disable a monitor by using the command line interface .................... 2005

**Unbind monitors** 2005
To unbind a monitor from a service by using the command line interface .... 2006
To unbind a monitor from a service by using the configuration utility .......... 2006

**Remove monitors** 2006
To remove a monitor by using the command line interface .................... 2006
To remove a monitor by using the configuration utility ......................... 2006

**View monitors** 2007
To view monitor bindings by using the command line interface ............... 2007
To view monitor bindings by using the configuration utility .................... 2007
To view monitors by using the command line interface ........................ 2007
To view monitors by using the configuration utility .............................. 2007

**Close monitor connections** 2008
Closing Monitor Connections at the Service or Service Group Level ........ 2008

**Ignore the upper limit on client connections for monitor probes** 2009
To set the Skip MaxClients for Monitor Connections option by using the command line interface 2009
To set the Skip MaxClients for Monitor Connections option by using the configuration utility 2010

IP Prefix NAT

Use Case: Zonification of Clients for a Deployment of a NetScaler appliance and an Optimization Device

Configuration Steps

Sample configuration

Static ARP

Specify a VLAN in a Static ARP Entry

Set the Timeout for Dynamic ARP Entries

Neighbor Discovery

Configuration Steps

IP Tunnels

Configure IP Tunnels

Customizing IP Tunnels Globally

GRE Payload Options in a GRE IP Tunnel

IPv6 Traffic through GRE IPV4 Tunnels

Send Response Traffic Through an IP-IP Tunnel

Interfaces

Configuring MAC-Based Forwarding

Configuring Network Interfaces

Setting the Network Interface Parameters

Enabling and Disabling Network Interfaces

Resetting Network Interfaces

Monitoring a Network Interface

Configuring Forwarding Session Rules

Assigning an ACL rule to an Existing Forwarding Session Rule

Disabling Steering for Forwarding Sessions on a Cluster Setup

Understanding VLANs

Applying Rules to Classify Frames

VLANs and Packet Forwarding on the NetScaler

Configuring a VLAN

Configuring VLANs in an HA Setup

Creating or Modifying a VLAN

Monitoring VLANs
Configuring VLANs on a Single Subnet

Configuring VLANs on Multiple Subnets

Configuring Multiple Untagged VLANs across Multiple Subnets

Configuring Multiple VLANs with 802.1q Tagging

Configuring NSVLAN

Configuring Allowed VLAN List

Configuring Bridge Groups

Configuring VMACs

Configuring Link Aggregation

Redundant Interface Set

Binding an SNIP address to an Interface

Monitor the Bridge Table and Changing the Aging time

NetScaler Appliances in Active-Active Mode Using VRRP

Configuring Active-Active Mode

Configuring Send to Master

Bind CA certificates to the virtual server .................................................. 2506
Stricter control on client certificate validation ......................................... 2506

Server authentication 2507
Enable (or disable) server certificate authentication ............................... 2507
Configure a common name for server certificate authentication ............. 2510

SSL actions and policies 2511

SSL policies 2512
SSL default syntax policies ................................................................. 2513
SSL policy configuration ................................................................. 2513

SSL built-in actions and user-defined actions 2513
Examples of built-in actions in a policy ................................................ 2514
User-defined SSL actions .................................................................... 2515

SSL policy binding 2516
Bind an SSL policy globally by using the CLI ........................................ 2516
Bind an SSL policy globally by using the GUI .................................... 2517
Bind or unbind an SSL policy to a virtual server by using the CLI ......... 2517
Bind an SSL policy to a virtual server by using the GUI .................... 2518

SSL policy labels 2518
Create an SSL policy label and bind policies to the label by using the CLI 2519
Configure an SSL policy label and bind policies to the label by using the GUI 2519

Support for DTLS protocol 2519
DTLS configuration ............................................................................... 2520
Features not supported by a DTLS virtual server ................................. 2521
Parameters not used by a DTLS virtual server ................................... 2521
Features not supported by a DTLS service ......................................... 2521
Parameters not used by a DTLS service .......................................... 2522
DTLS profile ...................................................................................... 2522
Example for an end-to-end DTLS configuration .................................. 2523
DTLS cipher support ........................................................................ 2523
DTLS cipher support on NetScaler VPX, MPX/SDX (N2 and N3 based) appliances 2530

Support for Intel Coleto SSL chip based platforms 2531

MPX 9700/10500/12500/15500 FIPS appliances 2532
HSM configuration ............................................................................ 2533
NetScaler 11.1

Create and transfer FIPS keys ........................................... 2537

Configure FIPS appliances in a high availability setup .............. 2542
  Configure FIPS appliances in a high availability setup by using the CLI ........................................... 2543
  Configure FIPS appliances in a high availability setup by using the GUI ........................................... 2544

Update the firmware to version 2.2 on a FIPS card ................. 2544
  Limitations ................................................................... 2545
  Prerequisites .................................................................. 2545
  Update the FIPS firmware to version 2.2 on a standalone appliance ........................................... 2545
  Update the FIPS firmware to version 2.2 on appliances in a high availability pair ......................... 2547
  Update the FIPS firmware to version 1.1 on a standalone appliance ........................................... 2548

Reset a locked HSM ......................................................... 2548
  Reset a locked HSM by using the CLI ........................................... 2548
  Reset a locked HSM by using the GUI ........................................... 2549

MPX 14000 FIPS appliances ................................................ 2549
  Limitations ................................................................... 2550
  Configure the HSM .......................................................... 2550
  Create FIPS keys ............................................................. 2552
  Import a FIPS key by using the CLI ........................................... 2553
  Create a certificate signing request by using the CLI ......................... 2553
  Create a server certificate by using the CLI ............................... 2554
  Add a certificate-key pair by using the CLI ........................................... 2554

SDX 14000 FIPS appliances ................................................ 2555

Limitations ................................................................... 2556

Terminology .................................................................. 2557

Initialize the HSM ............................................................. 2557
  Zeroize the HSM by using the Management Service ........................................... 2557
  Initialize the HSM by using the Management Service ........................................... 2558

Create partitions .............................................................. 2558
  Create a partition by using the Management Service ........................................... 2558

Provision a new instance or modify an existing instance and assign a partition ........................................... 2558
  Provision a new instance or modify an existing instance ........................................... 2559

NetScaler 11.1

Configure the HSM for an instance on an SDX 14030/14060/14080 FIPS appliance

- Initialize the FIPS card ................................................................. 2560
- Initialize the FIPS card by using the CLI ................................... 2560

Create a FIPS key for an instance on an SDX 14030/14060/14080 FIPS appliance

- Create a FIPS key by using the CLI ............................................... 2562
- Import a FIPS key by using the CLI ............................................. 2563
- Create a certificate signing request by using the CLI ...................... 2563
- Create a server certificate by using the CLI .................................... 2564
- Add a certificate-key pair by using the CLI ..................................... 2564

Upgrade the FIPS firmware

- Upgrade the FIPS firmware .......................................................... 2565

Support for Thales nShield® HSM

Architecture overview

Prerequisites

Configure the ADC-Thales integration

- Configure the Thales HSM ............................................................. 2568
- Enable remote configuration push on the HSM ............................... 2569
- Configure the ADC to use the Thales HSM ..................................... 2569
- Create an HSM RSA Key ............................................................... 2573
- Configure the Entities on the ADC ............................................... 2576

Limitations

Appendix

Support for Gemalto SafeNet Network hardware security module

- Supported versions matrix ........................................................... 2586

Prerequisites

Configure a SafeNet client on the ADC

Configure Safenet HSMs in a high availability setup on the ADC

Additional ADC configuration

NetScaler appliances in a high availability setup
Limitations

Appendix

Run the script .......................... 2596
Create a certificate ............................. 2597
Copy the certificate to the HSM .................. 2597
Copy the certificate and key from the HSM to the NetScaler appliance .......... 2597
Use SSH to connect to the SafeNet HSM ........ 2597
Register the NetScaler on the SafeNet HSM .................. 2598
Assign the client a partition from the partition list .................. 2598
Register the HSM with its certificate on the NetScaler .................. 2598
Verify the network trust links (NTLs) connectivity between the ADC and HSM ........ 2599
Save the configuration .................. 2599
Configure automatic start of the gateway daemon at boot time .......... 2599

NetScaler Release Notes

January 6, 2019

Release notes describe how the software has changed in a particular build, and the issues known to exist in that build.

The release notes document includes all or some of the following sections:

- **What’s New**: The enhancements and other changes released in the build.
- **Fixed Issues**: The issues that are fixed in the build.
- **Known Issues**: The issues that exist in the build.
- **Points to Note**: The important aspects to keep in mind while using the build.
- **Limitations**: The limitations that exist in the build.

**Note**

- The [# XXXXXX] labels under the issue descriptions are internal tracking IDs used by the NetScaler team.
- These release notes do not document security related fixes. For a list of security related fixes and advisories, see the Citrix security bulletin.

For the latest release notes (build 60.13), click this [link](#).

Getting started with NetScaler

January 6, 2019

Intended for system and network administrators who install and configure complex networking equipment, this section of the library describes initial set-up and basic configuration of the NetScaler.

Understanding the NetScaler

The NetScaler product is an application switch that performs application-specific traffic analysis to intelligently distribute, optimize, and secure Layer 4-Layer 7 (L4-L7) network traffic for web applications. For example, a NetScaler bases load balancing decisions on individual HTTP requests instead of on long-lived TCP connections, so that the failure or slowdown of a server is managed much more quickly and with less disruption to clients. The ADC feature set can be broadly categorized as consisting of switching features, security and protection features, and server-farm optimization features.
Switching features

When deployed in front of application servers, a NetScaler ensures optimal distribution of traffic by the way in which it directs client requests. Administrators can segment application traffic according to information in the body of an HTTP or TCP request, and on the basis of L4–L7 header information such as URL, application data type, or cookie. Numerous load balancing algorithms and extensive server health checks improve application availability by ensuring that client requests are directed to the appropriate servers.

Security and protection features

The NetScaler security and protection features protect web applications from Application Layer attacks. An ADC appliance allows legitimate client requests and can block malicious requests. It provides built-in defenses against denial-of-service (DoS) attacks and supports features that protect against legitimate surges in application traffic that would otherwise overwhelm the servers. An available built-in firewall protects web applications from Application Layer attacks, including buffer overflow exploits, SQL injection attempts, cross-site scripting attacks, and more. In addition, the firewall provides identity theft protection by securing confidential corporate information and sensitive customer data.

Optimization features

Optimization features offload resource-intensive operations, such as Secure Sockets Layer (SSL) processing, data compression, client keep-alive, TCP buffering, and the caching of static and dynamic content from servers. This improves the performance of the servers in the server farm and therefore speeds up applications. An ADC appliance supports several transparent TCP optimizations, which mitigate problems caused by high latency and congested network links, accelerating the delivery of applications while requiring no configuration changes to clients or servers.

Understanding policies and expressions

A policy defines specific details of traffic filtering and management on a NetScaler. It consists of two parts: the expression and the action. The expression defines the types of requests that the policy matches. The action tells the ADC appliance what to do when a request matches the expression. As an example, the expression might be to match a specific URL pattern to a type of security attack, with the action being to drop or reset the connection. Each policy has a priority, and the priorities determine the order in which the policies are evaluated.
When an ADC appliance receives traffic, the appropriate policy list determines how to process the traffic. Each policy on the list contains one or more expressions, which together define the criteria that a connection must meet to match the policy.

For all policy types except Rewrite policies, a NetScaler appliance implements only the first policy that a request matches, not any additional policies that it might also match. For Rewrite policies, the ADC appliance evaluates the policies in order and, in the case of multiple matches, performs the associated actions in that order. Policy priority is important for getting the results you want.

**Processing order of features**

Depending on requirements, you can choose to configure multiple features. For example, you might choose to configure both compression and SSL offload. As a result, an outgoing packet might be compressed and then encrypted before being sent to the client.

The following figure shows the DataStream packet flow in the NetScaler appliance. DataStream is supported for MySQL and MS SQL databases.

The following figure shows the DataStream packet flow in the NetScaler appliance. DataStream is supported for MySQL and MS SQL databases. For information about the DataStream feature, see DataStream.

Figure 2. DataStream Packet Flow Diagram

**Where does a NetScaler appliance fit in the network?**

January 6, 2019

A NetScaler appliance resides between the clients and the servers, so that client requests and server responses pass through it. In a typical installation, virtual servers configured on the appliance provide connection points that clients use to access the applications behind the appliance. In this case, the appliance owns public IP addresses that are associated with its virtual servers, while the real servers are isolated in a private network. It is also possible to operate the appliance in a transparent mode as an L2 bridge or L3 router, or even to combine aspects of these and other modes.

**Physical deployment modes**

A NetScaler appliance logically residing between clients and servers can be deployed in either of two physical modes: inline and one-arm. In inline mode, multiple network interfaces are connected to different Ethernet segments, and the appliance is placed between the clients and the servers. The
NetScaler 11.1

The appliance has a separate network interface to each client network and a separate network interface to each server network. The appliance and the servers can exist on different subnets in this configuration. It is possible for the servers to be in a public network and the clients to directly access the servers through the appliance, with the appliance transparently applying the L4-L7 features. Usually, virtual servers (described later) are configured to provide an abstraction of the real servers. The following figure shows a typical inline deployment.

Figure 1. Inline Deployment

In one-arm mode, only one network interface of the appliance is connected to an Ethernet segment. The appliance in this case does not isolate the client and server sides of the network, but provides access to applications through configured virtual servers. One-arm mode can simplify network changes needed for NetScaler installation in some environments.

For examples of inline (two-arm) and one-arm deployment, see Understanding Common Network Topologies.

NetScaler as an L2 device

A NetScaler appliance functioning as an L2 device is said to operate in L2 mode. In L2 mode, the ADC appliance forwards packets between network interfaces when all of the following conditions are met:

- The packets are destined to another device’s media access control (MAC) address.
- The destination MAC address is on a different network interface.
- The network interface is a member of the same virtual LAN (VLAN).

By default, all network interfaces are members of a pre-defined VLAN, VLAN 1. Address Resolution Protocol (ARP) requests and responses are forwarded to all network interfaces that are members of the same VLAN. To avoid bridging loops, L2 mode must be disabled if another L2 device is working in parallel with the NetScaler appliance.

For information about how the L2 and L3 modes interact, see Packet forwarding modes.

For information about configuring L2 mode, see the “Enable and disable layer 2 mode” section in Packet forwarding modes.

NetScaler as a packet forwarding device

A NetScaler appliance can function as a packet forwarding device, and this mode of operation is called L3 mode. With L3 mode enabled, the appliance forwards any received unicast packets that are destined for an IP address that does not belong to the appliance, if there is a route to the destination. The appliance can also route packets between VLANs.

In both modes of operation, L2 and L3, the appliance generally drops packets that are in:
• Multicast frames
• Unknown protocol frames destined for an appliance’s MAC address (non-IP and non-ARP)
• Spanning Tree protocol (unless BridgeBPDUs is ON)

For information about how the L2 and L3 modes interact, see Packet forwarding modes.
For information about configuring the L3 mode, see Packet forwarding modes.

How a NetScaler appliance communicates with clients and servers

January 6, 2019

A NetScaler appliance is usually deployed in front of a server farm and functions as a transparent TCP proxy between clients and servers, without requiring any client-side configuration. This basic mode of operation is called Request Switching technology and is the core of NetScaler functionality. Request Switching enables an appliance to multiplex and offload the TCP connections, maintain persistent connections, and manage traffic at the request (application layer) level. This is possible because the appliance can separate the HTTP request from the TCP connection on which the request is delivered.

Depending on the configuration, an appliance might process the traffic before forwarding the request to a server. For example, if the client attempts to access a secure application on the server, the appliance might perform the necessary SSL processing before sending traffic to the server.

To facilitate efficient and secure access to server resources, an appliance uses a set of IP addresses collectively known as NetScaler-owned IP addresses. To manage your network traffic, you assign NetScaler-owned IP addresses to virtual entities that become the building blocks of your configuration. For example, to configure load balancing, you create virtual servers to receive client requests and distribute them to services, which are entities representing the applications on your servers.

Understanding NetScaler-owned IP addresses

To function as a proxy, a NetScaler appliance uses a variety of IP addresses. The key NetScaler-owned IP addresses are:

• NetScaler IP (NSIP) address

  The NSIP address is the IP address for management and general system access to the appliance itself, and for communication between appliances in a high availability configuration.

• Virtual server IP (VIP) address

  A VIP address is the IP address associated with a virtual server. It is the public IP address to which clients connect. An appliance managing a wide range of traffic may have many VIPs configured.
• Subnet IP (SNIP) address

A SNIP address is used in connection management and server monitoring. You can specify multiple SNIP addresses for each subnet. SNIP addresses can be bound to a VLAN.

• IP Set

An IP set is a set of IP addresses, which are configured on the appliance as SNIP. An IP set is identified with a meaningful name that helps in identifying the usage of the IP addresses contained in it.

• Net Profile

A net profile (or network profile) contains an IP address or an IP set. A net profile can be bound to load balancing or content switching virtual servers, services, service groups, or monitors. During communication with physical servers or peers, the appliance uses the addresses specified in the profile as source IP addresses.

**How Traffic flows are managed**

Because a NetScaler appliance functions as a TCP proxy, it translates IP addresses before sending packets to a server. When you configure a virtual server, clients connect to a VIP address on the NetScaler appliance instead of directly connecting to a server. As determined by the settings on the virtual server, the appliance selects an appropriate server and sends the client's request to that server. By default, the appliance uses a SNIP address to establish connections with the server, as shown in the following figure.

**Figure 1. Virtual Server Based Connections**

In the absence of a virtual server, when an appliance receives a request, it transparently forwards the request to the server. This is called the transparent mode of operation. When operating in transparent mode, an appliance translates the source IP addresses of incoming client requests to the SNIP address but does not change the destination IP address. For this mode to work, L2 or L3 mode has to be configured appropriately.

For cases in which the servers need the actual client IP address, the appliance can be configured to modify the HTTP header by inserting the client IP address as an additional field, or configured to use the client IP address instead of a SNIP address for connections to the servers.

**Traffic management building blocks**

The configuration of a NetScaler appliance is typically built up with a series of virtual entities that serve as building blocks for traffic management. The building block approach helps separate traffic flows. Virtual entities are abstractions, typically representing IP addresses, ports, and protocol handlers for
processing traffic. Clients access applications and resources through these virtual entities. The most commonly used entities are virtual servers and services. Virtual servers represent groups of servers in a server farm or remote network, and services represent specific applications on each server.

Most features and traffic settings are enabled through virtual entities. For example, you can configure an appliance to compress all server responses to a client that is connected to the server farm through a particular virtual server. To configure the appliance for a particular environment, you need to identify the appropriate features and then choose the right mix of virtual entities to deliver them. Most features are delivered through a cascade of virtual entities that are bound to each other. In this case, the virtual entities are like blocks being assembled into the final structure of a delivered application. You can add, remove, modify, bind, enable, and disable the virtual entities to configure the features. The following figure shows the concepts covered in this section.

Figure 2. How traffic management building blocks work

A simple load balancing configuration

In the example shown in the following figure, the NetScaler appliance is configured to function as a load balancer. For this configuration, you need to configure virtual entities specific to load balancing and bind them in a specific order. As a load balancer, an appliance distributes client requests across several servers and thus optimizes the utilization of resources.

The basic building blocks of a typical load balancing configuration are services and load balancing virtual servers. The services represent the applications on the servers. The virtual servers abstract the servers by providing a single IP address to which the clients connect. To ensure that client requests are sent to a server, you need to bind each service to a virtual server. That is, you must create services for every server and bind the services to a virtual server. Clients use the VIP address to connect to a NetScaler appliance. When the appliance receives client requests sent to the VIP address, it sends them to a server determined by the load balancing algorithm. Load balancing uses a virtual entity called a monitor to track whether a specific configured service (server plus application) is available to receive requests.

Figure 3. Load balancing virtual server, services, and monitors

In addition to configuring the load balancing algorithm, you can configure several parameters that affect the behavior and performance of the load balancing configuration. For example, you can configure the virtual server to maintain persistence based on source IP address. The appliance then directs all requests from any specific IP address to the same server.

Understanding virtual servers

A virtual server is a named NetScaler entity that external clients can use to access applications hosted on the servers. It is represented by an alphanumeric name, virtual IP (VIP) address, port, and protocol.
The name of the virtual server is of only local significance and is designed to make the virtual server easier to identify. When a client attempts to access applications on a server, it sends a request to the VIP instead of the IP address of the physical server. When the appliance receives a request at the VIP address, it terminates the connection at the virtual server and uses its own connection with the server on behalf of the client. The port and protocol settings of the virtual server determine the applications that the virtual server represents. For example, a web server can be represented by a virtual server and a service whose port and protocol are set to 80 and HTTP, respectively. Multiple virtual servers can use the same VIP address but different protocols and ports.

Virtual servers are points for delivering features. Most features, like compression, caching, and SSL offload, are normally enabled on a virtual server. When the appliance receives a request at a VIP address, it chooses the appropriate virtual server by the port on which the request was received and its protocol. The appliance then processes the request as appropriate for the features configured on the virtual server.

In most cases, virtual servers work in tandem with services. You can bind multiple services to a virtual server. These services represent the applications running on physical servers in a server farm. After the appliance processes requests received at a VIP address, it forwards them to the servers as determined by the load balancing algorithm configured on the virtual server. The following figure illustrates these concepts.

Figure 4. Multiple Virtual Servers with a Single VIP Address

The preceding figure shows a configuration consisting of two virtual servers with a common VIP address but different ports and protocols. Each of the virtual servers has two services bound to it. The services s1 and s2 are bound to VS_HTTP and represent the HTTP applications on Server 1 and Server 2. The services s3 and s4 are bound to VS_SSL and represent the SSL applications on Server 2 and Server 3 (Server 2 provides both HTTP and SSL applications). When the appliance receives an HTTP request at the VIP address, it processes the request as specified by the settings of VS_HTTP and sends it to either Server 1 or Server 2. Similarly, when the appliance receives an HTTPS request at the VIP address, it processes it as specified by the settings of VS_SSL and it sends it to either Server 2 or Server 3.

Virtual servers are not always represented by specific IP addresses, port numbers, or protocols. They can be represented by wildcards, in which case they are known as wildcard virtual servers. For example, when you configure a virtual server with a wildcard instead of a VIP, but with a specific port number, the appliance intercepts and processes all traffic conforming to that protocol and destined for the predefined port. For virtual servers with wildcards instead of VIPs and port numbers, the appliance intercepts and processes all traffic conforming to the protocol.

Virtual servers can be grouped into the following categories:

- Load balancing virtual server

  Receives and redirects requests to an appropriate server. Choice of the appropriate server is
based on which of the various load balancing methods the user configures.

• Cache redirection virtual server

Redirects client requests for dynamic content to origin servers, and requests for static content to cache servers. Cache redirection virtual servers often work in conjunction with load balancing virtual servers.

• Content switching virtual server

Directs traffic to a server on the basis of the content that the client has requested. For example, you can create a content switching virtual server that directs all client requests for images to a server that serves images only. Content switching virtual servers often work in conjunction with load balancing virtual servers.

• Virtual private network (VPN) virtual server

Decrypts tunneled traffic and sends it to intranet applications.

• SSL virtual server

Receives and decrypts SSL traffic, and then redirects to an appropriate server. Choosing the appropriate server is similar to choosing a load balancing virtual server.

Understanding services

Services represent applications on a server. While services are normally combined with virtual servers, in the absence of a virtual server, a service can still manage application-specific traffic. For example, you can create an HTTP service on a NetScaler appliance to represent a web server application. When the client attempts to access a web site hosted on the web server, the appliance intercepts the HTTP requests and creates a transparent connection with the web server.

In service-only mode, an appliance functions as a proxy. It terminates client connections, uses a SNIP address to establish a connection to the server, and translates the source IP addresses of incoming client requests to a SNIP address. Although the clients send requests directly to the IP address of the server, the server sees them as coming from the SNIP address. The appliance translates the IP addresses, port numbers, and sequence numbers.

A service is also a point for applying features. Consider the example of SSL acceleration. To use this feature, you must create an SSL service and bind an SSL certificate to the service. When the appliance receives an HTTPS request, it decrypts the traffic and sends it, in clear text, to the server. Only a limited set of features can be configured in the service-only case.

Services use entities called monitors to track the health of applications. Every service has a default monitor, which is based on the service type, bound to it. As specified by the settings configured on the monitor, the appliance sends probes to the application at regular intervals to determine its state.
If the probes fail, the appliance marks the service as down. In such cases, the appliance responds to client requests with an appropriate error message or re-routes the request as determined by the configured load balancing policies.

Introduction to the NetScaler product line

January 3, 2019

The NetScaler product line optimizes delivery of applications over the internet and private networks, combining application-level security, optimization, and traffic management into a single, integrated appliance. You can install a NetScaler appliance in your server room and route all connections to your managed servers through it. The NetScaler features that you enable and the policies you set are then applied to incoming and outgoing traffic.

A NetScaler appliance can be integrated into any network as a complement to existing load balancers, servers, caches, and firewalls. It requires no additional client or server side software, and can be configured using the NetScaler web-based GUI and CLI configuration utilities.

NetScaler Hardware Platforms

NetScaler hardware is available in a variety of platforms that have a range of hardware specifications:

NetScaler MPX hardware platform
NetScaler SDX hardware platform

NetScaler Editions

The NetScaler operating system is available in three editions:

- Standard
- Enterprise
- Platinum

The Standard and Advanced editions have limited features available. Feature licenses are required for all editions.

For more information about NetScaler software editions, see the NetScaler Editions datasheet.

For information about how to obtain and install licenses, see Licensing.
**Supported releases on NetScaler hardware**

See the following compatibility matrix tables for all NetScaler hardware platforms and the software releases supported on these platforms:

- NetScaler MPX Hardware-Software Compatibility Matrix
- NetScaler SDX Hardware-Software Compatibility Matrix

**Supported browsers**

To access the NetScaler GUI, your workstation must have a supported web browser.

Operating system: Windows 7
Browser and versions:
- Internet Explorer; versions 9, 10, and 11
- Mozilla Firefox; versions 3.6.25 and above
- Google Chrome; latest version

Operating system: Windows 64 bit
Browser and versions:
- Internet Explorer; versions 8, 9, 10, and 11
- Google Chrome; latest version

Operating system: MAC
Browser and versions:
- Mozilla Firefox; versions 3.6.25 and above
- Safari; versions 5.1.3 and above
- Google Chrome; latest version

**Install the hardware**

December 18, 2018

Before installing a NetScaler appliance, review the pre-installation checklist.

To use the SDX appliance, you must complete the following tasks by following the instructions given in the resources provided in table. Complete the tasks in the sequence given.

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Read safety, cautions, warnings, and other information</td>
</tr>
</tbody>
</table>
Read the caution and danger information you need to know, before installing the product.

2. Prepare for installation

Unpack your appliance and ensure all parts were delivered, prepare the site and rack, and follow basic electrical safety precautions before you install your new appliance.

3. Install the hardware

Rack mount the appliance, install transceivers (if available), and connect the appliance to the network and a power source.

4. Configure the appliance.

Configure the initial settings of the NetScaler appliance by using the GUI or the serial console.

Follow the steps given in the following documentations to complete these tasks:

- NetScaler MPX hardware documentation
- NetScaler SDX hardware documentation

Access a NetScaler

December 18, 2018

A NetScaler appliance has both a command line interface (CLI) and a graphical user interface (GUI). The GUI includes a configuration utility for configuring the appliance and a statistical utility, called Dashboard. For initial access, all appliances ship with the default NetScaler IP address (NSIP) of 192.168.100.1 and default subnet mask of 255.255.0.0. You can assign a new NSIP and an associated subnet mask during initial configuration.

If you encounter an IP address conflict when deploying multiple NetScaler units, check for the following possible causes:

- Did you select an NSIP that is an IP address already assigned to another device on your network?
- Did you assign the same NSIP to multiple NetScaler appliances?
- The NSIP is reachable on all physical ports. The ports on a NetScaler are host ports, not switch ports.

The following table summarizes the available access methods.

<table>
<thead>
<tr>
<th>Access Method</th>
<th>Port</th>
<th>Default IP Address Required?</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLI</td>
<td>Console</td>
<td>N</td>
</tr>
<tr>
<td>CLI and GUI</td>
<td>Ethernet</td>
<td>S</td>
</tr>
</tbody>
</table>
**Command line interface**

You can access the CLI either locally, by connecting a workstation to the console port, or remotely, by connecting through secure shell (SSH) from any workstation on the same network.

**Log on to the Command Line Interface through the Console Port**

The appliance has a console port for connecting to a computer workstation. To log on to the appliance, you need a serial crossover cable and a workstation with a terminal emulation program.

To log on to the CLI through the console port, follow these steps:

1. Connect the console port to a serial port on the workstation, as described in
2. On the workstation, start HyperTerminal or any other terminal emulation program. If the logon prompt does not appear, you may need to press ENTER one or more times to display it.
3. Log on by using the administrator credentials. The command prompt (>) appears on the workstation monitor.

**Log on to the Command Line Interface by using SSH**

The SSH protocol is the preferred remote access method for accessing an appliance remotely from any workstation on the same network. You can use either SSH version 1 (SSH1) or SSH version 2 (SSH2.)

If you do not have a working SSH client, you can download and install any of the following SSH client programs:

- **PuTTY**
  
  Open Source software supported on multiple platforms. Available at:
  
  “http://www.chiark.greenend.org.uk/~sgtatham/putty/”

- **Vandyke Software SecureCRT**
  
  Commercial software supported on the Windows platform. Available at:
  
  “http://www.vandyke.com/products/securecrt/”

These programs have been tested by the Citrix NetScaler team, which has verified that they work correctly with a NetScaler appliance. Other programs may also work correctly, but have not been tested.

To verify that the SSH client is installed properly, use it to connect to any device on your network that accepts SSH connections.

To log on to a NetScaler appliance by using an SSH client, follow these steps:

1. On your workstation, start the SSH client.
2. For initial configuration, use the default IP address (NSIP), which is 192.168.100.1. For subsequent access, use the NSIP that was assigned during initial configuration. Select either SSH1 or SSH2 as the protocol.

3. Log on by using the administrator credentials. For example.

```
login as: nsroot
Using keyboard-interactive authentication.
Password: 
Last login: Tue Jun 16 10:37:28 2009 from 10.102.29.9
Done
```

**NetScaler GUI**

**Important**

A certificate-key pair is required for HTTPS access to the Citrix ADC GUI. On the ADC, a certificate-key pair is automatically bound to the internal services. On an MPX or SDX appliance, the default key size is 1024 bytes, and on a VPX instance, the default key size is 512 bytes. However, most browsers today do not accept a key that is less than 1024 bytes. As a result, HTTPS access to the VPX configuration utility is blocked.

Additionally, if a license is not present on an MPX appliance when it starts, and you add a license later and restart the appliance, you might lose the certificate binding.

Citrix recommends that you install a certificate-key pair of at least 1024 bytes on a NetScaler for HTTPS access to the GUI, and that you install an appropriate license before starting the ADC.

The graphical user interface includes a configuration utility and a statistical utility, called Dashboard, either of which you access through a workstation connected to an Ethernet port on the appliance.

The system requirements for the workstation running the GUI are as follows:
• For Windows-based workstations, a Pentium 166 MHz or faster processor.
• For Linux-based workstations, a Pentium platform running Linux kernel v2.2.12 or above, and glibc version 2.12-11 or later. A minimum of 32 MB RAM is required, and 48 MB RAM is recommended. The workstation should support 16-bit color mode, KDE and KWM window managers used in conjunction, with displays set to local hosts.
• For Solaris-based workstations, a Sun running either Solaris 2.6, Solaris 7, or Solaris 8.

Your workstation must have a supported web browser to access the configuration utility and Dashboard.

The following browsers are supported.

**Operating System:**
Windows 7

**Browser:** Internet Explorer (version 9, 10, and 11), Mozilla Firefox (version 3.6.25 and above), Google Chrome (latest).

**Operating System:**
Windows 64 bit

**Browser:** Internet Explorer (version 8, 9, 10, and 11), Google Chrome (version latest)

**Operating System:**
MAC

**Browser:** Mozilla Firefox (version 3.6.25 and above), Safari (version 5.1.3 and above), Google Chrome (version latest)

**Use the NetScaler GUI**

Once you log on to the configuration utility, you can configure the appliance through a graphical interface that includes context-sensitive help.

To log on to the GUI, follow these steps:

1. Open your web browser and enter the NetScaler IP (NSIP) as an HTTP address. If you have not yet set up the initial configuration, enter the default NSIP (http://192.168.100.1). The Citrix Logon page appears.

   Note: If you have two NetScaler appliances in a high availability setup, make sure that you do not access the GUI by entering the IP address of the secondary NetScaler appliance. If you do so and use the GUI to configure the secondary appliance, your configuration changes will not be applied to the primary NetScaler appliance.

2. In the User Name text box, type nsroot.
3. In the Password text box, type the administrative password you assigned to the nsroot account during initial configuration and click Login. The Configuration Utility page appears.

If you need to access the online help, select Help from the Help menu at the top right corner.

**Use the Statistical Utility**

Dashboard, the statistical utility, is a browser-based application that displays charts and tables on which you can monitor the performance of a NetScaler appliance.

To log on to Dashboard, follow these steps:

1. Open your web browser and enter the NSIP as an HTTP address. The Citrix Logon page appears.
2. In the User Name text box, type nsroot.
3. In the Password text box, type the administrative password you assigned to the nsroot account during initial configuration.

**Configure the ADC for the first time**

December 18, 2018

For initial configuration of a NetScaler MPX appliance, see *Initial Configuration of a Citrix MPX appliance*.

For initial configuration of a Citrix SDX appliance, see *Initial Configuration of a Citrix SDX appliance*.

**NITRO API**

You can use the NITRO API to configure the NetScaler appliance. NITRO exposes its functionality through Representational State Transfer (REST) interfaces. Therefore, NITRO applications can be developed in any programming language. Additionally, for applications that must be developed in Java or .NET or Python, NITRO APIs are exposed through relevant libraries that are packaged as separate Software Development Kits (SDKs). For more information, see *NITRO API*.

**Configure high availability**

January 6, 2019

You can deploy two NetScaler appliances in a high availability configuration, where one unit actively accepts connections and manages servers while the secondary unit monitors the first. The NetScaler appliance that is actively accepting connections and managing the servers is called a primary unit and
the other one is called a secondary unit in a high availability configuration. If there is a failure in the primary unit, the secondary unit becomes the primary and begins actively accepting connections.

Each NetScaler appliance in a high availability pair monitors the other by sending periodic messages, called heartbeat messages or health checks, to determine the health or state of the peer node. If a health check for a primary unit fails, the secondary unit retries the connection for a specific time period. For more information about high availability, see High Availability. If a retry does not succeed by the end of the specified time period, the secondary unit takes over for the primary unit in a process called failover. The following figure shows two high availability configurations, one in one-arm mode and the other in two-arm mode.

**Figure 1. High availability in one-arm mode**

**Figure 2. High availability in two-arm mode**

In one-arm configuration, both NS1 and NS2 and servers S1, S2, and S3 are connected to the switch.

In two-arm configuration, both NS1 and NS2 are connected to two switches. The servers S1, S2, and S3 are connected to the second switch. The traffic between client and the servers passes through either NS1 or NS2.

To set up a high availability environment, configure one ADC appliance as primary and another as secondary. Perform the following tasks on each of the ADC appliances:

- Add a node.
- Disable high availability monitoring for unused interfaces.

**Add a Node**

A node is a logical representation of a peer NetScaler appliance. It identifies the peer unit by ID and NSIP. An appliance uses these parameters to communicate with the peer and track its state. When you add a node, the primary and secondary units exchange heartbeat messages asynchronously. The node ID is an integer that must not be greater than 64.

**Through CLI**

To add a node by using the command line interface, follow these steps:

At the command prompt, type the following commands to add a node and verify that the node has been added:

- add HA node <id> <IPAddress>
- show HA node <id>

**Example**
Through GUI

To add a node by using the GUI, follow these steps:

1. Navigate to System > High Availability.
2. Click Add on the Nodes tab.
3. On the Create HA Node page, in the Remote Node IP Address text box, type the NSIP Address (for example, 10.102.29.170) of the remote node.
4. Ensure that the Configure remote system to participate in High Availability setup check box is selected. Provide the login credentials of the remote node in the text boxes under Remote System Login Credentials.
5. Select the Turn off HA monitor on interfaces/channels that are down check box to disable the HA monitor on interfaces that are down.

Verify that the node you added appears in the list of nodes in the Nodes tab.

Disable high availability monitoring for unused interfaces

The high availability monitor is a virtual entity that monitors an interface. You must disable the monitor for interfaces that are not connected or being used for traffic. When the monitor is enabled on an interface whose status is DOWN, the state of the node becomes NOT UP. In a high availability configuration, a primary node entering a NOT UP state might cause a high availability failover. An interface is marked DOWN under the following conditions:

- The interface is not connected
- The interface is not working properly
- The cable connecting the interface is not working properly
To disable the high availability monitor for an unused interface by using the command line interface, follow these steps:

At the command prompt, type the following commands to disable the high availability monitor for an unused interface and verify that it is disabled:

- `set interface <id> -haMonitor OFF`
- `show interface <id>`

**Example**

```
set interface 1/8 -haMonitor OFF
Done
show interface 1/8
Interface 1/8 (Gig Ethernet 10/100/1000 MBits) #2
  flags=0x4000 <ENABLED, DOWN, down, autoneg, 802.1q>
  MTU=1514, native vlan=1, MAC=00:d0:68:15:fd:3d, downtime 238h55m44s
  Requested: media AUTO, speed AUTO, duplex AUTO, fctl OFF, throughput 0
  RX: Pkts(0) Bytes(0) Errs(0) Drops(0) Stalls(0)
  TX: Pkts(0) Bytes(0) Errs(0) Drops(0) Stalls(0)
  NIC: InDisc(0) OutDisc(0) Fctls(0) Stalls(0) Hangs(0) Muted(0)
Bandwidth thresholds are not set.
```

When the high availability monitor is disabled for an unused interface, the output of the show interface command for that interface does not include “HAMON.”

**Through GUI**

To disable the high availability monitor for unused interfaces by using the GUI, follow these steps:

1. Navigate to System > Network > Interfaces.
2. Select the interface for which the monitor must be disabled.
3. Click Open. The Modify Interface dialog box appears.
4. In HA Monitoring, select the OFF option.
5. Click OK.
6. Verify that, when the interface is selected, “HA Monitoring: OFF” appears in the details at the bottom of the page.
Configure a FIPS appliance for the first time

December 18, 2018

A certificate-key pair is required for HTTPS access to the configuration utility and for secure remote procedure calls. RPC nodes are internal system entities used for system-to-system communication of configuration and session information. One RPC node exists on each appliance. This node stores the password, which is checked against the one provided by the contacting appliance. To communicate with other NetScaler appliances, each appliance requires knowledge of the other appliances, including how to authenticate on the other appliance. RPC nodes maintain this information, which includes the IP addresses of the other NetScaler appliances and the passwords used to authenticate on each.

On a NetScaler MPX appliance virtual appliance, a certificate-key pair is automatically bound to the internal services. On a FIPS appliance, a certificate-key pair must be imported into the hardware security module (HSM) of a FIPS card. To do so, you must configure the FIPS card, create a certificate-key pair, and bind it to the internal services.

Configure secure HTTPS by using the CLI

To configure secure HTTPS by using the CLI, follow these steps

1. Initialize the hardware security module (HSM) on the FIPS card of the appliance. For information about initializing the HSM, see Configure the HSM.

2. If the appliance is part of a high availability setup, enable the SIM. For information about enabling the SIM on the primary and secondary appliances, see “Configure FIPS appliances in a high availability setup.”

3. Import the FIPS key into the HSM of the FIPS card of the appliance. At the command prompt, type:
   
   ```
   import ssl fipskey serverkey -key ns-server.key -inform PEM
   ```

4. Add a certificate-key pair. At the command prompt, type:
   
   ```
   add certkey server -cert ns-server.cert -fipskey serverkey
   ```

5. Bind the certificate-key created in the previous step to the following internal services. At the command prompt, type:
   
   ```
   bind ssl service nshttps-127.0.0.1-443 -certkeyname server
   bind ssl service nshttps-::11-443 -certkeyname server
   ```

Configure secure HTTPS by using the GUI

To configure secure HTTPS by using the GUI, follow these steps:
1. Initialize the hardware security module (HSM) on the FIPS card of the appliance. For information about initializing the HSM, see Configure the HSM.

2. If the appliance is part of a high availability setup, enable the secure information system (SIM). For information about enabling the SIM on the primary and secondary appliances, see Configure FIPS appliances in a high availability setup.

3. Import the FIPS key into the HSM of the FIPS card of the appliance. For more information about importing a FIPS key, see the Import an existing FIPS key section.

4. Navigate to Traffic Management > SSL > Certificates.

5. In the details pane, click Install.

6. In the Install Certificate dialog box, type the certificate details.

7. Click Create, and then click Close.

9. In the details pane, on the Action tab, click Internal Services.

10. Select nshttps-127.0.0.1-443 from the list, and then click Open.

11. On the SSL Settings tab, in the Available pane, select the certificate created in step 7, click Add, and then click OK.

12. Select nshttps-::1-443 from the list, and then click Open.

13. On the SSL Settings tab, in the Available pane, select the certificate created in step 7, click Add, and then click OK.

14. Click OK.

**Configure secure RPC by using the CLI**

To configure secure RPC by using the CLI, follow these steps:

1. Initialize the hardware security module (HSM) on the FIPS card of the appliance. For information about initializing the HSM, see Configure the HSM.

2. Enable the secure information system (SIM). For information about enabling the SIM on the primary and secondary appliances, see Configure FIPS appliances in a high availability setup.

3. Import the FIPS key into the HSM of the FIPS card of the appliance. At the command prompt, type:
   ```bash
   import ssl fipskey serverkey -key ns-server.key -inform PEM
   ```

4. Add a certificate-key pair. At the command prompt, type:
   ```bash
   add certkey server -cert ns-server.cert -fipskey serverkey
   ```
5. Bind the certificate-key pair to the following internal services. At the command prompt, type:
   bind ssl service nsrpcs-127.0.0.1-3008 -certkeyname server
   bind ssl service nskrpcs-127.0.0.1-3009 -certkeyname server
   bind ssl service nsrcpcs-::1-3008 -certkeyname server

6. Enable secure RPC mode. At the command prompt, type:
   set ns rpcnode <IP address> -secure YES

**Configure secure RPC by using the GUI**

To configure secure RPC by using the GUI, follow these steps:

1. Initialize the hardware security module (HSM) on the FIPS card of the appliance. For information about initializing the HSM, see [Configure the HSM](#).
2. Enable the secure information system (SIM). For information about enabling the SIM on the primary and secondary appliances, [Configure FIPS appliances in a high availability setup](#).
3. Import the FIPS key into the HSM of the FIPS card of the appliance. For more information about importing a FIPS key, the [Import an existing FIPS key](#) section.
4. Navigate to Traffic Management > SSL > Certificates.
5. In the details pane, click Install.
6. In the Install Certificate dialog box, type the certificate details.
7. Click Create, and then click Close.
9. In the details pane, on the Action tab, click Internal Services.
10. Select nsrpcs-127.0.0.1-3008 from the list, and then click Open.
11. On the SSL Settings tab, in the Available pane, select the certificate created in step 7, click Add, and then click OK.
12. Select nskrpcs-127.0.0.1-3009 from the list, and then click Open.
13. On the SSL Settings tab, in the Available pane, select the certificate created in step 7, click Add, and then click OK.
14. Select nsrcpcs-::1-3008 from the list, and then click Open.
15. On the SSL Settings tab, in the Available pane, select the certificate created in step 7, click Add, and then click OK.
16. Click OK.
17. Navigate to System > Network > RPC.
18. In the details pane, select the IP address, and click Open.
19. In the Configure RPC Node dialog box, select Secure.
20. Click OK.
Common network topologies

January 6, 2019

As described in the “Physical deployment mode” section in Where does a NetScaler appliance fit in the network?, you can deploy the NetScaler appliance either inline between the clients and servers or in one-arm mode. Inline mode uses a two-arm topology, which is the most common type of deployment.

Set up a common two-arm topology

In a two-arm topology, one network interface is connected to the client network and another network interface is connected to the server network, ensuring that all traffic flows through the appliance. This topology might require you to reconnect your hardware and also might result in a momentary downtime. The basic variations of two-arm topology are multiple subnets, typically with the appliance on a public subnet and the servers on a private subnet, and transparent mode, with both the appliance and the servers on the public network.

Set up a simple two-arm multiple subnet topology

One of the most commonly used topologies has the NetScaler appliance inline between the clients and the servers, with a virtual server configured to handle the client requests. This configuration is used when the clients and servers reside on different subnets. In most cases, the clients and servers reside on public and private subnets, respectively.

For example, consider an appliance deployed in two-arm mode for managing servers S1, S2, and S3, with a virtual server of type HTTP configured on the appliance, and with HTTP services running on the servers. The servers are on a private subnet and a SNIP is configured on the appliance to communicate with the servers. The Use SNIP (USNIP) option must be enabled on the appliance so that it uses the SNIP instead of the MIP.

As shown in the following figure, the VIP is on public subnet 217.60.10.0, and the NSIP, the servers, and the SNIP are on private subnet 192.168.100.0/24.

Figure 1. Topology Diagram for Two-Arm Mode, Multiple Subnets

To deploy a NetScaler appliance in two-arm mode with multiple subnets, follow these steps:

1. Configure the NSIP and default gateway, as described in Configuring the NetScaler IP Address (NSIP).
2. Configure the SNIP, as described in Configuring Subnet IP Addresses.
3. Enable the USNIP option, as described in To enable or disable USNIP mode section.
4. Configure the virtual server and the services, as described in Creating a Virtual Server section and Configuring Services section.
5. Connect one of the network interfaces to a private subnet and the other interface to a public subnet.

**Set up a simple two-arm transparent topology**

Use transparent mode if the clients need to access the servers directly, with no intervening virtual server. The server IP addresses must be public because the clients need to be able to access them. In the example shown in the following figure, a NetScaler appliance is placed between the client and the server, so the traffic must pass through the appliance. You must enable L2 mode for bridging the packets. The NSIP and MIP are on the same public subnet, 217.60.10.0/24.

Figure 2. Topology Diagram for Two-Arm, Transparent Mode

To deploy a NetScaler appliance in two-arm, transparent mode, follow these steps:

1. Configure the NSIP and default gateway, as described in [Configuring the NetScaler IP Address (NSIP)](NSIP).
2. Enable L2 mode, as described in [Enabling and Disabling Layer 2 Mode](NSIP).
3. Configure the default gateway of the managed servers as the MIP.
4. Connect the network interfaces to the appropriate ports on the switch.

**Set up common one-arm topologies**

The two basic variations of one-arm topology are with a single subnet and with multiple subnets.

**Set up a simple one-arm single subnet topology**

You can use a one-arm topology with a single subnet when the clients and servers reside on the same subnet. For example, consider a NetScaler appliance deployed in one-arm mode for managing servers S1, S2, and S3. A virtual server of type HTTP is configured on an ADC appliance, and HTTP services are running on the servers. As shown in the following figure, the NetScaler IP address (NSIP), the Mapped IP address (MIP), and the server IP addresses are on the same public subnet, 217.60.10.0/24.

Figure 3. Topology Diagram for One-Arm Mode, Single Subnet

To deploy a NetScaler appliance in one-arm mode with a single subnet, follow these steps:

1. Configure the NSIP and the default gateway, as described in [Configuring the NetScaler IP Address (NSIP)](NSIP).
2. Configure the virtual server and the services, as described in [Creating a Virtual Server section](NSIP) and [Configuring Services section](NSIP).
3. Connect one of the network interfaces to the switch.
NetScaler 11.1

**Set up a simple one-arm multiple subnet topology**

You can use a one-arm topology with multiple subnets when the clients and servers reside on the different subnets. For example, consider a NetScaler appliance deployed in one-arm mode for managing servers S1, S2, and S3, with the servers connected to switch SW1 on the network. A virtual server of type HTTP is configured on the appliance, and HTTP services are running on the servers. These three servers are on the private subnet, so a subnet IP address (SNIP) is configured to communicate with them. The Use Subnet IP address (USNIP) option must be enabled so that the appliance uses the SNIP instead of a MIP. As shown in the following figure, the virtual IP address (VIP) is on public subnet 217.60.10.0/24; the NSIP, SNIP, and the server IP addresses are on private subnet 192.168.100.0/24.

[Figure 4. Topology Diagram for One-Arm Mode, Multiple Subnets]

To deploy a NetScaler appliance in one-arm mode with multiple subnets, follow these steps:

1. Configure the NSIP and the default gateway, as described in [Configuring the NetScaler IP Address (NSIP)](#).
2. Configure the SNIP and enable the USNIP option, as described in [Configuring Subnet IP Addresses](#).
3. Configure the virtual server and the services, as described in [Creating a Virtual Server section](#) and [Configuring Services section](#).
4. Connect one of the network interfaces to the switch.

**System management settings**

December 18, 2018

Once your initial configuration is in place, you can configure settings to define the behavior of the NetScaler appliance and facilitate connection management. You have a number of options for handling HTTP requests and responses. Routing, bridging, and MAC based forwarding modes are available for handling packets not addressed to the NetScaler appliance. You can define the characteristics of your network interfaces and can aggregate the interfaces. To prevent timing problems, you can synchronize the Citrix clock with a Network Time Protocol (NTP) server. The NetScaler appliance can operate in various DNS modes, including as an authoritative domain name server (ADNS). You can set up SNMP for system management and customize syslog logging of system events. Before deployment, verify that your configuration is complete and correct.

**System settings**

December 18, 2018
Configuration of system settings includes basic tasks such as configuring HTTP ports to enable connection keep-alive and server offload, setting the maximum number of connections for each server, and setting the maximum number of requests per connection. You can enable client IP address insertion for situations in which a proxy IP address is not suitable, and you can change the HTTP cookie version.

You can also configure a NetScaler appliance to open FTP connections on a controlled range of ports instead of ephemeral ports for data connections. This improves security, because opening all ports on the firewall is insecure. You can set the range anywhere from 1,024 to 64,000.

Before deployment, go through the verification checklists to verify your configuration. To configure HTTP parameters and the FTP port range, use the NetScaler GUI.

You can modify the types of HTTP parameters described in the following table.

**Parameter Type: HTTP Port Information**

**Specifies:** The web server HTTP ports used by your managed servers. If you specify the ports, the appliance performs request switching for any client request that has a destination port matching a specified port.

- **Note:** If an incoming client request is not destined for a service or a virtual server that is specifically configured on the appliance, the destination port in the request must match one of the globally configured HTTP ports. This allows the appliance to perform connection keep-alive and server off-load.

**Parameter Type: Limits**

**Specifies:** The maximum number of connections to each managed server, and the maximum number of requests sent over each connection. For example, if you set Max Connections to 500, and the appliance is managing three servers, it can open a maximum of 500 connections to each of the three servers. By default, the appliance can create an unlimited number of connections to any of the servers it manages. To specify an unlimited number of requests per connection, set Max Requests to 0.

- **Note:** If you are using the Apache HTTP server, you must set Max Connections equal to the value of the MaxClients parameter in the Apache httpd.conf file. Setting this parameter is optional for other web servers.

**Parameter Type: Client IP Insertion**

** Specifies:** Enable/disable insertion of the client’s IP address into the HTTP request header. You can specify a name for the header field in the adjacent text box. When a web server managed by an appliance receives a mapped IP address or a subnet IP address, the server identifies it as the client’s IP address. Some applications need the client’s IP address for logging purposes or to dynamically determine the content to be served by the web server.

You can enable insertion of the actual client IP address into the HTTP header request sent from the client to one, some, or all servers managed by the appliance. You can then access the inserted ad-
address through a minor modification to the server (using an Apache module, ISAPI interface, or NSAPI interface).

**Parameter Type:** Cookie Version

**Specifies:** The HTTP cookie version to use when COOKIEINSERT persistence is configured on a virtual server. The default, version 0, is the most common type on the Internet. Alternatively, you can specify version 1.

**Parameter Type:** Requests/Responses

**Specifies:** Options for handling certain types of requests, and enable/disable logging of HTTP error responses.

**Parameter Type:** Server Header Insertion

**Specifies:** Insert a server header in NetScaler-generated HTTP responses.

To configure HTTP parameters by using the GUI, follow these steps:

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Settings**, click **Change HTTP parameters**.
3. In the **Configure HTTP parameters** dialog box, specify values for some or all of the parameters that appear under the headings listed in the table above.
4. Click **OK**.

To set the FTP port range by using the GUI, follow these steps:

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Settings**, click **Change global system settings**.
3. Under **FTP Port Range**, in the **Start Port** and **End Port** text boxes, type the lowest and highest port numbers, respectively, for the range you want to specify (for example, 5000 and 6000).
4. Click **OK**.

## Packet forwarding modes

January 6, 2019

The NetScaler appliance can either route or bridge packets that are not destined for an IP address owned by the appliance (that is, the IP address is not the NSIP, a MIP, a SNIP, a configured service, or a configured virtual server). By default, L3 mode (routing) is enabled and L2 mode (bridging) is disabled, but you can change the configuration. The following flow chart shows how the appliance evaluates packets and either processes, routes, bridges, or drops them.

**Figure 1. Interaction between Layer 2 and Layer 3 Modes**

An appliance can use the following modes to forward the packets it receives:
- Layer 2 (L2) Mode
- Layer 3 (L3) Mode
- MAC-Based Forwarding Mode

**Enable and disable layer 2 mode**

Layer 2 mode controls the Layer 2 forwarding (bridging) function. You can use this mode to configure a NetScaler appliance to behave as a Layer 2 device and bridge the packets that are not destined for it. When this mode is enabled, packets are not forwarded to any of the MAC addresses, because the packets can arrive on any interface of the appliance and each interface has its own MAC address.

With Layer 2 mode disabled (which is the default), the appliance drops packets that are not destined for one of its MAC address. If another Layer 2 device is installed in parallel with the appliance, Layer 2 mode must be disabled to prevent bridging (Layer 2) loops. You can use the configuration utility or the command line to enable Layer 2 mode.

Note: The appliance does not support spanning tree protocol. To avoid loops, if you enable L2 mode, do not connect two interfaces on the appliance to the same broadcast domain.

**To enable or disable Layer 2 mode by using the CLI**

At the command prompt, type the following commands to enable/disable Layer 2 mode and verify that it has been enabled/disabled:

- `enable ns mode <Mode>`
- `disable ns mode <Mode>`
- `show ns mode`

**Examples**

```
> enable ns mode l2
Done
> show ns mode
Mode Acronym Status
——— ——- ——
1) Fast Ramp FR ON
2) Layer 2 mode L2 ON

```
Done
>
> disable ns mode l2
Done
> show ns mode

Mode Acronym Status
——— —— ——
1) Fast Ramp FR ON
2) Layer 2 mode L2 OFF
.
.
.
Done
>

To enable or disable Layer 2 mode by using the GUI

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Modes and Features, click Configure modes.
3. In the Configure Modes dialog box, to enable Layer 2 mode, select the Layer 2 Mode check box. To disable Layer 2 mode, clear the check box.
4. Click OK. The Enable/Disable Mode(s)? message appears in the details pane.
5. Click Yes.

Enable and disable layer 3 mode

Layer 3 mode controls the Layer 3 forwarding function. You can use this mode to configure a NetScaler appliance to look at its routing table and forward packets that are not destined for it. With Layer 3 mode enabled (which is the default), the appliance performs route table lookups and forwards all packets that are not destined for any appliance-owned IP address. If you disable Layer 3 mode, the appliance drops these packets.

To enable or disable Layer 3 mode by using the CLI

At the command prompt, type the following commands to enable/disable Layer 3 mode and verify that it has been enabled/disabled:

- enable ns mode <Mode>
- disable ns mode <Mode>
• show ns mode

Examples

> enable ns mode l3
Done
> show ns mode

Mode Acronym Status
——- ——- ——
1) Fast Ramp FR ON
2) Layer 2 mode L2 OFF
.
.
.
9) Layer 3 mode (ip forwarding) L3 ON
.
.
.
Done
>

> disable ns mode l3
Done
> show ns mode

Mode Acronym Status
——- ——- ——
1) Fast Ramp FR ON
2) Layer 2 mode L2 OFF
.
.
.
9) Layer 3 mode (ip forwarding) L3 OFF
.
.
.
Done
>

To enable or disable Layer 3 mode by using the GUI

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Modes and Features, click Configure modes.
3. In the Configure Modes dialog box, to enable Layer 3 mode, select the Layer 3 Mode (IP Forwarding) check box. To disable Layer 3 mode, clear the check box.
4. Click OK. The Enable/Disable Mode(s)? message appears in the details pane.
5. Click Yes.

**Enable and disable MAC based forwarding mode**

You can use MAC-based forwarding to process traffic more efficiently and avoid multiple-route or ARP lookups when forwarding packets, because the NetScaler appliance remembers the MAC address of the source. To avoid multiple lookups, the appliance caches the source MAC address of every connection for which it performs an ARP lookup, and it returns the data to the same MAC address.

MAC-based forwarding is useful when you use VPN devices because the appliance ensures that all traffic flowing through a particular VPN passes through the same VPN device.

The following figure shows the process of MAC-based forwarding.

**Figure 2. MAC-Based Forwarding Process**

When MAC-based forwarding is enabled, the appliance caches the MAC address of:

- The source (a transmitting device such as router, firewall, or VPN device) of the inbound connection.
- The server that responds to the requests.

When a server responds through an appliance, the appliance sets the destination MAC address of the response packet to the cached address, ensuring that the traffic flows in a symmetric manner, and then forwards the response to the client. The process bypasses the route table lookup and ARP lookup functions. However, when an appliance initiates a connection, it uses the route and ARP tables for the lookup function. To enable MAC-based forwarding, use the configuration utility or the command line.

Some deployments require the incoming and outgoing paths to flow through different routers. In these situations, MAC-based forwarding breaks the topology design. For a global server load balancing (GSLB) site that requires the incoming and outgoing paths to flow through different routers, you must disable MAC-based forwarding and use the appliance’s default router as the outgoing router.

With MAC-based forwarding disabled and Layer 2 or Layer 3 connectivity enabled, a route table can specify separate routers for outgoing and incoming connections. To disable MAC-based forwarding, use the configuration utility or the command line.

**To enable or disable MAC-based forwarding by using the CLI**

At the command prompt, type the following commands to enable/disable MAC-based forwarding mode and verify that it has been enabled/disabled:
- `<enable ns mode <Mode>>`
- `<disable ns mode <Mode>>`
- `<show ns mode`

**Example**

```
' pre codeblock

``` enable ns mode mbf
Done
show ns mode

<table>
<thead>
<tr>
<th>Mode</th>
<th>Acronym</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fast Ramp</td>
<td>FR</td>
<td>ON</td>
</tr>
<tr>
<td>Layer 2 mode</td>
<td>L2</td>
<td>OFF</td>
</tr>
<tr>
<td>MAC-based forwarding</td>
<td>MBF</td>
<td>ON</td>
</tr>
</tbody>
</table>

Done
```

``` disable ns mode mbf
Done
show ns mode

<table>
<thead>
<tr>
<th>Mode</th>
<th>Acronym</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fast Ramp</td>
<td>FR</td>
<td>OFF</td>
</tr>
<tr>
<td>Layer 2 mode</td>
<td>L2</td>
<td>OFF</td>
</tr>
<tr>
<td>MAC-based forwarding</td>
<td>MBF</td>
<td>OFF</td>
</tr>
</tbody>
</table>

Done
```

**To enable or disable MAC-based forwarding by using the GUI**

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Modes and Features group, click Configure modes.
3. In the Configure Modes dialog box, to enable MAC-based forwarding mode, select the MAC Based Forwarding check box. To disable MAC-based forwarding mode, clear the check box.
4. Click OK. The Enable/Disable Mode(s)? message appears in the details pane.
5. Click Yes.

**Network interfaces**

December 18, 2018
The NetScaler interfaces are numbered in slot/port notation. In addition to modifying the characteristics of individual interfaces, you can configure virtual LANs to restrict traffic to specific groups of hosts. You can also aggregate links into high-speed channels.

**Virtual LANs**

The NetScaler appliance supports (Layer 2) port and IEEE802.1Q tagged virtual LANs (VLANs). VLAN configurations are useful when you need to restrict traffic to certain groups of stations. You can configure a network interface to belong to multiple VLANs by using IEEE 802.1q tagging.

You can bind your configured VLANs to IP subnets. The ADC appliance (if it is configured as the default router for the hosts on the subnets) then performs IP forwarding between these VLANs.

The NetScaler appliance supports the following types of VLANs.

- **Default VLAN**
  
  By default, the network interfaces on a NetScaler appliance are included in a single, port-based VLAN as untagged network interfaces. This default VLAN has a VID of 1 and exists permanently. It cannot be deleted, and its VID cannot be changed.

- **Port-Based VLANs**
  
  A set of network interfaces that share a common, exclusive, Layer 2 broadcast domain define the membership of a port-based VLAN. You can configure multiple port-based VLANs. When you add an interface to a new VLAN as an untagged member, it is automatically removed from the default VLAN.

- **Tagged VLAN**
  
  A network interface can be a tagged or untagged member of a VLAN. Each network interface is an untagged member of only one VLAN (its native VLAN). The untagged network interface forwards the frames for the native VLAN as untagged frames. A tagged network interface can be a part of more than one VLAN. When you configure tagging, be sure that both ends of the link have matching VLAN settings. You can use the configuration utility to define a tagged VLAN (nsvlan) that can have any ports bound as tagged members of the VLAN. Configuring this VLAN requires a reboot of the ADC appliance and therefore must be done during initial network configuration.

**Link aggregate channels**

Link aggregation combines incoming data from multiple ports into a single high speed link. Configuring the link aggregate channel increases the capacity and availability of the communication channel between a NetScaler appliance and other connected devices. An aggregated link is also referred to as a channel.
When a network interface is bound to a channel, the channel parameters have precedence over the network interface parameters. A network interface can be bound to only one channel. Binding a network interface to a link aggregate channel changes the VLAN configuration. That is, binding network interfaces to a channel removes them from the VLANs that they originally belonged to and adds them to the default VLAN. However, you can bind the channel back to the old VLAN, or to a new one. For example, if you have bound network interfaces 1/2 and 1/3 to a VLAN with ID 2, and then you bind them to link aggregate channel LA/1, the network interfaces are moved to the default VLAN, but you can bind them to VLAN 2.

Note: You can also use Link Aggregation Control Protocol (LACP) to configure link aggregation. For more information, see Configuring Link Aggregation by Using the Link Aggregation Control Protocol.

Clock synchronization

December 18, 2018

You can configure your NetScaler appliance to synchronize its local clock with a Network Time Protocol (NTP) server. This ensures that its clock has the same date and time settings as the other servers on your network. NTP uses User Datagram Protocol (UDP) port 123 as its transport layer. You have to add NTP servers in the NTP configuration file so that the appliance periodically gets updates from these servers.

If you do not have a local NTP server, you can find a list of public, open access, NTP servers at the official NTP site at http://www.ntp.org.

To configure clock synchronization on your appliance, follow these steps:

1. Log on to the command line and enter the shell command.

2. At the shell prompt, copy the ntp.conf file from the /etc directory to the /nsconfig directory. If the file already exists in the /nsconfig directory, make sure that you remove the following entries from the ntp.conf file:
   restrict localhost
   restrict 127.0.0.2
   These entries are required only if you want to run the device as a time server. However, this feature is not supported on the NetScaler appliance.

3. Edit /nsconfig/ntp.conf by typing the IP address for the desired NTP server under the file's server and restrict entries.

4. Create a file named rc.netscaler in the /nsconfig directory, if the file does not already exist in the directory.
5. Edit `/nsconfig/rc.netscaler` by adding the following entry: `/usr/sbin/ntpd -c /nsconfig/ntp.conf -l /var/log/ntpd.log &

This entry starts the ntpd service, checks the ntp.conf file, and logs messages in the `/var/log` directory.

Note: If the time difference between the NetScaler appliance and the time server is more than 1000 sec, the ntpd service terminates with a message to the ADC log. To avoid this, you need to start ntpd with the `-g` option, which forcibly syncs the time. Add the following entry in `/nsconfig/rc.netscaler`:

```
/usr/sbin/ntpd -g -c /nsconfig/ntp.conf -l /var/log/ntpd.log &
```

If you do not want to forcibly sync the time when there is a large difference, you can set the date manually and then start ntpd again. You can check the time difference between the appliance and the time server by running the following command in the shell:

```
ntpdate -q <IP address or domain name of the NTP server>
```

6. Reboot the appliance to enable clock synchronization.

Note: If you want to start time synchronization before you restart the appliance, enter the following command (which you added to the rc.netscaler file in step 5) at the shell prompt:

```
/usr/sbin/ntpd -c /nsconfig/ntp.conf -l /var/log/ntpd.log &
```

## DNS configuration

December 18, 2018

You can configure a NetScaler appliance to function as an Authoritative Domain Name Server (ADNS), DNS proxy server, End Resolver, or Forwarder. You can add DNS resource records such as SRV Records,AAAA Records, A Records, MX Records, NS Records, CNAME Records, PTR Records, and SOA Records. Also, the appliance can balance the load on external DNS servers.

A common practice is to configure an appliance as a forwarder. For this configuration, you need to add external name servers. After you have added the external servers, you should verify that your configuration is correct.

You can add, remove, enable, and disable external name servers. You can create a name server by specifying its IP address, or you can configure an existing virtual server as the name server.

When adding name servers, you can specify IP addresses or virtual IP addresses (VIPs). If you use IP addresses, the appliance load balances requests to the configured name servers in a round robin manner. If you use VIPs, you can specify any load balancing method.
Add a name server by using the CLI

At the command prompt, type the following commands to add a name server and verify the configuration:

- `<add dns nameServer <IP>`
- `<show dns nameServer <IP>`

**Example**

```
add dns nameServer 10.102.29.10
Done
show dns nameServer 10.102.29.10
1) 10.102.29.10 - State: DOWN
Done
```

Add a name server by using the GUI

1. Navigate to Traffic Management > DNS > Name Servers.
2. In the details pane, click Add.
3. In the Create Name Server dialog box, select IP Address.
4. In the IP Address text box, type the IP address of the name server (for example, 10.102.29.10). If you are adding an external name server, clear the Local check box.
5. Click Create, and then click Close.
6. Verify that the name server you added appears in the Name Servers pane.

SNMP configuration

January 6, 2019

The Simple Network Management Protocol (SNMP) network management application, running on an external computer, queries the SNMP agent on the NetScaler appliance. The agent searches the management information base (MIB) for data requested by the network management application and sends the data to the application.

SNMP monitoring uses traps messages and alarms. SNMP traps messages are asynchronous events that the agent generates to signal abnormal conditions, which are indicated by alarms. For example, if you want to be informed when CPU utilization is above 90 percent, you can set up an alarm for that
NetScaler 11.1

condition. The following figure shows a network with a NetScaler appliance that has SNMP enabled and configured.

Figure 1. SNMP on the NetScaler appliance

The SNMP agent on a NetScaler appliance supports SNMP version 1 (SNMPv1), SNMP version 2 (SNMPv2), and SNMP version 3 (SNMPv3). Because it operates in bilingual mode, the agent can handle SNMPv2 queries, such as Get-Bulk, and SNMPv1 queries. The SNMP agent also sends traps compliant with SNMPv2 and supports SNMPv2 data types, such as counter64. SNMPv1 managers (programs on other servers that request SNMP information from the ADC appliance) use the NS-MIB-smiv1.mib file when processing SNMP queries. SNMPv2 managers use the NS-MIB-smiv2.mib file.

The NetScaler appliance supports the following enterprise-specific MIBs:

- A subset of standard MIB-2 groups
  Provides MIB-2 groups SYSTEM, IF, ICMP, UDP, and SNMP.
- A system enterprise MIB
  Provides system-specific configuration and statistics.

To configure SNMP, you specify which managers can query the SNMP agent, add SNMP trap listeners that will receive the SNMP trap messages, and configure SNMP Alarms.

Add SNMP managers

You can configure a workstation running a management application that complies with SNMP version 1, 2, or 3 to access an appliance. Such a workstation is called an SNMP manager. If you do not specify an SNMP manager on the appliance, the appliance accepts and responds to SNMP queries from all IP addresses on the network. If you configure one or more SNMP managers, the appliance accepts and responds to SNMP queries from only those specific IP addresses. When specifying the IP address of an SNMP manager, you can use the netmask parameter to grant access from entire subnets. You can add a maximum of 100 SNMP managers or networks. To add an SNMP manager by using the CLI

At the command prompt, type the following commands to add an SNMP manager and verify the configuration:

**add snmp manager <IPAddress> … [-netmask <netmask>] **

**show snmp manager** <IPAddress>

Example:

> add snmp manager 10.102.29.5 -netmask 255.255.255.255
Done
> show snmp manager 10.102.29.5
To add an SNMP manager by using the GUI:

1. In the navigation pane, expand System, expand SNMP, and then click Managers.
2. In the details pane, click Add.
3. In the Add SNMP Manager dialog box, in the IP Address text box, type the IP address of the workstation running the management application (for example, 10.102.29.5).
4. Click Create, and then click Close.
5. Verify that the SNMP manager you added appears in the Details section at the bottom of the pane.

Add SNMP traps listeners

After configuring the alarms, you need to specify the trap listener to which the appliance will send the trap messages. Apart from specifying parameters like IP address and the destination port of the trap listener, you can specify the type of trap (either generic or specific) and the SNMP version.

You can configure a maximum of 20 trap listeners for receiving either generic or specific traps.

To add an SNMP trap listener by using the CLI

At the command prompt, type the following command to add an SNMP trap and verify that it has been added:

- add snmp trap specific <IP>
- show snmp trap

Example

> add snmp trap specific 10.102.29.3
Done
> show snmp trap
Type DestinationIP DestinationPort Version SourceIP Min-Severity Community
--- --- --- --- --- --- --- --- --- ---
generic 10.102.29.9 162 V2 NetScaler IP N/A public
generic 10.102.29.5 162 V2 NetScaler IP N/A public
generic 10.102.120.101 162 V2 NetScaler IP N/A public
To add an SNMP trap listener by using the GUI

1. In the navigation pane, expand System, expand SNMP, and then click Traps.
2. In the details pane, click Add.
3. In the Create SNMP Trap Destination dialog box, in the Destination IP Address text box, type the IP address (for example, 10.102.29.3).
4. Click Create and then click Close.
5. Verify that the SNMP trap you added appears in the Details section at the bottom of the pane.

Configure SNMP alarms

You configure alarms so that the appliance generates a trap message when an event corresponding to one of the alarms occurs. Configuring an alarm consists of enabling the alarm and setting the severity level at which a trap is generated. There are five severity levels: Critical, Major, Minor, Warning, and Informational. A trap is sent only when the severity of the alarm matches the severity specified for the trap.

Some alarms are enabled by default. If you disable an SNMP alarm, the appliance will not generate trap messages when corresponding events occur. For example, if you disable the Login-Failure SNMP alarm, the appliance will not generate a trap message when a login failure occurs.

To enable or disable an alarm by using the CLI

At the command prompt, type the following commands to enable or disable an alarm and verify that it has been enabled or disabled:

```
set snmp alarm <trapName> [-state ENABLED|DISABLED]
```

Example

```
> set snmp alarm LOGIN-FAILURE -state ENABLED
Done
```
To set the severity of the alarm by using the CLI

At the command prompt, type the following commands to set the severity of the alarm and verify that the severity has been set correctly:

- set snmp alarm <trapName> [-severity <severity>]
- show snmp alarm <trapName>

**Example**

`> set snmp alarm LOGIN-FAILURE -severity Major
Done
> show snmp alarm LOGIN-FAILURE
Alarm Alarm Threshold Normal Threshold Time State Severity Logging
| ——— | ———— | ———— | ———— | ———— | ———— |
| 1) LOGIN-FAILURE N/A N/A N/A ENABLED Major ENABLED
Done
>`

To configure alarms by using the GUI

1. In the navigation pane, expand System, expand SNMP, and then click Alarms.
2. In the details pane, select an alarm (for example, LOGIN-FAILURE), and then click Open.
3. In the Configure SNMP Alarm dialog box, to enable the alarm, select Enabled in the State drop-down list. To disable the alarm, select Disabled.
4. In the Severity drop-down list, select a severity option (for example, Major).
5. Click OK, and then click Close.
6. Verify that the parameters for the SNMP alarm you configured are correctly configured by viewing the Details section at the bottom of the pane.

**Verify configuration**

December 18, 2018
After you’ve finished configuring your system, complete the following checklists to verify your configuration.

**Configuration checklist**

- The build running is:
- There are no incompatibility issues. (Incompatibility issues are documented in the build’s release notes.)
- The port settings (speed, duplex, flow control, monitoring) are the same as the switch’s port.
- Enough mapped IP addresses have been configured to support all server-side connections during peak times.
  - The number of configured mapped IP addresses is:____
  - The expected number of simultaneous server connections is:
    [ ] 62,000 [ ] 124,000 [ ] Other____

**Topology configuration checklist**

The routes have been used to resolve servers on other subnets.

The routes entered are:

_________________________________________

- If the NetScaler appliance is in a public-private topology, reverse NAT has been configured.
- The failover (high availability) settings configured on the ADC appliance resolve in a one arm or two-arm configuration. All unused network interfaces have been disabled:

_________________________________________

- If the ADC appliance is placed behind an external load balancer, then the load balancing policy on the external load balancer is not “least connection.”
  The load balancing policy configured on the external load balancer is:
  _______________________________________
  
- If the ADC appliance is placed in front of a firewall, the session time-out on the firewall is set to a value greater than or equal to 300 seconds.

Note: The TCP idle connection timeout on a NetScaler appliance is 360 seconds. If the timeout on the firewall is also set to 300 seconds or more, then the appliance can perform TCP connection multiplexing effectively because connections will not be closed earlier.

The value configured for the session time-out is: ______________
Server configuration checklist

- “Keep-alive” has been enabled on all the servers.
  The value configured for the keep-alive time-out is: ___________________
- The default gateway has been set to the correct value. (The default gateway should either be a NetScaler appliance or upstream router.) The default gateway is:
  _______________________________________
- The server port settings (speed, duplex, flow control, monitoring) are the same as the switch port settings.
  _______________________________________
- If the Microsoft® Internet Information Server is used, buffering is enabled on the server.
- If an Apache Server is used, the MaxConn (maximum number of connections) parameter is configured on the server and on the NetScaler appliance.
  The MaxConn (maximum number of connections) value that has been set is:
  _______________________________________
- If a Netscape Enterprise Server is used, the maximum requests per connection parameter is set on the NetScaler appliance. The maximum requests per connection value that has been set is:
  _______________________________________ 

Software features configuration checklist

- Does the Layer 2 mode feature need to be disabled? (Disable if another Layer 2 device is working in parallel with a NetScaler appliance.)
  Reason for enabling or disabling:
  _______________________________________
- Does the MAC-based forwarding feature need to be disabled? (If the MAC address used by return traffic is different, it should be disabled.)
  Reason for enabling or disabling:
  _______________________________________
- Does host-based reuse need to be disabled? (Is there virtual hosting on the servers?)
  Reason for enabling or disabling:
  _______________________________________

© 1999-2018 Citrix Systems, Inc. All rights reserved.
- Do the default settings of the surge protection feature need to be changed?
  
  Reason for changing or not changing:
  ____________________________________________

**Access checklist**

- The system IPs can be pinged from the client-side network.
- The system IPs can be pinged from the server-side network.
- The managed server(s) can be pinged through the NetScaler.
- Internet hosts can be pinged from the managed servers.
- The managed server(s) can be accessed through the browser.
- The Internet can be accessed from managed server(s) using the browser.
- The system can be accessed using SSH.
- Admin access to all managed server(s) is working.

*Note: When you are using the ping utility, ensure that the pinged server has ICMP ECHO enabled, or your ping will not succeed.*

**Firewall checklist**

The following firewall requirements have been met:

- UDP 161 (SNMP)
- UDP 162 (SNMP trap)
- TCP/UDP 3010 (GUI)
- HTTP 80 (GUI)
- TCP 22 (SSH)

**Load balance traffic on a NetScaler appliance**

January 6, 2019

The load balancing feature distributes client requests across multiple servers to optimize resource utilization. In a real-world scenario with a limited number of servers providing service to a large number of clients, a server can become overloaded and degrade the performance of the server farm. A NetScaler appliance uses load balancing criteria to prevent bottlenecks by forwarding each client request to the server best suited to handle the request when it arrives.

To configure load balancing, you define a virtual server to proxy multiple servers in a server farm and balance the load among them.
When a client initiates a connection to the server, a virtual server terminates the client connection and initiates a new connection with the selected server, or reuses an existing connection with the server, to perform load balancing. The load balancing feature provides traffic management from Layer 4 (TCP and UDP) through Layer 7 (FTP, HTTP, and HTTPS).

The NetScaler appliance uses a number of algorithms, called load balancing methods, to determine how to distribute the load among the servers. The default load balancing method is the Least Connections method.

A typical load balancing deployment consists of the entities described in the following figure.

- **Virtual server.** An entity that is represented by an IP address, a port, and a protocol. The virtual server IP address (VIP) is usually a public IP address. The client sends connection requests to this IP address. The virtual server represents a bank of servers.
- **Service.** A logical representation of a server or an application running on a server. Identifies the server’s IP address, a port, and a protocol. The services are bound to the virtual servers.
- **Server object.** An entity that is represented by an IP address. The server object is created when you create a service. The IP address of the service is taken as the name of the server object. You can also create a server object and then create services by using the server object.
- **Monitor.** An entity that tracks the health of the services. The appliance periodically probes the servers using the monitor bound to each service. If a server does not respond within a specified response timeout, and the specified number of probes fails, the service is marked DOWN. The appliance then performs load balancing among the remaining services.

**Load balancing**

January 6, 2019

To configure load balancing, you must first create services. Then, you create virtual servers and bind the services to the virtual servers. By default, the NetScaler appliance binds a monitor to each service. After binding the services, verify your configuration by making sure that all of the settings are correct.

Note: After you deploy the configuration, you can display statistics that show how the entities in the configuration are performing. Use the statistical utility or the `stat lb vserver <vserverName>` command.

Optionally, you can assign weights to a service. The load balancing method then uses the assigned weight to select a service. For getting started, however, you can limit optional tasks to configuring some basic persistence settings, for sessions that must maintain a connection to a particular server, and some basic configuration-protection settings.
The following flow chart illustrates the sequence of the configuration tasks.

Figure 1. Sequence of Tasks to Configure Load Balancing

Enable load balancing

Before configuring load balancing, make sure that the load balancing feature is enabled.

To enable load balancing by using the CLI

At the command prompt, type the following commands to enable load balancing and verify that it is enabled:

- `enable feature lb`
- `show feature`

**Example**

```
enable feature lb
Done
show feature
```

<table>
<thead>
<tr>
<th>Feature</th>
<th>Acronym</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Logging</td>
<td>WL</td>
<td>OFF</td>
</tr>
<tr>
<td>Protection</td>
<td>SP</td>
<td>OFF</td>
</tr>
<tr>
<td>Load Balancing</td>
<td>LB</td>
<td>ON</td>
</tr>
<tr>
<td>Offloading</td>
<td>SSL</td>
<td>ON</td>
</tr>
</tbody>
</table>

To enable load balancing by using the GUI

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Modes and Features, click Change basic features.
3. In the Configure Basic Features dialog box, select the Load Balancing check box, and then click OK.
4. In the Enable/Disable Feature(s)? message, click Yes.
Configure services and a virtual server

When you have identified the services you want to load balance, you can implement your initial load balancing configuration by creating the service objects, creating a load balancing virtual server, and binding the service objects to the virtual server.

To implement the initial load balancing configuration by using the CLI

At the command prompt, type the following commands to implement and verify the initial configuration:

- `add service <name> <IPaddress> <serviceType> <port>`
- `add lb vserver <vServerName> <serviceType> [<IPaddress> <port>]`
- `bind lb vserver <name> <serviceName>`
- `<show service bindings <serviceName>`

Example

```plaintext
1   > add service service-HTTP-1 10.102.29.5 HTTP 80
2          Done
3   > add lb vserver vserver-LB-1 HTTP 10.102.29.60 80
4          Done
5   > bind lb vserver vserver-LB-1 service-HTTP-1
6          Done
7   > show service bindings service-HTTP-1
8          service-HTTP-1 (10.102.29.5:80) - State : DOWN
9
10   1)   vserver-LB-1 (10.102.29.60:80) - State : DOWN

11          Done
```

To implement the initial load balancing configuration by using the GUI

1. Navigate to Traffic Management > Load Balancing.
2. In the details pane, under Getting Started, click Load Balancing wizard, and follow the instructions to create a basic load balancing setup.
3. Return to the navigation pane, expand Load Balancing, and then click Virtual Servers.
4. Select the virtual server that you configured and verify that the parameters displayed at the bottom of the page are correctly configured.
5. Click Open.
6. Verify that each service is bound to the virtual server by confirming that the Active check box is selected for each service on the Services tab.
**Persistence settings**

December 18, 2018

You must configure persistence on a virtual server if you want to maintain the states of connections on the servers represented by that virtual server (for example, connections used in e-commerce). The appliance then uses the configured load balancing method for the initial selection of a server, but forwards to that same server all subsequent requests from the same client.

If persistence is configured, it overrides the load balancing methods once the server has been selected. If the configured persistence applies to a service that is down, the appliance uses the load balancing methods to select a new service, and the new service becomes persistent for subsequent requests from the client. If the selected service is in an Out Of Service state, it continues to serve the outstanding requests but does not accept new requests or connections. After the shutdown period elapses, the existing connections are closed. The following table lists the types of persistence that you can configure.

<table>
<thead>
<tr>
<th>Persistence Type</th>
<th>Persistent Connections</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source IP, SSL Session ID, Rule, DESTIP, SRCIPDESTIP</td>
<td>250K</td>
</tr>
<tr>
<td>CookieInsert, URL passive, Custom Server ID</td>
<td>Memory limit. In case of CookieInsert, if time out is not 0, any number of connections is allowed until limited by memory.</td>
</tr>
</tbody>
</table>

Table 1. Limitations on Number of Simultaneous Persistent Connections

If the configured persistence cannot be maintained because of a lack of resources on an appliance, the load balancing methods are used for server selection. Persistence is maintained for a configured period of time, depending on the persistence type. Some persistence types are specific to certain virtual servers. The following table shows the relationship.

<table>
<thead>
<tr>
<th>Persistence Type</th>
<th>HTTP</th>
<th>HTTPS</th>
<th>TCP</th>
<th>UDP/IP</th>
<th>SSL_Bridge</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source IP</td>
<td>YES</td>
<td>YES</td>

<td>YES</td>
<td>NO</td>
<td>NO</td>
<td>NO</td>
</tr>
<tr>
<td>SSL Session ID</td>
<td>NO</td>
<td>YES</td>
<td>NO</td>
<td>NO</td>
<td>YES</td>
</tr>
<tr>
<td>URL Passive</td>
<td>YES</td>
<td>YES</td>
<td>NO</td>
<td>NO</td>
<td>NO</td>
</tr>
</tbody>
</table>
## Persistence Types Available for Each Type of Virtual Server

<table>
<thead>
<tr>
<th>Table 2</th>
<th>Persistence Types Available for Each Type of Virtual Server</th>
</tr>
</thead>
</table>

You can also specify persistence for a group of virtual servers. When you enable persistence on the group, the client requests are directed to the same selected server regardless of which virtual server in the group receives the client request. When the configured time for persistence elapses, any virtual server in the group can be selected for incoming client requests.

Two commonly used persistence types are persistence based on cookies and persistence based on server IDs in URLs.

### Configure persistence based on cookies

When you enable persistence based on cookies, the NetScaler appliance adds an HTTP cookie into the Set-Cookie header field of the HTTP response. The cookie contains information about the service to which the HTTP requests must be sent. The client stores the cookie and includes it in all subsequent requests, and the ADC uses it to select the service for those requests. You can use this type of persistence on virtual servers of type HTTP or HTTPS.

The NetScaler appliance inserts the cookie `<NSC_XXXX>=<ServiceIP><ServicePort>` where:

- `<NSC_XXXX>` is the virtual server ID that is derived from the virtual server name.
- `<ServiceIP>` is the hexadecimal value of the IP address of the service.
- `<ServicePort>` is the hexadecimal value of the port of the service.

The ADC encrypts ServiceIP and ServicePort when it inserts a cookie, and decrypts them when it receives a cookie.

**Note:** If the client is not allowed to store the HTTP cookie, the subsequent requests do not have the HTTP cookie, and persistence is not honored.

By default, the ADC appliance sends HTTP cookie version 0, in compliance with the Netscape specification. It can also send version 1, in compliance with RFC 2109.

© 1999-2018 Citrix Systems, Inc. All rights reserved.
You can configure a timeout value for persistence that is based on HTTP cookies. Note the following:

- If HTTP cookie version 0 is used, the NetScaler appliance inserts the absolute Coordinated Universal Time (GMT) of the cookie’s expiration (the expires attribute of the HTTP cookie), calculated as the sum of the current GMT time on an ADC appliance, and the timeout value.
- If an HTTP cookie version 1 is used, the ADC appliance inserts a relative expiration time (Max-Age attribute of the HTTP cookie). In this case, the client software calculates the actual expiration time.

Note: Most client software currently installed (Microsoft Internet Explorer and Netscape browsers) understand HTTP cookie version 0; however, some HTTP proxies understand HTTP cookie version 1.

If you set the timeout value to 0, the ADC appliance does not specify the expiration time, regardless of the HTTP cookie version used. The expiration time then depends on the client software, and such cookies are not valid if that software is shut down. This persistence type does not consume any system resources. Therefore, it can accommodate an unlimited number of persistent clients.

An administrator can change the HTTP cookie version.

To change the HTTP cookie version by using the CLI

At the command prompt, type:

```
set ns param [-cookieversion ( 0 | 1 )]
```

Example:

```
set ns param -cookieversion 1
```

To change the HTTP cookie version by using the GUI

1. Navigate to System > Settings.
2. In the details pane, click Change HTTP Parameters.
3. In the Configure HTTP Parameters dialog box, under Cookie, select Version 0 or Version 1.

Note: For information about the parameters, see Configuring Persistence Based on Cookies.

To configure persistence based on cookies by using the CLI

At the command prompt, type the following commands to configure persistence based on cookies and verify the configuration:
To configure persistence based on cookies by using the GUI

2. In the details pane, select the virtual server for which you want to configure persistence (for example, vserver-LB-1), and then click Open.
3. In the Configure Virtual Server (Load Balancing) dialog box, on the Method and Persistence tab, in the Persistence list, select COOKIEINSERT.
4. In the Time-out (min) text box, type the time-out value (for example, 2).
5. Click OK.
6. Verify that the virtual server for which you configured persistence is correctly configured by selecting the virtual server and viewing the Details section at the bottom of the pane.

Configure persistence based on server IDs in URLs

The NetScaler appliance can maintain persistence based on the server IDs in the URLs. In a technique called URL passive persistence, the ADC extracts the server ID from the server response and embeds it in the URL query of the client request. The server ID is an IP address and port specified as a hexadecimal number. The ADC extracts the server ID from subsequent client requests and uses it to select the server.
URL passive persistence requires configuring either a payload expression or a policy infrastructure expression specifying the location of the server ID in the client requests. For more information about expressions, see “Policy Configuration and Reference.”

Note: If the server ID cannot be extracted from the client requests, server selection is based on the load balancing method.

**Example: Payload Expression**

The expression, URLQUERY contains sid= configures the system to extract the server ID from the URL query of a client request, after matching token sid= . Thus, a request with the URL http://www.citrix.com/index.asp?&sid=c0a864100050 is directed to the server with the IP address 10.102.29.10 and port 80.

The timeout value does not affect this type of persistence, which is maintained as long as the server ID can be extracted from the client requests. This persistence type does not consume any system resources, so it can accommodate an unlimited number of persistent clients.

Note: For information about the parameters, see Load Balancing.

**To configure persistence based on server IDs in URLs by using the CLI**

At the command prompt, type the following commands to configure persistence based on server IDs in URLs and verify the configuration:

```
1. set lb vserver <name> -persistenceType URLPASSIVE
2. show lb vserver <name>
```

**Example:**

```
1. set lb vserver vserver-LB-1 -persistenceType URLPASSIVE
2. Done
3. show lb vserver vserver-LB-1
  vserver-LB-1 (10.102.29.60:80) - HTTP  Type: ADDRESS
  .
  .
  .
  Persistence: URLPASSIVE
  Persistence Timeout: 2 min
4. .
5. .
6. .
7. Done
```
To configure persistence based on server IDs in URLs by using the GUI

2. In the details pane, select the virtual server for which you want to configure persistence (for example, vserver-LB-1), and then click Open.
3. In the Configure Virtual Server (Load Balancing) dialog box, on the Method and Persistence tab, in the Persistence list, select URLPASSIVE.
4. In the Time-out (min) text box, type the time-out value (for example, 2).
5. In the Rule text box, enter a valid expression. Alternatively, click Configure next to the Rule text box and use the Create Expression dialog box to create an expression.
6. Click OK.
7. Verify that the virtual server for which you configured persistence is correctly configured by selecting the virtual server and viewing the Details section at the bottom of the pane.

Configure features to protect the load balancing configuration

December 18, 2018

You can configure URL redirection to provide notifications of virtual server malfunctions, and you can configure backup virtual servers to take over if a primary virtual server becomes unavailable.

Configure URL redirection

You can configure a redirect URL to communicate the status of the appliance in the event that a virtual server of type HTTP or HTTPS is down or disabled. This URL can be a local or remote link. The appliance uses HTTP 302 redirect.

Redirects can be absolute URLs or relative URLs. If the configured redirect URL contains an absolute URL, the HTTP redirect is sent to the configured location, regardless of the URL specified in the incoming HTTP request. If the configured redirect URL contains only the domain name (relative URL), the HTTP redirect is sent to a location after appending the incoming URL to the domain configured in the redirect URL.

Note: If a load balancing virtual server is configured with both a backup virtual server and a redirect URL, the backup virtual server takes precedence over the redirect URL. In this case, a redirect is used when both the primary and backup virtual servers are down.

To configure a virtual server to redirect client requests to a URL by using the CLI

At the command prompt, type the following commands to configure a virtual server to redirect client requests to a URL and verify the configuration:
To configure a virtual server to redirect client requests to a URL by using the GUI

2. <In the details pane, select the virtual server for which you want to configure URL redirection (for example, vserver-LB-1), and then click Open.
3. <In the Configure Virtual Server (Load Balancing) dialog box, on the Advanced tab, in the Redirect URL text box, type the URL (for example, http://www.newdomain.com/mysite/maintenance), and then click OK.
4. <Verify that the redirect URL you configured for the server appears in the Details section at the bottom of the pane.

Configure backup virtual servers

If the primary virtual server is down or disabled, the appliance can direct the connections or client requests to a backup virtual server that forwards the client traffic to the services. The appliance can also send a notification message to the client regarding the site outage or maintenance. The backup virtual server is a proxy and is transparent to the client.
You can configure a backup virtual server when you create a virtual server or when you change the optional parameters of an existing virtual server. You can also configure a backup virtual server for an existing backup virtual server, thus creating a cascaded backup virtual server. The maximum depth of cascading backup virtual servers is 10. The appliance searches for a backup virtual server that is up and accesses that virtual server to deliver the content.

You can configure URL redirection on the primary for use when the primary and the backup virtual servers are down or have reached their thresholds for handling requests.

Note: If no backup virtual server exists, an error message appears, unless the virtual server is configured with a redirect URL. If both a backup virtual server and a redirect URL are configured, the backup virtual server takes precedence.

To configure a backup virtual server by using the CLI

At the command prompt, type the following commands to configure a backup server and verify the configuration:

- `<set lb vserver <name> [-backupVserver <string>]`
- `<show lb vserver <name>`

Example

```
set lb vserver vserver-LB-1 -backupVserver vserver-LB-2
Done
show lb vserver vserver-LB-1
vserver-LB-1 (10.102.29.60:80) - HTTP Type: ADDRESS
State: DOWN
Last state change was at Wed Jun 17 08:56:34 2009 (+661 ms)
.
.
.
Backup: vserver-LB-2
.
.
.
Done
```

To set up a backup virtual server by using the GUI

2. In the details pane, select the virtual server for which you want to configure the backup virtual server (for example, vserver-LB-1), and then click Open.
3. In the Configure Virtual Server (Load Balancing) dialog box, on the Advanced tab, in the Backup Virtual Server list, select the backup virtual server (for example, vserver-LB-2, and then click OK.
4. Verify that the backup virtual server you configured appears in the Details section at the bottom of the pane.
   Note: If the primary server goes down and then comes back up, and you want the backup virtual server to function as the primary server until you explicitly reestablish the primary virtual server, select the Disable Primary When Down check box.

A typical load balancing scenario

January 6, 2019

In a load balancing setup, the NetScaler appliances are logically located between the client and the server farm, and they manage traffic flow to the servers.

The following figure shows the topology of a basic load balancing configuration.

Figure 1. Basic Load Balancing Topology

The virtual server selects the service and assigns it to serve client requests. Consider the scenario in the preceding figure, where the services service-HTTP-1 and service-HTTP-2 are created and bound to the virtual server named virtual server-LB-1. Virtual server-LB-1 forwards the client request to either service-HTTP-1 or service-HTTP-2. The system selects the service for each request by using the Least Connections load balancing method. The following table lists the names and values of the basic entities that must be configured on the system.

Table 1. LB Configuration Parameter Values

The following figure shows the load balancing sample values and required parameters that are described in the preceding table.

Figure 2. Load Balancing Entity Model

The following tables list the commands used to configure this load balancing setup by using the command line interface.
To enable load balancing

```
enable feature lb
```

To create a service named service-HTTP-1

```
add service service-HTTP-1 10.102.29.5 HTTP 80
```

To create a service named service-HTTP-2

```
add service service-HTTP-2 10.102.29.6 HTTP 80
```

To create a virtual server named vserver-LB-1

```
add lb vserver vserver-LB-1 HTTP 10.102.29.60 80
```

To bind a service named service-HTTP-1 to a virtual server named vserver-LB-1

```
bind lb vserver vserver-LB-1 service-HTTP-1
```

To bind a service named service-HTTP-2 to a virtual server named vserver-LB-1

```
bind lb vserver vserver-LB-1 service-HTTP-2
```

Table 2. Initial Configuration Tasks

For more information about the initial configuration tasks, see Setting Up Basic Load Balancing.

<table>
<thead>
<tr>
<th>Task</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>To view the properties of a virtual server named vserver-LB-1</td>
<td>show lb vserver vserver-LB-1</td>
</tr>
<tr>
<td>To view the statistics of a virtual server named vserver-LB-1</td>
<td>stat lb vserver vserver-LB-1</td>
</tr>
<tr>
<td>To view the properties of a service named service-HTTP-1</td>
<td>show service service-HTTP-1</td>
</tr>
<tr>
<td>To view the statistics of a service named service-HTTP-1</td>
<td>stat service service-HTTP-1</td>
</tr>
<tr>

<td>show service bindings service-HTTP-1</td>
</tr>
</tbody>
</table>

Table 3. Verification Tasks

<table>
<thead>
<tr>
<th>Task</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>To configure persistence on a virtual server named vserver-LB-1</td>
<td>set lb vserver vserver-LB-1 -persistenceType SOURCEIP -persistenceMask 255.255.255.255 -timeout 2</td>
</tr>
</tbody>
</table>
To configure COOKIEINSERT persistence on a virtual server named vserver-LB-1

```bash
set lb vserver vserver-LB-1 -persistenceType COOKIEINSERT
```

To configure URLPassive persistence on a virtual server named vserver-LB-1

```bash
set lb vserver vserver-LB-1 -persistenceType URLPASSIVE
```

To configure a virtual server to redirect the client request to a URL on a virtual server named vserver-LB-1

```bash
set lb vserver vserver-LB-1 -redirectURL http://www.newdomain.com/mysite/maintenance
```

To set a backup virtual server on a virtual server named vserver-LB-1

```bash
set lb vserver vserver-LB-1 -backupVserver vserver-LB-2
```

### Table 4. Customization Tasks

For more information about configuring persistence, see [Choosing and Configuring Persistence Settings](#). For information about configuring a virtual server to redirect a client request to a URL and setting up a backup virtual server, see [Configuring Features to Protect the Load Balancing Configuration](#).

### Accelerate load balanced traffic by using compression

January 6, 2019

Compression is a popular means of optimizing bandwidth usage, and most web browsers support compressed data. If you enable the compression feature, the NetScaler appliance intercepts requests from clients and determines whether the client can accept compressed content. After receiving the HTTP response from the server, the appliance examines the content to determine whether it is compressible. If the content is compressible, the appliance compresses it, modifies the response header to indicate the type of compression performed, and forwards the compressed content to the client.

NetScaler compression is a policy-based feature. A policy filters requests and responses to identify responses to be compressed, and specifies the type of compression to apply to each response. The appliance provides several built-in policies to compress common MIME types such as text/html, text/plain, text/xml, text/css, text/rtf, application/msword, application/vnd.ms-excel, and application/vnd.ms-powerpoint. You can also create custom policies. The appliance does not compress compressed MIME types such as application/octet-stream, binary, bytes, and compressed image formats such as GIF and JPEG.

To configure compression, you must enable it globally and on each service that will provide responses that you want compressed. If you have configured virtual servers for load balancing or content switch-
ing, you should bind the polices to the virtual servers. Otherwise, the policies apply to all traffic that passes through the appliance.

**Compression configuration task sequence**

The following flow chart shows the sequence of tasks for configuring basic compression in a load balancing setup.

Figure 1. Sequence of Tasks to Configure Compression

Note: The steps in the above figure assume that load balancing has already been configured.

**Enable compression**

By default, compression is not enabled. You must enable the compression feature to allow compression of HTTP responses that are sent to the client.

**To enable compression by using the CLI**

At the command prompt, type the following commands to enable compression and verify the configuration:

- `enable ns feature CMP`
- `show ns feature`

<table>
<thead>
<tr>
<th>Feature</th>
<th>Acronym</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Feature</td>
<td>Mode</td>
</tr>
<tr>
<td>---</td>
<td>----------------------------------</td>
<td>------</td>
</tr>
<tr>
<td>1</td>
<td>Web Logging</td>
<td>WL</td>
</tr>
<tr>
<td>2</td>
<td>Surge Protection</td>
<td>SP</td>
</tr>
<tr>
<td>7</td>
<td>Compression Control</td>
<td>CMP</td>
</tr>
<tr>
<td>8</td>
<td>Priority Queuing</td>
<td>PQ</td>
</tr>
</tbody>
</table>

Done

**To enable compression by using the GUI**

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Modes and Features, click Change basic features.
3. In the Configure Basic Features dialog box, select the Compression check box, and then click OK.
4. In the Enable/Disable Feature(s)? dialog box, click Yes.

**Configure services to compress data**

In addition to enabling compression globally, you must enable it on each service that will deliver files to be compressed.

**To enable compression on a service by using the CLI**

At the command prompt, type the following commands to enable compression on a service and verify the configuration:

- set service <name> -CMP YES
- show service <name>
> show service SVC_HTTP1

SVC_HTTP1 (10.102.29.18:80) - HTTP

State: UP

Last state change was at Tue Jun 16 06:19:14 2009 (+737 ms)

Time since last state change: 0 days, 03:03:37.200

Server Name: 10.102.29.18

Server ID : 0    Monitor Threshold : 0

Max Conn: 0    Max Req: 0    Max Bandwidth: 0 kbits

Use Source IP: NO

Client Keepalive(CKA): NO

Access Down Service: NO

TCP Buffering(TCPB): NO

HTTP Compression(CMP): YES

Idle timeout: Client: 180 sec    Server: 360 sec

Client IP: DISABLED
Cacheable: NO

SC: OFF

SP: OFF

Down state flush: ENABLED

1) Monitor Name: tcp-default

State: DOWN  Weight: 1

Probes: 1095  Failed [Total: 1095 Current: 1095]

Last response: Failure - TCP syn sent, reset received.

Response Time: N/A

Done

To enable compression on a service by using the GUI

1. Navigate to Traffic Management > Load Balancing > Services.
2. In the details pane, select the service for which you want to configure compression (for example, service-HTTP-1), and then click Open.
3. On the Advanced tab, under Settings, select the Compression check box, and then click OK.
4. Verify that, when the service is selected, HTTP Compression(CMP): ON appears in the Details section at the bottom of the pane.
**Bind a compression policy to a virtual server**

If you bind a policy to a virtual server, the policy is evaluated only by the services associated with that virtual server. You can bind compression policies to a virtual server either from the Configure Virtual Server (Load Balancing) dialog box or from the Compression Policy Manager dialog box. This topic includes instructions to bind compression policies to a load balancing virtual server by using the Configure Virtual Server (Load Balancing) dialog box. For information about how you can bind a compression policy to a load balancing virtual server by using the Compression Policy Manager dialog box, see Configuring and Binding Policies with the Policy Manager.

**To bind or unbind a compression policy to a virtual server by using the command line**

At the command prompt, type the following commands to bind or unbind a compression policy to a load balancing virtual server and verify the configuration:

```
(bind|unbind) lb vserver <name> -policyName <string>
```

- show lb vserver <name>

**Example:**

```
1   bind lb vserver lbvip -policyName ns_cmp_msapp
2     Done
3   > show lb vserver lbvip
4   lbvip (8.7.6.6:80) - HTTP Type: ADDRESS
5     State: UP
6     Last state change was at Thu May 28 05:37:21 2009 (+685 ms)
7     Time since last state change: 19 days, 04:26:50.470
8     Effective State: UP
9     Client Idle Timeout: 180 sec
10    Down state flush: ENABLED
11    Disable Primary Vserver On Down : DISABLED
12    Port Rewrite : DISABLED
13    No. of Bound Services : 1 (Total) 1 (Active)
14    Configured Method: LEASTCONNECTION
15    Current Method: Round Robin, Reason: Bound service's state changed to UP
16    Mode: IP
17    Persistence: NONE
18    Vserver IP and Port insertion: OFF
```
To bind or unbind a compression policy to a load balancing virtual server by using the GUI

2. In the details pane, select the virtual server to which you want to bind or unbind a compression policy (for example, Vserver-LB-1), and then click Open.
3. In the Configure Virtual Server (Load Balancing) dialog box, on the Policies tab, click Compression.
4. Do one of the following:
   - To bind a compression policy, click Insert Policy, and then select the policy you want to bind to the virtual server.
   - To unbind a compression policy, click the name of the policy you want to unbind from the virtual server, and then click Unbind Policy.
5. Click OK.

Secure load balanced traffic by using SSL

January 6, 2019

The NetScaler SSL offload feature transparently improves the performance of web sites that conduct SSL transactions. By offloading CPU-intensive SSL encryption and decryption tasks from the local web server to the appliance, SSL offloading ensures secure delivery of web applications without the performance penalty incurred when the server processes the SSL data. Once the SSL traffic is decrypted, it can be processed by all standard services. The SSL protocol works seamlessly with various types of HTTP and TCP data and provides a secure channel for transactions using such data.

To configure SSL, you must first enable it. Then, you configure HTTP or TCP services and an SSL virtual server on the appliance, and bind the services to the virtual server. You must also add a certificate-key pair and bind it to the SSL virtual server. If you use Outlook Web Access servers, you must create
an action to enable SSL support and a policy to apply the action. An SSL virtual server intercepts incoming encrypted traffic and decrypts it by using a negotiated algorithm. The SSL virtual server then forwards the decrypted data to the other entities on the appliance for appropriate processing.

For detailed information about SSL offloading, see SSL offload and acceleration.

SSL configuration task sequence

To configure SSL, you must first enable it. Then, you must create an SSL virtual server and HTTP or TCP services on the NetScaler appliance. Finally, you must bind a valid SSL certificate and the configured services to the SSL virtual server.

An SSL virtual server intercepts incoming encrypted traffic and decrypts it using a negotiated algorithm. The SSL virtual server then forwards the decrypted data to the other entities on the NetScaler appliance for appropriate processing.

The following flow chart shows the sequence of tasks for configuring a basic SSL offload setup.

Figure 1. Sequence of Tasks to Configure SSL Offloading

Enable SSL offload

You should enable the SSL feature before configuring SSL offload. You can configure SSL-based entities on the appliance without enabling the SSL feature, but they will not work until you enable SSL.

Enable SSL by using the CLI

At the command prompt, type the following commands to enable SSL Offload and verify the configuration:

- `enable ns feature SSL`
- `show ns feature`
<table>
<thead>
<tr>
<th>Feature</th>
<th>Acronym</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>1) Web Logging</td>
<td>WL</td>
<td>ON</td>
</tr>
<tr>
<td>2) Surge Protection</td>
<td>SP</td>
<td>OFF</td>
</tr>
<tr>
<td>3) Load Balancing</td>
<td>LB</td>
<td>ON</td>
</tr>
<tr>
<td>9) SSL Offloading</td>
<td>SSL</td>
<td>ON</td>
</tr>
<tr>
<td>10) Global Server Load Balancing</td>
<td>GSLB</td>
<td>ON</td>
</tr>
</tbody>
</table>

## Enable SSL by using the GUI

Follow these steps:

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Modes and Features, click Change basic features.
3. Select the SSL Offloading check box, and then click OK.
4. In the Enable/Disable Feature(s)? message box, click Yes.

## Create HTTP services

A service on the appliance represents an application on a server. Once configured, services are in the disabled state until the appliance can reach the server on the network and monitor its status. This topic covers the steps to create an HTTP service.

Note: For TCP traffic, perform the procedures in this and the following topics, but create TCP services instead of HTTP services.
**Add an HTTP service by using the CLI**

At the command prompt, type the following commands to add a HTTP service and verify the configuration:

```
add service <name> (<IP> <serverName>) <serviceType> <port>
```

- `show service <name>`

**Example:**

```
> add service SVC_HTTP1 10.102.29.18 HTTP 80
Done

> show service SVC_HTTP1

SVC_HTTP1 (10.102.29.18:80) - HTTP

  State: UP

  Last state change was at Wed Jul 15 06:13:05 2009

  Time since last state change: 0 days, 00:00:15.350

  Server Name: 10.102.29.18

  Server ID : 0  Monitor Threshold : 0

  Max Conn: 0  Max Req: 0  Max Bandwidth: 0 kbits

  Use Source IP: NO
```
Client Keepalive (CKA): NO

Access Down Service: NO

TCP Buffering (TCPB): NO

HTTP Compression (CMP): YES

Idle timeout: Client: 180 sec Server: 360 sec

Client IP: DISABLED

Cacheable: NO

SC: OFF

SP: OFF

Down state flush: ENABLED

1) Monitor Name: tcp-default

State: UP Weight: 1

Probes: 4 Failed [Total: 0 Current: 0]

Last response: Success - TCP syn+ack received.
Add an HTTP service by using the GUI

Follow these steps:

1. Navigate to Traffic Management > SSL Offload > Services.
2. In details pane, click Add.
3. In the Create Service dialog box, in the Service Name, Server, and Port text boxes, type the name of the service, IP address, and port (for example, SVC_HTTP1, 10.102.29.18, and 80).
4. In the Protocol list, select the type of the service (for example, HTTP).
5. Click Create, and then click Close. The HTTP service you configured appears in the Services page.
6. Verify that the parameters you configured are correctly configured by selecting the service and viewing the Details section at the bottom of the pane.

Add an SSL based virtual server

In a basic SSL offloading setup, the SSL virtual server intercepts encrypted traffic, decrypts it, and sends the clear text messages to the services that are bound to the virtual server. Offloading CPU-intensive SSL processing to the appliance allows the back-end servers to process a greater number of requests.

Add an SSL-based virtual server by using the CLI

At the command prompt, type the following commands to create an SSL-based virtual server and verify the configuration:

- add lb vserver <name> <serviceType> [<IPAddress> <port>]
- show lb vserver <name>

Caution: To ensure secure connections, you must bind a valid SSL certificate to the SSL-based virtual server before you enable it.

Example:

```
1 > add lb vserver vserver-SSL-1 SSL 10.102.29.50 443
2
```
Done

> show lb vserver vserver-SSL-1

vserver-SSL-1 (10.102.29.50:443) - SSL Type: ADDRESS

State: DOWN[Certkey not bound] Last state change was at Tue Jun 16 06:33:08 2009 (+176 ms)

Time since last state change: 0 days, 00:03:44.120

Effective State: DOWN Client Idle Timeout: 180 sec

Down state flush: ENABLED

Disable Primary Vserver On Down : DISABLED

No. of Bound Services : 0 (Total) 0 (Active)

Configured Method: LEASTCONNECTION Mode: IP

Persistence: NONE

Vserver IP and Port insertion: OFF

Add an SSL-based virtual server by using the GUI

Follow these steps:

1. Navigate to Traffic Management > SSL Offload > Virtual Servers.
2. In the details pane, click Add.
3. In the Create Virtual Server (SSL Offload) dialog box, in the Name, IP Address, and Port text boxes, type the name of the virtual server, IP address, and port (for example, Vserver-SSL-1, 10.102.29.50, and 443).
4. In the Protocol list, select the type of the virtual server, for example, SSL.
5. Click Create, and then click Close.
6. Verify that the parameters you configured are correctly configured by selecting the virtual server and viewing the Details section at the bottom of the pane. The virtual server is marked as DOWN because a certificate-key pair and services have not been bound to it.

Caution: To ensure secure connections, you must bind a valid SSL certificate to the SSL-based virtual server before you enable it.

Bind services to the SSL virtual server

After decrypting the incoming data, the SSL virtual server forwards the data to the services that you have bound to the virtual server.

Data transfer between the appliance and the servers can be encrypted or in clear text. If the data transfer between the appliance and the servers is encrypted, the entire transaction is secure from end to end. For more information about configuring the system for end-to-end security, see [SSL offload and acceleration].

Bind a service to a virtual server by using the CLI

At the command prompt, type the following commands to bind service to the SSL virtual server and verify the configuration:

- `bind lb vserver <name> <serviceName>`
- `show lb vserver <name>`

Example:

```
1 > bind lb vserver vserver-SSL-1 SVC_HTTP1
2
3
4
5
```
Done

> show lb vserver vserver-SSL-1 vserver-SSL-1 (10.102.29.50:443) -
SSL Type:

ADDRESS State: DOWN[Certkey not bound]

Last state change was at Tue Jun 16 06:33:08 2009 (+174 ms)

Time since last state change: 0 days, 00:31:53.70

Effective State: DOWN Client Idle

Timeout: 180 sec

Down state flush: ENABLED Disable Primary Vserver On Down:

DISABLED No. of Bound Services: 1 (Total) 0 (Active)

Bind a service to a virtual server by using the GUI

1. Navigate to Traffic Management > SSL Offload > Virtual Servers.
2. In the details pane, select a virtual server, and then click Open.
3. On the Services tab, in the Active column, select the check boxes next to the services that you want to bind to the selected virtual server.
4. Click OK.
5. Verify that the Number of Bound Services counter in the Details section at the bottom of the pane is incremented by the number of services that you bound to the virtual server.

Add a certificate key pair

An SSL certificate is an integral element of the SSL Key-Exchange and encryption/decryption process. The certificate is used during SSL handshake to establish the identity of the SSL server. You can use a valid, existing SSL certificate that you have on the NetScaler appliance, or you can create your own SSL certificate. The appliance supports RSA/DSA certificates of up to 4096 bits.

Note: Citrix recommends that you use a valid SSL certificate that has been issued by a trusted certificate authority. Invalid certificates and self-created certificates are not compatible with all SSL clients.

Before a certificate can be used for SSL processing, you must pair it with its corresponding key. The certificate key pair is then bound to the virtual server and used for SSL processing.

Add a certificate key pair by using the CLI

At the command prompt, type the following commands to create a certificate key pair and verify the configuration:

- `add ssl certKey <certKeyName> -cert <string> [-key <string>]`
- `show sslcertkey <name>`

Example:

```
1 > add ssl certKey CertKey-SSL-1 -cert ns-root.cert -key ns-root.key
2
3
4
5
6 Done
```
Add a certificate key pair by using the GUI

Follow these steps:

1. Navigate to Traffic Management > SSL > Certificates.
2. In the details pane, click Add.
3. In the Install Certificate dialog box, in the Certificate-Key Pair Name text box, type a name for the certificate key pair you want to add, for example, Certkey-SSL-1.
4. Under Details, in Certificate File Name, click Browse (Appliance) to locate the certificate. Both
the certificate and the key are stored in the /nsconfig/ssl/ folder on the appliance. To use a certificate present on the local system, select Local.

5. Select the certificate you want to use, and then click Select.

6. In Private Key File Name, click Browse (Appliance) to locate the private key file. To use a private key present on the local system, select Local.

7. Select the key you want to use and click Select. To encrypt the key used in the certificate key pair, type the password to be used for encryption in the Password text box.

8. Click Install.

9. Double-click the certificate key pair and, in the Certificate Details window, verify that the parameters have been configured correctly and saved.

**Bind an SSL certificate key pair to the virtual server**

After you have paired an SSL certificate with its corresponding key, you must bind the certificate key pair to the SSL virtual server so that it can be used for SSL processing. Secure sessions require establishing a connection between the client computer and an SSL-based virtual server on the appliance. SSL processing is then carried out on the incoming traffic at the virtual server. Therefore, before enabling the SSL virtual server on the appliance, you need to bind a valid SSL certificate to the SSL virtual server.

**Bind an SSL certificate key pair to a virtual server by using the CLI**

At the command prompt, type the following commands to bind an SSL certificate key pair to a virtual server and verify the configuration:

- `bind ssl vserver <vServerName> -certkeyName <string>`
- `show ssl vserver <name>`

**Example:**

```
1 > bind ssl vserver Vserver-SSL-1 -certkeyName CertKey-SSL-1
2
3 Done
4
5
6
7
8
9 > show ssl vserver Vserver-SSL-1
10
11
12
```
Advanced SSL configuration for VServer Vserver-SSL-1:

DH: DISABLED

Ephemeral RSA: ENABLED Refresh Count: 0

Session Reuse: ENABLED Timeout: 120 seconds

Cipher Redirect: ENABLED

SSLv2 Redirect: ENABLED

ClearText Port: 0

Client Auth: DISABLED

SSL Redirect: DISABLED

Non FIPS Ciphers: DISABLED

SSLv2: DISABLED SSLv3: ENABLED TLSv1: ENABLED

1) CertKey Name: CertKey-SSL-1 Server Certificate

1) Cipher Name: DEFAULT

Description: Predefined Cipher Alias
Bind an SSL certificate key pair to a virtual server by using the GUI

Follow these steps:

1. Navigate to Traffic Management > SSL Offload > Virtual Servers.
2. Select the virtual server to which you want to bind the certificate key pair, for example, Vserver-SSL-1, and click Open.
3. In the Configure Virtual Server (SSL Offload) dialog box, on the SSL Settings tab, under Available, select the certificate key pair that you want to bind to the virtual server (for example, Certkey-SSL-1), and then click Add.
4. Click OK.
5. Verify that the certificate key pair that you selected appears in the Configured area.

Configure support for Outlook web access

If you use Outlook Web Access (OWA) servers on your NetScaler appliance, you must configure the appliance to insert a special header field, FRONT-END-HTTPS: ON, in HTTP requests directed to the OWA servers, so that the servers generate URL links as https:// instead of http://.

Note: You can enable OWA support for HTTP-based SSL virtual servers and services only. You cannot apply it for TCP-based SSL virtual servers and services.

To configure OWA support, do the following:

• Create an SSL action to enable OWA support.
• Create an SSL policy.
• Bind the policy to the SSL virtual server.

Create an SSL action to enable OWA support

Before you can enable Outlook Web Access (OWA) support, you must create an SSL action. SSL actions are bound to SSL policies and triggered when incoming data matches the rule specified by the policy.

Create an SSL action to enable OWA support by using the CLI

At the command prompt, type the following commands to create an SSL action to enable OWA support and verify the configuration:
Create an SSL action to enable OWA support by using the GUI

Follow these steps:

1. Navigate to Traffic Management > SSL > Policies.
2. In the details pane, on the Actions tab, click Add.
3. In the Create SSL Action dialog box, in the Name text box, type Action-SSL-OWA.
5. Click Create, and then click Close.
6. Verify that Action-SSL-OWA appears in the SSL Actions page.

Create SSL policies

SSL policies are created by using the policy infrastructure. Each SSL policy has an SSL action bound to it, and the action is carried out when incoming traffic matches the rule that has been configured in the policy.
Create an SSL policy by using the CLI

At the command prompt, type the following commands to configure an SSL policy and verify the configuration:

- `add ssl policy <name> -rule <expression> -reqAction <string>`
- `show ssl policy <name>`

**Example:**

```
> add ssl policy Policy-SSL-1 -rule ns_true -reqAction Action-SSL-OWA

Done

> show ssl policy Policy-SSL-1

Name: Policy-SSL-1 Rule: ns_true
Action: Action-SSL-OWA Hits: 0
Policy is bound to following entities
1) PRIORITY : 0

Done
```

Create an SSL policy by using the GUI

Follow these steps:

1. Navigate to Traffic Management > SSL > Policies.
2. In the details pane, click Add.
3. In the Create SSL Policy dialog box, in the Name text box, type the name of the SSL Policy (for example, Policy-SSL-1).
4. In Request Action, select the configured SSL action that you want to associate with this policy (for example, Action-SSL-OWA). The ns_true general expression applies the policy to all successful SSL handshake traffic. However, if you need to filter specific responses, you can create policies with a higher level of detail. For more information about configuring granular policy expressions, see [SSL actions and policies](/en-us/netscaler/11-1/ssl/ssl-actions-and-policies.html).
5. In Named Expressions, choose the built-in general expression ns_true and click Add Expression. The expression ns_true now appears in the Expression text box.
6. Click Create, and then click Close.
7. Verify that the policy is correctly configured by selecting the policy and viewing the Details section at the bottom of the pane.

**Bind the SSL policy to the SSL virtual server**

After you configure an SSL policy for Outlook Web Access, bind the policy to a virtual server that will intercept incoming Outlook traffic. If the incoming data matches any of the rules configured in the SSL policy, the policy is triggered and the action associated with it is carried out.

**Bind an SSL policy to an SSL virtual server by using the CLI**

At the command prompt, type the following commands to bind an SSL policy to an SSL virtual server and verify the configuration:

- `bind ssl vserver <vServerName> -policyName <string>`
- `show ssl vserver <name>`

**Example:**

```
> bind ssl vserver Vserver-SSL-1 -policyName Policy-SSL-1
Done
> show ssl vserver Vserver-SSL-1
Advanced SSL configuration for VServer Vserver-SSL-1:
  DH: DISABLED
  Ephemeral RSA: ENABLED
  Refresh Count: 0
  Session Reuse: ENABLED
  Timeout: 120 seconds
  Cipher Redirect: ENABLED
  SSLv2 Redirect: ENABLED
  ClearText Port: 0
  Client Auth: DISABLED
```
Bind an SSL policy to an SSL virtual server by using the GUI

Follow these steps:

1. Navigate to Traffic Management > SSL Offload > Virtual Servers.
2. In the details pane, select the virtual server (for example, Vserver-SSL-1), and then click Open.
3. In the Configure Virtual Server (SSL Offload) dialog box, click Insert Policy, and then select the policy that you want to bind to the SSL virtual server. Optionally, you can double-click the Priority field and type a new priority level.
4. Click OK.

Features at a glance

December 18, 2018

NetScaler features can be configured independently or in combinations to address specific needs. Although some features fit more than one category, the numerous NetScaler features can generally be categorized as application switching and traffic management features, application acceleration features, and application security and firewall features, and an application visibility feature.

To understand the order in which the features perform their processing, see Processing Order of Features section.

Application switching and traffic management features

December 18, 2018
Below are the application switching and traffic management features.

**SSL Offloading**

Transparencyly offloads SSL encryption and decryption from web servers, freeing server resources to service content requests. SSL places a heavy burden on an application's performance and can render many optimization measures ineffective. SSL offload and acceleration allow all the benefits of Citrix Request Switching technology to be applied to SSL traffic, ensuring secure delivery of web applications without degrading end-user performance.

For more information, see [SSL offload and acceleration](#).

**Access Control Lists**

Compares incoming packets to Access Control Lists (ACLs). If a packet matches an ACL rule, the action specified in the rule is applied to the packet. Otherwise, the default action (ALLOW) is applied and the packet is processed normally. For the appliance to compare incoming packets to the ACLs, you have to apply the ACLs. All ACLs are enabled by default, but you have to apply them in order for the NetScaler appliance to compare incoming packets against them. If an ACL is not required to be a part of the lookup table, but still needs to be retained in the configuration, it should be disabled before the ACLs are applied. An ADC appliance does not compare incoming packets to disabled ACLs.

For more information, see [Access Control List](#).

**Load Balancing**

Load balancing decisions are based on a variety of algorithms, including round robin, least connections, weighted least bandwidth, weighted least packets, minimum response time, and hashing based on URL, domain source IP, or destination IP. Both the TCP and UDP protocols are supported, so the NetScaler appliance can load balance all traffic that uses those protocols as the underlying carrier (for example, HTTP, HTTPS, UDP, DNS, NNTP, and general firewall traffic). In addition, the ADC appliance can maintain session persistence based on source IP, cookie, server, group, or SSL session. It allows users to apply custom Extended Content Verification (ECV) to servers, caches, firewalls and other infrastructure devices to ensure that these systems are functioning properly and are providing the right content to users. It can also perform health checks using ping, TCP, or HTTP URL, and the user can create monitors based on Perl scripts.

To provide high-scale WAN optimization, the CloudBridge appliances deployed at data centers can be load balanced through NetScaler appliances. The bandwidth and number of concurrent sessions can be improved significantly.

For more information, see [Load Balancing](#).
Traffic Domains

Traffic domains provide a way to create logical ADC partitions within a single NetScaler appliance. They enable you to segment network traffic for different applications. You can use traffic domains to create multiple isolated environments whose resources do not interact with each other. An application belonging to a specific traffic domain communicates only with entities, and processes traffic, within that domain. Traffic belonging to one traffic domain cannot cross the boundary of another traffic domain. Therefore, you can use duplicate IP addresses on the appliance as long as an addresses is not duplicated within the same domain.

For more information, see Traffic Domains.

Network Address Translation

Network address translation (NAT) involves modification of the source and/or destination IP addresses, and/or the TCP/UDP port numbers, of IP packets that pass through the NetScaler appliance. Enabling NAT on the appliance enhances the security of your private network, and protects it from a public network such as the Internet, by modifying your network's source IP addresses when data passes through the NetScaler appliance.

The NetScaler appliance supports the following types of network address translation:

**INAT**: In Inbound NAT (INAT), an IP address (usually public) configured on the NetScaler appliance listens to connection requests on behalf of a server. For a request packet received by the appliance on a public IP address, the ADC replaces the destination IP address with the private IP address of the server. In other words, the appliance acts as a proxy between clients and the server. INAT configuration involves INAT rules, which define a 1:1 relationship between the IP address on the NetScaler appliance and the IP address of the server.

**RNAT**: In Reverse Network Address Translation (RNAT), for a session initiated by a server, the NetScaler appliance replaces the source IP address in the packets generated by the server with an IP address (type SNIP) configured on the appliance. The appliance thereby prevents exposure of the server's IP address in any of the packets generated by the server. An RNAT configuration involves an RNAT rule, which specifies a condition. The appliance performs RNAT processing on those packets that match the condition.

**Stateless NAT46 Translation**: Stateless NAT46 enables communication between IPv4 and IPv6 networks, by way of IPv4 to IPv6 packet translation and vice versa, without maintaining any session information on the NetScaler appliance. A stateless NAT46 configuration involves an IPv4-IPv6 INAT rule and an NAT46 IPv6 prefix.

**Stateful NAT64 Translation**: The stateful NAT64 feature enables communication between IPv4 clients and IPv6 servers through IPv6 to IPv4 packet translation, and vice versa, while maintaining session
information on the NetScaler appliance. A stateful NAT64 configuration involves an NAT64 rule and an NAT64 IPv6 prefix.

For more information, see Configuring Network Address Translation.

**Multipath TCP Support**

NetScaler appliances support Multipath TCP (MPTCP). MPTCP is a TCP/IP protocol extension that identifies and uses multiple paths available between hosts to maintain the TCP session. You must enable MPTCP on a TCP profile and bind it to a virtual server. When MPTCP is enabled, the virtual server functions as an MPTCP gateway and converts MPTCP connections with the clients to TCP connections that it maintains with the servers.

For more information, see MPTCP (Multi-Path TCP).

**Content Switching**

Determines the server to which to send the request on the basis of configured content switching policies. Policy rules can be based on the IP address, URL, and HTTP headers. This allows switching decisions to be based on user and device characteristics such as who the user is, what type of agent is being used, and what content the user requested.

For more information, see Content Switching.

**Global Server Load Balancing (GSLB)**

Extends the traffic management capabilities of a NetScaler to include distributed Internet sites and global enterprises. Whether installations are spread across multiple network locations or multiple clusters in a single location, the NetScaler maintains availability and distributes traffic across them. It makes intelligent DNS decisions to prevent users from being sent to a site that is down or overloaded. When the proximity-based GSLB method is enabled, the NetScaler can make load balancing decisions based on the proximity of the client’s local DNS server (LDNS) in relation to different sites. The main benefit of the proximity-based GSLB method is faster response time resulting from the selection of the closest available site.

For more information, see Global Server Load Balancing.

**Dynamic Routing**

Enables routers to obtain topology information, routes, and IP addresses from neighboring routers automatically. When dynamic routing is enabled, the corresponding routing process listens to route
NetScaler 11.1

updates and advertises routes. The routing processes can also be placed in passive mode. Routing protocols enable an upstream router to load balance traffic to identical virtual servers hosted on two standalone NetScaler units using the Equal Cost Multipath technique.

For more information, see Configuring Dynamic Routes.

Link Load Balancing

Load balances multiple WAN links and provides link failover, further optimizing network performance and ensuring business continuity. Ensures that network connections remain highly available, by applying intelligent traffic control and health checks to distribute traffic efficiently across upstream routers. Identifies the best WAN link to route both incoming and outbound traffic based on policies and network conditions, and protects applications against WAN or Internet link failure by providing rapid fault detection and failover.

TCP Optimization

You can use TCP profiles to optimize TCP traffic. TCP profiles define the way that NetScaler virtual servers process TCP traffic. Administrators can use the built-in TCP profiles or configure custom profiles. After defining a TCP profile, you can bind it to a single virtual server or to multiple virtual servers.

Some of the key optimization features that can be enabled by TCP profiles are:

- TCP keep-alive—Checks the operational status of the peers at specified time intervals to prevent the link from being broken.
- Selective Acknowledgment (SACK)—Improves the performance of data transmission, especially in long fat networks (LFNs).
- TCP window scaling—Allows efficient transfer of data over long fat networks (LFNs).

For more information on TCP Profiles, see Configuring TCP Profiles.

CloudBridge Connector

The Citrix NetScaler CloudBridge Connector feature, a fundamental part of the Citrix OpenCloud framework, is a tool used to build a cloud-extended data center. The OpenCloud Bridge enables you to connect one or more NetScaler appliances or NetScaler virtual appliances on the cloud-to your network without reconfiguring your network. Cloud hosted applications appear as though they are running on one contiguous enterprise
network. The primary purpose of the OpenCloud Bridge is to enable companies to move their applications to the cloud while reducing costs and the risk of application failure. In addition, the OpenCloud Bridge increases network security in cloud environments. An OpenCloud Bridge is a Layer-2 network bridge that connects a NetScaler appliance or NetScaler virtual appliance on a cloud instance to a NetScaler appliance or NetScaler virtual appliance on your LAN. The connection is made through a tunnel that uses the Generic Routing Encapsulation (GRE) protocol. The GRE protocol provides a mechanism for encapsulating packets from a wide variety of network protocols to be forwarded over another protocol. Then Internet Protocol security (IPsec) protocol suite is used to secure the communication between the peers in the OpenCloud Bridge.

For more information, see CloudBridge.

**DataStream**

The NetScaler DataStream feature provides an intelligent mechanism for request switching at the database layer by distributing requests on the basis of the SQL query being sent.

When deployed in front of database servers, a NetScaler ensures optimal distribution of traffic from the application servers and Web servers. Administrators can segment traffic according to information in the SQL query and on the basis of database names, user names, character sets, and packet size.

You can configure load balancing to switch requests according to load balancing algorithms, or you can elaborate the switching criteria by configuring content switching to make a decision based on SQL query parameters, such as user name, database names, and command parameters. You can further configure monitors to track the states of database servers.

The advanced policy infrastructure on the NetScaler appliance includes expressions that you can use to evaluate and process the requests. The advanced expressions evaluate traffic associated with MySQL database servers. You can use request-based expressions (expressions that begin with MYSQL.CLIENT and MYSQL.REQ) in advanced policies to make request switching decisions at the content switching virtual server bind point and response-based expressions (expressions that begin with MYSQL.RES) to evaluate server responses to user-configured health monitors.

Note: DataStream is supported for MySQL and MS SQL databases.

For more information, see DataStream.

**Application acceleration features**

December 18, 2018

- AppCompress
Uses the gzip compression protocol to provide transparent compression for HTML and text files. The typical 4:1 compression ratio yields up to 50% reduction in bandwidth requirements out of the data center. It also results in significantly improved end-user response time, because it reduces the amount of data that must be delivered to the user's browser.

- **Cache Redirection**

  Manages the flow of traffic to a reverse proxy, transparent proxy, or forward proxy cache farm. Inspects all requests, and identifies non-cacheable requests and sends them directly to the origin servers over persistent connections. By intelligently redirecting non-cacheable requests back to the origin web servers, the NetScaler appliance frees cache resources and increases cache hit rates while reducing overall bandwidth consumption and response delays for these requests.

  For more information, see “Cache Redirection.”

- **AppCache**

  Helps optimize web content and application data delivery by providing a fast in-memory HTTP/1.1 and HTTP/1.0 compliant web caching for both static and dynamic content. This on-board cache stores the results of incoming application requests even when an incoming request is secured or the data compressed, and then reuses the data to fulfill subsequent requests for the same information. By serving data directly from the on-board cache, the appliance can reduce page regeneration times by eliminating the need to funnel static and dynamic content requests to the server.

  For more information, see “Integrated Caching.”

- **TCP Buffering**

  Buffers the server’s response and delivers it to the client at the client’s speed, thus offloading the server faster and thereby improving the performance of web sites.

---

**Application security and firewall features**

December 18, 2018

Below are the security and firewall features.

**Denial of service (DoS) attack defense**

Detects and stops malicious distributed denial-of-service (DDoS) attacks and other types of malicious attacks before they reach your servers, preventing them from affecting network and application performance. The NetScaler appliance identifies legitimate clients and elevates their priority, leaving suspect clients unable to consume a disproportionate percentage of resources and cripple your site. The appliance provides application-level protection from the following types of malicious attacks:
- SYN flood attacks
- Pipeline attacks
- Teardrop attacks
- Land attacks
- Fraggle attacks
- Zombie connection attacks

The appliance aggressively defends against these types of attacks by preventing the allocation of server resources for these connections. This insulates servers from the overwhelming flood of packets associated with these events.

The appliance also protects network resources from ICMP based attacks by using ICMP rate limiting and aggressive ICMP packet inspection. It performs strong IP reassembly, drops a variety of suspicious and malformed packets, and applies Access Control Lists (ACLs) to site traffic for further protection.

For more information, see [HTTP Denial-of-Service Protection](#).

**Content Filtering**

Provides protection from malicious attacks for web sites at the Layer 7 level. The appliance inspects each incoming request according to user-configured rules based on HTTP headers, and performs the action the user configured. Actions can include resetting the connection, dropping the request, or sending an error message to the user's browser. This allows the appliance to screen unwanted requests and reduces your servers' exposure to attacks.

This feature can also analyze HTTP GET and POST requests and filter out known bad signatures, allowing it to defend your servers against HTTP-based attacks.

For more information, see [Content Filtering](#).

**Responder**

Functions like an advanced filter and can be used to generate responses from the appliance to the client. Some common uses of this feature are generation of redirect responses, user defined responses, and resets.

For more information, see [Responder](#).

**Rewrite**

Modifies HTTP headers and body text. You can use the rewrite feature to add HTTP headers to an HTTP request or response, make modifications to individual HTTP headers, or delete HTTP headers. It also enables you to modify the HTTP body in requests and responses.
When the appliance receives a request or sends a response, it checks for rewrite rules, and if applicable rules exist, it applies them to the request or response before passing it on to the web server or client computer.

For more information, see Rewrite.

**Priority Queuing**

Prioritizes user requests to ensure that the most important traffic is serviced first during surges in request volume. You can establish priority based on request URLs, cookies, or a variety of other factors. The appliance places requests in a three-tier queue based on their configured priority, enabling business-critical transactions to flow smoothly even during surges or site attacks.

For more information, see Priority Queuing.

**Surge Protection**

Regulates the flow of user requests to servers and controls the number of users that can simultaneously access the resources on the servers, queuing any additional requests once your servers have reached their capacity. By controlling the rate at which connections can be established, the appliance blocks surges in requests from being passed on to your servers, thus preventing site overload.

For more information, see Surge Protection.

**Citrix Gateway**

1 Citrix Gateway is a secure application access solution that provides administrators granular application-level policy and action controls to secure access to applications and data while allowing users to work from anywhere. It gives IT administrators a single point of control and tools to help ensure compliance with regulations and the highest levels of information security across and outside the enterprise. At the same time, it empowers users with a single point of access—optimized for roles, devices, and networks—to the enterprise applications and data they need. This unique combination of capabilities helps maximize the productivity of today’s mobile workforce.

2

3 For more information, see [Citrix Gateway](https://docs.citrix.com/en-us/netscaler-gateway.html).
NetScaler 11.1

Application Firewall

Protects applications from misuse by hackers and malware, such as cross site scripting attacks, buffer overflow attacks, SQL injection attacks, and forceful browsing, by filtering traffic between each protected web server and users that connect to any web site on that web server. The application firewall examines all traffic for evidence of attacks on web server security or misuse of web server resources, and takes the appropriate action to prevent these attacks from succeeding.

For more information, see Application Firewall.

Application visibility feature

December 18, 2018

• NetScaler Insight Center

NetScaler Insight Center is a high performance collector that provides end-to-end user experience visibility across Web and HDX (ICA) traffic. It collects HTTP and ICA AppFlow records generated by NetScaler ADC appliances and populates analytical reports covering Layer 3 to Layer 7 statistics. NetScaler Insight Center provides in-depth analysis for the last five minutes of real-time data, and for historical data collected for the last one hour, one day, one week, and one month.

HDX (ICA) analytic dashboard enables you to drill down from HDX Users, Applications, Desktops, and even from gateway-level information. Similarly, HTTP analytics provide a bird’s eye view of Web Applications, URLs Accessed, Client IP Addresses and Server IP Addresses, and other dashboards. The administrator can drill down and identify the pain points from any of these dashboards, as appropriate for the use case.

• EdgeSight for NetScaler

Support for application performance monitoring based on end user experience. This solution leverages the HTML injection feature to obtain various time values, which are used by EdgeSight server for analysis and report generation. EdgeSight for NetScaler provides a way to monitor the performance benefits of a NetScaler and determine potential bottlenecks in a network.

For more information, see “EdgeSight Monitoring for NetScaler.”

• Enhanced Application Visibility Using AppFlow

The NetScaler appliance is a central point of control for all application traffic in the data center. It collects flow and user-session level information valuable for application performance monitoring, analytics, and business intelligence applications. AppFlow transmits this information by using the Internet Protocol Flow Information eXport (IPFIX) format, which is an open Internet Engineering Task Force (IETF) standard defined in RFC 5101. IPFIX (the standardized version
of Cisco's NetFlow) is widely used to monitor network flow information. AppFlow defines new Information Elements to represent application-level information.

Using UDP as the transport protocol, AppFlow transmits the collected data, called flow records, to one or more IPv4 collectors. The collectors aggregate the flow records and generate real-time or historical reports.

AppFlow provides visibility at the transaction level for HTTP, SSL, TCP, and SSL_TCP flows. You can sample and filter the flow types that you want to monitor.

To limit the types of flows to monitor, by sampling and filtering the application traffic, you can enable AppFlow for a virtual server. AppFlow can also provide statistics for the virtual server.

You can also enable AppFlow for a specific service, representing an application server, and monitor the traffic to that application server.

For more information, see “AppFlow.”

• Stream Analytics

The performance of your web site or application depends on how well you optimize the delivery of the most frequently requested content. Techniques such as caching and compression help accelerate the delivery of services to clients, but you need to be able to identify the resources that are requested most frequently, and then cache or compress those resources. You can identify the most frequently used resources by aggregating real-time statistics about website or application traffic. Statistics such as how frequently a resource is accessed relative to other resources and how much bandwidth is consumed by those resources help you determine whether those resources need to be cached or compressed to improve server performance and network utilization. Statistics such as response times and the number of concurrent connections to the application help you determine whether you must enhance server-side resources.

If the web site or application does not change frequently, you can use products that collect statistical data, and then manually analyze the statistics and optimize the delivery of content. However, if you do not want to perform manual optimizations, or if your web site or application is dynamic in nature, you need infrastructure that can not only collect statistical data but can also automatically optimize the delivery of resources on the basis of the statistics. On the NetScaler appliance, this functionality is provided by the Stream Analytics feature. The feature operates on a single NetScaler appliance and collects run-time statistics on the basis of criteria that you define. When used with NetScaler policies, the feature also provides you with the infrastructure that you need for automatic, real-time traffic optimization.

For more information, see “Action Analytics.”
FAQs

December 18, 2018

This section provides the frequently asked questions on the following NetScaler features

- AppFlow
- AutoScale
- Call Home
- Clustering
- Connection Management
- Configuration Utility
- Content Switching
- Debugging
- High Availability
- Hardware
- Integrated Caching
- Load Balancing
- Migration
- SDX
- SSL
- Installing, Upgrading, and Downgrading

Solutions for Telecom Service Providers

December 18, 2018

Information and Communication Technology (ICT) is about bringing the Internet user closer to the apps and data. The latest datacenter technologies have enabled the user, apps and data to be located anywhere. A user can access apps and data from the office or from home, or from a location such as an airport. The apps and data can be located either on the enterprise's premises, in a public or private cloud, or on a hybrid host. The result has been on only increased productivity, but also reduced costs of ownership and maintenance.

Service provides offer the core infrastructure needed for carrying the user's apps and data over the network. Because the core infrastructure serves millions of subscribers and a wide variety of apps and data, requirements for scale and protocol support are very high. The core infrastructure handles two major types of traffic: data plane and control plane. Each of these planes has its own scale and protocol-support requirements.

The data plane is the part of the core infrastructure that carries user apps and data from end to end, that is, between end-user equipment and the application server. The number of users accessing apps
and data is in the thousands of millions, so throughput and IP-addressing requirements are very high. Every user in the network must be uniquely identifiable. Only then can the service provider control the traffic, monitor network usage, deliver user-specific services, and log information correctly. Many of the today’s client devices and application servers support IPv6 natively. The core infrastructure must not only support a mix of IPv4 and IPv6 clients and servers, but also provide the technologies for cross-communication between IPv4 and IPv6. Finally, a service provider is measured by the quality of service (directly related to end-user experience) and the availability of service without disruptions. The data plane should be resilient enough to provide both quality and availability at the same time.

The control-plane infrastructure manages user traffic and maintains the business and network operations services. The most important of the many protocols that run in this plane are Diameter, Radius, and SMPP. Diameter is a base protocol over which several other function-specific protocols have been developed. For example:

- Gx interface between the Policy and Charging Enforcement Function (PCEF) and the Policy and Charging Rules Function (PCRF)
- Gy interface between the Online Charging System (OCS) and the Cisco Packet Data Network Gateway (PGW)/Policy and Charging Enforcement Function (PCEF)

The volume of control plane traffic is in direct proportion to user activity. To manage the control plane traffic, service providers use several ADC functionalities, such as load balancing and content switching. They need fine-grain control of control plane traffic, which equals data-plane traffic in complexity.

Service providers must meet demanding service-level agreements (SLAs), and are scrutinized thoroughly by regulators for compliance. Adhering to requirements while managing the data and control plane traffic requires a service provider to keep its infrastructure nimble, within budget, easily upgradable, and flexible. As the most powerful and advanced ADCs in the market today, NetScaler ADC products are a natural fit for the service-provider environment.

### Large Scale NAT

January 6, 2019

This feature is available with a NetScaler enterprise or platinum edition license.

The Internet’s phenomenal growth has resulted in a shortage of public IPv4 addresses. Large Scale NAT (LSN/CGNAT) provides a solution to this issue, maximizing the use of available public IPv4 addresses by sharing a few public IPv4 addresses among a large pool of Internet users.

LSN translates private IPv4 addresses into public IPv4 addresses. It includes network address and port translation methods to aggregate many private IP addresses into fewer public IPv4 addresses. LSN is designed to handle NAT on a large scale. The NetScaler LSN feature is very useful for Internet
Service Providers (ISPs) and carriers providing millions of translations to support a large number of users (subscribers) and at very high throughput.

**LSN Architecture**

The LSN architecture of an ISP using Citrix products consists of subscribers (Internet users) in private address spaces accessing the Internet through a NetScaler appliance deployed in ISP’s core network. Subscribers are connected to the ISP through the ISP’s access network. Usually, subscribers for commercial use of the Internet are directly connected to the ISP’s access network. Serving those subscribers requires only one level of NAT (NAT44).

Noncommercial subscribers, however, are typically behind customer-premises equipment (CPE), such as routers and modems, that also implements NAT. These two levels of NAT create the NAT444 model. Deploying a NetScaler appliance in an ISP’s core network for LSN functionality is transparent to the subscribers and requires no configuration changes to subscribers or the CPEs.

The NetScaler appliance receives all subscriber packets destined to the Internet. The appliance is configured with a pool of pre-defined NAT IP addresses to use for LSN. The NetScaler appliance uses its LSN feature to translate the source IP address (private) and port of the packet to the NAT IP address (public) and NAT port, and then sends the packet to its destination on the Internet. The appliance maintains a record of all active sessions that use the LSN feature. These sessions are called LSN sessions. The NetScaler appliance also maintains the mappings between subscriber IP address and port, and NAT IP address and port, for each session. These mappings are called LSN mappings. From LSN sessions and LSN mappings, the NetScaler appliance recognizes a response packet (received from the Internet) belonging to a particular session. The appliance translates the destination IP address and port of the response packet from NAT IP address:port to the subscriber IP address:port, and sends the translated packet to the subscriber.

**LSN Features Supported on NetScaler appliance**

The following describes some of the LSN features supported on NetScaler appliance:

**NAT Resource Allocation**

The NetScaler appliance allocates NAT IP addresses and ports, from its pre-defined NAT resource pool, to subscribers to translate their packets for transmission to external hosts (Internet). The NetScaler appliance supports the following types of NAT IP address and port allocation for subscribers:

- **Deterministic.** The NetScaler appliance allocates a NAT IP address and a block of ports to each subscriber. The appliance sequentially allocates NAT resources to these subscribers. It assigns the first block of ports on the beginning NAT IP address to the beginning subscriber IP address.
The next range of ports is assigned to the next subscriber, and so on, until the NAT address does not have enough ports for the next subscriber. At that point, the first port block on the next NAT address is assigned to the subscriber, and so on.

The NetScaler appliance logs the allocated NAT IP address and the port block for a subscriber. For a connection, a subscriber can be identified just by its mapped NAT IP address and port block. Because of this reason, the NetScaler appliance does not log any LSN session created or deleted. If the entire block of ports is being used, the NetScaler appliance drops any new connection from the subscriber.

- **Dynamic.** The NetScaler appliance allocates a random NAT IP address and a port from the LSN NAT pool for a subscriber’s connection. When port block allocation is enabled in the configuration, the appliance allocates a random NAT IP address and a block of ports for a subscriber when it initiates a connection for the first time. The NetScaler appliance then allocates this NAT IP address and one of the ports from the allocated block to each subsequent connection from this subscriber. If the entire block of ports is being used, the appliance allocates a new random port block to the subscriber when it initiates a new connection. One of the port in the new port block is allocated for the new connection.

**IP Pooling**

The following NAT resource allocation options are available for subsequent sessions of a subscriber who was allocated a random NAT IP address and port for an existing session.

- **Paired.** The NetScaler appliance allocates the same NAT IP address for all sessions associated with the same subscriber. When no more ports are available for that address, the appliance drops any new connections from the subscriber. This option is needed for proper functioning of certain applications that require creation of multiple sessions on the same source IP address (for example in peer-to-peer applications that use RTP or RTCP protocol.

- **Random.** The NetScaler appliance allocates random NAT IP addresses, from the pool, for different sessions associated with the same subscriber.

**Reusing LSN Mappings**

The NetScaler appliance can reuse an existing LSN map for new connections originating from the same subscriber IP address and port. The NetScaler LSN feature supports the following types of LSN mapping reuse:

1. **Endpoint Independent.** The NetScaler appliance reuses the LSN mapping for subsequent packets sent from the same subscriber IP address and port (X:x) to any external IP address and port. This type of LSN map reuse is useful for proper functioning of VOIP and peer-to-peer applications.
2. **Address dependent.** The NetScaler appliance reuses the LSN mapping for subsequent packets sent from the same subscriber IP address and port \((X:x)\) to the same external IP address \((Y)\), regardless of the external port.

3. **Address port dependent.** The NetScaler appliance reuses the LSN mapping for subsequent packets sent from the same internal IP address and port \((X:x)\) to the same external IP address and port \((Y:y)\) while the mapping is still active.

### LSN Filtering

The NetScaler appliance can filter packets from external hosts based on the active LSN sessions and LSN mappings. Consider an example of an LSN mapping that includes the mapping of subscriber IP:port \((X:x)\), NAT IP:port \((N:n)\), and external host IP:port \((Y:y)\). The NetScaler LSN feature supports the following types of filtering:

1. **Endpoint Independent.** The NetScaler appliance filters out only those packets that are not destined to NAT IP:port \((N:n)\), which represents subscriber IP:port \((X:x)\), regardless of the external host IP address and port source \((Z:z)\). The NetScaler appliance forwards any packets destined to \(X:x\). In other words, sending packets from the subscriber to any external IP address is sufficient to allow packets from any external host to the subscriber. This type of filtering is useful for proper functioning of VOIP and peer-to-peer applications.

2. **Address dependent.** The NetScaler appliance filters out packets not destined to NAT IP:port \((N:n)\), which represents subscriber IP:port \((X:x)\). In addition, the appliance filters out packets from external host IP address and port \((Y:y)\) destined for \(N:n\) if the subscriber has not previously sent packets to \(Y:anyport\) (external port independent). In other words, receiving packets from a specific external host requires that the subscriber first send packets to that specific external host's IP address.

3. **Address port dependent.** The NetScaler appliance filters out packets not destined to NAT IP:port \((N:n)\), which represents subscriber IP:port \((X:x)\). In addition, the appliance filters out packets from external host IP address and port \((Y:y)\) destined for \(N:n\) if the subscriber has not previously sent packets to \(Y:y\). In other words, receiving packets from a specific external host requires that the subscriber first send packets to that specific external IP address and port.

### Quotas

The NetScaler appliance can limit the number of NAT ports and sessions for each subscriber to ensure fair distribution of resources among subscribers. The NetScaler appliance can also limit the number of session for a subscriber group to ensure fair distribution of resources among different subscriber groups.

- **Port quota.** The NetScaler appliance can limit the LSN NAT ports to be used at a time by each subscriber for a specified protocol. For example, you could limit each subscriber to a maxi-
mum of 500 TCP NAT ports. When the LSN NAT mappings for a subscriber reach the limit, the NetScaler appliance does not allocate additional NAT ports of the specified protocol to that subscriber.

- **Subscriber Session Limit.** The number of concurrent session for a subscriber can be more than it port quota. The NetScaler appliance can limit the LSN sessions allowed for each subscriber for a specified protocol. When the number of LSN sessions reaches the limit for a subscriber, the NetScaler appliance does not allow the subscriber to open additional sessions of the specified protocol.

- **Group Session Limit.** The NetScaler appliance can limit the total number of LSN sessions allowed for a subscriber group for a specified protocol. When the total number of LSN sessions reaches the limit for a group for a specified protocol, the NetScaler appliance does not allow any subscriber of the group to open additional sessions of the specified protocol. For example, You limit a group to a maximum of 10000 UDP sessions. When the total number of UDP sessions for this group reaches 10000, the NetScaler appliance does not allow any subscriber of the group to open additional UDP sessions.

### Application Layer Gateways

For some Application layer protocols, the IP addresses and protocol port numbers are also communicated in the packet’s payload. Application Layer Gateway for a protocol parses the packet’s payload and does necessary changes to ensure that the protocol continues to work over LSN.

The NetScaler appliance supports ALG for the following protocols:

- FTP
- ICMP
- TFTP
- PPTP
- SIP
- RTSP

### Hairpin Support

The NetScaler appliance supports communication between subscribers or internal hosts using NAT IP addresses. This type of communication between two subscribers using NAT IP addresses is called hairpin flow. Hairpin flow is enabled by default, and you cannot disable it.

### Points to Consider before Configuring LSN

December 18, 2018
Consider the following points before configuring LSN on a NetScaler appliance:

- Make sure that you understand the different components of Large Scale NAT, described in RFCs 6888, 5382, 5508, and 4787.
- Endpoint independent mapping (EIM) and endpoint independent filtering (EIF) are disabled by default. These options must be enabled for proper functioning of VoIP and peer-to-peer (P2P) applications.
- **Logging LSN:** Following are the consideration points for logging LSN information:
  - Citrix recommends logging the LSN information on external log servers instead of on the NetScaler appliance. Logging on external servers facilitates optimal performance when the appliance creates large numbers of LSN log entries (in order of millions).
  - Citrix recommends using SYSLOG over TCP, or NSLOG. By default SYSLOG uses UDP, and NSLOG uses only TCP to transfer log information to the log servers. TCP is more reliable than UDP for transferring complete data.
  - The following limitations apply to SYSLOG over TCP:
    * The Syslog over TCP solution does not provide authentication, integrity check, and privacy.
    * The NetScaler appliance relies on the TCP protocol to provide confirmation of SYSLOG message delivery to external log servers.
- **High Availability:** Following are the consideration points for high availability of NetScaler appliances for LSN:
  - Citrix recommends configuring the LSN feature in a high availability deployment of two NetScaler appliances for uninterrupted and seamless operation of all LSN sessions.
  - In a high availability deployment, Citrix recommends:
    * Setting the SYNC VLAN parameter for dedicating a VLAN for all HA related communication.
    * Synchronizing the symmetric RSS key of the primary node to the secondary node for stateful synchronization of a large number of LSN mappings and sessions.
    * Binding the subnet of LSN IP addresses to a VLAN to avoid flooding of GARP broadcasts on all VLANs after a failover.
  - In a high availability deployment of NetScaler appliances, ALG-related sessions are not mirrored to the secondary appliance.
- **Application Layer Gateways (ALGs):** Following are the consideration points related for ALGs on a NetScaler appliance:
  - The following are not supported for SIP ALG:
    * Multicast IP addresses
    * Encrypted SDP
    * SIP messages over TLS
    * FQDN translation in SIP messages
    * Authentication of SIP messages
* Traffic domains, admin partitions, and NetScaler clusters.
* SIP messages with multipart bodies.
- The following are not supported for RTSP ALG:
  * Multicast RTSP sessions
  * RTSP session over UDP
  * NetScaler traffic domains, admin partitions, and NetScaler clusters
- The NetScaler appliance does not support ALG for the IPSec protocol.

- If you disable the LSN feature when some LSN sessions exist on the NetScaler appliance, these sessions continue to exist for the duration of the configured timeout interval.
- LSN takes precedence over RNAT. If a packet from a specified LSN subscriber also matches a RNAT rule, the packet is translated according to the LSN configuration.
- Forwarding of packets related only to the LSN sessions is based on the NetScaler appliance’s routing table.
- Unlike with subnet IP addresses, selection of an LSN NAT IP address for a subscriber’s connection is not based on the routing entry for the destination IP address.
- For inbound packets, static LSN mappings take precedence over dynamic LSN mappings.
- For outbound packets, LSN application profiles take precedence over static mapping.
- When a large number of LSN sessions (> 1 million) exist on the NetScaler appliance, Citrix recommends displaying selected LSN sessions instead of all of them. In the command line interface or the configuration utility, use the selection parameters for showing LSN session operation.
- LSN is not supported in a NetScaler cluster.
- To reduce the amount of active memory allocated to the LSN feature, you must warm restart the NetScaler appliance after changing the configured-memory setting. Without a warm restart, you can only increase the amount of active memory.

### Configuration Steps for LSN

December 18, 2018

Configuring LSN on a NetScaler appliance consists of the following tasks:

1. **Set the global LSN parameters.** Global parameters include the amount of NetScaler memory reserved for the LSN feature and synchronization of LSN sessions in a high availability setup.
2. **Create an LSN client entity and bind subscribers to it.** An LSN client entity is a set of subscribers on whose traffic you want the NetScaler appliance to perform LSN. The client entity includes IPv4 addresses and extended ACL rules for identifying subscribers. An LSN client can be bound to only one LSN group. The command line interface has two commands for creating an LSN client entity and binding a subscriber to the LSN client entity. The configuration utility combines these two operations on a single screen.
3. **Create an LSN pool and bind NAT IP addresses to it.** An LSN pool defines a pool of NAT IP addresses to be used by the NetScaler appliance to perform LSN. The pool is assigned parameters, such as port block allocation and NAT type (Deterministic or Dynamic). An LSN pool bound to an LSN group applies to all subscribers of an LSN client entity bound to the same group. Only LSN Pools and LSN groups with the same NAT type settings can be bound together. Multiple LSN pools can be bound to an LSN group. For Dynamic NAT, an LSN pool can be bound to multiple LSN groups. For Deterministic NAT, pools bound to an LSN group cannot be bound to other LSN groups. The command line interface has two commands for creating an LSN pool and binding NAT IP addresses to the LSN pool. The configuration utility combines these two operations on a single screen.

4. **(Optional) Create an LSN Transport Profile for a specified protocol.** An LSN transport profile defines various timeouts and limits, such as maximum LSN sessions and maximum ports usage, that a subscriber can have for a given protocol. You bind an LSN transport profile for each protocol (TCP, UDP, and ICMP) to an LSN group. A profile can be bound to multiple LSN groups. A profile bound to an LSN group applies to all subscribers of an LSN client bound to the same group. By default, one LSN transport profile with default settings for TCP, UDP, and ICMP protocols is bound to an LSN group during its creation. This profile is called default transport profile. An LSN transport profile that you bind to an LSN group overrides the default LSN transport profile for that protocol.

5. **(Optional) Create an LSN Application Profile for a specified protocol and bind a set of destination ports to it.** An LSN application profile defines the LSN mapping and LSN filtering controls of a group for a given protocol and for a set of destination ports. For a set of destination ports, you bind an LSN profile for each protocol (TCP, UDP, and ICMP) to an LSN group. A profile can be bound to multiple LSN groups. An LSN application profile bound to an LSN group applies to all subscribers of an LSN client bound to the same group. By default, one LSN application profile with default settings for TCP, UDP, and ICMP protocols for all destination ports is bound to an LSN group during its creation. This profile is called a default application profile. When you bind an LSN application profile, with a specified set of destination ports, to an LSN group, the bound profile overrides the default LSN application profile for that protocol at that set of destination ports. The command line interface has two commands for creating an LSN application profile and binding a set of destination ports to the LSN application profile. The configuration utility combines these two operations on a single screen.

6. **Create an LSN Group and bind LSN pools, (optional) LSN transport profiles, and (optional) LSN application profiles to the LSN group.** An LSN group is an entity consisting of an LSN client, LSN pool(s), LSN transport profile(s), and LSN application profiles(s). A group is assigned parameters, such as port block size and logging of LSN sessions. The parameter settings apply to all the subscribers of an LSN client bound to the LSN group. Only LSN Pools and LSN groups with the same NAT type settings can be bound together. Multiple LSN pools can be bound to an LSN group. For Dynamic NAT, an LSN pool can be bound to multiple LSN groups. For Deterministic
NAT, pools bound to an LSN group cannot be bound to other LSN groups. Only one LSN client entity can be bound to an LSN group, and an LSN client entity bound to an LSN group cannot be bound to other LSN groups. The command line interface has two commands for creating an LSN group and binding LSN pools, LSN transport profiles, LSN application profiles to the LSN group. The configuration utility combines these two operations in a single screen.

The following table lists the maximum numbers of different LSN entities and bindings that can be created on a NetScaler appliance. These limits are also subject to memory available on the NetScaler appliance.

<table>
<thead>
<tr>
<th>LSN entities and bindings</th>

**Configuration Using the Command Line Interface**

**To create an LSN client by using the command line interface**

At the command prompt, type:

```
1  add lsn client <clientname>
2
3  show lsn client
```

**To bind a network address or an ACL rule to an LSN client by using the command line interface**

At the command prompt, type:

```
1  bind lsn client <clientname> ((-network <ip_addr> [-netmask <netmask>] [-td<positive_integer>]) | -aclname <string>)
2
3  show lsn client
```

**To create an LSN pool by using the command line interface**

At the command prompt, type:

```
1  add lsn pool <poolname> [-nattype ( DYNAMIC | DETERMINISTIC )] [-portblockallocation ( ENABLED | DISABLED )] [-portrealloctimeout <secs>] [-maxPortReallocTmq <positive_integer>]
2
3  show lsn pool
```

**To bind an IP address range to an LSN pool by using the command line interface**

At the command prompt, type:

```
1  bind lsn pool <poolname> <lsnip>
2
3  show lsn pool
```

**Note:** For removing LSN IP addresses from an LSN pool, use the unbind lsn pool command.
To create an LSN transport profile by using the command line interface

At the command prompt, type:

```
1   add lsn transportprofile <transportprofilename> <transportprotocol> [-sessiontimeout <secs>] [-finrsttimeout <secs>] [-portquota <positive_integer>] [-sessionquota <positive_integer>] [-portpreserveparity ( ENABLED | DISABLED )] [-portpreserverange ( ENABLED | DISABLED )] [-syncheck ( ENABLED | DISABLED )]
```

```
2
3   show lsn transportprofile
```

To create an LSN application profile by using the command line interface

At the command prompt, type:

```
1   add lsn appsprofile <appsprofilename> <transportprotocol> [-ippooling (PAIRED | RANDOM )] [-mapping <mapping>] [-filtering <filtering>] [-tcpproxy ( ENABLED | DISABLED )] [-td <positive_integer>]
```

```
2
3   show lsn appsprofile
```

To bind an application protocol port range to an LSN application profile by using the command line interface

At the command prompt, type:

```
1   bind lsn appsprofile <appsprofilename> <lsnport>
```

```
2
3   show lsn appsprofile
```

To create an LSN group by using the command line interface

At the command prompt, type:

```
1   add lsn group <groupname> -hostname <hostname> [-clientname ( DYNAMIC | DETERMINISTIC )] [-portblocksize <positive_integer>] [-logging ( ENABLED | DISABLED )] [-sessionLogging ( ENABLED | DISABLED )] [-sessionSync ( ENABLED | DISABLED )] [-snmptraplimit <positive_integer>] [-ftp ( ENABLED | DISABLED )]
```

```
2
3   show lsn group
```
To bind LSN profiles and LSN pools to an LSN group by using the command line interface

At the command prompt, type:

```
1 bind lsn group <groupname> (-poolname <string> | -transportprofilename <string> | -appsprofilename <string>)
2
3 show lsn group
```

**Configuration Using the Configuration Utility**

To configure an LSN client and bind an IPv4 network address or an ACL rule by using the configuration utility

Navigate to **System > Large Scale NAT > Clients**, and add a client and then bind an IPv4 network address or an ACL rule to the client.

To configure an LSN pool and bind NAT IP addresses by using the configuration utility

Navigate to **System > Large Scale NAT > Pools**, and add a pool and then bind an NAT IP address or a range of NAT IP addresses to the pool.

To configure an LSN transport profile by using the configuration utility

1. Navigate to **System > Large Scale NAT > Profiles**.
2. On the details pane, click **Transport** tab, and then add a transport profile.

To configure an LSN application profile by using the configuration utility

1. Navigate to **System > Large Scale NAT > Profiles**.
2. On the details pane, click **Application** tab, and then add an application profile.

To configure an LSN group and bind an LSN client, pools, transport profiles, and application profiles by using the configuration utility

Navigate to **System > Large Scale NAT > Groups**, and add a group and then bind an LSN client, pools, transport profiles, and application profiles to the group.

**Parameter Descriptions (of commands listed in the CLI procedure)**

- add lsn client
  - clientname

  Name for the LSN client entity. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.),
space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after
the LSN client is created. The following requirement applies only to the CLI: If the name
includes one or more spaces, enclose the name in double or single quotation marks (for
example, “lsn client1” or ‘lsn client1’).
This is a mandatory argument. Maximum Length: 127

Parameter Descriptions (of commands listed in the CLI procedure)

• bind lsn client
  – clientname
    Name for the LSN client entity. Must begin with an ASCII alphanumeric or underscore (_)
    character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.),
    space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after
    the LSN client is created. The following requirement applies only to the CLI: If the name
    includes one or more spaces, enclose the name in double or single quotation marks (for
    example, “lsn client1” or ‘lsn client1’).
    This is a mandatory argument. Maximum Length: 127
  – network
    IPv4 address(es) of the LSN subscriber(s) or subscriber network(s) on whose traffic you
    want the NetScaler appliance to perform Large Scale NAT.
  – netmask
    Subnet mask for the IPv4 address specified in the Network parameter.
    Default value: 255.255.255.255
  – td
    ID of the traffic domain on which this subscriber or the subscriber network (as specified
    by the network parameter) belongs.
    If you do not specify an ID, the subscriber or the subscriber network becomes part of the
    default traffic domain.
    Default value: 0
    Minimum value: 0
    Maximum value: 4094
  – aclname
Name(s) of any configured extended ACL(s) whose action is ALLOW. The condition specified in the extended ACL rule identifies the traffic from an LSN subscriber for which the NetScaler appliance is to perform large scale NAT. Maximum Length: 127

Parameter Descriptions (of commands listed in the CLI procedure)

- add lsn pool
  - poolname

  Name for the LSN pool. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN pool is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “lsn pool1” or ‘lsn pool1’).

  This is a mandatory argument. Maximum Length: 127

- nattype

  Type of NAT IP address and port allocation (from the LSN pools bound to an LSN group) for subscribers (of the LSN client entity bound to the LSN group):

  Available options function as follows:

  * **Deterministic**—Allocate a NAT IP address and a block of ports to each subscriber (of the LSN client bound to the LSN group). The NetScaler appliance sequentially allocates NAT resources to these subscribers. The NetScaler appliance assigns the first block of ports (block size determined by the port block size parameter of the LSN group) on the beginning NAT IP address to the beginning subscriber IP address. The next range of ports is assigned to the next subscriber, and so on, until the NAT address does not have enough ports for the next subscriber. In this case, the first port block on the next NAT address is used for the subscriber, and so on. Because each subscriber now receives a deterministic NAT IP address and a block of ports, a subscriber can be identified without any need for logging. For a connection, a subscriber can be identified based only on the NAT IP address and port, and the destination IP address and port.

  * **Dynamic**—Allocate a random NAT IP address and a port from the LSN NAT pool for a subscribers connection. If port block allocation is enabled (in LSN pool) and a port block size is specified (in the LSN group), the NetScaler appliance allocates a random NAT IP address and a block of ports for a subscriber when it initiates a connection for the first time. The appliance allocates this NAT IP address and a port (from the
allocated block of ports) for different connections from this subscriber. If all the ports are allocated (for different subscribers connections) from the subscribers allocated port block, the appliance allocates a new random port block for the subscriber. Only LSN Pools and LSN groups with the same NAT type settings can be bound together. Multiple LSN pools can be bound to an LSN group.

Possible values: DYNAMIC, DETERMINISTIC

Default value: DYNAMIC

- **portblockallocation**

Allocate a random NAT port block, from the available NAT port pool of an NAT IP address, for each subscriber when the NAT allocation is set as Dynamic NAT. For any connection initiated from a subscriber, the NetScaler appliance allocates a NAT port from the subscribers allocated NAT port block to create the LSN session.

You must set the port block size in the bound LSN group. For a subscriber, if all the ports are allocated from the subscribers allocated port block, the NetScaler appliance allocates a new random port block for the subscriber.

For Deterministic NAT, this parameter is enabled by default, and you cannot disable it.

Possible values: ENABLED, DISABLED

Default value: DISABLED

- **portrealloctimeout**

The waiting time, in seconds, between deallocating LSN NAT ports (when an LSN mapping is removed) and reallocating them for a new LSN session. This parameter is necessary in order to prevent collisions between old and new mappings and sessions. It ensures that all established sessions are broken instead of redirected to a different subscriber. This is not applicable for ports used in:

* Deterministic NAT
* Address-Dependent filtering and Address-Port-Dependent filtering
* Dynamic NAT with port block allocation

In these cases, ports are immediately reallocated.

Default value: 0

Maximum value: 600

- **maxPortReallocTmq**

Maximum number of ports for which the port reallocation timeout applies for each NAT IP address. In other words, the maximum deallocated-port queue size for which the reallocation timeout applies for each NAT IP address.
When the queue size is full, the next port deallocated is reallocated immediately for a new LSN session.

Default value: 65536

Maximum value: 65536

**Parameter Descriptions (of commands listed in the CLI procedure)**

- **bind lsn pool**
  - **poolname**
    Name for the LSN pool. Must begin with an ASCII alphanumeric or underscore (\_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN pool is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “lsn pool1” or ‘lsn pool1’).
    
    This is a mandatory argument. Maximum Length: 127
  - **lsnip**
    IPv4 address or a range of IPv4 addresses to be used as NAT IP address(es) for LSN.
    
    After the pool is created, these IPv4 addresses are added to the NetScaler appliance as NetScaler owned IP address of type LSN. An LSN IP address associated with an LSN pool cannot be shared with other LSN pools. IP addresses specified for this parameter must not already exist on the NetScaler appliance as any NetScaler owned IP addresses. In the command line interface, separate the range with a hyphen. For example: 10.102.29.30-10.102.29.189. You can later remove some or all the LSN IP addresses from the pool, and add IP addresses to the LSN pool.

- **add lsn transportprofile**
  - **transportprofilename**
    Name for the LSN transport profile. Must begin with an ASCII alphanumeric or underscore (\_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN transport profile is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “lsn transport profile1” or ‘lsn transport profile1’).
This is a mandatory argument. Maximum Length: 127

- **transportprotocol**

  Protocol for which to set the LSN transport profile parameters.

  This is a mandatory argument.

  Possible values: TCP, UDP, ICMP

- **sessiontimeout**

  Timeout, in seconds, for an idle LSN session. If an LSN session is idle for a time that exceeds this value, the NetScaler appliance removes the session.

  This timeout does not apply for a TCP LSN session when a FIN or RST message is received from either of the endpoints.

  Default value: 120

  Minimum value: 60

- **finsrttimeout**

  Timeout, in seconds, for a TCP LSN session after a FIN or RST message is received from one of the endpoints.

  If a TCP LSN session is idle (after the NetScaler appliance receives a FIN or RST message) for a time that exceeds this value, the NetScaler appliance removes the session.

  Since the LSN feature of the NetScaler appliance does not maintain state information of any TCP LSN sessions, this timeout accommodates the transmission of the FIN or RST, and ACK messages from the other endpoint so that both endpoints can properly close the connection.

  Default value: 30

- **portquota**

  Maximum number of LSN NAT ports to be used at a time by each subscriber for the specified protocol. For example, each subscriber can be limited to a maximum of 500 TCP NAT ports. When the LSN NAT mappings for a subscriber reach the limit, the NetScaler appliance does not allocate additional NAT ports for that subscriber.

  Default value: 0

  Minimum value: 0

  Maximum value: 65535

- **sessionquota**
Maximum number of concurrent LSN sessions allowed for each subscriber for the specified protocol. When the number of LSN sessions reaches the limit for a subscriber, the NetScaler appliance does not allow the subscriber to open additional sessions.

Default value: 0
Minimum value: 0
Maximum value: 65535

- portpreserveparity

Enable port parity between a subscriber port and its mapped LSN NAT port. For example, if a subscriber initiates a connection from an odd numbered port, the NetScaler appliance allocates an odd numbered LSN NAT port for this connection. You must set this parameter for proper functioning of protocols that require the source port to be even or odd numbered, for example, in peer-to-peer applications that use RTP or RTCP protocol.

Possible values: ENABLED, DISABLED
Default value: DISABLED

- portpreserverange

If a subscriber initiates a connection from a well-known port (0-1023), allocate a NAT port from the well-known port range (0-1023) for this connection. For example, if a subscriber initiates a connection from port 80, the NetScaler appliance can allocate port 100 as the NAT port for this connection.

This parameter applies to dynamic NAT without port block allocation. It also applies to Deterministic NAT if the range of ports allocated includes well-known ports.

When all the well-known ports of all the available NAT IP addresses are used in different subscribers connections (LSN sessions), and a subscriber initiates a connection from a well-known port, the NetScaler appliance drops this connection.

Possible values: ENABLED, DISABLED
Default value: DISABLED

- syncheck

Silently drop any non-SYN packets for connections for which there is no LSN-NAT session present on the NetScaler appliance.

If you disable this parameter, the NetScaler appliance accepts any non-SYN packets and creates a new LSN session entry for this connection.

Following are some reasons for the NetScaler appliance to receive such packets:
* LSN session for a connection existed but the NetScaler appliance removed this session because the LSN session was idle for a time that exceeded the configured session timeout.
* Such packets can be a part of a DoS attack.

Possible values: ENABLED, DISABLED
Default value: ENABLED

**Parameter Descriptions (of commands listed in the CLI procedure)**

- **add lsn appsprofile**
  - **appsprofilename**
    Name for the LSN application profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN application profile is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “lsn application profile1” or ‘lsn application profile1’).
    This is a mandatory argument. Maximum Length: 127
  - **transportprotocol**
    Name of the protocol for which the parameters of this LSN application profile applies.
    This is a mandatory argument.
    Possible values: TCP, UDP, ICMP
  - **ippooling**
    NAT IP address allocation options for sessions associated with the same subscriber.
    Available options function as follows:
    * **Paired**—The NetScaler appliance allocates the same NAT IP address for all sessions associated with the same subscriber. When all the ports of a NAT IP address are used in LSN sessions (for same or multiple subscribers), the NetScaler appliance drops any new connection from the subscriber.
    * **Random**—The NetScaler appliance allocates random NAT IP addresses, from the pool, for different sessions associated with the same subscriber.
    This parameter is applicable to dynamic NAT allocation only.
    Possible values: PAIRED, RANDOM
    Default value: RANDOM
- **mapping**

Type of LSN mapping to apply to subsequent packets originating from the same subscriber IP address and port.

Consider an example of an LSN mapping that includes the mapping of the subscriber IP:port (X:x), NAT IP:port (N:n), and external host IP:port (Y:y).

Available options function as follows:

* **ENDPOINT-INDEPENDENT**—Reuse the LSN mapping for subsequent packets sent from the same subscriber IP address and port (X:x) to any external IP address and port.

* **ADDRESS-DEPENDENT**—Reuse the LSN mapping for subsequent packets sent from the same subscriber IP address and port (X:x) to the same external IP address (Y), regardless of the external port.

* **ADDRESS-PORT-DEPENDENT**—Reuse the LSN mapping for subsequent packets sent from the same internal IP address and port (X:x) to the same external IP address and port (Y:y) while the mapping is still active.

Possible values: ENDPOINT-INDEPENDENT, ADDRESS-DEPENDENT, ADDRESS-PORT-DEPENDENT

Default value: ADDRESS-PORT-DEPENDENT

- **filtering**

Type of filter to apply to packets originating from external hosts.

Consider an example of an LSN mapping that includes the mapping of subscriber IP:port (X:x), NAT IP:port (N:n), and external host IP:port (Y:y).

Available options function as follows:

* **ENDPOINT INDEPENDENT**—Filters out only packets not destined to the subscriber IP address and port X:x, regardless of the external host IP address and port source (Z:z). The NetScaler appliance forwards any packets destined to X:x. In other words, sending packets from the subscriber to any external IP address is sufficient to allow packets from any external hosts to the subscriber.

* **ADDRESS DEPENDENT**—Filters out packets not destined to subscriber IP address and port X:x. In addition, the appliance filters out packets from Y:y destined for the subscriber (X:x) if the client has not previously sent packets to Y:anyp (external port independent). In other words, receiving packets from a specific external host requires that the subscriber first send packets to that specific external host’s IP address.

* **ADDRESS PORT DEPENDENT** (the default)—Filters out packets not destined to subscriber IP address and port (X:x). In addition, the NetScaler appliance filters out packets from Y:y destined for the subscriber (X:x) if the subscriber has not previously sent...
packets to Y:y. In other words, receiving packets from a specific external host requires that the subscriber first send packets first to that external IP address and port.

Possible values: ENDPOINT-INDEPENDENT, ADDRESS-DEPENDENT, ADDRESS-PORT-DEPENDENT

Default value: ADDRESS-PORT-DEPENDENT

- tcpproxy

Enable TCP proxy, which enables the NetScaler appliance to optimize the TCP traffic by using Layer 4 features.

Possible values: ENABLED, DISABLED

Default value: DISABLED

- td

ID of the traffic domain through which the NetScaler appliance sends the outbound traffic after performing LSN.

If you do not specify an ID, the appliance sends the outbound traffic through the default traffic domain, which has an ID of 0.

Default value: 65535

Maximum value: 65535

Parameter Descriptions (of commands listed in the CLI procedure)

- bind lsn appsprofile

- appsprofilename

Name for the LSN application profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN application profile is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “Lsn application profile1” or ‘Lsn application profile1’).

This is a mandatory argument. Maximum Length: 127

- lsnport

Port numbers or range of port numbers to match against the destination port of the incoming packet from a subscriber. When the destination port is matched, the LSN application profile is applied for the LSN session. Separate a range of ports with a hyphen. For example, 40-90.
Parameter Descriptions (of commands listed in the CLI procedure)

- add lsn group
  - groupname
    Name for the LSN group. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN group is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “lsn group1” or ‘lsn group1’).
    This is a mandatory argument. Maximum Length: 127
  - clientname
    Name of the LSN client entity to be associated with the LSN group. You can associate only one LSN client entity with an LSN group. You cannot remove this association or replace with another LSN client entity once the LSN group is created.
    This is a mandatory argument. Maximum Length: 127
  - nattype
    Type of NAT IP address and port allocation (from the bound LSN pools) for subscribers:
    Available options function as follows:
    * **Deterministic**—Allocate a NAT IP address and a block of ports to each subscriber (of the LSN client bound to the LSN group). The NetScaler appliance sequentially allocates NAT resources to these subscribers. The NetScaler appliance assigns the first block of ports (block size determined by the port block size parameter of the LSN group) on the beginning NAT IP address to the beginning subscriber IP address. The next range of ports is assigned to the next subscriber, and so on, until the NAT address does not have enough ports for the next subscriber. In this case, the first port block on the next NAT address is used for the subscriber, and so on. Because each subscriber now receives a deterministic NAT IP address and a block of ports, a subscriber can be identified without any need for logging. For a connection, a subscriber can be identified based only on the NAT IP address and port, and the destination IP address and port.
    * **Dynamic**—Allocate a random NAT IP address and a port from the LSN NAT pool for a subscriber’s connection. If port block allocation is enabled (in LSN pool) and a port block size is specified (in the LSN group), the NetScaler appliance allocates a random NAT IP address and a block of ports for a subscriber when it initiates a connection for the first time. The appliance allocates this NAT IP address and a port (from the...
allocated block of ports) for different connections from this subscriber. If all the ports are allocated (for different subscribers connections) from the subscribers allocated port block, the appliance allocates a new random port block for the subscriber.

Possible values: DYNAMIC, DETERMINISTIC

Default value: DYNAMIC

- **portblocksize**

  Size of the NAT port block to be allocated for each subscriber.

  To set this parameter for Dynamic NAT, you must enable the port block allocation parameter in the bound LSN pool. For Deterministic NAT, the port block allocation parameter is always enabled, and you cannot disable it.

  In Dynamic NAT, the NetScaler appliance allocates a random NAT port block, from the available NAT port pool of an NAT IP address, for each subscriber. For a subscriber, if all the ports are allocated from the subscribers allocated port block, the appliance allocates a new random port block for the subscriber.

- **logging**

  Log mapping entries and sessions created or deleted for this LSN group. The NetScaler appliance logs LSN sessions for this LSN group only when both logging and session logging parameters are enabled.

  The appliance uses its existing syslog and audit log framework to log LSN information. You must enable global level LSN logging by enabling the LSN parameter in the related NSLOG action and SYLOG action entities. When the Logging parameter is enabled, the NetScaler appliance generates log messages related to LSN mappings and LSN sessions of this LSN group. The appliance then sends these log messages to servers associated with the NSLOG action and SYSLOG actions entities.

  A log message for an LSN mapping entry consists of the following information:

  * NSIP address of the NetScaler appliance
  * Time stamp
  * Entry type (MAPPING or SESSION)
  * Whether the LSN mapping entry is created or deleted
  * Subscriber’s IP address, port, and traffic domain ID
  * NAT IP address and port
  * Protocol name
  * Destination IP address, port, and traffic domain ID might be present, depending on the following conditions:
    * Destination IP address and port are not logged for Endpoint-Independent mapping
- Only Destination IP address (and not port) is logged for Address-Dependent mapping
- Destination IP address and port are logged for Address-Port-Dependent mapping

Possible values: ENABLED, DISABLED
Default value: DISABLED

- sessionLogging

Log sessions created or deleted for the LSN group. The NetScaler appliance logs LSN sessions for this LSN group only when both logging and session logging parameters are enabled.

A log message for an LSN session consists of the following information:

* NSIP address of the NetScaler appliance
* Time stamp
* Entry type (MAPPING or SESSION)
* Whether the LSN session is created or removed
* Subscriber’s IP address, port, and traffic domain ID
* NAT IP address and port
* Protocol name
* Destination IP address, port, and traffic domain ID

Possible values: ENABLED, DISABLED
Default value: DISABLED

- sessionSync

In a high availability (HA) deployment, synchronize information of all LSN sessions related to this LSN group with the secondary node. After a failover, established TCP connections and UDP packet flows are kept active and resumed on the secondary node (new primary).

For this setting to work, you must enable the global session synchronization parameter.

Possible values: ENABLED, DISABLED
Default value: ENABLED

- snmptraplimit

Maximum number of SNMP Trap messages that can be generated for the LSN group in one minute.

Default value: 100
Minimum value: 0
Maximum value: 10000
- ftp

Enable Application Layer Gateway (ALG) for the FTP protocol. For some application-layer protocols, the IP addresses and protocol port numbers are usually communicated in the packets payload. When acting as an ALG, the appliance changes the packets payload to ensure that the protocol continues to work over LSN.

**Note:** The NetScaler appliance also includes ALG for ICMP and TFTP protocols. ALG for the ICMP protocol is enabled by default, and there is no provision to disable it. ALG for the TFTP protocol is disabled by default. ALG is enabled automatically for an LSN group when you bind a UDP LSN application profile, with endpoint-independent-mapping, endpoint-independent filtering, and destination port as 69 (well-known port for TFTP), to the LSN group.

Possible values: ENABLED, DISABLED

Default value: ENABLED

**Parameter Descriptions (of commands listed in the CLI procedure)**

- bind lsn group
  - groupname
    
    Name for the LSN group. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN group is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “lsn group1” or ‘lsn group1’).
    
    This is a mandatory argument. Maximum Length: 127
  - poolname
    
    Name of the LSN pool to bind to the specified LSN group. Only LSN Pools and LSN groups with the same NAT type settings can be bound together. Multiples LSN pools can be bound to an LSN group.
    
    For Deterministic NAT, pools bound to an LSN group cannot be bound to other LSN groups. For Dynamic NAT, pools bound to an LSN group can be bound to multiple LSN groups.
    
    Maximum Length: 127
  - transportprofilename
    
    Name of the LSN transport profile to bind to the specified LSN group. Bind a profile for each protocol for which you want to specify settings.
By default, one LSN transport profile with default settings for TCP, UDP, and ICMP protocols is bound to an LSN group during its creation. This profile is called a default transport.

An LSN transport profile that you bind to an LSN group overrides the default LSN transport profile for that protocol. Maximum Length: 127

- appsprofilename

Name of the LSN application profile to bind to the specified LSN group. For each set of destination ports, bind a profile for each protocol for which you want to specify settings.

By default, one LSN application profile with default settings for TCP, UDP, and ICMP protocols for all destination ports is bound to an LSN group during its creation. This profile is called a default application profile.

When you bind an LSN application profile, with a specified set of destination ports, to an LSN group, the bound profile overrides the default LSN application profile for that protocol at that set of destination ports. Maximum Length: 127

Sample LSN Configurations

December 18, 2018

The following are examples of configuring LSN through command line interface.

Create a simple LSN configuration with a single subscriber network, single LSN NAT IP address, and default settings:

```bash
1 add lsn client LSN-CLIENT-1
2 Done
3
4 bind lsn client LSN-CLIENT-1 -network 192.0.2.0 -netmask 255.255.255.0
5 Done
6
7 add lsn pool LSN-POOL-1
8 Done
9
10 bind lsn pool LSN-POOL-1 203.0.113.3
11 Done
12
13 add lsn group LSN-GROUP-1 -clientname LSN-CLIENT-1
14 done
15
16 add lsn group LSN-GROUP-1 -clientname LSN-CLIENT-1
17 done
18
```
Create an LSN configuration with an extended ACL for identifying LSN subscribers:

```
1  add ns acl LSN-ACL-2 ALLOW -srcIP 192.0.2.10-192.0.2.20
2  Done
3
4  apply acls
5  Done
6
7  add lsn client LSN-CLIENT-2
8  Done
9
10  bind lsn client LSN-CLIENT-2 - aclname LSN-ACL-2
11  Done
12
13  add lsn pool LSN-POOL-2
14  Done
15
16  bind lsn pool LSN-POOL-2 203.0.113.5-203.0.113.10
17  Done
18
19  add lsn group LSN-GROUP-2 - clientname LSN-CLIENT-2
20  Done
21
22  bind lsn group LSN-GROUP-2 - poolname LSN-POOL-2
23  Done
24
25
```

Create an LSN configuration with endpoint-independent mapping for HTTP protocol (port 80) and address-port dependent mapping for SSH protocol (port 22). Also, restrict each subscriber to use a maximum of 1000 NAT ports for TCP protocol and 100 NAT ports for UDP protocol. Restrict each subscriber to have a maximum of 2000 concurrent sessions for TCP protocol. Restrict
the group to have a maximum of 30000 concurrent sessions for TCP protocol:

```plaintext
add lsn client LSN-CLIENT-3
Done
bind lsn client LSN-CLIENT-3 -network 192.0.3.0 -netmask 255.255.255.0
Done
add lsn pool LSN-POOL-3
Done
bind lsn pool LSN-POOL-3 203.0.113.11
Done
add lsn group LSN-GROUP-3 -clientname LSN-CLIENT-3
Done
bind lsn group LSN-GROUP-3 -poolname LSN-POOL-3
Done
add lsn appsprofile LSN-APPS-HTTPPROFILE-3 TCP -mapping ENDPOINT-INDEPENDENT
Done
bind lsn appsprofile LSN-APPS-HTTPPROFILE-3 80
Done
bind lsn group LSN-GROUP-3 -applicationprofilename LSN-APPS-HTTPPROFILE-3
Done
add lsn appsprofile LSN-APPS-SSHPROFILE-3 TCP -mapping ADDRESS-PORT-DEPENDENT
Done
```
Create an LSN configuration for a large set of subscribers:

```plaintext
add lsn client LSN-CLIENT-4
Done
bind lsn client LSN-CLIENT-4 -network 192.0.4.0 -netmask 255.255.255.0
Done
bind lsn client LSN-CLIENT-4 -network 192.0.5.0 -netmask 255.255.255.0
Done
bind lsn client LSN-CLIENT-4 -network 192.0.6.0 -netmask 255.255.255.0
Done
```
bind lsn client LSN-CLIENT-4 -network 192.0.7.0 -netmask 255.255.255.0
Done

bind lsn client LSN-CLIENT-4 -network 192.0.8.0 -netmask 255.255.255.0
Done

add lsn pool LSN-POOL-4
Done

bind lsn pool LSN-POOL-4 203.0.113.30-203.0.113.40
Done

bind lsn pool LSN-POOL-4 203.0.113.45-203.0.113.50
Done

bind lsn pool LSN-POOL-4 203.0.113.55-203.0.113.60
Done

add lsn group LSN-GROUP-4 -clientname LSN-CLIENT-4
Done

bind lsn group LSN-GROUP-4 -poolname LSN-POOL-4
Done

add lsn appsprofile LSN-APPS-WELLKNOWNPROFILE-4 TCP -mapping ENDPOINT-INDEPENDENT
Done

bind lsn appsprofile LSN-APPS-WELLKNOWN-PORTS-PROFILE-4 1- 1023
Done

bind lsn group LSN-GROUP-4 -applicationprofilename LSN-APPS-WELLKNOWN-PORTS-PROFILE-4
Create an LSN configuration with sharing of NAT resources among multiple LSN groups. In this example, LSN pool LSN-POOL-5 is shared with LSN groups LSN-GROUP-5 and LSN-GROUP-6:

<table>
<thead>
<tr>
<th>Line</th>
<th>Command</th>
<th>Arguments</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>add lsn client</td>
<td>LSN-CLIENT-5</td>
</tr>
<tr>
<td>2</td>
<td>Done</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>bind lsn client</td>
<td>LSN-CLIENT-5 -network 192.0.15.0 -netmask 255.255.255.0</td>
</tr>
<tr>
<td>4</td>
<td>Done</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>add lsn pool</td>
<td>LSN-POOL-5</td>
</tr>
<tr>
<td>6</td>
<td>Done</td>
<td></td>
</tr>
<tr>
<td>7</td>
<td>bind lsn pool</td>
<td>LSN-POOL-5 203.0.113.12-203.0.113.14</td>

<tr>
<td>8</td>
<td>Done</td>
<td></td>
</tr>
<tr>
<td>9</td>
<td>add lsn group</td>
<td>LSN-GROUP-5 -clientname LSN-CLIENT-5</td>
</tr>
<tr>
<td>10</td>
<td>Done</td>
<td></td>
</tr>
<tr>
<td>11</td>
<td>bind lsn group</td>
<td>LSN-GROUP-5 -poolname LSN-POOL-5</td>
</tr>
<tr>
<td>12</td>
<td>Done</td>
<td></td>
</tr>
<tr>
<td>13</td>
<td>add lsn client</td>
<td>LSN-CLIENT-6</td>
</tr>
<tr>
<td>14</td>
<td>Done</td>
<td></td>
</tr>
<tr>
<td>15</td>
<td>bind lsn client</td>
<td>LSN-CLIENT-6 -network 192.0.16.0 -netmask 255.255.255.0</td>
</tr>
<tr>
<td>16</td>
<td>Done</td>
<td></td>
</tr>
<tr>
<td>17</td>
<td>add lsn pool</td>
<td>LSN-POOL-6</td>
</tr>
<tr>
<td>18</td>
<td>Done</td>
<td></td>
</tr>
<tr>
<td>19</td>
<td>bind lsn pool</td>
<td>LSN-POOL-6 203.0.113.15-203.0.113.18</td>
</tr>
<tr>
<td>20</td>
<td>Done</td>
<td></td>
</tr>
</tbody>
</table>

© 1999-2018 Citrix Systems, Inc. All rights reserved.
Create an LSN configuration with deterministic NAT resource allocation:

```
add lsn group LSN-GROUP-6 -clientname LSN-CLIENT-6
Done
bind lsn group LSN-GROUP-6 -poolname LSN-POOL-6
Done
bind lsn group LSN-GROUP-6 -poolname LSN-POOL-5
Done
```

Create an LSN configuration with multiple subscriber networks having the same network address but each network belonging to a different traffic domain. Also, restrict the outbound traffic related to HTTP protocol (port 80), sending it through a particular traffic domain (td 5):

```
add lsn client LSN-CLIENT-7
Done
bind lsn client LSN-CLIENT-7 -network 192.0.17.0 -netmask 255.255.255.0
Done
add lsn pool LSN-POOL-7 -nattype DETERMINISTIC
Done
bind lsn pool LSN-POOL-7 203.0.113.19-203.0.113.23
Done
add lsn group LSN-GROUP-7 -clientname LSN-CLIENT-7 -nattype DETERMINISTIC -portblocksize 1024
Done
bind lsn group LSN-GROUP-7 -poolname LSN-POOL-7
Done
```
```
Done

bind lsn client LSN-CLIENT-8 -network 192.0.18.0 -netmask 255.255.255.0 -td 1

Done

bind lsn client LSN-CLIENT-8 -network 192.0.18.0 -netmask 255.255.255.0 -td 2

Done

bind lsn client LSN-CLIENT-8 -network 192.0.18.0 -netmask 255.255.255.0 -td 3

Done

add lsn pool LSN-POOL-8

Done

bind lsn pool LSN-POOL-8 203.0.113.80-203.0.113.86

Done

add lsn group LSN-GROUP-8 -clientname LSN-CLIENT-8

Done

bind lsn group LSN-GROUP-8 -poolname LSN-POOL-8

Done

add lsn appsprofile LSN-APPS-HTTP-PROFILE-8 TCP -td 5

Done

bind lsn appsprofile LSN-APPS-HTTP-PROFILE-8 80

Done

bind lsn group LSN-GROUP-8 -applicationprofilename LSN-APPS-HTTP-PROFILE-8

Done
```
Create an LSN configuration that restricts the outbound traffic of a specific protocol (TCP), sending it through a particular traffic domain (td 5). With endpoint-independent filtering, receive inbound traffic related to this protocol (TCP) on any traffic domain:

```bash
add lsn client LSN-CLIENT-9
Done
bind lsn client LSN-CLIENT-9 -network 192.0.9.0 -netmask 255.255.255.0 -td 1
Done
add lsn pool LSN-POOL-9
Done
bind lsn pool LSN-POOL-9 203.0.113.90
Done
add lsn group LSN-GROUP-9 -clientname LSN-CLIENT-9
Done
bind lsn group LSN-GROUP-9 -poolname LSN-POOL-9
Done
add lsn appsprofile LSN-APPS-PROFILE-9 TCP -filtering ENDPOINT-INDEPENDENT -td 5
Done
bind lsn group LSN-GROUP-9 -appprofile LSN-APPS-PROFILE-9
Done
```

Create an LSN configuration that restricts outbound HTTP (port 80) traffic, sending it through a particular traffic domain (td 10). With address-dependent filtering, receive inbound traffic related to this protocol (HTTP) on the specified traffic domain (td 10):

```bash
add lsn client LSN-CLIENT-10
```
Configuring Static LSN Maps

December 18, 2018

The NetScaler appliance supports manual creation of a one-to-one LSN mapping between a subscriber IP address:port and a NAT IP address:port. Static LSN mappings are useful in cases where you
want to ensure that the connections initiated to a NAT IP:Port maps to the subscriber IP address:Port. For example, Web servers located in the internal network.

To create a static LSN mapping by using the command line interface

At the command prompt, type:

```
add lsn static <name> <transportprotocol> <subscrIP> <subscrPort> [-td <positive_integer>] [natIP] [natPort] [-destIP <ip_addr> [-dsttd <positive_integer>]]
```

To create a static LSN mapping by using the configuration utility

Navigate to System > Large Scale NAT > Static, and add a new static mapping.

Parameter Descriptions (of commands listed in the CLI procedure)

**add lsn static name**

Name for the LSN static mapping entry. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN group is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “lsn static1” or ‘lsn static1’). This is a mandatory argument. Maximum Length: 127

**transportprotocol**

Protocol for the LSN mapping entry. This is a mandatory argument. Possible values: TCP, UDP, ICMP

**subscrIP**

IPv4 address of an LSN subscriber for the LSN mapping entry. This is a mandatory argument.
**subscrPort**

Port of the LSN subscriber for the LSN mapping entry. This is a mandatory argument. Maximum value: 65535

**td**

ID of the traffic domain to which the subscriber belongs. If you do not specify an ID, the subscriber is assumed to be a part of the default traffic domain. Default value: 0, Minimum value: 0, Maximum value: 4094

**natIP**

IPv4 address, already existing on the NetScaler appliance as type LSN, to be used as NAT IP address for this mapping entry.

**natPort**

NAT port for this LSN mapping entry.

**destIP**

Destination IP address for the LSN mapping entry.

**dstttld**

ID of the traffic domain through which the destination IP address for this LSN mapping entry is reachable from the NetScaler appliance. If you do not specify an ID, the destination IP address is assumed to be reachable through the default traffic domain, which has an ID of 0. Default value: 0, Minimum value: 0, Maximum value: 4094

**Wildcard Port Static Maps**

A static mapping entry is usually a one-to-one LSN mapping between a subscriber IP address:port and a NAT IP address:port. A one-to-one static LSN mapping entry exposes only one port of the subscriber to the Internet.

Some situations might require exposing all ports (64K) of a subscriber to the Internet (for example, a server hosted on an internal network and running a different service on each port). To make these
internal services accessible through the Internet, you have to expose all the ports of the server to the Internet.

One way to meet this requirement is to add 64K one-to-one static mapping entries, one mapping entry for each port. Creating 64K entries is very cumbersome and a big task. Also, this large number of configuration entries might lead to performance issues in the NetScaler appliance.

Another simple method is to use wildcard ports in a static mapping entry. You just need to create one static mapping entry with NAT-port and subscriber-port parameters set to the wildcard character (*), and the protocol parameter set to ALL, to expose all the ports of a subscriber to the Internet. For a subscriber’s inbound or outbound connections matching a wildcard static mapping entry, the subscriber’s port does not change after the NAT operation.

When a subscriber-initiated connection to the Internet matches a wildcard static mapping entry, the NetScaler appliance assigns a NAT port that has the same number as the subscriber port from which the connection is initiated. Similarly, an Internet host gets connected to a subscriber’s port by connecting to the NAT port that has the same number as the subscriber’s port.

**Configuring the NetScaler appliance to Provide Access to All Ports of an IPv4 Subscriber**

To configure the NetScaler appliance to provide access to all ports of an IPv4 subscriber, create a wildcard static map with the following mandatory parameter settings:

- **Protocol=ALL**
- **Subscriber port = ***
- **NAT port = ***

In a wildcard static map, unlike in a one-to-one static map, setting the NAT IP parameter is mandatory. Also, the NAT IP address assigned to a wildcard static map cannot be used for any other subscribers.

To create a wildcard static map by using the command line interface

At the command prompt, type:

```
1 add lsn static <name> ALL <subscrIP> * <natIP> * [-td <positive_integer>] [-destIP <ip_addr> [-dsttd <positive_integer>]]
2
3 show lsn static
```

**Sample Configuration**

In the following sample configuration of a wildcard static map, all ports of a subscriber whose IP address is 192.0.2.10 are made accessible through NAT IP 203.0.11.33.

**Sample configuration:**
Configuring Application Layer Gateways

December 18, 2018

For some Application layer protocols, the IP addresses and protocol port numbers are also communicated in the packet’s payload. Application Layer Gateway for a protocol parses the packet’s payload and does necessary changes to ensure that the protocol continues to work over LSN.

The NetScaler appliance supports ALG for the following protocols:

- FTP
- ICMP
- TFTP
- PPTP
- SIP
- RTSP

Application Layer Gateway for FTP, ICMP, and TFTP Protocols

December 18, 2018

You can enable or disable ALG for the FTP protocol for an LSN configuration by enabling or disabling the FTP option of the LSN group of the LSN configuration.

ALG for the ICMP protocol is enabled by default, and there is no provision to disable it.

ALG for the TFTP protocol is disabled by default. TFTP ALG is enabled automatically for an LSN configuration when you bind a UDP LSN application profile, with endpoint-independent-mapping, endpoint-independent filtering, and destination port as 69 (well-known port for TFTP), to the LSN group.

Sample LSN Configuration for FTP ALG:
In the following sample LSN configuration, FTP ALG is enabled for subscribers that have IP address in the range 192.0.2.30-192.0.2.100.

```
1   add lsn static NAT44-WILDCARD-STATIC-1 ALL 192.0.2.10 * 203.0.113.33 *
2
3   Done
```

**Sample LSN Configuration for TFTP ALG:**

In the following sample LSN configuration, endpoint-independent mapping and endpoint-independent filtering are enabled for TFTP protocol (UDP port 69). The NetScaler appliance automatically enables TFTP ALG for this LSN configuration.
Application Layer Gateway for PPTP Protocol

December 18, 2018

The NetScaler appliance supports Application Layer Gateways (ALGs) for the Point-to-Point Tunneling Protocol (PPTP).

PPTP is a network protocol that enables secure transfer of data from a remote client to an enterprise server by creating a tunnel across TCP/IP-based data networks. PPTP encapsulates PPP packets into IP packets for transmission over the Internet. PPTP establishes a tunnel for each communicating PPTP network server (PNS)-PPTP Access Concentrator (PAC) pair. After the tunnel is set up, enhanced generic routing encapsulation (GRE) is used to exchange PPP packets. A call ID in the GRE header indicates the session to which a particular PPP packet belongs.

The NetScaler appliance recognizes PPTP packets that arrive on the default TCP port, 1723. The appli-
NetScaler 11.1

NetScaler parses PPTP control packets, translates the call ID, and assigns a NAT IP address. For two-way
data communication between the client and server, the NetScaler appliance creates an LSN session
entry based on the server call ID, and an LSN session based on the client call ID. The appliance then
parses the GRE data packets and translates call IDs on the basis of the two LSN session entries.

For PPTP protocol, the NetScaler appliance also includes timeout setting for any idle PPTP LSN ses-
sions. If a PPTP LSN session is idle for a time that exceeds the timeout setting, the NetScaler appliance
removes the session.

Limitations:
The following are the limitations of PPTP ALG on a NetScaler appliance:

- PPTP ALG is not supported for hairpin LSN flow.
- PPTP ALG is not supported to work with any RNAT configuration.
- PPTP ALG is not supported in NetScaler clusters.

Configuring PPTP ALG

Configuring PPTP ALG on the NetScaler appliance consist of the following tasks:

- Create an LSN configuration and enable PPTP ALG on it. In an LSN configuration, the LSN group
  includes the PPTP ALG setting. For instructions on creating an LSN configuration, see Configuration
  Steps for LSN.
- (Optional) Set the global timeout for idle PPTP LSN sessions.

To enable PPTP ALG for an LSN configuration by using the CLI

At the command prompt, type:

```bash
1 add lsn group <groupname> -clientname <string> [-pptp ( ENABLED | DISABLED )]
2
3 show lsn group
```

To set the global timeout for idle PPTP LSN sessions by using the CLI

At the command prompt, type:

```bash
1 set appAlgParam -pptpGreIdleTimeout <positive_integer>
2
3 show appAlgParam
```
Example:

In the following sample LSN configuration, PPTP ALG is enabled for subscribers in the 192.0.2.0/24 network.

Also idle PPTP LSN session timeout is set to 200 secs.

```
1  add lsn client LSN-CLIENT-1
2  Done
3
4  bind lsn client LSN-CLIENT-1 -network 192.0.2.0 -netmask 255.255.255.0
5  Done
6
7  add lsn pool LSN-POOL-1
8  Done
9
10
11  bind lsn pool LSN-POOL-1 203.0.113.3
12  Done
13
14  add lsn group LSN-GROUP-1 -clientname LSN-CLIENT-1 -pptp ENABLED
15  Done
16
17  bind lsn group LSN-GROUP-1 -poolname pool1 LSN-POOL-1
18  Done
19
20
21  set appAlgParam -pptpGreIdleTimeout 200
22  Done
23
24
25
26
27
```

Application Layer Gateway for SIP Protocol

January 6, 2019

Using Large Scale NAT (LSN) with Session Initiation Protocol (SIP) is complicated, because SIP messages contain IP addresses in the SIP headers as well as in the SIP body. When LSN is used with SIP, the SIP headers contain information about the caller and the receiver, and the device translates this information to hide it from the outside network. The SIP body contains the Session Description Protocol (SDP) information, which includes IP addresses and port numbers for transmission of the media.
SIP ALG adheres to the following RFCs:

- RFC 3261
- RFC 3581
- RFC 4566
- RFC 4475

How SIP ALG Works

How IP address translation is performed depends on the type and direction of the message. A message can be any of the following:

- Inbound request
- Outbound response
- Outbound request
- Inbound response

For an outgoing message, the private IP address and port number of the SIP client are replaced with the NetScaler owned public IP address and port number, called the LSN pool IP address and port number, specified during LSN configuration. For an incoming message, the LSN pool IP address and the port number are replaced with the private address of the client. If the message contains any public IP addresses, the NetScaler SIP ALG retains them. Also, a pinhole is created on the:

- LSN pool IP address and port on behalf of the private client, so that the messages that arrive at this IP address and port from the public network are treated as SIP messages.
- Public IP address and port on behalf of the public clients, so that the messages that arrive at this IP address and port from the private network are treated as SIP messages.

When a SIP message is sent out across the network, the SIP Application Layer Gateway (ALG) collects information from the message and translates the IP addresses in the following headers into LSN pool IP addresses:

- Via
- Contact
- Route
- Record-Route

In the following sample SIP request message, LSN replaces the IP addresses in the header fields to hide them from the outside network.

```
1 INVITE adam@10.102.185.156 SIP/2.0 Via: SIP/2.0/UDP 192.170.1.161:62914 From: eve@10.120.210.3 To: adam@10.102.185.156 Call-ID: a12abcde@10.120.210.3 Contact: adam@10.102.185.156 Route: <sip:netscreen@10.150.20.3:5060> Record-Route: <sip:netscreen@10.150.20.3:5060>
```
When a message containing SDP information arrives, the SIP ALG collects information from the message and translates the IP addresses in the following fields into LSN pool IP addresses and port numbers:

- **c= (connection information)**
  This field can appear at the session or media level. It appears in the following format:
  
  \[c=<\text{network-type}><\text{address-type}><\text{connection-address}>\]

  If the destination IP address is a unicast IP address, the SIP ALG creates pinholes by using the IP address and port numbers specified in the \(m=\) field.

- **m= (media announcement)**
  This field appears at the media level and contains the description of the media. It appears in the following format:

  \[m=<\text{media}><\text{port}><\text{transport}><\text{fmt list}>\]

- **a= (information about the media field)**
  This field can appear at the session or media level, in the following format:

  \[a=<\text{attribute}>\]
  \[a=<\text{attribute}>:\text{value}\]

The following excerpt from a sample SDP section shows the fields that are translated for resource allocation.

\[o=\text{user 2344234 55234434 IN IP4 10.150.20.3}\]
\[c=IN IP4 10.150.20.3\]
\[m=audio 43249 RTP/AVP 0\]

The following table shows how SIP payload is translated.

### Limitations of SIP ALG

A SIP ALG has the following limitations:

- Only SDP payload is supported.
- The following are not supported:
  - Multicast IP addresses
  - Encrypted SDP
  - SIP TLS
  - FQDN translation
  - SIP layer authentication
Tested SIP Clients and Proxy Servers

The following SIP clients and proxy server have been tested with SIP ALG:

- **SIP Clients:** X-Lite, Zoiper, Ekiga, Avaya
- **Proxy Server:** openSIPS

LSN SIP Scenario: SIP Proxy Outside the Private Network (Public Network)

SIP Client Registration

For a typical SIP call, SIP client must register with the SIP registrar by composing a REGISTER request and sending it to the SIP registrar. The NetScaler appliance’s SIP ALG intercepts the request, replaces the IP address and port number in the request with the LSN pool IP address and port number provided in the LSN configuration, and forwards the request to the SIP registrar. The SIP ALG then opens a pinhole in the NetScaler configuration to allow further SIP communication between the SIP client and the SIP registrar. The SIP registrar sends a 200 OK response to the SIP client over the LSN pool IP address and port number. The NetScaler appliance captures this response in the pinhole, and the SIP ALG replaces the SIP header, putting the original Contact, Via, Route, and Record-Route SIP fields back into the message. The SIP ALG then forwards the message to the SIP client. The following figure shows how SIP ALG uses LSN in a SIP call registration flow.

Outgoing Calls

A SIP call is initiated with a SIP INVITE message sent from the internal to the external network. The SIP ALG performs NAT on the IP addresses and port numbers in the Via, Contact, Route, and Record-Route SIP header fields, replacing them with the LSN pool IP address and port number. LSN stores these mappings for subsequent SIP messages in the SIP call. The SIP ALG then opens separate pinholes in the NetScaler configuration to allow SIP and media through the NetScaler appliance on the dynamically assigned ports specified in the SDP and SIP headers. When a 200 OK message arrives at the NetScaler, it is captured by one of the created pinholes. The SIP ALG replaces the SIP header, restoring the original Contact, Via, Route, and Record-Route SIP fields, and then forwards the message to the internal SIP client.
Incoming Calls

A SIP incoming call is initiated with a SIP INVITE message from the external client to the internal network. The SIP registrar forwards the INVITE message to the SIP client in the internal network, using the pinhole that was created when the Internal SIP client registered with the SIP registrar.

The SIP ALG performs NAT on the LSN IP addresses and port numbers in the Via, Contact, Route, and Record-Route SIP header fields, translating them to the IP address and port number of the internal SIP client, and forwards the request to the SIP client. When the 200 OK response message sent by the internal SIP client arrives at the NetScaler appliance, the SIP ALG performs NAT on the IP addresses and port numbers in the Via, Contact, Route, and Record-Route SIP header fields, translating them to the LSN pool IP address and port number, forwards the response message to the SIP registrar, and then opens a pinhole in the outbound direction for further SIP communication.

Call Termination

The BYE message terminates a call. When the device receives a BYE message, it translates the header fields in the message just as it does for any other message. But because a BYE message must be acknowledged by the receiver with a 200 OK, the ALG delays call teardown for 15 seconds to allow time for transmission of the 200 OK.

Call Between Clients in the Same Network

When both client A and client B in the same network initiate a call, the SIP messages are routed through the SIP proxy in the outside network. The SIP ALG processes the INVITE from client A as a normal outgoing call. Since client B is in the same network, the SIP proxy sends the INVITE back to the NetScaler appliance. The SIP ALG examines the INVITE message, determines that it contains the NAT IP address of client A, and replaces that address with the private IP address of client A before sending the message to client B. Once the call is established between the clients, the NetScaler is not involved in the media transmission between the clients.

More LSN SIP Scenarios: SIP Proxy Inside the Private Network

If you want to host the SIP Proxy server inside the private network, Citrix recommends that you do one of the following:

- Configure a static LSN Mapping for the private SIP proxy. For more information, see Configuring Static LSN Maps. Make sure that the NAT port is the same as the port configured in the SIP ALG profile.
- Configure the SIP Proxy server inside a demilitarized zone (DMZ).
Figures 1 and 2 show the following scenarios:

- Scenario 1—SIP client in the private network registers with the SIP proxy server in the same network. ALG operations are not performed, because the SIP client and SIP proxy server are in the same network.
- Scenario 2—SIP client in the public network registers with the SIP proxy server in the private network. The REGISTER message from the public SIP client is sent to the NetScaler appliance by using the static LSN mapping configured on the appliance, and the appliance creates a pinhole for further SIP operations.
- Scenario 3—SIP Incoming call flow. A SIP incoming call is initiated with a SIP INVITE message from the external to the internal network. The NetScaler appliance receives the INVITE message from SIP client C2, which is in the external network, through the static LSN maps configured on the NetScaler appliance. The appliance creates a pinhole and forwards the INVITE message to the SIP proxy. The SIP proxy then forwards the INVITE message to SIP client C1 in the internal network. SIP client C1 then sends 180 and 200 OK messages to the SIP proxy, which in turn forwards the message to SIP client C2 through the NetScaler appliance. When the 200 OK response message sent by internal SIP client C1 arrives at the NetScaler, the SIP ALG performs NAT on the IP addresses and port numbers in the Via, Contact, Route, and Record-Route SIP header fields, and in the SDP fields, replacing them with the LSN pool IP address and port number. The SIP ALG then forwards the response message to SIP client C2 and opens a pinhole in the outbound direction for further SIP communication.

Support for Audit Logs

You can log ALG information as part of LSN logging by enabling ALG in the LSN audit logging configuration. For more information on LSN logging, see Logging and Monitoring LSN. A log message for an ALG entry in the LSN log consists of the following information:

- Time stamp
- Type of SIP message (for example, SIP request)
- Source IP address and port of the SIP client
- Destination IP address and port of the SIP proxy
- NAT IP address and port
- SIP method
- Sequence number
- Whether or not the SIP client is registered
- Caller’s user name and domain
Sample audit log:

Request:

```
07/19/2013:09:49:19 GMT Informational 0-PPE-0 : default ALG

Configuring SIP ALG

You need to configure the SIP ALG as part of the LSN configuration. For instructions on configuring LSN, see Configuration Steps for LSN. While configuring LSN, make sure that you:

- Set the following parameters while adding the LSN application profile:
  - IP Pooling = PAIRED
  - Address and Port Mapping = ENDPOINT-INDEPENDENT
  - Filtering = ENDPOINT-INDEPENDENT

Important: For the SIP ALG to work, a full cone NAT configuration is mandatory.

Example:

```
add lsn appsprofile app_tcp TCP -ippooling PAIRED -mapping ENDPOINT-INDEPENDENT -filtering ENDPOINT-INDEPENDENT
```
NetScaler 11.1

- Create a SIP ALG profile and make sure that you define either the source port range or destination port range.

**Example:**

```
1 add lsn sipalgprofile sipalgprofile_tcp -sipsrcportrange 1-65535 -
sipdstportrange 5060 -openViaPinhole ENABLED -openRecordRoutePinhole
ENABLED - sipTransportProtocol TCP
```

- Set SIP ALG = ENABLED, while creating the LSN group.

**Example:**

```
1 add lsn group g1 -clientname c1 -sipalg ENABLED
```

- Bind the SIP ALG profile to the LSN group.

**Sample SIP ALG Configuration:**

The following sample configuration shows how to create a simple LSN configuration with a single subscriber network, single LSN NAT IP address, SIP ALG specific setting, and configure SIP ALG:

```
1 add lsn pool p1
2 Done
3 bind lsn pool p1 10.102.185.190
4 Done
5 add lsn client c1
6 Done
7 bind lsn client c1 -network 192.170.1.0 -netmask 255.255.255.0
8 Done
9 add lsn appsprofile app_tcp TCP -ippooling PAIRED -mapping ENDPOINT-INDEPENDENT -filtering ENDPOINT-INDEPENDENT
10 Done
11 add lsn appsprofile app_udp UDP -ippooling PAIRED -mapping ENDPOINT-INDEPENDENT -filtering ENDPOINT-INDEPENDENT
12 Done
13 add lsn appsprofile app_tcp TCP -ippooling PAIRED -mapping ENDPOINT-INDEPENDENT -filtering ENDPOINT-INDEPENDENT
14 Done
15 add lsn appsprofile app_udp UDP -ippooling PAIRED -mapping ENDPOINT-INDEPENDENT -filtering ENDPOINT-INDEPENDENT
16 Done
17 add lsn appsprofile app_tcp TCP -ippooling PAIRED -mapping ENDPOINT-INDEPENDENT -filtering ENDPOINT-INDEPENDENT
18 Done
19 add lsn appsprofile app_udp UDP -ippooling PAIRED -mapping ENDPOINT-INDEPENDENT -filtering ENDPOINT-INDEPENDENT
20 Done
21 add lsn appsprofile app_tcp TCP -ippooling PAIRED -mapping ENDPOINT-INDEPENDENT -filtering ENDPOINT-INDEPENDENT
22 Done
23 Done
```
bind lsn appsprofile app_tcp 1-65535
Done

bind lsn appsprofile app_udp 1-65535
Done

add lsn sipalgprofile sipalgprofile_tcp -sipdstportrange 5060 -openViaPinhole ENABLED -openRecordRoutePinhole ENABLED -sipTransportProtocol TCP
Done

add lsn sipalgprofile sipalgprofile_udp -sipdstportrange 5060 -openViaPinhole ENABLED -openRecordRoutePinhole ENABLED -sipTransportProtocol UDP
Done

add lsn group g1 -clientname c1 -sipalg ENABLED
Done

bind lsn group g1 -poolname p1
Done

bind lsn group g1 -appsprofilename app_tcp
Done

bind lsn group g1 -appsprofilename app_udp
Done

bind lsn group g1 -sipalgprofilename sipalgprofile_tcp
Done

bind lsn group g1 -sipalgprofilename sipalgprofile_udp
Done
Real Time Streaming Protocol (RTSP) is an application-level protocol for the transfer of real-time media data. Used for establishing and controlling media sessions between endpoints, RTSP is a control channel protocol between the media client and the media server. The typical communication is between a client and a streaming media server.

Streaming media from a private network to a public network requires translating IP addresses and port numbers over the network. NetScaler functionality includes an Application Layer Gateway (ALG) for RTSP, which can be used with Large Scale NAT (LSN) to parse the media stream and make any necessary changes to ensure that the protocol continues to work over the network.

How IP address translation is performed depends on the type and direction of the message, and the type of media supported by the client-server deployment. Messages are translated as follows:

- **Outbound request**—Private IP address to NetScaler owned public IP address called an LSN pool IP address.
- **Inbound response**—LSN pool IP address to private IP address.
- **Inbound request**—No translation.
- **Outbound response**—Private IP address to LSN pool IP address.

### Limitations of RTSP ALG

The RTSP ALG does not support the following:

- Multicast RTSP sessions
- RTSP session over UDP
- TD/admin partitioning/cluster deployments
- RSTP Authentication
- HTTP tunneling

### RTSP and LSN scenario

The following figure shows an RTSP SETUP request flow. Typically, a SETUP request specifies how a single media stream must be transported. The request contains the media stream URL and a transport specifier. This specifier typically includes one local port for receiving RTP data (audio or video), and another for receiving RTCP data (meta information). The server reply usually confirms the chosen parameters and fills in the missing parts, such as the server’s chosen ports. Each media stream must be configured by using the SETUP command before an aggregate play request can be sent.
NetScaler 11.1

In a typical RTSP communication, the media client in the public network sends a SETUP request to the media server in the private network. RSTP ALG intercepts the request and, in the media stream, replaces the public IP address and port number with the LSN pool IP address and LSN port number. The following figure shows the translation performed by a NetScaler appliance in the media stream for an outbound request:

The media server in the private network uses the LSN pool IP address and LSN port number to send a 200 OK response to the media client in the public network. The NetScaler RTSP ALG intercepts the response and replaces the LSN pool IP address and LSN port number with the public IP address and port number of the media client. The following figure shows the translation performed by a NetScaler appliance in the media stream for an inbound response:

**Configuring RTSP ALG**

Configure RTSP ALG as part of the LSN configuration. For instructions on configuring LSN, see *Configuration Steps for LSN*. While configuring LSN, make sure that you:

- Set the **NAT Type** as DETERMINISTIC or DYNAMIC while adding the LSN pool.
- Set the following parameters while adding the LSN application profile:
  - IP Pooling = PAIRED
  - Address and Port Mapping = ENDPOINT-INDEPENDENT
  - Filtering = ENDPOINT-INDEPENDENT
- Create a RTSP ALG profile and bind the RTSP ALG profile to the LSN group

**Sample RTSP ALG Configuration:**

The following sample configuration shows how to create a simple LSN configuration with a single subscriber network, single LSN NAT IP address, and RTSP ALG settings:

```
1 enable ns feature WL SP LB CS LSN
2 done
3 add lsn pool pool1 -natype DETERMINISTIC
4 done
5 bind lsn pool pool1 10.102.218.246
6 done
7 add lsn client client1
8 done
9```

© 1999-2018 Citrix Systems, Inc. All rights reserved.
bind lsn client client1 -network 200.200.200.11 -netmask 255.255.255.0
Done

add lsn appsprofile app1 TCP -ippooling PAIRED -mapping ENDPOINT-INDEPENDENT -filtering ENDPOINT-INDEPENDENT
Done

Logging and Monitoring LSN

January 6, 2019

You can log LSN information to diagnose, troubleshoot problems, and to meet legal requirements. You can monitor the performance of the LSN feature by using LSN statistical counters and displaying current LSN sessions.

Logging LSN

Logging LSN information is one of the important functions required by the ISPs to meet legal requirements and for identifying the source of traffic at any given time.

A NetScaler appliance logs LSN mapping entries and the LSN sessions created or deleted for each LSN group. You can control logging of LSN information for an LSN group by using the logging and session logging parameters of the LSN group. These are group level parameters and are disabled by default. The NetScaler appliance logs LSN sessions for an LSN group only when both logging and session logging parameters are enabled.

The following table displays the logging behavior for an LSN group for various settings of logging and session logging parameters.

<table>
<thead>
<tr>
<th>Logging</th>
<th>Session Logging</th>
<th>Logging Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enabled</td>
<td>Enabled</td>
<td>Logs LSN mapping entries as well as LSN sessions.</td>
</tr>
<tr>
<td>Enabled</td>
<td>Disabled</td>
<td>Logs LSN mapping entries but not LSN sessions.</td>
</tr>
<tr>
<td>Disabled</td>
<td>Enabled</td>
<td>Logs neither mapping entries nor LSN sessions.</td>
</tr>
</tbody>
</table>

A log message for an LSN mapping entry consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced.
- Time stamp
• Entry type (MAPPING)
• Whether the LSN mapping entry was created or deleted
• Subscriber’s IP address, port, and traffic domain ID
• NAT IP address and port
• Protocol name
• Destination IP address, port, and traffic domain ID might be present, depending on the following conditions:
  – Destination IP address and port are not logged for Endpoint-Independent mapping.
  – Only the destination IP address is logged for Address-Dependent mapping. The port is not logged.
  – Destination IP address and port are logged for Address-Port-Dependent mapping.

A log message for an LSN session consists of the following information:
• NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced.
• Time stamp
• Entry type (SESSION)
• Whether the LSN session is created or removed
• Subscriber’s IP address, port, and traffic domain ID
• NAT IP address and port
• Protocol name
• Destination IP address, port, and traffic domain ID

The appliance uses its existing syslog and audit log framework to log LSN information. You must enable global level LSN logging by enabling the LSN parameter in the related NSLOG action and SYSLOG action entities. When the Logging parameter is enabled, the NetScaler appliance generates log messages related to LSN mappings and LSN sessions of this LSN group. The appliance then sends these log messages to servers associated with the NSLOG action and SYSLOG action entities.

For logging LSN information, Citrix recommends:
• Logging the LSN information on external log servers instead of on the NetScaler appliance. Logging on external servers facilitates optimal performance when the appliance creates large amounts of LSN log entries (in order of millions).
• Using SYSLOG over TCP, or NSLOG. By default SYSLOG uses UDP, and NSLOG uses only TCP to transfer log information to the log servers. TCP is more reliable than UDP for transferring complete data.

**Note:**
– The SYSLOG generated on NetScaler appliance are dynamically sent to the external log servers.
When using SYSLOG over TCP, if the TCP connection is down or the SYSLOG server is busy, then the NetScaler appliances stores the logs in buffer and send the data once the connection is active.

For more information about configuring logging, see Audit Logging.

Configuring LSN logging consists of the following tasks:

- **Configuring the NetScaler appliance for logging.** This task involves creating and setting various entities and parameters of the NetScaler appliance:
  - **Create a SYSLOG or NSLOG audit logging configuration.** Creating an audit logging configuration involves the following tasks:
    * Create a NSLOG or SYSLOG audit action and enable the LSN parameter. Audit actions specify the IP addresses of log servers.
    * Create a SYSLOG or NSLOG audit policy and bind the audit action to the audit policy. Audit actions specify the IP addresses of log servers. Optionally, you can set the transport method for log messages that are sent to the external log servers. By default UDP is selected, you can set the transport method as TCP for a reliable transport mechanism. Bind the audit policy to system global.
    * Create a SYSLOG or NSLOG audit policy and bind the audit action to the audit policy.
    * Bind the audit policy to system global.
  
  **Note:** For an existing audit logging configuration, just enable the LSN parameter for logging LSN information in the server specified by the audit action.

- **Enable logging and session logging parameters.** Enable logging and session logging parameters either as you add LSN groups or after you have created the groups. The NetScaler appliance generates log messages related to these LSN groups and sends them to the server of those audit actions that have the LSN parameter enabled.

- **Configuring log servers.** This task involves installing SYSLOG or NSLOG packages on the desired servers. This task also involves specifying the NSIP address of the NetScaler appliance in the configuration file of SYSLOG or NSLOG. Specifying the NSIP address enables the server to identify the log information sent by the NetScaler appliance for storing them in a log file.

For more information about configuring logging, see Audit Logging.

**SYSLOG Configuration Using the Command Line Interface**

To create a SYSLOG server action for LSN logging by using the command line interface

At the command prompt, type:

```
add audit syslogAction <name> <serverIP> [-serverPort <port>] -logLevel <logLevel>... [-transport (TCP)] [-lsn ( ENABLED | DISABLED )]
```
To create a SYSLOG server policy for LSN logging by using the command line interface

At the command prompt, type:

```
add audit syslogPolicy <name> <rule> <action>
```

To bind a SYSLOG server policy to system global for LSN logging by using the command line interface

At the command prompt, type:

```
bind system global [<policyName> [-priority <positive_integer>]]
```

SYSLOG Configuration Using the Configuration Utility

To configure a SYSLOG server action for LSN logging by using the configuration utility

1. Navigate to Systems > Auditing > Syslog and, on the Servers tab, add a new auditing server or edit an existing server.
2. To enable LSN logging, select the Large Scale NAT Logging option.
3. (Optional) To enable SYSLOG over TCP, select the TCP Logging option.

To configure a SYSLOG server policy for LSN logging by using the configuration utility

Navigate to Systems > Auditing > Syslog and, on the Policies tab, add a new policy or edit an existing policy.

To bind a SYSLOG server policy to system global for LSN logging by using the configuration utility

1. Navigate to Systems > Auditing > Syslog.
2. On the Policies tab, in the Action list, click Global Bindings to bind the audit global policies.

NSLOG Configuration Using the Command Line Interface

To create a NSLOG server action for LSN logging by using the command line interface

At the command prompt, type:

```
add audit nslogAction <name> <serverIP> [-serverPort <port>] -logLevel <logLevel> ... [-lsn ( ENABLED | DISABLED )]
```
To create a NSLOG server policy for LSN logging by using the command line interface

At the command prompt, type:

```
1 add audit nslogPolicy <name> <rule> <action>
```

To bind a NSLOG server policy to system global for LSN logging by using the command line interface

At the command prompt, type:

```
1 bind system global [<policyName>]
```

NSLOG Configuration Using the Configuration Utility

To configure a NSLOG server action for LSN logging by using the configuration utility

1. Navigate to Systems > Auditing > Nslog and, on the Servers tab, add a new auditing server or, edit an existing server.
2. To enable LSN logging, select the Large Scale NAT Logging option.

To configure a NSLOG server policy for LSN logging by using the configuration utility

Navigate to Systems > Auditing > Nslog and, on the Policies tab, add a new policy or edit an existing policy.

To bind a NSLOG server policy to system global for LSN logging by using the configuration utility

1. Navigate to Systems > Auditing > Nslog.
2. On the Policies tab, in the Action list, click Global Bindings to bind the audit global policies.

Example

The following configuration specifies two SYSLOG and two NSLOG servers for storing log entries including LSN logs. LSN Logging is configured for LSN groups LSN-GROUP-2 and LSN-GROUP-3.

The NetScaler appliance generates log messages related to LSN mappings and LSN sessions of these LSN groups, and sends them to the specified log servers.

```
1 add audit syslogAction SYS-ACTION-1 198.51.101.10 -logLevel ALL -lsn ENABLED
2 Done
```
The following configuration specifies SYSLOG configuration for sending log messages to the external SYSLOG server 192.0.2.10 using TCP.

```bash
3 add audit syslogPolicy SYSLOG-POLICY-1 ns_true SYS-ACTION-1
4 Done
5 bind system global SYSLOG-POLICY-1
6 Done
7
8 add audit syslogAction SYS-ACTION-2 198.51.101.20 -logLevel ALL -lsn ENABLED
9 Done
10 add audit syslogPolicy SYSLOG-POLICY-2 ns_true SYS-ACTION-2
11 Done
12 bind system global SYSLOG-POLICY-2
13 Done
14
15 add audit nslogAction NSLOG-ACTION-1 198.51.101.30 -logLevel ALL -lsn ENABLED
16 Done
17 add audit nslogPolicy NSLOG-POLICY-1 ns_true NSLOG-ACTION-1
18 Done
19 bind system global NSLOG-POLICY-1
20 Done
21 add audit nslogAction NSLOG-ACTION-2 198.51.101.40 -logLevel ALL -lsn ENABLED
22 Done
23 add audit nslogPolicy NSLOG-POLICY-2 ns_true NSLOG-ACTION-2
24 Done
25 bind system global NSLOG-POLICY-2
26 Done
27
28 add lsn group LSN-GROUP-3 -clientname LSN-CLIENT-2 -logging ENABLED -sessionLogging ENABLED
29 Done
30 set lsn group LSN-GROUP-2 -logging ENABLED -sessionLogging ENABLED
31 Done
```

© 1999-2018 Citrix Systems, Inc. All rights reserved.
The following table displays sample LSN log entries of each type stored on the configured log servers. These LSN log entries are generated by a NetScaler appliance whose NSIP address is 10.102.37.115.

<table>

**Minimal Logging**

Deterministic LSN configurations and Dynamic LSN configurations with port block significantly reduces the LSN log volume. For these two types of configuration, the NetScaler appliance allocates a NAT IP address and a block of ports to a subscriber. The NetScaler appliance generates a log message for a port block at the time of allocation to a subscriber. The NetScaler appliance also generates a log message when a NAT IP address and port block is freed. For a connection, a subscriber can be identified just by its mapped NAT IP address and port block. Because of this reason, the NetScaler ap-
NetScaler 11.1

The NetScaler appliance does not log any LSN session created or deleted. The appliance also neither logs any mapping entry created for a session nor when the mapping entry gets removed.

The minimal logging feature for deterministic LSN configurations and dynamic LSN configurations with port block is enabled by default and there is no provision to disable it. In other words, the NetScaler appliance automatically do minimal logging for deterministic LSN configurations and dynamic LSN configurations with port block. There is no option available for disabling this feature. The appliance sends the log messages to all the configured log servers.

A log message for each port block consists of the following information:

- NSIP address of the NetScaler appliance
- Time stamp
- Entry type as DETERMINISTIC or PORTBLOCK
- Whether a port block is allocated or is freed
- Subscriber's IP address and the assigned NAT IP address and port block
- Protocol name

Minimal Logging for Deterministic LSN Configuration

Consider an example of a simple deterministic LSN configuration for four subscribers having the IP address 192.0.17.1, 192.0.17.2, 192.0.17.3, and 192.0.17.4.

In this LSN configuration, the port block size is set to 32768 and LSN NAT IP address pool has IP addresses in the range 203.0.113.19-203.0.113.23.

```
1  add lsn client LSN-CLIENT-7
2  Done
3  bind lsn client LSN-CLIENT-7 -network 192.0.17.0 -netmask 255.255.255.253
4  Done
5  add lsn pool LSN-POOL-7 -nattype DETERMINISTIC
6  Done
7  bind lsn pool LSN-POOL-7 203.0.113.19-203.0.113.23
8  Done
9  add lsn group LSN-GROUP-7 -clientname LSN-CLIENT-7 -nattype DETERMINISTIC -portblocksize 32768
10 Done
11 bind lsn group LSN-GROUP-7 -poolname LSN-POOL-7
12 Done
```

The NetScaler appliance sequentially preallocates, from the LSN NAT IP pool and on the basis of the set port block size, an LSN NAT IP address and a block of ports to each subscriber. It assigns the first block of ports (1024-33791) on the beginning NAT IP address (203.0.113.19) to the beginning subscriber.
IP address (192.0.17.1). The next range of ports is assigned to the next subscriber, and so on, until the NAT address does not have enough ports for the next subscriber. At that point, the first port block on the next NAT IP address is assigned to the subscriber, and so on. The appliance logs the NAT IP address and the block of ports allocated for each subscriber.

The NetScaler appliance does not log any LSN session created or deleted for these subscribers. The appliance generates the following log messages for the LSN configuration.

<table>
<thead>
<tr>
<th>Time</th>
<th>Informational</th>
<th>Code</th>
<th>Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>03/23/2015</td>
<td>00:30:56</td>
<td>GMT</td>
<td>Informational 0-PPE-0 : default LSN LSN_DETERMINISTIC 79201453 0 : Dtrstc ALLOC Client 12.0.0.241, NatInfo 50.0.0.2:59904 to 60415</td>
</tr>
<tr>
<td>03/23/2015</td>
<td>00:30:56</td>
<td>GMT</td>
<td>Informational 0-PPE-0 : default LSN LSN_DETERMINISTIC 79201454 0 : Dtrstc ALLOC Client 12.0.0.242, NatInfo 50.0.0.2:60416 to 60927</td>
</tr>
<tr>
<td>03/23/2015</td>
<td>00:30:56</td>

<td>Informational 0-PPE-0 : default LSN LSN_DETERMINISTIC 79201455 0 : Dtrstc ALLOC Client 12.0.0.243, NatInfo 50.0.0.2:60928 to 61439</td>
</tr>
</tbody>
</table>

When you remove the LSN configuration, the allocated NAT IP address and block of ports is freed from each subscriber. The appliance logs NAT IP address and block of ports freed from each subscriber. The appliance generates the following log messages for each subscriber when you remove the LSN configuration.

```
1) 03/23/2015:00:33:57 GMT Informational 0-PPE-0 : default LSN LSN_DETERMINISTIC 79201706 0 : Dtrstc FREE Client 12.0.0.238, NatInfo 50.0.0.2:58368 to 58879
2) 03/23/2015:00:33:57 GMT Informational 0-PPE-0 : default LSN LSN_DETERMINISTIC 79201707 0 : Dtrstc FREE Client 12.0.0.239, NatInfo 50.0.0.2:58880 to 59391
3) 03/23/2015:00:33:57 GMT Informational 0-PPE-0 : default LSN LSN_DETERMINISTIC 79201708 0 : Dtrstc FREE Client 12.0.0.240, NatInfo 50.0.0.2:59392 to 59903
```

### Minimal Logging for Dynamic LSN Configuration with Port Block

Consider an example of a simple dynamic LSN configuration with port block for any subscriber in the network 192.0.2.0/24. In this LSN configuration, the port block size is set to 1024 and LSN NAT IP address pool has IP addresses in the range 203.0.113.3-203.0.113.4.

```
set lsn parameter -memLimit 4000
Done
add lsn client LSN-CLIENT-1
```
Done
bind lsn client LSN-CLIENT-1 -network 192.0.2.0 -netmask 255.255.255.0
Done
add lsn pool LSN-POOL-1
Done
bind lsn pool LSN-POOL-1 203.0.113.3-203.0.113.4
Done
add lsn group LSN-GROUP-1 -clientname LSN-CLIENT-1 -portblocksize 1024
Done
bind lsn group LSN-GROUP-1 -poolname pool1 LSN-POOL-1
Done

1 The NetScaler appliance allocates a random NAT IP address and a block of ports, from the LSN NAT IP pool and on the basis of the set port block size, for a subscriber when it initiates a session for the first time. The NetScaler logs the NAT IP address and block of ports allocated to this subscriber. The appliance does not log any LSN session created or deleted for this subscriber. If all the ports are allocated (for different subscriber’s sessions) from the subscriber’s allocated port block, the appliance allocates a new random NAT IP address and port block for the subscriber for additional sessions. The NetScaler logs every NAT IP address and port block allocated to a subscriber.

2 The appliance generates the following log message when the subscriber, having the IP address 192.0.2.1, initiates a session. The log message shows that the appliance has allocated NAT IP address 203.0.113.3 and port block 1024-2047 to the subscriber.

30/23/2015:00:07:12 GMT Informational 0-PPE-3 : default LSN LSN_PORTBLOCK 106725793 0 : Port-block ALLOC Client 12.0.2.72, NatInfo 203.0.113.3:1024 to 2047, Proto:TCP

1 Once there are no more sessions left that is using the allocated NAT IP address and one of the ports in the allocated port block, the allocated NAT IP address and block of ports is freed from the subscriber. The NetScaler logs that the NAT IP address and the block of ports is freed from the subscriber. The appliance generates the following log messages for the subscriber, having the IP address 192.0.2.1, when no more sessions are left that is using the allocated NAT IP address (203.0.113.3) and a port from the allocated port block (1024-2047). The log message shows that the NAT IP address and port block are freed from the subscriber.

30/23/2015:00:11:09 GMT Informational 0-PPE-3 : default LSN LSN_PORTBLOCK 106814342 0 : Port-
## Load Balancing SYSLOG Servers

The NetScaler appliance sends its SYSLOG events and messages to all the configured external log servers. This results in storing redundant messages and makes monitoring difficult for system administrators. To address this issue, the NetScaler appliance offers load balancing algorithms that can load balance the SYSLOG messages among the external log servers for better maintenance and performance. The supported load balancing algorithms include RoundRobin, LeastBandwidth, CustomLoad, LeastConnection, LeastPackets, and AuditlogHash.

### Load balancing of SYSLOG servers using the command line interface

Add a service and specify the service type as SYSLOGTCP or SYSLOGUDP.

```bash
add service () <serviceType (SYSLOGTCP | SYSLOGUDP)>
```

Add a load balancing virtual server, specify the service type as SYSLOGTCP or SYSLOGTCP, and load balancing method as AUDITLOGHASH.

```bash
add lb vserver <serviceType (SYSLOGTCP | SYSLOGUDP)> [-lbMethod ]
```

Bing the service to the load balancing virtual server.

### Bind lb vserver

Add a SYSLOG action and specify the load balancing server name that has SYSLOGTCP or SYSLOGUDP as service type.

```
add syslogaction [-lbVserverName ] [-logLevel ]
```

Add a SYSLOG policy by specifying the rule and action.

```
add syslogpolicy
```

Bind the SYSLOG policy to the system global for the policy to take effect.

```
bind system global
```

### Load balancing of SYSLOG servers using the configuration utility
1. Add a service and specify the service type as SYSLOGTCP or SYSLOGUDP.

   Navigate to Traffic Management > Services, click Add and select SYLOGTCP or SYSLOGUDP as protocol.

2. Add a load balancing virtual server, specify the service type as SYSLOGTCP or SYSLOGTCP, and load balancing method as AUDITLOGHASH.

   Navigate to Traffic Management > Virtual Servers, click Add and select SYLOGTCP or SYSLOGUDP as protocol.

3. Bind the service to the load balancing virtual server to the service.

   Bind the service to the load balancing virtual server.

   Navigate to Traffic Management > Virtual Servers, select a virtual server and then select AUDITLOGHASH in the Load Balancing Method.

4. Add a SYSLOG action and specify the load balancing server name that has SYSLOGTCP or SYSLOGUDP as service type.

   Navigate to System > Auditing, click Servers and add a server by selecting LB Vserver option in Servers.

5. Add a SYSLOG policy by specifying the rule and action.

   Navigate to System > Syslog, click Policies and add a SYSLOG policy.

6. Bind the SYSLOG policy to the system global for the policy to take effect.

   Navigate to System > Syslog, select a SYSLOG policy and click Action, and then click Global Bindings and bind the policy to system global.

**Example:**

The following configuration specifies load balance of SYSLOG messages among the external log servers using the AUDITLOGHASH as load balancing method. The NetScaler appliance generates SYSLOG events and messages that are load balanced amongst the services, service 1, service 2, and service 3.
add service service1 192.0.2.10 SYSLOGUDP 514
Done
add service service2 192.0.2.11 SYSLOGUDP 514
Done
add service service3 192.0.2.11 SYSLOGUDP 514
Done
add lb vserver lbvserver1 SYSLOGUDP -lbMethod AUDITLOGHASH
Done
bind lb vserver lbvserver1 service1
Done
bind lb vserver lbvserver1 service2
Done
bind lb vserver lbvserver1 service3
Done
add syslogaction sysaction1 -lbVserverName lbvserver1 -logLevel All
Done
add syslogpolicy syspol1 ns_true sysaction1
Done
bind system global syspol1
Done

### Logging HTTP Header Information

The NetScaler appliance can now log request header information of an HTTP connection that is using the LSN functionality of the NetScaler. The following header information of an HTTP request packet can be logged:

- URL that the HTTP request is destined to.
- HTTP Method specified in the HTTP request.
- HTTP version used in the HTTP request.
- IP address of the subscriber that sent the HTTP request.

The HTTP header logs can be used by ISPs to see the trends related to the HTTP protocol among a set of subscribers. For example, an ISP can use this feature to find out the most popular websites among a set of subscribers.
An HTTP header log profile is a collection of HTTP header attributes (for example, URL and HTTP method) that can be enabled or disabled for logging. The HTTP header log profile is then bound to an LSN group. The NetScaler appliance then logs HTTP header attributes, which are enabled in the bound HTTP header log profile for logging, of any HTTP requests related to the LSN group. The appliance then sends the log messages to the configured log servers.

An HTTP header log profile can be bound to multiple LSN groups but an LSN group can have only one HTTP header log profile.

### To create an HTTP header log profile by using the command line interface

At the command prompt, type:

```
add lsn httphdrlogprofile [-logURL ( ENABLED | DISABLED )] [-logMethod ( ENABLED | DISABLED )] [-logVersion ( ENABLED | DISABLED )] [-logHost ( ENABLED | DISABLED )]
```

```
show lsn httphdrlogprofile
```

### To bind an HTTP header log profile to an LSN group by using the command line interface

At the command prompt, type:

```
bind lsn group -httphdrlogprofilename
```

```
show lsn group
```

### Example

In the following example of an LSN configuration, HTTP header log profile HTTP-HEADER-LOG-1 is bound to LSN group LSN-GROUP-1. The log profile has all the HTTP attributes (URL, HTTP method, HTTP version, and HOST IP address) enabled for logging so that all these attributes are logged for any HTTP requests from subscribers (in the network 192.0.2.0/24) related to the LSN group.

```
add lsn httphdrlogprofile HTTP-HEADER-LOG-1
Done

set lsn parameter -memLimit 4000
Done
```
add lsn client LSN-CLIENT-1
Done
bind lsn client LSN-CLIENT-1 -network 192.0.2.0 -netmask 255.255.255.0
Done
add lsn pool LSN-POOL-1
Done
bind lsn pool LSN-POOL-1 203.0.113.3-203.0.113.4
Done
add lsn group LSN-GROUP-1 -clientname LSN-CLIENT-1 -portblocksize 1024
Done
bind lsn group LSN-GROUP-1 -poolname pool1 LSN-POOL-1
Done
bind lsn group LSN-GROUP-1 -httphdrlogprofilename HTTP-HEADER-LOG-1
Done

The NetScaler generates the following HTTP header log message when one of the subscriber belonging to the LSN configuration example sends an HTTP request.

The log message tells us that a client having the IP address 192.0.2.33 sends an HTTP request to URL example.com using HTTP method GET and HTTP version 1.1.

03/19/2015:16:24:04 GMT Informational 0-PPE-1 : default LSN Message 59 0 : “LSN Client IP:TD 10.102.37.118:0 URL: example.com Host: 192.0.2.33 Version: HTTP1.1 Method: GET”

## Logging MSISDN Information

A Mobile Station Integrated Subscriber Directory Number (MSISDN) is a telephone number uniquely identifying a subscriber across multiple mobile networks. The MSISDN is associated with a country code and a national destination code identifying the subscriber's operator.

You can configure a NetScaler appliance to include MSISDNs in LSN log entries for subscribers in mobile networks. The presence of MSISDNs in the LSN logs helps the administrator in faster and accurate back tracing of a mobile subscriber who has violated a policy or law, or whose information is required by lawful interception agencies.
The following sample LSN log entries include MSISDN information for a connection from a mobile subscriber in an LSN configuration. The log entries show that a mobile subscriber whose MSISDN is E164:5556543210 was connected to destination IP:port 23.0.0.1:80 through the NAT IP:port 203.0.113.3:45195.

<table>
<thead>
<tr>
<th>Log Entry Type</th>
<th>Sample Log Entry</th>
</tr>
</thead>
</table>

### Perform the following tasks for including MSISDN information in LSN logs

- **Create an LSN log profile**. An LSN log profile includes the log subscriber ID parameter, which specifies whether to or not to include the MSISDN information in the LSN logs of an LSN configuration. Enable the log subscriber ID parameter when creating the LSN log profile.
- **Bind the LSN log profile to an LSN group of an LSN configuration**. Bind the created LSN log profile to an LSN group of an LSN configuration by setting the log profile name parameter to the created LSN log profile name. For instructions on configuring Large Scale NAT, see [Configuration Steps for LSN](/en-us/netscaler/11-1/netscaler-support-for-telecom-service-providers/lsn-introduction/configuration-steps-lsn.html).
### To create an LSN log profile by using the CLI

At the command prompt, type:

```
add lsn logprofile <logprofilename -logSubscriberID ( ENABLED | DISABLED )
```

```
show lsn logprofile
```

### To bind an LSN log profile to an LSN group of an LSN configuration by using the CLI

At the command prompt, type:

```
bind lsn group -logProfileName
```

```
show lsn group
```

**Sample Configuration:**

In this example of LSN configuration, the LSN log profile has the log subscriber ID parameter enabled. The profile is bound to LSN group LSN-GROUP-9. MSISDN information is included in the LSN session and LSN mapping logs for connections from mobile subscribers (in the network 192.0.2.0/24).

```
add lsn logprofile LOG-PROFILE-MSISDN-9 -logSubscriberID ENABLED

Done
```

```
add lsn client LSN-CLIENT-9

Done
```

```
bind lsn client LSN-CLIENT-9 -network 192.0.2.0 -netmask 255.255.255.0

Done
```

```
add lsn pool LSN-POOL-9

Done
```

```
bind lsn pool LSN-POOL-9 203.0.113.3-203.0.113.4

Done
```

```
add lsn group LSN-GROUP-9 -clientname LSN-CLIENT-9

Done
```

```
bind lsn group LSN-GROUP-9 -poolname LSN-POOL-9

Done
```

```
bind lsn group LSN-GROUP-9 -logprofilename LOG-PROFILE-MSISDN-9

Done
```
Displaying Current LSN Sessions

You can display the current LSN sessions for detecting any unwanted or inefficient LSN sessions on the NetScaler appliance. You can display all or some LSN sessions on the basis of selection parameters.

Note: When more than a million LSN sessions exist on the NetScaler appliance, Citrix recommends displaying selected LSN sessions instead of all by using the selection parameters.

Configuration Using the Command Line Interface

To display all LSN sessions by using the command line interface

```
show lsn session
```

To display selective LSN sessions by using the command line interface

```
show lsn session [-clientname | -network [-netmask] [-td]] [-natIP [-natPort]]
```

Example

```
To display all LSN sessions existing on a NetScaler

![lsn-session](/en-us/netscaler/media/show-lsn-session1.png)

To display all LSN sessions related to an LSN client entity LSN-CLIENT-2

![lsn-session2](/en-us/netscaler/media/lsn-session-2.png)

Done

To display all LSN sessions that uses 203.0.113.5 as the NAT IP address

![lsn-session3](/en-us/netscaler/media/lsn-session-3.png)
```

Configuration Using the Configuration Utility

```
To display all or selected LSN sessions by using the configuration
```
1. Navigate to System > Large Scale NAT > Sessions, and click the NAT44 tab.

1. For displaying LSN sessions on the basis of selection parameters, click Search.

### Parameter Descriptions (of commands listed in the CLI procedure)

- show lsn session
  
  - clientname
    
    Name of the LSN Client entity. Maximum Length: 127

  - network
    
    IP address or network address of subscriber(s).

  - netmask
    
    Subnet mask for the IP address specified by the network parameter.
    
    Default value: 255.255.255.255

  - td
    
    Traffic domain ID of the LSN client entity.
    
    Default value: 0
    
    Minimum value: 0
    
    Maximum value: 4094

  - natIP
    
    Mapped NAT IP address used in LSN sessions.
Displaying LSN Statistics

You can display statistics related to the LSN feature for evaluating the performance of the LSN feature or to troubleshoot problems. You can display a summary of statistics of the LSN feature or of a particular LSN group. The statistical counters reflect events since the NetScaler appliance was last restarted. All these counters are reset to 0 when the NetScaler appliance is restarted.

To display all LSN statistics by using the command line interface

At the command prompt, type:

```
stat lsn
```

To display statistics for a specified LSN group by using the command line interface

At the command prompt, type:

```
stat lsn group []
```

### Example

```
stat lsn

Large Scale NAT statistics
Rate/s Total
LSN TCP Received Packets 0 40
LSN TCP Received Bytes 0 3026
LSN TCP Transmitted Packets 0 40
LSN TCP Transmitted Bytes 0 3026
LSN TCP Dropped Packets 0 0
LSN TCP Current Sessions 0 0
LSN UDP Received Packets 0 0
LSN UDP Received Bytes 0 0
LSN UDP Transmitted Packets 0 0
LSN UDP Transmitted Bytes 0 0
LSN UDP Dropped Packets 0 0
LSN UDP Current Sessions 0 0
LSN ICMP Received Packets 0 982
LSN ICMP Received Bytes 0 96236
```
NetScaler 11.1

LSN ICMP Transmitted Packets 0 0
LSN ICMP Transmitted Bytes 0 0
LSN ICMP Dropped Packets 0 982
LSN ICMP Current Sessions 0 0
LSN Subscribers 0 1

Done

stat lsn group LSN-GROUP-1

LSN Group Statistics
Rate (/s) Total
TCP Translated Pkts 0 40
TCP Translated Bytes 0 3026
TCP Dropped Pkts 0 0
TCP Current Sessions 0 0
UDP Translated Pkts 0 0
UDP Translated Bytes 0 0
UDP Dropped Pkts 0 0
UDP Current Sessions 0 0
ICMP Translated Pkts 0 0
ICMP Translated Bytes 0 0
ICMP Dropped Pkts 0 0
ICMP Current Sessions 0 0
Current Subscribers 0 1

Done

</tbody>
</table>
fullValues

Specifies that numbers and strings should be displayed in their full form. Without this option, long strings are shortened and large numbers are abbreviated.

ntimes

The number of times, in intervals of seven seconds, the statistics should be displayed.

Default value: 1

logFile

The name of the log file to be used as input.

clearstats

Clear the statistics / counters

Possible values: basic, full

## Compact Logging

Logging LSN information is one of the important functions needed by ISPs to meet legal requirements and be able to identify the source of traffic at any given time. This eventually results in a huge volume of log data, requiring the ISPs to make large investments to maintain the logging infrastructure.

Compact logging is a technique for reducing the log size by using a notational change involving short codes for event and protocol names. For example, C for client, SC for session created, and T for TCP. Compact logging results in an average of 40 percent reduction in log size.

The following examples of NAT44 mapping creation log entries show the advantage of compact logging.
## Configuration Steps

Perform the following tasks for logging LSN information in compact format:

- **Create an LSN log profile.** An LSN log profile includes the Log Compact parameter, which specifies whether to or not to log information in compact format for an LSN configuration.
- **Bind the LSN log profile to an LSN group of an LSN configuration.** Bind the created LSN log profile to an LSN group of an LSN configuration by setting the Log Profile Name parameter to the created LSN log profile name. All sessions and mappings for this LSN group are logged in compact format.

### To create an LSN log profile by using the CLI

```plaintext
add lsn logprofile -logCompact (ENABLED|DISABLED)
```

### To bind an LSN log profile to an LSN group of an LSN configuration by using the CLI

```plaintext
bind lsn group -logProfileName
```

**Sample configuration:**

```plaintext
add lsn logprofile LOG-PROFILE-COMPACT-9 -logCompact ENABLED
Done
add lsn client LSN-CLIENT-9
Done
```
bind lsn client LSN-CLIENT-9 -network 192.0.2.0 -netmask 255.255.255.0
Done
add lsn pool LSN-POOL-9
Done
bind lsn pool LSN-POOL-9 203.0.113.3-203.0.113.4
Done
add lsn group LSN-GROUP-9 -clientname LSN-CLIENT-9
Done
bind lsn group LSN-GROUP-9 -poolname LSN-POOL-9
Done
bind lsn group LSN-GROUP-9 -logProfileName LOG-PROFILE-COMPACT-9
Done

### IPFIX Logging

The NetScaler appliance supports sending information about LSN events in Internet Protocol Flow Information Export (IPFIX) format to the configured set of IPFIX collector(s). The appliance uses the existing AppFlow feature to send LSN events in IPFIX format to the IPFIX collectors.

IPFIX based logging is available for the following large scale NAT44 related events:

- Creation or deletion of an LSN session.
- Creation or deletion of an LSN mapping entry.
- Allocation or de-allocation of port blocks in the context of deterministic NAT.
- Allocation or de-allocation of port blocks in the context of dynamic NAT.
- Whenever subscriber session quota is exceeded.

### Points to Consider before you Configure IPFIX logging

Before you start configuring IPSec ALG, consider the following points:

- You must configure the AppFlow feature and IPFIX collector(s) on the NetScaler appliance. For instructions, see Configuring the AppFlow feature topic.

### Configuration Steps

Perform the following tasks for logging LSN information in IPFIX format
- **Enable LSN logging in the AppFlow configuration**. Enable the LSN logging parameter as part of AppFlow configuration.

- **Create an LSN log profile**. An LSN log profile includes the IPFIX parameter that enables or disables the log information in IPFIX format.

- **Bind the LSN log profile to an LSN group of an LSN configuration**. Bind the LSN log profile to one or multiple LSN group(s). Events related to the bound LSN group will be logged in IPFIX format.

---

### To enable LSN logging in the AppFlow configuration by using the CLI

```
set appflow param -lsnLogging ( ENABLED | DISABLED )
show appflow param
```

### To create an LSN log profile by using the CLI

```
set lsn logprofile -logipfix ( ENABLED | DISABLED )
show lsn logprofile
```

### To bind the LSN log profile to an LSN group of an LSN configuration by using the CLI

```
bind lsn group -logProfileName
show lsn group
```

---

**To create an LSN log profile by using the GUI**

Navigate to **System > Large Scale NAT > Profiles**, click **Log** tab, and then add a log profile.

**To bind the LSN log profile to an LSN group of an LSN configuration by using the GUI**

1. Navigate to **System > Large Scale NAT > LSN Group**, open the LSN group.
2. In **Advanced Settings**, click + **Log Profile** to bind the created Log profile to the LSN group.
STUN Timeout

December 18, 2018

STUN (Session Traversal Utilities for NAT) enables an end host operating behind a NAT device to discover its NAT IP address and NAT port allocated by the NAT device. Interactive communication applications (for example real-time voice, video, and messaging) running on these hosts use the STUN protocol for discovering NAT IP address and port information. This information is used by these applications to connect to their peer applications in the Internet. STUN protocol includes servers, known as STUN servers, residing in the Internet. Using the STUN protocol, an application of an end host sends a request to a known STUN server, which in turn then embeds the NAT IP address and port in the payload of its response packet.

In an LSN deployment of a NetScaler appliance for an ISP, interactive communication applications (for example real-time voice, video, and messaging) running on a subscribers can use the STUN protocol to discover whether it is behind a NAT (NetScaler appliance) device or not. These applications send a request to a known STUN server. On receiving the request, the NetScaler allocates a NAT IP address and a port for this request, creates an LSN session and an LSN mapping entry, translates the packet with the allocated NAT IP address and port, and then forwards the packet to the STUN server. The STUN server embeds the allocated NAT IP address and port in the payload of its response packet. When the subscriber finally receives the packet, from the payload of the packet it learns that it is behind a NAT device, and the NAT IP address and port allocated for the session.

The application then notifies the peer applications that it is reachable at the NAT IP address and the port of the LSN mapping entry created for the STUN session. It notifies by embedding the NAT IP address and port in the payload of the packets sent to the peer applications. For making the application reachable at the same LSN mapping entry for any external application, full Cone NAT (endpoint Independent mapping and Endpoint Independent filtering) is enabled for the LSN configuration on the NetScaler appliance.

The NetScaler detects an LSN session of type STUN if the request packets are destined to TCP or UDP port 3478, and then marks the created mapping entry of type STUN. The NetScaler applies a timeout called, STUN timeout, to the created STUN LSN mapping entry. A STUN timeout is the maximum time that the NetScaler maintains an idle STUN LSN mapping entry since it was last used by any LSN session. If the STUN LSN mapping session is unused for a time that exceeds the STUN timeout, the NetScaler removes the mapping entry.

For an application on a subscriber that use STUN LSN mapping entry to stay available to other peer applications on the Internet, the application periodically sends keep-alive messages to the NetScaler appliance so that the STUN LSN mapping entry does not timeout. A higher frequency of keep-alive messages can have an affect on the performance a subscriber, especially, if the subscriber is a mobile device. A higher value of STUN timeout reduces the frequency of keep-alive messages from a subscriber.
ALGs on the NetScaler appliance do not apply to an LSN session that use a STUN LSN mapping entry because NAT IP address and NAT port are communicated in payload of the packets related to the session.

For subscribers’ applications that use STUN protocol, the LSN configuration must have the following settings:

- STUN timeout. In an LSN configuration, the LSN group includes the STUN timeout setting.
- Endpoint-independent mapping and endpoint-independent filtering for STUN protocol ports.

For instructions on creating an LSN configuration, see Configuration Steps for LSN.

**Example:**

The following sample LSN configuration applies to applications that use STUN protocol over TCP or UDP. STUN timeout is set to 10 mins. Endpoint-independent mapping and endpoint-independent filtering is set for the STUN TCP port (3748) and the STUN UDP port (3748).

```
1 add lsn client LSN-CLIENT-1
  Done
2 bind lsn client LSN-CLIENT-1 -network 192.0.2.0 -netmask 255.255.255.0
  Done
3 add lsn pool LSN-POOL-1
  Done
4 bind lsn pool LSN-POOL-1 203.0.113.3
  Done
5 add lsn group LSN-GROUP-1 -clientname LSN-CLIENT-1 -stuntimeout 10
  Done
6 bind lsn group LSN-GROUP-1 -poolname pool1 LSN-POOL-1
  Done
7 add lsn appsprofile LSNAPPSPROFILE-TCP-STUN-1 TCP -mapping ENDPOINT-INDEPENDENT -filtering ENDPOINT-INDEPENDENT
  Done
```
TCP SYN Idle Timeout

December 18, 2018

SYN idle timeout is the timeout for establishing TCP connections that use LSN on the NetScaler appliance. If a TCP session is not established within the configured timeout period, the NetScaler removes the session. SYN idle timeout is useful in providing protection against SYN flood attacks. In an LSN configuration, the LSN group entity includes the SYN idle timeout setting.

Example:

In the following sample LSN configuration, SYN idle timeout is set to 30 secs for TCP connections related to subscribers from the 192.0.2.0/24 network.
Overriding LSN configuration with Load Balancing Configuration

December 18, 2018

An LSN configuration takes precedence over any load balancing configuration by default. For overriding the large scale networking (LSN) configuration with the load balancing configuration for traffic matching both configurations, create a net profile with Override LSN parameter enabled and bind this profile to the virtual server of the load balancing configuration. USNIP or USIP settings of the load balancing configuration are applied to the traffic, instead of applying the LSN IP address of the LSN configuration.

This option is useful in an LSN deployment that includes NetScaler appliances and value added services, such as firewall and optimization devices. In this type of deployment, the ingress traffic on the NetScaler appliance is required to pass through these value-added services before an LSN configuration on the appliance is applied to the traffic. For the NetScaler appliance to send the ingress traffic to a value added service, a load balancing configuration is created and override LSN is enabled on the appliance. The load balancing configuration includes value added services, represented as load balancing services, bound to a virtual server of type ANY. The virtual server is configured with listen policies for identifying the traffic to be sent to the value added service.

To enable override lsn in a net profile by using the CLI

To enable override lsn while adding a net profile, at the command prompt, type
To enable override LSN while adding a net profile, at the command prompt, type

```
1 add netProfile <name> -overrideLsn ( ENABLED | DISABLED )
2 show netprofile <name>
```

To enable override LSN in a net profile by using GUI

1. Navigate to System > Network > Net Profiles.
2. Set the Override LSN parameter while adding or modifying net profiles.

In the following sample configuration, net profile NETPROFILE-OVERRIDELSN-1 has override LSN option enabled and is bound to load balancing virtual server LBVS-1.

**Sample configuration:**

```
1 add netprofile NETPROFILE-OVERRIDELSN-1 -overrideLsn ENABLED
2 Done
3 set lb vserver LBVS-1 -netprofile NETPROFILE-OVERRIDELSN-1
4 Done
```

**Clearing LSN Sessions**

*December 18, 2018*

You can remove any unwanted or inefficient LSN sessions from the NetScaler appliance. The appliance immediately releases resources (such as NAT IP address, port, and memory) allocated for these sessions, making the resources available for new sessions. The appliance also drops all the subsequent packets related to these removed sessions. You can remove all or selected LSN sessions from the NetScaler appliance.
NetScaler 11.1

**To clear all LSN sessions by using the command line interface**

At the command prompt, type:

```plaintext
1 flush lsn session
2 show lsn session
```

**To clear selective LSN sessions by using the command line interface**

At the command prompt, type:

```plaintext
1 flush lsn session [-clientname <string>] [-network <ip_addr> [-netmask <netmask>] [-td <positive_integer>]] [-natIP <ip_addr> [-natPort <port>]]
2 show lsn session
```

**Example**

Clear all LSN sessions existing on a NetScaler

```plaintext
1 flush lsn session
2 Done
```

Clear all LSN sessions related to LSN client entity LSN-CLIENT-1

```plaintext
1 flush lsn session -clientname LSN-CLIENT-1
2 Done
```

Clear all LSN sessions related to a subscriber network (192.0.2.0) of LSN client entity LSN-CLIENT-2 belonging to traffic domain 100

```plaintext
1 flush lsn session -clientname LSN-CLIENT-2 - network 192.0.2.0 - netmask 255.255.255.0 - td 100
2 Done
```
To clear all LSN sessions by using the configuration utility

Navigate to System > Large Scale NAT > Sessions, and click Flush Sessions.

Parameter Descriptions (of commands listed in the CLI procedure)

- flush lsn session
  - clientname
    Name of the LSN Client entity. Maximum Length: 127
  - network
    IP address or network address of subscriber(s).
  - netmask
    Subnet mask for the IP address specified by the network parameter.
    Default value: 255.255.255.255
  - td
    Traffic domain ID of the LSN client entity.
    Default value: 0
    Minimum value: 0
    Maximum value: 4094
  - natIP
    Mapped NAT IP address used in LSN sessions.
  - natPort
    Mapped NAT port used in the LSN sessions.

Load Balancing SYSLOG Servers

December 18, 2018

The NetScaler appliance send its SYSLOG events and messages to all the configured external log servers. This results in storing redundant messages and makes monitoring difficult for system administrators. To address this issue, the NetScaler appliance offers load balancing algorithms that can load balance the SYSLOG messages among the external log servers for better maintenance and performance. The supported load balancing algorithms include RoundRobin, LeastBandwidth, CustomLoad, LeastConnection, LeastPackets, and AuditlogHash.
Load balancing of SYSLOG servers using the command line interface

At the command prompt, type:

Add a service and specify the service type as SYSLOGTCP or SYSLOGUDP.

```
1 add service <name>(<IP> | <serverName>) <serviceType (SYSLOGTCP | SYSLOGUDP)> <port>
```

Add a load balancing virtual server, specify the service type as SYSLOGTCP or SYSLOGTCP, and load balancing method as AUDITLOGHASH.

```
1 add lb vserver <name> <serviceType (SYSLOGTCP | SYSLOGUDP)> [-lbMethod <AUDITLOGHASH>]
```

Bind the service to the load balancing virtual server.

```
1 bind lb vserver <name> <serviceName>
```

1. Add a SYSLOG action and specify the load balancing server name that has SYSLOGTCP or SYSLOGUDP as service type.

```
1 add syslogaction <name> <serverIP> [-lbVserverName <string>] [-logLevel <logLevel>]
```

Add a SYSLOG policy by specifying the rule and action.

```
1 add syslogpolicy <name> <rule> <action>
```

Bind the SYSLOG policy to the system global for the policy to take effect.

```
1 bind system global <policyName>
```

**Load balancing of SYSLOG servers using the configuration utility**

1. Add a service and specify the service type as SYSLOGTCP or SYSLOGUDP.

   Navigate to Traffic Management > Services, click Add and select SYLOGTCP or SYSLOGUDP as protocol.

2. Add a load balancing virtual server, specify the service type as SYSLOGTCP or SYSLOGTCP, and load balancing method as AUDITLOGHASH.

   Navigate to Traffic Management > Virtual Servers, click Add and select SYLOGTCP or SYSLOGUDP-Pas protocol.
3. Bing the service to the load balancing virtual server to the service.

Bing the service to the load balancing virtual server.

Navigate to Traffic Management > Virtual Servers, select a virtual server and then select AUDITLOGHASH in the Load Balancing Method.

4. Add a SYSLOG action and specify the load balancing server name that has SYSLOGTCP or SYSLOGUDP as service type.

Navigate to System > Auditing, click Servers and add a server by selecting LB Vserver option in Servers.

5. Add a SYSLOG policy by specifying the rule and action.

Navigate to System > Syslog, click Policies and add a SYSLOG policy.

6. Bind the SYSLOG policy to the system global for the policy to take effect.

Navigate to System > Syslog, select a SYSLOG policy and click Action, and then click Global Bindings and bind the policy to system global.

Example:
The following configuration specifies load balance of SYSLOG messages among the external log servers using the AUDITLOGHASH as load balancing method. The NetScaler appliance generates SYSLOG events and messages that are load balanced amongst the services, service1, service2, and service 3.

```
add service service1 192.0.2.10 SYSLOGUDP 514
add service service2 192.0.2.11 SYSLOGUDP 514
add service service3 192.0.2.11 SYSLOGUDP 514
add lb vserver lbvserver1 SYSLOGUDP -lbMethod AUDITLOGHASH
bind lb vserver lbvserver1 service1
bind lb vserver lbvserver1 service2
bind lb vserver lbvserver1 service3
add syslogaction sysaction1 -lbVserverName lbvserver1 -logLevel All
add syslogpolicy syspol1 ns_true sysaction1
bind system global syspol1
```
Limitations:
The NetScaler appliance does not support an external load balancing virtual server load balancing the SYSLOG messages among the log servers.

Port Control Protocol

December 18, 2018

NetScaler appliances now support Port Control Protocol (PCP) for large scale NAT (LSN). Many of an ISP’s subscriber applications must be accessible from Internet (for example, Internet of Things (IOT) devices, such as an IP camera that provides surveillance over the Internet). One way to meet this requirement is to create static large scale NAT (LSN) maps. But for a very large number of subscribers, creating static LSN NAT maps is not a feasible solution.

Port Control Protocol (PCP) enables a subscriber to request specific LSN NAT mappings for itself and/or for other 3rd party devices. The large scale NAT device creates an LSN map and sends it to the subscriber. The subscriber sends the remote devices on the Internet the NAT IP address: NAT port at which they can connect to the subscriber.

Applications usually send frequent keep-alive messages to the large scale NAT device so that their LSN mappings do not time out. PCP helps reduce the frequency of such keep-alive messages by enabling the applications to learn the timeout settings of the LSN mappings. This helps reduce bandwidth consumption on the ISP’s access network and battery consumption on mobile devices.

PCP is a client-server model and runs over the UDP transport protocol. A NetScaler appliance implements the PCP server component and is compliant with RFC 6887.

Configuration Steps

Perform the following tasks for configuring PCP:

- (Optional) Create a PCP profile. A PCP profile includes settings for PCP related parameters (for example, to listen for mapping and peer PCP requests). A PCP profile can be bound to a PCP server. A PCP profile bound to a PCP server applies all its settings to the PCP server. A PCP profile can be bound to multiple PCP servers. By default, one PCP profile with default parameters settings is bound to all PCP servers. A PCP profile that you bind to a PCP server overrides the default PCP profile settings for that server. A default PCP profile has the following parameter settings:
  - Mapping: Enabled
  - Peer: Enabled
  - Minimum map life: 120 seconds
- Maximum max life: 86400 seconds
- Announce count: 10
- Third Party: Disabled

- Create a PCP server and bind a PCP profile to it. Create a PCP server on the NetScaler appliance to listen for PCP related requests and messages from the subscribers. A Subnet IP (SNIP) address must be assigned to a PCP server to access it. By default, a PCP server listens on port 5351.
- Bind the PCP server to an LSN group of an LSN configuration. Bind the created PCP server to an LSN group of an LSN configuration by setting the PCP Server parameter to specify the created PCP server. The created PCP server can be accessed only by the subscribers of this LSN group.

Note
A PCP server for a large scale NAT configuration does not serve requests from subscribers that are identified from ACL rules.

To create a PCP profile by using the CLI

At the command prompt, type:

```
add pcp profile <name> [-mapping ( ENABLED | DISABLED )] [-peer ( ENABLED | DISABLED )] [-minMapLife <secs>] [-maxMapLife <secs>] [-announceMultiCount <positive_integer>] [-thirdParty ( ENABLED | DISABLED )]
```

```
show pcp profile <name>
```

To create a PCP server by using the CLI

At the command prompt, type:

```
add pcp server <name> <IPAddress> [-port <portNum>|*] [-pcpProfile <string>]
```

```
show pcp server <name>
```

Sample Configuration for NAT44

In the following sample configuration, PCP server PCP-SERVER-9, with default PCP settings, is bound to LSN group LSN-GROUP-9. PCP-SERVER-9 serves PCP requests from subscribers in network 192.0.2.0/24.

Sample configuration:
Dual-Stack Lite

January 6, 2019

Because of the shortage of IPv4 addresses, and the advantages of IPv6 over IPv4, many ISPs have started transitioning to IPv6 infrastructure. But during the transition, ISPs must continue to support IPv4 along with IPv6, because most of the public Internet still uses only IPv4, and many subscribers do not support IPv6.

Dual Stack Lite (DS-Lite) is an IPv6 transition solution for ISPs with IPv6 infrastructure to connect their...
IPv4 subscribers to the Internet. DS-Lite uses IPv4-in-IPv6 tunneling to send a subscriber’s IPv4 packet through a tunnel on the IPv6 access network to the ISP. The IPv6 packet is decapsulated to recover the subscriber’s IPv4 packet and is then sent to the Internet after NAT address and port translation and other LSN related processing. The response packets traverse through the same path to the subscriber.

The NetScaler appliance implements the AFTR component of a DS-Lite deployment and is compliant with RFC 6333.

Architecture

The Dual-Stack Lite architecture for an ISP consists of the following components:

- **Basic Bridging Broadband (B4).** Basic Bridging broadband, or B4, is a device or component that resides in the subscriber premises. Typically, B4 is a component in the CPE devices in the subscriber premises. IPv4 subscribers are connected to the IPv6-only ISP access network through the CPE device containing the B4 component. The main function of the B4 is to initiate an IPv6 tunnel between B4 and an address family transition router (AFTR) in order to send or receive subscriber IPv4 request or response packets over the tunnel. B4 includes an IPv6 address known as the B4 tunnel endpoint address. B4 uses this address to source IPv6 packets to AFTR and receive packets from AFTR.

- **Address family transition router (AFTR).** AFTR is a device or component residing in the ISP’s core network. AFTR terminates the IPv6 tunnel from the B4 device. In other words, the IPv6 tunnel is formed between B4 in the subscriber premise and AFTR in ISP core network. AFTR decapsulates IPv6 packets received from B4 to recover the subscribers’ original IPv4 packets. AFTR sends the IPv4 packets to the LSN device or component. LSN routes the IPv4 packets to their destination after performing NAT address and port translation (NAT 44) and other LSN related processing. AFTR includes an IPv6 address known as the AFTR tunnel endpoint address. AFTR uses this address to source IPv6 packets to B4 and receive IPv6 packets from B4. The NetScaler appliance implements the AFTR component.

- **Softwire.** The IPv6 tunnel created between B4 and AFTR is called a softwire.

The DS-Lite architecture of an ISP using a NetScaler appliance consists of subscribers in private address spaces accessing the Internet through a NetScaler appliance deployed in ISP’s core network. IPv4 subscribers are connected to a CPE device that includes the DS-Lite B4 functionality. The CPE device is connected to the ISP core network through ISP’s IPv6-only access network. The NetScaler appliance contains the DS-Lite AFTR and LSN functionality.

IPv4 subscribers connected to the CPE device are assigned private IPv4 addresses either manually or through DHCP server running on the CPE device. On the CPE device, the AFTR tunnel endpoint address is specified manually or through DHCPv6. Configuration of CPE devices is vendor specific and therefore outside the scope of this documentation.
Upon receiving a request packet that is from an IPv4 subscriber and destined to a location on the Internet, the B4 component of the CPE device encapsulates the IPv4 packet in an IPv6 packet and sends it to the NetScaler appliance in the ISP core network. The NetScaler appliance’s AFTR functionality decapsulates the IPv6 packet to recover the subscriber’s original IPv4 packet. The LSN functionality of the NetScaler appliance translates the source IP address and port of the IPv4 packet to an NAT IP address and NAT port selected from the configured NAT pool, and then sends the packet to its destination on the Internet.

The appliance maintains a record of all active sessions that use the AFTR and LSN functionalities. These sessions are called DS-Lite sessions. The NetScaler appliance also maintains the mappings between B4 IPv6 address, subscriber IPv4 address and port, and NAT IPv4 address and port, for each DS-Lite session. These mappings are called DS-Lite LSN mappings. From DS-Lite session entries and DS-Lite LSN mapping entries, the NetScaler appliance recognizes a response packet (received from the Internet) as belonging to a particular DS-Lite session.

When the NetScaler appliance receives a response packet belonging to a particular DS-Lite session, the appliance’s LSN functionality translates the destination IP address and port of the response packet from NAT IP address and port to the subscriber IP address and port, the AFTR functionality encapsulates the resulting packet in an IPv6 packet and sends it to the CPE device. The B4 functionality of the CPE device decapsulates the IPv6 packet to recover the IPv4 response packet, and then sends the IPv4 packet to the subscriber.

**Example**

Consider an example of a DS-Lite deployment consisting of NetScaler NS-1 in an ISP’s core network, CPE device B4-CPE-1 in a subscriber premise, and a single IPv4 subscriber SUB-1. B4-CPE-1 supports the B4 functionality of DS-Lite feature.

The following table lists the settings used in this example.

<table>
<thead>
<tr>
<th>Entity</th>
<th>Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>IPv4 address of subscriber</td>
<td>SUB-1</td>
<td>192.0.2.51</td>
</tr>
<tr>
<td>IPv6 address of softwire endpoint on</td>
<td>B4-CPE-1</td>
<td>2001:DB8::3:4</td>
</tr>
<tr>
<td>the B4 device</td>
<td>(B4-CPE-1)</td>
<td></td>
</tr>
<tr>
<td>IPv6 address of the softwire</td>
<td></td>
<td>2001:DB8::5:6</td>
</tr>
<tr>
<td>endpoint on the AFTR device</td>
<td>(NS-1)</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
NetScaler 11.1

Settings on NetScaler appliance NS-1:

<table>
<thead>
<tr>
<th>Entity</th>
<th>Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>LSN client</td>
<td>LSN-DSLITE-CLIENT-1</td>
<td>Network6 (Identifying traffic from B4 devices) = 2001:DB8::3:0/100</td>
</tr>
<tr>
<td>LSN pool</td>
<td>LSN-DSLITE-POOL-1</td>
<td>LSN IPs (NAT IP) = 203.0.113.61 - 203.0.113.70</td>
</tr>
<tr>
<td>IPv6 Profile</td>
<td>LSN-DSLITE-PROFILE-1</td>
<td>Type = DS-LITE; IPv6 address (AFTR IPv6 address) = One of the NetScaler owned IPv6 address of type SNIP6 = 2001:DB8::5:6</td>
</tr>
<tr>
<td>LSN group</td>
<td>LSN-DSLITE-GROUP-1</td>
<td>LSN client = LSN-DSLITE-CLIENT-1; LSN pool = LSN-DSLITE-POOL-1; IPv6 profile = LSN-DSLITE-PROFILE-1</td>
</tr>
</tbody>
</table>

Following is the traffic flow in this example:

1. IPv4 subscriber SUB-1 sends a request to [http://www.example.com/](http://www.example.com/). The IPv4 packet has:
   - Source IP address = 192.0.2.51
   - Source port = 2552
   - Destination IP address = 198.51.100.250
   - Destination port = 80

2. Upon receiving the IPv4 request packet, B4-CPE-1 encapsulates it in the payload of an IPv6 packet and then sends the IPv6 packet to NS-1. The IPv6 packet has:
   - Source IP address = 2001:DB8::3:4
   - Destination IP address = 2001:DB8::5:6

3. When NS-1 receives the IPv6 packet, the AFTR module decapsulates the packet by removing the IPv6 headers. The resulting packet is SUB-1’s original IPv4 request packet.

4. The LSN module of NS-1 translates the source IP address and port of the packet to an NAT IP address and NAT port selected from the configured NAT pool. The translated IPv4 packet has:
   - Source IP address = 203.0.113.61
5. The LSN module also creates an LSN mapping and session entry for this DS Lite session. The mapping includes the following information:
   - Source IP address of the IPv6 packet (B4-CPE-1’s IPv6 address) = 2001:DB8::3:4
   - Source IP address of the IPv4 packet (SUB-1’s IPv4 address) = 192.0.2.51
   - Source port of the IPv4 packet = 2552
   - NAT IP address = 203.0.113.61
   - NAT port = 3002

6. NS-1 sends the resulting IPv4 packet to its destination on the Internet.

7. The server for www.example.com processes the request packet and sends a response packet. The IPv4 response packet has:
   - Source IP address = 198.51.100.250
   - Source port = 80
   - Destination IP address = 203.0.113.61
   - Destination port = 3002

8. Upon receiving the IPv4 packet, NS-1 examines the LSN mapping and session entries and finds that the IPv4 response packet belongs to a DS Lite session. The LSN module of NS-1 translates the destination IP address and port. The IPv4 packet now has:
   - Source IP address = 198.51.100.250
   - Source port = 80
   - Destination IP address = 192.0.2.51
   - Destination port = 2552

9. The AFTR module of NS-1 encapsulates the IPv4 packet in an IPv6 packet and then sends the IPv6 packet to B4-CPE-1. The IPv6 packet has:
   - Source IP address = 2001:DB8::5:6
   - Destination IP address = 2001:DB8::3:4

10. Upon receiving the packet, B4-CPE-1 decapsualtes the IPv6 packet by removing the IPv6 headers, and then sends the resulting IPv4 packet to CL-1.

**Points to Consider before Configuring DS-Lite**

December 18, 2018

Consider the following points before configuring DS-Lite on a NetScaler appliance:
1. You must understand the different components of DS-Lite, described in RFC 6333.

2. A DS-lite configuration on a NetScaler appliance uses the LSN commands sets. In a DS-Lite configuration, the LSN client entity specifies the IPv6 address or IPv6 network address or ACL6 rules for identifying the traffic from the B4 device. A DS-Lite configuration also includes an IPv6 profile, which specifies the IPv6 address AFTR component on a NetScaler appliance. For more information on NetScaler LSN feature, see Large Scale NAT.

3. For a DS-Lite configuration, the NetScaler appliance supports LSN for IPv4 packets that belong to one of the following protocols only. The NetScaler appliance drops IPv4 packets belonging to other protocols:
   - TCP
   - UDP
   - ICMP

4. The NetScaler appliance supports the following ALGs DS-Lite:
   - ICMP
   - FTP
   - TFTP
   - Session Initiation Protocol (SIP)
   - Real Time Streaming Protocol (RTSP)

---

**Configuring DS-Lite**

December 18, 2018

A DS-lite configuration on a NetScaler appliance uses the LSN commands sets. In a DS-Lite configuration, the LSN client entity specifies the IPv6 address or IPv6 network address or ACL6 rules for identifying the traffic from the B4 device. For more information on the NetScaler LSN feature, see Large Scale NAT. A DS-Lite configuration also includes an IPv6 profile, which specifies the IPv6 address (of type SNIP6) of the DS-Lite AFTR component on a NetScaler appliance.

Configuring DS-Lite on a NetScaler appliance consists of the following tasks:

**Set the global LSN parameters.** Global parameters include the amount of NetScaler memory reserved for the LSN feature and synchronization of LSN sessions in a high availability setup.

- **Create an LSN client entity for identifying traffic from B4 CPE devices.** The LSN client entity refers to a set of DS-Lite B4 devices. The client entity includes IPv6 addresses or IPv6 network address or ACL6 rules for identifying the traffic from these B4 devices. An LSN client can be bound to only one LSN group. The command line interface has two commands for creating an LSN client entity and binding a subscriber to the LSN client entity. The configuration utility combines these two operations on a single screen.
• **Create an LSN pool and bind NAT IP addresses to it.** An LSN pool defines a pool of NAT IP addresses to be used by the NetScaler appliance to perform LSN. The command line interface has two commands for creating an LSN pool and binding NAT IP addresses to the LSN pool. The configuration utility combines these two operations on a single screen.

• **Create an LSN IP6 profile.** An LSN IP6 profile defines the IPv6 address of the DS-Lite AFTR component on the NetScaler appliance. The IPv6 address must be one of the NetScaler owned IPv6 address of type SNIP6.

• **(Optional) Create an LSN Transport Profile for a specified protocol.** An LSN transport profile defines various timeouts and limits, such as maximum LSN sessions and maximum ports usage that a subscriber can have for a given protocol. You bind an LSN transport profile for each protocol (TCP, UDP, and ICMP) to an LSN group. A profile can be bound to multiple LSN groups. A profile bound to an LSN group applies to all subscribers of an LSN client bound to the same group. By default, one LSN transport profile with default settings for TCP, UDP, and ICMP protocols is bound to an LSN group during its creation. This profile is called the default transport profile. An LSN transport profile that you bind to an LSN group overrides the default LSN transport profile for that protocol.

• **(Optional) Create an LSN Application Profile for a specified protocol and bind a set of destination ports to it.** An LSN application profile defines the LSN mapping and LSN filtering controls of a group for a given protocol and for a set of destination ports. For a set of destination ports, you bind an LSN profile for each protocol (TCP, UDP, and ICMP) to an LSN group. A profile can be bound to multiple LSN groups. An LSN application profile bound to an LSN group applies to all subscribers of an LSN client bound to the same group. By default, one LSN application profile with default settings for TCP, UDP, and ICMP protocols for all destination ports is bound to an LSN group during its creation. This profile is called a default application profile. When you bind an LSN application profile, with a specified set of destination ports, to an LSN group, the bound profile overrides the default LSN application profile for that protocol at that set of destination ports. The command line interface has two commands for creating an LSN application profile and binding a set of destination ports to the LSN application profile. The configuration utility combines these two operations on a single screen.

• **Create an LSN Group and bind LSN pools, LSN IPv6 profile, (optional) LSN transport profiles, and (optional) LSN application profiles to the LSN group.** An LSN group is an entity consisting of an LSN client, an LSN IPv6 profile, LSN pool(s), LSN transport profile(s), and LSN application profiles(s). A group is assigned parameters, such as port block size and logging of LSN sessions. The parameter settings apply to all the subscribers of an LSN client bound to the LSN group. Only one LSN IPv6 profile can be bound to an LSN group, and an LSN IPv6 profile bound to an LSN group cannot be bound to other LSN groups. Only LSN Pools and LSN groups with the same NAT type settings can be bound together. Multiple LSN pools can be bound to an LSN group. Only one LSN client entity can be bound to an LSN group, and an LSN client entity bound to an LSN group cannot be bound to other LSN groups. The command line interface
NetScaler 11.1

has two commands for creating an LSN group and binding LSN pools, LSN transport profiles, and LSN application profiles to the LSN group. The configuration utility combines these two operations in a single screen.

**Configuration by Using the Command Line**

**To create an LSN client by using the command line interface:**

At the command prompt, type:

```
1 add lsn client <clientname>
2
3 show lsn client
```

**To bind an IPv6 network or an ACL6 rule to an LSN client by using the command line interface:**

At the command prompt, type:

```
1 bind lsn client <clientname> (-network6 <ipv6_addr> | -acl6name <string>)
2
3 show lsn client
```

**To create an LSN pool by using the command line interface:**

At the command prompt, type:

```
1 add lsn pool <poolname> [-nattype (DYNAMIC)] [-portblockallocation (ENABLED | DISABLED)] [-portreallocate <secs>] [-maxPortReallocTmq <positive_integer>]
2
3 show lsn pool
```

**To bind an IP address range to an LSN pool by using the command line interface:**

At the command prompt, type:

```
1 bind lsn pool <poolname> <lsnip>
2
3 show lsn pool
```

**Note:** For removing LSN IP addresses from an LSN pool, use the unbind lsn pool command.

**To configure an LSN IPv6 profile by using the command line interface:**

At the command prompt, type:
NetScaler 11.1

To create an LSN transport profile by using the command line interface:

At the command prompt, type:

```bash
add lsn transportprofile <transportprofilename> <transportprotocol> [-sessiontimeout <secs>] [-finrsttimeout <secs>] [-portquota <positive_integer>] [-sessionquota <positive_integer>] [-portpreserveparity ( ENABLED | DISABLED )] [-portpreserverange ( ENABLED | DISABLED )] [-syncheck ( ENABLED | DISABLED )]
```

2
3

show lsn transportprofile

To create an LSN application profile by using the command line interface:

At the command prompt, type:

```bash
add lsn appsprofile <appsprofilename> <transportprotocol> [-ippooling ( PAIRED | RANDOM )] [-mapping <mapping>] [-filtering <filtering>] [-tcpproxy ( ENABLED | DISABLED )] [-td <positive_integer>]
```

2
3

show lsn appsprofile

To bind an application protocol port range to an LSN application profile by using the command line interface:

At the command prompt, type:

```bash
bind lsn appsprofile <appsprofilename> <lsnport>
```

2
3

show lsn appsprofile

To create an LSN group by using the command line interface:

At the command prompt, type:

```bash
add lsn group <groupname> -clientname <string> [-nattype ( DYNAMIC )] [-portblocksize <positive_integer>] [-logging ( ENABLED | DISABLED )] [-sessionLogging ( ENABLED | DISABLED )] [-sessionSync ( ENABLED | DISABLED )] [-snmptraplimit <positive_integer>] [-ftp ( ENABLED | DISABLED )] [-ppptp ( ENABLED | DISABLED )] [-sipalg ( ENABLED | DISABLED )] [-rtspalg ( ENABLED | DISABLED )] [-ip6profile <string>]
```
To bind LSN protocol profiles and LSN pools to an LSN group by using the command line interface:

At the command prompt, type:

```
bind lsn group <groupname> (-poolname <string> | -transportprofilename <string> | -httpdrclogprofilename <string> | -appsprofilename <string> | -sipalgprofilename <string> | -rtspalgprofilename <string>)
```

Configuration by Using the Configuration Utility

To configure an LSN client and bind an IPv6 network address or an ACL6 rule by using the configuration utility:

Navigate to System > Large Scale NAT > Clients, and add a client and then bind an IPv6 network address or an ACL6 rule to the client.

To configure an LSN pool and bind NAT IP addresses by using the configuration utility:

Navigate to System > Large Scale NAT > Pools, and add a pool and then bind an NAT IP address or a range of NAT IP addresses to the pool.

To configure an LSN IPv6 profile by using the configuration utility:

Navigate to System > Large Scale NAT > Profiles, click the IPv6 tab, and assign an IPv6 address for DS-Lite AFTR.

To configure an LSN transport profile by using the configuration utility:

1. Navigate to System > Large Scale NAT > Profiles.
2. On the details pane, click Transport, and then add a transport profile.

To configure an LSN application profile by using the configuration utility:

1. Navigate to System > Large Scale NAT > Profiles.
2. On the details pane, click Application, and then add an application profile.

To configure an LSN group and bind an LSN client, an LSN IPv6 profile, pools, transport profiles, and application profiles by using the configuration utility:

Navigate to System > Large Scale NAT > Groups, and add a group and then bind an LSN client, an LSN IPv6 profile, pools, transport profiles, and application profiles to the group.
Logging and Monitoring DS-Lite

You can log DS-Lite information to diagnose or troubleshoot problems, and to meet legal requirements. The NetScaler appliance supports all LSN logging features for logging DS-Lite information. For configuring DS-Lite logging, use the procedures for configuring LSN logging, described at Logging and Monitoring LSN.

A log message for a DS-Lite LSN mapping entry consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (MAPPING)
- Whether the DS-Lite LSN mapping entry was created or deleted
- IPv6 address of B4
- Subscriber’s IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID might be present, depending on the following conditions:
  - Destination IP address and port are not logged for Endpoint-Independent mapping.
  - Only the destination IP address is logged for Address-Dependent mapping. The port is not logged.
  - Destination IP address and port are logged for Address-Port-Dependent mapping.

A log message for a DS-Lite session consists of the following information:
- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (SESSION)
- Whether the DS-Lite session is created or removed
- IPv6 address of B4
- Subscriber's IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID

The following table shows sample DS-Lite log entries of each type stored on the configured log servers. These log entries are generated by a NetScaler appliance whose NSIP address is 10.102.37.115. You can log DS-Lite information to diagnose or troubleshoot problems, and to meet legal requirements. The NetScaler appliance supports all LSN logging features for logging DS-Lite information. For configuring DS-Lite logging, use the procedures for configuring LSN logging, described at Loggging and Monitoring LSN.

A log message for a DS-Lite LSN mapping entry consists of the following information:
- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (MAPPING)
- Whether the DS-Lite LSN mapping entry was created or deleted
- IPv6 address of B4
- Subscriber's IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID might be present, depending on the following conditions:
  - Destination IP address and port are not logged for Endpoint-Independent mapping.
  - Only the destination IP address is logged for Address-Dependent mapping. The port is not logged.
  - Destination IP address and port are logged for Address-Port-Dependent mapping.

A log message for a DS-Lite session consists of the following information:
- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (SESSION)
- Whether the DS-Lite session is created or removed
**NetScaler 11.1**

- IPv6 address of B4
- Subscriber’s IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID

The following table shows sample DS-Lite log entries of each type stored on the configured log servers. These log entries are generated by a NetScaler appliance whose NSIP address is 10.102.37.115.

<table>
<thead>
<tr>
<th>LSN Log Entry Type</th>
<th>Sample Log Entry</th>
</tr>
</thead>
</table>
**Displaying Current DS-Lite Sessions**

You can display the current DS-Lite sessions for detecting any unwanted or inefficient sessions on the NetScaler appliance. You can display all or some DS-Lite sessions, on the basis of selection parameters.

**Configuration by Using the Command Line Interface**

**To display all DS-Lite sessions by using the command line interface:**

At the command prompt, type:

```
show lsn session -nattype DS-Lite
```

**To display selected DS-Lite sessions by using the command line interface:**

At the command prompt, type:

```
show lsn session -nattype DS-Lite [-clientname <string>] [-network <ip_addr>][-netmask <netmask>] [-td <positive_integer>] [-natIP <ip_addr>][-natPort <port>]]
```

**Example:**

The following sample output displays all DS-Lite sessions existing on a NetScaler appliance:

```
show lsn session -nattype DS-Lite
B4-Address SubscrIP SubscrPort SubscrTD DstIP DstPort DstTD NatIP NatPort Proto Dir
1. 2001:DB8::3:4 192.0.2.51 2552 0 198.51.100.250 80 0 203.0.113.61 3002 TCP OUT
2. 2001:DB8::3:4 192.0.2.51 3551 0 198.51.100.300 80 0 203.0.113.61 52862 TCP OUT
3. 2001:DB8::3:4 192.0.2.100 4556 0 198.51.100.250 0 0 203.0.113.61 48116 ICMP OUT
4. 2001:DB8::190 192.0.2.150 3881 0 198.51.100.199 80 0 203.0.113.69 48305 TCP OUT
Done
```
Configuration Using the Configuration Utility

To display all or selected DS-Lite sessions by using the configuration utility

1. Navigate to System > Large Scale NAT > Sessions, and click the DS-Lite tab.
2. For displaying DS-Lite sessions on the basis of selection parameters, click Search.

Clearing DS-Lite Sessions

You can remove any unwanted or inefficient DS-Lite sessions from the NetScaler appliance. The appliance immediately releases the resources (such as NAT IP address, port, and memory) allocated for these sessions, making the resources available for new sessions. The appliance also drops all the subsequent packets related to these removed sessions. You can remove all or selected DS-Lite sessions from the NetScaler appliance.

To clear all DS-Lite sessions by using the command line interface:

At the command prompt, type:

flush lsn session –nattype DS-Lite
show lsn session –nattype DS-Lite

To clear selected DS-Lite sessions by using the command line interface:

At the command prompt, type:

```
1 flush lsn session - nattype DS-Lite [-clientname <string>] [-network <ip_addr> [-netmask <netmask>] [-td <positive_integer>]] [-natIP <ip_addr> [-natPort <port>]]
2
3 show lsn session - nattype DS-Lite
```

To clear all or selected DS-Lite sessions by using the configuration utility:

1. Navigate to System > Large Scale NAT > Sessions, and click the DS-Lite tab.
2. Click Flush Sessions.

Configuring DS-Lite Static Maps

December 18, 2018

The NetScaler appliance supports manual creation of DS-Lite LSN mappings, which contain the mapping between the following information:

- Subscriber’s IP address and port, and IPv6 address of B4 device or component
• NAT IP address and port

Static DS-Lite LSN mappings are useful in cases where you want to ensure that the connections initiated to a NAT IP address and port map to the subscriber IP address and port through the specified B4 device (for example, web servers located in the internal network).

Note: This feature is supported in release 11.0 build 64.x and later.

**To create a DS-Lite static LSN mapping by using the command line**

At the command prompt, type:

```
1 add lsn static <name> <transportprotocol> <subscrIP> <subscrPort> [-td <positive_integer>] [-network6 <B4_ADDR>] [<natIP> [<natPort>]] [-destIP<ip_addr> [-dstd <positive_integer>]]
2
3 show lsn static
```

**Parameter Descriptions**

**add lsn static**

- **name**
  
  Name for the LSN static mapping entry. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN group is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “ds-lite lsn static1” or ‘ds-lite lsn static1’). This is a mandatory argument. Maximum Length: 127

- **transportprotocol**
  
  Protocol for the DS-Lite LSN mapping entry.

- **subscrIP**
  
  IPv4 address of a subscriber for the DS-Lite LSN mapping entry.

- **subscrPort**
  
  Port of the subscriber for the DS-Lite LSN mapping entry.

- **Network6**
  
  IPv6 address of the B4 device or component.

- **td**
ID of the traffic domain to which the B4 device belongs. The IPv6 address of the B4 device is specified in the network6 parameter. If you do not specify an ID, the B4 device is assumed to be a part of the default traffic domain.

- **natIP**
  IPv4 address, already existing on the NetScaler appliance as type LSN, to be used as NAT IP address for this mapping entry.

- **natPort**
  NAT port for this DS-Lite LSN mapping entry.

- **destIP**
  Destination IP address for the DS-Lite LSN mapping entry.

- **dsttd**
  ID of the traffic domain through which the destination IP address for this DS-Lite LSN mapping entry is reachable from the NetScaler appliance. If you do not specify an ID, the destination IP address is assumed to be reachable through the default traffic domain, which has an ID of 0.

**To create a DS-Lite static LSN mapping by using the configuration utility**

Navigate to System > Large Scale NAT > Static, and add a new DS-Lite static LSN mapping.

**Configuring Deterministic NAT Allocation for DS-Lite**

December 18, 2018

Deterministic NAT allocation for DS-Lite LSN deployments is a type of NAT resource allocation in which the NetScaler appliance pre-allocates, from the LSN NAT IP pool and on the basis of the specified port block size, an LSN NAT IP address and a block of ports to each subscriber (subscriber behind B4 device).

**Note:** This feature is supported in release 11.0 build 64.x and later.

The appliance sequentially allocates NAT resources to these subscribers. It assigns the first block of ports on the beginning NAT IP address to the beginning subscriber IP address. The next range of ports is assigned to the next subscriber, and so on, until the NAT address does not have enough ports for the next subscriber. At that point, the first port block on the next NAT address is assigned to the subscriber, and so on.

The NetScaler appliance logs the allocated NAT IP address and the port block for a subscriber. For a connection, a subscriber can be identified by just its mapped NAT IP address and port block. For this reason, the NetScaler appliance does not log the creation or deletion of an LSN session.
A DS-Lite subscriber can have only one deterministic port block. If the entire block of ports is being used, the NetScaler appliance drops any new connection from the subscriber.

**Example: Deterministic DS-Lite**

In this example, a deterministic DS-Lite configuration includes four subscribers with IP addresses 192.0.17.5, 192.0.17.6, 192.0.17.7, and 192.0.17.8. These ipv4 subscribers are behind a B4 device having the IPv6 address 2001:DB8::3:4. In this configuration, the port block size is set to 20480 and LSN NAT IP address pool has IP addresses in the range 203.0.113.41-203.0.113.42.

The NetScaler appliance sequentially pre-allocates, from the LSN NAT IP pool and on the basis of the set port block size, an LSN NAT IP address and a block of ports to each subscriber. It assigns the first block of ports (1024-21503) on the beginning NAT IP address (203.0.113.41) to the beginning subscriber IP address (192.0.17.5). The next range of ports is assigned to the next subscriber, and so on, until the NAT address does not have enough ports for the next subscriber. At that point, the first port block on the next NAT IP address is assigned to the subscriber, and so on. The NetScaler logs the NAT IP address and the block of ports allocated for each subscriber.

The NetScaler appliance does not log any LSN session created or deleted for these subscribers.

The following table lists the NAT IP address and blocks of ports allocated to each subscriber in this example:

<table>
<thead>
<tr>
<th>Subscriber IP address</th>
<th>Allocated NAT IP address</th>
<th>Allocated Block of Ports</th>
<th>IPv6 address of B4</th>
</tr>
</thead>
<tbody>
<tr>
<td>192.0.17.5</td>
<td>203.0.113.41</td>
<td>1024 - 21503</td>
<td>2001:DB8::3:4</td>
</tr>
<tr>
<td>192.0.17.6</td>
<td>203.0.113.41</td>
<td>21504 - 41983</td>
<td>2001:DB8::3:4</td>
</tr>
<tr>
<td>192.0.17.7</td>
<td>203.0.113.41</td>
<td>41984 - 62463</td>
<td>2001:DB8::3:4</td>
</tr>
<tr>
<td>192.0.17.8</td>
<td>203.0.113.42</td>
<td>1024 - 21503</td>
<td>2001:DB8::3:4</td>
</tr>
</tbody>
</table>

**Configuration Steps**

You need to configure deterministic NAT as part of the DS-Lite configuration. For instructions on configuring DS-Lite, see [Configuring DS-Lite](#). While configuring DS-Lite, make sure that you:

- Set the NAT Type parameter to Deterministic when adding the LSN pool and the LSN group.
NetScaler 11.1

- Set the desired port block size parameter when adding the LSN group, unless you can accept the default value.

Points to Consider before Configuring Deterministic DS-Lite

Consider the following points before configuring deterministic DS-Lite:

- The complete IP address of each subscriber must be specified in a separate add lsn client command, by setting the Network and Netmask parameters. (Set Netmask to 255.255.255.255.) Also the IPv4 address of the B4 device specified in Network6 parameter must be complete (/128 prefix). In other words, Network and Network6 parameter do not accept addresses other than /32 bit mask and /128 prefix, respectively.
- The NetScaler appliance drops connections from subscribers that are not specified in any deterministic DS-Lite configuration but are behind B4 devices specified in a deterministic DS-Lite configuration.
- The NetScaler appliance recognizes subscribers having the same IPv4 address as different subscribers if they are behind different B4 devices. A combination of subscriber IPv4 address and B4 device defines a unique subscriber in the LSN client entity of a DS-Lite configuration.

Sample Deterministic DS-Lite Configuration:

The following configuration uses the settings listed in section Example: Deterministic DS-Lite.

```
1 add lsn client LSN-DSLITE-CLIENT-10
2
3 Done
4 bind lsn client LSN-DSLITE-CLIENT-10 -network 192.0.17.5 -netmask 255.255.255.255 -network6 2001:DB8::3:4/128
5
6 Done
7 bind lsn client LSN-DSLITE-CLIENT-10 -network 192.0.17.6 -netmask 255.255.255.255 -network6 2001:DB8::3:4/128
8
9 Done
10 bind lsn client LSN-DSLITE-CLIENT-10 -network 192.0.17.7 -netmask 255.255.255.255 -network6 2001:DB8::3:4/128
11
12 Done
13 bind lsn client LSN-DSLITE-CLIENT-10 -network 192.0.17.8 -netmask 255.255.255.255 -network6 2001:DB8::3:4/128
14
15 Done
16 add lsn pool LSN-DSLITE-POOL-10 -nattype DETERMINISTIC
17
```
Configuring Application Layer Gateways for DS-Lite

December 18, 2018

For some application layer protocols, the IP addresses and protocol port numbers are also communicated in the packet’s payload. Application Layer Gateway (AGL) for a protocol parses the packet payload and does necessary changes to ensure that the protocol continues to work over DS-Lite.

The NetScaler appliance supports ALG for the following protocols for DS-Lite:

- FTP
- ICMP
- TFTP
- SIP
- RTSP

Application Layer Gateway for FTP, ICMP, and TFTP Protocols

December 18, 2018

You can enable or disable ALG for the FTP protocol for a DS-Lite configuration by enabling or disabling the FTP ALG option of the LSN group of the configuration.

ALG for the ICMP protocol is enabled by default, and there is no provision to disable it.
ALG for the TFTP protocol is disabled by default. TFTP ALG is enabled automatically for a DS-Lite configuration when you bind a UDP LSN application profile, with endpoint-independent-mapping, endpoint-independent filtering, and destination port as 69 (well-known port for TFTP), to the LSN group.

Application Layer Gateway for SIP Protocol

December 18, 2018

Using DS-Lite with Session Initiation Protocol (SIP) is complicated, because SIP messages contain IP addresses in the SIP headers as well as in the SIP body. When LSN is used with SIP, the SIP headers contain information about the caller and the receiver, and the device translates this information to hide it from the outside network. The SIP body contains the Session Description Protocol (SDP) information, which includes IP addresses and port numbers for transmission of the media. SIP ALG for DS-Lite is compliant with RFC 3261, RFC 3581, RFC 4566, and RFC 4475.

Limitations of SIP ALG

SIP ALG for DS-Lite has the following limitations:

- Only SDP payload is supported.
- The following are not supported:
  - Multicast IP addresses
  - Encrypted SDP
  - SIP TLS
  - FQDN translation
  - SIP layer authentication
  - Admin partitions
  - NetScaler clusters
  - Multipart body
  - Line folding

Configuring SIP ALG

You need to configure the SIP ALG as part of the LSN configuration. For instructions on configuring LSN, see Configuring DS-Lite. While configuring LSN, make sure that you:

- Set the following parameters while adding an LSN application profile:
  - IP Pooling = PAIRED
NetScaler 11.1

- Address and Port Mapping = ENDPOINT-INDEPENDENT
- Filtering = ENDPOINT-INDEPENDENT
  - Create a SIP ALG profile and make sure that you define either the source port range or destination port range. Bind the SIP ALG profile to the LSN group
  - Enable SIP ALG in the LSN group

**To enable SIP ALG for an LSN configuration by using the CLI**

At the command prompt, type:

```
1 add lsn group <groupname> -clientname <string>[-sipalg ( ENABLED | DISABLED )]
2
3 show lsn group<groupname>
```

**To enable SIP ALG for an LSN configuration by using the CLI**

At the command prompt, type:

```
1 add lsn sipalgprofile<sipalgprofilename>[-dataSessionIdleTimeout<
  positive_integer>][-sipSessionTimeout<positive_integer>][-registrationTimeout<
  positive_integer>][-sipsrcportrange<port[-port]>][-sipdstportrange<port[-port]>][-openRegisterPinhole ( ENABLED | DISABLED )][-openContactPinhole ( ENABLED | DISABLED )][-openViaPinhole ( ENABLED | DISABLED )][-openRecordRoutePinhole ( ENABLED | DISABLED )][-sipTransportProtocol ( TCP | UDP )][-openRoutePinhole ( ENABLED | DISABLED )][-rport ( ENABLED | DISABLED )]
2
3 show lsn sipalgprofile<sipalgprofilename>
```

**Sample Configuration**

The following sample DS-Lite configuration, SIP ALG is enabled for TCP traffic from B4 devices in the network 2001:DB8::3:0/96.

```
1 add lsn client LSN-DSLITE-CLIENT-1
2 Done
3 bind lsn client LSN-DSLITE-CLIENT-1 -network6 2001:DB8::3:0/96
4 Done
```
Application Layer Gateway for RTSP Protocol

December 18, 2018

Real Time Streaming Protocol (RTSP) is an application-level protocol for the transfer of real-time media data. Used for establishing and controlling media sessions between end points, RTSP is a control channel protocol between the media client and the media server. The typical communication is between a client and a streaming media server.

Streaming media from a private network to a public network requires translating IP addresses and port numbers over the network. NetScaler functionality includes an Application Layer Gateway (ALG) for RTSP, which can be used with Large Scale NAT (LSN) to parse the media stream and make any necessary changes to ensure that the protocol continues to work over the network.

How IP address translation is performed depends on the type and direction of the message, and the type of media supported by the client-server deployment. Messages are translated as follows:

- Outbound request—Private IP address to NetScaler owned public IP address called LSN IP address.
NetScaler 11.1

- Inbound response—LSN IP address to private IP address.
- Inbound request—No translation.
- Outbound response—Private IP address to LSN pool IP address.

**Limitations of RTSP ALG**

The RTSP ALG does not support the following:

- Multicast RTSP sessions
- RTSP session over UDP
- Admin partitions
- NetScaler clusters
- RTSP Authentication
- HTTP tunneling

**Configuring RTSP ALG**

Configure RTSP ALG as part of the LSN configuration. For instructions on configuring LSN, see Configuring DS-Lite. While configuring LSN, make sure that you:

- Set the following parameters while adding an LSN application profile:
  - IP Pooling = PAIRED
  - Address and Port Mapping = ENDPOINT-INDEPENDENT
  - Filtering = ENDPOINT-INDEPENDENT
- Enable RTSP ALG in the LSN group
- Create a RTSP ALG profile and bind the RTSP ALG profile to the LSN group

**To enable RTSP ALG for an LSN configuration by using the CLI**

At the command prompt, type:

```
1  add lsn group <groupname> -clientname <string> [-rtspalg ( ENABLED | DISABLED )]
2
3  show lsn group <groupname>
```

**To enable RTSP ALG for an LSN configuration by using the CLI**

At the command prompt, type:
Sample RTSP ALG Configuration

The following sample DS-Lite configuration, RTSP ALG is enabled for TCP traffic from B4 devices in the network 2001:DB8::4:0/96.

Sample RTSP ALG Configuration:

1 add lsn rtspalgprofile <rtspalgprofilename> [-rtspIdleTimeout <positive_integer>] -rtspportrange <port[-port]> [-rtspTransportProtocol (TCP|UDP)]  
2  
3 show lsn rtspalgprofile <rtspalgprofilename>
Logging and Monitoring DS-Lite

December 18, 2018

You can log DS-Lite information to diagnose or troubleshoot problems, and to meet legal requirements. The NetScaler appliance supports all LSN logging features for logging DS-Lite information. For configuring DS-Lite logging, use the procedures for configuring LSN logging, described at Logging and Monitoring LSN.

A log message for a DS-Lite LSN mapping entry consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (MAPPING)
- Whether the DS-Lite LSN mapping entry was created or deleted
- IPv6 address of B4
- Subscriber’s IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID might be present, depending on the following conditions:
  - Destination IP address and port are not logged for Endpoint-Independent mapping.
  - Only the destination IP address is logged for Address-Dependent mapping. The port is not logged.
  - Destination IP address and port are logged for Address-Port-Dependent mapping.

A log message for a DS-Lite session consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (SESSION)
- Whether the DS-Lite session is created or removed
- IPv6 address of B4
- Subscriber’s IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID

The following table shows sample DS-Lite log entries of each type stored on the configured log servers. These log entries are generated by a NetScaler appliance whose NSIP address is 10.102.37.115. You can log DS-Lite information to diagnose or troubleshoot problems, and to meet legal requirements. The
NetScaler appliance supports all LSN logging features for logging DS-Lite information. For configuring DS-Lite logging, use the procedures for configuring LSN logging, described at Logging and Monitoring LSN.

A log message for a DS-Lite LSN mapping entry consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (MAPPING)
- Whether the DS-Lite LSN mapping entry was created or deleted
- IPv6 address of B4
- Subscriber’s IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID might be present, depending on the following conditions:
  - Destination IP address and port are not logged for Endpoint-Independent mapping.
  - Only the destination IP address is logged for Address-Dependent mapping. The port is not logged.
  - Destination IP address and port are logged for Address-Port-Dependent mapping.

A log message for a DS-Lite session consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (SESSION)
- Whether the DS-Lite session is created or removed
- IPv6 address of B4
- Subscriber’s IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID

The following table shows sample DS-Lite log entries of each type stored on the configured log servers. These log entries are generated by a NetScaler appliance whose NSIP address is 10.102.37.115.
Displaying Current DS-Lite Sessions

You can display the current DS-Lite sessions for detecting any unwanted or inefficient sessions on the NetScaler appliance. You can display all or some DS-Lite sessions, on the basis of selection parameters.

To display all DS-Lite sessions by using the command line interface

At the command prompt, type:

```
show lsn session -nattype DS-Lite
```
To display selected DS-Lite sessions by using the command line interface

At the command prompt, type:

```
show lsn session -nattype DS-Lite [-clientname <string>] [-network <ip_addr> [-netmask <netmask>] [-td <positive_integer>]] [-natIP <ip_addr> [-natPort <port>]]
```

The following sample output displays all DS-Lite sessions existing on a NetScaler appliance:

```
show lsn session -nattype DS-Lite

1 B4 Address SubscrIP SubscrPort SubscrTD DstIP DstPort DstTD NatIP NatPort Proto Dir
2 1. 2001::DB8::3:4 192.0.2.51 2552 0 198.51.100.250 80 0 203.0.113.61 3002 TCP OUT
3 2. 2001::DB8::3:4 192.0.2.51 3551 0 198.51.100.300 80 0 203.0.113.61 52862 TCP OUT
4 3. 2001::DB8::3:4 192.0.2.100 4556 0 198.51.100.250 0 0 203.0.113.61 48116 ICMP OUT
5 4. 2001::DB8::3:4 192.0.2.150 3881 0 198.51.100.199 80 0 203.0.113.69 48305 TCP OUT
6 Done
```

Configuration Using the Configuration Utility

To display all or selected DS-Lite sessions by using the configuration utility

1. Navigate to System > Large Scale NAT > Sessions, and click the DS-Lite tab.
2. For displaying DS-Lite sessions on the basis of selection parameters, click Search.

Clearing DS-Lite Sessions

You can remove any unwanted or inefficient DS-Lite sessions from the NetScaler appliance. The appliance immediately releases the resources (such as NAT IP address, port, and memory) allocated for these sessions, making the resources available for new sessions. The appliance also drops all the subsequent packets related to these removed sessions. You can remove all or selected DS-Lite sessions from the NetScaler appliance.
To clear all DS-Lite sessions by using the command line interface

At the command prompt, type:

```
1 flush lsn session - nattype DS-Lite
2 show lsn session - nattype DS-Lite
```

To clear selected DS-Lite sessions by using the command line interface

At the command prompt, type:

```
1 flush lsn session - nattype DS-Lite [-clientname <string>] [-network <ip_addr> [-netmask <netmask>][-td <positive_integer>]] [-natIP <ip_addr> [-natPort <port>]]
2 show lsn session - nattype DS-Lite
```

To clear all or selected DS-Lite sessions by using the configuration utility

1. Navigate to System > Large Scale NAT > Sessions, and click the DS-Lite tab.
2. Click Flush Sessions.

Logging HTTP Header Information

The NetScaler appliance can log request header information of an HTTP connection that is using the DS-Lite functionality. The following header information of an HTTP request packet can be logged:

- URL that the HTTP request is destined to
- HTTP Method specified in the HTTP request
- HTTP version used in the HTTP request
- IPv4 address of the subscriber that sent the HTTP request

The HTTP header logs can be used by ISPs to see the trends related to the HTTP protocol among a set of subscribers. For example, an ISP can use this feature to find out the most popular website among a set of subscribers.

Configuration Steps

Perform the following tasks for configuring the NetScaler appliance to log HTTP header information:
• **Create an HTTP header log profile.** An HTTP header log profile is a collection of HTTP header attributes (for example, URL and HTTP method) that can be enabled or disabled for logging.

• **Bind the HTTP header to an LSN group of a DS-Lite LSN configuration.** Bind the HTTP header log profile to an LSN group of an LSN configuration by setting the HTTP header log profile name parameter to the name of the created HTTP header log profile. The NetScaler appliance then logs HTTP header information of any HTTP requests related to the LSN group. An HTTP header log profile can be bound to multiple LSN groups, but an LSN group can have only one HTTP header log profile.

**To create an HTTP header log profile by using the command line interface**

At the command prompt, type:

```
1   add lsn httphdrlogprofile <httphdrlogprofilename> [-logURL ( ENABLED | DISABLED )] [-logMethod ( ENABLED | DISABLED )] [-logVersion ( ENABLED | DISABLED )] [-logHost ( ENABLED | DISABLED )]
2   show lsn httphdrlogprofile
```

**To bind an HTTP header log profile to an LSN group by using the command line interface**

At the command prompt, type:

```
1   bind lsn group <groupname> -httphdrlogprofilename <string>
2   show lsn group <groupname>
```

**Sample Configuration**

In the following DS-Lite LSN configuration, HTTP header log profile HTTP-HEADER-LOG-1 is bound to LSN group LSN-DSLITE-GROUP-1. The log profile has all the HTTP attributes (URL, HTTP method, HTTP version, and HOST IP address) enabled for logging, so that all these attributes are logged for any HTTP requests from B4 devices (in the network 2001:DB8:5001::/96).

**Sample Configuration:**

```
1   add lsn httphdrlogprofile HTTP-HEADER-LOG-1
2   Done
3   add lsn client LSN-DSLITE-CLIENT-1
4   Completed
```

IPFIX Logging

The NetScaler appliance supports sending information about LSN events in Internet Protocol Flow Information Export (IPFIX) format to the configured set of IPFIX collector(s). The appliance uses the existing AppFlow feature to send LSN events in IPFIX format to the IPFIX collectors.

IPFIX based logging is available for the following DS_Lite related events:

- Creation or deletion of an LSN session.
- Creation or deletion of an LSN mapping entry.
- Allocation or de-allocation of port blocks in the context of deterministic NAT.
• Allocation or de-allocation of port blocks in the context of dynamic NAT.
• Whenever subscriber session quota is exceeded.

**Points to Consider before you Configure IPFIX logging**

Before you start configuring IPSec ALG, consider the following points:

• You must configure the AppFlow feature and IPFIX collector(s) on the NetScaler appliance. For instructions, see Configuring the AppFlow feature.

**Configuration Steps**

Perform the following tasks for logging LSN information in IPFIX format:

• **Enable LSN logging in the AppFlow configuration.** Enable the LSN logging parameter as part of AppFlow configuration.
• **Create an LSN log profile.** An LSN log profile includes the IPFIX parameter that enables or disables the log information in IPFIX format.
• **Bind the LSN log profile to an LSN group of an LSN configuration.** Bind the LSN log profile to one or multiple LSN group(s). Events related to the bound LSN group will be logged in IPFIX format.

**To enable LSN logging in the AppFlow configuration by using the CLI**

At the command prompt, type:

```
1 set appflow param -lsnLogging (ENABLED |DISABLED )
2 show appflow param
```

**To create an LSN log profile by using the CLI**

At the command prompt, type:

```
1 set lsn logprofile <logProfileName> -logipfix ( ENABLED | DISABLED )
2 show lsn logprofile
```

**To bind the LSN log profile to an LSN group of an LSN configuration by using the CLI**

At the command prompt, type:
To create an LSN log profile by using the GUI

Navigate to **System > Large Scale NAT > Profiles**, click **Log** tab, and then add a log profile.

To bind the LSN log profile to an LSN group of an LSN configuration by using the GUI

1. Navigate to **System > Large Scale NAT > LSN Group**, open the **LSN** group.
2. In **Advanced Settings**, click **+ Log Profile** to bind the created Log profile to the LSN group.

Port Control Protocol for DS-Lite

December 18, 2018

NetScaler appliances now support Port Control Protocol (PCP) for large scale NAT (LSN). Many of an ISP’s subscriber applications must be accessible from Internet (for example, Internet of Things (IOT) devices, such as an IP camera that provides surveillance over the Internet). One way to meet this requirement is to create static large scale NAT (LSN) maps. But for a very large number of subscribers, creating static LSN NAT maps is not a feasible solution.

Port Control Protocol (PCP) enables a subscriber to request specific LSN NAT mappings for itself and/or for other 3rd party devices. The large scale NAT device creates an LSN map and sends it to the subscriber. The subscriber sends the remote devices on the Internet the NAT IP address:NAT port at which they can connect to the subscriber.

Applications usually send frequent keep-alive messages to the large scale NAT device so that their LSN mappings do not time out. PCP helps reduce the frequency of such keep-alive messages by enabling the applications to learn the timeout settings of the LSN mappings. This helps reduce bandwidth consumption on the ISP’s access network and battery consumption on mobile devices.

PCP is a client-server model and runs over the UDP transport protocol. A NetScaler appliance implements the PCP server component and is compliant with RFC 6887.

**Configuration Steps**

Perform the following tasks for configuring PCP:

```bash
1 bind lsn group <groupname> -logProfileName <lsnlogprofilename>
2
3 show lsn group
```
• (Optional) Create a PCP profile. A PCP profile includes settings for PCP related parameters (for example, to listen for mapping and peer PCP requests). A PCP profile can be bound to a PCP server. A PCP profile bound to a PCP server applies all its settings to the PCP server. A PCP profile can be bound to multiple PCP servers. By default, one PCP profile with default parameters settings is bound to all PCP servers. A PCP profile that you bind to a PCP server overrides the default PCP profile settings for that server. A default PCP profile has the following parameter settings:
  – Mapping: Enabled
  – Peer: Enabled
  – Minimum map life: 120 seconds
  – Maximum max life: 86400 seconds
  – Announce count: 10
  – Third Party: Disabled

• Create a PCP server and bind a PCP profile to it. Create a PCP server on the NetScaler appliance to listen for PCP related requests and messages from the subscribers. A Subnet IP (SNIP) address must be assigned to a PCP server to access it. By default, a PCP server listens on port 5351.

• Bind the PCP server to an LSN group of an LSN configuration. Bind the created PCP server to an LSN group of an LSN configuration by setting the PCP Server parameter to specify the created PCP server. The created PCP server can be accessed only by the subscribers of this LSN group. Note: A PCP server for a large scale NAT configuration does not serve requests from subscribers that are identified from ACL rules.

To create a PCP profile by using the CLI

At the command prompt, type:

```
1 add pcp profile <name> [-mapping ( ENABLED | DISABLED )] [-peer ( ENABLED | DISABLED )] [-minMapLife <secs>] [-maxMapLife <secs>] [-announceMultiCount <positive_integer>] [-thirdParty ( ENABLED | DISABLED )]
2
3 show pcp profile <name>
```

To create a PCP server by using the CLI

At the command prompt, type:

```
1 add pcp server <name> <IPAddress> [-port <portNum>*] [-pcpProfile <string>]
2
```
Sample Configuration for DS-LITE

In the following sample configuration, PCP server PCP-SERVER-1, with PCP settings from PCP-DSLITE-PROFILE-1, is bound to LSN group LSN-DSLITE-GROUP-1. PCP-SERVER-9 serves PCP requests from IPv4 subscribers behind B4 devices from network 2001:DB8::3/100.

**Sample configuration:**

```bash
3 show pcp server <name>

Sample Configuration for DS-LITE

In the following sample configuration, PCP server PCP-SERVER-1, with PCP settings from PCP-DSLITE-PROFILE-1, is bound to LSN group LSN-DSLITE-GROUP-1. PCP-SERVER-9 serves PCP requests from IPv4 subscribers behind B4 devices from network 2001:DB8::3/100.

**Sample configuration:**

```bash
1 add pcp profile PCP-DSLITE-PROFILE-1 -minMapLife 300
2 Done
3 add pcp server PCP-DSLITE-SERVER-1 192.0.3.10 -pcpProfile PCP-DSLITE-PROFILE-1
4 Done
5 add lsn client LSN-DSLITE-CLIENT-1
6 Done
7 bind lsn client LSN-DSLITE-CLIENT-1 -network6 2001:DB8::3/100
8 Done
9 add lsn pool LSN-DSLITE-POOL-1
10 Done
11 bind lsn pool LSN-DSLITE-POOL-1 203.0.113.61 - 203.0.113.70
12 Done
13 add lsn ip6profile LSN-DSLITE-PROFILE-1 -type DS-Lite -network6 2001:DB8::5:6
14 Done
15 add lsn group LSN-DSLITE-PROFILE-1 -clientname LSN-NAT64-CLIENT-1 -ip6profile LSN-NAT64-PROFILE-1
16 Done
17 bind lsn group LSN-DSLITE-GROUP-1 -poolname LSN-NAT64-POOL-1
18 Done
19 bind lsn group LSN-DSLITE-GROUP-1 -poolname PCP-NAT64-SERVER-1
20 Done
```

**Large Scale NAT64**

January 6, 2019

Because of the imminent exhaustion of IPv4 addresses, ISPs have started transitioning to IPv6 infrastructure. But during the transition, ISPs must continue to support IPv4 along with IPv6, because most of the public Internet still uses IPv4. Large scale NAT64 is an IPv6 transition solution for ISPs with IPv6
NetScaler 11.1

infrastructure to connect their IPv6-only subscribers to the IPv4 Internet. DNS64 is a solution for enabling discovery of IPv4-only domains by IPv6-only clients. DNS64 is used with large scale NAT64 to enable seamless communication between IPv6-only clients and IPv4-only servers.

A NetScaler appliance implements large scale NAT64 and DNS64 and is compliant with RFCs 6145, 6146, 6147, 6052, 3022, 2373, 2765, and 2464.

Architecture

The NAT64 architecture of an ISP using a NetScaler appliance consists of IPv6 subscribers accessing the IPv4 Internet through a NetScaler appliance deployed in the ISP’s core network. IPv6 subscribers are connected to the ISP core network through the ISP’s IPv6-only access network.

The large scale NAT64 functionality of a NetScaler appliance enables communication between IPv6 clients and IPv4 servers through IPv6-to-IPv4 packet translation, and vice versa, while maintaining session information on the NetScaler appliance. NetScaler DNS64 functionality represents IPv4-only domains to IPv6-subscribers by synthesizing DNS AAAA records for IPv4-only domains and sending them to the subscribers.

Large scale NAT64 has two main components: NAT64 prefix and NAT IPv4 pool. DNS64 has one main component, DNS64 prefix, which has the same value as NAT64 prefix.

Upon receiving an AAAA request from an IPv6-only subscriber for a domain name that is hosted on an IPv4-only web server on the Internet, the NetScaler DNS64 functionality synthesizes an AAAA record for the domain name and sends it to the subscriber. The AAAA record is synthesized by concatenating the DNS64 prefix (which is set to the NAT64 prefix) and the actual IPv4 address of the domain name.

The subscriber now has an IPv6 destination address that corresponds to the desired domain name. The subscriber sends the request to the synthesized IPv6 address. Upon receiving the IPv6 request, the large scale NetScaler NAT64 functionality translates the IPv6 request packet to an IPv4 request packet. Large scale NAT64 sets the IPv4 request’s destination address to the IPv4 address, which is extracted from the IPv6 request’s destination address by stripping the NAT64 prefix from the IPv6 address. The destination port is retained from the IPv6 request. Large Scale NAT64 also sets the source IP address:source port of the IPv4 packet to the NAT IP address:NAT port selected from the configured NAT pool.

The appliance maintains a record of all active sessions that use the large scale NAT64 functionality. These sessions are called large scale NAT64 sessions. The appliance also maintains the mappings between subscriber IPv6 address and port, and NAT IPv4 address and port, for each large scale NAT64 session. These mappings are called large scale NAT64 mappings. From large scale NAT64 session entries and large scale NAT64 mapping entries, the NetScaler appliance recognizes a response packet (received from the Internet) as belonging to a particular NAT64 session.
When the appliance receives an IPv4 response packet belonging to a particular NAT64 session, it uses the information stored in the NAT64 session to translate the IPv4 packet into an IPv6 packet, and then sends the IPv6 response packet to the subscriber.

Example: Traffic Flow of NAT64 and DNS64 Deployment

Consider an example of a large scale NAT64 and DNS64 deployment consisting of NetScaler appliance NS-1 and two local DNS servers, DNS-1 and DNS-2, in an ISP’s core network, and IPv6 subscriber SUB-1. SUB-1 is connected to NS-1 through the ISP’s IPv6 access network. NS-1 includes large scale NAT64 and DNS64 configurations for enabling the communication between IPv6 subscriber SUB-1 and IPv4 hosts (internal and external).

Large scale NAT64 configuration includes a NAT64 prefix (2001:DB8:300::/96) and NAT IPv4 pool for translation of IPv6 requests to IPv4 requests and IPv4 responses to IPv6 responses.

DNS64 configuration includes a DNS load balancing virtual server LBVS-DNS64-1 (2001:DB8:9999::99) and a DNS64 prefix (2001:DB8:300::/96). LBVS-DNS64-1 represents local DNS server DNS-1 and DNS-2 to ISP’s subscribers. The DNS64 prefix, which has the same value as the NAT64 prefix, is used for synthesizing DNS AAAA records from DNS A records received from DNS servers DNS-1 and DNS-2. NS-1 responds with a synthesized AAAA record to SUB-1 for a DNS request to resolve an IPv4 host.

DNS64 Traffic Flow

Traffic flows between IPv6 subscriber SUB-1 and site www.example.com, which resides on an IPv4-only web server on the Internet, as follows:

1. IPv6 subscriber SUB-1 sends a DNS AAAA request for www.example.com to its designated DNS server (2001:DB8:9999::99).
2. DNS load balancing virtual server LBVS-DNS64-1 (2001:DB8:9999::99) on NetScaler appliance NS-1 receives the AAAA request. LBVS-DNS64-1’s load balancing algorithm selects DNS server DNS-1 and forwards the AAAA request to it.
3. DNS-1 returns an empty record or an error message, because there is no AAAA record available for www.example.com.
4. Because the DNS64 option is enabled on LBVS-DNS64-1 and the AAAA request from CL1 matches the condition specified in DNS64-Policy-1, NS-1 sends a DNS A request to DNS-1 for the IPv4 address of www.example.com.
5. DNS-1 responds with the A record of 192.0.2.60 for www.example.com.
6. DNS64 module on NS-1 synthesizes an AAAA record for www.example.com by concatenating the DNS64 Prefix (2001:DB8:300::/96) associated with LBVS-DNS64-1, and IPv4 address (192.0.2.60) for www.example.com = 2001:DB8:300::192.0.2.60
7. NS1 sends the synthesized AAAA record to IPv6 client CL1. NS1 also caches the A record into its memory. NS1 uses the cached A record to synthesize AAAA records for subsequent AAAA requests.

**NAT64 Traffic Flow**

1. IPv6 subscriber SUB-1 sends a request to 2001:DB8:5001:30 www.example.com. The IPv6 packet has:
   - Source IP address = 2001:DB8:5001:30
   - Source port = 2552
   - Destination IP address = 2001:DB8:300::192.0.2.60
   - Destination port = 80

2. IPv6 subscriber SUB-1 sends a request to 2001:DB8:5001:30 www.example.com. The IPv6 packet has:
   - Source IP address = 2001:DB8:5001:30
   - Source port = 2552
   - Destination IP address = 2001:DB8:300::192.0.2.60
   - Destination port = 80

3. When NS-1 receives the IPv6 packet, the large scale NAT64 module creates a translated IPv4 request packet with:
   - Source IP address = One of the IPv4 addresses available in the configured NAT pool (203.0.113.61)
   - Source port = One of ports available with the allocated NAT IPv4 address (3002)
   - Destination IP address = IPv4 address extracted from the IPv6 request’s destination address by stripping the NAT64 prefix (2001:DB8:300::/96) from the IPv6 address (192.0.2.60)
   - Destination port = IPv6 request’s destination port (80)

4. The large scale NAT64 module also creates mapping and session entries for this large scale NAT64 flow. The session and mapping entries include the following information:
   - Source IP address of the IPv6 packet = 2001:DB8:5001:30
   - Source port of the IPv6 packet = 2552
   - NAT IP address = 203.0.113.61
   - NAT port = 3002
   - NS-1 sends the resulting IPv4 packet to its destination on the Internet.

5. Upon receiving the request packet, the server for www.example.com processes the packet and sends a response packet to NS-1. The IPv4 response packet has:
   - Source IP address = 192.0.2.60
   - Source port = 80
• Destination IP address = 203.0.113.61
• Destination port = 3002

6. Upon receiving the IPv4 response packet, NS-1 examines the large scale NAT64 mapping and session entries and finds that the IPv4 response packet belongs to a large scale NAT64 session. The large scale NAT64 module creates a translated IPv6 response packet:

• Source IP address = 2001:DB8:300::192.0.2.60
• Source port = 80
• Destination IP address = 2001:DB8:5001:30
• Destination port = 2552

7. NS-1 sends the translated IPv6 response to client SUB-1.

Large Scale NAT64 features Supported on NetScaler appliances

Large scale NAT64 on a NetScaler appliance supports the standard LSN feature set. For more information on these LSN features, see LSN Architecture.

Following are some of the large scale NAT64 features supported on NetScaler appliances:

• ALGs. Support of application Layer Gateway (ALG) for SIP, RTSP, FTP, ICMP, and TFTP protocols.
• Deterministic/Fixed NAT. Support for pre-allocation of blocks of ports to subscribers to minimize logging.
• Mapping. Support of Endpoint-independent mapping (EIM), Address-dependent mapping (ADM), and Address-Port dependent mapping (APDM).
• Filtering. Support of Endpoint-Independent Filtering (EIF), Address-Dependent Filtering (ADF), and Address-Port-Dependent Filtering (APDF).
• Quotas. Configurable limits on number of ports, sessions per subscriber, and sessions per LSN group.
• Static Mapping. Support for manually defining a large scale NAT64 mapping.
• Hairpin Flow. Support for communication between subscribers or internal hosts using NAT IP addresses.
• 464XLAT connections. Support for communication between IPv4-only applications on IPv6 subscriber hosts and IPv4 hosts on the Internet through IPv6 network.
• Variable length NAT64 and DNS64 prefixes. The NetScaler appliance supports defining NAT64 and DNS64 prefixes of lengths of 32, 40, 48, 56, 64, and 96.
• Multiple NAT64 and DNS64 prefix. The NetScaler appliance supports multiple NAT64 and DNS64 prefixes.
• LSN Clients. Support for specifying or identifying subscribers for large scale NAT64 by using IPv6 prefixes and extended ACL6 rules.
• Logging. Support for logging NAT64 sessions for law enforcement. In addition, the following are also supported for logging.
- **Reliable SYSLOG**. Support for sending SYSLOG messages over TCP to external log servers for a more reliable transport mechanism.

- **Load balancing of log servers**. Support for load balancing of external log servers for preventing storage of redundant log messages.

- **Minimal Logging**. Deterministic LSN configurations or Dynamic LSN configurations with port block significantly reduce the large scale NAT64 log volume.

- **Logging MSISDN information**. Support for including subscribers’ MSISDN information in large scale NAT64 logs to identify and track subscriber activity over the Internet.

### Points to Consider for Configuring Large Scale NAT64

December 18, 2018

Before you start configuring large scale NAT64 and DNS64, consider these points:

1. Make sure you understand the different components of large scale NAT64, described in RFCs.
2. The NetScaler appliance supports only the following ALGs for large Scale NAT64:
   - FTP
   - TFTP
   - ICMP
   - SIP
   - RTSP
3. In a high availability setup of two NetScaler appliances, large NAT64 session synchronization (connection mirroring) is not supported.

### Configuring DNS64

December 18, 2018

Creating the required entities for stateful NAT64 configuration on the NetScaler appliance involves the following procedures:

- Add DNS services. DNS services are logical representations of DNS servers for which the NetScaler appliance acts as a DNS proxy server. For more information on setting optional parameters of a service, see “Load Balancing”.
- Add DNS64 action and DNS64 policy and then bind the DNS64 action to the DNS64 policy. A DNS64 policy specifies conditions to be matched against traffic for DNS64 processing according to the settings in the associated DNS64 action. The DNS64 action specifies the mandatory DNS64 prefix and the optional exclude-rule and mapped-rule settings.
NetScaler 11.1

- Create a DNS load balancing virtual server and bind the DNS services and the DNS64 policy to it. The DNS load balancing virtual server acts as a DNS proxy server for DNS servers represented by the bound DNS services. Traffic arriving at the virtual server is matched against the bound DNS64 policy for DNS64 processing. For more information on setting optional parameters of a load balancing virtual server, see “Load Balancing.”

**Note**
The command line interface has separate commands for these two tasks, but the GUI combines them in a single dialog box.

- Enable caching of DNS records. Enable the global parameter for the NetScaler appliance to cache DNS records, which are obtained through DNS proxy operations. For more information on enabling caching of DNS records, see “Enabling Caching of DNS Records”.

**To create a service of type DNS by using the command line interface**

At the command prompt, type:

```
1 add service <name> <IP> <serviceType> <port> ...
```

**To create a DNS64 action by using the command line interface**

At the command prompt, type:

```
1 add dns action64 <actionName> -Prefix <ipv6_addr|*> [-mappedRule <expression>] [-excludeRule <expression>]
```

**To create a DNS64 policy by using the command line interface**

At the command prompt, type:

```
1 add dns policy64 <name> -rule <expression> -action <string>
```

**To create a DNS load balancing virtual server by using the command line interface**

At the command prompt, type:

```
1 add lb vserver <name> DNS <IPAddress> <port> -dns64 (ENABLED | DISABLED ) [-bypassAAAA ( YES | NO)] ...
```
NetScaler 11.1

To bind the DNS services and the DNS64 policy to the DNS load balancing virtual server by using the command line interface

At the command prompt, type:

```plaintext
bind lb vserver <name> <serviceName> ...
bind lb vserver <name> -policyName <string> -priority <positive_integer> ...
```

Sample configuration:

```plaintext
add service SVC-DNS-1 203.0.113.50 DNS 53
Done
add service SVC-DNS-2 203.0.113.60 DNS 53
Done
add dns Action64 DNS64-Action-1 -Prefix 2001:DB8:300::/96
Done
add dns Policy64 DNS64-Policy-1 -rule "CLIENT.IPv6.SRC.IN_SUBNET(2001:DB8:5001::/64)" -action DNS64-Action-1
Done
add lb vserver LBVS-DNS64-1 DNS 2001:DB8:9999::99 53 -dns64 ENABLED
Done
bind lb vserver LBVS-DNS64-1 SVC-DNS-1
Done
bind lb vserver LBVS-DNS64-1 SVC-DNS-2
Done
bind lb vserver LBVS-DNS64-1 -policyname DNS64-Policy-1 -priority 2
Done
```

Configuring Large Scalr NAT64

December 27, 2018

A large scale NAT64 configuration on a NetScaler appliance uses the LSN commands sets. In a large scale NAT64 configuration, the LSN client entity specifies the IPv6 address or IPv6 network address, or ACL6 rules, for identifying IPv6 subscribers. A NAT64 configuration also includes an IPv6 profile, which specifies a NAT64 prefix.

Configuring NAT64 on a NetScaler appliance consists of the following tasks:

- Set the global LSN parameters. Global parameters include the amount of NetScaler memory reserved for the LSN feature and synchronization of LSN sessions in a high availability setup.
• Create an LSN client entity for identifying traffic from IPv6 subscribers. The LSN client entity
refers to a set of IPv6 subscribers. The client entity includes IPv6 addresses or IPv6 network
prefixes, or ACL6 rules, for identifying the traffic from these subscribers. An LSN client can be
bound to only one LSN group. The command line interface has two commands for creating an
LSN client entity and binding a subscriber to the LSN client entity. The GUI combines these two
operations on a single screen.
• Create an LSN pool and bind NAT IP addresses to it. An LSN pool defines a pool of NAT IP ad-
dresses to be used by the NetScaler appliance to perform large scale NAT64. The command line
interface has two commands for creating an LSN pool and binding NAT IP addresses to the LSN
pool. The GUI combines these two operations on a single screen.
• Create an LSN IP6 profile. An LSN IP6 profile defines the NAT64 prefix for a large scale NAT64
configuration.
• (Optional) Create an LSN Transport Profile for a specified protocol. An LSN transport profile de-
defines various timeouts and limits, such as maximum large scale NAT64 sessions and maximum
ports usage that a subscriber can have for a given protocol. You bind an LSN transport profile
for each protocol (TCP, UDP, and ICMP) to an LSN group. A profile can be bound to multiple LSN
groups. A profile bound to an LSN group applies to all subscribers of an LSN client bound to
the same group. By default, one LSN transport profile with default settings for TCP, UDP, and
ICMP protocols is bound to an LSN group during its creation. This profile is called the default
transport profile. An LSN transport profile that you bind to an LSN group overrides the default
LSN transport profile for that protocol.
• (Optional) Create an LSN Application Profile for a specified protocol and bind a set of destination
ports to it. An LSN application profile defines the LSN mapping and LSN filtering controls of a
group for a given protocol and for a set of destination ports. For a set of destination ports, you
bind an LSN profile for each protocol (TCP, UDP, and ICMP) to an LSN group. A profile can be
bound to multiple LSN groups. An LSN application profile bound to an LSN group applies to all
subscribers of an LSN client bound to the same group. By default, one LSN application profile
with default settings for TCP, UDP, and ICMP protocols for all destination ports is bound to an
LSN group during its creation. This profile is called a default application profile. When you bind
an LSN application profile, with a specified set of destination ports, to an LSN group, the bound
profile overrides the default LSN application profile for that protocol at that set of destination
ports. The command line interface has two commands for creating an LSN application profile
and binding a set of destination ports to the LSN application profile. The GUI combines these
two operations on a single screen.
• Create an LSN Group and bind LSN pools, LSN IPv6 profile, (optional) LSN transport profiles,
and (optional) LSN application profiles to the LSN group. An LSN group is an entity consisting
of an LSN client, an LSN IPv6 profile, LSN pool(s), LSN transport profile(s), and LSN application
profiles(s). A group is assigned parameters, such as port block size and logging of LSN sessions.
The parameter settings apply to all the subscribers of an LSN client bound to the LSN group.
Only one LSN IPv6 profile can be bound to an LSN group, and an LSN IPv6 profile bound to an LSN group cannot be bound to other LSN groups. Only LSN Pools and LSN groups with the same NAT type settings can be bound together. Multiples LSN pools can be bound to an LSN group. Only one LSN client entity can be bound to an LSN group, and an LSN client entity bound to an LSN group cannot be bound to other LSN groups. The command line interface has two commands for creating an LSN group and binding LSN pools, LSN transport profiles, and LSN application profiles to the LSN group. The GUI combines these two operations in a single screen.

**Configuration Using the Command Line**

You can create different configurations using the command line interface. Follow the steps given below.

**To create an LSN client by using the command line interface**

At the command prompt, type:

```bash
1 add lsn client <clientname>
2 show lsn client
```

**To bind an IPv6 network or an ACL6 rule to an LSN client by using the command line interface**

At the command prompt, type:

```bash
1 bind lsn client <clientname> (-network6 <ipv6_addr|*>| -acl6name <string>)
2 show lsn client
```

**To create an LAN pool by using the command line interface**

At the command prompt, type:

```bash
1 add lsn pool <poolname>
2 show lsn pool <poolname>
```
To bind NAT IP addresses to an LSN pool by using the command line interface

At the command prompt, type:

```
bind lsn pool <poolname> <lsnip>
```

Note

For removing NAT IP (LSN IP addresses) addresses from an LSN pool, use the unbind lsn pool command.

To configure an LSN IPv6 profile by using the command line interface

At the command prompt, type:

```
add lsn ip6profile <name> -type NAT64 -natprefix <ipv6_addr>*
```

To create an LSN transport profile by using the command line interface

At the command prompt, type:

```
add lsn transportprofile <transportprofilename> <transportprotocol> [-sessiontimeout <secs>] [-finrsttimeout <secs>] [-portquota <positive_integer>] [-sessionquota <positive_integer>] [-portpreserveparity ( ENABLED | DISABLED )] [-portpreserverange ( ENABLED | DISABLED )] [-syncheck ( ENABLED | DISABLED )]
```

To create an LSN application profile by using the command line interface

At the command prompt, type:

```
add lsn appsprofile <appsprofilename> <transportprotocol> [-ippooling ( PAIRED | RANDOM )] [-mapping <mapping>] [-filtering <filtering>] [-tcpproxy ( ENABLED | DISABLED )]
```

© 1999-2018 Citrix Systems, Inc. All rights reserved.
To bind an application protocol port range to an LSN application profile by using the command line interface

At the command prompt, type:

```
1 bind lsn appsprofile <appsprofilename> <lsnport>
2 show lsn appsprofile
```

To create an LSN group by using the command line interface

At the command prompt, type:

```
1 add lsn group <groupname> -clientname <string> [-nattype ( DYNAMIC | DETERMINISTIC )] [-portblocksize <positive_integer>] [-logging( ENABLED | DISABLED )] [-sessionLogging ( ENABLED | DISABLED )][-sessionSync ( ENABLED | DISABLED )] [-snmtraplimit<positive_integer>] [-ftp ( ENABLED | DISABLED )] [-sipalg ( ENABLED | DISABLED )][-rtspalg ( ENABLED |DISABLED )] [-ip6profile <string>]
2 show lsn group
```

To bind LSN protocol profiles and LSN pools to an LSN group by using the command line interface

At the command prompt, type:

```
1 bind lsn group <groupname> (-poolname <string> | -transportprofilename <string> | -httphdrlogprofilename <string> | -appsprofilename <string> | -sipalgprofilename <string> | rtspalgprofilename <string>)
2 show lsn group
```

Sample Large Scale NAT64 Configurations

Here are some sample configurations of large scale NAT64:

**Simple large scale NAT64 configuration with default settings:**

```
1 add lsn client LSN-NAT64-CLIENT-1
2
3 bind lsn client LSN-NAT64-CLIENT-1 -network6 2001:db8:5001::/96
```
add lsn pool LSN-NAT64-POOL-1
bind lsn pool LSN-NAT64-POOL-1 203.0.113.61 - 203.0.113.70
add lsn ip6profile LSN-NAT64-PROFILE-1 -type NAT64 -natprefix 2001:DB8:300::/96
add lsn group LSN-NAT64-GROUP-1 -clientname LSN-NAT64-CLIENT-1 -
ip6profile LSN-NAT64-PROFILE-1
bind lsn group LSN-NAT64-GROUP-1 -poolname LSN-NAT64-POOL-1

Simple large scale NAT64 configuration with an extended ACL6 rule for identifying subscribers:

add ns acl6 LSN-NAT64-ACL-2 ALLOW - srcIPv6 = 2001:DB8:5002::20 - 2001:DB8:5002::200
apply acl6s
add lsn client LSN-NAT64-CLIENT-2
bind lsn client LSN-NAT64-CLIENT-2 - acl6name LSN-NAT64-ACL-2
add lsn pool LSN-NAT64-POOL-2
bind lsn pool LSN-NAT64-POOL-2 203.0.113.5-203.0.113.10
add lsn ip6profile LSN-NAT64-PROFILE-2 -type NAT64 -natprefix 2001:DB8:302::/96
add lsn group LSN-NAT64-GROUP-2 -clientname LSN-NAT64-CLIENT-2 -
ip6profile LSN-NAT64-PROFILE-2
bind lsn group LSN-NAT64-GROUP-2 -poolname LSN-NAT64-POOL-2

Large scale NAT64 configuration with deterministic NAT resource allocation:

add lsn client LSN-NAT64-CLIENT-7
bind lsn client LSN-NAT64-CLIENT-7 -network6 2001:DB8:1002::7/128
add lsn pool LSN-NAT64-POOL-7 -nattype DETERMINISTIC
bind lsn pool LSN-NAT64-POOL-7 203.0.113.24-203.0.113.27

LargescaleNAT64configurationwithdeterministicNATresourceallocation:
Configuring Application Layer Gateways for Large Scale NAT64

December 18, 2018

For some Application layer protocols, the IP addresses and protocol port numbers are also communicated in the packet payload. Application Layer Gateway for a protocol parses the packet’s payload and does necessary changes to ensure that the protocol continues to work over large scale NAT64.

The NetScaler appliance supports ALG for the following protocols for large scale NAT64:

- FTP
- ICMP
- TFTP
- SIP
- RTSP

Application Layer Gateway for FTP, ICMP, and TFTP Protocols

December 18, 2018

You can enable or disable ALG for the FTP protocol for an large scale NAT64 configuration by enabling or disabling the FTP ALG option of the LSN group of the configuration.

ALG for the ICMP protocol is enabled by default, and there is no provision to disable it.

ALG for the TFTP protocol is disabled by default. TFTP ALG is enabled automatically for an large scale NAT64 configuration when you bind a UDP LSN application profile, with endpoint-independent-mapping, endpoint-independent filtering, and destination port as 69 (well-known port for TFTP), to the LSN group.

```
8  add lsn ip6profile LSN-NAT64-PROFILE-7 -type NAT64 -natprefix 2001:DB8::307::/96
9
10 add lsn group LSN-NAT64-GROUP-7 -clientname LSN-NAT64-CLIENT-7 -
ip6profile LSN-NAT64-PROFILE-7 -nattype DETERMINISTIC -portblocksize 256
11
12 bind lsn group LSN-NAT64-GROUP-7 -poolname LSN-POOL-7
```
Using Large Scale NAT64 with Session Initiation Protocol (SIP) is complicated, because SIP messages contain IP addresses in the SIP headers as well as in the SIP body. When LSN is used with SIP, the SIP headers contain information about the caller and the receiver, and the device translates this information to hide it from the outside network. The SIP body contains the Session Description Protocol (SDP) information, which includes IP addresses and port numbers for transmission of the media. SIP ALG for large scale NAT64 is compliant with RFC 3261, RFC 3581, RFC 4566, and RFC 4475.

Limitations of SIP ALG

SIP ALG for large scale NAT64 has the following limitations:

- Only SDP payload is supported.
- The following are not supported:
  - Multicast IP addresses
  - Encrypted SDP
  - SIP TLS
  - FQDN translation
  - SIP layer authentication
  - Traffic Domains
  - Admin partitions
  - NetScaler clusters
  - Multipart body
  - Line folding

Configuring SIP ALG

You need to configure the SIP ALG as part of the LSN configuration. For instructions on configuring LSN, see Configuration Large Scale NAT64. While configuring LSN, make sure that you:

- Set the following parameters while adding an LSN application profile:
  - IP Pooling = PAIRED
  - Address and Port Mapping = ENDPOINT-INDEPENDENT
  - Filtering = ENDPOINT-INDEPENDENT
- Create a SIP ALG profile and make sure that you define either the source port range or destination port range. Bind the SIP ALG profile to the LSN group.
- Enable SIP ALG in the LSN group.
To enable SIP ALG for an LSN configuration by using the CLI

At the command prompt, type:

```
1 add lsn group <groupname> -clientname <string> [-sipalg ( ENABLED | DISABLED )]
2 show lsn group <groupname>
```

To enable SIP ALG for an LSN configuration by using the CLI

At the command prompt, type:

```
1 add lsn sipalgprofile <sipalgprofilename>[-dataSessionIdleTimeout < positive_integer>] [-sipSessionTimeout <positive_integer>] [-registrationTimeout <positive_integer>] [-sipsrctype <port[-port]>] [-sipdstportrange <port[-port]>] [-openRegisterPinhole ( ENABLED | DISABLED )] [-openContactPinhole ( ENABLED | DISABLED )] [-openViaPinhole ( ENABLED | DISABLED )] [-openRecordRoutePinhole ( ENABLED | DISABLED )] [-sipTransportProtocol ( TCP | UDP ) [-openRoutePinhole ( ENABLED | DISABLED )] [-rport ( ENABLED | DISABLED )]
2 show lsn sipalgprofile <sipalgprofilename>
```

Sample Configuration

The following sample large scale NAT64 configuration, SIP ALG is enabled for TCP traffic from subscriber devices in the network 2001:DB8:1003::/96.

```
1 add lsn client LSN-NAT64-CLIENT-9
2 Done
3 bind lsn client LSN-NAT64-CLIENT-9 -network6 2001:DB8:1002::/96
5 Done
7 add lsn pool LSN-NAT64-POOL-9
8 Done
10 bind lsn pool LSN-NAT64-POOL-9 203.0.113.90
11 Done
12 Done
```
add lsn ip6profile LSN-NAT64-PROFILE-9 -type NAT64 -natprefix 2001:DB8:309::/96
Done
add lsn appsprofile LSN-NAT64-APPS-PROFILE-9 TCP -ippooling PAIRED -mapping ENDPOINT-INDEPENDENT -filtering ENDPOINT-INDEPENDENT
Done
add lsn sipalgprofile SIPALGPROFILE-9 -sipdstportrange 5060 -sipTransportProtocol TCP
Done
add lsn group LSN-NAT64-GROUP-9 -clientname LSN-NAT64-CLIENT-9 -ip6profile LSN-NAT64-PROFILE-7 -sipalg ENABLED
Done
bind lsn group LSN-NAT64-GROUP-9 -poolname LSN-NAT64-POOL-9
Done
bind lsn group LSN-NAT64-GROUP-9 -appsprofilename LSN-NAT64-APPSPROFILE-9
Done
bind lsn group LSN-NAT64-GROUP-9 -sipalgprofilename SIPALGPROFILE-9

Application Layer Gateway for RTSP Protocol

December 18, 2018

Real Time Streaming Protocol (RTSP) is an application-level protocol for the transfer of real-time media data. Used for establishing and controlling media sessions between end points, RTSP is a control channel protocol between the media client and the media server. The typical communication is between a client and a streaming media server.

Streaming media from a private network to a public network requires translating IP addresses and port numbers over the network. NetScaler functionality includes an Application Layer Gateway (ALG) for RTSP, which can be used with Large Scale NAT (LSN) to parse the media stream and make any necessary changes to ensure that the protocol continues to work over the network.

How IP address translation is performed depends on the type and direction of the message, and the type of media supported by the client-server deployment. Messages are translated as follows:

- Outbound request—Private IP address to NetScaler owned public IP address called LSN IP address.
• Inbound response—LSN IP address to private IP address.
• Inbound request—No translation.
• Outbound response—Private IP address to LSN pool IP address.

Limitations of RTSP ALG

The RTSP ALG does not support the following:

• Multicast RTSP sessions
• RTSP session over UDP
• Admin partitions
• NetScaler clusters
• RTSP Authentication
• HTTP tunneling

Configuring RTSP ALG

Configure RTSP ALG as part of the LSN configuration. For instructions on configuring LSN, see Configuring Large Scale NAT64. While configuring, make sure that you:

• Set the following parameters while adding an LSN application profile:
  – IP Pooling = PAIRED
  – Address and Port Mapping = ENDPOINT-INDEPENDENT
  – Filtering = ENDPOINT-INDEPENDENT
• Enable RTSP ALG in the LSN group
• Create a RTSP ALG profile and bind the RTSP ALG profile to the LSN group

To enable RTSP ALG for an LSN configuration by using the CLI

At the command prompt, type:

```
1 add lsn group <groupname> -clientname <string> [-rtspalg ( ENABLED | DISABLED )]
2
3 show lsn group <groupname>
```

To enable RTSP ALG for an LSN configuration by using the CLI

At the command prompt, type:
Sample RTSP ALG Configuration

The following sample large scale NAT64 configuration, RTSP ALG is enabled for TCP traffic from subscriber devices in the network 2001:DB8:1002::/96.

```
1 add lsn rtspalgprofile <rtspalgprofilename> [-rtspIdleTimeout < positive_integer>] -rtspportrange <port[-port]> [-rtspTransportProtocol (TCP|UDP)]
2
3 show lsn rtspalgprofile <rtspalgprofilename>
```

```
1 add lsn client LSN-NAT64-CLIENT-9
Done
3 bind lsn client LSN-NAT64-CLIENT-9 -network6 2001:DB8:1002::/96
Done
5 add lsn pool LSN-NAT64-POOL-9
Done
7 bind lsn pool LSN-NAT64-POOL-9 203.0.113.90
Done
9 add lsn ip6profile LSN-NAT64-PROFILE-9 -type NAT64 -natprefix 2001:DB8:309::/96
Done
11 add lsn appsprofile LSN-NAT64-APPS-PROFILE-9 TCP -ippooling PAIRED -mapping ENDPOINT-INDEPENDENT -filtering ENDPOINT-INDEPENDENT
Done
13 add lsn rtspalgprofile RTSPALGPROFILE-9 -rtspIdleTimeout 1000 -rtspportrange 554
Done
15 add lsn group LSN-NAT64-GROUP-9 -clientname LSN-NAT64-CLIENT-9 -ip6profile LSN-NAT64-PROFILE-7 -rtspalg ENABLED
Done
17 bind lsn group LSN-NAT64-GROUP-9 -poolname LSN-NAT64-POOL-9
Done
19 bind lsn group LSN-NAT64-GROUP-9 -appsprofile LSN-NAT64-APPSPROFILE-9
Done
21 bind lsn group LSN-NAT64-GROUP-9 -rtspalgprofilename RTSPALGPROFILE-9
Done
```
Configuring Static Large Scale NAT64 Maps

December 18, 2018

The NetScaler appliance supports manual creation of NAT64 mappings, which contain the mapping between the following information:

- Subscriber’s IP address and port
- NAT IP address and port

Static Large Scale NAT64 mappings are useful in cases where you want to ensure that the IPv4 connections initiated to a NAT IP address:port are IPv6 translated and mapped to the subscriber IP address:port (for example, web servers located in the internal network).

To create a Large Scale NAT64 mapping by using the command line

At the command prompt, type:

```
1  add lsn static <name> <transportprotocol> <subscrIP> <subscrPort> [ [<natIP> [<natPort>] ] [-destIP <ip_addr> [-dsttd <positive_integer>]] ]
2
3  show lsn static
```

Wildcard Port Static Large Scale NAT64 Maps

A static large scale NAT64 mapping entry is usually a one-to-one mapping between a subscriber IPv6 address:port and a NAT IPv4 address:port. A one-to-one static large scale NAT64 mapping entry exposes only one port of the subscriber IP address to the Internet.

Some situations might require exposing all ports (64K - limited to the maximum number of ports of a NAT IPv4 address) of a subscriber IP address to the Internet (for example, a server hosted on an internal network and running a different service on each port). To make these internal services accessible through the Internet, you have to expose all the ports of the server to the Internet.

One way to meet this requirement is to add 64 thousand one-to-one static mapping entries, one mapping entry for each port. Creating those entries is very cumbersome and a big task. Also, this large number of configuration entries might lead to performance issues in the NetScaler appliance.

A simpler method is to use wildcard ports in a static mapping entry. You just need to create one static mapping entry with NAT-port and subscriber-port parameters set to the wildcard character (*), and the protocol parameter set to ALL, to expose all the ports of a subscriber IP address for all protocols to the Internet.
For a subscriber’s inbound or outbound connections matching a wildcard static mapping entry, the subscriber’s port does not change after the NAT operation. When a subscriber-initiated connection to the Internet matches a wildcard static mapping entry, the NetScaler appliance assigns a NAT port that has the same number as the subscriber port from which the connection is initiated. Similarly, an Internet host gets connected to a subscriber’s port by connecting to the NAT port that has the same number as the subscriber’s port.

To configure the NetScaler appliance to provide access to all ports of a subscriber IPv6 address, create a wildcard static map with the following mandatory parameter settings:

- Protocol=ALL
- Subscriber port = *
- NAT port = *

In a wildcard static map, unlike in a one-to-one static map, setting the NAT IP parameter is mandatory. Also, the NAT IP address assigned to a wildcard static map cannot be used for any other subscribers.

To create a wildcard static map by using the command line interface

At the command prompt, type:

```
add lsn static <name> ALL <subscrIP> * <natIP> * [-td <positive_integer>] [-destIP <ip_addr>]
```

In the following sample configuration of a wildcard static map, all ports of a subscriber whose IP address is 2001:DB8:5001::3 are made accessible through NAT IP 203.0.113.33.

```
add lsn static NAT64-WILDCARD-STATIC-1 ALL 2001:DB8:5001::3 * 203.0.113.33 *
```

Done

Logging and Monitoring Large Scale NAT64

December 18, 2018

You can log large scale NAT64 information to diagnose and troubleshoot problems, and to meet legal requirements. You can monitor the performance of the large scale NAT64 deployment by using statistical counters and displaying the related current sessions.
Logging Large Scale NAT64

Logging large scale NAT64 information is required for ISPs to meet legal requirements and identify the source of traffic at any given time.

A log message for a large scale NAT64 mapping entry consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced.
- Time stamp.
- Entry type (MAPPING).
- Whether the mapping entry was created or deleted.
- Subscriber’s IP address, port, and traffic domain ID.
- NAT IP address and port.
- Protocol name.
- Destination IP address, port, and traffic domain ID might be present, depending on the following conditions:
  - Destination IP address and port are not logged for endpoint-independent mapping.
  - Only the destination IP address is logged for address-dependent mapping. The port is not logged.
  - Destination IP address and port are logged for address-port-dependent mapping.

A log message for a large scale NAT64 session consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (SESSION)
- Whether the session is created or removed
- Subscriber’s IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID

The following table displays sample large scale NAT64 log entries of each type stored on the configured log servers. The log entries show that a subscriber whose IPv6 address is 2001:db8:5001::9 was connected to destination IP:port 23.0.0.1:80 through NAT IP:port 203.0.113.63:45195 on April 7, 2016, from 14:07:57 GMT to 14:10:59 GMT.
Log Entry Type | Sample Log Entry
--- | ---

**Configuration Steps**

You can configure logging of large scale NAT64 information for a large scale NAT64 configuration by setting the LSN group's logging and session logging parameters. These are group level parameters and are disabled by default. The NetScaler appliance logs large scale NAT64 sessions for an LSN group only when both logging and session logging parameters are enabled.

The following table displays the logging behavior for an LSN group for various settings of logging and session logging parameters.
### Logging Session Logging Logging Behavior

<table>
<thead>
<tr>
<th>Logging</th>
<th>Session Logging</th>
<th>Logging Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enabled</td>
<td>Enabled</td>
<td>Logs LSN mapping entries as well as LSN sessions</td>
</tr>
<tr>
<td>Enabled</td>
<td>Disabled</td>
<td>Logs LSN mapping entries but not LSN sessions</td>
</tr>
<tr>
<td>Disabled</td>
<td>Enabled</td>
<td>Logs neither mapping entries nor LSN sessions</td>
</tr>
</tbody>
</table>

#### To log large scale NAT64 information by using the CLI

To set the logging and session logging parameters while adding an LSN group, at the command prompt, type:

```
add lsn group <groupname> -clientname <string> [-logging (ENABLED|DISABLED)] [-sessionLogging (ENABLED|DISABLED)]
```

To set the logging and session logging parameters for an existing LSN group, at the command prompt, type:

```
set lsn group <groupname> [-logging (ENABLED|DISABLED)] [-sessionLogging (ENABLED|DISABLED)]
```

#### Sample Configuration

In this example of large scale NAT64 configuration, logging and session logging parameters are enabled for LSN group LSN-NAT64-GROUP-1.

The NetScaler appliance logs large scale NAT64 session and mapping information for connections from subscribers (in the network 2001:DB8:5001::/96).

#### Sample configuration:

```
add lsn client LSN-NAT64-CLIENT-1
Done

bind lsn client LSN-NAT64-CLIENT-1 -network6 2001:DB8:5001::/96
Done
```
Logging MSISDN Information for Large Scale NAT64

A Mobile Station Integrated Subscriber Directory Number (MSISDN) is a telephone number uniquely identifying a subscriber across multiple mobile networks. The MSISDN is associated with a country code and a national destination code identifying the subscriber’s operator.

You can configure a NetScaler appliance to include MSISDNs in large scale NAT64 LSN log entries for subscribers in mobile networks. The presence of MSISDNs in the LSN logs facilitates faster and accurate back tracing of a mobile subscriber who has violated a policy or law, or whose information is required by lawful interception agencies.

The following sample LSN log entries include MSISDN information for a connection from a mobile subscriber in an LSN configuration. The log entries show that a mobile subscriber whose MSISDN is E164:5556543210 and IPv6 address is 2001:db8:5001::9 was connected to destination IP:port 23.0.0.1:80 through the NAT IP:port 203.0.113.63:45195 on April 7, 2016, from 14:07:57 GMT to 14:10:59 GMT.

<table>
<thead>
<tr>
<th>Log Entry Type</th>
<th>Sample Log Entry</th>
</tr>
</thead>
</table>
NetScaler 11.1

<table>
<thead>
<tr>
<th>Log Entry Type</th>
<th>Sample Log Entry</th>
</tr>
</thead>
</table>

**Configuration Steps**

Perform the following tasks for including MSISDN information in LSN logs:

- **Create an LSN log profile.** An LSN log profile includes the log subscriber ID parameter, which specifies whether to or not to include the MSISDN information in the LSN logs of an LSN configuration.
- **Bind the LSN log profile to an LSN group of an LSN configuration.** Bind the created LSN log profile to an LSN group of an LSN configuration by setting the log profile name parameter to the created LSN log profile name. MSISDN information is included in all LSN logs related to mobile subscribers of this LSN group.

**To create an LSN log profile by using the CLI**

At the command prompt, type:

```plaintext
1 add lsn logprofile <logprofilename> -logSubscriberID ( ENABLED | DISABLED )
2```

© 1999-2018 Citrix Systems, Inc. All rights reserved. 353
To bind an LSN log profile to an LSN group of an NAT64 LSN configuration by using the CLI

At the command prompt, type:

```
bind lsn group <groupname> -logProfileName <lsnlogprofilename>
```

```
show lsn group
```

Sample Configuration

In this example of NAT64 LSN configuration, the LSN log profile LOG-PROFILE-MSISDN-1 has the log subscriber ID parameter enabled. LOG-PROFILE-MSISDN-1 is bound to LSN group LSN-NAT64-GROUP-1. MSISDN information is included in the LSN session and LSN mapping logs for connections from mobile subscribers (in network 2001:DB8:5001::/96).

```
add lsn logprofile LOG-PROFILE-MSISDN-1 -logSubscriberID ENABLED
Done
add lsn client LSN-NAT64-CLIENT-1
Done
bind lsn client LSN-NAT64-CLIENT-1 -network6 2001:DB8:5001::/96
Done
add lsn pool LSN-NAT64-POOL-1
Done
bind lsn pool LSN-NAT64-POOL-1 203.0.113.61 - 203.0.113.70
Done
add lsn ip6profile LSN-NAT64-PROFILE-1 -type NAT64 -natprefix 2001:DB8:300::/96
Done
add lsn group LSN-NAT64-GROUP-1 -clientname LSN-NAT64-CLIENT-1 -ip6profile LSN-NAT64-PROFILE-1
Done
bind lsn group LSN-NAT64-GROUP-1 -poolname LSN-NAT64-POOL-1
Done
bind lsn group LSN-NAT64-GROUP-1 -logprofilename LOG-PROFILE-MSISDN-1
Done
```

Compact Logging for Large Scale NAT

Logging LSN information is one of the important functions needed by ISPs to meet legal requirements and be able to identify the source of traffic at any given time. This eventually results in a huge volume
of log data, requiring the ISPs to make large investments to maintain the logging infrastructure.

Compact logging is a technique for reducing the log size by using a notational change involving short codes for event and protocol names. For example, C for client, SC for session created, and T for TCP. Compact logging results in an average of 40 percent reduction in log size.

**Configuration Steps**

Perform the following tasks for logging LSN information in compact format:

1. Create an LSN log profile. An LSN log profile includes the Log Compact parameter, which specifies whether to or not to log information in compact format for an LSN configuration.
2. Bind the LSN log profile to an LSN group of an LSN configuration. Bind the created LSN log profile to an LSN group of an LSN configuration by setting the Log Profile Name parameter to the created LSN log profile name. All sessions and mappings for this LSN group are logged in compact format.

**To create an LSN log profile by using the CLI**

At the command prompt, type:

```
add lsn logprofile <logprofilename> -logCompact (ENABLED|DISABLED)
show lsn logprofile
```

**To bind an LSN log profile to an LSN group of an LSN configuration by using the CLI**

At the command prompt, type:

```
bind lsn group <groupname> -logProfileName <lsnlogprofilename>
show lsn group
```

**Sample Configuration for NAT64:**

```
add lsn logprofile LOG-PROFILE-COMPACT-1 -logCompact ENABLED
Done
add lsn client LSN-NAT64-CLIENT-1
Done
bind lsn client LSN-NAT64-CLIENT-1 -network6 2001:DB8:5001::/96
Done
add lsn pool LSN-NAT64-POOL-1
Done
```
Logging HTTP Header Information

The NetScaler appliance can log request header information of an HTTP connection that is using the NetScaler large scale NAT64 functionality. The following header information of an HTTP request packet can be logged:

- URL that the HTTP request is destined to
- HTTP Method specified in the HTTP request
- HTTP version used in the HTTP request
- IPv6 address of the subscriber that sent the HTTP request

The HTTP header logs can be used by ISPs to see the trends related to the HTTP protocol among a set of subscribers. For example, an ISP can use this feature to find out the most popular website among a set of subscribers.

Configuration Steps

Perform the following tasks for configuring the NetScaler appliance to log HTTP header information:

- Create an HTTP header log profile. An HTTP header log profile is a collection of HTTP header attributes (for example, URL and HTTP method) that can be enabled or disabled for logging.
- Bind the HTTP header to an LSN group of a large scale NAT64 configuration. Bind the HTTP header log profile to an LSN group of an LSN configuration by setting the HTTP header log profile name parameter to the name of the created HTTP header log profile. The NetScaler appliance then logs HTTP header information of any HTTP requests related to the LSN group. An HTTP header log profile can be bound to multiple LSN groups, but an LSN group can have only one HTTP header log profile.
To create an HTTP header log profile by using the the command line interface

At the command prompt, type:

```
1  add lsn httphdrlogprofile <httphdrlogprofilename> [-logURL ( ENABLED | DISABLED )] [-logMethod ( ENABLED | DISABLED )] [-logVersion ( ENABLED | DISABLED )] [-logHost ( ENABLED | DISABLED )]
2
3  show lsn httphdrlogprofile
```

To bind an HTTP header log profile to an LSN group by using the the command line interface

At the command prompt, type:

```
1  bind lsn group <groupname> -httphdrlogprofilename <string>
2
3  show lsn group <groupname>
```

Sample Configuration

```
1  add lsn httphdrlogprofile HTTP-HEADER-LOG-1
2  Done
3  add lsn client LSN-NAT64-CLIENT-1 Done
4
5  bind lsn client LSN-NAT64-CLIENT-1 -network6 2001:DB8:5001::/96
6  Done
7  add lsn pool LSN-NAT64-POOL-1
8  Done
9  bind lsn pool LSN-NAT64-POOL-1 203.0.113.61 - 203.0.113.70
10  Done
11  add lsn ip6profile LSN-NAT64-PROFILE-1 -type NAT64 -natprefix 2001:DB8:300::/96
12  Done
13  add lsn group LSN-NAT64-GROUP-1 -clientname LSN-NAT64-CLIENT-1 -ip6profile LSN-NAT64-PROFILE-1
14  Done
15  bind lsn group LSN-NAT64-GROUP-1 -poolname LSN-NAT64-POOL-1
16  Done
17  bind lsn group LSN-NAT64-GROUP-1 -httphdrlogprofilename HTTP-HEADER-LOG-1
18  Done
```
Displaying Current Large Scale NAT64 Sessions

You can display the current large scale NAT64 sessions in order to detect any unwanted or inefficient sessions on the NetScaler appliance. You can display all or some large scale NAT64 sessions on the basis of selection parameters.

**Note**

When more than a million large scale NAT64 sessions exist on the NetScaler appliance, Citrix recommends using the selection parameters to display selected large scale NAT64 sessions instead of displaying all of them.

**To display all large scale NAT64 sessions by using the command line interface**

At the command prompt, type:

```
show lsn session - nattype NAT64
```

**To display selective large scale NAT64 sessions by using the command line interface**

At the command prompt, type:

```
show lsn session - nattype NAT64 [-network6 <ipv6_addr|*>] [-clientname <string>] [-natIP <ip_addr> [-natPort <port>]]
```

Displaying Large Scale NAT64 Statistics

You can display statistics related to large scale NAT64 module, and evaluate its performance or troubleshoot problems. You can display a summary of statistics of all large scale NAT64 configurations or of a particular large scale NAT64 configuration. The statistical counters reflect events since the NetScaler appliance was last restarted. All these counters are reset to 0 when the NetScaler appliance is restarted.

**To display total statistics of large scale NAT64 by using the command line interface**

At the command prompt, type:

```
stat lsn nat64
```
To display statistics for a specified large scale NAT64 configuration by using the command line interface

At the command prompt, type:

```sh
stat lsn group <groupname>
```

Clearing Large Scale NAT64 Sessions

You can remove any unwanted or inefficient large scale NAT64 sessions from the NetScaler appliance. The appliance immediately releases resources (such as NAT IP address, port, and memory) allocated for these sessions, making the resources available for new sessions. The appliance also drops all the subsequent packets related to these removed sessions. You can remove all or selected large scale NAT64 sessions from the NetScaler appliance.

To clear all large scale NAT64 sessions by using the command line interface

At the command prompt, type:

```sh
flush lsn session -nattype NAT64
show lsn session -nattype NAT64
```

To clear selective large scale NAT64 sessions by using the command line interface

At the command prompt, type:

```sh
flush lsn session -nattype NAT64 [-network6 <ipv6_addr[*]>] [-clientname <string>] [-natIP <ip_addr> [-natPort <port>]]
show lsn session -nattype NAT64 [-network6 <ipv6_addr[*]>] [-clientname <string>] [-natIP <ip_addr> [-natPort <port>]]
```

Sample configuration:

Clear all large scale NAT64 sessions existing on a NetScaler appliance

```sh
flush lsn session -nattype NAT64
Done
```

Clear all large scale NAT64 sessions related to client entity LSN-NAT64-CLIENT-1

```sh
flush lsn session -nattype NAT64 [-network6 <ipv6_addr[*]>] [-clientname <string>] [-natIP <ip_addr> [-natPort <port>]]
```
Clear all large scale NAT64 sessions related to a subscriber network (2001:DB8:5001::/96) of LSN client entity LSN-NAT64-CLIENT-2

Port Control Protocol for Large Scale NAT64

December 18, 2018

NetScaler appliances now support Port Control Protocol (PCP) for large scale NAT (LSN). Many of an ISP’s subscriber applications must be accessible from Internet (for example, Internet of Things (IOT) devices, such as an IP camera that provides surveillance over the Internet). One way to meet this requirement is to create static large scale NAT (LSN) maps. But for a very large number of subscribers, creating static LSN NAT maps is not a feasible solution.

Port Control Protocol (PCP) enables a subscriber to request specific LSN NAT mappings for itself and/or for other 3rd party devices. The large scale NAT device creates an LSN map and sends it to the subscriber. The subscriber sends the remote devices on the Internet the NAT IP address:NAT port at which they can connect to the subscriber.

Applications usually send frequent keep-alive messages to the large scale NAT device so that their LSN mappings do not time out. PCP helps reduce the frequency of such keep-alive messages by enabling the applications to learn the timeout settings of the LSN mappings. This helps reduce bandwidth consumption on the ISP’s access network and battery consumption on mobile devices.

PCP is a client-server model and runs over the UDP transport protocol. A NetScaler appliance implements the PCP server component and is compliant with RFC 6887.

Configuration Steps

Perform the following tasks for configuring PCP:

- **(Optional) Create a PCP profile.** A PCP profile includes settings for PCP related parameters (for example, to listen for mapping and peer PCP requests). A PCP profile can be bound to a PCP server. A PCP profile bound to a PCP server applies all its settings to the PCP server. A PCP profile can be bound to multiple PCP servers. By default, one PCP profile with default parameters
settings is bound to all PCP servers. A PCP profile that you bind to a PCP server overrides the
default PCP profile settings for that server. A default PCP profile has the following parameter
settings:

- Mapping: Enabled
- Peer: Enabled
- Minimum map life: 120 seconds
- Maximum max life: 86400 seconds
- Announce count: 10
- Third Party: Disabled

- **Create a PCP server and bind a PCP profile to it.** Create a PCP server on the NetScaler appliance to listen for PCP related requests and messages from the subscribers. A Subnet IP (SNIP) or (SNIP6) address must be assigned to a PCP server to access it. By default, a PCP server listens on port 5351.

- **Bind the PCP server to an LSN group of an LSN configuration.** Bind the created PCP server to an LSN group of an LSN configuration by setting the PCP Server parameter to specify the created PCP server. The created PCP server can be accessed only by the subscribers of this LSN group.

**Note**

A PCP server for a large scale NAT configuration does not serve requests from subscribers that are identified from ACL rules.

To create a PCP profile by using the CLI

At the command prompt, type:

```
1 add pcp profile <name> [-mapping ( ENABLED | DISABLED )] [-peer ( ENABLED | DISABLED )] [-minMapLife <secs>] [-maxMapLife <secs>] [-announceMultiCount <positive_integer>] [-thirdParty ( ENABLED | DISABLED )]
2
3 show pcp profile <name>
```

To create a PCP server by using the CLI

At the command prompt, type:

```
1 add pcp server <name> <IPAddress> [-port <portNum|*>] [-pcpProfile <string>]
2
3 show pcp server <name>
```
**Sample Configuration for NAT64**

In the following sample configuration, PCP server PCP-SERVER-1, with PCP settings from PCP-PROFILE-1, is bound to LSN group LSN-NAT64-GROUP-1. PCP-SERVER-1 serves PCP requests from IPv6 subscribers in network 2001::/96.

**Sample configuration:**

```plaintext
1  add pcp profile PCP-PROFILE-1 -minMapLife 400
2  Done
3  add pcp server PCP-SERVER-1 2001:DB8:6001::90 -pcpProfile PCP-PROFILE-1
4  Done
5  add lsn client LSN-NAT64-CLIENT-1
6  Done
7  bind lsn client LSN-NAT64-CLIENT-1 -network6 2001:DB8:5001::/96
8  Done
9  add lsn pool LSN-NAT64-POOL-1
10 Done
11 bind lsn pool LSN-NAT64-POOL-1 203.0.113.61 - 203.0.113.70
12 Done
13 add lsn ip6profile LSN-NAT64-PROFILE-1 -type NAT64 -natprefix 2001:DB8:3001::/96
14 Done
15 add lsn group LSN-NAT64-PROFILE-1 -clientname LSN-NAT64-CLIENT-1 -ip6profile LSN-NAT64-PROFILE-1
16 Done
17 bind lsn group LSN-NAT64-GROUP-1 -poolname LSN-NAT64-POOL-1
18 Done
19 bind lsn group LSN-NAT64-GROUP-1 -pcpServer PCP-NAT64-SERVER-1
20 Done
```

**Telco subscriber management**

January 6, 2019

The number of subscribers in a telco network is increasing at an unprecedented rate, and managing them is becoming a challenge for service providers. Newer, faster, and smarter devices are placing high demand on the network and the subscriber management systems. It is no longer feasible to provide each subscriber the same standard of service, and the need for traffic processing on a per-subscriber basis is imperative.

The NetScaler appliance provides the intelligence to profile subscribers on the basis of their information stored in the Policy and Charging Rules Function (PCRF). When a mobile subscriber connects to
the Internet, the packet gateway associates an IP address with the subscriber and forwards the data packet to the appliance. The appliance receives the subscriber information dynamically, or you can configure static subscribers. This information enables the appliance to apply its rich traffic management capabilities, such as content switching, integrated caching, rewrite, and responder, on a per-subscriber basis to manage the traffic.

Before you configure the NetScaler appliance to manage subscribers, you must allocate memory to the module that stores subscriber sessions. For dynamic subscribers, you must configure an interface through which the appliance receives session information. Static subscribers must be assigned IDs, and you can associate them with policies.

You can also do the following:

- Subscriber policy enforcement and management.
- Configure the appliance to uniquely identify a subscriber by using only the IPv6 prefix instead of the complete IPv6 address.
- Use policies to optimize TCP traffic for both dynamic and static subscribers. These policies associate different TCP profiles with different types of users.
- Manage idle sessions on a NetScaler appliance.
- Enable logging to a log server.
- Remove LSN sessions for deleted subscriber sessions.

Allocating memory for the subscriber session store module

Each subscriber session entry consumes 1 KB of memory. Storing 500,000 subscriber sessions at any point in time requires 500 MB of memory. This value must be added to the minimum memory requirement, which is shown as part of the output of the “show extendedmemoryparam” command. In the following example, the output is for a NetScaler VPX instance with 3 packet engines and 8 GB memory.

To store 500,000 subscriber sessions on this appliance, the configured memory must be 2058+500 MB (500,000 x 1 KB = 500 MB.)

Note

The configured memory must be in multiples of 2 MB and must not exceed the maximum memory usage limit. The appliance must be restarted for the changes to take effect.

Example

```
1  show extendedmemoryparam
2       Extended Memory Global Configuration. This memory is utilized by
2       LSN and Subscriber Session Store Modules:
3       Active Memory Usage: 0 MBytes
```
Configure an interface for dynamic subscribers

The NetScaler appliance dynamically receives the subscriber information through any of the following types of interface:

- Gx Interface
- RADIUS Interface
- RADIUS and Gx Interface

Note

- In an HA setup, the subscriber sessions are continually synchronized on the secondary node. In the event of a failover, the subscriber information is still available on the secondary node.

Gx interface

A Gx interface (as specified in 3GPP 29.212) is a standard interface based on the Diameter protocol that allows exchange of policy control and charging rules between a PCRF and a Policy and Charging Enforcement Function (PCEF) entity in a Telco network.

As soon as an IP-CAN session is established, the packet gateway forwards the subscriber ID, such as the MSISDN, and Framed-IP address information about the subscriber to the PCRF as a Diameter message. When the data packet arrives at the appliance from packet gateway (PGW), the appliance uses the subscriber IP address to query the PCRF to get the subscriber information. This is also known as secondary PCEF functionality.
The Policy and Charging Control (PCC) rules received by the appliance over the Gx interface are stored on the appliance for the duration of the subscriber session, that is, until the PCRF sends a Re-Authentication Request (RAR) message with a Session-Release-Cause AVP or the subscriber session is terminated from the CLI or the configuration utility. If there are any updates to an existing subscriber, the PCRF sends the updates in an RAR message. A subscriber session is initiated when a subscriber logs on to the network, and terminated when the subscriber logs off.

The following illustration shows the high-level traffic flow. It assumes that the data plane traffic is HTTP. The appliance sends a Credit Control Request (CCR) over a Gx interface to the PCRF server and, in the credit control answer (CCA), receives the PCC rules and, optionally, other information, such as the Radio Access Technology (RAT) type, that applies to the particular subscriber. PCC rules include one or more policy (rule) names and other parameters. The appliance uses this information to retrieve the predefined rules stored on the appliance, and to direct the flow of traffic. It also stores this information in the subscriber policy and enforcement management system for the duration of the subscriber session. After a subscriber session is terminated, the appliance discards all the information about the subscriber.

The following example shows the commands for configuring a Gx interface. The commands are in boldface.

**To set up a Gx interface, perform the following tasks**

Add a DIAMETER service for each Gx interface. For example:

```
1 add service pcrf-svc1 203.0.113.1 DIAMETER 3868
2 add service pcrf-svc2 203.0.113.2 DIAMETER 3868
```

Add a non-addressable DIAMETER load balancing virtual server and bind the services created in step 1 to this virtual server. For more than one service, specify a persistenceType and the persistAVPno so that specific sessions are handled by the same PCRF server. For example:

```
1 add lb vserver vdia DIAMETER 0.0.0.0 0 -persistenceType DIAMETER - persistAVPno 263
2 bind lb vserver vdia pcrf-svc1
3 bind lb vserver vdia pcrf-svc2
```

Configure NetScaler diameter identity and realm. Identity and realm are used as Origin-Host and Origin-Realm AVPs in diameter messages sent by the Gx client. For example:

```
1 set ns diameter -identity netscaler.com -realm com
```
Configure the Gx interface to use the virtual server created in step 2 as the PCRF virtual server. Specify the PCRF realm to use as Destination-Realm AVP in diameters messages sent by the Gx client. For example:

```
set subscriber gxInterface -vServer vdiam -pcrfRealm pcrf.com
```

Set the subscriber interface type to GxOnly. For example:

```
set subscriber param -interfaceType GxOnly
```

To see the Gx interface configuration and status, type:

```
show subscriber gxinterface
```

**Example**

```
show subscriber gxinterface
Gx Interface parameters:
   PCRF Vserver: vdiam (UP)
   Gx Client Identity...: netscaler.com
   Gx Client Realm ..........: com
   PCRF Realm: pcrf.com
   Hold Packets On Subscriber Absence: YES
   CCR Request Timeout: 10 Seconds
   CCR Request Retry Attempts: 3
   RevalidationTimeout: 1200 Seconds
   NegativeTTL: 120 Seconds
   ServicePath AVP code:262099 ServicePath AVP VendorID: 3845
   PCRF Connection State: Gx Connection Established with PCRF.
Done
```

**ARGUMENTS**

**vServer**

Name of the load balancing or content switching virtual server to which the Gx connections are established. The service type of the virtual server must be DIAMETER or SSL_DIAMETER. This parameter is mutually exclusive with the service parameter. Therefore, you cannot set both service and the virtual server in the Gx interface.
Service

Name of DIAMETER or SSL_DIAMETER service corresponding to PCRF to which the Gx connection is established. This parameter is mutually exclusive with the vserver parameter. Therefore, you cannot set both service and the virtual server in the Gx Interface.

pcrfRealm

The realm of PCRF to which the message is to be routed. This is the realm used in Destination-Realm AVP by NetScaler Gx client (as a Diameter node).

holdOnSubscriberAbsence

Set to Yes to hold packets until the subscriber session information is fetched from the PCRF server. If set to No, the default subscriber profile is applied until the subscriber session information is fetched from the PCRF server. If a default subscriber profile is not configured, an UNDEF is raised for expressions that use subscriber attributes.

requestTimeout

Time, in seconds, within which the Gx CCR request must complete. If the request does not complete within this time, the request is retransmitted for the number of times specified in the requestRetryAttempts parameter. If request is not complete even after retransmitting, then the default subscriber profile is applied to this subscriber. If a default subscriber profile is not configured, an UNDEF is raised for expressions that use subscriber attributes. Zero disables the timeout. Default value: 10

requestRetryAttempts

Specify the number of times a request must be retransmitted if the request does not complete within the value specified in the requestTimeout parameter. Default value: 3

revalidationTimeout

Time, in seconds, after which the Gx CCR-U request is sent after any PCRF activity on a session. Any RAR or CCA message resets the timer. Zero value disables the idle timeout.

negativeTTL

Time, in seconds, after which the Gx CCR-I request is resent for sessions that have not been resolved by PCRF because the server is down or there is no response or a failed response is received. Instead of polling the PCRF server constantly, a negative-TTL makes the appliance hold on to an unresolved session. For negative sessions, the appliance inherits the attributes from the default subscriber profile,
if one is configured and from the RADIUS accounting message, if one is received. Zero value disables the negative sessions. The appliance does not install negative sessions even if a subscriber session could not be fetched. Default value: 600

**servicePathAVP**

The AVP code in which PCRF sends the service path applicable to a subscriber.

**servicePathVendorid**

The vendor id of the AVP in which PCRF sends the service path applicable to a subscriber.

**To configure Gx interface by using the GUI**

1. Navigate to Traffic Management > Subscriber > Parameters.
2. Click Configure Subscriber Parameters.
3. In Interface Type, select GxOnly.
4. Specify the values for the all required parameters.
5. Click OK.

**RADIUS interface**

With a RADIUS interface, the packet gateway forwards the subscriber information in a RADIUS Accounting Start message to the appliance through the RADIUS interface as soon as an IP-CAN session is established. A service of type RADIUSListener processes RADIUS Accounting messages. Add a shared secret for the RADIUS client. If a shared secret is not configured, the RADIUS message is silently dropped. The following example shows the commands for configuring a RADIUS interface. The commands are in boldface.

To set up a RADIUS interface, perform the following tasks:

Create a RADIUS listener service at the SNIP address where the RADIUS messages are received. For example:

```bash
add service srad1 192.0.0.206 RADIUSLISTENER 1813
```

Configure the subscriber RADIUS interface to use this service. For example:

```bash
set subscriber radiusInterface -listeningService srad1
```

Set the subscriber interface type to RadiusOnly. For example:

```bash
set subscriber param -interfaceType RadiusOnly
```
Add a RADIUS client specifying a subnet and shared secret. For example:

```
1 add radius client 192.0.2.0/24 -radkey client123
```

A subnet of 0.0.0.0/0 implies that it is the default shared secret for all clients. To see the RADIUS interface configuration and status, type:

```
1 show subscriber radiusInterface
```

RADIUS Interface parameters:

Radius Listener Service: srad1(UP)

Done

**Example:**

```
1 add service pcrf-svc1 203.0.113.1 DIAMETER 3868
2 add service pcrf-svc2 203.0.113.2 DIAMETER 3868
```

**ARGUMENTS**

**ListeningService**

Name of the RADIUS listening service that will process the RADIUS accounting requests.

**svrState**

The state of the RADIUS listening service.

The following illustration shows the high-level traffic flow.

**To configure RadiusOnly interface by using the GUI**

1. Navigate to Traffic Management > Subscriber > Parameters.
2. Click Configure Subscriber Parameters.
3. In Interface Type, select RadiusOnly.
4. Specify the values for the all required parameters.
5. Click OK.
RADIUS and Gx interface

With a RADIUS and Gx interface, as soon as an IP-CAN session is established, the packet gateway forwards the subscriber ID, such as the MSISDN, and Framed-IP address information about the subscriber to the appliance through the RADIUS interface. The appliance uses this subscriber ID to query the PCRF on the Gx interface to get the subscriber information. This is known as primary PCEF functionality. The following example shows the commands for configuring a RADIUS and Gx interface.

```
1 set subscriber param -interfaceType RadiusandGx
2 add service pcrf-svc 203.0.113.1 DIAMETER 3868
3 add lb vserver vdiam DIAMETER 0.0.0.0 0 -persistenceType DIAMETER - persistAVPno 263
4 bind lb vserver vdiam pcrf-svc
5 set subscriber gxInterface -vServer vdiam -pcrfRealm testrealm1.net - holdOnSubscriberAbsence YES -revalidationTimeout 60 -negativeTTL 120
6 add service srad1 192.0.0.206 RADIUSLISTENER 1813 set subscriber radiusInterface -listeningService srad1
```

The following illustration shows the high-level traffic flow.

To configure RADIUSAndGx interface by using the GUI

1. Navigate to Traffic Management > Subscriber > Parameters.
2. Click Configure Subscriber Parameters.
3. In Interface Type, select RadiusAndGx.
4. Specify the values for all required parameters.
5. Click OK.

Configure static subscribers

You can configure the subscribers manually on the NetScaler appliance by using the command line or the configuration utility. You create static subscribers by assigning a unique subscriber ID and optionally associating a policy with each subscriber. The following examples show the commands for configuring a static subscriber.

In the following examples, subscriptionIdvalue specifies the international telephone number, and subscriptionIdType (E164 in this example) specifies the general format for international telephone numbers.

```
1 add subscriber profile 203.0.113.6 -subscriberRules policy1 policy2 - subscriptionIdType E164 - subscriptionIdvalue 98767543211
2 add subscriber profile 2002::a66:e8d3/64 -subscriberRules policy1 policy3 -subscriptionIdtype E164 - subscriptionIdvalue 98767543212
```
To view the configured subscriber profiles, type:

```
show subscriber profile
```

```
1 > show subscriber profile
1) Subscriber IP: 2002::/64
   Profile Attributes:
   Active Rules: policy1, policy3
   Subscriber Id Type: E164
   Subscriber Id Value: 98767543212
2) Subscriber IP: 203.0.113.6
   Profile Attributes:
   Active Rules: policy1, policy2
   Subscriber Id Type: E164
   Subscriber Id Value: 98767543211
```

**Default subscriber profile**

A default subscriber profile is used if the subscriber IP address is not found in the subscriber session store on the appliance. In the following example, a default subscriber profile is added with the subscriber rule policy1.

```
1 > add subscriber profile * -subscriberRules policy1
```

**View and clear subscriber sessions**

Use the following command to display all the static and dynamic subscriber sessions.

```
show subscriber sessions
```

```
1 > show subscriber sessions
1) Subscriber IP: 2002::/64
   Session Attributes:
   Active Rules: policy1, policy3
   Subscriber Id Type: E164
   Subscriber Id Value: 98767543212
2) Subscriber IP: *
   Session Attributes:
   Active Rules: policy1
3) Subscriber IP: 203.0.113.6
   Session Attributes:
   Active Rules: policy1, policy2
```
Use the following command to clear a single session or the complete session store. If you do not specify an IP address, the complete subscriber session store is cleared.

```
1 clear subscriber sessions <ip>
```

### Subscriber policy enforcement & management system

The NetScaler appliance uses the subscriber’s IP address as the key to the subscriber policy enforcement and management system.

You can add subscriber expressions to read the subscriber information available in the Subscriber Policy Enforcement & Management System. These expressions can be used with policy rules and actions that are configured for NetScaler features, such as integrated caching, rewrite, responder, and content switching.

The following commands are an example of adding a subscriber-based responder action and policy. The policy evaluates to true if the subscriber rule value is “pol1”.

```bash
1 add responder action error_msg respondwith 'HTTP/1.1 403 OK
    You are not authorized to access Internet'
2 add responder policy no_internet_access "SUBSCRIBER_RULE_ACTIVE("pol1")" error_msg
```

The following example shows the commands to add a subscriber-based rewrite action and policy. The action inserts an HTTP header “X-Nokia-MSISDN” by using the value of AVP(45) in the subscriber session.
In the following example, two policies are configured on the appliance. When the appliance checks the subscriber information and the subscriber rule is cache_enable, it performs caching. If the subscriber rule is cache_disable, the appliance does not perform caching.

```
1 > add rewrite action AddHDR-act insert_http_header X-Nokia-MSISDN "SUBSCRIBER.AVP(45).VALUE"
2 > add rewrite policy AddHDR-pol "HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL).EQUALS_ANY("patset-test")" AddHDR-act
```

For a complete list of expressions starting with “SUBSCRIBER.” see the Policy Configuration Guide.

### IPv6 prefix based subscriber sessions

A telco user is generally identified by the IPv6 prefix rather than the complete IPv6 address. The NetScaler appliance now uses the prefix instead of the complete IPv6 address (/128) to identify a subscriber in the database (subscriber store). For communicating with the PCRF server (for example, in a CCR-I message), the appliance now uses the framed-IPv6-Prefix AVP instead of the complete IPv6 address. The default prefix length is /64, but you can configure the appliance to use a different value.

**To configure the IPv6 prefix by using the command line**

```
set subscriber param -ipv6PrefixLookupList ...
```

The first example command below sets a single prefix and the second example command sets multiple prefixes.

```
1 set subscriber param -ipv6PrefixLookupList 64
2 set subscriber param -ipv6PrefixLookupList 64 72 96
```

**To configure the IPv6 prefix by using the configuration utility**

1. Navigate to **Traffic Management > Subscriber > Parameters**.
2. In the details pane, under **Settings**, click **Configure Subscriber Parameters** and in **IPv6 Prefix Lookup List**, specify one or more prefixes.
**Idle session management of subscriber sessions in a Telco network**

Subscriber session cleanup on a NetScaler appliance is based on control plane events, such as a RADIUS Accounting Stop message, a Diameter RAR (session release) message, or a “clear subscriber session” command. In some deployments, the messages from a RADIUS client or a PCRF server might not reach the appliance. Additionally, during heavy traffic, the messages might be lost. A subscriber session that is idle for a long time continues to consume memory and IP resources on the NetScaler appliance. The idle session management feature provides configurable timers to identify idle sessions, and cleans up these sessions on the basis of the specified action.

A session is considered idle if no traffic from this subscriber is received on the data plane or the control plane. You can specify an update, terminate (inform PCRF and then delete the session), or delete (without informing PCRF) action. The action is taken only after the session is idle for the time specified in the idle timeout parameter.

**To configure the idle session timeout and the associated action by using the command line**

```
set subscriber param [-idleTTL <positive_integer>] [-idleAction <idleAction>]
```

**Examples:**

```
1 set subscriber param -idleTTL 3600 -idleAction ccrTerminate
2 set subscriber param -idleTTL 3600 -idleAction ccrUpdate
3 set subscriber param -idleTTL 3600 -idleAction delete
```

To disable the idle session timeout, set the idle timeout to zero.

```
set subscriber param -idleTTL 0
```

**To configure the idle session timeout and the associated action by using the configuration utility**

1. Navigate to **Traffic Management > Subscriber > Parameters**.
2. In the details pane, under **Settings**, click **Configure Subscriber Parameters** and specify an **Idle Time** and **Idle Action**.
**Subscriber session event logging**

If you enable subscriber logging, you can track the RADIUS and Gx control plane messages specific to a subscriber, and use the historical data to analyze subscriber activities. Some of the key attributes are MSISDN and time stamp. The following attributes are also logged:

- Session Event (Install, Update, Delete, Error)
- Gx Message Type (CCR-I, CCR-U, CCR-T, RAR)
- Radius Message Type (Start, Stop)
- Subscriber IP
- SubscriberID Type (MSISDN(E164), IMSI)
- SubscriberID value

By using these logs, you can track users by IP address and, if available, MSISDN.

You can enable subscriber session logging to a local or remote syslog or nslog server. The following example shows how to enable subscriber logging to a remote syslog server.

```
> add syslogAction sysact1 192.0.2.0 -loglevel EMERGENCY ALERT CRITICAL ERROR WARNING NOTICE INFORMATIONAL -subscriberlog enabled
```

From these logs, you can learn about any activity related to a user, such as the time when a session was updated, deleted, or created (installed). Additionally, error messages are also logged.

**Examples:**

1. The following log entries are examples of RADIUS and Gx session creation, session update, and session deletion.

   09/30/2015:16:29:18 GMT  Informational 0-PPE-0 : default SUBSCRIBER SESSION_EVENT 147 0 : Session Install, GX MsgType: CCR-I, RADIUS MsgType: Start, IP: 100.10.1.1, ID: E164 - 30000000001

   09/30/2015:16:30:18 GMT  Informational 0-PPE-0 : default SUBSCRIBER SESSION_EVENT 148 0 : Session Update, GX MsgType: CCR-U, IP: 100.10.1.1, ID: E164 - 30000000001

   09/30/2015:17:27:56 GMT  Informational 0-PPE-0 : default SUBSCRIBER SESSION_EVENT 185 0 : Session Delete, GX MsgType: CCR-T, RADIUS MsgType: Stop, IP: 100.10.1.1, ID: E164 - 30000000001

2. The following log entries are examples of failure messages, such as when a subscriber is not found on the PCRF server and when the appliance cannot connect to the PCRF server.

   09/30/2015:16:44:15 GMT  Error 0-PPE-0 : default SUBSCRIBER SESSION_FAILURE 169 0 : Failure Reason: PCRF failure response, GX MsgType: CCR-I, IP: 100.10.1.1

   Sep 30 13:03:01 09/30/2015:16:49:08 GMT 0-PPE-0 : default SUBSCRIBER SES-
Subscriber aware LSN session termination

In earlier releases, if a subscriber session is deleted when a RADIUS Accounting STOP or a PCRF-RAR message is received, or as a result of any other event, such as TTL expiry or flush, the corresponding LSN sessions of the subscriber are removed only after the configured LSN timeout period. LSN sessions that are kept open until this timeout expires continue to consume resources on the appliance.

From release 11.1, a new parameter (subscrSessionRemoval) is added. If this parameter is enabled, and the subscriber information is deleted from the subscriber database, LSN sessions corresponding to that subscriber are also removed. If this parameter is disabled, the subscriber sessions are timed out as specified by the LSN timeout settings.

To configure subscriber aware LSN session termination by using the CLI

At the command prompt, type:

```bash
set lsn parameter -subscrSessionRemoval ( ENABLED | DISABLED )
```

```
1 > set lsn parameter -subscrSessionRemoval ENABLED
2 Done
3 > sh lsn parameter
4 LSN Global Configuration:
5
6   Active Memory Usage: 0 MBytes
7   Configured Memory Limit: 0 MBytes
8   Maximum Memory Usage Limit: 912 MBytes
9   Session synchronization: ENABLED
10  Subscriber aware session removal: ENABLED
```

To configure subscriber aware LSN session termination by using the GUI

1. Navigate to System > Large Scale NAT.
2. In Getting started, click Set LSN Parameter.
3. Set the Subscriber Aware Session Removal parameter.
Troubleshooting

If your deployment is not working as expected, use the following commands to troubleshoot:

- show subscriber gxinterface
  This command’s output can include the following error messages (shown here with suggested responses):
  - Gx Interface Not Configured-Use set subscriber param command to configure the correct interface type.
  - PCRF not configured-Configure a Diameter vServer or Service on GxInterface-Use the set subscriber gx interface command to assign a Diameter virtual server or service to this interface.
  - PCRF is not ready-Check corresponding vserver/service for more details-Use the show LB vserver or show service command to check the state of the service.
  - NetScaler is waiting for CEA from PCRF-Capability negotiation between the PCRF and NetScaler might be failing. This could be an intermittent state. If it persists, check the DIAMETER settings on your PCRF server.
  - Memory is not configured to store subscriber sessions. Please use ‘set extendedmemoryparam -memlimit <>'-Use the set extendedmemoryparam command to configure extended memory.

- show subscriber radiusinterface
  If “Not Configured” is the output of this command, use the set subscriber radiusinterface command to specify a RADIUSListener service.

If subscriber logging is enabled, you can get more detailed information from the log files.

Subscriber aware traffic steering

January 6, 2019

Traffic steering directs subscriber traffic from one point to another. When a subscriber connects to the network, the packet gateway associates an IP address with the subscriber and forwards the data packet to the NetScaler appliance. The appliance communicates with the PCRF server over the Gx interface to get the policy information. Depending on the policy information, the appliance performs one of the following actions:

- Forward the data packet to another set of services (as shown in the following illustration).
- Drop the packet.
- Perform only Large Scale NAT (LSN), if LSN is configured on the appliance.

The values shown in the following figure are configured in the CLI procedure that follows the figure. A content switching virtual server on the NetScaler appliance directs requests to the value added ser-
NetScaler 11.1

services or skips them, depending on the defined rule, and then sends the packet out to the Internet after performing LSN.

**To configure traffic steering for the above deployment by using the CLI**

Add the appliance's subnet IP (SNIP) addresses.

**Example:**

```
1  add ns ip 192.168.10.1 255.255.255.0 -type snip
2  add ns ip 192.168.20.1 255.255.255.0 -type snip
3  add ns ip 100.100.100.1 255.0.0.0 -type snip
4  add ns ip 200.200.200.1 255.0.0.0 -type snip
5  add ns ip 100.1.1.1 255.0.0.0 -type snip
6  add ns ip 200.201.1.1 255.0.0.0 -type snip
```

Add the VLANs. VLANs help the appliance identify the source of the traffic. Bind the VLANs to the interfaces and subnet IP addresses.

**Example:**

```
1  add vlan 10
2  add vlan 20
3  add vlan 100
4  add vlan 200
5  bind vlan 10 -ifnum 1/4 -tagged -IPAddress 192.168.10.1 255.255.255.0
6  bind vlan 20 -ifnum 1/4 -tagged -IPAddress 192.168.20.1 255.255.255.0
7  bind vlan 100 -ifnum 1/2 -tagged -IPAddress 100.1.1.1 255.0.0.0
8  bind vlan 200 -ifnum 1/3 -tagged -IPAddress 200.1.1.1 255.0.0.0
```

Specify the VLAN on which the subscriber traffic arrives on the appliance. Specify the service path AVP that tells the appliance where to look for the service path name within the subscriber session. For primary PCEF functionality, specify the interfaceType as RadiusAndGx.
Configure a service and virtual server of type Diameter, and bind the service to the virtual server. Then, specify the PCRF realm and subscriber Gx interface parameters. For primary PCEF functionality, configure a RADIUS listener service and RADIUS interface.

Example:

```
set ns param -servicePathIngressVLAN 100
set subscriber gxinterface -servicepathAVP 1001 1005 -
    servicepathVendorid 10415
set subscriber param -interfaceType RadiusAndGx
```

Add service functions to associate a VAS with an ingress VLAN. Add a service path to define the chain, that is, specify the VAS that the packet must be sent to and the order in which it must go to that VAS. The service path name is usually sent by the PCRF. However, the service path of the default subscriber profile (*) applies if any of the following is true:

- PCRF does not have the subscriber information.
- The subscriber information does not include this AVP.
- The appliance is unable to query the PCRF. For example, the service representing the PCRF is DOWN.

The service path AVP that contains this name must already be configured as part of the global configuration. Bind the service function to the service path. The service index specifies the order in which the VAS is added to the chain. The highest number (255) indicates the beginning of the chain.

Example:
Add the LSN configuration. That is, define the NAT pool and identify the clients for which the appliance must perform LSN.

```plaintext
1 add lsn pool pool1
2 bind lsn pool pool1 200.201.1.1
3 add lsn client client1
4 bind lsn client client1 -network 100.0.0.0 -netmask 255.0.0.0
5 add lsn group group1 -clientname client1
6 bind lsn group group1 -poolname pool1
```

The appliance performs LSN by default. To override LSN, you must create a net profile with the overrideLsn parameter enabled, and bind this profile to all the load balancing virtual servers that are configured for value added services (VASs).

**Example:**

```plaintext
1 add netprofile np1
2 set netprofile np1 -overrideLsn ENABLED
3 set lb vserver vs1 -netprofile np1
```

Configure the VAS on the appliance. This includes creating the services and virtual servers and then binding the services to the virtual servers.

```plaintext
1 add service vas1 192.168.10.2 80 -usip YES
2 add service sint 200.10.1.10 80 -usip YES
3 add lb vserver vs1 ANY -m MAC -l2Conn ON
```
Add the content switching (CS) configuration. This includes virtual servers, policies, and their associated actions. The traffic arrives at the CS virtual server and is then redirected to the appropriate load balancing virtual server. Define expressions that associate a virtual server with a service function.

**Example:**

```plaintext
add cs vserver cs1 ANY * 80 -l2Conn ON
add cs action csact1 -targetLBVserver vs1
add cs action csactint -targetLBVserver vint
add cs policy cspol1 -rule SUBSCRIBER.SERVICEPATH.IS_NEXT("SF1") && SYS.VSERVER("vs1").STATE.EQ(UP) -action csact1
bind cs vserver cs1 -policyName cspol1 -priority 110
bind cs vserver cs1 -lbvserver vint
```

**To configure traffic steering on the appliance by using the GUI**

1. Navigate to **System > Network > IPs** and add the subnet IP addresses.
2. Navigate to **System > Network > VLANs** and add VLANs, Bind the VLANs to the interfaces and subnet IP addresses.
3. Navigate to **Traffic Management > Service Chaining > Configure Service Path Ingress VLAN** and specify an ingress VLAN.
4. Navigate to **Traffic Management > Subscriber > Parameters > Configure Subscriber Parameters** and specify the following:
   - Interface Type: Specify **RadiusAndGx**.
   - Configure a diameter virtual server, PCRF realm, and the subscriber GX interface parameters.
   - Specify the RADIUS interface parameters.
5. Navigate to **Traffic Management > Service Chaining > Service Function** and add service functions to associate a value-added service with an ingress VLAN.
6. Navigate to **System > Network > Large Scale NAT**. Click **Pools** and add a pool. Click **Clients** and add a client. Click **Groups** and add a group and specify the client. Edit the group and bind the
pool to this group.

7. Navigate to System > Network > Net Profiles and add a net profile. Select Override LSN. Optionally, navigate to System > Network > Settings > Configure Layer 3 Parameters and verify that Override LSN is not selected.

8. Navigate to Traffic Management > Load Balancing > Virtual Servers and configure the virtual servers and value-added services on the appliance. Bind the services and the net profile to the virtual server.

9. Navigate to Traffic Management > Content Switching > Virtual Servers and configure a virtual server, policy, and action. Specify the target load balancing virtual server.

To configure service chaining on the appliance by using the GUI

1. Navigate to System > Network > IPs and add the subnet IP addresses.
2. Navigate to System > Network > VLANs and add VLANs, Bind the VLANs to the interfaces and subnet IP addresses.
3. Navigate to Traffic Management > Service Chaining > Configure Service Path Ingress VLAN and specify an ingress VLAN.
4. Navigate to Traffic Management > Subscriber > Parameters > Configure Subscriber Parameters and specify the following:
   - Interface Type: Specify RadiusAndGx.
   - Configure a diameter virtual server, PCRF realm, and the subscriber GX interface parameters.
   - Specify the RADIUS interface parameters.
5. Navigate to Traffic Management > Service Chaining > Service Function and add service functions to associate a value-added service with an ingress VLAN.
6. Navigate to System > Network > Large Scale NAT. Click Pools and add a pool. Click Clients and add a client. Click Groups and add a group and specify the client. Edit the group and bind the pool to this group.
7. Navigate to System > Network > Net Profiles and add a net profile. Select Override LSN. Optionally, navigate to System > Network > Settings > Configure Layer 3 Parameters and verify that Override LSN is not selected.
8. Navigate to Traffic Management > Load Balancing > Virtual Servers and configure the virtual servers and value-added services on the appliance. Bind the services and the net profile to the virtual server.
9. Navigate to Traffic Management > Content Switching > Virtual Servers and configure a virtual server, policy, and action. Specify the target load balancing virtual server.
Subscriber aware service chaining

January 6, 2019

With the huge increase in the data traffic passing through telco networks, it is no longer feasible for service providers to steer all the traffic through all the value added services (VAS). A service provider should be able to optimize usage of VAS and intelligently steer traffic to improve the user experience. For example, video optimization is not required for traffic that does not include a video. Moreover, if a subscriber is connected to a 4G network, content can be streamed in high definition (HD), and video optimization might not be needed. However, video optimization improves the experience for a user in a 3G network. Similarly, caching provides a faster and better user experience and can be enabled depending on the subscriber plan. Another example of VAS is parental control. If parents provide a mobile handset to a minor child, they would like some kind of control over the websites that their child visits.

To do the above and more, service providers must be able to provide value-added services on a per-subscriber basis. In other words, entities in the service provider network must be capable of extracting the subscriber information and intelligently steering the packet on the basis of this information.

Service chaining determines the set of services through which the traffic from a subscriber must pass before going to the Internet. Instead of sending all the traffic to all the services, the NetScaler intelligently routes all requests from a subscriber to a specific set of services on the basis of the policy defined for that subscriber.

The following figure shows the entities involved in service chaining. The values shown are configured in the procedure that follows the figure. A content switching virtual server on the NetScaler appliance directs requests to the value added services or skips them, depending on the defined rule, and then sends the packet out to the Internet after performing LSN.

To configure service chaining for the above deployment by using the CLI

Add the appliance's subnet IP (SNIP) addresses.

Example:

```bash
1 add ns ip 192.168.10.1 255.255.255.0 -type snip
2 add ns ip 192.168.20.1 255.255.255.0 -type snip
3 add ns ip 192.168.30.1 255.255.255.0 -type snip
4 add ns ip 192.168.40.1 255.255.255.0 -type snip
5 add ns ip 192.168.50.1 255.255.255.0 -type snip
```
Add the VLANs. VLANs help the appliance identify the source of the traffic. Bind the VLANs to the interfaces and subnet IP addresses. Add an ingress and an egress VLAN for each VAS.

**Example:**

```plaintext
add vlan 10
add vlan 20
add vlan 30
add vlan 40
add vlan 50
add vlan 60
add vlan 100
add vlan 200
bind vlan 10 -ifnum 1/4 -tagged -IPAddress 192.168.10.1 255.255.255.0
bind vlan 20 -ifnum 1/4 -tagged -IPAddress 192.168.20.1 255.255.255.0
bind vlan 20 -ifnum 1/4 -tagged -IPAddress 192.168.30.1 255.255.255.0
bind vlan 20 -ifnum 1/4 -tagged -IPAddress 192.168.40.1 255.255.255.0
bind vlan 20 -ifnum 1/4 -tagged -IPAddress 192.168.50.1 255.255.255.0
bind vlan 20 -ifnum 1/4 -tagged -IPAddress 192.168.60.1 255.255.255.0
bind vlan 100 -ifnum 1/2 -tagged -IPAddress 100.1.1.1 255.0.0.0
bind vlan 200 -ifnum 1/3 -tagged -IPAddress 200.201.1.1 255.0.0.0
```

Specify the VLAN on which the subscriber traffic arrives on the appliance. Specify the service path
AVP that tells the appliance where to look for the service path name within the subscriber session. For primary PCEF functionality, specify the interfaceType as RadiusAndGx.

**Example:**

```plaintext
1  set ns param -servicePathIngressVLAN 100
2  set subscriber_gxinterface -servicepathAVP 1001 1005 -servicepathVendorid 10415
3  set subscriber param -interfaceType RadiusAndGx
```

Configure a service and virtual server of type Diameter, and bind the service to the virtual server. Then, specify the PCRF realm and subscriber Gx interface parameters. For primary PCEF functionality, configure a RADIUS listener service and RADIUS interface.

**Example:**

```plaintext
1  add service sd1 10.102.232.200 DIAMETER 3868
2  add lb vserver vdiam DIAMETER 0.0.0.0 0 -persistenceType DIAMETER -persistAVPno 263
3  bind lb vserver vdiam sd1
4  set ns diameter -identity netscaler.scl1.net -realm pcrf1.net
5  set subscriber_gxInterface -vServer vdiam -pcrfRealm pcrf1.net -holdOnSubscriberAbsence YES -idleTTL 1200 -negativeTTL 120
6  add service srad1 10.102.232.236 RADIUSServer 1813
7  set subscriber radiusInterface -listeningService srad1
```

Add service functions to associate a VAS with an ingress VLAN. Add a service path to define the chain, that is, specify the VAS that the packet must be sent to and the order in which it must go to that VAS. The service path name is usually sent by the PCRF. However, the service path of the default subscriber profile (*) applies if any of the following is true:

- PCRF does not have the subscriber information.
- The subscriber information does not include this AVP.
- The appliance is unable to query the PCRF. For example, the service representing the PCRF is DOWN.

The service path AVP that contains this name must be configured as part of the global configuration earlier. Bind the service function to the service path. The service index specifies the order in which the
VAS is added to the chain. The highest number (255) indicates the beginning of the chain.

**Example:**

```
1  add ns servicefunction SF1 -ingressVLAN 20
2  add ns servicefunction SF2 -ingressVLAN 40
3  add ns servicefunction SF3 -ingressVLAN 60
4  add ns servicepath pol1
5  bind ns servicepath pol1 -servicefunction SF1 -index 255
6  bind ns servicepath pol1 -servicefunction SF2 -index 254
7  bind ns servicepath pol1 -servicefunction SF3 -index 253
8  add ns servicepath pol2
9  bind ns servicepath pol2 -servicefunction SF2 -index 255
10 add ns servicepath pol3
11 bind ns servicepath pol3 -servicefunction SF1 -index 255
12 add subscriber profile * -subscriberrules default_path
```

Add the LSN configuration. That is, define the NAT pool and identify the clients for which the appliance must perform LSN.

**Example:**

```
1  add lsn pool pool1
2  bind lsn pool pool1 200.201.1.1
3  add lsn client client1
4  bind lsn client client1 -network 100.0.0.0 -netmask 255.0.0.0
5  add lsn group group1 -clientname client1
6  bind lsn group group1 -poolname pool1
```

The appliance performs LSN by default. To override LSN, you must create a net profile with over-
rideLsn parameter enabled and bind this profile to all the load balancing virtual servers that are configured for value added services (VASs).

**Example:**

```plaintext
1  add netprofile np1
2
3  set netprofile np1 -overrideLsn ENABLED
4
5  set lb vserver vs1 -netprofile np1
```

Configure the VAS on the appliance. This includes creating the services and virtual servers and then binding the services to the virtual servers.

**Example:**

```plaintext
1  add service vas1 192.168.10.2 ANY 80 -usip YES
2
3  add service vas2 192.168.30.2 ANY 80 -usip YES
4
5  add service vas3 192.168.50.2 ANY 80 -usip YES
6
7  add service sint 200.10.1.10 ANY 80 -usip YES
8
9  add lb vserver vs1 ANY -m MAC -l2Conn ON
10
11 add lb vserver vs2 ANY -m MAC -l2Conn ON
12
13 add lb vserver vs3 ANY -m MAC -l2Conn ON
14
15 add lb vserver vint ANY -m MAC -l2Conn ON
16
17 bind lb vserver vs1 vas1
18
19 bind lb vserver vs2 vas2
20
21 bind lb vserver vs3 vas3
22
23 bind lb vserver vint sint
```

Add the content switching (CS) configuration. This includes virtual servers, policies, and their associated actions. The traffic arrives at the CS virtual server and is then redirected to the appropriate load balancing virtual server. Define expressions that associate a virtual server with a service function.

**Example:**
To configure service chaining on the appliance by using the GUI

1. Navigate to **System > Network > IPs** and add the subnet IP addresses.
2. Navigate to **System > Network > VLANs** and add VLANS, Bind the VLANs to the interfaces and subnet IP addresses.
3. Navigate to **Traffic Management > Service Chaining> Configure Service Path Ingress VLAN** and specify an ingress VLAN.
4. Navigate to **Traffic Management > Subscriber > Parameters > Configure Subscriber Parameters** and specify the following:
   - Interface Type: Specify **RadiusAndGx**.
   - Configure a diameter virtual server, PCRF realm, and the subscriber GX interface parameters.
   - Specify the RADIUS interface parameters.
5. Navigate to **Traffic Management > Service Chaining> Service Function** and add service functions to associate a value-added service with an ingress VLAN.
6. Navigate to System> Network> Large Scale NAT. Click Pools and add a pool. Click Clients and add a client. Click Groups and add a group and specify the client. Edit the group and bind the pool to this group.

7. Navigate to System> Network> Net Profiles and add a net profile. Select Override LSN. Optionally, navigate to System> Network> Settings> Configure Layer 3 Parameters and verify that Override LSN is not selected.

8. Navigate to Traffic Management> Load Balancing> Virtual Servers and configure the virtual servers and value-added services on the appliance. Bind the services and the net profile to the virtual server.

9. Navigate to Traffic Management> Content Switching> Virtual Servers and configure a virtual server, policy, and action. Specify the target load balancing virtual server.

**Policy based TCP profile selection**

December 18, 2018

You can configure the NetScaler appliance to perform TCP optimization based on subscriber attributes. For example, the appliance can select different TCP profiles at runtime, based on the network to which the user equipment (UE) is connected. As a result, you can improve a mobile user’s experience by setting some parameters in the TCP profiles and then using policies to select the appropriate profile.

Create separate TCP profiles for subscribers connecting through a 4G network and for users connecting through any other network. Define a policy rule that is selected on the basis of a subscriber parameter, such as RAT-type. In the following examples, if RAT-Type is EUTRAN, a TCP profile that supports a faster connection is selected (Example 1). For all other RAT-Type values, a different TCP profile is selected (Example 2).

**Note**

The RAT-Type AVP (AVP code 1032) is of type Enumerated and is used to identify the radio access technology that is serving the UE.

The value “1004” indicates that the RAT is EUTRAN. (RFC 29.212).

**Example1:**

```
1 add ns tcpProfile tcp2 -WS ENABLED -SACK ENABLED -WSVal 8 -initialCwnd 16 - oooQSize 15000 -slowStartIncr 1 -bufferSize 1000000 -flavor BIC -dynamicReceiveBuffering DISABLED -sendBuffersize 1000000 -dsack DISABLED -maxcwnd 4000000 -fack ENABLED -minRTO 500 -maxburst 15
2 add appqoe action appact2 -priority HIGH -tcpprofile tcp2
```
Load Balance Control-Plane Traffic that is based on Diameter, SIP, and SMPP Protocols

December 18, 2018

With the increase in control-plane traffic, the servers can become a bottleneck because the traffic is not optimally distributed among the servers. Therefore, messages must be load balanced. The NetScaler appliance supports Diameter, SIP, and SMPP load balancing.

SIP

NetScaler enables you to load balance SIP messages over UDP or over TCP (including TLS) to a group of proxy servers. NetScaler also provides Call-ID based persistence and Call-ID hash load balancing method using which you direct packets for a particular SIP session to the same load balanced SIP server.

The NetScaler default expressions language contains a number of expressions that operate on Session Initiation Protocol (SIP) connections. These expressions are intended to be used in policies for SIP protocol that operates on a request/response basis. These expressions can be used in content switching, rate limiting, responder, and rewrite policies.

For more information, see Load Balancing a Group of SIP Servers.
SMPP

Millions of short messages are exchanged daily between individuals and value-added service providers, such as banks, advertisers, and directory services, by using the short message peer to peer (SMPP) protocol. Often, message delivery is delayed because servers are overloaded and traffic is not optimally distributed among the servers.

The NetScaler appliance provides optimal distribution of messages across your servers, preventing poor performance and outages. The NetScaler appliance:

- Load balances messages originating from the server and from the client
- Monitors the health of the message centers
- Provides content switching support for the message centers
- Handles concatenated messages

**Limitation:** Message IDs, from the message center, longer than 59 bytes are not supported. If the message ID length returned by the message center is more than 59 bytes, ancillary operations fail and the NetScaler appliance responds with an error message.

For more information, see SMPP Load Balancing.

Diameter

Diameter is a base protocol with more than 50 protocols (also called applications) built over it. Therefore, the diameter traffic generated in a Telco network is high. To optimally maintain this diameter traffic, the NetScaler appliance performs load balancing, content switching, and acts as a relay agent. Additionally, the appliance offers rewrite and responder functionality. The appliance supports rate limiting of Diameter messages.

For more information, see Configuring Diameter Load Balancing.

Provide DNS Infrastructure/Traffic Services, such as, Load Balancing, Caching, and Logging for Telecom Service Providers

December 18, 2018

Telecom service providers can configure the NetScaler appliance to function as a DNS proxy. Caching of DNS records, which is an important function of a DNS proxy, is enabled by default on the NetScaler appliance. This enables the NetScaler appliance to provide quick responses for repeated translations and hence enhances the customer experience and also saves the bandwidth. The caches responses from DNS name servers. When the appliance receives a DNS query, it checks for the queried domain in its cache. If the address for the queried domain is present in its cache, the NetScaler appliance returns
the corresponding address to the client. Otherwise, it forwards the query to a DNS name server that checks for the availability of the address and returns it to the NetScaler appliance. The NetScaler appliance then returns the address to the client.

For requests for a domain that has been cached earlier, the NetScaler appliance serves the Address record of the domain from the cache without querying the configured DNS server and hence saves the bandwidth.

From 11.0 release onwards, NetScaler also logs the DNS requests that it receives and also the responses that it sends to the client. Telecom service providers can use this log to:

- Audit the DNS responses to the client
- Audit DNS clients
- Detect and prevent DNS attacks
- Troubleshooting

For more information, see Domain Name System.

Provide Subscriber Load Distribution Using GSLB Across Core-Networks of a Telecom Service Provider

December 18, 2018

Scalability, high availability and performance are critical to service provider deployments. While many service providers deploy their infrastructure at a single location or multiple location, these deployments are subject to a number of inherent limitations, such as:

- If the site loses connectivity to all or part of the public Internet, it will be inaccessible to users and customers, which can have significant impact on the business.
- Users accessing the site from geographically distant locations may experience large and highly variable delays, which are exacerbated by the large number of round trips that HTTP requires to transfer content.

NetScaler appliance's Global Server Load Balancing (GSLB) overcomes these problems by distributing traffic among sites deployed in multiple geographic locations. By serving content from many different points in the Internet, GSLB alleviates the impact of network bandwidth bottlenecks and provides robustness in case of network failures at a particular site. Users can be automatically directed to the nearest or least loaded site at the time of the request, minimizing the likelihood of long download delays and/or service disruptions.

You can use NetScaler appliance’s global server load balancing for:

- Disaster recovery or high availability by configuring an Active-standby data center setup that consists of an active and a standby data center. When a failover occurs as a result of a disaster
event, the standby data center becomes operational.

- High availability and speed by configuring an active-active data center setup that consists of multiple active data centers. Client requests are load balanced across active data centers.
- Directing client requests to the data center that is closest in geographical distance or network distance by configuring a proximity setup.
- Full-DNS resolutions, GSLB processes DNS queries of the A, AAAA and CNAME types, and the DNS function option can process DNS queries of all other types, such as MX and PTR. Also, if the recursive resolution is enabled, the appliance will forward DNS queries for domain names that are not configured on the NetScaler appliance.

For more information, see

Global Server Load Balancing.

**Bandwidth Utilization Using Cache Redirection Functionality**

December 18, 2018

The volume of web traffic on the Internet is enormous and a large percentage of that traffic is redundant. Multiple clients ask web servers for the same content repeatedly leading to inefficient use of bandwidth. To relieve the origin web server of processing each request, Internet Service Providers (ISPs) can use the cache redirection feature of NetScaler appliance and serve the content from a cache server instead of from the origin server. The NetScaler appliance analyzes incoming requests, sends requests for cacheable data to cache servers, and sends non-cacheable requests and dynamic HTTP requests to origin servers. Cache redirection feature of NetScaler is policy-based, and by default, requests that match a policy are sent to the origin server, and all other requests are sent to a cache server. You can combine content switching with cache redirection to cache selective content and serve content from specific cache servers for specific types of requested content.

For more information, see Cache Redirection.

**NetScaler TCP Optimization**

December 18, 2018

The NetScaler appliance provides advanced TCP tuning and optimization techniques and capabilities that are well suited to modern 3.5 and 4G networks, improving user experience and perceived download speeds significantly.

This section focuses on detailed instructions relevant to:

- Choosing and inserting an appropriate NetScaler T1000 Series model in a mobile network for TCP optimization
Full configuration instructions related to not only TCP optimization but also for appropriate Layer-2 and Layer-3 configuration of the T1 device

Getting Started

January 6, 2019

Hardware

Citrix provides a wide breath of NetScaler models that might be loosely based on two factors:

- Capacity, currently ranging from hundreds of Mbps for the low-end VPX appliance to 160Gbps for the high-end 25000 MPX series appliance
- Telco grade, with the availability of the T1000 series for Telco datacenters.

Your Citrix Sales or Support representative can help you select the appropriate hardware for your demo, trial, or production needs.

The remainder of this section uses a NetScaler T1200 as a reference hardware. Note that putting aside superficial differences related to number and notation of available interfaces (see * in note) or well-documented limitations of NetScaler VPX (see ** in note) the instructions should apply mostly verbatim regardless of the NetScaler model selected.

**Note**

- For instance the T1010 model only has 12x1GbE typically marked as 1/1-1/12 rather than the 10/x notation used in this document.
- **A NetScaler VPX instance typically doesn’t support LACP aggregation; it might also not support VLAN tagging.**

Initial Setup

Through Serial Console

After a serial cable is connected, you can log on to the NetScaler appliance with the following credentials:

- Username: nsroot
- Password: nsroot

Once logged in, configure the basic details of the NetScaler appliance as shown in the screen capture below.
NetScaler 11.1

Example:

```
1 set ns config - IPAddress <ip_addr> -netmask <netmask>
2 saveconfig
3 reboot -warm
```

After you restart the appliance, you might use SSH for further configuration of the T1100 nodes.

**Through LOM**

Lights out Management (LOM) port on the front panel of the NetScaler appliance allows operator to remotely monitor and manage the appliance independently of the operating system. Operator can change the IP address, power cycle, and perform a code dump by connecting to the NetScaler appliance through the LOM port.

Default IP Address of LOM port is 192.168.1.3

**Figure.** Initial Configuration of LOM Module

Set a static IP on your laptop and plug it directly into the LOM interface with a crossover cable or into a switch in the same broadcast domain as the LOM interface.

For initial configuration, type the port’s default address: `http://192.168.1.3` in a web browser and change the LOM port’s default IP address.

Refer to Configuration Guides for further details.

**Software**

The NetScaler TCP optimization for mobile networks is constantly evolving. The capabilities and tunings outlined in this document require a NetScaler Telco build. Here is an example showing the NetScaler Telco build.

Example:

```
1 show ver
2
3 NetScaler NS11.0: Build 64.957.nc, Date: Aug 26 2016, 02:00:23
```

If the T1000 has not shipped with the appropriate build revision, contact the NetScaler Customer Support.
Important

Both the appliances should have the same software image.

SSH Client

A NetScaler appliance can be configured by using either the CLI or the HTML5 GUI. However, this section provides only CLI-based instructions.

While the CLI is accessible through the NetScaler serial console, an SSH client is normally recommended to allow for remote NetScaler configuration.

Management Network

January 6, 2019

Connectivity

Most NetScaler devices offer redundant 1GbE OAM ports, notated as 0/1 and 0/2. To provide for redundancy in case of a switch failure, you should connect the relevant ports to different upstream switches.

A high-level overview of the recommended connectivity is outlined in the following diagram:

After the NetScaler appliance is connected to the management network, subsequent configuration steps can be performed remotely using SSH or web connectivity to the CLI and GUI respectively.

Routing

The add route command may be used to configure any routes appropriate to the management network. The relevant gateway should be reachable on the NSIP subnet, as shown below.

Example:

```
1 add route <network> <netmask> <gateway>
```

Licensing

December 18, 2018

A valid license file should be installed on the NetScaler appliance. The license should support at least as many Gbps as the expected maximum Gi-LAN throughput.
License files should be copied through an SCP client to the /nsconfig/license of the appliance, as shown in the screen capture below.

Example:

```
1  shell ls /nsconfig/license/
2
3  CNS_V3000_SERVER_PLT_Retail.lic ssl
```

Do a warm restart to apply the new license, as shown in the screen capture below.

Example:

```
1  reboot -warm
2
3  Are you sure you want to restart NetScaler (Y/N)? [N]:y
4
5  Done
```

After the restart completes, verify that the license has been properly applied, by using the show license CLI.

In the example below a 3Gbps Platinum license has been successfully installed.

Example:

```
1  > show license
2
3  License status:
4
5  Web Logging: YES
6
7  ...
8
9  Model Number ID: 3000
10
11  License Type: Platinum License
12
13  Done
```

High Availability

January 6, 2019
High availability (HA) refers to an active-standby operational mode of a NetScaler device pair. Each device has its own dedicated management IP address. All other IP addresses are owned by the active device in the pair.

**Connectivity**

While there are multiple connectivity options for a NetScaler HA pair, the most recommended one is depicted in the following diagram:

In the above diagram, the N+1 red links between each T1000 and the respective switch imply N+1 redundancy - as explained in Connectivity. For instance, considering a 45 Gbps Gi-LAN N=5 is an appropriate value, with 6x10GbE LACP channels between each switch and the respective T1000 as well as between the two switches.

An extra pair of links is recommended between the NetScaler pair, to provide for HA communication isolation from the OAM network.

**Gi-LAN Integration**

January 6, 2019

Typically, a NetScaler appliance is inserted as a separate L3 inline node in the Gi-LAN, similarly to an L3 router.

Figure: A simple depiction of a Gi-LAN

**Connectivity**

A physical NetScaler connectivity to upstream switches is recommended to provide for sufficient redundancy. For example, assuming that a NetScaler appliance is inserted in a Gi-LAN that is handling a total (uplink+downlink) of 24Gbps, connectivity with 4x10GbE or more interfaces is recommended. This effectively provides for N+1 redundancy in case of a link failure.

The relevant ports on the upstream switch should be configured for LACP port aggregation. The relevant configuration on NetScaler is outlined below:

**Connectivity Configuration:**

```
1  set interface 10/1 - tagall ON - lacpMode ACTIVE - lacpKey 1
2
3  set interface 10/2 - tagall ON - lacpMode ACTIVE - lacpKey 1
```
You can verify the appropriate functionality of LACP using the “show interface” command:

**show interface:**

```
sh interface LA/1
```

```
1) Interface LA/1 (802.3ad Link Aggregate) #39
   flags=0x4100c020 <ENABLED, UP, AGGREGATE, UP, HAMON, 802.1q>
   MTU=1500, native vlan=1, MAC=02:e0:ed:33:88:b0, uptime 340h11m56s
   Requested: media NONE, speed AUTO, duplex NONE, fctl NONE,
   throughput 0
   Actual: throughput 4000
   LLDP Mode: NONE,
   RX: Pkts(918446) Bytes(110087414) Errs(0) Drops(795989) Stalls(0)
   TX: Pkts(124113) Bytes(15255532) Errs(0) Drops(0) Stalls(0)
   NIC: InDisc(0) OutDisc(0) Fctls(0) Stalls(0) Hangs(0) Muted(0)
   Bandwidth thresholds are not set.
```

Disable the remaining unused interfaces and turn off the monitor.

```
set interface 10/5 –haMonitor OFF
```

<table>
<thead>
<tr>
<th>Command:</th>
</tr>
</thead>
<tbody>
<tr>
<td>set interface 10/24 –haMonitor OFF</td>
</tr>
<tr>
<td>disable interface 10/5</td>
</tr>
<tr>
<td>disable interface 10/24</td>
</tr>
</tbody>
</table>
Configuration of physical interfaces is not shared across the two NetScaler units. Hence, the above commands must be run across both NetScaler nodes in case of an HA pair deployment.

**HA Configuration**

All other configuration parameters are shared between the NetScaler nodes of an HA pair. Hence, HA sync should be enabled prior to any other configuration commands being run. Basic HA configuration involves the following steps:

1. Using the exact same NetScaler hardware, software, and license: HA pairs are not supported between different models (i.e. a T1100 and an MPX21550) or same models with different firmware levels. Refer to the appropriate instructions on upgrading an existing HA pair - [Upgrading to Release 11.1](#).

2. Establishing the HA pair.

   **Example:**

   ```
   netscaler-1> add HA node 1 <netscaler-2-NSIP>
   netscaler-2> add HA node 1 <netscaler-1-NSIP>
   ```

3. Verify the HA pair establishment running the following command in either node; both nodes should be visible, one of them as Primary (active), the other as a Secondary (standby).

   **Example:**

   ```
   "show HA node 
   ```

4. Enable failsafe mode and maxFlips. This ensures that in **case** of a route monitor failure on both nodes at least one node remains active without active/standby status constantly switching.

   **Example:**

   ```
   set HA node -failsafe ON  
   set HA node -maxFlips 3 -maxFlipTime 1200
   ```

5. Finally, enable HA sync to occur over the dedicated intra-NetScaler ports rather than the OAM network.

   **Example:**

   ```
   add vlan 4080 -aliasName syncVlan
   set HA node -syncvlan 4080
   ```
**Note**

The VLAN 4080 in the commands in the above example shouldn’t be taken literally. Any unused VLAN-ID might be reserved.

## VLAN Configuration

After the physical interfaces have been appropriately configured, you might configure the appropriate Gi-LAN VLANs. For instance, consider a rather simple Gi-LAN environment with an ingress/egress VLAN pair with 100/101 VLAN-identifier respectively.

The following commands configure the relevant VLANs on top of the LACP channel created in the prior step.

```bash
add vlan 100
add vlan 101
bind vlan 100 –ifnum LA/1 –tagged
bind vlan 101 –ifnum LA/1 –tagged
```

## IPv4 Configuration

Typically, a NetScaler appliance requires one SNIP per VLAN. The example below assumes that the networks outlined in the Gi-LAN integration diagram, given in the beginning of this page, have a /24 subnet mask:

```bash
add ns ip 192.168.1.254 255.255.255.0 –vserver DISABLED –mgmtAccess DISABLED
add ns ip 192.168.2.254 255.255.255.0 –vserver DISABLED –mgmtAccess DISABLED
```

After the SNIPs have been configured they should be associated with the appropriate VLAN:

```bash
bind vlan 100 –IPAddress 192.168.1.254 255.255.255.0
bind vlan 101 –IPAddress 192.168.2.254 255.255.255.0
```

## IPv4 Static Routing

The example outlined in the [Management Network](https://en-us/netscaler/11-1/netscaler-support-for-telecom-service-providers/NS_TCP_optimization/NS_TCP_opt_mgmt_network.html) section calls for only a couple of static routing rules:

- A 10.0.0.0/8 static route to the clients through the ingress router
A default route to the internet through the egress router

**Example:**

```
add route 0.0.0.0 0.0.0.0 192.168.2.1
add route 10.0.0.0 255.0.0.0 192.168.1.1
```

### IPv4 Policy-Based (VLAN – VLAN) routing

A NetScaler appliance allows for policy-based routing instead of static routing, with routing decisions usually keyed against the incoming interface and/or VLAN rather than destination IP. Policy-based routing is either a convenient alternative, in case the client source IP address range is subject to periodic changes, or a mandatory consideration, in case a packet’s destination IP address is not sufficient by itself to reach a routing decision (i.e. in case of overlapping client IP addresses across multiple VLANs).

**Example:**

```
add ns pbr fromWirelessToInternet ALLOW –nextHop 192.168.2.1 –vlan 100 –priority 10
Done
add ns pbr fromInternetToWireless ALLOW –nextHop 192.168.1.1 –vlan 200 –priority 20
Done
apply ns pbrs
```

### IPv6 Configuration

The following commands assign IPv6 SNIP per vlan. The example below assumes that the networks outlined in the Figure: A simple depiction of a Gi-LAN in this page have a /64 subnet mask:

**Command:**

```
add ns ip6 fd00:192:168:1::254/64 -vServer DISABLED –mgmtAccess DISABLED
add ns ip6 fd00:192:168:2::254/64 -vServer DISABLED –mgmtAccess DISABLED
bind vlan 100 -IPAddress fd00:192:168:1::254/64
bind vlan 200 -IPAddress fd00:192:168:2::254/64
```

### IPv6 Routing

After IPv6 addressing is complete, IPv6 static routing might be configured:
**Example:**
add route6 fd00:10::/64 fd00:192:168:1::1
add route6 ::/0 fd00:192:168:2::1

Or using policy-based routing:

**Example:**
add ns pbr6 fromWirelessToInternetv6 ALLOW -vlan 100 -priority 10 -nextHop fd00:192:168:2::1
add ns pbr6 fromInternetToWirelessv6 ALLOW -vlan 200 -priority 20 -nextHop fd00:192:168:1::1
apply ns pbr6

## LACP Redundancy and Failover

In case of an HA configuration, it’s recommended to leverage the throughput option to configure a low threshold for the LACP channel. For instance, consider a 25Gbps Gi-LAN and a 4x10GbE channel between each NetScaler appliance in the HA pair and the upstream switch to provide N+1 link redundancy:

**Example:**
set interface LA/1 –haMonitor ON –throughput 29000

In case of a double-link failure between the primary appliance and the upstream switch the maximum Gi-LAN throughput that can be supported would fall to 20Gbps. A 29Gbps low threshold per the example above would result in a redundancy switchover event to the secondary appliance (which has not suffered similar link failures) so that Gi-LAN traffic is not affected.

## Route Monitors

In addition to LACP redundancy, route monitor checks might be configured and associated with the HA pair configuration. Route monitor checks can be useful to detect failures between the NetScaler appliance and the next-hop routers, especially if said routers are not directly connected but through an upstream switch.
TCP Optimization Configuration

January 6, 2019

Before configuring TCP optimization, apply the following basic configuration settings on the NetScaler appliance:

Initial configuration:

```
1  enable ns feature LB IPv6PT
2  enable ns mode FR L3 USIP MBF Edge USNIP PMTUD
3  disable ns feature SP
4  disable ns mode TCPB
5  set lb parameter -preferDirectRoute NO
6  set lb parameter -vServerSpecificMac ENABLED
7  set l4param -l2ConnMethod Vlan
8  set rsskeytype -rsstype SYMMETRIC
9  set ns param -useproxyport DISABLED
```

Note

Restart the NetScaler appliance if you change the rsskeytype system parameter.

TCP Termination

For NetScaler T1 to apply TCP optimization it needs to first terminate incoming TCP traffic. Towards this end, a wildcard TCP vserver should be created and configured to intercept ingress traffic and then forward it to the Internet router.

Static/Dynamic Routing Environment

For environments with static or dynamic routing in place, vserver can rely on routing table info to forward packets towards internet router. Default route must point to the internet router and also routing
entries for client subnets towards wireless router should be in place:

Example:

```bash
1 add lb vserver vsrv-wireless TCP * * -persistenceType NONE -
   Listenpolicy "CLIENT.VLAN.ID.EQ(100) && SYS.VSERVER("vsrv-wireless ") STATE.EQ(UP)" -m IP -cltTimeout 9000
2 add route 0.0.0.0 0.0.0.0 192.168.2.1
3 add route 10.0.0.0 255.0.0.0 192.168.1.1
```

**VLAN-to-VLAN (PBR) Environment**

There are customer environments where subscriber traffic is segmented to multiple flows and needs to be forwarded to different routers based on incoming traffic parameters. Policy Based Routing (PBR) can be used to route packets based on incoming packet parameters, such as VLAN, MAC address, Interface, source IP, source port, destination IP address, and destination port.

Example:

```bash
1 add lb vserver vsrv-wireless TCP * * -m IP -l2Conn ON -listenpolicy "
   CLIENT.VLAN.ID.EQ(100) || CLIENT.VLAN.ID.EQ(101) || CLIENT.VLAN.ID.
   EQ(102)"
2
3 add ns pbr pbr-vlan100-to-vlan200 ALLOW -vlan 100 -nexthop 172.16.200.1
4
5 add ns pbr pbr-vlan101-to-vlan201 ALLOW -vlan 101 -nexthop 172.16.201.1
6
7 add ns pbr pbr-vlan102-to-vlan202 ALLOW -vlan 102 -nexthop 172.16.202.1
```

Using Policy Based Routing to route TCP optimized traffic is a new feature added in release 11.1 50.10. For previous releases, having multiple “mode MAC” vserver entities per VLAN is an alternative solution for multi-VLAN environments. Each vserver has a bound service representing the internet router for the particular flow.

Example:

```bash
1 add server internet_router_1 172.16.200.1
2
3 add server internet_router_2 172.16.201.1
4
5 add server internet_router_3 172.16.202.1
6
7 add service svc-internet=1 internet_router_1 TCP * -usip YES -
   useproxyport NO
```
add service svc-internet-2 internet_router_2 TCP * -usip YES -useproxyport NO
add service svc-internet-3 internet_router_3 TCP * -usip YES -useproxyport NO
bind service svc-internet-1 -monitorName arp
bind service svc-internet-2 -monitorName arp
bind service svc-internet-3 -monitorName arp
add lb vserver vsrv-wireless-1 TCP * * -Listenpolicy "CLIENT.VLAN.ID.EQ(100) && SYS.VSERVER("vsrv-wireless-1").STATE.EQ(UP)" -m MAC -l2Conn ON
add lb vserver vsrv-wireless-2 TCP * * -Listenpolicy "CLIENT.VLAN.ID.EQ(101) && SYS.VSERVER("vsrv-wireless-2").STATE.EQ(UP)" -m MAC -l2Conn ON
add lb vserver vsrv-wireless-3 TCP * * -Listenpolicy "CLIENT.VLAN.ID.EQ(102) && SYS.VSERVER("vsrv-wireless-3").STATE.EQ(UP)" -m MAC -l2Conn ON
bind lb vserver vsrv-wireless-1 svc-internet-1
bind lb vserver vsrv-wireless-2 svc-internet-2
bind lb vserver vsrv-wireless-3 svc-internet-3

Note
The vserver mode is MAC in contrast to previous examples where it is mode IP. This is required to retain the destination IP information when we have service(s) bound to vserver. Also, the additional PBR configuration need to route non-optimized traffic.

TCP Optimization

Out-of-the-box NetScaler TCP termination is configured for TCP pass-through functionality. TCP pass-through essentially means that NetScaler T1 may transparently intercept a client-server TCP stream but does not retain separate client/server buffers or otherwise apply any optimization techniques.

To enable TCP optimization a TCP profile, named as nstcpprofile, is used to specify TCP configurations that is used if no TCP configurations are provided at the service or virtual server level and it should be
modified as follows:

**Command:**

```plaintext
1 add ns tcpProfile nstcpprofile -WS ENABLED -SACK ENABLED -WSVal 8 -mss 1460 -maxBurst 30 -initialCwnd 16 -oooQSize 15000 -minRTO 800 -bufferSize 4000000 -flavor BIC -dynamicReceiveBuffering ENABLED -KA ENABLED -sendBuffsize 4000000 -rstWindowAttenuate ENABLED -spoofSynDrop ENABLED -ecn ENABLED -frto ENABLED -maxcwnd 1000000 -fack ENABLED -rstMaxAck enabled -tcpmode ENDPOINT
```

**Note**

If there is not any profile explicitly created and bound to vserver and service, the profile nstcp_default_profile is bound by default.

In case of multiple TCP profiles requirement, extra TCP profiles can be created and associated with the appropriate virtual server

**Command:**

```plaintext
1 add ns tcpProfile custom_profile -WS ENABLED -SACK ENABLED -WSVal 8 -mss 1460 -maxBurst 30 -initialCwnd 16 -oooQSize 15000 -minRTO 800 -bufferSize 4000000 -flavor BIC -dynamicReceiveBuffering ENABLED -KA ENABLED -sendBuffsize 4000000 -rstWindowAttenuate ENABLED -spoofSynDrop ENABLED -ecn ENABLED -frto ENABLED -maxcwnd 1000000 -fack ENABLED -rstMaxAck enabled -tcpmode ENDPOINT
2 3 set lb vserver vsrv-wireless -tcpProfileName custom_profile
```

**Note**

For deployments with vserver -m MAC and service, same profile should be associated with service.

```plaintext
1 set service svc-internet -tcpProfileName custom_profile
```

**TCP Optimization Capabilities**

Most of the relevant TCP optimization capabilities of a NetScaler appliance are exposed through a corresponding TCP profile. Typical CLI parameters that should be considered when creating a TCP profile are the following:

1. **Window Scaling (WS):** TCP Window scaling allows increasing the TCP receive window size beyond 65535 bytes. It helps improving TCP performance overall and specially in high bandwidth and long delay networks. It helps with reducing latency and improving response time over TCP.
2. **Selective acknowledgment (SACK):** TCP SACK addresses the problem of multiple packet loss which reduces the overall throughput capacity. With selective acknowledgment the receiver can inform the sender about all the segments which are received successfully, enabling sender to only retransmit the segments which were lost. This technique helps T1 improve overall throughput and reduce the connection latency.

3. **Window Scaling Factor (WSVal):** Factor used to calculate the new window size. It must be configured with a high value in order to allow the advertised window by NS to be at least equal to the buffer size.

4. **Maximum Segment Size (MSS):** MSS of a single TCP segment. This value depends on the MTU setting on intermediate routers and end clients. A value of 1460 corresponds to an MTU of 1500.

5. **maxBurst:** Maximum number of TCP segments allowed in a burst.

6. **Initial Congestion Window size (initialCwnd):** TCP initial congestion window size determines the number of bytes which can be outstanding in beginning of the transaction. It enables T1 to send those many bytes without bothering for congestion on the wire.

7. **Maximum OOO packet queue size (oooQSize):** TCP maintains Out Of Order queue to keep the OOO packets in the TCP communication. This setting impacts system memory if the queue size is long as the packets need to be kept in runtime memory. Thus this needs to be kept at optimized level based on the kind of network and application characteristics.

8. **Minimum RTO (minRTO):** The TCP retransmission timeout is calculated on each received ACK based on internal implementation logic. The default retransmission timeout happens at 1 second to start with and this can be tweaked with this setting. For second retransmission of these packets RTO will be calculated by N*2 and then N*4 ... N*8... goes on till last retransmission attempt.

9. **bufferSize / sendBuffsize:** these refer to the maximum amount of data that the T1 may receive from the server and buffer internally without sending to the client. They should be set to a value larger (at least double) than the Bandwidth Delay Product of the underlying transmission channel.

10. **flavor:** this refers to the TCP congestion control algorithm. Valid values are Default, BIC, CUBIC, Westwood and Nile.

11. **Dynamic receive buffering:** allows the receive buffer to be adjusted dynamically based on memory and network conditions. It will fill up the buffer as much as it’s required to keep the client's download pipe full instead of filling up, by reading ahead from server, a fixed size buffer, as latter is specified in TCP profile and typically based on criteria such as 2*BDP, for a connection. NetScaler T1 monitors the network conditions to the client and estimates how much it should read ahead from the server.

12. **Keep-Alive (KA):** Send periodic TCP keep-alive (KA) probes to check if peer is still up.

13. **rstWindowAttenuate:** Defending TCP against spoofing attacks. It will reply with corrective ACK when a sequence number is invalid.

14. **rstMaxAck:** Enable or disable acceptance of RST that is out of window yet echoes highest ACK.
sequence number.

15. **spoofSynDrop**: Drop of invalid SYN packets to protect against spoofing.

16. **Explicit Congestion Notification(ecn)**: It sends notification of the network congestion status to the sender of the data and takes corrective measures for data congestion or data corruption.

17. **Forward RTO-Recovery**: In case of spurious retransmissions, the congestion control configurations are reverted to their original state.

18. **TCP maximum congestion window (maxcwnd)**: TCP maximum congestion window size that is user configurable.

19. **Forward acknowledgment (FACK)**: To avoid TCP congestion by explicitly measuring the total number of data bytes outstanding in the network, and helping the sender (either T1 or a client) control the amount of data injected into the network during retransmission timeouts.

20. **tcpmode**: TCP optimization modes for specific profile.

For the above parameters please consult [1] for guidance on picking the appropriate values. For the remaining ones, the values outlined in TCP Optimization should apply to most cases.

### Analytics and Reporting

December 18, 2018

The TCP Speed Reporting is a NetScaler feature which extracts TCP connection statistics, as a measure of TCP download and upload performance, and is utilized in TCP Insight reports of the Citrix Application Delivery Management (ADM). To achieve this, NetScaler monitors each TCP connection, locates packet bursts on an idle time-out basis and reports key metrics (such as byte count, retransmitted byte count and duration) for the identified maximum burst. TCP Speed Reporting feature is enabled by default, support both TCP and HTTP vServers and depends on the Appflow/ULFD reporting infrastructure.

### Real-time Statistics

December 18, 2018

The stat command might be used to verify that TCP optimization is properly applied:

**Command:**

```
1 > stat lb vserver vsrv-wireless
2 Virtual Server Summary
3 actSvcs vsvrIP port Protocol State Health
4 vsrv...eless * 0 TCP UP 100
```
Virtual Server Statistics

<table>
<thead>

</table>
The Total counters should constantly increase for an operational system. In addition, the Rate counters should be non-zero.

Note
The preceding output is from an operational yet idle lab system, explaining the zero rate.

SNMP

December 18, 2018

SNMP agent can be queried for system specific information from a remote device (SNMP Manager). Based on the query, the agent searches for the equal object identifier (OID) in the management information base (MIB) for the data requested and sends the information to the SNMP Manager. The following are the most useful SNMP OIDs for Telco deployments:

Memory

- resMemUsage (1.3.6.1.4.1.5951.4.1.1.41.2)
Percentage of memory utilization on NetScaler.

Packet Engine CPU

- resCpuUsage (1.3.6.1.4.1.5951.4.1.1.41.1)
CPU utilization percentage.
- nsCPUTable (1.3.6.1.4.1.5951.4.1.1.41.6)
This table contains information about each CPU in NetScaler.

Indexed on: nsCPUname

- **nsCPUname (1.3.6.1.4.1.5951.4.1.1.41.6.1.1)**
  The name of the CPU.

- **nsCPUusage (1.3.6.1.4.1.5951.4.1.1.41.6.1.2)**
  CPU utilization percentage.

### Throughput

- **allNicTotRxMbits (1.3.6.1.4.1.5951.4.1.1.71.1)**
  Number of megabits received by the NetScaler appliance.

- **allNicTotTxMbits (1.3.6.1.4.1.5951.4.1.1.71.2)**
  Number of megabits transmitted by the NetScaler appliance.

- **ipTotRxPkts (1.3.6.1.4.1.5951.4.1.1.43.25)**
  IP packets received.

- **ipTotRxMbits (1.3.6.1.4.1.5951.4.1.1.43.27)**
  Megabits of IP data received.

- **ipTotTxPkts (1.3.6.1.4.1.5951.4.1.1.43.28)**
  IP packets transmitted.

- **ipTotTxMbits (1.3.6.1.4.1.5951.4.1.1.43.30)**
  Megabits of IP data transmitted.

### Connections

**Active connections:**

- **tcpActiveServerConn (1.3.6.1.4.1.5951.4.1.1.46.8)**
  Connections to a server currently responding to requests.

**Total connections:**

- **tcpCurServerConn (1.3.6.1.4.1.5951.4.1.1.46.1)**
  Server connections, including connections in the Opening, Established, and Closing state.

- **tcpCurClientConn (1.3.6.1.4.1.5951.4.1.1.46.2)**
Client connections, including connections in the Opening, Established, and Closing state.

**Note:** Because of SYN-Cookie, this doesn’t include Client in Opening state

- **tcpTotZombieCltConnFlushed (1.3.6.1.4.1.5951.4.1.1.46.26)**
  Client connections that are flushed because the client has been idle for some time.

- **tcpTotZombieSvrConnFlushed (1.3.6.1.4.1.5951.4.1.1.46.27)**
  Server connections that are flushed because there have been no client requests in the queue for some time.

**Errors**

- **tcpErrSynGiveUp (1.3.6.1.4.1.5951.4.1.1.46.37)**
  Attempts to establish a connection on the NetScaler that timed out.

- **tcpErrRetransmitGiveUp (1.3.6.1.4.1.5951.4.1.1.46.60)**
  Number of times NetScaler terminates a connection after retransmitting the packet seven times on that connection. Retransmission happens when receiving end doesn’t acknowledges the packet.

- **ifInDiscards (1.3.6.1.2.1.2.2.1.13)**
  The number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol. One possible reason for discarding such a packet could be to free up buffer space.

- **ifOutDiscards (1.3.6.1.2.1.2.2.1.19)**
  The number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being transmitted. One possible reason for discarding such a packet could be to free up buffer space.

- **ifErrTxOverflow (1.3.6.1.4.1.5951.4.1.1.54.1.36)**
  Number of packets that have passed through the overflow queues, during transmission on the specified interface, since the NetScaler appliance was started or the interface statistics were cleared. This gets incremented only on congested ports.

**Optimized/Bypass connections**

- **tcpOptimizationEnabled (1.3.6.1.4.1.5951.4.1.1.46.131)**
  Total number of connections enabled with TCP optimization.

- **tcpOptimizationBypassed (1.3.6.1.4.1.5951.4.1.1.46.132)**
  Total number of connections bypassed TCP Optimization.
Technical Recipes

December 18, 2018

The NetScaler T1 models provide advanced features and a powerful policy configuration language that allow for evaluation of complex decision in runtime.

While it is not possible to evaluate all capabilities that are potentially unlocked by the T1000 features and policy configuration guide, technical recipes consider implementation of various requirements brought in by Telco operators. Feel free to re-use the “recipes” as is or adapt to your environment.

Per-user Connection Limit

The NetScaler T1 model can be configured to limit the number of connections per unique subscriber IP. With the below configuration, N concurrent TCP connections per IP (CLIENT.IP.SRC) is allowed. For every attempt for connection beyond the configured threshold, T1 sends an RST. For maximum 2 concurrent connections per user:

**Command:**

```
1 add stream selector streamSel_usrlimit CLIENT.IP.SRC
2 add ns limitIdentifier limitId_usrlimit -threshold 2 -mode CONNECTION -selectorName streamSel_usrlimit
3 add responder policy respPol_usrlimit "SYS.CHECK_LIMIT(" limitId_usrlimit")" RESET
4 bind lb vserver vsrv=wireless -policyName respPol_usrlimit -priority 1 -gotoPriorityExpression END
```

Smooth Insertion/Deletion of Vserver

Many operators concern about TCP connections disruption when the NetScaler T1 model is activated inline for TCP optimization or when it is disabled for maintenance purposes. To avoid breaking existing connections when vserver is introduced, the following configuration needs to be applied before configuring or activating vserver for TCP optimization:

**Command:**

```
1 add ns acl acl-ingress ALLOW -vlan 100
2 add forwardingSession fwd-ingress -aclname acl-ingress
3 apply ns acls
```

Forwarding sessions are effective on top of routing (either static or dynamic or PBR) and create session entries for traffic that is routed (L3 mode). Any existing connection is handled by forwarding session
due to corresponding sessions, and upon vserver introduction it starts capturing only new TCP connections.

ACLs can be configured to capture only specific ports like vserver, in order to avoid creating sessions for unnecessary traffic, which is memory consuming. Another option is to remove specific configuration after vserver activation.

For maintenance purposes, vserver should be disabled and its state appears as OUT OF SERVICE. When this happens, the vserver terminates all connections immediately by default. To make vserver to still serve the existing connections and not accept new, the following configuration should be applied:

**Command:**

```
set lb vserver vsrv-wireless -downStateFlush DISABLED
```

New connections go through the routing table, and corresponding session entries are created due to forwarding sessions.

**Policy-Based TCP Profiling**

Policy-based TCP Profile selection allows operators to configure TCP profile dynamically for clients coming from different traffic domains (i.e. 3G or 4G). Some of the QoS metrics are different for these traffic domains, and in order to achieve better performance, you need to change some of the TCP parameter dynamically. Consider a case where clients coming from 3G and 4G hit same vserver and use same TCP profile, which have negative impact on some client's performance. AppQoE functionality can classify these clients and dynamically change TCP profile on vserver.

**Example:**

```
1 enable feature AppQoE
2
3 add ns tcpProfile nstcpprofile1 -WS ENABLED -SACK ENABLED -WSVal 8 -mss 1460 -maxBurst 30 -initialCwnd 16 -oooQSize 15000 -minRTO 800 -slowStartIncr 1 -bufferSize 4000000 -flavor BIC -KA ENABLED -sendBufsize 4000000 -rstWindowAttenuate ENABLED -spoofSynDrop ENABLED -frto ENABLED -maxcwnd 1000000 -fack ENABLED -tcpmode ENDPOINT
4
5 add ns tcpProfile nstcpprofile2 -WS ENABLED -SACK ENABLED -WSVal 8 -mss 1460 -maxBurst 15 -initialCwnd 16 -oooQSize 15000 -minRTO 800 -slowStartIncr 1 -bufferSize 128000 -flavor BIC -KA ENABLED -sendBufsize 6000000 -rstWindowAttenuate ENABLED -spoofSynDrop ENABLED -frto ENABLED -maxcwnd 64000 -fack ENABLED -tcpmode ENDPOINT
```
The NetScaler T1 model is capable to receive the subscriber information dynamically through Gx or Radius or Radius and Gx interface and apply different TCP profile on a per-subscriber basis.

**Command:**

```plaintext
1  add appqoe action action_1 -priority HIGH -tcpprofile nstcpprofile1
2  add appqoe action action_2 -priority HIGH -tcpprofile nstcpprofile2
3  add appqoe policy appqoe_4G -rule ”CLIENT.VLAN.ID.EQ(100)” -action action_1
4  add appqoe policy appqoe_3G -rule ”CLIENT.VLAN.ID.EQ(200)” -action action_2

```

For integration of the NetScaler T1 model with operator control-plane network, see [Telco Subscriber Management](#).

**Scalability**

January 6, 2019

Because TCP optimization is resource intensive, a single NetScaler appliance, even a high end appliance, might not be able to sustain high Gi-LAN throughputs. To expand the capacity of your network, you can deploy NetScaler appliances in an N+1 cluster formation. In a cluster deployment, the NetScaler appliances work together as a single system image. The client traffic is distributed across the cluster nodes with the help of external switch device.
**Topology**

Figure 1 is an example of a cluster consisting of four T1300-40G nodes.

The setup shown in Figure 1 has the following properties:

1. All cluster nodes belong to the same network (also known as an L2 cluster).
2. Data plane and backplane traffic are handled by different switches.
3. Assuming Gi-LAN throughput is 200 Gbps and that a T1300-40G appliance can sustain 80Gbps of throughput, we need three T1300-40G appliances. To provide redundancy in case of single cluster node failure, we deploy four appliances in total.
4. Each node will receive up to 67Gbps of traffic (50Gbps in normal operating conditions and 67Gbps in case of single cluster node failure), so it needs 2x40Gbps connections to the upstream switch. To provide redundancy in case of switch failure, we deploy a couple of upstream switches and double the number of connections.
5. Cluster Link Aggregation (CLAG) is used to distribute traffic across cluster nodes. A single CLAG handles both client and server traffic. Link Redundancy is enabled on the CLAG, so only one “subchannel” is selected at any given time and handles the traffic. If some link fails or throughput falls below specified threshold, the other subchannel is selected.
6. The upstream switch performs symmetric port-channel load balancing (for example, source-dest-ip-only algorithm of Cisco IOS 7.0(8) N1(1)) so that forward and reverse traffic flows are handled by the same cluster node. This property is desirable because it eliminates packet reordering, which would degrade TCP performance.
7. Fifty percent of data traffic is expected to be steered to backplane, which means each node will steer up to 34Gbps to other cluster nodes (25Gbps in normal operating conditions and 34Gbps in case of single cluster node failure). Thus, each node needs at least 4x10G connections to the backplane switch. To provide redundancy in case of switch failure, we deploy a couple of backplane switches and double the number of connections. Link redundancy is not currently supported for backplane, so Cisco VPC or equivalent technology is desired to achieve switch-level redundancy.
8. MTU size of steered packets is 1578 bytes, so backplane switches must support an MTU more than 1500 bytes.

**Note:** The design depicted in Figure 1 is also applicable to T1120 and T1310 appliances. For T1310 we would use 40GbE interfaces for the backplane connections, since it lacks 10GbE ports.

**Note:** While this document uses Cisco VPC as an example, if working with non-Cisco switches alternate equivalent solutions could be used, such as Juniper’s MLAG.

**Note:** While other topologies such as ECMP instead of CLAG are possible, they are not currently supported for this particular use case.
Configuring TCP Optimization in a NetScaler T1000 Cluster

After physical installation, physical connectivity, software installation, and licensing are completed, you can proceed with the actual cluster configuration. The configurations described below apply to the cluster depicted in Figure 1.

Note: For more information about cluster configuration, see “Setting up a NetScaler cluster.”

Assume that the four T1300 nodes in Figure 1 have the following NSIP addresses:

Four T1300 nodes with NSIP address:

1. T1300-40-1: 10.102.29.60
2. T1300-40-2: 10.102.29.70
3. T1300-40-3: 10.102.29.80
4. T1300-40-4: 10.102.29.90

The cluster will be managed through the cluster IP (CLIP) address, which is assumed to be 10.78.16.61.

Setting Up the Cluster

To begin configuring the cluster shown in Figure 1, log on to the first appliance that you want to add to the cluster (for example, T1300-40-1) and do the following.

1. At the command prompt, enter the following commands:

   Command:

   1 > add cluster instance 1
   2 > add cluster node 0 10.102.29.60 -state ACTIVE
   3 > add ns ip 10.102.29.61 255.255.255.255 -type clip
   4 > enable cluster instance 1
   5 > save ns config
   6 > reboot - warm

2. After the appliance restarts, connect to the Cluster IP (CLIP) address and add the rest of the nodes to the cluster:

   Command:

   1 > add cluster node 1 10.102.29.70 -state ACTIVE
   2 > add cluster node 2 10.102.29.80 -state ACTIVE
   3 > add cluster node 3 10.102.29.90 - state ACTIVE
   4 > save ns config

3. Connect to the NSIP address of each of the newly added nodes and join the cluster:

   Command:
After the nodes restart, proceed with backplane configuration. On the cluster IP address, enter the following commands to create an LACP channel for the backplane link of each cluster node:

**Command:**

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 &gt; set interface 0/10/[1-8] - lacpkey 1 - lacpmode ACTIVE</td>
</tr>
<tr>
<td>2 &gt; set interface 1/10/[1-8] - lacpkey 2 - lacpmode ACTIVE</td>
</tr>
<tr>
<td>3 &gt; set interface 2/10/[1-8] - lacpkey 3 - lacpmode ACTIVE</td>
</tr>
<tr>
<td>4 &gt; set interface 3/10/[1-8] - lacpkey 4 - lacpmode ACTIVE</td>
</tr>
</tbody>
</table>

5. Similarly, configure dynamic LA and VPC on the backplane switches. Make sure the MTU of the backplane switch interfaces is at least 1578 bytes.

6. Verify the channels are operational:

**Command:**

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 &gt; show channel 0/LA/1</td>
</tr>
<tr>
<td>2 &gt; show channel 1/LA/2</td>
</tr>
<tr>
<td>3 &gt; show channel 2/LA/3</td>
</tr>
<tr>
<td>4 &gt; show channel 3/LA/4</td>
</tr>
</tbody>
</table>

7. Configure the cluster node backplane interfaces.

**Command:**

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 &gt; set cluster node 0 - backplane 0/LA/1</td>
</tr>
<tr>
<td>2 &gt; set cluster node 1 - backplane 1/LA/2</td>
</tr>
<tr>
<td>3 &gt; set cluster node 2 - backplane 2/LA/3</td>
</tr>
<tr>
<td>4 &gt; set cluster node 3 - backplane 3/LA/4</td>
</tr>
</tbody>
</table>

8. Check the cluster status and verify that the cluster is operational:

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 &gt; show cluster instance</td>
</tr>
<tr>
<td>2 &gt; show cluster node</td>
</tr>
</tbody>
</table>

For more information on cluster setup, see “Setting up aNetScaler cluster”

**Distributing Traffic Across Cluster Nodes**

After you have formed the NetScaler cluster, deploy Cluster Link Aggregation (CLAG) to distribute traffic across cluster nodes. A single CLAG link will handle both client and server traffic.
On the cluster IP address, execute the following commands to create the Cluster Link Aggregation (CLAG) group shown in Figure 1:

**Command:**

```
1 > set interface 0/40/[1-4] -lacpMode active -lacpKey 5 -lagType Cluster
2 > set interface 1/40/[1-4] -lacpMode active -lacpKey 5 -lagType Cluster
3 > set interface 2/40/[1-4] -lacpMode active -lacpKey 5 -lagType Cluster
4 > set interface 3/40/[1-4] -lacpMode active -lacpKey 5 -lagType Cluster
```

Configure dynamic link aggregation on the external switches.

Then, enable Link Redundancy as follows:

**Code:**

```
1 > set channel CLA/1 -linkRedundancy ON -lrMinThroughput 240000
```

Finally, check the channel status by entering:

**Command:**

```
1 > show channel CLA/1
```

The channel should be UP and the actual throughput should be 320000.

For more information about cluster link aggregation, see the following topics:

- Dynamic Cluster Link Aggregation
- Link Redundancy in a Cluster with LACP.

Because we will be using MAC-based forwarding (MBF), configure a linkset and bind it to the CLAG group as follows:

**Command:**

```
1 > add linkset LS/1
2 > bind linkset LS/1 -ifnum CLA/1
```

More information about linksets, see the following topics:

- Configuring Linksets
- Using Cluster LA Channel with Linksets

**Configuring VLAN and IP Addresses**

We will be using striped IP configuration, which means that IP addresses are active on all nodes (default setting). See “Striped, Partially Striped, and Spotted Configurations” for more information about this topic.
1. Add the ingress and egress SNIPs:

**Command:**

```
1 > add ns ip 172.16.30.254 255.255.255.0 -type SNIP
2 > add ns ip 172.16.31.254 255.255.255.0 -type SNIP
3 > add ns ip6 fd00:172:16:30::254/112 -type SNIP
4 > add ns ip6 fd00:172:16:31::254/112 -type SNIP
```

2. Add the corresponding ingress and egress VLANs:

**Command:**

```
1 > add vlan 30 -aliasName wireless
2 > add vlan 31 -aliasName internet
```

3. Bind VLANs with IPs and linkset:

**Command:**

```
1 > bind vlan 31 -ifnum LS/1 -tagged
2 > bind vlan 30 -ifnum LS/1 -tagged
3 > bind vlan 30 -IPAddress 172.16.30.254 255.255.255.0
4 > bind vlan 31 -IPAddress 172.16.31.254 255.255.255.0
5 > bind vlan 30 -IPAddress fd00:172:16:30::254/112
6 > bind vlan 31 -IPAddress fd00:172:16:31::254/112
```

More ingress and egress VLANs can be added if needed.

**Configuring TCP Optimization**

At this point, we have applied all cluster specific commands. To complete the configuration, follow the steps described in TCP optimization configuration.

**Configuring Dynamic Routing**

A NetScaler cluster can be integrated into the dynamic routing environment of the customer’s network. Following is an example of dynamic routing configuration using BGP routing protocol (OSPF is also supported).

1. From the CLIP address, enable BGP and dynamic routing on ingress and egress IP addresses:

**Command:**
2. Open vtysh and configure BGP for the egress side:

Code:

```
1 > shell
2 root@ns# vtysh
3 ns# configure terminal
4 ns(config)# router bgp 65531
5 ns(config-router)# network 10.0.0.0/24
6 ns(config-router)# neighbor 172.16.31.100 remote-as 65530
7 ns(config-router)# neighbor 172.16.31.100 update-source 172.16.31.254
8 ns(config-router)# exit
9 ns(config)# ns route-install propagate
10 ns(config)# ns route-install default
11 ns(config)# ns route-install bgp
12 ns(config)# exit
```

3. Configure the egress-side BGP peer to advertise the default route to the NetScaler cluster. For example:

Command:

```
1 router bgp 65530
2 bgp router-id 172.16.31.100
3 network 0.0.0.0/0
4 neighbor 172.16.31.254 remote-as 65531
```

4. Follow similar steps to configure the ingress side.

5. From vtysh verify that configuration is propagated to all cluster nodes, by entering:

Command:

```
1 ns# show running-config
```

6. Finally, log on to NSIP address of each cluster node and verify routes advertised from BGP peer:

Command:

```
1 > show route | grep BGP
```
TCP uses the following optimization techniques and congestion control strategies (or algorithms) to avoid network congestion in data transmission.

**Congestion Control Strategies**

The Transmission Control Protocol (TCP) has long been used to establish and manage Internet connections, handle transmission errors, and smoothly connect web applications with client devices. But network traffic has become more difficult to control, because packet loss does not depend only on the congestion in the network, and congestion does not necessarily cause packet loss. Therefore, to measure congestion, a TCP algorithm should focus on both packet loss and bandwidth.

**NILE Algorithm**

Citrix Systems has developed a new congestion-control algorithm, NILE, a TCP optimization algorithm designed for high-speed networks such as LTE, LTE advanced and 3G. Nile addresses unique challenges caused by fading, random or congestive losses, link layer retransmissions and carrier aggregation.

The NILE algorithm:

- Bases queue-latency estimates on round-trip time measurements.
- Uses a congestion-window-increase function that is inversely proportional to the measured queue latency. This method results in approaching the network congestion point more slowly than does the standard TCP method, and reduces the packet losses during congestion.
- Can distinguish between random loss and congestion based loss on the network by using the estimated queue latency.

The telecom service providers can use the NILE algorithm in their TCP infrastructure to:

- Optimize mobile and long-distance networks— The NILE algorithm achieves higher throughput compared to standard TCP. This feature is especially important for mobile and long-distance networks.
- Decrease application perceived latency and enhance subscriber experience— The Nile algorithm uses packet loss information to determine whether the transmission-window size should be increased or decreased, and uses queuing delay information to determine the size of the increment or decrement. This dynamic setting of transmission-window size decreases the application latency on the network.
To configure NILE support using the command line interface

At the command prompt, type the following:

```
set ns tcpProfile <name> [-flavor NILE]
```

Configuring NILE support using the configuration utility

1. Navigate to System> Profiles> TCP Profiles and click TCP profiles.
2. From the TCP Flavor drop-down list, select NILE.

Example:

```
set ns tcpProfile tcpprofile1 -flavor NILE
```

Proportional Rate Recovery (PRR) Algorithm

TCP Fast Recovery mechanisms reduce web latency caused by packet losses. The new Proportional Rate Recovery (PRR) algorithm is a fast recovery algorithm that evaluates TCP data during a loss recovery. It is patterned after Rate-Halving, by using the fraction that is appropriate for the target window chosen by the congestion control algorithm. It minimizes window adjustment, and the actual window size at the end of recovery is close to the Slow-Start threshold (ssthresh).

TCP Fast Open (TFO)

TCP Fast Open (TFO) is a TCP mechanism that enables speedy and safe data exchange between a client and a server during TCP's initial handshake. This feature is available as a TCP option in the TCP profile bound to a virtual server of a NetScaler appliance. TFO uses a TCP Fast Open Cookie (a security cookie) that the NetScaler appliance generates to validate and authenticate the client initiating a TFO connection to the virtual server. By using the TFO mechanism, you can reduce an application's network latency by the time required for one full round trip, which significantly reduces the delay experienced in short TCP transfers.

How TFO works

When a client tries to establish a TFO connection, it includes a TCP Fast Open Cookie with the initial SYN segment to authenticate itself. If authentication is successful, the virtual server on the NetScaler appliance can include data in the SYN-ACK segment even though it has not received the final ACK
segment of the three-way handshake. This saves up to one full round-trip compared to a normal TCP connection, which requires a three-way handshake before any data can be exchanged.

A client and a backend server perform the following steps to establish a TFO connection and exchange data securely during the initial TCP handshake.

1. If the client does not have a TCP Fast Open Cookie to authenticate itself, it sends a Fast Open Cookie request in the SYN packet to the virtual server on the NetScaler appliance.
2. If the TFO option is enabled in the TCP profile bound to the virtual server, the appliance generates a cookie (by encrypting the client’s IP address under a secret key) and responds to the client with a SYN-ACK that includes the generated Fast Open Cookie in a TCP option field.
3. The client caches the cookie for future TFO connections to the same virtual server on the appliance.
4. When the client tries to establish a TFO connection to the same virtual server, it sends SYN that includes the cached Fast Open Cookie (as a TCP option) along with HTTP data.
5. The NetScaler appliance validates the cookie, and if the authentication is successful, the server accepts the data in the SYN packet and acknowledges the event with a SYN-ACK, TFO Cookie, and HTTP Response.

Note: If the client authentication fails, the server drops the data and acknowledges the event only with a SYN indicating a session timeout.

1. On the server side, if the TFO option is enabled in a TCP profile bound to a service, the NetScaler appliance determines whether the TCP Fast Open Cookie is present in the service to which it is trying to connect.
2. If the TCP Fast Open Cookie is not present, the appliance sends a cookie request in the SYN packet.
3. When the backend server sends the Cookie, the appliance stores the cookie in the server information cache.
4. If the appliance already has a cookie for the given destination IP pair, it replaces the old cookie with the new one.
5. If the cookie is available in the server information cache when the virtual server tries to reconnect to the same backend server by using the same SNIP address, the appliance combines the data in SYN packet with the cookie and sends it to the backend server.
6. The backend server acknowledges the event with both data and a SYN.

Note: If the server acknowledges the event with only a SYN segment, the NetScaler appliance immediately resends the data packet after removing the SYN segment and the TCP options from the original packet.
Configuring TCP Fast Open

To use the TCP Fast Open (TFO) feature, enable the TCP Fast Open option in the relevant TCP profile and set the TFO Cookie Timeout parameter to a value that suits the security requirement for that profile.

To enable or disable TFO by using the command line

At the command prompt, type one of the following commands to enable or disable TFO in a new or existing profile.

Note: The default value is DISABLED.

```
1. add tcpprofile <TCP Profile Name> - tcpFastOpen ENABLED | DISABLED
2. set tcpprofile <TCP Profile Name> - tcpFastOpen ENABLED | DISABLED
3. unset tcpprofile <TCP Profile Name> - tcpFastOpen
```

Examples:

add tcpprofile Profile1 – tcpFastOpen
Set tcpprofile Profile1 – tcpFastOpen Enabled
unset tcpprofile Profile1 – tcpFastOpen

To set TCP Fast Open cookie timeout value by using the command line interface

At the command prompt, type:

```
1. set tcpparam - tcpfastOpenCookieTimeout <Timeout Value>
```

Example:

```
1. set tcpprofile - tcpfastOpenCookieTimeout 30secs
```

To configure the TCP Fast Open by using the GUI

1. Navigate to Configuration > System > Profiles > and then click Edit to modify a TCP profile.
2. On the Configure TCP Profile page, select the TCP Fast Open checkbox.
3. Click OK and then Done.

To Configure the TCP Fast Cookie timeout value by using the GUI

Navigate to Configuration > System > Settings > Change TCP Parameters and then Configure TCP Parameters page to set the TCP Fast Open Cookie timeout value.
TCP Hystart

A new TCP profile parameter, hystart, enables the Hystart algorithm, which is a slow-start algorithm that dynamically determines a safe point at which to terminate (ssthresh). It enables a transition to congestion avoidance without heavy packet losses. This new parameter is disabled by default.

If congestion is detected, Hystart enters a congestion avoidance phase. Enabling it gives you better throughput in high-speed networks with high packet loss. This algorithm helps maintain close to maximum bandwidth while processing transactions. It can therefore improve throughput.

Configuring TCP Hystart

To use the Hystart feature, enable the Cubic Hystart option in the relevant TCP profile.

To configure Hystart by using the command line interface (CLI)

At the command prompt, type one of the following commands to enable or disable Hystart in a new or existing TCP profile.

```
1 add tcpprofile <profileName> -hystart ENABLED
2 set tcpprofile <profileName> -hystart ENABLED
3 unset tcprofile <profileName> -hystart
```

Examples:

```
1 add tcpprofile Profile1 - tcpFastOpen
2 Set tcpprofile Profile1 - tcpFastOpen Enabled
3 unset tcprofile Profile1 - tcpFastOpen
```

To configure Hystart support by using the GUI

1. Navigate to Configuration > System > Profiles > and click Edit to modify a TCP profile.
2. On the Configure TCP Profile page, select the Cubic Hystart check box.
3. Click OK and then Done.

Optimization Techniques

TCP uses the following optimization techniques and methods for optimized flow controls.
Policy based TCP Profile Selection

Network traffic today is more diverse and bandwidth-intensive than ever before. With the increased traffic, the effect that Quality of Service (QoS) has on TCP performance is significant. To enhance QoS, you can now configure AppQoE policies with different TCP profiles for different classes of network traffic. The AppQoE policy classifies a virtual server’s traffic to associate a TCP profile optimized for a particular type of traffic, such as 3G, 4G, LAN, or WAN.

To use this feature, create a policy action for each TCP profile, associate an action with AppQoE policies, and bind the policies to the load balancing virtual servers.

Configuring Policy Based TCP Profile Selection

Configuring policy based TCP profile selection consists of the following tasks:

- Enabling AppQoE. Before configuring the TCP profile feature, you must enable the AppQoE feature.
- Adding AppQoE Action. After enabling the AppQoE feature, configure an AppQoE action with a TCP profile.
- Configuring AppQoE based TCP Profile Selection. To implement TCP profile selection for different classes of traffic, you must configure AppQoE policies with which your NetScaler appliance can distinguish the connections and bind the correct AppQoE action to each policy.
- Binding AppQoE Policy to Virtual Server. Once you have configured the AppQoE policies, you must bind them to one or more load balancing, content switching, or cache redirection virtual servers.

Configuring using the command line interface

To enable AppQoE by using the command line interface:

At the command prompt, type the following commands to enable the feature and verify that it is enabled:

```
1 enable ns feature appqoe
2
3 show ns feature
```

To bind a TCP profile while creating an AppQoE action using the command line interface

At the command prompt, type the following AppQoE action command with tcpprofiletobind option.

Binding a TCP Profile:
To configure an AppQoE policy by using the command line interface

At the command prompt, type:

```
add appqoe policy <name> -rule <expression> -action <string>
```

To bind an AppQoE policy to load balancing, cache redirection or content switching virtual servers by using the command line interface

At the command prompt, type:

```
bind cs vserver cs1 -policyName <appqoe_policy_name> -priority <priority>
bind lb vserver <name> -policyName <appqoe_policy_name> -priority <priority>
bind cr vserver <name> -policyName <appqoe_policy_name> -priority <priority>
```

Example:

```
add ns tcpProfile tcp1 -WS ENABLED -SACK ENABLED -WSVal 8 -nagle ENABLED -maxBurst 30 -initialCwnd 16 -oooQSize 15000 -minRTO 500 -slowStartIncr 1 -bufferSize 4194304 -flavor BIC -KA ENABLED -sendBufsize 4194304 -rstWindowAttenuate ENABLED -spoofSynDrop ENABLED -dsack enabled -frto ENABLED -maxcwnd 4000000 -fack ENABLED -tcpmode ENDPOINT
add appqoe action appact1 -priority HIGH -tcpprofile tcp1
add appqoe policy apppoll1 -rule "client.ip.src.eq(10.102.71.31)" -action appact1
```
Configuring Policy based TCP Profiling using the GUI

To enable AppQoE by using the GUI

1. Navigate to System > Settings.
2. In the details pane, click Configure Advanced Features.
3. In the Configure Advanced Features dialog box, select the AppQoE check box.
4. Click OK.

To configure AppQoE policy by using the GUI

1. Navigate to App-Expert > AppQoE > Actions.
2. In the details pane, do one of the following:
3. To create a new action, click Add.
4. To modify an existing action, select the action, and then click Edit.
5. In the Create AppQoE Action or the Configure AppQoE Action screen, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in “Parameters for configuring the AppQoE Action” as follows (asterisk indicates a required parameter):
   a) Name—name
   b) Action type—respondWith
   c) Priority—priority
   d) Policy Queue Depth—polqDepth
   e) Queue Depth—priqDepth
   f) DOS Action—dosAction
6. Click Create.

To bind AppQoE policy by using the GUI

1. Navigate to Traffic Management > Load Balancing > Virtual Servers, select a server and then click Edit.
2. In the Policies section and click (+) to bind an AppQoE policy.
3. In the Policies slider, do the following:
a) Select a policy type as AppQoE from the drop-down list.
b) Select a traffic type from the drop-down list.
4. In the Policy Binding section, do the following:
   a) Click New to create a new AppQoE policy.
   b) Click Existing Policy to select an AppQoE policy from the drop-down list.
5. Set the binding priority and click Bind to the policy to the virtual server.
6. Click Done.

**SACK Block Generation**

TCP performance slows down when multiple packets are lost in one window of data. In such a scenario, a Selective Acknowledgement (SACK) mechanism combined with a selective repeat retransmission policy overcomes this limitation. For every incoming out-of-order packet, you must generate a SACK block.

If the out-of-order packet fits in the reassembly queue block, insert packet info in the block, and set the complete block info as SACK-0. If an out-of-order packet does not fit into reassembly block, send the packet as SACK-0 and repeat the earlier SACK blocks. If an out-of-order packet is a duplicate and packet info is set as SACK-0 then D-SACK the block.

**Note:** A packet is considered as D-SACK if it is an acknowledged packet, or an out of order packet which is already received.

**Client Reneging**

A NetScaler appliance can handle client reneging during SACK based recovery.

**Memory checks for marking end_point on PCB is not considering total available memory**

In a NetScaler appliance, if the memory usage threshold is set to 75 percent instead of using the total available memory, it causes new TCP connections to bypass TCP optimization.

**Unnecessary retransmissions due to missing SACK blocks**

In a non-endpoint mode, when you send DUPACKS, if SACK blocks are missing for few out of order packets, triggers additional retransmissions from the server.
**SNMP for number of connections bypassed optimization because of overload**

The following SNMP ids have been added to a NetScaler appliance to track number of connections bypassed TCP optimization due to overload.

1. 1.3.6.1.4.1.5951.4.1.1.46.13 (tcpOptimizationEnabled). To track the total number of connections enabled with TCP optimization.
2. 1.3.6.1.4.1.5951.4.1.1.46.132 (tcpOptimizationBypassed). To track the total number of connections bypassed TCP Optimization.

**Dynamic Receive Buffer**

To maximize TCP performance, a NetScaler appliance can now dynamically adjust the TCP receive buffer size.

**Troubleshooting Guidelines**

January 6, 2019

**Technical Support**

All troubleshooting and escalation queries require a recent NetScaler techsupport bundle, which captures current configuration, firmware version installed, log files, outstanding cores, and others.

**Example:**

```
1  show techsupport
2  showtechsupport data collector tool - $Revision: #5 $!
3  ...
4  All the data will be collected under
5       /var/tmp/support/collector_P_192.168.121.117_18Jun2015_09_53
6  ...
7  Archiving all the data into ”/var/tmp/support/collector_P_192
8        .168.121.117_18Jun2015_09_53.tar.gz” ....
9  Created a symbolic link for the archive with /var/tmp/support/support.
10     tgz
11   /var/tmp/support/support.tgz ---- points to ---> /var/tmp/support/
12            collector_P_192.168.121.117_18Jun2015_09_53.tar.gz
13  After a techsupport bundle has been generated, it might be copied using
14         SCP.
```
Traces

NetScaler TCP optimization issues normally require NetScaler traces to troubleshoot properly. Note that one should try to capture traces under similar conditions, i.e. on the same cell, during the same time of day, using the same user equipment and application, and others.

The start nstrace and stop nstrace commands might be used to capture traces:

- It’s strongly recommended that the appropriate filter is used to avoid capturing extraneous, unnecessary packets on the trace. For instance use start nstrace -filter ‘IP == 10.20.30.40’ to only capture packets being sent to or received from IP address 10.20.30.40, which is the user equipment IP address.
- Do not use the -tcpdump option, since it strips the nstrace headers which are required for debugging.

Trace Analysis

After a NetScaler trace has been captured, it might be viewed with Wireshark 1.12 or later. Verify that the captured traces include the appropriate NetScaler Packet Trace headers, as shown in the screen capture below:

The additional debug headers are also visible per the illustration below:

Connection Table

When the issue is related to TCP optimization and it can be reproduced or it’s on-going, it is best to get also the connection table when the issue occurs from the primary T1 node.

To get the table you shall need to switch to the BSD shell and run the following command:

```bash
1 shell
2 ...
3
4 nscli -U 127.0.0.1:nsroot:nsroot show connectiontable -detail full link > /var/tmp/contable.log
```

Note

The command might be executed for a longer time and management CPU might be stressed at that time (depends on the number of connection table entries), but it's not service affecting.
Frequently Asked Questions

December 18, 2018

Timeouts

Important
Before using any nsapimgr knob, consult with Citrix Customer Support.

The following is a list of different idle connection timeouts that can be set on NetScaler T1 virtual servers and services. Idle timeout set for client or server connections at the vserver or service level are applicable only for the connections in TCP ESTABLISHED state and are idle.

- Load Balancing virtual server cltTimeout parameter specifies the time in seconds that a connection from a client to a Load Balancing virtual server must be idle, before the appliance closes the connection.
- Service svrTimeout parameter specifies the time in seconds that a connection from the appliance to a service or server must be idle, before the appliance closes the connection.
- Service cltTimeout parameter specifies the time in seconds that a connection from a client to a service must be idle, before the appliance closes the connection.

When a service is bound to a Load Balancing virtual server, then the cltTimeout for the Load Balancing virtual server takes precedence, and the service cltTimeout for service is ignored.

In case of there is not service bound to Load Balancing virtual server, global idle timeout, namely tcpServer, is used for server side connections. It can be configured as follows:

**Command:**

```
set ns timeout - tcpServer 9000
```

Connections in other state have different timeout values:

- Half open connections idle timeout: 120 seconds (hardcoded value)
- TIME_WAIT connections idle timeout: 40 seconds (hardcoded value)
- Half close connections idle timeout. By default it is 10s and can be configured between 1s and 600s using the snippet

**Command:**

```
set ns timeout - halfclose 10
```

When half-close timeout is triggered, connection is moved to zombie state. When zombie timeout expires, zombie cleanup kicks in and T1 sends RST on both client and server side for given connection by default.
- Zombie timeout: Interval at which the zombie cleanup process must run to clean up inactive TCP connections. Default timeout value is 120s and can be configured between 1s and 600s.

**Command:**

```
set ns timeout -zombie 120
```

---

**Maximum Segment Size Table**

A NetScaler T1 appliance defends against SYN flood attacks by using SYN cookies instead of maintaining half-open connections on the system memory stack. The appliance sends a cookie to each client that requests a TCP connection, but it does not maintain the states of half-open connections. Instead, the appliance allocates system memory for a connection only upon receiving the final ACK packet, or, for HTTP traffic, upon receiving an HTTP request. This prevents SYN attacks and allows normal TCP communications with legitimate clients to continue uninterrupted. Specific function is enabled by default without option to disable.

However, there is caveat as standard SYN cookies limit connections to the use of only eight Maximum Segment Size (MSS) values. If connection MMS does not match with any predefined value, it will pick up the next available lower value towards both client and server side.

The predefined TCP Maximum Segment Size (MSS) values are the following and can be configured through a new nsapimgr knob.

<table>
<thead>
<tr>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>1460</td>
</tr>
<tr>
<td>1440</td>
</tr>
<tr>
<td>1330</td>
</tr>
<tr>
<td>1220</td>
</tr>
<tr>
<td>956</td>
</tr>
<tr>
<td>536</td>
</tr>
<tr>
<td>384</td>
</tr>
<tr>
<td>128</td>
</tr>
</tbody>
</table>

The new MSS table:

- Need not contain Jumbo-Frame support. Even though by default 8 values are reserved in the MSS table for jumbo frames, the table settings can be modified to include standard Ethernet-sized frames only.
- Should have 16 values
- Should have values in descending order
- Should include 128 as the last value

If the new MSS table is valid, the table is stored and the old values are switched out at the SYN-cookie rotation time. Otherwise the new table returns an error. Changes are applied to new connections while existing connections preserve the old MSS table until the connections expire or are terminated.

To display the current MSS table in a NetScaler appliance, type the following command.

**Command:**

```
```
Example:

```
1 >shell
2 # nsapimgr -d mss_table

Example:

1 # nsapimgr -d mss_table
2 MSS table
3 {
4   9176,9156,8192,7168,6144,4196,3072,2048,1460,1440,1330,1212,956,536,384,128
7 }
8
9 Done.
```

To change the mss table, type the following command:

**Command:**

```
1 >shell
2 # nsapimgr -s mss_table=16 comma seperated values
```

Example:

```
1 # nsapimgr -ys mss_table
   =9176,9156,8192,7168,6144,4196,3072,2048,1460,1400,1330,1212,956,536,384,128
2 # nsapimgr -d mss_table
3 MSS table
4 {
5   9176,9156,8192,7168,6144,4196,3072,2048,1460,1400,1330,1212,956,536,384,128
8 }
9
10 Done.
```

An example using standard Ethernet-sized values is depicted below:

**Example:**
To make this change permanent even after the NetScaler appliance restarts, include the command “#nsapimgr -ys mss_table=<16 comma seperated values>” in the “/nsconfig/rc.netscaler” file. If the “rc.netscaler” file doesn’t exist, create it under the “/nsconfig” folder, and then append the command.

Memory Overload Protection

A NetScaler Packet Processing Engine (PPE) starts bypassing connections from TCP optimization if the memory in use by that one PPE is more than a specified high watermark value. If a PPE memory utilization goes above ~2.6GB, then it starts bypassing any new connections from optimization. The existing connections (ones admitted for optimization previously) continues getting optimization. This watermark value has been purposefully selected and is not recommended for tuning.

Note

If you believe that there is a good reason to change that watermark value, contact Customer Support.

Support for Happy Eyeballs Clients

If the NetScaler appliance receives a SYN for a destination for which the state is unknown, the appliance first checks the reachability of the server and then acknowledges the client. This probing mechanism enables clients with dual IP stacks to discover the reachability of dual-stack internet servers. If the client discovers that both IPv6 and IPv4 access are available, it establishes a connection to the server that responds more quickly, and resets the other. For the connection for the NetScaler appliance receives a reset, it will reset the corresponding server side connection.
**Note:** This feature has no user configurable TCP settings to be disabled/enabled on the NetScaler appliance.

For more information on Happy Eyeballs support, see RFC 6555.

**NetScaler Solutions**

January 11, 2019

NetScaler solutions simplify the task of setting up frequently deployed configurations.

**This section includes the following solutions**

- Setting Up NetScaler for XenApp/XenDesktop
- RISE Integration: NetScaler ADC and Cisco Nexus 7000 Series Switch
- Global Server Load Balancing (GSLB) Powered Zone Preference
- NetScaler in a Private Cloud Managed by Microsoft Windows Azure Pack and Cisco ACI

**Setting up NetScaler for Citrix Virtual Apps and Desktops**

January 14, 2019

A NetScaler appliance can provide load balanced, secure remote access to your Citrix Virtual Apps and Desktops applications. You can use the NetScaler load balancing feature to distribute traffic across the Citrix Virtual Apps and Desktops server, and the Citrix Gateway feature to provide secure remote access to the servers. NetScaler can also accelerate and optimize the traffic flow and offer visibility features that are useful for Citrix Virtual Apps and Desktops deployments.

Figure 1. NetScaler appliance in Citrix Virtual Apps and Desktops setup

The above figure shows the components involved in this deployment:

- **NetScaler Gateway.** Provides the URL for user access, and provides security by authenticating the users.

- **NetScaler load balancing virtual server.** Load balances the traffic for the Web Interface or StoreFront servers. You can also deploy a load balancing virtual server in front of the Citrix Virtual Apps and Desktop servers to load balance key components such as XML Broker and Desktop Delivery Controller (DDC) server.

- **Web Interface or StoreFront or Web Interface on NetScaler.** Provides the interface through which you can access the applications.
Note: Web Interface on NetScaler (WIonNS) is a customization of the Web Interface product, hosted on the NetScaler appliance.

- **Citrix Virtual Apps and Desktops.** Provides the applications that your users want to access.

To set up the NetScaler for Citrix Virtual Apps and Desktops by using the NetScaler GUI

**Prerequisites**

- Citrix Virtual Apps and Desktop servers are configured and available.
- Web Interface, StoreFront, or Web Interface on NetScaler servers are configured and available.
- You have a working knowledge of Citrix Gateway, NetScaler, Citrix Virtual Apps and Desktops, and StoreFront/Web Interface/Web Interface on NetScaler.
- Make sure that you have configured a virtual server and a service and bound the service to the virtual server.

**Procedure:**

1. Log on to the NetScaler appliance and on the **Configuration** tab click **XenApp and XenDesktop**.
2. On the **Details** pane, click **Get Started**. If the setup exists on the NetScaler, click the **Edit** link corresponding to each of the section that you want to modify.
3. Select the product (StoreFront, Web Interface, or Web Interface on NetScaler) that in your deployment provides the interface for access to the Citrix Virtual Apps and Desktops applications.
4. Set up secure remote access.
   a) In the NetScaler Gateway Settings** section, specify the details for the VPN virtual server and click **Continue**.
   b) In the **Server Certificate** section, choose an existing certificate or install a new certificate and click **Continue**.
   c) In the **Authentication** section, configure the primary authentication mechanism to be used and specify the server details or use an existing server and click **Continue**.
   d) In the **StoreFront** section, specify the details of the server that provides the interface for accessing the applications and click **Continue**.
   e) You can use one of the following as your StoreFront server.
      i. LB vserver pointing to multiple SF servers.
      ii. Web Interface or StoreFront server directly reachable from the NetScaler appliance.
      iii. Web Interface on NetScaler.
5. Click **Done** to complete the configuration.

**Global Server Load Balancing (GSLB) Powered Zone Preference**

January 14, 2019
GSLB powered zone preference is a feature that integrates Citrix Virtual Apps and Desktops, StoreFront, and NetScaler to provide clients access to the most optimized data center on the basis of the client location.

In a distributed Citrix Virtual Apps and Desktops deployment, StoreFront might not select an optimal datacenter when multiple equivalent resources are available from multiple datacenters. In such cases, StoreFront randomly selects a datacenter. It can send the request to any of the Citrix Virtual Apps and Desktops servers in any datacenter, regardless of proximity to the client making the request.

With this enhancement, the client IP address is examined when an HTTP request arrives at the Citrix Gateway appliance, and the real client IP address is used to create the datacenter preference list that is forwarded to StoreFront. If the NetScaler appliance is configured to insert the zone preference header, StoreFront 3.5 or later can use the information provided by the appliance to reorder the list of delivery controllers and connect to an optimal delivery controller in the same zone as the client. StoreFront selects the optimal gateway VPN virtual server for the selected datacenter zone, adds this information to the ICA file with appropriate IP addresses, and sends it to the client. Storefront then tries to launch applications hosted on the preferred datacenter’s delivery controllers before trying to contact equivalent controllers in other datacenters.

For more information about configuring this solution, click here.

For a video overview about GSLB powered zone preference solution, click https://www.youtube.com/watch?v=Y8DElum0Xp0.

NetScaler in a Private Cloud Managed by Microsoft Windows Azure Pack and Cisco ACI

January 14, 2019

You can use a NetScaler appliance for load balancing in a private cloud that is managed through Microsoft Windows Azure Pack. The network for the private cloud is automated by using Cisco ACI and NetScaler.

This solution involves many integration points, such as Windows Azure Pack (WAP) to Cisco APIC, Cisco APIC to System Center Virtual Machine Manager (SCVMM), and Cisco APIC to NetScaler. As a tenant in the private cloud, you can enable NAT, provision network services, and add a load balancer.

WAP supports tenant and administrator portals where an administrator can perform administrative tasks such as ACI registration, VIP range, NetScaler device association with virtual machine cloud, tenant user account creation, and so on. Tenants can log on to the WAP Tenant Portal and configure the network, bridge domains, and Virtual Routing and Forwarding (VRFs), and make use of the NetScaler load balancing and RNAT features.
Important

- In this solution, the NetScaler appliance provides only basic load balancing.
- Tenants can deploy multiple VIP addresses with different ports for the same network, but must ensure that the IP and port combination is unique.
- The NetScaler device package supports only single-context deployment. Each Tenant gets a dedicated NetScaler instance.
- WAP supports NetScaler MPX appliances and NetScaler VPX virtual appliances, including NetScaler VPX instances deployed on the NetScaler SDX platform.

The following illustration provides an overview of the solution:

Prerequisites

Make sure that:

- You have conceptual knowledge of Cisco ACI components and NetScalers.
  - For more information about the NetScalers, see the NetScaler product documentation at http://docs.citrix.com/.
- All the required components of Cisco ACI, including Cisco APIC in the datacenter, are set up and configured. For more information about Cisco ACI and its components, see the product documentation at: http://www.cisco.com/c/en/us/support/cloud-systems-management/application-policy-infrastructure-controller-apic/tds-products-support-series-home.html.
- You have installed NetScaler software release 11.1 or later.
- You configure NetScalers in Cisco ACI, so that they can be managed by using Cisco APIC.
- From Cisco APIC, make sure that:
  - Management connectivity of Cisco APIC to NetScaler are established.
  - You upload the NetScaler device package version 11.1-52.3 and register the NetScaler device in Cisco ACI by using Cisco APIC.
  - You configure the NetScaler appliance in Cisco APIC’s common tenant and make sure that there are no faults in Cisco APIC.
You have configured all the APIC specific configurations such as, VLAN pool, L3OutServicesDom, L3ExtOUT, resource pool, and so on. For more information, see *Cisco documentation*.

**Creating a NetScaler Load Balancer in a Plan in the Service Management Portal (Admin Portal)**

January 14, 2019

The Service Management Portal in WAP allows an administrator to register Cisco APIC with WAP and also create a hosting plan. As part of the plan, you can specify the VIP range, associate the NetScaler load balancer with the plan, create tenant user accounts, and so on.

**To create a NetScaler Load Balancer in a Plan in the Admin Portal:**

2. In the Navigation pane, select **PLANS**.
3. In the plans pane, select the plan that you want to add a load balancer.
4. In the selected plan’s pane, select **Networking (ACI)**.
5. On the **Networking (ACI)** pane, in the **L4-L7 SERVICE POOL** drop-down list, select the L4-L7 resource pool that you had created in Cisco APIC.
6. Create a tenant user account and associate the user with the plan you have created.

**Configuring a NetScaler Load Balancer by Using the Service Management Portal (Tenant Portal)**

January 14, 2019

In WAP, once the Tenant creates the Bridge Domain (BD), VRF, and a Network, the Tenant can configure NetScaler Load Balancer through the Service Management Portal (Tenant Portal).

**To configure NetScaler Load Balancer in Service Management Portal (Tenant Portal):**

2. Create a bridge domain and VRF, as follows:
   a. In the navigation pane, select **ACI**.
   b. Click **NEW**.
   c. In the **NEW** pane, select **BRIDGE DOMAIN**.
d. In the **BRIDGE DOMAIN** field, enter the bridge domain name (for example, BD01).

e. (Optional) In the **SUBNET’S GATEWAY** field, enter the subnet’s gateway (for example, 192.168.1.1/24).

f. In the **VRF** field, select a VRF that is already part of the subscription or select **Create One** to create a VRF.

g. Click **CREATE**.

3. Create a network and associate it with the bridge domain that you created. Do the following:

   a. In the navigation pane, select **ACI**.

   b. Click **NEW**.

   c. In the **NEW** pane, select **NETWORK**.

   d. In the **NETWORK NAME** field, enter the network name (for example, S01).

   e. In the **BRIDGE DOMAIN** drop-down list, select the bridge domain you have created. (for example, BD01).

   f. In the subnet’s **GATEWAY** field, enter the subnet’s gateway address (for example, 172.23.2.1/24).

   g. (Optional) In the **DNS SERVER IP/IPS** field, enter the DNS server details.

   h. Click **CREATE**.

4. In the **ACI** pane, select **NETWORKS**.

5. Double-click the network that you have created. Then, in the network pane, select **Enable load balancer (public)**. In the **IP ADDRESS** field, a VIP is automatically assigned from the VIP Range that the administrator configured in the Admin Portal. For more information, see [Creating a NetScaler Load Balancer to a Plan in Service Management Portal (Admin Portal)].

6. Double-click the network that you have created. Then, in the network pane, select **Enable load balancer (public)**. In the **IP ADDRESS** field, a VIP is automatically assigned from the VIP Range that the administrator configured in the Admin Portal. For more information, see [Creating a NetScaler Load Balancer to a Plan in Service Management Portal Admin Portal]

6. In the network pane, select the **Load Balancers** tab, and click **ADD**.

7. In the **ADD NETWORK LOAD BALANCER** pane, do the following:

   a. In the **NAME** field, enter the name for the load balancer.

   b. Optionally, in the **VIRTUAL IP ADDRESS** field, assign the load balancer a VIP address from the VIP range that you defined earlier.

   c. Optionally, in the **PROTOCOL** field, select **TCP**.

   d. In the **PORT** field, enter the port number.
8. Click CREATE.

The NetScaler Load Balancer is displayed in the LOAD BALANCERS tab and the NetScaler Load Balancer is data path ready.

Deleting a NetScaler Load Balancer from the Network

January 14, 2019

Using Service Management Portal (Tenant Portal), from the Network, you can delete the NetScaler load balancer that you created.

To delete a NetScaler load balancer from the Network:

2. In the navigation pane, select ACI.
3. In the ACI pane, on the NETWORKS tab, click the network that you created.
4. In the selected network’s pane, select the NetScaler load balancer and click DELETE.
5. Click OK to delete the NetScaler load balancer.

Support matrix and usage guidelines

January 6, 2019

This document lists the different hypervisors and features supported on a NetScaler VPX instance as well as the limitations and usage guidelines that apply.

- Table 1-6 list the different supported hypervisors.
- Table 7 lists the different VPX features and limitations for the different hypervisors supported on a NetScaler VPX instance.
- Table 8 lists the supported web browsers that allow you access the GUI and Dashboard.

Table 1. VPX instance on XenServer

<table>
<thead>
<tr>
<th>XenServer version</th>
<th>SysID</th>
<th>VPX models</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.2, 6.5</td>
<td>450000</td>
<td>VPX 10, VPX 25, VPX 200, VPX 1000, VPX 3000, VPX 5000, VPX 8000, VPX 10G, VPX 15G, VPX 25G, VPX 40G</td>
</tr>
</tbody>
</table>
Table 2. VPX instance on VMware ESX server

<table>
<thead>
<tr>
<th>VMware ESX version</th>
<th>SysID</th>
<th>VPX models</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.5 (build number: 3568722); 6.0 (build number: 3620759)</td>
<td>450010</td>
<td>VPX 10, VPX 25, VPX 200, VPX 1000, VPX 3000, VPX 5000, VPX 8000, VPX 10G, VPX 15G, VPX 25G, VPX 40G, VPX 100G</td>
</tr>
</tbody>
</table>

Table 3. VPX on Microsoft Hyper-V

<table>
<thead>
<tr>
<th>Hyper-V version</th>
<th>SysID</th>
<th>VPX models</th>
</tr>
</thead>
<tbody>
<tr>
<td>2012, 2012R2</td>
<td>450020</td>
<td>VPX 10, VPX 25, VPX 200, VPX 1000, VPX 3000, VPX 8000</td>
</tr>
</tbody>
</table>

Table 4. VPX instance on generic KVM

<table>
<thead>
<tr>
<th>Generic KVM version</th>
<th>SysID</th>
<th>VPX models</th>
</tr>
</thead>
<tbody>
<tr>
<td>RHEL 7.2, Ubuntu 15</td>
<td>450070</td>
<td>VPX 10, VPX 25, VPX 200, VPX 1000, VPX 3000, VPX 5000, VPX 8000, VPX 10G, VPX 15G. VPX 25G, VPX 40G, VPX 100G</td>
</tr>
</tbody>
</table>

Note: The VPX instance is qualified for hypervisor release versions mentioned in table 1 - 4, and not for patch releases within a version. However, the VPX instance is expected to work seamlessly with patch releases of a supported version. If it does not, log a support case for troubleshooting and debugging.

Table 5. VPX instance on AWS

<table>
<thead>
<tr>
<th>AWS version</th>
<th>SysID</th>
<th>VPX models</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>450040</td>
<td>VPX 10, VPX 200, VPX 1000, VPX 3000, VPX 5000, VPX 15G, VPX BYOL</td>
</tr>
</tbody>
</table>

Table 6. VPX instance on Azure
<table>

<td>VPX 3000, VPX BYOL</td>
</tr>
</tbody>
</table>

Table 7. VPX feature matrix

*Clustering support is available on SRIOV for client- and server-facing interfaces and not for the backplane.

**Interface DOWN events are not recorded in NetScaler VPX instances.

For Static LA, traffic might still be sent on the interface whose physical status is DOWN.

For LACP, peer device knows interface DOWN event based on LACP timeout mechanism.

Short timeout: 3 seconds

Long timeout: 90 seconds

For LACP, interfaces should not be shared across VMs.

For Dynamic routing, convergence time depends on the Routing Protocol since link events are not detected.

Monitored static Route functionality fails if monitors are not bound to static routes since Route state depends on the VLAN status. The VLAN status depends on the link status.

Partial failure detection does not happen in high availability if there is link failure. High availability-split brain condition might happen if there is link failure.

***When any link event (disable/enable, reset) is generated from a VPX instance, the physical status of the link does not change. For static LA, any traffic initiated by the peer gets dropped on the instance.

For LACP, peer device knows interface DOWN event based on LACP timeout mechanism.

Short timeout: 3 seconds

Long timeout: 90 seconds

For LACP, interfaces should not be shared across VMs.

- For the VLAN tagging feature to work, do the following:

On the VMware ESX, set the port group’s VLAN ID to 1 - 4095 on the vSwitch of VMware ESX server. For more information about setting a VLAN ID on the vSwitch of VMware ESX server, see [pdf](#).
Install a NetScaler VPX instance on XenServer

January 6, 2019

To install VPX instances on Citrix XenServer, you must first install XenServer on a machine with adequate system resources. To perform the NetScaler VPX instance installation, you use Citrix XenCenter, which must be installed on a remote machine that can connect to the XenServer host through the network.

For more information about XenServer, see XenServer documentation.

The following figure shows the bare-metal solution architecture of NetScaler VPX instance on XenServer.

**Figure.** A NetScaler VPX instance on XenServer

**Prerequisites for installing a NetScaler VPX instance on XenServer**

Before you begin installing a virtual appliance, do the following:

- Install XenServer version 6.0 or later on hardware that meets the minimum requirements.
- Install XenCenter on a management workstation that meets the minimum system requirements.
- Obtain virtual appliance license files. For more information about virtual appliance licenses, see the NetScaler VPX Licensing Guide at http://support.citrix.com/article/ctx122426.

**XenServer hardware requirements**

The following table describes the minimum hardware requirements for a XenServer platform running a NetScaler VPX instance.

**Table 1.** Minimum system requirements for XenServer running a nCore VPX instance
Component Requirement

CPU 2 or more 64-bit x86 CPUs with virtualization assist (Intel-VT or AMD-V) enabled. Note: To run NetScaler VPX instance, hardware support for virtualization must be enabled on the XenServer host. Make sure that the BIOS option for virtualization support is not disabled. Consult your BIOS documentation for more details.

RAM 3 GB

Disk space Locally attached storage (PATA, SATA, SCSI) with 40 GB of disk space. Note: XenServer installation creates a 4 GB partition for the XenServer host control domain; the remaining space is available for NetScaler VPX instance and other virtual machines.

NIC One 1-Gbps NIC; recommended: two 1-Gbps NICs

For information about installing XenServer, see the XenServer documentation at http://support.citrix.com/product/xens/.

The following table lists the virtual computing resources that XenServer must provide for each nCore VPX virtual appliance.

**Table 2. Minimum virtual computing resources required for running a ncore VPX instance**

<table>
<thead>
<tr>
<th>Component</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Memory</td>
<td>2 GB</td>
</tr>
<tr>
<td>Virtual CPU (VCPU)</td>
<td>2</td>
</tr>
<tr>
<td>Virtual network interfaces</td>
<td>2</td>
</tr>
</tbody>
</table>

Note: For production use of NetScaler VPX instance, Citrix recommends that CPU priority (in virtual machine properties) be set to the highest level, in order to improve scheduling behavior and network latency.
XenCenter system requirements

XenCenter is a Windows client application. It cannot run on the same machine as the XenServer host. The following table describes the minimum system requirements.

**Table 3. Minimum system requirements for XenCenter installation**

<table>
<thead>
<tr>
<th>Component</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Operating system</td>
<td>Windows 7, Windows XP, Windows Server 2003, or Windows Vista</td>
</tr>
<tr>
<td>.NET framework</td>
<td>Version 2.0 or later</td>
</tr>
<tr>
<td>CPU</td>
<td>750 MHz; recommended: 1 gigahertz (GHz) or faster</td>
</tr>
<tr>
<td>RAM</td>
<td>1 GB, recommended: 2 GB</td>
</tr>
<tr>
<td>NIC</td>
<td>100 Mb/s or faster NIC</td>
</tr>
</tbody>
</table>

For information about installing XenCenter, see the XenServer documentation at [http://support.citrix.com/product/xens/](http://support.citrix.com/product/xens/).

Install NetScaler VPX instances on XenServer by using XenCenter

After you have installed and configured XenServer and XenCenter, you can use XenCenter to install virtual appliances on XenServer. The number of virtual appliances that you can install depends on the amount of memory available on the hardware that is running XenServer.

After you have used XenCenter to install the initial NetScaler VPX instance (.xva image) on XenServer, you have the option to use Command Center to provision NetScaler VPX instance. For more information, see the Command Center documentation.

To install NetScaler VPX instances on XenServer by using XenCenter, follow these steps:

1. Start XenCenter on your workstation.
2. On the Server menu, click Add.
3. In the Add New Server dialog box, in the Hostname text box, type the IP address or DNS name of the XenServer that you want to connect to.
4. In the User Name and Password text boxes, type the administrator credentials, and then click Connect. The XenServer name appears in the navigation pane with a green circle, which indicates that the XenServer is connected.
5. In the navigation pane, click the name of the XenServer on which you want to install NetScaler VPX instance.
6. On the VM menu, click Import.

7. In the Import dialog box, in Import file name, browse to the location at which you saved the NetScaler VPX instance .xva image file. Make sure that the Exported VM option is selected, and then click Next.

8. Select the XenServer on which you want to install the virtual appliance, and then click Next.

9. Select the local storage repository in which to store the virtual appliance, and then click Import to begin the import process.

10. You can add, modify, or delete virtual network interfaces as required. When finished, click Next.

11. Click Finish to complete the import process.

   Note: To view the status of the import process, click the Log tab.

12. If you want to install another virtual appliance, repeat steps 5 through 11.

   **Note**

   After the initial configuration of the VPX instance, if you want to upgrade the appliance to the latest software release, see Upgrading or Downgrading the System Software.

---

**Configure VPX instances to use single root I/O virtualization (SR-IOV) network interfaces**

December 18, 2018

After you have installed and configured a NetScaler VPX instance on XenServer, you can configure the virtual appliance to use SR-IOV network interfaces.

**Limitations**

XenServer does not support the following features on SRIOV interfaces:

- L2 mode switching
- Clustering
- Admin partitioning [Shared VLAN mode]
- High Availability [Active - Active mode]
- Jumbo frames
- IPv6 protocol in Cluster environment

**Prerequisites**

On the XenServer host, ensure that you:
NetScaler 11.1

- Add the Intel 82599 Network Interface Card (NIC) to the host.
- Blacklist the ixgbevf driver by adding the following entry to the `/etc/modprobe.d/blacklist.conf` file:
  ```
  blacklist ixgbevf
  ```
- Enable SR-IOV Virtual Functions (VFs) by adding the following entry to the `/etc/modprobe.d/ixgbe` file:
  ```
  options ixgbe max_vfs=<number_of_VFs>
  ```
  where `<number_of_VFs>` is the number of SR-IOV VFs that you want to create.
- Verify that SR-IOV is enabled in BIOS.

IXGBE driver version 3.22.3 is recommended.

### Assign SR-IOV VFs to the VPX instance by using the XenServer host

To assign SR-IOV network interfaces to NetScaler VPX instance, follow these steps:

1. On the XenServer host, use the following command to assign the SR-IOV VFs to the NetScaler VPX instance:
   ```bash
   xe host-call-plugin plugin=iovirt host-uuid=<Xen host UUID> fn=assign_free_vf args:uuid=<Netcaler VM UUID> args:ethdev=<interface name> args:mac=<mac addr>
   ```
   Where:
   - `<Xen host UUID>` is the UUID of the XenServer host.
   - `<Netcaler VM UUID>` is the UUID of the NetScaler VPX instance.
   - `<interface name>` is the interface for the SR-IOV VFs.
   - `<mac addr>` is the mac address of the SR-IOV VF.

   **Note**
   Specify the mac address that you want use in the `args:mac=` parameter, if not specified, the iovirt script randomly generates and assigns a mac address. Also, if you want use the SR-IOV VFs in Link Aggregation mode, make sure that you specify the mac address as 00:00:00:00:00:00.

2. Boot the NetScaler VPX instance.

### Unassign SR-IOV VFs to the VPX instance by using the XenServer host

If you have assigned an incorrect SR-IOV VFs or if you want modify the a assigned SR-IOV VFs, you need to unassign and reassign the SR-IOV VFs to the NetScaler VPX instance.

To unassign SR-IOV network interface assigned to a NetScaler VPX instance, follow these steps:
1. On the XenServer host, use the following command to assign the SR-IOV VFs to the NetScaler VPX instance and reboot the NetScaler VPX instance:

   ```bash
   xe host-call-plugin plugin=iovirt host-uuid=<Xen_host_UUID> fn=unassign_all args:uuid=<Netscalar_VM_UUID>
   ```

   Where:
   - `<Xen_host_UUID>` - The UUID of the XenServer host.
   - `<Netscalar_VM_UUID>` - The UUID of the NetScaler VPX instance

2. Boot the NetScaler VPX instance.

### Configuring VLAN on the SR-IOV Interface

**Important**

While you are assigning the SR-IOV VFs to the NetScaler VPX instance, make sure that you specify MAC address 00:00:00:00:00:00 for the VFs.

To use the SR-IOV virtual functions in link aggregation mode, you need to disable spoof checking for virtual functions that you have created. On the XenServer host, use the following command to disable spoof checking:

   ```bash
   ip link set <interface_name> vf <VF_id> spoofchk off
   ```

   Where:
   - `<interface_name>` is the interface name.
   - `<VF_id>` is the virtual function ID.

After disabling spoof checking for all the Virtual Function that you have created, restart the NetScaler VPX instance and configure link aggregation. For instructions, see [Configure link aggregation](#).

### Configure VLAN on the SR-IOV Interface

You can configure VLAN on the SR-IOV Virtual Functions, for instructions, see [Configuring a VLAN](#).

**Important**

Make sure that the XenServer host does not contain VLAN settings for the VF interface.

### Install a NetScaler VPX instance on VMware ESX

December 18, 2018

Before installing NetScaler VPX instances on VMware ESX, make sure that VMware ESX Server is installed on a machine
with adequate system resources. To install a NetScaler VPX instance on VMware ESXi, you use VMware vSphere client. The client or tool must be installed on a remote machine that can connect to VMware ESX through the network.

This section includes the following topics:

- Prerequisites
- Installing a NetScaler VPX instance on VMware ESX

**Important**

You cannot install standard VMware Tools or upgrade the VMware Tools version available on a NetScaler VPX instance. VMware Tools for a NetScaler VPX instance are delivered as part of the NetScaler software release.

**Prerequisites**

Before you begin installing a virtual appliance, do the following:

- Install VMware ESX on hardware that meets the minimum requirements.
- Install VMware Client on a management workstation that meets the minimum system requirements.
- Download the NetScaler VPX appliance setup files.
- Label the physical network ports of VMware ESX.
- Obtain VPX license files. For more information about NetScaler VPX instance licenses, see the *NetScaler VPX Licensing Guide* at [http://support.citrix.com/article/ctx131110](http://support.citrix.com/article/ctx131110).

**VMware ESX hardware requirements**

The following table describes the minimum system requirements for VMware ESX servers running NetScaler VPX ncore virtual appliance.

<table>
<thead>
<tr>
<th>Component</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>2 or more 64-bit x86 CPUs with virtualization assist (Intel-VT or AMD-V) enabled. Note that to run NetScaler VPX instance, hardware support for virtualization must be enabled on the VMware ESX host. Make sure that the BIOS option for virtualization support is not disabled. For more information, see your BIOS documentation.</td>
</tr>
<tr>
<td>RAM</td>
<td>3 GB</td>
</tr>
<tr>
<td>Disk space</td>
<td>40 GB of disk space available</td>
</tr>
<tr>
<td>Network</td>
<td>One 1-Gbps NIC; Two 1-Gbps NICs recommended (The network interfaces must be Intel</td>
</tr>
</tbody>
</table>
For information about installing VMware ESX, see [http://www.vmware.com/](http://www.vmware.com/).

The following table lists the virtual computing resources that the VMware ESX server must provide for each VPX ncore virtual appliance.

Table 2. Minimum virtual computing resources required for running a NetScaler VPX instance

<table>
<thead>
<tr>
<th>Component</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Memory</td>
<td>2 GB</td>
</tr>
<tr>
<td>Virtual CPU (VCPU)</td>
<td>2</td>
</tr>
<tr>
<td>Virtual network interfaces</td>
<td>1. Note that with ESX, you can install a maximum of 10 virtual network interfaces if the VPX hardware is upgraded version to 7 or higher.</td>
</tr>
<tr>
<td>Disk space</td>
<td>20 GB</td>
</tr>
</tbody>
</table>

Note that this is in addition to any disk requirements for the hypervisor.

For production use of VPX virtual appliance, the full memory allocation must be reserved. CPU cycles (in MHz) equal to at least the speed of one CPU core of the ESX should also be reserved.

**VMware vSphere client system requirements**

VMware vSphere is a client application that can run on Windows and Linux operating systems. It cannot run on the same machine as the VMware ESX server. The following table describes the minimum system requirements.

Table 3. Minimum system requirements for VMware vSphere client installation

<table>
<thead>
<tr>
<th>Component</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Operating system</td>
<td>For detailed requirements from VMware, search for the “vSphere Compatibility Matrixes” PDF file at <a href="http://kb.vmware.com/">http://kb.vmware.com/</a>.</td>
</tr>
<tr>
<td>CPU</td>
<td>750 megahertz (MHz); 1 gigahertz (GHz) or faster recommended</td>
</tr>
<tr>
<td>RAM</td>
<td>1 GB; 2 GB recommended</td>
</tr>
<tr>
<td>Network Interface Card (NIC)</td>
<td>100 Mbps or faster NIC</td>
</tr>
</tbody>
</table>
OVF Tool 1.0 system requirements

OVF Tool is a client application that can run on Windows and Linux systems. It cannot run on the same machine as the VMware ESX server. The following table describes the minimum system requirements.

Table 4. Minimum system requirements for OVF tool installation

<table>
<thead>
<tr>
<th>Component</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Operating system</td>
<td>For detailed requirements from VMware, search for the “OVF Tool User Guide” PDF file at <a href="http://kb.vmware.com/">http://kb.vmware.com/</a>.</td>
</tr>
<tr>
<td>CPU</td>
<td>750 MHz minimum, 1 GHz or faster recommended</td>
</tr>
<tr>
<td>RAM</td>
<td>1 GB Minimum, 2 GB recommended</td>
</tr>
<tr>
<td>Network Interface Card (NIC)</td>
<td>100 Mbps or faster NIC</td>
</tr>
</tbody>
</table>

Downloading the NetScaler VPX setup files

The NetScaler VPX instance setup package for VMware ESX follows the Open Virtual Machine (OVF) format standard. You can download the files from MyCitrix.com. You need a My Citrix account to log on. If you do not have a My Citrix account, access the home page at [http://www.mycitrix.com](http://www.mycitrix.com), click the New Users link, and follow the instructions to create a new My Citrix account.

Once logged on, navigate the following path from the My Citrix home page:

MyCitrix.com > Downloads > NetScaler > Virtual Appliances.

Copy the following files to a workstation on the same network as the ESX server. Copy all three files into the same folder.

- NSVPX-ESX-<release number>-<build number>-disk1.vmdk (for example, NSVPX-ESX-9.3-39.8-disk1.vmdk)
- NSVPX-ESX-<release number>-<build number>.ovf (for example, NSVPX-ESX-9.3-39.8.ovf)
- NSVPX-ESX-<release number>-<build number>.mf (for example, NSVPX-ESX-9.3-39.8.mf)
Label the physical network ports of VMware ESX

Before installing a VPX virtual appliance, label all the interfaces that you plan to assign to virtual appliances, in a unique format, for example, NS_NIC_1_1, NS_NIC_1_2, and so on. In large deployments, labeling in a unique format helps in quickly identifying the interfaces that are allocated to the VPX virtual appliance among other interfaces used by other virtual machines, such as Windows and Linux. Such labeling is especially important when different types of virtual machines share the same interfaces.

To label the physical network ports of VMware ESX server, follow these steps:

1. Log on to the VMware ESX server by using the vSphere client.
2. On the vSphere client, select the Configuration tab, and then click Networking.
3. At the top-right corner, click Add Networking.
4. In the Add Network Wizard, for Connection Type, select Virtual Machine, and then click Next.
5. Scroll through the list of vSwitch physical adapters, and choose the physical port that will map to interface 1/1 on the virtual appliances.
6. Enter the label of the interface, for example, NS_NIC_1_1 as the name of the vSwitch that will be associated with interface 1/1 of the virtual appliances.
7. Click Next to finish the vSwitch creation. Repeat the procedure, beginning with step 2, to add any additional interfaces to be used by your virtual appliances. Label the interfaces sequentially, in the correct format (for example, NS_NIC_1_2).

Install a NetScaler VPX instance on VMware ESX

After you have installed and configured VMware ESX, you can use the VMware vSphere client to install virtual appliances on the VMware ESX server. The number of virtual appliances that you can install depends on the amount of memory available on the hardware that is running VMware ESX.

To install NetScaler VPX instances on VMware ESX by using VMware vSphere Client, follow these steps:

1. Start the VMware vSphere client on your workstation.
2. In the IP address / Name text box, type the IP address of the VMware ESX server that you want to connect to.
3. In the User Name and Password text boxes, type the administrator credentials, and then click Login.
4. On the File menu, click Deploy OVF Template.
5. In the Deploy OVF Template dialog box, in Deploy from file, browse to the location at which you saved the NetScaler VPX instance setup files, select the .ovf file, and click Next.
6. Map the networks shown in the virtual appliance OVF template to the networks that you configured on the ESX host. Click Next to start installing a virtual appliance on VMware ESX. When installation is complete, a pop-up window informs you of the successful installation.
7. You are now ready to start the NetScaler VPX instance. In the navigation pane, select the NetScaler VPX instance that you have just installed and, from the right-click menu, select **Power On**. Click the **Console** tab to emulate a console port.

8. If you want to install another virtual appliance, repeat steps 6 through 6.

**Note**

By default, the NetScaler VPX instance uses E1000 network interfaces.

After the installation, you can use vSphere client or vSphere Web Client to manage virtual appliances on VMware ESX.

For more information about installing a NetScaler VPX appliance on VMware ESX, see the following video.

---

**Configure a NetScaler VPX instance to use VMXNET3 network interface**

January 6, 2019

After you have installed and configured the NetScaler VPX instance on the VMware ESX, you can use the VMware vSphere web client to configure the virtual appliance to use VMXNET3 network interfaces.

To configure NetScaler VPX instances to use VMXNET3 network interfaces by using the VMware vSphere Web Client:

1. In the vSphere Web Client, select Hosts and Clusters.
2. Upgrade the Compatibility setting of the NetScaler VPX instance to ESX, as follows:
   a. Power off the NetScaler VPX instance.
   b. Right-click the NetScaler VPX instance and select Compatibility > Upgrade VM Compatibility.
   c. In the Configure VM Compatibility dialog box, select ESXi 5.5 and later from the Compatible with drop-down list and click OK.
3. Right-click on the NetScaler VPX instance and click Edit Settings.
4. In the `<virtual_appliance>` - Edit Settings dialog box, click the CPU section.
5. In the CPU section, update the following:
   - Number of CPUs
   - Number of Sockets
   - Reservations
   - Limit
   - Shares
Set the values as follows:

- In the CPU drop-down list, select the number of CPUs to assign to the virtual appliance.
- In the Cores per Socket drop-down list, select the number of sockets.
- (Optional) In the CPU Hot Plug field, select or unselect the Enable CPU Hot Add checkbox.
  Note: Citrix recommends accepting the default (disabled).
- In the Reservation drop-down list, select the number that is shown as the maximum value.
- In the Limit drop-down list, select the number that is shown as the maximum value.
- In the Shares drop-down lists, select Custom and the number that is shown as the maximum value.

6. In the Memory section, update the following:

- Size of RAM
- Reservations
- Limit
- Shares

Set the values as follows:

- In the RAM drop-down list, select the size of the RAM. It should be number of vCPUs x 2 GB. For example, if the number of vCPUs is 4, the RAM should be 4 x 2 GB = 8 GB.
  Note: For an Enterprise or Platinum edition of the NetScaler VPX appliance, make sure that you allocate 4 GB of RAM to each vCPU. For example, if the number of vCPU is 4 then RAM = 4 x 4 GB = 16 GB.
- In the Reservation drop-down list, enter the value for the memory reservation, and select the Reserve all guest memory (All locked) checkbox. The memory reservation should be the number of vCPUs x 2 GB. For example, if the number of vCPUs is 4, the memory reservation should be 4 x 2 GB = 8 GB.
  Note: For an Enterprise or Platinum edition of the NetScaler VPX appliance, make sure that you allocate 4 GB of RAM to each vCPU. For example, if the number of vCPU is 4 then RAM = 4 x 4 GB = 16 GB.
- In the Limit drop-down list, select the number that is shown as the maximum value.
- In the Shares drop-down lists, select Custom and the number that is shown as the maximum value.

7. Add a VMXNET3 network interface. From the New device drop-down list, select Network and click Add.

8. In the New Network section, from the drop-down list, select the network interface, and do the following:
- In the Adapter Type drop-down list, select VMXNET3.
Important

The default E1000 network interface and VMXNET3 cannot coexist, make sure that you remove the E1000 network interface and use VMXNET3 (0/1) as the management interface.

9. Click OK.

11. Once the NetScaler VPX instance powers on, you can use the following command to verify the configuration:

```
> show interface summary
```

The output should show all the interfaces that you configured:

```
> show interface summary

<table>
<thead>
<tr>
<th>Interface</th>
<th>MTU</th>
<th>MAC</th>
<th>Suffix</th>
</tr>
</thead>
<tbody>
<tr>
<td>0/1</td>
<td>1500</td>
<td>00:0c:29:89:1d:0e</td>
<td>NetScaler Virtual Interface, VMXNET3</td>
</tr>
<tr>
<td>1/1</td>
<td>9000</td>
<td>00:0c:29:89:1d:18</td>
<td>NetScaler Virtual Interface, VMXNET3</td>
</tr>
<tr>
<td>1/2</td>
<td>9000</td>
<td>00:0c:29:89:1d:22</td>
<td>NetScaler Virtual Interface, VMXNET3</td>
</tr>
<tr>
<td>LO/1</td>
<td>9000</td>
<td>00:0c:29:89:1d:0e</td>
<td>Netscaler Loopback</td>
</tr>
</tbody>
</table>
```

Note

After you add a VMXNET3 interface and restart the NetScaler VPX appliance, the VMWare ESX hypervisor might change the order in which the NIC is presented to the VPX appliance. So, network adapter 1 might not always remain 0/1, resulting in loss of management connectivity to the VPX appliance. To avoid this issue, change the virtual network of the network adapter accordingly. This is a VMWare ESX hypervisor limitation.

Configure a NetScaler VPX instance to use SR-IOV network interface

January 6, 2019

After you have installed and configured the NetScaler VPX instance on VMware ESX, you can use the
NetScaler 11.1

VMware vSphere web client to configure the virtual appliance to use single root I/O virtualization (SR-IOV) network interfaces.

Limitations

A NetScaler VPX configured with SR-IOV network interface has the following limitations:

- The following features are not supported on SR-IOV interfaces using Intel 82599 10G NIC on ESX VPX:
  - L2 mode switching
  - Static Link Aggregation and LACP
  - Clustering
  - Admin partitioning [Shared VLAN mode]
  - High Availability [Active - Active mode]
  - Jumbo frames
  - IPv6

- The following features are not supported for on SR-IOV interface with an Intel 82599 10G NIC on KVM VPX:
  - Static Link Aggregation and LACP
  - L2 mode switching
  - Clustering
  - Admin partitioning [Shared VLAN mode]
  - High Availability [Active – Active mode]
  - Jumbo frames
  - IPv6
  - VLAN configuration on Hypervisor for SR-IOV VF interface through “ip link” command is not supported

Prerequisite

Make sure that you:

- Add the Intel 82599 Network Interface Card (NIC) to the ESX Host. IXGBE driver version 3.7.13.7.14iov is recommended.

- Enable SR-IOV on the host physical adapter, as follows:

  1. In the vSphere Web Client, navigate to the Host.
  2. On the Manage > Networking tab, select Physical adapters. The SR-IOV Status field shows whether a physical adapter supports SR-IOV.
  3. Select the physical adapter, and then click the pencil icon to open the Edit Settings dialog box.
4. Under SR-IOV, select **Enabled** from the **Status** drop-down list.

5. In the **Number of virtual functions** field, enter the number of virtual functions that you want to configure for the adapter.

6. Click **OK**.

7. Restart the host.

- Create a Distributed Virtual Switch (DVS) and Portgroups. For instructions, see the VMware Documentation.

**Note**

Citrix has qualified the SR-IOV configuration on DVS and Portgroups only.

**To configure NetScaler VPX instances to use SR-IOV network interface by using VMware vSphere Web Client:**

1. In the vSphere Web Client, select **Hosts and Clusters**.

2. Upgrade the Compatibility setting of the NetScaler VPX instance to ESX 5.5 or later, as follows:
   a. Power off the NetScaler VPX instance.
   b. Right-click the NetScaler VPX instance and select **Compatibility > Upgrade VM Compatibility**.
   c. In the **Configure VM Compatibility** dialog box, select **ESXi 5.5 and later** from the **Compatible with** drop-down list and click **OK**.

3. Right-click on the NetScaler VPX instance and click **Edit Settings**.

4. In the `<virtual_appliance>- Edit Settings` dialog box, click the **CPU** section.

5. In the **CPU** section, update the following settings:
   - Number of CPUs
   - Number of Sockets
   - Reservations
   - Limit
   - Shares

Set the values as follows:
   a. In the **CPU** drop-down list, select the number of CPUs to assign to the virtual appliance.
   b. In the **Cores per Socket** drop-down list, select the number of sockets.
   c. (Optional) In the **CPU Hot Plug** field, select or clear the **Enable CPU Hot Add** check box.

   **Note**: Citrix recommends accepting the default (disabled).
   d. In the **Reservation** drop-down list, select the number that is shown as the maximum value.
e. In the **Limit** drop-down list, select the number that is shown as the maximum value.

f. In the **Shares** drop-down lists, select **Custom** and the number that is shown as the maximum value.

6. In the **Memory** section, update the following settings:

   - **Size of RAM**
   - **Reservations**
   - **Limit**
   - **Shares**

   Set the values as follows:

   a. In the **RAM** drop-down list, select the size of the RAM. It should be number of vCPUs x 2 GB. For example, if the number of vCPU is 4 then \( \text{RAM} = 4 \times 2 \text{ GB} = 8 \text{ GB} \).

   **Note:** For Enterprise or Platinum edition of the NetScaler VPX appliance, make sure that you allocate 4 GB of RAM to each vCPU. For example, if the number of vCPU is 4 then \( \text{RAM} = 4 \times 4 \text{ GB} = 16 \text{ GB} \).

   b. In the **Reservation** drop-down list, enter the value for the memory reservation, and select the **Reserve all guest memory (All locked)** check box. The memory reservation should be number of vCPUs x 2 GB. For example, if the number of vCPUs is 4, the memory reservation should be \( 4 \times 2 \text{ GB} = 8 \text{ GB} \).

   **Note:** For Enterprise or Platinum edition of the NetScaler VPX appliance, make sure that you allocate 4 GB of RAM to each vCPU. For example, if the number of vCPU is 4 then \( \text{RAM} = 4 \times 4 \text{ GB} = 16 \text{ GB} \).

   c. In the **Limit** drop-down list, select the number that is shown as the maximum value.

   d. In the **Shares** drop-down lists, select **Custom**, and select the number that is shown as the maximum value.

7. Add an SR-IOV network interface. From the **New device** drop-down list, select **Network** and click **Add**.

8. In the **New Network** section. From the drop-down list, select the Portgroup that you created, and do the following:

   a. In the **Adapter Type** drop-down list, select **SR-IOV passthrough**.

   b. In the **Physical function** drop-down list, select the physical adapter mapped with the Portgroup.

   c. In the **Guest OS MTU Change** drop-down list, select **Disallow**.

9. In the `<virtual_appliance> - Edit Settings` dialog box, click the **VM Options** tab.

10. On the **VM Options** tab, select the **Advanced** section. From the **Latency Sensitivity** drop-down list, select **High**.
NetScaler 11.1

11. Click **OK**.

13. Once the NetScaler VPX instance powers on, you can use the following command to verify the configuration:

```
> show interface summary
```

The output should show all the interfaces that you configured:

```
> show interface summary

<table>
<thead>
<tr>
<th>Interface</th>
<th>MTU</th>
<th>MAC</th>
<th>Suffix</th>
</tr>
</thead>
<tbody>
<tr>
<td>0/1</td>
<td>1500</td>
<td>00:0:c:29:1b:81:0b</td>
<td>NetScaler Virtual</td>
</tr>
<tr>
<td>10/1</td>
<td>1500</td>

```
Migrating the NetScaler VPX from E1000 to SR-IOV or VMXNET3 Network Interfaces

December 18, 2018

You can configure your exiting NetScaler VPX instances that use E1000 network interfaces to use SR-IOV or VMXNET3 network interfaces.

To configure an existing NetScaler VPX instance to use SR-IOV network interfaces, see Configuring NetScaler VPX instances to use Single Root I/O Virtualization (SR-IOV) Network Interface.

To configure an existing NetScaler VPX instance to use VMXNET3 network interfaces, see Configuring NetScaler VPX instances to use VMXNET3 Network Interface.

Configure a NetScaler VPX instance to use PCI passthrough network interface

January 6, 2019

Overview

After you have installed and configured a NetScaler VPX instance on VMware ESX Server, you can use the vSphere Web Client to configure the virtual appliance to use PCI passthrough network interfaces.

The PCI passthrough feature allows a guest virtual machine to directly access physical PCI and PCIe devices connected to a host.

Prerequisites

- The firmware version of the Intel XL710 NIC on the host is 5.04.
- A PCI passthrough device connected to and configured on the host
- Supported NICs:
  - Intel X710 10G NIC
  - Intel XL710 Dual Port 40G NIC
  - Intel XL710 Single Port 40G NIC
Configure passthrough devices on a host

Before configuring a passthrough PCI device on a virtual machine, you should configure it on the host machine. Follow these steps to configure passthrough devices on a host.

1. Select the host from the Navigator panel of the vSphere Web Client.
2. Click Manage > Settings > PCI Devices. All available passthrough devices are displayed.
3. Right-click the device that you want to configure and click Edit.
4. The Edit PCI Device Availability window appears.
5. Select the devices to be used for passthrough and click OK.
6. Restart the host machine.

Configure passthrough devices on a NetScaler VPX instance

Follow these steps to configure a passthrough PCI device on a NetScaler VPX instance.

1. Power off the virtual machine.
2. Right-click the virtual machine and select Edit Settings.
3. On the Virtual Hardware tab, select PCI Device from the New Device drop-down menu, and click Add.
4. Expand New PCI device and select the passthrough device to connect to the virtual machine from the drop-down list and click OK.

Note

VMXNET3 network interface and PCI Passthrough Network Interface cannot coexist.

6. Power on the guest virtual machine.

You have completed the steps to configuring NetScaler VPX to use PCI passthrough network interfaces.

Install a NetScaler VPX instance on Microsoft Hyper-V server

December 18, 2018

To install Citrix NetScaler VPX instances on Microsoft Windows Server, you must first install Windows Server, with the Hyper-V role enabled, on a machine with adequate system resources. While installing the Hyper-V role, be sure to specify the network interface cards (NICs) on the server that Hyper-V will use to create the virtual networks. You can reserve some NICs for the host. Use Hyper-V Manager to perform the NetScaler VPX instance installation.
NetScaler VPX instance for Hyper-V is delivered in virtual hard disk (VHD) format. It includes the default configuration for elements such as CPU, network interfaces, and hard-disk size and format. After you install NetScaler VPX instance, you can configure the network adapters on virtual appliance, add virtual NICs, and then assign the NetScaler IP address, subnet mask, and gateway, and complete the basic configuration of the virtual appliance.

After the initial configuration of the VPX instance, if you want to upgrade the appliance to the latest software release, see Upgrade a NetScaler VPX standalone appliance

**Note**

Intermediate System-to-Intermediate System (ISIS) protocol is not supported on the NetScaler VPX virtual appliance hosted on the HyperV-2012 platform.

### Prerequisites for installing NetScaler VPX instance on Microsoft servers

Before you begin installing a virtual appliance, do the following:

- Download the virtual appliance setup files.
- Obtain NetScaler VPX instance license files. For more information about NetScaler VPX instance licenses, see the [NetScaler VPX Licensing Guide](http://support.citrix.com/article/ctx131110) at [http://support.citrix.com/article/ctx131110](http://support.citrix.com/article/ctx131110).

### Microsoft server hardware requirements

The following table describes the minimum system requirements for Microsoft Servers.

<table>
<thead>
<tr>
<th>Component</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>CPU</td>
<td>1.4 GHz 64-bit processor</td>
</tr>
<tr>
<td>RAM</td>
<td>3 GB</td>
</tr>
<tr>
<td>Disk Space</td>
<td>32 GB or greater</td>
</tr>
</tbody>
</table>

The following table lists the virtual computing resources for each NetScaler VPX instance.

<table>
<thead>
<tr>
<th>Component</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>CPU</td>
<td></td>
</tr>
<tr>
<td>RAM</td>
<td></td>
</tr>
<tr>
<td>Disk Space</td>
<td></td>
</tr>
</tbody>
</table>
**NetScaler 11.1**

<table>
<thead>
<tr>
<th>Component</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAM</td>
<td>2 GB</td>
</tr>
<tr>
<td>Virtual CPU</td>
<td>2</td>
</tr>
<tr>
<td>Disk Space</td>
<td>20 GB</td>
</tr>
<tr>
<td>Virtual Network Interfaces</td>
<td>1</td>
</tr>
</tbody>
</table>

**Download the NetScaler VPX setup files**

NetScaler VPX instance for Hyper-V is delivered in virtual hard disk (VHD) format. You can download the files from MyCitrix.com. You will need a My Citrix account to log on. If you do not have a My Citrix account, access the home page at [http://www.mycitrix.com](http://www.mycitrix.com), click the New Users link, and follow the instructions to create a new My Citrix account.

To download the NetScaler VPX instance setup files, follow these steps:

1. In a Web browser, go to [http://www.citrix.com](http://www.citrix.com) and click My Citrix.
2. Type your user name and password.
3. Click Downloads.
4. In Search Downloads by Product, select NetScaler.
5. Under Virtual Appliances, click NetScaler VPX.
6. Copy the compressed file to your server.

**Install the NetScaler VPX instance on Microsoft servers**

After you have enabled the Hyper-V role on Microsoft Server and extracted the virtual appliance files, you can use Hyper-V Manager to install NetScaler VPX instance. After you import the virtual machine, you need to configure the virtual NICs by associating them to the virtual networks created by Hyper-V.

You can configure a maximum of eight virtual NICs. Even if the physical NIC is DOWN, the virtual appliance assumes that the virtual NIC is UP, because it can still communicate with the other virtual appliances on the same host (server).

**Note**

You cannot change any settings while the virtual appliance is running. Shut down the virtual appliance and then make changes.

**To install NetScaler VPX instance on Microsoft Server by using Hyper-V Manager:**
1. To start Hyper-V Manager, click **Start**, point to **Administrative Tools**, and then click **Hyper-V Manager**.

2. In the navigation pane, under **Hyper-V Manager**, select the server on which you want to install NetScaler VPX instance.

3. On the **Action** menu, click **Import Virtual Machine**.

4. In the **Import Virtual Machine** dialog box, in **Location**, specify the path of the folder that contains the NetScaler VPX instance software files, and then select **Copy the virtual machine (create a new unique ID)**. This folder is the parent folder that contains the Snapshots, Virtual Hard Disks, and Virtual Machines folders.

5. Note: If you received a compressed file, make sure that you extract the files into a folder before you specify the path to the folder.

6. Click **Import**.

7. Verify that the virtual appliance that you imported is listed under **Virtual Machines**.

8. To install another virtual appliance, repeat steps 2 through 6.

**Important**

Make sure that you extract the files to a different folder in step 4.

**Auto-provision a NetScaler VPX instance on Hyper-V**

Auto-provisioning of NetScaler VPX instance is optional. If auto-provisioning is not done, the virtual appliance provides an option to configure the IP address and so on.

To auto-provision NetScaler VPX instance on Hyper-V, follow these steps.

1. Create an ISO9660 compliant ISO image using the xml file as depicted in the example. Make sure that the name of the xml file is **userdata**.

```xml
<?xml version="1.0" encoding="UTF-8" standalone="no"?>
<Environment xmlns:oe="http://schemas.dmtf.org.ovf/environment/1"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
oe:id=""
xmlns="http://schemas.dmtf.org.ovf/environment/1">
  <PlatformSection>
  <Kind>HYPER-V</Kind>
  <Version>2013.1</Version>
  <Vendor>CISCO</Vendor>
  <Locale>en</Locale>
</PlatformSection>
```
2. Copy the ISO image to Hyper-V server.

3. Select the virtual appliance that you imported, and then on the Action menu, select Settings. You can also select the virtual appliance and then right click and select Settings. The Settings window for the selected virtual appliance is displayed.

4. In the Settings window, under the hardware section, click on IDE Controller.

5. In the right window pane, select DVD Drive and click on Add. The DVD Drive is added under the IDE Controller section in the left window pane.

6. Select the DVD Drive added in step 5. In the right window pane, select the Image file radio button and click on Browse and select the ISO image that you copied on Hyper-V server, in step 2.

7. Click Apply.

**Note**

The virtual appliance instance comes up in the default IP address, when:

- The DVD drive is attached and the ISO file is not provided.
- The ISO file does not include the userdata file.
- The userdata file name or format is not correct.

To configure virtual NICs on the NetScaler VPX instance, follow these steps:

1. Select the virtual appliance that you imported, and then on the Action menu, select Settings.
2. In the Settings for <virtual appliance name> dialog box, click Add Hardware in the left pane.
3. In the right pane, from the list of devices, select Network Adapter.
4. Click Add.
5. Verify that Network Adapter (not connected) appears in the left pane.
6. Select the network adapter in the left pane.
7. In the right pane, from the **Network** drop-down list, select the virtual network to connect the adapter to.
8. To select the virtual network for additional network adapters that you want to use, repeat steps 6 and 7.
9. Click **Apply**, and then click **OK**.

**To configure the NetScaler VPX instance:**

1. Right-click the virtual appliance that you previously installed, and then select **Start**.
2. Access the console by double-clicking the virtual appliance.
3. Type the NetScaler IP address, subnet mask, and gateway for your virtual appliance.

You have completed the basic configuration of your virtual appliance. Type the IP address in a Web browser to access the virtual appliance.

---

**Install a NetScaler VPX instance on Linux-KVM platform**

December 18, 2018

To set up a NetScaler VPX for the Linux-KVM platform, you can use the graphical Virtual Machine Manager (Virt-Manager) application. If you prefer the Linux-KVM command line, you can use the virsh program.

The host Linux operating system must be installed on suitable hardware by using virtualization tools such as KVM Module and QEMU. The number of virtual machines (VMs) that can be deployed on the hypervisor depends on the application requirement and the chosen hardware.

After you provision a NetScaler VPX instance, you can add additional interfaces.

**Limitations and usage guidelines**

**General recommendations**

To avoid unpredictable behavior, apply the following recommendations:

- Do not change the MTU of the vnet interface associated with the VPX VM. Shut down the VPX VM before modifying any configuration parameters, such as Interface modes or CPU.
- Do not force a shutdown of the VPX VM. That is, do not use the **Force off** command.
- Any configurations done on the host Linux might or might not be persistent, depending on your Linux distribution settings. You can choose to make these configurations persistent to ensure consistent behavior across reboots of host Linux operating system.
The NetScaler package has to be unique for each of the NetScaler VPX instance provisioned.

Limitations

Live migration of a VPX instance that runs on KVM is not supported.

Prerequisites for installing a NetScaler VPX instance on Linux-KVM platform

December 18, 2018

Check the minimum system requirements for a Linux-KVM serves running a NetScaler VPX instance.

CPU requirement:

- 64-bit x86 processors with the hardware virtualization features included in the AMD-V and Intel VT-X processors.

To test whether your CPU supports Linux host, enter the following command at the host Linux shell prompt:

```bash
  egrep '^flags.*(vmx|svm)'/proc/cpuinfo
```

If the BIOS settings for the above extension are disabled, you must enable them in BIOS.

- Provide at least 2 CPU cores to Host Linux.
- There is no specific recommendation for processor speed, but higher the speed, the better the performance of the VM application.

Memory (RAM) requirement:

Minimum 4 GB for the host Linux kernel. Add additional memory as required by the VMs.

Hard disk requirement:

Calculate the space for Host Linux kernel and VM requirements. A single NetScaler VPX VM requires 20 GB of disk space.

Software requirements

The Host kernel used must be a 64-bit Linux kernel, release 2.6.20 or later, with all virtualization tools. Citrix recommends newer kernels, such as 3.6.11-4 and later.

Many Linux distributions such as Red Hat, Centos, and Fedora, have tested kernel versions and associated virtualization tools.
**Guest VM hardware requirements**

NetScaler VPX supports IDE and virtIO hard disk type. The Hard Disk Type has been configured in the XML file, which is a part of the NetScaler package.

**Networking requirements**

NetScaler VPX supports virtIO para-virtualized, SR-IOV, and PCI Passthrough network interfaces.

For more information about the supported network interfaces, see:

- Provision the NetScaler VPX instance by using the Virtual Machine Manager
- Configure a NetScaler VPX instance to use SR-IOV network interfaces
- Configure a NetScaler VPX instance to use PCI passthrough network interfaces

**Source Interface and Modes**

The source device type can be either Bridge or MacVTap. In case of MacVTap, four modes are possible - VEPA, Bridge, Private and Pass-through.

Check the types of interfaces that you can use and the supported traffic types, as given below.

**Bridge:**

- Linux Bridge.
- Ethables and iptables settings on host Linux might filter the traffic on the bridge if you do not choose the correct setting or disable IPtable services.

**MacVTap (VEPA mode):**

- Better performance than a bridge.
- Interfaces from the same lower device can be shared across the VMs.
- Inter-VM communication using the same
- lower device is possible only if upstream or downstream switch supports VEPA mode.

**MacVTap (private mode):**

- Better performance than a bridge.
- Interfaces from the same lower device can be shared across the VMs.
- Inter-VM communication using the same lower device is not possible.

**MacVTap (bridge mode):**

- Better as compared to bridge.
- Interfaces out of same lower device can be shared across the VMs.
- Inter-VM communication using the same lower device is possible, if lower device link is UP.
MacVTap (Pass-through mode):

- Better as compared to bridge.
- Interfaces out of same lower device cannot be shared across the VMs.
- Only one VM can use the lower device.

Note: For best performance by the VPX instance, ensure that the gro and lro capabilities are switched off on the source interfaces.

Properties of source interfaces

Make sure that you switch off the generic-receive-offload (gro) and large-receive-offload (lro) capabilities of the source interfaces. To switch off the gro and lro capabilities, run the following commands at the host Linux shell prompt.

```
ethtool -K eth6 gro off
ethool -K eth6 lro off
```

Example:

```
[root@localhost ~]# ethtool -K eth6
Offload parameters for eth6:
rx-checksumming: on
tx-checksumming: on
scatter-gather: on
tcp-segmentation-offload: on
udp-fragmentation-offload: off
generic-segmentation-offload: on
generic-receive-offload: off
large-receive-offload: off
rx-vlan-offload: on
tx-vlan-offload: on
ntuple-filters: off
```
Example:

If the host Linux bridge is used as a source device, as in the following example, gro and lro capabilities must be switched off on the vnet interfaces, which are the virtual interfaces connecting the host to the guest VMs.

```
[root@localhost ~]# brctl show eth6_br
  bridge name   bridge id     STP enabled interfaces
  eth6_br     8000.00e0ed1861ae no  eth6
                 vnet0
                 vnet2
[root@localhost ~]#
```

In the above example, the two virtual interfaces are derived from the eth6_br and are represented as vnet0 and vnet2. Run the following commands to switch off gro and lro capabilities on these interfaces.

```
ethtool -K vnet0 gro off
ethtool -K vnet2 gro off
ethtool -K vnet0 lro off
ethtool -K vnet2 lro off
```

Promiscuous mode

The promiscuos mode has to be enabled for the following features to work:

- L2 mode
- Multicast traffic processing
- Broadcast
- IPV6 traffic
- VMAC
- Dynamic routing

Use the following command to enable the promicuous mode.
Module required

For better network performance, make sure the vhost_net module is present in the Linux host. To check the existence of vhost_net module, run the following command on the Linux host:

```
lsmod | grep "vhost\_net"
```

If vhost_net is not yet running, enter the following command to run it:

```
modprobe vhost\_net
```

Provision the NetScaler VPX instance by using OpenStack

January 6, 2019

You can provision a NetScaler VPX instance in an Openstack environment either by using the Nova boot command (OpenStack CLI) or Horizon (OpenStack dashboard).

Provisioning a VPX instance, optionally involves using data from the config drive. Config drive is a special configuration drive that attaches to the instance as a CD-ROM device when it boots. This configuration drive can be used to pass networking configuration such as management IP address, network mask, default gateway, and to inject customer scripts.

In a NetScaler appliance, the default authentication mechanism is password based. Now, SSH key-pair authentication mechanism is supported for NetScaler VPX instances on OpenStack environment.

The key-pair (public key and private key) needs to be generated before using Public Key Cryptography mechanism. You can use different mechanisms, such as Horizon, Puttygen.exe for Windows, and ssh-keygen for Linux environment, to generate the key pair. Refer to online documentation of respective mechanisms for more information about generating key pair.
Once a key pair is available, copy the private key to a secure location to which authorized persons will have access. In OpenStack, public key can be deployed on a VPX instance by using Horizon or Nova boot command. When a VPX instance is provisioned by using OpenStack, it first detects that the instance is booting in an OpenStack environment by reading a specific BIOS string. This string is “OpenStack Foundation” and for Red Hat Linux distributions it is stored in /etc/nova/release. This is a standard mechanism that is available in all OpenStack implementations based on KVM hypervisor platform. The drive should have a specific OpenStack label.

If the config drive is detected, the instance attempts to read the network configuration, custom scripts, and SSH key pair if provided.

**Userdata file**

The NetScaler VPX instance uses a customized OVF file, also known as userdata file, to inject network configuration, custom scripts. This file is provided as part of config drive. Here is an example of a customized OVF file.

```xml
<?xml version="1.0" encoding="UTF-8" standalone="no"?>
<Environment xmlns:oe="http://schemas.dmtf.org.ovf/environment/1"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xmlns:cs="http://schemas.dmtf.org.ovf/environment/1"
xmlns:cs="http://schemas.citrix.com/openstack">
<PlatformSection>
<Version>2016.1</Version>
<Vendor>VPX</Vendor>
<Locale>en</Locale>
</PlatformSection>
<PropertySection>
<Property oe:key="com.citrix.netscaler.ovf.version" oe:value="1.0"/>
<Property oe:key="com.citrix.netscaler.platform" oe:value="NSVPX"/>
<Property oe:key="com.citrix.netscaler.orch_env" oe:value="openstack-orch-env"/>
<Property oe:key="com.citrix.netscaler.mgmt.ip" oe:value="10.1.2.22"/>
<Property oe:key="com.citrix.netscaler.mgmt.netmask" oe:value="255.255.255.0"/>
<Property oe:key="com.citrix.netscaler.mgmt.gateway" oe:value="10.1.2.1"/>
</PropertySection>
<cs:ScriptSection>
<cs:Version>1.0</cs:Version>
<ScriptSettingSection xmlns="http://schemas.citrix.com/openstack"
xmlns:i="http://www.w3.org/2001/XMLSchema-instance">
```

© 1999-2018 Citrix Systems, Inc. All rights reserved.
In the OVF file above “PropertySection” is used for NetScaler networking configuration while <cs:ScriptSection> is used to enclose all scripts. <Scripts></Scripts> tags are used to bundle all scripts together. Each script is defined in between <Script> </Script> tags. Each script tag has
following fields/tags:

a) <Type>: Specifies value for script type. Possible values: Shell/Perl/Python/NSLCI (for NetScaler CLI scripts)

b) <Parameter>: Provides parameters to the script. Each script can have multiple <Parameter> tags.

c) <BootScript>: Specifies script execution point. Possible values for this tag: before/after. “before” specifies script will be executed before PE comes up. “after” specifies that the script will be executed after PE comes up.

d) <Text>: Pastes content of a script.

Note

Currently the VPX instance does not take care of sanitization of scripts. As an administrator, you should check the validity of the script.

Not all sections need to be present. Use an empty “PropertySection” to only define scripts to execute on first boot or an empty <cs:ScriptSection> to only define networking configuration.

After the required sections of the OVF file (userdata file) are populated, use that file to provision the VPX instance.

Network configuration

As part of network configuration, the VPX instance reads:

- Management IP address
- Network mask
- Default gateway

After the parameters are successfully read, they are populated in the NetScaler configuration, to allow managing the instance remotely. If the parameters are not read successfully or the config drive is not available, the instance transitions to the default behavior, which is:

- The instance attempts to retrieve the IP address information from DHCP.
- If DHCP fails or times-out, the instance comes up with default network configuration (192.168.100.1/16).

Customer script

The VPX instance allows to execute a custom script during initial provisioning. The appliance supports script of type Shell, Perl, Python, and NetScaler CLI commands.
**SSH key pair authentication**

The VPX instance copies public key, available within the configuration drive as part of instance meta data, into its “authorized_keys” file. This allows the user to access the instance with private key.

**Note**

When an SSH key is provided, the default credentials (nsroot/nsroot) no longer work. If password-based access is needed, log on with the respective SSH private key and manually set a password.

**Before you begin**

Before you provision a VPX instance on OpenStack environment, extract the .qcow2 file from the .tgz file and build an OpenStack image from the qcow2 image. Follow these steps:

1. Extract the .qcow2 file from the .tgz file by typing the following command.

```
1 tar xvzf <TAR file>
2 tar xvzf <NSVPX-KVM-12.0-26.2_nc.tgz>
3 NSVPX-KVM.xml
4 NSVPX-KVM-12.0-26.2_nc.qcow2
```

2. Build an OpenStack image using the .qcow2 file extracted in step 1 by typing the following command.

```
1 openstack image create --container-format bare --property hw_disk_bus=ide --disk-format qcow2 --file <path to qcow2 file> --public <name of the OpenStack image>
2 glance image-create --name="NS-VPX-12-0-26-2" --property hw_disk_bus=ide --ispublic=true --container-format=bare --disk-format=qcow2< NSVPX-KVM-12.0-26.2_nc.qcow2
```

**Figure 1:** The following illustration provides a sample output for the glance image-create command.

**Provisioning the VPX instance**

You can provision a VPX instance in two ways by using one of the options:

- Horizon (OpenStack dashboard)
- Nova boot command (OpenStack CLI)
Provision a VPX instance by using the OpenStack dashboard

Follow these steps to provision the VPX instance by using Horizon:

1. Log on to the OpenStack dashboard.
2. In the Project panel on the left hand side of the dashboard, select Instances.
3. In the Instances panel, click Launch Instance to open the Instance Launching wizard.
4. In the Launch Instance wizard, fill in the details, like:
   1. Instance Name
   2. Instance Flavor
   3. Instance Count
   4. Instance Boot Source
   5. Image Name
5. Deploy a new key pair or an existing key pair through Horizon by completing the following steps:
   a) If you don’t have an existing key pair, create the key by using any existing mechanisms. If you’ve an existing key, skip this step.
   b) Copy the content of public key.
   c) Go to Horizon > Instances > Create New Instances.
   d) Click Access & Security.
   e) Click the + sign next to the Key Pair drop-down menu and provide values for shown parameters.
   f) Paste public key content in Public key box, give a name to the key and click Import Key Pair.
6. Click the Post Creation tab in the wizard. In Customization Script, add the content of the userdata file. The userdata file contains the IP address, Netmask and Gateway details, and customer scripts of the VPX instance.
7. After a key pair is selected or imported, check config-drive option and click Launch.

Provision the VPX instance by using OpenStack CLI

Follow these steps to provision a VPX instance by using OpenStack CLI.

1. To create an image from qcow2, type the following command:

```
openstack image create --container-format bare --property hw_disk_bus=ide --diskformat qcow2 --file NSVPX-OpenStack.qcow2 --public VPX-ToT-Image
```

2. To select an image for creating an instance, type the following command:
3. To create an instance of a particular flavor, type the following command to choose a flavor ID/Name of from a list:

   openstack flavor list

4. To attach a NIC to a particular network, type the following command to choose a network ID from a network list:

   openstack network list

5. To create an instance, type the following command:

   openstack server create --flavor FLAVOR_ID --image IMAGE_ID --key-name KEY_NAME
   --user-data USER_DATA_FILE_PATH --config-drive True --nic net-id=net-uuid
   INSTANCE_NAME
   openstack server create --image VPX-ToT-Image --flavor m1.medium --user-data
   ovf.xml --config-drive True --nic net-id=2734911b-ee2b-48d0-a1b6-3efd44b761b9
   VPX-ToT

**Figure 2**: The following illustration provides a sample output.

**Configure a NetScaler VPX instance to use SR-IOV network interfaces**

January 6, 2019

You can use the Virtual Machine Manager to configure a NetScaler VPX instance running on Linux-KVM to use single root I/O virtualization (SR-IOV) network interfaces with Intel 82599 10G NIC and X710 10G and XL710 40G NICs.

This section describes how to:

- Configure a NetScaler VPX Instance to Use SR-IOV Network Interface
- Configure Static LA/LACP on the SR-IOV Interface
- Configure VLAN on the SR-IOV Interface
Limitations

Keep the limitations in mind while using Intel 82599, X710, XL710 NICs. The following features not supported.

Limitations for Intel 82599 NICs:

- L2 mode switching
- Admin partitioning (shared VLAN mode)
- High availability (active-active mode)
- Jumbo Frames.
- IPv6: You can configure only up to 30 unique IPv6 addresses in a VPX instance if you’ve atleast one SR-IOV interface.
- VLAN configuration on Hypervisor for SRIOV VF interface through “ip link” command is not supported.
- Interface parameter configurations such as speed, duplex, and autonegotiations are not supported.

Limitations for X710 10G and XL710 40G NICs:

- L2 mode switching.
- In a cluster, Jumbo Frames are not supported when the XL710 NIC is used as a data interface.
- Interface list re-orders when interfaces are disconnected and reconnected.
- Interface parameter configurations such as speed, duplex, and auto negotiations are not supported.
- Interface name is 40/X for both XL710 and X710 NICs
- Up to 16 Intel XL710/X710 SRIOV or PCI Passthrough interfaces can be supported on a VPX instance.

Note: For IPv6 to work with X710 10G and XL710 40G NICs, you need to enable trust mode on the Virtual Functions (VFs) by typing the following command on the KVM host:

```
## ip link set <PNIC> <VF> trust on
```

For example:

```
## ip link set ens785f1 vf 0 trust on
```

Prerequisites

Before you configure a NetScaler VPX instance to use SR-IOV network interfaces, complete the following prerequisite tasks. See the NIC column for details about about how to complete the corresponding tasks.
<table>
<thead>
<tr>
<th>Task</th>
<th>82599 NIC</th>
<th>X710 and XL710 NICs</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Add the NIC to the KVM host.</td>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>2. Download and install the latest Intel driver.</td>
<td>IXGE driver</td>
<td>I40E driver</td>
</tr>
<tr>
<td>3. Blacklist the driver on the KVM host.</td>
<td>Add the following entry in the /etc/modprobe.d/blacklist.conf file: <code>blacklist ixgbevf</code>. Use IXGE driver version 4.3.15 (recommended).</td>
<td>Add the following entry in the /etc/modprobe.d/blacklist.conf file: <code>blacklist i40evf</code>. Use i40e driver version 2.0.26 (recommended).</td>
</tr>
<tr>
<td>4. Enable SR-IOV Virtual Functions (VFs) on the KVM host. In both the commands in the next two columns: <code>number_of_VFs</code> = the number of Virtual VFs that you want to create. <code>device_name</code> = the interface name.</td>
<td>If you are using earlier version of kernel 3.8, then add the following entry to the /etc/modprobe.d/ixgbe file and restart the KVM host: <code>*options ixgbe max_vfs=*</code>. If you are using kernel 3.8 version or later, create VFs using the following command: <code>*echo &gt; /sys/class/net/device/sriov_numvfs*</code>. See example in figure 1.</td>
<td>If you are using earlier version of kernel 3.8, then add the following entry to the /etc/modprobe.d/i40e.conf file and restart the KVM host: <code>*options i40e max_vfs=*</code>. If you are using kernel 3.8 version or later, create VFs using the following command: <code>*echo &gt; /sys/class/net/device/sriov_numvfs*</code>. See example in figure 2.</td>
</tr>
<tr>
<td>5. Make the VFs persistent by adding the commands that you used to create VFs, to the rc.local file.</td>
<td>See example in figure 3.</td>
<td>See example in figure 3.</td>
</tr>
</tbody>
</table>

**Important**

When you create the SR-IOV VFs, ensure that you do not assign MAC addresses to the VFs.

**Figure 1:** Enable SR-IOV VFs on the KVM host for 82599 10G NIC.

**Figure 2:** Enable SR-IOV VFs on the KVM host for X710 10G and XL710 40G NICs.

**Figure 3:** Make the VFs persistent.
Configure a NetScaler VPX instance to use SR-IOV network interface

To configure NetScaler VPX instance to use SR-IOV network interface by using Virtual Machine Manager, complete these steps:

1. Power off the NetScaler VPX instance.
2. Select the NetScaler VPX instance and then select Open.
   1. In the <virtual_machine on KVM> window, select the icon.
   1. Select Add Hardware.
   5. In the Add New Virtual Hardware dialog box, do the following:
      1. Select PCI Host Device.
      2. In the Host Device section, select the VF you have created and click Finish.

![Figure 4:VF for 82599 10G NIC](image)

![Figure 5: VF for XL710 NIC](image)

6. Repeat Step 4 and 5 to add the VFs that you have created.
7. Power on the NetScaler VPX instance.
8. After the NetScaler VPX instance powers on, use the following command to verify the configuration:

```
> show interface summary
```

The output shows all the interfaces that you configured.

![Figure 6: output summary for 82599.](image)

![Figure 7. Output summary for X710 and XL710 NICs.](image)

Configure static LA/LACP on the SR-IOV interface

Important

When you are creating the SR-IOV VFs, ensure that you do not assign MAC addresses to the VFs.

To use the SR-IOV VFs in link aggregation mode, disable spoof checking for VFs that you have created. On the KVM host, use the following command to disable spoof checking:

```
*ip link set \<interface\>\_name\> vf \<VF\>\_id\> spoofchk off*
```

Where:

- Interface_name – is the interface name.
VF_id – is the Virtual Function id.

For example:

After you disable spoof checking for all the VFs that you have created. Restart the NetScaler VPX instance and configure link aggregation. For detailed instructions, see Configure Link Aggregation.

**Configuring VLAN on the SR-IOV Interface**

You can configure VLAN on SR-IOV VFs. For detailed instructions, see Configuring a VLAN.

**Important**

Ensure that the KVM host does not contain VLAN settings for the VF interface.

**Configure a NetScaler VPX instance to use PCI passthrough network interfaces**

January 6, 2019

After you have installed and configured a NetScaler VPX instance on the Linux-KVM platform, you can use the Virtual Machine Manager to configure the virtual appliance to use PCI passthrough network interfaces.

**Prerequisites**

- The firmware version of the Intel XL710 Network Interface Card (NIC) on the KVM Host is 5.04.
- The KVM Host supports input–output memory management unit (IOMMU) and Intel VT-d, and they are enabled in the BIOS of the KVM Host. On the KVM Host, to enable IOMMU, add the following entry to the `/boot/grub2/grub.cfg` file:

```
intel_iommu=1
```

- Execute the following command and reboot the KVM Host:

```
Grub2-mkconfig –o /boot/grub2/grub.cfg
```

To configure NetScaler VPX instances to use PCI passthrough network interfaces by using the Virtual Machine Manager:

1. Power off the NetScaler VPX instance.
2. Select the NetScaler VPX instance and click **Open**.
3. In the `<virtual_machine on KVM>` window, click the **i** icon.
4. Click **Add Hardware**.
5. In the **Add New Virtual Hardware** dialog box, do the following:
   a. Select **PCI Host Device**.
   b. In the **Host Device** section, select the Intel XL710 physical function.
   c. Click **Finish**.

6. Repeat steps 4 and 5 to add any additional Intel XL710 physical functions.

7. Power on the NetScaler VPX instance.

8. Once the NetScaler VPX instance powers on, you can use the following command to verify the configuration:

   The output should show all the interfaces that you configured:

---

**Provision the NetScaler VPX instance by using the virsh program**

December 18, 2018

The virsh program is a command line tool for managing VM Guests. Its functionality is similar to that of Virtual Machine Manager. It enables you to change a VM Guest’s status (start, stop, pause, and so on), to set up new Guests and devices, and to edit existing configurations. The virsh program is also useful for scripting VM Guest management operations.

To provision NetScaler VPX by using the virsh program, follow these steps:

1. Use the tar command to untar the NetScaler VPX package. The NSVPX-KVM-*_nc.tgz package contains following components:
   - The Domain XML file specifying VPX attributes [NSVPX-KVM-*_nc.xml]
   - Check sum of NS-VM Disk Image [Checksum.txt]
   - NS-VM Disk Image [NSVPX-KVM-*_nc.raw]

   Example:

   ```
   1 tar -xvzf NSVPX-KVM-10.1-117_nc.tgz
   2 NSVPX-KVM-10.1-117_nc.xml
   3 NSVPX-KVM-10.1-117_nc.raw
   4 checksum.txt
   ```

2. Copy the NSVPX-KVM-*_nc.xml XML file to a file named `<DomainName>-NSVPX-KVM-*_nc.xml`. The `<DomainName>` is also the name of the virtual machine. Example:

   ```
   1 cp NSVPX-KVM-10.1-117_nc.xml NetScaler-VPX-NSVPX-KVM-10.1-117_nc.xml
   ```

---

© 1999-2018 Citrix Systems, Inc. All rights reserved.
3. Edit the `<DomainName>-NSVPX-KVM-*_nc.xml` file to specify the following parameters:

- **name**— Specify the name.
- **mac**— Specify the MAC address.
  Note: The domain name and the MAC address have to be unique.
- **sourcefile**— Specify the absolute disk-image source path. The file path has to be absolute.
  You can specify the path of the RAW image file or a QCOW2 image file.
  If you want to specify a RAW image file, specify the disk image source path as shown in the following example:

  **Example:**
  ```xml
  <name>NetScaler-VPX</name>
  <macaddress='52:54:00:29:74:b3'/>
  <sourcefile='/root/NSVPX-KVM-10.1-117_nc.raw'/>
  ```

  Specify the absolute QCOW2 disk-image source path and define the driver type as `qcow2`, as shown in the following example:

  **Example:**
  ```xml
  <name>NetScaler-VPX</name>
  <macaddress='52:54:00:29:74:b3'/>
  <drivername='qemu' type='qcow2'/>
  <sourcefile='/root/NSVPX-KVM-10.1-117_nc.qcow'/>
  ```

4. Edit the `<DomainName>-NSVPX-KVM-*_nc.xml` file to configure the networking details:

- **source dev**— specify the interface.
- **mode**— specify the mode. The default interface is `Macvtap Bridge`.

**Example:** Mode: MacVTap Bridge Set target interface as ethx and mode as bridge Model type as `virtio`

```
<interface type='direct'>
  <mac address='52:54:00:29:74:b3'/>
  <source dev='eth0' mode='bridge'/>
  <target dev='macvtap0'/>
  <model type='virtio'/>
  <alias name='net0'/>
  <address type='pci' domain='0x0000' bus='0x00' slot='0x03' function='0x0'/>
</interface>
```

Here, eth0 is the physical interface attached to the VM.

5. Define the VM attributes in the `<DomainName>-NSVPX-KVM-*_nc.xml` file by using the following command: `virsh define <DomainName>-NSVPX-KVM-*_nc.xml`

**Example:**
Start the VM by entering following command:

```
virsh start [<DomainName>] <DomainUUID>]
```

Example:

```
virsh start NetScaler-VPX
```

Connect the Guest VM through the console

```
virsh console [<DomainName>] <DomainUUID> <DomainID>]
```

Example:

```
virsh console NetScaler-VPX
```

**Add additional interfaces to NetScaler VPX instance using virsh program**

After you have provisioned the NetScaler VPX on KVM, you can add additional interfaces.

To add additional interfaces, follow these steps:

1. Shut down the NetScaler VPX instance running on the KVM.

```
Edit the <DomainName>-NSVPX-KVM-*_nc.xml file using the command: virsh edit [<DomainName>]
```

2. 

3. In the <DomainName>-NSVPX-KVM-*_nc.xml file, append the following parameters:

   a) **For MacVTap**

   - Interface type— Specify the interface type as ‘direct’.
   - Mac address— Specify the Mac address and make sure the MAC address is unique across the interfaces.
   - source dev— Specify the interface name.
   - mode— Specify the mode; the modes supported are - Bridge, VEPA, Private, and Pass-through
   - model type— Specify the model type as virtio

© 1999-2018 Citrix Systems, Inc. All rights reserved.
Example:

Mode: MacVTap Pass-through

Set target interface as ethx, Mode as bridge, and model type as virtio

```xml
1 <interface type='direct'>
2   <mac address='52:54:00:29:74:b3'/>
3   <source dev='ethx' mode='passthrough'/>
4   <model type='virtio'/>
5 </interface>
```

Here eth1 is the physical interface attached to the VM.

b) **For Bridge Mode**

Note: Make sure that you have configured a Linux bridge in the KVM host, bound the physical interface to the bridge, and put the bridge in the UP state.

- Interface type— Specify the interface type as ‘bridge’.
- Mac address— Specify the Mac address and make sure the MAC address is unique across the interfaces.
- source bridge— Specify the bridge name.
- model type— Specify the model type as virtio

Example: Bridge Mode

```xml
1 <interface type='bridge'>
2   <mac address='52:54:00:2d:43:a4'/>
3   <source bridge='br0'/>
4   <model type='virtio'/>
5 </interface>
```

**Manage the NetScaler VPX guest VMs**

January 6, 2019

You can use the Virtual Machine Manager and the virsh program to perform management tasks such as starting or stopping a VM Guest, setting up new guests and devices, editing existing configurations, and connecting to the graphical console through Virtual Network Computing (VNC).
Manage the VPX guest VMs by using Virtual Machine Manager

• List the VM guests

The main Window of the Virtual Machine Manager displays a list of all the VM Guests for each VM host server it is connected to. Each VM Guest entry contains the virtual machine’s name, along with its status (Running, Paused, or Shutoff) displayed as icon.

• Open a graphical console

Opening a Graphical Console to a VM Guest enables you to interact with the machine like you would with a physical host through a VNC connection. To open the graphical console in the Virtual Machine Manager, right-click the VM Guest entry and select the Open option from the pop-up menu.

• Start and shut down a guest

You can start or stop a VM Guest from the Virtual Machine Manager. To change the state of the VM, right-click the VM Guest entry and select Run or one of the Shut Down options from the pop-up menu.

• Reboot a guest

You can reboot a VM Guest from the Virtual Machine Manager. To reboot the VM, right-click the VM Guest entry, and then select Shut Down > Reboot from the pop-up menu.

• Delete a guest

Deleting a VM Guest removes its XML configuration by default. You can also delete a guest’s storage files. Doing so completely erases the guest.

1. In the Virtual Machine Manager, right-click the VM Guest entry.
2. Select Delete from the pop-up menu. A confirmation window opens.
   Note: The Delete option is enabled only when the VM Guest is shut down.
3. Click Delete.
4. To completely erase the guest, delete the associated .raw file by selecting the Delete Associated Storage Files check box.

Manage the NetScaler VPX guest VMs using the virsh program

• List the VM Guests and their current states.

To use virsh to display information about the Guests

virsh list –all

The command output displays all domains with their states.

Example output:
<table>
<thead>
<tr>
<th>Id</th>
<th>Name</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Domain-0</td>
<td>running</td>
</tr>
<tr>
<td>1</td>
<td>Domain-1</td>
<td>paused</td>
</tr>
<tr>
<td>2</td>
<td>Domain-2</td>
<td>inactive</td>
</tr>
<tr>
<td>3</td>
<td>Domain-3</td>
<td>crashed</td>
</tr>
</tbody>
</table>

- Open a virsh console.
  
  Connect the Guest VM through the console
  
  ```
  virsh console [<DomainID> | <DomainName> | <DomainUUID>]
  ```
  
  Example:
  ```
  virsh console NetScaler-VPX
  ```

- Start and shut down a guest.
  
  Guests can be started using the DomainName or Domain-UUID.
  
  ```
  virsh start [<DomainName> | <DomainUUID>]
  ```
  
  Example
  ```
  virsh start NetScaler-VPX
  ```

  **To shut down a guest:**
  
  ```
  virsh shutdown [<DomainID> | <DomainName> | <DomainUUID>]
  ```
  
  Example:
  ```
  virsh shutdown NetScaler-VPX
  ```

- Reboot a guest
  
  ```
  virsh reboot [<DomainID> | <DomainName> | <DomainUUID>]
  ```
  
  Example:
  ```
  virsh reboot NetScaler-VPX
  ```

Delete a guest

To delete a Guest VM you need to shut-down the Guest and un-define the `<DomainName>-NSVPX-KVM-*_nc.xml` before you run the delete command.

```bash
1 virsh shutdown [<DomainID> | <DomainName> | <DomainUUID>]
2 virsh undefine [<DomainName> | <DomainUUID>]
```

Example:
```
1 virsh shutdown NetScaler-VPX
2 virsh undefine NetScaler-VPX
```

Note: The delete command doesn’t remove disk image file which needs to be removed manually.
Microsoft Azure Resource Manager (ARM) is a management framework that allows administrators to deploy, manage and monitor Azure resources. Azure Resource Manager can handle these tasks as a group, rather than individually, in a single operation.

The NetScaler VPX virtual appliance is available as an image in the Microsoft Azure Marketplace. When you deploy NetScaler VPX on Microsoft Azure Resource Manager (ARM), you can leverage the Azure cloud computing capabilities and use NetScaler load balancing and traffic management features for your business needs. You can deploy NetScaler VPX instances on Azure Resource Manager either as standalone instances or as high availability pairs in active-active or active-standby modes.

This document assumes that you are familiar with Azure terminology and network details. For information about Microsoft Azure services, see Microsoft Azure Documentation Center.

This document also assumes that you have basic knowledge of a NetScaler appliance. For detailed information about NetScaler appliances, see:

- NetScaler
- NetScaler Gateway

This document provides information about:

- Network Architecture
- How NetScaler VPX Works on Azure
- Traffic Flow through Port Address Translation
- Traffic Flow through Network Address Translation
- Port Usage Guidelines
- Limitations

Network Architecture

In ARM, a NetScaler VPX virtual machine (VM) resides in a virtual network. A virtual Network Interface Card (NIC) is created on each NetScaler VM. The network security group (NSG) configured in the virtual network is bound to the NIC, and together they control the traffic flowing into the VM and out of the VM.

The NSG forwards the requests to the NetScaler VPX instance, and the VPX instance sends them to the servers. The response from a server follows the same path in reverse. The NSG can be configured to control a single VPX VM, or, with subnets and virtual networks, can control traffic in multiple VPX VM deployment.

The NIC contains network configuration details such as the virtual network, subnets, internal IP address, and Public IP address.

While on ARM, it is good to know the following IP addresses used to access the VMs:

- Public IP (PIP) address is the Internet-facing IP address configured directly on the virtual NIC of the NetScaler VM. This allows you to directly access a VM from the external network without the need to configure inbound and outbound rules on the NSG.
- NetScaler IP (NSIP) address is internal IP address configured on the VM. It is non-routable.
- Virtual IP address (VIP) is configured by using the NSIP and a port number. Clients access NetScaler services through the PIP address, and when the request reaches the NIC of the NetScaler VPX VM or the Azure load balancer, the VIP gets translated to internal IP (NSIP) and internal port number.
- Internal IP address is the private internal IP address of the VM from the virtual network’s address space pool. This IP address cannot be reached from the external network. This IP address is by default dynamic unless you set it to static. Traffic from the internet is routed to this address according to the rules created on the NSG. The NSG works with the NIC to selectively send the right type of traffic to the right port on the NIC, which depends on the services configured on the VM.

The following figure shows how traffic flows from a client to a server through a NetScaler VPX instance provisioned in ARM.

How NetScaler VPX Works on Azure

In an on-premises deployment, a NetScaler VPX instance requires at least three IP addresses:

- Management IP address, called the NetScaler IP (NSIP) address
- Subnet IP (SNIP) address for communicating with the server farm
NetScaler 11.1

- Virtual server IP (VIP) address for accepting client requests

In an Azure deployment, you can provision a NetScaler VPX instance in Azure in two ways:

- With a multi-NIC, multi-IP architecture
- With a single-IP architecture

**Note**
VPX virtual appliances can be deployed on any instance type that has two or more cores and more than 2GB memory.

The following image illustrates how multiple IP addresses are used to perform the functions of NSIP, SNIP, and VIP, with a single NIC in a standalone deployment. According to your requirement, you can configure multiple NICs with different IP addresses.

For more information about NetScaler multi-NIC, multi-IP deployment on Azure, see the following links:

- Configuring Multiple IPs for a NetScaler VPX Appliance in Standalone Mode
- Configuring Multiple Azure NICs and IPs in NetScaler VPX in an HA Mode

In single IP mode the three IP functions of a NetScaler appliance are multiplexed onto one IP address. This single IP address is assigned to an instance during provisioning through DHCP, and it is a private (internal) address and it uses different port numbers to function as the NSIP, SNIP, and VIP.

The following image illustrates how a single IP address is used to perform the functions of NSIP, SNIP, and VIP.

**Note**
The single IP mode is available only in Azure deployments. This mode is not available for a NetScaler VPX instance on your premises, on AWS, or in other type of deployment.

**Traffic Flow through Port Address Translation**

In an Azure deployment, when you provision the NetScaler VPX instance as a virtual machine (VM), Azure assigns a public IP (PIP) address and an internal IP address (non-routable) to the NetScaler virtual machine. Inbound and Outbound rules are defined on the NSG for the NetScaler instance, along with a public port and a private port for each rule defined. The NetScaler instance listens on the internal IP address and private port.

Any external request is received on the NetScaler VPX VM’s virtual NIC. The NIC is bound to the NSG, which specifies the private IP and private port combination into which to translate the request’s destination address and port (the public IP address and port). ARM performs port address translation (PAT) to map the Public IP address and port to the internal IP address and private port of the NetScaler virtual machine, and forwards the traffic to the virtual machine.
The following figure shows how Azure performs port address translation to direct traffic to the NetScaler internal IP address and private port.

In this example, the Public IP address assigned to the VM is 140.x.x.x, and the internal IP address is 10.x.x.x. When the inbound and outbound rules are defined, public HTTP port 80 is defined as the port on which the client requests are received, and a corresponding private port, 10080, is defined as the port on which the NetScaler virtual machine listens. The client request is received on the Public IP address 140.x.x.x at port 80. Azure performs port address translation to map this address and port to internal IP address 10.x.x.x on private port 10080 and forwards the client request.

For information about port usage guidelines while, see Port Usage Guidelines.

For information about NSG and access control lists, see What is a Network Security Group?

Traffic Flow Through Network Address Translation

You can also request a Public IP (PIP) address for your NetScaler virtual machine (instance level). If you use this direct PIP at the VM level, you need not define inbound and outbound rules to intercept the network traffic. The incoming request from the Internet is received on the VM directly. Azure performs network address translation (NAT) and forwards the traffic to the internal IP address of the NetScaler instance.

The following figure shows how Azure performs network address translation to map the NetScaler internal IP address.

In this example, the Public IP assigned to the NSG is 140.x.x.x and the internal IP address is 10.x.x.x. When the inbound and outbound rules are defined, public HTTP port 80 is defined as the port on which the client requests are received, and a corresponding private port, 10080, is defined as the port on which the NetScaler virtual machine listens. The client request is received on the Public IP address (140.x.x.x). Azure performs network address translation to map the PIP to the internal IP address 10.x.x.x on port 10080, and forwards the client request.

Note

NetScaler VPX VMs in high availability are controlled by external or internal load balancers that have inbound rules defined on them to control the load balancing traffic. The external traffic is first intercepted by these load balancers and the traffic is diverted according to the load balancing rules configured, which has backend pools, NAT rules, and health probes defined on the load balancers.

Port Usage Guidelines

You can configure additional inbound and outbound rules n NSG while creating the NetScaler virtual machine or after the virtual machine is provisioned. Each inbound and outbound rule is associated
with a public port and a private port.

Before configuring NSG rules, note the following guidelines regarding the port numbers you can use:

1. The following ports are reserved by the NetScaler virtual machine. You cannot define these as private ports when using the Public IP address for requests from the Internet.
   Ports 21, 22, 80, 443, 8080, 67, 161, 179, 500, 520, 3003, 3008, 3009, 3010, 3011, 4001, 5061, 9000, 7000.
   However, if you want Internet-facing services such as the VIP to use a standard port (for example, port 443) you have to create port mapping by using the NSG. The standard port is then mapped to a different port that is configured on the NetScaler for this VIP service.
   For example, a VIP service might be running on port 8443 on the NetScaler instance but be mapped to public port 443. So, when the user accesses port 443 through the Public IP, the request is actually directed to private port 8443. However, if you want Internet-facing services such as the VIP to use a standard port (for example, port 443) you have to create port mapping by using the NSG. The standard port is then mapped to a different port that is configured on the NetScaler for this VIP service.
   **Note:** If you access the NetScaler instance in Network Access mode (Full SSL VPN), you need to map the private port 8443 to the public port 8443.

2. Public IP address does not support protocols in which port mapping is opened dynamically, such as passive FTP or ALG.

3. High availability does not work for traffic that uses a public IP address (PIP) associated with a VPX instance, instead of a PIP configured on the Azure load balancer. For more information about configuring NetScaler VPX HA in ARM, see [Configuring NetScaler VPX in High Availability Mode in Azure Resource Manager](#) and [Configuring Multiple Azure NICs and IP Addresses for NetScaler VPX Instances in HA Mode](#).

4. In a NetScaler Gateway deployment, you need not configure a SNIP address, because the NSIP can be used as a SNIP when no SNIP is configured.
   You must configure the VIP address by using the NSIP address and some nonstandard port number. For call-back configuration on the backend server, the VIP port number has to be specified along with the VIP URL (for example, url:port).

**Note**

In Azure Resource Manager, a NetScaler VPX instance is associated with two IP addresses - a public IP address (PIP) and an internal IP address. While the external traffic connects to the PIP, the internal IP address or the NSIP is non-routable. To configure VIP in VPX, use the internal IP address (NSIP) and any of the free ports available. Do not use the PIP to configure VIP.

Example: If NSIP of a NetScaler VPX is 10.1.0.3 and an available free port is 10022, then you can configure VIP by providing the 10.1.0.3:10022 (NSIP address+port) combination.
Limitations

Running the NetScaler VPX load balancing solution on ARM imposes the following limitations:

1. The Azure architecture does not accommodate support for the following NetScaler features:
   - Clustering
   - IPv6
   - Gratuitous ARP (GARP)
   - L2 Mode
   - Tagged VLAN
   - Dynamic Routing
   - Virtual MAC (VMAC)
   - USIP
   - CloudBridge Connector

2. If you expect that you might have to shut down and temporarily deallocate the NetScaler VPX virtual machine at any time, assign a static Internal IP address while creating the virtual machine. If you do not assign a static internal IP address, Azure might assign the virtual machine a different IP address each time it restarts, and the virtual machine might become inaccessible.

3. In an Azure deployment, only the following NetScaler VPX models are supported: VPX 10, VPX 25, VPX 200, VPX 1000, and VPX 3000. For more information, see the NetScaler VPX Data Sheet. If you use a NetScaler VPX instance with a model number higher than VPX 3000, the network throughput might not be the same as specified by the instance’s license. However, other features, such as SSL throughput and SSL transactions per second, might improve.

4. The “deployment ID” that is generated by Azure during virtual machine provisioning is not visible to the user in ARM. You cannot use the deployment ID to deploy NetScaler VPX appliance on ARM.

5. Active-passive or active-standby HA mode is not supported for VPX configured with multiple NICs and multiple IP addresses.

6. The NetScaler VPX appliance supports 5 Mb/s throughput and standard edition features when it’s initialized.

7. For a XenApp and XenDesktop deployment, a VPN virtual server on a NetScaler appliance can be configured in the following modes:
   - Basic mode, where the ICAOnly VPN virtual server parameter is set to ON. The Basic mode works fully on an unlicensed NetScaler VPX instance.
• Smart-Access mode, where the ICAOnly VPN virtual server parameter is set to OFF. The Smart-Access mode works for only 5 AAA session users on an unlicensed NetScaler VPX instance.

Note
To configure the Smart Control feature, you must apply a platinum license to the NetScaler VPX instance.

Configure a NetScaler VPX standalone instance

January 18, 2019

You can provision a single NetScaler VPX instance in Azure Resource Manager (ARM) portal in a standalone mode by creating the virtual machine and configuring other resources.

Before you begin

Make sure that you have the following:

• A Microsoft Azure user account
• Access to Microsoft Azure Resource Manager
• Microsoft Azure SDK
• Microsoft Azure PowerShell

On the Microsoft Azure Portal page, log on to the Azure Resource Manager portal by providing your user name and password.

Note
In ARM portal, clicking an option in one pane opens a new pane to the right. Navigate from one pane to another to configure your device.

Summary of configuration steps

1. Configure a resource group
2. Configure a network security group
3. Configure virtual network and its subnets
4. Configure a storage account
5. Configure an availability set
6. Configure a NetScaler VPX instance
Configure a resource group

Create a new resource group that is a container for all your resources. Use the resource group to deploy, manage, and monitor your resources as a group.

1. Click **New > Management > Resource group**.
2. In the **Resource group** pane, enter the following details:
   - Resource group name
   - Resource group location
3. Click **Create**.

Configure a network security group

Create a network security group (NSG) to assign inbound and outbound rules to control the incoming and outgoing traffic within the virtual network. NSG allows you to define security rules for a single virtual machine and also to define security rules for a virtual network subnet.

1. Click **New > Networking > Network security group**.
2. In the **Create network security group** pane, enter the following details, and then click **Create**.
   - Name - type a name for the security group
   - Resource group - select the resource group from the drop-down list

   **Note**
   Ensure that you have selected the correct location. The list of resources that appear in the drop-down list is different for different locations.

Configure a virtual network and subnets

Virtual networks in ARM provide a layer of security and isolation to your services. VMs and services that are part of the same virtual network can access each other.

For these steps to create a virtual network and subnets.

1. Click **New > Networking > Virtual Network**.
2. In the **Virtual Network** pane, ensure the deployment mode is **Resource Manager** and click **Create**.
3. In the **Create virtual network** pane, enter the following values, and then click **Create**.
   - Name of the virtual network
   - Address space - type the reserved IP address block for the virtual network
   - Subnet - type the name of the first subnet (you will create the second subnet later in this step)
   - Subnet address range - type the reserved IP address block of the subnet
   - Resource group - select the resource group created earlier from the drop-down list
Configure the second subnet

1. Select the newly created virtual network from All resources pane and in the Settings pane, click Subnets.
2. Click +Subnet and create the second subnet by entering the following details.
   - Name of the second subnet
   - Address range - type the reserved IP address block of the second subnet
   - Network security group - select the NSG from the drop-down list
3. Click Create.

Configure a storage account

The ARM IaaS infrastructure storage includes all services where we can store data in the form of blobs, tables, queues, and files. You can also create applications using these forms of storage data in ARM.

Create a storage account to store all your data.

1. Click +New > Data + Storage > Storage account.
2. In the Create storage account pane, enter the following details:
   - Name of the account
   - Deployment mode - make sure to select Resource Manager
   - Account kind - select General purpose from the drop-down list
   - Replication - select Locally redundant storage from the drop-down list
   - Resource group - select the newly created resource group from the drop-down list
3. Click Create.

Configure an availability set

An availability set guarantees that at least one VM is kept up and running in case of planned or unplanned maintenance. Two or more VMs under the same ‘availability set’ are placed on different fault domains to achieve redundant services.

1. Click +New.
2. Click See all in the MARKETPLACE pane and click Virtual Machines.
3. Search for availability set, and then select Availability set entity from the list displayed.
4. Click Create, and in the Create availability set pane, enter the following details:
   - Name of the set
   - Resource group - select the newly created resource group from the drop-down list
5. Click Create.
Configure a NetScaler VPX instance

Create an instance of NetScaler VPX in the virtual network. Obtain the NetScaler VPX image from the Azure marketplace, and then use the Azure Resource Manager portal to create a NetScaler VPX instance.

Before you begin creating the NetScaler VPX instance, make sure that you have created a virtual network with required subnets in which the instance will reside. You can create virtual networks during VM provisioning, but without the flexibility to create different subnets. For information about creating virtual networks, see [http://azure.microsoft.com/en-us/documentation/articles/create-virtual-network/](http://azure.microsoft.com/en-us/documentation/articles/create-virtual-network/).

Optionally, configure DNS server and VPN connectivity that allows a virtual machine to access Internet resources.

**Note**
Citrix recommends that you create resource group, network security group, virtual network, and other entities before you provision the NetScaler VPX VM, so that the network information is available during provisioning.

1. Click **+New > Networking**.
2. Click **See All** and in the Networking pane, click **Citrix NetScaler VPX Bring Your Own License**.

As a quick way to find any entity on ARM portal, you can also type the name of the entity in the Azure Marketplace search box and press <Enter>. Type NetScaler in the search box to find the Citrix NetScaler images.

**Note**
Ensure to select the latest image. Your Citrix NetScaler image might have the release number in the name.

3. On the **NetScaler VPX Bring Your Own License** page, from the drop-down list, select **Resource Manager** and click **Create**.

4. In the **Create virtual machine** pane, specify the required values in each section to create a virtual machine. Click **OK** in each section to save your configuration.

**Basic**
- **Name** - specify a name for the NetScaler VPX instance
- **VM disk type** - select SSD (default value) or HDD from the drop-down menu
- **User name and Password** - specify a user name and password to access the resources in the resource group that you have created
- **Authentication Type** - select SSH Public Key or Password
- **Resource group** - select the resource group you have created from the drop-down list

© 1999-2018 Citrix Systems, Inc. All rights reserved.
You can create a resource group here, but Citrix recommends that you create a resource group from Resource groups in Azure Resource Manager and then select the group from the drop-down list.

Size

Depending on the VM disk type, SDD or HDD, you selected in Basic settings, the disk sizes are displayed.

• Select a disk size according to your requirement and click **Select**.

Settings

• Select the default (Standard) disk type
• Storage account - select the storage account
• Virtual network - select the virtual network
• Subnet - set the subnet address
• Public IP address - select the type of IP address assignment
• Network security group - select the security group that you have created. Ensure that inbound and outbound rules are configured in the security group.
• Availability Set - select the availability set from the drop-down box

Summary

The configuration settings are validated and the Summary page displays the result of the validation. If the validation fails, the Summary page displays the reason of the failure. Go back to the particular section and make changes as required. If the validation passes, click **OK**.

Buy

Review the offer details and legal terms on the Purchase page and click **Purchase**.

For high availability deployment, create two independent instances of NetScaler VPX in the same availability set and in the same resource group to deploy them in active-standby and active-active configuration.

**Configure multiple IP addresses for a NetScaler VPX standalone instance**

January 6, 2019

This section explains how to configure a standalone NetScaler VPX instance with multiple IP addresses, in Azure Resource Manager (ARM). The VPX instance can have one or more NIC attached to it, and each NIC can have one or more static or dynamic public and private IP addresses assigned to it. You can assign multiple IP addresses as NSIP, VIP, SNIP, and so on. In a NetScaler instance on Azure, you can assign multiple IP addresses as NSIP, VIP, SNIP, and so on. For more information, see the Azure documentation [Assign multiple IP addresses to virtual machines using the Azure portal](#).
If you want to use PowerShell commands, see Configure multiple IP addresses for a NetScaler VPX instance in standalone mode by using PowerShell commands.

**Use Case**

In this use case, a standalone NetScaler VPX appliance is configured with a single NIC that is connected to a virtual network (VNET). The NIC is associated with three IP configurations (ipconfig), each servers a different purpose - as shown in the table.

<table>
<thead>
<tr>
<th>IPConfig</th>
<th>Associated with</th>
</tr>
</thead>
<tbody>
<tr>
<td>IPConfig-1</td>
<td>Static public IP address; static private IP address</td>
</tr>
<tr>
<td>IPConfig-2</td>
<td>Static public IP address; static private address</td>
</tr>
<tr>
<td>IPConfig-3</td>
<td>Static private IP address</td>
</tr>
</tbody>
</table>

**Note**

IPConfig-3 is not associated with any public IP address.

**Diagram**: Topology

Here is the visual representation of the use case.

**Note**

In a multi-NIC, multi-IP Azure NetScaler VPX deployment, the private IP associated with the primary (first) IPConfig of the primary (first) NIC is automatically added as the management NSIP of the appliance. The remaining private IP addresses associated with IPConfigs need to be added in the NetScaler appliance as a VIP or SNIP by using the “add ns ip” command, according to your requirement.

**Before you begin**

Before you begin, create a VPX instance by following the steps given at this link:

[Configure a NetScaler VPX standalone instance](#)

For this use case, the NSDoc0330VM NetScaler instance is created.

**Procedure to configure multiple IP addresses for a NetScaler VPX instance in standalone mode.**

For configuring multiple IP addresses for a NetScaler VPX appliance in standalone mode:

1. Add IP addresses to the VM
2. Configure NetScaler-owned IP addresses

**Step 1: Add IP addresses to the VM**

1. In the portal, click **More services > type virtual machines** in the filter box, and then click **Virtual machines**.

2. In the **Virtual machines** blade, click the VM you want to add IP addresses to. Click **Network interfaces** in the virtual machine blade that appears, and then select the network interface.

In the blade that appears for the NIC you selected, click **IP configurations**. The existing IP configuration that was assigned when you created the VM, **ipconfig1**, is displayed. For this use case, make sure the IP addresses associated with ipconfig1 are static. Next, create two more IP configurations: ipconfig2 (VIP) and ipconfig3 (SNIP).

To create additional ipconfigs, create **Add**.

In the **Add IP configuration** window, enter a **Name**, specify allocation method as **Static**, enter an IP address (192.0.0.5 for this use case), and enable **Public IP address**.

**Note**
Before adding a static private IP address, check for IP address availability and make sure the IP address belongs to the same subnet to which the NIC is attached.

Next, click **Configure required settings** to create a static public IP addressees for ipconfig2.

By default, public IPs are dynamic. To make sure that the VM always uses the same public IP address, create a static Public IP.

In the Create public IP address blade, add a Name, under Assignment click **Static**. And then click **OK**.

**Note**
Even when you set the allocation method to static, you cannot specify the actual IP address assigned to the public IP resource. Instead, it gets allocated from a pool of available IP addresses in the Azure location the resource is created in.

Follow the steps to add one more IP configuration for ipconfig3. Public IP is not mandatory.

**Step 2: Configure NetScaler-owned IP addresses**

Configure the NetScaler-owned IP addresses by using the NetScaler GUI or the command “add ns ip.” For more information, see [https://docs.citrix.com/en-us/netscaler/11-1/networking/ip-addressing/configuring-netscaler-owned-ip-addresses.html](https://docs.citrix.com/en-us/netscaler/11-1/networking/ip-addressing/configuring-netscaler-owned-ip-addresses.html)

You’ve now configured multiple IP addresses for a NetScaler VPX instance in standalone mode.
Configure a high-availability setup with a single IP address and a single NIC

January 25, 2019

In a Microsoft Azure deployment, a high availability configuration of two NetScaler virtual machines is achieved by using the Azure load balancer, which distributes the client traffic across the virtual servers configured on both the NetScaler instances.

Note

For a NetScaler HA deployment on Azure cloud to work, you need a floating public IP (PIP) that can be moved between the two NetScaler HA nodes. The Azure Load Balancer (ALB) provides that floating PIP, which is moved to the second node automatically in the event of a failover.

Two types of Azure load balancers are available for high availability:

- **Azure external load balancer**: If the client traffic originates from the Internet, you have to deploy the external load balancer between the Internet and the NetScaler VPX instances to distribute client traffic.

- **Azure internal load balancer**: If the client traffic originates from within the virtual network, or is forwarded by a gateway or firewall within the virtual network, you have to deploy the internal load balancer to distribute client traffic.

To achieve high availability on Azure, you must add the two NetScaler VMs as a load balanced set and configure the NSG.

When two NetScaler VPX instances are configured in active-active mode, both instances must have the same configuration. The client traffic is distributed across the virtual servers in both the instances by the Azure load balancer. The VIP addresses in both the instances are different and should match the NSIP of that VPX instance.

The active-passive mode provides failover capability. In this mode, the VPX instances synchronize their configuration states. When the primary instance fails, the secondary instance takes over.

For information about high availability in NetScaler appliance, see [High Availability](#).

**Before You Begin**

Note the following before you begin configuring the NetScaler instances in high availability mode in the Azure virtual network.

- The two NetScaler virtual machines that you want to add to a load balanced set should be provisioned in the same virtual network.
• A load balanced set applies only to a VM’s default NIC. Therefore the VIP has to be configured on the VPX's default NIC.
• In an active-passive deployment, the Azure load balancer monitors both the primary and the secondary NetScaler VM by sending them TCP probes. These TCP probes are sent on port 9000.

Summary of Steps to Configure NetScaler VPX in a High Availability Mode

1. Configure a resource group
2. Configure a network security group
3. Configure virtual network and its subnets
4. Configure a storage account
5. Configure an availability set
6. Configure a NetScaler VPX instance
7. Configure internal and external load balancers
8. Configure health probes
9. Configure backend pools
10. Configure NAT rules
11. Configure load balancing rules

After configuring all the resources, you can configure the VMs in high availability mode with either an external load balancer or with an internal load balancer.

This article provides procedures to configure resources specific to high availability mode. For procedures to configure the other resources, see Configuring NetScaler VPX in a Standalone Mode in Azure Resource Manager.

You need to set up two NetScaler VPX instances for high availability mode. To set up a NetScaler VPX instance, see Configuring a NetScaler VPX Instance.

Configuring Internal and External Load Balancers

Create a load balancer to distribute traffic between the virtual machines that are part of the same virtual network. The load balancing features can load balance level 4 traffic and support only TCP and UDP traffic.

Configuring an Internal Load Balancer

2. In the Create load balancer pane, enter the following details:
   • Name of the load balancer
   • Scheme - select Internal to configure an internal load balancer
Virtual network - select the newly created virtual network from the drop-down list
Subnet - select the associated subnet
IP address assignment - select Static
Private IP address - assign a private IP address for the internal load balancer
Resource group - select the newly created resource group from the drop-down list

3. Click Create.

Configuring an External Load Balancer

1. To create an external load balancer, follow similar steps as creating an internal load balancer with the following differences:
   - Schema - select Public
   - Public IP address - assign a public IP address to the external load balancer
2. Click Create.

Configuring a Health Probe on a Load Balancer

Create custom TCP or HTTP probes to monitor the health of the various server instances. When the VM fails to respond to the probe for three consecutive times, the Azure load balancer will not send the traffic to the nonresponsive VM.

1. Click All resources and search for the load balancer that you created by typing the name in the search box.
2. In the Settings pane, click Probes.
3. Click +Add and in the Add probe pane, enter the following details:
   - Name of the health probe
   - Protocol - select TCP
   - Port - type 9000
   - Set the Interval and Unhealthy threshold limits
4. Click OK.

Configuring a Backend Pool on a Load Balancer

Create backend pools, that is, a pool of IP addresses associated with the virtual machine Network Interface Cards (NIC) to which the load is distributed.

1. Click All resources and search for the load balancer that you have created by typing the name in the search box.
2. In the Settings pane, select Backend pools.
3. Click +Add and in the Add backend pool pane, enter the following details:
   • Name of the backend pool
   • Availability set - select the availability set created earlier
   • Virtual machines - select the NetScaler VPX instances that are in high availability deployment. Press <Ctrl> to select multiple instances.

4. Click OK.

**Configuring a NAT rule on a load balancer**

Create custom NAT rules on LB to define the inbound traffic flowing through the front end IP address and distributed to the back end IP address. Make sure that no two NAT rules has the combination of same service and same target port.

1. Click All resources and search for the load balancer that you have created by typing the name in the search box.
2. In the Settings pane, select Inbound NAT rules.
3. Click +Add and in the Add inbound NAT rule pane, add a NAT rule for each type of request. You can add multiple NAT rules.
4. Enter the following details, and then click OK.
   • Name of the rule
   • Service - select the required service from the drop-down list
   • Port - type the correct port number
   • Target - select the NetScaler VPX that will be the target of this rule
   • Target port - the target port is automatically populated depending on the service selected

   **Note**
   Citrix recommends TCP services for the NetScaler VPX VM on port 9000.

**Configuring a Load Balancing Rule on a Load Balancer**

By creating a load balancer rule, you can define a combination of a front end IP address and port, and back end IP address and port associated with VMs.

For example, create a rule so that all HTTP requests coming on the public IP will be forwarded to the availability set on their port 80.
1. Click All resources and search for the load balancer that you have created by typing the name in the search box.
2. In the Settings pane, select Load balancing rules.
3. Click +Add and in the Add load balancing rules pane, create load balancing rules for each type of incoming network traffic.
4. Enter the following details:
   • Name of the rule
   • Protocol - select the protocol
   • Port - type the port number based on the port selected
   • Backend pool - select the backend pool from the drop-down list
   • Probe - select the health probe from the drop-down list
5. Click OK.

Configuring NetScaler high availability with the Azure external load balancer

If your client traffic originates from the Internet, you have to deploy the external load balancer to create a high availability configuration of NetScaler virtual machines in a load-balanced set.

The following figure shows how high availability is achieved in active-active mode by using the external load balancer. The two NetScaler VMs are in a load-balanced set that accepts client traffic from the Internet over port 15000. The Azure external load balancer load balances these client requests between the two virtual machines.

Before you begin configuring the load-balanced set through the Azure portal, do one of the following:

• For an active-passive deployment, configure the NetScaler virtual machines as primary and secondary nodes by using the following command: `add ha node <ID> <IP address>`.  
• For an active-active deployment, configure the required services on the two NetScaler virtual machines.

Configuring NetScaler high availability with the Azure internal load balancer

If your client traffic originates from within the virtual network with a regional scope, you have to deploy the internal load balancer to achieve high availability of NetScaler virtual machines added to a load-balanced set.

The following figure shows how high availability is achieved in an active-active mode by using the internal load balancer. The two NetScaler virtual machines are in a load-balanced set that accepts
NetScaler 11.1

client traffic from the Internet at port 15001. The Azure internal load balancer load balances these client requests between the two virtual machines.

Before you begin configuring the load-balanced set by using Azure PowerShell, do one of the following:

- For an active-passive deployment, configure the NetScaler virtual machines as primary and secondary nodes by using the following command: `add ha node <ID> <IP address>`.
- For an active-active deployment, configure the required services on the two NetScaler virtual machines.

You can configure the load-balanced set only by using Azure PowerShell.

**Accessing the NetScaler VPX Virtual Machine**

You can access the NetScaler instance either through its graphical user interface (GUI) or through the command line interface (CLI). You can use the PIP to access the NetScaler virtual machine instance.

To log on to the virtual machine, use your username and password specified while creating the virtual machine.

You can change the password after you log on to the instance.

**To access the NetScaler instance through the GUI**

In a browser’s address field, type the virtual network public IP address provided by Azure during virtual machine provisioning, or type the PIP address.

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>Make sure you have created NSG inbound or outbound rules to allow access to the private port 80 or 443 when accessing the GUI by using the virtual network IP.</td>
</tr>
</tbody>
</table>

**To access the NetScaler instance through the CLI**

Use any command line access tool (for example, Putty). Specify either the virtual network public IP address provided by Azure during NetScaler VPX provisioning, or specify the PIP address. Use SSH protocol with port 22.

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>Make sure that you have created NSG inbound or outbound rules to allow access to private port 22 when accessing the CLI by using the virtual network IP.</td>
</tr>
</tbody>
</table>

For information about getting started with a NetScaler appliance, see the Getting Started guide.
NetScaler appliances configured for global server load balancing (GSLB) provide disaster recovery and continuous availability of applications by protecting against points of failure in a wide area network (WAN). GSLB can balance the load across data centers by directing client requests to the closest or best performing data center, or to surviving data centers in case of an outage.

This section describes how to enable GSLB on VPX instances on two sites in a Microsoft Azure environment, by using Windows PowerShell commands.

For more information about GSLB, see Global Server Load Balancing.

You can configure GSLB on a NetScaler VPX instances on Azure, in two steps:

1. Create a VPX instance with multiple NICs and multiple IP addresses, on each site.
2. Enable GSLB on the VPX instances.

For more information about configuring multiple NICs and IP addresses see:

- Configuring Multiple IPs for a NetScaler VPX Appliance in Standalone Mode.
- Configuring Multiple Azure NICs and IPs in NetScaler VPX in an HA Mode

**Use Case**

This use case includes two sites - Site 1 and Site 2. Each site has a VM (VM1 and VM2) configured with multiple NICs, multiple IP addresses, and GSLB.

**Figure.** GSLB setup implemented across two sites - Site 1 and Site 2.

In this use case, each VM has three NICs - NIC 0/1, 1/1, and 1/2. Each NIC can have multiple private and public IP addresses. The NICs are configured for the following purposes.

- NIC 0/1: to serve management traffic
- NIC 1/1: to serve client-side traffic
- NIC 1/2: to communicate with back-end servers

For information about the IP addresses configured on each NIC in this use case, see the IP Configuration Details section.
Parameters

Following are sample parameters settings for this use case in this document. You can use different settings if you wish.

$location="West Central US"
$vnetName="NSVPX-vnet"
$RGName="multiIP-RG"
$prmStorageAccountName="multiipstorageacnt"
$avSetName="MultiIP-avset"
$vmSize="Standard_DS3_V2"

Note: The minimum requirement for a VPX instance is 2 vCPUs and 2GB RAM.

$publisher="citrix"
$offer="netscalervpx111"
$sku="netscalerbyol"
$version="latest"
$vmNamePrefix="MultiIPVPX"
$nicNamePrefix="MultiipVPX"
$osDiskSuffix="osdiskdb"
$numberOfVMs=1
$ipAddressPrefix="10.0.0."
$ipAddressPrefix1="10.0.1."
$ipAddressPrefix2="10.0.2."
$pubIPName1="MultiIP-pip1"
$pubIPName2="MultiIP-pip2"
$IpConfigName1="IPConfig1"
$IPConfigName2="IPConfig-2"
$IPConfigName3="IPConfig-3"
$IPConfigName4="IPConfig-4"
$frontendSubnetName="default"
$backendSubnetName1="subnet_1"
$backendSubnetName2="subnet_2"
$suffixNumber=10

1. Create a multi-NIC, multi-IP VM by Using PowerShell commands

Follow steps 1-10 to create VM1 with multiple NICs and multi IP addresses, by using PowerShell commands:
1. Create resource group
2. Create storage account
3. Create availability set
4. Create virtual network
5. Create public IP address
6. Create NICs
7. Create VM config object
8. Get credentials and set OS properties for the VM
9. Add NICs
10. Specify OS disk and create VM

After you complete all the steps and commands to create VM1, repeat these steps to create VM2 with parameters specific to it.

Create Resource Group

```powershell
New-AzureRMResourceGroup -Name $RGName -Location $location
```

Create Storage Account

```powershell
$prmStorageAccount=New-AzureRMStorageAccount -Name $prmStorageAccountName -ResourceGroupName $RGName -Type Standard_LRS -Location $location
```

Create Availability Set

```powershell
$avSet=New-AzureRMAvailabilitySet -Name $avSetName -ResourceGroupName $RGName -Location $location
```
### Create Virtual Network

1. Add subnets.

   ```powershell
   $subnet1 = New-AzureRmVirtualNetworkSubnetConfig -Name $frontendSubnetName -AddressPrefix "10.0.0.0/24"
   $subnet2 = New-AzureRmVirtualNetworkSubnetConfig -Name $backendSubnetName1 -AddressPrefix "10.0.1.0/24"
   $subnet3 = New-AzureRmVirtualNetworkSubnetConfig -Name $backendSubnetName2 -AddressPrefix "10.0.2.0/24"
   ```

2. Add virtual network object.

   ```powershell
   $vnet = New-AzureRmVirtualNetwork -Name $vnetName -ResourceGroupName $RGName -Location $location -AddressPrefix 10.0.0.0/16 -Subnet $subnet1, $subnet2, $subnet3
   ```

3. Retrieve subnets.

   ```powershell
   $frontendSubnet = $vnet.Subnets | ? { $_.Name -eq $frontendSubnetName }
   $backendSubnet1 = $vnet.Subnets | ? { $_.Name -eq $backendSubnetName1 }
   $backendSubnet2 = $vnet.Subnets | ? { $_.Name -eq $backendSubnetName2 }
   ```

### Create Public IP Address

```powershell
$pip1 = New-AzureRmPublicIpAddress -Name $pubIPName1 -ResourceGroupName $RGName -Location $location -AllocationMethod Dynamic
$pip2 = New-AzureRmPublicIpAddress -Name $pubIPName2 -ResourceGroupName $RGName -Location $location -AllocationMethod Dynamic
```  

### Create NICs

**NIC 0/1**

```powershell
$nic1Name = $nicNamePrefix + $suffixNumber + "-Mgmnt"
$ipAddress1 = $ipAddressPrefix + $suffixNumber
```
NetScaler 11.1

1. `$IPConfig1=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName1 -SubnetId $frontendSubnet.Id -PublicIpAddress $pip1 -PrivateIpAddress $ipAddress1 -Primary`
2. `$nic1=New-AzureRMNetworkInterface -Name $nic1Name -ResourceGroupName $RGName -Location $location -IpConfiguration $IPConfig1`

### NIC 1/1

1. `$nic2Name = $nicNamePrefix + $suffixNumber + "-frontend"`
2. `$ipAddress2 = $ipAddressPrefix1 + ($suffixNumber)`
3. `$ipAddress3 = $ipAddressPrefix1 + ($suffixNumber + 1)`
4. `$IPConfig2=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName2 -PublicIpAddress $pip2 -SubnetId $backendSubnet1.Id -PrivateIpAddress $ipAddress2 -Primary`
5. `$IPConfig3=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName3 -SubnetId $backendSubnet1.Id -PrivateIpAddress $ipAddress3`  
6. `nic2=New-AzureRMNetworkInterface -Name $nic2Name -ResourceGroupName $RGName -Location $location -IpConfiguration $IPConfig2, $IPConfig3`

### NIC 1/2

1. `$nic3Name = $nicNamePrefix + $suffixNumber + "-backend"`
2. `$ipAddress4 = $ipAddressPrefix2 + ($suffixNumber)`
3. `$IPConfig4=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName4 -SubnetId $backendSubnet2.Id -PrivateIpAddress $ipAddress4 -Primary`
4. `$nic3=New-AzureRMNetworkInterface -Name $nic3Name -ResourceGroupName $RGName -Location $location -IpConfiguration $IPConfig2, $IPConfig3`

### Create VM config object

1. `$vmName = $vmNamePrefix`
2. `$vmConfig=New-AzureRMVMConfig -VMName $vmName -VMSize $vmSize -AvailabilitySetId $avSet.Id`

### Get credentials and set OS properties for the VM

1. `$cred=Get-Credential -Message "Type the name and password for VPX login ."`
2. `$vmConfig=Set-AzureRMVMOOperatingSystem -VM $vmConfig -Linux -ComputerName $vmName -Credential $cred`
3. `$vmConfig=Set-AzureRMVMSourceImage -VM $vmConfig -PublisherName $publisher -Offer $offer -Skus $sku -Version $version`
**Add NICs**

1. $vmConfig=Add-AzureRMVMNetworkInterface -VM $vmConfig -Id $nic1.Id - Primary
2. $vmConfig=Add-AzureRMVMNetworkInterface -VM $vmConfig -Id $nic2.Id
3. $vmConfig=Add-AzureRMVMNetworkInterface -VM $vmConfig -Id $nic3.Id

**Specify OS disk and create VM**

1. $osDiskName=$vmName + "-" + $osDiskSuffix
2. $osVhdUri=$prmStorageAccount.PrimaryEndpoints.Blob.ToString() + "vhds/" + $osDiskName + ".vhd"
3. $vmConfig=Set-AzureRMVMOSDisk -VM $vmConfig -Name $osDiskName -VhdUri $osVhdUri -CreateOption fromImage
4. Set-AzureRmVMPlan -VM $vmConfig -Publisher $publisher -Product $offer - Name $sku
5. New-AzureRMVM -VM $vmConfig -ResourceGroupName $RGName -Location $location

**Note**

Repeat steps 1-10 listed in “Create Multi-NIC VMs by Using PowerShell Commands” to create VM2 with parameters specific to VM2.

**IP Configuration details**

In this use case, the following IP addresses are used.

**Table 1. IP addresses used in VM1**

<table>
<thead>
<tr>
<th>NIC</th>
<th>Private IP</th>
<th>Public IP (PIP)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0/1</td>
<td>10.0.0.10</td>
<td>PIP1</td>
<td>Configured as NSIP (management IP)</td>
</tr>
<tr>
<td>1/1</td>
<td>10.0.1.10</td>
<td>PIP2</td>
<td>Configured as SNIP/GSLB Site IP</td>
</tr>
<tr>
<td>1/1</td>
<td>10.0.1.11</td>
<td></td>
<td>Configured as LB server IP; public IP is not mandatory</td>
</tr>
</tbody>
</table>
2. Configure GSLB sites and other necessary GSLB settings

Perform the tasks described in the following topic to configure the two GSLB sites and other necessary settings:

Configuring Global Server Load Balancing (GSLB)
Here is a sample GSLB configuration for this use case.

```
1  enable ns feature LB  GSLB
2  add gslb site site1 10.0.1.10 -publicIP PIP2
3  add gslb site site2 20.0.1.10 -publicIP PIP5
4  add gslb service site1_gslb_http_svc1 10.0.1.11 HTTP 80 -publicIP PIP3
    -publicPort 80 -siteName site1
5  add gslb service site2_gslb_http_svc1 20.0.1.11 HTTP 80 -publicIP PIP6
    -publicPort 80 -siteName site2
6  add gslb vserver gslb_http_vip1 HTTP
7  bind gslb vserver gslb_http_vip1 -serviceName site2_gslb_http_svc1
8  bind gslb vserver gslb_http_vip1 -serviceName site1_gslb_http_svc1
9  bind gslb vserver gslb_http_vip1 -domainName www.gslbindia.com -TTL 5
```

You've configured GSLB on NetScaler VPX instances running on Azure. For additional information about how to configure GSLB on NetScaler VPX instances, see the Configuring Citrix NetScaler GSLB in Microsoft Azure video.

**Configure address pools (IIP) for a Citrix Gateway appliance**

January 18, 2019

In some situations, users who connect with the NetScaler Gateway Plug-in need a unique IP address for NetScaler Gateway. When you enable address pools (also known as IP pooling) for a group, NetScaler Gateway can assign a unique IP address alias to each user. You configure address pools by using intranet IP (IIP) addresses.

You can configure address pools on a NetScaler Gateway deployed on Azure by following this two-step procedure:

- Registering the private IP addresses that will be used in the address pool, in Azure
- Configuring address pools in the NetScaler Gateway appliance

**Register a private IP address in the Azure portal**

In Azure, you can deploy a NetScaler virtual instance with multiple IP addresses. You can add IP addresses to a VPX instance in two ways:

a. While provisioning a VPX instance
For more information about how to add multiple IP addresses while provisioning a VPX instance, see Configuring Multiple IP Addresses for a NetScaler VPX Appliance in Azure Resource Manager. To add IP addresses by using PowerShell commands while provisioning a VPX instance, see Configuring Multiple IP Addresses for a NetScaler VPX Instance in Standalone Mode.

b. After provisioning a VPX instance.

After you’ve provisioned a VPX instance, follow these steps to register a private IP address in the Azure portal, which you configure as an address pool in the NetScaler Gateway appliance.

1. From Azure Resource Manager (ARM), go to the already created NetScaler VPX instance > Network interfaces. Choose the network interface which is bound to a subnet to which the IIP that you want to register belongs.

2. Click IP Configurations, and then click Add.

3. Provide the required details as shown in the example below and click OK.

Configure address pools in the Citrix Gateway appliance

For more information about how to configure address pools on the NetScaler Gateway, see this page.

Limitation: You can not bind a range of IIP addresses to users. Every IIP address that is used in an address pool should be registered.

Configure multiple IP addresses for a NetScaler VPX instance in standalone mode by using PowerShell commands

January 6, 2019

Overview

In an Azure environment, a NetScaler VPX virtual appliance can be deployed with multiple NICs. Each NIC can have multiple IP addresses. This section describes how to deploy a Netscaler VPX instance with a single NIC and multiple IP addresses, by using PowerShell commands. You can use the same script for multi-NIC and multi-IP deployment.

Note

In this document, IP-Config refers to a pair of IP addresses, public IP and private IP, that is associated with an individual NIC. For more information, see the Azure Resource Manager Terminology section.
Use case

In this use case, a single NIC is connected to a virtual network (VNET). The NIC is associated with three IP configurations, as shown in the following table.

<table>
<thead>
<tr>
<th>IPConfig</th>
<th>Associated with</th>
</tr>
</thead>
<tbody>
<tr>
<td>IPConfig-1</td>
<td>Static public IP address; static private IP address</td>
</tr>
<tr>
<td>IPConfig-2</td>
<td>Static public IP address; static private address</td>
</tr>
<tr>
<td>IPConfig-3</td>
<td>Static private IP address</td>
</tr>
</tbody>
</table>

**Note**

IPConfig-3 is not associated with any public IP address.

Diagram: Topology

Here is the visual representation of the use case.

**Note**

In a multi-NIC, multi-IP Azure NetScaler VPX deployment, the private IP address associated with the primary (first) IPConfig of the primary (first) NIC is automatically added as the management NSIP address of the appliance. The remaining private IP addresses associated with IPConfigs must be added in the NetScaler appliance as VIPs or SNIPs by using the “add ns ip” command, as determined by your requirements.

Here is the summary of the steps required for configuring multiple IP addresses for a NetScaler VPX virtual appliance in standalone mode:

1. Create Resource Group
2. Create Storage Account
3. Create Availability Set
4. Create NSG
5. Create Virtual Network
6. Create Public IP Address
7. Assign IP Configuration
8. Create NIC
9. Create NetScaler VPX Instance
10. Check NIC Configurations
11. Check VPX-side Configurations
Script

Parameters

Following are sample parameters settings for the use case in this document. You can use different settings if you wish.

$locName="westcentralus"
$rgName="Azure-MultiIP"
$nicName1="VM1-NIC1"
$vNetName="Azure-MultiIP-vnet"
$vNetAddressRange="11.6.0.0/16"
$frontEndSubnetName="frontEndSubnet"
$frontEndSubnetRange="11.6.1.0/24"
$prmStorageAccountName="multiipstorage"
$avSetName="multiip-avSet"
$vmSize="Standard_DS4_V2" (This parameter creates a VM with up to four NICs.)

Note: The minimum requirement for a VPX instance is 2 vCPUs and 2GB RAM.

$publisher="citrix"
$offer="netscalervpx110-6531" (You can use different offers.)
$sku="netscalerbyol" (According to your offer, the SKU can be different.)
$version="latest"
$pubIPName1="PIP1"
$pubIPName2="PIP2"
$domName1="multiipvpx1"
$domName2="multiipvpx2"
$vmNamePrefix="VPXMutiIP"
$osDiskSuffix="osmultiipalbdiskdb1"

Network Security Group (NSG)-related information:

$nsgName="NSG-MultiIP"
$rule1Name="Inbound-HTTP"
$rule2Name="Inbound-HTTPS"
1. Create Resource Group

```powershell
New-AzureRmResourceGroup -Name $rgName -Location $locName
```

2. Create Storage Account

```powershell
$prmStorageAccount = New-AzureRMStorageAccount -Name $prmStorageAccountName -ResourceGroupName $rgName -Type Standard_LRS -Location $locName
```

3. Create Availability Set

```powershell
$avSet = New-AzureRmAvailabilitySet -Name $avSetName -ResourceGroupName $rgName -Location $locName
```

4. Create Network Security Group (NSG)

1. Add rules. You must add a rule to the NSG for any port that serves traffic.

```powershell
$rule1 = New-AzureRmNetworkSecurityRuleConfig -Name $rule1Name -Description "Allow HTTP" -Access Allow -Protocol Tcp -Direction Inbound -Priority 101 -SourceAddressPrefix Internet -SourcePortRange * -DestinationAddressPrefix * -DestinationPortRange 80
$rule2 = New-AzureRmNetworkSecurityRuleConfig -Name $rule2Name -Description "Allow HTTPS" -Access Allow -Protocol Tcp -Direction Inbound -Priority 110 -SourceAddressPrefix Internet -SourcePortRange * -DestinationAddressPrefix * -DestinationPortRange 443
$rule3 = New-AzureRmNetworkSecurityRuleConfig -Name $rule3Name -Description "Allow SSH" -Access Allow -Protocol Tcp -Direction Inbound -Priority 120 -SourceAddressPrefix Internet -SourcePortRange * -DestinationAddressPrefix * -DestinationPortRange 22
```
2. Create NSG object.

```powershell
$nsg = New-AzureRmNetworkSecurityGroup -ResourceGroupName $rgName -Location $locName -Name $nsgName -SecurityRules $rule1,$rule2,$rule3
```

5. Create Virtual Network

1. Add subnets.

```powershell
$frontendSubnet = New-AzureRmVirtualNetworkSubnetConfig -Name $frontEndSubnetName -AddressPrefix $frontEndSubnetRange
```

2. Add virtual network object.

```powershell
$vnet = New-AzureRmVirtualNetwork -Name $vNetName -ResourceGroupName $rgName -Location $locName -AddressPrefix $vNetAddressRange -Subnet $frontendSubnet
```

3. Retrieve subnets.

```powershell
$subnetName = "frontEndSubnet"
$subnet1 = $vnet.Subnets | ?{ $_.Name -eq $subnetName }
```

6. Create Public IP Address

```powershell
$pip1 = New-AzureRmPublicIpAddress -Name $pubIPName1 -ResourceGroupName $rgName -DomainNameLabel $domName1 -Location $locName -AllocationMethod Static
$pip2 = New-AzureRmPublicIpAddress -Name $pubIPName2 -ResourceGroupName $rgName -DomainNameLabel $domName2 -Location $locName -AllocationMethod Static
```

**Note**

Check availability of domain names before using.

Allocation method for IP addresses can be dynamic or static.

7. Assign IP Configuration

In this use case, consider the following points before assigning IP addresses:
• IPConfig-1 belongs to subnet1 of VPX1.
• IPConfig-2 belongs to subnet1 of VPX1.
• IPConfig-3 belongs to subnet1 of VPX1.

Note
When you assign multiple IP configurations to a NIC, one configuration must be assigned as primary.

1 $IPAddress1="11.6.1.27"
2 $IPConfig1=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName1 -Subnet $subnet1 -PrivateIpAddress $IPAddress1 -PublicIpAddress $pip1 -Primary
3 $IPAddress2="11.6.1.28"
4 $IPConfig2=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName2 -Subnet $subnet1 -PrivateIpAddress $IPAddress2 -PublicIpAddress $pip2
5 $IPAddress3="11.6.1.29"
6 $IPConfig3=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName3 -Subnet $subnet1 -PrivateIpAddress $IPAddress3 -Primary

Use a valid IP address that meets your subnet requirements and check its availability.

8. Create NIC

1 $nic1=New-AzureRmNetworkInterface -Name $nicName1 -ResourceGroupName $rgName -Location $locName -IpConfiguration $IPConfig1,$IPConfig2,$IPConfig3 -NetworkSecurityGroupId $nsg.Id

9. Create NetScaler VPX Instance

1. Initialize variables.

1 $suffixNumber = 1
2 $vmName = $vmNamePrefix + $suffixNumber

2. Create VM config object.

1 $vmConfig=New-AzureRMVMConfig -VMName $vmName -VMSize $vmSize -AvailabilitySetId $avSet.Id

3. Set credentials, OS, and image.
NetScaler 11.1

1 $cred=Get-Credential -Message "Type the name and password for VPX login."
2 $vmConfig=Set-AzureRMVMOperatingSystem -VM $vmConfig -Linux -ComputerName $vmName -Credential $cred
3 $vmConfig=Set-AzureRMVMSourceImage -VM $vmConfig -PublisherName $publisher -Offer $offer -Skus $sku -Version $version

4. Add NIC.

1 $vmConfig=Add-AzureRMVMNetworkInterface -VM $vmConfig -Id $nic1.Id -Primary

Note
In a multi-NIC VPX deployment, one NIC should be primary. So, "-Primary" needs to be appended while adding that NIC to the VPX instance.

5. Specify OS disk and create VM.

1 $osDiskName=$vmName + "-" + $osDiskSuffix1
2 $osVhdUri=$prmStorageAccount.PrimaryEndpoints.Blob.ToString() + "vhds/" + $osDiskName + ".vhd"
3 $vmConfig=Set-AzureRMVMOSDisk -VM $vmConfig -Name $osDiskName -VhdUri $osVhdUri -CreateOption fromImage
4 Set-AzureRmVMPlan -VM $vmConfig -Publisher $publisher -Product $offer -Name $sku
5 New-AzureRMVM -VM $vmConfig -ResourceGroupName $rgName -Location $locName

10. Check NIC Configurations

After the VPX instance starts, you can check the IP addresses allocated to IPConfigs of the VPX NIC by using the following command.

1 $nic.IPConfig

11. Check VPX-side Configurations

When the Netscaler VPX instance starts, a private IP address associated with primary IPconfig of the primary NIC is added as the NSIP address. The remaining private IP addresses must be added as VIP or SNIP addresses, as determined by your requirements. Use the following command.
You've now configured multiple IP addresses for a NetScaler VPX instance in standalone mode. For additional information about how to configure multiple IP addresses for a NetScaler VPX instance in standalone mode, see the Citrix NetScaler deployments in Microsoft Azure video.

**Configure multiple Azure VIPs for a standalone or high availability VPX instance**

January 10, 2019

In Azure Resource Manager (ARM), configure multiple public virtual IP addresses (VIPs) for both single NetScaler VPX deployment, and also for high availability (HA) deployment.

**Note:** Multiple VIPs can be configured for external load balancers only.

For deploying NetScaler VPX instances in both single mode and high availability mode, you have to use PowerShell commands alone, as you can create multiple front-end IP addresses (FIP) through PowerShell only.

**Deploy a NetScaler VPX in standalone mode**

This section provides PowerShell commands to deploy a NetScaler VPX in a standalone mode with multiple front-end IPs mapped to a single back-end pool.

Configure multiple FIPs, back-end pools, LB rules, and inbound NAT rules as part of configuring Azure load balancer.

Make sure that the following conditions are met in a single NetScaler VPX deployment:

1. A back-end pool contains only one NetScaler VPX instance.
2. Two load balancer rules are defined and are mapped to the following two VIPs:
   a) VIP1:80 > Back-end Pool 1:10080
   b) VIP2:80 > Back-end Pool 1:10081
3. A load balancer rule is defined to map VIP1:10080 > Back-end Pool 1:80, to access NetScaler VPX user interface.
4. An inbound NAT rule is defined to map VIP1:22 > Back-end Pool 1:22 to access NetScaler VPX through SSH.

The following image illustrates how you can configure multiple cloud service IP addresses on Azure Resource Manager for NetScaler virtual servers.

Run the following PowerShell commands to deploy a NetScaler VPX instance in a standalone mode:
1. Create Resource Group

$rgName="<resource group name>"
$locName="<location name, such as West US>"

*Command:*

New-AzureRmResourceGroup -Name $rgName -Location $locName

*For example:*

$rgName = “ARM-LB-NS”
$locName = “East Asia”
New-AzureRmResourceGroup -Name $rgName -Location $locName

2. Create Storage Account

You must select a globally unique name for your storage account that contains only lowercase letters and numbers.

$saName="<storage account name>"
$saType="<storage account type, specify one: Standard_LRS, Standard_GRS, Standard_RAGRS, or Premium_LRS>"

*Command:*

New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -Type $saType -Location $locName

*For example:*

$saName="vpxstorage"
$saType="Standard_LRS"
New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -Type $saType -Location $locName

3. Create Availability Set

$avName="<availability set name>"

*Command:*

New-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName -Location $locName

*For example:*

$avName="avNSSet"
4. Create Virtual Network and Subnet

Add new virtual network with at least one subnet, if it is not created previously.

$vnetName = “LBVnet”

Commands:

Create subnets

$frontendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name frontendSubnet -AddressPrefix 10.0.1.0/24

(Configure this parameter value as per your requirement)

$backendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name backendSubnet -AddressPrefix 10.0.2.0/24

Create Virtual Network:

New-AzureRmVirtualNetwork -Name $vnetName -ResourceGroupName $rgName -Location $locName -AddressPrefix 10.0.0.0/16 -Subnet $frontendSubnet,$backendSubnet

5. Create Public IP Address

The number of public IPs created should be equal to number of External VIPs required.

• Before using, check for the availability of the value for DomainNameLabel.
• Create two VIPs.

Commands:

$pubName1=”PublicIP1”
$dnsName1=”nsvpx1”
$pubName2=”PublicIP2”
$dnsName2=”nsvpx2”

$publicIP1 = New-AzureRmPublicIpAddress -Name $pubName1 -ResourceGroupName $rgName -Location $locName -AllocationMethod Static -DomainNameLabel $dnsName1

$publicIP2 = New-AzureRmPublicIpAddress -Name $pubName2 -ResourceGroupName $rgName -Location $locName -AllocationMethod Static -DomainNameLabel $dnsName2
6. Create Front-end IP for Specified Public IP Addresses

$FIPName1 = "VIP1"
$FIPName2 = "VIP2"

Commands:
$frontendIP1 = New-AzureRmLoadBalancerFrontendIpConfig -Name $FIPName1 -PublicIpAddress $publicIP1
$frontendIP2 = New-AzureRmLoadBalancerFrontendIpConfig -Name $FIPName2 -PublicIpAddress $publicIP2

7. Create Back-end Pool

$BEPool1 = "backend-Pool1"

Command:
$beaddresspool1 = New-AzureRmLoadBalancerBackendAddressPoolConfig -Name $BEPool1

8. Create Health Probe

Create TCP health probe with port 9000 and interval 5 seconds.

Command:
$healthProbe = New-AzureRmLoadBalancerProbeConfig -Name HealthProbe -Protocol Tcp -Port 9000 -IntervalInSeconds 5 -ProbeCount 2

9. Create Load Balancer Rule

For each front-end IP and service, we need to create lbRule.

Here back-end address pool can contain set of virtual machines. For single VPX deployment only single VPX instance will be part of this pool.

Note: Combined values for front-end IP configuration, back-end address pool, front-end port, back-end port parameters should not be same for any two rules.

For example, every FIP/VIP access, and HTTP service uses front-end port 80. As back-end pool is same, back-end port needs to be used differently for each load balancer rule.

Commands:
NetScaler 11.1

$lbrule1 = New-AzureRmLoadBalancerRuleConfig -Name “HTTP1” -FrontendIpConfiguration $frontendIP1 -BackendAddressPool $beAddressPool1 -Probe $healthProbe -Protocol Tcp -FrontendPort 80 -BackendPort 10080

$lbrule2 = New-AzureRmLoadBalancerRuleConfig -Name “HTTP2” -FrontendIpConfiguration $frontendIP2 -BackendAddressPool $beAddressPool1 -Probe $healthProbe -Protocol Tcp -FrontendPort 80 -BackendPort 10081

LB rule to access http service of NS can be added in the following way:

Command:

$lbrule3 = New-AzureRmLoadBalancerRuleConfig -Name “HTTPNS” -FrontendIpConfiguration $frontendIP1 -BackendAddressPool $beAddressPool1 -Probe $healthProbe -Protocol Tcp -FrontendPort 10080 -BackendPort 80

10. Create Inbound NAT Rules

Create NAT rules for services that does not require to be load balanced.

For example, create an ssh access to VPX instance.

Protocol - FrontEndPort - BackendPort triplet should not be same for two NAT rules belonging to same front-end IP.

Command:

$inboundNATRule1 = New-AzureRmLoadBalancerInboundNatRuleConfig -Name SSH1 -FrontendIpConfiguration $frontendIP1 -Protocol TCP -FrontendPort 22 -BackendPort 22

11. Create Load Balancer

Create load balancer with all of the above defined rules, front-end IPs, and a back-end pool.

Command:

$lbName = “NSALB”

$NRPLB = New-AzureRmLoadBalancer -ResourceGroupName $rgName -Name $lbName -Location $locName -InboundNatRule $inboundNATRule1 -FrontendIpConfiguration $frontendIP1, $frontendIP2 -LoadBalancingRule $lbrule1, $lbrule2, $lbrule3 -BackendAddressPool $beAddressPool1 -Probe $healthProbe

12. Create NIC

Create a NIC and associate it with the NetScaler VPX instance.
NetScaler 11.1

Commands:

$nicName="NIC1"
$lbName="NSALB"
$bePoolIndex=0
$natRuleIndex=0
$subnetIndex=0 ß Frontend subnet index

$lb=Get-AzureRmLoadBalancer -Name $lbName -ResourceGroupName $rgName

13. Create NetScaler VPX Instance

Create NetScaler VPX instance from MarketPlace image and attach the NIC to the virtual instance.

Commands:

$vmName="VPX1"
$vmSize="Standard_A3" / "Standard_DS4"
$pubName="citrix"
$skuName = "netscalerbyol"
$offerName="netscalervpx110-6531"
$avSet=Get-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName
$vm1=New-AzureRmVMConfig -VMName $vmName -VMSize $vmSize -AvailabilitySetId $avset.Id
$cred=Get-Credential -Message "Type Credentials which will be used to login to VPX instance"
$vm1=Set-AzureRmVMOperatingSystem -VM $vm1 -Linux -ComputerName $vmName -Credential $cred -Verbose
$vm1=Set-AzureRmVMSourceImage -VM $vm1 -PublisherName $pubName -Offer $offerName -Skus $skuName -Version "latest"
$vm1=Add-AzureRmVMNetworkInterface -VM $vm1 -Id $nic1.Id
$diskName="dynamic"
$storageAcc=Get-AzureRmStorageAccount -ResourceGroupName $rgName -Name $saName
$osDiskUri1=$storageAcc.PrimaryEndpoints.Blob.ToString() + "vhds1/" + $diskName + ".vhd"

© 1999-2018 Citrix Systems, Inc. All rights reserved.
$vm1=Set-AzureRmVMOSDisk -VM $vm1 -Name $diskName -VhdUri $osDiskUri1 -CreateOption fromImage
Set-AzureRmVMPlan -VM $vm1 -Publisher $pubName -Product $offerName -Name $skuName
New-AzureRmVM -ResourceGroupName $rgName -Location $locName -VM $vm1
The above commands creates a NetScaler VPX instance, then add virtual servers to the NetScaler VPX instance for the specified front end services.

Deploying NetScaler VPX in High Availability Mode

This section provides PowerShell commands to deploy a NetScaler VPX in HA deployment with multiple front-end IPs mapped to a single back-end pool.

Configure multiple FIPs, backend pools, load balance rules, and inbound NAT rules as part of the Azure load balancer.

Make sure that the following conditions are met in HA deployment of NetScaler VPX instances:

1. A back-end pool contains two NetScaler VPX instances, which are part of HA.
2. Two load balancer rules are defined and are mapped to following two VIPS:
   a) VIP1:80 > Back-end Pool 1:10080
   b) VIP2:80 > Back-end Pool 1:10081
3. A load balancer rule is defined, which maps VIP1:10080 > Back-end Pool 1:80, to access NetScaler VPX GUI.
4. Two inbound NAT rules are defined to map the following two VIPS:
   a) VIP1:22 > Back-end Pool 1:22 to access NetScaler VPX Primary
   b) VIP1:10022 > Back-end Pool-1:22 to access NetScaler VPX Secondary through SSH

All services that are defined as part of Azure load balancer rules will get load balanced. That is, if the primary VPX fails, the secondary VPX will take care of all of the services in Active-Passive HA deployment.

The following image illustrates how you can configure multiple cloud service IP addresses on Azure Resource Manager for NetScaler virtual servers in HA mode.

1. Create Resource Group

    $rgName="<resource group name>"
    $locName="<location name, such as West US>"

    Commands:
    New-AzureRmResourceGroup -Name $rgName -Location $locName
**For example:**

```powershell
$rgName = “ARM-Mult-VIP-HA”
$locName = “East Asia”
New-AzureRmResourceGroup -Name $rgName -Location $locName
```

**2. Create Storage Account**

You must select a globally unique name for your storage account that contains only lowercase letters and numbers.

```powershell
$saName="<storage account name>"
$saType="<storage account type, specify one: Standard_LRS, Standard_GRS, Standard_RAGRS, or Premium_LRS>"
```

*Commands:*

```powershell
New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -Type $saType -Location $locName
```

**For example:**

```powershell
$saName="vpxstorage1"
$saType="Standard_LRS"
New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -Type $saType -Location $locName
```

**3. Create Availability Set**

```powershell
$avName="<availability set name>"
```

*Command:*

```powershell
New-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName -Location $locName
```

**For example:**

```powershell
$avName="avNSSetARM"
```

**4. Create Virtual Network and Subnet**

Add new virtual network with at least one subnet if it is not created previously.

```powershell
$vnetName = “LBVnet”
```

NetScaler 11.1

 Commands:

 Create subnets:

$frontendSubnet = New-AzureRmVirtualNetworkSubnetConfig -Name frontendSubnet -AddressPrefix 10.0.7.0/24 (this parameter value should be as per your requirement)

$backendSubnet = New-AzureRmVirtualNetworkSubnetConfig -Name backendSubnet -AddressPrefix 10.0.8.0/24

 Create Virtual Network:

New-AzureRmVirtualNetwork -Name $vnetName -ResourceGroupName $rgName -Location $locName -AddressPrefix 10.0.0.0/16 -Subnet $frontendSubnet,$backendSubnet

5. Create Public IP Address

The number of public IP addresses created should be equal to the number of external VIPs required.

• Before using, check for the availability of the value for Domain.Name.Label.
• Create two VIPs.

 Commands:

$pubName1 = "PublicIp1"
$dnsName1 = "nsvpx1"
$pubName2 = "PublicIp2"
$dnsName2 = "nsvpx2"

$publicIP1 = New-AzureRmPublicIpAddress -Name $pubName1 -ResourceGroupName $rgName -Location $locName -AllocationMethod Static -DomainNameLabel $dnsName1

$publicIP2 = New-AzureRmPublicIpAddress -Name $pubName2 -ResourceGroupName $rgName -Location $locName -AllocationMethod Static -DomainNameLabel $dnsName2

6. Create Front-end IP Addresses

$FIPName1 = "VIP1"
$FIPName2 = "VIP2"

Commands:

$frontendIP1 = New-AzureRmLoadBalancerFrontendIpConfig -Name $FIPName1 -PublicIpAddress $publicIP1

$frontendIP2 = New-AzureRmLoadBalancerFrontendIpConfig -Name $FIPName2 -PublicIpAddress $publicIP2

© 1999-2018 Citrix Systems, Inc. All rights reserved. 534
7. Create Back-end Pool

$BEPool1 = “backend-Pool1”

Command:

$beaddresspool1= New-AzureRmLoadBalancerBackendAddressPoolConfig -Name $BEPool1

8. Create Health Probe

Create TCP health probe with port 9000 and interval 5 seconds.

Command:

$healthProbe = New-AzureRmLoadBalancerProbeConfig -Name HealthProbe -Protocol Tcp -Port 9000 -IntervalInSeconds 5 -ProbeCount 2

9. Create Load Balancer Rules

For each front end IP and service, you have to create a separate load balancer rule.

Back-end address pool can contain set of virtual machines. For a single NetScaler VPX deployment, only single NetScaler VPX instance will be part of this pool.

Note: Combined values for front-end IP configuration, back-end address pool, front-end port, back-end port parameters should not be the same for any two rules.

Examples:

Each FIP/VIP access and HTTP service uses front-end port 80. As back-end pool is same, back-end port has to be used differently for each load balancer rule.

Command:

$lbrule1 = New-AzureRmLoadBalancerRuleConfig -Name “HTTP1” -FrontendIpConfiguration $frontendIP1 -BackendAddressPool $beAddressPool1 -Probe $healthProbe -Protocol Tcp -FrontendPort 80 -BackendPort 10080

$lbrule2 = New-AzureRmLoadBalancerRuleConfig -Name “HTTP2” -FrontendIpConfiguration $frontendIP2 -BackendAddressPool $beAddressPool1 -Probe $healthProbe -Protocol Tcp -FrontendPort 80 -BackendPort 10081

Load balancer configuration rule to access the HTTP service of a netScaler can be added in the following way:

Command:
$lbrule3 = New-AzureRmLoadBalancerRuleConfig -Name “HTTPNS” -FrontendIpConfiguration $frontendIP1 -BackendAddressPool $beAddressPool1 -Probe $healthProbe -Protocol Tcp -FrontendPort 10080 -BackendPort 80

10. Create Inbound NAT Rules

Create NAT rules for services that does not require to be load balanced.

For example, create an ssh access to VPX instance.

**Note:** Protocol - Front-end Port - Back-end Port triplet should not be the same for two NAT rules belonging to the same front-end IP address.

**Commands:**

$inboundNATRule1 = New-AzureRmLoadBalancerInboundNatRuleConfig -Name SSH1 -FrontendIpConfiguration $frontendIP1 -Protocol TCP -FrontendPort 22 -BackendPort 22

$inboundNATRule2 = New-AzureRmLoadBalancerInboundNatRuleConfig -Name SSH2 -FrontendIpConfiguration $frontendIP1 -Protocol TCP -FrontendPort 10022 -BackendPort 22

11. Create Load Balancer

Create load balancer with all of the above defined rules, front-end IPs, and a back-end pool.

**Command:**

$lbName=”NSALB”

$NRPLB = New-AzureRmLoadBalancer -ResourceGroupName $rgName -Name $lbName -Location $locName -InboundNatRule $inboundNATRule1, $inboundNATRule2 -FrontendIpConfiguration $frontendIP1, $frontendIP2 -LoadBalancingRule $lbrule1, $lbrule2, $lbrule3 -BackendAddressPool $beAddressPool1 -Probe $healthProbe

12. Create NIC

Create a NIC and associate it with the NetScaler VPX instance.

**Commands:**

$nicName=”NIC1”

$lbName=”NSALB”

$bePoolIndex=0

$natRuleIndex=0
NetScaler 11.1

subnetIndex=0 $ Frontend subnet index

$lb=Get-AzureRmLoadBalancer -Name $lbName -ResourceGroupName $rgName

$nicName="NIC2"

$lbName="NSALB"

$bePoolIndex=0

$natRuleIndex=182 <sup>nd</sup> SSH rule

subnetIndex=0

13. Create NetScaler VPX Instances

Create a NetScaler VPX instance from MarketPlace image and attach a NIC to it.

Commands:

$vmName="VPX1"

$vmSize="Standard_A3"

$pubName="citrix"

$skuName = "netscalerbyol"

$offerName="netscalervpx110-6531"

$avSet=Get-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName

$vm1=New-AzureRmVMConfig -VMName $vmName -VMSize $vmSize -AvailabilitySetId $avset.Id

$cred=Get-Credential -Message "Type Credentials which will be used to login to VPX instance"

$vm1=Set-AzureRmVMOperatingSystem -VM $vm1 -Linux -ComputerName $vmName -Credential $cred -Verbose

$vm1=Set-AzureRmVMSourceImage -VM $vm1 -PublisherName $pubName -Offer $offerName -Skus $skuName -Version "latest"

$vm1=Add-AzureRmVMNetworkInterface -VM $vm1 -Id $nic1.Id

$diskName="dynamic"
$storageAcc=Get-AzureRmStorageAccount -ResourceGroupName $rgName -Name $saName
$osDiskUri1=$storageAcc.PrimaryEndpoints.Blob.ToString() + “vhds1/” + $diskName + “.vhd”
$vm1=Set-AzureRmVMOSDisk -VM $vm1 -Name $diskName -VhdUri $osDiskUri1 -CreateOption fromImage
Set-AzureRmVMPlan -VM $vm1 -Publisher $pubName -Product $offerName -Name $skuName
New-AzureRmVM -ResourceGroupName $rgName -Location $locName -VM $vm1
$vmName=”VPX2”
$vmSize=”Standard_A3”
$pubName=”citrix”
$skuName = “netscalerbyol”
$offerName=”netscalervpx110-6531”
$avSet=Get-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName
$vm2=New-AzureRmVMConfig -VMName $vmName -VMSize $vmSize -AvailabilitySetId $avset.Id
$cred=Get-Credential -Message “Type Credentials which will be used to login to VPX instance”
$vm2=Set-AzureRmVMOperatingSystem -VM $vm2 -Linux -ComputerName $vmName -Credential $cred -Verbose
$vm2=Set-AzureRmVMSourceImage -VM $vm2 -PublisherName $pubName -Offer $offerName -Skus $skuName -Version “latest”
$vm2=Add-AzureRmVMNetworkInterface -VM $vm2 -Id $nic2.Id
$diskName=”dynamic”
$storageAcc=Get-AzureRmStorageAccount -ResourceGroupName $rgName -Name $saName
$osDiskUri2=$storageAcc.PrimaryEndpoints.Blob.ToString() + “vhds2/” + $diskName + “.vhd”
$vm1=Set-AzureRmVMOSDisk -VM $vm2 -Name $diskName -VhdUri $osDiskUri2 -CreateOption fromImage
Set-AzureRmVMPlan -VM $vm2 -Publisher $pubName -Product $offerName -Name $skuName
New-AzureRmVM -ResourceGroupName $rgName -Location $locName -VM $vm2

14. Create High Availability

When both NetScaler VPX instances are running, connect to both VPX instances through SSH to configure the virtual machines.
1. To configure Active-Passive HA, run “add HA node #nodeID” command on both nodes, and then run configuration commands on Primary VPX instance.

2. To configure Active-Active HA, run same set of configuration commands on both nodes.

Azure ARM Components

This table lists those of the Azure Resource Manager (ARM) components that can be created using PowerShell, and those that can be created using the Azure Resource Manager portal.

<table>
<thead>
<tr>
<th>-</th>
<th>PowerShell</th>
<th>ARM Portal</th>
</tr>

PowerShell scripts for Azure deployment

December 18, 2018

This topic provides the PowerShell cmdlets with which you can perform the following configurations in Azure PowerShell:

- Provision NetScaler VPX in Standalone Mode
- Configure NetScaler VPX HA with Azure External Load Balancer
- Configure NetScaler VPX HA with Azure Internal Load Balance

Provision NetScaler VPX in Standalone Mode

1. Creating a resource group

The resource group can include all the resources for the solution, or only those resources that you want to manage as a group. The location specified here is the default location for resources in that resource group. Make sure all commands to create a load balancer use the same resource group.

$rgName = "<resource group name>"
$locName = "<location name, such as West US>"
New-AzureRmResourceGroup -Name $rgName -Location $locName

For example:
$rgName = "ARM-VPX"
$locName = "West US"
New-AzureRmResourceGroup -Name $rgName -Location $locName

2. Creating a storage account

Choose a unique name for your storage account that contains only lowercase letters and numbers.

$saname = "<storage account name>"
$satype = "<storage account type, specify one: Standard_LRS, Standard_GRS, Standard_RAGRS, or Premium_LRS>"
New-AzureRmStorageAccount -Name $saname -ResourceGroupName $rgname -Type $satype -Location $locname
For example:

```
$saName="vpxstorage"
$saType="Standard_LRS"
New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -Type $saType -Location $locName
```

3. Creating an availability set

Availability set helps to keep your virtual machines available during downtime, such as during maintenance. A load balancer configured with an availability set ensures that your application is always available.

```
$avName="<availability set name>"
New-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName -Location $locName
```

4. Creating a virtual network

Add a new virtual network with at least one subnet, if the subnet was not created previously.

```
$FrontendAddressPrefix="10.0.1.0/24"
$BackendAddressPrefix="10.0.2.0/24"
$vnetAddressPrefix="10.0.0.0/16"
$frontendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name frontendSubnet -AddressPrefix $FrontendAddressPrefix
$backendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name backendSubnet -AddressPrefix $BackendAddressPrefix
New-AzureRmVirtualNetwork -Name TestNet -ResourceGroupName $rgName -Location $locName -AddressPrefix $vnetAddressPrefix -Subnet $frontendSubnet,$backendSubnet
```

For example:

```
$frontendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name frontendSubnet -AddressPrefix $FrontendAddressPrefix
$backendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name backendSubnet -AddressPrefix $BackendAddressPrefix
New-AzureRmVirtualNetwork -Name TestNet -ResourceGroupName $rgName -Location $locName -AddressPrefix $vnetAddressPrefix -Subnet $frontendSubnet,$backendSubnet
```

5. Creating a NIC

Create a NIC and associate the NIC with the NetScaler VPX instance. The front end Subnet created in the above procedure is indexed at 0 and the back end Subnet is indexed at 1. Now create NIC in one of the three following ways:
NetScaler 11.1

a) **NIC with Public IP address**

$nicName="<name of the NIC of the VM>"

$pip = New-AzureRmPublicIpAddress -Name $nicName -ResourceGroupName $rgName -Location $locName -AllocationMethod Dynamic

$nic = New-AzureRmNetworkInterface -Name $nicName -ResourceGroupName $rgName -Location $locName -SubnetId $vnet.Subnets[$subnetIndex].Id -PublicIpAddressId $pip.Id

b) **NIC with Public IP and DNS label**

$nicName="<name of the NIC of the VM>"

$domName="<domain name label>"

$pip = New-AzureRmPublicIpAddress -Name $nicName -ResourceGroupName $rgName -DomainNameLabel $domName -Location $locName -AllocationMethod Dynamic

Before assigning $domName, check it is available or not by using command:

Test-AzureRmDnsAvailability -DomainQualifiedName $domName -Location $locName

$nic = New-AzureRmNetworkInterface -Name $nicName -ResourceGroupName $rgName -Location $locName -SubnetId $vnet.Subnets[$subnetIndex].Id -PublicIpAddressId $pip.Id

*For example:*

$nicName="frontendNIC"

$domName="vpxazure"

$pip = New-AzureRmPublicIpAddress -Name $nicName -ResourceGroupName $rgName -DomainNameLabel $domName -Location $locName -AllocationMethod Dynamic

$nic = New-AzureRmNetworkInterface -Name $nicName -ResourceGroupName $rgName -Location $locName -SubnetId $vnet.Subnets[0].Id -PublicIpAddressId $pip.Id

c) **NIC with Dynamic Public Address and Static Private IP address**

Make sure that the private (static) IP address you add to the VM should be the same range as that of the subnet specified.

$nicName="<name of the NIC of the VM>"

$staticIP="<available static IP address on the subnet>"

$pip = New-AzureRmPublicIpAddress -Name $nicName -ResourceGroupName $rgName -Location $locName -AllocationMethod Dynamic

$nic = New-AzureRmNetworkInterface -Name $nicName -ResourceGroupName $rgName -Location $locName -SubnetId $vnet.Subnets[$subnetIndex].Id -PublicIpAddressId $pip.Id -PrivateIpAddress $staticIP
6. **Creating a virtual object**

$vmName="<VM name>"

$vmSize="<VM size string>"

$avSet=Get-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName

$vm=New-AzureRmVMConfig -VMName $vmName -VMSize $vmSize -AvailabilitySetId $avset.Id

7. **Getting the NetScaler VPX image**

$pubName="<Image publisher name>"

$offerName="<Image offer name>"

$skuName="<Image SKU name>"

$cred=Get-Credential -Message "Type the name and password of the local administrator account."

Provide your credentials that is used to login into VPX

$vm=Set-AzureRmVMOperatingSystem -VM $vm -Linux -ComputerName $vmName -Credential $cred -Verbose

$vm=Set-AzureRmVMSourceImage -VM $vm -PublisherName $pubName -Offer $offerName -Skus $skuName -Version "latest"

$vm=Add-AzureRmVMNetworkInterface -VM $vm -Id $nic.Id

*For example*:

$pubName="citrix"

The following command is used for displaying all offers from Citrix:

<table>
<thead>
<tr>
<th>Get-AzureRmVMImageOffer -Location $locName -Publisher $pubName</th>
<th>Select Offer</th>
</tr>
</thead>
</table>

$offerName="netscalervpx110-6531"

The following command is used to know sku offered by publisher for specific offer name:

<table>
<thead>
<tr>
<th>Get-AzureRmVMImageSku -Location $locName -Publisher $pubName -Offer $offerName</th>
<th>Select Skus</th>
</tr>
</thead>
</table>

8. **Creating a virtual machine**

$diskName="<name identifier for the disk in Azure storage, such as OSDisk>"
NetScaler 11.1

For example:

$diskName="dynamic"
$pubName="citrix"
$offerName="netscalervpx110-6531"
$skuName="netscalerbyol"

$storageAcc=Get-AzureRmStorageAccount -ResourceGroupName $rgName -Name $saName
$osDiskUri=$storageAcc.PrimaryEndpoints.Blob.ToString() + “vhds/” + $diskName + “.vhd”
$vm=Set-AzureRmVMOSDisk -VM $vm -Name $diskName -VhdUri $osDiskUri -CreateOption fromImage

When you create VM from Images present in marketplace, use the following command to specify the VM plan:
Set-AzureRmVMPlan -VM $vm -Publisher $pubName -Product $offerName -Name $skuName
New-AzureRmVM -ResourceGroupName $rgName -Location $locName -VM $vm

Provision NetScaler VPX in HA with Azure External Load Balancer

Log on to AzureRmAccount using your Azure user credentials.

1) Creating a resource group

The location specified here is the default location for resources in that resource group. Make sure that all commands used to create a load balancer use the same resource group.

$rgName="<resource group name>”
$locName="<location name, such as West US>”
New-AzureRmResourceGroup -Name $rgName -Location $locName

For example:

$rgName = “ARM-LB-NS”
$locName = “West US”
New-AzureRmResourceGroup -Name $rgName -Location $locName

2) Creating a storage account

Choose a unique name for your storage account that contains only lowercase letters and numbers.

$saName="<storage account name>”
NetScaler 11.1

$saType="<storage account type, specify one: Standard_LRS, Standard_GRS, Standard_RAGRS, or Premium_LRS>">

New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -Type $saType -Location $locName

For example:

$saName="vpxstorage"
$saType="Standard_LRS"

New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -Type $saType -Location $locName

3) **Creating an availability set**

A load balancer configured with an availability set ensures that your application is always available.

$avName="<availability set name>"

New-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName -Location $locName

4) **Creating a virtual network**

Add a new virtual network with at least one subnet, if the subnet was not created previously.

$vnetName = “LBVnet”

$FrontendAddressPrefix="10.0.1.0/24”

$BackendAddressPrefix="10.0.2.0/24”

$vnetAddressPrefix="10.0.0.0/16”

$frontendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name frontendSubnet -AddressPrefix $FrontendAddressPrefix

$backendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name backendSubnet -AddressPrefix $BackendAddressPrefix

$vnet=New-AzureRmVirtualNetwork -Name $vnetName -ResourceGroupName $rgName -Location $locName -AddressPrefix $vnetAddressPrefix -Subnet $frontendSubnet,$backendSubnet

**Note:** Choose the AddressPrefix parameter value as per your requirement.

Assign front end and back end subnet to the virtual network that you created earlier in this step.

If the front end subnet is the first element of array vnet, subnetId should be $vnet.Subnets[0].Id.

If the front end subnet is the second element in the array, the subnetId should be $vnet.Subnets[1].Id, and so on..

5) **Configuring front end IP address and creating back end address pool**
Configure a front end IP address for the incoming load balancer network traffic and create a back end address pool to receive the load balanced traffic.

```powershell
$pubName="PublicIp1"
publicIP1 = New-AzureRmPublicIpAddress -Name $pubName -ResourceGroupName $rgName -Location $locName -AllocationMethod Static -DomainNameLabel nsvpx

Note: Check for the availability of the value for DomainNameLabel.

FIPName = “ELBFIP”

frontendIP1 = New-AzureRmLoadBalancerFrontendIpConfig -Name $FIPName -PublicIpAddress publicIP1

BEPool = “LB-backend-Pool”

beaddresspool1= New-AzureRmLoadBalancerBackendAddressPoolConfig -Name $BEPool

8) Creating a health probe

Create a TCP health probe with port 9000 and interval 5 seconds.

healthProbe = New-AzureRmLoadBalancerProbeConfig -Name HealthProbe -Protocol Tcp -Port 9000 -IntervalInSeconds 5 -ProbeCount 2

9) Creating a load balancing rule

Create a LB rule for each service that you are load balancing.

For example:

You can use the following example to load balance http service.

lbrule1 = New-AzureRmLoadBalancerRuleConfig -Name “HTTP-LB” -FrontendIpConfiguration frontendIP1 -BackendAddressPool $beAddressPool1 -Probe $healthProbe -Protocol Tcp -FrontendPort 80 -BackendPort 80

10) Creating inbound NAT rules

Create NAT rules for services that you are not load balancing.

For example, when creating a SSH access to a NetScaler VPX instance.

Note: Protocol-FrontEndPort-BackendPort triplet should not be the same for two NAT rules.

inboundNATRule1= New-AzureRmLoadBalancerInboundNatRuleConfig -Name SSH1 -FrontendIpConfiguration $frontendIP1 -Protocol TCP -FrontendPort 22 -BackendPort 22

inboundNATRule2= New-AzureRmLoadBalancerInboundNatRuleConfig -Name SSH2 -FrontendIpConfiguration $frontendIP1 -Protocol TCP -FrontendPort 10022 -BackendPort 22

11) Creating a load balancer entity
Create the load balancer adding all objects (NAT rules, load balancer rules, probe configurations) together.

$lbName="ELB"

$NRPLB = New-AzureRmLoadBalancer -ResourceGroupName $rgName -Name $lbName -Location $locName -InboundNatRule $inboundNATRule1, $inboundNATRule2 -FrontendIpConfiguration $frontendIP1 -LoadBalancingRule $lbrule1 -BackendAddressPool $beAddressPool1 -Probe $healthProbe

12) Creating a NIC

Create two NICs and associate each NIC with each VPX instance

a) NIC1 with VPX1

For example:

$nicName="NIC1"

$lbName="ELB"

$bePoolIndex=0

* Rule indexes starts from 0.

$natRuleIndex=0

$subnetIndex=0

* Frontend subnet index

$lb=Get-AzureRmLoadBalancer -Name $lbName -ResourceGroupName $rgName

b) NIC2 with VPX2

For example:

$nicName="NIC2"

$lbName="ELB"

$bePoolIndex=0

$natRuleIndex=1

* Second Inbound NAT (SSH) rule we need to use

$subnetIndex=0

* Frontend subnet index
NetScaler 11.1

$lb=Get-AzureRmLoadBalancer -Name $lbName -ResourceGroupName $rgName

13) Creating NetScaler VPX instances

Create two NetScaler VPX instances as part of the same resource group and availability set, and attach it to the external load balancer.

a) NetScaler VPX instance 1

For example:

$vmName="VPX1"
$vmSize="Standard_A3"
$pubName="citrix"
$offerName="netscalervpx110-6531"
$skuName="netscalerbyol"
$avSet=Get-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName
$vm1=New-AzureRmVMConfig -VMName $vmName -VMSize $vmSize -AvailabilitySetId $avset.Id
$cred=Get-Credential -Message "Type Credentials which will be used to login to VPX instance"
$vm1=Set-AzureRmVMOperatingSystem -VM $vm1 -Linux -ComputerName $vmName -Credential $cred -Verbose
$vm1=Set-AzureRmVMSourceImage -VM $vm1 -PublisherName $pubName -Offer $offerName -Skus $skuName -Version "latest"
$vm1=Add-AzureRmVMNetworkInterface -VM $vm1 -Id $nic1.Id
$diskName="dynamic"
$storageAcc=Get-AzureRmStorageAccount -ResourceGroupName $rgName -Name $saName
$osDiskUri1=$storageAcc.PrimaryEndpoints.Blob.ToString() + "vhds1/" + $diskName + ".vhd"
$vm1=Set-AzureRmVMOSDisk -VM $vm1 -Name $diskName -VhdUri $osDiskUri1 -CreateOption fromImage
Set-AzureRmVMPlan -VM $vm1 -Publisher $pubName -Product $offerName -Name $skuName
New-AzureRmVM -ResourceGroupName $rgName -Location $locName -VM $vm1

b) NetScaler VPX instance 2

For example:
NetScaler 11.1

$vmName=”VPX2”
$vmSize=”Standard_A3”
$avSet=Get-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName
$vm2=New-AzureRmVMConfig -VMName $vmName -VMSize $vmSize -AvailabilitySetId $avset.Id
$cred=Get-Credential -Message “Type Credentials which will be used to login to VPX instance”
$vm2=Set-AzureRmVMOperatingSystem -VM $vm2 -Linux -ComputerName $vmName -Credential $cred -Verbose
$vm2=Set-AzureRmVMSourceImage -VM $vm2 -PublisherName $pubName -Offer $offerName -Skus $skuName -Version “latest”
$vm2=Add-AzureRmVMNetworkInterface -VM $vm2 -Id $nic2.Id
$diskName=”dynamic”
$storageAcc=Get-AzureRmStorageAccount -ResourceGroupName $rgName -Name $saName
$osDiskUri1=$storageAcc.PrimaryEndpoints.Blob.ToString() + “vhds2/” + $diskName + “.vhd”
$vm2=Set-AzureRmVMOSDisk -VM $vm2 -Name $diskName -VhdUri $osDiskUri1 -CreateOption fromImage
Set-AzureRmVMPlan -VM $vm2 -Publisher $pubName -Product $offerName -Name $skuName
New-AzureRmVM -ResourceGroupName $rgName -Location $locName -VM $vm2

14) Configuring the virtual machines

When both the NetScaler VPX instances start, then connect to both NetScaler VPX instances using the SSH protocol to configure the virtual machines.

a) Active-Active: Run the same set of configuration commands on the command line of both the NetScaler VPX instances.

b) Active-Passive: Run this command on the command line of both the NetScaler VPX instances.

`add ha node #nodeID <nsip of other NetScaler VPX>`

In Active-Passive mode, run configuration commands on the primary node only.

Provision NetScaler VPX in HA with Azure Internal Load Balancer

Log on to AzureRmAccount using your Azure user credentials.

1) Creating a resource group

The location specified here is the default location for resources in that resource group. Make sure all commands to create a load balancer use the same resource group.
NetScaler 11.1

$rName="<resource group name>"

$locName="<location name, such as West US>"

New-AzureRmResourceGroup -Name $rName -Location $locName

For example:

$rName = “ARM-LB-NS”

$locName = “West US”

New-AzureRmResourceGroup -Name $rName -Location $locName

2) **Creating a storage account**

Choose a unique name for your storage account that contains only lowercase letters and numbers.

$saName="<storage account name>"

$saType="<storage account type, specify one: Standard_LRS, Standard_GRS, Standard_RAGRS, or Premium_LRS>"

New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -Type $saType -Location $locName

For example:

$saName="vpxstorage"

$saType="Standard_LRS"

New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -Type $saType -Location $locName

3) **Creating an availability set**

A load balancer configured with an availability set ensures that your application is always available.

$avName="<availability set name>"

New-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName -Location $locName

4) **Creating a virtual network**

Add a new virtual network with at least one subnet, if the subnet was not created previously.

$vnetName = “LBVnet”

$vnetAddressPrefix="10.0.0.0/16"

$FrontendAddressPrefix="10.0.1.0/24"

$BackendAddressPrefix="10.0.2.0/24"

$vnet=New-AzureRmVirtualNetwork -Name $vnetName -ResourceGroupName $rgName -Location $locName -AddressPrefix $vnetAddressPrefix -Subnet $frontendSubnet,$backendSubnet’
NetScaler 11.1

$frontendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name frontendSubnet -AddressPrefix $FrontendAddressPrefix

$backendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name backendSubnet -AddressPrefix $BackendAddressPrefix

Note: Choose the AddressPrefix parameter value as per your requirement.

Assign front end and back end subnet to the virtual network that you created earlier in this step.
If the front end subnet is the first element of array vnet, subnetId should be $vnet.Subnets[0].Id.
If the front end subnet is the second element in the array, the subnetId should be $vnet.Subnets[1].Id, and so on..

5) Creating an back end address pool

$beaddresspool= New-AzureRmLoadBalancerBackendAddressPoolConfig -Name “LB-backend”

6) Creating NAT rules

Create NAT rules for services that you are not load balancing.

$inboundNATRule1= New-AzureRmLoadBalancerInboundNatRuleConfig -Name “Inboundnatrule1” -FrontendIpConfiguration $frontendIP -Protocol TCP -FrontendPort 3441 -BackendPort 3389

$inboundNATRule2= New-AzureRmLoadBalancerInboundNatRuleConfig -Name “RDP2” -FrontendIpConfiguration $frontendIP -Protocol TCP -FrontendPort 3442 -BackendPort 3389

Use front end and back end ports as per your requirement.

7) Creating a health probe

Create a TCP health probe with port 9000 and interval 5 seconds.

$healthProbe = New-AzureRmLoadBalancerProbeConfig -Name “HealthProbe” -Protocol tcp -Port 9000 -IntervalInSeconds 5 -ProbeCount 2

8) Creating a load balancing rule

Create a LB rule for each service that you are load balancing.

For example:

You can use the following example to load balance http service.

$lbrule = New-AzureRmLoadBalancerRuleConfig -Name “lbrule1” -FrontendIpConfiguration $frontendIP -BackendAddressPool $beAddressPool -Probe $healthProbe -Protocol Tcp -FrontendPort 80 -BackendPort 80

Use front end and back end ports as per your requirement.

9) Creating a load balancer entity
Create the load balancer adding all objects (NAT rules, load balancer rules, probe configurations) together.

```powershell
$NRPLB = New-AzureRmLoadBalancer -ResourceGroupName $rgname -Name “InternalLB” -Location $locName -FrontendIpConfiguration $frontendIP -InboundNatRule $inboundNatRule1,$inboundNatRule2 -LoadBalancingRule $lbrule -BackendAddressPool $beAddressPool -Probe $healthProbe
```

10) **Creating a NIC**

Create two NICs and associate each NIC with each NetScaler VPX instance

```powershell
$backendnic1= New-AzureRmNetworkInterface -ResourceGroupName $rgName -Name lb-nic1-be -Location $locName -PrivateIpAddress 10.0.2.6 -Subnet $backendSubnet -LoadBalancerBackendAddressPool $nrplb.BackendAddressPools[0] -LoadBalancerInboundNatRule $nrplb.InboundNatRules[0]
```

This NIC is for NetScaler VPX 1. The Private IP should be in same subnet as that of subnet added.

```powershell
```

This NIC is for NetScaler VPX 2. The parameter Private IPAddress can have any private IP as per your requirement.

11) **Creating NetScaler VPX instances**

Create two VPX instances part of same resource group and availability set and attach it to the internal load balancer.

a) NetScaler VPX instance 1

*For example:*

```powershell
$vmName="VPX1"
$vmSize="Standard_A3"
$avSet=Get-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName
$vm1=New-AzureRmVMConfig -VMName $vmName -VMSize $vmSize -AvailabilitySetId $avset.Id
$cred=Get-Credential -Message “Type Credentials which will be used to login to VPX instance”
$vm1=Set-AzureRmVMOperatingSystem -VM $vm1 -Linux -ComputerName $vmName -Credential $cred -Verbose
$vm1=Set-AzureRmVMSourceImage -VM $vm1 -PublisherName $pubName -Offer $offerName -Skus $skuName -Version “latest”
$vm1=Add-AzureRmVMNetworkInterface -VM $vm1 -Id $backendnic1.Id
$diskName="dynamic"
```
NetScaler 11.1

```
$storageAcc=Get-AzureRmStorageAccount -ResourceGroupName $rgName -Name $saName
$osDiskUri1=$storageAcc.PrimaryEndpoints.Blob.ToString() + “vhds1/” + $diskName + “.vhd”
$vm1=Set-AzureRmVMOSDisk -VM $vm1 -Name $diskName -VhdUri $osDiskUri1 -CreateOption fromImage
Set-AzureRmVMPlan -VM $vm1 -Publisher $pubName -Product $offerName -Name $skuName
New-AzureRmVM -ResourceGroupName $rgName -Location $locName -VM $vm1

b) NetScaler VPX instance 2

For example:
$vmName=”VPX2”
$vmSize=”Standard_A3”
$avSet=Get-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName
$vm2=New-AzureRmVMConfig -VMName $vmName -VMSize $vmSize -AvailabilitySetId $avset.Id
$cred=Get-Credential -Message “ Type Credentials which will be used to login to VPX instance “
$vm2=Set-AzureRmVMOperatingSystem -VM $vm2 -Linux -ComputerName $vmName -Credential $cred -Verbose
$vm2=Set-AzureRmVMSourceImage -VM $vm2 -PublisherName $pubName -Offer $offerName -Skus $skuName -Version “latest”
$vm2=Add-AzureRmVMNetworkInterface -VM $vm2 -Id $backendnic2.Id
$diskName=”dynamic”
$storageAcc=Get-AzureRmStorageAccount -ResourceGroupName $rgName -Name $saName
$osDiskUri1=$storageAcc.PrimaryEndpoints.Blob.ToString() + “vhds2/” + $diskName + “.vhd”
$vm2=Set-AzureRmVMOSDisk -VM $vm2 -Name $diskName -VhdUri $osDiskUri1 -CreateOption fromImage
Set-AzureRmVMPlan -VM $vm2 -Publisher $pubName -Product $offerName -Name $skuName
New-AzureRmVM -ResourceGroupName $rgName -Location $locName -VM $vm2

12) Configuring the virtual machines

When both the NetScaler VPX instances start, then connect to both NetScaler VPX instances using the SSH protocol to configure the virtual machines.

a) Active-Active: Run the same set of configuration commands on the command line of both the NetScaler VPX instances.

b) Active-Passive: Run this command on the command line of both the NetScaler VPX instances.
```
add ha node #nodeID <nsip of other NetScaler VPX>

In Active-Passive mode, run configuration commands on the primary node only.

**Azure terminology**

January 6, 2019

Some of the new terms used in Azure Resource Manager are listed below. This list helps you relate to the terms and concepts used in Azure Service Management or classical mode of deployment.

1. **Azure Load Balancer** – Azure load balancer is a resource that distributes incoming traffic among computers in a network. Traffic is distributed among virtual machines defined in a load-balancer set. A load balancer can be external or internet-facing, or it can be internal.

2. **Azure Resource Manager (ARM)** – ARM is the new management framework for services in Azure. Azure Load Balancer is managed using ARM-based APIs and tools.

3. **Back-End Address Pool** – These are IP addresses associated with the virtual machine Network Interface Card (NIC) to which load will be distributed.

4. **BLOB - Binary Large Object** – Any binary object like a file or an image that can be stored in Azure storage.

5. **Front-End IP Configuration** – An Azure Load balancer can include one or more front-end IP addresses, also known as a virtual IPs (VIPS). These IP addresses serve as ingress for the traffic.

6. **Instance Level Public IP (ILPIP)** – An ILPIP is a public IP address that you can assign directly to your virtual machine or role instance, rather than to the cloud service that your virtual machine or role instance resides in. This does not take the place of the VIP (virtual IP) that is assigned to your cloud service. Rather, it's an additional IP address that you can use to connect directly to your virtual machine or role instance.

   **Note:** In the past, an ILPIP was referred to as a PIP, which stands for public IP.

7. **Inbound NAT Rules** – This contains rules mapping a public port on the load balancer to a port for a specific virtual machine in the back end address pool.

8. **IP-Config** - It can be defined as an IP address pair (public IP and private IP) associated with an individual NIC. In an IP-Config, the public IP address can be NULL. Each NIC can have multiple IP-Config associated with it, which can be upto 255.

9. **Load Balancing Rules** – A rule property that maps a given front-end IP and port combination to a set of back-end IP addresses and port combination. With a single definition of a load balancer resource, you can define multiple load balancing rules, each rule reflecting a combination of a front end IP and port and back end IP and port associated with virtual machines.
10. Network Security Group (NSG) – NSG contains a list of Access Control List (ACL) rules that allow or deny network traffic to your virtual machine instances in a virtual network. NSGs can be associated with either subnets or individual virtual machine instances within that subnet. When a NSG is associated with a subnet, the ACL rules apply to all the virtual machine instances in that subnet. In addition, traffic to an individual virtual machine can be restricted further by associating a NSG directly to that virtual machine.

11. Private IP addresses – Used for communication within an Azure virtual network, and your on-premises network when you use a VPN gateway to extend your network to Azure. Private IP addresses allow Azure resources to communicate with other resources in a virtual network or an on-premises network through a VPN gateway or ExpressRoute circuit, without using an Internet-reachable IP address. In the Azure Resource Manager deployment model, a private IP address is associated with the following types of Azure resources – virtual machines, internal load balancers (ILBs), and application gateways.

12. Probes – This contains health probes used to check availability of virtual machines instances in the back end address pool. If a particular virtual machine does not respond to health probes for some time, then it is taken out of traffic serving. Probes enable you to keep track of the health of virtual instances. If a health probe fails, the virtual instance will be taken out of rotation automatically.

13. Public IP Addresses (PIP) – PIP is used for communication with the Internet, including Azure public-facing services and is associated with virtual machines, Internet-facing load balancers, VPN gateways, and application gateways.

14. Region - An area within a geography that does not cross national borders and that contains one or more datacenters. Pricing, regional services, and offer types are exposed at the region level. A region is typically paired with another region, which can be up to several hundred miles away, to form a regional pair. Regional pairs can be used as a mechanism for disaster recovery and high availability scenarios. Also referred to generally as location.

15. Resource Group - A container in Resource Manager holds related resources for an application. The resource group can include all of the resources for an application, or only those resources that are logically grouped together

16. Storage Account – An Azure storage account gives you access to the Azure blob, queue, table, and file services in Azure Storage. Your storage account provides the unique namespace for your Azure storage data objects.

17. Virtual Machine – The software implementation of a physical computer that runs an operating system. Multiple virtual machines can run simultaneously on the same hardware. In Azure, virtual machines are available in a variety of sizes.

18. Virtual Network - An Azure virtual network is a representation of your own network in the cloud. It is a logical isolation of the Azure cloud dedicated to your subscription. You can fully control the IP address blocks, DNS settings, security policies, and route tables within this network. You can also
further segment your VNet into subnets and launch Azure IaaS virtual machines and cloud services (PaaS role instances). Additionally, you can connect the virtual network to your on-premises network using one of the connectivity options available in Azure. In essence, you can expand your network to Azure, with complete control on IP address blocks with the benefit of enterprise scale Azure provides.

**Deploy a NetScaler VPX instance on Oracle Public Cloud**

January 17, 2019

**Important**

NetScaler VPX instance on Oracle is in Limited Availability. If you'd like to participate, contact your local sales team or request a call at [https://www.citrix.com/products/netscaler-adc/form/inquiry/](https://www.citrix.com/products/netscaler-adc/form/inquiry/).

The NetScaler VPX virtual appliance (release 11.1 build 52.126) is available as a downloadable image with which you can create an instance in Oracle Public Cloud (OPC) environment. NetScaler VPX in OPC enables you to leverage cloud computing capabilities of OPC and use NetScaler load balancing and traffic management features for your business needs. You can deploy NetScaler VPX instances in OPC as standalone instances.

This section includes the following topics:

- Supported Features
- Hardware Requirements
- The Create Instance Wizard
- Terminology
- Limitations

**Supported Features**

A NetScaler VPX instance running in an Oracle Public Cloud deployment supports the following NetScaler features:

- Load Balancing
- ICA Proxy
- Content Switching
- AAA
- Rewrite
- Responder
- RDP Proxy
- nFactor
NetScaler 11.1

- LDAP
- VPN (CVPN/Full)
- GSLB

**Hardware Requirements**

VPX virtual appliances can be deployed in OPC as any instance type that has two or more cores and more than 2GB memory.

**The Create Instance Wizard**

You can create an instance on Oracle Public Cloud by using the Create Instance wizard.

Figure 1: The Oracle Create Instance wizard

The wizard takes you through these pages. Use the forward and back button to move between pages or click the required page.

- Image: choose a template of a virtual hard disk of a specific size with an installed operating system. You can use images to create virtual machine instances in Oracle Compute Cloud Service.
- Shape: specify the OCPU and memory for your instance.
- Instance: enter details of your instance such as name, label, description, tags, customer attributes, and add SSH public key.
- Network: configure network settings for your instance such as IP networks, security lists, and so on.
- Storage: attach existing storage volumes, or create and attach a storage volume to the instance.
- Review: verify the settings for the new instance.

**Terminology**

This section describes the key terms that are used in this section.

- Instance: A virtual machine in Oracle Compute Cloud Service, created by using a specific machine image, with CPU and memory resources defined by a shape.

- IP Network: An IP subnet in your account. The address range of the IP network is determined by the IP address prefix that you specify while creating the IP network. These IP addresses aren’t part of the common pool of Oracle-provided IP addresses used by the shared network. When you add an instance to an IP network, the instance is assigned an IP address in that subnet. You can assign IP addresses to instances either statically or dynamically, depending on your business needs. So you have complete control over the IP addresses assigned to your instances.
• Security Protocol: A protocol with which you can specify a transport protocol and the source and destination ports to use with the specified protocol. When you create a security rule, you can specify the security protocols that you want to use to permit traffic. Traffic is enabled by a security rule when the protocol in the packet matches the protocol specified here. If no protocol is specified, all protocols are allowed.

• Security Rule: A firewall rule that you can define to control network access to Oracle Compute Cloud Service instances through a specified security application.

For more information, see Oracle Compute Cloud Service Terminology.

Limitations

• You can’t upgrade or downgrade a NetScaler VPX instance running on OPC.
• Only two-arm topology is supported.

Prerequisites

December 18, 2018

Important

NetScaler VPX instance on Oracle is in Limited Availability. If you’d like to participate, contact your local sales team or request a call at https://www.citrix.com/products/netscaler-adc/form/inquiry/.

Before attempting to create a NetScaler instance in OPC, make sure you have the following:

• An Oracle Cloud Account
• An SSH key pair

Take the following steps to meet the above requirements:

1. Create and configure your account on Oracle Cloud.

You must have an Oracle.com account to request a trial or purchase a subscription to an Oracle Cloud service. For more information about setting up your Oracle account see Overview of Subscribing to an Oracle Cloud Service Trial.

2. Create an SSH key pair

Before you create an instance in Oracle Public Cloud, you need to create and configure at least one SSH key pair, because after your instance is created, SSH key exchange is the first and only method of accessing the instance.

a. Generate an SSH key pair by following the procedure described Generating an SSH Key Pair.
Following is an example of creating an SSH key pair in RSA format.

```bash
ssh-keygen -b 2048 -t rsa
```

b. Upload the public key to the Oracle Public Cloud interface by following procedure described at [Uploading the SSH Public Key](#). Once uploaded, you can assign the SSH key to any instance. You can also upload the key later while creating the instance.

## Configure a NetScaler VPX standalone instance on Oracle Public Cloud

January 18, 2019

NetScaler VPX configuration on Oracle Public Cloud involves the following tasks:

1. Upload a NetScaler VPX Image and Associate It with the Oracle Cloud Web Console.
2. Configure the VPX instance.
3. Configure NetScaler owned IP Addresses and an LB vServer.

### Upload a NetScaler VPX image and associate it with the Oracle Cloud Web console

After obtaining the raw.tar.gz file image from Citrix, associate it with the Oracle Web console as follows:

1. Launch cloud.oracle.com and click **Sign In** in the upper-right corner.
2. From the **Cloud Account** drop-down menu, select the appropriate data center and click **My Services**.
3. In the **Enter your Identity Domain** field, enter the identity domain that Oracle assigned to your account, and click **Go**.
4. Enter your user name and password and click **Sign In**.
5. From the Dashboard, click **Compute > Open Service Console**.
6. Click **Images**.
7. The **Private Images** page appears.
8. Click **Upload Image**.
9. Enter your password, and then click **Continue**.
10. The **Upload Image** page appears in a new tab.
11. In the **Image File** field, browse to select the raw.tar.gz image file that you want to upload.
12. In the **Target Object** field, enter the name of the object that the image file should be stored as in Oracle Storage Cloud Service.

13. Click **Upload**.

14. After the image is uploaded, it appears under **Private Images**.

15. Click the image and click **Associate Image**.

16. The **Associate Image** window appears.

17. Specify a name and description for the image that is being created.

18. Click **Select File** to select the file.

19. Click **OK** to associate the new image with the file.

For more information about uploading image files to Oracle cloud, see: https://docs.oracle.com/cloud/latest/stcomputeclouds/STCSG/GUID-799D6F6D-BDED-4DDE-9B3D-BE23BE5F687F.htm#STCSG-GUID-799D6F6D-BDED-4DDE-9B3D-BE23BE5F687F

**Configure a NetScaler instance**

Complete these steps to a VPX instance.

1. Launch the Create Instance wizard to create instances. Select and enter the details in the **Shape** and **Instance** pages. For more information about how to create an instance, see [Creating an Instance from the Instances Page](https://docs.oracle.com/cloud/latest/stcomputeclouds/STCSG/GUID-799D6F6D-BDED-4DDE-9B3D-BE23BE5F687F.htm#STCSG-GUID-799D6F6D-BDED-4DDE-9B3D-BE23BE5F687F).

2. In the **Network** page, clear the **Shared Network** check box and click **Configure Interface > Create IP Network** to create an IP network for the management IP (NIC 1/1) and click **Create**. Specify the other details in the **Configure IP Network Interface** window and click **Save**. Repeat the steps for NIC 1/2 and NIC 1/3. For more information, see [IP Network Options at this page](https://docs.oracle.com/cloud/latest/stcomputeclouds/STCSG/GUID-799D6F6D-BDED-4DDE-9B3D-BE23BE5F687F.htm#STCSG-GUID-799D6F6D-BDED-4DDE-9B3D-BE23BE5F687F): [Creating an Instance from the Instances Page](https://docs.oracle.com/cloud/latest/stcomputeclouds/STCSG/GUID-799D6F6D-BDED-4DDE-9B3D-BE23BE5F687F.htm#STCSG-GUID-799D6F6D-BDED-4DDE-9B3D-BE23BE5F687F).

   **Note**

   In **Configure IP Network Interface**, select the Default Gateway check box.

   Set Public IP Address to **Auto Generated** for NIC 1/1 and 1/2 and specify private IP addresses for all three NICs.

3. On the **Storage** page, you can attach existing storage volumes to your instance, if necessary, or create storage volumes and attach them to the instance. In this example, select the default storage.

4. On the **Review** page, verify the information that you’ve entered, and then click **Create**.

   Monitor the status of the instance. When the status is shown as “Running,” the instance is ready.

5. Create an **IP Address Prefix Set**. For more information about how to create an IP address prefix set, see [Creating an IP Address Prefix Set](https://docs.oracle.com/cloud/latest/stcomputeclouds/STCSG/GUID-799D6F6D-BDED-4DDE-9B3D-BE23BE5F687F.htm#STCSG-GUID-799D6F6D-BDED-4DDE-9B3D-BE23BE5F687F).
6. Create **Security Protocols**. For more information about how to create a security protocol, see *Creating a Security Protocol for IP Networks*.

7. Create **Security Rules**. For more information about how to create a security rule for IP networks, see *Creating a Security Rule for IP Networks*.

**Configure NetScaler owned IP addresses and an LB vServer**

1. Configure the NetScaler owned IP addresses by using the NetScaler GUI or the command “add ns ip.” For more information, see *Configuring NetScaler-Owned IP Addresses*.

2. Configure the NetScaler instance as a load balancing virtual server (LB vServer). For more information, see *Set up basic load balancing*.

**Scenario**

January 18, 2019

---

**Important**

NetScaler VPX instance on Oracle is in Limited Availability. If you’d like to participate, contact your local sales team or request a call at [https://www.citrix.com/products/netscaler-adc/form/inquiry/](https://www.citrix.com/products/netscaler-adc/form/inquiry/).

This scenario illustrates how to deploy a NetScaler VPX standalone instance in Oracle Public Cloud (OPC). The user creates a standalone VPX instance with multiple NICs. The instance, which is configured as a load balancing virtual server, communicates with back-end servers (the server farm). For this configuration, you have to set up the required communication routes between the instance and the back-end servers, and between the instance and the external hosts on the public Internet.

This scenario illustrates how to deploy a NetScaler VPX standalone instance in Oracle Public Cloud (OPC). As a user, create a standalone VPX instance with multiple NICs. The instance, which is configured as a load balancing virtual server, communicates with back-end servers (the server farm). For this configuration, you have to set up the required communication routes:

You create three NICs. Each NIC can be configured with a pair of IP addresses (public and private). The NICs serve the following purposes.

<table>
<thead>
<tr>
<th>NIC</th>
<th>Purpose</th>
<th>Associated with</th>
</tr>
</thead>
<tbody>
<tr>
<td>NIC 1/1</td>
<td>Serves management traffic</td>
<td>Public IP address and private IP address</td>
</tr>
<tr>
<td></td>
<td>(NSIP)</td>
<td></td>
</tr>
</tbody>
</table>

© 1999-2018 Citrix Systems, Inc. All rights reserved.
The following public IP addresses are used in this example.

<table>
<thead>
<tr>
<th>Entity</th>
<th>Public IP address</th>
</tr>
</thead>
<tbody>
<tr>
<td>NSIP</td>
<td>192.168.30.2</td>
</tr>
<tr>
<td>VIP</td>
<td>192.168.10.2</td>
</tr>
<tr>
<td>SNIP</td>
<td>192.168.20.2</td>
</tr>
<tr>
<td>Back-end server1</td>
<td>192.168.20.10</td>
</tr>
<tr>
<td>Back-end server2</td>
<td>192.168.20.11</td>
</tr>
</tbody>
</table>

Note
Oracle assigns a static public IP address and a dynamic private IP. For more information, see Network Settings.

To create the required instances and set up the required security rules for this scenario, complete the following tasks:

1. From the Oracle Web Console, click **Create Instance** and click **Private Images**.

2. Select the required image and click **Review and Create**. The **Create Instance** wizard starts, displaying the default settings.

   **Note**
   If you click **Create** without going through the pages in the wizard, an image with the default settings is created. No SSH keys are associated with it. So make sure you enter the necessary details on each page of the wizard.

   While deploying a NetScaler VPX instance on Oracle Public Cloud, an SSH key pair is mandatory. However, the user cannot use the key pair to log on to the VPX instance. The user must use nsroot as the user name and as the password to log on.

3. On the **Shape** page, select the shape that you want to use. The shape specifies the OCPU and memory resources to be allocated to the instance. Click the arrow next to the Review and Create tab.
on the upper right corner to go to the Instance page. In this scenario, you create an instance with 1 OCPU.

4. On the Instance page, select or enter the following, and then go to the next page:
   - **High Availability Policy**: Active
   - **Name**: `Instance name`
   - **Label**: default value
   - **Description**: None
   - **Tags**: None
   - **SSH Keys**: Add the SSH key that you created in the Prerequisites section.
   - **Custom Attributes**: None

5. On the **Network** page, clear the **Shared Network** check box and click **Configure Interface**.

6. In the Configure IP Network Interface window, click **Create IP Network** to create an IP network for the management IP (NSIP). Add an IP Address Prefix (192.168.30.0/24), a name, and a description. Click **Create**

7. In the Configure IP Network Interface window, select the IP Network that you’ve just created, add a static IP address, and select an auto-generated public IP address. Make sure the **Default Gateway** check box is selected.

8. Similarly create IP networks for NIC 1/2 and NIC 1/3 as follows.

   **NIC 1/2**
   - **Name**: IPConfig1 (for NIC 1/2)
   - **IP Address Prefix**: 192/168.10.0/24

   **NIC 1/3**
   - **Name**: IPConfig2 (for NIC 1/3)
   - **IP Address Prefix**: 192.168.20.0/24

9. Configure IP Network Interface as follows:

   **NIC 1/2**
   - **Interface**: eth1
   - **IP Network**: IPConfig1
   - **Static IP Addresses**: 192.168.10.2
   - **Public IP Address**: Auto Generated

   **NIC 1/3**
   - **Interface**: eth2
   - **IP Network**: IPConfig2
   - **Static IP Addresses**: 192.168.20.2
Next, click the arrow to go to the **Storage** page.

**Note**

For NIC 1/2 and 1/3, do not select the **Default Gateway** check box.

8. On the **Storage** page, you can attach existing storage volumes to your instance, if necessary, or create storage volumes and attach them to the instance. In this example, select the default storage.

9. On the **Review** page, verify the information that you’ve entered, and then click **Create**.

10. Monitor the status of the instance. When the status is shown as “Running,” the instance is ready. Follow the same steps to create two back-end servers.

11. From the Oracle web console, click **IP Network** > **IP Address Prefix Sets** > **Create IP Network**. Specify the name and the IP Address Prefix Set.

12. Create a security protocol with which to create security rules. You’ll create a security protocol for HTTP.

13. Create a security rule to allow external traffic to access the NetScaler Instance. For this scenario, create a rule to allow HTTP requests from external traffic to the NetScaler instance.

Now you can log on to your instance by using either GUI or SSH and complete the initial configuration. To find the oracle-assigned NetScaler management IP address, in the Oracle web console, click **Instances**. To the find the NetScaler management IP address pair, click the instance details icon for the instance that you created.

You can use SSH to log on to your instance as an nsroot user, by using the following command:

```bash
ssh -i ./<private key> nsroot@<ip address>
```

When prompted, type the password nsroot.

Next, configure the NetScaler-owned IP addresses and the NetScaler instance as a load balancing virtual server:

- Configure the NetScaler-owned IP addresses by using the NetScaler GUI or the command “add ns ip.” For more information, see [https://docs.citrix.com/en-us/netscaler/11-1/networking/ip-addressing/configuring-netscaler-owned-ip-addresses.html](https://docs.citrix.com/en-us/netscaler/11-1/networking/ip-addressing/configuring-netscaler-owned-ip-addresses.html)

**Example:** Here’s a sample LB configuration done by using the NetScaler CLI.

```
1   Add nsip 192.168.20.2 255.255.255.0
2
3   Add lb vs v1 http 192.168.10.2 80
4
```
The preceding configuration is based on the following assumptions:

<table>
<thead>
<tr>
<th>Entity</th>
<th>Private IP address</th>
</tr>
</thead>
<tbody>
<tr>
<td>VIP</td>
<td>192.168.10.2</td>
</tr>
<tr>
<td>SNIP</td>
<td>192.168.20.2</td>
</tr>
<tr>
<td>Back-end server1</td>
<td>192.168.20.10</td>
</tr>
<tr>
<td>Back-end server2</td>
<td>192.168.20.11</td>
</tr>
</tbody>
</table>

**Deploy a NetScaler VPX Instance on Cisco CSP 2100**

January 18, 2019

You can deploy an SR-IOV-enabled NetScaler VPX instance on Cisco Cloud Services Platform (CSP) 2100 to configure network functions virtualization (NFV) for your environment. The Cisco CSP 2100 is a turnkey, open, x86 Linux Kernel-based virtual machine (KVM) software and hardware platform for data center NFV.

This section describes how to deploy a NetScaler VPX instance on Cisco CSP 2100 and enable SR-IOV on the instance.

**Points to Note**

- Supported NetScaler version: From release 11.1 56.x and later
- Qualified on CSP version 2.2.3 build 32

**Deploy a NetScaler VPX Instance on Cisco CSP 2100**

Deploy a NetScaler VPX instance on Cisco CSP 2100 is a 2-step process:

1. Upload the NetScaler VPX qcow image.
2. Enable SR-IOV on the VPX instance.
Complete the following steps:

1. Download the NetScaler VPX 11.1 56.x qcow image from the Citrix download site.

2. Log on to Cisco CSP 2100 with your logon credentials.

3. From the dashboard, select **Configuration > Repository**.

4. From the Repository window, select the plus sign.

5. Select **Browse** to browse to the downloaded NetScaler VPX qcow image.

6. Select **Upload** to upload the VPX image to CSP 2100.

Next, provision the VPX instance and add SR-IOV interfaces to it.

1. From the CSP dashboard, select **Configuration > Services**

2. Select the plus sign. The **Create Service** template appears. Enter the following specifications:

   - Name
   - Target Host Name
   - Image Name: qcow image that you’ve already downloaded
   - Number of cores: minimum two
   - Disk Space: Minimum 20 GB
   - RAM: Minimum 2,048 GB

3. To add an SR-IOV interface, select the plus sign next to VNIC. The **VNIC Configuration** window appears.

4. For **Interface Type**, select **Passthrough**.

5. Specify the VLAN range.

6. For **Passthrough Mode**, select **SR-IOV**.

7. For **Network Name**, select an SR-IOV supported NIC. Click **Submit**.

8. Click **Deploy** to complement the process. It might take a moment for the NetScaler VPX instance to be deployed on Cisco CSP 2100.

9. Next, log on to the NetScaler VPX instance to complete the initial configuration.

**Limitations**

The following are CSP 2100-related limitations:

- If you power off the NetScaler VPX instance by using the CSP 2100 GUI, the NetScaler VPX configuration might get lost.
- In host VLAN mode, the VPX Niantic SR-IOV interfaces must be configured to 9k MTU size.
• Due to vCPU scheduling issues on the CSP 2100 platform, latency, transmit stall, and transmit queue overflow might be observed on the NetScaler VPX instance.
• The “Tag-all” command is not supported on a VPX Niantic SR-IOV interface.
• The LACP feature is not supported on a VPX Niantic SR-IOV interface.

Jumbo frames on NetScaler VPX instances

December 18, 2018

NetScaler VPX appliances support receiving and transmitting jumbo frames containing up to 9216 bytes of IP data. Jumbo frames can transfer large files more efficiently than it is possible with the standard IP MTU size of 1500 bytes.

A NetScaler appliance can use jumbo frames in the following deployment scenarios:
• Jumbo to Jumbo. The appliance receives data as jumbo frames and sends it as jumbo frames.
• Non-Jumbo to Jumbo. The appliance receives data as regular frames and sends it as jumbo frames.
• Jumbo to Non-Jumbo. The appliance receives data as jumbo frames and sends it as regular frames.

For more information, see Configuring Jumbo Frames Support on a NetScaler Appliance.

Jumbo Frames support is available on NetScaler VPX appliances running on the following virtualization platforms:
• VMware ESX
• Linux-KVM Platform
• Citrix XenServer
• Amazon Web Services (AWS)

Jumbo frames on VPX appliances works similar to Jumbo frames on MPX appliances. For more information on Jumbo Frames and its use cases, see Configuring Jumbo Frames on MPX appliances. The use cases of Jumbo Frames on MPX appliances also apply to VPX appliances.

Configure jumbo frames for a VPX instance running on VMware ESX

Perform the following tasks for configuring Jumbo Frames on a NetScaler VPX appliance running on VMware ESX server:

1. Set the MTU of the interface or channel of the VPX appliance to a value in the range 1501-9000. Use the CLI or GUI to set the MTU size. Note that NetScaler VPX appliances running on VMware ESX support receiving and transmitting jumbo frames containing up to only 9000 bytes of IP data.
2. Set the same MTU size on the corresponding physical interfaces of the VMware ESX server by using its management applications. For more information about setting the MTU size on the physical interfaces of VMware ESX, see http://vmware.com/.

Configure jumbo frames for a VPX instance running on Linux-KVM server

Perform the following tasks for configuring Jumbo Frames on a NetScaler VPX appliance running on a Linux-KVM Server:

1. Set the MTU of the interface or channel of the VPX appliance to a value in the range 1501-9216. Use the NetScaler VPX CLI or GUI to set the MTU size.
2. Set the same MTU size on the corresponding physical interfaces of a Linux-KVM Server by using its management applications. For more information about setting the MTU size on the physical interfaces of Linux-KVM, see http://www.linux-kvm.org/.

Configure jumbo frames for a VPX instance running on Citrix XenServer

Perform the following tasks for configuring Jumbo Frames on a NetScaler VPX appliance running on Citrix XenServer:

1. On the Networking tab, select the network - network 0/1/2.
2. Select Properties and edit MTU. The drop-down selection menu for MTU is unavailable unless all the VPXs that use the network are shutdown.

Configure jumbo frames for a VPX instance running on AWS

Host-level configuration is not required for VPX on Azure. To configure Jumbo Frames on VPX, follow the steps given in Configuring Jumbo Frames Support on a NetScaler Appliance.

Hardware Installation

December 18, 2018

Note

For the latest content, see NetScaler MPX.

The following sections describe the hardware installation and initial configuration for all NetScaler hardware platforms.
### NetScaler 11.1

<table>
<thead>
<tr>
<th>Hardware Platforms</th>
<th>Describes the NetScaler hardware platforms and provides detailed information about each platform and its components.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Preparing for Installation</td>
<td>Describes how to unpack the NetScaler appliance and prepare the site and rack for installing the appliance. Lists the cautions and warnings that you should review before you install the appliance.</td>
</tr>
<tr>
<td>Installing the Hardware</td>
<td>Describes the steps to install the rails, mount the hardware, connect the cables, and turn on the appliance.</td>
</tr>
<tr>
<td>Initial Configuration</td>
<td>Describes how to perform initial configuration of your NetScaler appliance and assign management and network IP addresses.</td>
</tr>
<tr>
<td>Lights Out Management Port of the NetScaler Appliance</td>
<td>Describes the different operations you can perform on your NetScaler appliance by using the Lights Out Management Port.</td>
</tr>
</tbody>
</table>

For information about NetScaler hardware and software compatibility and the supported upgrade and downgrade paths, see [http://support.citrix.com/article/CTX113357](http://support.citrix.com/article/CTX113357).

### Licensing

December 18, 2018

The following topics describe the migration instructions for setting up a new version of a NetScaler appliance with a list of all new and deprecated commands, parameters, and SNMP OIDs.

This document includes the following information:

- NetScaler Licensing Overview
- NetScaler Gateway Universal License

### NetScaler licensing overview

January 6, 2019
The process of allocating your NetScaler licenses has been greatly simplified. The new licensing framework allows you to focus on getting maximum value from Citrix products.

In the NetScaler GUI, you can use your hardware serial number (HSN) or your license access code to allocate your licenses. Alternatively, if a license is already present on your local computer, you can upload it to the appliance.

For all other functionality, such as returning or reallocating your license, you must use the licensing portal. Optionally, you can still use the licensing portal for license allocation. For more information about the licensing portal, see http://support.citrix.com/article/CTX131110.

**Note:** Purchase separate licenses for each appliance in a high availability pair. Ensure that the same types of licenses are installed on both the appliances. For example, if you purchase a platinum license for one appliance, you must purchase another platinum license for the other appliance.

**Prerequisites**

To use the hardware serial number or license access code to allocate your licenses:

- You must be able to access public domains through the appliance. For example, the appliance should be able to access www.citrix.com. The license allocation software internally accesses the Citrix licensing portal for your license. To access a public domain:
  - Use a proxy server or set up a DNS server.
  - Configure a NetScaler IP (NSIP) address or a subnet IP (SNIP) address on your NetScaler appliance.

- Your license must be linked to your hardware, or you must have a valid license access code. Citrix sends your license access code by email when you purchase a license.

**Allocate a license by using the GUI**

If your license is already linked to your hardware, the license allocation process can use the hardware serial number. Otherwise, you must type the license access code.

You can partially allocate licenses as required for your deployment. For example, if your license file contains 10 licenses, but your current requirement is for only six licenses, you can allocate six licenses now, and allocate more licenses later. You cannot allocate more than the total number of licenses present in your license file.

**To allocate your license**

1. In a web browser, type the IP address of the NetScaler appliance (for example, http://192.168.100.1).
2. In User Name and Password, type the administrator credentials.

3. On the Configuration tab, navigate to System \ Licenses.

4. In the details pane, click Manage Licenses, click Add New License, and then select one of the following options:

   - **Use Serial Number.** The software internally fetches the serial number of your appliance and uses this number to display your licenses.

   - **Use license access code.** Citrix emails the license access code for the license that you purchased. Enter the license access code in the text box.

   If you do not want to configure internet connectivity on the NetScaler appliance, you can use a proxy server. Select the Connect through Proxy Server check box and specify the IP address and port of your proxy server.

5. Click Get Licenses. Depending on the option that you selected, one of the following dialog boxes appears.

   - The following dialog box appears if you selected Hardware Serial Number.

   - The following dialog box appears if you selected license access code.

6. Select the license file that you want to use to allocate your licenses.

7. In the Allocate column, enter the number of licenses to be allocated. Then click Get.

   - If you selected Hardware Serial Number, enter the number of licenses, as shown in the following screenshot.

   - If you selected license access code, enter the number of licenses, as shown in the following screenshot.

8. Click restart for the license to take effect.

9. In the restart dialog box, click OK to proceed with the changes, or click Close to cancel the changes.

### Install a license

If you downloaded your license file to your local computer by accessing the licensing portal, you must upload the license to the appliance.

### To install a license file by using the GUI

1. In a web browser, type the IP address of the NetScaler appliance (for example, http://192.168.100.1).
2. In User Name and Password, type the administrator credentials.
3. On the Configuration tab, navigate to System Licenses.
4. In the details pane, click Manage Licenses.
5. Click Add New License, then select Upload license files from a local computer.
6. Click Browse. Navigate to the location of the license files, select the license file, and then click Open.
7. Click restart to apply the license.
8. In the restart dialog box, click OK to proceed with the changes, or click Close to cancel the changes.

To install the licenses by using the CLI:

1. Open an SSH connection to the ADC appliance by using an SSH client, such as PuTTY.
2. Log on to the ADC appliance by using the administrator credentials.
3. Switch to the shell prompt, create a license subdirectory in the nsconfig directory, if it does not exist, and copy one or more new license files to this directory.

Example

```
1 login: nsroot
2 Password: nsroot
3 Last login: Mon Aug 4 03:37:27 2008 from 10.102.29.9
4 Done
5 > shell
6 Last login: Mon Aug 4 03:51:42 from 10.103.25.64
7 root@ns# mkdir /nsconfig/license
8 root@ns# cd /nsconfig/license
```

Copy one or more new license files to this directory.

**Note:** The NetScaler appliance does not prompt for a reboot option when you use the command line interface to install the licenses. Run the reboot -w command to warm restart the system, or run the restart command to restart the system normally.

Verify licensed features

Before using a feature, ensure that your license supports the feature.

To verify the licensed features by using the CLI

1. Open an SSH connection to the ADC appliance by using an SSH client, such as PuTTY.
2. Log on to the ADC appliance by using the administrator credentials.

3. At the command prompt, enter the `sh ns license` command to display the features supported by the license.

**Example**

```
1  sh ns license
2   License status:
3       Web Logging: YES
4       Surge Protection: YES
5       .......
6
7       HTML Injection: YES
8   Done
```

**To verify the licensed features by using the GUI**

1. In a web browser, type the IP address of the ADC appliance, such as `http://192.168.100.1`.
2. In User Name and Password, type the administrator credentials.
3. Provide the User name and Password and click **Login**.
4. In the navigation pane, expand **System**, and then click **Licenses**. You see a green check mark next to the licensed features.

**Enable or disable a feature**

When you use the NetScaler appliance for the first time, you must enable a feature before you can use its functionality. If you configure a feature before it is enabled, a warning message appears. The configuration is saved but it applies only after the feature is enabled.

**To enable a feature by using the CLI**

At the command prompt, type the following commands to enable a feature and verify the configuration:

- `enable feature <FeatureName>`
- `show feature`

**Example**

```
1  enable feature lb cs
2  done
```
**NetScaler 11.1**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Acronym</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>1) Web Logging</td>
<td>WL</td>
<td>OFF</td>
</tr>
<tr>
<td>2) Surge Protection</td>
<td>SP</td>
<td>ON</td>
</tr>
<tr>
<td>3) Load Balancing</td>
<td>LB</td>
<td>ON</td>
</tr>
<tr>
<td>4) Content Switching</td>
<td>CS</td>
<td>ON</td>
</tr>
<tr>
<td>5) Cache Redirection</td>
<td>CR</td>
<td>ON</td>
</tr>
</tbody>
</table>

24) NetScaler Push

<table>
<thead>
<tr>
<th>Feature</th>
<th>Acronym</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>push</td>
<td>OFF</td>
</tr>
</tbody>
</table>

The example shows how to enable load balancing (lb) and content switching (cs).

If the license key is not available for a particular feature, the following error message appears for that feature:

ERROR: feature(s) not licensed

Note: To enable an optional feature, you must have a feature-specific license. For example, you have purchased and installed the Citrix NetScaler Enterprise Edition license. However, to enable the Integrated Caching feature, you must purchase and install the AppCache license.

**To disable a feature by using the CLI**

At the command prompt, type the following commands to disable a feature and verify the configuration:

- `disable feature <FeatureName>`
- `show feature`

**Example**

The following example shows how to disable load balancing (LB).

```
> disable feature lb
Done
> show feature

Feature    Acronym
Status
```
Check license expiration information

You can check NetScaler license expiration information through GUI or CLI.

NetScaler VPX Express license

Starting with NetScaler release 12.0 56.20, VPX Express for on-premise and cloud deployments does not require a license file and it comes with the following features:

- 20 Mbps bandwidth
- All ADC standard license features, except Citrix Gateway
- Maximum 250 SSL sessions
- 20 Mbps SSL throughput

You can upgrade the VPX Express License to the following two options:

1. A standalone NetScaler VPX license
2. NetScaler Pooled Capacity license for VPX instances. For more information, see NetScaler Pooled Capacity.

Citrix Gateway Universal License

December 18, 2018

The Citrix Gateway universal license limits the number of concurrent user sessions to the number of licenses purchased. If you purchase 100 licenses, you can have 100 concurrent sessions at any time. When a user ends a session, that license is released for the next user. A user who logs on to the Citrix Gateway from more than one computer occupies a license for each session.
If all licenses are occupied, no additional connections can be opened until a user ends a session or the administrator terminates the session using the configuration utility. When a connection is closed, the license is released and can be used for a new user.

This document includes the following information:

- Obtaining the Universal License
- Installing the Universal License
- Verifying Installation of the Universal License

**Obtaining the Universal License**

You need the following information before going to the Citrix Web site for the universal license.

- Your user ID and password for My Citrix
  
  Register at My Citrix (www.mycitrix.com) to receive your user ID and password.
  
  Note: If you cannot locate either the license code or your user ID and password, contact Citrix Customer Service.

- The host name of the Citrix Gateway
  
  The entry field for this name on My Citrix is case-sensitive, so make sure that you copy the host name exactly as it is configured on the NetScaler appliance.

- The number of licenses you want to include in the license file
  
  You do not have to download all of the licenses you are entitled to at once. For example, if your company purchased 100 licenses, you can choose to download 50. You can allocate the rest in another license file at a later time. Multiple license files can be installed on the Citrix Gateway.

  **Note:** Before obtaining your licenses, make sure you configure the host name of the NetScaler appliance using the Setup Wizard and then restart the appliance.

**To obtain your universal license**

2. Enter your user name and password. If this is the first time you are logging on to the site, you are asked for additional background information.
3. Under My Tools, point to Choose a toolbox, and click Activation System/Manage Assets.
4. In the Current Tool drop-down menu, select Activate/Allocate and follow the directions to obtain your license file.
Installing the Universal License

To install the license, see “Installing the License”. After installation, verify that the license was installed correctly.

Verifying Installation of the Universal License

Before proceeding, verify that your universal license is installed correctly.

To verify installation of the universal license by using the command line interface

1. Open an SSH connection to the NetScaler appliance by using an SSH client, such as PuTTY.
2. Log on to the NetScaler appliance by using the administrator credentials.
3. Use the show license command to verify that “SSL VPN = YES” and that Maximum Users has increased from 5 to the expected number of concurrent users.

To verify installation of the universal license by using the configuration utility

1. In a Web browser, type the IP address of the NetScaler appliance, such as http://192.168.100.1.
2. In User Name and Password, type the administrator credentials.
3. In the navigation pane, expand System, and then click Licenses.
4. In the Licenses pane, you will see a green check mark next to NetScaler Gateway. The field Maximum Citrix Gateway Users Allowed displays the number of concurrent user sessions licensed on the NetScaler appliance.

NetScaler Pooled Capacity

December 18, 2018

NetScaler pooled capacity is a licensing framework that comprises a common bandwidth and instance pool that is hosted on and served by Citrix Application Delivery Management.

For complete information, see NetScaler Pooled Capacity “NetScaler Pooled Capacity”.

Upgrade and downgrade a NetScaler appliance

December 18, 2018
NetScaler 11.1 offers new and updated features with increased functionality. A comprehensive list of enhancements is listed in the release notes accompanying the release announcement. Take a moment to read this document before you upgrade your software.

Understand the licensing framework and types of licenses before you upgrade your software. A software edition upgrade may require new licenses, such as upgrading from the standard edition to the enterprise edition, the standard edition to the platinum edition, or the enterprise edition to the platinum edition.

Note: For upgrading or downgrading the nodes in a cluster setup, see “Upgrading or Downgrading the Cluster Software”.

Upgrading from release 10.1 build 121.10 or any earlier releases to release 10.1 build 122.17 and later involves some location changes of user monitor script files. For details, see Directory Locations of Script Files for User Monitors.

This document includes the following information:

- New and Deprecated Commands, Parameters, and SNMP OIDs
- Upgrading to Release 11.1
- Downgrading from Release 11.1

Note

For best practices for upgrading NetScaler appliances, read the article CTX126793.

AAA application traffic

December 21, 2018

Many companies restrict web site access to valid users only, and control the level of access permitted to each user. The AAA feature allows a site administrator to manage access controls with the NetScaler appliance instead of managing these controls separately for each application. Doing authentication on the appliance also permits sharing this information across all web sites within the same domain that are protected by the appliance.

The AAA feature supports authentication, authorization, and auditing for all application traffic. To use AAA, you must configure authentication virtual servers to handle the authentication process and traffic management virtual servers to handle the traffic to web applications that require authentication. You also configure your DNS to assign FQDNs to each virtual server. After configuring the virtual servers, you configure a user account for each user that will authenticate via the NetScaler appliance, and optionally you create groups and assign user accounts to groups. After creating user accounts and groups, you configure policies that tell the appliance how to authenticate users, which resources to allow users to access, and how to log user sessions. To put the policies into effect, you bind each
policy globally, to a specific virtual server, or to the appropriate user accounts or groups. After configuring your policies, you customize user sessions by configuring session settings and binding your session policies to the traffic management virtual server. Finally, if your intranet uses client certs, you set up the client certificate configuration.

Before configuring AAA, you should be familiar with and understand how to configure load balancing, content switching, and SSL on the NetScaler appliance.

**How AAA works**

January 6, 2019

AAA provides security for a distributed internet environment by allowing any client with the proper credentials to connect securely to protected application servers from anywhere on the Internet. This feature incorporates the three security features of AAA. Authentication enables the NetScaler appliance to verify the client’s credentials, either locally or with a third-party authentication server, and allow only approved users to access protected servers. Authorization enables the ADC to verify which content on a protected server it should allow each user to access. Auditing enables the ADC to keep a record of each user’s activity on a protected server.

To understand how AAA works in a distributed environment, consider an organization with an intranet that its employees access in the office, at home, and when traveling. The content on the intranet is confidential and requires secure access. Any user who wants to access the intranet must have a valid user name and password. To meet these requirements, the ADC does the following:

- Redirects the user to the login page if the user accesses the intranet without having logged in.
- Collects the user’s credentials, delivers them to the authentication server, and caches them in a directory that is accessible through LDAP.
- Verifies that the user is authorized to access specific intranet content before delivering the user’s request to the application server.
- Maintains a session timeout after which users must authenticate again to regain access to the intranet. (You can configure the timeout.)
- Logs the user accesses, including invalid login attempts, in an audit log.

Authentication requires that several entities: the client, the NetScaler appliance, the external authentication server if one is used, and the application server, respond to each other when prompted by performing a complex series of tasks in the correct order. If you are using an external authentication server, this process can be broken down into the following fifteen steps.

1. The client sends a GET request for a URL on the application server.
2. The NetScaler appliance's traffic management virtual server redirects the request to the application server.
3. The application server determines that the client has not been authenticated, and therefore sends an HTTP 200 OK response via the TM vserver to the client. The response contains a hidden script that causes the client to issue a POST request for /cgi/tm.

4. The client sends a POST request for /cgi/tm.

5. The NetScaler appliance’s authentication virtual server redirects the request to the authentication server.

6. The authentication server creates an authentication session, sets and caches a cookie that consists of the initial URL and the domain of the traffic management virtual server, and then sends an HTTP 302 response via the authentication virtual server, redirecting the client to /vpn/index.html.

7. The client sends a GET request for /vpn/index.html.

8. The authentication virtual server redirects the client to the authentication server login page.

9. The client sends a GET request for the login page, enters credentials, and then sends a POST request with the credentials back to the login page.

10. The authentication virtual server redirects the POST request to the authentication server.

11. If the credentials are correct, the authentication server tells the authentication virtual server to log the client in and redirect the client to the URL that was in the initial GET request.

12. The authentication virtual server logs the client in and sends an HTTP 302 response that redirects the client to the initially requested URL.

13. The client sends a GET request for their initial URL.

14. The traffic management virtual server redirects the GET request to the application server.

15. The application server responds via the traffic management virtual server with the initial URL.

If you use local authentication, the process is similar, but the authentication virtual server handles all authentication tasks instead of forwarding connections to an external authentication server. The following figure illustrates the authentication process.

**Figure 1. Authentication Process Traffic Flow**

When an authenticated client requests a resource, the ADC, before sending the request to the application server, checks the user and group policies associated with the client account, to verify that the client is authorized to access that resource. The ADC handles all authorization on protected application servers. You do not need to do any special configuration of your protected application servers.

AAA traffic management handles password changes for users by using the protocol-specific method for the authentication server. For most protocols, neither the user nor the administrator needs to do anything different than they would without AAA traffic management. Even when an LDAP authentication server is in use, and that server is part of a distributed network of LDAP servers with a single designated domain administration server, password changes are usually handled seamlessly. When an authenticated client of an LDAP server changes his or her password, the client sends a credential modify request to AAA traffic management, which forwards it to the LDAP server. If the user’s LDAP server is also the domain administration server, that server responds appropriately and AAA traffic
NetScaler 11.1

management then performs the requested password change. Otherwise, the LDAP server sends AAA traffic management an LDAP_REFERRAL response to the domain administration server. AAA traffic management follows the referral to the indicated domain administration server, authenticates to that server, and performs the password change on that server.

When configuring AAA traffic management with an LDAP authentication server, the system administrator must keep the following conditions and limitations in mind:

- AAA traffic management assumes that the domain administration server in the referral accepts the same bind credentials as the original server.
- AAA traffic management only follows LDAP referrals for password change operations. In other cases AAA traffic management refuses to follow the referral.
- AAA traffic management only follows one level of LDAP referrals. If the second LDAP server also returns a referral, AAA traffic management refuses to follow the second referral.

The ADC supports auditing of all states and status information, so you can see the details of what each user did while logged on, in chronological order. To provide this information, the appliance logs each event, as it occurs, either to a designated audit log file on the appliance or to a syslog server. Auditing requires configuring the appliance and any syslog server that you use.

**Enabling AAA**

December 13, 2018

To use the AAA - Application Traffic feature, you must enable it. You can configure AAA entities—such as the authentication and traffic management virtual servers—before you enable the AAA feature, but the entities will not function until the feature is enabled.

**To enable AAA by using the command line interface**

At the command prompt, type the following commands to enable AAA and verify the configuration:

- `enable ns feature AAA`
- `show ns feature`

**Example**

- `enable feature AAA`
  
  Done
- `show ns feature`
<table>
<thead>
<tr>
<th>Feature</th>
<th>Acronym</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>1) Web Logging</td>
<td>WL</td>
<td>OFF</td>
</tr>
<tr>
<td>2) Surge Protection</td>
<td>SP</td>
<td>ON</td>
</tr>
<tr>
<td>3) AAA</td>
<td>AAA</td>
<td>ON</td>
</tr>
<tr>
<td>23) HTML Injection</td>
<td>HTMLInjection</td>
<td>ON</td>
</tr>
<tr>
<td>24) NetScaler Push</td>
<td>push</td>
<td>OFF</td>
</tr>
</tbody>
</table>

To enable AAA by using the configuration utility

1. Navigate to System > Settings.
2. In the details pane, under Modes and Features, click Change basic features.
3. In the Configure Basic Features dialog box, select the Authentication, Authorization and Auditing check box.
4. Click OK.

Setting up an authentication virtual server

December 13, 2018

All authentication requests are redirected by the traffic management virtual server (load balancing or content switching) to the authentication virtual server. This virtual server processes the associated authentication policies and accordingly provides access to the application.

To set up an authentication virtual server by using the CLI

1. Enable the AAA feature.
   
   `ns-cli-prompt> enable ns feature AAA`

2. Configure an authentication virtual server. It must be of type SSL and make sure to bind SSL certificate-key pair to the virtual server.
   
   `ns-cli-prompt> add authentication vserver <name> SSL <ipaddress> <port>
   
   `ns-cli-prompt> bind ssl certkey <auth-vserver-name> <certkey>`
3. Specify the FQDN of the domain for the authentication virtual server.

   ns-cli-prompt> set authentication vserver <name> -authenticationDomain <FQDN>

4. Associate the authentication virtual server to the relevant traffic management virtual server.

   Note:
   The FQDN of the traffic management virtual server must be in the same domain as the FQDN of the authentication virtual server for the domain session cookie to function correctly.

On the traffic management virtual server:

   • Enable authentication.
   • Specify the FQDN of the authentication virtual server as the authentication host of the traffic management virtual server.
   • [Optional] Specify the authentication domain on the traffic management virtual server.

   Note:
   If you do not configure the authentication domain, the appliance assigns an FQDN that consists of the FQDN of the authentication virtual server without the hostname portion. For example, if domain name of the authentication virtual server is `tm.xyz.bar.com`, the appliance assigns `xyz.bar.com` as the authentication domain.

   For load balancing:

   ns-cli-prompt> set lb vserver <name> -authentication ON -authenticationhost <FQDN> [-authenticationdomain <authdomain>]

   For content switching:

   ns-cli-prompt> set cs vserver <name> <protocol> <IPAddress> <port>

   1. Verify that both the virtual servers are UP and configure correctly.

      ns-cli-prompt> show authentication vserver <name>

To set up an authentication virtual server by using the GUI

1. Enable the AAA feature.

   Navigate to System > Settings, click Configure Basic features, and enable Authentication, Authorization and Auditing.

2. Configure the authentication virtual server.

   Navigate to Security > AAA - Application Traffic > Virtual Servers, and configure as required (refer to the configurations provided in the CLI procedure provided above).

3. Configure the traffic management virtual server for authentication.
For load balancing:

Navigate to Traffic Management > Load Balancing > Virtual Servers, and configure the virtual server as required (refer to the configurations provided in the CLI procedure provided above).

For content switching:

Navigate to Traffic Management > Content Switching > Virtual Servers, and configure the virtual server as required (refer to the configurations provided in the CLI procedure provided above).

4. Verify the authentication setup.

Navigate to Security > AAA - Application Traffic > Virtual Servers, and check the details of the relevant authentication virtual server.

Configuring the authentication virtual server

December 13, 2018

To configure AAA, first configure an authentication virtual server to handle authentication traffic. Next, bind an SSL certificate-key pair to the virtual server to enable it to handle SSL connections. For additional information about configuring SSL and creating a certificate-key pair, see SSL certificates.

To configure an authentication virtual server by using the command line interface

To configure an authentication virtual server and verify the configuration, at the command prompt type the following commands in the order shown:

- add authentication vserver <name> ssl <ipaddress>
- show authentication vserver <name>
- bind ssl certkey <certkeyName>
- show authentication vserver <name>
- set authentication vserver <name> -authenticationDomain <FQDN>
- show authentication vserver <name>

Example

```
1 > add authentication vserver Auth-Vserver-2 SSL 10.102.29.77 443
2 Done
3 > show authentication vserver Auth-Vserver-2
4 Auth-Vserver-2 (10.102.29.77:443) - SSL Type: CONTENT
```
To configure an authentication virtual server by using the configuration utility

2. In the details pane, do one of the following:
   - To create a new authentication virtual server, click Add.
   - To modify an existing authentication virtual server, select the virtual server, and then click Edit. The Configuration dialog opens with the Basic Settings area expanded.

3. Specify values for the parameters as follows (asterisk indicates a required parameter):
• Name*—name (Cannot be changed for a previously created virtual server)
• IP Address*—ipaddress
• Domain*—authenticationDomain
• Failed login timeout—failedLoginTimeout (Seconds allowed before login fails and user must start login process again.)
• Max login attempts—maxLoginAttempts (Number of login attempts allowed before user is locked out)

Note: The authentication virtual server uses only the SSL protocol and port 443, so those options are greyed out. Any options that are not mentioned are not relevant and should be ignored.

4. Click Continue to display the Certificates area.

5. In the Certificates area, configure any SSL certificates you want to use with this virtual server.
   • To configure a CA certificate, click the arrow on the right of CA Certificate to display the CA Cert Key dialog box, select the certificate you want to bind to this virtual server, and click Save.
   • To configure a server certificate, click the arrow on the right of Server Certificate, and follow the same process as for CA certificate.

6. Click Continue to display the Advanced Authentication Policies area.

7. If you want to bind an advanced authentication policy to the virtual server, click the arrow on the right side of the line to display the Authentication Policy dialog box, choose the policy that you want to bind to the server, set the priority, and then click OK.

8. Click Continue to display the Basic Authentication Policies area.

9. If you want to create a basic authentication policy and bind it to the virtual server, click the plus sign to display the Policies dialog box, and follow the prompts to configure the policy and bind it to this virtual server.

10. Click Continue to display the 401-Based Virtual Servers area.

11. In the 401-Based Virtual Servers area, configure any load balancing or content switching virtual servers that you want to bind to this virtual server.
   • To bind a load balancing virtual server, click the arrow to the right of LB virtual server to display the LB Virtual Servers dialog box, and follow the prompts.
   • To bind a content switching virtual server, click the arrow to the right of CS virtual server to display the CS Virtual Servers dialog box, and follow the same process as to bind an LB virtual server.

12. If you want to create or configure a group, in the Groups area click the arrow to display the Groups dialog box, and follow the prompts.
13. Review your settings, and when you are finished, click Done. The dialog box closes. If you created a new authentication virtual server, it now appears in the Configuration window list.

Configuring a traffic management virtual server

December 13, 2018

After you have created and configured your authentication virtual server, you next create or configure a traffic management virtual server and associate your authentication virtual sever with it. You can use either a load balancing or content switching virtual server for a traffic management virtual server. For more information about creating and configuring either type of virtual server, see the Citrix Traffic Management Guide at Traffic Management.

Note
The FQDN of the traffic management virtual server must be in the same domain as the FQDN of the authentication virtual server for the domain session cookie to function correctly.

You configure a traffic management virtual server for AAA by enabling authentication and then assigning the FQDN of the authentication server to the traffic management virtual server. You can also configure the authentication domain on the traffic management virtual server at this time. If you do not configure this option, the NetScaler appliance assigns the traffic management virtual server an FQDN that consists of the FQDN of the authentication virtual server without the hostname portion. For example, if domain name of the authentication virtual server is tm.xyz.bar.com, the appliance assigns xyz.bar.com. as the authentication domain.

To configure a TM virtual server for AAA by using the command line interface

At the command prompt, type one of the following sets of commands to configure a TM virtual server and verify the configuration:

- set lb vserver <name> -authentication ON -authenticationhost <FQDN> [-authenticationdomain <authdomain>]
- show lb vserver <name>
- set cs vserver <name> -authentication ON -authenticationhost <FQDN> [-authenticationdomain <authdomain>]
- show cs vserver <name>

Example

1 > set lb vserver vs-cont-sw -Authentication ON -AuthenticationHost mywiki.index.com
To configure a TM virtual server for AAA by using the configuration utility

1. In the navigation pane, do one of the following.
   • Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
   • Navigate to **Traffic Management > Content Switching > Virtual Servers**
   • In the details pane, select the virtual server on which you want to enable authentication, and then click **Edit**.
   • In the Domain text box, type the authentication domain.
   • In the **Advanced** menu on the right, select **Authentication**.
   • Choose either **Form Based Authentication** or **401 Based Authentication**, and fill in the Authentication information.
     - For Form Based Authentication, enter the Authentication FQDN (the fully-qualified domain name of the authentication server), the Authentication VServer (the IP address of the authentication virtual server), and the Authentication Profile (the profile to use for authentication).
     - For 401 Based Authentication, enter the Authentication VServer and the Authentication Profile only.
   • Click **OK**. A message appears in the status bar, stating that the vserver has been configured successfully.
**Simplified login protocol support for AAA**

The login protocol between AAA traffic management virtual servers and AAA virtual servers is simplified to use internal mechanisms as opposed to sending the encrypted data through query parameters. By leveraging this feature, the replay of requests is prevented.

**Configuring DNS**

December 13, 2018

For the domain session cookie used in the authentication process to function correctly, you must configure DNS to assign both the authentication and the traffic management virtual servers to FQDNs in the same domain. For information about how to configure DNS address records, see [Domain Name System](#).

**Verifying your setup for AAA**

December 13, 2018

After you configure authentication and traffic management virtual servers and before you create user accounts, you should verify that both virtual servers are configured correctly and are in the UP state.

**To verify authentication virtual server setup by using the command line interface**

At the command prompt, type the following command:

```
show authentication vserver <name>
```

```
1   > show authentication vserver Auth-Vserver-2
2   Auth-Vserver-2 (10.102.29.77:443) - SSL Type: CONTENT
3   State: UP
4   Client Idle Timeout: 180 sec
5   Down state flush: DISABLED
6   Disable Primary Vserver On Down : DISABLED
7   Authentication : ON
8   Current AAA Users: 0
9   Authentication Domain: myCompany.employee.com
10  Done
```
To verify your AAA virtual server setup by using the configuration utility

2. Review the information in the AAA Virtual Servers pane to verify that your configuration is correct and your authentication virtual server is accepting traffic. You can select a specific virtual server to view detailed information in the details pane.

Creating an authentication profile

December 13, 2018

When you want the same authentication settings to be used by multiple traffic management virtual servers, you can create an authentication profile which specifies the authentication virtual server, the authentication host, the authentication domain, and authentication level.

This authentication profile can be associated with the relevant traffic management virtual servers.

To configure an authentication profile by using the CLI

- Create the authentication profile and set the required parameters.
  For example, to create a profile with an authentication virtual server named “authVS”.
  
  \[
  \text{ns-cli-prompt}\> \text{add authentication authnProfile authProfile1 -authnVsName authVS -authenticationHost authnVS.example.com -authenticationDomain example.com -authenticationLevel}\]

  \textbf{Note:}
  
  The authentication weight or level will depend on the virtual server to which the traffic will bind. A session that is created by authenticating against traffic management virtual server at given level cannot be used to access traffic management virtual server at a higher level.

- Bind the authentication profile to the relevant traffic management virtual servers.
  
  For example, to bind authProfile1 to a load balancing virtual server named “vserver1”.
  
  \[
  \text{ns-cli-prompt}\> \text{set lb vserver vserver1 -authnProfile authProfile1}\]

To configure an authentication profile by using the GUI

In the Configuration tab, navigate to Security > AAA - Application Traffic > Authentication Profile, and configure the authentication profile as required.
Configuring users and groups

December 13, 2018

After configuring the AAA basic setup, you create users and groups. You first create a user account for each person who will authenticate via the NetScaler appliance. If you are using local authentication controlled by the NetScaler appliance itself, you create local user accounts and assign passwords to each of those accounts.

You also create user accounts on the NetScaler appliance if you are using an external authentication server. In this case, however, each user account must exactly match an account for that user on the external authentication server, and you do not assign passwords to the user accounts that you create on the NetScaler appliance. The external authentication server manages the passwords for users that authenticate with the external authentication server.

If you are using an external authentication server, you can still create local user accounts on the NetScaler appliance if, for example, you want to allow temporary users (such as visitors) to log in but do not want to create entries for those users on the authentication server. You assign a password to each local user account, just as you would if you were using local authentication for all user accounts.

Each user account must be bound to policies for authentication and authorization. To simplify this task, you can create one or more groups and assign user accounts to them. You can then bind policies to groups instead of individual user accounts.

To create a local AAA user account by using the command line interface

At the command prompt, type the following commands to create a local AAA user account and verify the configuration:

- `add aaa user <username> [-password <password>]`
- `show aaa user`

**Example**

```
1 > add aaa user user-2 -password emptybag
2 Done
3 > show aaa user
4 1) UserName: user-1
5 2) UserName: user-2
6 Done
```
NetScaler 11.1

To change the password for an existing AAA local user account by using the command line interface

At the command prompt, type the following command and, when prompted, type the new password:

```
set aaa user <username>
```

Example

```
> set aaa user user-2
Enter password:
Done
```

To configure AAA local users by using the configuration utility

1. Navigate to Security > AAA - Application Traffic > Users
2. In the details pane, do one of the following:
   • To create a new user account, click Add.
   • To modify an existing user account, select the user account, and then click Open.
3. In the Create AAA User dialog box, in the User Name text box, type a name for the user.
4. If creating a locally authenticated user account, clear the External Authentication check box and provide a local password that the user will use to log on
5. Click Create or OK, and then click Close. A message appears in the status bar, stating that the user has been configured successfully.

To create AAA local groups and add users to them by using the command line interface

At the command prompt, type the following commands. Type the first command one time, and type the second command once for each user:

- add aaa group <groupname>
- show aaa group

Example

```
> add aaa group group-2
Done
> show aaa group
1) GroupName: group-1
2) GroupName: group-2
Done
```
To remove users from an AAA group by using the command line interface

At the command prompt, unbind users from the group by typing the following command once for each user account that is bound to the group:

- **unbind aaa group <groupname> -username <username>**

**Example**

```
1 > bind aaa group group-2 -username user-2
2   Done
3 > show aaa group group-2
4       GroupName: group-2
5
6       UserName: user-2
7   Done
```

To remove an AAA group by using the command line interface

First remove all users from the group. Then, at the command prompt, type the following command to remove an AAA group and verify the configuration:

- **rm aaa group <groupname>**

- **show aaa group**

**Example**

```
1   rm aaa group group-hr
2   Done
3   show aaa group
4   1) GroupName: group-1
5       2) GroupName: group-finance
6   Done
```
To configure AAA local groups and add users to them by using the configuration utility

1. Navigate to Security > AAA - Application Traffic > Groups

2. In the details pane, do one of the following:
   - To create a new group, click Add.
   - To modify an existing group, select the group, and then click Edit.

3. If you are creating a new group, in the Create AAA Group dialog box, in the Group Name text box, type a name for the group.

4. In the Advanced area to the right, click AAA Users.
   - To add a user to the group, select the user, and then click Add.
   - To remove a user from the group, select the user, and then click Remove.
   - To create a new user account and add it to the group, click the Plus icon, and then follow the instructions in “To configure AAA local users by using the configuration utility.”

5. Click Create or OK. The group that you created appears in the AAA Groups page.

Configuring AAA policies

December 13, 2018

After you set up your users and groups, you next configure authentication policies, authorization policies, and audit policies to define which users are allowed to access your intranet, which resources each user or group is allowed to access, and what level of detail AAA will preserve in the audit logs. An authentication policy defines the type of authentication to apply when a user attempts to log on. If external authentication is used, the policy also specifies the external authentication server. Authorization policies specify the network resources that users and groups can access after they log on. Auditing policies define the audit log type and location.

You must bind each policy to put it into effect. You bind authentication policies to authentication virtual servers, authorization policies to one or more user accounts or groups, and auditing policies both globally and to one or more user accounts or groups.

When you bind a policy, you assign a priority to it. The priority determines the order in which the policies you define are evaluated. You can set the priority to any positive integer. In the NetScaler appliance operating system, policy priorities work in reverse order: the higher the number, the lower the priority. For example, if you have three policies with priorities of 10, 100, and 1000, the policy assigned a priority of 10 is performed first, then the policy assigned a priority of 100, and finally the policy assigned an order of 1000. The AAA feature implements only the first of each type of policy that a request matches, not any additional policies of that type that a request might also match, so policy priority is important for getting the results you intend.
You can leave yourself plenty of room to add other policies in any order, and still set them to evaluate in the order you want, by setting priorities with intervals of 50 or 100 between each policy when you bind the policies. You can then add additional policies at any time without having to reassign the priority of an existing policy.

For additional information about binding policies on the NetScaler appliance, see the *Citrix Traffic Management Guide* at [Traffic Management](#).

### Authentication policies

December 13, 2018

The NetScaler appliance can authenticate users with local user accounts or by using an external authentication server. The appliance supports the following authentication types:

- **LOCAL**
  
  Authenticates to the NetScaler appliance by using a password, without reference to an external authentication server. User data is stored locally on the NetScaler appliance.

- **RADIUS**
  
  Authenticate to an external Radius server.

- **LDAP**
  
  Authenticates to an external LDAP authentication server.

- **TACACS**
  
  Authenticates to an external Terminal Access Controller Access-Control System (TACACS) authentication server.

  After a user authenticates to a TACACS server, the NetScaler appliance connects to the same TACACS server for all subsequent authorizations. When a primary TACACS server is unavailable, this feature prevents delays while the ADC waits for the first TACACS server to time out before resending the authorization request to the second TACACS server.

  **Note**

  When authenticating through a TACACS server, AAA traffic management logs only successfully executed TACACS commands, to prevent the logs from showing TACACS commands that were entered by users who were not authorized to execute them.

Starting from NetScaler 12.0 Build 57.x, the Terminal Access Controller Access-Control System (TACACS) is not blocking the AAA daemon while sending the TACACS request. The AAA daemon allows LDAP, and RADIUS authentication to proceed with the request. The TACACS authentication request resumes once TACACS server acknowledges the TACACS request.
• **CERT**

  Authenticates to the NetScaler appliance by using a client certificate, without reference to an external authentication server.

• **NEGOTIATE**

  Authenticates to a Kerberos authentication server. If there is an error in Kerberos authentication, NetScaler appliance uses NTLM authentication.

• **SAML**

  Authenticates to a server that supports the Security Assertion Markup Language (SAML).

• **SAML IDP**

  Configures the NetScaler appliance to serve as a Security Assertion Markup Language (SAML) Identity Provider (IdP).

• **WEB**

  Authenticates to a web server, providing the credentials that the web server requires in an HTTP request and analyzing the web server response to determine that user authentication was successful.

An authentication policy is comprised of an expression and an action. Authentication policies use NetScaler appliance expressions.

After creating an authentication action and an authentication policy, bind it to an authentication virtual server and assign a priority to it. When binding it, also designate it as either a primary or a secondary policy. Primary policies are evaluated before secondary policies. In configurations that use both types of policy, primary policies are normally more specific policies while secondary policies are normally more general policies intended to handle authentication for any user accounts that do not meet the more specific criteria.

**To add an authentication action by using the command line interface**

If you do not use LOCAL authentication, you need to add an explicit authentication action. To do this, at the command prompt, type the following command:

```
add authentication tacacsAction <name> -serverip <IP> [-serverPort <port>][-authTimeout <positive_integer>][ ... ]
```

**Example**

```
```
To configure an authentication action by using the command line interface

To configure an existing authentication action, at the command prompt, type the following command:

```
set authentication tacacsAction <name> -serverip <IP> [-serverPort <port>][-authTimeout <positive_integer>][ ... ]
```

Example

```
2 Done
```

To remove an authentication action by using the command line interface

To remove an existing RADIUS action, at the command prompt, type the following command:

```
rm authentication radiusAction <name>
```

Example

```
1 > rm authentication tacacsaction Authn-Act-1
2 Done
```

To configure an authentication server by using the configuration utility

Note

In the configuration utility, the term server is used instead of action, but refers to the same task.

2. In the details pane, on the Servers tab, do one of the following:
   • To create a new authentication server, click Add.
   • To modify an existing authentication server, select the server, and then click Open.
3. In the Create Authentication Server or Configure Authentication Server dialog box, type or select values for the parameters.
   • Name*—radiusActionName (Cannot be changed for a previously configured action)
   • Authentication Type*—authtype (Set to RADIUS, cannot be changed)
   • IP Address*—serverip </IP>
To create and bind an authentication policy by using the command line interface

At the command prompt, type the following commands in the order shown to create and bind an authentication policy and verify the configuration:

- `add authentication negotiatePolicy <name> <rule> <reqAction>
- “show authentication localPolicy
- “bind authentication vserver -policy [-priority] [-secondary]]
- `show authentication vserver <name>

Example

```
1  > add authentication localPolicy Authn-Pol-1 ns_true Done
2  > show authentication localPolicy
3 1) Name: Authn-Pol-1 Rule: ns_true Request action : LOCAL Done
4  > bind authentication vserver Auth-Vserver-2 -policy Authn-Pol-1
5 Done
6  > show authentication vserver Auth-Vserver-2
    Auth-Vserver-2 (10.102.29.77:443) - SSL Type: CONTENT State: UP Client Idle Timeout: 180 sec Down state flush: DISABLED Disable Primary Vserver On Down : DISABLED Authentication : ON
    Current AAA Users: 0 Authentication Domain: myCompany.employee.com
8 1) Primary authentication policy name: Authn-Pol-1 Priority: 0
9 Done
```

To modify an existing authentication policy by using the command line interface

At the command prompt, type the following commands to modify an existing authentication policy:

`sset authentication localPolicy <name> <rule> [-reqaction <action>]`

Example

```
1  > set authentication localPolicy Authn-Pol-1 'ns_true' Done
```
To remove an authentication policy by using the command line interface

At the command prompt, type the following command to remove an authentication policy:

```
rm authentication localPolicy <name>
```

Example

```
1 > rm authentication localPolicy Authn-Pol-1
2 Done
```

To configure and bind authentication policies by using the configuration utility

1. Navigate to Security > AAA - Application Traffic > Policies > Authentication, and then select the type of policy that you want to create.
2. In the details pane, on the Policies tab, do one of the following:
   - To create a new policy, click Add.
   - To modify an existing policy, select the action, and then click Edit.
3. In the Create Authentication Policy or Configure Authentication Policy dialog, type or select values for the parameters.
   - Name*—policyname (Cannot be changed for a previously configured action)
   - Authentication Type*—authtype
   - Server*—authVsName
   - Expression*—rule (You enter expressions by first choosing the type of expression in the leftmost drop-down list beneath the Expression window, and then by typing your expression directly into the expression text area, or by clicking Add to open the Add Expression dialog box and using the drop-down lists in it to construct your expression.)
4. Click Create or OK. The policy that you created appears in the Policies page.
5. Click the Servers tab, and in the details pane do one of the following:
   - To use an existing server, select it, and then click .
   - To create a new server, click Add, and follow the instructions.
6. If you want to designate this policy as a secondary authentication policy, on the Authentication tab, click Secondary. If you want to designate this policy as a primary authentication policy, skip this step.
7. Click Insert Policy.
8. Choose the policy you want to bind to the authentication virtual server from the drop-down list.
9. In the Priority column to the left, modify the default priority as needed to ensure that the policy is evaluated in the proper order.
10. Click OK. A message appears in the status bar, stating that the policy has been configured successfully.
LDAP authentication policies

December 13, 2018

As with other types of authentication policies, a Lightweight Directory Access Protocol (LDAP) authentication policy is comprised of an expression and an action. After creating an authentication policy, you bind it to an authentication virtual server and assign a priority to it. When binding it, you also designate it as either a primary or a secondary policy. In addition to standard authentication functions, LDAP can search other active directory (AD) servers for user accounts for users that do not exist locally. This function is called referral support or referral chasing.

Normally you configure the NetScaler appliance to use the IP address of the authentication server during authentication. With LDAP authentication servers, you can also configure the ADC to use the FQDN of the LDAP server instead of its IP address to authenticate users. Using an FQDN can simplify an otherwise much more complex AAA configuration in environments where the authentication server might be at any of several IP addresses, but always uses a single FQDN. To configure authentication by using a server's FQDN instead of its IP address, you follow the normal configuration process except when creating the authentication action. When creating the action, you use the `serverName` parameter instead of the `serverIP` parameter, and substitute the server's FQDN for its IP address.

Before you decide whether to configure the ADC to use the IP or the FQDN of your LDAP server to authenticate users, consider that configuring AAA to authenticate to an FQDN instead of an IP address adds an extra step to the authentication process. Each time the ADC authenticates a user, it must resolve the FQDN. If a great many users attempt to authenticate simultaneously, the resulting DNS lookups might slow the authentication process.

LDAP referral support is disabled by default and cannot be enabled globally. It must be explicitly enabled for each LDAP action. You must also make sure that the AD server accepts the same binddn credentials that are used with the referring (GC) server. To enable referral support, you configure an LDAP action to follow referrals, and specify the maximum number of referrals to follow.

If referral support is enabled, and the NetScaler appliance receives an LDAP_REFERRAL response to a request, AAA follows the referral to the active directory (AD) server contained in the referral and performs the update on that server. First, AAA looks up the referral server in DNS, and connects to that server. If the referral policy requires SSL/TLS, it connects via SSL/TLS. It then binds to the new server with the binddn credentials that it used with the previous server, and performs the operation which generated the referral. This feature is transparent to the user.

Note
These instructions assume that you are already familiar with the LDAP protocol and have already configured your chosen LDAP authentication server.

For more information about setting up authentication policies in general, see Authentication Policies. For more information about NetScaler appliance expressions, which are used in the policy rule,
To enable LDAP referral support by using the command line interface

At the command prompt, type the following commands:

- set authentication ldapAction <name> -followReferrals ON
- set authentication ldapAction <name> -maxLDAPReferrals <integer>

Example

```
1 > set authentication ldapAction ldapAction-1 -followReferrals ON
2 > set authentication ldapAction ldapAction-1 -maxLDAPReferrals 2
```

To enable LDAP referral support by using the configuration utility

Note

In the configuration utility, the term server is used instead of action, but refers to the same task.

1. Navigate to Security > AAA - Application Traffic > Policies > LDAP.
2. In the details pane, on the Servers tab, select the LDAP server that you want to configure, and then click Edit.
3. In the Configure Authentication Server dialog, scroll down to the Referrals check box, and select it.
4. In the Maximum Referral Level text box, type the maximum number of referrals to allow.
5. Click OK, and then click Close.

Negotiate authentication policies

December 13, 2018

As with other types of authentication policies, a Negotiate authentication policy is comprised of an expression and an action. After creating an authentication policy, you bind it to an authentication virtual server and assign a priority to it. When binding it, you also designate it as either a primary or a secondary policy.

In addition to standard authentication functions, the Negotiate Action command can now extract user information from a keytab file instead of requiring you to enter that information manually. If a keytab has more than one SPN, AAA selects the correct SPN. You can configure this feature at the command line, or by using the configuration utility.
Note: These instructions assume that you are already familiar with the LDAP protocol and have already configured your chosen LDAP authentication server.

**To configure AAA to extract user information from a keytab file by using the command line interface**

At the command prompt, type the appropriate command:

- `add authentication negotiateAction <name> [-keytab <string>]`
- `set authentication negotiateAction <name> [-keytab <string>]`

Example

```
1 > set authentication negotiateAction negotiateAction-1 -keytab keytab-1
```

**To configure AAA to extract user information from a keytab file by using the configuration utility**

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>In the configuration utility, the term server is used instead of action, but refers to the same task.</td>
</tr>
</tbody>
</table>

2. In the details pane, on the Servers tab, do one of the following:
   - If you want to create a new Negotiate action, click Add.
   - If you want to modify an existing Negotiate action, in the data pane select the action, and then click Edit.
3. If you are creating a new Negotiate action, in the Name text box, type a name for your new action. The name can be from one to 127 characters in length and can consist of upper- and lowercase letters, numbers, and the hyphen (-) and underscore (_) characters. If you are modifying an existing Negotiate action, skip this step. The name is read-only; you cannot change it.
4. Under Negotiate, if the Use Keytab file check box is not already checked, check it.
5. In the Keytab file path text box, type the full path and filename of the keytab file that you want to use.
6. In the Default authentication group text box, type the authentication group that you want to set as default for this user.
7. Click Create or OK to save your changes.

**RADIUS authentication policies**

December 13, 2018

© 1999-2018 Citrix Systems, Inc. All rights reserved.
As with other types of authentication policies, a Remote Authentication Dial In User Service (RADIUS) authentication policy is comprised of an expression and an action. After creating an authentication policy, you bind it to an authentication virtual server and assign a priority to it. When binding it, you also designate it as either a primary or a secondary policy. However, setting up a RADIUS authentication policy has certain special requirements that are described below.

Normally you configure the NetScaler appliance to use the IP address of the authentication server during authentication. With RADIUS authentication servers, you can now configure the ADC to use the FQDN of the RADIUS server instead of its IP address to authenticate users. Using an FQDN can simplify an otherwise much more complex AAA configuration in environments where the authentication server might be at any of several IP addresses, but always uses a single FQDN. To configure authentication by using a server’s FQDN instead of its IP address, you follow the normal configuration process except when creating the authentication action. When creating the action, you substitute the `serverName` parameter for the `serverIP` parameter.

Before you decide whether to configure the NetScaler appliance to use the IP or the FQDN of your RADIUS server to authenticate users, consider that configuring AAA to authenticate to an FQDN instead of an IP address adds an extra step to the authentication process. Each time the ADC authenticates a user, it must resolve the FQDN. If a great many users attempt to authenticate simultaneously, the resulting DNS lookups might slow the authentication process.

<table>

<td>These instructions assume that you are already familiar with the RADIUS protocol and have already configured your chosen RADIUS authentication server.</td>
</tr>
</tbody>
</table>

For more information about setting up authentication policies in general, see Authentication Policies. For more information about NetScaler appliance expressions, which are used in the policy rule, see Policies and Expressions.

### To add an authentication action for a RADIUS server by using the command line interface

If you authenticate to a RADIUS server, you need to add an explicit authentication action. To do this, at the command prompt, type the following command:

```
```
The following example adds a RADIUS authentication action named **Authn-Act-1**, with the server IP **10.218.24.65**, the server port **1812**, the authentication timeout **15** minutes, the radius key **WareTheLorax**, NAS IP disabled, and NAS ID **NAS1**.

```
1 > add authentication radiusaction Authn-Act-1 -serverip 10.218.24.65 -serverport 1812 -authtimeout 15 -radkey WareTheLorax -radNASip DISABLED -radNASid NAS1
2 Done
```

The following example adds the same RADIUS authentication action, but using the server FQDN **rad01.example.com** instead of the IP.

```
1 > add authentication radiusaction Authn-Act-1 -serverName rad01.example.com -serverport 1812 -authtimeout 15 -radkey WareTheLorax -radNASip DISABLED -radNASid NAS1
2 Done
```

**To configure an authentication action for an external RADIUS server by using the command line**

To configure an existing RADIUS action, at the command prompt, type the following command:

```
set authentication radiusAction <name> [-serverip <IP> | -serverName] <FQDN>][{-serverPort <port> } [-authTimeout <positive_integer>] }{-radKey } [-radNASip ( ENABLED | DISABLED )][-radNASid <string>] [-radVendorID <positive_integer>] [-radAttributeNameType <positive_integer>] [-radGroupPrefix <string>] [-radGroupSeparator <string>] [-passEncoding <passEncoding>][-ipVendorID <positive_integer>] [-ipAttributeNameType <positive_integer>] [-ipAccounting ( ON | OFF )][-pwdVendorID <positive_integer> [-pwdAttributeNameType <positive_integer>]] [-defaultAuthenticationGroup <string>] [-callingstationid ( ENABLED | DISABLED )]
```

**To remove an authentication action for an external RADIUS server by using the command line interface**

To remove an existing RADIUS action, at the command prompt, type the following command:

```
rm authentication radiusAction <name>
```

Example
To configure a RADIUS server by using the configuration utility

Note

In the configuration utility, the term server is used instead of action, but refers to the same task.

1. Navigate to Security > AAA - Application Traffic > Policies > Authentication > Radius
2. In the details pane, on the Servers tab, do one of the following:
   • To create a new RADIUS server, click Add.
   • To modify an existing RADIUS server, select the server, and then click Edit.
3. In the Create Authentication RADIUS Server or Configure Authentication RADIUS Server dialog, type or select values for the parameters. To fill out parameters that appear beneath Send Calling Station ID, expand Details.
   • Name*—radiusActionName (Cannot be changed for a previously configured action)
   • Authentication Type*—authtype (Set to RADIUS, cannot be changed)
   • Server Name / IP Address*—Choose either Server Name or Server IP
     – Server Name*—serverName <FQDN>
     – IP Address*—serverIp <IP> If the server is assigned an IPv6 IP address, select the IPv6 check box.
   • Port*—serverPort
   • Time-out (seconds)*—authTimeout
   • Secret Key*—radKey (RADIUS shared secret.)
   • Confirm Secret Key*—Type the RADIUS shared secret a second time. (No command line equivalent.)
   • Send Calling Station ID—callingstationid
   • Group Vendor Identifier—radVendorID
   • Group Attribute Type—radAttributeType
   • IP Address Vendor Identifier—ipVendorID
   • pwdVendorID—pwdVendorID
   • Password Encoding—passEncoding
   • Default Authentication Group—defaultAuthenticationGroup
   • NAS ID—radNASid
   • Enable NAS IP address extraction—radNASip
   • Group Prefix—radGroupsPrefix
   • Group Separator—radGroupSeparator
   • IP Address Attribute Type—ipAttributeType
   • Password Attribute Type—pwdAttributeType
• Accounting—accounting
  4. Click Create or OK. The policy that you created appears in the Servers page.

SAML authentication policies

December 13, 2018

For information on NetScaler appliance as a SAML SP and IdP, see SAML Authentication.

Web authentication policies

December 13, 2018

AAA is now able to authenticate a user to a web server, providing the credentials that the web server requires in an HTTP request and analyzing the web server response to determine that user authentication was successful. As with other types of authentication policies, a Web authentication policy is comprised of an expression and an action. After creating an authentication policy, you bind it to an authentication virtual server and assign a priority to it. When binding it, you also designate it as either a primary or a secondary policy.

To set up web-based authentication with a specific web server, first you create a web authentication action. Since authentication to web servers does not use a rigid format, you must specify exactly which information the web server requires and in which format when creating the action. To do this, you create an expression in NetScaler appliance default syntax that contains the following items:

- **Server IP**—The IP address of the authentication Web server.
- **Server Port**—The port of the authentication Web server.
- **Authentication Rule**—An expression in NetScaler appliance default syntax that contains the user's credentials in the format that the Web server expects.
- **Scheme**—HTTP (for unencrypted web authentication) or HTTPS (for encrypted web authentication).
- **Success Rule**—An expression in NetScaler appliance default syntax that matches the web server response string that signifies that the user authenticated successfully.

For all other parameters, follow the normal rules for the add authentication action command.

Next you create a policy associated with that action. The policy is similar to an LDAP policy, and like LDAP policies uses NetScaler appliance syntax.

**Note**
These instructions assume that you are already familiar with the authentication requirements...
of the web server(s) to which you want to authenticate, and have already configured the web authentication server.

To configure a Web authentication action by using the command line interface

To create a web authentication action at the command line, at the command line type the following command:

```
add authentication webAuthAction <name> -serverIP <ip_addr|ipv6_addr>* -serverPort <port>* [-fullReqExpr <string>] -scheme ( http | https ) -successRule <expression> [-defaultAuthenticationGroup <string>][-Attribute1 <string>][-Attribute2 <string>][-Attribute3 <string>][-Attribute4 <string>][-Attribute5 <string>][-Attribute6 <string>][-Attribute7 <string>][-Attribute8 <string>][-Attribute9 <string>][-Attribute10 <string>][-Attribute11 <string>][-Attribute12 <string>][-Attribute13 <string>][-Attribute14 <string>][-Attribute15 <string>][-Attribute16 <string>]
```

Example

```
1 > add authentication webAuthAction webauth1 -serverIP 10.214.56.31 -serverPort 80 -
```

To configure a Web authentication action by using the configuration utility

Note

In the configuration utility, the term server is used instead of action, but refers to the same task.

1. Navigate to Security > AAA - Application Traffic > Policies > LDAP.
2. In the details pane, on the Servers tab, do one of the following:
   • If you want to create a new web authentication action, click Add.
   • If you want to modify an existing web authentication action, in the data pane select the action, and then click Edit.
3. If you are creating a new web authentication action, in the Create Authentication Web server dialog box, Name text box, type a name for the new web authentication action. The name can be from one to 127 characters in length, and can consist of upper- and lowercase letters, numbers, and the hyphen (-) and underscore (_) characters. If you are modifying an existing web authentication action, skip this step. The name is read-only; you cannot change it.
4. In the Web Server IP Address text box, type the IPv4 or IPv6 IP address of the authentication web server. If the address is an IPv6 IP address, select the IPv6 check box first.
5. In the Port text box, type the port number on which the web server accepts connections.
6. Select HTTP or HTTPS in the Protocol drop-down list.
7. In the HTTP Request Expression text area, type a PCRE-format regular expression that creates the web server request that contains the user's credentials in the exact format expected by the authentication web server.
8. In the Expression to validate the Authentication text area, type a NetScaler appliance default syntax expression that describes the information in the web server response that indicates that user authentication was successful.
9. Fill out the remaining fields as described in the general authentication action documentation.
10. Click OK.

Configuring advanced authentication policies

December 13, 2018

If you know exactly how you want an authentication policy to be configured, you can use the advanced authentication policy dialog to create the policy quickly.

To configure an advanced authentication policy by using the configuration utility

2. In the details pane do one of the following:
   • To create a new policy, click Add.
   • To modify an existing policy, select the policy, and then click Edit.
3. In the Create Authentication Policy or Configure Authentication Policy dialog box, type or select values for the parameters.
   • Name*—The policy name. Cannot be changed for a previously configured policy.
   • Action Type*—The policy type: Cert, Negotiate, LDAP, RADIUS, SAML, SAMLIDP, TACACS, or WEBAUTH.
   • Action*—The authentication action (profile) to associate with the policy. You can choose an existing authentication action, or click the plus and create a new action of the proper type.
   • Log Action—The audit action to associate with the policy. You can choose an existing audit action, or click the plus and create a new action.
   • Expression*—The rule that selects connections to which you want to apply the action that you specified. The rule can be simple ("true" selects all traffic) or complex. You enter expressions by first choosing the type of expression in the leftmost drop-down list beneath the Expression window, and then by typing your expression directly into the expression text area, or by clicking Add to open Add Expression dialog box and using the drop-down lists in it to construct your expression.)
• Comment—You can type a comment that describes the type of traffic that this authentication policy will apply to. Optional.

4. Click Create or OK, and then click Close. If you created a policy, that policy appears in the Authentication Policies and Servers page.

Authorizing user access to application resources

December 13, 2018

You can control the resources that an authenticated user can access within an application. To do this, associate an authorization policy to each of the users, either individually or by associating the policy to a group of users. The authorization policy must specify the following:

• Rule. The resource to which access must be authorized. This can be specified by using basic or advanced expressions.

• Action. Whether access to the resource must be allowed or denied.

By default, access to all resources within an application is DENIED to all users. However, you can change this default authorization action to ALLOW access to all users (by setting the session parameters in session profile or by setting the global session parameters).

Warning

For optimum security, Citrix recommends that you do not to change the default authorization action from DENY to ALLOW. Instead, it is advised to create specific authorization policies for users who need access to specific resources.

To configure authorization by using the CLI

1. Configure the authorization policy.

\texttt{ns-cli-prompt} > \texttt{add authorization policy <name> <rule> <action>}

2. Associate the policy with the appropriate user or group.

• Bind the policy to a specific user.

\texttt{ns-cli-prompt} > \texttt{bind aaa user <username> -policy <policyname>}

• Bind the policy to a specific group.

\texttt{ns-cli-prompt} > \texttt{bind aaa group <groupName> -policy <policyname>}

To configure authorization by using the GUI (Configuration tab)

1. Create the authorization policy.
Navigate to Security > AAA - Application Traffic > Policies > Authorization, click Add and then define the policy as required.

2. Associate the policy with the appropriate user or group.

Navigate to Security > AAA - Application Traffic > Users or Groups, and edit the relevant user or group to associate it with the authorization policy.

Sample authorization configurations

Here are some example configurations to authorize user access to some application resources. Note that these are CLI commands. You can do similar configurations using the GUI, although you must not enclose the expression within quotes (".

• add authorization policy authzpol1 "HTTP.REQ.URL.SUFFIX.EQ("gif")" ALLOW
• bind aaa user user1 -policy authzpol1
• add authorization policy authzpol2 "HTTP.REQ.URL.SUFFIX.EQ("png")" DENY
• bind aaa group group1 -policy authzpol2

Auditing authenticated sessions

December 13, 2018

You can configure the NetScaler appliance to keep a log of all the events that are triggered in an authenticated session. Using this information, you can audit state and status information, to see the history for users in chronological order.

To do this, define an audit policy that specifies the following:

• **Log type.** The logs can be stored remotely (syslog) or locally on the NetScaler appliance (nslog).
• **Rule.** The conditions on which the logs are stored.
• **Action.** Details of the log server and other details for creating the log entries.

This audit policy can be configured at different levels: user-level, group-level, AAA virtual server, and global system level. The policies configured at the user-level have the highest priority.

**Note**

This topic details steps for using syslog. Make necessary changes to use nslog.
To configure syslog auditing by using the CLI

1. Configure the audit server with the relevant log settings.
   
   \[ ns-cli-prompt > \textbf{add audit syslogAction <name> <serverIP> \ldots} \]

2. Configure the audit policy by associating the audit server.
   
   \[ ns-cli-prompt > \textbf{add audit syslogPolicy <name> <rule> <action>} \]

3. Associate the audit policy with one of the following entities:
   
   - Bind the policy to a specific user.
     
     \[ ns-cli-prompt > \textbf{bind aaa user <userName>-policy <policyname> \ldots} \]
   
   - Bind the policy to a specific group.
     
     \[ ns-cli-prompt > \textbf{bind aaa group <groupName>-policy <policyname> \ldots} \]
   
   - Bind the policy to a AAA virtual server.
     
     \[ ns-cli-prompt > \textbf{bind authentication vserver <name>-policy <policyname> \ldots} \]
   
   - Bind the policy globally to the NetScaler appliance.
     
     \[ ns-cli-prompt > \textbf{bind tm global -policyName <policyname> \ldots} \]

To configure syslog auditing by using the GUI (Configuration tab)

1. Configure the audit server and policy.
   
   Navigate to Security > AAA - Application Traffic > Policies > Auditing > Syslog, and configure the server and the policy in the relevant tabs.

2. Associate the policy with one of the following:
   
   - Bind the policy to a specific user.
     
     Navigate to Security > AAA - Application Traffic > Users, and associate the authorization policy with the relevant user.
   
   - Bind the policy to a specific group.
     
     Navigate to Security > AAA - Application Traffic > Groups, and associate the authorization policy with the relevant group.
   
   - Bind the policy to a AAA virtual server.
     
     Navigate to Security > AAA - Application Traffic > Virtual Servers, and associate the authorization policy with the relevant virtual server.
• Bind the policy globally to the NetScaler appliance.

Navigate to Security > AAA - Application Traffic > Policies > Auditing > Syslog or Nslog, select the authorization policy, and click Action > Global Bindings to bind the policy globally.

Session settings

December 13, 2018

After you configure your AAA profiles, you configure session settings to customize your user sessions. The session settings are:

• **The session timeout.**
  Controls the period after which the user is automatically disconnected and must authenticate again to access your intranet.

• **The default authorization setting.**
  Determines whether the NetScaler appliance will by default allow or deny access to content for which there is no specific authorization policy.

• **The single sign-on setting.**
  Determines whether the NetScaler appliance will log users onto all web applications automatically after they authenticate, or will pass users to the web application logon page to authenticate for each application.

• **The credential index setting.**
  Determines whether the NetScaler appliance will use primary or the secondary authentication credentials for single signon.

To configure the session settings, you can take one of two approaches. If you want different settings for different user accounts or groups, you create a profile for each user account or group for which you want to configure custom sessions settings. You also create policies to select the connections to which to apply particular profiles, and you bind the policies to users or groups. You can also bind a policy to the authentication virtual server that handles the traffic to which you want to apply the profile.

If you want the same settings for all sessions, or if you want to customize the default settings for sessions that do not have specific profiles and policies configured, you can simply configure the global session settings.
Session profiles

To customize your user sessions, you first create a session profile. The session profile allows you to override global settings for any of the session parameters.

Note
The terms “session profile” and “session action” mean the same thing.

To create a session profile by using the command line interface

At the command prompt, type the following commands to create a session profile and verify the configuration:

- `add tm sessionAction <name> [-sessTimeout <mins>] [-defaultAuthorizationAction (ALLOW | DENY)][-SSO (ON | OFF)][-ssoCredential (PRIMARY | SECONDARY)] [-ssoDomain <string>] [-httpOnlyCookie (YES | NO)] [-persistentCookie (ENABLED | DISABLED)] [-persistentCookieValidity <minutes>]`
- `show tm sessionAction <name>`

Example

```
1 > add tm sessionAction session-profile -sessTimeout 30 -
   defaultAuthorization ALLOW
2   Done
3 > show tm sessionAction session-profile
4 1)   Name: session-profile
5     Authorization action : ALLOW
6     Session timeout: 30 minutes
7   Done
```

To modify a session profile by using the command line interface

At the command prompt, type the following commands to modify a session profile and verify the configuration:

- `set tm sessionAction <name> [-sessTimeout <mins>] [-defaultAuthorizationAction (ALLOW | DENY)][-SSO (ON | OFF)][-ssoCredential (PRIMARY | SECONDARY)] [-ssoDomain <string>] [-httpOnlyCookie (YES | NO)] [-persistentCookie (ENABLED | DISABLED)] [-persistentCookieValidity <minutes>]`
• `show tm sessionAction`

**Example**

```plaintext
1  > set tm sessionAction session-profile -sessTimeout 30 -
    defaultAuthorization ALLOW
2   Done
3  > show tm sessionAction session-profile
4  1)  Name: session-profile
5    Authorization action : ALLOW
6    Session timeout: 30 minutes
7   Done
```

**To remove a session profile by using the command line interface**

At the command prompt, type the following command to remove a session profile:

```plaintext
rm tm sessionAction <name>
```

**To configure session profiles by using the configuration utility**

3. In the details pane, click the Profiles tab.
4. On the Profiles tab, do one of the following:
   - To create a new session profile, click Add.
   - To modify an existing session profile, select the profile, and then click Edit.
5. In the Create TM Session Profile or Configure TM Session Profile dialog, type or select values for the parameters.
   - Name*—actionname (Cannot be changed for a previously configured session action.)
   - Session Time-out—sesstimeout
   - Single Signon to Web Applications—sso
   - Credential Index—ssocredential
   - Single Sign-on Domain—ssoDomain
   - HTTPOnly Cookie—httpOnlyCookie
   - Enable Persistent Cookie—persistentCookie
   - Persistent Cookie Validity—persistentCookieValidity
6. Click Create or OK. The session profile that you created appears in the Session Policies and Profiles pane.
Session policies

December 13, 2018

After you create one or more session profiles, you create session policies and then bind the policies globally or to an authentication virtual server to put them into effect.

To create a session policy by using the command line interface

At the command prompt, type the following commands to create a session policy and verify the configuration:

1. `add tm sessionPolicy <name> <rule> <action>`
2. `show tm sessionPolicy <name>`

Example

```
1 > add tm sessionPolicy session-pol "URL == /*.gif" session-profile
2 Done
3 > show tm sessionPolicy session-pol
4 1) Name: session-pol   Rule: URL == '/*.gif'
5                      Action: session-profile
6 Done
```

To modify a session policy by using the command line interface

At the command prompt, type the following commands to modify a session policy and verify the configuration:

1. `set tm sessionPolicy <name> [-rule <expression>] [-action <action>]`
2. `show tm sessionPolicy <name>`

Example

```
1 > set tm sessionPolicy session-pol "URL == /*.gif" session-profile
2 Done
3 > show tm sessionPolicy session-pol
4 1) Name: session-pol   Rule: URL == '/*.gif'
5                      Action: session-profile
6 Done
```
To globally bind a session policy by using the command line interface

At the command prompt, type the following commands to globally bind a session policy and verify the configuration:

```
bind tm global -policyName <policyname> [-priority <priority>]
```

Example

```
> bind tm global -policyName session-pol
Done

> show tm sessionPolicy session-pol
1) Name: session-pol  Rule: URL == '/* .gif'
  Action: session-profile
  Policy is bound to following entities
    1) TM GLOBAL  PRIORITY : 0

Done
```

To bind a session policy to an authentication virtual server by using the command line interface

At the command prompt, type the following command to bind a session policy to an authentication virtual and verify the configuration:

```
bind authentication vserver <name> -policy <policyname> [-priority <priority>]
```

Example

```
> bind authentication vserver auth-vserver-1 -policyName Session-Pol-1 -priority 1000
Done
```

To unbind a session policy from an authentication virtual server by using the command line interface

At the command prompt, type the following commands to unbind a session policy from an authentication virtual server and verify the configuration:

```
unbind authentication vserver <name> -policy <policyname>
```

Example
To unbind a globally bound session policy by using the command line interface

At the command prompt, type the following commands to unbind a globally-bound session policy:

```
unbind tm global -policyName <policyname>
```

Example

```
1 > unbind tm global -policyName Session-Pol-1
2 Done
```

To remove a session policy by using the command line interface

First unbind the session policy from global, and then, at the command prompt, type the following commands to remove a session policy and verify the configuration:

```
rm tm sessionPolicy <name>
```

Example

```
1 > rm tm sessionPolicy Session-Pol-1
2 Done
```

To configure and bind session policies by using the configuration utility

3. In the details pane, on the Policies tab, do one of the following:
   - To create a new session policy, click Add.
   - To modify an existing session policy, select the policy, and then click Edit.
4. In the Create Session Policy or Configure Session Policy dialog, type or select values for the parameters.
   - Name*—policyname (Cannot be changed for a previously configured session policy.)
   - Request Profile*—actionname
   - Expression*—rule (You enter expressions by first choosing the type of expression in the leftmost drop-down list beneath the Expression text area and then typing your expression.)
directly into the expression text area, or by clicking Add to open the Add Expression dialog box and using the drop-down lists in it to construct your expression.)

5. Click Create or OK. The policy that you created appears in the details pane of the Session Policies and Profiles page.

6. To globally bind a session policy, in the details pane, select Global Bindings from the Action drop-down list, and fill in the dialog.
   - Select the name of the session policy you want to globally bind.
   - Click OK.

7. To bind a session policy to an authentication virtual server, in the navigation pane, click Virtual Servers, and add that policy to the policies list.
   - In the details pane, select the virtual server, and then click Edit.
   - In the Advanced Selections to the right of the detail area, click Policies.
   - Select a policy, or click the plus icon to add a policy.
   - In the Priority column to the left, modify the default priority as needed to ensure that the policy is evaluated in the proper order.
   - Click OK.

A message appears in the status bar, stating that the policy has been configured successfully.

Global session settings

December 13, 2018

In addition to or instead of creating session profiles and policies, you can configure global session settings. These settings control the session configuration when there is no explicit policy overriding them.

To configure the session settings by using the command line interface

At the command prompt, type the following commands to configure the global session settings and verify the configuration:

```
set tm sessionParameter [-sessTimeout <mins>] [-defaultAuthorizationAction ( ALLOW | DENY )] [-SSO ( ON | OFF )] [-ssoCredential ( PRIMARY | SECONDARY )] [-ssoDomain <string>] [-httpOnlyCookie ( YES | NO )] [-persistentCookie ( ENABLED | DISABLED )] [-persistentCookieValidity <minutes>]
```

Example

```
1 > set tm sessionParameter -sessTimeout 30
2 Done
```
To configure the session settings by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic**
2. In the details pane, under **Settings**, click Change global settings.
3. In the **Global Session Settings** dialog, type or select values for the parameters.
   - Session Time-out—sessTimeout
   - Single Sign-on to Web Applications—sso
   - Credential Index—ssoCredential
   - Single Sign-on Domain—ssoDomain
   - HTTPOnly Cookie—httpOnlyCookie
   - Enable Persistent Cookie—persistentCookie
   - Persistent Cookie Validity (minutes)—persistentCookieValidity
   - Home Page—homepage
4. Click **OK**.

Traffic Settings

December 13, 2018

If you use forms-based or SAML single sign-on (SSO) for your protected applications, you configure that feature in the Traffic settings. SSO enables your users to log on once to access all protected applications, rather than requiring them to log on separately to access each one.

Forms-based SSO allows you to use a web form of your own design as the sign-on method instead of a generic pop-up window. You can therefore put your company logo and other information you might want your users to see on the logon form. SAML SSO allows you to configure one NetScaler appliance or virtual appliance instance to authenticate to another NetScaler appliance on behalf of users who have authenticated with the first appliance.

To configure either type of SSO, you first create a forms or SAML SSO profile. Next, you create a traffic profile and link it to the SSO profile you created. Next, you create a policy, link it to the traffic profile. Finally, you bind the policy globally or to an authentication virtual server to put your configuration into effect.
After creating at least one forms or SAML sso profile, you must next create a traffic profile.

**Note**

In this feature, the terms “profile” and “action” mean the same thing.

### To create a traffic profile by using the command line interface

At the command prompt, type:

```
add tm trafficAction <name> [-appTimeout <mins>] [-SSO ( ON | OFF ) [-formSSOAction <string>] [-persistentCookie ( ENABLED | DISABLED )] [-InitiateLogout ( ON | OFF )]
```

**Example**

```
add tm trafficAction Traffic-Prof-1 -appTimeout 10 -SSO ON -formSSOAction SSO-Prof-1
```

### To modify a session profile by using the command line interface

At the command prompt, type:

```
set tm trafficAction <name> [-appTimeout <mins>] [-SSO ( ON | OFF ) [-formSSOAction <string>] [-persistentCookie ( ENABLED | DISABLED )] [-InitiateLogout ( ON | OFF )]
```

**Example**

```
set tm trafficAction Traffic-Prof-1 -appTimeout 10 -SSO ON -formSSOAction SSO-Prof-1
```

### To remove a session profile by using the command line interface

At the command prompt, type:

```
rm tm trafficAction <name>
```
To configure traffic profiles by using the configuration utility

3. In the details pane, click the Profiles tab.
4. On the Profiles tab, do one of the following:
   - To create a new traffic profile, click Add.
   - To modify an existing traffic profile, select the profile, and then click Edit.
5. In the Create Traffic Profile or Configure Traffic Profile dialog box, specify values for the parameters.
   - Name*—name (Cannot be changed for a previously configured session action.)
   - AppTimeout—appTimeout
   - Single Sign-On—SSO
   - Form SSO Action—formSSOAction
   - SAML SSO Action—samlSSOAction
   - Enable Persistent Cookie—persistentCookie
   - Initiate Logout—InitiateLogout
6. Click Create or OK. The traffic profile that you created appears in the Traffic Policies, Profiles, and either the Form SSO Profiles or SAML SSO Profiles pane, as appropriate.

Traffic policies

December 13, 2018

After you create one or more form SSO and traffic profiles, you create traffic policies and then bind the policies, either globally or to a traffic management virtual server, to put them into effect.

To create a traffic policy by using the command line interface

At the command prompt, type:

```
add tm trafficPolicy <name> <rule> <action>
```
Example

```
add tm trafficPolicy Traffic-Pol-1 "HTTP.REQ.HEADER("Cookie").CONTAINS("login=true")" Traffic-Prof-1
```

To modify a traffic policy by using the command line interface

At the command prompt, type:

```
set tm trafficPolicy <name> <rule> <action>
```

Example

```
set tm trafficPolicy Traffic-Pol-1 "HTTP.REQ.HEADER("Cookie").CONTAINS("login=true")" Traffic-Prof-1
```

To globally bind a traffic policy by using the command line interface

At the command prompt, type:

```
bind tm global -policyName <string> [-priority <priority>]
```

Example

```
bind tm global -policyName Traffic-Pol-1
```

To bind a traffic policy to a load balancing or content switching virtual server by using the command line interface

At the command prompt, type one of the following commands:

- `bind lb vserver <name> -policy <policyName> [-priority <priority>]`
- `bind cs vserver <name> -policy <policyName> [-priority <priority>]`

Example

```
bind authentication vserver auth-vserver-1 -policyName Traffic-Pol-1 -priority 1000
```
To unbind a globally bound traffic policy by using the command line interface

At the command prompt, type:

```
unbind tm global -policyName <policyname>
```

Example

```
unbind tm global -policyName Traffic-Pol-1
```

To unbind a traffic policy from a load balancing or content switching virtual server by using the command line interface

At the command prompt, type one of the following commands:

- `unbind lb vserver <name> -policy <policyname>`
- `unbind cs vserver <name> -policy <policyname>`

Example

```
unbind authentication vserver auth-vserver-1 -policyName Traffic-Pol-1
```

To remove a traffic policy by using the command line interface

First unbind the session policy from global, and then, at the command prompt, type:

```
rm tm trafficPolicy <name>
```

Example

```
rm tm trafficPolicy Traffic-Pol-1
```

To configure and bind traffic policies by using the configuration utility

3. In the details pane, do one of the following:
   - To create a new session policy, click Add.
To modify an existing session policy, select the policy, and then click **Edit**.

4. In the Create Traffic Policy or Configure Traffic Policy dialog, specify values for the parameters.
   - **Name**—policyName (Cannot be changed for a previously configured session policy.)
   - **Profile**—actionName
   - **Expression**—rule (You enter expressions by first choosing the type of expression in the leftmost drop-down list beneath the Expression text area and then typing your expression directly into the expression text area, or by clicking Add to open the Add Expression dialog box and using the drop-down lists in it to construct your expression.)

5. Click **Create** or **OK**. The policy that you created appears in the details pane of the **Session Policies** and **Profiles** page.

### Form SSO profiles

December 13, 2018

To enable and configure forms-based SSO, you first create an SSO profile.

**Note**

- Forms-based single sign-on does not work if the form is customized to include Javascript.
- In this feature, the terms “profile” and “action” mean the same thing.

**To create a form SSO profile by using the command line interface**

At the command prompt, type:

```
add tm formSSOAction <name> -actionURL <URL> -userField <string> -passwdField <string> -ssoSuccessRule <expression> [-nameValuePair <string>] [-responsizesize <positive_integer>] [-nvtype (STATIC | DYNAMIC) ] [-submitMethod (GET | POST) ]
```

**Example**

```
1  add tm formSSOAction SSO-Prof-1 -actionURL "/logon.php"
2  -userField "loginID" -passwdField "passwd"
3  -nameValuePair "loginID passwd" -responsizesize "9096"
4  -ssoSuccessRule "HTTP.RES.HEADER("Set-Cookie").CONTAINS("LogonID")"
5  -nvtype STATIC -submitMethod GET
6  -sessTimeout 10 -defaultAuthorizationAction ALLOW
```
To modify a form SSO by using the command line interface

At the command prompt, type:

```
set tm formSSOAction <name> -actionURL <URL> -userField <string> -passwdField <string> -ssoSuccessRule <expression> [-nameValuePair <string>] [-responsesize <positive_integer>] [-nvtype ( STATIC | DYNAMIC )] [-submitMethod ( GET | POST )]
```

Example

```
1 set tm formSSOAction SSO-Prof-1 -actionURL "/logon.php"
2 -userField "loginID" -passwdField "passwd"
3 -ssoSuccessRule "HTTP.RES.HEADER("Set-Cookie").CONTAINS("LogonID")"
4 -nameValuePair "loginID passwd" -responsesize "9096"
5 -nvtype STATIC -submitMethod GET
6 -sessTimeout 10 -defaultAuthorizationAction ALLOW
```

To remove a form SSO profile by using the command line interface

At the command prompt, type:

```
rm tm formSSOAction <name>
```

Example

```
1 rm tm sessionAction SSO-Prof-1
```

To configure form SSO profiles by using the configuration utility

2. In the details pane, click the Form SSO Profiles tab.
3. On the Form SSO Profiles tab, do one of the following:
   - To create a new form SSO profile, click Add.
   - To modify an existing form SSO profile, select the profile, and then click Edit.
4. In the Create Form SSO Profile or Configure Form SSO Profile dialog, specify values for the parameters:
   - Name*—name (Cannot be changed for a previously configured session action.)
   - Action URL*—actionURL
To enable and configure SAML-based SSO, you first create a SAML SSO profile.

**To create a SAML SSO profile by using the command line interface**

At the command prompt, type:

```
add tm samlSSOProfile <name> -samlSigningCertName <string> -assertionConsumerServiceURL <URL> -relaystateRule <expression> -sendPassword (ON | OFF)[-samlIssuerName <string>]
```

**Example**

```
add tm samlSSOProfile saml-SSO-Prof-1 -samlSigningCertName "Example, Inc." -assertionConsumerServiceURL "https://service.example.com" -relaystateRule "true" -sendPassword "ON" -samlIssuerName "Example, Inc."
```

**To modify a SAML SSO by using the command line interface**

At the command prompt, type:

```
set tm samlSSOProfile <name> -samlSigningCertName <string> -assertionConsumerServiceURL <URL> -relaystateRule <expression> -sendPassword (ON | OFF)[-samlIssuerName <string>]
```
Example

```
set tm samlSSOProfile saml-SSO-Prof-1 -samlSigningCertName "Example, Inc." -assertionConsumerServiceURL "https://service.example.com" -relaystateRule "true" -sendPassword "ON" -samlIssuerName "Example, Inc."
```

To remove a SAML SSO profile by using the command line interface

At the command prompt, type:

```
rm tm samlSSOProfile <name>
```

Example

```
rm tm sessionAction saml-SSO-Prof-1
```

To configure a SAML SSO profile by using the configuration utility

2. In the details pane, click the SAML SSO Profiles tab.
3. On the SAML SSO Profiles tab, do one of the following:
   - To create a new SAML SSO profile, click Add.
   - To modify an existing SAML SSO profile, select the profile, and then click OpenEdit.
4. In the Create SAML SSO Profiles or the Configure SAML SSO Profiles dialog box, set the following parameters:
   - Name*
   - Signing Certificate Name*
   - ACS URL*
   - Relay State Rule*
   - Send Password
   - Issuer Name
5. Click Create or OK, and then click Close. The SAML SSO profile that you created appears in the Traffic Policies, Profiles, and SAML SSO Profiles pane.

Session timeout for OWA 2010

December 13, 2018
You can now force OWA 2010 connections to time out after a specified period of inactivity. OWA sends repeated keepalive requests to the server to prevent timeouts. Keeping the connections open can interfere with single sign-on.

**To force OWA 2010 to timeout after a specified period by using the command line interface**

At the command prompt, type the following commands:

- `add tm trafficAction <actname> [-forcedTimeout <forcedTimeout> -forcedTimeoutVal <mins>]`

  For `<actname>`, substitute a name for your traffic policy. For `<mins>`, substitute the number of minutes after which to initiate a forced timeout. For `<forcedTimeout>`, substitute one of the following values:
  - **START**—Starts the timer for forced timeout if a timer has not already been started. If a running timer exists, has no effect.
  - **STOP**—Stops a running timer. If no running timer is found, has no effect.
  - **RESET**—Restarts a running timer. If no running timer is found, starts a timer just as if the START option had been used.

- `add tm trafficPolicy <polname> <rule> <actname>`

  For `<polname>`, substitute a name for your traffic policy. For `<rule>`, substitute a rule in NetScaler appliance default syntax.

- `bind lb vserver <vservername> -policyName <name> -priority <number>`

  For `<vservername>`, substitute the name of the AAA traffic management virtual server. For `<priority>`, substitute an integer that designates the policy’s priority.

**Example**

```
1 add tm trafficAction act-owa2010timeout -forcedTimeout RESET -forcedTimeoutVal 10
2 add tm trafficPolicy pol-owa2010timeout true act-owa2010timeout
3 bind lb vserver vs-owa2010 -policyName pol-owa2010timeout -priority 10
```

**Authenticating with client certificates**

December 13, 2018
Web sites that contain sensitive content, such as online banking websites or websites with employee personal information, sometimes require client certificates for authentication. To configure AAA to authenticate users on the basis of client-side certificate attributes, you first enable client authentication on the traffic management virtual server and bind the root certificate to the authentication virtual server. Then, you implement one of two options. You can configure the default authentication type on the authentication virtual server as CERT, or you can create a certificate action that defines what the NetScaler appliance must do to authenticate users on the basis of a client certificate. In either case, your authentication server must support CRLs. You configure the ADC to extract the user name from the SubjectCN field or another specified field in the client certificate.

When the user tries to log on to an authentication virtual server for which an authentication policy is not configured, and a global cascade is not configured, the user name information is extracted from the specified field of the certificate. If the required field is extracted, the authentication succeeds. If the user does not provide a valid certificate during the SSL handshake, or if the user name extraction fails, authentication fails. After it validates the client certificate, the ADC presents a logon page to the user.

The following procedures assume that you have already created a functioning AAA configuration, and therefore they explain only how to enable authentication by using client certificates. These procedures also assume that you have obtained your root certificate and client certificates and have placed them on the ADC in the /nsconfig/ssl directory.

**To configure the AAA client certificate parameters by using the command line interface**

At the command prompt, type the following commands, in the order shown, to configure the certificate and verify the configuration:

- `add ssl certKey <certKeyName> -cert <certFile> -key <keyFile> -password -inform <inform> -expiryMonitor <expiryMonitor> -notificationPeriod <notificationPeriod>`
- `bind ssl certKey <certKeyName> -vServer <certKeyName> -CA -crlCheck Mandatory`
- `show ssl certKey [<certKeyName>]`
- `set aaa parameter -defaultAuthType CERT`
- `show aaa parameter`
- `set aaa certParams -userNameField "Subject:CN"`
- `show aaa certParams`
To configure the AAA client certificate parameters by using the configuration utility

2. In the details pane, select the virtual server that you want to configure to handle client certificate authentication, and then click Edit.
3. On the Configuration page, under Certificates, click the right arrow (>) to open the CA Cert Key installation dialog.
4. In the CA Cert Key dialog box, click Insert.
5. In the CA Cert Key - SSL Certificates dialog box, click Install.
6. In the Install Certificate dialog box, set the following parameters, whose names correspond to the CLI parameter names as shown:
   - Certificate-Key Pair Name*—certkeyName
   - Certificate File Name—certFile
   - Key File Name—keyFile
   - Certificate Format—inform
   - Password—password
   - Certificate Bundle—bundle
   - Notify When Expires—expiryMonitor
   - Notification Period—notificationPeriod
7. Click Install, and then click Close.
8. In the CA Cert Key dialog box, in the Certificate list, select the root certificate.
9. Click Save.
10. Click Back to return to the main configuration screen.
12. In the details pane, select the policy you want to configure to handle client certificate authentication, and then click Edit.
13. In the Configure Authentication CERT Policy dialog, Server drop-down list, select the virtual server you just configured to handle client certificate authentication.
14. Click OK. A message appears in the status bar, stating that the configuration completed successfully.

Support to notify number of unsuccessful login attempts

The NetScaler appliance can now log the number of unsuccessful login attempts made from the last successful log on. The feature works only if the persistentLoginAttempts option is enabled on the appliance. By default, the option is disabled on the NetScaler appliance.

A NetScaler administrator can use this information to verify if any unauthorized attempts have occurred on a secured external user account.

To use this feature, at the NetScaler appliance command prompt, type:
set aaa parameter -maxLoginAttempts <value> [-failedLoginTimeout <value>] -persistentLoginAttempts (ENABLED | DISABLED)

Example:
set aaa parameter -maxLoginAttempts 4 -failedLoginTimeout 3 -persistentLoginAttempts ENABLED

Client certificate pass-through

December 13, 2018

The NetScaler appliance can now be configured to pass client certificates through to protected applications that require client certificates for user authentication. The ADC first authenticates the user, then inserts the client certificate into the request and sends it to the application. This feature is configured by adding appropriate SSL policies.

The exact behavior of this feature when a user presents a client certificate depends upon the configuration of the VPN virtual server.

• If the VPN virtual server is configured to accept client certificates but not require them, the ADC inserts the certificate into the request and then forwards the request to the protected application.
• If the VPN virtual server has client certificate authentication disabled, the ADC renegotiates the authentication protocol and reauthenticates the user before it inserts the client certificate in the header and forwards the request to the protected application.
• If the VPN virtual server is configured to require client certificate authentication, the ADC uses the client certificate to authenticate the user, then inserts the certificate in the header and forwards the request to the protected application.

In all of these cases, you configure client certificate pass-through as follows.

To create and configure client certificate pass-through by using the command line interface

At the command prompt, type the following commands:

• add vpn vserver <name> SSL <IP> 443

For <name>, substitute a name for the virtual server. The name must contain from one to 127 ASCII characters, beginning with a letter or underscore (_), and containing only letters, numbers, and the underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. For <IP>, substitute the IP address assigned to the virtual server."
• set ssl vserver <name> -clientAuth ENABLED -clientCert <clientcert>
  For <name>, substitute the name of the virtual server that you just created. For <clientCert>, substitute one of the following values:
  – disabled—disables client certificate authentication on the VPN virtual server.
  – mandatory—configures the VPN virtual server to require client certificates to authenticate.
  – optional—configures the VPN virtual server to allow client certificate authentication, but not to require it.

• bind vpn vserver 
  For <name>, substitute the name of the VPN virtual server that you created.

• bind vpn vserver 
  For <name>, substitute the name of the VPN virtual server that you created.

• bind ssl vserver 
  For <name>, substitute the name of the virtual server that you created. For <certkeyName>, substitute the client certificate key.

• bind ssl vserver 
  For <name>, substitute the name of the virtual server that you created. For <certkeyName>, substitute the client certificate key.

• add ssl action 
  For <actname>, substitute a name for the SSL action.

• add ssl policy 
  For <polname>, substitute a name for your new SSL policy. For <actname>, substitute the name of the SSL action that you just created.

• bind ssl vserver 
  For <name>, substitute the name of the VPN virtual server.

Example

| 1 | add vpn vserver vs-certpassthru SSL 10.121.250.75 443 |
| 2 | set ssl vserver vs-certpassthru -clientAuth ENABLED -clientCert optional |
| 3 | bind vpn vserver vs-certpassthru -policy local |
| 4 | bind vpn vserver vs-certpassthru -policy cert |
| 5 | bind ssl vserver vs-certpassthru -certkeyName mycertKey |
| 6 | bind ssl vserver vs-certpassthru -certkeyName mycertKey -CA -ocspCheck Optional |
| 7 | add ssl action act-certpassthru -clientCert ENABLED -certHeader CLIENT-CERT |
Configuring AAA with commonly used protocols

December 13, 2018

Configuring the NetScaler appliance for AAA needs a specific setup on the NetScaler appliance and clients' browsers. The configuration varies with the protocol used for AAA.

For more information about configuring the NetScaler appliance for Kerberos authentication, see Handling Authentication, Authorization and Auditing with Kerberos/NTLM.

Handling authentication, authorization and auditing with Kerberos/NTLM

January 6, 2019

Kerberos, a computer network authentication protocol, provides secure communication over the Internet. Designed primarily for client-server applications, it provides for mutual authentication by which the client and server can each ensure the other’s authenticity. Kerberos uses a trusted third party, referred to as Key Distribution Center (KDC). A KDC consists of an Authentication Server (AS), which authenticates a user, and a Ticket Granting Server (TGS).

Each entity on the network (client or server) has a secret key that is known only to itself and the KDC. The knowledge of this key implies authenticity of the entity. For communication between two entities on the network, the KDC generates a session key, referred to as the Kerberos ticket or service ticket. The client makes a request to the AS for credentials for a specific server. The client then receives a ticket, referred to as Ticket Granting Ticket (TGT). The client then contacts the TGS, using the TGT it received from the AS to prove its identity, and asks for a service. If the client is eligible for the service, the TGS issues a Kerberos ticket to the client. The client then contacts the server hosting the service (referred to as the service server), using the Kerberos ticket to prove that it is authorized to receive the service. The Kerberos ticket has a configurable lifetime. The client authenticates itself with the AS only once. If it contacts the physical server multiple times, it reuses the AS ticket.

The following figure shows the basic functioning of the Kerberos protocol.

Figure 1. Functioning of Kerberos

Kerberos authentication has the following advantages:
• Faster authentication. When a physical server gets a Kerberos ticket from a client, the server has enough information to authenticate the client directly. It does not have to contact a domain controller for client authentication, and therefore the authentication process is faster.
• Mutual authentication. When the KDC issues a Kerberos ticket to a client and the client uses the ticket to access a service, only authenticated servers can decrypt the Kerberos ticket. If the virtual server on the NetScaler appliance is able to decrypt the Kerberos ticket, you can conclude that both the virtual server and client are authenticated. Thus, the authentication of the server happens along with the authentication of the client.
• Single sign-on between Windows and other operating systems that support Kerberos.

Kerberos authentication may have the following disadvantages:

• Kerberos has strict time requirements; the clocks of the involved hosts must be synchronized with the Kerberos server clock to ensure that the authentication does not fail. You can mitigate this disadvantage by using the Network Time Protocol daemons to keep the host clocks synchronized. Kerberos tickets have an availability period, which you can configure.
• Kerberos needs the central server to be available continuously. When the Kerberos server is down, no one can log on. You can mitigate this risk by using multiple Kerberos servers and fallback authentication mechanisms.
• Because all the authentication is controlled by a centralized KDC, any compromise in this infrastructure, such as the user’s password for a local workstation being stolen, can allow an attacker to impersonate any user. You can mitigate this risk to some extent by using only a desktop machine or laptop that you trust, or by enforcing preauthentication by means of a hardware-token.

To use Kerberos authentication, you must configure it on the NetScaler appliance and on each client.

Optimizing Kerberos authentication on AAA

The NetScaler appliance now optimizes and improves the system performance while Kerberos authentication. The AAA daemon remembers the outstanding Kerberos request for the same user to avoid load on Key Distribution Center (KDC), which will avoid duplicate requests.

How NetScaler appliance implements Kerberos for client authentication

January 6, 2019

Important
Kerberos/NTLM authentication is supported only in the NetScaler 9.3 nCore release or later, and it can be used only for AAA traffic management virtual servers.

NetScaler appliance handles the components involved in Kerberos authentication in the following way:
Key Distribution Center (KDC)

In the Windows 2000 Server or later versions, the Domain Controller and KDC are part of the Windows Server. If the Windows Server is UP and running, it indicates that the Domain Controller and KDC are configured. The KDC is also the Active Directory server.

Note
All Kerberos interactions are validated with the Windows Kerberos Domain Controller.

Authentication service and protocol negotiation

A NetScaler appliance supports Kerberos authentication on the AAA traffic management authentication virtual servers. If the Kerberos authentication fails, the NetScaler appliance uses the NTLM authentication.

By default, Windows 2000 Server and later Windows Server versions use Kerberos for AAA. If you create an authentication policy with NEGOTIATE as the authentication type, the NetScaler appliance attempts to use the Kerberos protocol for AAA and if the client’s browser fails to receive a Kerberos ticket, the NetScaler appliance uses the NTLM authentication. This process is referred to as negotiation.

The client may fail to receive a Kerberos ticket in any of the following cases:

- Kerberos is not supported on the client.
- Kerberos is not enabled on the client.
- The client is in a domain other than that of the KDC.
- The Access Directory on the KDC is not accessible to the client.

For Kerberos/NTLM authentication, the NetScaler appliance does not use the data that is present locally on the NetScaler appliance.

Authorization

The traffic management virtual server can be a load balancing virtual server or a content switching virtual server.

Auditing

The NetScaler appliance supports auditing of Kerberos authentication with the following audit logging:

- Complete audit trail of the traffic management end-user activity
- SYSLOG and high performance TCP logging
NetScaler 11.1

- Complete audit trail of system administrators
- All system events
- Scriptable log format

**Supported Environment**

Kerberos authentication does not need any specific environment on the NetScaler appliance. The client (browser) must provide support for Kerberos authentication.

**High Availability**

In a high availability setup, only the active NetScaler appliance joins the domain. In case of a failover, the NetScaler appliance lwagent daemon joins the secondary NetScaler appliance to the domain. No specific configuration is required for this functionality.

**Kerberos authentication process**

The following figure shows a typical process for Kerberos authentication in the NetScaler appliance environment.

![Figure 1. Kerberos Authentication Process on NetScaler appliance](image)

The Kerberos authentication occurs in the following stages:

**Client authenticates itself to the KDC**

1. The NetScaler appliance receives a request from a client.
2. The traffic management (load balancing or content switching) virtual server on the NetScaler appliance sends a challenge to the client.
3. To respond to the challenge, the client gets a Kerberos ticket.
   - The client sends the Authentication Server of the KDC a request for a ticket-granting ticket (TGT) and receives the TGT. (See 3, 4 in the figure, Kerberos Authentication Process.)
   - The client sends the TGT to the Ticket Granting Server of the KDC and receives a Kerberos ticket. (See 5, 6 in the figure, Kerberos Authentication Process.)

**Note**

The above authentication process is not necessary if the client already has a Kerberos ticket whose lifetime has not expired. In addition, clients such as Web Services, .NET, or J2EE, which support SPNEGO, get a Kerberos ticket for the target server, create an SPNEGO token, and insert the token in the HTTP header when they send an HTTP request. They do not go through the client...
**Client requests a service.**

1. The client sends the Kerberos ticket containing the SPNEGO token and the HTTP request to the traffic management virtual server on the NetScaler appliance. The SPNEGO token has the necessary GSSAPI data.
2. The NetScaler appliance establishes a security context between the client and the NetScaler appliance. If the NetScaler appliance cannot accept the data provided in the Kerberos ticket, the client is asked to get a different ticket. This cycle repeats till the GSSAPI data is acceptable and the security context is established. The traffic management virtual server on the NetScaler appliance acts as an HTTP proxy between the client and the physical server.

**NetScaler appliance completes the authentication.**

1. After the security context is complete, the traffic management virtual server validates the SPNEGO token.
2. From the valid SPNEGO token, the virtual server extracts the user ID and GSS credentials, and passes them to the authentication daemon.
3. A successful authentication completes the Kerberos authentication.

---

**Configuring kerberos authentication on the NetScaler appliance**

December 13, 2018

This topic provides the detailed steps to configure Kerberos authentication on the NetScaler appliance by using the CLI and the GUI.

**Configuring Kerberos authentication on the CLI**

1. Enable the AAA feature to ensure the authentication of traffic on the appliance.

```
ns-cli-prompt> enable ns feature AAA
```

2. Add the keytab file to the NetScaler appliance. A keytab file is necessary for decrypting the secret received from the client during Kerberos authentication. A single keytab file contains authentication details for all the services that are bound to the traffic management virtual server on the NetScaler appliance.

First generate the keytab file on the Active Directory server and then transfer it to the NetScaler appliance.

a) Log on to the Active Directory server and add a user for Kerberos authentication. For example, to add a user named “Kerb-SVC-Account”:
net user Kerb-SVC-Account freebsd!@#456 /add

Note
In the User Properties section, ensure that the “Change password at next logon option” is not selected and the “Password does not expire” option is selected.

b) Map the HTTP service to the above user and export the keytab file. For example, run the following command on the Active Directory server:

ktpass/out keytabfile/princ HTTP/owa.newacp.com@NEWACP.COM/pass freebsd!@#456 /mapuser newacp/dummy /ptype KRBS_NT_PRINCIPAL

Note
You can map more than one service if authentication is required for more than one service. If you want to map more services, repeat the above command for every service. You can give the same name or different names for the output file.

c) Transfer the keytab file to the NetScaler appliance by using the unix ftp command or any other file transfer utility of your choice.

d) Log on to the NetScaler appliance, and run the ktutil utility to verify the keytab file. The keytab file has an entry for the HTTP service after it is imported.

The ktutil interactions are as follows:

root@ns# ktutil
ktutil: rkt /var/keytabfile
ktutil: list

<table>
<thead>
<tr>
<th>slot</th>
<th>KVNO</th>
<th>Principal</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>2</td>
<td>HTTP/owa.newacp.com@NEWACP.COM</td>
</tr>
</tbody>
</table>

ktutil: wkt /etc/ krb5.keytab
ktutil: list

<table>
<thead>
<tr>
<th>slot</th>
<th>KVNO</th>
<th>Principal</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>2</td>
<td>HTTP/owa.newacp.com@NEWACP.COM</td>
</tr>
</tbody>
</table>

ktutil: quit

3. The NetScaler appliance must obtain the IP address of the domain controller from the fully qualified domain name (FQDN). Therefore, Citrix recommends configuring the NetScaler appliance with a DNS server.

ns-cli-prompt> add dns nameserver <ip-address>
4. Configure the authentication action and then associate it to an authentication policy.
   a) Configure the negotiate action.

   \texttt{ns-cli-prompt> add authentication negotiateAction <name> -domain <domainName> -
   domainUser <domainUsername> -domainUserPasswd <domainUserPassword>}

   b) Configure the negotiate policy and associate the negotiate action to this policy.

   \texttt{ns-cli-prompt> add authentication negotiatePolicy <name> <rule> <reqAction>}

5. Create an authentication virtual server and associate the negotiate policy with it.
   a) Create an authentication virtual server.

   \texttt{ns-cli-prompt> add authentication vserver <name> SSL <ipAuthVserver> 443 -
   authenticationDomain <domainName>}

   b) Bind the negotiate policy to the authentication virtual server.

   \texttt{ns-cli-prompt> bind authentication vserver <name> -policy <negotiatePolicyName>}

6. Associate the authentication virtual server with the traffic management (load balancing or con-
tent switching) virtual server.

   \texttt{ns-cli-prompt> set lb vserver <name> -authn401 ON -authnVsName <string>}

   \texttt{Note}

   Similar configurations can also be done on the content switching virtual server.

7. Verify the configurations by doing the following:
   a) Access the traffic management virtual server, using the FQDN. For example, \texttt{Sample}

   b) View the details of the session on the CLI.

   \texttt{ns-cli-prompt> show aaa session}

\section*{Configuring Kerberos authentication on the GUI}

1. Enable the AAA feature.

   Navigate to \textbf{System > Settings}, click \textbf{Configure Basic Features} and enable the AAA feature.

2. Add the keytab file as detailed in step 2 of the CLI procedure mentioned above.
3. Add a DNS server.

Navigate to Traffic Management > DNS > Name Servers, and specify the IP address for the DNS server.

4. Configure the Negotiate action and policy.

Navigate to Security > AAA - Application Traffic > Policies > Authentication > Advanced Policies > Policy, and create a policy with Negotiate as the action type.

5. Bind the negotiate policy to the authentication virtual server.

Navigate to Security > AAA - Application Traffic > Virtual Servers, and associate the Negotiate policy with the authentication virtual server.

6. Associate the authentication virtual server with the traffic management (load balancing or content switching) virtual server.

Navigate to Traffic Management > Load Balancing > Virtual Servers, and specify the relevant authentication settings.

Note

Similar configurations can also be done on the content switching virtual server.

7. Verify the configurations as detailed in step 7 of the CLI procedure mentioned above.

Configuring kerberos authentication on a client

December 13, 2018

Kerberos support must be configured on the browser to use Kerberos for authentication. You can use any Kerberos-compliant browser. Instructions for configuring Kerberos support on Internet Explorer and Mozilla Firefox follow. For other browsers, see the documentation of the browser.

To configure Internet Explorer for Kerberos authentication

1. In the Tools menu select Internet Options.
2. On the Security tab, click Local Intranet, and then click Sites.
3. In the Local Intranet dialog box, make sure that the Automatically detect intranet network option is selected, and then click Advanced.
4. In the Local Intranet dialog box, add the web sites of the domains of the traffic management virtual server on the NetScaler appliance. The specified sites become local intranet sites.
5. Click Close or OK to close the dialog boxes.
To configure Mozilla Firefox for Kerberos authentication

1. Make sure that you have Kerberos properly configured on your computer.
2. Type about:config in the URL bar.
3. In the filter text box, type network.negotiate.
4. Change network.negotiate-auth.delegation-uris to the domain that you want to add.
5. Change network.negotiate-auth.trusted-uris to the domain that you want to add.
   Note: If you are running Windows, you also need to enter sspi in the filter text box and change the network.auth.use-sspi option to False.

Offloading Kerberos authentication from physical servers

January 6, 2019

The NetScaler appliance can offload authentication tasks from servers. Instead of the physical servers authenticating the requests from clients, the NetScaler appliance authenticates all the client requests before it forwards them to any of the physical servers bound to it. The user authentication is based on Active Directory tokens.

There is no authentication between the NetScaler appliance and the physical server, and the authentication offload is transparent to the end users. After the initial logon to a Windows computer, the end user does not have to enter any additional authentication information in a pop-up or on a logon page.

In the current NetScaler appliance release, Kerberos authentication is available only for AAA traffic management virtual servers. Kerberos authentication is not supported for SSL VPN in the Citrix Gateway Enterprise Edition appliance or for NetScaler appliance management.

Kerberos authentication requires configuration on the NetScaler appliance and on client browsers.

To configure Kerberos authentication on the NetScaler appliance

1. Create a user account on Active Directory. When creating a user account, verify the following options in the User Properties section:
   - Make sure that you do not select the Change password at next logon option.
   - Be sure to select the Password does not expire option.
2. On the AD server, at the CLI command prompt, type:
   - ktpass -princ HTTP/kerberos.crete.lab.net@crete.lab.net -ptype KRB5_NT_PRINCIPAL -mapuser kerbuser@crete.lab.net -mapop set -pass Citrix1 -out C:\kerstabfile.txt
Note

Be sure to type the above command on a single line. The output of the above command is written into the C:\kerbtabfile.txt file.

3. Upload the kerbtabfile.txt file to the /etc directory of the NetScaler appliance by using a Secure Copy (SCP) client.

4. Run the following command to add a DNS server to the NetScaler appliance.
   ```
   add dns nameserver 1.2.3.4
   ```
   The NetScaler appliance cannot process Kerberos requests without the DNS server. Be sure to use the same DNS server that is used in the Microsoft Windows domain.

5. Switch to the shell prompt and run the following commands from the shell prompt:
   ```
   • ktutil # rkt /etc/kerbtabfile.txt
   • # wkt /etc/krb5.keytab
   • # list
   ```
   The list command displays the user account details that you created in the Active Directory. A sample screen of the output of the list command is shown below.
   
   Figure 1. Sample Output of the list Command

6. Switch to the command line interface of NetScaler appliance.

7. Run the following command to create a Kerberos authentication server:
   ```
   • add authentication negotiateAction KerberosServer -domain "crete.lab.net" -domainUser kerbuser -domainUserPasswd Citrix1
   ```

8. Run the following command to create a negotiation policy:
   ```
   • add authentication negotiatePolicy Kerberos-Policy "REQ.IP.DESTIP == 192.168.17.200"KerberosServer
   ```

9. Run the following command to create an authentication virtual server.
   ```
   • add authentication vserver Kerb-Auth SSL 192.168.17.201 443 -AuthenticationDomain crete.example.com
   ```

10. Run the following command to bind the Kerberos policy to the authentication virtual server:
    ```
    • bind authentication vserver Kerb-Auth -policy Kerberos-Policy -priority 100
    ```

11. Run the following command to bind an SSL certificate to the authentication virtual server. You can use one of the test certificates, which you can install from the GUI NetScaler appliance. Run the following command to use the ServerTestCert sample certificate.
12. Create an HTTP load balancing virtual server with the IP address, 192.168.17.200.

   Ensure that you create a virtual server from the command line interface for NetScaler 9.3 releases if they are older than 9.3.47.8.

13. Run the following command to configure an authentication virtual server:

   ```
   • set lb vserver <name>-authn401 ON -authnVsName Kerb-Auth
   ```

14. Enter the host name `Example` in the address bar of the Web browser.

   The Web browser displays an authentication dialog box because the Kerberos authentication is not set up in the browser.

   **Note**

   Kerberos authentication requires a specific configuration on the client. Ensure that the client can resolve the hostname, which results in the Web browser connecting to an HTTP virtual server.

15. Configure Kerberos on the Web browser of the client computer.

   - For configuring on Internet Explorer, see Configuring Internet Explorer for Kerberos authentication.
   - For configuring on Mozilla Firefox, see Configuring Internet Explorer for Kerberos authentication.

16. Verify whether you can access the backend physical server without authentication.

### To configure Internet Explorer for Kerberos authentication

1. Select **Internet Options** from the **Tools** menu.
2. Activate the **Security** tab.
3. Select **Local Intranet** from the Select a zone to view change security settings section.
4. Click **Sites**.
5. Click **Advanced**.
6. Specify the URL, `Example` and click **Add**.
7. Restart **Internet Explorer**.

### To configure Mozilla Firefox for Kerberos authentication

1. Enter `about:config` in the address bar of the browser.
2. Click the warning disclaimer.
3. Type `Network.Negotiate-auth.trusted-uris` in the Filter box.

5. In the Enter String Value dialog box, specify www.crete.example.com.

6. Restart Firefox.

**NetScaler appliance kerberos single sign-on**

December 13, 2018

NetScaler appliances now support single sign-on (SSO) using the Kerberos 5 protocol. Users log on to a proxy, the Application Delivery Controller (ADC), which then provides access to protected resources.

The NetScaler appliance Kerberos SSO implementation requires the user’s password for SSO methods that rely on basic, NTLM, or forms-based authentication. The user’s password is not required for Kerberos SSO, although if Kerberos SSO fails and the NetScaler appliance has the user’s password, it uses the password to attempt NTLM SSO.

If the user’s password is available, the KCD account is configured with a realm, and no delegated user information is present, the NetScaler AD Kerberos SSO engine impersonates the user to obtain access to authorized resources. Impersonation is also called unconstrained delegation.

The NetScaler appliance Kerberos SSO engine can also be configured to use a delegated account to obtain access to protected resources on the user’s behalf. This configuration requires delegated user credentials, a keytab, or a delegated user certificate and matching CA certificate. Configuration that uses a delegated account is called constrained delegation.

**An overview of NetScaler appliance kerberos SSO**

January 6, 2019

To use the NetScaler appliance Kerberos SSO feature, users first authenticate with Kerberos or a supported third-party authentication server. Once authenticated, the user requests access to a protected web application. The web server responds with a request for proof that the user is authorized to access that web application. The user’s browser contacts the Kerberos server, which verifies that the user is authorized to access that resource, and then provides the user’s browser with a service ticket that provides proof. The browser resends the user’s request to the web application server with the service ticket attached. The web application server verifies the service ticket, and then allows the user to access the application.

AAA traffic management implements this process as shown in the following diagram. The diagram illustrates the flow of information through the NetScaler appliance and AAA traffic management, on a
secure network with LDAP authentication and Kerberos authorization. AAA traffic management environments that use other types of authentication have essentially the same information flow, although they might differ in some details.

Figure 1. A Secure Network with LDAP and Kerberos

The AAA traffic management with authentication and authorization in a Kerberos environment requires that the following actions take place.

1. The client sends a request for a resource to the traffic management virtual server on the NetScaler appliance.
2. The traffic management virtual server passes the request to the authentication virtual server, which authenticates the client and then passes the request back to the traffic management virtual server.
3. The traffic management virtual server sends the client's request to the web application server.
4. The web application server responds to the traffic management virtual server with a 401 Unauthorized message that requests Kerberos authentication, with fallback to NTLM authentication if the client does not support Kerberos.
5. The traffic management virtual server contacts the Kerberos SSO daemon.
6. The Kerberos SSO daemon contacts the Kerberos server and obtains a ticket-granting ticket (TGT) allowing it to request service tickets authorizing access to protected applications.
7. The Kerberos SSO daemon obtains a service ticket for the user and sends that ticket to the traffic management virtual server.
8. The traffic management virtual server attaches the ticket to the user's initial request and sends the modified request back to the web application server.
9. The web application server responds with a 200 OK message.

These steps are transparent to the client, which just sends a request and receives the requested resource.

Integration of NetScaler appliance Kerberos SSO with authentication methods

All AAA traffic management authentication mechanisms support NetScaler appliance Kerberos SSO. AAA traffic management supports the Kerberos SSO mechanism with the Kerberos, CAC (Smart Card) and SAML authentication mechanisms with any form of client authentication to the NetScaler appliance. It also supports the HTTP-Basic, HTTP-Digest, Forms-based, and NTLM (versions 1 and 2) SSO mechanisms if the client uses either HTTP-Basic or Forms-Based authentication to log on to the NetScaler appliance.

The following table shows each supported client-side authentication method, and the supported server-side authentication method for that client-side method.

Table 1. Supported Authentication Methods
### Setting up NetScaler appliance SSO

December 13, 2018

You can configure NetScaler appliance SSO to work in one of two ways: by impersonation or by delegation. SSO by impersonation is a simpler configuration than SSO by delegation, and is therefore usually preferable when your configuration allows it. To configure NetScaler appliance SSO by impersonation, you must have the user’s user name and password.

To configure NetScaler appliance SSO by delegation, you must have the delegated user’s credentials in one of the following formats: the user’s user name and password, the keytab configuration that includes the user name and an encrypted password, or the delegated user certificate and the matching CA certificate.

### Prerequisites

December 13, 2018

Before you configure NetScaler appliance SSO, you need to have your NetScaler appliance fully configured to manage traffic to and authentication for your web application servers. Therefore, you must
configure either load balancing or content switching, and then AAA, for these web application servers. You should also verify routing between the appliance, your LDAP server, and your Kerberos server.

If your network is not already configured in this manner, perform the following configuration tasks:

- Configure a server and service for each web application server.
- Configure a traffic management virtual server to handle traffic to and from your web application server.

Following are brief instructions and examples for performing each of these tasks from the NetScaler appliance command line. For further assistance, see Setting up an Authentication Virtual Server.

To create a server and service by using the command line

For NetScaler appliance SSO to obtain a TGS (service ticket) for a service, either the FQDN assigned to the server entity on the NetScaler appliance must match the FQDN of the web application server, or the server entity name must match the NetBios name of the web application server. You can take either of the following approaches:

- Configure the NetScaler appliance server entity by specifying the FQDN of the web application server.
- Configure the NetScaler appliance server entity by specifying the IP address of the web application server, and assign the server entity the same name as the NetBios name of the web application server.

At the command prompt, type the following commands:

```
1 - add server name <serverFQDN>
2
3 - add service name serverName serviceType port
```

For the variables, substitute the following values:

- **serverName**: A name for the NetScaler appliance to use to refer to this server.
- **serverFQDN**: The FQDN of the server. If the server has no domain assigned to it, use the server’s IP address and make sure that the server entity name matches the NetBios name of the web application server.
- **serviceName**: A name for the NetScaler appliance to use to refer to this service.
- **type**: The protocol used by the service, either HTTP or MSSQLSVC.
- **port**: The port on which the service listens. HTTP services normally listen on port 80. Secure HTTPS services normally listen on port 443.
Example

The following examples add server and service entries on the NetScaler appliance for the web application server was1.example.com. The first example uses the FQDN of the web application server; the second uses the IP address.

To add the server and service using the web application server FQDN, was1.example.com, you would type the following commands:

1. add server was1 was1.example.com
2. add service was1service was1 HTTP 80

To add the server and service using the web application server IP and NetBios name, where the web application server IP is 10.237.64.87 and its NetBios name is WAS1, you would type the following commands:

1. add server WAS1 10.237.64.87
2. add service was1service WAS1 HTTP 8

To create a traffic management virtual server by using the command line

The traffic management virtual server manages traffic between the client and the web application server. You can use either a load balancing or a content switching virtual server as the traffic management server. The SSO configuration is the same for either type.

To create a load balancing virtual server, at the command prompt, type the following command:

   add lb vserver <vserverName> <type> <IP> <port>

For the variables, substitute the following values:

- **vserverName**—A name for the NetScaler appliance to use to refer to this virtual server.
- **type**—The protocol used by the service, either HTTP or MSSQLSVC.
- **IP**—The IP address assigned to the virtual server. This would normally be an IANA-reserved, non-public IP address on your LAN.
- **port**—The port on which the service listens. HTTP services normally listen on port 80. Secure HTTPS services normally listen on port 443.

Example

To add a load balancing virtual server called tmvserver1 to a configuration that manages HTTP traffic on port 80, assigning it a LAN IP address of 10.217.28.20 and then binding the load balancing virtual server to the wasservice1 service, you would type the following commands:
To create an authentication virtual server by using the command line

The authentication virtual server manages authentication traffic between the client and the authentication (LDAP) server. To create an authentication virtual server, at the command prompt type the following commands:

1. add authentication vserver <authvservername> SSL <IP> 443
2. set authentication vserver <authvservername> -authenticationdomain <domain>

For the variables, substitute the following values:

- **authvservername** — A name for the NetScaler appliance to use to refer to this authentication virtual server. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.), pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Can be changed after the authentication virtual server is added by using the rename authentication vserver command.
- **IP** — The IP address assigned to the authentication virtual server. As with the traffic management virtual server, this address would normally be an IANA-reserved, non-public IP on your LAN.
- **domain** — The domain assigned to the virtual server. This would usually be the domain of your network. It is customary, though not required, to enter the domain in all capitals when configuring the authentication virtual server.

Example

To add an authentication virtual server called authvserver1 to your configuration and assign it the LAN IP 10.217.28.21 and the domain EXAMPLE.COM, you would type the following commands:

1. add authentication vserver authvserver1 SSL 10.217.28.21 443
2. set authentication vserver authvserver1 -authenticationdomain EXAMPLE.COM

To configure a traffic management virtual server to use an authentication profile

The authentication virtual server can be configured to handle authentication for a single domain or for multiple domains. If it is configured to support authentication for multiple domains, you must
also specify the domain for NetScaler appliance SSO by creating an authentication profile, and then configuring the traffic management virtual server to use that authentication profile.

Note

The traffic management virtual server can be either a load balancing (lb) or content switching (cs) virtual server. The following instructions assume that you are using a load balancing virtual server. To configure a content switching virtual server, simply substitute set cs vserver for set lb vserver. The procedure is otherwise the same.

To create the authentication profile, and then configure the authentication profile on a traffic management virtual server, type the following commands:

```
1 - add authentication authnProfile <authnProfileName> {  
2   -authvserverName <string> } 
3   {  
4     -authenticationHost <string> }  
5   {  
6     -authenticationDomain <string> }  
7
8 - set lb vserver \<vserverName\> -authnProfile <authnProfileName>
```

For the variables, substitute the following values:

- **authnprofileName**—A name for the authentication profile. Must begin with a letter, number, or the underscore character (_), and must consist of from one to thirty-one alphanumeric or hyphen (-), period (.), pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters.
- **authvserverName**—The name of the authentication virtual server that this profile uses for authentication.
- **authenticationHost**—Host name of the authentication virtual server.
- **authenticationDomain**—Domain for which NetScaler appliance SSO handles authentication. Required if the authentication virtual server performs authentication for more than one domain, so that the correct domain is included when the NetScaler appliance sets the traffic management virtual server cookie.

**Example**

To create an authentication profile named authnProfile1 for authentication of the example.com domain, and to configure the load balancing virtual server vserver1 to use the authentication profile authnProfile1, you would type the following commands:

```
1 add authentication authnProfile authnProfile1 -authnvsName authvsesrver1
```
Configuring SSO

December 13, 2018

Configuring NetScaler appliance SSO to authenticate by impersonation is simpler than configuring SSO to authenticate by delegation, and is therefore usually preferable when your configuration allows it. You just create a KCD account. You can use the user’s password.

If you do not have the user’s password, you can configure NetScaler appliance SSO to authenticate by delegation. Although somewhat more complex than configuring SSO to authenticate by impersonation, the delegation method provides flexibility in that a user’s credentials might not be available to the NetScaler appliance in all circumstances.

For either impersonation or delegation, you must also enable integrated authentication on the web application server.

Enabling integrated authentication on the web application server

December 13, 2018

To set up NetScaler appliance Kerberos SSO on each web application server that Kerberos SSO will manage, use the configuration interface on that server to configure the server to require authentication. Select Kerberos (negotiate) authentication by preference, with fallback to NTLM for clients that do not support Kerberos.

Following are instructions for configuring Microsoft Internet Information Server (IIS) to require authentication. If your web application server uses software other than IIS, consult the documentation for that web server software for instructions.

To configure Microsoft IIS to use integrated authentication

1. Log on to the IIS server and open Internet Information Services Manager.
2. Select the web site for which you want to enable integrated authentication. To enable integrated authentication for all IIS web servers managed by IISM, configure authentication settings for the Default Web Site. To enable integrated authentication for individual services (such as Exchange, Exadmin, ExchWeb, and Public), configure these authentication settings for each service individually.
3. Open the **Properties** dialog box for the default web site or for the individual service, and click the **Directory Security** tab.
4. Beside **Authentication** and **Access Control**, select **Edit**.
5. Disable anonymous access.
6. Enable Integrated Windows authentication (only). Enabling integrated Windows authentication should automatically set protocol negotiation for the web server to Negotiate, NTLM, which specifies Kerberos authentication with fallback to NTLM for non-Kerberos capable devices. If this option is not automatically selected, manually set protocol negotiation to Negotiate, NTLM.

**Setting up SSO by impersonation**

December 13, 2018

You can configure the KCD account for NetScaler appliance SSO by impersonation. In this configuration, the NetScaler appliance obtains the user’s username and password when the user authenticates to the authentication server and uses those credentials to impersonate the user to obtain a ticket-granting ticket (TGT). If the user’s name is in UPN format, the appliance obtains the user’s realm from UPN. Otherwise, it obtains the user’s name and realm by extracting it from the SSO domain used during initial authentication, or from the session profile.

When configuring the KCD account, you must set the realm parameter to the realm of the service that the user is accessing. The same realm is also used as the user’s realm if the user’s realm cannot be obtained from authentication with the NetScaler appliance or from the session profile.

**To create the KCD account for SSO by impersonation with a password**

At the command prompt, type the following command:

```
add aaa kcdaccount <accountname> -realmStr <realm>
```

For the variables, substitute the following values:

- **accountname.** The KCD account name.
- **realm.** The domain assigned to NetScaler appliance SSO.

**Example**

To add a KCD account named kcdaccount1, and use the keytab named kcdvserver.keytab, you would type the following command:

```
1 add aaa kcdAccount kcdaccount1 -keytab kcdvserver.keytab
```

For information on configuring Kerberos impersonation through NetScaler GUI, see **Citrix Support**.
Configuring SSO by Delegation

December 13, 2018

To configure SSO by Delegation, you need to perform the following tasks:

- If you are configuring delegation by delegated user certificate, install the matching CA certificates on the NetScaler appliance and add them to the NetScaler appliance configuration.
- Create the KCD account on the appliance. The appliance uses this account to obtain service tickets for your protected applications.
- Configure the Active Directory server.

Installing the client CA certificate on the NetScaler appliance

If you are configuring NetScaler appliance SSO with a client certificate, you must copy the matching CA certificate for the client certificate domain (the client CA certificate) to the NetScaler appliance, and then install the CA certificate. To copy the client CA certificate, use the file transfer program of your choice to transfer the certificate and private-key file to the NetScaler appliance, and store the files in /nsconfig/ssl.

To install the client CA certificate on the NetScaler appliance

At the command prompt, type the following command:

```
add ssl certKey <certkeyName> -cert <cert> [(-key <key> [-password]])|-fipsKey <fipsKey>][(-inform ( DER | PEM ))[-expiryMonitor ( ENABLED | DISABLED | UNSET )][-notificationPeriod <positive_integer>]] [-bundle (YES | NO )]
```

For the variables, substitute the following values:

- **certkeyName.** A name for the client CA certificate. Must begin with an ASCII alphanumeric or underscore (_) character, and must consist of from one to thirty-one characters. Allowed characters include the ASCII alphanumerics, underscore, hash (#), period(.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the certificate-key pair is created. If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “my cert” or ‘my cert’).

- **cert.** Full path name and file name of the X509 certificate file used to form the certificate-key pair. The certificate file must be stored on the NetScaler appliance, in the /nsconfig/ssl/ directory.

- **key.** Full path name and file name of the file that contains the private key to the X509 certificate file. The key file must be stored on the NetScaler appliance in the /nsconfig/ssl/ directory.
NetScaler 11.1

- **password.** If a private key is specified, the passphrase used to encrypt the private key. Use this option to load encrypted private keys in PEM format.

- **fipsKey.** Name of the FIPS key that was created inside the Hardware Security Module (HSM) of a FIPS appliance, or a key that was imported into the HSM.

  **Note**

  You can specify either a key or a fipsKey, but not both.

- **inform.** Format of the certificate and private-key files, either PEM or DER.

- **passplain.** Pass phrase used to encrypt the private key. Required when adding an encrypted private-key in PEM format.

- **expiryMonitor.** Configure the NetScaler appliance to issue an alert when the certificate is about to expire. Possible values: ENABLED, DISABLED, UNSET.

- **notificationPeriod.** If expiryMonitor is ENABLED, number of days before the certificate expires to issue an alert.

- **bundle.** Parse the certificate chain as a single file after linking the server certificate to its issuer’s certificate within the file. Possible values: YES, NO.

**Example**

The following example adds the specified delegated user certificate customer-cert.pem to the NetScaler appliance configuration along with the key customer-key.pem, and sets the password, certificate format, expiration monitor, and notification period.

To add the delegated user certificate, you would type the following commands:

```
1  "'add ssl certKey customer -cert "/nsconfig/ssl/customer-cert.pem" -key "/nsconfig/ssl/customer-key.pem" -password "dontUseDefaultPWs!""
2  "inform PEM -expiryMonitor ENABLED [-notificationPeriod 14]
```

**Creating the KCD account**

If you are configuring NetScaler appliance SSO by delegation, you can configure the KCD account to use the user’s log-on name and password, to use the user’s log-on name and keytab, or to use the user’s client certificate. If you configure SSO with user name and password, the NetScaler appliance uses the delegated user account to obtain a Ticket Granting Ticket (TGT), and then uses the TGT to obtain service tickets for the specific services that each user requests. If you configure SSO with keytab file, the NetScaler appliance uses the delegated user account and keytab information. If you configure SSO with a delegated user certificate, the NetScaler appliance uses the delegated user certificate.
To create the KCD account for SSO by delegation with a password

At the command prompt, type the following commands:

```bash
add aaa kcdaccount <accountname> -delegatedUser root -kcdPassword <password> -realmStr <realm>
```

For the variables, substitute the following values:

- **accountname**: A name for the KCD account.
- **password**: A password for the KCD account.
- **realm**: The realm of the KCD account, usually the domain for which SSO is active.

Example (UPN Format)

To add a KCD account named kcdaccount1 to the NetScaler appliance configuration with a password of password1 and a realm of EXAMPLE.COM, specifying the delegated user account in UPN format (as root), you would type the following commands:

```bash
1 add aaa kcdaccount kcdaccount1 -delegatedUser root
2 -kcdPassword password1 -realmStr EXAMPLE.COM
```

Example (SPN Format)

To add a KCD account named kcdaccount1 to the NetScaler appliance configuration with a password of password1 and a realm of EXAMPLE.COM, specifying the delegated user account in SPN format, you would type the following commands:

```bash
1 add aaa kcdAccount kcdaccount1 -realmStr EXAMPLE.COM
2 -delegatedUser "host/kcdvserver.example.com" -kcdPassword password1
```

Creating the KCD account for SSO by delegation with a keytab

If you plan to use a keytab file for authentication, first create the keytab. You can create the keytab file manually by logging onto the AD server and using the ktpass utility, or you can use the NetScaler appliance configuration utility to create a batch script, and then run that script on the AD server to generate the keytab file. Next, use FTP or another file transfer program to transfer the keytab file to the NetScaler appliance and place it in the /nsconfig/krb directory. Finally, configure the KCD account for NetScaler appliance SSO by delegation and provide the path and file name of the keytab file to the NetScaler appliance.
To create the keytab file manually

Log on to the AD server command line and, at the command prompt, type the following command:

```
kt-pass princ <SPN> ptype KRB5_NT_PRINCIPAL mapuser <DOMAIN><username> pass <password> -out <File_Path>
```

For the variables, substitute the following values:

- **SPN**: The service principal name for the KCD service account.
- **DOMAIN**: The domain of the Active Directory server.
- **username**: The KSA account username.
- **password**: The KSA account password.
- **path**: The full path name of the directory in which to store the keytab file after it is generated.

To use the NetScaler appliance configuration utility to create a script to generate the keytab file

1. Navigate to **Security > AAA - Application Traffic**.
2. In the data pane, under **Kerberos Constrained Delegation**, click **Batch file to generate Keytab**.
3. In the **Generate KCD (Kerberos Constrained Delegation) Keytab Script** dialog box, set the following parameters:
   - **Domain User Name**: The KSA account username.
   - **Domain Password**: The KSA account password.
   - **Service Principal**: The service principal name for the KSA.
   - **Output File Name**: The full path and file name to which to save the keytab file on the AD server.
4. Clear the **Create Domain User Account** check box.
5. Click **Generate Script**.
6. Log on to the Active Directory server and open a command line window.
7. Copy the script from the **Generated Script** window and paste it directly into the Active Directory server command-line window. The keytab is generated and stored in the directory under the file name that you specified as **Output File Name**.
8. Use the file transfer utility of your choice to copy the keytab file from the Active Directory server to the NetScaler appliance and place it in the /nsconfig/krb directory.

To create the KCD account

At the command prompt, type the following command:

```
add aaa kcdaccount <accountname> -keytab <keytab>
```
Example

To add a KCD account named kcdaccount1, and use the keytab named kcdvserver.keytab, you would type the following commands:

```
1 add aaa kcdaccount kcdaccount1 -keytab kcdvserver.keytab
```

To create the KCD account for SSO by delegation with a delegated user cert

At the command prompt, type the following command:

```
add aaa kcdaccount <accountname> -realmStr <realm> -delegatedUser <user_nameSPN> -usercert <cert> -cacert <cacert>
```

For the variables, substitute the following values:

- **accountname**. A name for the KCD account.
- **realmStr**. The realm for the KCD account, usually the domain for which SSO is configured.
- **delegatedUser**. The delegated user name, in SPN format.
- **usercert**. The full path and name of the delegated user certificate file on the NetScaler appliance. The delegated user certificate must contain both the client certificate and the private key, and must be in PEM format. If you use smart card authentication, you might need to create a smart card certificate template to allow certificates to be imported with the private key.
- **cacert**. The full path to and name of the CA certificate file on the NetScaler appliance.

Example

To add a KCD account named kcdaccount1, and use the keytab named kcdvserver.keytab, you would type the following command:

```
1 add aaa kcdaccount kcdaccount1 -realmStr EXAMPLE.COM
2 -delegatedUser "host/kcdvserver.example.com" -usercert /certs/usercert
3 -cacert /cacerts/cacert
```

Setting up Active Directory for NetScaler appliance SSO

When you configure SSO by delegation, in addition to creating the KCDAccount on the NetScaler appliance, you must also create a matching Kerberos Service Account (KSA) on your LDAP active directory server, and configure the server for SSO. To create the KSA, use the account creation process on the active directory server. To configure SSO on the active directory server, open the properties window
for the KSA. In the Delegation tab, enable the following options: Trust this user for delegation to specified services only and Use any Authentication protocol. (The Kerberos only option does not work, because it does not enable protocol transition or constrained delegation.) Finally, add the services that NetScaler appliance SSO will manage.

**Note**

If the Delegation tab is not visible in the KSA account properties dialog box, before you can configure the KSA as described, you must use the Microsoft setspn command-line tool to configure the active directory server so that the tab is visible.

**To configure delegation for the Kerberos service account**

1. In the LDAP account configuration dialog box for the Kerberos service account that you created, click the **Delegation** tab.
2. Choose “Trust this user for delegation to the specified services only”.
3. Under “Trust this user for delegation to the specified services only,” choose “Use any authentication protocol”.
4. Under “Services to which this account can present delegated credentials,” click **Add**.
5. In the **Add Services** dialog box, click **Users** or **Computers**, choose the server that hosts the resources to be assigned to the service account, and then click **OK**.

**Note**

Constrained delegation does not support services hosted in domains other than the domain assigned to the account, even though Kerberos might have a trust relationship with other domains.

6. Back in the **Add Services** dialog box, in the **Available Services** list, choose the services assigned to the service account. NetScaler appliance SSO supports the HTTP and MSSQLSvc services.
7. Click **OK**.

**Generating the KCD keytab script**

December 13, 2018

The KCD Keytab Script dialog box generates the keytab script, which in turn generates the keytab file necessary to configure KCD on the NetScaler appliance.
To generate the KCD keytab script by using the configuration utility

2. In the details pane, under Kerberos Constrained Delegation, click Batch file to generate keytab.
3. In the Generate KCD (Kerberos Constrained Delegation) Keytab Script dialog box, fill out the fields as described below.
   - Domain User Name: The name of the domain user.
   - Domain Password: The password for the domain user.
   - Service Principal: The service principal.
   - Output File Name: A filename for the KCD script file.
   - Create Domain User Account: Select this check box to create the specified domain user account.
4. Click Generate Script to generate the script. The script is generated, and appears in the Generated Script text box below the Generate Script button.
5. Copy the script, and save it as a file on your AD domain controller. You must now run this script on the domain controller to generate the keytab file, and then copy the keytab file to the /nsconfig/krb directory on the NetScaler appliance.
6. Click OK.

SAML authentication

January 6, 2019

Security Assertion Markup Language (SAML) is an XML-based authentication mechanism that provides single sign-on capability and is defined by the OASIS Security Services Technical Committee.

Why SAML?

Consider a scenario in which a service provider (LargeProvider) hosts a number of applications for a customer (BigCompany). BigCompany has users that must seamlessly access these applications. In a traditional setup, LargeProvider would need to maintain a database of users of BigCompany. This raises some concerns for each of the following stakeholders:

- LargeProvider must ensure security of user data.
- BigCompany must validate the users and keep the user data up-to-date, not just in its own database, but also in the user database maintained by LargeProvider. For example, a user removed from the BigCompany database must also be removed from the LargeProvider database.
- A user has to log on individually to each of the hosted applications.

The SAML authentication mechanism provides an alternative approach. The following deployment diagram shows how SAML works.
The concerns raised by traditional authentication mechanisms are resolved as follows:

- LargeProvider does not have to maintain a database for BigCompany users. Freed from identity management, LargeProvider can concentrate on providing better services.
- BigCompany does not bear the burden of making sure the LargeProvider user database is kept in sync with its own user database.
- A user can log on once, to one application hosted on LargeProvider, and be automatically logged on to the other applications that are hosted there.

The NetScaler appliance can be deployed as a SAML Service Provider (SP) and a SAML Identity Provider (IdP). Read through the relevant topics to understand the configurations that must be performed on the NetScaler appliance.

A NetScaler appliance configured as a SAML service provider can now enforce an audience restriction check. The audience restriction condition evaluates to “Valid” only if the SAML replying party is a member of at least one of the specified audiences.

You can configure a NetScaler appliance to parse attributes in SAML assertions as group attributes. Parsing them as group attributes enables the appliance to bind policies to the groups.

Note
A NetScaler appliance MPX FIPS appliance used as a SAML service provider now supports encrypted assertions. Also, a NetScaler appliance MPX FIPS appliance functioning as a SAML service provider or a SAML identity provider can now be configured to use the SHA2 algorithms on FIPS hardware.

Configuring FIPS offload support using the command line interface:

1. Add SSL FIPS

   `add ssl fipsKey fips-key`

2. Create a CSR and use it at CA server to generate a certificate. You can then copy the certificate in `/nsconfig/ssl`. Let’s assume that the file is `fips3cert.cer`.

   `add ssl certKey fips-cert -cert fips3cert.cer -fipsKey fips-key`

3. Specify this certificate in the SAML action for SAML SP module

   `set samlAction <name> -samlSigningCertName fips-cert`

4. Use the certificate in samlIdpProfile for SAML IDP module

   `set samlIdpProfile fipstest -samlIdpCertName fips-cert`

The following table lists some articles that are specific to deployments where the NetScaler appliance is used as a SAML SP or a SAML IdP.
NetScaler appliance as a SAML SP

December 13, 2018

The SAML Service Provider (SP) is a SAML entity that is deployed by the service provider. When a user tries to access a protected application, the SP evaluates the client request. If the client is unauthenticated (does not have a valid NSC_TMAA or NSC_TMAS cookie), the SP redirects the request to the SAML Identity Provider (IdP).

The SP also validates SAML assertions that are received from the IdP.

When the NetScaler appliance is configured as an SP, all user requests are received by a traffic management virtual server (load balancing or content switching) that is associated with the relevant SAML action.

The NetScaler appliance also supports POST and Redirect bindings during logout.

Note

A NetScaler appliance can be used as a SAML SP in a deployment where the SAML IdP is configured either on the appliance or on any external SAML IdP.

When used as a SAML SP, a NetScaler appliance:

- Can extract the user information (attributes) from the SAML token. This information can then be used in the policies that are configured on the NetScaler appliance. For example, if you want to extract the GroupMember and emailaddress attributes, in the SAMLAction, specify the Attribute2 parameter as GroupMember and the Attribute3 parameter as emailaddress.
Default attributes such as username, password, and logout URL must not be extracted in attributes 1 to 16, because they are implicitly parsed and stored in the session.

- Can extract attribute names of up to 127 bytes from an incoming SAML assertion. The previous limit was 63 bytes. Support introduced in NetScaler 11.0 Build 64.x.

- Supports post, redirect, and artifact bindings. Support for redirect and artifact bindings is introduced in NetScaler 11.0 Build 55.x.

Note
Redirect binding should not be used for large amounts of data, when the assertion after inflate or decoding is greater than 10K.

- Can decrypt assertions. Support introduced in NetScaler 11.0 Build 55.x.

- Can extract multi-valued attributes from a SAML assertion. These attributes are sent in nested XML tags such as:

  `<AttributeValue>`<AttributeValue>Value1</AttributeValue>
  `<AttributeValue>Value2</AttributeValue>
  `</AttributeValue>`

When presented with the above XML, the NetScaler appliance can extract both Value1 and Value2 as values of a given attribute, as opposed to the old firmware that extracts only Value1.

Note
Support introduced in NetScaler 11.0 Build 64.x.

- Can specify the validity of a SAML assertion.

  If the system time on NetScaler appliance SAML IdP and the peer SAML SP is not in sync, the messages might get invalidated by either party. To avoid such cases, you can now configure the time duration for which the assertions will be valid.

  This duration, called the “skew time,” specifies the number of minutes for which the message should be accepted. The skew time can be configured on the SAML SP and the SAML IdP.

Note
Support introduced in NetScaler 11.0 Build 64.x.

- Can send additional attribute called ‘ForceAuth’ in the authentication request to external IDP (Identity Provider). By default, the ForceAuthn is set to ‘False’. It can be set to ‘True’ to suggest IDP to force authentication despite existing authentication context. Additionally, NetScaler appliance SP does authentication request in query parameter when configured with artifact binding.
To configure the NetScaler appliance as a SAML SP by using the command line interface

1. Configure a SAML SP action.

   **Example**
   
   The following command adds a SAML action that redirects unauthenticated user requests.
   
   ```
   add authentication samlAction SamlSPAct1 -samlIdPCertName nssp -samlRedirectUrl https://auth1.example.com
   ```

2. Configure the SAML policy.

   **Example**
   
   The following command defines a SAML policy that applies the above defined SAML action to all traffic.
   
   ```
   add authentication samlPolicy SamlSPPol1 ns_true SamlSPAct1
   ```

3. Bind the SAML policy to the authentication virtual server.

   **Example**
   
   The following command binds the SAML policy to a authentication virtual server named “av_saml”.
   
   ```
   bind authentication vserver av_saml -policy SamlSPPol1
   ```

4. Bind the authentication virtual server to the appropriate traffic management virtual server.

   **Example**
   
   The following command adds a load balancing virtual server named “lb1_ssl” and associates the authentication virtual server named “av_saml” to the load balancing virtual server.
   
   ```
   add lb vserver lb1_ssl SSL 10.217.28.224 443 -persistenceType NONE -cltTimeout 180 -AuthenticationHost auth1.example.com -Authentication ON -authnVsName av_saml
   ```

To configure a NetScaler appliance as a SAML SP by using the graphical user interface

1. Configure the SAML action and policy.

   Navigate to **Security > AAA - Application Traffic > Policies > Authentication > Advanced Policies > Policy**, create a policy with SAML as the action type, and associate the required SAML action with the policy.

2. Associate the SAML policy with an authentication virtual server.

   Navigate to **Security > AAA - Application Traffic > Virtual Servers**, and associate the SAML policy with the authentication virtual server.
3. Associate the authentication server with the appropriate traffic management virtual server.

Navigate to Traffic Management > Load Balancing (or Content Switching) > Virtual Servers, select the virtual server, and associate the authentication virtual server with it.

NetScaler appliance as a SAML IdP

December 13, 2018

The SAML IdP (Identity Provider) is a SAML entity that is deployed on the customer network. The IdP receives requests from the SAML SP and redirects users to a logon page, where they must enter their credentials. The IdP authenticates these credentials with the user directory (external authentication server, such as LDAP) and then generates a SAML assertion that is sent to the SP.

The SP validates the token, and the user is then granted access to the requested protected application.

When the NetScaler appliance is configured as an IdP, all requests are received by an authentication virtual server that is associated with the relevant SAML IdP profile.

Note

A NetScaler appliance can be used as a IdP in a deployment where the SAML SP is configured either on the appliance or on any external SAML SP.

When used as a SAML IdP, a NetScaler appliance:

- Supports all authentication methods that it supports for traditional logons.
- Digitally signs assertions. Support for the SHA256 algorithm is introduced in NetScaler 11.0 Build 55.x.
- Supports single-factor and two-factor authentication. SAML must not be configured as the secondary authentication mechanism.
- Can encrypt assertions by using the public key of the SAML SP. This is recommended when the assertion includes sensitive information. Support introduced in NetScaler 11.0 Build 55.x.
- Can be configured to accept only digitally signed requests from the SAML SP. Support introduced in NetScaler 11.0 Build 55.x.
- Can log on to the SAML IdP by using the following 401-based authentication mechanisms: Negotiate, NTLM, and Certificate. Support introduced in NetScaler 11.0 Build 55.x.
- Can be configured to send 16 attributes in addition to the NameId attribute. The attributes must be extracted from the appropriate authentication server. For each of them, you can specify the name, the expression, the format, and a friendly name in the SAML IdP profile. Support introduced in NetScaler 11.0 Build 55.x.
- If the NetScaler appliance is configured as a SAML IdP for multiple SAML SP, a user can gain access to applications on the different SPs without explicitly authenticating every time. The NetScaler appliance creates a session cookie for the first authentication, and every subsequent request uses this cookie for authentication. Support introduced in NetScaler 11.0 Build 55.x.

- Can send multi-valued attributes in a SAML assertion. Support introduced in NetScaler 11.0 Build 64.x.

- Supports post and redirect bindings. Support for redirect bindings is introduced in NetScaler 11.0 Build 64.x.

- Can specify the validity of a SAML assertion.

  If the system time on NetScaler appliance SAML IdP and the peer SAML SP is not in sync, the messages might get invalidated by either party. To avoid such cases, you can now configure the time duration for which the assertions will be valid.

  This duration, called the “skew time,” specifies the number of minutes for which the message should be accepted. The skew time can be configured on the SAML SP and the SAML IdP.

  **Note**
  Support introduced in NetScaler 11.0 Build 64.x.

- Can be configured to serve assertions only to SAML SPs that are pre-configured on or trusted by the IdP. For this configuration, the SAML IdP must have the service provider ID (or issuer name) of the relevant SAML SPs. Support introduced in NetScaler 11.0 Build 64.x.

  **Note**
  Before proceeding, make sure that you have an authentication virtual server that is linked to an LDAP authentication server.

---

**To configure a NetScaler appliance as a SAML IdP by using the command line interface**

1. Configure a SAML IdP profile.

   **Example**

   Adding NetScaler appliance as an IdP with SiteMinder as the SP.

   ```bash
   add authentication samlIdPProfile samlIDPProf1 -samlSPCertName siteminder -cert -encryptAssertion ON -samlIdPCertName ns-cert -assertionConsumerServiceURL http://sm-proxy.nsi-test.com:8080/affwebservices/public/saml2assertionconsumer -rejectUnsignedRequests ON -signatureAlg RSA-SHA256 -digestMethod SHA256
   ```
2. Configure the SAML authentication policy and associate the SAML IdP profile as the action of the policy.

```bash
add authentication samlIdPPolicy samlIDPPol1 -rule ns\_true -action samlIDPProf1
```

3. Bind the policy to the authentication virtual server.

```bash
bind authentication vserver saml-auth-vserver -policy samlIDPPol1 -priority 100
```

To configure a NetScaler appliance as a SAML IdP by using the graphical user interface

1. Configure the SAML IdP profile and policy.

   Navigate to Security > AAA - Application Traffic > Policies > Authentication > Advanced Policies > Policy, and create a policy with SAML IdP as the action type, and associate the required SAML IdP profile with the policy.

2. Associate the SAML IdP policy with an authentication virtual server.

   Navigate to Security > AAA - Application Traffic > Virtual Servers, and associate the SAML IdP policy with the authentication virtual server.

Configuring SAML single sign-on

December 13, 2018

To provide single sign-on capabilities across applications that are hosted on the service provider, you can configure SAML single sign-on on the SAML SP.

Configuring SAML single sign-on by using the command line interface

1. Configure the SAML SSO profile.

   **Example**

   In the following command, `Example` is the load balancing virtual server that has a web link from the SharePoint portal. Nssp.example.com is the Traffic Management virtual server that is load balancing the SharePoint server.

   ```bash
   add tm samlSSOProfile tm-saml-sso -samlSigningCertName nssp -assertionConsumerServiceURL "https://nssp2.example.com/cgi/samlauth" -relayStateRule "https://nssp2.example.com/samlssosso.html" -sendPassword ON -samlIssuerName nssp.example.com
   ```
2. Associate the SAML SSO profile with the traffic action.

**Example**

The following command enables SSO and binds the SAML SSO profile created above to a traffic action.

```
add tm trafficAction html\_act -SSO ON -samlSSOProfile tm-saml-sso
```

3. Configure the traffic policy that specifies when the action must be executed.

**Example**

The following command associates the traffic action with a traffic policy.

```
add tm trafficPolicy html_pol "HTTP.REQ.URL.CONTAINS("abc.html")" html_act
```

4. Bind the traffic policy created above to a traffic management virtual server (load balancing or content switching). Alternatively, the traffic policy can be associated globally.

```
bind lb vserver lb1_ssl -policyName html_pol -priority 100 -gotoPriorityExpression END -type REQUEST
```

**Configuring SAML single sign-on by using the graphical user interface**

1. Define the SAML SSO profile, the traffic profile, and the traffic policy.

   Navigate to **Security > AAA - Application Traffic > Policies > Traffic**, select the appropriate tab, and configure the settings.

2. Bind the traffic policy to a traffic management virtual server or globally to the NetScaler appliance.

**OAuth authentication**

December 13, 2018

The AAA traffic management feature now supports OAuth and OpenID-Connect mechanisms for authenticating and authorizing users to applications that are hosted on applications such as Google, Facebook, and Twitter.
The authentication mechanism facilitates the inline verification of OpenID tokens. The NetScaler appliance can be configured to obtain certificates and verify signatures on the token.

A major advantage of using the OAuth and OpenID-Connect mechanisms is that the user information is not sent to the hosted applications and therefore the risk of identity theft is considerably reduced.

The NetScaler appliance configured for AAA now accepts incoming tokens that are signed using HMAC HS256 algorithm. In addition, the public keys of the SAML Identity Provider (IdP) are read from a file, instead of learning from an URL endpoint.

In the NetScaler appliance implementation, the application to be accessed is represented by the AAA traffic management virtual server. So, to configure OAuth, you must configure an OAuth policy which must then be associated with a AAA traffic management virtual server.

**Note**

OAuth on NetScaler appliance is currently qualified for all SAML IdPs that are compliant with “OpenID connect 2.0”.

**To configure OAuth by using the configuration utility:**

1. Configure the OAuth action and policy.
   Navigate to **Security > AAA - Application Traffic > Policies > Authentication > Advanced Policies > Policy**, and create a policy with OAuth as the action type, and associate the required OAuth action with the policy.

2. Associate the OAuth policy with an authentication virtual server.
   Navigate to **Security > AAA - Application Traffic > Virtual Servers**, and associate the OAuth policy with the authentication virtual server.

**Note**

Attributes (1 to 16) can be extracted in the OAuth response. Currently these attributes are not evaluated. They are added for the future reference.

**To configure OAuth by using the command line interface:**

1. Define an OAuth action.
   ```
   ```

2. Associate the action with an advanced authentication policy.
   ```
   add authentication Policy** <name> -rule <expression> -action <string> 
   ```
**Example**

```bash
preblock add authentication oauthAction a -authorizationEndpoint https://example.com/ -tokenEndpoint https://example.com/ -clientId sadf -clientsecret df
```

For more information on authentication OAuthAction parameters, see “authentication OAuthAction”.

**Note**

When a certEndpoint is specified, the NetScaler appliance polls that endpoint at the configured frequency to learn the keys. To configure a NetScaler appliance to read the local file and parse keys from that file, a new configuration option is introduced as follows.

```bash
set authentication OAuthAction <> -**CertFilePath** <path to local file with jwks>
```

### Multi-Factor (nFactor) authentication

**December 13, 2018**

**Important**

Supported from NetScaler 11.0 Build 62.x onwards.

Multi-factor authentication enhances the security of an application by requiring users to provide multiple proofs of identity to gain access. The NetScaler appliance provides an extensible and flexible approach to configuring multi-factor authentication. This approach is called *nFactor authentication*.

With nFactor authentication you can:

- Configure any number of authentication factors.
- Base the selection of the next factor on the result of executing the previous factor.
- Customize the login interface. For example, you can customize the label names, error messages, and help text.
- Extract user group information without doing authentication.
- Configure pass-through for an authentication factor. This means that no explicit login interaction is required for that factor.
- Configure the order in which different types of authentication are applied. Any of the authentication mechanisms that are supported on the NetScaler appliance can be configured as any factor of the nFactor authentication setup. These factors are executed in the order in which they are configured.
- Configure the NetScaler appliance to proceed to an authentication factor that must be executed when authentication fails. To do so, you configure another authentication policy with the exact same condition, but with the next highest priority and with the action set to “NO_AUTH”. You
must also configure the next factor, which must specify the alternative authentication mechanism to apply.

For a nFactor benefit, see One Public IP for AAA-TM Deployments on NetScaler.

Sample deployments using nFactor authentication:

- Getting two passwords up-front, pass-through in next factor. Read
- Group extraction followed by certificate or LDAP authentication, based on group membership. Read
- SAML followed by LDAP or certificate authentication, based on attributes extracted during SAML. Read
- SAML in first factor, followed by group extraction, and then LDAP or certificate authentication, based on groups extracted. Read
- Prefilling user name from certificate. Read
- Certificate authentication followed by group extraction for 401 enabled traffic management virtual servers. Read
- Username and 2 passwords with group extraction in third factor. Read
- Certificate fallback to LDAP in same cascade; one virtual server for both certificate and LDAP authentication. Read
- LDAP in first factor and WebAuth in second factor. Read
- Domain drop down in first factor, then different policy evaluations based on group. Read

How to configure nFactor authentication

January 6, 2019

The primary entity used for nFactor authentication is called a login schema.

A login schema specifies an authentication schema XML file that defines the manner in which the login form will be rendered. Considering the interaction that the user must have when logging in to the application, you can create a single file for multiple factors or different files for different factors. View sample XML file.

- **Single file for multiple factors.** User will be provided a single form in which to provide credentials for multiple authentication factors.

- **Different files for different factors.** User will be provided a different form for each authentication factor.

Next, you must associate the XML file(s) with login schema(s). You can also specify expressions to extract the user name and the password from the login form.
Tip

You can configure an authentication factor to be pass-through. This means that the user is not required to provide credentials explicitly and there is no login form for that factor. The credentials are either taken from the previous factor or the user name and/or password are dynamically extracted by using the username/password expressions that are configured for that login schema. You must set the login schema to “NOSCHEMA”, instead of an XML file.

Now that the login schemas are configured, you must specify the manner in which they must be invoked. A login schema can be invoked by using either a login schema policy or an authentication policy label. The decision depends on the following:

- **Login schema policy.**
  - Specifies the condition on which the login form must be presented to the user.
  - Must be bound to an authentication virtual server.
  - In an authentication virtual server that has multiple login schema policies, the policy with the highest priority that evaluates to true is executed. That is, the login form associated with that policy is presented to the user.
  - The login schema policy is only used to present the first login form.

- **Authentication policy label.**
  - Specifies a collection of authentication policies for a particular factor. Each policy label corresponds to a single factor.
  - Specifies the login form that must be presented to the user.
  - Must be bound as the next factor of an authentication policy or of another authentication policy label.
  - Typically, a policy label includes authentication policies for a specific authentication mechanism. However, you can also have a policy label that has authentication policies for different authentication mechanisms.

To summarize, the configurations you must perform to set up nFactor authentication are as follows:

1. Create the authentication schema XML files.
2. Associate each XML file with a login schema.
3. Associate each login schema with a login schema policy or authentication policy label.
4. Bind login schema policy to an authentication virtual server.
5. Bind authentication policy label, as next factor, to an authentication policy.

**How nFactor authentication works**

December 13, 2018

Imagine a user requesting access to an application that requires user credentials. As is the case in
NetScaler appliance deployments, the request arrives at the NetScaler appliance through a traffic management virtual server (in this case, a load balancing virtual server). Since the user must provide authentication credentials, the load balancing virtual server redirects the request to the authentication virtual server, which does the following:

1. Checks to determine whether any login schema policies are associated with the authentication virtual server.
   - If yes, the user is presented the login form associated with the login schema policy with the highest priority that evaluates to true.
   - If no, the default login form is presented to the user.

   **Note**
   The default login schema files are available in the `/nsconfig/loginschema/LoginSchema/` directory of the NetScaler appliance. Citrix recommends that you copy these files to the `/nsconfig/loginschema/` directory before using them, so that changes made to the files are preserved post reboot.

2. The authentication policies that are associated with the authentication virtual server are evaluated. For the policies that are evaluated to true, the actions are executed in order of priority until one of the actions succeeds.

3. The policy label that is associated as the next factor is invoked.

4. The authentication policies that are associated with the authentication policy label are evaluated. For the policies that are evaluated to true, the actions are executed in order of priority until one of the actions succeeds.

5. The policy label that is associated as the next factor is invoked.

6. Steps 4 and 5 are performed repetitively till all the configured next factors are executed.

**Configuring nFactor authentication**

January 6, 2019

To understand the step-wise configurations for nFactor authentication, let us consider a 2-factor authentication deployment where the 1st factor is LDAP authentication and the 2nd factor is RADIUS authentication.

This sample deployment requires the user to login to both factors using a single login form. Therefore, we define a single login form that accepts two passwords. The first password is used for LDAP authentication and the other for RADIUS authentication. [View XML file](#).

Here are the configurations that are performed.
1. Configure the load balancing virtual server for authentication

   ```
   add lb vserver lbvs55 HTTP 1.217.193.55 80 -AuthenticationHost auth56.aaatm.com -Authentication ON
   ```

2. Configure the authentication virtual server.

   ```
   add authentication vserver auth56 SSL 1.217.193.56 443 -AuthenticationDomain aaatm.com
   ```

3. Configure the login schema for the login form and bind it to a login schema policy.

   ```
   add authentication loginSchema login1 -authenticationSchema login-2passwd.xml -userCredentialIndex 1 -passwordCredentialIndex 2
   add authentication loginSchemaPolicy login1 -rule true -action login1
   ```

4. Configure a login schema for the pass-through and bind it to a policy label

   ```
   add authentication loginSchema login2 -authenticationSchema noschema
   add authentication policylabel label1 -loginSchema login2
   ```

5. Configure the LDAP and RADIUS policies.

   ```
   add authentication ldapAction ldapAct1 -serverIP 1.217.28.180 -ldapBase “dc=aaatm, dc=com” -ldapBindDn administrator@aaatm.com -ldapBindDnPassword 71ca2b11ad800ce2787fb7deb54842875b8f3c -encrypted -encryptmethod ENCMTHD_3 -ldapLoginName samAccountName -groupAttrName memberOf -subAttributeName CN
   add authentication Policy ldap -rule true -action ldapAct1
   add authentication radiusAction radius -serverIP 1.217.22.20 -radKey a740d6a0aeb3288fa0a6fbe932d329acd -encrypted -encryptmethod ENCMTHD_3 -radNASip ENABLED -radNASid NS28.50 -radAttributeType 11 -ipAttributeType 8
   add authentication Policy radius -rule true -action radius
   ```

6. Bind the login schema policy to the authentication virtual server

   ```
   bind authentication vserver auth56 -policy login1 -priority 1 -gotoPriorityExpression END
   ```

7. Bind the LDAP policy (first factor) to the authentication virtual server.

   ```
   bind authentication vserver auth56 -policy ldap -priority 1 -nextFactor label1 -gotoPriorityExpression next
   ```

8. Bind the RADIUS policy (second factor) to the authentication policy label.

   ```
   bind authentication policylabel label1 -policyName radius -priority 2 -gotoPriorityExpression end
   ```
Admin Partitioning

January 6, 2019

A NetScaler appliance can be partitioned into logical entities called admin partitions, where each partition can be configured and used as a separate NetScaler appliance. The following figure shows the partitions of a NetScaler being used by different customers and departments:

A partitioned NetScaler appliance has a single default partition and one or more admin partitions. The following table provides further details on the two partition types:

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>In a partitioned appliance, the mode BridgeBPDUs can be enabled only in the default partition and not in the administrative partitions.</td>
</tr>
</tbody>
</table>

Default Partition
Admin Partitions

**Availability:**

The NetScaler appliance ships with a single partition, which is called a default partition. The default partition is retained even after the NetScaler appliance is partitioned.

Must be explicitly created as described in Configure admin partitions.

**Number of Partitions:**

One

A NetScaler appliance can have one or more (maximum of 512) admin partitions.

**User Access and Roles:**

The default partition can be accessed and configured by all NetScaler users who are not associated with a partition-specific command policy. As always, the operations that a user can perform are restricted by the associated command policy.

Can be created only by NetScaler superusers who also specify the users for that partition. Only superusers and associated users of the partition can access and configure the admin partition.

Note: Partition users do not have shell access.

**File Structure:**

All files in a default partition are stored in the default NetScaler file structure.

For example, the NetScaler configuration file is stored in the /nsconfig directory and NetScaler logs are stored in the /var/log/ directory.

All files in an admin partition are stored in directory paths that have the name of the admin partition.
For example, the NetScaler configuration file (ns.conf) is stored in the `/nsconfig/partitions/<partitionName>` directory. Other partition-specific files are stored in the `/var/partitions/<partitionName>` directories.

Some other paths in an admin partition:

- Downloaded files: `/var/partitions/<partitionName>/download/`
- Log files: `/var/partitions/<partitionName>/log/`

**Note:** Currently, logging is not supported at partition-level. Therefore, this directory is empty and all logs are stored in the `/var/log/` directory.

- SSL CRL certificate related files: `/var/partitions/<partitionName>/netscaler/ssl`

**Resources Available:**

All NetScaler resources.

NetScaler resources that are explicitly assigned to the admin partition.

**User access and roles**

In authenticating and authorizing a partitioned NetScaler appliance, a root administrator can assign a partition administrator to one or more partitions. The partition administrator can authorize users to that partition without affecting other partitions. These are partition users and they are authorized to access only that partition using SNIP address. Both the root administrator and the partition administrator can configure role based access (RBA by authorizing users to access different applications.

Administrators and user roles can be described as follows:

**Root Administrator.** Accesses the partitioned appliance through its NSIP address and can grant user access to one or more partitions. The administrator can also assign partition administrators to one or more partitions. The administrator can create a partition administrator from the default partition using a NSIP address or switch to a partition and then create a user and assign partition admin access using a SNIP address.

**Partition Administrator.** Accesses the specified partition through a NSIP address assigned by the root administrator. The administrator can assign role-based access to partition user access to that partition and also configure external server authentication using partition specific configuration.

**System User.** Accesses partitions through the NSIP address. Has access to the partitions and resources specified by the root administrator.

**Partition User.** Accesses a partition through a SNIP address. This user account is created by the partition administrator and the user has access to resources, only within the partition.

**Points to remember**

Following are some points to remember when providing role-based access in a partition.
1. NetScaler users accessing the GUI through NSIP address will use default partition authentication configuration to log on to the appliance.
2. Partition system users accessing the GUI through partition SNIP address will use partition specific authentication configuration to log on to the appliance.
3. Partition user created in a partition cannot login using NSIP address.
4. NetScaler user bound to a partition cannot login using partition SNIP address.
5. External users accessing a partition through external server configuration as LDAP, Radius, or TACACS added in the partition. The user must access using SNIP address to directly log onto the partition.

Use case for managing role Based access in an partitioned setup

Consider a scenario where an enterprise organization, www.example.com has multiple business units and a centralized administrator who manages all instances in their network. However, they want to provide exclusive user privileges and environment for each business unit.

Following are the administrators and users managed by default partition authentication configuration and partition specific configuration in a partitioned appliance.

John: Root Administrator
George: Partition Administrator
Adam: System User
Jane: Partition User

John, is the root administrator of a partitioned NetScaler appliance. John manages all user accounts and administrative user accounts across partitions (for example, P1, P2, P3, P4, and P5) within the appliance. He provides granular role-based access to entities from the default partition of the appliance. John creates user accounts and assigns partition access to each account. George being a network engineer within the organization prefers to have a role based access to few applications running on partition P2. Based on user management, John creates a partition administrator role for George and associates his user account with command policies for authorization privileges. Jane being another network engineer wants to directly access an application running only on partition P2, George (partition administrator) can create a partition user account for her and associate her account with command policies for authorization privileges. Jane’s user account created within the partition is now directly associated with P2. Now Jane can access the NetScaler Management interface through SNIP address and cannot switch to any other partition.
If Jane’s user account is created by a partition administrator in partition P2, she can access the NetScaler Management interface only through SNIP address (created within the partition) and not permitted to access the interface through NSIP address. Similarly, if Adam’s user account is created by a root administrator in the default partition and is bound to P2 partition, he can access the NetScaler Management interface only through NSIP address or SNIP address created in the default partition (with management access enabled) and not permitted to access the partition interface through SNIP address created in the administrative partition.

Configure roles and responsibilities for partition administrators

Following are the configurations performed by a root administrator in a default partition.

Creating administrative partitions and system users – A root administrator creates administrative partitions and system users in the default partition of the appliance. The administrator then associates the users to different partitions. If you are bound to one or more partitions, you can switch from one partition to another based on user bindings. Also, your access to one or more bound partitions is authorized only by the root administrator.

Authorizing system user as partition administrator for a specific partition – Once a user account is created, the root administrator switches to a specific partition and authorizes the user as the partition administrator. This is done by assigning partition-admin command policy to the user account. Now, the user can access the partition as partition administrator and manage entities within the partition.

Following are the configurations perform by a partition administrator in an administrative partition.

Configuring SNIP address in an administrative partition- The partition administrator logs on to the partition and creates a SNIP address and provides management access to the address.

Creating and Binding a Partition System User with Partition Command Policy -The partition administrator creates partition users and defines the scope of user access. This is done by binding the user account to partition command policies.

Creating and Binding a Partition System User Groups with Partition Command Policy -The partition administrator creates partition user groups and defines the scope of user group access. This is done by binding the user group account to partition command policies.

Configuring External Server authentication for external users (optional)-This configuration is done for authenticating external TACACS users accessing the partition using SNIP address.

Following are the tasks performed in configuring role-based access for partition users in an Administrative Partition.
1. Creating an Administrative Partition – Before you create partition users in an administrative partition, you must first create the partition. As a root administrator, you can create a partition from the default partition using the configuration utility or a command line interface.

2. Switching user access from default partition to partition P2 – If you are partition administrator accessing the appliance from the default partition, you can switch from default partition to a specific partition (for example, partition P2) based on user binding.

3. Adding SNIP address to the Partition user account with Management access enabled—Once you have switched your access to an administration partition, you must create a SNIP address and provide management access to the address.

4. Creating and Binding a Partition System User with Partition Command Policy—If you are a partition administrator, you can create partition users and define the scope of user access. This is done by binding the user account to partition command policies.

5. Creating and Binding Partition user group with Partition Command Policy—If you are a partition administrator, you can create partition user groups and define the scope of user access control. This is done by bind the user group account to partition command policies.

Configuring External Server authentication for external users (optional)—This configuration is done for authenticating external TACACS users accessing the partition using SNIP address.

Benefits of using admin partitions

You can avail the following benefits by using admin partitions for your deployment:

- Allows delegation of administrative ownership of an application to the customer.
- Reduces the cost of ADC ownership without compromising on performance and ease-of-use.
- Safeguards from unwarranted configuration changes. In a non-partitioned NetScaler appliance, authorized users of other application could intentionally or unintentionally change configurations that are required for your application. This could lead to undesirable behavior. This possibility is reduced in a partitioned NetScaler appliance.
- Isolates traffic between different applications by the use of dedicated VLANs for each partition.
- Accelerates and allows to scale application deployments.
- Allows application-level or localized management and reporting.

Let us analyze a couple of cases to understand the scenarios in which you can use admin partitions.

User case 1: How Admin partition is used in an enterprise network

Let us consider a scenario faced by a company named Foo.com.

- Foo.com has a single NetScaler.
- There are five departments and each department has one application that requires to be deployed with the NetScaler.
Each application must be managed independently by a different set of users or administrators. Other users must be restricted from accessing the configurations. The application or back-end must be able to share resources like IP addresses. The global IT department must be able to control NetScaler-level settings which must be common to all partitions. Applications must be independent of one another. An error in configuration of one application must not affect the other.

A non-partitioned NetScaler would not be able to satisfy these requirements. However, you can achieve all these requirements by partitioning a NetScaler. Simply create a partition for each of the applications, assign the required users to the partitions, specify a VLAN for each partition, and define global settings on the default partition.

**Use case 2: How an admin partition is used by a service provider**

Let us consider a scenario faced by a service provider named **BigProvider**:

- **BigProvider** has 5 customers: 3 small enterprises and 2 large enterprises.
- **SmallBiz**, **SmallerBiz**, and **StartupBiz** need only the most basic NetScaler functionality.
- **BigBiz** and **LargeBiz** are larger enterprises and have applications that attract a lot of traffic. They would like to use some of the more complex NetScaler functionality.

In a non-partitioned approach, the NetScaler administrator would typically use a NetScaler SDX appliance and provision a NetScaler instance for each customer.

This solution suits **BigBiz** and **LargeBiz** because their applications need the undiminished power of the entire non-partitioned NetScaler appliance. However, this solution might not be as cost effective for servicing **SmallBiz**, **SmallerBiz**, and **StartupBiz**.

Therefore, **BigProvider** decides on the following solution:

- Using a NetScaler SDX appliance to bring up dedicated NetScaler instances for **BigBiz** and **LargeBiz**.
- Using a single NetScaler which is partitioned into three partitions, one each for **SmallBiz**, **SmallerBiz**, and **StartupBiz**.

The NetScaler administrator (superuser) creates an admin partition for each of these customers, specifies the users for the partitions, specifies the NetScaler resources for the partitions, and specifies the VLAN to be used by the traffic that is destined for each of the partitions.

**Supported NetScaler configurations**

January 6, 2019
Depending on the NetScaler configuration and the partition in which the configuration is performed, NetScaler configurations can be categorized into three types of configurations as given below.

**Note**

- Admin partitions cannot be set up on a NetScaler cluster. This means that a NetScaler cluster cannot be partitioned.
- Admin partitions cannot be set up on a NetScaler MPX-FIPS appliance.
- **Case 3** lists the NetScaler features that are not supported in admin partitions.

**Case 1 (global configurations)**

Configurations that can be performed ONLY in the default partition and which are available or impact all the admin partitions.

- Updates to built-in entities for monitors, TCP profiles, HTTP profiles, and so on.
- Updates to global parameters for syslog, nslog, weblog, content switching, IPSEC, SIP, DHCP, Surge protection, TCP buffering, and system collection.
- High availability (HA) configurations
- Interface and VLAN changes
- User configurations

**Case 2 (partition-specific configurations)**

Configurations that can be performed independently in default and admin partitions. These configurations are applicable only to the partition in which they are performed.

- Getting traffic level statistics for a partition.
- Partition admin can update IP bindings for VLAN which is bound to that partition. But cannot update the interface bindings.
- Clearing NetScaler configurations.
- Feature-specific parameters for the following features: AppFlow, AppQoE, HTTP compression, DNS, TCP, HTTP, encryption, responder, rewrite, and SSL.
- Feature-specific configurations such as virtual servers, services, monitors, and so on.

**Case 3**

Configurations that cannot be performed on admin partitions. These features can be configured in the default partition, but there is no impact on admin partitions.
**NetScaler 11.1**

**Note**
Configurations that are supported on admin partitions for a particular release are marked as **Yes**.

## Configure admin partitions

**December 13, 2018**

**Important**

- Only superusers are authorized to create and configure admin partitions.
- Unless specified otherwise, configurations to set up an admin partition must be done from the default partition.
By partitioning a NetScaler appliance, you are in-effect creating multiple instances of a single NetScaler appliance. Each instance has its own configurations and the traffic of each of these partitions is isolated from the other by assigning each partition a dedicated VLAN or a shared VLAN.

A partitioned NetScaler has one default partition and the admin partitions that are created. To set up an admin partition, you must first create a partition with the relevant resources (memory, maximum bandwidth, and connections). Then, specify the users that can access the partition and the level of authorization for each of the users on the partition.

Accessing a partitioned NetScaler is the same as accessing a non-partitioned NetScaler: through the NSIP address or any other management IP address. As a user, after you provide your valid logon credentials, you are taken to the partition to which you are bound. Any configurations that you create are saved to that partition. If you are associated with more than one partition, you are taken to the first partition with which you were associated. If you want to configure entities on one of your other partitions, you must explicitly switch to that partition.

After accessing the appropriate partition, configurations that you perform are saved to that partition and are specific to that partition.

**Note**

- NetScaler superusers and other non-partition users are taken to the default partition.
- Users of all the 512 partitions can log in simultaneously.

**Tip**

To access a partitioned NetScaler appliance over HTTPS by using the SNIP (with management access enabled), make sure that each partition has the certificate of its partition administrator. Within the partition, the partition admin must do the following:

1. Add the certificate to the NetScaler.
   
   ```
   add ssl certKey ns-server-certificate -cert ns-server.cert -key ns-server.key
   ```

2. Bind it to a service named “nskrpcs-<SNIP>-3009”, where <SNIP> must be replaced with the SNIP address, in this case 100.10.10.1.

   ```
   bind ssl service nskrpcs-100.10.10.1-3009 -certKeyName ns-server-certificate
   ```

**Partition resource limiting**

In a partitioned NetScaler appliance, a network administrator can create a partition with partition resources such as memory, bandwidth, and connection limit configured as unlimited. This is done by specifying Zero as the partition resource value, where Zero indicates the resource is unlimited on the partition and it can be consumed up to system limits. Partition resource configuration is useful when
you migrate a traffic domain deployment to an administrative partition or if you do not know about resource allocation limit for a partition in a given deployment.

Resource limit for an administrative partition is as follows:

1. **Partition memory.** This is the maximum allocated memory for a partition. You must make sure to specify the values when creating a partition.

   **Note**
   
   From NetScaler 12.0 onwards, when you create a partition, you must set the memory limit as Zero or if a partition is already created with a specific memory limit, you can reduce the limit to any value or set the limit as Zero.

   **Parameter:** `maxMemLimit`

   Maximum memory is allocated in megabytes in a partition. A zero value indicates the memory is unlimited on the partition and it can consume up to the system limits.

   **Default value:** 10

2. **Partition bandwidth.** Maximum allocated bandwidth for a partition. If you specify a limit, make sure it is within the appliance’s licensed throughput. Otherwise, you are not limiting the bandwidth that can be used by the partition. The specified limit is accountable for the bandwidth that the application requires. If the application bandwidth exceeds the specified limit, packets are dropped.

   **Note**
   
   From NetScaler 12.0 onwards, when you create a partition, you can set the partition bandwidth limit to Zero or if a partition is already created with a specific bandwidth, you can reduce bandwidth or set the limit as Zero.

   **Parameter:** `maxBandwidth`

   Maximum bandwidth is allocated in Kbps in a partition. A zero value indicates the bandwidth is unrestricted. That is, the partition can consume up to the system limits.

   **Default value:** 10240

   **Maximum Value:** 4294967295

3. **Partition connection.** Maximum number of concurrent connections that can be open in a partition. The value must accommodate the maximum simultaneous flow expected within the partition. The partition connections are accounted from the partition quota memory. Previously, the connections were accounted from the default partition quota memory. It is configured only on the client-side, not on the back-end server-side TCP connections. New connections cannot be established beyond this configured value.
Note

From NetScaler 12.0 onwards, you can create a partition with number of open connections set to Zero or if you have already created a partition with a specific number of open connections, you can reduce the connection limit or set the limit as Zero.

Parameter: maxConnections

Maximum number of concurrent connections that can be open in the partition. A zero value indicates no limit on number of open connections.

Default value: 1024
Minimum value: 0
Maximum Value: 4294967295

Configure an admin partition

To configure an admin partition, complete the following tasks.

Access an admin partition

To access in an admin partition by using the command line interface

1. Log on to the NetScaler appliance.
2. Check if you are in the correct partition. The command prompt displays the name of the currently selected partition.
3. If yes, skip to the next step.
4. If no, get a list of the partitions with which you are associated and switch over to the appropriate partition.
   - show system user <username>
   - switch ns partition <partitionName>
5. Now, you can perform the required configurations just as a non-partitioned NetScaler.

To access an admin partition by using the configuration utility

1. Log on to the NetScaler appliance.
2. Check if you are in the correct partition. The top bar of the graphical user interface displays the name of the currently selected partition.
   - If yes, skip to the next step.
• If no, navigate to Configuration > System > Administrative Partitions > Partitions, right-click the partition to which you want to switch, and select Switch.

3. Now, you can perform the required configurations just as a non-partitioned NetScaler.

Add an admin partition

The root administrator adds an administrative partition from the default partition and binds the partition with VLAN 2.

**To create an administrative partition by using the command line interface**

At the command prompt, type:

```
1 add partition <partitionname>
```

Switch user access from default partition to an admin partition

Now switch user access from default partition to partition Par1.

**To switch a user account from default partition to an admin partition by using the command line interface:**

At the command prompt, type:

```
1 Switch ns partition <pname>
```

Adding SNIP address to a partition user account with management access enabled

In the partition, create SNIP address with management access enabled.

**To add SNIP address to the partition user account with management access enabled by using the command line interface:**

At the command prompt, type:

```
1 > add ns ip <ip address> <subnet mask> -mgmtAccess enabled
```

Create and Bind a partition user with partition command policy

In partition, create a partition system user and bind the user with partition-admin command policies.
To create and bind a partition system user with partition command policy by using the command line interface:

At the command prompt, type:

```
1 > add system user <username> <password>
2  Done
```

Creating and binding partition user group with partition command policy

In Partition Par1, create a partition system user group and bind the group with partition command policy such as partition admin, partition read-only, partition-operator, or partition-network.

To create and bind a partition user group with partition command policy by using the command line interface:

```
1 > add system group <groupName>
2 > bind system group <groupName> (-userName | -policyName <cmdpolicy> <priority> | -partitionName)
```

Configuring external server authentication for external users

In partition Par1 you can configure an external server authentication to authenticate external TACACS users accessing the partition through SNIP address.

To configure external server authentication for external users by using the command line interface:

At the command prompt, type:

```
1  add authentication tacacsaction <name> -serverip <IP> -tacacsSecret <secret key> -authorization ON -accounting ON
2  add authentication policy <policname> -rule true -action <name>
3  bind system global <policname> -priority <value>1
```

Configure a Partition System User Accounts in a Partition by using the GUI

To configure a partition user account in an administrative partition, you must create a partition user or a partition user group and bind it partition command policies. Also, you can configure the external server authentication for an external user.
**To create a partition user account in a partition by using the GUI**

Navigate to System > User Administration, click Users to add a partition system user and bind the user to command policies (partitionadmin/partitionread-only/partition-operator/partition-network).

**To create a partition user group account in a partition by using the GUI**

Navigate to System > User Administration, click Groups to add a partition system user group and bind the user group to command policies (partitionadmin/partitionread-only/partition-operator/partition-network).

**To configure External server authentication for external users by using the GUI**

Navigate to System > Authentication > Basic Actions and click TACACS to configure TACACS server for authenticating external users accessing the partition.

**Sample Configuration**

The following configuration shows how to create a partition user or a partition user group and bind it partition command policies. Also, how to configure the external server authentication for authenticating an external user.

```
1   add partition Par1
2   switch ns partition Par1
3   > add ns ip 10.102.29.203 255.255.255.0 -mgmtAccessenabled
4   > add system user John Password
5   > bind system user Jane partition-read-only -priority 1
6   > add system group Retail
7   > bind system group Retail -policyname partition-network 1 (where 1 is the priority number)
8   > bind system group Retail -username Jane
9   > add authentication tacacsaaction tacuser -serverip 10.102.29.200 -
tacacsSecret Password -authorization ON -accounting ON
10  > add authentication policy polname -rule true -action tacacsAction
11  > bind system global polname -priority 1
```

### Configure an LACP ethernet channel on the default admin partition

With Link Aggregation Control Protocol (LACP), you can combine multiple ports into a single, high-speed link (also called a channel). An LACP-enabled appliance exchanges LACP Data Units (LACPDU) over the channel.

There are three LACP configuration modes that you can enable in the default partition of a NetScaler appliance:

1. **Active.** A port in active mode sends LACPDU. Link aggregation is formed if the other end of the Ethernet link is in the LACP active or passive mode.
2. **Passive.** A port in passive mode sends LACPDU only when it receives LACPDU. The link aggregation is formed if the other end of the Ethernet link is in the LACP active mode.
3. **Disable.** Link aggregation is not formed.

**Note**

By default, the link aggregation is disabled in the default partition of the appliance.

LACP exchanges LACPDU between devices connected by an Ethernet link. These devices are typically referred as an actor or partner.

A LACPDU data unit contains the following parameters:
- LACP Mode. Active, passive or disable.
- LACP timeout. The waiting period before timing out the partner or actor. Possible values: Long and Short. Default: Long.
- Port Key. To distinguish between the different channel. When key is 1, LA/1 is created. When key is 2, LA/2 is created. Possible values: Integer from 1 through 8. 4 through 8 is for cluster CLAG.
- System Priority. Uses this priority along with system MAC to form the system ID to uniquely identify the system during LACP negotiation with the partner. Sets system priority from 1 and 65535. The default value is set to 32768.
- Interface. Supports 8 interfaces per channel on NetScaler 10.1 appliance and supports 16 interfaces per channel on NetScaler 10.5 and 11.0 appliances.

After exchanging LACPDUs, the actor and partner negotiate the settings and decide whether to add the ports to the aggregation.

**Configure and verify LACP**

**To configure and verify LACP on a NetScaler appliance by using the command line**

1. Enable LACP on each interface.
   
   At the command prompt, type:

   ```
   set interface <Interface_ID> -lacpMode PASSIVE -lacpKey 1
   ```

   When you enable LACP on an interface, the channels are dynamically created. Additionally, when you enable LACP on an interface and set lacpKey to 1, the interface is automatically bound to channel LA/1.

   **Note**

   When you bind an interface to a channel, the channel parameters take precedence over the interface parameters, so the interface parameters are ignored. If a channel was created dynamically by LACP, you cannot perform add, bind, unbind, or remove operations on the channel. A channel dynamically created by LACP is automatically deleted when you disable LACP on all interfaces of the channel.

2. Set the system priority.
   
   At the command prompt, type:

   ```
   set lacp -sysPriority <Positive_Integer>
   ```

3. Verify that LACP is working as expected.
   
   ```
   show interface <Interface_ID>
   ```
show channel

show LACP

Note

In some versions of Cisco IOS, running the switchport trunk native vlan <VLAN_ID> command causes the Cisco switch to tag LACP PDUs. This causes the LACP channel between the Cisco switch and the NetScaler appliance to fail. However, this issue does not affect the static link aggregation channels configured in the above procedure.

SNMP support for admin partitions

December 13, 2018

A partitioned NetScaler appliance uses SNMP infrastructure for partition rate limiting and for monitoring partition resource utilization details.

SNMP traps for admin partition rate limiting

On a partitioned NetScaler appliance, a PARTITION-RATE-LIMIT alarm can generate nine SNMP traps for notifying a partition resource (such as bandwidth, connection, or memory) has reached its limit or returned to normal.

The following nine SNMP traps are generated when:

- **partitionCONNThresholdReached.** The number of active connections for a partition exceeds its high threshold percentage.
- **partitionCONNThresholdNormal.** The number of active connections is less than or equal to the normal threshold percentage.
- **partitionBWThresholdReached.** The partition's bandwidth usage reaches its high threshold percentage.
- **partitionMEMThresholdReached.** The current memory usage of the partition exceeds its high threshold percentage.
- **partitionMEMThresholdNormal.** The current memory usage of the partition becomes less than or equal to the normal threshold percentage.
- **partitionMEMLimitExceeded.** The current memory usage of the partition exceeds its memory limit percentage.
- **partitionCONNLimitExceeded.** The number of active connections for a partition exceeds its configured limit and new connections are being dropped.
- **partitionCONNLimitNormal.** The number of active connections for a partition goes below its configured limit and the partition can now accept a new connection.
• **partitionBWLimitExceeded.** The current bandwidth usage for a partition has exceeded its configured limit.

The threshold values for the SNMP traps are non-configurable and are as follows are:

- High threshold = 80% (applicable for all partition rate limit traps)
- Low threshold = 60 % (applicable for all partition rate limit traps)
- Memory limit = 95% (applicable only for partition memory traps)

### Configuring PARTITION-RATE-LIMIT alarm

To configure PARTITION-RATE-LIMIT alarm in a specific partition and enable generation of the SNMP trap messages.

1. Enable PARTITION-RATE-LIMIT Alarm
2. Configure PARTITION-RATE-LIMIT Alarm
3. Configure SNMP Trap Destination

#### To enable PARTITION-RATE-LIMIT alarm by using the NetScaler CLI

At the command prompt, type the following commands:

```
1 enable snmp alarm PARTITION-RATE-LIMIT
2
3 show snmp alarm PARTITION-RATE-LIMIT
```

#### To configure PARTITION-RATE-LIMIT Alarm by using the NetScaler CLI

At the command prompt, type the following command

```
1 set snmp alarm PARTITION-RATE-LIMIT [-state ( ENABLED | DISABLED )] [-severity <severity>] [-logging ( ENABLED | DISABLED )]
```

#### To configure SNMP trap destination by using the NetScaler CLI

At the command prompt, type the following command:

```
1 add snmp trap <trapClass> <trapDestination> [-version <version>] [-td <positive_integer>] [-destPort <port>] [-communityName <string>] [-srcIP <ip_addr|ipv6_addr>] [-severity <severity>] [-allPartitions ( ENABLED | DISABLED )]
```
To configure PARTITION-Rate-Limit alarm by using the NetScaler GUI

Navigate to System > SNMP > Alarms, select PARTITION-RATE-LIMIT alarm and configure the alarm parameters.

To configure SNMP trap destination by using the NetScaler GUI

Navigate to System > SNMP > Trap, specify the IP address of the destination device.

SNMP monitoring for partition resource utilization

Using SNMP, you can monitor a partition’s resource (such as bandwidth, connection, and memory) utilization details at real time on a NetScaler appliance. This is done by sending a SNMP request (such as SNMP GET, SNMP GET BULK, SNMP GETNEXT, or SNMP WALK) from the SNMP Manager.

Note

In order to monitor partition resources, you must configure the SNMP community in the default partition. Wherein, the partitionTable is maintained in the default partition, and the SNMP communication is done through the NSIP address of the appliance.

Consider a scenario where a NetScaler administrator wants to know the bandwidth usage of partition P1 on the appliance. The SNMP Manager retrieves this information by sending an SNMP GET request on the corresponding OID (partitionCurrentBandwidth) to the NSIP address of the appliance. The SNMP agent on the default partition retrieves and sends the current bandwidth usage of P1 to the SNMP Manager through the NSIP address.

The following table lists the SNMP counters which are part of partitionTable and its description:

<table>
<thead>
<tr>
<th>SNMP Parameter</th>
<th>SNMP OID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>partitionName</td>
<td>1.3.6.1.4.1.5951.4.1.1.88.1.1</td>
<td>Partition name</td>
</tr>
<tr>
<td>partitionCurrentBandwidth</td>
<td>1.3.6.1.4.1.5951.4.1.1.88.1.2</td>
<td>Current bandwidth usage of the partition.</td>
</tr>
<tr>
<td>partitionCurrentConnections</td>
<td>1.3.6.1.4.1.5951.4.1.1.88.1.3</td>
<td>Current number of active connections of the partition.</td>
</tr>
<tr>
<td>partitionMemoryUsagePcnt</td>
<td>1.3.6.1.4.1.5951.4.1.1.88.1.4</td>
<td>Current Memory usage (in percentage) of the partition.</td>
</tr>
</tbody>
</table>

The following topics provide a conceptual reference and configuration instructions for the AppExpert and other features of the NetScaler appliance.

**Note**

For information about policy extensions, see Policy Extensions.

- **Action Analytics**: Collects run-time statistics on the basis of pre-defined criteria. When used with policies, the feature also provides you with the infrastructure for automatic, real-time traffic optimization.

- **AppExpert Applications and Templates**: Simplify configuration steps for the Citrix® NetScaler® appliance by using applications, application templates, Citrix Gateway applications, and entity templates.

- **AppQoE**: Application level Quality of Experience (AppQoE) integrates several existing policy-based security features of the NetScaler appliance into a single integrated feature that takes advantage of a new queuing mechanism, fair queuing.

- **Entity Template**: Describes how to use entity templates to set up and configure individual NetScaler entities, such as a policy or virtual server. An entity template provides a specification and a set of defaults for the object.

- **HTTP Callouts**: An HTTP request that the NetScaler appliance generates and sends to an external application when certain criteria are met during policy evaluation.

- **Pattern Sets**: Allow string matching during the evaluation of a default syntax policy.

- **Policies and Expressions**: Rules that determine the operations that the NetScaler appliance must perform.

- **Rate Limiting**: Defines the maximum load for a given network entity or virtual entity on the NetScaler appliance.

- **Responder**: Bases responses on who sends the request, where it is sent from, and other criteria with security and system management implications.

- **Rewrite**: Rewrites information in the requests or responses handled by the NetScaler appliance.

- **String Maps**: Perform pattern matching in all NetScaler features that use the default policy syntax.
Action analytics

December 10, 2018

The performance of your website or application depends on how well you optimize the delivery of the most frequently requested content. Techniques such as caching and compression help accelerate the delivery of services to clients, but you need to be able to identify the resources that are requested most frequently, and then cache or compress those resources. You can identify the most frequently used resources by aggregating real-time statistics about website or application traffic. Statistics such as how frequently a resource is accessed relative to other resources and how much bandwidth is consumed by those resources help you determine whether those resources need to be cached or compressed to improve server performance and network utilization. Statistics such as response times and the number of concurrent connections to the application help you determine whether you must enhance server-side resources.

If the website or application does not change frequently, you can use products that collect statistical data, and then manually analyze the statistics and optimize the delivery of content. However, if you do not want to perform manual optimizations, or if your website or application is dynamic in nature, you need infrastructure that can not only collect statistical data but can also automatically optimize the delivery of resources on the basis of the statistics. On the NetScaler appliance, this functionality is provided by the action analytics feature. The feature operates on a single NetScaler appliance and collects run-time statistics on the basis of criteria that you define. When used with NetScaler policies, the feature also provides you with the infrastructure that you need for automatic, real-time traffic optimization.

When configuring the action analytics feature, you specify the request attributes for which you want to collect statistical data, for example, URLs and HTTP methods by configuring default syntax expressions in an entity called a selector. Then, you configure an identifier to configure settings such as the sampling interval and sample count. You also configure a policy that enables the appliance to evaluate traffic as specified by the selector-identifier pair. Finally, you bind the policy to a bind point to begin collecting statistics.

The appliance also provides you with a set of built-in selectors, identifiers, and responder policies that you can use to get started with the feature.

The appliance aggregates the following statistics:

- The number of requests.
- The bandwidth consumed by the requests.
- The response time.
- The number of concurrent connections.

You can configure the feature to perform run-time sorting of the records on an attribute of your choice. You can view the statistical data by using either the command-line interface or the Stream Sessions
Configure a selector

January 6, 2019

A selector is a filter for identifying requests. It consists of up to five individual default syntax expressions that identify request attributes such as the client IP address and the URL in the request. Each expression is a non-compound default syntax expression and is considered to be in an AND relationship with the other expressions. Following are some examples of selector expressions:

- `HTTP.REQ.URL`
- `CLIENT.IP.SRC`
- `HTTP.RES.BODY(1000).AFTER_STR("<string>").BEFORE_STR("<string>")`
- `CLIENT.IP.SRC.SUBNET(24)`

Selectors are used in rate limiting and action analytics configurations. A selector is optional in a rate limiting configuration but is required in an action analytics configuration.

The order in which you specify parameters is significant. For example, if you configure an IP address and a domain (in that order) in one selector, and then specify the domain and the IP address (in the reverse order) in another selector, the NetScaler considers these values to be unique. This can lead to the same transaction being counted twice. Also, if multiple policies invoke the same selector, the NetScaler, again, can count the same transaction more than once.

If you modify an expression in a selector, you may get an error if any policy that invokes it is bound to a new policy label or bind point. For example, suppose that you create a selector named myLimitSelector1, invoke it from myLimitID1, and invoke the identifier from a DNS policy named dnsRateLimit1. If you change the expression in myLimitSelector1, you might receive an error when binding dnsRateLimit1 to a new bind point. The workaround is to modify these expressions before creating the policies that invoke them.

The NetScaler appliance provides built-in selectors for some of the most common use cases. Refer to the pdf.

You can also configure a selector with expressions that identify the request attributes of your choice. For example, you might want to create a record for a request that arrives with a specific header. To evaluate the header, you can add `HTTP.REQ.HEADER("")` to the selector that you intend to use.

To configure a selector by using the command line interface:

At the command prompt, type the following commands to configure a selector and verify the configuration:

- `add stream selector <name> <rule> ...`
- `show stream selector`
NetScaler 11.1

Example

```
1  > add stream selector myselector HTTP.REQ.URL CLIENT.IP.SRC
2    Done
3  > show stream selector myselector
4    Name: myselector
5    Expressions:
6      1) HTTP.REQ.URL
7      2) CLIENT.IP.SRC
8    Done
9  >
```

To modify or remove a selector by using the command line interface:

- To modify a selector, type the set stream selector command, the name of the selector, and the rule parameter with the expressions. Enter the existing expressions that you want to retain, along with the new expressions that you want to add.
- To remove a selector, type the rm stream selector command and the name of the selector.

To configure a selector by using the GUI:

2. In the details pane, do one of the following:
   - To create a selector, click Add.
   - To modify a selector, select the selector, and then click Edit.
3. In the Create Selector or Configure Selector page, set the following parameters:
   - Name
   - Expressions
     To add the expression to the selector configuration, click Add. To remove an expression from the selector configuration, in the Expression box, select the expression, and then click Delete.
     Note: In the Expressions box, enter a valid parameter. For example, enter HTTP. Then, enter a period after this parameter. A drop-down menu appears. The contents of this menu provide the keywords that can follow the initial keyword that you entered. To select the next keyword in this expression prefix, double-click the selection in the drop-down menu. The Expressions text box displays both the first and second keywords for the expression prefix, for example, HTTP.REQ. Continue adding expression components until the complete expression is formed.
4. Click Add.
5. Continue adding up to five non-compound expressions.
6. Click **OK** and then **Close**.

### Configure a stream identifier

December 18, 2018

You configure a stream identifier to specify parameters for collecting statistical data from requests identified by a given selector. An identifier specifies the selector to be used, the statistics collection interval, the sample count, and the field on which the records are to be sorted.

The NetScaler appliance includes the following built-in stream identifiers for common use cases. All the built-in identifiers specify a sample count of 1 and an interval of 1 minute. Additionally, they sort the data on the REQUESTS attribute. They differ only in being associated with different built-in selectors. Each built-in identifier is associated with a built-in selector of the same name (for example, the built-in identifier Top_URL is associated with the built-in selector Top_URL). Following are the built-in identifiers:

- Top_URL
- Top_CLIENTS
- Top_URL_CLIENTS_LBVSERVER
- Top_URL_CLIENTS_CSVSERVER
- Top_MSSQL_QUERY_DB_LBVSERVER
- Top_MYSQL_QUERY_DB_LBVSERVER

For more information about the built-in selectors, see Configuring a Selector.

**Note:**

The maximum length for storing string results of selectors (for example, HTTP.REQ.URL) is 60 characters. If the string (for example, URL) is 1000 characters long, of which 50 characters are enough to uniquely identify a string, use an expression to extract only the required 50 characters.

You cannot modify a built-in identifier's configuration. However, you can create an identifier with a configuration of your choice.

To configure a stream identifier by using the command line interface

At the command prompt, type the following commands to configure a stream identifier and verify the configuration:

- `add stream identifier <name> <selectorName> [-interval <positive_integer>] [-SampleCount <positive_integer>] [-sort <sort>]`
- `show stream identifier <name>`
To configure a stream identifier by using the GUI

1. Navigate to **AppExpert > Action Analytics > Stream Identifiers**.
2. In the details pane, do one of the following:
   - To create a stream identifier, click **Add**.
   - To modify a stream identifier, select the identifier, and then click **Edit**.
3. In the Configure Stream Identifier page, set the following parameters:
   - Name
   - Selector
   - Interval
   - Sample Count
   - Sort
4. Click **OK**, and then click **Close**.

### View statistics

December 18, 2018

You can view the collected statistics in tabular format in the command-line interface and in graphical format in the GUI.

The following table describes the collected statistics:

<table>
<thead>
<tr>
<th>Statistics</th>
<th>stat stream identifier</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of requests</td>
<td>Req</td>
<td>The number of requests for which records were created in the last &lt;interval&gt; number of minutes.</td>
</tr>
<tr>
<td>Statistics</td>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>---------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Bandwidth consumed</td>
<td>BandW</td>
<td>The total bandwidth consumed by the requests that were received in the last <code>&lt;interval&gt;</code> number of minutes. The total bandwidth of a request is the bandwidth consumed by the request and its response. The value is rounded off to the next higher or next lower integer value. Consequently, it might differ slightly from the expected value. For example, if a request's total bandwidth consumption is 2.2 KB, one instance of the request might be shown as having consumed 2 KB and two instances might be shown as having consumed 4 KB, but three instances might be shown as having consumed 7 KB.</td>
</tr>
<tr>
<td>Response time</td>
<td>RspTime</td>
<td>The average response time for all the requests received in the last <code>&lt;interval&gt;</code> number of minutes.</td>
</tr>
<tr>
<td>Concurrent connections</td>
<td>Conn</td>
<td>The total number of concurrent connections that are currently open.</td>
</tr>
</tbody>
</table>

To view the statistical data collected for a stream identifier by using the command line

At the command prompt, type:

```
stat stream identifier <name> [<pattern> ...] [-detail] [-fullValues] [-
```
ntimes <positive_integer>] [-logFile <input_filename>] [-sortBy <sortBy> [<sortOrder>]]

Examples

Example 1 show how to sort the output on the BandW column, in the descending order. Example 2 sorts the output in Example 1, on the Req column, and in the ascending order

Example 1:

```
> stat stream identifier myidentifier -sortBy BandW Descending -fullValues
Stream Session statistics
  Req          BandW
User1         508          125924
User2         5020         12692
User3         2025          4316
RspTime       Conn
User1         5694          0
User2         109           0
User3          3            0
Done
```

Example 2:

```
> stat stream identifier myidentifier -sortBy Req Ascending -fullValues
Stream Session statistics
  Req          BandW
User1         508          125924
User3         2025          4316
User2         5020         12692
RspTime       Conn
User1         5694          0
User3          3            0
User2          109           0
Done
```

To view the statistical data collected for a stream identifier by using the GUI

2. Select the stream identifier whose sessions you want to view, and then click Statistics For information about how you can group the output on the basis of the values collected for various selector expressions.

## Grouping records on attribute values

December 18, 2018

Statistical information such as the number of times a particular URL has been accessed overall and per client, and the total number of GET and POST requests per client can provide valuable insights into whether any of your resources need to be expanded to meet the demand or be optimized for delivery. To obtain such statistics, you must use an appropriate set of selector expressions, and then use the pattern parameter in the stat stream identifier command. The grouping is based on the pattern that is specified in the command. Grouping can be performed concurrently on the values of multiple expressions.

In the command-line interface, you can group the output by using patterns of your choice. In the GUI, the pattern depends on the choices you make when drilling down through the values of various selector expressions. For example, consider a selector that has the expressions HTTP.REQ.URL, CLIENT.IP.SRC, and HTTP.REQ.LB_VSERVER.NAME, in that order. The statistics home page displays icons for each of these expressions. If you click the icon for CLIENT.IP.SRC, the output is based on the patterns \(?\). The output displays statistics for each client IP address. If you click an IP address, the output is based on the patterns \( * <\text{IP address}> \) ? and \( ? <\text{IP address}> *\) where \(<\text{IP address}>\) is the IP address you selected. In the resulting output, if you click a URL, the pattern used is \(<\text{URL}> <\text{IP address}> ?\).

### To group the records on the values of selector expressions by using the command line interface

At the command prompt, enter the following command to group the records on the basis of a selector expression:

```
stat stream identifier <name> [<pattern> ...]
```

**Examples**

Each example uses a different pattern to demonstrate the effect of the pattern on the output of the stat stream identifier command. The selector expressions are HTTP.REQ.URL and HTTP.REQ.HEADER("UserHeader"), in that order. The requests contain a custom header whose name is UserHeader. Note that in the examples, a given statistical value changes as determined by the grouping, but the sum total of the values for a given field remains the same.
Example 1

In the following command, the pattern used is `? ?`. The appliance groups the output on the values collected for both selector expressions. The row headers consist of the expression values separated by a question mark (`?`). The row with the header `/mysite/mypage1.html?Ed` displays statistics for requests made by user Ed for the URL `/mysite/mypage1.html`.

```
> stat stream identifier myidentifier ? ? -fullValues
Stream Session statistics
Req     BandW
/mysite/mypage2.html?Grace 1 2553
/mysite/mypage1.html?Grace 2 4
/mysite/mypage1.html?Ed 8 16
/mysite/mypage2.html?Joe 1 2554
/mysite/mypage1.html?Joe 5 10
/mysite/?Joe 1 4
RspTime Conn
/mysite/mypage2.html?Grace 0 0
/mysite/mypage1.html?Grace 0 0
/mysite/mypage1.html?Ed 0 0
/mysite/mypage2.html?Joe 0 0
/mysite/mypage1.html?Joe 0 0
/mysite/?Joe 6 0
Done
```

Example 2

In the following command, the pattern used is `* ?`. The appliance groups the output on the values accumulated for the second expression `HTTP.REQ.HEADER("UserHeader")`. The rows display statistics for all requests made by users Grace, Ed, and Joe.

```
> stat stream identifier myidentifier * ?
Stream Session statistics
Req     BandW RspTime Conn
Grace 3 2557 0 0
Ed 8 16 0 0
Joe 7 2568 6 0
Done
```

Example 3

In the following command, the pattern used is `? *`, which is the default pattern. The output is grouped on the values collected for the first selector expression. Each row displays statistics for one URL.

```
> stat stream identifier myidentifier ? * -fullValues
```
Example 4

In the following command, the pattern used is * *. The appliance displays one set of collective statis-
tics for all the requests received, with no row title.

```
$ stat stream identifier myidentifier * *
```

Example 5

In the following command, the pattern is /mysite/mypage1.html *. The appliance displays one
set of collective statistics for all the requests received for the URL /mysite/mypage1.html, with no
row title.

```
$ stat stream identifier myidentifier /mysite/mypage1.html *
```

To group the records on the values of selector expressions by using the GUI

1. Navigate to **AppExpert > Action Analytics > Stream Identifiers**.
2. In the details pane, click the stream identifier for which you want to view statistics, and then
   click **Stream Sessions**.
3. On the Home page, click the icon for the stream selector by which you want to group the output.
4. To return to the Home page from the statistics page for a selector expression, click **Home**.
5. To view statistics for the value of a given selector expression, click the value. You can repeat this step for a selector expression value in each subsequent output until you obtain the statistics you want.

### Clearing a stream session

December 10, 2018

You can flush all the records that have been accumulated for a stream identifier.

#### To clear a stream session by using the command line interface

At the command prompt, enter the following commands to clear a stream session and verify the results:

- clear stream session
- stat stream identifier

**Example**

This example uses the stat stream identifier command first, so that a comparison can be made with the stat stream identifier command that is used for verifying the result of the clear stream session command.

```
1 > stat stream identifier myidentifier
2 Stream Session statistics
3 /aed....html  Req BandW RspTime Conn
4 / 2 0 0 0
5 Done
6 > clear stream session myidentifier
7 Done
8 > stat stream identifier myidentifier
9 Done
```

#### To clear a stream session by using the GUI

1. Navigate to **AppExpert > Action Analytics > Stream Identifiers**.
2. Select the stream identifier whose sessions you want to clear, and then click **Clear Sessions**.
Configure policy for optimizing traffic

December 18, 2018

To put the selector-identifier pair in your action analytics configuration into effect, you must associate the pair with the point in the traffic flow at which you want to collect statistics. You can do so by configuring a default syntax policy and referencing the stream identifier from the policy rule. You can use compression policies, caching policies, rewrite policies, application firewall policies, responder policies, and any other policies whose action is based on a Boolean expression.

The action analytics feature introduces a set of default syntax expressions and functions for collecting and evaluating data. The expression `ANALYTICS.STREAM(<identifier_name>)` is used for referencing the identifier that you want to use. The expression `COLLECT_STATS` is used to collect statistical data. Functions such as `IS_TOP(<uint>)` and `IS_TOP_FREQUENTS(<uint>)` are used for making automatic, real-time traffic optimization decisions.

- **IS_TOP(<number>).** Finds if a given object is in the top of elements. For example, is the element among the top 10 elements. When multiple elements have the count, they are considered to be similar in nature. The sort function must be turned on to avoid an undefined condition.

- **IS_TOP_FREQUENTS(<frequency>).** Finds if a given object is in the top of the elements that are in the top elements. For example, is the element among the top 50% of all the top elements maintained. Elements having the same values are considered similar in nature. The sort function must be turned on to avoid an undefined condition.

It is your policy configuration that determines whether the NetScaler appliance must only collect data from traffic or also perform an action. If the appliance must only collect statistical data, you can configure a policy with the rule `ANALYTICS.STREAM().COLLECT_STATS` and the action `NOOP`. The `NOOP` policy must be the policy with the highest priority at the bind point. This policy is sufficient if you are only collecting statistics. Traffic optimization decisions, such as what to compress or cache, must be based on manual, periodic evaluation of the statistical data.

If, in addition to collecting statistics, the appliance must also perform an action on the traffic, you must configure the `gotoPriorityExpression` parameter of the `NOOP` policy such that another policy that has the desired rule and action is evaluated subsequently. This second policy must have a rule that begins with the `ANALYTICS.STREAM()` prefix and a function that evaluates the data.

Following is an example of two responder policies that are configured and bound globally. The policy `responder_stat_collection` enables the appliance to collect statistics based on the identifier, myidentifier. The policy `responder_notify` evaluates the data that is collected.

**Example**
How to limit bandwidth consumption for user or client device

December 10, 2018

Your web site, application, or file hosting service has finite network and server resources available to it to serve all its users. One of the most important resources is bandwidth. Substantial bandwidth consumption by only a subset of the user base can result in network congestion and reduced resource availability to other users. To prevent network congestion, you might have to limit a client’s bandwidth consumption by using temporary service denial techniques such as responding to a client request with an HTML page if it has exceeded a preconfigured bandwidth value over a fixed time period leading up to the request.

In general, you can regulate bandwidth consumption either per client device or per user. This use case demonstrates how you can limit bandwidth consumption per client to 100 MB over a time period of one hour. The use case also demonstrates how you can regulate bandwidth consumption per user to 100 MB over a time period of one hour, by using a custom header that provides the user name. In both cases, the tracking of bandwidth consumption over a moving time period of one hour is achieved by setting the interval parameter in the stream identifier to 60 minutes. The use cases also demonstrate how you can import an HTML page to send to a client that has exceeded the limit. Importing an HTML page not only simplifies the configuration of the responder action in these use cases, but also simplifies the configuration of all responder actions that need the same response.

To limit bandwidth consumption per user or client device by using the command line interface

In the command-line interface, perform the following tasks to configure action analytics for limiting a client’s or user’s bandwidth consumption. Each step includes sample commands and their output.

1. **Set up your load balancing configuration.** Configure load balancing virtual server mysitevip,
and then configure all the services that you need. Bind the services to the virtual server. The following example creates ten services and binds the services to mysitevip.

```
1 > add lb vserver mysitevip HTTP 192.0.2.17 80
2  Done
3 > add service service[1-10] 192.0.2.[240-249] HTTP 80
4  service "service1" added
5  service "service2" added
6  service "service3" added
7  .
8  .
9  .
10 service "service10" added
11  Done
12 > bind lb vserver vserver1 service[1-10]
13  service "service1" bound
14  service "service2" bound
15  service "service3" bound
16  .
17  .
18  .
19  service "service10" bound
20  Done
```

2. **Configure the stream selector.** Configure one of the following stream selectors:

   - To limit bandwidth consumption per client, configure a stream selector that identifies the client IP address.
     ```
     1 > add stream selector myselector CLIENT.IP.SRC
     2  Done
     ```

   - To limit bandwidth consumption per user on the basis of the value of a request header that provides the user name, configure a stream selector that identifies the header. In the following example, the name of the header is UserHeader.
     ```
     1 > add stream selector myselector HTTP.REQ.HEADER("UserHeader")
     2  Done
     ```

3. **Configure a stream identifier.** Configure a stream identifier that uses the stream selector. Set the interval parameter to 60 minutes.

   ```
   1 > add stream identifier myidentifier myselector -interval 60 -sampleCount 1 -sort BANDWIDTH
   ```
4. **Configure the responder action.** Import the HTML page that you want to send to users or clients that have exceeded the bandwidth consumption limit, and then use the page in responder action crossed_limits.

```
1 > import responder htmlpage http://192.0.2.20:80/stdpages/wait.html crossed-limits.html
2 This operation may take some time, Please wait...
3 Done
4 Done
5 > add responder action crossed_limits respondwithhtmlpage crossed-limits.html
6 Done
```

5. **Configure the responder policies.** Configure responder policy myrespol1 with the rule ANALYTICS.STREAM("myidentifier").COLLECT_STATS and the action NOOP. Then, configure policy myrespol2 for determining whether a client or user has crossed the 100 MB limit. The policy myrespol2 is configured with the responder action crossed_limits.

```
1 > add responder policy myrespol1 'ANALYTICS.STREAM("myidentifier") .COLLECT_STATS' NOOP
2 Done
3 > add responder policy myrespol2 'ANALYTICS.STREAM("myidentifier") .BANDWIDTH.GT(1048576)' crossed_limits
4 Done
```

6. **Bind the responder policies to the load balancing virtual server.** The policy myrespol1, which only collects statistical data, must have the higher priority and a GOTO expression of NEXT.

```
1 > bind lb vserver mysitevip -policyName myrespol1 -priority 1 -gotoPriorityExpression NEXT
2 Done
3 > bind lb vserver mysitevip -policyName myrespol2 -priority 2 -gotoPriorityExpression END
4 Done
```

7. **Test the configuration.** Test the configuration by sending test HTTP requests, from multiple clients or users, to the load balancing virtual server and using the stat stream identifier command to view the statistics that are collected for the specified identifier. The following output displays statistics for clients.

```
1 > stat stream identifier myidentifier -sortBy BandW -fullValues
2 Stream Session statistics
```
AppExpert applications and templates

December 13, 2018

An AppExpert application is a collection of configuration information that you set up on the NetScaler appliance for securing and optimizing traffic for a Web application, such as Microsoft SharePoint. Managing AppExpert applications is simplified by a graphical user interface (GUI) that allows you to specify application traffic subsets and a distinct set of security and optimization policies for processing each traffic subset. Additionally, it consolidates all deployment tasks in one view, so you can quickly configure target IP addresses for clients and specify host servers.

Prebuilt application templates for widely used Web applications, such as Microsoft Outlook Web Access and Microsoft SharePoint, are available on the AppExpert Templates page of the Citrix Community website at “http://community.citrix.com/display/ns/AppExpert+Templates.”

Each prebuilt template provides you with an initial configuration for managing the associated Web application. You can customize prebuilt application templates for your organization. If a prebuilt application template does not suit your requirements, you can create a custom application without using a template.

Regardless of whether you use a prebuilt application template or you create a custom application, you can export the configuration to a template file. You can then share the template with other administrators or import the template to other NetScaler appliances that require a similar AppExpert application configuration.

To get started with an AppExpert application, you must first obtain the appropriate application template and import the template to the NetScaler appliance. After the AppExpert application is set up, you must verify that the application is working correctly. If required, you can customize the configuration to suit your requirements.
Periodically, you can verify and monitor the configuration by viewing the hit counters for various application components, statistics, and the Application Visualizer. You can also configure authentication, authorization, and auditing (AAA) policies for the application.

**AppExpert application terminology**

Following are the terms used in the AppExpert applications feature and the descriptions of the entities for which the terms are used:

**Public endpoint.** The IP address and port combination at which the NetScaler appliance receives client requests for the associated web application. A public endpoint can be configured to receive either HTTP or secure HTTP (HTTPS) traffic. All client requests for the web application must be sent to a public endpoint. An AppExpert application can be assigned multiple endpoints. You configure public endpoints after you import a template.

**Application unit.** An AppExpert application entity that processes a subset of web application traffic and load balances a set of services that host the associated content. The subset of traffic that an application unit must manage is defined by a rule. Each application unit also defines its own set of traffic optimization and security policies for the requests and responses that it manages. The NetScaler services associated with these policies are Compression, Caching, Rewrite, Responder, and application firewall.

By default, every AppExpert application with at least one application unit includes a default application unit, which cannot be deleted. The default application unit is not associated with a rule for identifying requests and is always placed last in the order of application units. It defines a set of policies for processing any request that does not match the rules that are configured for the other application units, thereby ensuring that all client requests are processed.

Application units and their associated rules, policies, and actions are included in AppExpert application templates.

**Service.** The combination of the IP address of the server that hosts the web application instance and the port to which the application is mapped on the server, in the format <IP address>:<Port>. A web application that serves a large number of requests is usually hosted on multiple servers. Each server is said to host an instance of the web application, and each such instance of the web application is represented by a service on the NetScaler appliance. Services are deployment-specific and are therefore not included in templates. You must configure services after you import a template.

**Application unit rule.** Either a classic expression or a default syntax expression that defines the characteristics of a traffic subset for an application unit. The following example rule is a default syntax expression that identifies a traffic subset that consists of four image types:
For more information about default syntax expressions and classic policy expressions, see Policies and Expressions.

**Traffic Subset.** A set of client requests that require a common set of traffic optimization and security policies. A traffic subset is managed by an application unit and is defined by a rule.

### How AppExpert Application Works

January 6, 2019

When the endpoint receives a client request, the NetScaler appliance evaluates the request against the rule that is configured for the topmost application unit. If the request satisfies this rule, the request is processed by the policies that are configured for the application unit, and then forwarded to a service. The choice of service depends on which services are configured for the application, and on settings such as the load balancing algorithm and persistence method configured for the application unit.

If the request does not satisfy the rule, the request is evaluated against the rule for the next topmost application unit. In this order, the request is evaluated against each application unit rule until the request satisfies a rule. If the request does not satisfy any of the configured rules, it is processed by the default application unit, which is always the last application unit.

You can configure multiple public endpoints for an AppExpert application. In such a configuration, by default, each application unit processes requests received by all the public endpoints and load balances all the services that are configured for the application. However, you can specify that an application unit processes traffic from only a subset of the public endpoints and load balances only a subset of the services that are configured for the AppExpert application.

The following flow diagram illustrates the AppExpert Application flow sequence for using a built-in application template.

If you prefer to create a customized application without using a template, do the following:

1. Create a custom application.
2. Configure application and deployment settings.
3. Export the configuration to new template files (optional).
4. Import the template files to other NetScaler appliances that require a similar AppExpert application configuration

### Get started with AppExpert

December 10, 2018
To get started with an AppExpert application, you must first obtain an application template and import the template to a NetScaler appliance. After the AppExpert application is set up, you must verify that the application is working correctly. If required, you can customize the configuration to suit your requirements.

Periodically, you can verify and monitor the configuration by viewing the hit counters for various application components. You can also configure authentication, authorization, and auditing (AAA) policies for the application.

The process of setting up an application can be done in two ways:

- Using a prebuilt application template
- Creating a custom application without using a template.

If you prefer to set up the application by using a prebuilt application template, do the following:

1. Download an application template.
2. Import template files to NetScaler appliance.
3. Verify application setup.
4. Configure application and deployment settings.
5. Export the configuration to new template files (optional).
6. Import the template files to other NetScaler appliances that require a similar AppExpert application configuration.

NetScaler’s video tutorials enable you to understand NetScaler features in easy and simple way. Watch https://www.youtube.com/watch?v=aqayflvCR_0 video to learn how to set up an application using AppExpert Application template.

**Downloading an Application Template**

December 18, 2018

AppExpert application setup begins with downloading an application template from the Citrix Community Website at [http://community.citrix.com/display/ns/AppExpert+Templates](http://community.citrix.com/display/ns/AppExpert+Templates) to your local computer or NetScaler appliance. The application templates are designed to be imported and exported, so that you can easily share application-specific configurations within an organization or across organizations. An application template includes the following set of entities:

1. Application components (for example, web pages, files, archives, and web services)
2. Traffic management entities (for example, virtual server IP addresses and associated load-balancing algorithms, and SSL offload settings) for the application components.
3. NetScaler policies used for optimizing the application traffic.
Note:
Application templates are available in different versions for configuring different types of NetScaler appliances.

Importing an Application Template

December 13, 2018

For NetScaler software version 9.3 or later, each AppExpert template has two XML files: a Template file and a Deployment file. You must import both files from your local computer to a NetScaler appliance. You can either import the template files from your computer to the AppExpert application templates directory in NetScaler appliance or upload files to a NetScaler appliance and then import them from the appliance.

Note: When you import a template from an appliance, you have to provide the variable value available in the template. By default, the pre-configured value is display https://docs.citrix.com/en-us/netscaler/11/appexpert/appexpert-application-templates/creating-managing-templates/netscaler-application-template-deployment-files.html

After you import the template files, the application-configuration and deployment information populates the target application automatically. The appliance imports all the configuration from the template files through the NITRO API. If you do not import the deployment file, the system generates an application populated with content switching virtual server configuration. For more information about the format of application templates and deployment files, see Understanding NetScaler Application Templates and Deployment Files.

When you import a template, if you do not include a deployment file, you have to configure the public endpoints in the application that the system automatically generates from the template. One endpoint for HTTP and another endpoint for HTTPS. When configuring a public endpoint of type HTTPS, make sure you enable the SSL feature, bind the server certificate, and include the server-certificate and certificate-key files.

For more information about configuring endpoints after you import a template, see Configuring Public Endpoints.

To import AppExpert application template files to a NetScaler appliance by using the GUI:

1. Navigate to AppExpert > Applications.
2. In the details pane, click Import Template.
3. On the Import page, set the following parameters:
   a) Application Name (mandatory)
   b) Template File (mandatory)
   c) Use deployment file
4. Click **Continue** to auto populate application-configuration and deployment information into an application.

NetScaler’s video tutorials enable you to understand NetScaler features in an easy and simply way. Watch [https://www.youtube.com/watch?v=AR9TwSD9uJM](https://www.youtube.com/watch?v=AR9TwSD9uJM) video to learn how to import an application template.

### Verifying and Testing Application Configuration

**January 6, 2019**

The GUI includes icons that indicate the states of the entities in the AppExpert application. These icons are displayed for applications and application units and are based on the health checks that the NetScaler appliance performs periodically on services and entities. The following table lists the icons and describes their meanings.

<table>
<thead>
<tr>
<th>Icon</th>
<th>Entity</th>
<th>Indicates that</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application</td>
<td>At least one public endpoint is up. The application will accept client requests from the public endpoints that are up.</td>
<td></td>
</tr>
<tr>
<td>Application unit</td>
<td>The application unit is up. The application unit is up when at least one service or service group is up.</td>
<td></td>
</tr>
<tr>
<td>Application</td>
<td>The public endpoint is out of service (disabled). This indicator is displayed when only one public endpoint is configured for the AppExpert application.</td>
<td></td>
</tr>
<tr>
<td>Application</td>
<td>All the endpoints that are configured for the application are out of service. This indicator is displayed only when multiple endpoints are configured for the application.</td>
<td></td>
</tr>
</tbody>
</table>
NetScaler 11.1

<table>
<thead>
<tr>
<th>Icon</th>
<th>Entity</th>
<th>Indicates that</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Application unit</td>
<td>All the services configured for the application unit are down.</td>
</tr>
</tbody>
</table>

You must ensure that the icons for each application and its application units are green at all times. If the icon that is displayed for an application is not green, verify that you have configured the public endpoints correctly. If the icon that is displayed for an application unit is not green, verify that the services are configured correctly. However, note that a green indicator does not mean that the state of all associated entities is UP. It only means that the application has sufficient resources (endpoints and services) to serve client requests. To verify that the state of all associated entities is UP, check the health of all the entities on the statistics page for the application.

**Customizing the configuration**

December 13, 2018

After you verify that the AppExpert application is working correctly, you can customize the configuration to suit your requirements.

After you verify that the AppExpert application configuration is working correctly, you can configure the application and the deployment settings to suit your requirements. When you import an application template and deployment file, the system automatically populates the target application with the available configuration settings (such as application units, application unit rules, policies, persistence settings, load balancing methods, profiles, and traffic settings). In this application, you can configure deployment settings such as public endpoints, services, and service groups for each traffic subset. If you want the AppExpert application to manage a traffic subset that is not included in the template, you can either add an application unit for a traffic subset or modify the existing application unit. After you customize the configuration, you can also specify the order of evaluation for each traffic subset that the application manages.

Configuring an AppExpert application consists of the following steps:

1. Configuring Public Endpoints
2. Configuring Application Units
3. Specifying the Order of Evaluation
4. Viewing Application Configuration using Visualizer

Also, you can configure the policies that the template provided. If the AppExpert application template does not include policies for a particular NetScaler feature, such as Rewrite or application firewall, you can configure your own policies.
Configure public endpoints

December 13, 2018

If you did not specify a public endpoint when importing an AppExpert application, you can specify public endpoints after you create the application. You can configure one public endpoint of type HTTP and one public endpoint of type HTTPS for your AppExpert application.

If endpoints are already configured for the application, you can dissociate endpoints from the AppExpert application and delete any endpoints that you no longer need. Note that when you dissociate a public endpoint from the AppExpert application, the endpoint is automatically unbound from the associated application unit, but it is not deleted from the system.

To configure public endpoints for an AppExpert application:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, right-click the application for which you want to configure public endpoints, and then click **Edit**.
3. In the **Applications** page, go to **Public Endpoint** section and click the pencil icon.
4. In the **Public Endpoint** slider, set the following parameters.
   a) Public endpoint type. Select the radio button to define the endpoint type.
   b) Name. Name of the public endpoint.
   c) IP address. IP address of the public endpoint.
   d) Port. Port number of the public endpoint.
   e) Protocol. Select a protocol type as HTTP or HTTPS.
5. Click **Continue**.
6. In the **Application Units** section, select an application unit from the list.
7. Click **Continue** to set the policy and server details.
8. Click **OK** and then **Done**.
9. Click **Close**.

For more information about the parameters in the **Configure Public Endpoint** dialog box, see **Content Switching**.

Configure services and service groups for an application unit

December 10, 2018

When you configure a service or service group, you either modify an existing service or service group, or add new services to the AppExpert application. You add services or service groups if you did not specify them when you imported the application template. You also add services and service groups when you increase the number of servers that host instances of the application. You can configure a
service and service group for an application unit only after you configure the service or service group for the AppExpert application.

To configure a service or service group for the AppExpert application:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, right-click the application and then click **Edit**.
3. In the **Applications** page, select an application unit and then click **Continue**.
4. In the **Services and Service Groups** section, do the following:
   a) In the Service Binding slider, set the following parameters.
      i. Service. Select a load balancing service from the list or create a new service.
      ii. Weight. Provide a weight value for the service.
   b) Click **Bind** and then **Done**.
   c) In the ServiceGroup Binding slider, set the following parameters:
      i. Service Group Name. Select a load balancing service group or create a new service group.
      ii. Click **Bind** and then **Done**.
   d) Click **Done**.
5. Click **Continue** to set other configurations.

**Create application units**

December 10, 2018

You might need to add application units for traffic subsets that are either specific to your web application implementation or not defined in the template. When creating an application unit, you must configure a rule for the application unit.

To create an application unit for the AppExpert application:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, right-click the application for which you want to add an application unit, and then click **Add**.
3. In the **Applications** page, go to Application Units section and click the **pencil** icon.

To configure policy expressions for an application unit:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, right-click the application for which you want to add an application unit, and then click **Add**.
3. In the **Applications** page, go to Application Units** section and click the **+** icon. to create a unit and add policy expressions.
4. To specify the format of the new expression, do one of the following:
To configure an application unit rule:

1. In the navigation pane of the GUI, expand **AppExpert**, and then click **Applications**.
2. In the details pane, right-click the application unit for which you want to modify the rule, and then click **Open**.
3. In the **Configure Application Unit** dialog box, do the following:
   a) To specify the format of the new expression, do one of the following:
      • To specify that you want to configure a classic expression in the Rule box, click **Classic Syntax**.
      • To specify that you want to configure an advanced expression in the Rule box, click **Default Syntax**.
   b) In the Rule box, configure the expression.
4. Click **OK**.

### Configuring policies for application units

December 18, 2018

For an AppExpert application, you can configure policies for Compression, Caching, Rewrite, Responder, and Application Firewall. The templates that you download from the Citrix Community web site provide you with a set of policies that fulfill the most common application management requirements. You might want to fine-tune or customize these policies. If the set of policies provided for a given application unit does not include policies for a particular feature, you can create and bind your own policies for that feature.

If you create an AppExpert application without using a template, you must configure all the policies that the web application needs.
The GUI uses various icons to indicate whether or not policies are configured for a feature. For an application unit, if a policy is configured for a given feature, an icon that represents the feature is displayed. For example, if a compression policy is configured for an application unit, a compression icon is displayed in the Compression column for the application unit. For features for which no policy is configured, an icon depicting a plus sign (+) is displayed.

**Note:**

When configuring policies for application units, you might need to configure policies and expressions that are either in the classic or default syntax. Additionally, when you configure default syntax policies, you might need to specify parameters such as Goto expressions and invoke policy banks.

For information about configuring policies and expressions in both formats, see [Policies and Expressions](#).

### Configuring compression policies

You can use either classic policies or advanced policies to configure compression, but you cannot bind compression policies of both types to the same application unit.

To configure a compression policy for an application unit:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Compression column.
3. In the Configure Compression Policies dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
   - Click **Switch to Default Syntax** if you want to configure a default syntax compression policy.
     If you want to bind or configure classic compression policies, and if you are in the default syntax view, you can click **Switch to Classic Syntax** to return to the classic policy view and begin modifying bound classic policies or create and bind new classic compression policies.
     **Important:** This setting also determines what policies are displayed when you want to insert a policy. For example, if you are in the default syntax view, when you click Insert Policy, the list that appears in the Policy Name column will include only default syntax policies. You cannot bind policies of both types to an application unit.
   - If you want to configure classic policies, click either **Request** or **Response**, depending on whether you want the policy to be evaluated at request-time or at response-time.
You can configure both request-time and response-time classic compression policies for an application unit. After evaluating all of the request-time policies, if no match is found, the appliance evaluates response-time policies.

- To modify a compression policy that is already bound to the application unit, click the name of the policy, and then click Modify Policy. Then, in the Configure Compression Policy dialog box, modify the policy, and then click OK.
  For information about modifying a compression policy, see Compression.
- To unbind a policy, click the name of the policy, and then click Unbind Policy.
- To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
- To regenerate assigned priorities, click Regenerate Priorities.
- To insert a new policy, click Insert Policy and, in the list that is displayed in the Policy Name column, click New Policy. Then, in the Create Compression Policy dialog box, configure the policy, and then click Create.
  For information about modifying a compression policy, see Compression.
- If you are configuring a default syntax expression, do the following:
  - In the Goto Expression column, select a Goto expression.
  - In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.

4. Click Apply Changes, and then click Close.

**Configuring Caching Policies**

You can use only default syntax policies and expressions to configure Caching policies.

To configure Caching policies for an application unit:

1. Navigate to AppExpert > Applications.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Caching column.
3. In the Configure Cache Policies dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
   - Click either Request or Response, depending on whether you want the policy to be evaluated at request-time or at response-time.
   You can configure both request-time and response-time Caching policies for an application unit. After evaluating all of the request-time policies, if no match is found, the appliance evaluates response-time policies.
   - To modify a Caching policy that is already bound to the application unit, click the name of the policy, and then click Modify Policy. Then, in the Configure Cache Policy dialog box, modify the policy, and then click OK.
   For information about modifying a Caching policy, see Integrated Caching.
• To unbind a policy, click the name of the policy, and then click **Unbind Policy**.
• To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
• To regenerate assigned priorities, click **Regenerate Priorities**.
• To insert a new policy, click **Insert Policy** and, in the list that is displayed in the Policy Name column, click **New Policy**. Then, in the **Create Cache Policy** dialog box, configure the policy, and then click **Create**.
For information about modifying a Caching policy, see **Integrated Caching**.
• In the Goto Expression column, select a Goto expression.
• In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.

4. Click **Apply Changes**, and then click **Close**.

**Configuring Rewrite policies**

You can use only default syntax policies and expressions to configure Rewrite policies.

To configure Rewrite policies for an application unit:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Rewrite column.
3. In the **Configure Rewrite Policies** dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
   • Click either Request or Response, depending on whether you want the policy to be evaluated at request-time or at response-time.
   You can configure both request-time and response-time Rewrite policies for an application unit. After evaluating all of the request-time policies, if no match is found, the appliance evaluates response-time policies.
   • To modify a Rewrite policy that is already bound to the application unit, click the name of the policy, and then click **Modify Policy**. Then, in the Configure Rewrite Policy dialog box, modify the policy, and then click OK.
   For information about modifying a Rewrite policy, see **Rewrite**.
   • To unbind a policy, click the name of the policy, and then click **Unbind Policy**.
   • To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
   • To regenerate assigned priorities, click **Regenerate Priorities**.
   • To insert a new policy, click **Insert Policy** and, in the list that is displayed in the Policy Name column, click **New Policy**. Then, in the **Create Rewrite Policy** dialog box, configure the policy, and then click **Create**.
   For information about modifying a Rewrite policy, see **Rewrite**.
• In the Goto Expression column, select a Goto expression.
• In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.

4. Click Apply Changes, and then click Close.

Configuring Responder policies

You can use only default syntax policies and expressions to configure Responder policies.

To configure Responder policies for an application unit:

1. Navigate to AppExpert > Applications.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Responder column.
3. In the Configure Responder Policies dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
   • To modify a Filter policy that is already bound to the application unit, click the name of the policy, and then click Modify Policy. Then, in the Configure Responder Policy dialog box, modify the policy, and then click OK.
     For information about modifying a Responder policy, see Responder.
   • To unbind a policy, click the name of the policy, and then click Unbind Policy.
   • To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
   • To regenerate assigned priorities, click Regenerate Priorities.
   • To insert a new policy, click Insert Policy and, in the list that is displayed in the Policy Name column, click New Policy. Then, in the Create Responder Policy dialog box, configure the policy, and then click Create.
     For information about modifying a Responder policy, see Responder.
   • In the Goto Expression column, select a Goto expression.
   • In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.

4. Click Apply Changes, and then click Close.

Configuring Application Firewall policies

You can configure both classic and default syntax policies and expressions for Application Firewall. However, if a policy of one type is already bound globally or to a virtual server that is configured on the appliance, you cannot bind a policy of the other type to an application unit. For example, if a default syntax policy is already bound either globally or to a virtual server, you cannot bind a classic policy to an application unit.
To configure Application Firewall policies for an application unit:

1. Navigate to AppExpert > Applications.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Application Firewall column.
3. In the Configure Application Firewall Policies dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
   - Click either Classic Expression or Advanced Expression depending on the type of expression you want to configure for the Application Firewall policy.
     **Important:** This setting also determines what policies are displayed when you want to insert a policy. For example, if you select Advanced Expression, when you click Insert Policy, the list that appears in the Policy Name column will include only default syntax policies. You cannot bind policies of both types to an application unit. This option is not available if a policy of either type is already bound either globally or to a virtual server.
   - To modify an application firewall policy that is already bound to the application unit, click the name of the policy, and then click Modify Policy. Then, in the Configure Application Firewall Policy dialog box, modify the policy, and then click OK. For information about modifying a application firewall policy, see Policies.
   - To unbind a policy, click the name of the policy, and then click Unbind Policy.
   - To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
   - To regenerate assigned priorities, click Regenerate Priorities.
   - To insert a new policy, click Insert Policy and, in the list that is displayed in the Policy Name column, click NewPolicy. Then, in the Create Application Firewall Policy dialog box, configure the policy, and then click Create. For information about modifying a application firewall policy, see Policies.
4. Click Apply Changes, and then click Close.

### Configuring Application Units

December 10, 2018

To configure an application unit by using the GUI:

1. Navigate to AppExpert > Applications > Application Unit section and then click the plus icon to add a new application unit for a traffic subset.
2. In the Application Unit slider, set the following parameters:
NetScaler 11.1

- Name
- Expression

You can insert an expression either by adding the expression components manually or by using the Expression Editor link. To manually add an expression, enter a selector component and then type a period (.) to display a list from which you can select the next component. For example, type HTTP and then type a period. A drop-down menu appears. The contents of this menu provide the keywords that can follow the initial keyword that you entered. Select a component from the drop-down menu. The Expression* text box now displays the components that you have added to the expression (for example, HTTP.REQ). Continue adding components until the complete expression is formed.

If you prefer assistance to form the expression, you can use the Expression Editor link. On the Expression Editor page, you can form an expression by selecting components from the drop-down boxes. Select the components and click Done to insert the expression on the Application Unit page.

3. Click **Continue** to bind services and service groups.

4. Click the Service section to select or add a virtual service and bind it to the application unit.

5. Click **Continue** and click the Service Group section to select or add a virtual service group and bind it to the application unit.

6. Click Bind and **Continue** to configure Advanced Settings (such as Policies, Method, Persistence, Protection, Profiles, Push, Authentication, and Traffic Settings) for the application unit.

7. Click the plus icon in each section to set the configuration parameters.

8. Click **OK** and then **Done**.

To edit an application unit for an application by using the GUI:

Navigate to **AppExpert** > **Applications**, select an application and click **Edit**. In the Application Unit section, select an entity, click the edit icon and modify the application unit settings.

**Note**: You cannot modify the name and rule expression for an existing application unit.

NetScaler’s video tutorials enable you to understand NetScaler features in an easy and simple way. Watch <https://www.youtube.com/watch?v=bJ5_i8fV2hc> video to learn how configure an application unit.

### Configuring public endpoints for an application

December 10, 2018

To configure public endpoints for an application by using the GUI:
1. Navigate to AppExpert > Applications, select an application entity, and then click Edit.
2. In the Public Endpoint section, click + to configure a new public endpoint.
3. In the Public Endpoint slider, do one of the following:
   a) Click New to create a new endpoint.
   b) Click Existing Public Endpoint to select an endpoint from the drop-down list.
4. Set the following endpoint parameters:
   a) Name
   b) IP address
   c) Protocol
   d) Port
5. Click Continue to configure additional settings such as application units, GSLB server bindings, policies, profiles, push, traffic settings, and authentication.
6. Click OK and then Done.
7. Click Continue and then Done.

To edit a public endpoint for an application by using the GUI:

Navigate to AppExpert > Applications, select an application, and click Edit. In the Public Endpoint section, select an endpoint, click the pen icon, and modify the endpoint settings.

To delete a public endpoint for an application by using the GUI:

Navigate to AppExpert > Applications > Public Endpoint, click the pen icon to view the delete icon next to the entity.

NetScaler’s video tutorials enable you to understand NetScaler features in an easy and simply way. Watch <https://www.youtube.com/watch?v=z4v-edQiVpw> video to learn how to configure a public endpoint.

**Specifying the Order of Evaluation of Application Units**

December 10, 2018

Application unit rules are evaluated in the order in which they are placed in the GUI. The rule that is configured for the topmost application unit is always configured first, followed by the rule that is configured for the second topmost application unit, and so on. The default application unit is always evaluated last.

When a request matches the rule that is configured for an application unit, the request is processed by the application unit, and no further matching is performed. Therefore, the order of evaluation of application units becomes an important factor if the traffic subsets for two or more application units overlap. If the traffic subsets for two or more application units overlap, you must specify the order in which an incoming request is matched against the application unit rules.
To specify the order of evaluation of application units:

1. Navigate to AppExpert > Applications, select an application and click Edit. In the Application Unit section, click the Pencil icon and then hover the cursor over the check box to the left of the name of the application unit. Click the icon that appears next to the check box and hold down the mouse to drag the application up or down to a new location in the priority list.

Configuring Persistency Groups for Application Units

December 10, 2018

You can configure a persistency group for the application units in an AppExpert application. In the context of an AppExpert application, a persistency group is a group of application units that you can treat as a single entity for the purpose of applying common persistence settings. When the application is exported to an application template file, the persistency group settings are included, and they are automatically applied to the application units when you import the AppExpert application.

To configure a persistency group for an application by using the GUI:

1. Navigate to AppExpert > Applications.
2. In the Applications View dialog box, click the name of the application for whose application units you want to configure a persistency group, and then click Configure Persistency Groups.
3. In the Configure Persistency Groups dialog box, do one of the following:
   • To add a persistency group, click Add.
   • To modify a persistency group, click Open.
4. In the Create Persistency Group or Configure Persistency Group dialog box, set the following parameters:
   • Group Name—Name of the persistency group. For the NetScaler appliance to recognize the persistency group as part of the application’s configuration, the name of the AppExpert application must be included in the name of the persistency group, as a prefix. Therefore, by default, the appliance displays the prefix in the Group Name box, and you cannot remove that prefix. Enter a name of your choice after the prefix.
   • Persistence—Type of persistence for the virtual server. If you select SOURCEIP, in the IPv4 Netmask box, enter a network mask that specifies the number of bits that the appliance must consider when creating persistence sessions. If you select COOKIEINSERT, in the Cookie Domain and Cookie Name boxes, specify a domain attribute to send in the Set-Cookie directive, and a name for the cookie, respectively.
   • Timeout—Time period for which a persistence session is in effect.
   • Backup Persistence—Type of backup persistence for the group.
   • Backup Timeout—Time period, in minutes, for which backup persistence is in effect.
   • Application Units—To add an application unit to the persistency group, in the Available
Application Units box, click the application unit, and then click Add. To remove an application unit from the persistency group, in the Configured Application Units box, click the application unit, and then click Remove.

5. Click OK.

Viewing AppExpert Applications and Configuring Entities by Using the Application Visualizer

December 10, 2018

The Visualizer feature shows you a graphical representation of an application’s configuration. It includes the name of the public endpoint, application units assigned to the public endpoint, and the number of policies and services bound to the application. You can use the Visualizer to obtain a visual overview of an AppExpert application’s configuration and configure some of the displayed entities. By default, the Visualizer displays application units, services, and monitors for the selected application.

To view an AppExpert application by using the Application Visualizer:

1. Navigate to AppExpert > Applications, select an application entity, and click Visualizer.

Configuring User Authentication, Authorization, and Auditing

December 10, 2018

You can configure authorization for users and groups to enable them to access an AppExpert application. If the AAA user or group for which you want to configure permissions has not already been created, you can create it from AppExpert and then configure permissions for application access.

To configure AAA users and AAA user groups for an application by using the configuring utility

1. Navigate to AppExpert > Applications, select an application entity, and then click Edit.
2. In the Advanced Settings section, click Authorization, and configure authorized users and user groups.
3. Click the AAA user section to bind authorized users to the application.
4. In the AAA User slider, set the parameters.
5. Click Continue, and then click Authorization Policies in the Advanced Settings section.
6. In the Authorization Policy slider, bind an authorization policy to the application.
7. Click Continue, and then click the Authorization Group section in the Advanced Settings section.
8. In the AAA Group Binding slider, bind an authorization user group to the application.
9. Click Continue, and then click Policies in the Advanced Settings section.
10. In the **Policies slider**, bind an **Audit Syslog** or **Audit NSlog** policy to the application.
11. Click **Continue** and then **Done**.

To edit AAA users and AAA user groups for an application by using the GUI:

Navigate to **AppExpert > Applications > Advanced Settings** and click **Authorization**. Then click the edit icon and specify values for user or user-group authorization settings.

To delete AAA users and AAA user groups by using the GUI:

Navigate to **AppExpert > Applications**, select an application and click **Edit**. In the **Applications** page, click **Advanced Settings** and click **Authorization**. Click the delete icon next to the entity.

---

### Monitoring a NetScaler Application

**December 13, 2018**

After you customize the AppExpert application, you can view application statistics to make sure that the application and all its entities are working correctly. You can also use the Application Visualizer to monitor statistics associated with certain entities such as policies and virtual servers.

You can also view the hit counters for various entities at regular intervals to make sure that counters are being updated.

### Viewing Application Statistics

In the **Applications** node, you can select an application and view the Statistics page for the application. On the Statistics page, you can monitor the health and states of public endpoints and application units, and view the following statistical information:

- Requests and responses per second for each of the public endpoints and application units.
- Bytes per second, at each endpoint, for incoming and outgoing traffic.
- Application unit hit counters and the number of client and server connections for each application unit.
- Statistics for the services that are bound to the application units.

On the Statistics page, you can also view CPU usage, memory usage, and system logs.

To view statistics for an application:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, click the application for which you want to view statistics, and then click **Statistics**.
Monitoring an Application by Using the Application Visualizer

You can use the Application Visualizer to monitor the number of requests received per second at a given point in time by the vservers and the number of hits per second at a given point in time for Rewrite, Responder, and Cache policies.

To view statistical information for vservers, Rewrite policies, Responder policies, and Cache policies in the Visualizer:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, select the application for which you want to view statistical information, and then click **Visualizer**.
3. In the **Application Visualizer** window, do the following:
   - To view the statistics, click **Show Stats**. The statistical information is displayed on the respective nodes in the Visualizer. This information is not updated in real time and has to be refreshed manually.
   - To refresh the statistical information, click **Refresh Stats**.

Viewing Hits

The hit counters that are provided for various AppExpert application entities enable you to monitor the functioning of public endpoints and application units. For an application, the Hits dialog box displays the total number of requests received by each configured public endpoint. For an application unit, the Hits dialog box displays the number of requests that the application unit processed from each of the public endpoints and the total hit count. For instructions on viewing hit counters, see Verifying and Testing the Configuration.

Deleting an Application

December 10, 2018

If you no longer need an application and its application units, you can delete it. When you delete an AppExpert application, backend services are not deleted, and any public endpoints that the application used become available for use by other applications.

When deleting an application, you are also prompted to specify whether you want to delete any bound policies and actions that are not used elsewhere.

To delete an application unit for an application by using the GUI:

Navigate to **AppExpert > Applications**, select an application and click **Edit**. In the **Application Unit** section, click the delete icon next to the entity
Configure application authentication, authorization, and auditing

December 13, 2018

You can configure Authentication, Authorization, and Auditing (AAA) for the applications that you configure on the appliance. An authentication policy that is configured for an application defines the type of authentication to apply when a user or group attempts to access the application. If external authentication is used, the policy also specifies the external authentication server. Authorization policies configured for an application specify whether a particular user or group can access the application. Auditing policies define the audit log type, the level at which logging is performed, and other audit server settings. Authentication and auditing policies use the classic policy format.

Authentication policies, authorization policies, and auditing policies can be configured in any order. However, before you configure AAA for an application, you must configure a public endpoint for the application.

Configuring authentication for an application involves specifying an authentication FQDN, an authentication virtual server, a server certificate, and authentication and session policies. Authentication policies are automatically bound to the authentication virtual server specified for the application.

To configure authentication for an AppExpert application:

1. Navigate to AppExpert > Applications.
2. In the details pane, do one of the following:
   a) Click Add to add an authentication for a new application.
   b) Click Edit to modify an existing application.
3. In the Applications page, select an Application Unit.
4. In the Application Unit slider page, click Authentication from the Advanced Settings section.
5. In the Authentication section, select the authentication type as follows:
   a) Form based authentication
   b) 401 based authentication
   c) None
6. Click OK and then click Done.

Configure application authorization

You can configure authorization for users and groups to enable then to access an AppExpert application. If the AAA user or group for which you want to configure permissions has not already been created, you can create it from AppExpert and then configure permissions for application access.

To configure permissions for a AAA user or group to access an AppExpert application:

1. Navigate to AppExpert > Applications.
2. In the details pane, click the AppExpert application for which you want to configure a user or group access.
3. In the Applications page, and then click Authorization. from the Advanced Settings section.
4. Do one of the following:
   • If the AAA user or group for which you want to configure permissions are already in the Groups/Users tree, drag the user or group from the Groups/Users tree to the Users or Groups node in the application tree. Then, right-click the user or group and click Allow.
   • If the AAA user or group for which you want to configure permissions is not configured on the appliance, in the application tree, right-click Users or Groups, and then click Add. In the Create AAA Group or Create AAA User dialog box, fill in the values, click Create, and then click Close.
      The user or group is created with the permission set to Allow. To change the permission setting, right-click the group or user, and then click the permission setting.
5. Click Done and then click Close.

Configure application auditing

When you configure auditing policies for an application, you must specify the server to which the log messages must be directed, the format of the messages logged, and the log level. Optionally, you can configure other settings, such as the log facility and date format. Auditing policies are automatically bound to all the AppExpert application’s public endpoints.

To configure auditing policies for an application:

1. Navigate to AppExpert > Applications.
2. In the details pane, click the application for which you want to configure auditing policies.
3. In the Application Unit slider page, click + icon in the Policies section to configure the auditing policies.
4. In the Policies slider page, select policy type as Syslog auditing or Nslog auditing and click Continue.
5. In the Policy binding section, set the following parameters.
   a) Select a policy for binding. If you do not have a policy for binding, click + to create a new policy.
   b) To create a new auditing policy, under Policy Name, click New Policy, and then, in the Policy page do the following:
      i. In the Name box, type a name for the policy.
      ii. The Name box already contains the string that is required at the beginning of the server name. You cannot modify the string.
      iii. From the Auditing Type list, select the auditing type (either SYSLOG or NSLOG).
      iv. If the audit server you want to specify is already listed in the Server list, select the server from the list, and then, if you want to modify the server settings, click Modify.
the Configure Auditing Server dialog box, modify the settings as appropriate, and then click OK. For more information about the settings in the Configure Auditing Server dialog box, see Auditing Authenticated Sessions.

v. If you want to configure a new audit server, click New, and then, in the Create Auditing Server dialog box, type a name for the server, specify the server IP address, port number, and other settings as appropriate. When finished, click OK.

vi. Click Create.

c) To change the priorities for the new auditing policies you created, under Priority, for each policy for which you want to change the priority, double-click the priority value and type new priority value.

d) To regenerate priorities, click Regenerate Priorities.

e) To unbind a policy, click the policy, and then click Unbind Policy.

f) To modify a policy, click the policy, and then click Modify Policy.

6. Click Apply Changes, and then click Close.

Disabling AAA for an Application

After you configure AAA for an application, you can disable the AAA configuration for that application. When you disable AAA for an application, the configuration is not lost. You can enable AAA for the application when you want to reapply the configuration.

To enable or disable AAA for an application:

1. Navigate to AppExpert > Applications.

2. In the details pane, click the application for which you want to enable or disable AAA, and then do one of the following:

3. To disable AAA for the application, click Turn Off AAA.

4. To enable AAA for the application, click Turn On AAA.

Setting Up a Custom NetScaler Application

December 13, 2018

If an AppExpert application template is not available for the Web application that you want to manage through the NetScaler appliance, or if available AppExpert application templates do not suit your requirements, you can create an AppExpert application without a template.

To create an AppExpert application without a template, you must first create an application and application units. Then, you configure public endpoints, services, and service groups. Finally, you configure the policies that determine how application traffic is evaluated and processed.
After you create the application and application units and configure policies, you must verify the configuration and test it to make sure that it is working correctly, just as you would when you configure an application by using a prebuilt AppExpert application template. Then, you must monitor the application to make sure that the application and its entities are working correctly.

**Creating an Application**

When you create an AppExpert application, the appliance creates a container to which you can add application units. The default application unit is not created until you create the first application unit.

To create an AppExpert application by using the GUI:

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click Applications, and then click Add.
3. In the Create Application dialog box, in Name, enter a name for the application, and then click OK.

**Creating Application Units**

For each subset of traffic associated with your web application, you must create an application unit.

To create an application unit for the AppExpert application by using the GUI:

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click the application for which you want to add an application unit, and then click Add.
3. Click Create.

**Configuring Public Endpoints for an AppExpert Application**

After you have created all the application units that you require, you must configure one or more public endpoints to enable clients to access the web application through the NetScaler appliance.

To configure public endpoints for an AppExpert application by using the GUI:

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click the application for which you want to configure public endpoints, and then click Configure Public Endpoints.
3. In the Choose Public Endpoints dialog box for the application, do one of the following:
   - If the endpoints you want are listed in the dialog box, click the corresponding check boxes.
   - If you want to specify all the public endpoints, click Activate All.
   - If you want to dissociate endpoints from the AppExpert application, clear the corresponding check boxes.
• If you want to create a new public endpoint, click Add. Then, in the Create public endpoint dialog box, configure endpoint settings, and then click OK.

In the Create public endpoint dialog box, you can specify only the name, IP address, port, and protocol for the endpoint. You can specify additional endpoint settings after you create the public endpoint. To specify additional endpoint settings, after you create the endpoint, in the Choose Public Endpoints dialog box, click the endpoint, and then click Open. Then, in the Configure Public Endpoint dialog box, provide additional settings, and then click OK.

For more information about the parameters in the Create public endpoint and Configure Public Endpoint dialog boxes, see Content Switching.

• If you want to modify a public endpoint, click the endpoint, and then click Open. Then, in the Configure Public Endpoint dialog box, modify settings for the endpoint, and then click OK.

For more information about the parameters in the Configure Public Endpoint dialog box, see Content Switching.

4. Click Close.

**Configuring Public Endpoints for an Application Unit**

For an application unit, you specify public endpoints in the same way as you would specify public endpoints for an application that is created from an AppExpert application template. For more information about specifying a subset of the endpoints for an application unit, see Configuring Endpoints for an Application Unit.

To configure endpoints for an application unit by using the GUI:

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click the application unit for which you want to specify public endpoints, and then click Configure Public Endpoints.
3. In the Choose Public Endpoints dialog box for the application unit, do one of the following:
   • If you are specifying endpoints for the application unit for the first time, clear the check boxes that correspond to the endpoints that you do not want to be bound to the application unit.
   • If you want to specify endpoints that are listed in the dialog box but not currently bound to the application unit, click the corresponding check boxes.
4. Click OK.

**Configuring Services and Service Groups for an AppExpert Application**

Services and service groups are available for application units only after you configure the services and service groups for the AppExpert application. Therefore, you must configure services and service
groups for the AppExpert application before you configure the services for the application units. All the services and service groups that you configure for an AppExpert application must use the same protocol (either HTTP or HTTPS). The procedure for configuring services and service groups for an AppExpert application that is not created from a template is the same as that for an application created from a template.

To configure a service or service group for the AppExpert application by using the GUI:

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click the application for which you want to configure services or service groups, and then click Configure Backend Services.
3. In the Configure Backend Services dialog box, do one of the following:
   • To configure services, click the Services tab.
   • To configure service groups, click the Service Groups tab.
4. On the Service or Service Groups tab, do one of the following:
   • If the services or service groups that you want are listed on the tab, click the corresponding check boxes.
   • If you want to specify all the services or service groups, click Activate All.
   • If you want to create a new service or service group, click Add. Then, in the Create Service dialog box or Create Service Group dialog box, configure settings for the service or service group, respectively, and then click Create.
   • If you want to modify a service, click the service, and then click Open. Then, in the Configure Service dialog box or Create Service Group dialog box, configure settings for the service or service group, respectively, and then click OK.

For information about the settings in the Create Service, Configure Service, and Create Service Group dialog boxes, see Load Balancing.

**Configuring services and service groups for an application Unit**

After you configure services and service groups, you must configure services and service groups for each application unit. However, this step is not necessary if each backend service hosts all the content associated with the web application. You configure services and service groups for an application unit if the content associated with the application unit is hosted on only a subset of the backend servers.

To configure services or service groups for an application unit by using the GUI:

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click the application unit for which you want to configure a service or service group, and then click Configure Backend Services.
3. In the Configure Backend Services dialog box, do one of the following:
   • To configure services, click the Services tab.
   • To configure service groups, click the Service Groups tab.
4. In the Services or Service Groups tab, do one of the following:
   - Clear the check boxes that correspond to the services or service groups that you do not want configured for the application unit. Make sure that the check boxes that correspond to the services or service groups that you want configured for the application unit are selected. Then, in the Weight column, specify the weight that you want to assign to each configured service.
   - To specify all services or service groups, click Activate All.

5. On the Method and Persistence and Advanced tabs, specify the desired parameters.

6. Click OK.

**Configuring Policies**

The procedures for configuring policies for an AppExpert application that is created without using a template are the same as those for an AppExpert application that was created from a template. For more information, see Configuring Policies for Application Units.

**Creating and managing template files**

December 10, 2018

After you set up an AppExpert application and customize it to suit your requirements, you can create a template from the configuration and then share the template with other administrators. Or, you can create a template and then import the template to other NetScaler appliances that require a similar AppExpert application configuration. This simplifies and expedites the process of setting up similar applications on other appliances.

AppExpert application template files can be exported either to the template directory on the NetScaler appliance or to a folder on your local computer. You can then upload and download the templates to and from the NetScaler appliance and rename the templates that are stored in the AppExpert application templates directory on your appliance.

AppExpert application template files can be exported either to the template directory on the NetScaler appliance or to a folder on your local computer. You can then upload and download the templates to and from the NetScaler appliance and rename the templates that are stored in the AppExpert application templates directory on your appliance.

**Exporting an appExpert application to a template file**

December 10, 2018
When you export an appExpert application, all application-configuration information is exported to a template file, and all deployment-specific information is exported to a deployment file. The string _deployment is automatically appended to the name of the template file to create the name of the deployment file. Both files are in XML format. If you choose to export the application template file to the NetScaler appliance, the template file is stored in the /nsconfig/nstemplates/applications directory and the deployment file is stored in the /nsconfig/nstemplates/applications/deployment_files/ directory. If you have configured a NetScaler Gateway application, you can choose to include the NetScaler Gateway policies in the template.

To export an AppExpert application to a template file by using the GUI:

1. Navigate to AppExpert > Application, select an application entity, and then click Edit.
2. On the Applications page, click the Export as a Template link to export the application configuration and deployment settings as a template.
3. In the Export Application slider, set the following parameters:
   a) Template Filename
   b) Deployment Filename
4. Click Continue and Done.
5. Navigate to AppExpert > Application and click Manage Templates to show the exported configuration as files on the Template File and Deployment File tabs.

Exporting a Content Switching Virtual Server Configuration to a Template File

December 13, 2018

You can also export a content switching configuration as an application template. You can export a content switching virtual server configuration to an application template either from the Content Switching Virtual Servers pane or from the Content Switching Visualizer. Configuration information, which includes the content switching virtual server, all associated load balancing virtual servers, services, service groups, and policies, is exported to a template file and all deployment-specific information is exported to a deployment file. The string “_deployment” is automatically appended to the name of the template file to create the name of the deployment file. Both files are in XML format. If you choose to export the application template file to the NetScaler appliance, the template file is stored in the /nsconfig/nstemplates/applications directory on the NetScaler appliance and the deployment file is stored in the /nsconfig/nstemplates/applications/deployment_files/ directory.

For more information about the format of application templates and deployment files, see Understanding NetScaler Application Templates and Deployment Files. The configuration information that is exported includes the content switching virtual server, all associated load balancing virtual servers, services, service groups, and policies.
However, if the content switching virtual server is already configured as the public endpoint for an AppExpert application, you cannot export the configuration to a template file. In this scenario, you must export the associated AppExpert application to a template.

For more information about exporting an AppExpert application to a template file, see Exporting an AppExpert Application to a Template File.

To export a content switching configuration to an application template file from the Content Switching Visualizer by using the GUI:

1. Navigate to Traffic Management > Content Switching > Virtual Servers.
2. In the details pane, click the name of the content switching virtual server whose configuration you want to export as a template file, and then click Visualizer.
3. In the Content Switching Visualizer, click the icon for the content switching vserver, click Related Tasks, and then click Create Template.
4. In the Export…as Template dialog box, enter a name for the template file, and then do one of the following:
   - To export the template file to the appliance, make sure that Browse (Appliance) is displayed.
   - To export the template file to your computer, click the Browse (Appliance) drop-down menu, click Local, browse to the location to which you want to save the file, and then click Save.
5. Provide the following information:
   - Introduction Description—Any text that introduces the AppExpert application template during import. This text is displayed on the Specify Application Name page of the AppExpert Template Wizard when the template is imported.
   - Summary Description—Any summary that you might want to display on the Summary page of the AppExpert Template Wizard when the template is imported.
   - Author—The name of the author of the template.
   - Major—The major version number of the template.
   - Minor—The minor version number of the template. This number is appended to the major version number and displayed on the Summary page of the AppExpert Template Wizard, during import, in the format Major.Minor.
6. Click OK.

To export a content switching configuration to an application template file from the Content Switching Virtual Servers pane by using the GUI:

1. Navigate to Traffic Management > Content Switching > Virtual Servers.
2. In the details pane, click the name of the content switching virtual server whose configuration you want to export as a template file, and then click Create AppExpert Template.
3. Perform steps 4 through 6 described in To export a content switching configuration to an application template file from the Content Switching Visualizer procedure.
Creating Variables in Application Templates

January 6, 2019

Application templates support the declaration of variables in the policy expressions and actions that are configured for an application. The ability to declare variables in policy expressions and actions enables you to replace preconfigured values in expressions (for example, configurable parameters such as the host name of a server or the target for a Rewrite action) with values that suit the environment into which you are importing the template. If variables have been configured for an AppExpert application template, the AppExpert Template Wizard, which appears when you import an AppExpert application template, includes a Specify Variable Values page on which you can specify appropriate values for the variables that are configured for the template.

As an example, consider the following policy expression that is configured to evaluate the value of the Host header in an HTTP request:

```
HTTP.REQ.HEADER("Host").CONTAINS("server1")
```

If you want the server name to be configurable at import time, you can specify the string “server1” as a variable. When importing the template, you can specify a new value for the variable on the Variables tab.

After you create a variable, you can do the following:

- Assign additional strings to an existing variable. After you create a variable for a string, you can select and assign other parts of the same or different expression to the variable. The strings you assign to a variable need not be the same. At import time, all the strings that are assigned to the variable are replaced with the value that you provide.
- View the string or strings that are assigned to the variable.
- View a list of all the entities and parameters that use the variable.

In the export application template wizard, you can define variables in certain fields (fields with an adjacent button) for the following entities:

- Cache policies
- Rewrite policies
- Rewrite actions
- Responder policies
- Responder actions

To configure a variable in a policy expression or action by using the GUI:

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click the application that you want to export to a template file, and then click Export.
3. In the Export…as Template dialog box, modify the default template file name if required, specify the location where you want to save the template, and then click Configure Variables.

4. In the Configure Variables dialog box, click the tab that lists the policy expression or action for which you want to configure a variable, select the expression, and then click Configure Variables.

5. In the Variables dialog box, click the button next to the expression or value in which you want to create a variable.

6. In the Variables dialog box, do the following:

   - To create a variable, in the text box that displays the configured expression or value, select the string that you want to be configurable at import time, and then click Add. In the Add Variable dialog box, specify a name and a description for the variable, and then click Create.

   - The name of the variable, its value, and the description you provided appear in the Available Variables listing in the dialog box. The name you provide will be the name of the associated field in the template import wizard, and the description will appear as alt text when the user positions the mouse pointer over the field.

   - To modify a variable, in the Available Variables list, click the variable, and then click Open. In the Add Variable dialog box, modify the value and the description, and then click OK.

   - To view all the strings that are assigned to a given variable, in the Available Variables listing, click the name of the variable. The strings that are assigned to the variable are highlighted.

   - To view a list of all the entities and parameters in which the variable is used, in the Available Variables listing, click the variable whose references you want to view, and then click Show References.

   - To assign a string to an existing variable, in the text box that displays the expression you configured, select the string you want to assign to an existing variable, right-click the selection, click Use Existing Selection, and then click the name of the variable to which you want to assign the string.

     If a variable has multiple strings assigned to it, when you specify a new value for the variable during import, all strings assigned to the variable are replaced with the new value.

7. Click Close.

**Uploading and downloading template files**

December 10, 2018
Template files can be uploaded from your local computer to the NetScaler appliance or downloaded from the appliance to your local computer. On the appliance, AppExpert application templates are always stored in the AppExpert application templates directory, which is /nsconfig/nstemplates/applications/.

To upload an AppExpert application template from your local computer to the NetScaler appliance:

1. Navigate to AppExpert > Templates.
2. In the details pane, click Manage Templates.
3. In the Manage Application Templates dialog box, click Application Templates, and then click Upload.
4. In the Upload Application Template dialog box, browse to the directory in which the template file is stored, click the template file, and then click Select.

The template file is uploaded to the AppExpert application template directory on the appliance.

To download an AppExpert application template from the NetScaler appliance to your local computer:

1. Navigate to AppExpert > Templates.
2. In the details pane, click Manage Templates.
3. In the Manage Application Templates dialog box, click the AppExpert application template that you want to download, and click Download.
4. In the Download Application Template dialog box, browse to the location to which you want to save the file, and then click Save.

Understanding NetScaler application templates and deployment files

December 10, 2018

When you export a NetScaler application, the following two files are automatically created:

- **NetScaler application template file.** Contains application-configuration information such as application units, rules, and configured policies.
- **Deployment file.** Contains deployment-specific information such as public endpoints, services, associated IP addresses, and configured variables.

In a template file or deployment file, each unit of application-configuration information is encapsulated in a specific XML element that is meant for that unit type. For example, each public endpoint and associated endpoint details are encapsulated within the <appendpoint> and <appendpoint> tags, and all the endpoint elements are encapsulated within the <appendpoint_list> and <appendpoint_list> tags.

**Note:** After you export a NetScaler application, you can add elements, remove elements, and modify existing elements before importing the application to a NetScaler appliance.
Example of a NetScaler Application Template

Following is an example of a template file that was created from a NetScaler application called SharePoint_Team_Site:

```xml
<?xml version="1.0" encoding="UTF-8" ?>
<template>
<template_info>
<application_name>SharePoint_Team_Site</application_name>
<templateversion_major>1</templateversion_major>
<templateversion_minor>1</templateversion_minor>
<author>Ed</author>
<introduction>An application for managing a SharePoint team site with images, reports, and XML content.</introduction>
<summary>This template includes variables</summary>
<version_major>9</version_major>
<version_minor>3</version_minor>
<build_number>38</build_number>
</template_info>
apptemplate>
<rewrite>
<rewriteaction_list>
<rewriteaction>
<name>Rw_name</name>
<type>replace</type>
<target>HTTP.REQ.BODY(10000).AFTER_REGEX(re/number/).
BEFORE_REGEX(re/address/)</target>
<stringbuilderexpr>"NA"</stringbuilderexpr>
<allow_unsafe_pi1>NO</allow_unsafe_pi1>
</rewriteaction>
<rewriteaction>
.
.
.
</rewriteaction>
<rewriteaction_list>
<rewritepolicy_list>
<rewritepolicy>
<name>Rw_number_NA</name>
<rule>HTTP.REQ.BODY(100000).CONTAINS("admin")</rule>
?action>Rw_name</action>
</rewritepolicy>
</rewritepolicy_list>
</rewritepolicy>
</rewriteaction_list>
</rewrite>
</apptemplate>
```
<rewritepolicy>
  .
  .
</rewritepolicy>
<rewritepolicy_list>
  .
  .
</rewritepolicy_list>
<rewrite>
  <appunit_list>
    <appunit>
      <name>SharePoint_Team_Sitedefault</name>
      <rule />
      <expressiontype>PE</expressiontype>
      <servicetype>HTTP</servicetype>
      <ipv46>0.0.0.0</ipv46>
      <ipmask>*</ipmask>
      <port>0</port>
      <range>1</range>
      <persistencetype>NONE</persistencetype>
      <timeout>2</timeout>
      <persistencebackup>NONE</persistencebackup>
      <backuppersistencetimeout>2</backuppersistencetimeout>
      <lbmethod>LEASTCONNECTION</lbmethod>
      <persistmask>255.255.255.255</persistmask>
      <v6persistmasklen>128</v6persistmasklen>
      <pq>OFF</pq>
      <sc>OFF</sc>
      <m>IP</m>
      <datalength>0</datalength>
      <dataoffset>0</dataoffset>
      <sessionless>DISABLED</sessionless>
      <state>ENABLED</state>
      <connfailover>DISABLED</connfailover>
      <clttimeout>180</clttimeout>
      <somethod>NONE</somethod>
      <sopersistence>DISABLED</sopersistence>
      <redirectportrewrite>DISABLED</redirectportrewrite>
      <downstateflush>DISABLED</downstateflush>
      <gt2gb>DISABLED</gt2gb>
      <ipmapping>0.0.0.0</ipmapping>
      <disableprimaryondown>DISABLED</disableprimaryondown>
      <insertvserveripport>OFF</insertvserveripport>
      <authentication>OFF</authentication>
    </appunit>
  </appunit_list>
</rewrite>
<authn401>OFF</authn401>
<push>DISABLED</push>
<pushlabel>none</pushlabel>
<l2conn>OFF</l2conn>
</appunit>

<appunit>
. . .
</appunit>

</appunit_list>
</apptemplate>
<parameters>

<property_list>
<property>

<variable_definition_list>
<variable_definition>
<name>body_size</name>
<defaultvalue>10000</defaultvalue>
<description>Evaluation Scope</description>
<startIndex>14</startIndex>
<length>5</length>
</variable_definition>
. . .
</variable_definition_list>
<object_type>rewriteaction</object_type>
<object_name>Rw_name</object_name>
<name>target</name>
</property>
. . .
</property_list>
</parameters>
</template>
Example of a deployment file

Following is the deployment file associated with the `SharePoint_Team_Site` application in the preceding example:

```xml
<?xml version="1.0" encoding="UTF8" ?>
<template_deployment>
  <template_info>
    <application_name>SharePoint_Team_Site</application_name>
    <templateversion_major>1</templateversion_major>
    <templateversion_minor>1</templateversion_minor>
    <author>Ed</author>
    <introduction>An application for managing a SharePoint team site with images, reports, and XML content.</introduction>
    <summary>This template includes variables</summary>
    <version_major>9</version_major>
    <version_minor>3</version_minor>
    <build_number>38</build_number>
  </template_info>
  <appendpoint_list>
    <appendpoint>
      <ipv46>10.111.111.1</ipv46>
      <port>80</port>
      <servicetype>HTTP</servicetype>
    </appendpoint>
  </appendpoint_list>
  <service_list>
    <service>
      <ip>10.102.20.5</ip>
      <port>80</port>
      <servicetype>HTTP</servicetype>
    </service>
    <service>
      .
    </service>
    <service>
      .
    </service>
    <service>
      .
    </service>
  </service_list>
  <variable_list>
    <variable>
      <name>body_size</name>
      <description>Evaluation Scope</description>
    </variable>
  </variable_list>
</template_deployment>
```
Deleting a Template File

December 10, 2018

If you no longer need an application template and its configuration, you can delete it. When you delete a template, the template XML file that is stored in the application template directory gets deleted. When you delete a template file, you are prompted to confirm the deletion. Click Yes to confirm and delete the selected file from the directory.

To delete a template file from the application template directory by using the GUI:

1. Navigate to AppExpert > Applications and then click Manage Template. Select a file from Template Files tab page or Deployment Files tab page and click Delete.

NetScaler Gateway Applications

December 10, 2018

When you configure an AppExpert application to manage a web application through the Citrix® NetScaler® appliance, you also create a set of application units and configure a set of traffic optimization and security policies for each unit. The policies that you configure for each application unit (policies for features such as Compression, Caching, and Rewrite) evaluate traffic that is meant only for that unit. In addition to these policies, you might want to configure Access Gateway policies for the application as a whole to optimize the application traffic when accessed through the Access Gateway. The Access Gateway Applications feature enables you to configure Access Gateway policies (Authorization, Traffic, Clientless Access, and TCP Compression) for an AppExpert application. After you configure NetScaler Gateway policies for AppExpert applications, you can include the policy configuration in the AppExpert application templates that you create.
You can also configure NetScaler Gateway policies for intranet subnets, file shares, and other network resources. Finally, you can create bookmarks for AppExpert applications and certain resources if you want users to be able to access them from the NetScaler Gateway home page.

You can configure the entities in the NetScaler Gateway Applications feature only by using the GUI.

**How an NetScaler Gateway Application Works**

When you create an AppExpert application in the Applications node in the GUI, a corresponding Access Gateway application is automatically created in the Access Gateway Applications node. Additionally, a rule that uses the AppExpert application's configured public endpoint is automatically created for the Access Gateway application entry. If multiple endpoints are configured for the AppExpert application, the rule includes all the configured public endpoints. The NetScaler appliance uses this rule to apply any configured Access Gateway policies to the traffic received at the AppExpert application's public endpoint. Traffic received at the AppExpert application's public endpoint is first evaluated against the NetScaler Gateway policies and then evaluated against the policies configured for AppExpert application's application units.

The rule that is created for the Clientless Access policies for an Access Gateway application is an advanced expression that also uses the public endpoint that is configured for the AppExpert application. Therefore, before you configure NetScaler Gateway policies for an AppExpert application, you must configure public endpoints for the AppExpert application.

When you include the NetScaler Gateway configuration in an application template, deployment-specific information, such as IP address and port information, and the rule that is created from this information are not included in the template.

**How a NetScaler Configuration for a File Share Works**

On the NetScaler appliance, you can configure Authorization policies for a file share that is hosted on your organization’s network.

When you create a file share, you specify a name for the file share and the network path to the file share. In the network path, you can specify either the name of the server or the server IP address. A rule that uses the components of the file share path is automatically created for the file share. This rule enables the appliance to identify requests for files hosted on the file share server. Any Authorization policies that are configured for the file share are applied to incoming requests.

The NetScaler configuration for a file share cannot be saved in AppExpert application templates.
How a NetScaler Configuration for an Intranet Subnet Works

For the intranet subnets that form a part of your network, you can configure policies for Authorization, Traffic, and TCP Compression on the NetScaler appliance. When adding an intranet subnet, you specify the IP address and the netmask of the intranet subnet. A rule that uses these two parameters is automatically created for the intranet subnet. The appliance applies the configured policies to any request that has a destination IP address and netmask set to the subnet’s IP address and netmask, respectively.

The NetScaler configuration for an intranet subnet cannot be saved in AppExpert application templates.

How the Other Resources Category Works

The Other Resources category enables you to configure Access Gateway policies for any network resource by using a rule of your choice. When you configure the NetScaler appliance to process requests for the network resource, you configure a classic expression to identify the requests that are associated with the network resource. You can configure Authorization, Traffic, Clientless Access, and TCP Compression policies for a network resource in Other Resources. The NetScaler appliance applies the configured NetScaler Gateway policies to any requests that match the configured rule.

The NetScaler configuration for a network resource in Other Resources cannot be saved in AppExpert application templates.

Entity Naming Conventions

The NetScaler Gateway Applications feature enforces a naming convention for some of the entities that you create in this feature. For example, the names of the profiles that you create for Traffic policies for an intranet subnet always begin with a string that consists of the name of the intranet subnet followed by an underscore (_). The name that you provide for the entity is appended to this string. If the name of a subnet is “subnet1,” the name of the profile begins with “subnet1_.” When such a naming convention is required (in the text box in which you type the name of an entity, for example), the user interface automatically inserts the string with which the name of the entity must begin and does not allow you to modify it.

Adding Intranet Subnets

December 10, 2018
You can specify authorization and Traffic policies for traffic that is bound for the intranet subnets that are configured in your network. The rules for these policies are automatically created by using the parameters you specify for the subnet.

To configure an intranet subnet by using the GUI:

1. In the navigation pane of the GUI, expand AppExpert, and then click Access Gateway Applications.
2. In the details pane, do one of the following:
   - To add an intranet subnet, click Intranet Subnets, and then click Add.
   - To modify an intranet subnet, click an intranet subnet, and then click Open.
3. In the Create Intranet Subnet or Configure Intranet Subnet dialog box, do the following:
   a) In the Name box, type a name for the intranet subnet you are adding. This parameter cannot be changed for an existing intranet subnet.
   b) In the IP Address box, type the IP address of the intranet subnet.
   c) In the Netmask box, type the netmask that will be used for the intranet subnet.
   d) Click Create or OK, and then click Close.

## Adding Other Resources

December 10, 2018

For a network resource that you add to Other Resources, you must configure a classic expression that identifies the subset of traffic associated with the resource. For more information about configuring a classic expression, see the .

To configure a resource in Other Resources by using the GUI:

1. In the navigation pane of the GUI, expand AppExpert, and then click Access Gateway Applications.
2. In the details pane, do one of the following:
   - To add a resource, click Other Resources, and then click Add.
   - To modify a resource, click a resource, and then click Open.
3. In the Create Resource or Configure Resource dialog box, do the following:
   a) In the Name box, type a name for the resource you are adding. This parameter cannot be changed for an existing resource.
   b) In the Rule box, type the rule that will identify the subset of traffic that is associated with the resource you are adding.
      Alternatively, click Configure, and then create the rule in the Create Expression dialog box.
   c) Click Create or OK, and then click Close.
Configuring Authorization Policies

December 10, 2018

You can configure NetScaler Gateway authorization policies for AAA users and groups to access a resource.

To configure permissions for a AAA user or group to access a resource by using the GUI:

1. In the navigation pane of the GUI, expand AppExpert, and then click **Access Gateway Applications**.

2. In the details pane, in the Authorization column, click the icon for the application, file share, intranet subnet, or resource for which you want to configure authorization policies for AAA users and groups.

3. Do one of the following:
   - If the AAA user or group for which you want to configure permissions is already in the Groups/Users tree, drag the user or group from the Groups/Users tree to the Users or Groups node in the `<application name>` tree. Then, right-click the user or group and click **Allow**.
   - If the AAA user or group for which you want to configure permissions is not configured on the appliance, in the `<application name>` tree, right-click Users or Groups, and then click Add. In the Create AAA Group or Create AAA User dialog box, fill in the values, click Create, and then click Close. The user or group is created with the permission set to Allow. To change the permission setting, right-click the group or user, and then click the permission setting.

4. Click **Close**.

Configuring Traffic Policies

December 10, 2018

The traffic policies that you configure for the resources in the NetScaler Gateway Applications node control client connections to the application. You do not have to configure a rule for the resource. The rule created automatically when you create the resource. You only need to associate a request profile with the traffic policy. In the traffic profile, you specify parameters such as the protocol, application time-out, and file type association.

To configure traffic policies for a resource

1. In the navigation pane of the GUI, expand AppExpert, and then click **Access Gateway Applications**.

2. In the details pane, in the Traffic column, click the icon provided for the application, file share, intranet subnet, or resource for which you want to configure traffic policies.
3. In the **Configure Traffic Policies** dialog box, do the following:
   
   • To specify an existing traffic policy, click **Insert Policy**, and then, in the Policy Name column, click the name of the policy.
   
   • To configure a new policy, click Insert Policy, and then, in the Policy Name column, click New Policy. In the Create Traffic Policy dialog box, in the Name box, after the underscore (_), type a name for the policy. Then, in Request Profile, either select an existing request profile or click New to configure a new request profile. You can also select an existing profile and then click Modify to modify the profile.
   
   For more information about configuring a traffic policy or profile, see NetScaler Gateway.
   
   • To modify a policy that you have inserted, in the Policy Name column, click the policy name, and then click Modify Policy. To modify only the associated profile, in the Profile column, click the name of the profile, and then click Modify Profile.
   
   • To regenerate the priorities assigned to the policies, click **Regenerate Priorities**.
   
   • To specify a new priority value for a policy, in the Priority column, double-click the assigned priority, and then enter the value you want.
   
   • To unbind a policy, click the policy, and then click **Unbind Policy**.

4. Click **Apply Changes**, and then click **Close**.

**Configuring Clientless Access Policies**

December 10, 2018

Clientless access, when configured for a resource on the NetScaler appliance, allows end-users to access the resource without using the NetScaler Gateway client software. Users can use web browsers to access resources such as Outlook Web Access. You configure clientless access for a resource by configuring a clientless access policy that is associated with a clientless access profile.

To configure a clientless access policy for a resource in the NetScaler Gateway Applications node:

1. In the navigation pane of the GUI, expand **AppExpert**, and then click **Access Gateway Applications**.

2. In the details pane, in the **Clientless Access** column, click the icon for the application, file share, intranet subnet, or resource for which you want to configure a clientless access policy.

3. In the **Configure Clientless Access Policies** dialog box, do the following:
   
   • To specify an existing clientless access policy, click **Insert Policy**, and then, in the Policy Name column, click the name of the policy.
   
   • To configure a new clientless access policy, click Insert Policy, and then, in the Policy Name column, click New Policy. In the Create Clientless Access Policy dialog box, in the Name box, after the underscore (_), type a name for the policy. Then, in Profile, either select an existing profile or click New to configure a new profile. You can also select an existing profile and then click Modify to modify the profile.
For more information about configuring a clientless access policy or profile, see **NetScaler Gateway**.

- To modify a policy that you have inserted, in the Policy Name column, click the policy name, and then click **Modify Policy**. To modify only the associated profile, in the Profile column, click the name of the profile, and then click Modify Profile.
- To specify a new priority value for a policy, in the Priority column, double-click the assigned priority, and then enter the value you want.
- To unbind a policy, click the policy, and then click **Unbind Policy**.

4. Click **Apply Changes**, and then click **Close**.

### Configuring TCP Compression Policies

December 10, 2018

You can configure TCP compression policies for an application to increase the performance of the application. TCP compression reduces network latency, reduces bandwidth requirements, and increases the speed of transmission. When configuring a TCP compression policy, you associate a compression action with the policy. The compression action specifies either Compress, GZIP, Deflate, or NoCompress as the compression type. For more information about the compression policies, and compression actions, see **NetScaler Gateway**.

To configure a TCP compression policy for a resource in the NetScaler Gateway Applications node

1. In the navigation pane of the GUI, expand AppExpert, and then click Access Gateway Applications.
2. In the details pane, in the TCP Compression column, click the icon for the application, file share, intranet subnet, or resource for which you want to configure a TCP compression policy.
3. In the Configure TCP Compression Policies dialog box, do the following:
   - To specify an existing TCP compression policy, click **Insert Policy**, and then, in the **Policy Name** column, click the name of the policy.
   - To create a new TCP compression policy, click Insert Policy, and then, in the Policy Name column, click New Policy. In the Create TCP Compression Policy dialog box, in the Policy Name box, after the underscore ("_") type a name for the policy. Then, in Action, either select an existing action or click New and configure a new action. You can also click View to view the configured compression type.
   - For more information about configuring a TCP compression policy or action, see NetScaler Gateway, Enterprise Edition at **NetScaler Gateway**.
   - To modify a policy that you have inserted, in the Policy Name column, click the policy name, and then click **Modify Policy**.
   - To regenerate the priorities assigned to the policies, click **Regenerate Priorities**.
NetScaler 11.1

- To specify a new priority value for a policy, in the Priority column, double-click the assigned priority, and then enter the value you want.
- To unbind a policy, click the policy, and then click Unbind Policy.

4. Click Apply Changes, and then click Close.

Configuring Bookmarks

December 10, 2018

You can configure bookmarks for an application or for a resource that you configure in the Other Resources category if you want the application or resource to be accessible from the NetScaler Gateway home page.

To configure a bookmark for an NetScaler Gateway application or a resource in the Other Resources category:

1. In the navigation pane of the GUI, expand AppExpert, and then click Access Gateway Applications.
2. In the details pane, click the application or resource for which you want to configure a bookmark, and then click Configure Bookmark.
3. In the Create Bookmark dialog box, configure values for the parameters.
   For more information about the parameters in the Create Bookmark dialog box, see NetScaler Gateway.
4. Click Create, and then click Close.

AppQoE

December 10, 2018

Application level Quality of Experience (AppQoE) integrates several existing policy-based security features of the NetScaler appliance into a single integrated feature that takes advantage of a new queuing mechanism, fair queuing. Fair queuing manages requests to load-balanced web servers and applications at the virtual server level instead of at the service level, allowing it to handle queuing of all requests to a web site or application as one group before load balancing, instead of as separate streams after load balancing.

The features that are integrated into AppQoE are HTTP Denial-of-Service Protection (HDOSP), Priority Queuing (PQ), and SureConnect. Collectively these services provide protection against a number of problems:
• **Simple overload.** Any server, no matter how robust, can accept only a limited number of connections at one time. When a protected web site or application receives too many requests at once, the Surge Protection feature detects the overload and queues the excess connections until the server can accept them. The Priority Queuing feature ensures that whoever most needs access to a resource is provided access without having to wait behind other lower-priority requests. The SureConnect feature displays an alternate web page that notifies users that the resource that they requested is not available.

• **Denial-of-Service (DOS) attacks.** Any public-facing resource is vulnerable to attacks whose purpose is to bring that service down and deny legitimate users access to it. The Surge Protection, Priority Queuing, and SureConnect features help manage DOS attacks as well as other types of high load. In addition, the HTTP Denial-of-Service Protection feature targets DOS attacks against your web sites, sending challenges to suspected attackers and dropping connections if the clients do not send an appropriate response.

Until the current version of the NetScaler operating system, these features were implemented at the service level, which means that each service was assigned its own queues. While service-level queues work, they also have some disadvantages, most of which are due to the NetScaler appliance having to load balance requests before implementing any of the protection features that rely on queuing. Implementing protection features before queuing has a number of advantages, some of which are listed below:

• Absolute priority of connections as configured in the priority queuing feature can be maintained.
• Connections are not flushed if a service transitions state, as they are in a service-level queue.
• During periods of high load, such as a denial-of-service attack, HTTP DoS and SureConnect come into play before load balancing, allowing these features to detect and divert unwanted or lower-priority traffic from the load balancer before the load balancer must cope with it.

In addition to implementing fair queuing, AppQoE integrates a set of features that each provide a different set of tools to achieve a common goal: protecting your networked resources from excessive or inappropriate demand. Putting these features into a common framework enables you to configure and implement them more easily.

**Enabling AppQoE**

December 10, 2018

To configure AppQoE, you must first enable the feature.
To enable AppQoE by using the command line

At the command prompt, type the following commands:

- `enable ns feature appqoe`
- `show ns feature`

Example:

```
1 > enable ns feature appqoe
2    Done
3 > show ns feature
4
5      Feature      Acronym    Status
6  ------- ------- ------
7  1)  Web Logging  WL        ON
8  2)  Surge Protection  SP  ON
9  3)  Load Balancing  LB  ON
10 ...
11  1)  AppQoE   AppQoE    ON
12    Done
```

To enable AppQoE by using the GUI

1. Navigate to System > Settings.
2. In the details pane, click Configure Advanced Features.
3. In the Configure Advanced Features dialog box, select the AppQoE check box.
4. Click OK.

AppQoE actions

December 10, 2018

After enabling the AppQoE feature, you must configure one or more actions for handling requests.

Important: No specific individual parameters are required to create an action, but you must include at least one parameter or you cannot create the action.

To configure an AppQoE action by using the command line

At the command prompt, type the following commands:
NetScaler 11.1

- add appqoe action <name> [-priority <priority>] [-respondWith (ACS|NS)<customfile>] [-altContentSvcName <string>] [-altContentPath <string>] [-maxConn <positive_integer>] [-delay <usecs>] [-polqDepth <positive_integer>] [-priqDepth <positive_integer>] [-dosTrigExpression <expression>] [-dosAction ( **SimpleResponse** | **HICResponse** )]
- show appqoe action

Example

To configure priority queuing with policy queue depths of 10 and 1000 for medium and lowest priority queues, respectively:

```
> add appqoe action appqoe=act-basic-prhigh -priority HIGH
Done

> add appqoe action appqoe=act-basic-prmedium -priority MEDIUM -polqDepth 10
Done

> add appqoe action appqoe=act-basic-prlow -priority LOW -polqDepth 1000
Done

> show appqoe action
1) Name: appqoe=act-basic-prhigh
   ActionType: PRIORITY_QUEUING
   Priority: HIGH
   PolicyQdepth: 0
   Qdepth: 0

2) Name: appqoe=act-basic-prmedium
   ActionType: PRIORITY_QUEUING
   Priority: MEDIUM
   PolicyQdepth: 10
   Qdepth: 0

3) Name: appqoe=act-basic-prlow
   ActionType: PRIORITY_QUEUING
   Priority: LOW
   PolicyQdepth: 1000
   Qdepth: 0
Done
```
To modify an existing AppQoE action by using the command line

At the command prompt, type the following commands:

- show appqoe action

To remove an AppQoE action by using the command line

At the command prompt, type the following commands:

- rm appqoe action <name>
- show appqoe action

Parameters for configuring an AppQoE action

- name
  A name for the new action, or the name of the existing action that you want to modify. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols.
- priority
  The priority queue to which the request is assigned. When a protected web server or application is heavily loaded and cannot accept additional requests, specifies the order in which waiting requests are to be fulfilled when resources are available. The choices are:
  1. **HIGH**. Fulfills the request as soon as resources are available.
  2. **MEDIUM**. Fulfills the request after it has fulfilled all requests in the HIGH priority queue.
  3. **LOW**. Fulfills the request after it has fulfilled all requests in the HIGH and MEDIUM priority queues.
  4. **LOWEST**. Fulfills the request only after it has fulfilled all requests in higher-priority queues.

If priority is not configured, then the NetScaler appliance assigns the request to the LOWEST priority queue by default.

- respondWith
  Configures the NetScaler to take the specified Responder action when the specified threshold is reached. Must be used with one of the following settings:
- **ACS**: Serves content from an alternate content service. Threshold: maxConn (maximum connections) or delay.
- **NS**: Serves a built-in response from the NetScaler. Threshold: maxConn (maximum connections) or delay.
- **NO ACTION**: Serves no alternative content. Assigns connections to the LOWEST priority queue if the maxConn (maximum connections) or delay threshold is reached.

- **altContentSvcName**
  - If -responseWith ACS is specified, the name of the alternative content service, usually an absolute URL to the web server that hosts the alternate content.

- **altContentPath**
  - If -responseWith ( ACS | NS ) is specified, the path to the alternative content.

- **polqDepth**
  - Policy queue depth threshold value for the policy queue associated with this action. When the number of connections in the policy queue associated with this action increases to the specified number, subsequent requests are assigned to the LOWEST policy queue. Minimum value: 1 Maximum value: 4,294,967,294

- **priqDepth**
  - Policy queue depth threshold value for the specified priority queue. If the number of requests in the specified queue on the virtual server to which the policy associated with the current action is bound increases to the specified number, subsequent requests are assigned to the LOWEST priority queue. Minimum value: 1 Maximum value: 4,294,967,294

- **maxConn**
  - The maximum number of connections that can be open for requests that match the policy rule. Minimum value: 1 Maximum value: 4,294,967,294

- **delay**
  - The delay threshold, in microseconds, for requests that match the policy rule. If a matching request has been delayed for longer than the threshold, the NetScaler appliance performs the specified action. If NO ACTION is specified, then the appliance assigns requests to the LOWEST priority queue. Minimum value: 1 Maximum value: 599999,999

- **dosTrigExpression**
  - Adds an optional second-level check to trigger DoS actions.

- **dosAction**
NetScaler 11.1

Action to take when the ADC determines that it or a protected server is under DoS attack. Possible values: SimpleResponse, HICResponse.

These values specify HTTP challenge-response methods for validating the authenticity of incoming requests to mitigate an HTTP-DDoS attack.

In the HTTP challenge-response generation and validation process, AppQoE uses cookies to validate the client’s response and verify that the client seems to be genuine. When sending a challenge, a NetScaler appliance generates two cookies:

Header cookie (_DOSQ). Contains client-specific information, so that the NetScaler appliance can verify the response.

Body cookie (_DOSH). Information used to validate the client machine. The client’s browser (or the user, in the case of HIC) computes a value for this cookie. The NetScaler appliance compares that value with the expected value to verify the client.

The information that the appliance sends to the client for computing the _DOSH value is based on the DoS Action configuration.

1. SimpleResponse: In this case, a NetScaler appliance splits the value and generates a JavaScript code to combine the final value. A client machine capable of computing the original value is considered genuine.

2. HICResponse: in this case, a NetScaler appliance generates two single-digit numbers and generates images for those numbers. Then, using a backpatch framework, the appliance inserts those images as base64 strings.

Limitations:

1. This is not a trivial CAPTCHA implementation, which is why that term not used.

2. The validation number is based on a NetScaler-generated number that does not change for 120s. This number should be dynamic or client specific.

To configure an AppQoE action by using the GUI

1. Navigate to App-Expert > AppQoE > Actions.
2. In the details pane, do one of the following:
   • To create a new action, click Add.
   • To modify an existing action, select the action, and then click Edit.
3. In the Create AppQoE Action or the Configure AppQoE Action screen, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in “Parameters for configuring the AppQoE Action” as follows (asterisk indicates a required parameter):
   • Name—name
AppQoE parameters

December 10, 2018

In the AppQoE parameters, you configure the session life of an AppQoE session, the file name of the file containing the customized response, and the number of client connections that can be placed in a queue.

To configure the AppQoE parameter settings by using the command line

At the command prompt, type the following commands:

- set appqoe parameter [-sessionLife <secs>] [-avgwaitingclient <positive_integer>] [-MaxAltRespBandWidth <positive_integer>] [-dosAttackThresh <positive_integer>]
- show appqoe parameter

Parameters for configuring the AppQoE parameters

- sessionLife

  Number of seconds to wait after displaying alternate content before the ADC displays the same content again. Default value: 300 Maximum Minimum value: 1 Maximum value: 4,294,967,294

- avgwaitingclient

  The average number of client requests that can be in the service waiting queue. Default value: 1000000 Maximum value: 4,294,967,294

- MaxAltRespBandWidth

  The maximum bandwidth to consume when sending alternate responses. If the maximum is reached, the ADC quits sending the alternate content till bandwidth consumption drops. Default value: 100 Minimum value: 1 Maximum value: 4,294,967,294
- \texttt{dosAtckThrsh}

  The denial-of-service attack threshold. The number of connections that must be waiting in queues before the ADC responds with DoS protection measures. Default value: 2000 Minimum value: 0 Maximum value: 4,294,967,294

**To configure the AppQoE parameter settings by using the GUI**

1. Navigate to \texttt{AppExpert }\textgreater \texttt{AppQoE}.
2. In the details pane, click \texttt{Configure AppQoE Parameters}.
3. In the \texttt{Configure AppQoE params} screen, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in “Parameters for configuring the AppQoE Parameters” as follows (asterisk indicates a required parameter):
   - Session Life (secs) \texttt{sessionLife}
   - Average waiting client—\texttt{avgwaitingclient}
   - Alternate Response Bandwidth Limit(Mbps) —\texttt{MaxAltRespBandWidth}
   - DOS Attack Threshold —\texttt{dosAttackThresh}
4. Click \texttt{OK}.

**AppQoE Policies**

December 10, 2018

To implement AppQoE, you must configure at least one policy to tell your NetScaler how to distinguish the connections to be queued in a specific queue.

**To configure an AppQoE policy by using the command line**

At the command prompt, type the following command:

\texttt{add appqoe policy <name> -rule <expression> -action <string>}

**Example:**

The following example selects requests with a User-Agent header that contains “Android”, and assigns them to the medium priority queue. These requests come from smartphones and tablets that run the Google Android operating system.

```
1 > add appqoe action appqoe-act-primd -priority MEDIUM
2 Done
```
Parameters for configuring an AppQoE policy

- **name**
  A name for the AppQoE policy. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. You should chose a name that helps identify the type of action.

- **rule**
  A NetScaler expression that tells the appliance which connections it should handle. For complete information about policy expressions, see the NetScaler Policy Configuration and Reference Guide at .

- **action**
  The AppQoE action to perform when a connection matches the policy.

To configure an AppQoE policy by using the GUI

2. In the details pane, do one of the following:
   - To create a new policy, click Add.
   - To modify an existing policy, select the policy, and then click Edit.
3. If you are creating a new policy, in the Create AppQoE Policy dialog, in the Name text box, type a name for your new policy.
   The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols.
(=), colon (:), and underscore (_) symbols. You should choose a name that helps identify the purpose and effect of this policy.

If you are modifying an existing policy, skip this step. You cannot change the name of an existing policy.

4. In the Action drop-down list, choose the AppQoE action to perform when the policy matches a connection. Click the plus (+) to open the Add AppQoE Action dialog and add a new action.

5. In the Rule text box, either enter the policy expression directly, or click New to create a policy expression. If you click New, perform the following steps:
   a) In the Create Expression dialog box, click Add.
   b) In the Add Expression dialog box, select a common expression from the Frequently Used Expressions drop-down list, or use the Construct Expression drop-down lists to create the expression that defines which traffic to filter.

   If you choose to create your own expression, you start by selecting the first term from the first drop-down list on the left side of the Construct Expression area. The choices in that list are:
   - HTTP: All traffic to port 80 and port 443.
   - SYS:
   - CLIENT:
   - SERVER:
   - ANALYTICS:
   - TEXT:

   The default choice is HTTP. After you make a choice in the first drop-down list (or accept the default), you can choose the next term in your expression from the drop-down list to the right of it. The terms in that list and other lists that follow change depending on your previous choices; the lists offer only terms that are valid choices. Continue to select terms until you have finished the expression.

   Use the Help and Preview Expression areas for assistance when creating the expression. For a complete description of the available choices, see the NetScaler Policy Configuration and Reference Guide at .
   c) When you have created the expression that you want, click OK. The expression is added in the Expression text box.

6. Click Create. The expression appears in the Rule text box.
Entity templates

December 13, 2018

An entity template is a collection of configuration information for an individual entity on a NetScaler® appliance. It provides a specification and a set of defaults for a configurable NetScaler entity, such as a policy, virtual server, service, or action. By using a template that defines a set of defaults, you can quickly configure multiple entities that require a similar configuration while eliminating several configuration steps.

Entity templates are available only in the GUI. You use the NetScaler GUI to create, manage, and use any type of entity template. You can share entity templates with other administrators and manage local folders that contain the templates. You can also import entity templates from and export entity templates to your local computer.

Before creating a template, you should be familiar with the configuration of the entity.

Note: You use entity templates to configure individual entities. To configure multiple entities related to a particular Web application, you must use an application template. For more information, see “AppExpert Applications and Templates.”

How Entity Templates Work:

When you create a template for a NetScaler entity, you specify default values for the entity. You specify what values must be read-only, what values must not be displayed, and what values users can configure. You also configure the pages that compose the template import wizard. All the information and settings you provide are stored in the template file.

When a user imports the entity template to a NetScaler appliance, a wizard guides the user through the various pages that you configured for the template. The wizard displays the read-only parameter values and prompts the user to specify values for the configurable parameters. After the user follows the instructions in the wizard, the appliance creates the entity with the configured values.

For example, you can create an entity template for HTTP services that provides a text box for a service name and assigns preset values for the service protocol, timeouts, thresholds, and monitors. Later, when you use the template to create new HTTP services, a wizard prompts you for a service name and supplies the preset values that you would otherwise have configured manually.

The procedure for creating entity templates for load balancing virtual servers is different than the App-Expert procedure for creating other entity templates. For more information, see “Creating an Entity Template.”

In addition, the procedure for using the template to create the load balancing virtual server entity is different. For more information, see “Creating an Entity from a Template.”
Configuring an entity template

December 10, 2018

You can create or modify an entity template either from the AppExpert feature node or from the associated NetScaler feature node for the entity. For example, you can create a content switching virtual server entity template in either the AppExpert feature node or the content switching feature node in the GUI.

If you create a template that is not based on an existing entity, you can specify the following options and settings for the template:

- The default value of a parameter.
- Whether the default values are visible to users.
- Whether the default values can be changed by users.
- The number of pages in the entity import wizard, including the page names, text, and available parameters.
- The entities that must be bound to the entity for which the template is being created.

For example, when you are creating a cache redirection virtual server template, you can specify the policies that you want to bind to the cache redirection virtual servers that you create from the template. However, only binding information is included in the template. The bound entities are not included. If the entity template is imported to another NetScaler appliance, the bound entities must exist on the appliance at import time for the binding to succeed. If none of the bound entities exist on the target appliance, the entity (for which the template was configured) is created without any bindings. If only a subset of the bound entities exist on the target appliance, they are bound to the entity that is created from the template.

When you create a template based on an existing entity, the configuration settings of the entity appear in the template. All bound entities are selected by default, but you can modify bindings as necessary. As in the case of a template that is not based on an existing entity, only binding information is included and not the entities. You can either save the template with the existing configuration settings or use the settings as a basis for creating a new configuration for a template.

Configuring variables in load balancing virtual server templates

January 6, 2019

Load balancing virtual server templates support the declaration of variables in the configured load balancing parameters and in bound policies and actions. The ability to declare variables enables you to replace preconfigured values with values that suit the environment into which you are importing
the template. The Entity Template Wizard, which appears when you import a template, includes a
Specify Variable Values page on which you can specify appropriate values for the variables that are
configured for the entity template. This wizard page appears only when you import a template that is
configured with existing variables.

As an example, consider the following expression configured for a policy that is bound to a load bal-
ancing virtual server for which you are creating a template. The expression evaluates the value of the
Accept-Language header in an HTTP request.

HTTP.REQ.HEADER("Accept-Language") .CONTAINS("en-us")

If you want the value of the header to be configurable at import time, you can specify the string en-
us as a variable. When importing the template, you can specify a new value for the variable on the
Specify Variable Values page.

After you create a variable, you can do the following:

• Assign additional strings to an existing variable. After you create a variable for a string, you can
  select and assign other parts of the same or different expression to the variable. The strings you
  assign to a variable need not be the same. At import time, all the strings that are assigned to
  the variable are replaced with the value that you provide.
• View the string or strings that are assigned to the variable.
• View a list of all the entities and parameters that use the variable.

To configure variables in a load balancing virtual server template

1. Navigate to Traffic Management > Load Balancing > Virtual Servers
2. In the details pane, right-click the virtual server that you want to export to a template file, and
   then click Create Template.
3. In the Create Template dialog box, modify the default template file name if required, specify
   the location where you want to save the template, and then click Configure Variables.
4. In the Configure Variables dialog box, click the tab that lists the entity for which you want to
   configure a variable, select the entity, and then click Configure Variables.
5. In the Variables for Entity Type: Entity Name dialog box, click the button next to the parameter
   value or expression in which you want to create a variable.
6. In the variables for Field Name dialog box, do the following:
   • To create a variable, in the text box that displays the configured expression or value, select
     the string that you want to be configurable at import time, and then click Add. In the Create
     Variable dialog box, specify a name and a description for the variable, and then click Create.
The name of the variable, its value, and the description you provided appear in the Available Variables listing in the dialog box. The name you provide will be the name of the associated field in the template import wizard, and the description will appear as alt text when the user positions the mouse pointer over the field.

- To modify a variable, in the Available Variables list, click the variable, and then click **Open**. In the **Create Variable** dialog box, modify the value and the description, and then click **OK**.

The new value that you specify will not replace the text selected in the text box that displays the configured expression or value. However, when you import the template, the new value will be displayed as the default value for the variable in the template import wizard.

- To view all the strings that are assigned to a given variable, in the Available Variables listing, click the name of the variable. The strings that are assigned to the variable are highlighted.

- To view a list of all the parameters, expressions, and actions in which the variable is used, in the Available Variables listing, click the variable whose references you want to view, and then click **Show References**.

- To assign a string to an existing variable, in the text box that displays the expression you configured, select the string you want to assign to an existing variable, right-click the selection, click **Use existing Variable**, and then click the name of the variable to which you want to assign the string.

If a variable has multiple strings assigned to it, when you specify a new value for the variable during import, all strings assigned to the variable are replaced with the new value.

7. Click **Close**.

### Modifying an entity template

**December 10, 2018**

You can modify only the parameters, bindings, and pages configured for a template. The name and location of the template specified when the template was created cannot be changed. The NetScaler appliance does not provide you with the option of modifying a load balancing virtual server template.

**To modify an entity template by using the AppExpert feature node**

1. Navigate to **AppExpert > Templates**.
2. In the details pane, on the **Entity Templates** tab, select the template you want to change, and then click **Open**.
3. In the **Modify…Template** dialog box, follow the instructions to modify a template.
4. Click **Finish**, and then click **Exit**.

**To modify an entity template by using its corresponding feature node**

1. Navigate to **Traffic Management**, select the feature (for example, Content Switching), and then select the entity (for example, Virtual Servers) for which you want to modify the entity template.
2. At the top of the details pane, click **Entity Templates**, and then click **Manage Template**.
3. In the **Manage <feature entity name> Entity Templates** dialog box, select the template that you want to modify, and then click **Modify**.
4. In the **Modify <template name> Template** dialog box, follow the instructions to modify a template.
5. Click **Finish**, and then click **Exit**.
6. Click **Close**.

**Deleting an entity template**

December 10, 2018

Deleting an entity template does not affect any objects that have been created by using the template. You can delete a load balancing virtual server template only from the AppExpert feature node.

**To delete an entity template by using the AppExpert feature node**

1. Navigate to **AppExpert > Templates**.
2. In the details pane, on the **Entity Templates** tab, click the template you want to delete, and then click **Remove**.

**To delete an entity template by using its corresponding feature node**

1. Navigate to **Traffic Management**, and select the feature (for example, Content Switching) and then select the entity (for example, Virtual Servers), for which you want to delete the entity template.
2. At the top of the details pane, click **Entity Templates**, and then click **Manage Template**.
3. In the **Manage...Entity Templates** dialog box, select the template that you want to delete, and then click **Delete**.
Creating an entity from a template

December 13, 2018

You can create an entity from an entity template either from the AppExpert feature node in the NetScaler GUI or from the NetScaler feature node that corresponds to the type of entity that you want to create. For example, you can create a content switching virtual server from a template with either the AppExpert feature node or the content switching feature node in the GUI.

The procedure for creating a load balancing virtual server from a template is different than the App-Expert procedure for creating other entities from templates.

After you create an instance of an entity using an entity template, you can configure it in the same way that you would any other object of that type, such as by using the GUI or the command line.

To create an entity from a template by using the AppExpert feature node

1. Navigate to AppExpert > Templates.
2. In the details pane, do one of the following:
   a) To create any entity other than a load balancing virtual server from a template, on the Entity Templates tab, click the template that you want to use, and then click Use Template.
   b) To create a load balancing virtual server from a template, on the LB Templates tab, click the template that you want to use, and then click Use Template.
3. In the <Entity Template Name> wizard, follow the instructions to create the entity on the NetScaler.
4. Click Finish, and then click Exit.

To create an entity from a template by using its corresponding feature node

1. Navigate to Traffic Management, and expand a feature node (for example, Content Switching), and then click an entity subnode (for example, Virtual Servers).
2. At the top of the details pane, click Entity Templates, and then click Use Template.
3. Click the name of the template that you want to use.
4. In the Use <template name> Template wizard, follow the instructions to create the entity.
   Only templates that match the current context are displayed. For example, in the details pane for content switching virtual servers, only entity templates for content switching virtual servers appear, if configured.
5. Click Finish, and then click Exit.
To create a load balancing virtual server by using a load balancing virtual server template

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.

2. In the details pane, click **Use Template**.

3. In the **Entity Template Wizard**, follow the instructions to create a load balancing virtual server on the NetScaler.

   Only templates that match the current context are displayed. For example, when you click Browse (Appliance), only entity templates for load balancing virtual servers appear, if configured.

4. Click **Finish**, and then click **Exit**.

   **Note:** The **Entity Template Wizard** includes a **Specify Variable Values** page on which you can specify new values for variables. For more information about configuring variables in load balancing virtual server templates, see Configuring Variables in Load Balancing Virtual Server Templates.

Managing entity template folders

December 13, 2018

You can organize only load balancing virtual server template folders.

To organize load balancing virtual server template folders

1. Navigate to **AppExpert > Templates > LB Templates**.

2. In the **Manage LB Templates** dialog box do one of the following:

   - To change the name of a folder, select the folder and click **Rename**.
     
     You can also click the folder that you want to rename, and then press F2. You cannot rename the top-level default folder.

   - To remove the folder, select the folder and click **Delete**.
     
     You can also click the folder that you want to remove, and then press the Delete key. You cannot remove the top-level default folder.

3. Click **Close**.
Uploading and downloading entity templates

December 10, 2018

You can import the entity templates that are stored on your local computer. You can also download entity templates from the NetScaler appliance to your local computer and then import them to other NetScaler appliances.

To upload an entity template to the NetScaler appliance

1. Navigate to Traffic Management, and expand a feature node (for example, Content Switching), and then click a subnode (for example, Virtual Servers) for which you want to upload an entity template.
2. At the top of the details pane, click Entity Templates, and then click Manage Template.
3. In the Manage…Entity Templates dialog box, click the top-level folder, and then click Upload.
4. In the Upload Entity Template dialog box, navigate to the template file that you want to upload, and then click Select.
5. Click Close.

To download an entity template from the NetScaler appliance

1. Navigate to Traffic Management, and expand a feature node (for example, Content Switching), and then click a subnode (for example, Virtual Servers) for which you want to upload an entity template.
2. At the top of the details pane, click Entity Templates, and then click Manage Template.
3. In the Manage…Entity Templates dialog box, click the template that you want to download, and then click Download.
4. In the Download Entity Template dialog box, navigate to the location at which you want to save the template on your local computer, enter a file name, and then click Save.
5. Click Close.

Understanding load balancing entity templates and deployment files

December 10, 2018

Load balancing entity templates are created in the same way that NetScaler application templates are created. When you export a load balancing virtual server to a template file, the following two files are automatically created:
- **Load balancing virtual server template file.** Contains XML elements that store the values of the parameters that are configured for the load balancing virtual server. The file also contains XML elements for storing information about bound policies.

- **Deployment file.** Contains XML elements that store deployment-specific information such as services, service groups, and configured variables.

In the template and deployment files, each unit of configuration information is encapsulated in a specific XML element that is meant for that unit type. For example, the load balancing method parameter, <lbmethod> and </lbmethod> tags.

Note: After you export a load balancing virtual server, you can add elements, remove elements, and modify existing elements before importing the configuration information to a NetScaler appliance.

**Example of a load balancing virtual server template**

Following is an example of a template file that was created from a load balancing virtual server called “Lbvip”:

```xml
<?xml version="1.0" encoding="UTF-8" ?>
<template>
  <template_info>
    <entity_name>Lbvip</entity_name>
    <version_major>10</version_major>
    <version_minor>0</version_minor>
    <build_number>40.406</build_number>
  </template_info>
  <entitytemplate>
    <lbvserver_list>
      <lbvserver>
        <name>Lbvip</name>
        <servicetype>HTTP</servicetype>
        <ipv4>0.0.0.0</ipv4>
        <ipmask>**</ipmask>
        <port>0</port>
        <range>1</range>
        <persistencetype>NONE</persistencetype>
        <timeout>2</timeout>
        <persistencebackup>NONE</persistencebackup>
        <backuppersistencetimeout>2</backuppersistencetimeout>
        <lbmethod>LEASTCONNECTION</lbmethod>
        <persistmask>255.255.255.255</persistmask>
        <v6persistmask>128</v6persistmask>
      </lbvserver>
    </lbvserver_list>
  </entitytemplate>
</template>
```
Example of a deployment file

Following is the deployment file associated with the virtual server in the preceding example:
<template_deployment>
  <template_info>
    <entity_name>Lbvip</entity_name>
    <version_major>10</version_major>
    <version_minor>0</version_minor>
    <build_number>40.406</build_number>
  </template_info>
  <service_list>
    <service>
      <ip>1.2.3.4</ip>
      <port>80</port>
      <servicetype>HTTP</servicetype>
    </service>
  </service_list>
  <servicegroup_list>
    <servicegroup>
      <name>svcgrp</name>
      <servicetype>HTTP</servicetype>
      <servicegroup_servicegroupmember_binding_list>
        <servicegroup_servicegroupmember_binding>
          <ip>1.2.3.90</ip>
          <port>80</port>
        </servicegroup_servicegroupmember_binding>
        <servicegroup_servicegroupmember Binding>
          <ip>1.2.8.0</ip>
          <port>80</port>
        </servicegroup_servicegroupmember Binding>
        <servicegroup_servicegroupmember Binding>
          <ip>1.2.8.1</ip>
          <port>80</port>
        </servicegroup_servicegroupmember Binding>
        <servicegroup_servicegroupmember Binding>
          <ip>1.2.9.0</ip>
          <port>80</port>
        </servicegroup_servicegroupmember Binding>
      </servicegroup_servicegroupmember_binding_list>
    </servicegroup>
  </servicegroup_list>
</template_deployment>

HTTP callouts

December 10, 2018
For certain types of requests, or when certain criteria are met during policy evaluation, you might want to stall policy evaluation briefly, retrieve information from a server, and then perform a specific action that depends on the information that is retrieved. At other times, when you receive certain types of requests, you might want to update a database or the content hosted on a Web server. HTTP callouts enable you to perform all these tasks.

An HTTP callout is an HTTP or HTTPS request that the NetScaler appliance generates and sends to an external application when certain criteria are met during policy evaluation. The information that is retrieved from the server can be analyzed by default syntax policy expressions, and an appropriate action can be performed. You can configure HTTP callouts for HTTP content switching, TCP content switching, rewrite, responder, and for the token-based method of load balancing.

Before you configure an HTTP callout, you must set up an application on the server to which the callout will be sent. The application, which is called the HTTP callout agent, must be configured to respond to the HTTP callout request with the required information. The HTTP callout agent can also be a Web server that serves the data for which the NetScaler appliance sends the callout. You must make sure that the format of the response to an HTTP callout does not change from one invocation to another.

After you set up the HTTP callout agent, you configure the HTTP callout on the NetScaler appliance. Finally, to invoke the callout, you include the callout in a default syntax policy in the appropriate NetScaler feature and then bind the policy to the bind point at which you want the policy to be evaluated.

After you have configured the HTTP callout, you must verify the configuration to make sure that the callout is working correctly.

## How an HTTP callout works

January 6, 2019

When the NetScaler appliance receives a client request, the appliance evaluates the request against the policies bound to various bind points. During this evaluation, if the appliance encounters the HTTP callout expression, SYS.HTTP_CALLOUT(<name>), it stalls policy evaluation briefly and sends a request to the HTTP callout agent by using the parameters configured for the specified HTTP callout. Upon receiving the response, the appliance inspects the specified portion of the response, and then either performs an action or evaluates the next policy, depending on whether the evaluation of the response from the HTTP callout agent evaluates to TRUE or FALSE, respectively. For example, if the HTTP callout is included in a responder policy, if the evaluation of the response evaluates to TRUE, the appliance performs the action associated with the responder policy.

If the HTTP callout configuration is incorrect or incomplete, or if the callout invokes itself recursively, the appliance raises an UNDEF condition, and updates the undefined hits counter.
The following figure illustrates the working of an HTTP callout that is invoked from a globally bound responder policy. The HTTP callout is configured to include the IP address of the client that is associated with an incoming request. When the NetScaler appliance receives a request from a client, the appliance generates the callout request and sends it to the callout server, which hosts a database of blacklisted IP addresses and an HTTP callout agent that checks whether the client’s IP address is listed in the database. The HTTP callout agent receives the callout request, checks whether the client’s IP address is listed, and sends a response that the NetScaler appliance evaluates. If the response indicates that the client’s IP address is not blacklisted, the appliance forwards the response to the configured service. If the client’s IP address is blacklisted, the appliance resets the client connection.

Figure 1. HTTP Callout Entity Model

Notes on the format of HTTP requests and responses

December 10, 2018

The NetScaler appliance does not check for the validity of the HTTP callout request. Therefore, before you configure HTTP callouts, you must know the format of an HTTP request. You must also know the format of an HTTP response, because configuring an HTTP callout involves configuring expressions that evaluate the response from the HTTP callout agent.

This section includes the following sections:

- Format of an HTTP Request
- Format of an HTTP Response

Format of an HTTP request

An HTTP request contains a series of lines that each end with a carriage return and a line feed, represented as either <CR><LF> or \r\n.

The first line of a request (the message line) contains the HTTP method and target. For example, a message line for a GET request contains the keyword GET and a string that represents the object that is to be fetched, as shown in the following example:

```
GET /mysite/mydirectory/index.html HTTP/1.1\r\n
```

The rest of the request contains HTTP headers, including a required Host header and, if applicable, a message body.

The request ends with a blank line (an extra <CR><LF> or \r\n).

Following is an example of a request:
Format of an HTTP Response

An HTTP response contains a status message, response HTTP headers, and the requested object or, if the requested object cannot be served, an error message.

Following is an example of a response:

```
HTTP/1.1 200 OK
Content-Length: 55
Content-Type: text/html
Last-Modified: Wed, 12 Aug 1998 15:03:50 GMT
Accept-Ranges: bytes
ETag: "04f97692cbd1:377"
Date: Thu, 19 Jun 2008 19:29:07 GMT

<55-character response>
```
For the format of the HTTP callout request, you can specify the individual attributes of the HTTP callout request (an attribute-based HTTP callout), or you can specify the entire HTTP callout request as a default syntax expression (an expression-based HTTP callout).

**Note:**

The appliance does not check for the validity of the request. You must make sure that the request is a valid request. An incorrect or incomplete HTTP callout configuration results in a runtime UNDEF condition that is not associated with an action. The UNDEF condition merely updates the Undefined Hits counter, which enables you to troubleshoot an incorrectly configured HTTP callout. However, the appliance parses the HTTP callout request to enable you to configure certain NetScaler features for the callout. This can lead to an HTTP callout invoking itself. For information about callout recursion and how you can avoid it, see “Avoiding HTTP Callout Recursion.”

Finally, regardless of whether you use HTTP request attributes or an expression to define the format of the HTTP callout request, you must specify the format of the response from the HTTP callout agent and the portion of the response that you want to evaluate. The response can be a Boolean value, a number, or text. The portion of the response that you want to evaluate is specified by an expression. For example, if you specify that the response contains text, you can use HTTP.RES.BODY(<unit>) to specify that the appliance must evaluate only the first <unit> bytes of the response from the callout agent.

At the command line, you first create an HTTP callout by using the `add` command. When you add a callout, all parameters are set to a default value of NONE, except the HTTP method, which is set to a default value of GET. You then configure the callout’s parameters by using the set command. The set command is used to configure both types of callouts (attribute-based and expression-based). The difference lies in the parameters that are used for configuring the two types of callouts. Accordingly, the command-line instructions that follow include a set command for configuring an attribute-based callout and a set command for configuring an expression-based callout. In the GUI, all of these configuration tasks are performed in a single dialog box.

**Note:** Before you put an HTTP callout into a policy, you can modify all configured parameters except the return type. Once an HTTP callout is in a policy, you cannot completely modify an expression that is configured in the callout. For example, you cannot change

```
1  HTTP.REQ.HEADER("myval") to
2  CLIENT.IP.SRC. However, you can modify the operators and arguments that are passed to the expression. For example, you can change
3  HTTP.REQ.HEADER("myVal1") to
4  HTTP.REQ.HEADER("myVal2"), or
5  HTTP.REQ.HEADER("myVal") to
```
HTTP callout configuration involves configuring default syntax expressions.

**To configure an HTTP callout by using the command line interface**

At the command prompt, do the following:

1. Create a HTTP callout.

```plaintext
add policy httpCallout <name>
```

*Example*:

```plaintext
add policy httpCallout mycallout
```

1. Configure the details of the HTTP callout.
   - To configure an attribute-based HTTP callout, type:

```plaintext
set policy httpCallout <name> [-IPAddress <ip_addr|ipv6_addr*>] [-port <port[*]] [-vServer <string>] [-returnType <returnType>] [-httpMethod ( GET | POST )] [-hostExpr <string>] [-urlStemExpr <string>] [-headers <name(value)> ...] [-parameters <name(value)> ...] [-resultExpr <string>]
```

*Example*:

```plaintext
> set policy httpCallout mycallout -vserver lbv1 -returnType num -httpMethod GET -hostExpr 'http.req.header("Host")' -urlStemExpr "http.req.url" -parameters Name("My Name") -headers Name("MyHeader") -resultExpr "http.res.body(10000).length"
```

To configure an expression-based HTTP callout, type:

```plaintext
set policy httpCallout <name> [-vServer <string>] [-returnType <returnType>] [-httpMethod ( GET | POST )] [-fullReqExpr <string>] [-resultExpr <string>]
```

*Example*:

```plaintext
> set policy httpCallout mycallout1 -vserver lbv1 -returnType num -httpMethod GET
```
3. Verify the configurations of the HTTP callout.

```
show policy httpCallout <name>
```

**To configure an HTTP callout by using the GUI**

1. Navigate to **AppExpert > HTTP Callouts**.
2. In the details pane, click **Add**.
3. In the **Create HTTP Callout** dialog box, configure the parameters of the HTTP callout. For a description of the parameter, hover the mouse cursor over the check box.
4. Click **Create** and then click **Close**.

**Verifying the Configuration**

January 6, 2019

For an HTTP callout to work correctly, all the HTTP callout parameters and the entities associated with the callout must be configured correctly. While the NetScaler appliance does not check the validity of the HTTP callout parameters, it indicates the state of the bound entities, namely the server or virtual server to which the HTTP callout is sent. The following table lists the icons and describes the conditions under which the icons are displayed.

<table>
<thead>
<tr>
<th>Icon</th>
<th>Indicates that</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Icon" /></td>
<td>The state of the server that hosts the HTTP callout agent, or the load balancing, content switching, or cache redirection virtual server to which the HTTP callout is sent is UP.</td>
</tr>
<tr>
<td><img src="image" alt="Icon" /></td>
<td>The state of the server that hosts the HTTP callout agent, or the load balancing, content switching, or cache redirection virtual server to which the HTTP callout is sent is OUT OF SERVICE.</td>
</tr>
</tbody>
</table>
For an HTTP callout to function correctly, the icon must be green at all times. If the icon is not green, check the state of the callout server or virtual server to which the HTTP callout is sent. If the HTTP callout is not working as expected even though the icon is green, check the parameters configured for the callout.

You can also verify the configuration by sending test requests that match the policy from which the HTTP callout is invoked, checking the hits counter for the policy and the HTTP callout, and verifying the responses that the NetScaler appliance sends to the client.

**Note:**

An HTTP callout can sometimes invoke itself recursively a second time. If this happens, the hits counter is incremented by two counts for each callout that is generated by the appliance. For the hits counter to display the correct value, you must configure the HTTP callout in such a way that it does not invoke itself a second time. For more information about how you can avoid HTTP callout recursion, see [Avoiding HTTP Callout Recursion](#).

### To view the hits counter for an HTTP callout

1. Navigate to AppExpert > HTTP Callouts.
2. In the details pane, click the HTTP callout for which you want to view the hits counter, and then view the hits in the Details area.

### Invoking an HTTP Callout

December 10, 2018

After you configure an HTTP callout, you invoke the callout by including the `SYS.HTTP_CALLOUT(<name>)` expression in a default syntax policy rule. In this expression, `<name>` is the name of the HTTP callout that you want to invoke.

You can use default syntax expression operators with the callout expression to process the response and then perform an appropriate action. The return type of the response from the HTTP callout agent
determines the set of operators that you can use on the response. If the part of the response that you want to analyze is text, you can use a text operator to analyze the response. For example, you can use the `CONTAINS(<string>)` operator to check whether the specified portion of the response contains a particular string, as in the following example:

```
SYS.HTTP_CALLOUT(mycallout).contains("Good IP address")
```

If you use the preceding expression in a responder policy, you can configure an appropriate responder action.

Similarly, if the part of the response that you want to evaluate is a number, you can use a numeric operator such as `GT(int)`. If the response contains a Boolean value, you can use a Boolean operator.

**Note:** An HTTP callout can invoke itself recursively. HTTP callout recursion can be avoided by combining the HTTP callout expression with a default syntax expression that prevents recursion. For information about how you can avoid HTTP callout recursion, see [Avoiding HTTP Callout Recursion](#).

You can also cascade HTTP callouts by configuring policies that each invoke a callout after evaluating previously generated callouts. In this scenario, after one policy invokes a callout, when the NetScaler appliance is parsing the callout before sending the callout to the callout server, a second set of policies can evaluate the callout and invoke additional callouts, which can in turn be evaluated by a third set of policies, and so on. Such an implementation is described in the following example.

First, you could configure an HTTP callout called `myCallout1`, and then configure a responder policy, `Pol1`, to invoke `myCallout1`. Then, you could configure a second HTTP callout, `myCallout2`, and a responder policy, `Pol2`. You configure `Pol2` to evaluate `myCallout1` and invoke `myCallout2`. You bind both responder policies globally.

To avoid HTTP callout recursion, `myCallout1` is configured with a unique custom HTTP header called “Request1.” `Pol1` is configured to avoid HTTP callout recursion by using the default syntax expression,

```
HTTPREQ.HEADER("Request1").EQ("Callout Request").NOT.
```

`Pol2` uses the same default syntax expression, but excludes the .NOT operator so that the policy evaluates `myCallout1` when the NetScaler appliance is parsing it. Note that `myCallout2` identifies its own unique header called “Request2,” and `Pol2` includes a default syntax expression to prevent `myCallout2` from invoking itself recursively.

**Example:**

```
> add policy httpCallout myCallout1
Done
```
set policy httpCallout myCallout1 -IPAddress 10.102.3.95 -port 80 -returnType TEXT -hostExpr "10.102.3.95" -urlStemExpr "/cgi-bin/check_clnt_from_database.pl" -headers Request1 ("Callout Request") -parameters cip(CLIENT.IP.SRC) -resultExpr "HTTP.RES.BODY(100)"

add responder policy Pol1 "HTTP.REQ.HEADER("Request1").EQ("Callout Request").NOT & SYS.HTTP_CALLOUT(myCallout1).CONTAINS("IP Matched")" RESET

bind responder global Pol1 100 END -type OVERRIDE

set policy httpCallout myCallout2 -IPAddress 10.102.3.96 -port 80 -returnType TEXT -hostExpr "10.102.3.96" -urlStemExpr "/cgi-bin/check_clnt_location_from_database.pl" -headers Request2 ("Callout Request") -parameters cip(CLIENT.IP.SRC) -resultExpr "HTTP.RES.BODY(200)"

add responder policy Pol2 "HTTP.REQ.HEADER("Request2").EQ("Callout Request").NOT & HTTP.REQ.HEADER("Request1").EQ("Callout Request") && SYS.HTTP_CALLOUT(myCallout2).CONTAINS ("APAC")" RESET

bind responder global Pol2 110 END -type OVERRIDE

Done
Avoiding HTTP callout recursion

December 18, 2018

Even though the NetScaler appliance does not check for the validity of the HTTP callout request, it parses the request once before it sends the request to the HTTP callout agent. This parsing allows the appliance to treat the callout request as any other incoming request, which in turn allows you to configure several useful NetScaler features (such as integrated caching, SureConnect, and Priority Queuing) to work on the callout request.

However, during this parsing, the HTTP callout request can hit the same policy and therefore invoke itself recursively. The appliance detects the recursive invocation and raises an undefined (UNDEF) condition. However, the recursive invocation results in the policy and HTTP callout hit counters being incremented by two counts each instead of one count each.

To prevent a callout from invoking itself, you must identify at least one unique characteristic of the HTTP callout request, and then exclude all requests with this characteristic from being processed by the policy rule that invokes the callout. You can do so by including another default syntax expression in the policy rule. The expression must precede the `SYS.HTTP_CALLOUT(<name>)` expression so that it is evaluated before the callout expression is evaluated. For example:

```
Expression that prevents callout recursion && SYS.HTTP_CALLOUT(<name>)
```

When you configure a policy rule in this way, when the appliance generates the request and parses it, the compound rule evaluates to FALSE, the callout is not generated a second time, and the hit counters are incremented correctly.

One way by which you can assign a unique characteristic to an HTTP callout request is to include a unique custom HTTP header when you configure the callout. Following is an example of an HTTP callout called “myCallout.” The callout generates an HTTP request that checks whether a client’s IP address is present in a database of blacklisted IP addresses. The callout includes a custom header called “Request,” which is set to the value “Callout Request.” A globally bound responder policy, “Pol1,” invokes the HTTP callout but excludes all requests whose Request header is set to this value, thus preventing a second invocation of myCallout. The expression that prevents a second invocation is `HTTP.REQ.HEADER("Request").EQ("Callout Request").NOT.`

Example:

```
1  > add policy httpCallout myCallout
2    Done
3 4  > set policy httpCallout myCallout -IPAddress 10.102.3.95 -port 80 -returnType TEXT -hostExpr "10.102.3.95" -urlStemExpr "/cgi-bin"
```
NetScaler 11.1

/\check_clnt_from_database.pl"’ -headers Request("Callout Request") -parameters cip(CLIENT.IP.SRC) -resultExpr "HTTP.RES.BODY(100)"

> add responder policy Pol1 "HTTP.REQ.HEADER("Request").EQ("Callout Request") .NOT & & SYS.HTTP_CALLOUT(myCallout).CONTAINS("IP Matched "")" RESET

> bind responder global Pol1 100 END -type OVERRIDE

Note:
You can also configure an expression to check whether the URL of the request includes the URL stem expression that is configured for the HTTP callout. If you want to implement this scenario, make sure that the HTTP callout agent is dedicated to respond only to HTTP callouts and not to other client requests directed through the appliance. If the HTTP callout agent is an application or Web server that serves other client requests, such an expression will prevent the appliance from processing those client requests. Instead, use a unique custom header as described earlier.

Caching HTTP Callout Responses

December 10, 2018

For improved performance while using callouts, you can use the integrated caching feature to cache callout responses. The responses are stored in an integrated caching content group named callout-ContentGroup for a specified time duration.

Note: To cache callout responses, make sure that the integrated caching feature is enabled.

To set the cache duration by using the command line interface

At the command prompt, type:

set policy httpCallout <name> -cacheForSecs <secs>

Example:

> set httpcallout httpcallout1 -cacheForSecs 120
To set the cache duration by using the GUI

1. Navigate to AppExpert > HTTP Callouts.
2. In the details pane, select the HTTP callout for which you want to set the cache duration and click Open.
3. In the Configure HTTP Callout dialog box, specify the Cache Expiration Time.
4. Verify that you have entered the correct time duration, and then click OK.

Use Case: Filtering Clients by Using an IP Blacklist

January 6, 2019

HTTP callouts can be used to block requests from clients that are blacklisted by the administrator. The list of clients can be a publicly known blacklist, a blacklist that you maintain for you organization, or a combination of both.

The NetScaler appliance checks the IP address of the client against the pre-configured blacklist and blocks the transaction if the IP address has been blacklisted. If the IP address is not in the list, the appliance processes the transaction.

To implement this configuration, you must perform the following tasks:

1. Enable responder on the NetScaler appliance.
2. Create an HTTP callout on the NetScaler appliance and configure it with details about the external server and other required parameters.
3. Configure a responder policy to analyze the response to the HTTP callout, and then bind the policy globally.
4. Create an HTTP callout agent on the remote server.

Enabling Responder

You must enable responder before you can use it.

To enable responder by using the GUI

1. Make sure that you have installed the responder license.
2. In the GUI, expand AppExpert, and right-click Responder, and then click Enable Responder feature.
Creating an HTTP Callout on the NetScaler Appliance

Create an HTTP callout, HTTP_Callout, with the parameter settings shown in the following table. For more information about creating an HTTP callout, see Configuring an HTTP Callout pdf.

Configuring a Responder Policy and Binding it Globally

After you configure the HTTP callout, verify the callout configuration, and then configure a responder policy to invoke the callout. While you can create a responder policy in the Policies sub-node and then bind it globally by using the Responder Policy Manager, this demonstration uses the Responder Policy Manager to create the responder policy and bind the policy globally.

To create a responder policy and bind it globally by using the GUI

1. Navigate to AppExpert > Responder.
2. In the details pane, under Policy Manager, click Policy Manager.
3. In the Responder Policy Manager dialog box, click Override Global.
4. Click Insert Policy, and then, under Policy Name, click **New Policy.
5. In the Create Responder Policy dialog box, do the following:
   a) In Name, type Policy-Responder-1.
   b) In Action, select RESET.
   c) In Undefined-Result Action, select Global undefined-result action.
   d) In Expression, type the following default syntax expression:

```
1 "HTTP.REQ.HEADER("Request\")\".EQ("Callout Request\")\".NOT && SYS.HTTP_CALLOUT(HTTP_Callout).CONTAINS("IP Matched")"
```
   e) Click Create, and then click Close.
6. Click Apply Changes, and then click Close.

Creating an HTTP Callout Agent on the Remote Server

You must now create an HTTP callout agent on the remote callout server that will receive callout requests from the NetScaler appliance and respond appropriately. The HTTP callout agent is a script that is different for each deployment and must be written with the server specifications in mind, such as the type of database and the scripting language supported.

Following is a sample callout agent that verifies whether the given IP address is part of an IP blacklist. The agent has been written in the Perl scripting language and uses a MYSQL database.
The following CGI script checks for a given IP address on the callout server.

```perl
#!/usr/bin/perl -w
print "Content-type: text/html\n\n";
use DBI;
use CGI qw(:standard);
# Take the Client IP address from the request query
my $ip_to_check = param('cip');
# Where a MYSQL database is running
my $dsn = 'DBI:mysql:BAD_CLIENT:localhost';
# Database username to connect with
my $db_user_name = 'dbuser';
# Database password to connect with
my $db_password = 'dbpassword';
my ($id, $password);
# Connecting to the database
my $dbh = DBI->connect($dsn, $db_user_name, $db_password);
my $sth = $dbh->prepare(qq{
    select * from bad_clnt
});
$sth->execute();
while (my ($ip_in_database) = $sth->fetchrow_array()) {
    chomp($ip_in_database);
    # Check for IP match
    if ($ip_in_database eq $ip_to_check) {
        print "\nIP Matched\n";
        $sth->finish();
        exit;
    }
}
print "\nIP Failed\n";
$sth->finish();
exit;
```

**Use Case: ESI Support for Fetching and Updating Content Dynamically**

January 6, 2019

Edge Side Includes (ESI) is a markup language for edge-level dynamic Web content assembly. It helps
in accelerating dynamic Web-based applications by defining a simple markup language to describe
cacheable and non-cacheable Web page components that can be aggregated, assembled, and deliv-
ered at the network edge. By using HTTP callouts on the NetScaler appliance, you can read through
the ESI constructs and aggregate or assemble content dynamically.

To implement this configuration, you must perform the following tasks:

1. Enable rewrite on the NetScaler appliance.
2. Create an HTTP callout on the appliance and configure it with details about the external server
   and other required parameters.
3. Configure a rewrite action to replace the ESI content with the callout response body.
4. Configure a rewrite policy to specify the conditions under which the action is performed, and
   then bind the rewrite policy globally.

**Enabling Rewrite**

Rewrite must be enabled before it is used on the NetScaler appliance. The following procedure de-
scribes the steps to enable the rewrite feature.

**To enable rewrite by using the GUI**

1. Make sure that you have installed the rewrite license.
2. In the GUI, expand AppExpert, and right-click Rewrite, and then click Enable Rewrite feature.

**Creating an HTTP Callout on the NetScaler Appliance**

For more information about creating an HTTP callout, see
Configuring an HTTP Callout.
For more information about the parameter values, see Parameters and Values for HTTP-Callout-2 pdf.

**Configuring the rewrite action**

Create a rewrite action, Action-Rewrite-1, to replace the ESI content with the callout response body.
Use the parameter settings shown in the following table.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Action-Rewrite-1</td>
</tr>
<tr>
<td>Type</td>
<td>Replace</td>
</tr>
</tbody>
</table>
To configure the rewrite action by using the GUI

1. Navigate to AppExpert > Rewrite > Actions.
2. In the details pane, click Add.
3. In the Create Rewrite Action dialog box, in Name, type Action-Rewrite-1.
4. In Type, select REPLACE.
5. In Expression to choose target text reference, type the following default syntax expression:

```
"HTTP.RES.BODY(500).AFTER_STR \"<example>\"\".BEFORE_STR \"</example>\"
```

1. In the String expression for replacement text, type the following string expression:

```
"SYS.HTTP_CALLOUT(HTTP-Callout-2)"
```

1. Click Create, and then click Close.

Creating the rewrite policy and binding it globally

Create a rewrite policy, Policy-Rewrite-1, with the parameter settings shown in the following table.

You can create a rewrite policy in the
Policies subnode and then bind it globally by using the
Rewrite Policy Manager. Alternatively, you can use the
Rewrite Policy Manager to perform both these tasks simultaneously. This demonstration uses the
Rewrite Policy Manager to perform both tasks.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Policy-Rewrite-1</td>
</tr>
<tr>
<td>Action</td>
<td>Action_Rewrite-1</td>
</tr>
<tr>
<td>Undefined Result Action</td>
<td>-Global undefined-result action-</td>
</tr>
</tbody>
</table>
To configure a rewrite policy and bind it globally by using the GUI

1. Navigate to AppExpert > Rewrite.
2. In the details pane, under Policy Manager, click Rewrite Policy Manager.
3. In the Rewrite Policy Manager dialog box, click Override Global.
4. Click Insert Policy, and then, in the Policy Name column, click New Policy.
5. In the Create Rewrite Policy dialog box, do the following:
   - In Name, type Policy-Rewrite-1.
     a) In Action, select Action-Rewrite-1.
     b) In Undefined-Result Action, select Global undefined-result action.
     c) In Expression, type the following default syntax expression:

   

   ```
   "HTTP.REQ.HEADER("Name")\CONTAINS\("Callout")\NOT"
   ```

5. Click Create, and then click Close.
6. Click Apply Changes, and then click Close.

Use Case: Access control and authentication

January 6, 2019

In high security zones, it is mandatory to externally authenticate the user before a resource is accessed by clients. On the NetScaler appliance, you can use HTTP callouts to externally authenticate the user by evaluating the credentials supplied. In this example, the assumption is that the client is sending the user name and password through HTTP headers in the request. However, the same information could be fetched from the URL or the HTTP body.

To implement this configuration, you must perform the following tasks:

1. Enable the responder feature on the NetScaler appliance.
2. Create an HTTP callout on the appliance and configure it with details about the external server and other required parameters.
3. Configure a responder policy to analyze the response, and then bind the policy globally.
4. Create a callout agent on the remote server.

**Enabling responder**

The responder feature must be enabled before it is used on the NetScaler appliance.

**To enable responder by using the GUI**

1. Make sure that the responder license is installed.
2. In the GUI, expand **AppExpert**, and right-click **Responder**, and then click **Enable Responder** feature.

**Creating an HTTP Callout on the NetScaler Appliance**

Create an HTTP callout, HTTPCallout, with the parameter settings shown in the following table. For more information about creating an HTTP callout, see *Configuring an HTTP Callout*.

Refer to **HTTP callout** table, for more information about its parameters and values.

**Creating a Responder policy to analyze the response**

Create a responder policy, Policy-Responder-3, that will check the response from the callout server and RESET the connection if the source IP address has been blacklisted. Create the policy with the parameters settings shown in the following table. While you can create a responder policy in the Policies subnode and then bind it globally by using the Responder Policy Manager, this demonstration uses the Responder Policy Manager to create the responder policy and bind the policy globally.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Policy-Responder-3</td>
</tr>
<tr>
<td>Action</td>
<td>RESET</td>
</tr>
<tr>
<td>Undefined-Result-Action</td>
<td>-Global undefined-result action-</td>
</tr>
</tbody>
</table>
Table 2. Parameters and Values for Policy-Responder-3

To create a responder policy and bind it globally by using the GUI

1. Navigate to AppExpert > Responder.
2. In the details pane, under Policy Manager, click Responder Policy Manager.
3. In the Responder Policy Manager dialog box, click Override Global.
4. Click Insert Policy, and then, in the Policy Name column, click New Policy.
5. In the Create Responder Policy dialog box, do the following:
   a) In Name, type Policy-Responder-3.
   b) In Action, select RESET.
   c) In Undefined-Result Action, select Global undefined-result action.
   d) In the Expression text box, type:

   ```
   "HTTP.REQ.HEADER("Request")\".EQ("Callout Request\")\".NOT &\n   SYS.HTTP_CALLOUT(HTTP-Callout-3).CONTAINS("Authentication\n   Failed\")"
   ```

   e) Click Create, and then click Close.
6. Click Apply Changes, and then click Close.

Creating an HTTP Callout agent on the remote server

You now need to create an HTTP callout agent on the remote callout server. The HTTP callout agent
receives callout requests from the NetScaler appliance and responds appropriately. The callout agent
is a script that is different for each deployment and must be written with server specifications in mind,
such as the type of database and the scripting language supported.

Following is sample callout agent pseudo-code that verifies whether the supplied user name and pass-
word are valid. The agent can be implemented in any programming language of your choice. The
pseudo-code is to be used only as a guideline for developing the callout agent. You can build addi-
tional functionality into the program.

To verify the supplied user name and password by using pseudo-code

1. Accept the user name and password supplied in the request and format them appropriately.
2. Connect to the database that contains all the valid user names and passwords.
3. Check the supplied credentials against your database.
4. Format the response as required by the HTTP callout.
5. Send the response to the NetScaler appliance.
Use Case: OWA-Based Spam Filtering

January 6, 2019

Spam filtering is the ability to dynamically block emails that are not from a known or trusted source or that have inappropriate content. Spam filtering requires an associated business logic that indicates that a particular kind of message is spam. When the NetScaler appliance processes Outlook Web Access (OWA) messages based on the HTTP protocol, HTTP callouts can be used to filter spam.

You can use HTTP callouts to extract any portion of the incoming message and check with an external callout server that has been configured with rules that are meant for determining whether a message is legitimate or spam. In case of spam email, for security reasons, the NetScaler appliance does not notify the sender that the email is marked as spam.

The following example conducts a very basic check for various listed keywords in the email subject. These checks can be more complex in a production environment.

To implement this configuration, you must perform the following tasks:

1. Enable the responder feature on the NetScaler appliance.
2. Create an HTTP callout on the NetScaler appliance and configure it with details about the external server and other required parameters.
3. Create a responder policy to analyze the response, and then bind the policy globally.
4. Create a callout agent on the remote server.

Enabling Responder

The responder feature must be enabled before it can be used on the NetScaler appliance.

To enable responder by using the GUI

1. Make sure that the responder license is installed.
2. In the GUI, expand AppExpert, and right-click Responder, and then click Enable Responder feature.

Creating an HTTP Callout on the NetScaler Appliance

Create an HTTP callout, HTTPCallout, with the parameter settings shown in the following table. For more information about creating an HTTP callout, see Configuring an HTTP Callout.

For more information, see Parameters and Values for HTTCallout pdf.
Creating a Responder Action

Create a responder action, Action-Responder-4. Create the action with the parameter settings shown in the following table.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Action-Responder-4</td>
</tr>
<tr>
<td>Type</td>
<td>Respond with</td>
</tr>
<tr>
<td>Target</td>
<td>&quot;&quot;HTTP/1.1 200 OK\r\nServer: Microsoft-IIS/6.0\r\nX-Powered-By: ASP.NET\r\nContent-Length: 0\r\nMS-WebStorage: 6.5.6944\r\nCache-Control: no-cache\r\n\n&quot;&quot;</td>
</tr>
</tbody>
</table>

Table 2. Parameters and Values for Action-Responder-4

To create a responder action by using the GUI

2. In the details pane, click Add.
3. In the Create Responder Action dialog box, in Name, type Action-Responder-4.
4. In Type, click Respond with.
5. In Target, type:

   ""HTTP/1.1 200 OK\r\nServer: Microsoft-IIS/6.0\r\nX-Powered-By: ASP.NET\r\nContent-Length: 0\r\nMS-WebStorage: 6.5.6944\r\nCache-Control: no-cache\r\n\n""

1. Click Create, and then click Close.

Creating a Responder Policy to Invoke the HTTP Callout

Create a responder policy, Policy-Responder-4, that will check the request body and, if the body contains the word “subject,” invoke the HTTP callout to verify the email. Create the policy with the parameter settings shown in the following table. While you can create a responder policy in the
Policies subnode and then bind it globally by using the Responder Policy Manager, this demonstration uses the Responder Policy Manager to create the responder policy and bind it globally.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Policy-Responder-4</td>
</tr>
<tr>
<td>Action</td>
<td>Action-Responder-4</td>
</tr>
<tr>
<td>Undefined-Result-Action</td>
<td>-Global undefined-result action-</td>
</tr>
<tr>
<td>Expression</td>
<td>&quot;HTTP.REQ.BODY(1000).CONTAINS(&quot;urn:schemas:httpmail:subject&quot;) &amp;&amp; SYS.HTTP_CALLOUT(HTTP-Callout-4)&quot;</td>
</tr>
</tbody>
</table>

To create a responder policy by using the GUI

1. Navigate to **AppExpert > Responder**.
2. In the details pane, under **Policy Manager**, click **Responder policy** manager.
3. In the **Responder Policy Manager** dialog box, click **Override Global**.
4. Click **Insert Policy**, and then, in the **Policy Name** column, click **New Policy**.
5. In the **Create Responder Policy** dialog box, do the following:
   a) In Name, type **Policy-Responder-4**.
   b) In Action, click **Action-Responder-4**.
   c) In Undefined-Result Action, click **Global undefined-result** action.
   d) In the **Expression** text box, type:

   ```
   "HTTP.REQ.BODY(1000).CONTAINS("urn:schemas:httpmail:subject") && SYS.HTTP_CALLOUT(HTTP-Callout-4)"
   ```

   e) Click **Create**, and then click **Close**.
6. Click **Apply Changes**, and then click **Close**.

Creating an HTTP Callout Agent on the Remote Server

You will now need to create an HTTP callout agent on the remote callout server. The HTTP callout agent receives callout requests from the NetScaler appliance and responds accordingly. The callout agent is a script that is different for each deployment and must be written with server specifications in mind, such as the type of database and the scripting language supported.

The following pseudo-code provides instructions for creating a callout agent that checks a list of words that are generally understood to indicate spam mails. The agent can be implemented in any program-
To identify spam email by using pseudo-code

1. Accept the email subject provided by the NetScaler appliance.
2. Connect to the database that contains all the terms against which the email subject is checked.
3. Check the words in the email subject against the spam word list.
4. Format the response as required by the HTTP callout.
5. Send the response to the NetScaler appliance.

Use Case: Dynamic Content Switching

December 18, 2018

This use case provides dynamic content switching by using an HTTP callout to get the name of the load balancing virtual server to which the request is forwarded.

1. Add a content switching virtual server.

   1 > add cs vserver cs_vserver1 HTTP 10.102.29.196 80

2. Create an HTTP callout.

   1 > add policy httpCallout http_callout1

3. Configure the HTTP callout to respond with the name of the load balancing virtual server from a request that contains the client IP address in the HTTP header “X-CLIENT-IP”.

4. Configure the content switching action to retrieve the callout response.

   1 > add cs action cs_action1 -targetVserverExpr 'SYS.HTTP_CALLOUT(http_callout1)'

Note: You must bind a load balancing virtual server to the content switching virtual server to account for:
The non-availability of the load balancing virtual server that the callout resolves to.
A UNDEF condition that results from the execution of the callout.

```
1 > bind cs vserver cs_vserver1 -lbvserver default_lbvip
```

5. Configure the content switching policy.

```
1 > add cs policy cs_policy1 -rule true -action cs_action1
```

6. Binding the content switching policy to the content switching virtual server.

```
1 > bind cs vserver cs_vserver1 -policyName cs_policy1 -priority 10
```

**Pattern sets and data sets**

December 10, 2018

Policy expressions for string matching operations on a large set of string patterns tend to become long and complex. Resources consumed by the evaluation of such complex expressions are significant in terms of processing cycles, memory, and configuration size. You can create simpler, less resource-intensive expressions by using pattern matching.

Depending on the type of patterns that you want to match, you can use one of the following features to implement pattern matching:

- A pattern set is an array of indexed patterns used for string matching during default syntax policy evaluation. Example of a pattern set: `imagetypes {svg, bmp, png, gif, tiff, jpg}`.
- A data set is a specialized form of pattern set. It is an array of patterns of types number (integer), IPv4 address, or IPv6 address.

In many cases, you can use either pattern sets or data sets. However, in cases where you want specific matches for numerical data or IPv4 and IPv6 addresses, you must use data sets.

**Note:**

Pattern sets and data sets can be used only in default syntax policies.

To use pattern sets or data sets, first create the pattern set or data set and bind patterns to it. Then, when you configure a policy for comparing a string in a packet, use an appropriate operator and pass the name of the pattern set or data set as an argument.
How string matching works with pattern sets and data sets

January 6, 2019

A pattern set or data set contains a set of patterns, and each pattern is assigned a unique index. When a policy is applied to a packet, an expression identifies a string to be evaluated, and the operator compares the string to the patterns defined in the pattern set or data set until a match is found or all patterns have been compared. Then, depending on its function, the operator returns either a boolean value that indicates whether or not a matching pattern was found or the index of the pattern that matches the string.

**Note:** This topic explains the working of a pattern set. Data sets work the same way. The only difference between pattern sets and data sets is the type of patterns defined in the set.

Consider the following use case to understand how patterns can be used for string matching.

You want to determine whether the URL suffix (target text) contains any of the image file extensions. Without using pattern sets, you would have to define a complex expression, as follows:

```
1 HTTP.REQ.URL.SUFFIX.CONTAINS("svg") || HTTP.REQ.URL.SUFFIX.CONTAINS("bmp") || HTTP.REQ.URL.SUFFIX.CONTAINS("png") ||
2 HTTP.REQ.URL.SUFFIX.CONTAINS("gif") || HTTP.REQ.URL.SUFFIX.CONTAINS("tiff") || HTTP.REQ.URL.SUFFIX.CONTAINS("jpg")
```

If the URL has a suffix of “jpg,” with the above compound expression, the Citrix ADC appliance has to iterate through the entire compound expression sequentially, from one sub expression to the next, to determine that the request refers to a jpg image. The following figure shows the steps in the process.

When a compound expression includes hundreds of sub expressions, the above process is resource intensive. A better alternative is an expression that invokes a pattern set, as shown in the following figure.

During policy evaluation as shown above, the operator (CONTAINS_ANY) compares the string identified in the request with the patterns defined in the pattern set until a match is found. With the Sample_Patset expression, the multiple iterations through six sub expressions are reduced to just one.

By eliminating the need to configure compound expressions that perform string matching with multiple OR operations, pattern sets or data sets simplify configuration and accelerate processing of requests and responses.

**Configuring a Pattern Set**

December 10, 2018
To configure a pattern set, you must specify the strings that are to serve as patterns. You can manually assign a unique index value to each of these patterns, or you can allow the index values to be assigned automatically.

Note: Pattern sets are case sensitive (unless you specify the expression to ignore case). Therefore, the string pattern “product1,” for example, is not the same as the string pattern “Product1.”

Points to remember about index values:

- You cannot bind the same index value to more than one pattern.
- An automatically assigned index value is one number larger than the highest index value of the existing patterns within the pattern set. For example, if the highest index value of existing patterns in a pattern set is 104, the next automatically assigned index value will be 105.
- If you do not specify an index for the first pattern, index value 1 is automatically assigned to that pattern.
- Index values are not regenerated automatically if one or more patterns are deleted or modified. For example, if the set contains five patterns, with indexes from 1 through 5, and if the pattern with an index of 3 is deleted, the other index values in the pattern set are not automatically regenerated to produce values from 1 through 4.
- The maximum index value that can be assigned to a pattern is 4294967290. If that value is already assigned to a pattern in the set, you must manually assign index values to any newly added patterns. An unused index value that is lower than a currently used value cannot be assigned automatically.

To configure a pattern set by using the command line interface

At the command prompt, do the following:

1. Create a pattern set.

    add policy patset <name>

    Example:

    1 > add policy patset samplepatset

2. Bind patterns to the pattern set.

    bind policy patset <name> <string> [-index <positive_integer>]

    Example:

    1 > bind policy patset samplepatset product1 -index 1

    Note: Repeat this step for all the patterns you want to bind to the pattern set.
3. Verify the configuration.
   
   `show policy patset <name>`

**To configure a pattern set by using the configuration utility**

1. Navigate to **AppExpert > Pattern Sets**.
2. In the details pane, click **Add** to open the **Create Pattern Set** dialog box.
3. Specify a name for the pattern set in the Name text box.
4. Under Specify Pattern, type the first pattern and, optionally, specify values for the following parameters:
   - **Treat back slash as escape character**—Select this check box to specify that any backslash characters that you might include in the pattern are to be treated as escape characters.
   - **Index**—A user assigned index value, from 1 through 4294967290.
5. Verify that you have entered the correct characters, and then click **Add**.
6. Repeat steps 4 and 5 to add additional patterns, and then click **Create**.

**Configuring a data set**

December 18, 2018

To configure a data set, you must specify the strings that are to serve as patterns, and assign a type (number, IPv4 address, or IPv6 address) to each pattern. You can manually assign a unique index value to each of these patterns, or you can allow the index values to be assigned automatically. Dataset is not related to HTTP or any 7 layer protocol. It works only on text/string. There are different types of dataset such as num, ulong, ipv4, and ipv6. To use a dataset on IP, we have to convert the input into text/string.

Note: Data sets are case sensitive (unless you specify the expression to ignore case). Therefore, the string pattern “product1,” for example, is not the same as the string pattern “Product1.”

The rules applied for index values of data sets are the same as those applied for pattern sets. For information about index values, see **Configuring a Pattern Set**.

**To configure a data set by using the command line interface**

At the command prompt, do the following:

1. Create a data set.
   
   `add policy dataset <name> <type>`

   **Example:**
1. Bind patterns to the data set.

```bash
bind policy dataset <name> <value> [-index <positive_integer>]
```

**Example:**

```bash
> bind policy dataset sampledataset 10.102.29.1 -index 1
```

**Note:**
Repeat this step for all the patterns you want to bind to the data set.

1. add policy expression sampleexpression client.ip.src.typecast_text_t.equals_any("sampledataset")
2. Verify the configuration.

```bash
show policy dataset <name>
```

**To configure a data set by using the configuration utility**

Navigate to **AppExpert > Data Sets**, click **Add** and specify the relevant details.

**Using pattern sets and data sets**

January 6, 2019

Default syntax policy expressions that take pattern sets or data sets as an argument can be used to perform string matching operations.

The usage is as follows:

```bash
<text>.<operator>("<name>")
```

where,

- `<text>` is the expression that identifies a string in a packet. Example: HTTP.REQ.HEADER("Host").
- `<operator>` is one of the operators described in the Pattern Set Types table pdf.

For sample usage, see **Sample Usage**.
Sample usage

December 10, 2018

To understand the usage of pattern sets in expressions, consider the example of a pattern set named “imagetypes.”

<table>
<thead>
<tr>
<th>Patterns</th>
<th>Index value</th>
</tr>
</thead>
<tbody>
<tr>
<td>svg</td>
<td>1</td>
</tr>
<tr>
<td>bmp</td>
<td>2</td>
</tr>
<tr>
<td>png</td>
<td>3</td>
</tr>
<tr>
<td>gif</td>
<td>4</td>
</tr>
<tr>
<td>tiff</td>
<td>5</td>
</tr>
<tr>
<td>jpg</td>
<td>6</td>
</tr>
</tbody>
</table>

Table 1. Pattern set “imagetypes”

**Example 1:** Determine whether the suffix of an HTTP request is one of the file extensions defined in the “imagetypes” pattern set.

- **Expression.** HTTP.REQ.URL.SUFFIX.EQUALS_ANY(“imagetypes”)
- **Sample URL.** [http://www.example.com/homepageicon.jpg](http://www.example.com/homepageicon.jpg)
- **Result.** TRUE

**Example 2:** Determine whether the suffix of an HTTP request is one of the file extensions defined in the “imagetypes” pattern set, and return the index of that pattern.

- **Expression.** HTTP.REQ.URL.SUFFIX.EQUALS_INDEX(“imagetypes”)
- **Sample URL.** [http://www.example.com/mylogo.gif](http://www.example.com/mylogo.gif)
- **Result.** 4 (The index value of the pattern “gif”)

**Example 3:** Use the index value of a pattern to determine whether the URL suffix is within a specified index-value range.

- **Expression.** HTTP.REQ.URL.SUFFIX.EQUALS_INDEX(“imagetypes”).GE(3) && HTTP.REQ.URL.SUFFIX.EQUALS_INDEX(“imagetypes”).LE(5)
- **Sample URL.** [http://www.example.com/mylogo.gif](http://www.example.com/mylogo.gif)
- **Result.** TRUE (The index value of gif file types is 4.)

**Example 4:** Implement one set of policies for file extensions bmp, jpg, and png, and a different set of policies for gif, tiff, and svg files.

An expression that returns the index of a matched pattern can be used to define traffic subsets for
a web application. The following two expressions could be used in content switching policies for a content switching virtual server:

- HTTP.REQ.URL.SUFFIX.EQUALS_INDEX("imagetypes").LE(3)
- HTTP.REQ.URL.SUFFIX.EQUALS_INDEX("imagetypes").GE(4)

Variables

December 10, 2018

Variables are named objects that store information in the form of tokens. These tokens are used within and across different transactions on the NetScaler Appliance for internal computation and policy processing.

The NetScaler appliance supports creation of variables of the following types:

- **Singleton variables.** Can have a single value of one of the following types: ulong and text (max-size). The ulong type is an unsigned 64-bit integer, the text type is a sequence of bytes, and max-size is the maximum number of bytes in the sequence.

- **Map variables.** Maps hold values associated with keys: each key-value pair is called a map entry. The key for each entry is unique within the map. Maps are specified as follows:

  map (key_type, value_type, max-values).

  where,

  - *key_type* is the data type of the key. It is of type text (max-size).

  - *value_type* is the data type of the values of the map. It can be of type ulong or text (max-size).

  - *max-values* is the maximum number of entries that the map can contain. It is of type ulong.

Values for these variables are set using assignments which must be invoked on policy actions.

- **Note:** Variables are not yet supported in a high-availability setup or in a cluster.

Variables Scope

A map variable or a singleton variable can have a global scope. Alternatively, the scope of a singleton variable can be limited to a single transaction.
• **Global Scope Variable** - A variable with global scope (the default) has only one instance, and that instance has the same value(s) across all cores of a NetScaler appliance and across all nodes of a cluster or HA configuration. Global variable values exist until they are explicitly deleted, until they expire, or until a standalone appliance is restarted or all nodes of a cluster or HA configuration are restarted.

• **Transaction Scope Variable** - A variable with transaction scope has a separate instance, with its own value, for each transaction processed by the NetScaler appliance. When the transaction processing is complete, the transaction variable value is deleted.

**Note**: Transaction scope variables are available in NetScaler release 10.5.e or later.

### Configuring and using Variables

December 10, 2018

You must first create a variable and then assign a value or specify the operation that must be performed on the variable. After performing these operations, you can use the assignment as a policy action.

Note: Once configured, a variable's settings cannot be modified or reset. If the variable needs to be changed, the variable and all references to the variable (expressions and assignments) must be deleted. The variable can then be re-added with new settings, and the references (expressions and assignments) can be re-added.

### To configure variables by using the command line interface

1. Create a variable.

   ```
   add ns variable <name> -type <string> [−scope global] [−ifFull ( undef | lru )] [−ifValueTooBig ( undef | truncate )] [−ifNoValue ( undef | init )] [−init <string>] [−expires <positive_integer>] [−comment <string>]
   ```

   **Note**: Refer to the man page “man add ns variable” for description of the command parameters.

   Example 1: Create a ulong variable named “my_counter” and initialize it to 1.

   ```
   add ns variable my_counter -type ulong -init 1
   ```

   Example 2: Create a map named “user_privilege_map”. The map will contain keys of maximum length 15 characters and text values of maximum length 10 characters, with a maximum of 10000 entries.

   ```
   add ns variable user_privilege_map -type map(text(15),text(10),10000)
   ```
NetScaler 11.1

Note: If the map contains 10000 unexpired entries, assignments for new keys reuse one of the least recently used entries. By default, an expression trying to get a value for a non-existent key will initialize an empty text value.

Assign the value or specify the operation to be performed on the variable. This is done by creating an assignment.

```
add ns assignment <name> -variable <expression> [-set <expression> | -add <expression> | -sub <expression> | -append <expression> | -clear ] [-comment <string>]
```

Note: A variable is referenced by using the variable selector ($). Therefore, $variable1 is used to refer to text or ulong variables. Similarly, $variable2[key-expression] is used to refer to map variables.

Example 1: Define an assignment named “inc_my_counter” that automatically adds 1 to the “my_counter” variable.

```
add ns assignment inc_my_counter -variable $my_counter -add 1
```

Example 2: Define an assignment named “set_user_privilege” that adds to the “user_privilege_map” variable an entry for the client’s IP address with the value returned by the “get_user_privilege” HTTP callout.

```
add ns assignment set_user_privilege -variable $user_privilege_map[client.ip.src.typecast_text_t] -set sys.http.callout( get_user_privilege)
```

Note: If an entry for that key already exists, the value will be replaced. Otherwise a new entry for the key and value will be added. Based on the previous declaration for user_privilege_map, if the map already has 10000 entries, one of the least recently used entries will be reused for the new key and value.

1. Invoke the variable assignment in a policy.

There are two functions that can operate on map variables.

- **$name.valueExists(key-expression)**. Returns true if there is a value in the map selected by the key-expression. Otherwise returns false. This function will update the expiration and LRU information if the map entry exists, but will not create a new map entry if the value does not exist.

- **$name.valueCount**. Returns the number of values currently held by the variable. This is the number of entries in a map. For a singleton variable, this is 0 if the variable is uninitialized or 1 otherwise.
Example: Invoke the assignment named “set_user_privilege” with a compression policy.

```plaintext
add cmp policy set_user_privilege_pol -rule $user_privilege_map.
valueExists(client.ip.src.typecast_text_t).not -resAction
set_user_privilege
```

Use Case to insert HTTP header in the response side

The following example shows an example of a singleton variable.

Add a singleton variable of type text. This variable can hold maximum 100 Bytes data.

```plaintext
add ns variable http_req_data -type text(100) -scope transaction
```

Add an assignment action, which will be used to store the HTTP request data into the variable.

```plaintext
req.body(100)
```

Add a rewrite action to insert HTTP header, whose value will be fetched from the variable.

```plaintext
add rewrite action act_ins_header insert_http_header user_name
$http_req_data.after_str("user_name").before_str("password")
```

Add a rewrite policy which will evaluate in the request time, and take assignment action to store data. When we hit this policy, we’ll take assignment action and store the data into the ns variable (http_req_data)

```plaintext
add rewrite policy pol_set_variable true set_http_req_data
bind rewrite global pol_set_variable 10 -type req_DEFAULT
```

Add a rewrite policy which will evaluate in the response time, and add an HTTP header in the response.

```plaintext
add rewrite policy pol_ins_header true act_ins_header
bind rewrite global pol_ins_header 10 -type res_DEFAULT
```

To configure variables by using the GUI

1. Navigate to AppExpert > NS Variables, to create a variable.
2. Navigate to AppExpert > NS Assignments, to assign value(s) to the variable.
3. Navigate to the appropriate feature area where you want to configure the assignment as an action.
Use Case: Caching User Privileges

December 10, 2018

In this use case, user privileges ("GOLD", "SILVER", and so on) must be retrieved from an external web service.

To achieve this use case, perform the following operations

Create an HTTP callout to fetch the user privileges from the external web service.

```plaintext
1 add policy httpcallout <name> [IPAddress <ip_addr> [ipv6_addr]] [port <port>] [-vServer <string>] [-returnType <returnType>] [-httpMethod (GET | POST)] [-hostExpr <string>] [-urlStemExpr <string>] [-headers <name(value)> ...] [-parameters <name(value)> ...] [-bodyExpr <string>] [-fullReqExpr <string>] [-scheme (http | https)] [-resultExpr <string>] [-cacheForSecs <secs>] [-comment <string>]
```

2 add policy httpcallout get_user_privilege -ipaddress 10.217.193.84 -port 80 -returnType text -httpMethod GET -hostExpr '/get_user_privilege' -resultExpr 'http.res.body(5)'

Store the privileges in a variable.

```plaintext
1 add ns variable <name> -type <string> [scope (global | transaction)] [-ifFull (undef | lru)] [-ifValueTooBig (undef | truncate)] [-ifNoValue (undef | init)] [-init <string>] [-expires <positive_integer>] [-comment <string>]

2 add ns variable user_privilege_map -type map(text(15),text(10),10000) -expires 1200

4 add ns assignment set_user_privilege -variable $user_privilege_map[client.ip.src] -set sys.http_callout(get_user_privilege)
```

Create a policy to check if there is already a cached entry for the client's IP address; if not, it calls the HTTP callout to set a map entry for the client.

```plaintext
1 add cmp policy <name> -rule <expression> -resAction <string>

2 add cmp policy set_user_privilege_pol -rule $user_privilege_map.valueExists(client.ip.src).not -resAction set_user_privilege
```

Create a policy that compresses if the cached privilege entry for the client is “GOLD”.

```plaintext
```
NetScaler 11.1

```
1  add cmp policy <name> -rule <expression> -resAction <string>
2  add cmp policy compress_if_gold_privilege_pol -rule '
   $user_privilege_map[client.ip.src].eq("GOLD")' -resAction compress
```

Bind the compression policies globally.

```
1  bind cmp global <policyName> [-priority <positive_integer>] [-state (ENABLED | DISABLED)] [-gotoPriorityExpression <expression>] [-type <type>] [-invoke (<labelType> <labelName>)]
2  bind cmp global set_user_privilege_pol -priority 10 NEXT
3  bind cmp global compress_if_gold_privilege_pol -priority 20 END
```

Use Case: Limiting the Number of Sessions

December 10, 2018

In this use case, the requirement is to limit the number of active backend sessions. In the deployment, each session login has login in the URL and each session logout has logout in the URL. On successful login, the backend sets a sessionid cookie with a unique 10 character value.

To achieve this use case, perform the following operations:

1. Create a map variable that can store each active session. The key of the map is the sessionid. The expiry time for the variable is set to 600 seconds (10 minutes).

```
1 > add ns variable session_map -type map(text(10),ulong,100) -expires 600
```

2. Create the following assignments for the map variable:

   • Create an entry for the sessionid and set that value to 1 (this value is not actually used).

```
1 > add ns assignment add_session -variable '$session_map[http.req.cookie.value("sessionid")]' -set 1
```

   • Deallocate the entry for a session ID, which implicitly decrements the value count for session_map.

```
1 > add ns assignment delete_session -variable '$session_map[http.req.cookie.value("sessionid")]' -clear
```
3. Create responder policies for the following:

- To check if a map entry exists for that sessionid in the HTTP request. The `add_session` assignment is executed if the map entry does not exist.

```bash
1 > add responder policy add_session_pol 'http.req.url.contains("twbkwbis.P_SabanciLogin") || $session_map.valueExists(http.req.cookie.value("netsuis"))' add_session
```

Note: The `valueExists()` function in the `add_session_pol` policy counts as a reference to the session's map entry, so each request resets the expiration timeout for its session. If no requests for a session are received after 10 minutes, the session's entry will be deallocated.

- To check when the session is logged out. The `delete_session` assignment is executed.

```bash
1 add responder policy delete_session_pol "http.req.url.contains("Logout")" delete_session
```

- To check for login requests and if the number of active sessions exceed 100. If these conditions are satisfied, in order to limit the number of sessions, the user is redirected to a page that indicates that the server is busy.

```bash
1 add responder action redirect_too_busy redirect "/too_busy.html"
2 add responder policy check_login_pol "http.req.url.contains("twbkwbis.P_SabanciLogin") && $session_map.valueCount > 100" redirect_too_busy
```

4. Bind the responder policies globally.

```bash
1 bind responder global add_session_pol 30 next
2 bind responder global delete_session_pol 10
3 bind responder global check_login_pol 20
```

**Policies and expressions**

December 10, 2018

The following topics provide the conceptual and reference information that you require for configuring advanced policies on the Citrix® NetScaler® appliance.
You can also download a list of all the expressions supported on the NetScaler appliance and the hierarchical order in which they can be invoked. The reference is in a zip file which you can download from:

- For more information, see [Citrix support article CTX137705](#)
- For NetScaler 10.1, see [Citrix support article CTX137705](#)

## Introduction to policies and expressions

December 13, 2018

For many NetScaler features, policies control how a feature evaluates data, which ultimately determines what the feature does with the data. A policy uses a logical expression, also called a rule, to evaluate requests, responses, or other data, and applies one or more actions determined by the outcome of the evaluation. Alternatively, a policy can apply a profile, which defines a complex action.

Some NetScaler features use default syntax policies, which provide greater capabilities than do the older, classic, policies. If you migrated to a newer release of the NetScaler software and have configured classic policies for features that now use default syntax policies, you might have to manually migrate policies to the default syntax.

Classic and advanced policies

December 13, 2018

Warning

Classic policy expressions are no longer supported from NetScaler 12.0 build 56.20 onwards and as an alternative, Citrix recommends you to use Advanced policies. For more information, see Advanced Policies.

Classic policies evaluate basic characteristics of traffic and other data. For example, classic policies can identify whether an HTTP request or response contains a particular type of header or URL.

Advanced policies can perform the same type of evaluations as classic policies. In addition, default syntax policies enable you to analyze more data (for example, the body of an HTTP request) and to configure more operations in the policy rule (for example, transforming data in the body of a request into an HTTP header).

In addition to assigning a policy an action or profile, you bind the policy to a particular point in the processing associated with the NetScaler features. The bind point is one factor that determines when the policy will be evaluated.

Benefits of using advanced policies

Default syntax policies use a powerful expression language that is built on a class-object model, and they offer several options that enhance your ability to configure the behavior of various NetScaler features. With default syntax policies, you can do the following:

- Perform fine-grained analyses of network traffic from layers 2 through 7.
- Evaluate any part of the header or body of an HTTP or HTTPS request or response.
- Bind policies to the multiple bind points that the default syntax policy infrastructure supports at the default, override, and virtual server levels.
- Use goto expressions to transfer control to other policies and bind points, as determined by the result of expression evaluation.
- Use special tools such as pattern sets, policy labels, rate limit identifiers, and HTTP callouts, which enable you to configure policies effectively for complex use cases.
Additionally, the GUI extends robust graphical user interface support for default syntax policies and expressions and enables users who have limited knowledge of networking protocols to configure policies quickly and easily. The GUI also includes a policy evaluation feature for default syntax policies. You can use this feature to evaluate a default syntax policy and test its behavior before you commit it, thus reducing the risk of configuration errors.

**Basic components of an advanced policy**

Following are a few characteristics of an Advanced policy:

- **Name.**
  Each policy has a unique name.

- **Rule.**
  The rule is a logical expression that enables the NetScaler feature to evaluate a piece of traffic or another object.
  
  For example, a rule can enable the NetScaler to determine whether an HTTP request originated from a particular IP address, or whether a Cache-Control header in an HTTP request has the value “No-Cache.”

  Advanced policies can use all of the expressions that are available in a classic policy, with the exception of classic expressions for the SSL VPN client. In addition, Advanced policies enable you to configure more complex expressions.

- **Bindings.**
  To ensure that the NetScaler can invoke a policy when it is needed, you associate the policy, or bind it, to one or more bind points.

  You can bind a policy globally or to a virtual server. For more information, see “About policy bindings.”

- **An associated action.**
  An action is a separate entity from a policy. Policy evaluation ultimately results in the NetScaler performing an action.

  For example, a policy in the integrated cache can identify HTTP requests for .gif or .jpeg files. An action that you associate with this policy determines that the responses to these types of requests are served from the cache.

  For some features, you configure actions as part of a more complex set of instructions known as a profile.
## How different NetScaler features use policies

The NetScaler supports a variety of features that rely on policies for operation. The following table summarizes how the NetScaler features use policies.

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Policy Type</th>
<th>How You Use Policies in the Feature</th>
</tr>
</thead>
<tbody>
<tr>
<td>System</td>
<td>Classic</td>
<td>For the Authentication function, policies contain authentication schemes for different authentication methods. For example, you can configure LDAP and certificate-based authentication schemes. You also configure policies in the Auditing function.</td>
</tr>
<tr>
<td>DNS</td>
<td>Advanced</td>
<td>To determine how to perform DNS resolution for requests.</td>
</tr>
<tr>
<td>SSL</td>
<td>Classic and Advanced</td>
<td>To determine when to apply an encryption function and add certificate information to clear text. To provide end-to-end security, after a message is decrypted, the SSL feature re-encrypts clear text and uses SSL to communicate with Web servers.</td>
</tr>
<tr>
<td>Compression</td>
<td>Classic and Advanced</td>
<td>To determine what type of traffic is compressed.</td>
</tr>
<tr>
<td>Integrated Caching</td>
<td>Advanced</td>
<td>To determine whether HTTP responses are cacheable.</td>
</tr>
<tr>
<td>Responder</td>
<td>Advanced</td>
<td>To configure the behavior of the Responder function.</td>
</tr>
<tr>
<td>Protection Features</td>
<td>Classic</td>
<td>To configure the behavior of the Filter, SureConnect, and Priority Queuing functions.</td>

<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Content Switching</td>
<td>Classic and Advanced</td>
<td>To determine what server or group of servers is responsible for serving responses, based on characteristics of an incoming request. Request characteristics include device type, language, cookies, HTTP method, content type, and associated cache server.</td>
</tr>
<tr>
<td>AAA - Traffic Management</td>
<td>Classic. Exceptions: Traffic policies support only default syntax policies and authorization policies support both classic and default syntax policies.</td>
<td>To check for client-side security before users log in and establish a session. Traffic policies, which determine whether single sign-on (SSO) is required, use only the default syntax. Authorization policies authorize users and groups that access intranet resources through the appliance.</td>
</tr>
<tr>
<td>Cache Redirection</td>
<td>Classic</td>
<td>To determine whether responses are served from a cache or from an origin server.</td>
</tr>
<tr>
<td>Feature Name</td>
<td>Policy Type</td>
<td>How You Use Policies in the Feature</td>
</tr>
<tr>
<td>--------------------------------------</td>
<td>-------------------</td>
<td>-------------------------------------</td>
</tr>
<tr>
<td>Rewrite</td>
<td>Advanced</td>
<td>To identify HTTP data that you want to modify before serving. The policies provide rules for modifying the data. For example, you can modify HTTP data to redirect a request to a new home page, or a new server, or a selected server based on the address of the incoming request, or you can modify the data to mask server information in a response for security purposes. The URL Transformer function identifies URLs in HTTP transactions and text files for the purpose of evaluating whether a URL should be transformed.</td>
</tr>
<tr>
<td>Application Firewall</td>
<td>Classic and Advanced</td>
<td>To identify characteristics of traffic and data that should or should not be admitted through the firewall.</td>
</tr>
<tr>
<td>NetScaler Gateway, Clientless Access function</td>
<td>Advanced</td>
<td>To define rewrite rules for general Web access using the NetScaler Gateway.</td>
</tr>
<tr>
<td>NetScaler Gateway</td>
<td>Classic</td>
<td>To determine how the NetScaler Gateway performs authentication, authorization, auditing, and other functions.</td>
</tr>
</tbody>
</table>
About actions and profiles

Policies do not themselves take action on data. Policies provide read-only logic for evaluating traffic. To enable a feature to perform an operation based on a policy evaluation, you configure actions or profiles and associate them with policies.

Note: Actions and profiles are specific to particular features. For information about assigning actions and profiles to features, see the documentation for the individual features.

About actions

Actions are steps that the NetScaler takes, depending on the evaluation of the expression in the policy. For example, if an expression in a policy matches a particular source IP address in a request, the action that is associated with this policy determines whether the connection is permitted.

The types of actions that the NetScaler can take are feature specific. For example, in Rewrite, actions can replace text in a request, change the destination URL for a request, and so on. In Integrated Caching, actions determine whether HTTP responses are served from the cache or an origin server.

In some NetScaler features actions are predefined, and in others they are configurable. In some cases, (for example, Rewrite), you configure the actions using the same types of expressions that you use to configure the associated policy rule.

About profiles

Some NetScaler features enable you to associate profiles, or both actions and profiles, with a policy. A profile is a collection of settings that enable the feature to perform a complex function. For example, in the application firewall, a profile for XML data can perform multiple screening operations, such as examining the data for illegal XML syntax or evidence of SQL injection.

Use of actions and profiles in particular features

The following table summarizes the use of actions and profiles in different NetScaler features. The table is not exhaustive. For more information about specific uses of actions and profiles for a feature, see the documentation for the feature.
### Feature Use of an Action Use of a Profile

<table>

**About policy bindings**

A policy is associated with, or bound to, an entity that enables the policy to be invoked. For example, you can bind a policy to request-time evaluation that applies to all virtual servers. A collection of policies that are bound to a particular bind point constitutes a policy bank.

Following is an overview of different types of bind points for a policy:

- **Request time global.**
  
  A policy can be available to all components in a feature at request time.

- **Response time global.**
A policy can be available to all components in a feature at response time.

- Request time, virtual server-specific.

A policy can be bound to request-time processing for a particular virtual server. For example, you can bind a request-time policy to a cache redirection virtual server to ensure that particular requests are forwarded to a load balancing virtual server for the cache, and other requests are sent to a load balancing virtual server for the origin.

- Response time, virtual server-specific.

A policy can also be bound to response-time processing for a particular virtual server.

- User-defined policy label.

For default syntax policies, you can configure custom groupings of policies (policy banks) by defining a policy label and collecting a set of related policies under the policy label.

- Other bind points.

The availability of additional bind points depends on type of policy (classic or default syntax), and specifics of the relevant NetScaler feature. For example, classic policies that you configure for the NetScaler Gateway have user and group bind points.

For additional information about default syntax policy bindings, see “Bind policies that use the default syntax” and Configure a policy bank for a virtual server. For additional information about classic policy bindings, see “Configure a classic policy.”

About evaluation order of policies

For classic policies, policy groups and policies within a group are evaluated in a particular order, depending on the following:

- The bind point for the policy, for example, whether the policy is bound to request-time processing for a virtual server or global response-time processing. For example, at request time, the NetScaler evaluates all request-time classic policies before evaluating any virtual server-specific policies.
- The priority level for the policy. For each point in the evaluation process, a priority level that is assigned to a policy determines the order of evaluation relative to other policies that share the same bind point. For example, when the NetScaler evaluates a bank of request-time, virtual server-specific policies, it starts with the policy that is assigned to the lowest priority value. In classic policies, priority levels must be unique across all bind points.

For Advanced policies, as with classic policies, the NetScaler selects a grouping, or bank, of policies at a particular point in overall processing. Following is the order of evaluation of the basic groupings, or banks, of Advanced policies:
1. Request-time global override
2. Request-time, virtual server-specific (one bind point per virtual server)
3. Request-time global default
4. Response-time global override
5. Response-time virtual server-specific
6. Response-time global default

However, within any of the preceding banks of policies, the order of evaluation is more flexible than in classic policies. Within a policy bank, you can point to the next policy to be evaluated regardless of the priority level, and you can invoke policy banks that belong to other bind points and user-defined policy banks.

**Order of evaluation based on traffic flow**

As traffic flows through the NetScaler and is processed by various features, each feature performs policy evaluation. Whenever a policy matches the traffic, the NetScaler stores the action and continues processing until the data is about to leave the NetScaler. At that point, the NetScaler typically applies all matching actions. Integrated Caching, which only applies a final Cache or NoCache action, is an exception.

Some policies affect the outcome of other policies. Following are examples:

- If a response is served from the integrated cache, some other NetScaler features do not process the response or the request that initiated it.
- If the Content Filtering feature prevents a response from being served, no subsequent features evaluate the response.

If the application firewall rejects an incoming request, no other features can process it.

**Classic and advanced policy expressions**

December 13, 2018

One of the most fundamental components of a policy is its rule. A policy rule is a logical expression that enables the policy to analyze traffic. Most of the policy’s functionality is derived from its expression.

An expression matches characteristics of traffic or other data with one or more parameters and values. For example, an expression can enable the NetScaler to accomplish the following:

- Determine whether a request contains a certificate.
- Determine the IP address of a client that sent a TCP request.
- Identify the data that an HTTP request contains (for example, a popular spreadsheet or word processing application).
• Calculate the length of an HTTP request.

About classic expressions

Classic expressions enable you to evaluate basic characteristics of data. They have a structured syntax that performs string matching and other operations.

Following are a few simple examples of classic expressions:

• An HTTP response contains a particular type of Cache Control header.
  res.http.header Cache-Control contains public
• An HTTP response contains image data.
  res.http.header Content-Type contains image/
• An SSL request contains a certificate.
  req.ssl.client.cert exists

About advanced policy expressions

Any feature that uses default syntax policies also uses Advanced expressions. For information about which features use Advanced policies, see the table NetScaler Feature, Policy Type, and Policy Usage.

Advanced policy expressions have a few other uses. In addition to configuring Advanced expressions in policy rules, you configure Advanced expressions in the following situations:

• Integrated Caching:
  You use Advanced policy expressions to configure a selector for a content group in the integrated cache.
• Load Balancing:
  You use Advanced policy expressions to configure token extraction for a load balancing virtual server that uses the TOKEN method for load balancing.
• Rewrite:
  You use Advanced policy expressions to configure rewrite actions.
• Rate-based policies:
  You use Advanced policy expressions to configure limit selectors when configuring a policy to control the rate of traffic to various servers.

Following are a few simple examples of Advanced policy expressions:
• An HTTP request URL contains no more than 500 characters.

\[\text{http.req.url.length} \leq 500\]

• An HTTP request contains a cookie that has fewer than 500 characters.

\[\text{http.req.cookie.length} < 500\]

• An HTTP request URL contains a particular text string.

\[\text{http.req.url.contains("html")}\]

## Converting policy expressions using NSPEPI tool

December 10, 2018

You can convert a classic expression to the Advanced policy expression by using the nspepi conversion tool. You can also use the tool to convert all the classic expressions in the NetScaler configuration to the Advanced policy (with the exception of NetScaler entities that currently support only classic expressions).

The conversion tool does not convert policies configured for the following features because the features currently support only classic policies:

• Authentication, Pre-authentication
• SSL
• Cache redirection
• VPN (session, traffic, and tunnel traffic)
• Content filtering (The responder feature not only provides you with functionality that is equivalent to that provided by the content filtering feature but also surpasses the content filtering feature in the use cases that it supports. Additionally, responder supports the more powerful default syntax for policy expressions.)

The following NetScaler features support both classic and Advanced policy expression and, therefore, support the conversion of classic expressions to Advanced policy expressions:

• Application firewall policies
• Authorization policies
• Named expressions
• Compression policies
• Content switching policies
• User-defined, rule-based tokens/persistency (the –rule parameter value that is specified for a load balancing virtual server)
**About the conversion process**

When parsing a NetScaler configuration file, the conversion tool performs the following actions:

1. In commands that create classic named expressions, the conversion tool replaces the names of the classic expressions with Advanced policy expression.
2. In commands that support only the classic policy, if classic named expressions are used, the conversion tool replaces the names of the classic expressions with the actual classic expressions they represent. This action ensures that the names of expressions in classic-only features do not reference the Advanced policy expression created from Step 1.
3. In commands associated with entities that support both the classic syntax and the Advanced policies, the conversion tool replaces all classic expressions in commands with Advanced policy expressions.

**Example:**

Consider the following sample configuration commands:

```plaintext
1    add policy expression ne_c1 "METHOD == GET"
2    add policy expression ne_c2 "ne_c1 || URL == /*.htm"
3    add filter policy pol1 -rule "ne_c2" -reqAction YES
4    add cmp policy pol2 -rule "REQ.HTTP.HEADER Accept CONTAINS \'text/html\'" -resAction COMPRESS
5    add cmp policy pol3 -rule "ne_c1 || ne_c2" -resAction GZIP
```

In the commands that create the classic named expressions ne_c1 and ne_c2, the tool replaces the names of the expressions with actual Advanced policy expression. This action, which corresponds to Step 1 described earlier, results in the following commands:

```plaintext
1    add policy expression ne_c2 "HTTP.REQUEST.METHOD.EQ("GET")"
2    add policy expression ne_c1 "HTTP.REQUEST.URL.SUFFIX.EQ("htm")"
```

The filter policy command supports only the classic syntax. Therefore, the conversion tool replaces the classic named expression ne_c1 with the actual classic expression it represents. Note that the tool replaces ne_c1 in the expression for ne_c2, and then replaces ne_c2 in the filter policy with the classic expression. This action, which corresponds to Step 2 described earlier, results in the following command:

```plaintext
add filter policy pol1 -rule "METHOD == GET || URL == /*.htm"-reqAction YES
```

The compression feature supports both classic and Advanced policy expression. Therefore, in the command that creates the compression policy pol2, the conversion tool replaces the expression with
Advanced policy expression. This action, which corresponds to Step 3 described earlier, results in the following command:

```
add cmp policy pol2 -rule "HTTP.REQ.HEADER("Accept").AFTER_STR("text/html").LENGTH.GT(0)" -resAction COMPRESS
```

The command that creates the compression policy pol3 is unaffected by the conversion process because, after the conversion process is complete, ne_c1 and ne_c2 reference the Advanced policy expression that results from Step 1.

Client security messages are not supported in the newer default policy format and, therefore, are lost. The

SYS.EVAL_CLASSIC_EXPR function is replaced with an Advanced policy expression. The following entities support the SYS.EVAL_CLASSIC_EXPR function:

- DNS policies
- Rate limit selectors
- Cache selectors
- Cache policies
- Content switching policies
- Rewrite policies
- URL transformation policies
- Responder policies
- Application firewall policies
- Authorization policies
- Compression policies
- CVPN access policies

After performing the conversion, the tool saves the changes in a new configuration file. The new configuration file is created in the directory in which the input file exists. The name of the new configuration file is the same as the name of the input configuration file except for the string new_ used as a prefix. Conversion warnings are reported in a warning line at the end of the screen output. Additionally, a warning file is created in the directory in which the input configuration file resides. For more information about the warning file and the types of warnings that are reported, see “Conversion warnings.”

**Convert expressions**

You can use the nspepi tool to convert a single classic expression to the Advanced policy expression. The nspepi tool must be run from the shell prompt on the NetScaler appliance.
**Convert a classic expression to the Advanced policy by using the CLI**

At the shell prompt, type:

`nspepi -e "<classic expression>"`

**Example:**

```
1 root@NS# nspepi -e "REQ.HTTP.URL == /*.htm"
2 "HTTP.REQ.URL.REGEX_MATCH(re#/(.*)\.htm#)"
```

**Convert a NetScaler configuration file**

You can use the nspepi tool to convert all the classic expressions in a NetScaler configuration file to the Advanced policy (except for those commands that do not support the Advanced policy). The nspepi tool must be run from the shell prompt on the NetScaler appliance.

**Convert all the classic expressions in a NetScaler configuration file to the default syntax by using the CLI**

At the shell prompt, type:

`nspepi -f "<ns config file>" -v`

**Example:**

```
1 root@NS# nspepi -f ns.conf
2 OUTPUT: New configuration file created: new_ns.conf
3 OUTPUT: New warning file created: warn_ns.conf
4 WARNINGS: Total number of warnings due to bind commands: 18
5 WARNINGS: Line numbers which has bind command issues: 305, 306, 706,
6 707, 708, 709, 710, 711, 712, 713,
7 714, 715, 767, 768, 774, 775, 776, 777
8 root@NS#
```

**Conversion warnings**

When classic expressions that are included in CLI commands are upgraded to the Advanced policy, the number of characters in the expression might exceed the 1499-character limit. The commands that include expressions longer than 1499 characters fail when the configuration is being applied. You must manually update these commands.
In addition, multiple classic policies can be bound to a given bind point with priority 0 or with equal priority, but the Advanced policy infrastructure does not support a priority value of 0 or policies with the same priority at a given bind point. These commands fail when the configuration is being applied. The commands must be updated manually with the correct priority values.

The line numbers of lines that threw a warning during conversion are listed at the end of the output in a warning line. In addition, a warning file is created in the same directory as the one in which the old and new configuration files reside. The name of the warning file is the same as the name of the input configuration file except that the string warn_ is added as a prefix.

**Before you proceed**

December 10, 2018

Before configuring expressions and policies, be sure you understand the relevant NetScaler feature and the structure of your data, as follows:

- Read the documentation on the relevant feature.
- Look at the data stream for the type of data that you want to configure.

You may want to run a trace on the type of traffic or content that you want to configure. This will give you an idea of the parameters and values, and operations on these parameters and values, that you need to specify in an expression.

**Note:** The NetScaler supports either classic or Advanced policy within a feature. You cannot have both types in the same feature. Over the past few releases, some NetScaler features have migrated from using classic policies and expressions to Advanced policy and expressions. If a feature of interest to you has changed to the Advanced policy format, you may have to manually migrate the older information. Following are guidelines for deciding if you need to migrate your policies:

- If you configured classic policies in a version of the Integrated Caching feature prior to release 9.0 and then upgrade to version 9.0 or later, there is no impact. All legacy policies are migrated to the Advanced policy format.
- For other features, you need to manually migrate classic policies and expressions to the Advanced syntax if the feature has migrated to the Advanced policy.

**Configure advanced policy infrastructure**

December 10, 2018

You can create advanced policies for various NetScaler features, including DNS, Rewrite, Responder, and Integrated Caching, and the clientless access function in the NetScaler Gateway. Policies control the behavior of these features.
When you create a policy, you assign it a name, a rule (an expression), feature-specific attributes, and an action that is taken when data matches the policy. After creating the policy, you determine when it is invoked by binding it globally or to either request-time or response-time processing for a virtual server.

Policies that share the same bind point are known as a policy bank. For example, all policies that are bound to a virtual server constitute the policy bank for the virtual server. When binding the policy, you assign it a priority level to specify when it is invoked relative to other policies in the bank. In addition to assigning a priority level, you can configure an arbitrary evaluation order for policies in a bank by specifying Goto expressions.

In addition to policy banks that are associated with a built-in bind point or a virtual server, you can configure policy labels. A policy label is a policy bank that is identified by an arbitrary name. You invoke a policy label, and the policies in it, from a global or virtual-server-specific policy bank. A policy label or a virtual-server policy bank can be invoked from multiple policy banks.

For some features, you can use the policy manager to configure and bind policies.

**Rules for names in identifiers used in policies**

December 18, 2018

The names of identifiers in the named expression, HTTP callout, pattern set, and rate limiting features must begin with an ASCII alphabet or an underscore (_). The remaining characters can be ASCII alphanumeric characters or underscores (_).

The names of these identifiers must not begin with the following reserved words:

- The words ALT, TRUE, or FALSE or the Q or S one-character identifier.
- The special-syntax indicator RE (for regular expressions) or XP (for XPath expressions).
- Expression prefixes, which currently are the following:
  - CLIENT
  - EXTEND
  - HTTP
  - SERVER
  - SYS
  - TARGET
  - TEXT
  - URL
  - MYSQL
  - MSSQL
Additionally, the names of these identifiers cannot be the same as the names of enumeration constants used in the policy infrastructure. For example, the name of an identifier cannot be IGNORE-CASE, YEAR, or LATIN2_CZECH_CS (a MySQL character set).

**Note:** The NetScaler appliance performs a case-insensitive comparison of identifiers with these words and enumeration constants. For example, names of the identifiers cannot begin with TRUE, True, or true.

**Create or modify a policy**

December 13, 2018

All policies have some common elements. Creating a policy consists, at minimum, of naming the policy and configuring a rule. The policy configuration tools for the various features have areas of overlap, but also differences. For the details of configuring a policy for a particular feature, including associating an action with the policy, see the documentation for the feature.

To create a policy, begin by determining the purpose of the policy. For example, you may want to define a policy that identifies HTTP requests for image files, or client requests that contain an SSL certificate. In addition to knowing the type of information that you want the policy to work with, you need to know the format of the data that the policy is analyzing.

Next, determine whether the policy is globally applicable, or if it pertains to a particular virtual server. Also consider the effect that the order in which your policies are evaluated (which will be determined by how you bind the policies) will have on the policy that you are about to configure.

**Create a policy by using the CLI**

At the command prompt, type the following commands to create a policy and verify the configuration:

```bash
1 - add responder|dns|cs|rewrite|cache policy <policyName> -rule <expression> [feature-specific information]
2
3 - show rewrite policy <name>
```

**Example 1:**

```bash
1 add rewrite policy "pol_remove-ae" true "act_remove-ae"
2 Done
3 > show rewrite policy pol_remove-ae
4 Name: pol_remove-ae
```
NetScaler 11.1

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td><strong>Rule:</strong> true</td>
</tr>
<tr>
<td>6</td>
<td><strong>RewriteAction:</strong> act_remove-ae</td>
</tr>
<tr>
<td>7</td>
<td><strong>UndefAction:</strong> Use Global</td>
</tr>
<tr>
<td>8</td>
<td><strong>Hits:</strong> 0</td>
</tr>
<tr>
<td>9</td>
<td><strong>Undef Hits:</strong> 0</td>
</tr>
<tr>
<td>10</td>
<td><strong>Bound to:</strong> GLOBAL RES_OVERRIDE</td>
</tr>
<tr>
<td>11</td>
<td><strong>Priority:</strong> 90</td>
</tr>
<tr>
<td>12</td>
<td><strong>GotoPriorityExpression:</strong> END</td>
</tr>
<tr>
<td>13</td>
<td><strong>Done</strong></td>
</tr>
</tbody>
</table>

**Example 2:**

```plaintext
1 add cache policy BranchReportsCachePolicy -rule q{
   2   http.req.url.query.value("actionoverride").contains("branchReports")
   }
   3 -action cache
   4 Done
5 show cache policy BranchReportsCachePolicy
   6   Name: BranchReportsCachePolicy
   7   Rule: http.req.url.query.value("actionoverride").contains("branchReports")
   8   CacheAction: CACHE
   9   Stored in group: DEFAULT
10   UndefAction: Use Global
11   Hits: 0
12   Undef Hits: 0
13 Done
```

**Note:** At the command line, quote marks within a policy rule (the expression) must be escaped or delimited with the q delimiter. For more information, see Configure advanced policy expressions: Get started.

**Create or modify a policy by using the GUI**

1. In the navigation pane, expand the name of the feature for which you want to configure a policy, and then click Policies. For example, you can select Content Switching, Integrated Caching, DNS, Rewrite, or Responder.
2. In the details pane, click Add, or select an existing policy and click Open. A policy configuration dialog box appears.
3. Specify values for the following parameters. (An asterisk indicates a required parameter. For a term in parentheses, see the corresponding parameter in “Parameters for creating or modifying a policy.”)
4. Click Create, and then click Close.
5. Click Save. A policy is added.
   Note: After you create a policy, you can view the policy’s details by clicking the policy entry in the configuration pane. Details that are highlighted and underlined are links to the corresponding entity (for example, a named expression).

Policy configuration examples

December 13, 2018

These examples show how policies and their associated actions are entered at the command line interface. In the GUI, the expressions would appear in the Expression window of the feature-configuration dialog box for the integrated caching or rewrite feature.

Following is an example of creating a caching policy. Note that actions for caching policies are built in, so you do not need to configure them separately from the policy:

```
add cache policy BranchReportsCachePolicy
  -rule q{
    http.req.url.query.value("actionoverride").contains("branchReports")
  }
  -action cache
```

Following is an example of a rewrite policy and action:

```
add rewrite action myAction1 INSERT_HTTP_HEADER "myHeader" "valueForMyHeader"
add rewrite policy myPolicy1 "http.req.url.contains("myURLstring")" myAction1
```

Note: At the command line, quote marks within a policy rule (the expression) must be escaped or delimited with the q delimiter. For more information, see Configure advanced policy expressions: Get started.

Bind policies using advanced policy

December 10, 2018

After defining a policy, you indicate when the policy is to be invoked by binding the policy to a bind point and specifying a priority level. You can bind a policy to only one bind point. A bind point can be global, that is, it can apply to all virtual servers that you have configured. Or, a bind point can be specific to a particular virtual server, which can be either a load balancing or a content switching virtual server. Not all bind points are available for all features.
The order in which policies are evaluated determines the order in which they are applied, and features typically evaluate the various policy banks in a particular order. Sometimes, however, other features can affect the order of evaluation. Within a policy bank, the order of evaluation depends on the values of parameters configured in the policies. Most features apply all of the actions associated with policies whose evaluation results in a match with the data that is being processed. The integrated caching feature is an exception.

**Feature-specific differences in policy bindings**

You can bind policies to built-in, global bind points (or banks), to virtual servers, or to policy labels. However, the NetScaler features differ in terms of the types of bindings that are available. The following table summarizes how you use policy bindings in various NetScaler features that use policies.

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Virtual Servers Configured in the Feature</th>
<th>Policies Configured in the Feature</th>
<th>Bind Points Configured for the Policies</th>
<th>Use of Policies in the Feature</th>

<td>To determine how the NetScaler Gateway performs authentication, authorization, auditing, and other functions, and to define rewrite rules for general Web access using the NetScaler Gateway.</td>
</tr>
</tbody>
</table>

**Bind points and order of evaluation**

For a policy to take effect, you must ensure that the policy is invoked at some point during processing. To do so, you associate the policy with a bind point. The collection of policies that is bound to a bind point is known as a policy bank.

Following are the bind points that the NetScaler evaluates, listed in the typical order of evaluation within a policy bank:

1. **Request-time override.** When a request flows through a feature, the NetScaler first evaluates request-time override policies for the feature.
2. **Request-time Load Balancing virtual server.** If policy evaluation cannot be completed after all the request-time override policies have been evaluated, the NetScaler processes request-time policies for load balancing virtual servers.
3. **Request-time Content Switching virtual server.** If policy evaluation cannot be completed after all the request-time policies for load balancing virtual servers have been evaluated, the NetScaler processes request-time policies for content switching virtual servers.
4. **Request-time default.** If policy evaluation cannot be completed after all request-time, virtual server-specific policies have been evaluated, the NetScaler processes request-time Advanced policies.
5. **Response-time override.** At response time, the NetScaler starts with policies that are bound to the response-time override bind point.

6. **Response-time Load Balancing virtual server.** If policy evaluation cannot be completed after all response-time override policies have been evaluated, the NetScaler process the response-time policies for load balancing virtual servers.

7. **Response-time Content Switching virtual server.** If policy evaluation cannot be completed after all policies have been evaluated for load balancing virtual servers, the NetScaler process the response-time policies for content switching virtual servers.

8. **Response-time default.** If policy evaluation cannot be completed after all response-time, virtual-server-specific policies have been evaluated, the NetScaler processes response-time Advanced policies.

### Policy evaluation across features

In addition to attending to evaluation of policies within a feature, if you have bound policies to a content switching virtual server, note that these policies are evaluated before other policies. Binding a policy to a content switching vserver produces a different result in NetScaler versions 9.0.x and later than in 8.x versions. In NetScaler 9.0 and later versions, evaluation occurs as follows:

- Content switching policies are evaluated before other policies. If a content switching policy evaluates to TRUE, the target load balancing vserver is selected.
- If all content switching policies evaluate to FALSE, the default load balancing vserver under the content switching VIP is selected.

After a target load balancing vserver is selected by the content switching process, policies are evaluated in the following order:

1. Policies that are bound to the global override bind point.
2. Policies that are bound to the default load balancing vserver.
3. Policies that are bound to the target content switching vserver.
4. Policies that are bound to the global default bind point.

To be sure that the policies are evaluated in the intended order, follow these guidelines:

- Make sure that the default load balancing vserver is not directly reachable from the outside; for example, the vserver IP address can be 0.0.0.0.
- To prevent exposing internal data on the load balancing default vserver, configure a policy to respond with a “503 Service Unavailable” status and bind it to the default load balancing vserver.

### Entries in a policy bank

Each entry in a policy bank has, at minimum, a policy and a priority level. You can also configure entries that change the priority-based evaluation order, and you can configure entries that invoke
external policy banks.

The following table summarizes each entry in a policy bank.

<table>
<thead>
<tr>
<th>Policy Name</th>
<th>Priority</th>
<th>Goto Expression</th>
<th>Invocation Type</th>
<th>Policy Bank to Be Invoked</th>
</tr>
</thead>
<tbody>
<tr>
<td>The policy name, or a “dummy” policy named NOPOLICY. The NOPOLICY entry controls evaluation flow without processing a rule.</td>
<td>An integer. Optional. Identifies the next policy in the bank to evaluate, or ends any further evaluation</td>
<td>Optional. Indicates that an external policy bank will be invoked. This field restricts the choices to a global policy label or a virtual server.</td>
<td>Optional. Used with Invocation Type. This is the label for a policy bank or a virtual server name. The NetScaler returns to the current bank after processing the external bank.</td>
<td></td>
</tr>
</tbody>
</table>

If the policy evaluates to TRUE, the NetScaler stores the action that is associated with the policy. If the policy evaluates to FALSE, the NetScaler evaluates the next policy. If the policy is neither TRUE nor FALSE, the NetScaler uses the associated Undef (undefined) action.

**Evaluation order within a policy bank**

Within a policy bank, the evaluation order depends on the following items:

- **A priority.**
  
  The most minimal amount of information about evaluation order is a numeric priority level. The lower the number, the higher the priority.

- **A Goto expression.**
  
  If supplied, the Goto expression indicates the next policy to be evaluated, typically within the same policy bank. Goto expressions can only proceed forward in a bank. To prevent looping, a policy bank configuration is not valid if a Goto statement points backwards in the bank.

- **Invocation of other policy banks.**
  
  Any entry can invoke an external policy bank. The NetScaler provides a built-in entity named NOPOLICY that does not have a rule. You can add a NOPOLICY entry in a policy bank when you
want to invoke another policy bank, but do not want to process any other rules prior to the invocation. You can have multiple NOPOLICY entries in multiple policy banks.

Values for a Goto expression are as follows:

- **NEXT.**
  
  This keyword selects the policy with the next higher priority level in the current policy bank.

- **An integer.**
  
  If you supply an integer, it must match the priority level of another policy in the current policy bank.

- **END.**
  
  This keyword stops evaluation after processing the current policy, and no additional policies in this bank are processed.

- **Blank.**
  
  If the Goto expression is empty, it is the same as specifying END.

- **A numeric expression.**
  
  This is an advanced policy expression that resolves to a priority number for another policy in the current bank.

- **USE_INVOCATION_RESULT.**
  
  This phrase can be used only if you are invoking an external policy bank. Entering this phrase causes the NetScaler to perform one of the following actions:
  
  - If the final Goto in the invoked policy bank has a value of END or is empty, the invocation result is END, and evaluation stops.
  
  - If the final Goto expression in the invoked policy bank is anything other than END, the NetScaler performs a NEXT.

The following table illustrates a policy bank that uses Goto statements and policy bank invocations.

<table>
<thead>
<tr>
<th>Policy Name</th>
<th>Priority</th>
<th>Goto</th>
<th>Invocation</th>
<th>Policy Bank to Be Invoked</th>
</tr>
</thead>
<tbody>
<tr>
<td>ClientCertificatePc</td>
<td>100</td>
<td>300</td>
<td>None</td>
<td>None</td>
</tr>
<tr>
<td>(rule: does the request contain a client certificate?)</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Table 3. Example of a Policy Bank That Uses Gotos and External Bank Invocations

<table>
<thead>
<tr>
<th>Policy Name</th>
<th>Priority</th>
<th>Goto</th>
<th>Invocation</th>
<th>Policy Bank to Be Invoked</th>
</tr>
</thead>
<tbody>
<tr>
<td>SubnetPolicy (rule: is the client from a private subnet?)</td>
<td>200</td>
<td>NEXT</td>
<td>None</td>
<td>None</td>
</tr>
<tr>
<td>NOPOLICY</td>
<td>300</td>

<td>My_Request_VServer</td>
</tr>
<tr>
<td>NOPOLICY</td>
<td>350</td>
<td>USE INVOCATION RESULT</td>
<td>Policy Label</td>
<td>My_Policy_Label</td>
</tr>
<tr>
<td>WorkingHoursPolicy (rule: is it working hours?)</td>
<td>400</td>
<td>END</td>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>

**How policy evaluation ends**

Evaluation of a policy bank ends when one of the following takes place:

- A policy evaluates to TRUE and its Goto statement value is END.
  No further policies or policy banks in this feature are evaluated.

- An external policy bank is invoked, its evaluation returns an END, and the Goto statement uses a value of USE_INVOCATION_RESULT or END.
  Evaluation continues with the next policy bank for this feature. For example, if the current bank is the request-time override bank, the NetScaler next evaluates request-time policy banks for the virtual servers.

- The NetScaler has walked through all the policy banks in this feature, but has not encountered an END.
  If this is the last entry to be evaluated in this policy bank, the NetScaler proceeds to the next feature.
How features use actions after policy evaluation

After evaluating all relevant policies for a particular data point (for example, an HTTP request), the NetScaler stores all the actions that are associated with any policy that matched the data.

For most features, all the actions from matching policies are applied to a traffic packet as it leaves the NetScaler. The Integrated Caching feature only applies one action: CACHE or NOCACHE. This action is associated with the policy with the lowest priority value in the “highest priority” policy bank (for example, request-time override policies are applied before virtual server-specific policies).

Bind a policy globally

December 10, 2018

The following binding procedures are typical. However, refer to the documentation for the feature of interest to you for complete instructions.

Bind an integrated caching policy globally by using the CLI

At the command prompt, type the following commands to bind an Integrated Caching policy and verify the configuration:

```
1 - bind cache global <policy> -priority <positiveInteger> [-type REQ_OVERRIDE | REQ_DEFAULT | RES_OVERRIDE | RES_DEFAULT]
2
3 - show cache global
```

Example:

```
1 > bind cache global _nonPostReq -priority 100 -type req_default
2 Done
3 > show cache global
4 1) Global bindpoint: REQ_DEFAULT
5 Number of bound policies: 2
6
7 2) Global bindpoint: RES_DEFAULT
8 Number of bound policies: 1
9 Done
```

The type argument is optional to maintain backward compatibility. If you omit the type, the policy is bound to REQ_DEFAULT or RES_DEFAULT, depending on whether the policy rule is a response-time or a request-time expression.
Bind a rewrite policy globally by using the CLI

At the command prompt, type the following commands to bind a Rewrite policy and verify the configuration:

```
1 - bind rewrite global <policyName> <priority> [-type REQ_OVERRIDE | REQ_DEFAULT | RES_OVERRIDE | RES_DEFAULT]
2
3 - show rewrite global
```

Example:

```
1 bind rewrite global pol_remove-pdf 100
2 Done
3 > show rewrite global
4   1) Global bindpoint: REQ_DEFAULT
5       Number of bound policies: 1
6
7   2) Global bindpoint: REQ_OVERRIDE
8       Number of bound policies: 1
9
10 Done
```

The type argument is optional for globally bound policies, to maintain backward compatibility. If you omit the type, the policy is bound to REQ_DEFAULT or RES_DEFAULT, depending on whether the policy rule is a response-time or a request-time expression.

Bind a compression policy globally by using the CLI

At the command prompt, type the following commands to bind a compression policy and verify the configuration:

```
1 - bind cmp global <policyName> -priority <positiveInteger> [-type REQ_OVERRIDE | REQ_DEFAULT | RES_OVERRIDE | RES_DEFAULT]
2
3 - show cmp global
```

Example:

```
1 > bind cmp global cmp_pol_1 -priority 100
2 Done
3 > show cmp policy cmp_pol_1
4   Name: cmp_pol_1
5   Rule: HTTP.REQ.URL.SUFFIX.EQ("BMP")
```
Bind a responder policy globally by using the CLI

At the command prompt, type the following commands to bind a Responder policy and verify the configuration:

1 - bind responder global <policyName> <priority> [-type OVERRIDE | DEFAULT ]
2
3 - show responder global

Example:

1  bind responder global pol404Error1 200
2  Done
3  > show responder global
4     1)  Global bindpoint:  REQ_DEFAULT
5     Number of bound policies:  1
6
7  Done

Bind a DNS policy globally by using the CLI

At the command prompt, type the following commands to bind a DNS policy and verify the configuration:

1 - bind dns global <policyName> <priority>
2
3 - show dns global

Example:

1  > bind dns global pol_ddos_drop1 150
2  Done
Bind an integrated caching, responder, rewrite, or compression policy globally by using the GUI

1. In the navigation pane, click the name of the feature for which you want to bind the policy.
2. In the details pane, click <Feature Name> policy manager.
3. In the Policy Manager dialog box, select the bind point to which you want to bind the policy (for example, for Integrated Caching, Rewrite, or Compression, you could select Request and Default Global). The Responder does not differentiate between request-time and response-time policies.
4. Click Insert Policy and, from the Policy Name pop-up menu, select the policy name. A priority is assigned automatically to the policy, but you can click the cell in the Priority column and drag it anywhere within the dialog box if you want the policy to be evaluated after other policies in this bank. The priority is automatically reset. Note that priority values within a policy bank must be unique.
5. Click Apply Changes.
6. Click Close. A message in the status bar indicates that the policy is bound successfully.

Bind a DNS policy globally by using the GUI

1. Navigate to Traffic Management > DNS > Policies.
2. In the details pane, click Global Bindings.
3. In the global bindings dialog box, click Insert Policy, and select the policy that you want to bind globally.
4. Click in the Priority field and enter the priority level.
5. Click OK. A message in the status bar indicates that the policy is bound successfully.

Bind a policy to a virtual server

December 10, 2018

A globally bound policy applies to all load balancing and content switching virtual servers.
Note that when binding a policy to a virtual server, you must identify it as a request-time or a response-time policy.

**Bind a policy to a load balancing or content switching virtual server by using the CLI**

At the command prompt, type the following commands to bind a policy to a load balancing or content switching virtual server and verify the configuration:

```
1 - bind lb|cs vserver <virtualServerName> -policyName <policyName> -priority <positiveInteger> -type REQUEST|RESPONSE
2
3 - show lb vserver <name>
```

**Example:**

```
1 > bind lb vserver lbvip -policyName ns_cmp_msapp -priority 50
2 Done
3 > show lb vserver lbvip
   lbvip (8.7.6.6:80) - HTTP Type: ADDRESS
   State: DOWN
   Last state change was at Wed Jul 15 05:54:24 2009 (+226 ms)
   Time since last state change: 28 days, 01:57:26.350
   Effective State: DOWN
   Client Idle Timeout: 180 sec
   Down state flush: ENABLED
   Disable Primary Vserver On Down : DISABLED
   Port Rewrite : DISABLED
   No. of Bound Services : 0 (Total) 0 (Active)
   Configured Method: LEASTCONNECTION
   Mode: IP
   Persistence: NONE
   Vserver IP and Port insertion: OFF
   Push: DISABLED  Push VServer:
   Push Multi Clients: NO
   Push Label Rule: none

1) Policy : ns_cmp_msapp Priority:50
2) Policy : cf-pol Priority:1 Inherited
```

© 1999-2018 Citrix Systems, Inc. All rights reserved.
Bind a policy to an SSL offload virtual server by using the CLI

At the command prompt, type the following commands to bind a policy to an SSL offload virtual server and verify the configuration:

```
bind ssl vserver <vServerName>@ -policyName <policyName> -priority <positiveInteger>
```

Bind a policy to a virtual server by using the GUI

1. In the navigation pane, expand Traffic Management > Load Balancing, Traffic Management > Content Switching, Traffic Management > SSL Offload, Security > AAA- Application Traffic, or NetScaler Gateway, and then click Virtual Servers.
2. In the details pane, double-click the virtual server to which you want to bind the policy, and then click Open.
3. On the Policies tab, click the icon for the type of policy that you want to bind (the choices are feature-specific), and then click the name of the policy. Note that for some features, you can bind both classic policies and policies that use the default syntax to the virtual server.
4. If you are binding a policy to a Content Switching virtual server, in the Target field select a load balancing virtual server to which traffic that matches the policy is sent.
5. Click OK. A message in the status bar indicates that the policy is bound successfully.

Display policy bindings

December 10, 2018

You can display policy bindings to verify that they are correct.

Display policy bindings by using the CLI

At the command prompt, type the following commands to display policy bindings and verify the configuration:

```
show rewrite policy <name>
```

Example:

```
1 > show rewrite policy pol_remove-pdf
2     Name: pol_remove-pdf
3     Rule: http.req.url.contains(".pdf")
4     RewriteAction: act_remove-ae
5     UndefAction: Use Global
```
Display global policy bindings for integrated caching, rewrite, or responder by using the GUI

1. In the navigation pane, expand the feature that contains the policy that you want to view, and then click Policies.
2. In the details pane, click the policy. Bound policies have a check mark next to them.
3. At the bottom of the page, under Details, next to Bound to, view the entity to which the policy is bound.

Display global policy bindings for DNS or clientless access in the NetScaler Gateway by using the GUI

1. Navigate to Traffic Management > DNS > Policies.
2. In the details pane, click Global Bindings.

Display global policy bindings for content switching by using the GUI

1. Navigate to Traffic Management > Content Switching > Policies.
2. In detailed pane, select policy.
3. In the details pane, click Show Bindings.

Unbind a policy

December 10, 2018

If you want to re-assign a policy or delete it, you must first remove its binding.
NetScaler 11.1

Unbind an integrated caching, rewrite, or compression advanced policy globally by using the CLI

At the command prompt, type the following commands to unbind an integrated caching, rewrite, or compression Advanced policy globally and verify the configuration:

```
1 - unbind cache|rewrite|cmp global <policyName> [-type req_override|req_default|res_override|res_default] [-priority <positiveInteger>]
2
3 - show cache|rewrite|cmp global
```

Example:

```
1 > unbind cache global_nonPostReq
2   Done
3 > show cache global
4   1) Global bindpoint: REQ_DEFAULT
5       Number of bound policies: 1
6
7   2) Global bindpoint: RES_DEFAULT
8       Number of bound policies: 1
9
10 Done
```

The priority is required only for the “dummy” policy named NOPOLICY.

Unbind a responder policy globally by using the CLI

At the command prompt, type the following commands to unbind a responder policy globally and verify the configuration:

```
1 - unbind responder global <policyName> [-type override|default] [-priority <positiveInteger>]
2
3 - show responder global
```

Example:

```
1 > unbind responder global pol404Error
2   Done
3 > show responder global
4   1) Global bindpoint: REQ_DEFAULT
5       Number of bound policies: 1
6   Done
```
The priority is required only for the “dummy” policy named NOPOLICY.

### Unbind a DNS policy globally by using the CLI

At the command prompt, type the following commands to unbind a DNS policy globally and verify the configuration:

```plaintext
1  -  unbind responder global <policyName>
2
3  -  unbind responder global
```

**Example:**

```plaintext
1  unbind dns global dfgdfg
2  Done
3  show dns global
4    Policy name : dfgdfggfhg
5      Priority : 100
6    Goto expression : END
7  Done
```

### Unbind an advanced policy from a virtual server by using the CLI

At the command prompt, type the following commands to unbind an Advanced policy from a virtual server and verify the configuration:

```plaintext
1  -  unbind cs vserver <name> -policyName <policyName> [-priority < positiveInteger>] [-type REQUEST|RESPONSE]
2
3  -  show lb vserver <name>
```

**Example:**

```plaintext
1  unbind cs vserver vs-cont-switch -policyName poll
2  Done
3  > show cs vserver vs-cont-switch
4    vs-cont-switch (10.102.29.10:80) - HTTP Type: CONTENT
5    State: UP
6    Last state change was at Wed Aug 19 08:56:55 2009 (+18 ms)
7    Time since last state change: 0 days, 02:47:55.750
8    Client Idle Timeout: 180 sec
9    Down state flush: ENABLED
10   Disable Primary Vserver On Down : DISABLED
```
The priority is required only for the “dummy” policy named NOPOLICY.

**Unbind an integrated caching, responder, rewrite, or compression Advanced policy globally by using the GUI**

1. In the navigation pane, click the feature with the policy that you want to unbind (for example, Integrated Caching).
2. In the details pane, click <Feature Name> policy manager.
3. In the Policy Manager dialog box, select the bind point with the policy that you want to unbind, for example, Advanced Global.
4. Click the policy name that you want to unbind, and then click Unbind Policy.
5. Click Apply Changes.
6. Click Close. A message in the status bar indicates that the policy is unbound successfully.

**Unbind a DNS policy globally by using the GUI**

1. Navigate to Traffic Management > DNS > Policies.
2. In the details pane, click Global Bindings.
3. In the Global Bindings dialog box, select policy and click unbind policy.
4. Click OK. A message in the status bar indicates that the policy is unbound successfully.

**Unbind an advanced policy from a load balancing or content switching virtual server by using the GUI**

1. Navigate to Traffic Management, and expand Load Balancing or Content Switching, and then click Virtual Servers.
2. In the details pane, double-click the virtual server from which you want to unbind the policy.
3. On the Policies tab, in the Active column, clear the check box next to the policy that you want to unbind.
4. Click OK. A message in the status bar indicates that the policy is unbound successfully.
Create policy labels

In addition to the built-in bind points where you set up policy banks, you can also configure user-defined policy labels and associate policies with them.

Within a policy label, you bind policies and specify the order of evaluation of each policy relative to others in the bank of policies for the policy label. The NetScaler also permits you to define an arbitrary evaluation order as follows:

- You can use “goto” expressions to point to the next entry in the bank to be evaluated after the current one.
- You can use an entry in a policy bank to invoke another bank.

Each feature determines the type of policy that you can bind to a policy label, the type of load balancing virtual server that you can bind the label to, and the type of content switching virtual server from which the label can be invoked. For example, a TCP policy label can only be bound to a TCP load balancing virtual server. You cannot bind HTTP policies to a policy label of this type. And you can invoke a TCP policy label only from a TCP content switching virtual server.

After configuring a new policy label, you can invoke it from one or more banks for the built-in bind points.

Create a caching policy label by using the CLI

At the command prompt, type the following commands to create a Caching policy label and verify the configuration:

```
1 - add cache policylabel <labelName> -evaluates req|res
2
3 - show cache policylabel<labelName>
```

Example:

```
1 > add cache policylabel lbl-cache-pol -evaluates req
2 Done
3
4 > show cache policylabel lbl-cache-pol
   Label Name: lbl-cache-pol
   Evaluates: REQ
   Number of bound policies: 0
   Number of times invoked: 0
5 Done
```
Create a content switching policy label by using the CLI

At the command prompt, type the following commands to create a Content Switching policy label and verify the configuration:

1  -  add cs policylabel <labelName> http|tcp|rtsp|ssl
2 3  -  show cs policylabel <labelName>

Example:

1  >  add cs policylabel lbl-cs-pol http
2  Done
3  >  show cs policylabel lbl-cs-pol
4  5  Label Name:  lbl-cs-pol
5  6  Label Type:  HTTP
6  7  Number of bound policies: 0
7  8  Number of times invoked: 0
8  Done

Create a rewrite policy label by using the CLI

At the command prompt, type the following commands to create a Rewrite policy label and verify the configuration:

1  -  add rewrite policylabel <labelName> http_req|http_res|url|text|clientless_vpn_req|clientless_vpn_res
2 3  -  show rewrite policylabel <labelName>

Example:

1  >  add rewrite policylabel lbl-rewrt-pol http_req
2  Done
3
4  >  show rewrite policylabel lbl-rewrt-pol
5  6  Label Name:  lbl-rewrt-pol
6  7  Transform Name:  http_req
7  8  Number of bound policies: 0
8  9  Number of times invoked: 0
9  Done
**Create a responder policy label by using the CLI**

At the command prompt, type the following commands to create a Responder policy label and verify the configuration:

```
1 - add responder policylabel <labelName>
2
3 - show responder policylabel <labelName>
```

**Example:**

```
1 > add responder policylabel lbl-respndr-pol
2 Done
3
4 > show responder policylabel lbl-respndr-pol
5   Label Name:(lbl-respndr-pol
6   Number of bound policies: 0
7   Number of times invoked: 0
8 Done
```

**Note:** Invoke this policy label from a policy bank. For more information, see the “Binding a Policy to a Policy Label” section.

**Create a policy label by using the GUI**

1. In the navigation pane, expand the feature for which you want to create a policy label, and then click Policy Labels. The choices are Integrated Caching, Rewrite, Content Switching, or Responder.
2. In the details pane, click Add.
3. In the Name box, enter a unique name for this policy label.
4. Enter feature-specific information for the policy label. For example, for Integrated Caching, in the Evaluates drop-down menu, you would select REQ if you want this policy label to contain request-time policies, or select RES if you want this policy label to contain response-time policies. For Rewrite, you would select a Transform name.
5. Click Create.
6. Configure one of the built-in policy banks to invoke this policy label. For more information, see the “Binding a Policy to a Policy Label” section. A message in the status bar indicates that the policy label is created successfully.
### Bind a policy to a policy label

As with policy banks that are bound to the built-in bind points, each entry in a policy label is a policy that is bound to the policy label. As with policies that are bound globally or to a vserver, each policy that is bound to the policy label can also invoke a policy bank or a policy label that is evaluated after the current entry has been processed. The following table summarizes the entries in a policy label.

- **Name**. The name of a policy, or, to invoke another policy bank without evaluating a policy, the “dummy” policy name NOPOLICY.

  You can specify NOPOLICY more than once in a policy bank, but you can specify a named policy only once.

- **Priority**. An integer. This setting can work with the Goto expression.

- **Goto Expression**. Determines the next policy to evaluate in this bank. You can provide one of the following values:
  - **NEXT**. Go to the policy with the next higher priority.
  - **END**. Stop evaluation.
  - **USE_INVOCATION_RESULT**. Applicable if this entry invokes another policy bank. If the final Goto in the invoked bank has a value of END, evaluation stops. If the final Goto is anything other than END, the current policy bank performs a NEXT.
  - **Positive number**: The priority number of the next policy to be evaluated.
  - **Numeric expression**. An expression that produces the priority number of the next policy to be evaluated.

  The Goto can only proceed forward in a policy bank.

  If you omit the Goto expression, it is the same as specifying END.

- **Invocation Type**. Designates a policy bank type. The value can be one of the following:
  - **Request Vserver**. Invokes request-time policies that are associated with a virtual server.
  - **Response Vserver**. Invokes response-time policies that are associated with a virtual server.
  - **Policy label**. Invokes another policy bank, as identified by the policy label for the bank.

- **Invocation Name**. The name of a virtual server or a policy label, depending on the value that you specified for the Invocation Type.

### Configure a policy label or virtual server policy bank

December 13, 2018
After you have created policies, and created policy banks by binding the policies, you can perform additional configuration of policies within a label or policy bank. For example, before you configure invocation of an external policy bank, you might want to wait until you have configured that policy bank.

This topic includes the following sections:

- Configure a policy label
- Configure a policy bank for a virtual server

**Configure a policy label**

A policy label consists of a set of policies and invocations of other policy labels and virtual server-specific policy banks. An Invoke parameter enables you to invoke a policy label or a virtual server-specific policy bank from any other policy bank. A special-purpose NoPolicy entry enables you to invoke an external bank without processing an expression (a rule). The NoPolicy entry is a “dummy” policy that does not contain a rule.

For configuring policy labels from the NetScaler command line, note the following elaborations of the command syntax:

- gotoPriorityExpression is configured as described in Table 2. Format of Each Entry in a Policy Bank of the section “Entries in a Policy Bank” in *Bind policies using advanced policy*.
- The type argument is required. This is unlike binding a conventional policy, where this argument is optional.
- You can invoke the bank of policies that are bound to a virtual server by using the same method as you use for invoking a policy label.

**Configure a policy label by using the CLI**

At the command prompt, type the following commands to configure a policy label and verify the configuration:

```
1 - bind cache|rewrite|responder policylabel <policylabelName> - policyName <policyName> -priority <priority> [-gotoPriorityExpression <gotopriorityExpression>] [-invoke reqvserver | resvserver|policylabel <policyLabelName>|<vserverName>]
2
3 - show cache|rewrite|responder policylabel <policylabelName>
```

**Example:**

```
1 bind cache policylabel _reqBuiltinDefaults -policyName _nonGetReq -priority 100
```
Invoke a policy label from a rewrite policy bank with a NOPOLICY entry by using the CLI

At the command prompt, type the following commands to invoke a policy label from a Rewrite policy bank with a NOPOLICY entry and verify the configuration:

```
1 - bind rewrite global <policyName> <priority> <gotoPriorityExpression>
   -type REQ_OVERRIDE|REQ_DEFAULT|RES_OVERRIDE|RES_DEFAULT -invoke
   reqvserver|resvserver|policylabel <policyLabelName>|<vserverName>

2

3 - show rewrite global
```

Example:

```
1 > bind rewrite global NOPOLICY 100 -type REQ_DEFAULT -invoke
   policylabel lbl-rewrt-pol
   Done

2

3 > show rewrite global
   1) Global bindpoint: REQ_DEFAULT
   Number of bound policies: 1
   2) Global bindpoint: REQ_OVERRIDE
   Number of bound policies: 1
   Done
```
Invoke a policy label from an Integrated Caching policy bank by using the CLI

At the command prompt, type the following commands to invoke a policy label from an Integrated Caching policy bank and verify the configuration:

1 - `bind cache global NOPOLICY -priority <priority> -gotoPriorityExpression <gotopriorityExpression> type REQ_OVERRIDE|REQ_DEFAULT|RES_OVERRIDE|RES_DEFAULT -invoke reqvserver|resvserver|policylabel <policyLabelName>|<vserverName>

Example:

```
1 bind cache global NOPOLICY -priority 100 -gotoPriorityExpression END -type REQ_DEFAULT -invoke policylabel lbl-cache-pol
2 Done
3 > show cache global
4   1) Global bindpoint: REQ_DEFAULT
5         Number of bound policies: 2
6   2) Global bindpoint: RES_DEFAULT
7         Number of bound policies: 1
8
9 Done
```

Invoke a policy label from a Responder policy bank by using the CLI

At the command prompt, type the following commands to invoke a policy label from a Responder policy bank and verify the configuration:

1 - `bind responder global NOPOLICY <priority> <gotopriorityExpression> type OVERRIDE|DEFAULT -invoke vserver|policylabel <policyLabelName>|<vserverName>

Example:

```
1 > bind responder global NOPOLICY 100 NEXT -type DEFAULT -invoke policylabel lbl-respndr-pol
2 Done
3 > show responder global
4   1) Global bindpoint: REQ_DEFAULT
```
Configure a policy label by using the GUI

1. In the navigation pane, expand the feature for which you want to configure a policy label, and then click Policy Labels. The choices are Integrated Caching, Rewrite, or Responder.

2. In the details pane, double-click the label that you want to configure.

3. If you are adding a new policy to this policy label, click Insert Policy, and in the Policy Name field, select New Policy. For more information about adding a policy, see Create or modify a policy. Note that if you are invoking a policy bank, and do not want a rule to be evaluated prior to the invocation, click Insert Policy, and in the Policy Name field select NOPOLICY.

4. For each entry in this policy label, configure the following:
   - **Policy Name:**
     This is already determined by the Policy Name, new policy, or NOPOLICY entry that you inserted in this bank.
   - **Priority:**
     A numeric value that determines either an absolute order of evaluation within the bank, or is used in conjunction with a Goto expression.
   - **Expression:**
     The policy rule. Policy expressions are described in detail in the following chapters. For an introduction, see Configure advanced policy expressions: Get started.
   - **Action:**
     The action to be taken if this policy evaluates to TRUE.
   - **Goto Expression:**
     Optional. Used to augment the Priority level to determine the next policy or policy bank to evaluate. For more information on possible values for a Goto expression, see Table 2. Format of Each Entry in a Policy Bank of the section “Entries in a Policy Bank” in Bind policies using advanced policy.
   - **Invoke:**
     Optional. Invokes another policy bank.

5. Click **OK**. A message in the status bar indicates that the policy label is configured successfully.
Configure a policy bank for a virtual server

You can configure a bank of policies for a virtual server. The policy bank can contain individual policies, and each entry in the policy bank can optionally invoke a policy label or a bank of policies that you configured for another virtual server. If you invoke a policy label or policy bank, you can do so without triggering an expression (a rule) by selecting a NOPOLICY “dummy” entry instead of a policy name.

Add policies to a virtual server policy bank by using the CLI

At the command prompt, type the following commands to add policies to a virtual server policy bank and verify the configuration:

```bash
1. bind lb|cs vserver <virtualServerName> <serviceType> [-policyName <policyName>] [-priority <positiveInteger>] [-gotoPriorityExpression <expression>] [-type REQUEST|RESPONSE]
2. show lb|cs vserver <virtualServerName>

Example:

1. add lb vserver vs-cont-sw TCP
   Done
2. show lb vserver vs-cont-sw
   vs-cont-sw (0.0.0.0:0) - TCP Type: ADDRESS
   State: DOWN
   Last state change was at Wed Aug 19 10:04:02 2009 (+279 ms)
   Time since last state change: 0 days, 00:02:14.420
   Effective State: DOWN
   Client Idle Timeout: 9000 sec
   Down state flush: ENABLED
   Disable Primary Vserver On Down: DISABLED
   No. of Bound Services: 0 (Total) 0 (Active)
   Configured Method: LEASTCONNECTION
   Mode: IP
   Persistence: NONE
   Connection Failover: DISABLED
3. Done
```

Invoke a policy label from a virtual server policy bank with a NOPOLICY entry by using the CLI

At the command prompt, type the following commands to invoke a policy label from a virtual server policy bank with a NOPOLICY entry and verify the configuration:
Configure a virtual server policy bank by using the GUI

1. In the left navigation pane, expand **Traffic Management** > **Load Balancing, Traffic Management** > **Content Switching, Traffic Management** > **SSLOffload, Security** > **AAA - Application Traffic**, or **NetScaler Gateway**, as appropriate, and then click **Virtual Servers**.
2. In the details pane, select the virtual server that you want to configure, and then click **Open**.
3. In the **Configure Virtual Server** dialog box click the **Policies** tab.
4. To create a new policy in this bank, click the icon for the type of policy or policy label that you want to add to the virtual server’s bank of policies, click **Insert Policy**. Note that if you want to invoke a policy label without evaluating a policy rule, select the NOPOLICY “dummy” policy.
5. To configure an existing entry in this policy bank, enter the following:
   - **Priority:**
     A numeric value that determines either an absolute order of evaluation within the bank or is used in conjunction with a Goto expression.
   - **Expression:**
     The policy rule. Policy expressions are described in detail in the following chapters. For an introduction, see Configuring Advanced Policy Expressions: Getting Started.
   - **Action:**
     The action to be taken if this policy evaluates to TRUE.
   - **Goto Expression:**
     Optional. Determines the next policy or policy bank evaluate. For more information on possible values for a Goto expression, see the section “Entries in a Policy Bank” in Bind policies using advanced policy.
   - **Invoke:**
Optional. To invoke another policy bank, select the name of the policy label or virtual server policy bank that you want to invoke.

6. Click **OK**. A message in the status bar indicates that the policy is configured successfully.

## Invoke or remove a policy label or virtual server policy bank

December 13, 2018

Unlike a policy, which can only be bound once, you can use a policy label or a virtual server’s policy bank any number of times by invoking it. Invocation can be performed from two places:

- From the binding for a named policy in a policy bank.
- From the binding for a NOPOLICY “dummy” entry in a policy bank.

Typically, the policy label must be of the same type as the policy from which it is invoked. For example, you would invoke a responder policy label from a responder policy.

Note: When binding or unbinding a global NOPOLICY entry in a policy bank at the command line, you specify a priority to distinguish one NOPOLICY entry from another.

## Invoke a rewrite or integrated caching policy label by using the CLI

At the command prompt, type the one of the following commands to invoke a rewrite or integrated caching policy label and verify the configuration:

```
1 - bind cache global <policy> -priority <positive_integer> [-gotoPriorityExpression <expression>] -type REQ_OVERRIDE|REQ_DEFAULT|RES_OVERRIDE|RES_DEFAULT] -invoke reqvserver|resvserver|policylabel <label_name>
2
3 - bind rewrite global <policy> -priority <positive_integer> [-gotoPriorityExpression <expression>] -type REQ_OVERRIDE|REQ_DEFAULT|RES_OVERRIDE|RES_DEFAULT] -invoke reqvserver|resvserver|policylabel <label_name>
4
5 - show cache global|show rewrite global
```

**Example:**

```
1 > bind cache global _nonPostReq2 -priority 100 -type req_override -invoke
2   policymodel lbl-cache-pol
3 Done
4 > show cache global
```
Invoke a responder policy label by using the CLI

At the command prompt, type the following commands to invoke a responder policy label and verify the configuration:

```
1 - bind responder global <policy_Name> <priority_as_positive_integer> 
   [<gotoPriorityExpression>] -type REQ_OVERRIDEREQ_DEFAULTOVERRIDE| 
   DEFAULT -invoke vserver|policylabel <label_name>
2
3 - show responder global
```

Example:

```
> bind responder global pol404Error1 300 -invoke policylabel lbl-
   respndr-pol
Done
3 > show responder global
4 1) Global bindpoint: REQ_DEFAULT
5 Number of bound policies: 2
6
7 Done
```

Invoke a virtual server policy bank by using the CLI

At the command prompt, type the following commands to invoke a Virtual Server Policy Bank and verify the configuration:

```
1 - bind lb vserver <vserver_name> -policyName <policy_Name> -priority < 
   positive_integer> [-gotoPriorityExpression <expression>] -type 
   REQUEST|RESPONSE -invoke reqvserver|resvserver|policylabel < 
   policy_Label_Name>
```
Example:

```plaintext
> bind lb vserver lbvip -policyName ns_cmp_msapp -priority 100
Done

> show lb vserver lbvip
  lbvip (8.7.6.6:80) - HTTP       Type: ADDRESS
  State: DOWN
  Last state change was at Wed Jul 15 05:54:24 2009 (+166 ms)
  Time since last state change: 28 days, 06:37:49.250
  Effective State: DOWN
  Client Idle Timeout: 180 sec
  Down state flush: ENABLED
  Disable Primary Vserver On Down : DISABLED
  Port Rewrite : DISABLED
  No. of Bound Services : 0 (Total)     0 (Active)
  Configured Method: LEASTCONNECTION
  Mode: IP
  Persistence: NONE
  Vserver IP and Port insertion: OFF
  Push: DISABLED    Push VServer:
  Push Multi Clients: NO
  Push Label Rule: none

  1)  CSPolicy: pol-cont-sw   CSVserver: vs-cont-sw    Priority: 100   Hits: 0

  2)  Policy : pol-ssl Priority:0

  3)  Policy : ns_cmp_msapp Priority:100

  4)  Policy : cf-pol Priority:1    Inherited

Done
```

Remove a rewrite or integrated caching policy label by using the CLI

At the command prompt, type one of the following commands to remove a rewrite or integrated caching policy label and verify the configuration:

```plaintext
- unbind rewrite global <policyName> -priority <positiveInteger> -type
  REQ_OVERRIDE|REQ_DEFAULT|RES_OVERRIDE|RES_DEFAULT
2
```
Example:

```bash
1 > unbind rewrite global NOPOLICY -priority 100 -type REQ_OVERRIDE
2 > show rewrite global
3 Done
4 1) Global bindpoint: REQ_DEFAULT
5  Number of bound policies: 1
6
7 Done
```

Remove a responder policy label by using the CLI

At the command prompt, type the following commands to remove a responder policy label and verify the configuration:

```bash
1 - unbind responder global <policyName> -priority <positiveInteger> -type OVERRIDE|DEFAULT
2
3 - show responder global
```

Example:

```bash
1 > unbind responder global NOPOLICY -priority 100 -type REQ_DEFAULT
2 Done
3 > show responder global
4 1) Global bindpoint: REQ_DEFAULT
5  Number of bound policies: 1
6
7 Done
```

Remove a virtual server policy label by using the CLI

At the command prompt, type one of the following commands to remove a Virtual Server policy label and verify the configuration:

```bash
1 - unbind lb vserver <virtualServerName> -policyName NOPOLICY-REWRITE|NOPOLICY-RESPONDER|NOPOLICY-CACHE -type REQUEST|RESPONSE -priority <positiveInteger>
```

© 1999-2018 Citrix Systems, Inc. All rights reserved.
NetScaler 11.1

```
2 - unbind cs vserver <virtualServerName> -policyName NOPOLICY-REWRITE|NOPOLICY-RESPONDER|NOPOLICY-CACHE -type REQUEST|RESPONSE -priority <positiveInteger>

4 - show lb vserver|show cs vserver
```

Example:

```
1 > unbind lb vserver lbvip -policyName ns_cmp_msapp -priority 200
2 Done
3 > show lb vserver lbvip
4   lbvip (8.7.6.6:80) - HTTP       Type: ADDRESS
5   State: DOWN
6   Last state change was at Wed Jul 15 05:54:24 2009 (+161 ms)
7   Time since last state change: 28 days, 06:47:54.600
8   Effective State: DOWN
9   Client Idle Timeout: 180 sec
10  Down state flush: ENABLED
11  Disable Primary Vserver On Down : DISABLED
12  Port Rewrite : DISABLED
13  No. of Bound Services : 0 (Total)    0 (Active)
14  Configured Method: LEASTCONNECTION
15  Mode: IP
16  Persistence: NONE
17  Vserver IP and Port insertion: OFF
18  Push: DISABLED   Push VServer:
19    Push Multi Clients: NO
20  Push Label Rule: none
21
22  1)    CSPolicy: pol-cont-sw CSVserver: vs-cont-sw Priority: 100   Hits: 0
23
24  1)    Policy : pol-ssl Priority:0
25  2)    Policy : cf-pol Priority:1   Inherited
26 Done
```

**Invoke a policy label or virtual server policy bank by using the GUI**

1. Bind a policy, as described in Bind a policy globally, Bind a policy to a virtual server, or Bind a policy to a policy label. Alternatively, you can enter a NOPOLICY “dummy” entry instead of a policy name. You do this if you do not want to evaluate a policy before evaluating the policy bank.
2. In the Invoke field, select the name of the policy label or virtual server policy bank that you want
to evaluate if traffic matches the bound policy. A message in the status bar indicates that the
policy label or virtual server policy bank is invoked successfully.

Remove a policy label invocation by using the GUI

1. Open the policy and clear the Invoke field. Unbinding the policy also removes the invocation of
the label. A message in the status bar indicates that the policy label is removed successfully.

Configure and bind policies with the policy manager

December 13, 2018

Warning:

Classic policy expressions are no longer supported from NetScaler 12.0 build 56.20 onwards and
as an alternative, Citrix recommends you to use Advanced policies. For more information, see
Advanced Policies.

Some applications provide a specialized Policy Manager in the NetScaler GUI to simplify configuring
policy banks. It also lets you find and delete policies and actions that are not being used.

The Policy Manager is currently available for the Rewrite, Integrated Caching, Responder, and Com-
pression features.

The following are keyboard equivalents for the procedures in this section:

- For editing a cell in the Policy Manager, you can tab to the cell and click F2 or press the SPACE
  bar on the keyboard.
- To select an entry in a drop-down menu, you can tab to the entry, press the space bar to view the
drop-down menu, use the UP and DOWN ARROW keys to navigate to the entry that you want,
  and press the space bar again to select the entry.
- To cancel a selection in a drop-down menu, press the Escape key.
- To insert a policy, tab to the row above the insertion point and press Control + Insert, or click
  Insert Policy.
- To remove a policy, tab to the row that contains the policy and press Delete.

Note: Note that when you delete the policy, the NetScaler searches the Goto Expression values of
other policies in the bank. If any of these Goto Expression values match the priority level of the deleted
policy, they are removed.
Configure policy bindings by using the policy manager

1. In the navigation pane, click the feature for which you want to configure policies. The choices are Responder, Integrated Caching, Rewrite or Compression.

2. In the details pane, click Policy Manager.

3. If you are configuring classic policy bindings for compression, in the Compression Policy Manager dialog box, click **Switch to Classic Syntax**. The dialog box switches to the classic syntax view and displays the Switch to Advanced Policy button. At any time before you complete configuring policy bindings, if you want to configure bindings for policies that use the Advanced Policy, click the Switch to Advanced Policy button.

4. For features other than Responder, to specify the bind point, click Request or Response, and then click one of the request-time or response-time bind points. The options are Override Global, LB Virtual Server, CS Virtual Server, Default Global, or Policy Label. If you are configuring the Responder, the Request and Response flow types are not available.

5. To bind a policy to this bind point, click Insert Policy, and select a previously configured policy, a NOPOLICY label, or the New policy option. Depending on the option that you select, you have the following choices:
   - **New policy**: Create the policy as described in “Create or modify a policy,” and then configure the priority level, GoTo expression, and policy invocation as described in the table, “Format of each entry in a policy bank.”
   - **Existing policy, NOPOLICY, or NOPOLICY<feature name>**: Configure the priority level, GoTo expression, and policy invocation as described in the table, “Format of each entry in a policy bank.” The NOPOLICY or NOPOLICY<feature name> options are available only for policies that use Advanced Policies.

6. Repeat the preceding steps to add entries to this policy bank.

7. To modify the priority level for an entry, you can do any of the following:
   - Double-click the Priority field for an entry and edit the value.
   - Click and drag a policy to another row in the table.
   - Click Regenerate Priorities.

   In all three cases, priority levels of all other policies are modified as needed to accommodate the new value. Goto Expressions with integer values are also updated automatically. For example, if you change a priority value of 10 to 100, all policies with a Goto Expression value of 10 are updated to the value 100.

8. To change the policy, action, or policy bank invocation for an row in the table, click the down arrow to the right of the entry and do one of the following:
• To change the policy, select another policy name or select New Policy and follow the steps in Create or modify a policy.
• To change the Goto Expression, select Next, End, USE_INVOCATION_RESULT, or select more and enter an expression whose result returns the priority level of another entry in this policy bank.
• To modify an invocation, select an existing policy bank, or click New Policy Label and follow the steps in Bind a policy to a policy label.

9. To unbind a policy or a policy label invocation from this bank, click any field in the row that contains the policy or policy label, and then click Unbind Policy.

10. When you are done, click Apply Changes. A message in the status bar indicates that the policy is bound successfully.

Remove unused policies by using the policy manager

1. In the navigation pane, click the feature for which you want to configure the policy bank. The choices are Responder, Integrated Caching, or Rewrite.
2. In the details pane, click <Feature Name> policy manager.
3. In the <Feature Name> Policy Manager dialog box, click Cleanup Configuration.
4. In the Cleanup Configuration dialog box, select the items that you want to delete, and then click Remove.
5. In the Remove dialog box, click Yes.
6. Click Close. A message in the status bar indicates that the policy is removed successfully.

Configuring advanced policy expression: getting started

December 10, 2018

Advanced policies evaluate data on the basis of information that you supply in Advanced policy expressions. An Advanced policy expression analyzes data elements (for example, HTTP headers, source IP addresses, the NetScaler system time, and POST body data). In addition to configuring an Advanced policy expression in a policy, in some NetScaler features, you configure Advanced policy expression outside of the context of a policy.

To create an Advanced policy expression, you select a prefix that identifies a piece of data that you want to analyze, and then you specify an operation to perform on the data. For example, an operation can match a piece of data with a text string that you specify, or it can transform a text string into an HTTP header. Other operations match a returned string with a set of strings or a string pattern. You configure compound expressions by specifying Boolean and arithmetic operators, and by using parentheses to control the order of evaluation.
Advanced policy expression can also contain classic expressions. You can assign a name to a frequently used expression to avoid having to build the expression repeatedly.

Policies and a few other entities include rules that the NetScaler uses to evaluate a packet in the traffic flowing through it, to extract data from the NetScaler system itself, to send a request (a “callout”) to an external application, or to analyze another piece of data. A rule takes the form of a logical expression that is compared against traffic and ultimately returns values of TRUE or FALSE.

The elements of the rule can themselves return TRUE or FALSE, string, or numeric values.

Before configuring an Advanced policy expression, you need to understand the characteristics of the data that the policy or other entity is to evaluate. For example, when working with the Integrated Caching feature, a policy determines what data can be stored in the cache. With Integrated Caching, you need to know the URLs, headers, and other data in the HTTP requests and responses that the NetScaler receives. With this knowledge, you can configure policies that match the actual data and enable the NetScaler to manage caching for HTTP traffic. This information helps you determine the type of expression that you need to configure in the policy.

**Basic elements of an advanced policy expression**

December 10, 2018

An Advanced policy expression consists of, at a minimum, a prefix (or a single element used in place of a prefix). Most expressions also specify an operation to be performed on the data that the prefix identifies. You format an expression of up to 1,499 characters as follows:

```plaintext
<prefix>.<operation> [<compound-operator> <prefix>.<operation>. . .]
```

where

- `<prefix>`
  
is an anchor point for starting an expression.

  The prefix is a period-delimited key that identifies a unit of data. For example, the following prefix examines HTTP requests for the presence of a header named Content-Type:

  ```plaintext
  http.req.header(“Content-Type”)
  ```

  Prefixes can also be used on their own to return the value of the object that the prefix identifies.

- `<operation>`
  
  identifies an evaluation that is to be performed on the data identified by the prefix.

  For example, consider the following expression:

  ```plaintext
  http.req.header(“Content-Type”).eq(“text/html”)
  ```
In this expression, the following is the operator component:

\texttt{eq(“text/html”)}

This operator causes the NetScaler to evaluate any HTTP requests that contain a Content-Type header, and in particular, to determine if the value of this header is equal to the string “text/html.” For more information, see Operations.

- \texttt{<compound-operator>}

is a Boolean or arithmetic operator that forms a compound expression from multiple prefix or prefix.operation elements.

For example, consider the following expression:

\texttt{http.req.header(“Content-Type”).eq(“text/html”) \&\& http.req.url.contains(“.html”)}

### Prefixes

An expression prefix represents a discrete piece of data. For example, an expression prefix can represent an HTTP URL, an HTTP Cookie header, or a string in the body of an HTTP POST request. An expression prefix can identify and return a wide variety of data types, including the following:

- A client IP address in a TCP/IP packet
- NetScaler system time
- An external callout over HTTP
- A TCP or UDP record type

In most cases, an expression prefix begins with one of the following keywords:

- **CLIENT:**
  - Identifies a characteristic of the client that is either sending a request or receiving a response, as in the following examples:
    - The prefix client.ip.dst designates the destination IP address in the request or response.
    - The prefix client.ip.src designates the source IP address.

- **HTTP:**
  - Identifies an element in an HTTP request or a response, as in the following examples:
    - The prefix http.req.body(integer) designates the body of the HTTP request as a multiline text object, up to the character position designated in integer.
    - The prefix http.req.header(“header_name”) designates an HTTP header, as specified in header_name.
    - The prefix http.req.url designates an HTTP URL in URL-encoded format.

- **SERVER:**
  - Identifies an element in the server that is either processing a request or sending a response.
• SYS:
  Identifies a characteristic of the NetScaler that is processing the traffic.

Note: Note that DNS policies support only SYS, CLIENT, and SERVER objects.

In addition, in the NetScaler Gateway, the Clientless VPN function can use the following types of prefixes:

• TEXT:
  Identifies any text element in a request or a response.

• TARGET:
  Identifies the target of a connection.

• URL:
  Identifies an element in the URL portion of an HTTP request or response.

As a general rule of thumb, any expression prefix can be a self-contained expression. For example, the following prefix is a complete expression that returns the contents of the HTTP header specified in the string argument (enclosed in quotation marks):

```
http.res.header.("myheader")
```

Or you can combine prefixes with simple operations to determine TRUE and FALSE values. For example, the following returns a value of TRUE or FALSE:

```
http.res.header.("myheader").exists
```

You can also use complex operations on individual prefixes and multiple prefixes within an expression, as in the following example:

```
http.req.url.length + http.req.cookie.length <= 500
```

Which expression prefixes you can specify depends on the NetScaler feature. The following table describes the expression prefixes that are of interest on a per-feature basis:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Types of Expression Prefix Used in the Feature</th>
</tr>
</thead>
<tbody>
<tr>
<td>DNS</td>
<td>SYS, CLIENT, SERVER</td>
</tr>
<tr>
<td>Responder in Protection Features</td>
<td>HTTP, SYS, CLIENT</td>
</tr>
<tr>
<td>Content Switching</td>
<td>HTTP, SYS, CLIENT</td>
</tr>
<tr>
<td>Rewrite</td>
<td>HTTP, SYS, CLIENT, SERVER, URL, TEXT, TARGET, VPN</td>
</tr>
<tr>
<td>Integrated Caching</td>
<td>HTTP, SYS, CLIENT, SERVER</td>
</tr>
</tbody>
</table>
### Single-element expressions

The simplest type of Advanced policy expression contains a single element. This element can be one of the following:

- **true.** An Advanced policy expression can consist simply of the value `true`. This type of expression always returns a value of `TRUE`. It is useful for chaining policy actions and triggering Goto expressions.
- **false.** An Advanced policy expression can consist simply of the value `false`. This type of expression always returns a value of `FALSE`.
- **A prefix for a compound expression.** For example, the prefix `HTTP.REQ.HOSTNAME` is a complete expression that returns a host name and `HTTP.REQ.URL` is a complete expression that returns a URL. The prefix could also be used in conjunction with operations and additional prefixes to form a compound expression.

### Operations

In most expressions, you also specify an operation on the data that the prefix identifies. For example, suppose that you specify the following prefix:

```
http.req.url
```

This prefix extracts URLs in HTTP requests. This expression prefix does not require any operators to be used in an expression. However, when you configure an expression that processes HTTP request URLs, you can specify operations that analyze particular characteristics of the URL. Following are a few possibilities:

- Search for a particular host name in the URL.
- Search for a particular path in the URL.
- Evaluate the length of the URL.
- Search for a string in the URL that indicates a time stamp and convert it to GMT.
The following is an example of a prefix that identifies an HTTP header named Server and an operation that searches for the string IIS in the header value:

```
http.res.header("Server").contains("IIS")
```

Following is an example of a prefix that identifies host names and an operation that searches for the string “www.mycompany.com” as the value of the name:

```
http.req.hostname.eq("www.mycompany.com")
```

### Basic operations on expression prefixes

The following table describes a few of the basic operations that can be performed on expression prefixes.

<table>
<thead>
<tr>
<th>Operation</th>
<th>Determines Whether or Not</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONTAINS(&lt;string&gt;)</td>
<td>The object matches &lt;string&gt;. Following is an example: http.req.header(&quot;Cache-Control&quot;).contains(&quot;no-cache&quot;)</td>
</tr>
<tr>
<td>EXISTS</td>
<td>A particular item is present in an object. Following is an example: http.res.header(&quot;MyHdr&quot;).exists</td>
</tr>
<tr>
<td>EQ(&lt;text&gt;)</td>
<td>A particular non-numeric value is present in an object. Following is an example: http.req.method.eq(post)</td>
</tr>
<tr>
<td>EQ(&lt;integer&gt;)</td>
<td>A particular numeric value is present in an object. Following is an example: client.ip.dst.eq(10.100.10.100)</td>
</tr>
<tr>
<td>LT(&lt;integer&gt;)</td>
<td>An object’s value is less than a particular value. Following is an example: http.req.content_length.lt(5000)</td>
</tr>
<tr>
<td>GT(&lt;integer&gt;)</td>
<td>An object’s value is greater than a particular value. Following is an example: http.req.content_length.gt(5)</td>
</tr>
</tbody>
</table>

The following table summarizes a few of the available types of operations.

</thead>
<tbody>
<tr>
<td>Text operations</td>
<td>Match individual strings and sets of strings with any portion of a target. The target can be an entire string, the start of a string, or any portion of text in between the start and the end of the string. For example, you can extract the string “XYZ” from “XYZSomeText”. Or, you can compare an HTTP header value with an array of different strings. You can also transform text into another type of data. Following are examples: Transform a string into an integer value, create a list from the query strings in a URL, and transform a string into a time value.</td>
</tr>
<tr>
<td>Numeric operations</td>
<td>Numeric operations include applying arithmetic operators, evaluating content length, the number of items in a list, dates, times, and IP addresses.</td>

</table>

**Compound advanced policy expressions**

December 13, 2018

You can configure an Advanced policy expression that contains Boolean or arithmetic operators and multiple atomic operations. The following compound expression contains a boolean AND:

```plaintext
http.req.hostname.eq("mycompany.com") && http.req.method.eq(post)
```

The following expression adds the value of two targets, and compares the result to a third value:

```plaintext
http.req.url.length + http.req.cookie.length <= 500
```

A compound expression can contain any number of logical and arithmetic operators. The following expression evaluates the length of an HTTP request on the basis of its URL and cookie, evaluates text in the header, and performs a Boolean AND on these two results:

```plaintext
http.req.url.length + http.req.cookie.length <= 500 && http.req.header.contains("some text")
```

You can use parentheses to control the order of evaluation in a compound expression.
Booleans in compound expressions

You configure compound expressions with the following operators:

- **&&**.
  This operator is a logical AND. For the expression to evaluate to TRUE, all components that are joined by the And must evaluate to TRUE. Following is an example:
  
  `http.req.url.hostname.eq("myHost") && http.req.header("myHeader").exists`

- **|**.
  This operator is a logical OR. If any component of the expression that is joined by the OR evaluates to TRUE, the entire expression is TRUE.

- **!**.
  Performs a logical NOT on the expression.

In some cases, the NetScaler GUI offers AND, NOT, and OR operators in the Add Expression dialog box. However, these are of limited use. Citrix recommends that you use the operators &&, and ! to configure compound expressions that use Boolean logic.

Parentheses in compound expressions

You can use parentheses to control the order of evaluation of an expression. The following is an example:

`http.req.url.contains("myCompany.com") || (http.req.url.hostname.eq("myHost") && http.req.header("myHeader").exists)`

The following is another example:

`(http.req.header("Content-Type").exists && http.req.header("Content-Type").eq("text/html")) || (http.req.header("Transfer-Encoding").exists || http.req.header("Content-Length").exists)`
**Compound operations for strings**

The following table describes operators that you can use to configure compound operations on string data.

<table>
<thead>
<tr>
<th>Operations that produce a string value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str + str</td>
<td>Concatenates the value of the expression on the left of the operator with the value on the right. Following is an example: http.req.hostname + http.req.url.protocol</td>

</tbody>
</table>
Compound operations for numbers

You can configure compound numeric expressions. For example, the following expression returns a numeric value that is the sum of an HTTP header length and a URL length:

\[ \text{http.req.header.length} + \text{http.req.url.length} \]

The following tables describes operators that you can use to configure compound expressions for numeric data.

<table>
<thead>
<tr>
<th>Arithmetic operations on numbers</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>num + num</td>
<td>Add the value of the expression on the left of the operator to the value of the expression on the right. Following is an example: ( \text{http.req.content_length} + \text{http.req.url.length} )</td>
</tr>
<tr>
<td>num – num</td>
<td>Subtract the value of the expression on the right of the operator from the value of the expression on the left.</td>
</tr>
<tr>
<td>num * num</td>
<td>Multiply the value of the expression on the left of the operator with the value of the expression on the right. Following is an example: ( \text{client.interface.rxthroughput} \ast 9 )</td>
</tr>
<tr>
<td>num / num</td>
<td>Divide the value of the expression on the left of the operator by the value of the expression on the right.</td>
</tr>

</tbody>
</table>

Functions for data types in the policy infrastructure

The NetScaler policy infrastructure supports the following numeric data types:

- Integer (32 bits)
- Unsigned long (64 bits)
- Double (64 bits)

Simple expressions can return all of these data types. Therefore, you can create compound expressions that use arithmetic operators and logical operators to evaluate or return values of these data types. Additionally, you can use all of these values in policy expressions. Literal constants of type unsigned long can be specified by appending the string ul to the number. Literal constants of type double contain a period (.), an exponent, or both.

Arithmetic Operators, Logical Operators, and Type Promotion

In compound expressions, the following standard arithmetic and logical operators can be used for the double and unsigned long data types:

- +, -, *, and /
%, ~, ^, &, , <<, and >> (do not apply to double)

•

• ==, !=, >, <, >=, and <=

All of these operators have the same meaning as in the C programming language.

In all cases of mixed operations between operands of type integer, unsigned long, and double, type promotion is performed so that the operation can be performed on operands of the same type. A type of lower precedence is automatically promoted to the type of the operand with the highest precedence involved in the operation. The order of precedence (higher to lower) is as follows:

• Double
• Unsigned long
• Integer

Therefore, an operation that returns a numeric result returns a result of the highest type involved in the operation.

For example, if the operands are of type integer and unsigned long, the integer operand is automatically converted to type unsigned long. This type conversion is performed even in simple expressions in which the type of data identified by the expression prefix does not match the type of data that is passed as the argument to the function. To illustrate such an example, in the operation HTTP.REQ.CONTENT_LENGTH.DIV(3ul), the integer returned by the prefix HTTP.REQ.CONTENT_LENGTH is automatically converted to unsigned long (the type of the data passed as the argument to the DIV() function), and an unsigned long division is performed. Similarly, the argument can be promoted in an expression. For example, HTTP.REQ.HEADER("myHeader").TYPECAST_DOUBLE_AT.DIV(5) promotes the integer 5 to type double and performs double-precision division.

For information about expressions for casting data of one type to data of another type, see Typecasting data.

**Specify the character set in expressions**

December 10, 2018

The policy infrastructure on the Citrix® NetScaler® appliance supports the ASCII and UTF-8 character sets. The default character set is ASCII. If the traffic for which you are configuring an expression consists of only ASCII characters, you need not specify the character set in the expression. However, you must specify the character set in every simple expression that is meant for UTF-8 traffic. To specify the
UTF-8 character set in a simple expression, you must include the SET_CHAR_SET(<charset>) function, with <charset> specified as UTF_8, as shown in the following examples:

```
1 HTTP.REQ.BODY(10).SET_CHAR_SET(UTF_8).CONTAINS("ß")
2 HTTP.RES.BODY(100).SET_CHAR_SET(UTF_8).BEFORE_STR("Bücher").AFTER_STR("Wörterbuch")
```

In an expression, the SET_CHAR_SET() function must be introduced at the point in the expression after which data processing must be carried out in the specified character set. For example, in the expression HTTP.REQ.BODY(1000).AFTER_REGEX(re/following example/).BEFORE_REGEX(re/In the preceding example/).CONTAINS_ANY("Greek_alphabet"), if the strings stored in the pattern set “Greek_alphabet” are in UTF-8, you must include the SET_CHAR_SET(UTF_8) function immediately before the CONTAINS_ANY("<strings>") function, as follows:

```
HTTP.REQ.BODY(1000).AFTER_REGEX(re/following example/).BEFORE_REGEX(re/In the preceding example/).SET_CHAR_SET(UTF_8).CONTAINS_ANY("Greek_alphabet")
```

The SET_CHAR_SET() function sets the character set for all further processing (that is, for all subsequent functions) in the expression unless it is overridden later in the expression by another SET_CHAR_SET() function that changes the character set. Therefore, if all the functions in a given simple expression are intended for UTF-8, you can include the SET_CHAR_SET(UTF_8) function immediately after functions that identify text (for example, the HEADER("<name>") or BODY(<int>) functions). In the second example that follows the first paragraph above, if the ASCII arguments passed to the AFTER_REGEX() and BEFORE_REGEX() functions are changed to UTF-8 strings, you can include the SET_CHAR_SET(UTF_8) function immediately after the BODY(1000) function, as follows:

```
HTTP.REQ.BODY(1000).SET_CHAR_SET(UTF_8).AFTER_REGEX(re/Bücher/).BEFORE_REGEX(re/Wörterbuch/).CONTAINS_ANY("Greek_alphabet")
```

The UTF-8 character set is a superset of the ASCII character set, so expressions configured for the ASCII character set continue to work as expected if you change the character set to UTF-8.

### Compound expressions with different character sets

In a compound expression, if one subset of expressions is configured to work with data in the ASCII character set and the rest of the expressions are configured to work with data in the UTF-8 character set, the character set specified for each individual expression is considered when the expressions are evaluated individually. However, when processing the compound expression, just before processing the operators, the appliance promotes the character set of the returned ASCII values to UTF-8. For example, in the following compound expression, the first simple expression evaluates data in the ASCII character set while the second simple expression evaluates data in the UTF-8 character set:

```
HTTP.REQ.HEADER("MyHeader")== HTTP.REQ.BODY(10).SET_CHAR_SET(UTF_8)
```
However, when processing the compound expression, just before evaluating the “is equal to” Boolean operator, the NetScaler appliance promotes the character set of the value returned by HTTP.REQ.HEADER(“MyHeader”) to UTF-8.

The first simple expression in the following example evaluates data in the ASCII character set. However, when the NetScaler appliance processes the compound expression, just before concatenating the results of the two simple expressions, the appliance promotes the character set of the value returned by HTTP.REQ.BODY(10) to UTF-8.

HTTP.REQ.BODY(10) + HTTP.REQ.HEADER(”MyHeader”).SET_CHAR_SET(UTF_8)

Consequently, the compound expression returns data in the UTF-8 character set.

Specify the character set based on the character set of traffic

You can set the character set to UTF-8 on the basis of traffic characteristics. If you are not sure whether the character set of the traffic being evaluated is UTF-8, you can configure a compound expression in which the first expression checks for UTF-8 traffic and subsequent expressions set the character set to UTF-8. Following is an example of a compound expression that first checks the value of “charset” in the request’s Content-Type header for “UTF-8” before checking whether the first 1000 bytes in the request contain the UTF-8 string Bücher:

HTTP.REQ.HEADER(”Content-Type”).SET_TEXT_MODE(IGNORECASE).TYPECAST_NVLIST_T(’=”;’, ’,”').VALUE(”charset”).EQ(”UTF-8”) && HTTP.REQ.BODY(1000).SET_CHAR_SET(UTF_8).CONTAINS(”Bücher”)

If you are sure that the character set of the traffic being evaluated is UTF-8, the second expression in the example is sufficient.

Character and string literals in expressions

During expression evaluation, even if the current character set is ASCII, character literals and string literals, which are enclosed in single quotation marks (‘’) and quotation marks (“”), respectively, are considered to be literals in the UTF-8 character set. In a given expression, if a function is operating on character or string literals in the ASCII character set and you include a non-ASCII character in the literal, an error is returned.

Values in hexadecimal and octal formats

When configuring an expression, you can enter values in octal and hexadecimal formats. However, each hexadecimal or octal byte is considered a UTF-8 byte. Invalid UTF-8 bytes result in errors regardless of whether the value is entered manually or pasted from the clipboard. For example, “\xce\x20” is
an invalid UTF-8 character because “c8” cannot be followed by “20” (each byte in a multi-byte UTF-8 string must have the high bit set). Another example of an invalid UTF-8 character is “\xce \xa9,” since the hexadecimal characters are separated by a white-space character.

**Functions that return UTF-8 strings**

Only the <text>.XPATH and <text>.XPATH_JSON functions always return UTF-8 strings. The following MYSQL routines determine at runtime which character set to return, depending on the data in the protocol:

- MYSQL_CLIENT_T.USER
- MYSQL_CLIENT_T.DATABASE
- MYSQL_REQ_QUERY_T.COMMAND
- MYSQL_REQ_QUERY_T.TEXT
- MYSQL_REQ_QUERY_T.TEXT(<unsigned int>)
- MYSQL_RES_ERROR_T.SQLSTATE
- MYSQL_RES_ERROR_T.MESSAGE
- MYSQL_RES_FIELD_T.CATALOG
- MYSQL_RES_FIELD_T.DB
- MYSQL_RES_FIELD_T.TTABLE
- MYSQL_RES_FIELD_T.ORIGINAL_TABLE
- MYSQL_RES_FIELD_T.NAME
- MYSQL_RES_FIELD_T.ORIGINAL_NAME
- MYSQL_RES_OK_T.MESSAGE
- MYSQL_RES_ROW_T.TEXT_ELEM(<unsigned int>)

**Terminal connection settings for UTF-8**

When you set up a connection to the NetScaler appliance by using a terminal connection (by using PuTTY, for example), you must set the character set for transmission of data to UTF-8.

**Classic expressions in advanced policy expressions**

December 13, 2018

**Warning**

Classic policy expressions are no longer supported from NetScaler 12.0 build 56.20 onwards and as an alternative, Citrix recommends you to use Advanced policies. For more information, see
Configure advanced policy expressions: Get started.

Classic expressions describe basic characteristics of traffic. In some cases, you may want to use a classic expression in an Advanced policy expression are no longer supported from NetScaler 12.0 build 56.20 onwards and as an alternative, Citrix recommends you to use Advanced policies. For more information, see Advanced Policies topic. You can do so with the Advanced policy expression configuration tool. This can be helpful when manually migrating the older classic expressions to the Advanced policy.

Note that when you upgrade the NetScaler to version 9.0 or higher, Integrated Caching policies are automatically upgraded to Advanced policies, and the expressions in these policies are upgraded to the Advanced policies.

The following is the syntax for all Advanced policy expressions that use a classic expression:

SYS.EVAL_CLASSIC_EXPR("expression")

Note

The syntax and the metadata for the SYS.EVAL_CLASSIC_EXPR expression is getting deprecated.
You can manually convert or use nspepi tool to convert the Classic expression to advanced expression.

Following are examples of the SYS.EVAL_CLASSIC_EXPR("expression") expression:

```
1 sys.eval_classic_expr("req.ssl.client.cipher.bits > 1000")
2 sys.eval_classic_expr("url contains abc")
3 sys.eval_classic_expr("req.ip.sourceip == 10.102.1.61 -netmask 255.255.255.255")
4 sys.eval_classic_expr("time >= */30:00GMT")
5 sys.eval_classic_expr("e1 || e2")
6 sys.eval_classic_expr("req.http.urllen > 50")
7 sys.eval_classic_expr("dayofweek == wedGMT")
```

Configure advanced policy expressions in a policy

December 10, 2018

You can configure an Advanced policy expression of up to 1,499 characters in a policy. The user interface for Advanced policy expressions depends to some extent on the feature for which you are configuring the expression, and on whether you are configuring an expression for a policy or for another use.

When configuring expressions on the command line, you delimit the expression by using quotation marks (" . ." or . .). Within an expression, you escape additional quotation marks by using a
back-slash (\). For example, the following are standard methods for escaping quotation marks in an expression:

"\"abc\\"
\"abc\"

You must also use a backslash to escape question marks and other backslashes on the command line. For example, the expression `http.req.url.contains(\"?\")` requires a backslash so that the question mark is parsed. Note that the backslash character will not appear on the command line after you type the question mark. On the other hand, if you escape a backslash (for example, in the expression `http.req.url.contains("\http")`), the escape characters are echoed on the command line.

To make an entry more readable, you can escape the quotation marks for an entire expression. At the start of the expression you enter the escape sequence “q” plus one of the following special characters: /{<~$ˆ+=&%@'?.

You enter only the special character at the end of the expression, as follows:

1  q@http.req.url.contains("sometext") && http.req.cookie.exists@
2  q~http.req.url.contains("sometext") && http.req.cookie.exists~

Note that an expression that uses the { delimiter is closed with }.

For some features (for example, Integrated Caching and Responder), the policy configuration dialog box provides a secondary dialog box for configuring expressions. This dialog enables you to choose from drop-down lists that show the available choices at each point during expression configuration. You cannot use arithmetic operators when using these configuration dialogs, but most other advanced policy expression features are available. To use arithmetic operators, write your expressions in free-form format.

**Configure an Advanced policy syntax rule by using the CLI**

**Note:**

Default syntax policy is now renamed as Advanced policy.

At the command prompt, type the following commands to configure a default syntax rule and verify the configuration:

1. `add cache|dns|rewrite|cs policy policyName **-rule** expression featureSpecificParameters **-action**`
2. `show cache|dns|rewrite|cs policy policyName`

Following is an example of configuring a caching policy:

**Example:**

```plaintext
1 > add cache policy pol-cache -rule http.req.content_length.le(5) - action INVAL
2    Done
3
4 > show cache policy pol-cache
5    Name: pol-cache
6    Rule: http.req.content_length.le(5)
7    CacheAction: INVAL
8    Invalidate groups: DEFAULT
9    UndefAction: Use Global
10   Hits: 0
11   Undef Hits: 0
12
13   Done
```

**Configure a default syntax policy expression by using the GUI**

1. In the navigation pane, click the name of the feature where you want to configure a policy, for example, you can select Integrated Caching, Responder, DNS, Rewrite, or Content Switching, and then click Policies.

2. Click Add.

3. For most features, click in the Expression field. For content switching, click Configure.

4. Click the Prefix icon (the house) and select the first expression prefix from the drop-down list. For example, in Responder, the options are HTTP, SYS, and CLIENT. The next set of applicable options appear in a drop-down list.

5. Double-click the next option to select it, and then type a period (.). Again, a set of applicable options appears in another drop-down list.

6. Continue selecting options until an entry field (signalled by parentheses) appears. When you see an entry field, enter an appropriate value in the parentheses. For example, if you select GT(int) (greater-than, integer format), you specify an integer in the parentheses. Text strings are delimited by quotation marks. Following is an example:

    `HTTP.REQ.BODY(1000).BETWEEN("this","that")`
To insert an operator between two parts of a compound expression, click the Operators icon (the sigma), and select the operator type. Following is an example of a configured expression with a Boolean OR (signalled by double vertical bars):

7. `HTTP.REQ.URL.EQ("www.mycompany.com") || HTTP.REQ.BODY(1000).BETWEEN("this", "that")`

8. To insert a named expression, click the down arrow next to the Add icon (the plus sign) and select a named expression.

9. To configure an expression using drop-down menus, and to insert built-in expressions, click the Add icon (the plus sign). The Add Expression dialog box works in a similar way to the main dialog box, but it provides drop-down lists for selecting options, and it provides text fields for data entry instead of parentheses. This dialog box also provides a Frequently Used Expressions drop-down list that inserts commonly used expressions. When you are done adding the expression, click OK.

10. When finished, click Create. A message in the status bar indicates that the policy expression is configured successfully.

**Test a default syntax expression by using the GUI**

1. In the navigation pane, click the name of the feature for which you want to configure a policy (for example, you can select Integrated Caching, Responder, DNS, Rewrite, or Content Switching), and then click Policies.
2. Select a policy and click Open.
3. To test the expression, click the Evaluate icon (the check mark).
4. In the expression evaluator dialog box, select the Flow Type that matches the expression.
5. In the HTTP Request Data or HTTP Response Data field, paste the HTTP request or response that you want to parse with the expression, and click Evaluate. Note that you must supply a complete HTTP request or response, and the header and body should be separated by blank line. Some programs that trap HTTP headers do not also trap the response. If you are copying and pasting only the header, insert a blank line at the end of the header to form a complete HTTP request or response.
Configure named advanced policy expressions

December 13, 2018

Instead of retyping the same expression multiple times in multiple policies, you can configure a named expression and refer to the name any time you want to use the expression in a policy. For example, you could create the following named expressions:

- ThisExpression:
  
  \texttt{http.req.body(100).contains("this")}

- ThatExpression:
  
  \texttt{http.req.body(100).contains("that")}

You can then use these named expressions in a policy expression. For example, the following is a legal expression based on the preceding examples:

<table>
<thead>
<tr>
<th>ThisExpression</th>
<th>ThatExpression</th>
</tr>
</thead>
<tbody>
<tr>
<td>ThisExpression</td>
<td>ThatExpression</td>
</tr>
</tbody>
</table>

You can use the name of an advanced policy expression as the prefix to a function. The named expression can be either a simple expression or a compound expression. The function must be one that can operate on the type of data that is returned by the named expression.

**Example 1: Simple Named Expression as a Prefix**

The following simple named expression, which identifies a text string, can be used as a prefix to the \texttt{AFTER\_STR(<string>)} function, which works with text data:

\texttt{HTTP.REQ.BODY(1000)}

If the name of the expression is top1KB, you can use \texttt{top1KB.AFTER\_STR(“username”)} instead of \texttt{HTTP.REQ.BODY(1000).AFTER\_STR(“username”).}

**Example 2: Compound named expression as a prefix**

You can create a compound named expression called basic_header_value to concatenate the user name in a request, a colon (:), and the user’s password, as follows:
add policy expression basic_header_value "HTTP.REQ.USER.NAME + ":" + HTTP.REQ.USER.PASSWD"

You can then use the name of the expression in a rewrite action, as shown in the following example:
add rewrite action insert_b64encoded_authorization insert_http_header authorization '"Basic " + basic_header_value.b64encode'-bypassSafetyCheck YES

In the example, in the expression that is used to construct the value of the custom header, the B64 encoding algorithm is applied to the string returned by the compound named expression.

You can also use a named expression (either by itself or as a prefix to a function) to create the text expression for the replacement target in a rewrite.

Configure a named default syntax expression by using the CLI

At the command prompt, type the following commands to configure a named expression and verify the configuration:

```
1 - add policy expression \<name\>\<value\>
2
3 - show policy expression \<name\>
```

Example:

```
1 > add policy expression myExp "http.req.body(100).contains("the other \")"
2   Done
3
4 > show policy expression myExp
5   1)   Name: myExp   Expr: "http.req.body(100).contains("the other")"
6   0   Hits: 0   Type : ADVANCED
4   Done
```

The expression can be up to 1,499 characters.

Configure a named expression by using the GUI

1. In the navigation pane, expand AppExpert, and then click Expressions.
2. Click Advanced Expressions.
3. Click Add.
4. Enter a name and a description for the expression.
5. Configure the expression by using the process described in Configure advanced policy expression. A message in the status bar indicates that the policy expression is configured successfully.

Configure advanced policy expressions outside the context of a policy

December 13, 2018

A number of functions, including the following, can require an advanced policy expression that is not part of a policy:

- Integrated Caching selectors:
  You define multiple non-compound expressions (selectlets) in the definition of the selector. Each selectlet is in an implicit logical AND relationship with the others.

- Load Balancing:
  You configure an expression for the TOKEN method of load balancing for a load balancing virtual server.

- Rewrite actions:
  Expressions define the location of the rewrite action and the type of rewriting to be performed, depending on the type of rewrite action that you are configuring. For example, a DELETE action only uses a target expression. A REPLACE action uses a target expression and an expression to configure the replacement text.

- Rate-based policies:
  You use advanced policy expressions to configure Limit Selectors. You can use these selectors when configuring policies to throttle the rate of traffic to various servers. You define up to five non-compound expressions (selectlets) in the definition of the selector. Each selectlet is in an implicit logical AND with the others.

Configure an advanced policy expression outside a policy by using the CLI (cache selector example)

At the command prompt, type the following commands to configure an advanced policy expression outside a policy and verify the configuration:

```
1 - add cache selector \<selectorName\> \<rule\>
2 - show cache selector \<selectorName\>
```

Example:
Advanced policy expressions: evaluating text

December 10, 2018

You can configure a policy with an advanced policy expression that evaluates text in a request or response. Advanced policy text expressions can range from simple expressions that perform string matching in HTTP headers to complex expressions that encode and decode text. You can configure text expressions to be case sensitive or case insensitive and to use or ignore spaces. You can also configure complex text expressions by combining text expressions with Boolean operators.

You can use expression prefixes and operators for evaluating HTTP requests, HTTP responses, and VPN and Clientless VPN data. However, text expression prefixes are not restricted to evaluating these elements of your traffic.
About text expressions

December 13, 2018

You can configure various expressions for working with text that flows through the NetScaler appliance. Following are some examples of how you can parse text by using a default syntax expression:

- Determine that a particular HTTP header exists.
  
  For example, you may want to identify HTTP requests that contains a particular Accept-Language header for the purpose of directing the request to a particular server.

- Determine that a particular HTTP URL contains a particular string.
  
  For example, you may want to block requests for particular URLs. Note that the string can occur at the beginning, middle, or end of another string.

- Identify a POST request that is directed to a particular application.
  
  For example, you may want to identify all POST requests that are directed to a database application for the purpose of refreshing cached application data.

Note that there are specialized tools for viewing the data stream for HTTP requests and responses. For example, from the following URL, you can download a Firefox Web browser plug-in that displays HTTP request and response headers:

The following plug-in displays headers, query strings, POST data, and other information:

After you download these plug-ins, they are accessible from the Firefox Tools menu.

About operations on text

A text-based expression consists of at least one prefix to identify an element of data and usually (although not always) an operation on that prefix. Text-based operations can apply to any part of a request or a response. Basic operations on text include various types of string matches.

For example, the following expression compares a header value with a string:

```
http.req.header("myHeader").contains("some-text")
```

Following expressions are examples of matching a file type in a request:

```
http.req.url.suffix.contains("jpeg")
http.req.url.suffix.eq("jpeg")
```
In the preceding examples, the contains operator permits a partial match and the eq operator looks for an exact match.

Other operations are available to format the string before evaluating it. For example, you can use text operations to strip out quotes and white spaces, to convert the string to all lowercase, or to concatenate strings.

Note: Complex operations are available to perform matching based on patterns or to convert one type of text format to another type.

For more information, see the following topics:

- Pattern sets and data sets.
- Regular expressions.
- Typecasting data.

Compounding and precedence in text expressions

You can apply various operators to combine text prefixes or expressions. For example, the following expression concatenates the returned values of each prefix:

```
http.req.hostname + http.req.url
```

Following is an example of a compound text expression that uses a logical AND. Both components of this expression must be TRUE for a request to match the expression:

```
http.req.method.eq(post)&&(http.req.body(1024).startswith("destination="))
```

Note: For more information on operators for compounding, see Compound default syntax expressions.

Categories of text expressions

The primary categories of text expressions that you can configure are:

- Information in HTTP headers, HTTP URLs, and the POST body in HTTP requests.
  For more information, see Expression prefixes for text in HTTP requests and responses.

- Information regarding a VPN or a clientless VPN.
  For more information, see Expression prefixes for VPNs and clientless VPNs.

- TCP payload information.
  For more information about TCP payload expressions, see Default syntax expressions: Parsing HTTP, TCP, and UDP data.
• Text in a Secure Sockets Layer (SSL) certificate.

For information about text expressions for SSL and SSL certificate data, see Default syntax expressions: Parsing SSL certificates and Expressions for SSL certificate dates.

**Note:** Parsing a document body, such as the body of a POST request, can affect performance. You may want to test the performance impact of policies that evaluate a document body.

**Guidelines for text expressions**

From a performance standpoint, it typically is best to use protocol-aware functions in an expression. For example, the following expression makes use of a protocol-aware function:

```plaintext
HTTP.REQ.URL.QUERY
```

The previous expression performs better than the following equivalent expression, which is based on string parsing:

```plaintext
HTTP.REQ.URL.AFTER_STR("?")
```

In the first case, the expression looks specifically at the URL query. In the second case, the expression scans the data for the first occurrence of a question mark.

There is also a performance benefit from structured parsing of text, as in the following expression:

```plaintext
HTTP.REQ.HEAD("Example").TYPECAST_LIST_T(',').GET(1)
```

(For more information on typecasting, see Typecasting data. The typecasting expression, which collects comma-delimited data and structures it into a list, typically would perform better than the following unstructured equivalent:

```plaintext
HTTP.REQ.HEAD("Example").AFTER_STR("","">)
```

Finally, unstructured text expressions typically have better performance than regular expressions. For example, the following is an unstructured text expression:

```plaintext
HTTP.REQ.HEAD("Example").AFTER_STR("more")
```

The previous expression would generally provide better performance than the following equivalent, which uses a regular expression:

```plaintext
HTTP.REQ.HEAD("Example").AFTER_REGEX(re/more/)
```

For more information on regular expressions, see Regular expressions.

**Expression prefixes for text in HTTP requests and responses**

January 6, 2019
An HTTP request or response typically contains text, such as in the form of headers, header values, URLs, and POST body text. You can configure expressions to operate on one or more of these text-based items in an HTTP request or response.

Refer to the Prefix Expression table to configure and extract text from different parts of an HTTP request or response.

### Expression prefixes for VPNs and clientless VPNs

**December 13, 2018**

The Advanced policy engine provides prefixes that are specific to parsing VPN or Clientless VPN data. This data includes the following:

- Host names, domains, and URLs in VPN traffic.
- Protocols in the VPN traffic.
- Queries in the VPN traffic.

These text elements are often URLs and components of URLs. In addition to applying the text-based operations on these elements, you can parse these elements by using operations that are specific to parsing URLs. For more information, see Expressions for extracting segments of URLs.

The following table describes the expression prefixes for this type of data.

<table>
<thead>
<tr>
<th>VPN and Clientless VPN Expression</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VPN.BASEURL.CVPN_DECODER</td>
<td>Extracts the original URL from a clientless VPN URL.</td>
</tr>
<tr>
<td>VPN.BASEURL.CVPN_ENCODE</td>
<td>Converts a URL to clientless VPN format.</td>
</tr>
<tr>
<td>VPN.BASEURL.HOSTNAME</td>
<td>Extracts the HTTP host name from the host name in the URL. This prefix cannot be used in bidirectional policies.</td>
</tr>
<tr>
<td>VPN and Clientless VPN Expression</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>VPN.BASEURL.HOSTNAME.DOMAIN</strong></td>
<td>Extracts the domain name from the host name. For example, if the host name is <a href="http://www.mycompany.com">www.mycompany.com</a> or <a href="http://www.mycompany.com:8080">www.mycompany.com:8080</a>, this prefix extracts mycompany.com. This prefix returns incorrect results if the host name is an IP address. For information on expressions for IP addresses, see “Default Syntax Expressions: IP and MAC Addresses, Throughput, VLAN IDs.” All text operations after this prefix are case insensitive.</td>
</tr>
<tr>
<td><strong>VPN.BASEURL.HOSTNAME.EQ (&lt;hostname &gt;)</strong></td>
<td>Returns a Boolean TRUE if the host name matches &lt;hostname &gt;. The comparison is case insensitive. For example, if the host name is <a href="http://www.mycompany.com">www.mycompany.com</a>, the following returns TRUE: vpn.baseurl.hostname.eq(&quot;www.mycompany.com&quot;). If the text mode is URLENCODED, the host name is decoded before comparison. For more information, see “Operations for HTTP, HTML, and XML Encoding and “Safe” Characters.”</td>
</tr>
<tr>
<td><strong>VPN.BASEURL.HOSTNAME.SERVER</strong></td>
<td>Evaluates the server portion of the host name. For example, if the host name is <a href="http://www.mycompany.com">www.mycompany.com</a> or <a href="http://www.mycompany.com:8080">www.mycompany.com:8080</a>, the server is <a href="http://www.mycompany.com">www.mycompany.com</a>. All text operations after this prefix are case insensitive.</td>
</tr>
<tr>
<td><strong>VPN.BASEURL.PATH</strong></td>
<td>Extracts a slash- (/) separated list from the path component of the URL. For example, this prefix extracts /a/b/c/mypage.html from the following URL: <a href="http://www.mycompany.com/a/b/c/mypage.html?a=1">http://www.mycompany.com/a/b/c/mypage.html?a=1</a>. The following expression selects just the “a”: http.req.url.path.get(1). For more information on the GET operation, see “Expressions for Extracting Segments of URLs.”</td>
</tr>
</tbody>
</table>
### VPN and Clientless VPN Expression

<table>
<thead>
<tr>
<th>Expression</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VPN.BASEURL.PATH.IGNORE_EMPTY_ELEMENTS</td>
<td>This prefix ignores the elements in a list. For example, the following comma-separated list has an empty element after “a=10”: a=10,,b=11, ,c=89. The element following b=11 contains a space, and by default, is not considered an empty element. Consider the following HTTP header: Cust_Header : 123,,15. The following expression returns a count of 4 when evaluating this header: http.req.header(&quot;Cust_Header&quot;).typecase_list_t(;'').ignore_empty_elements.count. The following expression returns a count of 5 when evaluating this header: http.req.header(&quot;Cust_Header&quot;).typecase_list_t(;'').count.</td>
</tr>
<tr>
<td>VPN.BASEURL.PATH_AND_QUERY</td>
<td>Evaluates the text in the URL that follows the host name. For example, if the URL is <code>&lt;http://www.mycompany.com/a/b/c/mypage.html?a=1&gt;</code>, this prefix evaluates /a/b/c/mypage.html?a=1.</td>
</tr>
<tr>
<td>VPN.BASEURL.PROTOCOL</td>
<td>Evaluates the protocol in the URL. Do not use this prefix in bidirectional policies.</td>
</tr>
<tr>
<td>VPN.BASEURL.QUERY</td>
<td>Extracts a name-value list, using the “=” and “&amp;” delimiters from the query string in a URL.</td>
</tr>
<tr>
<td>VPN.BASEURL.QUERY.IGNORE_EMPTY_ELEMENTS</td>
<td>This method ignores the empty elements in a name-value list. For example, in the following name-value list, there is an empty element following “a=10”: a=10;;b=11; ;c=89. The element following b=11 contains a space and is not considered an empty element. Consider the following HTTP header: Cust_Header : a=1;;b=2; ;c=3. The following expression produces a count of 4 after evaluating this header: http.req.header(&quot;Cust_Header&quot;).typecast_nvlist_t(=';').ignore_empty_elements.count. The following expression produces a count of 5 after evaluating the header: http.req.header(&quot;Cust_Header&quot;).typecast_nvlist_t(=';').count.</td>
</tr>
<tr>
<td>VPN and Clientless VPN Expression</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>VPN.BASEURL.SUFFIX</td>
<td>Evaluates the file name suffix in a URL. For example, if the path is /a/b/c/my.page.html, this operation selects “html.”</td>
</tr>
<tr>
<td>VPN.CLIENTLESS_BASEURL</td>
<td>Evaluates the clientless VPN base URL.</td>
</tr>
<tr>
<td>VPN.CLIENTLESS_BASEURL.CVPN_DECODE</td>
<td>Extracts the original URL from the clientless VPN formatted URL.</td>
</tr>
<tr>
<td>VPN.CLIENTLESS_BASEURL.CVPN_ENCODE</td>
<td>Converts a URL to the clientless VPN format.</td>
</tr>
<tr>
<td>VPN.CLIENTLESS_BASEURL.HOSTNAME</td>
<td>Evaluates the host name in the URL. Do not use this prefix in bidirectional policies.</td>
</tr>
<tr>
<td>VPN.CLIENTLESS_BASEURL.HOSTNAME.DOMAIN</td>
<td>Evaluates the domain name part of the host name. For example, if the host name is <a href="http://www.mycompany.com">www.mycompany.com</a> or <a href="http://www.mycompany.com:8080">www.mycompany.com:8080</a>, the domain is mycompany.com. This operation returns incorrect results if the host name is an IP address. For information on expressions for IP addresses, see “Default Syntax Expressions: IP and MAC Addresses, Throughput, VLAN IDs..” All text operations after this prefix are case insensitive.</td>
</tr>
<tr>
<td>VPN.CLIENTLESS_BASEURL.HOSTNAME.EQ(hostname)</td>
<td>Returns a Boolean TRUE if the host name matches &lt;hostname&gt;. For example, if the host name is <a href="http://www.mycompany.com">www.mycompany.com</a> or <a href="http://www.mycompany.com:8080">www.mycompany.com:8080</a>, the following is true: vpn.clientless_baseurl.hostname.eq(&quot;www.mycompany.com&quot;) The comparison is case insensitive. If the textmode is URLENCODED, the host name is decoded before comparison. For more information, see “Operations for HTTP, HTML, and XML Encoding and “Safe” Characters.”</td>
</tr>
</tbody>
</table>
### VPN and Clientless VPN Expression

<table>
<thead>
<tr>
<th>Expression</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>VPN.CLIENTLESS_BASEURL.HOSTNAME.SERVER</code></td>
<td>Evaluates the server part of a host name. For example, if the host name is <code>www.mycompany.com</code> or <code>www.mycompany.com:8080</code>, the server is <code>www.mycompany.com</code>. All text operations after this prefix are case insensitive.</td>
</tr>
<tr>
<td><code>VPN.CLIENTLESS_BASEURL.PATH</code></td>
<td>Evaluates a slash- (/) separated list in the URL path. For example, this prefix selects <code>/a/b/c/mypage.html</code> from the following URL: <code>&lt;http://www.mycompany.com/a/b/c/mypage.html?a=1&gt;</code>. The following expression selects “a” from the preceding URL: <code>http.req.url.path.get(1)</code>. For more information on the GET operation, see “Expressions for Extracting Segments of URLs.”</td>
</tr>
<tr>
<td><code>VPN.CLIENTLESS_BASEURL.PATH.IGNORE_EMPTY_ELEMENTS</code></td>
<td>Ignores empty elements in a list. For example, if the list delimiter is a comma (,) the following list has an empty element following “a=10”: <code>a=10,b=11, ,c=89</code>. The element following b=11 contains a space and is not considered an empty element. Consider the following HTTP header: <code>Cust_Header : 123&quot;,&quot;,15</code>. The following expression returns a value of 4 after evaluating this header: <code>http.req.header(&quot;Cust_Header&quot;).typecast_list_t(&quot;, &quot;).ignore_empty_elements.count</code>. The following expression returns a value of 5 after evaluating this header: <code>http.req.header(&quot;Cust_Header&quot;).typecast_list_t(,&quot;</code>).ignore_empty_elements.count`.</td>
</tr>
<tr>
<td><code>VPN.CLIENTLESS_BASEURL.PATH_AND_QUERY</code></td>
<td>Evaluates the text following the host name in a URL. For example, this prefix selects <code>/a/b/c/mypage.html?a=1</code> from the following URL: <code>&lt;http://www.mycompany.com/a/b/c/mypage.html?a=1&gt;</code>.</td>

</table>
VPN and Clientless VPN Expression | Description
---|---
VPN.HOST.EQ(<hostname>) | Returns a Boolean TRUE value if the host name matches the <hostname>. The comparison is case insensitive. For example, if the host name is www.mycompany.com or www.mycompany.com:8080, the following returns TRUE: vpn.host.eq(“www.mycompany.com”). If the text mode is URLENCODED the host name is decoded before comparison. For more information, see “Operations for HTTP, HTML, and XML Encoding and “Safe” Characters.”

VPN.HOST.SERVER | Extracts the server name part of the host name. For example, if the host name is www.mycompany.com or www.mycompany.com:8080, the server is www.mycompany.com. All text operations after this prefix are case insensitive.

---

**Basic operations on text**

December 13, 2018

Basic operations on text include operations for string matching, calculating the length of a string, and controlling case sensitivity. You can include white space in a string that is passed as an argument to an expression, but the string cannot exceed 255 characters.

**String comparison functions**

The following table lists basic string matching operations in which the functions return a Boolean TRUE or FALSE.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;text&gt;.CONTAINS(&lt;string&gt;)</td>
<td>Returns a Boolean TRUE value if the target contains &lt;string&gt;. Example: http.req.url.contains(”jpeg”)</td>
</tr>
<tr>
<td>Function</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| `<text>.EQ(<string>)` | Returns a Boolean TRUE value if the target is an exact match with `<string>`. For example, the following expression returns a Boolean TRUE for a URL with a host name of “myhostabc”:

`http.req.url.hostname.eq("myhostabc")` |
| `<text>.STARTSWITH(<string>)` | Returns a Boolean TRUE value if the target begins with `<string>`. For example, the following expression returns a Boolean TRUE for a URL with a host name of “myhostabc”:

`http.req.url.hostname.startswith("myhost")` |
| `<text>.ENDSWITH(<string>)` | Returns a Boolean TRUE value if the target ends with `<string>`. For example, the following expression returns a Boolean TRUE for a URL with a host name of “myhostabc”:

`http.req.url.hostname.endswith("abc")` |
<p>| <code>&lt;text&gt;.NE(&lt;string&gt;)</code> | Returns a Boolean TRUE value if the prefix is not equal to the string argument. If the prefix returns a non-string value, the function argument is compared to the string representation of the value returned by the prefix. You can use the functions with <code>SET_TEXT_MODE(IGNORECASE)</code> or <code>SET_TEXT_MODE(NOIGNORECASE)</code>, and with both ASCII and UTF-8 character sets. |
| <code>&lt;text&gt;.GT(&lt;string&gt;)</code> | Returns a Boolean TRUE value if the prefix is alphabetically greater than the string argument. If the prefix returns a non-string value, the function argument is compared to the string representation of the value returned by the prefix. You can use the functions with <code>SET_TEXT_MODE(IGNORECASE)</code> or <code>SET_TEXT_MODE(NOIGNORECASE)</code>, and with both ASCII and UTF-8 character sets. |</p>
<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>.GE(&lt;string&gt;)</code></td>
<td>Returns a Boolean TRUE value if the prefix is alphabetically greater than or equal to the string argument. If the prefix returns a non-string value, the function argument is compared to the string representation of the value returned by the prefix. You can use the functions with SET_TEXT_MODE(IGNORECASE) or SET_TEXT_MODE(NOIGNORECASE), and with both ASCII and UTF-8 character sets.</td>
</tr>
<tr>
<td><code>.LT(&lt;string&gt;)</code></td>
<td>Returns a Boolean TRUE value if the prefix is alphabetically lesser than the string argument. If the prefix returns a non-string value, the function argument is compared to the string representation of the value returned by the prefix. You can use the functions with SET_TEXT_MODE(IGNORECASE) or SET_TEXT_MODE(NOIGNORECASE), and with both ASCII and UTF-8 character sets.</td>
</tr>
<tr>
<td><code>.LE(&lt;string&gt;)</code></td>
<td>Returns a Boolean TRUE value if the prefix is alphabetically lesser than or equal to the string argument. If the prefix returns a non-string value, the function argument is compared to the string representation of the value returned by the prefix. You can use the functions with SET_TEXT_MODE(IGNORECASE) or SET_TEXT_MODE(NOIGNORECASE), and with both ASCII and UTF-8 character sets.</td>
</tr>
</tbody>
</table>

**Calculate the length of a string**

The `.LENGTH` operation returns a numeric value that is equal to the number of characters (not bytes) in a string:

```
<text>.LENGTH
```

For example, you may want to identify request URLs that exceed a particular length. Following is an expression that implements this example:
HTTP.REQ.URL.LENGTH < 500

After taking a count of the characters or elements in a string, you can apply numeric operations to them. For more information, see Default Syntax Expressions: Working with Dates, Times, and Numbers.

Consider, ignore, and change text case

The following functions operate on the case (upper-case or lower-case) of the characters in the string.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;text&gt;.SET_TEXT_MODE(IGNORECASE)</td>
<td>This function turns case sensitivity on or off for all text operations.</td>
</tr>
<tr>
<td>&lt;text&gt;.TO_LOWER</td>
<td>Converts the target to lowercase for a text block of up to 2 kilobyte (KB). Returns UNDEF if the target exceeds 2 KB. For example, the string “ABCd:” is converted to “abcd:”.</td>
</tr>
<tr>
<td>&lt;text&gt;.TO_UPPER</td>
<td>Converts the target to uppercase. Returns UNDEF if the target exceeds 2 KB. For example, the string “abcD:” is converted to “ABCD:”.</td>
</tr>
</tbody>
</table>

Strip specific characters from a string

You can use the STRIP_CHARS(<string>) function to remove specific characters from the text that is returned by a default syntax expression prefix (the input string). All instances of the characters that you specify in the argument are stripped from the input string. You can use any text method on the resulting string, including the methods used for matching the string with a pattern set.

For example, in the expression CLIENT.UDP.DNS.DOMAIN.STRIP_CHARS(.--_), the STRIP_CHARS(<string>) function strips all periods (.), hyphens (-), and underscores (_) from the domain name returned by the prefix CLIENT.UDP.DNS.DOMAIN. If the domain name that is returned is “a.dom_ai_n-name”, the function returns the string “adomainname”.

© 1999-2018 Citrix Systems, Inc. All rights reserved.
In the following example, the resulting string is compared with a pattern set called “listofdomains”:

```plaintext
CLIENT.UDP.DNS.DOMAIN.STRIP_CHARS(".-_") .CONTAINS_ANY("listofdomains")
```

**Note:** You cannot perform a rewrite on the string that is returned by the STRIP_CHARS(<string>) function.

The following functions strip matching characters from the beginning and end of a given string input.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;text&gt;.STRIP_START_CHARS(s)</td>
<td>Strips matching characters from the beginning of the input string until the first non-matching character is found and returns the remainder of the string. You must specify the characters that you want to strip as a single string within quotation marks. For example, if the name of a header is TestLang and ://en_us:is its value, HTTP.RES.HEADER(&quot;TestLang&quot;).STRIP_START_CHARS(&quot;://&quot;) strips the specified characters from the beginning of the value of the header until the first non-matching character e is found and returns en_us as a string.</td>
</tr>
<tr>
<td>&lt;text&gt;.STRIP_END_CHARS(s)</td>
<td>Strips matching characters from the end of the input string to the first non-matching character is found and returns the remainder of the string. You must specify the characters that you want to strip as a single string within quotation marks. For example, if the name of a header is TestLang and ://en_us:is its value, HTTP.RES.HEADER(&quot;TestLang&quot;).STRIP_START_CHARS(&quot;://&quot;) strips the specified characters from the end of the value of the header until the first non-matching character s is found and returns: //en_us as a string.</td>
</tr>
</tbody>
</table>

### Append a string to another string

You can use the APPEND() function to append the string representation of the argument to the string representation of the value returned by the preceding function. The preceding function can be one that returns a number, unsigned long, double, time value, IPv4 address, or IPv6 address. The argu-
Complex operations on text

January 6, 2019

In addition to performing simple string matching, you can configure expressions that examine more complex aspects of text, including examining the length of a string and looking within a text block for patterns rather than specific strings.

Be aware of the following for any text-based operation:

- For any operation that takes a string argument, the string cannot exceed 255 characters.
- You can include white space when you specify a string in an expression.

Operations on the length of a string

The following operations extract strings on the basis of a character count.

<table>
<thead>
<tr>
<th>Character Count Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;text&gt;.TRUNCATE(&lt;count&gt;)</code></td>
<td>Returns a string after truncating the end of the target by the number of characters in <code>&lt;count&gt;</code>. If the entire string is shorter than <code>&lt;count&gt;</code>, nothing is returned.</td>
</tr>
<tr>
<td><code>&lt;text&gt;.TRUNCATE(&lt;character&gt;, &lt;count&gt;)</code></td>
<td>Returns a string after truncating the text after specified by the number of characters specified in <code>&lt;character&gt;</code>.</td>
</tr>
<tr>
<td><code>&lt;text&gt;.PREFIX(&lt;character&gt;, &lt;count&gt;)</code></td>
<td>Selects the longest prefix in the target that has at most occurrences of <code>&lt;character&gt;</code>.</td>
</tr>
<tr>
<td><code>&lt;text&gt;.SUFFIX(&lt;character&gt;, &lt;count&gt;)</code></td>
<td>Selects the longest suffix in the target that has at most <code>&lt;count&gt;</code> occurrences of <code>&lt;character&gt;</code>. For example, consider the following response body: JLEwx. The following expression returns a value of “JLEwx”: <code>http.res.body(100).suffix('L',1)</code> The following expression returns “LLEwx”: <code>http.res.body(100).suffix('L',2)</code></td>
</tr>
</tbody>
</table>
Character Count Operation | Description
--- | ---
<text>.SUBSTR(<starting_offset>, <length>) | Select a string with number of characters from the target object. Begin extracting the string after the “. If the number of characters after the offset are fewer than the value of the “argument, select all the remaining characters.

<text>.SKIP(<character>, <count>) | Select a string from the target after skipping over the longest prefix that has at most occurrences of .

**Operations on a portion of a string**

Refer to the [String operations table](#) to know how to extract a subset of a larger string by using one of the operations.

**Operations for comparing the alphanumeric order of two strings**

The COMPARE operation examines the first nonmatching character of two different strings. This operation is based on lexicographic order, which is the method used when ordering terms in dictionaries.

This operation returns the arithmetic difference between the ASCII values of the first nonmatching characters in the compared strings. The following differences are examples:

- The difference between “abc” and “abd” is -1 (based on the third pair-wise character comparison).
- The difference between “@” and “abc” is -33.
- The difference between “1” and “abc” is -47.

Following is the syntax for the COMPARE operation.

<text>.COMPARE(<string>)

**Extract an integer from a string of bytes that represent text**

Refer to the [Integer extraction table](#) to know how to treat a string of bytes that represent text as a sequence of bytes, extract 8, 16, or 32 bits from the sequence, and then convert the extracted bits to an integer.
Convert text to a hash value

You can convert a text string to a hash value by using the HASH function. This function returns a 31-bit positive integer as a result of the operation. Following is the format of the expression:

\(<text>\).\text{HASH}

This function ignores case and white spaces. For example, after the operation, the two strings Ab c and a bc would produce the same hash value.

Encode and decode text by applying the Base64 encoding algorithm

The following two functions encode and decode a text string by applying the Base64 encoding algorithm:

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>text.B64ENCODE</td>
<td>Encodes the text string (designated by text) by applying the Base64 encoding algorithm.</td>
</tr>
<tr>
<td>text.B64DECODE</td>
<td>Decodes the Base64-encoded string (designated by text) by applying the Base64 decoding algorithm. The operation raises an UNDEF if text is not in B64-encoded format.</td>
</tr>
</tbody>
</table>

Refine the search in a rewrite action by using the EXTEND function

The EXTEND function is used in rewrite actions that specify patterns or pattern sets and target the bodies of HTTP packets. When a pattern match is found, the EXTEND function extends the scope of the search by a predefined number of bytes on both sides of the matching string. A regular expression can then be used to perform a rewrite on matches in this extended region. Rewrite actions that are configured with the EXTEND function perform rewrites faster than rewrite actions that evaluate entire HTTP bodies using only regular expressions.

The format of the EXTEND function is EXTEND\((m,n)\), where m and n are the number of bytes by which the scope of the search is extended before and after the matching pattern, respectively. When a match is found, the new search scope comprises m bytes that immediately precede the matching string, the string itself, and the n bytes that follow the string. A regular expression can then be used to perform a rewrite on a portion of this new string.

The EXTEND function can be used only if the rewrite action in which it is used fulfills the following requirements:
• The search is performed by using patterns or patterns sets (not regular expressions)
• The rewrite action evaluates only the bodies of HTTP packets.

Additionally, the EXTEND function can be used only with the following types of rewrite actions:
• replace_all
• insert_after_all
• delete_all
• insert_before_all

For example, you might want to delete all instances of "<http://exampleurl.com/>" and "<http://exampleurl.au/>" in the first 1000 bytes of the body. To do this, you can configure a rewrite action to search for all instances of the string exampleurl, extend the scope of the search on both sides of the string when a match is found, and then use a regular expression to perform the rewrite in the extended region. The following example extends the scope of the search by 20 bytes to the left and 50 bytes to the right of the matching string:

add rewrite action delurl_example delete_all 'HTTP.REQ.BODY(1000)'-pattern exampleurl -refineSearch 'extend(20,50).regex_select(re##http://exampleurl.(com|au)##)'

Convert text to hexadecimal format

The following function converts text to hexadecimal format and extracts the resulting string:

<text>.BLOB_TO_HEX(<string>)

For example, this function converts the byte string “abc” to “61:62:63”.

Encrypt and decrypt text

In default syntax expressions, you can use the ENCRYPT and DECRYPT functions to encrypt and decrypt text. Data encrypted by the ENCRYPT function on a given NetScaler appliance or high availability (HA) pair is intended for decryption by the DECRYPT function on the same NetScaler appliance or HA pair. The appliance supports the RC4, DES3, AES128, AES192, and AES256 encryption methods. The key value that is required for encryption is not user-specifiable. When an encryption method is set, the appliance automatically generates a random key value that is appropriate for the specified method. The default method is AES256 encryption, which is the most secure encryption method and the one that Citrix recommends.

You do not need to configure encryption unless you want to change the encryption method or you want the appliance to generate a new key value for the current encryption method.

Note: You can also encrypt and decrypt XML payloads. For information about the functions for encrypting and decrypting XML payloads, see Encrypt and decrypt XML payloads.
Configure encryption

During startup, the appliance runs the set ns encryptionParams command with, by default, the AES256 encryption method, and uses a randomly generated key value that is appropriate for AES256 encryption. The appliance also encrypts the key value and saves the command, with the encrypted key value, to the NetScaler configuration file. Consequently, the AES256 encryption method is enabled for the ENCRYPT and DECRYPT functions by default. The key value that is saved in the configuration file persists across reboots even though the appliance runs the command each time you restart it.

You can run the set ns encryptionParams command manually, or use the GUI, if you want to change the encryption method or if you want the appliance to generate a new key value for the current encryption method. To use the CLI to change the encryption method, set only the method parameter, as shown in “Example 1: Changing the Encryption Method.” If you want the appliance to generate a new key value for the current encryption method, set the method parameter to the current encryption method and the keyValue parameter to an empty string (“”), as shown in “Example 2: Generating a New Key Value for the Current Encryption Method.” After you generate a new key value, you must save the configuration. If you do not save the configuration, the appliance uses the newly generated key value only until the next restart, after which it reverts to the key value in the saved configuration.

Configure encryption by using the GUI

1. Navigate to System > Settings.
2. In the Settings area, click Change Encryption parameters.
3. In the Change Encryption Parameters dialog box, do one of the following:
   - To change the encryption method, in the Method list, select the encryption method that you want.
   - To generate a new key value for the current encryption method, click Generate a new key for the selected method.
4. Click OK.

Use the ENCRYPT and DECRYPT functions

You can use the ENCRYPT and DECRYPT functions with any expression prefix that returns text. For example, you can use the ENCRYPT and DECRIPT functions in rewrite policies for cookie encryption. In the following example, the rewrite actions encrypt a cookie named MyCookie, which is set by a back-end service, and decrypt the same cookie when it is returned by a client:

```
add rewrite action my-cookie-encrypt-action replace "HTTP.RES.SET_COOKIE.COOKIE("MyCookie").VALUE(0)""HTTP.RES.SET_COOKIE.COOKIE("MyCookie").VALUE(0).ENCRIPT"-bypassSafetyCheck YES
```
add rewrite action my-cookie-decrypt-action replace "HTTP.REQ.COOKIE.VALUE( "MyCookie")" "HTTP.REQ.COOKIE.VALUE("MyCookie").DECRYPT"-bypassSafetyCheck YES

After you configure policies for encryption and decryption, save the configuration to bring the policies into effect.

**Configure encryption key for third-party encryption**

In default syntax expressions, you can use ENCRYPT and DECRYPT functions for encrypting and decrypting text in a request or response. The data encrypted by the ENCRYPT function on an appliance (standalone, high availability or cluster) is intended to be decrypted by the DECRYPT function by the same appliance. The appliance supports RC4, DES, Triple-DES, AES92, and AES256 encryption methods and each of these methods use a secret key for both encryption and decryption of data. You can use any of these methods to encrypt and decrypt data in two ways - self-encryption and third-party encryption.

The self-encryption feature in an appliance (standalone, high availability or cluster) encrypts and then decrypts data by evaluating the header value. One example to understand this is the HTTP Cookie encryption. The expression evaluates the header, encrypts the HTTP cookie value in the Set-Cookie header in the outgoing response and then decrypts the cookie value when it is returned in the cookie header of a subsequent incoming request from the client. The key value is not user configurable, instead when an encryption method is configured in the set ns encryptionParams command, the appliance automatically generates a random key value for the configured method. By default, the command uses the AES256 encryption method, which is the highly secured method and Citrix recommends this method.

The third-party encryption feature encrypts or decrypts data with a third-party application. For example, a client may encrypt data in a request and the appliance decrypts the data before sending it to the back-end server or vice versa. To perform this, the appliance and the third-party application must share a secret key. On the appliance, you can directly configure the secret key using an encryption key object and key value is automatically generated by the appliance for a stronger encryption. The same key is manually configured on the third-party appliance so that both appliance and third-party application can use the same key for encrypting and decryption data.

**Note:**

Using third-party encryption, you can also encrypt and decrypt XML payloads. For information about the functions for encrypting and decrypting XML payloads, see “Encrypting and Decrypting XML Payloads.”
Cipher methods

A cipher method provides two functions: an encryption function that transforms a plaintext byte sequence into a ciphertext byte sequence, and a decryption function that transforms the ciphertext back to the plaintext. Cipher methods use byte sequences called keys to perform encryption and decryption. Cipher methods that use the same key for encryption and decryption are called symmetric. Cipher methods that use different keys for encryption and decryption are asymmetric. The most notable examples of asymmetric ciphers are in public key cryptography, which uses a public key available to anyone for encryption and a private key known only to the decryptor.

A good cipher method makes it infeasible to decrypt (“crack”) ciphertext if you don’t possess the key. “Infeasible” really means that cracking the cyphertext would take more time and computing resources than it is worth. As computers become more powerful and cheaper, ciphers that were formerly infeasible to crack become more feasible. Also, over time, flaws are found in cipher methods (or their implementations), making cracking easier. Newer cipher methods are therefore preferred over older ones. In general, longer length keys provide better security than shorter keys, at the cost of longer encryption and decryption times.

A cipher method can use stream ciphers or block ciphers. RC4 is the mostly secured stream ciphers and it is used only for legacy application. Block ciphers can include padding.

Stream ciphers

A stream cipher method operates on individual bytes. Only one stream cipher is available on NetScaler appliances: RC4, which uses a 128 bit (16 byte) key length. For a given key, RC4 generates a pseudo-random sequence of bytes, call a keystream, which is X-ORED with the plaintext to produce the ciphertext. RC4 is no longer considered secure and should be used only if required by legacy applications.

Block ciphers

A block cipher method operates on a fixed block of bytes. A NetScaler appliance provides two block ciphers: Data Encryption Standard (DES) and the Advanced Encryption Standard (AES). DES uses a block size of 8 bytes and (on a NetScaler appliance) two choices for key length: 64 bits (8 bytes), of which 56 bits are data and 8 bits are parity, and Triple-DES, a 192 bit (24 byte) key length. AES has a block size of 16 bytes and (on NetScaler) three choices for key length: 128 bits (16 bytes), 192 bits (24 bytes) and 256 bits (32 bytes).
Padding

If the plaintext for a block cipher is not an integral number of blocks, padding with additional bytes might be required. For example, suppose the plaintext is “xyzzy” (hex 78797a7a79). For an 8-byte Triple-DES block, this value would have to be padded to create 8 bytes. The padding scheme must allow the decryption function to determine the length of the original plaintext after decryption. Following are some padding schemes currently in use (n is the number of bytes added):

- **PKCS7**: Adds n bytes of value n each. For example, 78797a7a79030303. This is the padding scheme used by OpenSSL and ENCRYPT() policy function. The PKCS5 padding scheme is the same as PKCS7.
- **ANSI X.923**: Adds n-1 zero bytes and a final byte of value n. For example, 78797a7a79000003.
- **ISO 10126**: Adds n-1 random bytes and a final byte of value n. For example, 78797a7a79xxxx03, where xx can be any byte value. The DECRYPT() policy function accepts this padding scheme, which also allows it to accept the PKCS7 and ANSI X.923 schemes.
- **ISO/IEC 7816-4**: Adds a 0x80 byte and n-1 zero bytes. For example, 78797a7a79800000. This is also called OneAndZeros padding.
- **Zero**: Adds n zero bytes. Example: 78797a7a79000000. This can only be used with plaintext that does not include NUL bytes.

If padding is used and the plaintext is an integral number of blocks, an additional block is typically added so that the decryption function can unambiguously determine the original plaintext length. For PKCS7 and 8 byte block, this would be 0808080808080808.

Modes of operation

There are a number of different modes of operation for block ciphers, which specify how multiple blocks of plaintext are encrypted. Some modes use an initialization vector (IV), a block of data apart from the plaintext that is used to start the encryption process. It is a good practice to use a different IV for each encryption, so that the same plaintext produces different ciphertext. The IV does not need to be secret, and so is usually prepended to the ciphertext. Modes include:

- **Electronic Codebook (ECB)**: Each block of plaintext is encrypted independently. An IV is not used. Padding is required if the plaintext is not a multiple of the cipher block size. The same plaintext and key always produces the same ciphertext. Because of this, ECB is considered less secure than other modes and should only be used for legacy applications.
- **Cipher Block Chaining (CBC)**: Each block of plaintext is XORed with the previous ciphertext block, or the IV for the first block, before being encrypted. Padding is required if the plaintext is not a multiple of the cipher block size. This is the mode used with the NetScaler encryptionParams method.
- **Cipher Feedback (CFB)**: The previous ciphertext block, or the IV for the first block, is encrypted and the output is XORed with the current plaintext block to create the current ciphertext block.
The feedback can be 1 bit, 8 bits, or 128 bits. Since the plaintext is XORed with the cipher text, padding is not required.

- **Output Feedback (OFB):** A keystream is generated by applying the cipher successively to the IV and XORing the keystream blocks with the plaintext. Padding is not required.

### Configure encryption keys for third-party encryption

Following are the configuration tasks performed in configuring encryption key.

1. **Adding an encryption key.** Configures an encryption key for a specified cipher method with a specified key value.
2. **Modifying an encryption key.** You can edit parameters for a configured encryption key.
3. **Unsetting an encryption key.** Sets parameters for a configured encryption key to their default values. An encryptionKey value with the name must exist. Sets padding to DEFAULT (determined by the method), Deletes an existing IV, which causes ENCRYPT() to generate a random IV. Deletes an existing comment. The method and key value cannot be reset.
4. **Removing an encryption key.** Deletes a configured encryption key. The key cannot have any references.
5. **Show an encryption key.** Displays parameters for the configured encryption key or all configured keys. If the name is omitted, the key value is not displayed.

### Add an encryption key by using the CLI

At the command prompt, type:

```
add ns encryptionKey <name> -method <method> [-keyValue <hexstring>] [-padding (OFF | ON)] [-iv <hexstring>] [-comment <string>]
```

Where,

```
<method> = ( NONE | RC4 | DES3 | AES128 | AES192 | AES256 | DES | DES-CBC | DES-CFB | DES-ECB | DES-OFB | AES128-CBC | AES128-CFB | AES128-OFB | AES192-CBC | AES192-CFB | AES192-OFB | AES192-ECB | AES256-CBC | AES256-CFB | AES256-ECB | AES256-OFB ) <hexstring> = hex-encoded byte sequence
```

The above encryption methods specify the operation mode with CBC as the default mode of operation. Therefore, DES, DES2, AES128, AES192, and AES256 methods are equivalent to DES-CBC, DES3-CBC, AES128-CBC, AES192-CBC, and AES256-CBC methods.

### Modify an encryption key by using the CLI
At the command prompt, type:

```
set ns encryptionKey <name> [-method <method>] [-keyValue <hexstring>] [-padding ( OFF | ON )] [-iv <string>] [-comment <string>]
```

**Unset an encryption key by using the CLI**

At the command prompt, type:

```
unset ns encryptionKey <name> [-padding] [-iv] [-comment]
```

**Remove an encryption key by using the CLI**

At the command prompt, type:

```
rm ns encryptionKey <name>
```

**Show an encryption key by using the CLI**

At the command prompt, type:

```
show ns encryptionKey [ <name> ]
```

**Example:**

```
1  show ns encryptionKey [ <name> ]
2  add ns encryptionKey my_key -method aes256 -keyValue 26
   ea5537b7e0746089476e5658f9327c0b10c3b4778c673a5b38cee182874711 -iv
c2bf0b2e15c15004d6b14bc0dc7e5e365
3  set ns encryptionKey my_key -keyValue
   b8742b163abcf62d639837bbe3cef9fb5842d82d00dfe6548831d2bd1d93476
4  unset ns encryptionKey my_key -iv
5  rm ns encryptionKey my_key
6  show ns encryptionKey my_key
7  Name: my_key
8  Method: AES256
9  Padding: DEFAULT
10 Key Value: (not disclosed)
```

**Add an encryption key by using the GUI**

Navigate to System > Encryption Keys and click Add to create an encryption key.

**Modify an encryption key by using the GUI**

Navigate to System > Encryption Keys and click Edit to modify parameters for a configured encryption key.
NetScaler 11.1

Remove an encryption key by using the GUI

Navigate to System > Encryption keys and click Delete.

ENCRYPT and DECRYPT functions for third-party encryption

Following is the ENCRYPT function used for third-party encryption.

ENCRYPT (encryptionKey, out_encoding)

Where,

Input data for the appliance is the text to be encrypted

encryptionKey: An optional string parameter that specifies the configured encryption key object to provide the encryption method, secret key value and other encryption parameters. If omitted, the method uses the automatically generated key value associated with the set ns encryptionParamS command.

out_encoding: This value specifies how the output is encoded. If omitted, BASE64 encoding is used.

Input:

| BASE64: original PEM base64-encoding: 6 bits (0..63) encoded as one ASCII character: |
| 0..23 = 'A'..'Z', 24..51 = 'a'..'z', 52..61 = '0'..'9', 62 = '+', 63 = '/', '=' = pad byte |
| BASE64URL: URL and Filename safe base64-encoding: same as BASE64 except 62 = '-', 63 = '_' |
| HEX_UPPER: Hexadecimal with 0..9 = '0'..'9' and 10..15 = 'A'..'F' |
| HEX_LOWER: Hexadecimal with 0..9 = '0'..'9' and 10..15 = 'a'..'f' |
| HEX_COLONS: Hexadecimal with 0..9 = '0'..'9' and 10..15 = 'A'..'F'; ':' between each hex byte. Matches BLOB_TO_HEX() output format |
| HEX: For input, accepts HEX_UPPER, HEX_LOWER, and HEX_COLONS format. For output, produces HEX_LOWER format |

Output: The output is a text encrypted using the specified method and key and encoded using a specified output encoding. It inserts a generated IV before the encrypted text for block methods and modes that require an IV, and either no IV is specified for the encryptionKey or the encryptionKey is omitted.

Following is the DECRYPT function used for third-party decryption.

DECRYPT( encryptionKey, in_encoding)

Where,
Invest data is an encrypted text using the specified method and key encoded using the specified input encoding. This text is expected to include a generated IV before the encrypted text for block methods and modes that require an IV, and either no IV is specified for the encryptionKey or the encryptionKey is omitted.

encryptionKey—An optional string parameter that specifies the configured encryptionKey object to provide the encryption method, secret key and other encryption parameters. If omitted, the method and automatically generated key associated with the encryptionParams setting will be used.

in_encoding—An optional enumeration parameter that specifies how the input is expected to be encoded. The values are the same as the out_encoding of ENCRYPT. If omitted, BASE64 encoding will be expected.

The output data is an unencoded decrypted text.

**Variants and optional parameters**

Following are the variants of these functions with the optional parameters:

<table>
<thead>
<tr>
<th>Variant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENCRYPT</td>
<td>Use encryptionParams command and BASE64 output encoding parameter.</td>
</tr>
<tr>
<td>ENCRYPT(out_encoding)</td>
<td>Use encryptionParams and specified output encoding parameter.</td>

</tbody>
</table>
Configure HMAC keys

NetScaler appliances support a Hashed Message Authentication Code (HMAC) function that calculates a digest method or hash of input text by using a secret key shared between a message sender and message receiver. The digest method (derived from an RFC 2104 technique) authenticates the sender and verifies that the message content has not been altered. For example, when a client sends a message with the shared HMAC key to a NetScaler appliance, advanced (PI) policy expressions use the HMAC function to compute the hash-based code on the selected text. Then, when the receiver receives the message with the secret key, it recomputes the HMAC by comparing it with the original HMAC to determine whether the message has been altered. The HMAC function is supported by standalone appliances and by appliances in a high availability configuration or in a cluster. Using it is similar to configuring an encryption key.

The add ns hmackey and set ns hmackey commands include a parameter that specifies the digest method and the shared secret key to use for the HMAC computation.

To configure a HMAC key, you must perform the following:

1. Adding an HMAC key. Configures an HMAC key with a specified key value.
2. Modifying an HMAC key. Modifies parameters for a configured HMAC key. The digest method can be changed without changing the key value, since the key value length is not determined by the digest. However, it is advisable to specify a new key when changing the digest.
3. Unsetting an HMAC key. Sets parameters for a configured HMAC key to their default values. An hmacKey object with the name must exist. The only parameter that can be unset is the comment, which is deleted.
4. Removing an HMAC key. Deletes a configured key. The key cannot have any references.
5. Show an HMAC key. Displays parameters for the configured HMAC ac key or all configured keys. If the name is omitted, the key value is not displayed.

Add an HMAC key by using the CLI

At the command prompt, type:

```
add ns hmacKey <name> -digest <digest> -keyValue <hexstring> [-comment <string>]
```

Where,

```
<digest> = (MD2 | MD4 | MD5 | SHA1 | SHA224 | SHA256 | SHA384 | SHA512)
```

This command configures a key for the HMAC () function with the specified digest and key value and also validates the following:

- Name syntax is correct and does not duplicate the name of an existing key.
• Key value is valid hex. As specified by RFC 2104, the key can any length. On a NetScaler appliance, the key value can range from 0 to 255 bytes (0 to 510 hex characters). If the key is shorter than the digest block size, a warning is issued and the key is padded with zeroes. If the key is longer than the block size, it is run through the digest to produce an effective key that is the same length as the block.

Example:

```
add ns hmacKey my_hmac_key -digest sha1 -keyValue 0c753c6c5ef859189cacdf95b506d02c1797
```

The above encryption methods specify the operation mode with CBC as the default mode of operation. Therefore, DES, DES2, AES128, AES192, and AES256 methods are equivalent to DES-CBC, DES3-CBC, AES128-CBC, AES192-CBC, and AES256-CBC methods.

Modify an HMAC key by using the CLI

This command modifies the parameters configured for a HMAC key. You can change the digest without changing the key value, since the key value length is not determined by the digest. However, it is advisable to specify a new key when changing the digest. At the command prompt, type:

```
set ns hmacKey <name> [-digest <digest>] [-keyValue <hexvalue>] [-comment <string>]
```

Unset an HMAC key by using the CLI

This command sets parameters configured for a HMAC key with their default values. An hmacKey object with the name must exist. The only parameter that you can unset is the comment option, which is deleted. At the command prompt, type:

```
unset ns hmacKey <name> -comment
```

Remove an HMAC key by using the CLI

This command deletes the configured hmac key. The key cannot have references. At the command prompt, type:

```
rms ns hmacKey <name>
```

Show an HMAC key by using the CLI

At the command prompt, type:
Advanced policy expressions: working with dates, times, and numbers

December 13, 2018

Most numeric data that the NetScaler appliance processes consists of dates and times. In addition to working with dates and times, the appliance processes other numeric data, such as the lengths of HTTP requests and responses. To process this data, you can configure advanced policy expressions that process numbers.

A numeric expression consists of an expression prefix that returns a number and sometimes, but not always, an operator that can perform an operation on the number. Examples of expression prefixes that return numbers are SYS.TIME.DAY, HTTP.REQ.CONTENT_LENGTH, and HTTP.RES.BODY.LENGTH. Numeric operators can work with any prefix expression that returns data in numeric format. The GT(<int>) operator, for example, can be used with any prefix expression, such as HTTP.REQ.CONTENT_LENGTH, that returns an integer. Numeric expression prefixes and operators are also covered in Compound Operations for Numbers and Advanced Policy Expressions: Parsing HTTP, TCP, and UDP Data.

Format of dates and times in an expression

December 10, 2018

When configuring an advanced policy expression in a policy that works with dates and times (for example, the NetScaler system time or a date in an SSL certificate), you specify a time format as follows:

GMT|LOCAL [<yyyy>] [<month>] [<d>] [<h>] [<m>] [<s>]

Where:

- <yyyy> is a four-digit year after GMT or LOCAL.
• `<month>` is a three-character abbreviation for the month, for example, Jan, Dec.

• `<d>` is a day of the week or an integer for the date.

You cannot specify the day as Monday, Tuesday, and so on. You specify either an integer for a specific day of the month, or you specify a date as the first, second, third weekday of the month, and so on. Following are examples of specifying a day of the week:

- `Sun_1` is the first Sunday of the month.
- `Sun_3` is the third Sunday of the month.
- `Wed_3` is the third Wednesday of the month.
- `30` is an example of an exact date in a month.

• `<h>` is the hour, for example, 10h.

• `<s>` is the number of seconds, for example, 30s.

The following example expression is true if the date is between 2008 Jan and 2009 Jan, based on GMT.

```
http.req.date.between(GMT 2008 Jan, GMT 2009 Jan)
```

The following example expression is true for March and all months that follow March in the calendar year, based on GMT:

```
sys.time.ge(GMT 2008 Mar)
```

When you specify a date and time, note that the format is case sensitive and must preserve the exact number of blank spaces between entries.

**Note:**

In an expression that requires two time values, both must use GMT or both must use LOCAL. You cannot mix the two in an expression.

Unlike when you use the `SYS.TIME` prefix in an advanced policy expression, if you specify `SYS.TIME` in a rewrite action, the NetScaler returns a string in conventional date format (for example, Sun, 06 Nov 1994 08:49:37 GMT). For example, the following rewrite action replaces the `http.res.date` header with the NetScaler system time in a conventional date format:

```
add rewrite action sync_date replace http.res.date sys.time
```

### Expressions for the NetScaler system time

December 10, 2018
The SYS. TIME expression prefix extracts the NetScaler system time. You can configure expressions that establish whether a particular event occurred at a particular time or within a particular time range according to the NetScaler system time.

The following table describes the expressions that you can create by using the SYS. TIME prefix.

- **SYS.TIME.BETWEEN(<time1>, <time2>):**
  
  Returns a Boolean TRUE if the returned value is later than <time1> and earlier than <time2>.

  You format the <time1>, <time2> arguments as follows:
  - They must both be GMT or both LOCAL.
  - <time2> must be later than <time1>.

  For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following:
  
  - sys.time.between(GMT 2004, GMT 2006)
  - sys.time.between(GMT 2004 Jan, GMT 2006 Nov)
  - sys.time.between(GMT 2004 Jan, GMT 2006)
  - sys.time.between(GMT 2005 May Sun_1, GMT 2005 May Sun_3)
  - sys.time.between(GMT 2005 May 1, GMT May 2005 1)
  - sys.time.between(LOCAL 2005 May 1, LOCAL May 2005 1)

- **SYS.TIME.DAY:**

  Returns the current day of the month as a number from 1 through 31.

- **SYS.TIME.EQ(<time>):**

  Returns a Boolean TRUE if the current time is equal to the <time> argument.

  For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following (evaluation results are shown in parentheses):
  
  - sys.time.eq(GMT 2005) (TRUE in this example.)
  - sys.time.eq(GMT 2005 Dec) (FALSE in this example.)
  - sys.time.eq(LOCAL 2005 May) (Evaluates to TRUE or FALSE in this example, depending on the current time zone.)
  - sys.time.eq(GMT 10h) (TRUE in this example.)
  - sys.time.eq(GMT 10h 30s) (TRUE in this example.)
  - sys.time.eq(GMT May 10h) (TRUE in this example.)
  - sys.time.eq(GMT Sun) (TRUE in this example.)
  - sys.time.eq(GMT May Sun_1) (TRUE in this example.)

- **SYS.TIME.NE(<time>):**

  Returns a Boolean TRUE if the current time is not equal to the <time> argument.
• **SYS.TIME.GE(<time>):**

Returns a Boolean TRUE if the current time is later than or equal to <time>.

For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following (evaluation results are shown in parentheses):

- `sys.time.ge(GMT 2004)` (TRUE in this example.)
- `sys.time.ge(GMT 2005 Jan)` (TRUE in this example.)
- `sys.time.ge(LOCAL 2005 May)` (TRUE or FALSE in this example, depending on the current time zone.)
- `sys.time.ge(GMT 8h)` (TRUE in this example.)
- `sys.time.ge(GMT 30m)` (FALSE in this example.)
- `sys.time.ge(GMT May 10h)` (TRUE in this example.)
- `sys.time.ge(GMT May 10h 0m)` (TRUE in this example.)
- `sys.time.ge(GMT Sun)` (TRUE in this example.)
- `sys.time.ge(GMT May Sun_1)` (TRUE in this example.)

• **SYS.TIME.GT(<time>):**

Returns a Boolean TRUE if the time value is later than the <time> argument.

For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following (evaluation results are shown in parentheses):

- `sys.time.gt(GMT 2004)` (TRUE in this example.)
- `sys.time.gt(GMT 2005 Jan)` (TRUE in this example.)
- `sys.time.gt(LOCAL 2005 May)` (TRUE or FALSE, depending on the current time zone.)
- `sys.time.gt(GMT 8h)` (TRUE in this example.)
- `sys.time.gt(GMT 30m)` (FALSE in this example.)
- `sys.time.gt(GMT May 10h)` (FALSE in this example.)
- `sys.time.gt(GMT May 10h 0m)` (TRUE in this example.)
- `sys.time.gt(GMT Sun)` (FALSE in this example.)
- `sys.time.gt(GMT May Sun_1)` (FALSE in this example.)

• **SYS.TIME.HOURS:**

Returns the current hour as an integer from 0 to 23.

• **SYS.TIME.LE(<time>):**

Returns a Boolean TRUE if the current time value precedes or is equal to the <time> argument.

For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following (evaluation results are shown in parentheses):

- `sys.time.le(GMT 2006)` (TRUE in this example.)
- `sys.time.le(GMT 2005 Dec)` (TRUE in this example.)
- sys.time.le(LOCAL 2005 May) (TRUE or FALSE depending on the current timezone.)
- sys.time.le(GMT 8h) (FALSE in this example.)
- sys.time.le(GMT 30m) (TRUE in this example.)
- sys.time.le(GMT May 10h) (TRUE in this example.)
- sys.time.le(GMT Jun 11h) (TRUE in this example.)
- sys.time.le(GMT Wed) (TRUE in this example.)
- sys.time.le(GMT May Sun_1) (TRUE in this example.)

**SYS.TIME.LT(<time>):**

Returns a Boolean TRUE if the current time value precedes the <time> argument.

For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following (evaluation results are shown in parentheses):

- sys.time.lt(GMT 2006) (TRUE in this example.)
- sys.time.lt.time.lt(GMT 2005 Dec) (TRUE in this example.)
- sys.time.Lt(LOCAL 2005 May) (TRUE or FALSE depending on the current time zone.)
- sys.time.lt(GMT 8h) (FALSE in this example.)
- sys.time.lt(GMT 30m) (TRUE in this example.)
- sys.time.lt(GMT May 10h) (FALSE in this example.)
- sys.time.lt(GMT Jun 11h) (TRUE in this example.)
- sys.time.lt(GMT Wed) (TRUE in this example.)
- sys.time.lt(GMT May Sun_1) (FALSE in this example.)

**SYS.TIME.MINUTES:**

Returns the current minute as an integer from 0 to 59.

**SYS.TIME.MONTH:**

Extracts the current month and returns an integer from 1 (January) to 12 (December).

**SYS.TIME.RELATIVE_BOOT:**

Calculates the number of seconds to the closest previous or scheduled reboot, and returns an integer.

If the closest boot time is in the past, the integer is negative. If it is in the future, the integer is positive.

**SYS.TIME.RELATIVE_NOW:**

Calculates the number of seconds between the current NetScaler system time and the specified time, and returns an integer showing the difference.

If the designated time is in the past, the integer is negative; if it is in the future, the integer is positive.
• **SYS.TIME.SECONDS:**

Extracts the seconds from the current NetScaler system time, and returns that value as an integer from 0 to 59.

• **SYS.TIME.WEEKDAY:**

Returns the current weekday as a value from 0 (Sunday) to 6 (Saturday).

• **SYS.TIME.WITHIN (<time1>, <time2>):**

If you omit an element of time in `<time1>`, for example, the day or hour, it is assumed to have the lowest value in its range. If you omit an element in `<time2>`, it is assumed to have the highest value of its range.

The ranges for the elements of time are as follows: month 1-12, day 1-31, weekday 0-6, hour 0-23, minutes 0-59 and seconds 0-59. If you specify the year, you must do so in both `<time1>` and `<time2>`.

For example, if the time is GMT 2005 May 10 10h 15m 30s, and it is the second Tuesday of the month, you can specify the following (evaluation results are shown in parentheses):

- `sys.time.within(GMT 2004, GMT 2006)` (TRUE in this example.)
- `sys.time.within(GMT 2004 Jan, GMT 2006 Mar)` (FALSE, May is not in the range of January to March.)
- `sys.time.within(GMT Feb, GMT)` (TRUE, May is in the range of February to December.)
- `sys.time.within(GMT Sun_1, GMT Sun_3)` (TRUE, the second Tuesday is between the first Sunday and the third Sunday.)
- `sys.time.within(GMT 2005 May 1 10h, GMT May 2005 1 17h)` (TRUE in this example.)
- `sys.time.within(LOCAL 2005 May 1, LOCAL May 2005 1)` (TRUE or FALSE, depending on the NetScaler system time zone.)

• **SYS.TIME.YEAR:**

Extracts the year from the current system time and returns that value as a four-digit integer.

### Expressions for SSL certificate dates

December 10, 2018

You can determine the validity period for SSL certificates by configuring an expression that contains the following prefix:

**CLIENT.SSL.CLIENT_CERT**

The following example expression matches a particular time for expiration with the information in the certificate:
The following table describes time-based operations on SSL certificates. To obtain the expression you want, replace certificate in the expression in the first column with the prefix expression, “CLIENT.SSL.CLIENT_CERT”.

- `<certificate>.VALID_NOT_AFTER`:
  
  Returns the last day before certificate expiration. The return format is the number of seconds since GMT January 1, 1970 (0 hours, 0 minutes, 0 seconds).

- `<certificate>.VALID_NOT_AFTER.BETWEEN(<time1>, <time2>)`:
  
  Returns a Boolean TRUE value if the certificate validity is between the <time1> and <time2> arguments. Both <time1> and <time2> must be fully specified. Following are examples:
  
  GMT 1995 Jan is fully specified.
  GMT Jan is not fully specified
  GMT 1995 20 is not fully specified.
  GMT Jan Mon_2 is not fully specified.
  
  The <time1> and <time2> arguments must be both GMT or both LOCAL, and <time2> must be greater than <time1>.
  
  For example, if it is GMT 2005 May 1 10h 15m 30s, and the first Sunday of the month, you can specify the following (evaluation results are in parentheses).
  
  - ...between(GMT 2004, GMT 2006) (TRUE)
  - ...between(GMT 2004 Jan, GMT 2006 Nov) (TRUE)
  - ...between(GMT 2004 Jan, GMT 2006) (TRUE)
  - ...between(GMT 2005 May Sun_1, GMT 2005 May Sun_3) (TRUE)
  - ...between(GMT 2005 May 1, GMT May 2005 1) (TRUE)
  - ...between(LOCAL 2005 May 1, LOCAL May 2005 1) (TRUE or FALSE, depending on the NetScaler system time zone.)

- `<certificate>.VALID_NOT_AFTER.DAY`:
  
  Extracts the last day of the month that the certificate is valid, and returns a number from 1 through 31, as appropriate for the date.

- `<certificate>.VALID_NOT_AFTER.EQ(<time>);`:
  
  Returns a Boolean TRUE if the time is equal to the <time> argument.
  
  For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following (evaluation results for this example are in parentheses):
  
  - ...eq(GMT 2005) (TRUE)
- \ldots \text{eq}(\text{GMT 2005 Dec}) \ (\text{FALSE})
- \ldots \text{eq}(\text{LOCAL 2005 May}) \ (\text{TRUE or FALSE, depending on the current time zone})
- \ldots \text{eq}(\text{GMT 10h}) \ (\text{TRUE})
- \ldots \text{eq}(\text{GMT 10h 30s}) \ (\text{TRUE})
- \ldots \text{eq}(\text{GMT May 10h}) \ (\text{TRUE})
- \ldots \text{eq}(\text{GMT Sun}) \ (\text{TRUE})
- \ldots \text{eq}(\text{GMT May Sun}_1) \ (\text{TRUE})

- <\text{certificate}>.\text{VALID\_NOT\_AFTER\_GE}<\text{time}>:

Returns a Boolean TRUE if the time value is greater than or equal to the argument <time>.

For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):

- \ldots \text{ge}(\text{GMT 2004}) \ (\text{TRUE})
- \ldots \text{ge}(\text{GMT 2005 Jan}) \ (\text{TRUE})
- \ldots \text{ge}(\text{LOCAL 2005 May}) \ (\text{TRUE or FALSE, depending on the current time zone.})
- \ldots \text{ge}(\text{GMT 8h}) \ (\text{TRUE})
- \ldots \text{ge}(\text{GMT 30m}) \ (\text{FALSE})
- \ldots \text{ge}(\text{GMT May 10h}) \ (\text{TRUE})
- \ldots \text{ge}(\text{GMT May 10h 0m}) \ (\text{TRUE})
- \ldots \text{ge}(\text{GMT Sun}) \ (\text{TRUE})
- \ldots \text{ge}(\text{GMT May Sun}_1) \ (\text{TRUE})

- <\text{certificate}>.\text{VALID\_NOT\_AFTER\_GT}<\text{time}>:

Returns a Boolean TRUE if the time value is greater than the argument <time>.

For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):

- \ldots \text{gt}(\text{GMT 2004}) \ (\text{TRUE})
- \ldots \text{gt}(\text{GMT 2005 Jan}) \ (\text{TRUE})
- \ldots \text{gt}(\text{LOCAL 2005 May}) \ (\text{TRUE or FALSE, depending on the current time zone.})
- \ldots \text{gt}(\text{GMT 8h}) \ (\text{TRUE})
- \ldots \text{gt}(\text{GMT 30m}) \ (\text{FALSE})
- \ldots \text{gt}(\text{GMT May 10h}) \ (\text{FALSE})
- \ldots \text{gt}(\text{GMT May 0h 0m}) \ (\text{FALSE})
- \ldots \text{gt}(\text{GMT Sun}) \ (\text{FALSE})
- \ldots \text{gt}(\text{GMT May Sun}_1) \ (\text{FALSE})

- <\text{certificate}>.\text{VALID\_NOT\_AFTER\_HOURS}:

Extracts the last hour that the certificate is valid and returns that value as an integer from 0 to
• `<certificate>.VALID_NOT_AFTER.LE(<time>):`

Returns a Boolean TRUE if the time precedes or is equal to the `<time>` argument.

For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):

- . . .le(GMT 2006) (TRUE)
- . . .le(GMT 2005 Dec) (TRUE)
- . . .le(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
- . . .le(GMT 8h) (FALSE)
- . . .le(GMT 30m) (TRUE)
- . . .le(GMT May 10h) (TRUE)
- . . .le(GMT Jun 11h) (TRUE)
- . . .le(GMT Wed) (TRUE)
- . . .le(GMT May Sun_1) (TRUE)

• `<certificate>.VALID_NOT_AFTER.LT(<time>):`

Returns a Boolean TRUE if the time precedes the `<time>` argument.

For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following:

- . . .lt(GMT 2006) (TRUE)
- . . .lt(GMT 2005 Dec) (TRUE)
- . . .lt(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
- . . .lt(GMT 8h) (FALSE)
- . . .lt(GMT 30m) (TRUE)
- . . .lt(GMT May 10h) (FALSE)
- . . .lt(GMT Jun 11h) (TRUE)
- . . .lt(GMT Wed) (TRUE)
- . . .lt(GMT May Sun_1) (FALSE)

• `<certificate>.VALID_NOT_AFTER.MINUTES:`

Extracts the last minute that the certificate is valid and returns that value as an integer from 0 to 59.

• `<certificate>.VALID_NOT_AFTER.MONTH:`

Extracts the last month that the certificate is valid and returns that value as an integer from 1 (January) to 12 (December).

• `<certificate>.VALID_NOT_AFTER.RELATIVE_BOOT:`
Calculates the number of seconds to the closest previous or scheduled reboot and returns an integer. If the closest boot time is in the past, the integer is negative. If it is in the future, the integer is positive.

- `<certificate>.VALID_NOT_AFTER.RELATIVE_NOW;`

Calculates the number of seconds between the current system time and the specified time and returns an integer. If the time is in the past, the integer is negative; if it is in the future, the integer is positive.

- `<certificate>.VALID_NOT_AFTER.SECONDS;`

Extracts the last second that the certificate is valid and returns that value as an integer from 0 to 59.

- `<certificate>.VALID_NOT_AFTER.WEEKDAY;`

Extracts the last weekday that the certificate is valid. Returns a number between 0 (Sunday) and 6 (Saturday) to give the weekday in the time value.

- `<certificate>.VALID_NOT_AFTER.WITHIN(<time1>, <time2>);`

Returns a Boolean TRUE if the time lies within all the ranges defined by the elements in `<time1>` and `<time2>`.

If you omit an element of time from `<time1>`, it is assumed to have the lowest value in its range. If you omit an element from `<time2>`, it is assumed to have the highest value of its range. If you specify a year in `<time1>`, you must specify it in `<time2>`.

The ranges for elements of time are as follows: month 1-12, day 1-31, weekday 0-6, hour 0-23, minutes 0-59 and seconds 0-59. For the result to be TRUE, each element in the time must exist in the corresponding range that you specify in `<time1>`, `<time2>`.

For example, if time is GMT 2005 May 10 10h 15m 30s, and it is the second Tuesday of the month, you can specify the following (evaluation results are in parentheses):

- . . .within(GMT 2004, GMT 2006) (TRUE)
- . . .within(GMT 2004 Jan, GMT 2006 Mar) (FALSE, May is not in the range of January to March.)
- . . .within(GMT Feb, GMT) (TRUE, May is in the range for February to December)
- . . .within(GMT Sun_1, GMT Sun_3) (TRUE, the second Tuesday lies within the range of the first Sunday through the third Sunday)
- . . .within(GMT 2005 May 1 10h, GMT May 2005 117h) (TRUE)
- . . .within(LOCAL 2005 May 1, LOCAL May 2005 1) (TRUE or FALSE, depending on the NetScaler system time zone)

- `<certificate>.VALID_NOT_AFTER.YEAR;`

Extracts the last year that the certificate is valid and returns a four-digit integer.
• <certificate>.VALID_NOT_BEFORE:

Returns the date that the client certificate becomes valid.

The return format is the number of seconds since GMT January 1, 1970 (0 hours, 0 minutes, 0 seconds).

• <certificate>.VALID_NOT_BEFORE.BETWEEN(<time1>, <time2>):

Returns a Boolean TRUE if the time value is between the two time arguments. Both <time1> and <time2> arguments must be fully specified.

Following are examples:

GMT 1995 Jan is fully specified.
GMT Jan is not fully specified.
GMT 1995 20 is not fully specified.
GMT Jan Mon_2 is not fully specified.
The time arguments must be both GMT or both LOCAL, and <time2> must be greater than <time1>.

For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):

- . . .between(GMT 2004, GMT 2006) (TRUE)
- . . .between(GMT 2004 Jan, GMT 2006 Nov) (TRUE)
- . . .between(GMT 2004 Jan, GMT 2006) (TRUE)
- . . .between(GMT 2005 May Sun_1, GMT 2005 May Sun_3) (TRUE)
- . . .between(GMT 2005 May 1, GMT May 2005 1) (TRUE)
- . . .between(LOCAL 2005 May 1, LOCAL May 2005 1) (TRUE or FALSE, depending on the NetScaler system time zone.)

• <certificate>.VALID_NOT_BEFORE.DAY:

Extracts the last day of the month that the certificate is valid and returns that value as a number from 1 through 31 representing that day.

• <certificate>.VALID_NOT_BEFORE.EQ(<time>):

Returns a Boolean TRUE if the time is equal to the <time> argument.

For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):

- . . .eq(GMT 2005) (TRUE)
- . . .eq(GMT 2005 Dec) (FALSE)
- . . .eq(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
- . . . eq(GMT 10h) (TRUE)
- . . . eq(GMT 10h 30s) (TRUE)
- . . . eq(GMT May 10h) (TRUE)
- . . . eq(GMT Sun) (TRUE)
- . . . eq(GMT May Sun_1) (TRUE)

- <certificate>.VALID_NOT_BEFORE.GE(<time>):

  Returns a Boolean TRUE if the time is greater than (after) or equal to the <time> argument.

  For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the
  month of May in 2005, you can specify the following (evaluation results are in parentheses):

  - . . . ge(GMT 2004) (TRUE)
  - . . . ge(GMT 2005 Jan) (TRUE)
  - . . . ge(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
  - . . . ge(GMT 8h) (TRUE)
  - . . . ge(GMT 30m) (FALSE)
  - . . . ge(GMT May 10h) (TRUE)
  - . . . ge(GMT May 10h 0m) (TRUE)
  - . . . ge(GMT Sun) (TRUE)
  - . . . ge(GMT May Sun_1) (TRUE)

- <certificate>.VALID_NOT_BEFORE.GT(<time>):

  Returns a Boolean TRUE if the time occurs after the <time> argument.

  For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the
  month of May in 2005, you can specify the following (evaluation results are in parentheses):

  - . . . gt(GMT 2004) (TRUE)
  - . . . gt(GMT 2005 Jan) (TRUE)
  - . . . gt(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
  - . . . gt(GMT 8h) (TRUE)
  - . . . gt(GMT 30m) (FALSE)
  - . . . gt(GMT May 10h) (FALSE)
  - . . . gt(GMT May 10h 0m) (TRUE)
  - . . . gt(GMT Sun) (FALSE)
  - . . . gt(GMT May Sun_1) (FALSE)

- <certificate>.VALID_NOT_BEFORE.HOURS:

  Extracts the last hour that the certificate is valid and returns that value as an integer from 0 to
  23.

- **<certificate>.VALID_NOT_BEFORE.LE(<time>)**
Returns a Boolean TRUE if the time precedes or is equal to the <time> argument.

For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):

- \( \leq\) (GMT 2006) (TRUE)
- \( \leq\) (GMT 2005 Dec) (TRUE)
- \( \leq\) (LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
- \( \leq\) (GMT 8h) (FALSE)
- \( \leq\) (GMT 30m) (TRUE)
- \( \leq\) (GMT May 10h) (TRUE)
- \( \leq\) (GMT Jun 11h) (TRUE)
- \( \leq\) (GMT Wed) (TRUE)
- \( \leq\) (GMT May Sun_1) (TRUE)

- <certificate>.VALID_NOT_BEFORE.LT(<time>):

Returns a Boolean TRUE if the time precedes the <time> argument.

For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):

- \( <\) (GMT 2006) (TRUE)
- \( <\) (GMT 2005 Dec) (TRUE)
- \( <\) (LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
- \( <\) (GMT 8h) (FALSE)
- \( <\) (GMT 30m) (TRUE)
- \( <\) (GMT May 10h) (FALSE)
- \( <\) (GMT Jun 11h) (TRUE)
- \( <\) (GMT Wed) (TRUE)
- \( <\) (GMT May Sun_1) (FALSE)

- <certificate>.VALID_NOT_BEFORE.MINUTES:

Extracts the last minute that the certificate is valid. Returns the current minute as an integer from 0 to 59.

- <certificate>.VALID_NOT_BEFORE.MONTH:

Extracts the last month that the certificate is valid. Returns the current month as an integer from 1 (January) to 12 (December).

- <certificate>.VALID_NOT_BEFORE.RELATIVE_BOOT:

Calculates the number of seconds to the closest previous or scheduled NetScaler reboot and
returns an integer. If the closest boot time is in the past, the integer is negative; if it is in the future, the integer is positive.

• `<certificate>.VALID_NOT_BEFORE.RELATIVE_NOW`:
  Returns the number of seconds between the current NetScaler system time and the specified time as an integer. If the designated time is in the past, the integer is negative. If it is in the future, the integer is positive.

• `<certificate>.VALID_NOT_BEFORE.SECONDS`:
  Extracts the last second that the certificate is valid. Returns the current second as an integer from 0 to 59.

• `<certificate>.VALID_NOT_BEFORE.WEEKDAY`:
  Extracts the last weekday that the certificate is valid. Returns the weekday as a number between 0 (Sunday) and 6 (Saturday).

• `<certificate>.VALID_NOT_BEFORE.WITHIN(<time1>, <time2>)`:
  Returns a Boolean TRUE if each element of time exists within the range defined in the `<time1>`, `<time2>` arguments.
  If you omit an element of time from `<time1>`, it is assumed to have the lowest value in its range. If you omit an element of time from `<time2>`, it is assumed to have the highest value in its range. If you specify a year in `<time1>`, it must be specified in `<time2>`. The ranges for elements of time are as follows: month 1-12, day 1-31, weekday 0-6, hour 0-23, minutes 0-59 and seconds 0-59.
  For example, if the time is GMT 2005 May 10 10h 15m 30s, and it is the second Tuesday of the month, you can specify the following (evaluation results are in parentheses):
  
  - . . .within(GMT 2004, GMT 2006) (TRUE)
  - . . .within(GMT 2004 Jan, GMT 2006 Mar) (FALSE, May is not in the range of January to March.)
  - . . .within(GMT Feb, GMT) (TRUE, May is in the range of February to December.)
  - . . .within(GMT Sun_1, GMT Sun_3) (TRUE, the second Tuesday is between the first Sunday and the third Sunday.)
  - . . .within(GMT 2005 May 1 10h, GMT May 2005 117h) (TRUE)
  - . . .within(LOCAL 2005 May 1, LOCAL May 2005 1) (TRUE or FALSE, depending on the NetScaler system time zone)

• `<certificate>.VALID_NOT_BEFORE.YEAR`:
  Extracts the last year that the certificate is valid. Returns the current year as a four-digit integer.
### Expressions for HTTP request and response dates

December 13, 2018

The following expression prefixes return the contents of the HTTP Date header as text or as a date object. These values can be evaluated as follows:

- As a number. The numeric value of an HTTP Date header is returned in the form of the number of seconds since Jan 1, 1970.

  For example, the expression `http.req.date.mod(86400)` returns the number of seconds since the beginning of the day. These values can be evaluated using the same operations as other non-date-related numeric data. For more information, see [Expression prefixes for numeric data other than date and time](#).

- As an HTTP header. Date headers can be evaluated using the same operations as other HTTP headers.

  For more information, see [Default syntax expressions: Parsing HTTP, TCP, and UDP data](#).

- As text. Date headers can be evaluated using the same operations as other strings.

  For more information, see [Advanced Policy Expressions: Evaluating Text](#).

<table>
<thead>
<tr>
<th>Prefix</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTTP.REQ.DATE</td>
<td>Returns the contents of the HTTP Date header as text or as a date object. The date formats recognized are: RFC822. Sun, 06 Jan 1980 08:49:37 GMT, RFC850. Sunday, 06-Jan-80 09:49:37 GMT, and ASCTIME. Sun Jan 6 08:49:37 1980.</td>
</tr>
<tr>
<td>HTTP.RES.DATE</td>
<td>Returns the contents of the HTTP Date header as text or as a date object. The date formats recognized are: RFC822. Sun, 06 Jan 1980 8:49:37 GMT, RFC850. Sunday, 06-Jan-80 9:49:37 GMT, and ASCTIME. Sun Jan 6 08:49:37 1980.</td>
</tr>
</tbody>
</table>

### Generate the day of the week, as a string, in short and long formats

December 10, 2018
The functions, WEEKDAY_STRING_SHORT and WEEKDAY_STRING, generate the day of the week, as a string, in short and long formats, respectively. The strings that are returned are always in English. The prefix used with these functions must return the day of the week in integer format and the acceptable range for the value returned by the prefix is 0-6. Therefore, you can use any prefix that returns an integer in the acceptable range. An UNDEF condition is raised if the returned value is not in this range or if memory allocation fails.

Following are the descriptions of the functions:

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;prefix&gt;.WEEKDAY_STRING_SHORT</td>
<td>Returns the day of the week in short format. The short form is always 3 characters long with an initial capital and the remaining characters in lower case. For example, SYS.TIME.WEEKDAY.WEEKDAY_STRING_SHORT returns Sun if the value returned by the WEEKDAY function is 0 and Sat if the value returned by the prefix is 6.</td>
</tr>
<tr>
<td>&lt;prefix&gt;.WEEKDAY_STRING</td>
<td>Returns the day of the week in long format. The long form always has an initial capital, with the remaining characters in lower case. For example, SYS.TIME.WEEKDAY.WEEKDAY_STRING returns Sunday if the value returned by the WEEKDAY function is 0 and Saturday if the value returned by the prefix is 6.</td>
</tr>
</tbody>
</table>

**Expression prefixes for numeric data other than date and time**

December 13, 2018

In addition to configuring expressions that operate on time, you can configure expressions for the following types of numeric data:

- The length of HTTP requests, the number of HTTP headers in a request, and so on.
  
  For more information, see [Expressions for numeric HTTP payload data other than dates](#).

- IP and MAC addresses.
  
  For more information, see [Expressions for IP addresses and IP subnets](#).
- Client and server data in regard to interface IDs and transaction throughput rate.
  For more information, see Expressions for numeric client and server data.
- Numeric data in client certificates other than dates.
  For information on these prefixes, including the number of days until certificate expiration and
  the encryption key size, see Prefixes for numeric data in SSL certificates.

Converting numbers to text

December 13, 2018

The following functions produce binary strings from a number returned by an expression prefix. These functions are particularly useful in the TCP rewrite feature as replacement strings for binary data. For more information about the TCP rewrite feature, see Rewrite.

All the functions return a value of type text. The endianness that some of the functions accept as a parameter is either LITTLE_ENDIAN or BIG_ENDIAN.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;number&gt;.SIGNED8_STRING</code></td>
<td>Produces an 8-bit signed binary string representing the number. If the value is out of range, an undef condition is raised. Example: HTTP.REQ.BODY(100).GET_SIGNED8(16).SUB(3).SIGNED8_STRING</td>
</tr>
<tr>
<td><code>&lt;number&gt;.UNSIGNED8_STRING</code></td>
<td>Produces an 8-bit unsigned binary string representing the number. If the value is out of range, an undef condition is raised. Example: HTTP.REQ.BODY(100).GET_UNSIGNED8(31).ADD(3).UNSIGNED8_STRING</td>
</tr>
<tr>
<td><code>&lt;number&gt;.SIGNED16_STRING(&lt;endianness&gt;)</code></td>
<td>Produces a 16-bit signed binary string representing the number. If the value is out of range, an undef condition is raised. Example: HTTP.REQ.BODY(100).SKIP(12).GET_SIGNED16(0, BIG_ENDIAN).SUB(4).SIGNED16_STRING(BIG_ENDIAN)</td>
</tr>
<tr>
<td><code>&lt;number&gt;.UNSIGNED16_STRING(&lt;endianness&gt;)</code></td>
<td>Produces a 16-bit unsigned binary string representing the number. If the value is out of range, an undef condition is raised. Example: HTTP.REQ.BODY(100).GET_UNSIGNED16(47, LITTLE_ENDIAN).ADD(7).UNSIGNED16_STRING(LITTLE_ENDIAN)</td>
</tr>
</tbody>
</table>
Virtual server based expressions

December 10, 2018

The SYS.VSERVER("<vserver-name>") expression prefix enables you to identify a virtual server. You can use the following functions with this prefix to retrieve information related to the specified virtual server:

- **THROUGHPUT.** Returns the throughput of the virtual server in Mbps (Megabits per second). The value returned is an unsigned long number.
  
  **Usage:** SYS.VSERVER("vserver").THROUGHPUT

- **CONNECTIONS.** Returns the number of connections being managed by the virtual server. The value returned is an unsigned long number.
  
  **Usage:** SYS.VSERVER("vserver").CONNECTIONS

- **STATE.** Returns the state of the virtual server. The value returned is UP, DOWN, or
OUT_OF_SERVICE. One of these values can therefore be passed as an argument to the
EQ() operator to perform a comparison that results in a Boolean TRUE or FALSE.

**Usage:** SYS.VSERVER(“vserver”).STATE

- **HEALTH.** Returns the percentage of services in an UP state for the specified virtual server. The value returned is an integer.

  **Usage:** SYS.VSERVER(“vserver”).HEALTH

- **RESPTIME.** Returns the response time as an integer representing the number of microseconds. Response time is the average TTFB (Time To First Byte) from all the services bound to the virtual server.

  **Usage:** SYS.VSERVER(“vserver”).RESPTIME

- **SURGECOUNT.** Returns the number of requests in the surge queue of the virtual server. The value returned is an integer.

  **Usage:** SYS.VSERVER(“vserver”).SURGECOUNT

**Example 1:**
The following rewrite policy aborts rewrite processing if the number of connections at the load bal-
ancing virtual server LBvserver exceeds 10000:

```
add rewrite policy norewrite_pol sys.vserver("LBvserver").connections.gt(10000) norewrite
```

**Example 2:**
The following rewrite action inserts a custom header, TP, whose value is the throughout at the virtual
server LBvserver:

```
add rewrite action tp_header insert_http_header TP SYS.VSERVER("LBvserver").THROUGHPUT
```

**Example 3:**
The following audit log message action writes the average TTFB of the services bound to a virtual
server, to the newsnslog log file:

```
add audit messageaction log_vserver_resptime_act INFORMATIONAL "\"NS Response Time to Servers:" + sys.vserver("ssllb").resptime + "" millisec \"\”-logtoNewnslog YES -bypassSafetyCheck YES
```

**Advanced policy expressions: Parsing HTTP, TCP, and UDP data**

December 13, 2018
You can configure Advanced policy expressions to evaluate and process the payload in HTTP requests and responses. The payload associated with an HTTP connection includes the various HTTP headers (both standard and custom headers), the body, and other connection information such as the URL. Additionally, you can evaluate and process the payload in a TCP or UDP packet. For HTTP connections, for example, you can check whether a particular HTTP header is present or if the URL includes a particular query parameter.

You can configure expressions to transform the URL encoding and apply HTML or XML “safe” coding for subsequent evaluation. You can also use XPath and JSON prefixes to evaluate date in XML and JSON files, respectively.

You can also use text-based and numeric Advanced policy expressions to evaluate HTTP request and response data. For more information, see Advanced policy expressions: Evaluating text and Default Syntax Expressions: Working with Dates, Times, and Numbers.

About evaluating HTTP and TCP payload

December 13, 2018

The payload of an HTTP request or response consists of HTTP protocol information such as headers, a URL, body content, and version and status information. When you configure a default syntax expression to evaluate HTTP payload, you use a default syntax expression prefix and, if necessary, an operator.

For example, you use the following expression, which includes the http.req.header("<header_name>") prefix and the exists operator, if you want to determine whether an HTTP connection includes a custom header named “myHeader”:

```
http.req.header("myHeader").exists
```

You can also combine multiple Advanced policy expressions with Boolean and arithmetic operators. For example, the following compound expression could be useful with various NetScaler features, such as Integrated Caching, Rewrite, and Responder. This expression first uses the && Boolean operator to determine whether an HTTP connection includes the Content-Type header with a value of “text/html.” If that operation returns a value of FALSE, the expression determines whether the HTTP connection includes a “Transfer-Encoding” or “Content-Length” header.

```
(http.req.header("Content-Type").exists && http.req.header("Content-Type").eq("text/html")).|| (http.req.header("Transfer-Encoding").exists)|| (http.req.header("Content-Length").exists)
```

The payload of a TCP or UDP packet is the data portion of the packet. You can configure Advanced policy expressions to examine features of a TCP or UDP packet, including the following:

- Source and destination domains
NetScaler 11.1

- Source and destination ports
- The text in the payload
- Record types

The following expression prefixes extract text from the body of the payload:

- HTTP.REQ.BODY(integer). Returns the body of an HTTP request as a multiline text object, up to the character position designated in the integer argument. If there are fewer characters in the body than is specified in the argument, the entire body is returned.
- HTTP.RES.BODY(integer). Returns a portion of the HTTP response body. The length of the returned text is equal to the number in the integer argument. If there are fewer characters in the body than is specified in integer, the entire body is returned.
- CLIENT.TCP.PAYLOAD(integer). Returns TCP payload data as a string, starting with the first character in the payload and continuing for the number of characters in the integer argument.

Following is an example that evaluates to TRUE if a response body of 1024 bytes contains the string “https”, and this string occurs after the string “start string” and before the string “end string”:

```
http.res.body(1024).after_str("start_string").before_str("end_string").contains("https")
```

Note: You can apply any text operation to the payload body. For information on operations that you can apply to text, see Advanced policy expressions: Evaluating text.

### Expressions for identifying the protocol in an incoming IP packet

December 10, 2018

The following table lists the expressions that you can use to identify the protocol in an incoming packet.

<table>
<thead>
<tr>
<th>Expression</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLIENT.IP.PROTOCOL</td>
<td>Identifies the protocol in IPv4 packets sent by clients.</td>
</tr>
<tr>
<td>CLIENT.IPV6.PROTOCOL</td>
<td>Identifies the protocol in IPv6 packets sent by clients.</td>
</tr>
<tr>
<td>SERVER.IP.PROTOCOL</td>
<td>Identifies the protocol in IPv4 packets sent by servers.</td>
</tr>
<tr>
<td>SERVER.IPV6.PROTOCOL</td>
<td>Identifies the protocol in IPv6 packets sent by servers.</td>
</tr>
</tbody>
</table>

© 1999-2018 Citrix Systems, Inc. All rights reserved.
Arguments to the PROTOCOL function

You can pass the Internet Assigned Numbers Authority (IANA) protocol number to the PROTOCOL function. For example, if you want to determine whether the protocol in an incoming packet is TCP, you can use CLIENT.IP.PROTOCOL.EQ(6), where 6 is the IANA-assigned protocol number for TCP. For some protocols, you can pass an enumeration value instead of the protocol number. For example, instead of CLIENT.IP.PROTOCOL.EQ(6), you can use CLIENT.IP.PROTOCOL.EQ(TCP). The following table lists the protocols for which you can use enumeration values, and the corresponding enumeration values for use with the PROTOCOL function.

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Enumeration value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transmission Control Protocol (TCP)</td>
<td>TCP</td>
</tr>
<tr>
<td>User Datagram Protocol (UDP)</td>
<td>UDP</td>
</tr>
<tr>
<td>Internet Control Message Protocol (ICMP)</td>
<td>ICMP</td>
</tr>
<tr>
<td>IP Authentication Header (AH), for providing authentication services in IPv4 and IPv6</td>
<td>AH</td>
</tr>
<tr>
<td>Encapsulating Security Payload (ESP) protocol</td>
<td>ESP</td>
</tr>
<tr>
<td>General Routing Encapsulation (GRE)</td>
<td>GRE</td>
</tr>
<tr>
<td>IP-within-IP Encapsulation Protocol</td>
<td>IPIP</td>
</tr>
<tr>
<td>Internet Control Message Protocol for IPv6 (ICMPv6)</td>
<td>ICMPv6</td>
</tr>
<tr>
<td>Fragment Header for IPv6</td>
<td>FRAGMENT</td>
</tr>
</tbody>
</table>

Use case scenarios

The protocol expressions can be used in both request-based and response-based policies. You can use the expressions in various NetScaler features, such as load balancing, WAN optimization, content switching, rewrite, and listen policies. You can use the expressions with functions such as EQ() and NE(), to identify the protocol in a policy and perform an action.

Following are some use cases for the expressions:

- In Branch Repeater load balancing configurations, you can use the expressions in a listen policy for the wildcard virtual server. For example, you can configure the wildcard virtual server with the listen policy CLIENT.IP.PROTOCOL.EQ(TCP) so that the virtual server processes only TCP traffic and simply bridges all non-TCP traffic. Even though you can use an Access Control List instead of the listen policy, the listen policy provides better control over what traffic is processed.
For content switching virtual servers of type ANY, you can configure content switching policies that switch requests on the basis of the protocol in incoming packets. For example, you can configure content switching policies to direct all TCP traffic to one load balancing virtual server and all non-TCP traffic to another load balancing virtual server.

You can use the client-based expressions to configure persistence based on the protocol. For example, you can use CLIENT.IP.PROTOCOL to configure persistence on the basis of the protocols in incoming IPv4 packets.

**Expressions for HTTP and cache-control headers**

December 13, 2018

One common method of evaluating HTTP traffic is to examine the headers in a request or a response. A header can perform a number of functions, including the following:

- Provide cookies that contain data about the sender.
- Identify the type of data that is being transmitted.
- Identify the route that the data has traveled (the Via header).

**Note**

If an operation is used to evaluate both header and text data, the header-based operation always overrides the text-based operation. For example, the AFTER_STR operation, when applied to a header, overrides text-based AFTER_STR operations for all instances of the current header type.

**Prefixes for HTTP headers**

The following table describes expression prefixes that extract HTTP headers.
<table>
<thead>
<tr>
<th>HTTP Header Prefix</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTTP.REQ.HEADER(&quot;&quot;)</td>
<td>Returns the contents of the HTTP header specified by the argument. The header name cannot exceed 32 characters. Note that this prefix returns the value from the Host header by default. To use this value as a hostname you need to typecast it as follows: http.req.header(&quot;&quot;&quot;)</td>
</tr>
<tr>
<td></td>
<td>For more information on typecasting, see <a href="/en-us/netscaler/11-1/appexpert/policies-and-expressions/ns-typecasting-data-wrapper-con.html">Typecasting data</a>.</td>
</tr>
<tr>
<td>HTTP.REQ.FULL_HEADER</td>
<td>Returns the contents of the complete set of HTTP header fields including the request line (for example, “GET /brochures/index.html HTTP/1.1”) and the terminating \r\n sequence.</td>
</tr>
<tr>
<td>HTTP Header Prefix</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>HTTP.REQ.DATE</td>
<td>Returns the contents of the HTTP Date header. The following date formats are recognized: RFC822. Sun, 06 Jan 1980 8:49:37 GMT, RFC850. Sunday, 06-Jan-80 9:49:37 GMT, ASCII TIME. Sun Jan 6 08:49:37 1980. To evaluate a Date header as a date object, see Default Syntax Expressions: Working with Dates, Times, and Numbers.</td>
</tr>
<tr>
<td>HTTP.REQ.COOKIE</td>
<td>(Name/Value List) Returns the contents of the HTTP Cookie header.</td>
</tr>
<tr>
<td>HTTP.REQ.TXID</td>
<td>Returns the HTTP transaction ID. The value is a function of an internal transaction number, system boot time and system MAC address.</td>
</tr>
<tr>
<td>HTTP.RES.HEADER(&quot;&quot;)</td>
<td>Returns the contents of the HTTP header specified by the argument. The header name cannot exceed 32 characters.</td>
</tr>
<tr>
<td>HTTP Header Prefix</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>HTTP.RES.FULL_HEADER</td>
<td>Returns the contents of the complete set of HTTP header fields including the status line (for example, “HTTP/1.1 200 OK”) and the terminating \r\n\r\n sequence.</td>
</tr>
<tr>
<td>HTTP.RES.SET_COOKIE or HTTP.RES.SET_COOKIE2</td>
<td>Set-Cookie header object in a response.</td>
</tr>
<tr>
<td>HTTP.RES.SET_COOKIE(&lt;name&gt;) or HTTP.RES.SET_COOKIE2(&lt;name&gt;)</td>
<td>Returns the cookie of the specified name if it is present. If it is not present, returns a text object of length 0. Returns UNDEF if more than 15 Set-Cookie headers are present and the specified cookie was not found in these headers.</td>
</tr>
<tr>
<td>HTTP Header Prefix</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>HTTP.RES.SET_COOKIE(&lt;name&gt;).DOMAIN or HTTP.RES.SET_COOKIE2(&lt;name&gt;).DOMAIN</td>
<td>Returns the value of the first Domain field in the cookie. For example, if the cookie is Set-Cookie: Customer = “ABC”; DOMAIN=”.abc.com”; DOMAIN=.xyz.com, the following expression returns .abc.com: http.res.set_cookie.cookie(&quot;customer&quot;).domain. A string of zero length is returned if the Domain field or its value is absent.</td>
</tr>
<tr>
<td>HTTP.RES.SET_COOKIE</td>
<td>Returns a Boolean TRUE if a Cookie with the name specified in the &lt;name&gt; argument exists in the Set-Cookie header. This prefix returns UNDEF if more than 15 Set-Cookie headers are present and the named cookie is not in the first 15 headers.</td>
</tr>
<tr>
<td>HTTP Header Prefix</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>HTTP .RES.SET_COOKIE.COOKIE(&lt;name&gt;).EXPIRES or HTTP .RES.SET_COOKIE2.COOKIE(&lt;name&gt;).EXPIRES</td>
<td>Returns the Expires field of the cookie. This is a date string that can be evaluated as a number, as a time object, or as text. If multiple Expires fields are present, the first one is returned. If the Expires field is absent, a text object of length zero is returned. To evaluate the returned value as a time object, see Default Syntax Expressions: Working with Dates, Times, and Numbers.</td>
</tr>
<tr>
<td>HTTP .RES.SET_COOKIE PATH.GET(n)</td>
<td></td>
</tr>
</tbody>
</table>

© 1999-2018 Citrix Systems, Inc. All rights reserved.
<table>
<thead>
<tr>
<th>HTTP Header Prefix</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTTP.RES.SET_COOKIE2.COOKIE(&lt;name&gt;).PATH</td>
<td>Returns the value of Path field of the cookie as a slash- (/) separated list. Multiple instances of a slash are treated as single slash. If multiple Path fields are present, the value of the first instance is returned. For example, the following is a cookie with two path fields: Set-Cookie: Customer = “ABC”; PATH=“/a//b/c”; PATH=“/x/y/z”. The following expression returns /a//b/c from this cookie: http.res.set_cookie.cookie(“Customer”).path. The following expression returns b: http.res.set_cookie.cookie(“Customer”).path.get(2). Quotes are stripped from the returned value. A string of zero length is returned if the Path field or its value is absent.</td>
</tr>
<tr>
<td>HTTP Header Prefix</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>HTTP.RES.SET_COOKIE</td>
<td>Ignores the empty elements in the list. For example, in the list <code>a=10,b=11,,c=89</code>, the element delimiter in the list is <code>,</code> and the list has an empty element following <code>a=10</code>. The element following <code>b=11</code> is not considered an empty element. As another example, in the following expression, if a request contains <code>Cust_Header : 123,,24,,15</code> the following expression returns a value of 4: <code>http.req.header(&quot;Cust_Header&quot;).typecast_list_t(', ').ignore_empty_elements.count</code>. The following expression returns a value of 5: <code>http.req.header(&quot;Cust_Header&quot;).count</code></td>
</tr>
<tr>
<td>HTTP Header Prefix</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>HTTP .RES.SET_COOKIE.COOKIE(&lt;name&gt;).PORT or HTTP.RES.SET_COOKIE2.COOKIE(&lt;name&gt;).PORT</td>
<td>Port field of the cookie. Operate as a comma-separated list. For example, the following expression returns 80, 2580 from Set-Cookie: Customer = “ABC”; PATH=/a/b/c”; PORT= “80, 2580”: http.res.set_cookie.cookie(“ABC”).port. A string of zero length is returned if the Port field or value is absent.</td>
</tr>
<tr>
<td>HTTP Header Prefix</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>HTTP.RES.SET_COOKIE</td>
<td>Ignores the empty elements in the list. For example, in the list <code>a=10,b=11,,c=89</code>, the element delimiter in the list is <code>,</code> and the list has an empty element following <code>a=10</code>. The element following <code>b=11</code> is not considered an empty element. As another example, in the following expression, if a request contains <code>Cust_Header : 123,,24,,15</code> the following expression returns a value of 4: <code>http.req.header(&quot;Cust_Header&quot;).typecast_list_t(', ').ignore_empty_elements.count</code>. The following expression returns a value of 5: <code>http.req.header(&quot;Cust_Header&quot;).typecast_list_t(', ').count</code>.</td>
</tr>
<tr>
<td>HTTP Header Prefix</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>HTTP.RES.SET_COOKIE.COOKIE(&lt;name&gt;).VERSION or HTTP.RES.SET_COOKIE2.COOKIE(&lt;name&gt;).VERSION</td>
<td>Returns the value of the first Version field in the cookie as a decimal integer. For example, the following expression returns 1 from the cookie Set-Cookie: Customer = “ABC”; VERSION = “1”; VERSION = “0”: http.res.set_cookie.cookie(“CUSTOMER”).version. A zero is returned if the Version field or its value is absent or if the value is not a decimal number.</td>
</tr>
<tr>
<td>HTTP.RES.SET_COOKIE(&lt;integer&gt;) or HTTP.RES.&lt;integer&gt;)</td>
<td>Returns the nth instance (0-based) of the cookie with the specified name. If the cookie is absent, returns a text object of length 0. Returns UNDEF if more than 15 Set-Cookie headers are present and the cookie is not found.</td>
</tr>
</tbody>
</table>
**HTTP Header Prefix** | **Description**
--- | ---
HTTP.RES.SET_COOKIE.COOKIE(<name>, <integer>).DOMAIN | Returns the value of the Domain field of the first cookie with the specified name. For example, the following expression returns a value of abc.com from the cookie Set-Cookie : Customer = “ABC”; DOMAIN=”.abc.com”; DO-MAIN=.xyz.com: http.res.set_cookie.cookie(“CUSTOMER”).domain. A string of zero length is returned if the Domain field or its value is absent.
HTTP.RES.SET_COOKIE.<integer>.EXPIRES | Returns the nth instance (0-based) of the Expires field of the cookie with the specified name as a date string. The value can be operated upon as a time object that supports a number of date formats. If the Expires attribute is absent a string of length zero is returned.
<table>
<thead>
<tr>
<th>HTTP Header Prefix</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTTP.RES.SET_COOKIE.COOKIE(&lt;name&gt;, &lt;integer&gt;).PATH</td>
<td>Returns the value of the Path field of the nth cookie, as a ‘/’ separated list. Multiple /s are treated as a single /. For example, the following expression returns /a//b/c from the cookie Set-Cookie: Customer = “ABC”; PATH=“/a/b/c”; PATH=“/x/y/z”: http.res.set_cookie.cookie(&quot;CUSTOMER&quot;).path. The following returns b: http.res.set_cookie.cookie(&quot;CUSTOMER&quot;).path.get(2). A string of zero length is returned if the Path field or its value is absent.</td>
</tr>
<tr>
<td>HTTP Header Prefix</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>HTTP.RES.SET_COOKIE.&lt;integer&gt;).PATH.IGNORE_EMPTY_ELEMENTS or HTTP.RES.SET_COOKIE2.&lt;integer&gt;).PATH.IGNORE_EMPTY_ELEMENTS</td>
<td>Ignores the empty elements in the list. For example, in the list <code>a=10,b=11, ,c=89</code>, the element delimiter in the list is <code>,</code> and the list has an empty element following <code>a=10</code>. The element following <code>b=11</code> is not considered an empty element. As another example, in the following expression, if a request contains Cust_Header : 123,,24, ,15 the following expression returns a value of 4: http.req.header(&quot;Cust_Header&quot;).typecast_list_t(', ').ignore_empty_elements.count. The following expression returns a value of 5: http.req.header(&quot;Cust_Header&quot;).typecast_list_t(', ').count</td>
</tr>
<tr>
<td>HTTP Header Prefix</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>HTTP .RES.SET_COOKIE.COOKIE(&lt;name&gt;, &lt;integer&gt;).PORT or HTTP .RES.SET_COOKIE2.COOKIE(&lt;name&gt;, &lt;integer&gt;).PORT</td>
<td>Returns the value or values of the Port field of the named cookie as a ‘,’ separated list. For example, the following expression returns 80, 2580 from the cookie Set-Cookie: Customer = “ABC”; PATH= ”/a/b/c”; PORT= “80, 2580”: <code>http.res.set_cookie.cookie(“ABC”).port</code>. A string of zero length is returned if the Port field or its value is absent.</td>
</tr>
<tr>
<td>HTTP Header Prefix</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>HTTP.RES.SET_COOKIE.COOKIE(&lt;name&gt;,&lt;integer&gt;).PORT.IGNOR</td>
<td>Ignores the empty elements in the list. For example, in the list <code>a=10,b=11,,c=89</code>, the element delimiter in the list is <code>,</code>, and the list has an empty element following <code>a=10</code>. The element following <code>b=11</code> is not considered an empty element. As another example, in the following expression, if a request contains <code>Cust_Header : 123,,24,,15</code> the following expression returns a value of 4: <code>http.req.header(&quot;Cust_Header&quot;)</code>. The following expression returns a value of 5: <code>http.req.header(&quot;Cust_Header&quot;)</code>.</td>
</tr>
<tr>
<td>HTTP.RES.SET_COOKIE.COOKIE(&lt;name&gt;,&lt;integer&gt;).VERSION</td>
<td>Returns the value of the nth cookie as a decimal integer. A string of zero length is returned if the Port field or its value is absent.</td>
</tr>
</tbody>
</table>
HTTP Header Prefix | Description
--- | ---
HTTP.RES.TXID | Returns the HTTP transaction ID. The value is a function of an internal transaction number, system boot time and system MAC address.

### Operations for HTTP headers

The following table describes operations that you can specify with the prefixes for HTTP headers.

<table>
<thead>
<tr>
<th>HTTP Header Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>http header .EXISTS</td>
<td>Returns a Boolean TRUE if an instance of the specified header type exists. Following is an example: <code>http.req.header(&quot;Cache-Control&quot;).exists</code></td>
</tr>
<tr>
<td>http header.CONTAINS&quot; http header.CONTAINS(&lt;string&gt;)</td>
<td>Returns a Boolean TRUE if the <code>&lt;string&gt;</code> argument appears in any instance of the header value. Note: This operation overrides any text-based Contains operations on all instances of the current header type.</td>
</tr>
<tr>
<td>http header .COUNT</td>
<td>Returns the number of headers in a request or response, to a maximum of 15 headers of the same type. The result is undefined if there are more than 15 instances of the header.</td>
</tr>
<tr>
<td>http header.AFTER_STR(&lt;string&gt;)</td>
<td>Extracts the text that follows the first occurrence of the <code>&lt;string&gt;</code> argument. The headers are evaluated from the last instance to the first.</td>
</tr>
<tr>
<td>http header.BEFORE_STR(&lt;string&gt;)</td>
<td>Extracts the text that appears prior to the first occurrence of the input <code>&lt;string&gt;</code> argument. The headers are evaluated from the last instance to the first.</td>
</tr>
</tbody>
</table>
### HTTP Header Operation Description

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>http header.INSTANCE(&lt;instance number&gt;)</code></td>
<td>An HTTP header can occur multiple times in a request or a response. This operation returns the header that occurs <code>&lt;instance number&gt;</code> of places before the final instance. For example, <code>instance(0)</code> selects the last instance of the current type, <code>instance(1)</code> selects the next-to-last instance, and so on. This prefix cannot be used in bidirectional policies.</td>
</tr>
<tr>
<td><code>http header.SUBSTR(&lt;string&gt;)</code></td>
<td>Extracts the text that matches the <code>&lt;string&gt;</code> argument. The headers are evaluated from the last instance to the first.</td>
</tr>
<tr>
<td><code>http header.VALUE(&lt;instance number&gt;)</code></td>
<td>An HTTP header can occur multiple times in a request or a response. <code>VALUE(0)</code> selects the value in the last instance, <code>VALUE(1)</code> selects the value in the next-to-last instance, and so on. The <code>&lt;instance number&gt;</code> argument cannot exceed 14.</td>
</tr>
</tbody>
</table>

### Prefixes for cache-control headers

The following prefixes apply specifically to Cache-Control headers.

<table>
<thead>
<tr>
<th>HTTP Header Prefix</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>HTTP.REQ.CACHE_CONTROL</code></td>
<td>Returns a Cache-Control header in an HTTP request.</td>
</tr>
<tr>
<td><code>HTTP.RES.CACHE_CONTROL</code></td>
<td>Returns a Cache-Control header in an HTTP response.</td>
</tr>
</tbody>
</table>

### Operations for cache-control headers

You can apply any of the operations for HTTP headers to Cache-Control headers. For more information, see [Operations for HTTP headers](#).

In addition, the following operations identify specific types of Cache-Control headers. See RFC 2616 for information about these header types.
<table>
<thead>
<tr>
<th>HTTP Header Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cache-Control header.NAME(&lt;integer&gt;)</td>
<td>Returns as a text value the name of the Cache-Control header that corresponds to the nth component in a name-value list, as specified by &lt;integer&gt;. The index of the name-value component is 0-based. If the &lt;integer&gt; that is specified by the integer argument is greater than the number of components in the list, a zero-length text object is returned. Following is an example: http.req.cache_control.name(3).contains(“some_text”)</td>
</tr>
<tr>
<td>Cache-Control header.IS_INVALID</td>
<td>Returns a Boolean TRUE if the Cache-Control header is not present in the request or response. Following is an example: http.req.cache_control.is_invalid</td>
</tr>
<tr>
<td>Cache-Control header.IS_PRIVATE</td>
<td>Returns a Boolean TRUE if the Cache-Control header has the value Private. Following is an example: http.req.cache_control.is_private</td>
</tr>
<tr>
<td>Cache-Control header.IS_PUBLIC</td>
<td>Returns a Boolean TRUE if the Cache-Control header has the value Private. Following is an example: http.req.cache_control.is_public</td>
</tr>
<tr>
<td>Cache-Control header.IS_NO_STORE</td>
<td>Returns a Boolean TRUE if the Cache-Control header has the value No-Store. Following is an example: http.req.cache_control.is_no_store</td>
</tr>
<tr>
<td>Cache-Control header.IS_NO_CACHE</td>
<td>Returns a Boolean TRUE if the Cache-Control header has the value No-Cache. Following is an example: http.req.cache_control.is_no_cache</td>
</tr>
<tr>
<td>Cache-Control header.IS_MAX_AGE</td>
<td>Returns a Boolean TRUE if the Cache-Control header has the value Max-Age. Following is an example: http.req.cache_control.is_max_age</td>
</tr>
<tr>
<td>Cache-Control header.IS_MIN_FRESH</td>
<td>Returns a Boolean TRUE if the Cache-Control header has the value Min-Fresh. Following is an example: http.req.cache_control.is_min_fresh</td>
</tr>
<tr>
<td>Cache-Control header.IS_MAX_STALE</td>
<td>Returns a Boolean TRUE if the Cache-Control header has the value Max-Stale. Following is an example: http.req.cache_control.is_max_stale</td>
</tr>
<tr>
<td>HTTP Header Operation</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Cache-Control header.IS_MUST_REVALIDATE</td>
<td>Returns a Boolean TRUE if the Cache-Control header has the value Must-Revalidate. Following is an example: http.req.cache_control.is_must_revalidate</td>
</tr>
<tr>
<td>Cache-Control header.IS_NO_TRANSFORM</td>
<td>Returns a Boolean TRUE if the Cache-Control header has the value No-Transform. Following is an example: http.req.cache_control.is_no_transform</td>
</tr>
<tr>
<td>Cache-Control header.IS_ONLY_IF_CACHED</td>
<td>Returns a Boolean TRUE if the Cache-Control header has the value Only-If-Cached. Following is an example: http.req.cache_control.is_only_if_cached</td>
</tr>
<tr>
<td>Cache-Control header.IS_PROXY_REVALIDATE</td>
<td>Returns a Boolean TRUE if the Cache-Control header has the value Proxy-Revalidate. Following is an example: http.req.cache_control.is_proxy_revalidate</td>
</tr>
<tr>
<td>Cache-Control header.IS_S_MAXAGE</td>
<td>Returns a Boolean TRUE if the Cache-Control header has the value S-Maxage. Following is an example: http.req.cache_control.is_s_maxage</td>
</tr>
<tr>
<td>Cache-Control header.IS_UNKNOWN</td>
<td>Returns a Boolean TRUE if the Cache-Control header is of an unknown type. Following is an example: http.req.cache_control.is_unknown</td>
</tr>
<tr>
<td>Cache-Control header.MAX_AGE</td>
<td>Returns the value of the Cache-Control header Max-Age. If this header is absent or invalid, 0 is returned. Following is an example: http.req.cache_control.max_age.le(3)</td>
</tr>
<tr>
<td>Cache-Control header.MAX_STALE</td>
<td>Returns the value of the Cache-Control header Max-Stale. If this header is absent or invalid, 0 is returned. Following is an example: http.req.cache_control.max_stale.le(3)</td>
</tr>
<tr>
<td>Cache-Control header.MIN_FRESH</td>
<td>Returns the value of the Cache-Control header Min-Fresh. If this header is absent or invalid, 0 is returned. Following is an example: http.req.cache_control.min_fresh.le(3)</td>
</tr>
</tbody>
</table>
HTTP Header Operation | Description
--- | ---
Cache-Control header.S_MAXAGE | Returns the value of the Cache-Control header S-Maxage. If this header is absent or invalid, 0 is returned. Following is an example: `http.req.cache_control.s_maxage.eq(2)`

Expressions for extracting segments of URLs

December 13, 2018

You can extract URLs and portions of URLs, such as the host name, or a segment of the URL path. For example, the following expression identifies HTTP requests for image files by extracting image file suffixes from the URL:

```
http.req.url.suffix.eq("jpeg") || http.req.url.suffix.eq("gif")
```

Most expressions for URLs operate on text and are described in Expression Prefixes for Text in HTTP Requests and Responses. This section discusses the GET operation. The GET operation extracts text when used with the following prefixes:

- HTTP.REQ.URL.PATH
- VPN.BASEURL.PATH
- VPN.CLIENTLESS_BASEURL.PATH

The following table describes prefixes for HTTP URLs.

<table>
<thead>
<tr>
<th>URL Prefix</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTTP.REQ.URL.PATH.GET(&lt;n&gt;)</td>
<td>Returns a slash- (“/”) separated list from the URL path. For example, consider the following URL: <code>http://www.mycompany.com/dir1/dir2/dir3/index.html?a=1</code>. The following expression returns <code>dir1</code> from this URL: <code>&lt;http.req.url.path.get(1)&gt;</code>. The following expression returns <code>dir2</code>: <code>http.req.url.path.get(2)</code></td>
</tr>
</tbody>
</table>
HTTP.REQ.URL.PATH.GET_REVERSE(<n>)  
Returns a slash- (“/”) separated list from the URL path, starting from the end of the path. For example, consider the following URL: http://www.mycompany.com/dir1/dir2/dir3/index.html?a=1. The following expression returns index.html from this URL: <http.req.url.path.get_reverse(0)>. The following expression returns dir3: http.req.url.path.get_reverse(1)

### Expressions for HTTP status codes and numeric HTTP payload data other than dates

December 10, 2018

The following table describes prefixes for numeric values in HTTP data other than dates.

<table>
<thead>
<tr>
<th>Prefix</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTTP.REQ.CONTENT_LENGTH</td>
<td>Returns the length of an HTTP request as a number. Following is an example:</td>
</tr>
<tr>
<td></td>
<td>http.req.content_length &lt; 500</td>
</tr>
<tr>
<td>HTTP.RES.CONTENT_LENGTH</td>
<td>Returns the length of the HTTP response as a number. Following is an example:</td>
</tr>
<tr>
<td></td>
<td>http.res.content_length &lt;= 1000</td>
</tr>
<tr>
<td>HTTP.RES.STATUS</td>
<td>Returns the response status code</td>
</tr>
<tr>
<td>HTTP.RES.IS_REDIRECT</td>

**SIP expressions**

December 10, 2018

The NetScaler Advanced policy expressions language contains a number of expressions that operate on Session Initiation Protocol (SIP) connections. These expressions are intended to be used in policies for any supported protocol that operates on a request/response basis. These expressions can be used in content switching, rate limiting, responder, and rewrite policies.

Certain limitations apply to SIP expressions used with responder policies. Only the DROP, NOOP or RESPONDWITH actions are allowed on a SIP load balancing virtual server. Responder policies can be bound to a load balancing virtual server, an override global bind point, a default global bind point, or a sip_udp policy label.

The header format used by the SIP protocol is similar to that used by the HTTP protocol, so many of the new expressions look and function much like their HTTP analogs. Each SIP header consists of a line that includes the SIP method, the URL, and the version, followed by a series of name-value pairs that look like HTTP headers.

Following is a sample SIP header that is referred to in the expressions tables beneath it:

```
1 INVITE sip:16@www.sip.com:5060;transport=udp SIP/2.0
2 Record-Route: <sip:200.200.100.22;lr=on>
3 Via: SIP/2.0/UDP 200.200.100.22;branch=z9hG4bK444b.c8e103d1.0;rport =5060;
   received=10.102.84.18
4 Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;
   received=10.102.84.160
5 From: "12" <sip:12@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185
6 To: "16" <sip:16@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185
7 Call-ID: 00127f54-ec850017-0e46f5b9-5ec149c2@10.102.84.180
8 Max-Forwards: 69
9 CSeq: 101 INVITE
10 User-Agent: Cisco-CP7940G/8.0
11 Content-Length: 277
12 Content-Type: application/sdp
13 Content-Disposition: session;handling=optional
```
**SIP reference tables**

The following tables contain lists of expressions that operate on SIP headers. The first table contains expressions that apply to request headers. Most response-based expressions are nearly the same as the corresponding request-based expressions. To create a response expression from the corresponding request expression, you change the first two sections of the expression from SIP.REQ to SIP.RES, and make other obvious adjustments. The second table contains those response expressions that are unique to responses and have no request equivalents. You can use any element in the following tables as a complete expression on its own, or you can use various operators to combine these expression elements with others to form more complex expressions.

**SIP request expressions**

<table>
<thead>
<tr>
<th>Expression</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SIP.REQ.METHOD</td>
<td>Operates on the method of the SIP request. The supported SIP request methods are ACK, BYE, CANCEL, INFO, INVITE, MESSAGE, NOTIFY, OPTIONS, PRACK, PUBLISH, REFER, REGISTER, SUBSCRIBE, and UPDATE. This expression is a derivative of the text class, so all operations that are applicable to text are applicable to this method. For example, for a SIP request of INVITE sip:16@10.102.84.181:5060;transport=udp SIP/2.0, this expression returns INVITE.</td>
</tr>
<tr>
<td>SIP.REQ.URL</td>
<td>Operates on the SIP request URL. This expression is a derivative of the text class, so all operations that are applicable to text are applicable to this method. For example, for a SIP request of INVITE sip:16@10.102.84.181:5060;transport=udp SIP/2.0, this expression returns sip:16@10.102.84.181:5060;transport=udp.</td>
</tr>
<tr>
<td>SIP.REQ.URL.PROTOCOL</td>
<td>Returns the URL protocol. For example, for a SIP URL of sip:<a href="mailto:16@www.sip.com">16@www.sip.com</a>:5060;transport=udp, this expression returns sip.</td>
</tr>
<tr>
<td>Expression</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SIP.REQ.URL.HOSTNAME</td>
<td>Returns the hostname portion of the SIP URL. For example, for a SIP URL ofsip:<a href="mailto:16@www.sip.com">16@www.sip.com</a>:5060;transport=udp, this expression returns <a href="http://www.sip.com:5060">www.sip.com:5060</a>.</td>
</tr>
<tr>
<td>SIP.REQ.URL.HOSTNAME.PORT</td>
<td>Returns the port portion of the SIP URL hostname. If no port is specified, this expression returns the default SIP port, 5060. For example, for a SIP hostname of <a href="http://www.sip.com:5060">www.sip.com:5060</a>, this expression returns 5060.</td>
</tr>
<tr>
<td>SIP.REQ.URL.HOSTNAME.DOMAIN</td>
<td>Returns the domain name portion of the SIP URL hostname. If the host is an IP address, then this expression returns an incorrect result. For example, for a SIP hostname of <a href="http://www.sip.com:5060">www.sip.com:5060</a>, this expression returns sip.com. For a SIP hostname of 192.168.43.15:5060, this expression returns an error.</td>
</tr>
<tr>
<td>SIP.REQ.URL.HOSTNAME.SERVER</td>
<td>Returns the server portion of the host. For example, for a SIP hostname of <a href="http://www.sip.com:5060">www.sip.com:5060</a>, this expression returns www.</td>
</tr>
<tr>
<td>SIP.REQ.URL.USERNAME</td>
<td>Returns the username that precedes the @ character. For example, for a SIP URL of sip:<a href="mailto:16@www.sip.com">16@www.sip.com</a>:5060;transport=udp, this expression returns 16.</td>
</tr>
<tr>
<td>SIP.REQ.VERSION</td>
<td>Returns the SIP version number in the request. For example, for a SIP request of INVITE sip:16@10.102.84.181:5060;transport=udp SIP/2.0, this expression returns SIP/2.0.</td>
</tr>
<tr>
<td>SIP.REQ.VERSION.MAJOR</td>
<td>Returns the major version number (the number to the left of the period). For example, for a SIP version number of SIP/2.0, this expression returns 2.</td>
</tr>
<tr>
<td>Expression</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SIP.REQ.VERSION.MINOR</td>
<td>Returns the minor version number (the number to the right of the period). For example, for a SIP version number of SIP/2.0, this expression returns 0.</td>
</tr>
<tr>
<td>SIP.REQ.CONTENT_LENGTH</td>
<td>Returns the contents of the Content-Length header. This expression is a derivative of the sip_header_t class, so all operations that are available for SIP headers can be used. For example, for a SIP Content-Length header of Content-Length: 277, this expression returns 277.</td>
</tr>
<tr>
<td>SIP.REQ.TO</td>
<td>Returns the contents of the To header. For example, for a SIP To header of To: “16” <a href="">sip:16@sip_example.com</a>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns “16” <a href="">sip:16@sip_example.com</a>;tag=00127f54ec85a6d90cc14f45-53cc0185.</td>
</tr>
<tr>
<td>SIP.REQ.TO.ADDRESS</td>
<td>Returns the SIP URI, which is found in the sip_url object. All operations that are available for SIP URIs can be used. For example, for a SIP To header of To: “16” <a href="">sip:16@sip_example.com</a>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns sip:<a href="mailto:16@sip_example.com">16@sip_example.com</a>.</td>
</tr>
<tr>
<td>SIP.REQ.TO.DISPLAY_NAME</td>
<td>Returns the display name portion of the To header. For example, for a SIP To header of To: “16” <a href="">sip:16@sip_example.com</a>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns 16.</td>
</tr>
<tr>
<td>SIP.REQ.TO.TAG</td>
<td>Returns the “tag” value from the “tag” name value pair in the TO header. For example, for a SIP To header of To: “16” <a href="">sip:16@sip_example.com</a>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns 00127f54ec85a6d90cc14f45-53cc0185.</td>
</tr>
<tr>
<td>Expression</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SIP.REQ.FROM</td>
<td>Returns the contents of the From header. For example, for a SIP From header of From: “12” <a href="">sip:12@sip_example.com</a>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns sip:<a href="mailto:12@sip_example.com">12@sip_example.com</a>.</td>
</tr>
<tr>
<td>SIP.REQ.FROM.ADDRESS</td>
<td>Returns the SIP URI, which is found in the sip_url object. All operations that are available for SIP URIs can be used. For example, for a SIP From header of From: “12” <a href="">sip:12@sip_example.com</a>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns sip:<a href="mailto:12@sip_example.com">12@sip_example.com</a>.</td>
</tr>
<tr>
<td>SIP.REQ.FROM.DISPLAY_NAME</td>
<td>Returns the display name portion of the To header. For example, for a SIP From header of From: “12” <a href="">sip:12@sip_example.com</a>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns 12.</td>
</tr>
<tr>
<td>SIP.REQ.FROM.TAG</td>
<td>Returns the “tag” value from the “tag” name/value pair in the TO header. For example, for a SIP From header of From: “12” <a href="">sip:12@sip_example.com</a>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns 00127f54ec85a6d90cc14f45-53cc0185.</td>
</tr>
<tr>
<td>SIP.REQ.VIA</td>
<td>Returns the complete Via header. If there are multiple Via headers in the request, returns the last Via header. For example, for the two Via headers in the sample SIP header, this expression returns Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;re</td>
</tr>
<tr>
<td>SIP.REQ.VIA.SENTBY_ADDRESS</td>
<td>Returns the address that sent the request. For example, for the Via header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;re this expression returns 10.102.84.180.</td>
</tr>
<tr>
<td>Expression</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SIP.REQ.VIA.SENTBY_PORT</td>
<td>Returns the port that sent the request. For example, for the Via header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;received=10.102.84.160, this expression returns 5060.</td>
</tr>
<tr>
<td>SIP.REQ.VIA.RPORT</td>
<td>Returns the value from the rport name/value pair. For example, for the Via header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;received=10.102.84.160, this expression returns 5060.</td>
</tr>
<tr>
<td>SIP.REQ.VIA.BRANCH</td>
<td>Returns the value from the branch name/value pair. For example, for the Via header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;received=10.102.84.160, this expression returns z9hG4bK03e76d0b.</td>
</tr>
<tr>
<td>SIP.REQ.VIA.RECEIVED</td>
<td>Returns the value from the received name/value pair. For example, for the Via header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;received=10.102.84.160, this expression returns 10.102.84.160.</td>
</tr>
<tr>
<td>SIP.REQ.CALLID</td>
<td>Returns the contents of the Callid header. This expression is a derivative of the sip_header_t class, so all operations that are available for SIP headers can be used. For example, for a SIP Callid header of Call-ID: 00127f54-ec850017-0e46f5b9-5ec149c2@10.102.84.180, this expression returns 00127f54-ec850017-0e46f5b9-5ec149c2@10.102.84.180.</td>
</tr>
<tr>
<td>SIP.REQ.CSEQ</td>
<td>Returns the CSEQ number from the CSEQ, as an integer. For example, for a SIP CSEQ header of CSeq: 101 INVITE, this expression returns 101.</td>
</tr>
<tr>
<td>SIP.REQ.HEADER(&lt;header_name&gt;)</td>
<td>Returns the specified SIP header. For example, to return the SIP From header, you would type SIP.REQ.HEADER(&quot;From&quot;).</td>
</tr>
<tr>
<td>Expression</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SIP.REQ.HEADER(&lt;header_name&gt;).INSTANCE()</td>
<td>Returns the specified instance of the specified SIP header. Multiple instances of the same SIP header can occur. Where you want a specific instance of such a SIP header (for example, a specific Via header), you can specify that header by typing a number as the . Header instances are matched from last (0) to first. In other words, SIP.REQ.HEADER(&quot;Via&quot;).INSTANCE(0) returns the last instance of the Via header, while SIP.REQ.HEADER(&quot;Via&quot;).INSTANCE(1) returns the last instance but one of the Via header, and so on. For example, if used on the example SIP header, SIP.REQ.HEADER(&quot;Via&quot;).INSTANCE(1) returns Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060.</td>
</tr>
<tr>
<td>SIP.REQ.HEADER(&lt;header_name&gt;).VALUE()</td>
<td>Returns the contents of the specified instance of the specified SIP header. The usage is nearly the same as the previous expression. For example, if used on the SIP header example in the preceding table entry, SIP.REQ.HEADER(&quot;Via&quot;).VALUE(1) returns SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060.</td>
</tr>
<tr>
<td>SIP.REQ.HEADER(&lt;header_name&gt;).COUNT</td>
<td>Returns the number of instances of a particular header as an integer. For example, if used on the SIP header example above, SIP.REQ.HEADER(&quot;Via&quot;).COUNT returns 2.</td>
</tr>
</tbody>
</table>
### Expression Description

<table>
<thead>
<tr>
<th>Expression</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SIP.REQ.HEADER(&lt;header_name&gt;).EXISTS</td>
<td>Returns a boolean value of true or false, depending upon whether the specified header exists or not. For example, if used on the SIP header example above, SIP.REQ.HEADER(&quot;Expires&quot;).EXISTS returns true, while SIP.REQ.HEADER(&quot;Caller-ID&quot;).EXISTS returns false.</td>
</tr>
<tr>
<td>SIP.REQ.HEADER(&lt;header_name&gt;).LIST</td>
<td>Returns the comma-separated parameter list in the specified header. For example, if used on the SIP header example above, SIP.REQ.HEADER(&quot;Allow&quot;).LIST returns ACK,BYE,CANCEL,INVITE,NOTIFY,OPTIONS,REFER,REGISTER,UPDATE. You can append the string .GET() to select a specific list item. For example, to get the first item (ACK) from the above list, you would type SIP.REQ.HEADER(&quot;Allow&quot;).LIST.GET(0). To extract the second item (BYE), you would type SIP.REQ.HEADER(&quot;Allow&quot;).LIST.GET(1). Note: If the specified header contains a list of name/value pairs, the entire name/value pair is returned.</td>
</tr>
<tr>
<td>SIP.REQ.HEADER(&lt;header_name&gt;).TYPECAST_SIP_HEADER_T</td>
<td>Typecasts to . Any text can be typecasted to the sip_header_t class, after which all header-based operations can be used. After you perform this operation, you can apply all operations that can be used with . For example, the expression SIP.REQ.CONTENT_LENGTH.TYPECAST_SIP_HEADER_T typecasts all instances of the Content-Length header. After you perform this operation, you can apply all header operations to all instances of the specified header.</td>
</tr>
<tr>
<td>Expression</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------</td>
</tr>
<tr>
<td>SIP.REQ.HEADER(&lt;header_name&gt;).CONTAINS(&lt;string&gt;)</td>
<td>Returns boolean true if the specified text string is present in any instance of the specified header. Operates on all the instances of the specified header. Header instances are matched from last (0) to first.</td>
</tr>
<tr>
<td>SIP.REQ.HEADER(&lt;header_name&gt;).EQUALS_ANY(&lt;patset&gt;)</td>
<td>Returns boolean true if any pattern associated with &lt;patset&gt; matches any content in any instance of the specified header. Operates on all the instances of the specified header. Header instances are matched from last (0) to first.</td>
</tr>
<tr>
<td>SIP.REQ.HEADER(&lt;header_name&gt;).CONTAINS_ANY(&lt;patset&gt;)</td>
<td>Returns boolean true if any pattern associated with &lt;patset&gt; matches any content in any instance of the specified header. Operates on all the instances of the specified header. Header instances are matched from last (0) to first.</td>
</tr>
<tr>
<td>SIP.REQ.HEADER(&lt;header_name&gt;).CONTAINS_INDEX(&lt;patset&gt;)</td>
<td>Returns the index of the matching pattern associated with &lt;patset&gt; if that pattern matches any content in any instance of the specified header. Operates on all the instances of the specified header. Header instances are matched from last (0) to first.</td>
</tr>
<tr>
<td>SIP.REQ.HEADER(&lt;header_name&gt;).EQUALS_INDEX(&lt;patset&gt;)</td>
<td>Returns the index of the matching pattern associated with &lt;patset&gt; if that pattern matches any instance of the specified header. Operates on all the instances of the specified header. Header instances are matched from last (0) to first.</td>
</tr>
<tr>
<td>Expression</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------</td>
</tr>
<tr>
<td>SIP.REQ.HEADER(&lt;header_name&gt;).SUBSTR(&lt;string&gt;)</td>
<td>If the specified string is present in any instance of the specified header, this expression returns that string. For example, for the SIP header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;returns “rport=5060”. SIP.REQ.HEADER(“Via”).SUBSTR(“rport=5060”) returns “rport=5060”. SIP.REQ.HEADER(“Via”).SUBSTR(“rport=5061”) returns an empty string.</td>
</tr>
<tr>
<td>SIP.REQ.HEADER(&lt;header_name&gt;).AFTER_STR(&lt;string&gt;)</td>
<td>Specified string is present in any instance of the specified header, this expression returns the string immediately after that string. For example, for the SIP header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;return 5060. SIP.REQ.HEADER(“Via”).AFTER_STR(“rport=”). Returns 5060.</td>
</tr>
</tbody>
</table>
### Expression Description

<table>
<thead>
<tr>
<th>Expression</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SIP.REQ.HEADER(&lt;header_name&gt;).REGEX_MATCH(...)</td>
<td>Returns boolean true if the specified regular expression (regex) matches any instance of the specified header. You must specify the regular expression in the following format: <code>re&lt;delimiter&gt;regular expression&lt;same delimiter&gt;</code>. The regular expression cannot be larger than 1499 characters in length. It must conform to the PCRE regular expression library. See <a href="http://www.pcre.org/pcre.txt">http://www.pcre.org/pcre.txt</a> for documentation on PCRE regular expression syntax. The pcrepattern man page also has useful information on specifying patterns by using PCRE regular expressions. The regular expression syntax supported in this expression has some differences from PCRE. Back references are not allowed. You should avoid recursive regular expressions; although some work, many do not. The dot (.) metacharacter matches newlines. Unicode is not supported. <code>SET_TEXT_MODE(IGNORECASE)</code> overrules the (?i) internal option specified in the regular expression.</td>
</tr>
<tr>
<td>SIP.REQ.HEADER(&lt;header_name&gt;).REGEX_SELECT(...)</td>
<td>If the specified regex matches any text in any instance of the specified header, this expression returns the text. For example, for the SIP header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;received=10.102.84.160, the expression SIP.REQ.HEADER(“Via”).REGEX_SELECT(“received=[0-9]{1,3}.<em>[0-9]{1,3}.</em>[0-9]{1,3}.*[0-9]{1,3}”) returns received=10.102.84.160.</td>
</tr>
<tr>
<td>Expression</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SIP.REQ.HEADER(&lt;header_name&gt;).AFTER_REGEX(...)</td>
<td>If the specified regex matches any text in any instance of the specified header, this expression returns the string immediately after that text. For example, for the SIP header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;received=10.102.84.160, the expression SIP.REQ.HEADER(“Via”).AFTER_REGEX(“received=”).returns=10.102.84.160.</td>
</tr>
<tr>
<td>SIP.REQ.HEADER(&lt;header_name&gt;).BEFORE_REGEX(...)</td>
<td>If the specified regex matches any text in any instance of the specified header, this expression returns the string immediately before that text. For example, for the SIP header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;received=10.102.84.160, the expression SIP.REQ.HEADER(“Via”).BEFORE_REGEX(“[0-9]{1,3}.[0-9]{1,3}.”).returns=received=.</td>
</tr>
<tr>
<td>SIP.REQ.FULL_HEADER</td>
<td>Returns the entire SIP header, including the terminating CR/LF.</td>
</tr>
<tr>
<td>SIP.REQ.IS_VALID</td>
<td>Returns boolean true if the request format is valid.</td>
</tr>
<tr>
<td>SIP.REQ.BODY(&lt;length&gt;)</td>
<td>Returns the request body, up to the specified length. If the specified length is greater than the length of the request body, this expression returns the entire request body.</td>
</tr>
<tr>
<td>SIP.REQ.LB_VSERVER</td>
<td>Returns the name of the load balancing virtual server (LB vserver) that is serving the current request.</td>
</tr>
<tr>
<td>SIP.REQ.CS_VSERVER</td>
<td>Returns the name of the content switching virtual server (CS vserver) that is serving the current request.</td>
</tr>
</tbody>
</table>

**SIP response expressions**
### Expression Description

<table>
<thead>
<tr>
<th>Expression</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SIP.RES.STATUS</td>
<td>Returns the SIP response status code. For example, if the first line of the response is SIP/2.0 100 Trying, this expression returns 100.</td>
</tr>
<tr>
<td>SIP.RES.STATUS_MSG</td>
<td>Returns the SIP response status message. For example, if the first line of the response is SIP/2.0 100 Trying, this expression returns Trying.</td>
</tr>
<tr>
<td>SIP.RES.IS_REDIRECT</td>
<td>Returns boolean true if the response code is a redirect.</td>
</tr>
<tr>
<td>SIP.RES.METHOD</td>
<td>Returns the response method extracted from the request method string in the CSeq header.</td>
</tr>
</tbody>
</table>

### Operations for HTTP, HTML, and XML encoding and “safe” characters

December 10, 2018

The following operations work with the encoding of HTML data in a request or response and XML data in a POST body.

- **<text>.HTML_XML_SAFE:**
  - Transforms special characters into XML safe format, as in the following examples:
    - A left-pointing angle bracket (<) is converted to `<`
    - A right-pointing angle bracket (>) is converted to `>`
    - An ampersand (&) is converted to `&`
  - This operation safeguards against cross-site scripting attacks. Maximum length of the transformed text is 2048 bytes. This is a read-only operation.

    After applying the transformation, additional operators that you specify in the expression are applied to the selected text. Following is an example:

    `http.req.url.query.html_xml_safe. contains("myQueryString")`

- **<text>.HTTP_HEADER_SAFE:**
  - Converts all new line (`\n`) characters in the input text to `\%0A` to enable the input to be used safely in HTTP headers.

    This operation safeguards against response-splitting attacks.

    The maximum length of the transformed text is 2048 bytes. This is a read-only operation.
• `<text>.HTTP_URL_SAFE`:
  Converts unsafe URL characters to ‘%xx’ values, where “xx” is a hex-based representation of the input character. For example, the ampersand (&) is represented as %26 in URL-safe encoding. The maximum length of the transformed text is 2048 bytes. This is a read-only operation.

  Following are URL safe characters. All others are unsafe:
  
  - Alpha-numeric characters: a-z, A-Z, 0-9
  - Asterix: “*”
  - Ampersand: “&”
  - At-sign: “@”
  - Colon: “:”
  - Comma: “,”
  - Dollar: “$”
  - Dot: “.”
  - Equals: “=”
  - Exclamation mark: “!”
  - Hyphen: “-“
  - Open and close parentheses: “(, )”
  - Percent: “%”
  - Plus: “+”
  - Semicolon: “;”
  - Single quote: “’”
  - Slash: “/”
  - Question mark: “?”
  - Tilde: “~”
  - Underscore: “_”

• `<text>.MARK_SAFE`:
  Marks the text as safe without applying any type of data transformation.

• **<text>.SET_TEXT_MODE(URL_ENCODED|NO_URL_ENCODED)**
  Transforms all %HH encoding in the byte stream. This operation works with characters (not bytes). By default, a single byte represents a character in ASCII encoding. However, if you specify URL_ENCODED mode, three bytes can represent a character.

  In the following example, a PREFIX(3) operation selects the first 3 characters in a target.

  http.req.url.hostname.prefix(3)

  In the following example, the NetScaler can select up to 9 bytes from the target:

  http.req.url.hostname.set_text_mode(urlencoded).prefix(3)

• `<text>.SET_TEXT_MODE(PLUS_AS_SPACE|NO_PLUS_AS_SPACE)`:
  Specifies how to treat the plus character (+). The PLUS_AS_SPACE option replaces a plus
character with white space. For example, the text “hello+world” becomes “hello world.” The NO_PLUS_AS_SPACE option leaves plus characters as they are.

- `<text>.SET_TEXT_MODE(BACKSLASH_ENCODED|NO_BACKSLASH_ENCODED)`: Specifies whether or not backslash decoding is performed on the text object represented by `<text>`.

  If BACKSLASH_ENCODED is specified, the SET_TEXT_MODE operator performs the following operations on the text object:

  - All occurrences of “\XXX” will be replaced with the character “Y” (where XXX represents a number in the octal system and Y represents the ASCII equivalent of XXX). The valid range of octal values for this type of encoding is 0 to 377. For example, the encoded text “http\72//” and http\072//” will both be decoded to http://, where the colon (:) is the ASCII equivalent of the octal value “72”.
  - All occurrences of “\xHH” will be replaced with the character “Y” (HH represents a number in the hexadecimal system and Y denotes the ASCII equivalent of HH. For example, the encoded text “http\x3a//” will be decoded to http://, where the colon (:) is the ASCII equivalent of the hexadecimal value “3a”.
  - All occurrences of “\uWWXX” will be replaced with the character sequence “YZ” (Where WW and XX represent two distinct hexadecimal values and Y and Z represent their ASCII equivalents of WW and XX respectively. For example, the encoded text “http%u3a2f/” and “http%u003a//” will both be decoded to http://, where “3a” and “2f” are two hexadecimal values and the colon (:) and forward slash (“/”) represent their ASCII equivalents respectively.
  - All occurrences of “b”, “n”, “t”, “f”, and “r” are replaced with the corresponding ASCII characters.

  If NO_BACKSLASH_ENCODED is specified, backslash decoding is not performed on the text object.

- `<text>.SET_TEXT_MODE(BAD_ENCODE_RAISE_UNDEF|NO_BAD_ENCODE_RAISE_UNDEF)`: Performs the associated undefined action if either the URL_ENCODED or the BACKSLASH_ENCODED mode is set and bad encoding corresponding to the specified encoding mode is encountered in the text object represented by `<text>`.

  If NO_BAD_ENCODE_RAISE_UNDEF is specified, the associated undefined action will not be performed when bad encoding is encountered in the text object represented by `<text>`.

---

**Expressions for TCP, UDP, and VLAN data**

December 13, 2018
TCP and UDP data take the form of a string or a number. For expression prefixes that return string values for TCP and UDP data, you can apply any text-based operations. For more information, see Advanced policy expressions: Evaluating text.

For expression prefixes that return numeric value, such as a source port, you can apply an arithmetic operation. For more information, see Basic operations on expression prefixes and Compound operations for numbers.

The following table describes prefixes that extract TCP and UDP data.

<table>
<thead>
<tr>
<th>GET Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLIENT.TCP.PAYLOAD(&lt;integer&gt;)</td>
<td>Returns TCP payload data as a string, starting with the first character in the payload and continuing for the number of characters in the &lt;integer&gt; argument. You can apply any text-based operation to this prefix.</td>
</tr>
<tr>
<td>CLIENT.TCP.SRCPORT</td>
<td>Returns the ID of the current packet’s source port as a number.</td>
</tr>
<tr>
<td>CLIENT.TCP.DSTPORT</td>
<td>Returns the ID of the current packet’s destination port as a number.</td>
</tr>
<tr>
<td>CLIENT.TCP.OPTIONS</td>
<td>Returns the TCP options set by the client. Examples of TCP options are Maximum Segment Size (MSS), Window Scale, Selective Acknowledgements (SACK), and Time Stamp Option. The COUNT, TYPE(&lt;type&gt;), and TYPE_NAME(&lt;m&gt;) operators can be used with this prefix. For the TCP options set by the server, see the SERVER.TCP.OPTIONS prefix.</td>
</tr>
<tr>
<td>CLIENT.TCP.OPTIONS.COUNT</td>
<td>Returns the number of TCP options that the client has set.</td>
</tr>
<tr>
<td>CLIENT.TCP.OPTIONS.TYPE(&lt;type&gt;)</td>
<td>Returns the value of the TCP option whose type (or option kind) is specified as the argument. The value is returned as a string of bytes in big endian format (or network byte order). Parameters: type - Type value</td>
</tr>
<tr>
<td>GET Operation</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>CLIENT.TCP.OPTIONS.TYPE_NAME(&lt;m&gt;)</td>
<td>Returns the value of the TCP option whose enumeration constant is specified as the argument. The enumeration constants that you can pass as the argument are REPEATER, TIMESTAMP, SACK_PERMITTED, WINDOW, and MAXSEG. To specify the TCP option kind instead of these enumeration constants, use CLIENT.TCP.OPTIONS.TYPE(&lt;type&gt;). For other TCP options, you must use CLIENT.TCP.OPTIONS.TYPE(&lt;type&gt;). Parameters: m - TCP option enumeration constant</td>
</tr>
<tr>
<td>CLIENT.TCP.REPEATER_OPTION.EXISTS</td>
<td>Returns a Boolean TRUE if Repeater TCP options exist.</td>
</tr>
<tr>
<td>CLIENT.TCP.REPEATER_OPTION.IP</td>
<td>Returns the branch repeater's IPv4 address from the Repeater TCP options.</td>
</tr>
<tr>
<td>CLIENT.TCP.REPEATER_OPTION.MAC</td>
<td>Returns the branch repeater's MAC address from the Repeater TCP options.</td>
</tr>
<tr>
<td>CLIENT.UDP.DNS.DOMAIN</td>
<td>Returns the DNS domain name.</td>
</tr>
<tr>
<td>CLIENT.UDP.DNS.DOMAIN.EQ(&quot;&lt;hostname&gt;&quot;)</td>
<td>Returns a Boolean TRUE if the domain name matches the &lt;hostname&gt; argument. The comparison is case insensitive. Following is an example: client.udp.dns.domain.eq(&quot;www.mycompany.com&quot;)</td>
</tr>
<tr>
<td>CLIENT.UDP.DNS.IS_AAAAREC</td>
<td>Returns a Boolean TRUE if the record type is AAAA. These types of records indicate an IPv6 address in forward lookups.</td>
</tr>
<tr>
<td>CLIENT.UDP.DNS.IS_ANYREC</td>
<td>Returns a Boolean TRUE if it is of any record type.</td>
</tr>
<tr>
<td>CLIENT.UDP.DNS.IS_AREC</td>
<td>Returns a Boolean TRUE if the record is type A. Type A records provide the host address.</td>
</tr>
<tr>
<td>GET Operation</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------</td>
</tr>
<tr>
<td>CLIENT.UDP.DNS.IS_CNAME</td>
<td>Returns a Boolean TRUE if the record is of type CNAME. In systems that use multiple names to identify a resource, there is one canonical name and a number of aliases. The CNAME provides the canonical name.</td>
</tr>
<tr>
<td>CLIENT.UDP.DNS.IS_MX</td>
<td>Returns a Boolean TRUE if the record is of type MX (mail exchanger). This DNS record describes a priority and a host name. The MX records for the same domain name specify the email servers in the domain and the priority for each server.</td>
</tr>
<tr>
<td>CLIENT.UDP.DNS.IS_NS</td>
<td>Returns a Boolean TRUE if the record is of type NS. This is a name server record that includes a host name with an associated A record. This enables locating the domain name that is associated with the NS record.</td>
</tr>
<tr>
<td>CLIENT.UDP.DNS.IS_PTR</td>
<td>Returns a Boolean TRUE if the record is of type PTR. This is a domain name pointer and is often used to associate a domain name with an IPv4 address.</td>
</tr>
<tr>
<td>CLIENT.UDP.DNS.IS_SOA</td>
<td>Returns a Boolean TRUE if the record is of type SOA. This is a start of authority record.</td>
</tr>
<tr>
<td>CLIENT.UDP.DNS.IS_SRV</td>
<td>Returns a Boolean TRUE if the record is of type SRV. This is a more general version of the MX record.</td>
</tr>
<tr>
<td>CLIENT.UDP.DSTPORT</td>
<td>Returns the numeric ID of the current packet’s UDP destination port.</td>
</tr>
<tr>
<td>CLIENT.UDP.SRCPORT</td>
<td>Returns the numeric ID of the current packet’s UDP source port.</td>
</tr>
<tr>
<td>CLIENT.UDP.RADIUS</td>
<td>Returns RADIUS data for the current packet.</td>
</tr>
<tr>
<td>CLIENT.UDP.RADIUS.ATTR_TYPE(&lt;type&gt;)</td>
<td>Returns the value for the attribute type specified as the argument.</td>
</tr>
<tr>
<td>CLIENT.UDP.RADIUS.USERNAME</td>
<td>Returns the RADIUS user name.</td>
</tr>
<tr>
<td>CLIENT.TCP.MSS</td>
<td>Returns the maximum segment size (MSS) for the current connection as a number.</td>
</tr>
<tr>
<td>GET Operation</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>CLIENT.VLAN.ID</td>
<td>Returns the numeric ID of the VLAN through which the current packet entered the NetScaler.</td>
</tr>
<tr>
<td>SERVER.TCP.DSTPORT</td>
<td>Returns the numeric ID of the current packet’s destination port.</td>
</tr>
<tr>
<td>SERVER.TCP.SRCPORT</td>
<td>Returns the numeric ID of the current packet’s source port.</td>
</tr>
<tr>
<td>SERVER.TCP.OPTIONS</td>
<td>Returns the TCP options set by the server. Examples of TCP options are Maximum Segment Size (MSS), Window Scale, Selective Acknowledgements (SACK), and Time Stamp Option. The COUNT, TYPE(&lt;type&gt;), and TYPE_NAME(&lt;m&gt;) operators can be used with this prefix. For the TCP options set by the client, see the CLIENT.TCP.OPTIONS prefix.</td>
</tr>
<tr>
<td>SERVER.TCP.OPTIONS.COUNT</td>
<td>Returns the number of TCP options that the server has set.</td>
</tr>
<tr>
<td>SERVER.TCP.OPTIONS.TYPE(&lt;type&gt;)</td>
<td>Returns the value of the TCP option whose type (or option kind) is specified as the argument. The value is returned as a string of bytes in big endian format (or network byte order). Parameters: type - Type value</td>
</tr>
<tr>
<td>SERVER.TCP.OPTIONS.TYPE_NAME(&lt;m&gt;)</td>
<td>Returns the value of the TCP option whose enumeration constant is specified as the argument. The enumeration constants that you can pass as the argument are REPEATER, TIMESTAMP, SACK_PERMITTED, WINDOW, and MAXSEG. To specify the TCP option kind instead of these enumeration constants, use CLIENT.TCP.OPTIONS.TYPE(&lt;type&gt;). For other TCP options, you must use CLIENT.TCP.OPTIONS.TYPE(&lt;type&gt;). Parameters: m - TCP option enumeration constant</td>
</tr>
<tr>
<td>SERVER.VLAN</td>
<td>Operates on the VLAN through which the current packet entered the NetScaler.</td>
</tr>
</tbody>
</table>
Expressions for evaluating a DNS message and identifying its carrier protocol

December 10, 2018

You can evaluate DNS requests and responses by using expressions that begin with DNS.REQ and DNS.RES, respectively. You can also identify the transport layer protocol that is being used to send the DNS messages.

The following functions return the contents of a DNS query.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DNS.REQ.QUESTION.DOMAIN</td>
<td>Return the domain name (the value of the QNAME field) in the question section of the DNS query. The domain name is returned as a text string, which can be passed to EQ(), NE(), and any other functions that work with text.</td>
</tr>
<tr>
<td>DNS.REQ.QUESTION.TYPE</td>
<td>Return the query type (the value of the QTYPE field) in the DNS query. The field indicates the type of resource record (for example, A, AAAA, NS, SRV, PTR, CNAME, SOA, MX, and ANY) for which the name server is being queried. The returned value can be compared to one of the following values by using the EQ() and NE() functions: A, AAAA, NS, SRV, PTR, CNAME, SOA, MX, and ANY. Note: You can use only the EQ() and NE() functions with the TYPE function. Example: DNS.REQ.QUESTION.TYPE.EQ(MX)</td>
</tr>
<tr>
<td>Function</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DNS.RES.HEADER.RCODE</td>
<td>Return the response code (the value of the RCODE field) in the header section of the DNS response. You can use only the EQ() and NE() functions with the RCODE function. Following are the possible values: NOERROR, FORMERR, SERVFAIL, NXDOMAIN, NOTIMP, and REFUSED.</td>
</tr>
<tr>
<td>DNS.RES.QUESTION.DOMAIN</td>
<td>Return the domain name (the value of the QNAME field) in the question section of the DNS response. The domain name is returned as a text string, which can be passed to EQ(), NE(), and any other functions that work with text.</td>
</tr>
<tr>
<td>DNS.RES.QUESTION.TYPE</td>
<td>Return the query type (the value of the QTYPE field) in the question section of the DNS response. The field indicates the type of resource record (for example, A, NS, or CNAME) that is contained in the response. The returned value can be compared to one of the following values by using the EQ() and NE() functions: A, AAAA, NS, SRV, PTR, CNAME, SOA, MX, and ANY. You can use only the EQ() and NE() functions with the TYPE function. Example: DNS.RES.QUESTION.TYPE.EQ(SOA)</td>
</tr>
</tbody>
</table>

The following functions return the transport layer protocol name.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DNS.REQ.TRANSPORT</td>
<td>Return the name of the transport layer protocol that was used to send the DNS query. Possible values returned are TCP and UDP. You can use only the EQ() and NE() functions with the TRANSPORT function. Example: DNS.REQ.TRANSPORT.EQ(TCP)</td>
</tr>
</tbody>
</table>
**Function Description**

**DNS.RES.TRANSPORT**

Return the name of the transport layer protocol that was used for the DNS response. Possible values returned are TCP and UDP. You can use only the EQ() and NE() functions with the TRANSPORT function. Example: DNS.RES.TRANSPORT.EQ(TCP)

---

**XPath and HTML, XML, or JSON expressions**

December 10, 2018

The Advanced policy infrastructure supports expressions for evaluating and retrieving data from HTML, XML, and JavaScript Object Notation (JSON) files. This enables you to find specific nodes in an HTML, XML, or JSON document, determine if a node exists in the file, locate nodes in XML contexts (for example, nodes that have specific parents or a specific attribute with a given value), and return the contents of such nodes. Additionally, you can use XPath expressions in rewrite expressions.

The Advanced policy expression implementation for XPath comprises an Advanced policy expression prefix (such as “HTTP.REQ.BODY”) that designates HTML or XML text, and the XPATH operator that takes the XPath expression as its argument.

HTML files are a largely free-form collection of tags and text elements. You can use the `XPATH_HTML` operator, which takes an XPath expression as its argument, to process HTML files. JSON files are either a collection of name/value pairs or an ordered list of values. You can use the `XPATH_JSON` operator, which takes an XPath expression as its argument, to process JSON files.

- **<text> .XPATH(xpathex):**
  Operate on an XML file and return a Boolean value.
  
  For example, the following expression returns a Boolean TRUE if a node called “creator” exists under the node “Book” within the first 1000 bytes of the XML file.
  
  ```
  HTTP.REQ.BODY(1000).XPATH(xpathboolean(/Book/creator))
  ```
  
  **Parameters:**
  
  xpathex - XPath Boolean expression

- **<text> .XPATH(xpathex):**
  Operate on an XML file and return a value of data type “double.”
  
  For example, the following expression converts the string “36” (a price value) to a value of data type “double” if the string is in the first 1000 bytes of the XML file:
**HTTP.REQ.BODY(1000).XPATH(xp%number(/Book/price)%)**

Parameters:

- xpathex - XPath numeric expression

- `<text>.XPATH(xpathex)`: Operate on an XML file and return a node-set or a string. Node-sets are converted to corresponding strings by using the standard XPath string conversion routine.

  For example, the following expression selects all the nodes that are enclosed by "/Book/creator" (a node-set) in the first 1000 bytes of the body:

  **HTTP.REQ.BODY(1000).XPATH(xp%/Book/creator%)**

Parameters:

- xpathex - XPath expression

- `<text>.XPATH_HTML(xpathex)`: Operate on an HTML file and return a text value.

  For example, the following expression operates on an HTML file and returns the text enclosed in `<title></title>` tags if the title HTML element is found in the first 1000 bytes:

  **HTTP.REQ.BODY(1000).XPATH_HTML(xp%/html/head/title%)**

Parameters:

- xpathex - XPath text expression

- `<text>.XPATH_HTML_WITH_MARKUP(xpathex)`: Operate on an HTML file and return a string that contains the entire selected portion of the document, including markup such as including the enclosing element tags.

  The following expression operates on the HTML file and selects all content within the `<title>` tag, including markup.

  **HTTP.REQ.BODY(1000).XPATH_HTML_WITH_MARKUP(xp%/html/head/title%)**

Parameters:

- xpathex - XPath expression

- `<text>.XPATH_JSON(xpathex)`: Operate on a JSON file and return a Boolean value.

  For example, consider the following JSON file:

  ```json
  { "Book": { "creator": { "person": { "name": '<name>' }, "title": '<title>' } } }
  ```
The following expression operates on the JSON file and returns a Boolean TRUE if the JSON file contains a node named “creator,” whose parent node is “Book,” in the first 1000 bytes:

```
HTTP.REQ.BODY(1000).XPATH_JSON(boolean(/Book/creator))
```

Parameters:

- `xpathex` - XPath Boolean expression

- `<text>.XPATH_JSON(xpathex)`
  - Operate on a JSON file and return a value of data type “double.”

For example, consider the following JSON file:

```
{ “Book”:{ “creator”:{ “person”:{ “name”:’<name>' } }, “title”:’<title>’, “price”:”36” }}
```

The following expression operates on the JSON file and converts the string “36” to a value of data type “double” if the string is present in the first 1000 bytes of the JSON file.

```
HTTP.REQ.BODY(1000).XPATH_JSON(number(/Book/price))
```

Parameters:

- `xpathex` - XPath numeric expression

- `<text>.XPATH_JSON(xpathex)`
  - Operate on a JSON file and return a node-set or a string. Node-sets are converted to corresponding strings by using the standard XPath string conversion routine.

For example, consider the following JSON file:

```
{ “Book”:{ “creator”:{ “person”:{ “name”:’<name>' } }, “title”:’<title>’ } }
```

The following expression selects all the nodes that are enclosed by “/Book” (a node-set) in the first 1000 bytes of the body of the JSON file and returns the corresponding string value, which is “<name><title>”:

```
HTTP.REQ.BODY(1000).XPATH_JSON(xp/Book)
```

Parameters:

- `xpathex` - XPath expression

- `<text>.XPATH_JSON_WITH_MARKUP(xpathex)`
  - Operate on an XML file and return a string that contains the entire portion of the document for the result node, including markup such as including the enclosing element tags.

For example, consider the following JSON file:

```
{“Book”:{“creator”:{“person”:{“name”:’<name>’} }, “title”:’<title>’ }}
```

The following expression operates on the JSON file and selects all the nodes that are enclosed by “/Book/creator” in the first 1000 bytes of the body, which is “creator:{ person:{ name:'<name>' } }.”
HTTP.REQ.BODY(1000).XPATH_JSON_WITH_MARKUP(xp%/Book/creator%)

The portion of the JSON body that is selected by the expression is marked for further processing.

Parameters:
xpathex - XPath expression

• <text>.XPATH_WITH_MARKUP(xpathex):
Operate on an XML file and return a string that contains the entire portion of the document for the result node, including markup such as including the enclosing element tags.

For example, the following expression operates on an XML file and selects all the nodes enclosed by “/Book/creator” in the first 1000 bytes of the body.

HTTP.REQ.BODY(1000).XPATH_WITH_MARKUP(xp%/Book/creator%)

The portion of the JSON body that is selected by the expression is marked for further processing.

Parameters:
xpathex - XPath expression

Encrypt and decrypt XML payloads

December 13, 2018

You can use the XML_ENCRYPT() and XML_DECRYPT() functions in Advanced policy expressions to encrypt and decrypt, respectively, XML data. These functions conform to the W3C XML Encryption standard defined at “http://www.w3.org/TR/2001/PR-xmldsig-core-20010820/.” XML_ENCRYPT() and XML_DECRYPT() support a subset of the XML Encryption specification. In the subset, data encryption uses a bulk cipher method (RC4, DES3, AES128, AES192, or AES256), and an RSA public key is used to encrypt the bulk cipher key.

Note: If you want to encrypt and decrypt text in a payload, you must use the ENCRYPT and DECRYPT functions. For more information about these functions, see Encrypt and decrypt text.

The XML_ENCRYPT() and XML_DECRYPT() functions are not dependent on the encryption/decryption service that is used by the ENCRYPT and DECRYPT commands for text. The cipher method is specified explicitly as an argument to the XML_ENCRYPT() function. The XML_DECRYPT() function obtains the information about the specified cipher method from the
<xenc:EncryptedData> element. Following are synopses of the XML encryption and decryption functions:

- **XML_ENCRYPT(certKeyName, method [, flags])**: Returns an <xenc:EncryptedData> element that contains the encrypted input text and the encryption key, which is itself encrypted by using RSA.

- **XML_DECRYPT(certKeyName)**: Returns the decrypted text from the input <xenc:EncryptedData> element, which includes the cipher method and the RSA-encrypted key.

**Note:** The <xenc:EncryptedData> element is defined in the W3C XML Encryption specification.

Following are descriptions of the arguments:

- **certKeyName**: Selects an X.509 certificate with an RSA public key for XML_ENCRYPT() or an RSA private key for XML_DECRYPT(). The certificate key must have been previously created by an add ssl certKey command.

- **method**: Specifies which cipher method to use for encrypting the XML data. Possible values: RC4, DES3, AES128, AES192, AES256.

- **flags**: A bitmask specifying the following optional key information (<ds:KeyInfo>) to be included in the <xenc:EncryptedData> element that is generated by XML_ENCRYPT():
  - 1 - Include a KeyName element with the certKeyName. The element is <ds:KeyName>.
  - 2 - Include a KeyValue element with the RSA public key from the certificate. The element is <ds:KeyValue>.
  - 4 - Include an X509IssuerSerial element with the certificate serial number and issuer DN. The element is <ds:X509IssuerSerial>.
  - 8 - Include an X509SubjectName element with the certificate subject DN. The element is <ds:X509SubjectName>.
  - 16 - Include an X509Certificate element with the entire certificate. The element is <ds:X509Certificate>.

**Use the XML_ENCRYPT() and XML_DECRYPT() functions in expressions**

The XML encryption feature uses SSL certificate-key pairs to provide X.509 certificates (with RSA public keys) for key encryption and RSA private keys for key decryption. Therefore, before you use the XML_ENCRYPT() function in an expression, you must create an SSL certificate-key pair. The following command creates an SSL certificate-key pair, my-certkey, with the X.509 certificate, my-cert.pem, and the private key file, my-key.pem.
add ssl certKey my-certkey -cert my-cert.pem -key my-key.pem -passcrypt kxPeMRnYitY=

The following CLI commands create rewrite actions and policies for encrypting and decrypting XML content.

```
1 add rewrite action my-xml-encrypt-action replace "HTTP.RES.BODY(10000).XPATH_WITH_MARKUP(xp%/%)" "HTTP.RES.BODY(10000).XPATH_WITH_MARKUP(xp%/%).XML_encrypt("my-certkey", AES256, 31)" -bypassSafetyCheck YES
2 add rewrite action my-xml-decrypt-action replace "HTTP.REQ.BODY(10000).XPATH_WITH_MARKUP(xp//xenc:EncryptedData%)" "HTTP.REQ.BODY(10000).XPATH_WITH_MARKUP(xp//xenc:EncryptedData%).XML_decrypt("my-certkey")" -bypassSafetyCheck YES
3 add rewrite policy my-xml-encrypt-policy "HTTP.REQ.URL.CONTAINS("xml-encrypt")" my-xml-encrypt-action
4 add rewrite policy my-xml-decrypt-policy "HTTP.REQ.BODY(10000).XPATH(xp%boolean(/xenc:EncryptedData%))" my-xml-decrypt-action
5 bind rewrite global my-xml-encrypt-policy 30
6 bind rewrite global my-xml-decrypt-policy 30
```

In the above example, the rewrite action my-xml-encrypt-action encrypts the entire XML document (XPATH_WITH_MARKUP(xp%/%)) in the request by using the AES-256 bulk encryption method and the RSA public key from my-certkey to encrypt the bulk encryption key. The action replaces the document with an <xenc:EncryptedData> element containing the encrypted data and an encrypted key. The flags represented by 31 include all of the optional <ds:KeyInfo> elements.

The action my-xml-decrypt-action decrypts the first <xenc:EncryptedData> element in the response (XPATH_WEITH_MARKUP(xp%//xenc:EncryptedData%)). This requires the prior addition of the xenc XML namespace by use of the following CLI command:

```
add ns xmlnamespace xenc http://www.w3.org/2001/04/xmlenc##
```

The my-xml-decrypt-action action uses the RSA private key in my-certkey to decrypt the encrypted key and then uses the bulk encryption method specified in the element to decrypt the encrypted contents. Finally, the action replaces the encrypted data element with the decrypted content.

The rewrite policy my-xml-encrypt-policy applies my-xml-encrypt-action to requests for URLs containing xml-encrypt. The action encrypts the entire response from a service configured on the NetScaler appliance.

The rewrite policy my-xml-decrypt-policy applies my-xml-decrypt-action to requests that contain an
<xenc:EncryptedData> element ((XPATH(xp%//xenc:EncryptedData%) returns a non-empty string). The action decrypts the encrypted data in requests that are bound for a service configured on the NetScaler appliance.

**Advanced policy expressions: parsing SSL**

December 13, 2018

There are advanced policy expressions to parse SSL certificates and SSL client hello messages.

**Parse SSL certificates**

You can use advanced policy expressions to evaluate X.509 Secure Sockets Layer (SSL) client certificates. A client certificate is an electronic document that can be used to authenticate a user's identity. A client certificate contains (at a minimum) version information, a serial number, a signature algorithm ID, an issuer name, a validity period, a subject (user) name, a public key, and signatures.

You can examine both SSL connections and data in client certificates. For example, you may want to send SSL requests that use low-strength ciphers to a particular load balancing virtual server farm. The following command is an example of a Content Switching policy that parses the cipher strength in a request and matches cipher strengths that are less than or equal to 40:

```bash
add cs policy p1 -rule "client.ssl.cipher\_bits.le(40)"
```

As another example, you can configure a policy that determines whether a request contains a client certificate:

```bash
add cs policy p2 -rule "client.ssl.client\_cert EXISTS"
```

Or, you might want to configure a policy that examines particular information in a client certificate. For example, the following policy verifies that the certificate has one or more days before expiration:

```bash
add cs policy p2 -rule "client.ssl.client\_cert exists && client.ssl.client\_cert.days\_to\_expire.ge(1)"
```

**Note**

For information on parsing dates and times in a certificate, see [Format of Dates and Times in an Expression](#) and [Expressions for SSL Certificate Dates](#).
Prefixes for text-based SSL and certificate data

The following table describes expression prefixes that identify text-based items in SSL transactions and client certificates.

Table 1. Prefixes That Return Text or Boolean Values for SSL and Client Certificate Data

<table>
<thead>
<tr>
<th>Prefix</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLIENT.SSL.CLIENT_CERT</td>
<td>Returns the SSL client certificate in the current SSL transaction.</td>
</tr>
<tr>
<td>CLIENT.SSL.CLIENT_CERT.TO_PEM</td>
<td>Returns the SSL client certificate in binary format.</td>
</tr>
<tr>
<td>CLIENT.SSL.CIPHER_EXPORTABLE</td>
<td>Returns a Boolean TRUE if the SSL cryptographic SSL cryptographic cipher is exportable.</td>
</tr>
<tr>
<td>CLIENT.SSL.CIPHER_NAME</td>
<td>Returns the name of the SSL Cipher if invoked from an SSL connection, and a NULL string if invoked from a non-SSL connection.</td>
</tr>
<tr>
<td>CLIENT.SSL.IS_SSL</td>
<td>Returns a Boolean TRUE if the current connection is SSL-based.</td>
</tr>
</tbody>
</table>

Prefixes for numeric data in SSL certificates

The following table describes prefixes that evaluate numeric data other than dates in SSL certificates. These prefixes can be used with the operations that are described in Basic Operations on Expression Prefixes" and Compound Operations for Numbers.

Table 2. Prefixes That Evaluate Numeric Data Other Than Dates in SSL Certificates

<table>
<thead>
<tr>
<th>Prefix</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLIENT.SSL.CLIENT_CERT.DAYS_TO_EXPIRE</td>
<td>Returns the number of days that the certificate is valid, or returns -1 for expired certificates.</td>
</tr>
<tr>
<td>CLIENT.SSL.CLIENT_CERT.PK_SIZE</td>
<td>Returns the size of the public key used in the certificate.</td>
</tr>
<tr>
<td>CLIENT.SSL.CLIENT_CERT.VERSION</td>
<td>Returns the version number of the certificate. If the connection is not SSL-based, returns zero (0).</td>
</tr>
</tbody>
</table>
### NetScaler 11.1

<table>
<thead>
<tr>
<th>Prefix</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLIENT.SSL.CIPHER_BITS</td>
<td>Returns the number of bits in the cryptographic key. Returns 0 if the connection is not SSL-based.</td>
</tr>
<tr>
<td>CLIENT.SSL.VERSION</td>
<td>Returns a number that represents the SSL protocol version, as follows: 0. The transaction is not SSL-based.; 0x002. The transaction is SSLv2.; 0x300. The transaction is SSLv3.; 0x301. The transaction is TLSv1.; 0x302. The transaction is TLSv1.1.; 0x303. The transaction is TLSv1.2.</td>
</tr>
</tbody>
</table>

**Note**

For expressions related to expiration dates in a certificate, see [Expressions for SSL Certificate Dates](#).

### Expressions for SSL certificates

You can parse SSL certificates by configuring expressions that use the following prefix:

**CLIENT.SSL.CLIENT_CERT**

This section discusses the expressions that you can configure for certificates, with the exception of expressions that examine certificate expiration. Time-based operations are described in [Advanced Policy Expressions: Working with Dates, Times, and Numbers](#).

The following table describes operations that you can specify for the CLIENT.SSL.CLIENT_CERT prefix.

<table>
<thead>
<tr>
<th>SSL Certificate Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;certificate&gt;.EXISTS</code></td>
<td>Returns a Boolean TRUE if the client has an SSL certificate.</td>
</tr>
</tbody>
</table>
### SSL Certificate Operation

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;certificate&gt;.ISSUER</code></td>
<td>Returns the Distinguished Name (DN) of the Issuer in the certificate as a name-value list. An equals sign (&quot;=&quot;) is the delimiter for the name and the value, and the slash (&quot;/&quot;) is the delimiter that separates the name-value pairs. Following is an example of the returned DN: <code>/C=US/O=myCompany/OU=www.mycompany.com/CN=www.mycompany.com/emailAddress=myuserid@mycompany.com</code></td>
</tr>
<tr>
<td><code>&lt;certificate&gt;.ISSUER.IGNORE_EMPTY_ELEMENTS</code></td>
<td>Returns the Issuer and ignores the empty elements in a name-value list. For example, consider the following: Cert-Issuer: <code>/c=in/st=kar//l=bangelore //o=mycompany/ou=sales/ /emailAddress=myuserid@mycompany.com</code>. The following Rewrite action returns a count of 6 based on the preceding Issuer definition: <code>sh rewrite action insert_ssl_header Name: insert_sslOperation insert_http_header Target:Cert-Issuer Value:CLIENT.SSL.CLIENT_CERT.ISSUER .COUNT</code>. However, if you change the value to the following, the returned count is 9: <code>CLIENT.SSL.CLIENT_CERT.ISSUER.IGNORE_EMPTY_ELEMENTS.COUNT</code></td>
</tr>
</tbody>
</table>

### Advanced policy expressions: IP and MAC addresses, throughput, VLAN IDs

December 13, 2018

You can use Advanced policy expression prefixes that return IPv4 and IPv6 addresses, MAC addresses, IP subnets, useful client and server data such as the throughput rates at the interface ports (Rx, Tx, and RxTx), and the IDs of the VLANs through which packets are received. You can then use various operators to evaluate the data that is returned by these expression prefixes.
Expressions for IP Addresses and IP Subnets

You can use Advanced policy expressions to evaluate addresses and subnets that are in Internet Protocol version 4 (IPv4) or Internet Protocol version 6 (IPv6) format. Expression prefixes for IPv6 addresses and subnets include IPv6 in the prefix. Expression prefixes for IPv4 addresses and subnets include IP in the prefix. Following is an example of an expression that identifies whether a request has originated from a particular IPv4 subnet.

```
client.ip.src.in_subnet(147.1.0.0/16)
```

Following are two examples of Rewrite policies that examine the subnet from which the packet is received and perform a rewrite action on the Host header. With these two policies configured, the rewrite action that is performed depends on the subnet in the request. These two policies evaluate IP addresses that are in the IPv4 address format.

```
1 - add rewrite action URL1-rewrite-action replace "http.req.header("Host")" "\"www.mycompany1.com\""
2 - add rewrite policy URL1-rewrite-policy "http.req.header("Host").contains("\"www.test1.com\") & client.ip.src.in_subnet(147.1.0.0/16)" URL1-rewrite-action
3 - add rewrite action URL2-rewrite-action replace "http.req.header("Host")" "\"www.mycompany2.com\""
4 - add rewrite policy URL2-rewrite-policy "http.req.header("Host").contains("\"www.test2.com\") & client.ip.src.in_subnet(10.202.0.0/16)" URL2-rewrite-action
```

Note

The preceding examples are commands that you type at the NetScaler command-line interface (CLI) and, therefore, each quotation mark must be preceded by a backslash (\). For more information, see Configuring advanced policy expressions in a policy.

Prefixes for IPv4 Addresses and IP Subnets

The following table describes prefixes that return IPv4 addresses and subnets, and segments of IPv4 addresses. You can use numeric operators and operators that are specific to IPv4 addresses with these prefixes. For more information about numeric operations, see Basic Operations on Expression Prefixes and Compound Operations for Numbers.

Table 1. Prefixes That Evaluate IP and MAC Addresses
### Prefixes and Descriptions

<table>
<thead>
<tr>
<th>Prefix</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLIENT.IP.SRC</td>
<td>Returns the source IP of the current packet as an IP address or as a number.</td>
</tr>
<tr>
<td>CLIENT.IP.DST</td>
<td>Returns the destination IP of the current packet as an IP address or as a number.</td>
</tr>
<tr>
<td>SERVER.IP.SRC</td>
<td>Returns the source IP of the current packet as an IP address or as a number.</td>
</tr>
<tr>
<td>SERVER.IP.DST</td>
<td>Returns the destination IP of the current packet as an IP address or as a number.</td>
</tr>
</tbody>
</table>

### Operations for IPv4 Addresses

The following table describes the operators that can be used with prefixes that return an IPv4 address.

<table>
<thead>
<tr>
<th>Prefix</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;ip address&gt;.EQ(&lt;address&gt;)</code></td>
<td>Returns a Boolean TRUE if the IP address value is same as the <code>&lt;address&gt;</code> argument. The following example checks whether the client’s destination IP address is equal to 10.100.10.100: <code>client.ip.dst.eq(10.100.10.100)</code></td>
</tr>
<tr>
<td><code>&lt;ip address&gt;.GET1 . . GET4</code></td>
<td>Returns a portion of an IP address as a numeric value. For example, if the IP address value is 10.100.200.1, the following is returned: <code>client.ip.src.get1</code> Returns 10; <code>client.ip.src.get2</code> returns 100; <code>client.ip.src.get3</code> returns 200</td>
</tr>
<tr>
<td><code>&lt;ip address&gt;.IN_SUBNET(&lt;subnet&gt;)</code></td>
<td>Returns a Boolean TRUE if the <code>&lt;subnet&gt;</code> argument matches the subnet of the IP address value. For example, the following determines whether the client’s destination IP address subnet is 10.100.10.100/18: <code>client.ip.dst.eq(10.100.10.100/18)</code></td>
</tr>
</tbody>
</table>
### About IPv6 expressions

The IPv6 address format allows more flexibility than the older IPv4 format. IPv6 addresses are in the hexadecimal format (RFC 2373). In the following examples, Example 1 is an IPv6 address, Example 2 is a URL that includes the IPv6 address, and Example 3 includes the IPv6 address and a port number.

**Example 1:**

```
1 9901:0ab1:22a2:88a3:3333:4a4b:5555:6666
```

**Example 2:**

```
1 http://[9901:0ab1:22a2:88a3:3333:4a4b:5555:6666]/
```
Example 3:

```
https://[9901:0ab1:22a2:88a3:3333:4a4b:5555:6666]:8080/
```

In Example 3, the brackets separate the IP address from the port number (8080).

Note that you can only use the ‘+’ operator to combine IPv6 expressions with other expressions. The output is a concatenation of the string values that are returned from the individual expressions. You cannot use any other arithmetic operator with an IPv6 expression. The following syntax is an example:

```
client.ipv6.src + server.ip.dst
```

For example, if the client source IPv6 address is ABCD:1234::ABCD, and the server destination IPv4 address is 10.100.10.100, the preceding expression returns “ABCD:1234::ABCD10.100.10.100”.

Note that when the NetScaler appliance receives an IPv6 packet, it assigns a temporary IPv4 address from an unused IPv4 address range and changes the source address of the packet to this temporary address. At response time, the outgoing packet’s source address is replaced with the original IPv6 address.

Note

You can combine an IPv6 expression with any other expression except an expression that produces a Boolean result.

Expression prefixes for IPv6 addresses

The IPv6 addresses that are returned by the expression prefixes in the following table can be treated as text data. For example, the prefix `client.ipv6.dst` returns the destination IPv6 address as a string that can be evaluated as text.

The following table describes expression prefixes that return an IPv6 address.

Table 3. IPv6 Expression Prefixes That Return Text

<table>
<thead>
<tr>
<th>Prefix</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLIENT.IPV6</td>
<td>Operates on the IPv6 address in with the current packet.</td>
</tr>
<tr>
<td>CLIENT.IPV6.DST</td>
<td>Returns the IPv6 address in the destination field of the IP header.</td>
</tr>
</tbody>
</table>
NetScaler 11.1

<table>
<thead>
<tr>
<th>Prefix</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SERVER.IPV6</td>
<td>Operates on the IPv6 address in with the current packet.</td>
</tr>
<tr>
<td>SERVER.IPV6.DST</td>
<td>Returns the IPv6 address in the destination field of the IP header.</td>
</tr>
<tr>
<td>SERVER.IPV6.SRC</td>
<td>Returns the IPv6 address in the source field of the IP header. Following are examples: server.ipv6.src.in_subnet(2007::2008/64) server.ipv6.src.get1.le(2008)</td>
</tr>
</tbody>
</table>

**Operations for IPv6 prefixes**

The following table describes the operators that can be used with prefixes that return an IPv6 address:

Table 4. Operations That Evaluate IPv6 Addresses

<table>
<thead>
<tr>
<th>IPv6 Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;ipv6&gt;.EQ(&lt;IPv6_address&gt;)</td>
<td>Returns a Boolean TRUE if the IP address value is same as the argument. Following is an example: ‘client.ipv6.dst.eq(ABCD:1234::ABCD)’</td>
</tr>
<tr>
<td>&lt;ipv6&gt;.GET1...GET8</td>
<td>Returns a segment of an IPv6 address as a number. The following example expressions retrieve segments from the ipv6 address 1000:1001:CD10:0000:0000:89AB:4567:CDEF:client.ipv6.dst.get5 extracts 0000, which is the fifth set of bits in the address. client.ipv6.dst.get6 extracts 89AB. client.ipv6.dst.get7 extracts 4567. You can perform numeric operations on these segments. Note that you cannot perform numeric operations when you retrieve an entire IPv6 address. This is because expressions that return an entire IPv6 address, such as CLIENT.IPV6.SRC, return the address in text format.</td>
</tr>
</tbody>
</table>
IPv6 Operation | Description
---|---
<ipv6>.IN_SUBNET(<subnet>) | Returns a Boolean TRUE if the IPv6 address value is in the subnet specified by the <subnet> argument. Following is an example: client.ipv6.dst.eq(1000:1001:CD10:0000:0000:89AB:4567:CDEF/60)
<ipv6>.IS_IPV4 | Returns a Boolean TRUE if this is an IPv4 client, and returns a Boolean FALSE if it is not.
<ipv6>.SUBNET(<n>) | Returns the IPv6 address after applying the subnet mask specified as the argument. The subnet mask can take values between 0 and 128. For example: CLIENT.IPV6.SRC.SUBNET(24)

Expressions for MAC addresses

A MAC address consists of colon-delimited hexadecimal values in the format ###:###:###:###:###:###, where each “#” represents either a number from 0 through 9 or a letter from A through F. Default syntax expression prefixes and operators are available for evaluating source and destination MAC addresses.

Prefixes for MAC addresses

The following table describes prefixes that return MAC addresses.

Table 5. Prefixes That Evaluate MAC Addresses

<table>
<thead>
<tr>
<th>Prefix</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client.ether.dstmac</td>
<td>Returns the MAC address in the destination field of the Ethernet header.</td>
</tr>
<tr>
<td>client.ether.srcmac</td>
<td>Returns the MAC address in the source field of the Ethernet header.</td>
</tr>
</tbody>
</table>

Operations for MAC addresses

The following table describes the operators that can be used with prefixes that return a MAC address.

</tbody>
</table>

**Advanced policy expressions: stream analytics functions**

December 10, 2018

Stream Analytics expressions begin with the ANALYTICS.STREAM(<identifier_name>) prefix. The following list describes the functions that can be used with this prefix.

- **COLLECT_STATS**
  Collect statistical data from the requests that are evaluated against the policy and create a record for each request.

- **REQUESTS**
  Return the number of requests that exist for the specified record grouping. The value returned is of type unsigned long.

- **BANDWIDTH**
  Return the bandwidth statistic for the specified record grouping. The value returned is of type unsigned long.

- **RESPTIME**
  Return the response time statistic for the specified record grouping. The value returned is of type unsigned long.

- **CONNECTIONS**
  Return the number of concurrent connections that exist for the specified record grouping. The value returned is of type unsigned long.

- **IS_TOP(n)**
  Return a Boolean
  TRUE if the statistical value for the specified record grouping is one among the top n groups. Otherwise, return a Boolean FALSE.
**CHECK_LIMIT**

Return a Boolean
TRUE if the statistic for the specified record grouping has hit the preconfigured limit. Otherwise,
return a Boolean
FALSE.

---

**Advanced policy expressions: DataStream**

December 10, 2018

The policy infrastructure on the NetScaler appliance includes expressions that you can use to evaluate
and process database server traffic when the appliance is deployed between a farm of application
servers and their associated database servers.

This topic includes the following sections:

- Expressions for the MySQL Protocol
- Expressions for Evaluating Microsoft SQL Server Connections

**Expressions for the MySQL protocol**

The following expressions evaluate traffic associated with MySQL database servers. You can use the
request-based expressions (expressions that begin with MYSQL.CLIENT and MYSQL.REQ) in policies
to make request switching decisions at the content switching virtual server bind point and the
response-based expressions (expressions that begin with MYSQL.RES) to evaluate server responses
to user-configured health monitors.

- **MYSQL.CLIENT.** Operates on the client properties of a MySQL connection.
- **MYSQL.CLIENT.CAPABILITIES.** Returns the set of flags that the client has set in the capabilities
  field of the handshake initialization packet during authentication. Examples of the flags that
  are set are CLIENT_FOUND_ROWS, CLIENT_COMPRESS, and CLIENT_SSL.
- **MYSQL CLIENT CHAR_SET.** Returns the enumeration constant assigned to the character set
  that the client uses. The EQ(<m>) and NE(<m>) operators, which return Boolean values to in-
  dicate the result of a comparison, are used with this prefix. Following are the character set enu-
  meration constants:
  - LATIN2_CZECH_CS
  - DEC8_SWEDISH_CI

- **MYSQL.CLIENT.DATABASE.** Returns the name of the database specified in the authentication packet that the client sends to the database server. This is the databasename attribute.

- **MYSQL.CLIENT.USER.** Returns the user name (in the authentication packet) with which the client is attempting to connect to the database. This is the user attribute.

- **MYSQL.REQ.** Operates on a MySQL request.

- **MYSQL.REQ.COMMAND.** Identifies the enumeration constant assigned to the type of command in the request. The EQ(<m>) and NE(<m>) operators, which return Boolean values to indicate the result of a comparison, are used with this prefix. Following are the enumeration constant values:
  - SLEEP
  - QUIT
  - INIT_DB
  - QUERY
  - FIELD_LIST
  - CREATE_DB
  - DROP_DB
  - REFRESH
  - SHUTDOWN
  - STATISTICS
  - PROCESS_INFO
  - CONNECT
  - PROCESS_KILL
  - DEBUG
  - PING
  - TIME
  - DELAYED_INSERT
  - CHANGE_USER
  - BINLOG_DUMP
  - TABLE_DUMP
  - CONNECT_OUT
  - REGISTER_SLAVE
  - STMT_PREPARE
  - STMT_EXECUTE
  - STMT_SEND_LONG_DATA
- STMT_CLOSE
- STMT_RESET
- SET_OPTION
- STMT_FETCH

- **MYSQL.REQ.QUERY.** Identifies the query in the MySQL request.

- **MYSQL.REQ.QUERY.COMMAND.** Returns the first keyword in the MySQL query.

- **MYSQL.REQ.QUERY.SIZE.** Returns the size of the request query in integer format. The SIZE method is similar to the CONTENT_LENGTH method that returns the length of an HTTP request or response.

- **MYSQL.REQ.QUERY.TEXT.** Returns a string covering the entire query.

- **MYSQL.REQ.QUERY.TEXT(<n>).** Returns the first n bytes of the MySQL query as a string. This is similar to HTTP.BODY(<n>).

  **Parameters:**
  
n - Number of bytes to be returned

- **MYSQL.RES.** Operates on a MySQL response.

- **MYSQL.RES.ATLEAST_ROWS_COUNT(<i>).** Checks whether the response has at least i number of rows and returns a Boolean TRUE or FALSE to indicate the result.

  **Parameters:**
  
i - Number of rows

- **MYSQL.RES.ERROR.** Identifies the MySQL error object. The error object includes the error number and the error message.

- **MYSQL.RES.ERROR.MESSAGE.** Returns the error message that is retrieved from the server's error response.

- **MYSQL.RES.ERROR.NUM.** Returns the error number that is retrieved from the server’s error response.

- **MYSQL.RES.ERROR.SQLSTATE.** Returns the value of the SQLSTATE field in the server’s error response. The MySQL server translates error number values to SQLSTATE values.

- **MYSQL.RES.FIELD(<i>).** Identifies the packet that corresponds to the i<sup>th</sup> individual field in the server’s response. Each field packet describes the properties of the associated column. The packet count (i) begins at 0.

  **Parameters:**
  
i - Packet number

- **MYSQL.RES.FIELD(<i>).CATALOG.** Returns the catalog property of the field packet.
- **MYSQL.RES.FIELD(<i>).CHAR_SET.** Returns the character set of the column. The EQ(<m>) and NE(<m>) operators, which return Boolean values to indicate the result of a comparison, are used with this prefix.

- **MYSQL.RES.FIELD(<i>).DATATYPE.** Returns an enumeration constant that represents the data type of the column. This is the type (also called enum_field_type) attribute of the column. The EQ(<m>) and NE(<m>) operators, which return Boolean values to indicate the result of a comparison, are used with this prefix. The possible values for the various data types are:
  - DECIMAL
  - TINY
  - SHORT
  - LONG
  - FLOAT
  - DOUBLE
  - NULL
  - TIMESTAMP
  - LONGLONG
  - INT24
  - DATE
  - TIME
  - DATETIME
  - YEAR
  - NEWDATE
  - VARCHAR (new in MySQL 5.0)
  - BIT (new in MySQL 5.0)
  - NEWDECIMAL (new in MySQL 5.0)
  - ENUM
  - SET
  - TINY_BLOB
  - MEDIUM_BLOB
  - LONG_BLOB
  - BLOB
  - VAR_STRING
  - STRING
  - GEOMETRY

- **MYSQL.RES.FIELD(<i>).DB.** Returns the database identifier (db) attribute of the field packet.

- **MYSQL.RES.FIELD(<i>).DECIMALS.** Returns the number of positions after the decimal point if the type is DECIMAL or NUMERIC. This is the decimals attribute of the field packet.

- **MYSQL.RES.FIELD(<i>).FLAGS.** Returns the flags property of the field packet. Following are
the possible hexadecimal flag values:

- 0001: NOT_NULL_FLAG
- 0002: PRI_KEY_FLAG
- 0004: UNIQUE_KEY_FLAG
- 0008: MULTIPLE_KEY_FLAG
- 0010: BLOB_FLAG
- 0020: UNSIGNED_FLAG
- 0040: ZEROFILL_FLAG
- 0080: BINARY_FLAG
- 0100: ENUM_FLAG
- 0200: AUTO_INCREMENT_FLAG
- 0400: TIMESTAMP_FLAG
- 0800: SET_FLAG

- **MYSQL.RES.FIELD(<i>).LENGTH.** Returns the length of the column. This is the value of the length attribute of the field packet. The value that is returned might be larger than the actual value. For example, an instance of a VARCHAR(2) column might return a value of 2 even when it contains only one character.

- **MYSQL.RES.FIELD(<i>).NAME.** Returns the column identifier (the name after the AS clause, if any). This is the name attribute of the field packet.

- **MYSQL.RES.FIELD(<i>).ORIGINAL_NAME.** Returns the original column identifier (before the AS clause, if any). This is the org_name attribute of the field packet.

- **MYSQL.RES.FIELD(<i>).ORIGINAL_TABLE.** Returns the original table identifier of the column (before the AS clause, if any). This is the org_table attribute of the field packet.

- **MYSQL.RES.FIELD(<i>).TABLE.** Returns the table identifier of the column (after the AS clause, if any). This is the table attribute of the field packet.

- **MYSQL.RES.FIELDS_COUNT.** Returns the number of field packets in the response (the field_count attribute of the OK packet).

- **MYSQL.RES.OK.** Identifies the OK packet sent by the database server.

- **MYSQL.RES.OK.AFFECTED_ROWS.** Returns the number of rows affected by an INSERT, UPDATE, or DELETE query. This is the value of the affected_rows attribute of the OK packet.

- **MYSQL.RES.OK.INSERT_ID.** Identifies the unique_id attribute of the OK packet. If an autoincrement identity is not generated by the current MySQL statement or query, the value of unique_id, and hence the value returned by the expression, is 0.

- **MYSQL.RES.OK.MESSAGE.** Returns the message property of the OK packet.

- **MYSQL.RES.OK.STATUS.** Identifies the bit string in the server_status attribute of the OK packet. Clients can use the server status to check whether the current command is a part of a running
transaction. The bits in the server_status bit string correspond to the following fields (in the given order):

- IN TRANSACTION
- AUTO_COMMIT
- MORE RESULTS
- MULTI QUERY
- BAD INDEX USED
- NO INDEX USED
- CURSOR EXISTS
- LAST ROW SEEN
- DATABASE DROPPED
- NO BACKSLASH ESCAPES

- **MYSQL.RES.OK.WARNING_COUNT.** Returns the warning_count attribute of the OK packet.

- **MYSQL.RES.ROW(<i>).** Identifies the packet that corresponds to the \(i\)th individual row in the database server’s response.

  **Parameters:**
  
i - Row number

- **MYSQL.RES.ROW(<i>).DOUBLE_ELEM(<j>).** Checks whether the \(j\)th column of the \(i\)th row of the table is NULL. Following C conventions, both indexes \(i\) and \(j\) start from 0. Therefore, row \(i\) and column \(j\) are actually the \((i+1)\)th row and the \((j+1)\)th column, respectively.

  **Parameters:**
  
i - Row number
  j - Column number

- **MYSQL.RES.ROW(<i>).IS_NULL_ELEM(<j>).** Checks whether the \(j\)th column of the \(i\)th row of the table is NULL. Following C conventions, both indexes \(i\) and \(j\) start from 0. Therefore, row \(i\) and column \(j\) are actually the \((i+1)\)th row and the \((j+1)\)th column, respectively.

  **Parameters:**
  
i - Row number
  j - Column number

- **MYSQL.RES.ROW(<i>).NUM_ELEM(<j>).** Returns an integer value from the \(j\)th column of the \(i\)th row of the table. Following C conventions, both indexes \(i\) and \(j\) start from 0. Therefore, row \(i\) and column \(j\) are actually the \((i+1)\)th row and the \((j+1)\)th column, respectively.
Parameters:

i - Row number
j - Column number

- **MYSQL.RES.ROW(<i>).TEXT_ELEM(j).** Returns a string from the j<sup>th</sup> column of the i<sup>th</sup> row of the table. Following C conventions, both indexes i and j start from 0. Therefore, row i and column j are actually the (i+1)<sup>th</sup> row and the (j+1)<sup>th</sup> column, respectively.

Parameters:

i - Row number
j - Column number

- **MYSQL.RES.TYPE.** Returns an enumeration constant for the response type. Its values can be ERROR, OK, and RESULT_SET. The EQ(<m>) and NE(<m>) operators, which return Boolean values to indicate the result of a comparison, are used with this prefix.

**Expressions for evaluating Microsoft SQL server connections**

The following expressions evaluate traffic associated with Microsoft SQL Server database servers. You can use the request-based expressions (expressions that begin with MSSQL_CLIENT and MSSQL_REQ) in policies to make request switching decisions at the content switching virtual server bind point and the response-based expressions (expressions that begin with MSSQL_RES) to evaluate server responses to user-configured health monitors.

<table>
<thead>
<tr>
<th>Expression</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MSSQL_CLIENT.CAPABILITIES</td>
<td>Returns the OptionFlags1, OptionFlags2, OptionFlags3, and TypeFlags fields of the LOGIN7 authentication packet, in that order, as a 4-byte integer. Each field is 1 byte long and specifies a set of client capabilities.</td>
</tr>
<tr>
<td>MSSQL_CLIENT.DATABASE</td>
<td>Returns the name of the client database. The value returned is of type text.</td>
</tr>
<tr>
<td>MSSQL_CLIENT.USER</td>
<td>Returns the user name with which the client authenticated. The value returned is of type text.</td>
</tr>
</tbody>
</table>
### Expression Description

<table>
<thead>
<tr>
<th>Expression</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MSSQL.REQ.COMMAND</td>
<td>Returns an enumeration constant that identifies the type of command in the request sent to a Microsoft SQL Server database server. The value returned is of type text. Examples of the values of the enumeration constant are QUERY, RESPONSE, RPC, and ATTENTION. The EQ(&lt;m&gt;) and NE(&lt;m&gt;) operators, which return Boolean values to indicate the result of a comparison, are used with this expression.</td>
</tr>
<tr>
<td>MSSQL.REQ.QUERY.COMMAND</td>
<td>Returns the first keyword in the SQL query. The value returned is of type text.</td>
</tr>
<tr>
<td>MSSQL.REQ.QUERY.SIZE</td>
<td>Returns the size of the SQL query in the request. The value returned is a number.</td>
</tr>
<tr>
<td>MSSQL.REQ.QUERY.TEXT</td>
<td>Returns the entire SQL query as a string. The value returned is of type text.</td>
</tr>
<tr>
<td>MSSQL.REQ.QUERY.TEXT(&lt;n&gt;)</td>
<td>Returns the first n bytes of the SQL query. The value returned is of type text. Parameters: n - Number of bytes</td>
</tr>
<tr>
<td>MSSQL.REQ.RPC.NAME</td>
<td>Returns the name of the procedure that is being called in a remote procedure call (RPC) request. The name is returned as a string.</td>
</tr>
<tr>
<td>MSSQL.REQ.RPC.IS_PROCID</td>
<td>Returns a Boolean value that indicates whether the remote procedure call (RPC) request contains a procedure ID or an RPC name. A return value of TRUE indicates that the request contains a procedure ID and a return value of FALSE indicates that the request contains an RPC name.</td>
</tr>
<tr>
<td>MSSQL.REQ.RPC.PROCID</td>
<td>Returns the procedure ID of the remote procedure call (RPC) request as an integer.</td>
</tr>
<tr>
<td>MSSQL.REQ.RPC.BODY</td>
<td>Returns the body of the SQL request as a string in the form of parameters represented as “a=b” clauses separated by commas, where “a” is the RPC parameter name and “b” is its value.</td>
</tr>
</tbody>
</table>

Note: Not available for releases before 10.1.
<table>
<thead>
<tr>
<th>Expression</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>MSSQL.REQ.RPC.BODY(n)</strong></td>
<td>Returns part of the body of the SQL request as a string in the form of parameters represented as “a=b” clauses separated by commas, where “a” is the RPC parameter name and “b” is its value. Parameters are returned from only the first “n” bytes of the request, skipping the SQL header. Only complete name-value pairs are returned.</td>
</tr>
<tr>
<td><strong>MSSQL.RES.ATLEAST_ROWS_COUNT(i)</strong></td>
<td>Checks whether the response has at least i number of rows. The value returned is a Boolean TRUE or FALSE value. Parameters: i - Number of rows</td>
</tr>
<tr>
<td><strong>MSSQL.RES.DONE.ROWCOUNT</strong></td>
<td>Returns a count of the number of rows affected by an INSERT, UPDATE, or DELETE query. The value returned is of type unsigned long.</td>
</tr>
<tr>
<td><strong>MSSQL.RES.DONE.STATUS</strong></td>
<td>Returns the status field from the DONE token sent by a Microsoft SQL Server database server. The value returned is a number.</td>
</tr>
<tr>
<td><strong>MSSQL.RES.ERROR.MESSAGE</strong></td>
<td>Returns the error message from the ERROR token sent by a Microsoft SQL Server database server. This is the value of the MsgText field in the ERROR token. The value returned is of type text.</td>
</tr>
<tr>
<td><strong>MSSQL.RES.ERROR.NUM</strong></td>
<td>Returns the error number from the ERROR token sent by a Microsoft SQL Server database server. This is the value of the Number field in the ERROR token. The value returned is a number.</td>
</tr>
<tr>
<td><strong>MSSQL.RES.ERROR.STATE</strong></td>
<td>Returns the error state from the ERROR token sent by a Microsoft SQL Server database server. This is the value of the State field in the ERROR token. The value returned is a number.</td>
</tr>
<tr>
<td>Expression</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------</td>
</tr>
<tr>
<td>MSSQL.RES.FIELD(&lt;i&gt;).DATATYPE</td>
<td>Returns the data type of the ith field in the server response. The EQ(&lt;m&gt;) and NE(&lt;m&gt;) functions, which return Boolean values to indicate the result of a comparison, are used with this prefix. For example, the following expression returns a Boolean TRUE if the DATATYPE function returns a value of datetime for the third field in the response: MSSQL.RES.FIELD(&lt;2&gt;).DATATYPE.EQ(datetime) Parameters: i - Row number</td>
</tr>
<tr>
<td>MSSQL.RES.FIELD(&lt;i&gt;).LENGTH</td>
<td>Returns the maximum possible length of the ith field in the server response. The value returned is a number. Parameters: i - Row number</td>
</tr>
<tr>
<td>MSSQL.RES.FIELD(&lt;i&gt;).NAME</td>
<td>Returns the name of the ith field in the server response. The value returned is of type text. Parameters: i - Row number</td>
</tr>
<tr>
<td>MSSQL.RES.ROW(&lt;i&gt;).DOUBLE_ELEM(&lt;j&gt;)</td>
<td>Returns a value of type double from the jth column of the ith row of the table. If the value is not a double value, an UNDEF condition is raised. Following C conventions, both indexes i and j start from 0 (zero). Therefore, row i and column j are actually the (i + 1)th row and the (j + 1)th column, respectively. Parameters: i - Row number j - Column number</td>
</tr>
<tr>
<td>MSSQL.RES.ROW(&lt;i&gt;).NUM_ELEM(j)</td>
<td>Returns an integer value from the jth column of ith row of the table. If the value is not an integer value, an UNDEF condition is raised. Following C conventions, both indexes i and j start from 0 (zero). Therefore, row i and column j are actually the (i + 1)th row and the (j + 1)th column, respectively. Parameters: i - Row number j - Column number</td>
</tr>
<tr>
<td>Expression</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>MSSQL.RES.ROW&lt;i&gt;.IS_NULL_ELEM(j)</td>
<td>Checks whether the jth column of the ith row of the table is NULL and returns a Boolean TRUE or FALSE to indicate the result. Following C conventions, both indexes i and j start from 0 (zero). Therefore, row i and column j are actually the ((i + 1))th row and the ((j + 1))th column, respectively. Parameters: i - Row number j - Column number</td>
</tr>
<tr>
<td>MSSQL.RES.ROW&lt;i&gt;.TEXT_ELEM(j)</td>
<td>Returns a text string from the jth column of ith row of the table. Following C conventions, both indexes i and j start from 0 (zero). Therefore, row i and column j are actually the ((i + 1))th row and the ((j + 1))th column, respectively. Parameters: i - Row number j - Column number</td>
</tr>
<tr>
<td>MSSQL.RES.TYPE</td>
<td>Returns an enumeration constant that identifies the response type. Following are the possible return values: ERROR, OK, and RESULT_SET. The EQ(&lt;m&gt;) and NE(&lt;m&gt;) operators, which return Boolean values to indicate the result of a comparison, are used with this expression.</td>
</tr>
</tbody>
</table>

**Typecasting data**

January 6, 2019

You can extract data of one type (for example, text or an integer) from requests and responses and transform it to data of another type. For example, you can extract a string and transform the string to time format. You can also extract a string from an HTTP request body and treat it like an HTTP header or extract a value from one type of request header and insert it in a response header of a different type.

After typecasting the data, you can apply any operation that is appropriate for the new data type. For example, if you typecast text to an HTTP header, you can apply any operation that is applicable to HTTP headers to the returned value.

For more information about typecasting data, see the [Typecasting Operations pdf](#).
When you want to perform string matching operations that are more complex than the operations that you perform with the CONTAINS("<string>") or EQ("<string>") operators, you use regular expressions. The policy infrastructure on the Citrix® NetScaler® appliance includes operators to which you can pass regular expressions as arguments for text matching. The names of the operators that work with regular expressions include the string REGEX. The regular expressions that you pass as arguments must conform to the regular expression syntax that is described in “http://www.pcre.org/pcre.txt.” You can learn more about regular expressions at “http://www.regular-expressions.info/quickstart.html” and at “http://www.silverstones.com/thebat/Regex.html.”

The target text for an operator that works with regular expressions can be either text or the value of an HTTP header. Following is the format of a default syntax expression that uses a regular expression operator to operate on text:

```plaintext
<text>.<regex_operator>(re<delimiter><regex_pattern><delimiter>)
```

The string `<text>` represents the default syntax expression prefix that identifies a text string in a packet (for example, HTTP.REQ.URL). The string `<regex_operator>` represents the regular expression operator. The regular expression always begins with the string `re`. A pair of matching delimiters, represented by `<delimiter>`, enclose the string `<regex_pattern>`, which represents the regular expression.

The following example expression checks whether the URL in an HTTP packet contains the string `*.jpeg` (where `*` is a wildcard) and returns a Boolean TRUE or FALSE to indicate the result. The regular expression is enclosed within a pair of slash marks (/), which act as delimiters.

```plaintext
http.req.url.regex_match(re/*.jpeg/)
```

Regular expression operators can be combined to define or refine the scope of a search. For example, `<text>.AFTER_REGEX(re/regex_pattern1/).BEFORE_REGEX(re/regex_pattern2/)` specifies that the target for string matching is the text between the patterns `regex_pattern1` and `regex_pattern2`. You can use a text operator on the scope that is defined by the regular expression operators. For example, you can use the CONTAINS("<strings>") operator to check whether the defined scope contains the string `abc`:

```plaintext
<text>.AFTER_REGEX(re/regex_pattern1/).BEFORE_REGEX(re/regex_pattern2/).CONTAINS("abc")
```

**Note**

The process of evaluating a regular expression inherently takes more time than that for an operator such as CONTAINS("<string>") or EQ("<string>"), which work with simple string arguments. You should use regular expressions only if your requirement is beyond the scope of other operators.
**Basic characteristics of regular expressions**

December 10, 2018

Following are notable characteristics of regular expressions as defined on the NetScaler appliance:

- A regular expression always begins with the string “re” followed by a pair of delimiting characters (called delimiters) that enclose the regular expression that you want to use.

  For example, re#<regex_pattern># uses the number sign (#) as a delimiter.

- A regular expression cannot exceed 1499 characters.

- Digit matching can be done by using the string \d (a backslash followed by d).

- White space can be represented by using \s (a backslash followed by s).

- A regular expression can contain white spaces.

Following are the differences between the NetScaler syntax and the PCRE syntax:

- The NetScaler does not allow back references in regular expressions.

- You should not use recursive regular expressions.

- The dot meta-character also matches the newline character.

- Unicode is not supported.

- The operation SET_TEXT_MODE(IGNORECASE) overrides the (?i) internal option in the regular expression.

**Operations for regular expressions**

December 10, 2018

The following table describes the operators that work with regular expressions. The operation performed by a regular expression operator in a given default syntax expression depends on whether the expression prefix identifies text or HTTP headers. Operations that evaluate headers override any text-based operations for all instances of the specified header type. When you use an operator, replace <text> with the default syntax expression prefix that you want to configure for identifying text.
<table>
<thead>
<tr>
<th>Regular Expression Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;text&gt;.BEFORE_REGEX(&lt;regular expression&gt;)</code></td>
<td>Selects the text that precedes the string that matches the <code>&lt;regular expression&gt;</code> argument. If the regular expression does not match any data in the target, the expression returns a text object of length 0. The following expression selects the string “text” from “text/plain”. <code>http.res.header(&quot;content-type&quot;).before_regex(re#/#)</code></td>
</tr>
<tr>
<td><code>&lt;text&gt;.AFTER_REGEX(&lt;regular expression&gt;)</code></td>
<td>Selects the text that follows the string that matches the <code>&lt;regular expression&gt;</code> argument. If the regular expression does not match any text in the target, the expression returns a text object of length 0. The following expression extracts “Example” from “myExample”: <code>http.req.header(&quot;etag&quot;).after_regex(re/my/)</code></td>
</tr>
<tr>
<td><code>&lt;text&gt;.REGEX_SELECT(&lt;regular expression&gt;)</code></td>
<td>Selects a string that matches the <code>&lt;regular expression&gt;</code> argument. If the regular expression does not match the target, a text object of length 0 is returned. The following example extracts the string “NS-CACHE-9.0: 90” from a Via header: <code>http.req.header(&quot;via&quot;).regex_select(re!NS-CACHE\-\d\.\d!\s*\d{1,3}!)</code></td>
</tr>
</tbody>
</table>
Regular Expression Operation | Description
---|---
```.REGEX_MATCH(<regular expression>)``` | Returns TRUE if the target matches a `<regular expression>` argument of up to 1499 characters. The regular expression must be of the following format: `re<delimiter>regular expression< delimiter>` Both delimiters must be the same. Additionally, the regular expression must conform to the Perl-compatible (PCRE) regular expression library syntax. For more information, go to http://www.pcre.org/pcre.txt. In particular, see the pcrepattern man page. However, note the following: Back-references are not allowed. Recursive regular expressions are not recommended. The dot metacharacter also matches the newline character. The Unicode character set is not supported.

SET_TEXT_MODE(IGNORECASE) overrides the (?i) internal option specified in the regular expression. The following are examples:

```
http.req.hostname.regex_match(re/[[:alpha:]]+(abc){2,3}/)
```

and

```
http.req.url.set_text_mode(urlencoded).regex_match(re#(a b+c)#)
```

The following example matches ab and aB: `http.req.url.regex_match(re/a(?i)b/)` The following example matches ab, aB, Ab and AB: `http.req.url.set_text_mode(ignorecase).regex_match(re/ab/)` The following example performs a case-insensitive, multiline match in which the dot meta-character also matches a newline character: `http.req.body.regex_match(re/(?ixm) (ˆab (.* ) cd$) /)`

---

**Configuring classic policies and expressions**

January 6, 2019

Some NetScaler features use classic policies and classic expressions. As with default syntax policies,
classic policies can be either global or specific to a virtual server. However, to a certain extent, the configuration method and bind points for classic policies are different from those of default syntax policies. As with default syntax expressions, you can configure named expressions and use a named expression in multiple classic policies.

The following table summarizes NetScaler features that can be configured by using classic policies. Click here to view the table.

**Configure a classic policy**

December 13, 2018

You can configure classic policies and classic expressions by using either the GUI or the command-line interface. A policy rule cannot exceed 1,499 characters. When configuring the policy rule, you can use named classic expressions. For more information about named expressions, see Create named classic expressions. After configuring the policy, you bind it either globally or to a virtual server.

Note that there are small variations in the policy configuration methods for various NetScaler features.

Note: You can embed a classic expression in a default syntax expression by using the syntax SYS.EVAL_CLASSIC_EXPR(classic_expression), specifying the classic_expression as the argument.

**Create a classic policy by using the CLI**

At the command prompt, type the following commands to set the parameters and verify the configuration:

```
1 - add cmp policy <name> -rule <expression> -action <action>
2
3 - show cmp policy [<policyName>]
```

**Example**

The following commands first create a compression action and then create a compression policy that applies the action:

```
1 > add cmp action cmp-act-compress compress
2 Done
3 > show cmp action cmp-act-compress
4 1) Name: cmp-act-compress  Compression Type: compress
5 Done
```
Create a policy with classic expressions by using the GUI

1. In the navigation pane, expand the feature for which you want to configure a policy and, depending on the feature, do the following:
   - For Content Switching, Cache Redirection, and the application firewall, click Policies.
   - For SSL, click Policies, and then in the details pane, click the Policies tab.
   - For System Authentication, click Authentication, and then in the details pane, click the Policies tab.
   - For Filter, SureConnect, and Priority Queuing, expand Protection Features, select the desired function, and then in the details pane, click the Policies tab.
   - For the NetScaler Gateway, expand NetScaler Gateway, expand Policies, select the desired function, and then in the details pane, click the Policies tab.

2. For most features, click the Add button.

3. In the Create <feature name> Policy dialog box, in the Name* text box, enter a name for the policy.
   
   **Note:** You must begin a policy name with a letter or underscore. A policy name can consist of 1 to 31 characters, including letters, numbers, hyphen (-), period (.), pound sign (#), space ( ), and underscore (_).

4. For most features, you associate an action or a profile. For example, you may be required to select an action, or, in the case of a NetScaler Gateway or application firewall policy, you select a profile to associate with the policy. A profile is a set of configuration options that operate as a set of actions that are applied when the data being analyzed matches the policy rule.

5. Create an expression that describes the type of data that you want this policy to match.

   Depending on the type of policy you want to create, you can choose a predefined expression, or you can create a new expression.

   Named expressions are predefined expressions that you can reference by name in a policy rule.

6. Click Create to create your new policy.
7. Click Close to return to the Policies screen for the type of policy you were creating.

**Configure a classic expression**

December 13, 2018

Classic expressions consist of the following expression elements, listed in hierarchical order:

- **Flow Type.** Specifies whether the connection is incoming or outgoing. The flow type is REQ for incoming connections and RES for outgoing connections.
- **Protocol.** Specifies the protocol, the choices for which are HTTP, SSL, TCP, and IP.
- **Qualifier.** The protocol attribute, which depends on the selected protocol.
- **Operator.** The type of test you want to perform on the connection data. Your choice of operator depends upon the connection information you are testing. If the connection information you are testing is text, you use text operators. If it is a number, you use standard numeric operators.
- **Value.** The string or number against which the connection data element—defined by the flow type, protocol, and qualifier—is tested. The value can be either a literal or an expression. The literal or expression must match the data type of the connection data element.

In a policy, classic expressions can be combined to create more complex expressions using Boolean and comparative operators.

Expression elements are parsed from left to right. The leftmost element is either REQ or RES and designates a request or a response, respectively. Successive terms define a specific connection type and a specific attribute for that connection type. Each term is separated from any preceding or following term by a period. Arguments appear in parentheses and follow the expression element to which they are passed.

The following classic expression fragment returns the client source IP for an incoming connection.

```
REQ.IP.SOURCEIP
```

The example identifies an IP address in a request. The expression element SOURCEIP designates the source IP address. This expression fragment may not be useful by itself. You can use an additional expression element, an operator, to determine whether the returned value meets specific criteria. The following expression tests whether the client IP is in the subnet 200.0.0.0/8 and returns a Boolean TRUE or FALSE:

```
REQ.IP.SOURCEIP == 200.0.0.0 -netmask 255.0.0.0
```

**Create a classic policy expression by using the CLI**

At the command prompt, type the following commands to set the parameters and verify the configuration:
Add an expression for a classic policy by using the GUI

This procedure documents the Add Expression dialog box. Depending on the feature for which you are configuring a policy, the route by which you arrive at this dialog box may be different.

1. Perform steps 1-4 in “To create a policy with classic expressions by using the GUI.”

2. In the Add Expression dialog box, in Expression Type, click the type of expression you want to create.

3. Under Flow Type, click the down arrow and choose a flow type.

   The flow type is typically REQ or RES. The REQ option specifies that the policy applies to all incoming connections or requests. The RES option applies the policy to all outgoing connections or responses.

   For Application Firewall policies, you should leave the expression type set to General Expression, and the flow type set to REQ. The Application Firewall treats each request and response as a single paired entity, so all Application Firewall policies begin with REQ.

4. Under Protocol, click the down arrow and choose the protocol you want for your policy expression. Your choices are:
   - HTTP. Evaluates HTTP requests that are sent to a Web server. For classic expressions, HTTP includes HTTPS requests.
• SSL. Evaluates SSL data associated with the current connection.
• TCP. Evaluates the TCP data associated with the current connection.
• IP. Evaluates the IP addresses associated with the current connection.

5. Under Qualifier, click the down arrow and choose a qualifier for your policy.

The qualifier defines the type of data to be evaluated. The list of qualifiers that appears depends on which protocol you selected in step 4.

The following choices appear for the HTTP protocol:

• METHOD. Filters HTTP requests that use a particular HTTP method.
• URL. Filters HTTP requests for a specific Web page.
• URLQUERY. Filters HTTP requests that contain a particular query string.
• VERSION. Filters HTTP requests on the basis of the specified HTTP protocol version.
• HEADER. Filters on the basis of a particular HTTP header.
• URLLEN. Filters on the basis of the length of the URL.
• URLQUERY. Filters on the basis of the query portion of the URL.
• URLQUERYLEN. Filters on the basis of the length of the query portion of the URL only.

6. Under Operator, click the down arrow and choose the operator for your policy expression. Some common operators are:

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>==</td>
<td>Matches the specified value exactly or is exactly equal to the specified value.</td>
</tr>
<tr>
<td>!=</td>
<td>Does not match the specified value.</td>
</tr>
<tr>
<td>&gt;</td>
<td>Is greater than the specified value.</td>
</tr>
<tr>
<td>&lt;</td>
<td>Is less than the specified value.</td>
</tr>
<tr>
<td>&gt;=</td>
<td>Is greater than or equal to the specified value.</td>
</tr>
<tr>
<td>&lt;=</td>
<td>Is less than or equal to the specified value.</td>
</tr>
<tr>
<td>CONTAINS</td>
<td>Contains the specified value.</td>
</tr>
<tr>
<td>CONTENTS</td>
<td>Returns the contents of the designated header, URL, or URL query.</td>
</tr>
<tr>
<td>EXISTS</td>
<td>The specified header or query exists.</td>
</tr>
<tr>
<td>NOTCONTAINS</td>
<td>Does not contain the specified value.</td>
</tr>
<tr>
<td>NOTEXISTS</td>
<td>The specified header or query does not exist.</td>
</tr>
</tbody>
</table>

7. If a Value text box appears, type a string or numeric value, as appropriate. For example, chose
REQ as the Flow Type, HTTP as the Protocol, and HEADER as the qualifier, and then type the
value of the header string in the Value field and the header type for which you want to match
the string in the Header Name text box.

8. Click OK.

9. To create a compound expression, click Add. Note that the type of compounding that is done
depends on the following choices in the Create Policy dialog box:

- **Match Any Expression.** The expressions are in a logical OR relationship.
- **Match All Expressions.** The expressions are in a logical AND relationship.
- **Tabular Expressions.** Click the AND, OR, and parentheses buttons to control evaluation.
- **Advanced Free-Form.** Enter the expressions components directly into the Expression
  field, and click the AND, OR, and parentheses buttons to control evaluation.

### Bind a classic policy

December 10, 2018

Depending on the policy type, you can bind a classic policy either globally or to a virtual server. Policy
bind points are described in the table, “Policy Type and Bind Points for Policies in Features That Use
Classic Policies.”

**Note:** You can bind a classic policy to multiple bind points.

### Bind a classic policy globally by using the CLI

At the command prompt, type the following commands to set the parameters and verify the configu-
ration:

```
1 - bind cmp global <policyName> [-priority <positive_integer>]
2
3 - show cmp global
```

**Example**

```
1 > bind cmp global cmp-pol-compress -priority 2
2    Done
3 > show cmp global
4 1) Policy Name: cmp-pol-compress    Priority: 2
5 2) Policy Name: ns_nocmp_xml_ie    Priority: 8700
6 3) Policy Name: ns_nocmp_mozilla_47  Priority: 8800
```
Bind a classic policy to a virtual server by using the CLI

At the command prompt, type the following commands to set the parameters and verify the configuration:

```
1 - bind lb vserver <name> [<targetVserver>] [-policyName <string> [-priority <positive_integer>]]
2
3 - show lb vserver <name>
```

Example

```
> bind lb vserver lbtemp -policyName cmp-pol-compress -priority 1
Done
> show lb vserver lbtemp
lbtemp (10.102.29.101:80) - HTTP Type: ADDRESS
State: UP
Last state change was at Tue Oct 27 06:40:38 2009 (+557 ms)
Time since last state change: 0 days, 02:00:40.330
Effective State: UP
Client Idle Timeout: 180 sec
Down state flush: ENABLED
Disable Primary Vserver On Down : DISABLED
Port Rewrite : DISABLED
No. of Bound Services : 1 (Total) 1 (Active)
Configured Method: LEASTCONNECTION
Current Method: Round Robin, Reason: Bound service’s state changed to UP
Group: vserver-grp
Mode: IP
Persistence: COOKIEINSERT (version 0) Persistence Backup: SOURCEIP Persistence Mask: 255.255.255.255
Persistence Timeout: 2 min Backup Persistence Timeout: 2 min
Vserver IP and Port insertion: OFF
Push: DISABLED Push VServer:
```
### Bind a classic policy globally by using the GUI

**Note:** This procedure documents the Global Bindings dialog box. Depending on the feature for which you want to globally bind a policy, the route by which you arrive at this dialog box may be different.

1. In the navigation pane, expand the feature for which you want to globally bind a classic policy, and then locate the policy that you want to bind globally.

   **Note:** You cannot globally bind policies for Content Switching, Cache Redirection, SureConnect, Priority Queuing, or NetScaler Gateway Authorization.

2. In the details pane, click Global Bindings.

3. In the Bind/Unbind <feature name> Policy(s) to Global dialog box, click Insert Policy.

4. In the Policy Name column, click the name of an existing policy that you want to globally bind, or click New Policy to open the Create <feature name> Policy dialog box.

5. After you have selected the policy or created a new policy, in the Priority column, type the priority value.

   The lower the number, the sooner this policy is applied relative to other policies. For example, a policy assigned a priority of 10 is applied before a policy with a priority of 100. You can use the same priority for different policies. All features that use classic policies implement only the first policy that a connection matches, so policy priority is important for getting the results you intend.

   As a best practice, leave room to add policies by setting priorities with intervals of 50 (or 100) between each policy.

6. Click OK.

### Bind a classic policy to a virtual server by using the GUI

1. In the navigation pane, expand the feature that contains the virtual server to which you want to bind a classic policy (for example, if you want to bind a classic policy to a content switching
virtual server, expand Traffic Management > Content Switching), and then click Virtual Servers.

2. In the details pane, select the virtual server, and then click Open.

3. In the Configure <Feature> Virtual Server dialog box, on the Policies tab, click the feature icon for the type policy that you want, and then click Insert Policy.

4. In the Policy Name column, click the name of an existing policy that you want to bind to a virtual server, or click A to open the Create <feature name> Policy dialog box.

5. After you have selected the policy or created a new policy, in the Priority column, set the priority.
   If you are binding a policy to a content switching virtual server, in the Target column, select a load balancing virtual server to which traffic that matches the policy should be sent.

6. Click OK.

View classic policies

December 10, 2018

You can view classic policies by using either the GUI or the command line. You can view details such as the policy's name, expression, and bindings.

View a classic policy and its binding information by using the CLI

At the command prompt, type the following commands to view a classic policy and its binding information:

```
show <featureName> policy [policyName]
```

Example

```
 1 > show appfw policy GenericApplicationSSL_
 2 Name: GenericApplicationSSL_    Rule: ns_only_get_adv
 3 Profile: GenericApplicationSSL_Prof1    Hits: 0
 4 Undef Hits: 0
 5 Policy is bound to following entities
 6 1) REQ VSERVER app_u_GenericApplicationSSLPortalPages
     PRIORITY : 100
 7 Done
```

Note: If you omit the policy name, all policies are listed without the binding details.
View classic policies and policy bindings by using the GUI

1. In the navigation pane, expand the feature whose policies you want to view, (for example, if you want to view application firewall policies, expand Application Firewall), and then click Policies.
2. In the details pane, do one or more of the following:
   • To view details for a specific policy, click the policy. Details appear in the Details area of the configuration pane.
   • To view bindings for a specific policy, click the policy, and then click Show Bindings.
   • To view global bindings, click the policy, and then click Global Bindings. Note that you cannot bind a Content Switching, Cache Redirection, SureConnect, Priority Queuing, or NetScaler Gateway Authorization policy globally.

Create named classic expressions

December 13, 2018

A named classic expression is a classic expression that can be referenced through an assigned name. Often, you need to configure classic expressions that are large or complex and form a part of a larger compound expression. You might also configure classic expressions that you need to use frequently and in multiple compound expressions or classic policies. In these scenarios, you can create the classic expression you want, save it with a name of your choice, and then reference the expression from compound expressions or policies through its name. This saves configuration time and improves the readability of complex compound expressions. Additionally, any modifications to a named classic expression need to be made only once.

Some named expressions are built-in, and a subset of these are read-only. Built-in named expressions are divided into four categories: General, Anti-Virus, Personal Firewall, and Internet Security. General named expressions have a wide variety of uses. For example, from the General category, you can use the expressions ns_true and ns_false to specify a value of TRUE or FALSE, respectively, to be returned for all traffic. You can also identify data of a particular type (for example, HTM, DOC, or GIF files), determine whether caching headers are present, or determine whether the round trip time for packets between a client and the NetScaler is high (over 80 milliseconds).

Anti-Virus, Personal Firewall, and Internet Security named expressions test clients for the presence of a particular program and version and are used primarily in NetScaler Gateway policies.

Note: You cannot modify or delete built-in named expressions.

Create a named classic expression by using the CLI

At the command prompt, type the following commands to set the parameters and verify the configuration:
### Create a named classic expression by using the GUI

1. In the navigation pane, expand AppExpert, expand Expressions, and then click Classic Expressions.

2. In the details pane, click Add.

   Note: Some of the built-in expressions in the Expressions list are read-only.

3. In the Create Policy Expression dialog box, specify values for the following parameters:
   - Expression Name*—name
   - Client Security Message—clientSecurityMessage
   - Comments—comment

   *A required parameter

4. To create the expression, do one of the following:
   - You can choose inputs to this expression from the Named Expressions drop-down list.
   - You can create a new expression, as described in Add an expression for a classic policy by using the GUI.

5. When you are done, click Close. Verify that your new expression was created by scrolling to the bottom of the Classic Expressions list to view it.
Expressions reference-advanced policy expressions

January 6, 2019

Warning

Q and S prefixes are deprecated from NetScaler 12.0 build 56.20 onwards and are no longer supported in Advanced policy expressions.

The following table is a listing of default syntax expression prefixes, with cross-references to descriptions of these prefixes and the operators that you can specify for them. Note that some prefixes can work with multiple types of operators. For example, a cookie can be parsed by using operators for text or operators for HTTP headers.

You can use any element in the following tables as a complete expression on its own, or you can use various operators to combine these expression elements with others to form more complex expressions.

Note: The Description column in the following table contains cross-references to additional information about prefix usage and applicable operators for the prefix.

Click here to view the table.

Expressions reference-classic expressions

January 6, 2019

Warning

Classic policy expressions are no longer supported from NetScaler 12.0 build 56.20 onwards and as an alternative, Citrix recommends you to use Advanced policies. For more information, see Advanced Policies

The subtopics listed in the table of contents on the left side of your screen contain tables listing the NetScaler classic expressions.

In the table of operators, the result type of each operator is shown at the beginning of the description. In the other tables, the level of each expression is shown at the beginning of the description. For named expressions, each expression is shown as a whole.

Operators
<table>
<thead>
<tr>
<th>Expression Element</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>==</td>
<td>Boolean. Returns TRUE if the current expression equals the argument. For text operations, the items being compared must exactly match one another. For numeric operations, the items must evaluate to the same number.</td>
</tr>
<tr>
<td>!=</td>
<td>Boolean. Returns TRUE if the current expression does not equal the argument. For text operations, the items being compared must not exactly match one another. For numeric operations, the items must not evaluate to the same number.</td>
</tr>
<tr>
<td>CONTAINS</td>
<td>Boolean. Returns TRUE if the current expression contains the string that is designated in the argument.</td>
</tr>
<tr>
<td>NOTCONTAINS</td>
<td>Boolean. Returns TRUE if the current expression does not contain the string that is designated in the argument.</td>
</tr>
<tr>
<td>CONTENTS</td>
<td>Text. Returns the contents of the current expression.</td>
</tr>
<tr>
<td>EXISTS</td>
<td>Boolean. Returns TRUE if the item designated by the current expression exists.</td>
</tr>
<tr>
<td>NOTEXISTS</td>
<td>Boolean. Returns TRUE if the item designated by the current expression does not exist.</td>
</tr>
<tr>
<td>&gt;</td>
<td>Boolean. Returns TRUE if the current expression evaluates to a number that is greater than the argument.</td>
</tr>
<tr>
<td>&lt;</td>
<td>Boolean. Returns TRUE if the current expression evaluates to a number that is less than the argument.</td>
</tr>
<tr>
<td>&gt;=</td>
<td>Boolean. Returns TRUE if the current expression evaluates to a number that is greater than or equal to the argument.</td>
</tr>
</tbody>
</table>
### Expression Element Definition

<table>

### General expressions

<table>
<thead>
<tr>
<th>Expression Element</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>REQ</td>
<td>Flow Type. Operates on incoming (or request) packets.</td>
</tr>
<tr>
<td>REQ.HTTP</td>
<td>Protocol. Operates on HTTP requests.</td>
</tr>
<tr>
<td>REQ.HTTP.METHOD</td>
<td>Qualifier. Designates the HTTP method.</td>
</tr>
<tr>
<td>REQ.HTTP.URL</td>
<td>Qualifier. Designates the URL.</td>
</tr>
<tr>
<td>REQ.HTTP.URLTOKENS</td>
<td>Qualifier. Designates the URL token.</td>
</tr>
<tr>
<td>REQ.HTTP.VERSION</td>
<td>Qualifier. Designates the HTTP version.</td>
</tr>
<tr>
<td>REQ.HTTP.HEADER</td>
<td>Qualifier. Designates the HTTP header.</td>
</tr>
<tr>
<td>REQ.HTTP.URLLEN</td>
<td>Qualifier. Designates the number of characters in the URL.</td>
</tr>
<tr>
<td>REQ.HTTP.URLQUERY</td>
<td>Qualifier. Designates the query portion of the URL.</td>
</tr>
<tr>
<td>REQ.HTTP.URLQUERYLEN</td>
<td>Qualifier. Designates the length of the query portion of the URL.</td>
</tr>
<tr>
<td>REQ.SSL</td>
<td>Protocol. Operates on SSL requests.</td>
</tr>
<tr>
<td>REQ.SSL.CLIENT.CERT</td>
<td>Qualifier. Designates the entire client certificate.</td>
</tr>
<tr>
<td>REQ.SSL_CLIENT.CERT.SUBJECT</td>
<td>Qualifier. Designates the client certificate subject.</td>
</tr>
<tr>
<td>REQ.SSL_CLIENT.CERT.ISSUER</td>
<td>Qualifier. Designates the issuer of the client certificate.</td>
</tr>
<tr>
<td>REQ.SSL_CLIENT.CERT.SIGALGO</td>
<td>Qualifier. Designates the validation algorithm used by the client certificate.</td>
</tr>
<tr>
<td>REQ.SSL_CLIENT.CERT.VERSION</td>
<td>Qualifier. Designates the client certificate version.</td>
</tr>
<tr>
<td>Expression Element</td>
<td>Definition</td>
</tr>
<tr>
<td>------------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>REQ.SSL.CLIENT.CERT.VALIDFROM</td>
<td>Qualifier. Designates the date before which the client certificate is not valid.</td>
</tr>
<tr>
<td>REQ.SSL.CLIENT.CERT.VALIDTO</td>
<td>Qualifier. Designates the date after which the client certificate is not valid.</td>
</tr>
<tr>
<td>REQ.SSL.CLIENT.CERT.SERIALNUMBER</td>
<td>Qualifier. Designates the serial number of the client certificate.</td>
</tr>
<tr>
<td>REQ.SSL.CLIENT.CIPHER.TYPE</td>
<td>Qualifier. Designates the encryption protocol used by the client.</td>
</tr>
<tr>
<td>REQ.SSL.CLIENT.CIPHER.BITS</td>
<td>Qualifier. Designates the number of bits used by the client’s SSL key.</td>
</tr>
<tr>
<td>REQ.SSL.CLIENT.SSL.VERSION</td>
<td>Qualifier. Designates the SSL version that the client is using.</td>
</tr>
<tr>
<td>REQ.TCP</td>
<td>Protocol. Operates on incoming TCP packets.</td>
</tr>
<tr>
<td>REQ.TCP.SOURCEPORT</td>
<td>Qualifier. Designates the source port of the incoming packet.</td>
</tr>
<tr>
<td>REQ.TCP.DESTPORT</td>
<td>Qualifier. Designates the destination port of the incoming packet.</td>
</tr>
<tr>
<td>REQ.IP</td>
<td>Protocol. Operates on incoming IP packets.</td>
</tr>
<tr>
<td>REQ.IP.SOURCEIP</td>
<td>Qualifier. Designates the source IP of the incoming packet.</td>
</tr>
<tr>
<td>REQ.IP.DESTIP</td>
<td>Qualifier. Designates the destination IP of the incoming packet.</td>
</tr>
<tr>
<td>RES</td>
<td>Flow Type. Operates on outgoing (or response) packets.</td>
</tr>
<tr>
<td>RES.HTTP</td>
<td>Protocol. Operates on HTTP responses.</td>
</tr>
<tr>
<td>RES.HTTP.VERSION</td>
<td>Qualifier. Designates the HTTP version.</td>
</tr>
<tr>
<td>RES.HTTP.HEADER</td>
<td>Qualifier. Designates the HTTP header.</td>
</tr>
<tr>
<td>RES.HTTP.STATUSCODE</td>
<td>Qualifier. Designates the status code of the HTTP response.</td>
</tr>
<tr>
<td>RES.TCP</td>
<td>Protocol. Operates on incoming TCP packets.</td>
</tr>
<tr>
<td>RES.TCP.SOURCEPORT</td>
<td>Qualifier. Designates the source port of the outgoing packet.</td>
</tr>
</tbody>
</table>
Expression Element | Definition
--- | ---
RES.TCP.DESTPORT | Qualifier. Designates the destination port of the outgoing packet.
RES.IP | Protocol. Operates on outgoing IP packets.
RES.IP.SOURCEIP | Qualifier. Designates the source IP of the outgoing packet. This can be in IPv4 or IPv6 format. For example: add expr exp3 “sourceip == 10.102.32.123 –netmask 255.255.255.0 && destip == 2001::23/120”.
RES.IP.DESTIP | Qualifier. Designates the destination IP of the outgoing packet.

**Client security expressions**

The expressions to configure client settings on the Access Gateway with the following software:

- Antivirus
- Personal firewall
- Antispam
- Internet Security

For example usage, see [http://support.citrix.com/article/CTX112599](http://support.citrix.com/article/CTX112599).

**Actual Expression** | **Definition**
--- | ---
CLIENT.APPLICATION.AV(<NAME>.VERSION == <VERSION>) | Checks whether the client is running the designated anti-virus program and version.
CLIENT.APPLICATION.AV(<NAME>.VERSION != <VERSION>) | Checks whether the client is not running the designated anti-virus program and version.
CLIENT.APPLICATION.PF(<NAME>.VERSION == <VERSION>) | Checks whether the client is running the designated personal firewall program and version.
CLIENT.APPLICATION.PF(<NAME>.VERSION != <VERSION>) | Checks whether the client is not running the designated personal firewall program and version.
CLIENT.APPLICATION.IS(<NAME>.VERSION == <VERSION>) | Checks whether the client is running the designated internet security program and version.

### Actual Expression Definition

<table>
<thead>
<tr>
<th>Expression</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLIENT.APPLICATION.IS(&lt;NAME&gt;.VERSION != &lt;VERSION&gt;)</td>
<td>Checks whether the client is not running the designated internet security program and version.</td>
</tr>
<tr>
<td>CLIENT.APPLICATION.AS(&lt;NAME&gt;.VERSION == &lt;VERSION&gt;)</td>
<td>Checks whether the client is running the designated anti-spam program and version.</td>
</tr>
<tr>
<td>CLIENT.APPLICATION.AS(&lt;NAME&gt;.VERSION != &lt;VERSION&gt;)</td>
<td>Checks whether the client is not running the designated anti-spam program and version.</td>
</tr>
</tbody>
</table>

### Network-based expressions

<table>
<thead>
<tr>
<th>Expression</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>REQ</td>
<td>Flow Type. Operates on incoming, or request, packets.</td>
</tr>
<tr>
<td>REQ.VLANID</td>
<td>Qualifier. Operates on the virtual LAN (VLAN) ID.</td>
</tr>
<tr>
<td>REQ INTERFACE.ID</td>
<td>Qualifier. Operates on the ID of the designated NetScaler interface.</td>
</tr>
<tr>
<td>REQ INTERFACE.RXTHROUGHPUT</td>
<td>Qualifier. Operates on the raw received packet throughput of the designated NetScaler interface.</td>
</tr>
<tr>
<td>REQ INTERFACE.TXTHROUGHPUT</td>
<td>Qualifier. Operates on the raw transmitted packet throughput of the designated NetScaler interface.</td>
</tr>
<tr>
<td>REQ INTERFACE.RXTXTHROUGHPUT</td>
<td>Qualifier. Operates on the raw received and transmitted packet throughput of the designated NetScaler interface.</td>
</tr>
<tr>
<td>REQ ETHER SOURCEMAC</td>
<td>Qualifier. Operates on the source MAC address.</td>
</tr>
<tr>
<td>REQ ETHER DESTMAC</td>
<td>Qualifier. Operates on the destination MAC address.</td>
</tr>
<tr>
<td>RES</td>
<td>Flow Type. Operates on outgoing (or response) packets.</td>
</tr>
<tr>
<td>RES VLANID</td>
<td>Qualifier. Operates on the virtual LAN (VLAN) ID.</td>
</tr>
</tbody>
</table>
### Expression Definitions

<table>
<thead>
<tr>
<th>Expression</th>
<th>Definition</th>

</tbody>
</table>

### Date/Time Expressions

<table>
<thead>
<tr>
<th>Expression</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>TIME</td>
<td>Qualifier. Operates on the date and time of day, GMT.</td>
</tr>
<tr>
<td>DATE</td>
<td>Qualifier. Operates on the date, GMT.</td>
</tr>
<tr>
<td>DAYOFWEEK</td>
<td>Operates on the specified day in the week, GMT.</td>
</tr>
</tbody>
</table>

### File System Expressions

You can specify file system expressions in authorization policies for users and groups who access file sharing through the NetScaler Gateway file transfer utility (the VPN portal). These expressions work with the NetScaler Gateway file transfer authorization feature to control user access to file servers, folders, and files. For example, you can use these expressions in authorization policies to control access based on file type and size.

For more information, refer to the [File Name Expression pdf](#).

**Note:** File system expressions do not support regular expressions.
# Built-in named expressions (General)

<table>
<thead>
<tr>
<th>Expression</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>ns_all_apps_ncomp</td>
<td>Tests for connections with destination ports between 0 and 65535. In other words, tests for all applications.</td>
</tr>
<tr>
<td>ns_cachecontrol_nocache</td>
<td>Tests for connections with an HTTP Cache-Control header that contains the value “no-cache”.</td>
</tr>
<tr>
<td>ns_cachecontrol_nostore</td>
<td>Tests for connections with an HTTP Cache-Control header that contains the value “no-store”.</td>
</tr>
<tr>
<td>ns_cmpclient</td>
<td>Tests the client to determine if it accepts compressed content.</td>
</tr>
<tr>
<td>ns_content_type</td>
<td>Tests for connections with an HTTP Content-Type header that contains “text”.</td>
</tr>
<tr>
<td>ns_css</td>
<td>Tests for connections with an HTTP Content-Type header that contains “text/css”.</td>
</tr>
<tr>
<td>ns_ext_asp</td>
<td>Tests for HTTP connections to any URL that contains the string .asp—in other words, any connection to an active server page (ASP).</td>
</tr>
<tr>
<td>ns_ext_cfm</td>
<td>Tests for HTTP connections to any URL that contains the string .cfm</td>
</tr>
<tr>
<td>ns_ext.cgi</td>
<td>Tests for HTTP connections to any URL that contains the string .cgi—in other words, any connection to a common gateway interface (CGI) script.</td>
</tr>
<tr>
<td>ns_ext_ex</td>
<td>Tests for HTTP connections to any URL that contains the string .ex</td>
</tr>
<tr>
<td>ns_ext.exe</td>
<td>Tests for HTTP connections to any URL that contains the string .exe—in other words, any connection to an executable file.</td>
</tr>
<tr>
<td>ns_ext_htx</td>
<td>Tests for HTTP connections to any URL that contains the string .htx</td>
</tr>
<tr>
<td>Expression</td>
<td>Definition</td>
</tr>
<tr>
<td>--------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>ns_ext_not_gif</td>
<td>Tests for HTTP connections to any URL that does not contain the string .gif—in other words, any connection to a URL that is not a GIF image.</td>
</tr>
<tr>
<td>ns_ext_not_jpeg</td>
<td>Tests for HTTP connections to any URL that does not contain the string .jpeg—in other words, any connection to a URL that is not a JPEG image.</td>
</tr>
<tr>
<td>ns_ext_shtml</td>
<td>Tests for HTTP connections to any URL that contains the string .shtml—in other words, any connection to a server-parsed HTML page.</td>
</tr>
<tr>
<td>ns_false</td>
<td>Always returns a value of FALSE.</td>
</tr>
<tr>
<td>ns_farclient</td>
<td>Client is in a different geographical region from the NetScaler, as determined by the geographical region in the client’s IP address. The following regions are predefined: 192.0.0.0 – 193.255.255.255: Multi-regional, 194.0.0.0 – 195.255.255.255: European Union, 196.0.0.0 – 197.255.255.255: Other1, 198.0.0.0 – , 199.255.255.255: North America, 200.0.0.0 – 201.255.255.255: Central and South America, 202.0.0.0 – 203.255.255.255: Pacific Rim, 204.0.0.0 – 205.255.255.255: Other2, and 206.0.0.0 – 207.255.255.255: Other3</td>
</tr>
<tr>
<td>ns_header_cookie</td>
<td>Tests for HTTP connections that contain a Cookie header.</td>
</tr>
<tr>
<td>ns_headerPragma</td>
<td>Tests for HTTP connections that contain a Pragma: no-cache header.</td>
</tr>
<tr>
<td>ns_mozilla_47</td>
<td>Tests for HTTP connections whose User-Agent header contains the string Mozilla/4.7—in other words, any connection from a client using the Mozilla 4.7 Web browser.</td>
</tr>
<tr>
<td>ns_msexcel</td>
<td>Tests for HTTP connections whose Content-Type header contains the string application/vnd.msexcel—in other words, any connection transmitting a Microsoft Excel spreadsheet.</td>
</tr>
</tbody>
</table>
### Expression Definition

<table>
<thead>
<tr>
<th>Expression</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>ns_msie</td>
<td>Tests for HTTP connections whose User-Agent header contains the string MSIE—in other words, any connection from a client using any version of the Internet Explorer Web browser.</td>
</tr>
<tr>
<td>ns_msppt</td>
<td>Tests for HTTP connections whose Content-Type header contains the string application/vnd.ms-powerpoint—in other words, any connection transmitting a Microsoft PowerPoint file.</td>
</tr>
<tr>
<td>ns_msword</td>
<td>Tests for HTTP connections whose Content-Type header contains the string application/vnd.msword—in other words, any connection transmitting a Microsoft Word file.</td>
</tr>
<tr>
<td>ns_non_get</td>
<td>Tests for HTTP connections that use any HTTP method except for GET.</td>
</tr>
<tr>
<td>ns_slowclient</td>
<td>Returns TRUE if the average round trip time between the client and the NetScaler is more than 80 milliseconds.</td>
</tr>
<tr>
<td>ns_true</td>
<td>Returns TRUE for all traffic.</td>
</tr>
<tr>
<td>ns_url_path_bin</td>
<td>Tests the URL path to see if it points to the /bin/ directory.</td>
</tr>
<tr>
<td>ns_url_path_cgibin</td>
<td>Tests the URL path to see if it points to the CGI-BIN directory.</td>
</tr>
<tr>
<td>ns_url_path_exec</td>
<td>Tests the URL path to see if it points to the /exec/directory.</td>
</tr>
<tr>
<td>ns_url_tokens</td>
<td>Tests for the presence of URL tokens.</td>
</tr>
<tr>
<td>ns_xmldata</td>
<td>Tests for the presence of XML data.</td>
</tr>
</tbody>
</table>

### Built-in named expressions (Anti-Virus)

Summary examples of default syntax expressions and policies

December 10, 2018

The following table provides examples of default syntax expressions that you can use as the basis for your own default syntax expressions.

Table 1. Examples of Default Syntax Expressions

<table>
<thead>
<tr>
<th>Expression Type</th>
<th>Sample Expressions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Look at the method used in the HTTP request.</td>
<td>http.req.method.eq(post)http.req.method.eq(get)</td>
</tr>
<tr>
<td>Expression Type</td>
<td>Sample Expressions</td>
</tr>
<tr>
<td>-----------------</td>
<td>--------------------</td>
</tr>
<tr>
<td>Check for the presence of a header in a request (req) or response (res).</td>
<td><code>http.req.header(&quot;myHeader&quot;).exists</code>&lt;br&gt;<code>http.res.header(&quot;myHeader&quot;).exists</code></td>
</tr>
<tr>
<td>Look for a particular file type in an HTTP request based on the file extension.</td>
<td><code>http.req.url.contains(&quot;.html&quot;)</code>&lt;br&gt;<code>http.req.url.contains(&quot;.cgi&quot;)</code>&lt;br&gt;<code>http.req.url.contains(&quot;.asp&quot;)</code>&lt;br&gt;<code>http.req.url.contains(&quot;.exe&quot;)</code>&lt;br&gt;<code>http.req.url.contains(&quot;.cfm&quot;)</code>&lt;br&gt;<code>http.req.url.contains(&quot;.ex&quot;)</code>&lt;br&gt;<code>http.req.url.contains(&quot;.shtml&quot;)</code>&lt;br&gt;<code>http.req.url.contains(&quot;.htx&quot;)</code>&lt;br&gt;<code>http.req.url.contains(&quot;/cgi-bin/&quot;)</code>&lt;br&gt;<code>http.req.url.contains(&quot;/exec/&quot;)</code>&lt;br&gt;<code>http.req.url.contains(&quot;/bin/&quot;)</code></td>
</tr>
</tbody>
</table>
| Look for anything that is other than a particular file type in an HTTP request. | `http.req.url.contains(".gif").not;`<br>`http.req.url.contains(".jpeg").not;`
Check the type of file that is being sent in an HTTP response based on the Content-Type header.

- `http.res.header("Content-Type").contains("text")`
- `http.res.header("Content-Type").contains("application/msword")`
- `http.res.header("Content-Type").contains("vnd.ms-excel")`
- `http.res.header("Content-Type").contains("application/vnd.ms-powerpoint")`
- `http.res.header("Content-Type").contains("text/css")`
- `http.res.header("Content-Type").contains("text/xml")`
- `http.res.header("Content-Type").contains("image/"))`

Check whether this response contains an expiration header.

- `'http.res.header("Expires").exists`'

Check for a Set-Cookie header in a response.

- `http.res.header("Set-Cookie").exists`'

Check the agent that sent the response.

- `http.res.header("User-Agent").contains("Mozilla/4.7")`
- `http.res.header("User-Agent").contains("MSIE")`'

Check if the first 1024 bytes of the body of a request starts with the string "some text".

- `http.req.body(1024).contains("some text")`

The following table shows examples of policy configurations and bindings for commonly used functions.

Tutorial examples of default syntax policies for rewrite

December 10, 2018

With the rewrite feature, you can modify any part of an HTTP header, and, for responses, you can modify the HTTP body. You can use this feature to accomplish a number of useful tasks, such as removing unnecessary HTTP headers, masking internal URLs, redirecting Web pages, and redirecting queries or keywords.

In the following examples, you first create a rewrite action and a rewrite policy. Then you bind the policy globally.

This document includes the following details:

- Redirecting an External URL to an Internal URL
- Redirecting a Query
- Rewriting HTTP to HTTPS
- Removing Unwanted Headers
- Reducing Web Server Redirects
- Masking the Server Header

For more information about the commands and syntax descriptions, see Rewrite Command Reference page.

Redirecting an external URL to an internal URL

Updated: 2013-10-29

This example describes how to create a rewrite action and rewrite policy that redirects an external URL to an internal URL. You create an action, called act_external_to_internal, that performs the rewrite. Then you create a policy called pol_external_to_internal.

To redirect an external URL to an internal URL by using the command line interface

- To create the rewrite action, at the command prompt, type:
  
  add rewrite action act_external_to_internal REPLACE 'http.req.hostname.server' "host_name_of_internal_Web_server"
  
- To create the rewrite policy, at the NetScaler command prompt, type:
  
  add rewrite policy pol_external_to_internal 'http.req.hostname.server.eq("host_name_of_external_Web_server") act_external_to_internal'

- Bind the policy globally.
To redirect an external URL to an internal URL by using the GUI

1. Navigate to AppExpert > Rewrite > Actions.
2. In the details pane, click Add.
3. In the Create Rewrite Action dialog box, enter the name act_external_to_internal.
4. To replace the HTTP server host name with the internal server name, choose Replace from the Type list box.
5. In the Header Name field, type Host.
6. In the String expression for replacement text field, type the internal host name of your Web server.
7. Click Create and then click Close.
8. In the navigation pane, click Policies.
9. In the details pane, click Add.
10. In the Name field, type pol_external_to_internal. This policy will detect connections to the Web server.
11. In the Action drop-down menu, choose the action act_external_to_internal.
12. In the Expression editor, construct the following expression:

   ```plaintext
   HTTP.REQ.HOSTNAME.SERVER.EQ("www.example.com")
   ```

13. Bind your new policy globally.

Redirecting a query

This example describes how to create a rewrite action and rewrite policy that redirects a query to the proper URL. The example assumes that the request contains a Host header set to `www.example.com` and a GET method with the `string/query.cgi?server=5`. The redirect extracts the domain name from the host header and the number from the query string, and redirects the user’s query to the server `Web5.example.com`, where the rest of the user’s query is processed.

Note: Although the following commands appears on multiple lines, you should enter them on a single line without line breaks.

To redirect a query to the appropriate URL using the command line

- To create a rewrite action named act_redirect_query that replaces the HTTP server host name with the internal server name, type:
add rewrite action \texttt{act\_redirect\_query} REPLACE q\#http.req.header(“Host”).before_str(“.example.com”)’ “Web” + http.req.url.query.value(“server”)

• To create a rewrite policy named \texttt{pol\_redirect\_query}, type the following commands at the NetScaler command prompt. This policy detects connections, to the Web server, that contain a query string. Do not apply this policy to connections that do not contain a query string:

   add rewrite policy \texttt{pol\_redirect\_query} q\#http.req.header(“Host”).eq(“www.example.com”) && http.req.url.contains(“?”)’ \texttt{act\_redirect\_query}

• Bind your new policy globally.

Because this rewrite policy is highly specific and should be run before any other rewrite policies, it is advisable to assign it a high priority. If you assign it a priority of 1, it will be evaluated first.

**Rewriting HTTP to HTTPS**

Updated: 2014-09-17

This example describes how to rewrite Web server responses to find all URLs that begin with the string “http” and replace that string with “https.” You can use this to avoid having to update Web pages after moving a server from HTTP to HTTPS.

**To redirect HTTP URLs to HTTPS by using the command line interface**

• To create a rewrite action named \texttt{act\_replace\_http\_with\_https} that replaces all instances of the string “http” with the string “https,” enter the following command:

   add rewrite action \texttt{act\_replace\_http\_with\_https} replace_all ‘http.res.body(100)’ “https” -pattern http

• To create a rewrite policy named \texttt{pol\_replace\_http\_with\_https} that detects connections to the Web server, enter the following command:

   add rewrite policy \texttt{pol\_replace\_http\_with\_https} TRUE \texttt{act\_replace\_http\_with\_https} \texttt{NOREWRITE}

• Bind your new policy globally.

To troubleshoot this rewrite operation, see “Case Study: Rewrite Policy for Converting HTTP Links to HTTPS not Working.”

**Removing Unwanted Headers**

Updated: 2013-09-02
This example explains how to use a Rewrite policy to remove unwanted headers. Specifically, the example shows how to remove the following headers:

- **Accept Encoding header.** Removing the Accept Encoding header from HTTP responses prevents compression of the response.
- **Content Location header.** Removing the Content Location header from HTTP responses prevents your server from providing a hacker with information that might allow a security breach.

To delete headers from HTTP responses, you create a rewrite action and a rewrite policy, and you bind the policy globally.

**To create the appropriate Rewrite action by using the command line interface**

At the command prompt, type one of the following commands to either remove the Accept Encoding header and prevent response compression or remove the Content Location header:

- add rewrite action “act_remove-ae” delete_http_header “Accept-Encoding”
- add rewrite action “act_remove-cl” delete_http_header “Content-Location”

**To create the appropriate Rewrite policy by using the command line interface**

At the command prompt, type one of the following commands to remove either the Accept Encoding header or the Content Location header:

- add rewrite policy “pol_remove-ae” true “act_remove-ae”
- add rewrite policy “pol_remove-cl” true “act_remove-cl”

**To bind the policy globally by using the command line interface**

At the command prompt, type one of the following commands, as appropriate, to globally bind the policy that you have created:

- bind rewrite global pol_remove_ae 100
- bind rewrite global pol_remove_cl 200

**Reducing Web Server Redirects**

This example explains how to use a Rewrite policy to modify connections to your home page and other URLs that end with a forward slash (/) to the default index page for your server, preventing redirects and reducing load on your server.
To modify directory-level HTTP requests to include the default home page by using the command line

- To create a Rewrite action named action-default-homepage that modifies URLs that end in a forward slash to include the default home page index.html, type:

  add rewrite action “action-default-homepage” replace q#http.req.url.path “/” “/index.html”#

- To create a Rewrite policy named policy-default-homepage that detects connections to your home page and applies your new action, type:

  add rewrite policy “policy-default-homepage” q#http.req.url.path.EQ(“/”) “action-default-homepage”#

- Globally bind your new policy to put it into effect.

Masking the Server Header

This example explains how to use a Rewrite policy to mask the information in the Server header in HTTP responses from your Web server. That header contains information that hackers can use to compromise your Web site. While masking the header will not prevent a skilled hacker from finding out information about your server, it will make hacking your Web server more difficult and encourage hackers to choose less well protected targets.

To mask the Server header in responses from the command line

1. To create a Rewrite action named act_mask-server that replaces the contents of the Server header with an uninformative string, type:

   add rewrite action “act_mask-server” replace “http.RES.HEADER("Server")” “""Web Server 1.0"""

2. To create a Rewrite policy named pol_mask-server that detects all connections, type:

   add rewrite policy “pol_mask-server” true “act_mask-server”

3. Globally bind your new policy to put it into effect.

Tutorial Examples of Classic Policies

December 10, 2018

The following examples describe useful examples of classic policy configuration for certain NetScaler features, such as NetScaler Gateway, application firewall, and SSL.
NetScaler 11.1

This document includes the following details:

- NetScaler Gateway Policy to Check for a Valid Client Certificate
- Application Firewall Policy to Protect a Shopping Cart Application
- Application Firewall Policy to Protect Scripted Web Pages
- DNS Policy to Drop Packets from Specific IPs
- SSL Policy to Require Valid Client Certificates

NetScaler Gateway Policy to Check for a Valid Client Certificate

Updated: 2014-09-25

The following policies enable the NetScaler to ensure that a client presents a valid certificate before establishing a connection to a company’s SSL VPN.

To check for a valid client certificate by using the command line interface

- Add an action to perform client certificate authentication.
  
  ```
  add ssl action act1 -clientAuth DOCLIENTAUTH
  ```

- Create an SSL policy to evaluate the client requests.
  
  ```
  add ssl policy pol1 -rule "REQ.HTTP.METHOD == GET"-action act1
  ```

- Add a rewrite action to insert the certificate issuer details into the HTTP header of the requests being sent to web server.
  
  ```
  add rewrite action act2 insert\_http\_header "CertDN"CLIENT.FULL\_NAME
  ```

- Create a rewrite policy to insert the certificate issuer details, if the client certificate exists.
  
  ```
  add rewrite policy pol2 "CLIENT.FULL\_NAME"act2
  ```

Bind these new policies to the NetScaler VIP to put them into effect.

Application firewall policy to protect a shopping cart application

Shopping cart applications handle sensitive customer information, for example, credit card numbers and expiration dates, and they access back-end database servers. Many shopping cart applications also use legacy CGI scripts, which can contain security flaws that were unknown at the time they were written, but are now known to hackers and identity thieves.

A shopping cart application is particularly vulnerable to the following attacks:
• **Cookie tampering.** If a shopping cart application uses cookies, and does not perform the appropriate checks on the cookies that users return to the application, an attacker could modify a cookie and gain access to the shopping cart application under another user’s credentials. Once logged on as that user, the attacker could obtain sensitive private information about the legitimate user or place orders using the legitimate user’s account.

• **SQL injection.** A shopping cart application normally accesses a back-end database server. Unless the application performs the appropriate safety checks on the data users return in the form fields of its Web forms before it passes that information on to the SQL database, an attacker can use a Web form to inject unauthorized SQL commands into the database server. Attackers normally use this type of attack to obtain sensitive private information from the database or modify information in the database.

The following configuration will protect a shopping cart application against these and other attacks.

**To protect a shopping cart application by using the GUI**

1. Navigate to Security > Application Firewall > Profiles, and then click **Add**.
2. In the **Create Application Firewall Profile** dialog box, in the Profile Name field, enter **shopping_cart**.
3. In the Profile Type drop-down list, select Web Application.
4. In the Configure Select Advanced defaults.
5. Click **Create** and then click **Close**.
6. In the details view, double-click the new profile.
7. In the Configure Web Application Profile dialog box, configure your new profile as described below:
   - Click the Checks tab, double-click the Start URL check, and in the Modify Start URL Check dialog box, click the General tab and disable blocking, and enable learning, logging, statistics, and URL closure. Click OK and then click Close.
   - Note that if you are using the command line, you configure these settings by typing the following at the prompt, and pressing ENTER:

     ```
     set appfw profile shopping\_cart -startURLAction LEARN LOG STATS -startURLClosure ON
     ```
   - For the Cookie Consistency check and Form Field Consistency checks, disable blocking, and enable learning, logging, statistics, using a similar method to the Modify Start URL Check configuration.
If you are using the command line, you configure these settings by typing the following commands:

```
set appfw profile shopping\_cart -cookieConsistencyAction LEARN LOG STATS
set appfw profile shopping\_cart -fieldConsistencyAction LEARN LOG STATS
```

- For the SQL Injection check, disable blocking, and enable learning, logging, statistics, and transformation of special characters in the Modify SQL Injection Check dialog box, General tab, Check Actions section.

If you are using the command line, you configure these settings by typing the following at the prompt, and pressing ENTER:

```
set appfw profile shopping\_cart -SQLInjectionAction LEARN LOG STATS -SQLInjectionTransformSpecialChars ON
```

- For the Credit Card check, disable blocking; enable logging, statistics, and masking of credit card numbers; and enable protection for those credit cards you accept as forms of payment.

  - If you are using the GUI, you configure blocking, logging, statistics, and masking (or x-out) in the Modify Credit Card Check dialog box, General tab, Check Actions section. You configure protection for specific credit cards in the Settings tab of the same dialog box.

  - If you are using the command line, you configure these settings by typing the following at the prompt, and pressing ENTER:

    ```
    set appfw profile shopping\_cart -creditCardAction LOG STATS -creditCardXOut ON -creditCard <name> [\<name>...]
    ```

    For `<name>` you substitute the name of the credit card you want to protect. For Visa, you substitute VISA. For Master Card, you substitute MasterCard. For American Express, you substitute Amex. For Discover, you substitute Discover. For Diners Club, you substitute DinersClub. For JCB, you substitute JCB.

8. Create a policy named shopping\_cart that detects connections to your shopping cart application and applies the shopping\_cart profile to those connections.

To detect connections to the shopping cart, you examine the URL of incoming connections. If you host your shopping cart application on a separate host (a wise measure for security and other reasons), you can simply look for the presence of that host in the URL. If you host your shopping cart in a directory on a host that handles other traffic, as well, you must determine that the connection is going to the appropriate directory and/or HTML page.
The process for detecting either of these is the same; you create a policy based on the following expression, and substitute the proper host or URL for .

```
1  REQ.HTTP.HEADER URL CONTAINS <string>
```

- If you are using the GUI, you navigate to the application firewall Policies page, click the Add... button to add a new policy, and follow the policy creation process described in “To create a policy with classic expressions using the GUI” beginning on page 201 and following.

- If you are using the command line, you type the following command at the prompt and press Enter:

```
add appfw policy shopping_cart "REQ.HTTP.HEADER URL CONTAINS < string>"shopping_cart
```

2. Globally bind your new policy to put it into effect.

Because you want to ensure that this policy will match all connections to the shopping cart, and not be preempted by another more general policy, you should assign a high priority to it. If you assign one (1) as the priority, no other policy can preempt this one.

**Application firewall policy to protect scripted web pages**

Web pages with embedded scripts, especially legacy JavaScripts, often violate the “same origin rule,” which does not allow scripts to access or modify content on any server but the server where they are located. This security vulnerability is called cross-site scripting. The application firewall Cross-Site Scripting rule normally filters out requests that contain cross-site scripting.

Unfortunately, this can cause Web pages with older JavaScripts to stop functioning, even when your system administrator has checked those scripts and knows that they are safe. The example below explains how to configure the application firewall to allow cross-site scripting in Web pages from trusted sources without disabling this important filter for the rest of your Web sites.

**To protect Web pages with cross-site scripting by using the command line interface**

- At the command line, to create an advanced profile, type:

```
add appfw profile pr_xssokay -defaults advanced
```

- To configure the profile, type:

```
set appfw profile pr_xssokay -startURLAction NONE -startURLClosure OFF -cookieConsistencyAction LEARN LOG STATS -fieldConsistencyAction LEARN LOG STATS -crossSiteScriptingAction LEARN LOG STATS$
```
• Create a policy that detects connections to your scripted Web pages and applies the pr_xssokay profile, type:

```
add appfw policy pol_xssokay "REQ.HTTP.HEADER URL CONTAINS ^\.pl\?$
|| REQ.HTTP.HEADER URL CONTAINS ^\.js$s"pr\_xssokay
```

• Globally bind the policy.

**To protect Web pages with cross-site scripting by using the GUI**

1. Navigate to **Security > Application Firewall > Profiles.**
2. In the details view, click **Add.**
3. In the **Create Application Firewall Profile** dialog box, create a Web Application profile with advanced defaults and name it pr_xssokay. Click **Create** and then click **Close.**
4. In the details view, click the profile, click Open, and in the Configure Web Application Profile dialog box, configure the pr_xssokay profile as shown below.
   
   **Start URL Check:** Clear all actions.
   
   • **Cookie Consistency Check:** Disable blocking.
   • **Form Field Consistency Check:** Disable blocking.
   • **Cross-Site Scripting Check:** Disable blocking.

   This should prevent blocking of legitimate requests involving Web pages with cross-site scripting that you know are nonetheless safe.
5. Click **Policies,** and then click **Add.**
6. In the **Create Application Firewall Policy** dialog box, create a policy that detects connections to your scripted Web pages and applies the pr_xssokay profile:
   
   • **Policy name:** pol_xssokay
   • **Associated profile:** pr_xssokay

   **Policy expression:**

   ```
   "REQ.HTTP.HEADER URL CONTAINS ^\.pl\?$
   || REQ.HTTP.HEADER URL CONTAINS ^\.js$s"
   ```

7. Globally bind your new policy to put it into effect.
DNS Policy to drop packets from specific IPs

The following example describes how to create a DNS action and DNS policy that detects connections from unwanted IPs or networks, such as those used in a DDOS attack, and drops all packets from those locations. The example shows networks within the IANA reserved IP block 192.168.0.0/16. A hostile network will normally be on publicly routable IPs.

**To drop packets from specific IPs by using the command line interface**

- To create a DNS policy named `pol_ddos_drop` that detects connections from hostile networks and drops those packets, type:

  
  ```
  ```

  For the example networks in the 192.168.0.0/16 range, you substitute the IP and netmask in `#####.#####.#####/##` format of each network you want to block. You can include as many networks as you want, separating each `CLIENT.IP.SRC.IN_SUBNET(#####.#####.#####/##)` command with the OR operator.

- Globally bind your new policy to put it into effect.

SSL policy to require valid client certificates

The following example shows an SSL policy that checks the user’s client certificate validity before initiating an SSL connection with a client.

**To block connections from users with expired client certificates**

- Log on to the command line interface.

  If you are using the GUI, navigate to the SSL Policies page, then in the Data area, click the Actions tab.

- Create an SSL action named `act_current_client_cert` that requires that users have a current client certificate to establish an SSL connection with the NetScaler.

  ```
  add ssl action act_current_client_cert-clientAuth DOCLIENTAUTH -clientCert ENABLED -certHeader "clientCertificateHeader"-clientCertNotBefore ENABLED -certNotBeforeHeader "Mon, 01 Jan 2007 00:00:00 GMT"
  ```

- Create an SSL policy named `pol_current_client_cert` that detects connections to the Web server that contain a query string.
add ssl policy pol_current_client_cert 'REQ.SSL.CLIENT.CERT.VALIDFROM \>= "Mon, 01 Jan 2007 00:00:00 GMT"' act_block_ssl

- Bind your new policy globally.

Because this SSL policy should apply to any user's SSL connection unless a more specific SSL policy applies, you may want to assign it a low priority. If you assign it a priority of one thousand (1000), that should ensure that other SSL policies are evaluated first, meaning that this policy will apply only to connections that do not match more specific policy criteria.

Migration of Apache mod_rewrite rules to the default syntax

December 10, 2018

The Apache HTTP Server provides an engine known as mod_rewrite for rewriting HTTP request URLs. If you migrate the mod_rewrite rules from Apache to the NetScaler, you boost back-end server performance. In addition, because the NetScaler typically load balances multiple (sometimes thousands of) Web servers, after migrating the rules to the NetScaler you will have a single point of control for these rules.

Following are examples of mod_rewrite functions, and translations of these functions into Rewrite and Responder policies on the NetScaler.

Converting URL variations into canonical URLs

On some Web servers you can have multiple URLs for a resource. Although the canonical URLs should be used and distributed, other URLs can exist as shortcuts or internal URLs. You can make sure that users see the canonical URL regardless of the URL used to make an initial request.

In the following examples, the URL /~user is converted to /u/user.

Apache mod_rewrite solution for converting a URL

1  RewriteRule ^/~([^/]+)/(.*+) /u/$1/$2[R]

NetScaler solution for converting a URL

1  add responder action act1 redirect '"
2  add responder policy pol1 'HTTP.REQ.URL.AFTER_STR("/~")' -bypassSafetyCheck yes
3  add responder policy pol2 'HTTP.REQ.URL.STARTSWITH("/~") && HTTP.REQ.URL.LENGTH.GT(2)' act1
Converting host name variations to canonical host names

You can enforce the use of a particular host name for reaching a site. For example, you can enforce the use of www.example.com instead of example.com.

Apache mod_rewrite solution for enforcing a particular host name for sites running on a port other than 80

```
1 RewriteCond %{HTTP_HOST} !www.example.com
2 RewriteCond %{HTTP_HOST} !$
3 RewriteCond %{SERVER_PORT} !^80$
4 RewriteRule ^/(.*) http://www.example.com:%{SERVER_PORT} /$1 [L,R]
```

Apache mod_rewrite solution for enforcing a particular host name for sites running on port 80

```
1 RewriteCond %{HTTP_HOST} !www.example.com
2 RewriteCond %{HTTP_HOST} !$
3 RewriteRule ^/(.*) http://www.example.com/$1 [L,R]
```

NetScaler solution for enforcing a particular host name for sites running on a port other than 80
Moving a document root

Usually the document root of a Web server is based on the URL “/”. However, the document root can be any directory. You can redirect traffic to the document root if it changes from the top-level “/” directory to another directory.

In the following examples, you change the document root from / to /e/www. The first two examples simply replace one string with another. The third example is more universal because, along with replacing the root directory, it preserves the rest of the URL (the path and query string), for example, redirecting/example/file.html to /e/www/example/file.html.

Apache mod_rewrite solution for moving the document root

```perl
1 RewriteEngine on
2 RewriteRule ^/$ /e/www/ [R]
```

NetScaler solution for moving the document root

```plaintext
1 add responder action act1 redirect "'/e/www/'" -bypassSafetyCheck yes
2 add responder policy poll "!HTTP.REQ.URL.EQ("/"') act1
3 bind responder global poll 100 END
```
NetScaler solution for moving the document root and appending path information to the request

```
1 add responder action act1 redirect '/e/www'+HTTP.REQ.URL -
bypassSafetyCheck yes
2 add responder policy poll '!HTTP.REQ.URL.STARTS WITH("/e/www")' act1
3 bind responder global poll 100 END
```

Moving home directories to a new web server

You may want to redirect requests that are sent to home directories on a Web server to a different Web server. For example, if a new Web server is replacing an old one over time, as you migrate home directories to the new location you need to redirect requests for the migrated home directories to the new Web server.

In the following examples, the host name for the new Web server is newserver.

Apache mod_rewritesolution for redirecting to another Web server

```
1 RewriteRule ^/(.+)$ http://newserver/$1 [R,L]
```

NetScaler solution for redirecting to another Web server (method 1)

```
1 add responder action act1 redirect '"http://newserver"'+HTTP.REQ.URL' -
bypassSafetyCheck yes
2 add responder policy poll 'HTTP.REQ.URL.REGEX_MATCH(re^/(.+)#)' act1
3 bind responder global poll 100 END
```

NetScaler solution for redirecting to another Web server (method 2)

```
1 add responder action act1 redirect '"http://newserver"'+HTTP.REQ.URL' -
bypassSafetyCheck yes
2 add responder policy poll 'HTTP.REQ.URL.LENGTH.GT(1)' act1
3 bind responder global poll 100 END
```
**Working with structured home directories**

Typically, a site with thousands of users has a structured home directory layout. For example, each home directory may reside under a subdirectory that is named using the first character of the user name. For example, the home directory for jsmith (~jsmith/anypath) might be /home/j/jsmith/.www/anypath, and the home directory for rvalveti (~rvalveti/anypath) might be /home/r/rvalveti/.www/anypath.

The following examples redirect requests to the home directory.

**Apache mod_rewrite solution for structured home directories**

```apache
RewriteRule ^/~([a-z])[a-z0-9]+(\.*$) /home/$2/$1/.www/$3
```

**NetScaler solution for structured home directories**

```netscaler
1 NetScaler solution for structured home directories
2 add rewrite action act1 replace 'HTTP.REQ.URL' '/home/' + HTTP.REQ.URL.AFTER_STR('~').PREFIX(1)+'/'+ HTTP.REQ.URL.AFTER_STR('~').BEFORE_STR('/') +'/.' + HTTP.REQ.URL.SKIP('\'/,1) - bypassSafetyCheck yes
3 add rewrite policy pol1 'HTTP.REQ.URL.PATH.STARTSWITH("~/")' act1
4 bind rewrite global pol1 100
```

**Redirecting invalid URLs to other web servers**

If a URL is not valid, it should be redirected to another Web server. For example, you should redirect to another Web server if a file that is named in a URL does not exist on the server that is named in the URL.

On Apache, you can perform this check using mod_rewrite. On the NetScaler, an HTTP callout can check for a file on a server by running a script on the server. In the following NetScaler examples, a script named file_check.cgi processes the URL and uses this information to check for the presence of the target file on the server. The script returns TRUE or FALSE, and the NetScaler uses the value that the script returns to validate the policy.

In addition to performing the redirection, the NetScaler can add custom headers or, as in the second NetScaler example, it can add text in the response body.
NetScaler 11.1

Apache module_rewritesolution for redirection if a URL is wrong

<table>
<thead>
<tr>
<th>Line</th>
<th>Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>RewriteCond /your/docroot/%{ REQUEST_FILENAME } !-f</td>
</tr>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>add HTTPCallout Call</td>
</tr>
<tr>
<td>2</td>
<td>set policy httpCallout Call -IPAddress 10.102.59.101 -port 80 -hostExpr</td>
</tr>
<tr>
<td></td>
<td>”10.102.59.101” -returnType BOOL -ResultExpr 'HTTP.RES.BODY(100). CONTAINS(&quot;True&quot;)’ -urlStemExpr ’/cgi-bin/file_check.cgi’ - parameters query=http.req.url.path -headers Name(&quot;ddd&quot;)</td>
</tr>
<tr>
<td>3</td>
<td>add responder action act1 respondwith ’&quot;HTTP/1.1 302 Moved Temporarily\n\nLocation: <a href="http://webserverB.com%E2%80%9D+HTTP.REQ.URL+%E2%80%9D%5C%5Cn%5C%5CnHTTPCallout">http://webserverB.com”+HTTP.REQ.URL+”\\n\\nHTTPCallout</a> Used’” -bypassSafetyCheck yes</td>
</tr>
<tr>
<td>4</td>
<td>add responder policy poll !HTTP.REQ.HEADER(&quot;Name&quot;).EXISTS &amp;&amp; !SYS. HTTP_CALLOUT(call)’ act1</td>
</tr>
<tr>
<td>5</td>
<td>bind responder global poll 100</td>
</tr>
</tbody>
</table>

Rewriting a URL based on time

You can rewrite a URL based on the time. The following examples change a request for example.html to example.day.html or example.night.html, depending on the time of day.
Apache mod_rewrite solution for rewriting a URL based on the time

```
RewriteCond %{TIME_HOUR} >0700
RewriteCond %{TIME_MIN} >00
RewriteRule ^example\.html$ example.day.html [L]
RewriteRule ^example\.html$ example.night.html
```

NetScaler solution for rewriting a URL based on the time

```
add rewrite action act1 insert_before 'HTTP.REQ.URL.PATH.SUFFIX (\'/\',0)' "day."
add rewrite action act2 insert_before 'HTTP.REQ.URL.PATH.SUFFIX (\'/\',0)' "night."
add rewrite policy pol1 'SYS.TIME.WITHIN(LOCAL 07h 00m,LOCAL 18h 59m)' act1
add rewrite policy pol2 'true' act2
bind rewrite global pol1 101
bind rewrite global pol2 102
```

Redirecting to a new file name (Invisible to the User)

If you rename a Web page, you can continue to support the old URL for backward compatibility while preventing users from recognizing that the page was renamed.

In the first two of the following examples, the base directory is /~quux/. The third example accommodates any base directory and the presence of query strings in the URL.

Apache mod_rewrite solution for managing a file name change in a fixed location

```
RewriteEngine on
RewriteBase /~quux/
RewriteRule ^foo\.html$ bar.html
```
NetScaler solution for managing a file name change in a fixed location

```
1 add rewrite action act1 replace 'HTTP.REQ.URL.AFTER_STR("/~quux").SUBSTR("foo.html")' '"bar.html"'
2 add rewrite policy poll1 'HTTP.REQ.URL.ENDSWITH("/~quux/foo.html")' act1
3 bind rewrite global poll1 100
```

NetScaler solution for managing a file name change regardless of the base directory or query strings in the URL

```
1 add rewrite action act1 replace 'HTTP.REQ.URL.PATH.SUFFIX(\'\'/\',0)' '"bar.html"'
2 add rewrite policy poll1 'HTTP.REQ.URL.PATH.CONTAINS("foo.html")' act1
3 bind rewrite global poll1 100
```

Redirecting to new file name (user-visible URL)

If you rename a Web page, you may want to continue to support the old URL for backward compatibility and allow users to see that the page was renamed by changing the URL that is displayed in the browser.

In the first two of the following examples, redirection occurs when the base directory is /~quux/. The third example accommodates any base directory and the presence of query strings in the URL.

Apache mod_rewrite solution for changing the file name and the URL displayed in the browser

```
1 RewriteEngine on
2 RewriteBase /~quux/
3 RewriteRule ^old\.html$ new\.html [R]
```

NetScaler solution for changing the file name and the URL displayed in the browser

```
1 add responder action act1 redirect 'HTTP.REQ.URL.BEFORE_STR("foo.html")+'
   "$new.html"' -bypassSafetyCheck yes
2 add responder policy poll1 'HTTP.REQ.URL.ENDSWITH("/~quux/old.html")' act1
3 bind responder global poll1 100
```
**NetScaler solution for changing the file name and the URL displayed in the browser regardless of the base directory or query strings in the URL**

<table>
<thead>
<tr>
<th>Line</th>
<th>Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>add responder action act1 redirect 'HTTP.REQ.URL.PATH.BEFORE_STR(&quot;old. html&quot;)+&quot;new.html&quot;+HTTP.REQ.URL.AFTER_STR(&quot;old.html&quot;)' - bypassSafetyCheck yes</td>
</tr>
<tr>
<td>2</td>
<td>add responder policy poll 'HTTP.REQ.URL.PATH.CONTAINS(&quot;old.html&quot;)' act1</td>
</tr>
<tr>
<td>3</td>
<td>bind responder global poll 100</td>
</tr>
</tbody>
</table>

**Accommodating browser dependent content**

To accommodate browser-specific limitations—at least for important top-level pages—it is sometimes necessary to set restrictions on the browser type and version. For example, you might want to set a maximum version for the latest Netscape variants, a minimum version for Lynx browsers, and an average feature version for all others.

The following examples act on the HTTP header “User-Agent”, such that if this header begins with “Mozilla/3”, the page MyPage.html is rewritten to MyPage.NS.html. If the browser is “Lynx” or “Mozilla” version 1 or 2, the URL becomes MyPage.20.html. All other browsers receive page MyPage.32.html.

**Apache mod_rewrite solution for browser-specific settings**

<table>
<thead>
<tr>
<th>Line</th>
<th>Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>RewriteCond %{HTTP_USER_AGENT} ^Mozilla/3.*</td>
</tr>
<tr>
<td>2</td>
<td>RewriteRule ^MyPage.html$ MyPage.NS.html [L]</td>
</tr>
<tr>
<td>3</td>
<td>RewriteCond %{HTTP_USER_AGENT} ^Lynx/.* [OR]</td>
</tr>
<tr>
<td>4</td>
<td>RewriteCond %{HTTP_USER_AGENT} ^Mozilla/[12].*</td>
</tr>
<tr>
<td>5</td>
<td>RewriteRule ^MyPage.html$ MyPage.20.html [L]</td>
</tr>
<tr>
<td>6</td>
<td>RewriteRule ^fMyPage.html$ MyPage.32.html [L]</td>
</tr>
<tr>
<td>7</td>
<td>NetScaler solution for browser-specific settings</td>
</tr>
<tr>
<td>8</td>
<td>add patset pat1</td>
</tr>
<tr>
<td>9</td>
<td>bind patset pat1 Mozilla/1</td>
</tr>
<tr>
<td>10</td>
<td>bind Patset pat1 Mozilla/2</td>
</tr>
<tr>
<td>11</td>
<td>bind patset pat1 Lynx</td>
</tr>
<tr>
<td>12</td>
<td>bind Patset pat1 Mozilla/3</td>
</tr>
<tr>
<td>13</td>
<td>add rewrite action act1 insert_before 'HTTP.REQ.URL.SUFFIX' '&quot;NS.&quot;'</td>
</tr>
<tr>
<td>14</td>
<td>add rewrite action act2 insert_before 'HTTP.REQ.URL.SUFFIX' '&quot;20.&quot;'</td>
</tr>
</tbody>
</table>

Blocking access by robots

You can block a robot from retrieving pages from a specific directory or a set of directories to ease up the traffic to and from these directories. You can restrict access based on the specific location or you can block requests based on information in User-Agent HTTP headers.

In the following examples, the Web location to be blocked is /~quux/foo/arc/, the IP addresses to be blocked are 123.45.67.8 and 123.45.67.9, and the robot's name is NameOfBadRobot.

Apache mod_rewrite solution for blocking a path and a User-Agent header

```bash
1  RewriteCond %{HTTP_USER_AGENT} ^NameOfBadRobot.*
2  RewriteCond %{REMOTE_ADDR} ^123\.[45]\.67\.[8-9]$
3  RewriteRule ^/~quux/foo/arc/.* - [F]
```

NetScaler solution for blocking a path and a User-Agent header

```bash
1  add responder action act1 respondwith 'HTTP/1.1 403 Forbidden\r\n\n'
2  add responder policy pol1 'HTTP.REQ.URL.STARTSWITH("/~quux/foo/arc")' act1
3  bind responder global pol1 101 END
```

© 1999-2018 Citrix Systems, Inc. All rights reserved.
NetScaler 11.1

**Blocking access to inline images**

If you find people frequently going to your server to copy inline graphics for their own use (and generating unnecessary traffic), you may want to restrict the browser’s ability to send an HTTP Referer header.

In the following example, the graphics are located in Example.

**Apache mod_rewrite solution for blocking access to an inline image**

```bash
1  RewriteCond %{HTTP_REFERER} !^$
2  RewriteCond %{HTTP_REFERER} !^http://www.quux-corp.de/~quux/.*$
3  RewriteRule .*\.(gif|jpeg)$ - [F]
```

**NetScaler solution for blocking access to an inline image**

```bash
1  add patset pat1
2  bind patset pat1 .gif
3  bind patset pat1 .jpeg
4  add responder action act1 respondwith "HTTP/1.1 403 Forbidden\n\n" ,
5  add responder policy pol1 !HTTP.REQ.HEADER("Referer").EQ("") && !HTTP.REQ.HEADER("Referer").STARTSWITH("http://www.quux-corp.de/~quux/")&& HTTP.REQ.URL.ENDSWITH_ANY("pat1")' act1
6  bind responder global pol1 100
```

**Creating extensionless links**

To prevent users from knowing application or script details on the server side, you can hide file extensions from users. To do this, you may want to support extensionless links. You can achieve this behavior by using rewrite rules to add an extension to all requests, or to selectively add extensions to requests.

The first two of the following examples show adding an extension to all request URLs. In the last example, one of two file extensions is added. Note that in the last example, the mod_rewrite module can easily find the file extension because this module resides on the Web server. In contrast, the NetScaler
NetScaler 11.1

must invoke an HTTP callout to check the extension of the requested file on the Web server. Based on
the callout response, the NetScaler adds the .html or .php extension to the request URL.

Note
In the second NetScaler example, an HTTP callout is used to query a script named
file_check.cgi hosted on the server. This script checks whether the argument that is provided in
the callout is a valid file name.

Apache mod_rewrite solution for adding a .php extension to all requests

1  RewriteRule ^/?(a-z)+$ $1.php [L]

NetScaler policy for adding a .php extension to all requests

1  add rewrite action act1 insert_after 'HTTP.REQUEST.URL' '".php"'
2  add rewrite policy poll1 'HTTP.REQUEST.URL.PATH.REGEX_MATCH(re^/(a-z)+)#)
     ' act1
3  bind rewrite global poll1 100

Apache mod_rewrite solution for adding either .html or .php extensions to requests

1  RewriteCond %{REQUEST_FILENAME} .php -f
2  RewriteRule ^/?(a-zA-Z0-9)+$ $1.php [L]
3  RewriteCond %{REQUEST_FILENAME} .html -f
4  RewriteRule ^/?(a-zA-Z0-9)+$ $1.html [L]

NetScaler policy for adding either .html or .php extensions to requests

1  add HTTPCallout Call_html
2  add HTTPCallout Call_php
3  set policy httpCallout Call_html -IPAddress 10.102.59.101 -port 80 -
     hostExpr "10.102.59.101" -returnType BOOL -ResultExpr 'HTTP.RESP.
     BODY(100).CONTAINS("True")' -urlStemExpr '/cgi-bin/file_check.cgi"
     ' -parameters query=http.req.url+/".html"
Redirecting a Working URI to a New Format

Suppose that you have a set of working URLs that resemble the following:

```
/index.php?id=nnnn
```

To change these URLs to /nnnn and make sure that search engines update their indexes to the new URI format, you need to do the following:

- Redirect the old URIs to the new ones so that search engines update their indexes.
- Rewrite the new URI back to the old one so that the index.php script runs correctly.

To accomplish this, you can insert marker code into the query string (making sure that the marker code is not seen by visitors), and then removing the marker code for the index.php script.

The following examples redirect from an old link to a new format only if a marker is not present in the query string. The link that uses the new format is re-written back to the old format, and a marker is added to the query string.

**Apache mod_rewrite solution**

```
RewriteCond %{QUERY_STRING} !marker
RewriteRule ^(.*)$ http://example.com/$1 [R=302,L]
```
Ensuring That a Secure Server Is Used for Selected Pages

To make sure that only secure servers are used for selected Web pages, you can use the following Apache mod_rewrite code or NetScaler Responder policies.

**Apache mod_rewrite solution**

```
5  QUERY_STRING }
6  id=[-a-zA-Z0-9_]+)
7  RewriteRule ^/?index\.php$ %1% [R,L]
8  RewriteRule ^/?([-a-zA-Z0-9_]+)$ index.php?marker&id=$1 [L]
9  NetScaler solution
10  add responder action act_redirect redirect 'HTTP.REQ.URL.PROXY("BEFORE_STR("index.php")+HTTP.REQ.URL.QUERY.VALUE("id")")' - bypassSafetyCheck yes
11  add responder policy pol_redirect !HTTP.REQ.URL.QUERY.CONTAINS("marker") && HTTP.REQ.URL.QUERY.VALUE("id").REGEX_MATCH(re/[{-a-zA-Z0-9_}]+/) && HTTP.REQ.URL.ROUTE.CONTAINS("index.php")' act_redirect
12  bind responder global pol_redirect 100 END
13  add rewrite action act1 replace 'HTTP.REQ.URL.ROUTE.SUFFIX(/\'\/',0)' "index.phpmarker&id=+$HTTP.REQ.URL.ROUTE.SUFFIX(/\'\/',0)' - bypassSafetyCheck yes
14  add rewrite policy poll !HTTP.REQ.URL.QUERY.CONTAINS("marker")' act1
15  bind rewrite global poll 100 END
```

**NetScaler solution using regular expressions**

```
1  add responder action res_redirect redirect '"https://www.example.com' HTTP.REQ.URL' -bypassSafetyCheck yes
2  add responder policy pol_redirect '!CLIENT.TCP.DSTPORT.EQ(443)&&HTTP.REQ.URL.REGEX_MATCH(re/page/[1-5])' res_redirect
3  bind responder global pol_redirect 100 END
```
NetScaler solution using pattern sets

```
1  add patset pat1
2  bind patset pat1 page1
3  bind patset pat1 page2
4  bind patset pat1 page3
5  bind patset pat1 page4
6  bind patset pat1 page5
7  add responder action res_redirect redirect "https://www.example.com"+HTTP.REQ.URL" -bypassSafetyCheck yes
8  add responder policy pol_redirect "!CLIENT.TCP.DSTPORT.EQ(443) && HTTP.REQ.URL.CONTAINS_ANY("pat1")" res_redirect
9  bind responder global pol_redirect 100 END
```

Rate limiting

December 13, 2018

The rate limiting feature enables you to define the maximum load for a given network entity or virtual entity on the NetScaler appliance. The feature enables you to configure the appliance to monitor the rate of traffic associated with the entity and take preventive action, in real time, based on the traffic rate. This feature is particularly useful when the network is under attack from a hostile client that is sending the appliance a flood of requests. You can mitigate the risks that affect the availability of resources to clients, and you can improve the reliability of the network and the resources that the appliance manages.

You can monitor and control the rate of traffic that is associated with virtual and user-defined entities, including virtual servers, URLs, domains, and combinations of URLs and domains. You can throttle the rate of traffic if it is too high, base information caching on the traffic rate, and redirect traffic to a given load balancing virtual server if the traffic rate exceeds a predefined limit. You can apply rate-based monitoring to HTTP, TCP, and DNS requests.

To monitor the rate of traffic for a given scenario, you configure a rate limit identifier. A rate limit identifier specifies numeric thresholds such as the maximum number of requests or connections (of a particular type) that are permitted in a specified time period called a time slice.

Optionally, you can configure filters, known as stream selectors, and associate them with rate limit identifiers when you configure the identifiers. After you configure the optional stream selector and the limit identifier, you must invoke the limit identifier from a default syntax policy. You can invoke identifiers from any feature in which the identifier may be useful, including rewrite, responder, DNS, and integrated caching.
You can globally enable and disable SNMP traps for rate limit identifiers. Each trap contains cumulative data for the rate limit identifier's configured data collection interval (time slice), unless you specified multiple traps to be generated per time slice. For more information about configuring SNMP traps and managers, see “SNMP.”

Configuring a Stream Selector

December 10, 2018

A traffic stream selector is an optional filter for identifying an entity for which you want to throttle access. The selector is applied to a request or a response and selects data points (keys) that can be analyzed by a rate stream identifier. These data points can be based on almost any characteristic of the traffic, including IP addresses, subnets, domain names, TCP or UDP identifiers, and particular strings or extensions in URLs.

A stream selector consists of individual default syntax expressions called selectlets. Each selectlet is a non-compound default syntax expression. A traffic stream selector can contain up to five non-compound expressions called selectlets. Each selectlet is considered to be in an AND relationship with the other expressions. Following are some examples of selectlets:

```
1  http.req.url
2  http.res.body(1000>after_str("car_model").before_str("made_in"))
3  "client.ip.src.subnet(24)"
```

The order in which you specify parameters is significant. For example, if you configure an IP address and a domain (in that order) in one selector, and then specify the domain and the IP address (in the reverse order) in another selector, the NetScaler considers these values to be unique. This can lead to the same transaction being counted twice. Also, if multiple policies invoke the same selector, the NetScaler, again, can count the same transaction more than once.

Note: If you modify an expression in a stream selector, you may get an error if any policy that invokes it is bound to a new policy label or bind point. For example, suppose that you create a stream selector named myStreamSelector1, invoke it from myLimitID1, and invoke the identifier from a DNS policy named dnsRateLimit1. If you change the expression in myStreamSelector1, you might receive an error when binding dnsRateLimit1 to a new bind point. The workaround is to modify these expressions before creating the policies that invoke them.

To configure a traffic stream selector by using the command line interface

At the command prompt, type:
To configure a stream selector by using the GUI

Navigate to AppExpert > Rate Limiting > Selectors, click Add and specify the relevant details.

Viewing the Traffic Rate

December 10, 2018

If traffic through one or more virtual servers matches a rate-based policy, you can view the rate of this traffic. The rate statistics are maintained in the limit identifier that you named in the rule for the rate-based policy. If more than one policy uses the same limit identifier, you can view the traffic rate as defined by hits to all of the policies that use the particular limit identifier.

To view the traffic rate by using the command line interface

At the command prompt, type the following command to view the traffic rate:

```
1 show ns limitSessions <limitIdentifier>
```

Example:

```
1 sh limitsession myLimitSession
```

To view the traffic rate by using the GUI

1. Navigate to AppExpert > Rate Limiting > Limit Identifiers.
2. Select a limit identifier whose traffic rate you want to view.
3. Click the Show Sessions button. If traffic through one or more virtual servers has matched a rate limiting policy that uses this limit identifier (and the hits are within the configured time slice for this identifier), the Session Details dialog box appears. Otherwise, you receive a “No session exists” message.
Testing a Rate-Based Policy

December 10, 2018

To test a rate-based policy, you can send traffic to any virtual server to which a rate-based policy is bound.

Task overview: Testing a rate-based policy

1. Configure a stream selector (optional) and a rate limit identifier (required). For example:

```
1 add stream selector sel_subnet Q.URL "CLIENT.IP.SRC.SUBNET(24)"
2 add ns limitIdentifier k_subnet -Threshold 4 -timeSlice 3600 -mode REQUEST_RATE -limittype smooth -selectorName sel_subnet -trapsInTimeSlice 8
```

2. Configure the action that you want to associate with the policy that uses the rate limit identifier. For example:

```
1 add responder action resp_redirect redirect ";http://response_site.com/"
```

3. Configure a policy that uses the sys.check_limit expression prefix to call the rate limit identifier. For example, the policy can apply a rate limit identifier to all requests arriving from a particular subnet, as follows:

```
1 add responder policy resp_subnet "SYS.CHECK_LIMIT("k_subnet")" resp_redirect
```

4. Bind the policy globally or to a virtual server. For example:

```
1 bind responder global resp_subnet 6 END -type DEFAULT
```

5. In a browser address bar, send a test HTTP query to a virtual server. For example:

```
1 http://<IP of a vserver>/testsite/test.txt
```

6. At the NetScaler command prompt, type:

```
1 show ns limitSessions \<limitIdentifier\>
```
Viewing the Traffic Rate

December 10, 2018

If traffic through one or more virtual servers matches a rate-based policy, you can view the rate of this traffic. The rate statistics are maintained in the limit identifier that you named in the rule for the rate-based policy. If more than one policy uses the same limit identifier, you can view the traffic rate as defined by hits to all of the policies that use the particular limit identifier.

To view the traffic rate by using the command line interface

At the command prompt, type the following command to view the traffic rate:

```
show ns limitSessions <limitIdentifier>
```

Example:

```
sh limitsession myLimitSession
```

To view the traffic rate by using the GUI

1. Navigate to AppExpert > Rate Limiting > Limit Identifiers.
2. Select a limit identifier whose traffic rate you want to view.
3. Click the Show Sessions button. If traffic through one or more virtual servers has matched a rate limiting policy that uses this limit identifier (and the hits are within the configured time slice for this identifier), the Session Details dialog box appears. Otherwise, you receive a “No session exists” message.
Testing a Rate-Based Policy

December 10, 2018

To test a rate-based policy, you can send traffic to any virtual server to which a rate-based policy is bound.

Task overview: Testing a rate-based policy

1. Configure a stream selector (optional) and a rate limit identifier (required). For example:

```
1 add stream selector sel_subnet Q.URL "CLIENT.IP.SRC.SUBNET(24)"
2 add ns limitIdentifier k_subnet -Threshold 4 -timeSlice 3600 -mode REQUEST_RATE -limittype smooth -selectorName sel_subnet -trapsInTimeSlice 8
```

2. Configure the action that you want to associate with the policy that uses the rate limit identifier. For example:

```
1 add responder action resp_redirect redirect "\"http://response_site.com/\"
```

3. Configure a policy that uses the sys.check_limit expression prefix to call the rate limit identifier. For example, the policy can apply a rate limit identifier to all requests arriving from a particular subnet, as follows:

```
1 add responder policy resp_subnet "SYS.CHECK_LIMIT("k_subnet")"
   resp_redirect
```

4. Bind the policy globally or to a virtual server. For example:

```
1 bind responder global resp_subnet 6 END -type DEFAULT
```

5. In a browser address bar, send a test HTTP query to a virtual server. For example:

```
1 http://<IP of a vserver>/testsite/test.txt
```

6. At the NetScaler command prompt, type:

```
1 show ns limitSessions \<limitIdentifier\>
```

Example
7. Repeat the query and check the limit identifier statistics again to verify that the statistics are being updated correctly.

### Examples of Rate-Based Policies

January 6, 2019

The following table shows examples of rate-based policies.

### Sample Use Cases for Rate-Based Policies

December 10, 2018

The following scenarios describe two uses of rate-based policies in global server load balancing (GSLB):

- The first scenario describes the use of a rate-based policy that sends traffic to a new data center if the rate of DNS requests exceed 1000 per second.
- In the second scenario, if more than five DNS requests arrive for a local DNS (LDNS) client within a particular period, the additional requests are dropped.

### Redirecting Traffic on the Basis of Traffic Rate

In this scenario, you configure a proximity-based load balancing method, and a rate-limiting policy that identifies DNS requests for a particular region. In the rate-limiting policy, you specify a threshold of 1000 DNS requests per second. A DNS policy applies the rate limiting policy to DNS requests for the region “Europe.GB.17.London.UK-East.ISP-UK.” In the DNS policy, DNS requests that exceed the rate limiting threshold, starting with request 1001 and continuing to the end of the one-second interval, are to be forwarded to the IP addresses that are associated with the region “North America.US.TX.Dallas.US-East.ISP-US.”
The following configuration demonstrates this scenario:

```plaintext
add stream selector DNSSelector1 client.udp.dns.domain
add ns limitIdentifier DNSLimitIdentifier1 -threshold 5 -timeSlice 1000 -selectorName DNSSelector1
add dns policy DNSLimitPolicy1 "client.ip.src.matches_location("Europe.GB.17.London.*.*") && sys.check_limit("DNSLimitIdentifier1")" -preferredLocation "North America.US.TX.Dallas.*.*"
bind dns global DNSLimitPolicy1 5
```

**Dropping DNS Requests on the Basis of Traffic Rate**

In the following example of global server load balancing, you configure a rate limiting policy that permits a maximum of five DNS requests in a particular interval, per domain, to be directed to an LDNS client for resolution. Any requests that exceed this rate are dropped. This type of policy can help protect the NetScaler from resource exploitation. For example, in this scenario, if the time to live (TTL) for a connection is five seconds, this policy prevents the LDNS from requerying a domain. Instead, it uses data that is cached on the NetScaler.

```plaintext
add stream selector LDNSSelector1 client.udp.dns.domain client.ip.src
add ns limitIdentifier LDNSLimitIdentifier1 -threshold 5 -timeSlice 1000 -selectorName LDNSSelector1
add dns policy LDNSPolicy1 "client.udp.dns.domain.contains(".") && sys.check_limit("LDNSLimitIdentifier1")" -drop YES
bind dns global LDNSPolicy1 6
show gslb vserver gvip
gvip - HTTP State: UP
Last state change was at Mon Sep 8 11:50:48 2008 (+711 ms)
Time since last state change: 1 days, 02:55:08.830
Configured Method: STATICPROXIMITY
BackupMethod: ROUNDROBIN
No. of Bound Services : 3 (Total) 3 (Active)
Persistence: NONE Persistence ID: 100
Disable Primary Vserver on Down: DISABLED Site Persistence: NONE
```

Rate Limiting for Traffic Domains

December 10, 2018

You can configure rate limiting for traffic domains. The following expression in the NetScaler expressions language for identifies traffic associated with traffic domains.

- client.traffic_domain.id

You can configure rate limiting for traffic associated with a particular traffic domain, a set of traffic domains, or all traffic domains.

For configuring rate limiting for traffic domains, you perform the following steps on a NetScaler appliance by using the GUI or the NetScaler command line:

1. Configure a stream selector that uses the client.traffic_domain.id expression for identifying the traffic, associated with traffic domains, to be rate limited.
2. Configure a rate limit identifier that specifies parameters such as maximum threshold for traffic to be rate limited. You also associate a stream selector to the rate limiter in this step.
3. Configure an action that you want to associate with the policy that uses the rate limit identifier.
4. Configure a policy that uses the `sys.check_limit` expression prefix to call the rate limit identifier, and associate the action with this policy.

5. Bind the policy globally.

Consider an example in which two traffic domains, with IDs 10 and 20, are configured on NetScaler NS1. On traffic domain 10, LB1-TD-1 is configured to load balance servers S1 and S2; LB2-TD1 is configured to load balance servers S3 and S4.

On traffic domain 20, LB1-TD-2 is configured to load balance servers S5 and S6; LB2-TD2 is configured to load balance servers S7 and S8.

The following table lists some examples of rate limiting policies for traffic domains in the example setup.

<table>
<thead>
<tr>
<th>Purpose</th>
<th>CLI commands</th>
</tr>
</thead>
</table>
| Limit the number of requests to 10 per second for each of the traffic domains. | add stream selector tdratelimit-1
CLIENT.TRAFFIC_DOMAIN.ID add ns limitIdentifier limitidf-1 -threshold 10
-selectorName tdratelimit-1 -trapsInTimeSlice 0
add responder policy ratelimit-pol
"sys.check_limit("limitidf-1")" DROP bind responder global ratelimit-pol 1 |
| Limit the number of requests to 5 per client per second for each of the traffic domains. | add stream selector tdandclientip
CLIENT.IP,SRC,CLIENT.TRAFFIC_DOMAIN.ID add ns limitIdentifier td_limitidf -threshold 5
-selectorName tdandclientip -trapsInTimeSlice 5
add responder policy tdratelimit-pol
"sys.check_limit("td_limitidf")" DROP bind responder global tdratelimit-pol 2 |
| Limit the number of requests sent for a particular traffic domain (for example traffic domain 10) to 30 requests every 3 seconds. | add stream selector tdratelimit
CLIENT.TRAFFIC_DOMAIN.ID add ns limitIdentifier td10_limitidf -threshold 30
-timeSlice 3000 -selectorName tdratelimit-trapsInTimeSlice 5
add responder policy td10ratelimit "client.traffic_domain.id==10 &
sys.check_limit("td10_limitidf")" DROP bind responder global td10ratelimit 3 |
## NetScaler 11.1

<table>
<thead>
<tr>
<th>Purpose</th>
<th>CLI commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>Limit the number of connections to 5 per client per second for a particular traffic domain (for example traffic domain 20).</td>
<td>add stream selector tdandclientip CLIENT.IP.SRC CLIENT.TRAFFIC_DOMAIN.ID add ns limitIdentifier td20_limitidf -threshold 5 -mode CONNECTION -selectorName tdandclientip -trapsInTimeSlice 5 add responder policy td20_ratelimit “client.traffic_domain.id==20 &amp;&amp; sys.check_limit(“td20_limitidf”)” DROP bind responder global td20_ratelimit 4</td>
</tr>
</tbody>
</table>

### Configure rate limit at packet level

December 10, 2018

**Note:** This feature was introduced in NetScaler release 11.1 build 51.21.

You can collect statistics at the packet level to determine bad/attack prone packets flowing through all the connections identified by the selector. At any point, if the percentage of bad or attack-prone packets exceed the configured threshold, a corrective action (RESET or DROP) is triggered as per the configuration. This functionality can be used to address DDoS attacks involving small TCP packets in which PUSH flag is enabled.

The following configuration demonstrates this functionality. This configuration tracks packet credits for all the TCP connections flowing through the system. This creates a session and associates on pcb/natpcb and the performs the per packet check.

**Example:**

```plaintext
1 add stream selector packetcreditrateidentifierclient.ip.src client.tcp.
    srcport client.ip.dst client.tcp.dstport
2 3 add stream identifier packetcreditrateidentifier
    packetcreditrateidentifier -interval 1
4 5 add responder policy packetcreditrateidentifierownerpolicy "ANALYTICS.STREAM("
    packetcreditrateidentifier")".COLLECT_STATS("PACKET_CREDITS", <
    max_threshold_percentage>, ACTION)" NOOP
6 7 <max_threshold_percentage> is any value between 0-100.
```
ACTION can be either DROP/RESET

After the configuration is complete, we must bind this responder policy globally.

Example:

```
bind responder global packetcreditratesessionpolicy 101 END -type REQ_DEFAULT
bind responder global packetcreditratesessionpolicy 102 END -type NAT_REQ_DEFAULT
```

**Responder**

December 10, 2018

**Warning**

Responder and Rewrite filters are deprecated and as an alternative, Citrix recommends you to use filters using advanced policy infrastructure.

Today’s complex Web configurations often require different responses to HTTP requests that appear, on the surface, to be similar. When users request a Web site’s home page, you may want to provide a different home page depending on where each user is located, which browser the user is using, or which language(s) the browser accepts and the order of preference. You might want to break the connection immediately if the request is coming from an IP range that has been generating DDoS attacks or initiating hacking attempts.

With the Responder feature, responses can be based on who sends the request, where it is sent from, and other criteria with security and system management implications. The feature is simple and quick to use. By avoiding the invocation of more complex features, it reduces CPU cycles and time spent in handling requests that do not require complex processing.

For handling sensitive data such as financial information, if you want to ensure that the client uses a secure connection to browse a site, you can redirect the request to secure connection by using `https://` instead of `http://`.

To use the Responder feature, do the following:

- Enable the Responder feature on the NetScaler.
- Configure responder actions. The action can be to generate a custom response, redirect a request to a different Web page, or reset a connection.
- Configure responder policies. The policy determines the requests (traffic) on which an action has to be taken.
Bind each policy to a bind point put it into effect. A bind point refers to an entity at which NetScaler examines the traffic to see if it matches a policy. For example, a bind point can be a load balancing virtual server.

You can specify a default action for requests that do not match any policy, and you can bypass the safety check for actions that would otherwise generate error messages.

The Rewrite feature of NetScaler helps in rewriting some information in the requests or responses handled by NetScaler. The following section shows some differences between the two features.

**Comparison between Rewrite and Responder options**

The main difference between the rewrite feature and the responder feature is as follows:

Responder cannot be used for response or server-based expressions. Responder can be used only for the following scenarios depending on client parameters:

- Redirecting a http request to new Web sites or Web pages
- Responding with some custom response
- Dropping or resetting a connection at request level

In case of a responder policy, the NetScaler examines the request from the client, takes action according to the applicable policies, sends the response to the client, and closes the connection with the client.

In case of a rewrite policy, the NetScaler examines the request from the client or response from the server, takes action according to the applicable policies, and forwards the traffic to the client or the server.

In general, it is recommended to use responder if you want the NetScaler to reset or drop a connection based on a client or request-based parameter. Use responder to redirect traffic, or respond with custom messages. Use rewrite for manipulating data on HTTP requests and responses.

**Enabling the Responder Feature**

December 10, 2018

To use the Responder feature, you must first enable it.

To enable the responder feature by using the NetScaler command line:

At the command prompt, type the following commands to enable the responder feature and verify the configuration:

- enable ns feature <feature>
To enable the responder feature by using the GUI:

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Modes and Features, click Change advanced features.
3. In the Configure Advanced Features dialog box, select the Responder check box, and then click OK.
4. In the Enable/Disable Feature(s)? dialog box, click YES. A message appears in the status bar, stating that the feature has been enabled.

### Configuring a Responder Action

December 10, 2018

After enabling the responder feature, you must configure one or more actions for handling requests. The responder supports the following types of actions:

- **Respond with.** Sends the response defined by the Target expression without forwarding the request to a web server. (The NetScaler appliance substitutes for and acts as a web server.) Use this type of action to manually define a simple HTML-based response. Normally the text for a Respond with action consists of a web server error code and brief HTML page.

- **Respond with SQL OK.** Sends the designated SQL OK response defined by the Target expression. Use this type of action to send an SQL OK response to an SQL query.

---

```
<table>
<thead>
<tr>
<th>Feature</th>
<th>Acronym</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>1) Web Logging</td>
<td>WL</td>
<td>ON</td>
</tr>
<tr>
<td>2) Surge Protection</td>
<td>SP</td>
<td>ON</td>
</tr>
<tr>
<td>1) Responder</td>
<td>RESPONDER</td>
<td>ON</td>
</tr>
<tr>
<td>2) HTML Injection</td>
<td>HTMLInjection</td>
<td>ON</td>
</tr>
<tr>
<td>3) NetScaler Push</td>
<td>push</td>
<td>OFF</td>
</tr>
</tbody>
</table>
```
• **Respond with SQL Error.** Sends the designated SQL Error response defined by the Target expression. Use this type of action to send an SQL Error response to an SQL query.

• **Respond with HTML page.** Sends the designated HTML page as the response. You can choose from a drop-down list of HTML pages that were previously uploaded, or upload a new HTML page. Use this type of action to send an imported HTML page as the response.

• **Redirect.** Redirects the request to a different web page or web server. A Redirect action can redirect requests originally sent to a “dummy” web site that exists in DNS, but for which there is no actual web server, to an actual web site. It can also redirect search requests to an appropriate URL. Normally, the redirection target for a Redirect action consists of a complete URL.

To configure a responder action by using the NetScaler command line:

Displays the current settings for the specified responder action. If no action name is provided, displays a list of all responder actions currently configured on the NetScaler appliance, with abbreviated settings.

At the command prompt, type the following commands to configure a responder action and verify the configuration:

- add responder action <name> <type> <target> [-bypassSafetyCheck (YES | NO) ]
- show responder action

**Parameters:**

- **Name.** Name of the responder action. Maximum Length: 127
- **type.** Type of responder action. It can be: (respondwith).
- **target.** An expression specifying what to respond with
- **htmlpage.** Option specifying to respondwith htmlpage
- **bypassSafetyCheck.** The safety check to allow unsafe expressions. **Note:** This attribute is deprecated.
- **hits.** The number of times the action has been taken.
- **referenceCount.** The number of references to the action.
- **undefHits.** The number of times the action resulted in UNDEF.
- **comment.** Any type of information about this responder action.
- **builtin.** Flag to determine whether responder action is built-in or not

**Example:**

```plaintext
1 To create a responder action that displays a “Not Found” error page for URLs that do not exist:
```
To modify an existing responder action by using the NetScaler command line:

At the command prompt, type the following command to modify an existing responder action and verify the configuration:

- set responder action -target [-bypassSafetyCheck {YES | NO}]
- show responder action
Example:

```plaintext
1) set responder action act404Error -target ""HTTP/1.1 404 Not Found\n\n"+ "HTTP.REQ.URL.HTTP_URL_SAFE" + "does not exist on the web server."
2) Done
3) > show responder action
4)
5) 1) Name: act404Error
6) Operation: respondwith
7) Target: "HTTP/1.1 404 Not Found
8) "+ "HTTP.REQ.URL.HTTP_URL_SAFE" + "does not exist on the web server."
9) BypassSafetyCheck: NO
10) Hits: 0
11) Undef Hits: 0
12) Action Reference Count: 0
13) Done
```

To remove a responder action by using the NetScaler command line:

At the command prompt, type the following command to remove a responder action and verify the configuration:

- `rm responder action`
- `show responder action`

Example:

```plaintext
1) rm responder action act404Error
2) Done
3)
4) > show responder action
5) Done
```

To configure a responder action by using the GUI:

2. In the details pane, do one of the following:
   - To create a new action, click Add.
   - To modify an existing action, select the action, and then click Open.
3. Click Create or OK, depending on whether you are creating a new action or modifying an existing action.
4. Click Close. A message appears in the status bar, stating that the feature has been enabled.
5. To delete a responder action, select the action, and then click Remove. A message appears in the status bar, stating that the feature has been disabled.
To add an expression by using the Add Expression dialog box

1. In the Create Responder Action or Configure Responder Action dialog box, click Add.

2. In the Add Expression dialog box, in the first list box choose the first term for your expression.
   - HTTP. The HTTP protocol. Choose this if you want to examine some aspect of the request that pertains to the HTTP protocol.
   - SYS. The protected web site(s). Choose this if you want to examine some aspect of the request that pertains to the recipient of the request.
   - CLIENT. The computer that sent the request. Choose this if you want to examine some aspect of the sender of the request.
   - ANALYTICS. The analytics data associated with the request. Choose this if you want to examine request metadata.
   - SIP. A SIP request. Choose this if you want to examine some aspect of a SIP request.

   When you make your choice, the rightmost list box lists appropriate terms for the next part of your expression.

3. In the second list box, choose the second term for your expression. The choices depend upon which choice you made in the previous step, and are appropriate to the context. After you make your second choice, the Help window below the Construct Expression window (which was blank) displays help describing the purpose and use of the term you just chose.

4. Continue choosing terms from the list boxes that appear to the right of the previous list box, or typing strings or numbers in the text boxes that appear to prompt you to enter a value, until your expression is finished.

**Configuring the Global HTTP Action**

You can configure the global HTTP action to invoke a responder action when an HTTP request times out. To configure this feature, you must first create the responder action that you want to invoke. Then, you configure the global HTTP timeout action to respond to a timeout with that responder action.

To configure the global HTTP action by using the NetScaler command line:

At the command prompt, type the following command:

- set ns httpProfile -reqTimeoutAction <responder action name>
- save ns config

For <responder action name>, substitute the name of the responder action.
Configuring a Responder Policy

December 10, 2018

After you configure a responder action, you must next configure a responder policy to select the requests to which the NetScaler appliance should respond. A responder policy is based on a rule, which consists of one or more expressions. The rule is associated with an action, which is performed if a request matches the rule.

Note: For creating and managing responder policies, the GUI provides assistance that is not available at the NetScaler command prompt.

To configure a responder policy by using the NetScaler command line:

At the command prompt, type:

- `add responder policy [-appFlow]`
- `show responder policy`

Example:

```plaintext
1 > add responder policy policyThree "CLIENT.IP.SRC.IN_SUBNET(222.222.0.0/16)" RESET
2     Done
3 > show responder policy policyThree
4
5     Name: policyThree
6     Rule: CLIENT.IP.SRC.IN_SUBNET(222.222.0.0/16)
7     Responder Action: RESET
8     UndefAction: Use Global
9     Hits: 0
10    Undef Hits: 0
11     Done
```

To modify an existing responder policy by using the NetScaler command line:

At the command prompt, type:

- `set responder policy [-rule ] [-action ] [-undefAction ]`
- `show responder policy`

To remove a responder policy by using the NetScaler command line:

At the command prompt, type:

- `rm responder policy`
- `show responder policy`
To configure a responder policy by using the GUI:

2. In the details pane, do one of the following:
   • To create a new policy, click Add.
   • To modify an existing policy, select the policy, and then click Open.
3. Click Create or OK, depending on whether you are creating a new policy or modifying an existing policy.
4. Click Close. A message appears in the status bar, stating that the feature has been configured.

### Binding a Responder Policy

December 13, 2018

To put a policy into effect, you must bind it either globally, so that it applies to all traffic that flows through the NetScaler, or to a specific virtual server, so that the policy applies only to requests whose destination IP address is the VIP of that virtual server.

When you bind a policy, you assign a priority to it. The priority determines the order in which the policies you define are evaluated. You can set the priority to any positive integer.

In the NetScaler operating system, policy priorities work in reverse order—the higher the number, the lower the priority. For example, if you have three policies with priorities of 10, 100, and 1000, the policy assigned a priority of 10 is performed first, then the policy assigned a priority of 100, and finally the policy assigned an order of 1000. The responder feature implements only the first policy that a request matches, not any additional policies that it might also match, so policy priority is important for getting the results you intend.

You can leave yourself plenty of room to add other policies in any order, and still set them to evaluate in the order you want, by setting priorities with intervals of 50 or 100 between each policy when you globally bind it. You can then add additional policies at any time without having to reassign the priority of an existing policy.

For additional information about binding policies on the NetScaler, see Policies and Expressions.

**Note:** Responder policies cannot be bound to TCP-based virtual servers.
To globally bind a responder policy by using the NetScaler command line:

At the command prompt, type the following command to globally bind a responder policy and verify the configuration:

- `bind responder global <policyName> <priority> [gotoPriorityExpression [-type <type>] [-invoke (<labelType> <labelName>)]]
- `show responder global`

**Example:**

```bash
1 > bind responder global poliError 100
2 Done
3 > show responder global
4 1) Global bindpoint: REQ_DEFAULT
5 Number of bound policies: 1
6 Done
```

To bind responder policy to a specific virtual server by using the NetScaler command line:

At the command prompt, type:

- `bind lb vserver <name> -policyname <policy_name> -priority <priority>
- `sh lb vserver <name>

**Example:**

```bash
1 > bind lb vserver vs-loadbal -policyName policyTwo -priority 100
2 Done
3 > show lb vserver

To globally bind a responder policy by using the GUI:

1. Navigate to **AppExpert > Responder > Policies**.
2. On the **Responder Policies** page, select a responder policy, and then click **Policy Manager**.
3. In the **Responder Policy Manager** dialog box **Bind Points** menu, select Default Global.
4. Click **Insert Policy** to insert a new row and display a drop-down list of all unbound responder policies.
5. Click one of the policies on the list. That policy is inserted into the list of globally bound responder policies.
6. Click **Apply Changes**.
7. Click **Close**. A message appears in the status bar, stating that the configuration has been successfully completed.

To bind a responder policy to a specific virtual server by using the GUI:

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. On the **Load Balancing Virtual Servers** page, select the virtual server to which you want to bind the responder policy, and then click **Open**.
3. In the **Configure Virtual Server** (Load Balancing) dialog box, select the **Policies** tab, which displays a list of all policies configured on your NetScaler appliance.
4. Select the check box next to the name of the policy you want to bind to this virtual server.
5. Click **OK**. A message appears in the status bar, stating that the configuration has been successfully completed.

### Setting the default action for a responder policy

December 10, 2018
The NetScaler appliance generates an undefined event (UNDEF event) when a request does not match a responder policy, and then carries out the default action assigned to undefined events. By default, that action is to forward the request to the next feature without changing it. This default behavior is normally what you want; it ensures that requests that do not require special handling by a specific responder action are sent to your Web servers and clients receive access to the content that they requested.

If the Web site(s) your NetScaler appliance protects receive a significant number of invalid or malicious requests, however, you may want to change the default action to either reset the client connection or drop the request. In this type of configuration, you would write one or more responder policies that would match any legitimate requests, and simply redirect those requests to their original destinations. Your NetScaler appliance would then block any other requests as specified by the default action you configured.

You can assign any one of the following actions to an undefined event:

- **NOOP**
  
  The NOOP action aborts responder processing but does not alter the packet flow. This means that the appliance continues to process requests that do not match any responder policy, and eventually forwards them to the requested URL unless another feature intervenes and blocks or redirects the request. This action is appropriate for normal requests to your Web servers and is the default setting.

- **RESET**
  
  If the undefined action is set to RESET, the appliance resets the client connection, informing the client that it must re-establish its session with the Web server. This action is appropriate for repeat requests for Web pages that do not exist, or for connections that might be attempts to hack or probe your protected Web site(s).

- **DROP**
  
  If the undefined action is set to DROP, the appliance silently drops the request without responding to the client in any way. This action is appropriate for requests that appear to be part of a DDoS attack or other sustained attack on your servers.

**Note:** UNDEF events are triggered only for client requests. No UNDEF events are triggered for responses.

To set the undefined action by using the NetScaler command line:

At the command prompt, type the following command to set the undefined action and verify the configuration:
NetScaler 11.1

set responder param -undefAction (RESET DROP NOOP)

show responder param

Example:

```
1 > set responder param -undefAction RESET
2   Done
3 > show responder param
4     Action Name: RESET
5   Done
6 >
```

To set the undefined action by using the GUI:

1. Navigate to AppExpert > Responder, and then under Settings, click the **Change Responder Settings **link.
2. In the Set Responder Params dialog box, under Global Undefined-Result Action, select NOOP, RESET, or DROP.
3. Click OK. A message appears in the status bar, stating that the Responder Parameters have been configured.

Responder action and policy examples

December 13, 2018

Responder actions and policies are powerful and complex, but you can get started with relatively simple applications.

Example: Blocking access from specified IP addresses

The following procedures block access to your protected Web site(s) by clients originating from the CIDR 222.222.0.0/16. The responder sends an error message stating that the client is not authorized to access the URL requested.

To block access by using the NetScaler command line:

At the command prompt, type the following commands to block access:
NetScaler 11.1

- add responder action act_unauthorized respond with “HTTP/1.1 403 Forbidden\r\n\r
“Client: “ + CLIENT.IP.SRC + “ is not authorized to access URL:" + “HTTP.REQ.URL.HTTP_URL_SAFE”
- add responder policy pol_un “CLIENT.IP.SRC.IN_SUBNET (222.222.0.0/16)” act_unauthorized
- bind responder global pol_un 10

To block access by using the GUI:

1. In the navigation pane, expand **Responder**, and then click **Actions**.
2. In the details pane, click **Add**.
3. In the **Create Responder Action** dialog box, do the following:
   a) In the Name text box, type act_unauthorized.
   b) Under Type, select Respond with.
   c) In the Target text area, type the following string: “HTTP/1.1 200 OK\r\n\r
“Client: “ + CLIENT.IP.SRC + “ is not authorized to access URL:" + HTTP.REQ.URL.HTTP_URL_SAFE
   d) Click **Create**, and then click **Close**.
   
The responder action you configured, named act_unauthorized, now appears in the Responder Actions page.
4. In the navigation pane, click **Policies**.
5. In the details pane, click **Add**.
6. In the **Create Responder Policy** dialog box, do the following:
   a) In the Name text box, type pol_unauthorized.
   b) Under Action, select act_unauthorized.
   c) In the Expression window, type the following rule: CLIENT.IP.SRC.IN_SUBNET(222.222.0.0/16)
   d) Click **Create**, then click **Close**.
   
The responder policy you configured, named pol_unauthorized, now appears in the Responder Policies page.
7. Globally bind your new policy, pol_unauthorized, as described in **Binding a Responder Policy**.

**Example: Redirecting a client to a new URL**

The following procedures redirect clients who access your protected Web site(s) from within the CIDR 222.222.0.0/16 to a specified URL.

To redirect clients by using the NetScaler command line:

At the command prompt, type the following commands to redirect clients and verify the configuration:

- add responder action act_redirect redirect ”<http://www.example.com/404.html>”
- show responder action act_redirect
- add responder policy pol_redirect ”CLIENT.IP.SRC.IN_SUBNET(222.222.0.0/16) ”act_redirect
- show responder policy pol_redirect

© 1999-2018 Citrix Systems, Inc. All rights reserved.
To redirect clients by using the GUI:

1. Navigate to **AppExpert > Responder > Actions**.
2. In the details pane, click **Add**.
3. In the **Create Responder Action** dialog box, do the following:
   a) In the Name text box, type act_redirect.
   b) Under Type, select **Redirect**.
   c) In the Target text area, type the following string: 
      ```
      "http://www.example.com/404.html"
      ```
   d) Click , then **Create** click **Close**.
      The responder action you configured, named act_redirect, now appears in the Responder Actions page.
4. In the navigation pane, click **Policies**.
5. In the details pane, click **Add**.
6. In the **Create Responder Policy** dialog box, do the following:
   a) In the **Name** text box, type pol_redirect.
   c) In the Expression window, type the following rule: 
      ```
      CLIENT.IP.SRC.IN_SUBNET(222.222.0.0/16)
      ```
   d) Click **Create**, then click **Close**.
      The responder policy you configured, named pol_redirect, now appears in the Responder Policies page.
7. Globally bind your new policy, pol_redirect, as described in **Binding a Responder Policy**.

### Diameter Support for Responder

December 10, 2018

The Responder feature now supports the Diameter protocol. You can configure Responder to respond to Diameter requests as it does HTTP and TCP requests. For example, you could configure Responder to respond to requests from a specific Diameter origin with a redirect to a web page enhanced for...
NetScaler 11.1

mobile devices. A number of NetScaler expressions have been added that support examination of the Diameter header and the attribute-value pairs (AVPs). These expressions support lookup of specific AVPs by index, ID or name, examine the information in each AVP, and send an appropriate response.

To configure Responder to respond to a Diameter request:

At the command prompt, type the following commands:

- add responder action <actname> RESPONDWITH “DIAMETER.NEW_REDIRECT("aaa://host.example.com")”
  
  For <actname>, substitute a name for your new action. The name can consist of from one to 127 characters in length, and can contain letters, numbers, and the hyphen (-) and underscore (_) symbols. For aaa://host.example.com, substitute the URL of the diameter host to which you want to redirect connections.

- add responder policy <polname> “diameter.req.avp(264).value.eq("host1.example.net")”
  
  For <polname>, substitute a name for your new policy. As with <actname>, the name can consist of from one to 127 characters in length, and can contain letters, numbers, and the hyphen (-) and underscore (_) symbols. For host1.example.net, substitute the name of the originating host of the requests that you want to redirect. For <actname>, substitute the name of the action that you just created.

- bind lb vserver <vservername> -policyName <polname> -priority <priority> -type REQUEST
  
  For <vservername>, substitute the name of the load balancing virtual server to which you want to bind the policy. For <polname>, substitute the name of the policy you just created. For <priority>, substitute a priority for the policy.

Example:

To create a Responder action and policy to respond to Diameter requests that originate from “host1.example.net” with a redirect to “host.example.com”, you could add the following action and policy, and bind the policy as shown.

```
  1 > add responder action act_res_dm_redirect RESPONDWITH "DIAMETER.NEW_REDIRECT("aaa://host.example.com")"
  2 Done
  3
  4 > add responder pol_res_dm_redirect "diameter.req.avp(264).value.eq("host1.example.net")" act_res_dm_redirect
  5 Done
  6
  7 > bind lb vserver vs1 -policyName pol_res_dm_redirect -priority 10 -type REQUEST
  8 Done
```
The NetScaler expressions language contains expressions that can extract information from and manipulate RADIUS requests. These expressions enable you to use the Responder feature to respond to RADIUS requests. Your responder policies and actions can use any expression that is appropriate or relevant to a RADIUS request. The available expressions enable you to identify the RADIUS message type, extract any attribute-value pair (AVP) from the connection, and send different responses on the basis of that information. You can also create policy labels that invoke all responder policies for RADIUS connections.

You can use RADIUS expressions to construct simple responses that do not require communication with the RADIUS server to which the request was sent. When a responder policy matches a connection, the NetScaler constructs and sends the appropriate RADIUS response without contacting the RADIUS authentication server. For example, if the source IP address of a RADIUS request is from a subnet that is specified in the responder policy, the NetScaler can reply to that request with an access-reject message, or can simply drop the request.

You can also create policy labels to route specific types of RADIUS requests through a series of policies that are appropriate to those requests.

**Note:** The current RADIUS expressions do not work with RADIUS IPv6 attributes.

The NetScaler documentation for expressions that support RADIUS assumes familiarity with the basic structure and purpose of RADIUS communications. If you need more information about RADIUS, see your RADIUS server documentation or search online for an introduction to the RADIUS protocol.

### Configuring Responder Policies for RADIUS

The following procedure uses the NetScaler command line to configure a responder action and policy, and bind the policy to a RADIUS-specific global bind point.

To configure a Responder action and policy, and bind the policy:

At the command prompt, type the following commands:

- `add responder action <actName> <actType>`
- `add responder policy <polName> <rule> <actName>`
- `bind responder policy <polName> <priority> <nextExpr> -type <bindPoint>` where `<bindPoint>` represents one of the RADIUS-specific global bind points.
**RADIUS Expressions for Responder**

In a responder configuration, you can use the following NetScaler expressions to refer to various portions of a RADIUS request.

**Identifying the Type of Connection:**

- **RADIUS.IS_CLIENT**
  Returns TRUE if the connection is a RADIUS client (request) message.

- **RADIUS.IS_SERVER**
  Returns TRUE if the connection is a RADIUS server (response) message.

**Request Expressions:**

- **RADIUS.REQ.CODE**
  Returns the number that corresponds to the RADIUS request type. A derivative of the num_at class. For example, a RADIUS access request would return 1 (one). A RADIUS accounting request would return 4.

- **RADIUS.REQ.LENGTH**
  Returns the length of the RADIUS request, including the header. A derivative of the num_at class.

- **RADIUS.REQ.IDENTIFIER**
  Returns the RADIUS request identifier, a number assigned to each request that allows the request to be matched to the corresponding response. A derivative of the num_at class.

- **RADIUS.REQ.AVP(<AVP Code No>).VALUE**
  Returns the value of first occurrence of this AVP as a string of type text_t.

- **RADIUS.REQ.AVP(<AVP code no>).INSTANCE(instance number)**
  Returns the specified instance of the AVP as a string of type RAVP_t. A specific RADIUS AVP can occur multiple times in a RADIUS message. INSTANCE (0) returns the first instance, INSTANCE (1) returns second instance, and so on, up to sixteen instances.

- **RADIUS.REQ.AVP(<AVP code no>).VALUE(instance number)**
  Returns the value of specified instance of the AVP as a string of type text_t.

- **RADIUS.REQ.AVP(<AVP code no>).COUNT**
  Returns the number of instances of a specific AVP in a RADIUS connection, as an integer.
- RADIUS.REQ.AVP(<AVP code no>).EXISTS

  Returns TRUE if the specified type of AVP exists in the message, or FALSE if it does not.

**Response Expressions:**

RADIUS response expressions are identical to RADIUS request expressions, except that RES replaces REQ.

**Typecasts of AVP Values:**

The ADC supports expressions to typecast RADIUS AVP values to the text, integer, unsigned integer, long, unsigned long, ipv4 address, ipv6 address, ipv6 prefix and time data types. The syntax is the same as for other NetScaler typecast expressions.

**Example:**

The ADC supports expressions to typecast RADIUS AVP values to the text, integer, unsigned integer, long, unsigned long, ipv4 address, ipv6 address, ipv6 prefix and time data types. The syntax is the same as for other NetScaler typecast expressions.

```
1 RADIUS.REQ.AVP(8).VALUE(0).typecast_ip_address_at
```

**AVP Type Expressions:**

The NetScaler supports expressions to extract RADIUS AVP values by using the assigned integer codes described in RFC2865 and RFC2866. You can also use text aliases to accomplish the same task. Some examples follow.

- RADIUS.REQ.AVP (1).VALUE or RADIUS.REQ.USERNAME.value

  Extracts the RADIUS user-name value.

- RADIUS.REQ.AVP (4). VALUE or RADIUS.REQ.ACCT_SESSION_ID.value

  Extracts the Acct-Session-ID AVP (code 44) from the message.

- RADIUS.REQ.AVP (26). VALUE or RADIUS.REQ.VENDOR_SPECIFIC.VALUE

  Extracts the vendor-specific value.

The values of most commonly-used RADIUS AVPs can be extracted in the same manner.

**RADIUS Bind Points:**

Four global bind points are available for policies that contain RADIUS expressions.

- RADIUS_REQ_OVERRIDE

  Priority/override request policy queue.

- RADIUS_REQ_DEFAULT

  Standard request policy queue.
• RADIUS_RES_OVERRIDE
  Priority/override response policy queue.

• RADIUS_RES_DEFAULT
  Standard response policy queue.

**RADIUS Responder-Specific Expressions:**

• RADIUS_RESPONDWITH
  Respond with the specified RADIUS response. The response is created with NetScaler expressions, both RADIUS expressions and any others that are applicable.

• RADIUS.NEW_ANSWER
  Sends a new RADIUS answer to the user.

• RADIUS.NEW_ACCESSREJECT
  Rejects the RADIUS request.

• RADIUS.NEW_AVP
  Adds the specified new AVP to the response.

**Use Cases**

Following are use cases for RADIUS with responder.

**Blocking RADIUS Requests from a Specific Network**

To configure the responder feature to block authentication requests from a specific network, begin by creating a responder action that rejects requests. Use the action in a policy that selects requests from the networks that you want to block. Bind the responder policy to a RADIUS-specific global bind point, specifying:

- The priority
- END as the nextExpr value, to ensure that policy evaluation stops when this policy is matched
- RADIUS_REQ_OVERRIDE as the queue to which you assign the policy, so that it is evaluated before policies assigned to the default queue

To configure Responder to block logons from a specific network**

- add responder action <actName> <actType>
- add responder policy <polName> <rule> <actName>
- bind responder global <polName> <priority> <nextExpr> -type <bindPoint>
Example:

```plaintext
1  > add responder action rspActRadiusReject respondwith radius.
    new_accessreject
2    Done
3
4  > add responder policy rspPolRadiusReject client.ip.src.in_subnet
    (10.224.85.0/24) rspActRadiusReject
5    Done
6
7  > bind responder global rspPolRadiusReject 1 END -type
    RADIUS_REQ_OVERRIDE
```

DNS Support for the Responder Feature

December 10, 2018
