NetScaler 12.0

Disable high availability monitoring for unused interfaces ............................................. 20

Configure a FIPS appliance for the first time ................................................................. 22
  Configure secure HTTPS by using the CLI ................................................................. 22
  Configure secure HTTPS by using the GUI ................................................................. 22
  Configure secure RPC by using the CLI ................................................................. 23
  Configure secure RPC by using the GUI ................................................................. 24

Common network topologies ............................................................................................ 25
  Set up a common two-arm topology ........................................................................... 25
  Set up common one-arm topologies .......................................................................... 26

System management settings .......................................................................................... 27

System settings .................................................................................................................. 27

Packet forwarding modes ............................................................................................... 29
  Enable and disable layer 2 mode .................................................................................. 30
  Enable and disable layer 3 mode .................................................................................. 31
  Enable and disable MAC based forwarding mode ....................................................... 33

Network interfaces .......................................................................................................... 34
  Virtual LANs ................................................................................................................ 35
  Link aggregate channels ............................................................................................. 35

Clock synchronization .................................................................................................... 36

DNS configuration ............................................................................................................. 37
  Add a name server by using the CLI .......................................................................... 38
  Add a name server by using the GUI .......................................................................... 38

SNMP configuration ......................................................................................................... 38
  Add SNMP managers .................................................................................................... 39
  Add SNMP traps listeners ......................................................................................... 40
  Configure SNMP alarms ............................................................................................. 41

Verify configuration ........................................................................................................ 42
  Configuration checklist ............................................................................................... 43
  Topology configuration checklist ............................................................................... 43
  Server configuration checklist ................................................................................... 44
  Software features configuration checklist ................................................................. 44
  Access checklist ........................................................................................................... 45
  Firewall checklist ......................................................................................................... 45

Load balance traffic on a NetScaler appliance

Load balancing

- Enable load balancing
- Configure services and a virtual server

Persistence settings

- Configure persistence based on cookies
- Configure persistence based on server IDs in URLs

Configure features to protect the load balancing configuration

- Configure URL redirection
- Configure backup virtual servers

A typical load balancing scenario

Accelerate load balanced traffic by using compression

- Compression configuration task sequence
- Enable compression
- Configure services to compress data
- Bind a compression policy to a virtual server

Secure load balanced traffic by using SSL

- SSL configuration task sequence
- Enable SSL offload
- Create HTTP services
- Add an SSL based virtual server
- Bind services to the SSL virtual server
- Add a certificate key pair
- Bind an SSL certificate key pair to the virtual server
- Configure support for Outlook web access
- Create an SSL action to enable OWA support
- Create SSL policies
- Bind the SSL policy to the SSL virtual server

Features at a glance

Application switching and traffic management features

- SSL Offloading
- Access Control Lists
- Load Balancing
- Traffic Domains

# NetScaler URL Filtering

- URL List .......................................................... 415
  - URL List Types .................................................. 415
  - URL List Policy Expressions ............................... 416
## URL List Policy Actions
- Prerequisites
- DNS Server for DNS Requests
- Configuring a URL List
- Importing a custom URL list
- Setting up IWF URL List Support
- Configuring a URL List for HTTP traffic
- Configuring URL List for HTTPS traffic
- Configuring a URL List by using the GUI
- Configuring Audit Log Messaging
- URL List Semantics

## URL Categorization
- How URL Categorization Works
- Prerequisites
- URL Categorization Policy Expressions
- URL Categorization Policy Actions
- Configuring URL Categorization
- Setting up URL Categorization
- Configuring URL categorization for HTTP traffic
- Configuring URL categorization for HTTPS traffic
- Configuring URL Categorization by using the GUI
- Configuring Audit Log Messaging
- Storing Failure Errors Using SYSLOG Messaging
- URL Reputation Score

## NetScaler Solutions
- Setting Up NetScaler appliance for XenApp/XenDesktop
- Global Server Load Balancing (GSLB) Powered Zone Preference
- NetScaler appliance in a Private Cloud Managed by Microsoft Windows Azure Pack and Cisco ACI
- Creating a NetScaler appliance Load Balancer in a Plan in the Service Management Portal (Admin Portal)
Configuring a NetScaler appliance Load Balancer by Using the Service Management Portal (Tenant Portal) 443

Deleting a NetScaler appliance Load Balancer from the Network 445

Deploy a NetScaler VPX instance 445
   NetScaler Management and Analytics for NetScaler VPX instances 446

Support matrix and usage guidelines 446

Install a NetScaler VPX instance on XenServer 449
   Prerequisites for installing a NetScaler VPX instance on XenServer 449
   Install NetScaler VPX instances on XenServer by using XenCenter 451

Configure VPX instances to use single root I/O virtualization (SR-IOV) network interfaces 452
   Limitations 452
   Prerequisites 452
   Assign SR-IOV VFs to the VPX instance by using the XenServer host 453
   Unassign SR-IOV VFs to the VPX instance by using the XenServer host 453
   Configuring VLAN on the SR-IOV Interface 454
   Configure VLAN on the SR-IOV interface 454

Install a NetScaler VPX instance on VMware ESX 454
   Prerequisites 455
   Install a NetScaler VPX instance on VMware ESX 458

Configure a NetScaler VPX instance to use VMXNET3 network interface 459

Configure a NetScaler VPX instance to use SR-IOV network interface 461
   Limitations 462

Migrating the NetScaler VPX from E1000 to SR-IOV or VMXNET3 Network Interfaces 466

Configure a NetScaler VPX instance to use PCI passthrough network interface 466
   Overview 466
   Prerequisites 466
   Configure passthrough devices on a host 467
   Configure passthrough devices on a NetScaler VPX instance 467

Install a NetScaler VPX instance on Microsoft Hyper-V server 467
   Prerequisites for installing NetScaler VPX instance on Microsoft servers 468
   Install the NetScaler VPX instance on Microsoft servers 469
   Auto-provision a NetScaler VPX instance on Hyper-V 470
## Install a NetScaler VPX instance on Linux-KVM platform

| Limitations and usage guidelines | 472 |

## Prerequisites for installing a NetScaler VPX instance on Linux-KVM platform

| Software requirements | 473 |
| Guest VM hardware requirements | 474 |
| Networking requirements | 474 |
| Properties of source interfaces | 475 |
| Module required | 477 |

## Provision the NetScaler VPX instance by using OpenStack

| Userdata file | 477 |
| Network configuration | 480 |
| Customer script | 480 |
| SSH key pair authentication | 481 |
| Before you begin | 481 |
| Provisioning the VPX instance | 481 |

## Provision the NetScaler VPX instance by using the Virtual Machine Manager

| Check prerequisites for auto-provisioning a NetScaler VPX instance | 483 |
| Provision the NetScaler VPX instance by using a RAW image | 484 |
| Provision the NetScaler VPX instance by using a QCOW2 image | 485 |
| Enable auto-provisioning by attaching a CDROM drive | 486 |
| Add additional interfaces to the NetScaler VPX instance by using Virtual Machine Manager | 487 |

## Configure a NetScaler VPX instance to use SR-IOV network interfaces

| Limitations | 488 |
| Prerequisites | 489 |
| Configure a NetScaler VPX instance to use SR-IOV network interface | 490 |
| Configure static LA/LACP on the SR-IOV interface | 491 |
| Configuring VLAN on the SR-IOV Interface | 491 |

## Configure a NetScaler VPX instance to use PCI passthrough network interfaces

| Prerequisites | 492 |

## Provision the NetScaler VPX instance by using the virsh program

| Add additional interfaces to NetScaler VPX instance using virsh program | 493 |

## Manage the NetScaler VPX guest VMs

| Manage the VPX guest VMs by using Virtual Machine Manager | 496 |
| Manage the NetScaler VPX guest VMs using the virsh program | 497 |
Provision the NetScaler VPX instance with SR-IOV, on OpenStack 498
Prerequisites 499
Enable SR-IOV VFs on the host 499
Configure and make the VFs available to OpenStack 500
Provision the NetScaler VPX instance on OpenStack 500

Configure a NetScaler VPX instance on KVM to use OVS DPDK-based host interfaces 503
Prerequisites 503
Install DPDK 503
Build and install OVS 504
Create an OVS bridge 504
Attach physical interface to the OVS bridge 504
Attach vhost-user ports to the OVS data path 505
Provision a KVM-VPX with OVS-DPDK-based vhost-user ports 505
Points to note 512

Deploy a NetScaler VPX instance on AWS 512
AWS terminology 512
How a NetScaler VPX instance on AWS works 515
Supported instance type, ENI, and IP addresses 515

Limitations and usage guidelines 516

Prerequisites 517

Deploy a NetScaler VPX standalone instance on AWS 518
Deploy a NetScaler VPX instance on AWS by using the AWS web console 518
Configure a NetScaler VPX instance by using the Citrix CloudFormation template 522
Configure a NetScaler VPX instance by using the AWS CLI 523

Download a NetScaler VPX license 523

Load balancing servers in different availability zones 523

Deploy a high availability pair on AWS 524
Points to note 524
Deploy a high availability pair by using the Citrix CloudFormation template 525
Configuring SR-IOV on a high availability setup 527

Add back-end AWS Auto Scaling service 527
Before you begin 528
Add the AWS Auto Scaling service to a NetScaler VPX instance 529
Configure a NetScaler VPX instance to use SR-IOV network interface 531
  Change the interface type to SR-IOV 531
  Configure SR-IOV on a high availability setup 532

Upgrade a NetScaler VPX instance on AWS 533
  Change the EC2 instance type of a NetScaler VPX instance on AWS 533
  Upgrade the throughput or software edition of a NetScaler VPX instance on AWS 534
  Upgrade the system software of a NetScaler VPX instance on AWS 534
  Upgrade to a new NetScaler AMI instance by using a NetScaler high availability configuration 535
  Prerequisites and points to consider 535

Troubleshoot a VPX instance on AWS 538

Deploy a NetScaler VPX instance on Microsoft Azure 538
  Network architecture 539
  How a NetScaler VPX instance works on Azure 540
  Traffic flow through port address translation 541
  Traffic flow through network address translation 541
  Port usage guidelines 542
  NetScaler VPX licensing 543
  Limitations 544

Configure a NetScaler VPX standalone instance 545
  Before you begin 545
  Summary of configuration steps 545
  Configure a resource group 546
  Configure a network security group 546
  Configure a virtual network and subnets 546
  Configure a storage account 547
  Configure an availability set 547
  Configure a NetScaler VPX instance 548

Configure multiple IP addresses for a NetScaler VPX standalone instance 549
  Use case 550
  Before you begin 550

Configure a high-availability setup with multiple IP addresses and NICs 551
  Configure HA-INC nodes by using the Citrix high availability template 552

Configure a high-availability setup with multiple IP addresses and NICs by using PowerShell commands 554
  Configure HA-INC nodes by using PowerShell Ccmmands 555

Additional PowerShell scripts for Azure deployment 608
Provision a NetScaler VPX standalone instance 608
Provision a NetScaler VPX pair in a high availability setup with an Azure external load balancer 613
Provision a NetScaler VPX pair in a high availability setup with Azure internal load balancer 620

Azure terminology 625

Jumbo frames on NetScaler VPX instances 627
Configure jumbo frames for a VPX instance running on VMware ESX 628
Configure jumbo frames for a VPX instance running on Linux-KVM server 628
Configure jumbo frames for a VPX instance running on Citrix XenServer 628
Configure jumbo frames for a VPX instance running on AWS 628

Licensing 628

NetScaler licensing overview 629
Prerequisites 629
Allocate a license by using the GUI 630
Install a license 631
Verify licensed features 632
Enable or disable a feature 633
Check license expiration information 634
NetScaler VPX Express license 634

Citrix Gateway Universal License 635
Obtaining the Universal License 635
Installing the Universal License 636
Verifying Installation of the Universal License 636

NetScaler Pooled Capacity 637

Upgrade and downgrade a NetScaler appliance 637

Before you begin 637

Upgrade a Citrix NetScaler standalone appliance 638
Upgrade a Citrix NetScaler standalone appliance by using the GUI 639
Upgrade a Citrix NetScaler standalone appliance by using the CLI 639
Upgrade a Citrix NetScaler standalone appliance by using NITRO API 643
Directory locations of script files for user monitors 643
Check and install Citrix NetScaler 12.0 software update 643
NetScaler 12.0

Downgrade a Citrix NetScaler standalone appliance 644
   Procedure to downgrade a standalone Citrix NetScaler 644

Upgrade a high availability pair 646
   Points to note 647
   Upgrade a high availability pair by using the CLI 647
   Upgrade a high availability pair by using the GUI 651

Downgrade a high availability pair 651

Troubleshooting 652
   Resources for troubleshooting 652
   Troubleshooting issues related to the installation, upgrade, and downgrade processes 652

FAQs 656

New and deprecated commands, parameters, and SNMP OIDs 656

AAA application traffic 665

How AAA works 665

Enabling AAA 668
   To enable AAA by using the command line interface 668
   To enable AAA by using the configuration utility 669

Setting up an authentication virtual server 669
   To set up an authentication virtual server by using the CLI 669
   To set up an authentication virtual server by using the GUI 670

Configuring the authentication virtual server 671
   To configure an authentication virtual server by using the command line interface 671
   To configure an authentication virtual server by using the configuration utility 672

© 1999-2018 Citrix Systems, Inc. All rights reserved.
Configuring a traffic management virtual server 673
   To configure a TM virtual server for AAA by using the command line interface 674
   To configure a TM virtual server for AAA by using the configuration utility 675
   Simplified login protocol support for AAA 675

Configuring DNS 675

Verifying your setup for AAA 676
   To verify authentication virtual server setup by using the command line interface 676
   To verify your AAA virtual server setup by using the configuration utility 676

Creating an authentication profile 676
   To configure an authentication profile by using the CLI 677
   To configure an authentication profile by using the GUI 677

Configuring users and groups 677
   To create a local AAA user account by using the command line interface 678
   To change the password for an existing AAA local user account by using the command line interface 678
   To configure AAA local users by using the configuration utility 679
   To create AAA local groups and add users to them by using the command line interface 679
   To remove users from an AAA group by using the command line interface 680
   To remove an AAA group by using the command line interface 680
   To configure AAA local groups and add users to them by using the configuration utility 680

Configuring AAA policies 681

Authentication policies 681
   To add an authentication action by using the command line interface 683
   To configure an authentication action by using the command line interface 683
   To remove an authentication action by using the command line interface 684
   To configure an authentication server by using the configuration utility 684
   To create and bind an authentication policy by using the command line interface 685
   To modify an existing authentication policy by using the command line interface 685
   To remove an authentication policy by using the command line interface 685
   To configure and bind authentication policies by using the configuration utility 686

LDAP authentication policies 686
   To enable LDAP referral support by using the command line interface 688
   To enable LDAP referral support by using the configuration utility 688
   Key-based authentication support for LDAP users 688
Negotiate authentication policies 689
To configure AAA to extract user information from a keytab file by using the command line interface 690
To configure AAA to extract user information from a keytab file by using the configuration utility 690

RADIUS authentication policies 690
To add an authentication action for a RADIUS server by using the command line interface 691
To configure an authentication action for an external RADIUS server by using the command line 691
To remove an authentication action for an external RADIUS server by using the command line interface 692
To configure a RADIUS server by using the configuration utility 693

SAML authentication policies 694

Web authentication policies 694
To configure a Web authentication action by using the command line interface 695
To configure a Web authentication action by using the configuration utility 695

Configuring advanced authentication policies 696
To configure an advanced authentication policy by using the configuration utility 696

Authorizing user access to application resources 697
To configure authorization by using the CLI 697
To configure authorization by using the GUI (Configuration tab) 697

Auditing authenticated sessions 698
To configure syslog auditing by using the CLI 698
To configure syslog auditing by using the GUI (Configuration tab) 699

Session settings 700

Session profiles 700
To create a session profile by using the command line interface 701
To modify a session profile by using the command line interface 701
To remove a session profile by using the command line interface 702
To configure session profiles by using the configuration utility 702

Session policies 702
To create a session policy by using the command line interface 703
To modify a session policy by using the command line interface 703
To globally bind a session policy by using the command line interface .................... 703
To bind a session policy to an authentication virtual server by using the command line interface 704
To unbind a session policy from an authentication virtual server by using the command line interface ................................. 704
To unbind a globally bound session policy by using the command line interface ........ 705
To remove a session policy by using the command line interface .......................... 705
To configure and bind session policies by using the configuration utility .................. 705

Global session settings 706
To configure the session settings by using the command line interface .................. 706
To configure the session settings by using the configuration utility ...................... 707

Traffic Settings 707

Traffic profiles 707
To create a traffic profile by using the command line interface ......................... 708
To modify a session profile by using the command line interface ....................... 708
To remove a session profile by using the command line interface ...................... 708
To configure traffic profiles by using the configuration utility ......................... 709

Traffic policies 709
To create a traffic policy by using the command line interface ......................... 709
To modify a traffic policy by using the command line interface ...................... 710
To globally bind a traffic policy by using the command line interface ............... 710
To bind a traffic policy to a load balancing or content switching virtual server by using the command line interface ................................. 710
To unbind a globally bound traffic policy by using the command line interface .... 710
To unbind a traffic policy from a load balancing or content switching virtual server by using the command line interface ................................. 711
To remove a traffic policy by using the command line interface ...................... 711
To configure and bind traffic policies by using the configuration utility ............ 711

Form SSO profiles 712
To create a form SSO profile by using the command line interface ................... 712
To modify a form SSO by using the command line interface ........................... 712
To remove a form SSO profile by using the command line interface ................. 712
To configure form SSO profiles by using the configuration utility ................... 713

SAML SSO profiles 714
To create a SAML SSO profile by using the command line interface .................. 714
To modify a SAML SSO by using the command line interface ......................... 714
To remove a SAML SSO profile by using the command line interface .......................... 715
To configure a SAML SSO profile by using the configuration utility ......................... 715

### Invoking an HTTP Callout

896

### Avoiding HTTP callout recursion

899

### Caching HTTP Callout Responses

900

To set the cache duration by using the command line interface ........................................ 900
To set the cache duration by using the GUI ......................................................................... 901

### Use Case: Filtering Clients by Using an IP Blacklist

901

Enabling Responder ......................................................... 901
Creating an HTTP Callout on the NetScaler Appliance .................................................. 902
Configuring a Responder Policy and Binding it Globally ............................................... 902
Creating an HTTP Callout Agent on the Remote Server .............................................. 902

### Use Case: ESI Support for Fetching and Updating Content Dynamically

903

Enabling Rewrite .......................................................... 904
Creating an HTTP Callout on the NetScaler Appliance .................................................. 904
Configuring the rewrite action ......................................................................................... 904
Creating the rewrite policy and binding it globally ......................................................... 905

### Use Case: Access control and authentication

906

Enabling responder ............................................................ 907
Creating an HTTP Callout on the NetScaler Appliance .................................................. 907
Creating a Responder policy to analyze the response .................................................. 908
Creating an HTTP Callout agent on the remote server ................................................ 909

### Use Case: OWA-Based Spam Filtering

910

Enabling Responder ............................................................ 910
Creating an HTTP Callout on the NetScaler Appliance .................................................. 911
Creating a Responder Action ........................................................................................... 911
Creating a Responder Policy to Invoke the HTTP Callout ........................................... 912
Creating an HTTP Callout Agent on the Remote Server .............................................. 913

### Use Case: Dynamic Content Switching

913

Pattern sets and data sets ............................................... 914

How string matching works with pattern sets and data sets ...................................... 915

### Configuring a Pattern Set

916

To configure a pattern set by using the command line interface .................................. 916
To configure a pattern set by using the configuration utility .......................................... 917
Configuring a data set 917
To configure a data set by using the command line interface 918
To configure a data set by using the configuration utility 918

Using pattern sets and data sets 918

Variables 920
Variables Scope 921

Configuring and using Variables 921
To configure variables by using the command line interface 921
Use Case to insert HTTP header in the response side 923
To configure variables by using the GUI 924

Use Case: Caching User Privileges 924
To achieve this use case, perform the following operations 924

Use Case: Limiting the Number of Sessions 925

Policies and expressions 927

Introduction to policies and expressions 928

Classic and advanced policies 929
Benefits of using advanced policies 929
Basic components of an advanced policy 930
How different NetScaler features use policies 931
About actions and profiles 934
About policy bindings 936
About evaluation order of policies 937
Order of evaluation based on traffic flow 938

Classic and advanced policy expressions 938
About classic expressions 939
About advanced policy expressions 939

Converting policy expressions using NSPEPI tool 940
About the conversion process 941
Convert expressions 942
Convert a NetScaler configuration file 943
Conversion warnings 943
### Before you proceed

944

### Configure advanced policy infrastructure

944

### Rules for names in identifiers used in policies

945

### Create or modify a policy

946
- Create a policy by using the CLI ........................................... 946
- Create or modify a policy by using the GUI ............................... 947

### Policy configuration examples

948

### Bind policies using advanced policy

948
- Feature-specific differences in policy bindings ............................ 949
- Bind points and order of evaluation ........................................ 952
- Policy evaluation across features ............................................ 953
- Entries in a policy bank ...................................................... 953
- Evaluation order within a policy bank ..................................... 954
- How policy evaluation ends .................................................. 956
- How features use actions after policy evaluation ........................... 957

### Bind a policy globally

957
- Bind an integrated caching policy globally by using the CLI ......... 957
- Bind a rewrite policy globally by using the CLI .......................... 958
- Bind a compression policy globally by using the CLI .................. 958
- Bind a responder policy globally by using the CLI ..................... 959
- Bind a DNS policy globally by using the CLI ............................. 959
- Bind an integrated caching, responder, rewrite, or compression policy globally by using the GUI .................................................. 960
- Bind a DNS policy globally by using the GUI ............................. 960

### Bind a policy to a virtual server

960
- Bind a policy to a load balancing or content switching virtual server by using the CLI .................................................. 961
- Bind a policy to an SSL offload virtual server by using the CLI .......... 962
- Bind a policy to a virtual server by using the GUI ....................... 962

### Display policy bindings

962
- Display policy bindings by using the CLI .................................. 962
- Display global policy bindings for integrated caching, rewrite, or responder by using the GUI .......................................... 963
- Display global policy bindings for DNS or clientless access in the NetScaler Gateway by using the GUI ................................. 963
- Display global policy bindings for content switching by using the GUI .................................. 963
Unbind a policy

Unbind an integrated caching, rewrite, or compression advanced policy globally by using the CLI.

Unbind a responder policy globally by using the CLI.

Unbind a DNS policy globally by using the CLI.

Unbind an advanced policy from a virtual server by using the CLI.

Unbind an integrated caching, responder, rewrite, or compression Advanced policy globally by using the GUI.

Unbind a DNS policy globally by using the GUI.

Unbind an advanced policy from a load balancing or content switching virtual server by using the GUI.

Create policy labels

Create a caching policy label by using the CLI.

Create a content switching policy label by using the CLI.

Create a rewrite policy label by using the CLI.

Create a responder policy label by using the CLI.

Create a policy label by using the GUI.

Bind a policy to a policy label.

Configure a policy label or virtual server policy bank

Configure a policy label.

Configure a policy bank for a virtual server.

Invoke or remove a policy label or virtual server policy bank

Invoke a rewrite or integrated caching policy label by using the CLI.

Invoke a responder policy label by using the CLI.

Invoke a virtual server policy bank by using the CLI.

Remove a rewrite or integrated caching policy label by using the CLI.

Remove a responder policy label by using the CLI.

Remove a virtual server policy label by using the CLI.

Invoke a policy label or virtual server policy bank by using the GUI.

Remove a policy label invocation by using the GUI.

Configure and bind policies with the policy manager

Configure policy bindings by using the policy manager.

Remove unused policies by using the policy manager.

Configuring advanced policy expression: getting started
## Basic elements of an advanced policy expression

Prefixes ................................................................. 986
Single-element expressions ........................................ 988
Operations ................................................................. 988
Basic operations on expression prefixes ......................... 989

## Compound advanced policy expressions

Booleans in compound expressions .................................. 991
Parentheses in compound expressions ................................. 991
Compound operations for strings ..................................... 992
Compound operations for numbers ................................... 995

## Specify the character set in expressions

Compound expressions with different character sets ................ 1004
Specify the character set based on the character set of traffic ........................................ 1005
Character and string literals in expressions ........................ 1005
Values in hexadecimal and octal formats ......................... 1005
Functions that return UTF-8 strings ................................. 1006
Terminal connection settings for UTF-8 ............................. 1006

## Classic expressions in advanced policy expressions

Configure advanced policy expressions in a policy ............... 1007
Configure an Advanced policy syntax rule by using the CLI ......................... 1008
Configure a default syntax policy expression by using the GUI ........................................ 1009
Test a default syntax expression by using the GUI ................ 1010

## Configure named advanced policy expressions

Example 1: Simple Named Expression as a Prefix ................ 1011
Example 2: Compound named expression as a prefix .............. 1011
Configure a named default syntax expression by using the CLI ........................................ 1012
Configure a named expression by using the GUI .................. 1012

## Configure advanced policy expressions outside the context of a policy

Configure an advanced policy expression outside a policy by using the CLI (cache selector example) ........................................ 1013

## Advanced policy expressions: evaluating text

About text expressions .................................................. 1014
About operations on text ................................................ 1015
Compounding and precedence in text expressions ................ 1016
| Categories of text expressions | 1016 |
| Guidelines for text expressions | 1017 |

**Expression prefixes for text in HTTP requests and responses** | 1017

**Expression prefixes for VPNs and clientless VPNs** | 1018

**Basic operations on text** | 1027
- String comparison functions | 1027
- Calculate the length of a string | 1029
- Consider, ignore, and change text case | 1030
- Strip specific characters from a string | 1030
- Append a string to another string | 1031

**Complex operations on text** | 1032
- Operations on the length of a string | 1032
- Operations on a portion of a string | 1033
- Operations for comparing the alphanumeric order of two strings | 1033
- Extract an integer from a string of bytes that represent text | 1033
- Convert text to a hash value | 1034
- Encode and decode text by applying the Base64 encoding algorithm | 1034
- Refine the search in a rewrite action by using the EXTEND function | 1034
- Convert text to hexadecimal format | 1035
- Encrypt and decrypt text | 1035
- Configure encryption key for third-party encryption | 1037
- Configure HMAC keys | 1044
- Show an HMAC key by using the CLI | 1045

**Advanced policy expressions: working with dates, times, and numbers** | 1046

**Format of dates and times in an expression** | 1046

**Expressions for the NetScaler system time** | 1047

**Expressions for SSL certificate dates** | 1051

**Expressions for HTTP request and response dates** | 1060

**Generate the day of the week, as a string, in short and long formats** | 1060

**Expression prefixes for numeric data other than date and time** | 1061

**Converting numbers to text** | 1062
Advanced policy expressions: stream analytics functions

Advanced policy expressions: DataStream
- Expressions for the MySQL protocol
- Expressions for evaluating Microsoft SQL server connections

Typecasting data

Regular Expressions

Basic characteristics of regular expressions

Operations for regular expressions

Configuring classic policies and expressions

Configure a classic policy
- Create a classic policy by using the CLI
- Create a policy with classic expressions by using the GUI

Configure a classic expression
- Create a classic policy expression by using the CLI
- Add an expression for a classic policy by using the GUI

Bind a classic policy
- Bind a classic policy globally by using the CLI
- Bind a classic policy to a virtual server by using the CLI
- Bind a classic policy globally by using the GUI
- Bind a classic policy to a virtual server by using the GUI

View classic policies
- View a classic policy and its binding information by using the CLI
- View classic policies and policy bindings by using the GUI

Create named classic expressions
- Create a named classic expression by using the CLI
- Create a named classic expression by using the GUI

Expressions reference-advanced policy expressions

Expressions reference-classic expressions
- Operators
- General expressions
- Client security expressions
Network-based expressions .......................................................... 1162
Date/time expressions .................................................................. 1163
File system expressions ................................................................ 1163
Built-in named expressions (General) ............................................. 1164
Built-in named expressions (Anti-Virus) ......................................... 1166
Built-in named expressions (Personal Firewall) ............................. 1167
Built-in named expressions (Client Security) ................................. 1168

Summary examples of default syntax expressions and policies 1168

Tutorial examples of default syntax policies for rewrite 1176
Redirecting an external URL to an internal URL ................................ 1176
Redirecting a query ....................................................................... 1177
Rewriting HTTP to HTTPS ............................................................ 1178
Removing Unwanted Headers ....................................................... 1178
Reducing Web Server Redirects ..................................................... 1179
Masking the Server Header ............................................................ 1180

Tutorial Examples of Classic Policies 1180
NetScaler Gateway Policy to Check for a Valid Client Certificate .... 1181
Application firewall policy to protect a shopping cart application .... 1181
Application firewall policy to protect scripted web pages ............... 1184
DNS Policy to drop packets from specific IPs ............................... 1186
SSL policy to require valid client certificates ................................. 1186

Migration of Apache mod_rewrite rules to the default syntax 1187
Converting URL variations into canonical URLs ......................... 1187
Apache mod_rewrite solution for converting a URL ..................... 1187
NetScaler solution for converting a URL ....................................... 1187
Converting host name variations to canonical host names .......... 1188
Apache mod_rewrite solution for enforcing a particular host name for sites running on a port other than 80 .......................... 1188
Apache mod_rewrite solution for enforcing a particular host name for sites running on port 80 .............................................. 1188
NetScaler solution for enforcing a particular host name for sites running on a port other than 80 ............................................. 1188
NetScaler solution for enforcing a particular host name for sites running on port 80 .......................................................... 1189
Moving a document root ............................................................... 1189
Apache mod_rewrite solution for moving the document root ....... 1189
NetScaler solution for moving the document root ......................... 1189

© 1999-2018 Citrix Systems, Inc. All rights reserved.
NetScaler solution for moving the document root and appending path information to the request .......................................................... 1190
Moving home directories to a new web server ................................................. 1190
Apache mod_rewrite solution for redirecting to another Web server ............... 1190
NetScaler solution for redirecting to another Web server (method 1) ............... 1190
NetScaler solution for redirecting to another Web server (method 2) .......... 1190
Working with structured home directories ................................................. 1191
Apache mod_rewrite solution for structured home directories ................. 1191
NetScaler solution for structured home directories ......................................... 1191
Redirecting invalid URLs to other web servers ............................................ 1191
Apache mod_rewrite solution for redirection if a URL is wrong ................. 1192
NetScaler solution for redirection if a URL is wrong (method 1) ............... 1192
NetScaler solution for redirection if a URL is wrong (method 2) .......... 1192
Rewriting a URL based on time .............................................................. 1192
Apache mod_rewrite solution for rewriting a URL based on the time ........ 1193
NetScaler solution for rewriting a URL based on the time .......................... 1193
Redirecting to a new file name (Invisible to the User) ......................... 1193
Apache mod_rewrite solution for managing a file name change in a fixed location ................................. 1193
NetScaler solution for managing a file name change in a fixed location .... 1194
NetScaler solution for managing a file name change regardless of the base directory or query strings in the URL .......................................................... 1194
Redirecting to new file name (user-visible URL) ........................................ 1194
Apache mod_rewrite solution for changing the file name and the URL displayed in the browser ................................. 1194
NetScaler solution for changing the file name and the URL displayed in the browser ................................. 1194
NetScaler solution for changing the file name and the URL displayed in the browser regardless of the base directory or query strings in the URL .......................................................... 1195
Accommodating browser dependent content ............................................. 1195
Apache mod_rewrite solution for browser-specific settings ....................... 1195
Blocking access by robots ........................................................................... 1196
Apache mod_rewrite solution for blocking a path and a User-Agent header .... 1196
NetScaler solution for blocking a path and a User-Agent header .............. 1196
Blocking access to inline images ............................................................... 1197
Apache mod_rewrite solution for blocking access to an inline image ........ 1197
NetScaler solution for blocking access to an inline image .......................... 1197
Creating extensionless links ........................................................................ 1197
Apache mod_rewrite solution for adding a .php extension to all requests .... 1198
NetScaler policy for adding a .php extension to all requests ..................... 1198
Apache mod_rewrite solution for adding either .html or .php extensions to requests .......................................................... 1198
NetScaler policy for adding either .html or .php extensions to requests .................. 1198
### Redirecting a Working URI to a New Format

- Apache mod_rewrite solution
- NetScaler solution using regular expressions
- NetScaler solution using pattern sets

1199

### Ensuring That a Secure Server Is Used for Selected Pages

- Apache mod_rewrite solution
- NetScaler solution using regular expressions

1200

### Ratelimiting

1201

### Configuring a Stream Selector

1202
- To configure a traffic stream selector by using the command line interface
- To configure a stream selector by using the GUI

1203

### Viewing the Traffic Rate

1203
- To view the traffic rate by using the command line interface
- To view the traffic rate by using the GUI

1204

### Testing a Rate-Based Policy

1204
- Task overview: Testing a rate-based policy

1205

### Viewing the Traffic Rate

1205
- To view the traffic rate by using the command line interface
- To view the traffic rate by using the GUI

1206

### Testing a Rate-Based Policy

1206
- Task overview: Testing a rate-based policy

1207

### Examples of Rate-Based Policies

1207

### Sample Use Cases for Rate-Based Policies

1207
- Redirecting Traffic on the Basis of Traffic Rate
- Dropping DNS Requests on the Basis of Traffic Rate

1208

### Rate Limiting for Traffic Domains

1209

### Configure rate limit at packet level

1211

### Responder

1212
- Comparison between Rewrite and Responder options

1213

### Enabling the Responder Feature

1213

### Configuring a Responder Action

1214
- Configuring the Global HTTP Action

1218
Configuring a Responder Policy 1219

Binding a Responder Policy 1220

Setting the default action for a responder policy 1222

Responder action and policy examples 1224
   Example: Blocking access from specified IP addresses 1224
   Example: Redirecting a client to a new URL 1225

Diameter Support for Responder 1226

RADIUS Support for Responder 1228
   Configuring Responder Policies for RADIUS 1228
   RADIUS Expressions for Responder 1229
   Use Cases 1231

DNS Support for the Responder Feature 1232
   Configuring Responder Policies for DNS 1233

Troubleshooting 1234
   Resources for Troubleshooting 1234
   Troubleshooting Responder Issues 1234

Rewrite 1235
   Comparison between Rewrite and Responder options 1236

How rewrite works 1236
   Policy Evaluation 1238
   Rewrite Actions 1238

Enabling the rewrite feature 1239
   To enable the rewrite feature by using the command line interface 1239
   To enable the rewrite feature by using the GUI 1240

Configuring a Rewrite Action 1240
   To create a new rewrite action by using the command line interface 1241
   To modify an existing rewrite action by using the command line interface 1242
   To remove a rewrite action by using the command line interface 1243
   To configure a rewrite action by using the GUI 1243
   To add an expression by using the Add Expression dialog box 1243
   To evaluate a rewrite action by using the Rewrite Action Evaluator dialog box 1244
Configuring a Rewrite Policy

To add a new rewrite policy by using the command line interface
To modify an existing rewrite policy by using the command line interface
To remove a rewrite policy by using the command line interface
To configure a rewrite policy by using the GUI

Binding a Rewrite Policy

To globally bind a rewrite policy by using the command line interface
To bind rewrite policy to a specific virtual server by using the command line interface
To bind a rewrite policy to a bind point by using the GUI
To bind a rewrite policy to a specific virtual server by using the GUI

Configuring Rewrite Policy Labels

To configure a rewrite policy label by using the command line interface
To configure a rewrite policy label by using the GUI

Configuring the Default Rewrite Action

To configure the default action by using the command line interface
To configure the default action by using the GUI

Bypassing the Safety Check

To bypass the safety check by using the command line interface
To bypass safety check by using the GUI

Rewrite Action and Policy Examples

Example 1: Delete Old X-Forwarded-For and Client-IP Headers
To delete old X-Forwarded and Client-IP headers from a request by using the command line interface
To delete old X-Forwarded and Client-IP headers from a request by using the GUI

Example 2: Adding a Local Client-IP Header
To add a local Client-IP header by using the command line interface
To add a local Client-IP header by using the GUI

Example 3: Tagging Secure and Insecure Connections

Example 4: Mask the HTTP Server Type

Example 5: Redirect an external URL to an internal URL

Example 6: Migrating Apache Rewrite Module Rules
Example 7: Marketing Keyword Redirection 1264
Example 8: Redirect Queries to the Queried Server 1265
Example 9: Home Page Redirection 1266
Example 10: Policy-based RSA Encryption 1267
  Policy-based RSA encryption by using NetScaler command interface 1268
  Policy-based RSA encryption by using the GUI 1270
URL Transformation 1271
Configuring URL Transformation Profiles 1272
  To create a URL transformation profile by using the NetScaler command line 1272
  To modify an existing URL transformation profile or action by using the NetScaler command line 1273
  To remove a URL transformation profile and actions by using the NetScaler command line 1274
  To create a URL transformation profile by using the GUI 1274
  To configure a URL transformation profile and actions by using the GUI 1275
Configuring URL Transformation Policies 1276
  To configure a URL transformation policy by using the NetScaler command line 1276
  To remove a URL transformation policy by using the NetScaler command line 1277
  To configure a URL transformation policy by using the GUI 1277
  To add an expression by using the Add Expression dialog box 1278
Globally Binding URL Transformation Policies 1279
  To bind a URL transformation policy by using the NetScaler command line 1280
  To bind a URL transformation policy by using the GUI 1280
Globally Binding URL Transformation Policies 1281
  To bind a URL transformation policy by using the NetScaler command line 1282
  To bind a URL transformation policy by using the GUI 1282
Diameter Support for Rewrite 1283
  To configure Rewrite to modify a Diameter request 1284
DNS Support for the Rewrite Feature 1284
  DNS Expressions 1285
  DNS Bind Points 1285
  Rewrite Action Types for DNS 1285

To configure an App Firewall profile by using the GUI ........................................ 1351
Configuring an App Firewall rule or relaxation .................................................. 1353
To configure the Learning feature by using the GUI .................................................. 1355
To create and configure a policy by using the GUI .................................................. 1356
To create or configure an App Firewall rule (expression) ........................................ 1357
To add a firewall rule (expression) by using the Add Expression dialog box ................ 1359
To bind an App Firewall policy by using the GUI .................................................. 1360

Manual configuration by using the command line interface

To create a profile by using the command line interface ........................................ 1362
To configure a profile by using the command line interface ........................................ 1362
To create and configure a policy ........................................ 1363
To bind an App Firewall policy ........................................ 1363
To configure session limit per PE ........................................ 1364

Signatures

Protection options for your application ........................................ 1365
Getting started ........................................ 1366
Highlights ........................................ 1367

Manually configuring the signatures feature ........................................ 1367

Adding or removing a signatures object

To create a signatures object from a template ........................................ 1368

© 1999-2018 Citrix Systems, Inc. All rights reserved.
To create a signatures object by importing a file ............................................. 1369
To create a signatures object by importing a file by using the command line .......... 1369
To remove a signatures object by using the GUI ........................................... 1369
To remove a signatures object by using the command line ................................ 1370

Configuring or modifying a signatures object .............................................. 1370
To configure or modify a signatures object .................................................. 1370

Protecting JSON applications using signatures ......................................... 1373
Using the NetScaler App Firewall signatures to protect JSON applications ........ 1373
To add or remove JSON content-type by using the command line interface ....... 1374
To managing JSON content types by using the GUI ...................................... 1374
Configuring signature protection to detect attacks in JSON payload ................. 1375
Example of a signature to detect XSS in JSON payload ................................ 1375
Example of the payload .............................................................................. 1376
Example of the log message ....................................................................... 1377
Highlights ................................................................................................. 1377

Updating a signatures object ..................................................................... 1377
To update the App Firewall signatures from the source by using the command line . 1378
Updating a signatures object from a Citrix format file .................................. 1378
Updating a signatures object from a supported vulnerability scanning tool ........ 1379

Exporting a signatures object to a file ....................................................... 1380
To export a signatures object to a file ......................................................... 1380

The Signatures editor .................................................................................. 1381
To add or modify a local signature rule by using the Signatures Editor ............. 1381

To add a signature rule category .................................................................. 1383

Signature rule patterns ................................................................................. 1383
To configure a signature rule pattern ............................................................ 1384

To Import and merge rules ......................................................................... 1389

Signature updates in high availability deployment and build upgrades ............ 1389
Connecting to Amazon AWS ....................................................................... 1390
Signature updates during version upgrades ................................................... 1390

Overview of security checks ....................................................................... 1390

Top level protections ................................................................................... 1392
HTML cross-site scripting check

XSS Fine grained Relaxations .............................................. 1395
Using the Command Line to Configure the HTML Cross-Site Scripting check .................. 1396
Using the GUI to configure the HTML Cross-Site scripting check ................................ 1397
Using the Learn Feature with the HTML Cross-Site Scripting Check ............................. 1399
Using the Log Feature with the HTML Cross-Site Scripting Check ............................. 1400
Statistics for the HTML Cross-Site Scripting violations ............................................. 1402
Highlights .............................................................................. 1403

HTML SQL injection check

SQL fine grained relaxations .................................................. 1408
Using the command line to configure the SQL injection check ..................................... 1409
Using the GUI to configure the SQL injection security check ...................................... 1410
Using the Learn feature with the SQL injection check ................................................. 1413
Using the Log feature with the SQL injection check ..................................................... 1414
Statistics for the SQL Injection violations .................................................................... 1416
Highlights .............................................................................. 1417

Buffer overflow check

Using the command line to configure the Buffer Overflow security check ..................... 1418
Using the GUI to Configure the Buffer Overflow Security Check .................................. 1419
Using the Log Feature with the Buffer Overflow Security Check ................................. 1419
Statistics for the Buffer Overflow violations .................................................................. 1422
Highlights .............................................................................. 1423

Cookie consistency check

App Firewall support for Google web toolkit

What is GWT ............................................................................ 1427
How a GWT request works ..................................................... 1428
App Firewall protection for GWT applications .......................................................... 1429

Data leak prevention checks

Credit card check

Using the command line to configure the credit card check ........................................ 1433
Using the GUI to configure the credit card check ......................................................... 1434
Using the learn feature with the credit card check ...................................................... 1435
Using the log feature with the credit card check ......................................................... 1436
Statistics for the credit card violations ...................................................................... 1438
Highlights .............................................................................. 1438

Distributing traffic across cluster nodes 1683

Using Equal Cost Multiple Path (ECMP) 1683
To configure ECMP on the cluster by using the command line interface ................. 1684

Use Case: ECMP with BGP routing 1687

Using cluster link aggregation 1688

Static cluster link aggregation 1689
To configure a static cluster LA channel by using the command line interface ........ 1689

Dynamic cluster link aggregation 1690
To configure a dynamic cluster LA channel by using the command line interface ...... 1691

Link redundancy in a cluster with LACP 1692

Managing the NetScaler cluster 1693

Configuring linksets 1693
To configure a linkset by using the command line interface .............................. 1694
To configure a linkset by using the configuration utility ..................................... 1695

Nodegroups for spotted and partially-striped configurations 1695

Behavior of nodegroups 1696
General behavior of a cluster nodegroup ......................................................... 1696
Backing up nodes in a nodegroup ................................................................. 1697

Configuring nodegroups for spotted and partially-striped configurations 1697
To configure a nodegroup by using the command line interface ......................... 1698
To configure a nodegroup by using the configuration utility ............................... 1699

Configuring redundancy for nodegroups 1700
Configuring redundancy for nodegroups .......................................................... 1700

Disabling steering on the cluster backplane 1701

Synchronizing cluster configurations 1702
To synchronize cluster configurations by using the command line interface ........ 1702
To synchronize cluster configurations by using the configuration utility .............. 1703

Synchronizing time across cluster nodes 1703
To enable/disable PTP by using the command line interface ............................. 1703
To enable/disable PTP by using the configuration utility

**Synchronizing cluster files**
- To synchronize cluster files by using the command line interface
- To synchronize cluster files by using the configuration utility

**Viewing the statistics of a cluster**
- To view the statistics of a cluster instance by using the command line interface
- To view the statistics of a cluster node by using the command line interface
- To view the statistics of a cluster instance by using the configuration utility
- To view the statistics of a cluster node by using the configuration utility

**Discovering NetScaler appliances**
- To discover appliances by using the configuration utility

**Disabling a cluster node**
- To disable a cluster node by using the command line interface
- To disable a cluster node by using the configuration utility

**Removing a cluster node**
- To remove a cluster node by using the command line interface
- To remove a cluster node by using the configuration utility

**Removing a node from a cluster deployed using cluster link aggregation**
- To remove a node from a cluster that uses cluster link aggregation as the traffic distribution mechanism

**Detecting jumbo probe on a cluster**

**Monitoring cluster setup using SNMP MIB with SNMP link**
- Configuring SNMP MIB on CLIP

**IPv6 ready logo support for clusters**
- Supportable configurations for testing IPv6 core protocols
- Additional IPv6 cluster configuration

**Managing cluster heartbeat messages**
- To manage heartbeat messages on a node interface by using the NetScaler CLI

**Configuring owner node response status**
- To set owner node response status by using the NetScaler CLI
- Example
- To set owner node response status by using the NetScaler GUI
To edit owner node response status by using the NetScaler GUI

Monitor static route (MSR) support for inactive nodes in a spotted cluster configuration

VRRP interface binding in a single node active cluster

Cluster setup and usage scenarios

Creating a two-node cluster

Migrating an HA setup to a cluster setup

To convert a HA setup to cluster setup (without any downtime) by using the command line interface

Transitioning between a L2 and L3 Cluster

Transitioning a cluster from L2 to L3

Transitioning a cluster from L3 to L2

Setting up GSLB in a cluster

Using cache redirection in a cluster

Using L2 mode in a cluster setup

Using cluster LA channel with linksets

To configure cluster LA channel and linksets by using the NetScaler appliance command line

Backplane on LA channel

To deploy a cluster with the backplane interfaces as LA channels

Common interfaces for client and server and dedicated interfaces for backplane

Common switch for client, server, and backplane

Common switch for client and server and dedicated switch for backplane

Different switch for every node

Sample cluster configurations

Using VRRP in a cluster setup

Interface based VRRP

Configuring Interface based VRRP for IPv4

Configuring interface based VRRP for IPv6

Configuring IP based VRRP for IPv4
Configuring IP based VRRP for IPv6 ........................................ 1742

Create MX records for a mail exchange server 1841
  Add an MX record by using the CLI ........................ 1842
  Modify or remove an MX record by using the CLI .......... 1842
  Add an MX record by using the GUI ........................ 1842

Create NS Records for an authoritative server 1842
  Create an NS record by using the CLI ..................... 1843
  Create an NS record by using the GUI ..................... 1843

Create CNAME records for a subdomain 1843
  Add a CNAME record by using the CLI ...................... 1843
  Add a CNAME record by using the GUI ...................... 1844
  Cache CNAME records ....................................... 1844

Create NAPTR records for telecommunications domain 1844
  Create a NAPTR record by using CLI ....................... 1845
  Remove a NAPTR record by using CLI ...................... 1845
  Configure a NAPTR record using GUI ....................... 1845

Create PTR records for IPv4 and IPv6 addresses 1845
  Add a PTR record by using the CLI ........................ 1846
  Add a PTR record by using the GUI ........................ 1846
Create SOA records for authoritative information 1846
- Create an SOA record by using the CLI ........................................ 1846
- Modify or remove an SOA record by using the CLI ....................... 1847
- Configure an SOA record by using the GUI .............................. 1847

Create TXT records for holding descriptive text 1847
- Create a TXT resource record by using the CLI .......................... 1848
- Remove a TXT resource record by using the CLI ....................... 1848
- Configure a TXT record by using the GUI .............................. 1849

Viewing DNS statistics 1849
- View DNS records statistics by using the CLI .......................... 1849
- View DNS records statistics by using the GUI .......................... 1850

Configure a DNS zone 1850
- Create a DNS zone on the NetScaler appliance by using the CLI .......... 1851
- Modify or remove a DNS zone by using the CLI .......................... 1851
- Configure a DNS zone by using the GUI .............................. 1852

Configure the NetScaler as an ADNS server 1852
- Create an ADNS service .................................................. 1853
- Configure the ADNS setup to use TCP .................................. 1853
- Add DNS resource records .............................................. 1853
- Remove ADNS services .................................................. 1854
- Configure domain delegation ........................................... 1854

Configure the NetScaler appliance as a DNS proxy server 1855
- Create a load balancing virtual server ................................... 1856
- Create DNS services ..................................................... 1856
- Bind a load balancing virtual server to DNS services ................ 1857
- Configure the DNS proxy setup to use TCP ........................... 1857
- Configure time-to-live values for DNS entries ......................... 1857
- Flush DNS records ....................................................... 1858
- Add DNS resource records ............................................. 1859
- Remove a load balancing DNS virtual server ......................... 1859
- Limit the number of concurrent DNS requests on a client connection .. 1859

Configure the NetScaler as an end resolver 1860
- Enable recursive resolution ............................................. 1861
- Set the Number of Retries ............................................ 1862

Configure the NetScaler appliance as a forwarder 1862
Add a name server

Add a name server (when the NetScaler appliance acts as a forwarder) by using the CLI.
Add a name server (when the NetScaler appliance acts as a resolver) by using the CLI.

Set DNS lookup priority

Set the lookup priority to DNS by using the CLI.
Set lookup priority to DNS by using the GUI.

Disable and enable name servers

Enable or disable a name server by using the CLI.
Enable or disable a name server by using the GUI.

Configure DNS logging

DNS profiles.
Understand the NetScaler syslog log message format.
Understand the record logging format.
Limitations of DNS logging.
Configuring DNS logging.
Sample DNS logging configuration for NetScaler appliance configured as DNS proxy.
Sample DNS logging configuration for NetScaler appliance configured as ADNS.
Sample DNS logging configuration for NetScaler appliance configured as a forwarder.
Sample DNS logging configuration for NetScaler appliance configured as a resolver.
Configure policy based logging for DNS.

Configuring DNS suffixes

Create DNS suffixes.

DNS ANY query

Behavior in ADNS mode.
Behavior in DNS proxy mode.
Behavior for GSLB domains.

Configure negative caching of DNS records

Enable or disable negative caching by using the CLI.
Specify service or virtual server level DNS parameters by using the CLI.
Specify service or virtual server level DNS parameters by using the GUI.

Cache EDNS0 client subnet data when the NetScaler appliance is in proxy mode

Enable caching of ECS responses by using the CLI.
Limit the number of subnets that can be cached per domain by using the CLI.

Domain name system security extensions
NetScaler 12.0

Configure DNSSEC 1885
   Enable and disable DNSSEC ........................................ 1885
   Create DNS keys for a zone ........................................ 1886
   Publish a DNS key in a zone ....................................... 1888
   Configure a DNS key ............................................. 1889
   Sign and unsign a DNS zone ...................................... 1890
   View the NSEC records for a given record in a zone .......... 1892
   Remove a DNS key .................................................. 1892

Configure DNSSEC when the NetScaler is authoritative for a zone 1893

Configure DNSSEC for a zone for which the NetScaler is a DNS proxy server 1894
   Configure DNSSEC for a zone-less DNS proxy server configuration .............. 1894
   Configure DNSSEC for a partial zone ownership configuration ................. 1895

Configure DNSSEC for GSLB domain names 1896

Zone Maintenance 1896
   Re-sign an updated zone ............................................ 1896
   Roll over DNSSEC keys ............................................ 1896

Offload DNSSEC operations to the NetScaler 1900
   Enable DNSSEC offloading for a zone by using the CLI .......................... 1900
   Enable DNSSEC offloading for a zone by using the GUI .......................... 1901

Admin partition support for DNSSEC 1901

Supporting wildcard DNS domains 1902

Static proximity

Dynamic round trip time method
Configure a GSLB virtual server for dynamic RTT
Set the probing interval of local DNS servers

Configure static proximity

Add a location file to create a static proximity database
To add a location file by using the CLI
To add a location file by using the GUI
To view a static location file by using the GUI
To convert a location file into the NetScaler format

Add custom entries to a static proximity database
To add custom entries by using the command line interface
Parameters for adding custom entries
To add custom entries by using the configuration utility

Set location qualifiers
To set the location qualifiers by using the command line interface
To set the location qualifiers by using the configuration utility

Specify proximity method
To specify static proximity by using the command line interface
To specify static proximity by using the configuration utility

Synchronize GSLB static proximity database

Configure site-to-site communication
Changing the password of an RPC node
Encrypt the exchange of site metrics
Configure source IP address for an RPC node

Configure metrics exchange protocol
Enable site metrics exchange
Enable network metric exchange
Configuring a time delay for the GSLB services to be marked as DOWN when a MEP connection goes DOWN
Enable persistence information exchange

Configure GSLB by using a wizard
Configure active-active site 1976
To configure an active-active site by using the wizard ............................ 1977

Configure active-passive site 1978
To configure an active-passive site by using the wizard ............................ 1979

Configure parent-child topology 1981
To configure a parent-child deployment by using the wizard ...................... 1982

Configuring a Standard Load Balancing Setup ........................................ 1985

Configure an authoritative DNS service 1985
To create an ADNS service by using the command line interface ............... 1985
To modify an ADNS service by using the command line interface ............. 1986
To remove an ADNS service by using the command line interface .......... 1986
To configure an ADNS service by using the configuration utility .......... 1986

Configure a basic GSLB site 1986
To create a GSLB site by using the command line interface .................... 1987
To modify or remove a GSLB Site by using the command line interface ....... 1987
To configure a basic GSLB site by using the configuration utility ............ 1987
To view the statistics of a GSLB site by using the command line interface .... 1987
To view the statistics of a GSLB site by using the configuration utility ....... 1988

Configure a GSLB service 1988
To create a GSLB service by using the command line interface ............... 1988

Configure a GSLB service group 1990
GSLB domain name based autoscale service groups ................................ 1990

Configure a GSLB virtual server 1997
To create a GSLB virtual server by using the command line interface ....... 1997
Clearing the GSLB virtual server or service statistics ............................ 1999
Enabling and Disabling GSLB Virtual Servers ....................................... 2000

Bind GSLB services to a GSLB virtual server 2000
To bind a GSLB service to a GSLB virtual server by using the command line interface .... 2001
To unbind a GSLB service from a GSLB virtual server by using the command line interface .... 2001
To bind GSLB services by using the configuration utility ........................ 2001

Bind a domain to a GSLB virtual server 2001
To bind a domain to a GSLB virtual server by using the command line interface ........ 2001
To unbind a GSLB domain from a GSLB virtual server by using the command line interface  
To bind a domain to a GSLB virtual server by using the configuration utility  
To view the statistics of a domain by using the command line  
To view the statistics of a domain by using the configuration utility  
To view the configuration details of the entities bound to a GSLB domain using the command line  
To view the configuration details of the entities bound to a GSLB domain by using the configuration utility  

Example of a GSLB setup and configuration  
To configure the GSLB setup with NetScaler appliances by using the CLI commands  

Synchronize the configuration in a GSLB setup  
Manual synchronization between sites participating in GSLB  
Previewing GSLB synchronization  
Real-time synchronization between sites participating in GSLB  
Best practices for using the real-time synchronization feature  
To enable real-time synchronization by using the CLI  
To enable real-time synchronization by using the GUI  

GSLB dashboard  
Monitor GSLB services  
Configure monitor trigger  
Add or remove monitors  
Bind monitors to a GSLB service  

Use case: Deployment of domain name based autoscale service group  
Deployment scenario  

Use case: Deployment of IP address based autoscale service group  
Deployment scenario  

How-to articles  
Customize your GSLB configuration  
Modify maximum connections or maximum bandwidth for a GSLB service  
Create CNAME-based GSLB services  
Configure transition Out-Of-Service State (TROFS) in GSLB  
Configure dynamic weights for services

- Configure persistence based on source IP address 2025
- Configure persistence based on HTTP cookies 2026

### Manage client connections 2028
- Enable delayed cleanup of virtual server connections 2028
- Manage local DNS traffic by using DNS policies 2029
- Adding DNS Views 2036

### Configure GSLB for proximity 2037
- Configure dynamic round trip time (RTT) method 2037
- Configure static proximity 2038
- Configure static proximity and dynamic RTT 2038

### Protect the GSLB setup against failure 2039
- Configure a backup GSLB virtual server 2039
- Configure a GSLB setup to respond with multiple IP addresses 2040
- Configuring a GSLB Virtual Server to Respond with an Empty Address Record When DOWN 2041
- Configure a backup IP address for a GSLB domain 2041
- Divert excess traffic to a backup virtual server 2042

### Configure GSLB for disaster recovery 2044
- Configure GSLB for disaster recovery in an active-standby data center setup 2044
- Configure for disaster recovery in an active-active data center setup 2046
- Configuring for Disaster Recovery with Weighted Round Robin 2046
- Configuring for Disaster Recovery with Data Center Persistence 2048

### Override static proximity behavior by configuring preferred locations 2049
- Example 2051

### Configure GSLB service selection using content switching 2052
- Sample Configuration 2053

### Configure GSLB for DNS queries with NAPTR records 2054
- NAPTR Record Format 2055
- Configuration procedure 2055
- Sample configuration 2056

### Use the EDNS0 client subnet option for GSLB 2057
- Address validation 2059

Link load balancing 2065

Configuring a Basic LLB Setup 2065
  Configure services ....................................... 2066
  Configure an LLB virtual server and bind a service ............................................. 2068
  Configure the LLB method and persistence .............................................................. 2069
  Configure an LLB route ....................................... 2070
  Create and bind a transparent monitor ................................................................. 2072

Configuring RNAT with LLB 2075
  To add SNIPs for ISP routers by using the command line interface ............................... 2075
  To configure RNAT by using the command line interface ........................................... 2075
  To configure RNAT by using the configuration utility .............................................. 2076
  To enable Use Subnet IP mode by using the command line interface ............................. 2076
  To enable Use Subnet IP mode by using the configuration utility .................................. 2076

Configuring a Backup Route 2076
  To set the secondary virtual server as the backup virtual server by using the command line interface ............................................................. 2077
  To set the secondary virtual server as the backup virtual server by using the configuration utility ............................................................. 2078

Resilient LLB Deployment Scenario 2078

Monitoring an LLB Setup 2078
  Viewing the Statistics of a Virtual Server ............................................................... 2079
  Viewing the Statistics of a Service ............................................................................ 2080

Load Balancing 2080

How load balancing works 2081
  Load balancing basics ......................................................................................... 2081
  Understanding the topology .................................................................................. 2082
  Use of wildcards instead of IP addresses and ports .................................................. 2083
NetScaler 12.0

Configuring global HTTP ports .............................................. 2087

Set up basic load balancing .................................................. 2089
  Enabling Load Balancing .................................................... 2089
  Configuring a Server Object .............................................. 2090
  Configuring Services ........................................................ 2091
  Creating a Service ........................................................... 2091
  Creating a Virtual Server .................................................. 2095
  Binding Services to the Virtual Server ................................ 2096
  Verifying the Configuration .............................................. 2097

Load balance virtual server and service states ......................... 2100

Support for load balancing profile ....................................... 2101
  To create an LB profile by using the CLI .............................. 2102
  To create an LB profile by using the GUI .............................. 2103
  To associate an LB profile with an LB virtual server by using the CLI ......................................................... 2103
  To associate an LB profile with an LB virtual server by using the GUI ................................................................. 2104

Load balancing algorithms ................................................... 2104
  To set the startup round-robin factor by using the CLI ............ 2107
  To set the startup round-robin factor by using the GUI ............ 2107

Least connection method .................................................... 2107

Round robin method ........................................................... 2111

Least response time method .................................................. 2112
  Selection of services when weights are assigned .................... 2114

LRTM method ...................................................................... 2116
  Selection of services when weights are assigned .................... 2119

Hashing methods ................................................................. 2121
  The URL Hash Method ....................................................... 2122
  The Domain Hash Method ................................................... 2123
  The Destination IP Hash Method ......................................... 2124
  The Source IP Hash Method ................................................ 2124
  The Source IP Destination IP Hash Method ............................ 2124
  The Source IP Source Port Hash Method ............................... 2125
  The Call ID Hash Method .................................................. 2125

Least bandwidth method ....................................................... 2125

Least packets method

Custom load method

Static proximity method

Specifying the Proximity Method

Token method

To configure the Token load balancing method by using the command line interface
To configure the token load balancing method by using the configuration utility

Configure a load balancing method that does not include a policy

To set the load balancing method by using the command line interface
To set the load balancing method by using the configuration utility

Persistence and persistent connections

About Persistence

Source IP address persistence

HTTP cookie persistence

To change the httponly flag setting by using the command line interface
To change the httponly flag setting by using the configuration utility
Encrypting the Cookie

SSL session ID persistence

Backup Persistence Support for SSL session ID

Diameter AVP number persistence

To configure Diameter-based persistence on a virtual server by using the command line interface

Custom server ID persistence

To configure custom server ID persistence by using the configuration utility

IP address persistence

Persistence Based on Destination IP Addresses
Persistence Based on Source and Destination IP Addresses

SIP Call ID persistence

RTSP session ID persistence
Configure URL passive persistence 2149
    To configure URL passive persistence by using the CLI .................. 2149
    To configure persistence on a virtual server by using the GUI ............ 2150

Configure persistence based on user-defined rules 2150
    To configure persistence based on user-defined rules by using the CLI .......... 2151
    To configure persistence based on user-defined rules by using the GUI .......... 2151

Configure persistence types that do not require a rule 2152
    To configure persistence on a virtual server by using the CLI ................ 2152
    To configure persistence on a virtual server by using the GUI ............... 2153

Configure backup persistence 2153
    To set backup persistence for a virtual server by using the command line interface ........ 2154
    To set backup persistence for a virtual server by using the configuration utility .... 2155

Configure persistence groups 2155
    To create a virtual server persistency group by using the command line interface ........ 2156
    To modify a virtual server group by using the configuration utility .......... 2156
    To modify a virtual server group by using the command line interface ........ 2156

Share persistent sessions between virtual servers 2156
    Configuring Sharing of Persistent Sessions .................................. 2157
    To enable the useVserverPersistency parameter by using the command line interface .... 2157
    To enable the useVserverPersistency parameter by using the GUI .............. 2158
    To designate a vserver as a master vserver by using the command line interface ...... 2158
    To designate a vserver as a master vserver by using the GUI ................. 2158
    Arguments ............................................................................. 2158

Configure RADIUS load balancing with persistence 2160
    Enabling the Load Balancing or Content Switching Feature .................. 2160
    Configuring Virtual Servers ..................................................... 2161
    Configuring Services ................................................................ 2162
    Binding Virtual Servers to Services .......................................... 2162
    Configuring a Persistency Group for Radius .................................... 2163
    Configuring RADIUS Shared Secret ........................................... 2163

View persistence sessions 2165
    To view a persistence session by using the command line interface ............ 2165
    To view persistence sessions by using the configuration utility ............... 2165
Clear persistence sessions 2165
To clear a persistence session by using the command line interface ........................................ 2166
To clear persistence sessions by using the configuration utility .................................................. 2166

Override persistence settings for overloaded services 2167
To override persistence settings for overloaded services by using the command line interface 2168
To override persistence settings for overloaded services by using the configuration utility ........ 2168

Troubleshooting 2168

Customize a load balancing configuration 2170

Customize the hash algorithm for persistence across virtual servers 2171
To change the use-port-number global setting by using the CLI .............................................. 2171
To change the use-port-number global setting by using the GUI .............................................. 2172
To create a new service and specify a hash identifier for a service by using the CLI ................. 2172
To specify a hash identifier for an existing service by using the CLI ......................................... 2173
To specify a hash identifier while adding a service group member ........................................... 2173
To specify a hash identifier for a service by using the GUI ....................................................... 2174
To specify a hash identifier for an already configured service group member by using the GUI 2174

Configure the redirection mode 2174
To configure the redirection mode by using the CLI ................................................................. 2174
To configure the redirection mode by using the GUI ............................................................... 2175

Configure per-VLAN wildcarded virtual servers 2175
To configure a wildcarded virtual server that listens to a specific VLAN by using the CLI ...... 2175
To configure a wildcarded virtual server that listens to a specific VLAN by using the GUI ...... 2175

Assign weights to services 2176
To configure a virtual server to assign weights to services by using the CLI .......................... 2177
To configure a virtual server to assign weights to services by using the GUI .......................... 2177

Configure the MySQL and Microsoft SQL server version setting 2177
To set the Microsoft SQL server version parameter by using the CLI .................................. 2178
To set the MySQL server version parameter by using the CLI ................................................ 2178
To set the MySQL or Microsoft SQL server version parameter by using the GUI .................. 2179

Configure diameter load balancing 2179
How diameter load balancing works .......................................................................................... 2180
Load balancing diameter traffic ................................................................................................. 2181
Disconnect a session .................................................................................................................. 2181
Configure load balancing for diameter traffic ........................................ 2181

**Configure FIX load balancing** .................................................. 2184
  How FIX load balancing works .................................................. 2184
  Configure and monitor load balancing for FIX traffic .................. 2184
  To display FIX persistent sessions by using the command line interface 2185
  To configure FIX load balancing virtual server by using the GUI .... 2187
  To edit a FIX load balancing virtual server by using the GUI ........ 2188
  To delete a FIX load balancing virtual server by using the GUI ...... 2188
  To configure FIX Load Balancing Virtual Service by using the GUI . 2187
  To display FIX load balancing server statistics ......................... 2189
  To display Persistent sessions for a FIX server by using the GUI ... 2189
  To clear Persistent sessions for a FIX server by using the GUI ...... 2189

**Protect a load balancing configuration against failure** .................. 2189

**Redirect client requests to an alternate URL** .......................... 2189
  To configure a virtual server to redirect the client request to a URL by using the CLI 2190
  To configure a virtual server to redirect the client request to a URL by using the GUI 2190

**Configure a backup load balancing virtual server** ...................... 2190
  To set a backup virtual server by using the CLI ......................... 2191
  To set a backup virtual server by using the GUI ......................... 2191

**Configure spillover** ............................................................. 2191
  Configure a predefined spillover method .................................. 2193
  Configure policy based spillover ............................................. 2194

**Connection failover** ........................................................... 2198
  How connection failover works on NetScaler appliances .............. 2199
  Supported setup ...................................................................... 2200
  Features affected by connection failover .................................. 2201

**Flush the surge queue** ........................................................... 2202
  To flush a surge queue by using the CLI .................................. 2203
  To flush a surge queue by using the GUI .................................. 2204

**Manage a load balancing setup** ............................................... 2204

**Manage server objects** ......................................................... 2205
  To enable a server by using the CLI ........................................ 2205
  To enable or disable a server object by using the GUI ............... 2205
To disable a server object by using the CLI ........................................... 2205
To remove a server object by using the CLI ........................................... 2206
To remove a server object by using the GUI ........................................... 2206

Manage services .......................................................... 2206
To enable or disable a service by using the command line interface ........ 2206
To enable or disable a service by using the configuration utility .......... 2207

Manage a load balancing virtual server .............................................. 2207
To enable or disable a virtual server by using the command line interface 2207
To enable or disable a virtual server by using the configuration utility .... 2207
To unbind a service from a virtual server by using the command line interface 2207
To unbind a service from a virtual server by using the configuration utility 2208

Load balancing visualizer .......................................................... 2208
To view load balancing virtual server properties by using the Visualizer .. 2209
To view configuration details for services, service groups, and monitors by using the Visualizer in the configuration utility ........................................... 2210
To view statistical information by using the Visualizer ...................... 2210
To save configuration properties for any entity by using the Visualizer .... 2211
To bind a resource to a load balancing configuration by using the Visualizer 2211
To unbind a resource by using the Visualizer .................................. 2212
To modify a resource in a load balancing configuration by using the Visualizer 2212
To add, remove, or disable a resource in a load balancing configuration by using the Visualizer 2212

Manage client traffic ......................................................... 2212

Configure sessionless load balancing virtual servers ......................... 2213
Supported setup ........................................................................ 2214
Limitations ............................................................................. 2214
To add a sessionless virtual server by using the CLI ......................... 2215
To configure a sessionless virtual server by using the GUI ................ 2216

Redirect HTTP requests to a cache .............................................. 2216
To configure cache redirection on a virtual server by using the CLI .... 2217
To configure cache redirection on a virtual server by using the GUI .... 2217

Direct requests according to priority .................................................. 2217
To configure priority queuing on a virtual server by using the CLI .... 2217
To configure priority queuing on a virtual server by using the GUI .... 2217
Direct requests to a custom web page
To enable SureConnect on a virtual server by using the CLI
To enable SureConnect on a virtual server by using the GUI
Enable cleanup of virtual server connections
To configure the down state flush setting on a virtual server by using the CLI
To configure the down state flush setting on a virtual server by using the GUI
Rewrite ports and protocols for HTTP redirection
To configure HTTP redirection on a virtual server by using the CLI
To configure HTTP redirection on a virtual server by using the GUI
To configure SSL Redirect on an SSL virtual server or service by using the CLI
To configure SSL redirection and SSL port rewrite on an SSL virtual server or service by using the GUI
Insert IP address and port of a virtual server in the request header
To insert the IP address and port of the virtual server in the client requests by using the CLI
To insert the IP address and port of the virtual server in the client requests by using the GUI
Use a specified source IP for backend communication
Usage of a net profile for sending traffic
Manage net profiles
Create an IP set
Create a net profile
Bind a net profile to a NetScaler entity
Set a time-out value for idle client connections
To set a time-out value for idle client connections by using the CLI
To set a time-out value for idle client connections by using the GUI
Manage RTSP connections
To configure RTSP NAT by using the CLI
To configure RTSP NAT by using the GUI
Manage client traffic on the basis of traffic rate
Identify a connection with layer 2 parameters
To configure the L2 connection option by using the CLI
To configure the L2 connection option by using the GUI
Configure the prefer direct route option
To set the prefer direct route option by using the CLI
To set the prefer direct route option by using the GUI 2236

**Use a source port from a specified port range for backend communication** 2236
To specify a source port range or ranges by using the CLI 2237
To specify a source port range or ranges by using the GUI 2237

**Configure source IP persistency for backend communication** 2238
To enable source IP persistency in a net profile by using the CLI 2238
To enable source IP persistency in a net profile by using the GUI 2239
Example 2239

**Use IPv6 link local addresses on server side of a load balancing setup** 2239

**Advanced load balancing settings** 2240

**Gradually stepping up the load on a new service with virtual server–level slow start** 2241
Manual slow start 2242
Automated slow start 2243
Set the slow start parameters 2245

**The no-monitor option for services** 2246
To set the no-monitor option for a new service by using the CLI 2247
To set the no-monitor option for an existing service by using the CLI 2248
To set the no-monitor option for a service by using the GUI 2249

**Protect applications on protected servers against traffic surges** 2249
To set surge protection on the service by using the CLI 2249
To set surge protection on the service by using the GUI 2250

**Enable cleanup of virtual server and service connections** 2250
To set down state flush on the service by using the CLI 2252
To set down state flush on the service by using the GUI 2252
To set down state flush on the virtual server by using the CLI 2252
To set down state flush on the virtual server by using the GUI 2252

**Graceful shutdown of services** 2252
Adding a TROFS Code or String 2253
Disabling a Service 2254
To configure graceful shutdown for a service by using the command line interface 2255
To configure graceful shutdown for a service by using the configuration utility 2256

**Enable or disable persistence session on TROFS services** 2256
To set the trofsPersistence flag by using the command line interface 2257
Direct requests to a custom web page
To set SureConnect on the service by using the CLI .............................................. 2257
To set SureConnect on the service by using the GUI .............................................. 2257

Enable access to services when down
To enable access down on a service by using the CLI .............................................. 2258
To enable access down on a service by using the GUI .............................................. 2258

Enable TCP buffering of responses
To enable TCP Buffering on a service by using the CLI ........................................... 2259
To enable TCP Buffering on a service by using the GUI ........................................... 2259

Enable compression
To enable compression on a service by using the CLI .............................................. 2260
To enable compression on a service by using the GUI .............................................. 2260

Maintain client connection for multiple client requests
To enable client keep-alive on a service by using the CLI ........................................... 2260
To enable client keep-alive on a service by using the GUI ........................................... 2261

Insert the IP address of the client in the request header
To insert client IP address in the client request by using the CLI ................................ 2261
To insert client IP address in the client request by using the GUI ................................ 2261

Use source IP address of the client when connecting to the server
To enable USIP mode for a service by using the CLI .............................................. 2262
To enable USIP mode for a service by using the GUI .............................................. 2262

Configure the source port for server-side connections
Configure the use proxy port setting on a service ................................................. 2263
Configure the use proxy port setting globally ..................................................... 2264

Set a limit on the number of client connections
To set a limit to the number of client connections by using the CLI ......................... 2265
To set a limit to the number of client connections by using the GUI ......................... 2265

Set a limit on number of requests per connection to the server
To limit the number of client requests per connection by using the CLI .................. 2265
To limit the number of client requests per connection by using the GUI .................. 2266

Set a threshold value for the monitors bound to a service
To set the monitor threshold value on a service by using the CLI ................................. 2266
To set the monitor threshold value on a service by using the GUI ................................. 2266
Set a timeout value for idle client connections

To set a timeout value for idle client connections by using the CLI ........................................ 2267
To set a timeout value for idle client connections by using the GUI ........................................ 2267

Set a timeout value for idle server connections

To set a timeout value for idle server connections by using the CLI ........................................ 2267
To set a timeout value for idle server connections by using the GUI ........................................ 2268

Set a limit on the bandwidth usage by clients

To set a maximum bandwidth limit on a service by using the CLI ........................................ 2268
To set a maximum bandwidth limit on a service by using the GUI ........................................ 2268

Redirect client requests to a cache

To set cache redirection on a service by using the CLI .......................................................... 2268
To set cache redirection on a service by using the GUI .......................................................... 2269

Retain the VLAN identifier for VLAN transparency

To configure a load balancing virtual server to retain the client VLAN ID by using the CLI .... 2269
To configure a load balancing virtual server to retain the client VLAN ID by using the GUI .... 2269

Configure automatic state transition based on percentage health of bound services

To configure percentage based automatic state transition by using the CLI .......................... 2270
To configure percentage based automatic state transition by using the GUI .......................... 2270
To enable the ENTITY-STATE alarm by using the CLI ......................................................... 2270
To enable the ENTITY-STATE alarm by using the GUI ......................................................... 2270

Built-in monitors

TCP-based application monitoring

SSL service monitoring

FTP service monitoring

To send secure FTP probes to FTP services by using the CLI ............................................. 2274
To send secure FTP probes to FTP services by using the GUI ............................................. 2275

Secure monitoring of servers by using SFTP

To configure secure monitoring using SFTP by using the CLI ............................................ 2276
To configure secure monitoring using SFTP by using the GUI ............................................ 2276

Set SSL parameters on a secure monitor

Monitor Types that Support SSL Profiles ............................................................... 2277

© 1999-2018 Citrix Systems, Inc. All rights reserved.
SIP service monitoring 2278
RADIUS service monitoring 2278
Monitor accounting information delivery from a RADIUS server 2279
To configure a RADIUS accounting monitor by using the CLI 2280
DNS and DNS-TCP service monitoring 2280
LDAP service monitoring 2281
MySQL service monitoring 2282
SNMP service monitoring 2282
NNTP service monitoring 2283

Configuring Prefix-Based IPv6-IPv4 Translation

IP Prefix NAT

Use Case: Zonification of Clients for a Deployment of a NetScaler appliance and an Optimization Device

Configuration Steps

Sample configuration

Static ARP

Specify a VLAN in a Static ARP Entry

Set the Timeout for Dynamic ARP Entries

Neighbor Discovery

Configuration Steps

IP Tunnels

Configure IP Tunnels

Customizing IP Tunnels Globally

GRE Payload Options in a GRE IP Tunnel

IPv6 Traffic through GRE IPV4 Tunnels

Send Response Traffic Through an IP-IP Tunnel

Interfaces

Configuring MAC-Based Forwarding

Configuring Network Interfaces

Setting the Network Interface Parameters

Enabling and Disabling Network Interfaces

Resetting Network Interfaces

Monitoring a Network Interface

Configuring Forwarding Session Rules

Assigning an ACL rule to an Existing Forwarding Session Rule

Disabling Steering for Forwarding Sessions on a Cluster Setup

Understanding VLANS

 Applying Rules to Classify Frames

VLANs and Packet Forwarding on the NetScaler

Configuring a VLAN

Configuring VLANS in an HA Setup

Protocol extensions - use cases

- Message based load balancing ........................................... 2670
- Streaming .............................................................................. 2671
- Token based load balancing .................................................... 2672
- Load balancing persistence ..................................................... 2673
- TCP connection based load balancing ..................................... 2673
- SSL ..................................................................................... 2674

Tutorial – Add MQTT protocol to the NetScaler appliance by using protocol extensions 2674

Code listing for mqtt.lua 2675

Configure MQTT by using protocol extensions 2680

Configuring SSL offloading for MQTT 2680

Configuring SSL offloading with end-to-end encryption for MQTT 2681

Tutorial - load balancing syslog messages by using protocol extensions 2682

Code for parsing syslog message .............................................. 2683

Configuring syslog protocol by using protocol extensions 2685

Protocol extensions command reference 2686

Troubleshooting protocol extensions 2691

- Custom logging ................................................................. 2691

Policy extensions 2692

- Prerequisites for using policy extensions ............................... 2692
- How do policy extensions work? .......................................... 2693

Configuring policy extensions 2693

- Configure policy extensions by using the CLI ....................... 2694

Policy extensions - use cases 2696

- Case 1: Custom hash ......................................................... 2696
- Case 2: Collapse double slashes in URLs ............................. 2698
- Case 3: Combine headers .................................................. 2699

Troubleshooting policy extensions 2703

- Extension tracing ............................................................ 2704
- Custom logging .............................................................. 2707
## Optimization

### Client Keep-Alive

Configure client keep-alive

### AppExpert applications and templates

AppExpert application terminology

### AppExpert applications and templates

AppExpert application terminology

### Configure selectors and basic content groups

Advantages of selectors

Configure a selector

Content groups

### Configure policies for caching and invalidation

Actions to associate with integrated caching policies

Bind points for a policy

Order of policy evaluation

Configure a policy in the integrated cache

Globally binding an integrated caching policy

Bind an integrated caching policy to a virtual server

How to cache compressed and uncompressed versions of a file

Configure a policy bank for caching

Configure a policy label in an integrated cache

Unbind and delete an integrated caching policy and policy label

### Cache support for database protocols

### Configure expressions for caching policies and selectors

Expression syntax

Configure an expression in a caching policy or a selector

Display cached objects and cache statistics

### Display cached objects and cache statistics

View cached objects

Find particular cached responses

View cache statistics

Viewing cache statistics
Improve cache performance 2770
- Reduce flash crowds ........................................... 2770
- Refresh a response before expiration ...................... 2770
- Queue requests to the cache .................................. 2771
- Cache a response after a client halts a download ........ 2772
- Requiring a minimum number of server hits before caching .................. 2772
- Example for performance optimization .................... 2772

Configure cookies, headers, and polling 2773
- Divergence of cache behavior from the standards ........ 2773
- Remove cookies from a response ............................ 2775
- Inserting HTTP headers at response time ................. 2775
- Insert an age, via, or ETag header ......................... 2776
- Insert a cache-control header ............................. 2776
- Ignoring cache-control and pragma headers in requests 2777
- Polling the origin server every time a request is received 2779
- PET and client-specific content ........................... 2780
- PET and authentication, authorization, and auditing ...... 2781

Configure integrated cache as a forward proxy 2781

Default settings for the integrated cache 2782
- Default caching policies ...................................... 2782
- View default policies ........................................ 2782
- Default request policies ..................................... 2782
- Default response policies .................................... 2783
- Restrictions on default policies .............................. 2784
- Initial settings for the default content group ............ 2785

Troubleshooting 2787
- Resources for troubleshooting .............................. 2787
- Troubleshooting integrated caching issues ................ 2787

Front end optimization 2793
- Optimizations performed by the FEO feature .......... 2794
- How front end optimization works ....................... 2796
- Configure front end optimization ......................... 2797
- Prerequisites .................................................. 2797
- Verify front end optimization configuration ............. 2799
### Content accelerator
- How content accelerator works .............................................. 2800
- Configure content accelerator ............................................. 2801

### Media classification
- Enable media classification .................................................. 2806
- Verify media classification statistics ...................................... 2807

### Reputation

### IP reputation
- Using the Command Line to Configure the IP Reputation Feature .................................................. 2810
- Using the GUI to Configure the IP Reputation Feature ................................................................. 2812
- Highlights .................................................................................. 2813
- Debugging Tips ......................................................................... 2814

### SSL offload and acceleration

#### SSL offloading configuration
- Enable SSL ............................................................................. 2815
- Configure services ................................................................. 2816
- SSL virtual server configuration ............................................. 2818
- Configure an SSL-based virtual server by using the GUI .......... 2820
- Bind services to the SSL virtual server .................................. 2821
- Configure an SNI virtual server for secure hosting of multiple sites ............................. 2823
- Bind multiple server certificates to a single SSL virtual server by using the GUI ................. 2824
- Support for SNI on the back-end service ................................. 2824
- Configure SNI on the back-end service by using the CLI ....... 2825
- Add or update a certificate-key pair ........................................ 2826
- Bind the certificate-key pair to the SSL virtual server .......... 2829
- SSL virtual server parameters ............................................... 2832
- Global SSL parameters ......................................................... 2840

### How-to articles

### SSL certificates

#### Create a certificate
- Create a private key ............................................................. 2849
- Support for SHA 256 digest algorithm in a certificate signing request ........................................... 2850
- Support for subject alternative name in a certificate signing request .............................................. 2851
- Limitations .............................................................................. 2852
Submitting the CSR to the CA ................................................. 2853
Generate a test certificate .................................................. 2853
Create a certificate by using a wizard ................................. 2853
Create an end-user certificate .......................................... 2855

**Install, link, and update certificates** 2855
  - Link certificates .................................................. 2856
  - Add and link a certificate set .................................. 2856
  - Create a chain of certificates .................................. 2867
  - Update an existing server certificate ........................... 2868
  - Update an existing CA certificate ............................... 2870
  - Disable domain checks ........................................... 2870
  - Enable the expiry monitor ...................................... 2871
  - Update an intermediate certificate without breaking the links 2872
  - Display a certificate chain ..................................... 2873

**Generate a server test certificate** 2876
  - Generate a server test certificate by using the GUI ....... 2876

**Import and convert SSL files** 2876
  - Import a certificate file ........................................ 2877
  - Import PKCS#8 and PKCS#12 certificates ...................... 2878
  - Convert SSL certificates for import or export ............ 2880

**SSL profiles** 2881
  - Differences between the old and the new SSL profile infrastructure .................. 2881

**SSL profile infrastructure** 2882
  - Points to note .................................................. 2883
  - Enable the default profile ..................................... 2884
  - Use case 1 ..................................................... 2885
  - Use Case 2 .................................................... 2886
  - SSL profile parameters ......................................... 2887
  - Load an old configuration ...................................... 2896

**Appendix A: Sample migration of the SSL configuration after upgrade** 2897

**Appendix B: Default front-end and back-end SSL profile settings** 2904

**Legacy SSL profile** 2907
  - Enable stricter control on client certificate validation .................................. 2910
Certificate revocation lists

Create a CRL on the ADC ........................................... 2911
Add an existing CRL to the ADC ................................. 2912
Configure CRL refresh parameters .............................. 2913
Synchronize CRLs ...................................................... 2915
Perform client authentication by using a certificate revocation list .......... 2916

Monitor certificate status with OCSP ............................. 2918
OCSP implementation .................................................. 2918
OCSP request batching ................................................. 2918
OCSP response caching ............................................... 2919
OCSP responder configuration ...................................... 2919

OCSP stapling ............................................................ 2922
OCSP stapling solution .................................................. 2922
OCSP response caching of server certificates ...................... 2923
OCSP stapling configuration .......................................... 2923

Ciphers available on the NetScaler appliances ..................... 2928

ECDHE ciphers .......................................................... 2928
Unbind and bind ECC curves to an SSL virtual server by using the CLI ........ 2929

Diffie-Hellman (DH) parameters generation and achieving PFS with DHE .... 2930
Generate DH parameters by using the CLI ......................... 2931
Generate DH parameters by using the GUI ......................... 2931
Achieve perfect forward secrecy with DHE ....................... 2931
Optimize DH parameters generation by using the CLI .............. 2931
Optimize DH parameters generation by using the GUI .............. 2932

Cipher redirection .......................................................... 2932
Configure cipher redirection by using the CLI ..................... 2932
Configure cipher redirection by using the GUI ..................... 2934

Leverage hardware and software to improve ECDHE cipher performance .... 2934
Enable the hybrid model by using the CLI ......................... 2935
Enable the hybrid model by using the GUI ......................... 2936

ECDSA cipher suites support ........................................... 2936
ECDSA/RSA cipher and certificate selection ........................ 2940
Client authentication by using an ECDSA or an RSA certificate ......... 2940
NetScaler 12.0

Configure user-defined cipher groups on the ADC appliance 2940
- Configure a user-defined cipher group by using the CLI 2941
- Unbind ciphers from a cipher group by using the CLI 2944
- Remove a cipher group by using the CLI 2944
- Configure a user-defined cipher group by using the GUI 2944

Server certificate support matrix on the ADC appliance 2945

Client authentication 2947
- Provide the client certificate 2948
- Enable client-certificate based authentication 2948
- Bind CA certificates to the virtual server 2951
- Stricter control on client certificate validation 2951

Server authentication 2952
- Enable (or disable) server certificate authentication 2952
- Configure a common name for server certificate authentication 2955

SSL actions and policies 2956

SSL policies 2957
- SSL default syntax policies 2958
- SSL policy configuration 2958

SSL built-in actions and user-defined actions 2958
- Examples of built-in actions in a policy 2959
- User-defined SSL actions 2960

SSL policy binding 2961
- Bind an SSL policy globally by using the CLI 2961
- Bind an SSL policy globally by using the GUI 2962
- Bind or unbind an SSL policy to a virtual server by using the CLI 2962
- Bind an SSL policy to a virtual server by using the GUI 2963

SSL policy labels 2964
- Create an SSL policy label and bind policies to the label by using the CLI 2964
- Configure an SSL policy label and bind policies to the label by using the GUI 2964

Support for DTLS protocol 2964
- DTLS configuration 2965
- Features not supported by a DTLS virtual server 2966
- Parameters not used by a DTLS virtual server 2966

© 1999-2018 Citrix Systems, Inc. All rights reserved.
Features not supported by a DTLS service ............................................. 2966
Parameters not used by a DTLS service .................................................. 2967
DTLS profile .............................................................................................. 2967
Example for an end-to-end DTLS configuration ...................................... 2968
DTLS cipher support ................................................................................ 2975
DTLS cipher support on NetScaler VPX, MPX/SDX (N2 and N3 based) appliances 2975

Support for Intel Coleto SSL chip based platforms .................................. 2976

MPX 9700/10500/12500/15500 FIPS appliances ...................................... 2977
  HSM configuration .................................................................................... 2978
  Create and transfer FIPS keys ................................................................. 2982

Configure FIPS appliances in a high availability setup .............................. 2987
  Configure FIPS appliances in a high availability setup by using the CLI .... 2988
  Configure FIPS appliances in a high availability setup by using the GUI .... 2989

Update the firmware to version 2.2 on a FIPS card .................................. 2989
  Limitations ............................................................................................... 2990
  Prerequisites ............................................................................................ 2990
  Update the FIPS firmware to version 2.2 on a standalone appliance ......... 2990
  Update the FIPS firmware to version 2.2 on appliances in a high availability pair 2992
  Update the FIPS firmware to version 1.1 on a standalone appliance ......... 2993

Reset a locked HSM ................................................................................... 2993
  Reset a locked HSM by using the CLI .................................................... 2993
  Reset a locked HSM by using the GUI .................................................... 2994

MPX 14000 FIPS appliances .................................................................... 2994
  Limitations ............................................................................................... 2995
  Configure the HSM .................................................................................. 2995
  Create FIPS keys .................................................................................... 2997
  Import a FIPS key by using the CLI ....................................................... 2998
  Create a certificate signing request by using the CLI ......................... 2998
  Create a server certificate by using the CLI .......................................... 2999
  Add a certificate-key pair by using the CLI ......................................... 2999
  Support for hybrid FIPS mode on the MPX 14000 FIPS and SDX 14000 FIPS platforms 3000

SDX 14000 FIPS appliances .................................................................... 3002

Limitations ............................................................................................... 3003

Support for Gemalto SafeNet Network hardware security module 3033
- Supported versions matrix .................................. 3033

Prerequisites 3033

Configure a SafeNet client on the ADC 3034

Configure Safenet HSMs in a high availability setup on the ADC 3037

Additional ADC configuration 3041

NetScaler appliances in a high availability setup 3042

Limitations 3042

Appendix 3043
- Run the script ................................................. 3043
- Create a certificate ........................................... 3043
- Copy the certificate to the HSM ............................. 3044
- Copy the certificate and key from the HSM to the NetScaler appliance .................................. 3044
- Use SSH to connect to the SafeNet HSM ....................... 3044
- Register the NetScaler on the SafeNet HSM ................. 3045
- Assign the client a partition from the partition list .......... 3045
- Register the HSM with its certificate on the NetScaler ........................................... 3045
- Verify the network trust links (NTLs) connectivity between the ADC and HSM ................. 3045
- Save the configuration ......................................... 3046
- Configure automatic start of the gateway daemon at boot time ............................................. 3046

NetScaler Release Notes

January 28, 2019

Release notes describe how the software has changed in a particular build, and the issues known to exist in that build.

The release notes document includes all or some of the following sections:

- **What’s New**: The enhancements and other changes released in the build.
- **Fixed Issues**: The issues that are fixed in the build.
- **Known Issues**: The issues that exist in the build.
- **Points to Note**: The important aspects to keep in mind while using the build.
- **Limitations**: The limitations that exist in the build.

**Note**

- The [# XXXXXX] labels under the issue descriptions are internal tracking IDs used by the NetScaler team.
- These release notes do not document security related fixes. For a list of security related fixes and advisories, see the Citrix security bulletin.

To view the latest release notes document (build 60.10), click this [link].

Getting started with NetScaler

January 6, 2019

Intended for system and network administrators who install and configure complex networking equipment, this section of the library describes initial set-up and basic configuration of the NetScaler.

Understanding the NetScaler

The NetScaler product is an application switch that performs application-specific traffic analysis to intelligently distribute, optimize, and secure Layer 4-Layer 7 (L4–L7) network traffic for web applications. For example, a NetScaler bases load balancing decisions on individual HTTP requests instead of on long-lived TCP connections, so that the failure or slowdown of a server is managed much more quickly and with less disruption to clients. The ADC feature set can be broadly categorized as consisting of switching features, security and protection features, and server-farm optimization features.
Switching features

When deployed in front of application servers, a NetScaler ensures optimal distribution of traffic by the way in which it directs client requests. Administrators can segment application traffic according to information in the body of an HTTP or TCP request, and on the basis of L4–L7 header information such as URL, application data type, or cookie. Numerous load balancing algorithms and extensive server health checks improve application availability by ensuring that client requests are directed to the appropriate servers.

Security and protection features

The NetScaler security and protection features protect web applications from Application Layer attacks. An ADC appliance allows legitimate client requests and can block malicious requests. It provides built-in defenses against denial-of-service (DoS) attacks and supports features that protect against legitimate surges in application traffic that would otherwise overwhelm the servers. An available built-in firewall protects web applications from Application Layer attacks, including buffer overflow exploits, SQL injection attempts, cross-site scripting attacks, and more. In addition, the firewall provides identity theft protection by securing confidential corporate information and sensitive customer data.

Optimization features

Optimization features offload resource-intensive operations, such as Secure Sockets Layer (SSL) processing, data compression, client keep-alive, TCP buffering, and the caching of static and dynamic content from servers. This improves the performance of the servers in the server farm and therefore speeds up applications. An ADC appliance supports several transparent TCP optimizations, which mitigate problems caused by high latency and congested network links, accelerating the delivery of applications while requiring no configuration changes to clients or servers.

Understanding policies and expressions

A policy defines specific details of traffic filtering and management on a NetScaler. It consists of two parts: the expression and the action. The expression defines the types of requests that the policy matches. The action tells the ADC appliance what to do when a request matches the expression. As an example, the expression might be to match a specific URL pattern to a type of security attack, with the action being to drop or reset the connection. Each policy has a priority, and the priorities determine the order in which the policies are evaluated.
When an ADC appliance receives traffic, the appropriate policy list determines how to process the traffic. Each policy on the list contains one or more expressions, which together define the criteria that a connection must meet to match the policy.

For all policy types except Rewrite policies, a NetScaler appliance implements only the first policy that a request matches, not any additional policies that it might also match. For Rewrite policies, the ADC appliance evaluates the policies in order and, in the case of multiple matches, performs the associated actions in that order. Policy priority is important for getting the results you want.

**Processing order of features**

Depending on requirements, you can choose to configure multiple features. For example, you might choose to configure both compression and SSL offload. As a result, an outgoing packet might be compressed and then encrypted before being sent to the client.

The following figure shows the DataStream packet flow in the NetScaler appliance. DataStream is supported for MySQL and MS SQL databases.

The following figure shows the DataStream packet flow in the NetScaler appliance. DataStream is supported for MySQL and MS SQL databases. For information about the DataStream feature, see DataStream.

Figure 2. DataStream Packet Flow Diagram

**Where does a NetScaler appliance fit in the network?**

January 6, 2019

A NetScaler appliance resides between the clients and the servers, so that client requests and server responses pass through it. In a typical installation, virtual servers configured on the appliance provide connection points that clients use to access the applications behind the appliance. In this case, the appliance owns public IP addresses that are associated with its virtual servers, while the real servers are isolated in a private network. It is also possible to operate the appliance in a transparent mode as an L2 bridge or L3 router, or even to combine aspects of these and other modes.

**Physical deployment modes**

A NetScaler appliance logically residing between clients and servers can be deployed in either of two physical modes: inline and one-arm. In inline mode, multiple network interfaces are connected to different Ethernet segments, and the appliance is placed between the clients and the servers. The
NetScaler 12.0

The NetScaler 12.0 appliance has a separate network interface to each client network and a separate network interface to each server network. The appliance and the servers can exist on different subnets in this configuration. It is possible for the servers to be in a public network and the clients to directly access the servers through the appliance, with the appliance transparently applying the L4-L7 features. Usually, virtual servers (described later) are configured to provide an abstraction of the real servers. The following figure shows a typical inline deployment.

Figure 1. Inline Deployment

In one-arm mode, only one network interface of the appliance is connected to an Ethernet segment. The appliance in this case does not isolate the client and server sides of the network, but provides access to applications through configured virtual servers. One-arm mode can simplify network changes needed for NetScaler installation in some environments.

For examples of inline (two-arm) and one-arm deployment, see Understanding Common Network Topologies.

NetScaler as an L2 device

A NetScaler appliance functioning as an L2 device is said to operate in L2 mode. In L2 mode, the ADC appliance forwards packets between network interfaces when all of the following conditions are met:

- The packets are destined to another device's media access control (MAC) address.
- The destination MAC address is on a different network interface.
- The network interface is a member of the same virtual LAN (VLAN).

By default, all network interfaces are members of a pre-defined VLAN, VLAN 1. Address Resolution Protocol (ARP) requests and responses are forwarded to all network interfaces that are members of the same VLAN. To avoid bridging loops, L2 mode must be disabled if another L2 device is working in parallel with the NetScaler appliance.

For information about how the L2 and L3 modes interact, see Packet forwarding modes.

For information about configuring L2 mode, see the “Enable and disable layer 2 mode” section in Packet forwarding modes.

NetScaler as a packet forwarding device

A NetScaler appliance can function as a packet forwarding device, and this mode of operation is called L3 mode. With L3 mode enabled, the appliance forwards any received unicast packets that are destined for an IP address that does not belong to the appliance, if there is a route to the destination. The appliance can also route packets between VLANs.

In both modes of operation, L2 and L3, the appliance generally drops packets that are in:
NetScaler 12.0

- Multicast frames
- Unknown protocol frames destined for an appliance’s MAC address (non-IP and non-ARP)
- Spanning Tree protocol (unless BridgeBPDUs is ON)

For information about how the L2 and L3 modes interact, see Packet forwarding modes.
For information about configuring the L3 mode, see Packet forwarding modes.

How a NetScaler appliance communicates with clients and servers

January 6, 2019

A NetScaler appliance is usually deployed in front of a server farm and functions as a transparent TCP proxy between clients and servers, without requiring any client-side configuration. This basic mode of operation is called Request Switching technology and is the core of NetScaler functionality. Request Switching enables an appliance to multiplex and offload the TCP connections, maintain persistent connections, and manage traffic at the request (application layer) level. This is possible because the appliance can separate the HTTP request from the TCP connection on which the request is delivered.

Depending on the configuration, an appliance might process the traffic before forwarding the request to a server. For example, if the client attempts to access a secure application on the server, the appliance might perform the necessary SSL processing before sending traffic to the server.

To facilitate efficient and secure access to server resources, an appliance uses a set of IP addresses collectively known as NetScaler-owned IP addresses. To manage your network traffic, you assign NetScaler-owned IP addresses to virtual entities that become the building blocks of your configuration. For example, to configure load balancing, you create virtual servers to receive client requests and distribute them to services, which are entities representing the applications on your servers.

Understanding NetScaler-owned IP addresses

To function as a proxy, a NetScaler appliance uses a variety of IP addresses. The key NetScaler-owned IP addresses are:

- **NetScaler IP (NSIP) address**
  
  The NSIP address is the IP address for management and general system access to the appliance itself, and for communication between appliances in a high availability configuration.

- **Virtual server IP (VIP) address**
  
  A VIP address is the IP address associated with a virtual server. It is the public IP address to which clients connect. An appliance managing a wide range of traffic may have many VIPs configured.
• Subnet IP (SNIP) address

A SNIP address is used in connection management and server monitoring. You can specify multiple SNIP addresses for each subnet. SNIP addresses can be bound to a VLAN.

• IP Set

An IP set is a set of IP addresses, which are configured on the appliance as SNIP. An IP set is identified with a meaningful name that helps in identifying the usage of the IP addresses contained in it.

• Net Profile

A net profile (or network profile) contains an IP address or an IP set. A net profile can be bound to load balancing or content switching virtual servers, services, service groups, or monitors. During communication with physical servers or peers, the appliance uses the addresses specified in the profile as source IP addresses.

How Traffic flows are managed

Because a NetScaler appliance functions as a TCP proxy, it translates IP addresses before sending packets to a server. When you configure a virtual server, clients connect to a VIP address on the NetScaler appliance instead of directly connecting to a server. As determined by the settings on the virtual server, the appliance selects an appropriate server and sends the client’s request to that server. By default, the appliance uses a SNIP address to establish connections with the server, as shown in the following figure.

Figure 1. Virtual Server Based Connections

In the absence of a virtual server, when an appliance receives a request, it transparently forwards the request to the server. This is called the transparent mode of operation. When operating in transparent mode, an appliance translates the source IP addresses of incoming client requests to the SNIP address but does not change the destination IP address. For this mode to work, L2 or L3 mode has to be configured appropriately.

For cases in which the servers need the actual client IP address, the appliance can be configured to modify the HTTP header by inserting the client IP address as an additional field, or configured to use the client IP address instead of a SNIP address for connections to the servers.

Traffic management building blocks

The configuration of a NetScaler appliance is typically built up with a series of virtual entities that serve as building blocks for traffic management. The building block approach helps separate traffic flows. Virtual entities are abstractions, typically representing IP addresses, ports, and protocol handlers for
processing traffic. Clients access applications and resources through these virtual entities. The most commonly used entities are virtual servers and services. Virtual servers represent groups of servers in a server farm or remote network, and services represent specific applications on each server.

Most features and traffic settings are enabled through virtual entities. For example, you can configure an appliance to compress all server responses to a client that is connected to the server farm through a particular virtual server. To configure the appliance for a particular environment, you need to identify the appropriate features and then choose the right mix of virtual entities to deliver them. Most features are delivered through a cascade of virtual entities that are bound to each other. In this case, the virtual entities are like blocks being assembled into the final structure of a delivered application. You can add, remove, modify, bind, enable, and disable the virtual entities to configure the features. The following figure shows the concepts covered in this section.

Figure 2. How traffic management building blocks work

A simple load balancing configuration

In the example shown in the following figure, the NetScaler appliance is configured to function as a load balancer. For this configuration, you need to configure virtual entities specific to load balancing and bind them in a specific order. As a load balancer, an appliance distributes client requests across several servers and thus optimizes the utilization of resources.

The basic building blocks of a typical load balancing configuration are services and load balancing virtual servers. The services represent the applications on the servers. The virtual servers abstract the servers by providing a single IP address to which the clients connect. To ensure that client requests are sent to a server, you need to bind each service to a virtual server. That is, you must create services for every server and bind the services to a virtual server. Clients use the VIP address to connect to a NetScaler appliance. When the appliance receives client requests sent to the VIP address, it sends them to a server determined by the load balancing algorithm. Load balancing uses a virtual entity called a monitor to track whether a specific configured service (server plus application) is available to receive requests.

Figure 3. Load balancing virtual server, services, and monitors

In addition to configuring the load balancing algorithm, you can configure several parameters that affect the behavior and performance of the load balancing configuration. For example, you can configure the virtual server to maintain persistence based on source IP address. The appliance then directs all requests from any specific IP address to the same server.

Understanding virtual servers

A virtual server is a named NetScaler entity that external clients can use to access applications hosted on the servers. It is represented by an alphanumeric name, virtual IP (VIP) address, port, and protocol.
The name of the virtual server is of only local significance and is designed to make the virtual server easier to identify. When a client attempts to access applications on a server, it sends a request to the VIP instead of the IP address of the physical server. When the appliance receives a request at the VIP address, it terminates the connection at the virtual server and uses its own connection with the server on behalf of the client. The port and protocol settings of the virtual server determine the applications that the virtual server represents. For example, a web server can be represented by a virtual server and a service whose port and protocol are set to 80 and HTTP, respectively. Multiple virtual servers can use the same VIP address but different protocols and ports.

Virtual servers are points for delivering features. Most features, like compression, caching, and SSL offload, are normally enabled on a virtual server. When the appliance receives a request at a VIP address, it chooses the appropriate virtual server by the port on which the request was received and its protocol. The appliance then processes the request as appropriate for the features configured on the virtual server.

In most cases, virtual servers work in tandem with services. You can bind multiple services to a virtual server. These services represent the applications running on physical servers in a server farm. After the appliance processes requests received at a VIP address, it forwards them to the servers as determined by the load balancing algorithm configured on the virtual server. The following figure illustrates these concepts.

Figure 4. Multiple Virtual Servers with a Single VIP Address

The preceding figure shows a configuration consisting of two virtual servers with a common VIP address but different ports and protocols. Each of the virtual servers has two services bound to it. The services s1 and s2 are bound to VS_HTTP and represent the HTTP applications on Server 1 and Server 2. The services s3 and s4 are bound to VS_SSL and represent the SSL applications on Server 2 and Server 3 (Server 2 provides both HTTP and SSL applications). When the appliance receives an HTTP request at the VIP address, it processes the request as specified by the settings of VS_HTTP and sends it to either Server 1 or Server 2. Similarly, when the appliance receives an HTTPS request at the VIP address, it processes it as specified by the settings of VS_SSL and it sends it to either Server 2 or Server 3.

Virtual servers are not always represented by specific IP addresses, port numbers, or protocols. They can be represented by wildcards, in which case they are known as wildcard virtual servers. For example, when you configure a virtual server with a wildcard instead of a VIP, but with a specific port number, the appliance intercepts and processes all traffic conforming to that protocol and destined for the predefined port. For virtual servers with wildcards instead of VIPs and port numbers, the appliance intercepts and processes all traffic conforming to the protocol.

Virtual servers can be grouped into the following categories:

- Load balancing virtual server

  Receives and redirects requests to an appropriate server. Choice of the appropriate server is
based on which of the various load balancing methods the user configures.

• Cache redirection virtual server

Redirects client requests for dynamic content to origin servers, and requests for static content to cache servers. Cache redirection virtual servers often work in conjunction with load balancing virtual servers.

• Content switching virtual server

Directs traffic to a server on the basis of the content that the client has requested. For example, you can create a content switching virtual server that directs all client requests for images to a server that serves images only. Content switching virtual servers often work in conjunction with load balancing virtual servers.

• Virtual private network (VPN) virtual server

Decrypts tunneled traffic and sends it to intranet applications.

• SSL virtual server

Receives and decrypts SSL traffic, and then redirects to an appropriate server. Choosing the appropriate server is similar to choosing a load balancing virtual server.

Understanding services

Services represent applications on a server. While services are normally combined with virtual servers, in the absence of a virtual server, a service can still manage application-specific traffic. For example, you can create an HTTP service on a NetScaler appliance to represent a web server application. When the client attempts to access a web site hosted on the web server, the appliance intercepts the HTTP requests and creates a transparent connection with the web server.

In service-only mode, an appliance functions as a proxy. It terminates client connections, uses a SNIP address to establish a connection to the server, and translates the source IP addresses of incoming client requests to a SNIP address. Although the clients send requests directly to the IP address of the server, the server sees them as coming from the SNIP address. The appliance translates the IP addresses, port numbers, and sequence numbers.

A service is also a point for applying features. Consider the example of SSL acceleration. To use this feature, you must create an SSL service and bind an SSL certificate to the service. When the appliance receives an HTTPS request, it decrypts the traffic and sends it, in clear text, to the server. Only a limited set of features can be configured in the service-only case.

Services use entities called monitors to track the health of applications. Every service has a default monitor, which is based on the service type, bound to it. As specified by the settings configured on the monitor, the appliance sends probes to the application at regular intervals to determine its state.
If the probes fail, the appliance marks the service as down. In such cases, the appliance responds to client requests with an appropriate error message or re-routes the request as determined by the configured load balancing policies.

Introduction to the NetScaler product line

January 3, 2019

The NetScaler product line optimizes delivery of applications over the internet and private networks, combining application-level security, optimization, and traffic management into a single, integrated appliance. You can install a NetScaler appliance in your server room and route all connections to your managed servers through it. The NetScaler features that you enable and the policies you set are then applied to incoming and outgoing traffic.

A NetScaler appliance can be integrated into any network as a complement to existing load balancers, servers, caches, and firewalls. It requires no additional client or server side software, and can be configured using the NetScaler web-based GUI and CLI configuration utilities.

NetScaler Hardware Platforms

NetScaler hardware is available in a variety of platforms that have a range of hardware specifications:

NetScaler MPX hardware platform
NetScaler SDX hardware platform

NetScaler Editions

The NetScaler operating system is available in three editions:

- Standard
- Enterprise
- Platinum

The Standard and Advanced editions have limited features available. Feature licenses are required for all editions.

For more information about NetScaler software editions, see the NetScaler Editions datasheet.

For information about how to obtain and install licenses, see Licensing.
**Supported releases on NetScaler hardware**

See the following compatibility matrix tables for all NetScaler hardware platforms and the software releases supported on these platforms:

NetScaler MPX Hardware-Software Compatibility Matrix

NetScaler SDX Hardware-Software Compatibility Matrix

**Supported browsers**

To access the NetScaler GUI, your workstation must have a supported web browser.

Operating system: Windows 7
Browser and versions:
- Internet Explorer; versions 9, 10, and 11
- Mozilla Firefox; versions 3.6.25 and above
- Google Chrome; latest version

Operating system: Windows 64 bit
Browser and versions:
- Internet Explorer; versions 8, 9, 10, and 11
- Google Chrome; latest version

Operating system: MAC
Browser and versions:
- Mozilla Firefox; versions 3.6.25 and above
- Safari; versions 5.1.3 and above
- Google Chrome; latest version

**Install the hardware**

September 24, 2018

Before installing a NetScaler appliance, review the pre-installation checklist.

To use the SDX appliance, you must complete the following tasks by following the instructions given in the resources provided in table. Complete the tasks in the sequence given.

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Read safety, cautions, warnings, and other information</td>
</tr>
</tbody>
</table>
Read the caution and danger information you need to know, before installing the product.

2. Prepare for installation

Unpack your appliance and ensure all parts were delivered, prepare the site and rack, and follow basic electrical safety precautions before you install your new appliance.

3. Install the hardware

Rack mount the appliance, install transceivers (if available), and connect the appliance to the network and a power source.

4. Configure the appliance.

Configure the initial settings of the NetScaler appliance by using the GUI or the serial console.

Follow the steps given in the following documentations to complete these tasks:

- NetScaler MPX hardware documentation
- NetScaler SDX hardware documentation

**Access a NetScaler**

September 24, 2018

A NetScaler appliance has both a command line interface (CLI) and a graphical user interface (GUI). The GUI includes a configuration utility for configuring the appliance and a statistical utility, called Dashboard. For initial access, all appliances ship with the default NetScaler IP address (NSIP) of 192.168.100.1 and default subnet mask of 255.255.0.0. You can assign a new NSIP and an associated subnet mask during initial configuration.

If you encounter an IP address conflict when deploying multiple NetScaler units, check for the following possible causes:

- Did you select an NSIP that is an IP address already assigned to another device on your network?
- Did you assign the same NSIP to multiple NetScaler appliances?
- The NSIP is reachable on all physical ports. The ports on a NetScaler are host ports, not switch ports.

The following table summarizes the available access methods.

<table>
<thead>
<tr>
<th>Access Method</th>
<th>Port</th>
<th>Default IP Address Required? (Y/N)</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLI</td>
<td>Console</td>
<td>N</td>
</tr>
<tr>
<td>CLI and GUI</td>
<td>Ethernet</td>
<td>S</td>
</tr>
</tbody>
</table>
**Command line interface**

You can access the CLI either locally, by connecting a workstation to the console port, or remotely, by connecting through secure shell (SSH) from any workstation on the same network.

**Log on to the Command Line Interface through the Console Port**

The appliance has a console port for connecting to a computer workstation. To log on to the appliance, you need a serial crossover cable and a workstation with a terminal emulation program.

To log on to the CLI through the console port, follow these steps:

1. Connect the console port to a serial port on the workstation, as described in .
2. On the workstation, start HyperTerminal or any other terminal emulation program. If the logon prompt does not appear, you may need to press ENTER one or more times to display it.
3. Log on by using the administrator credentials. The command prompt (> ) appears on the workstation monitor.

**Log on to the Command Line Interface by using SSH**

The SSH protocol is the preferred remote access method for accessing an appliance remotely from any workstation on the same network. You can use either SSH version 1 (SSH1) or SSH version 2 (SSH2.)

If you do not have a working SSH client, you can download and install any of the following SSH client programs:

- PuTTY
  
  Open Source software supported on multiple platforms. Available at: “http://www.chiark.greenend.org.uk/~sgtatham/putty/”

- Vandyke Software SecureCRT
  
  Commercial software supported on the Windows platform. Available at: “http://www.vandyke.com/products/securecrt/”

These programs have been tested by the Citrix NetScaler team, which has verified that they work correctly with a NetScaler appliance. Other programs may also work correctly, but have not been tested.

To verify that the SSH client is installed properly, use it to connect to any device on your network that accepts SSH connections.

To log on to a NetScaler appliance by using an SSH client, follow these steps:

1. On your workstation, start the SSH client.
2. For initial configuration, use the default IP address (NSIP), which is 192.168.100.1. For subsequent access, use the NSIP that was assigned during initial configuration. Select either SSH1 or SSH2 as the protocol.

3. Log on by using the administrator credentials. For example.

   ```
   login as: nsroot
   Using keyboard-interactive authentication.
   Password:
   Last login: Tue Jun 16 10:37:28 2009 from 10.102.29.9
   Done
   ```

**NetScaler GUI**

---

**Important**

A certificate-key pair is required for HTTPS access to the Citrix ADC GUI. On the ADC, a certificate-key pair is automatically bound to the internal services. On an MPX or SDX appliance, the default key size is 1024 bytes, and on a VPX instance, the default key size is 512 bytes. However, most browsers today do not accept a key that is less than 1024 bytes. As a result, HTTPS access to the VPX configuration utility is blocked.

Additionally, if a license is not present on an MPX appliance when it starts, and you add a license later and restart the appliance, you might lose the certificate binding.

Citrix recommends that you install a certificate-key pair of at least 1024 bytes on a NetScaler for HTTPS access to the GUI, and that you install an appropriate license before starting the ADC.

The graphical user interface includes a configuration utility and a statistical utility, called Dashboard, either of which you access through a workstation connected to an Ethernet port on the appliance.

The system requirements for the workstation running the GUI are as follows:
For Windows-based workstations, a Pentium 166 MHz or faster processor.

For Linux-based workstations, a Pentium platform running Linux kernel v2.2.12 or above, and glibc version 2.12-11 or later. A minimum of 32 MB RAM is required, and 48 MB RAM is recommended. The workstation should support 16-bit color mode, KDE and KWM window managers used in conjunction, with displays set to local hosts.

For Solaris-based workstations, a Sun running either Solaris 2.6, Solaris 7, or Solaris 8.

Your workstation must have a supported web browser to access the configuration utility and Dashboard.

The following browsers are supported.

**Operating System:**
Windows 7

**Browser:** Internet Explorer (version 9, 10, and 11), Mozilla Firefox (version 3.6.25 and above), Google Chrome (latest).

**Operating System:**
Windows 64 bit

**Browser:** Internet Explorer (version 8, 9, 10, and 11), Google Chrome (version latest)

**Operating System:**
MAC

**Browser:** Mozilla Firefox (version 3.6.25 and above), Safari (version 5.1.3 and above), Google Chrome (version latest)

**Use the NetScaler GUI**

Once you log on to the configuration utility, you can configure the appliance through a graphical interface that includes context-sensitive help.

To log on to the GUI, follow these steps:

1. Open your web browser and enter the NetScaler IP (NSIP) as an HTTP address. If you have not yet set up the initial configuration, enter the default NSIP (http://192.168.100.1). The Citrix Login page appears.

   Note: If you have two NetScaler appliances in a high availability setup, make sure that you do not access the GUI by entering the IP address of the secondary NetScaler appliance. If you do so and use the GUI to configure the secondary appliance, your configuration changes will not be applied to the primary NetScaler appliance.

2. In the User Name text box, type nsroot.
3. In the Password text box, type the administrative password you assigned to the nsroot account during initial configuration and click Login. The Configuration Utility page appears.

If you need to access the online help, select Help from the Help menu at the top right corner.

**Use the Statistical Utility**

Dashboard, the statistical utility, is a browser-based application that displays charts and tables on which you can monitor the performance of a NetScaler appliance.

To log on to Dashboard, follow these steps:

1. Open your web browser and enter the NSIP as an HTTP address. The Citrix Logon page appears.
2. In the User Name text box, type nsroot.
3. In the Password text box, type the administrative password you assigned to the nsroot account during initial configuration.

**Configure the ADC for the first time**

November 2, 2018

For initial configuration of a NetScaler MPX appliance, see Initial Configuration of a Citrix MPX appliance.

For initial configuration of a Citrix SDX appliance, see Initial Configuration of a Citrix SDX appliance.

**NITRO API**

You can use the NITRO API to configure the NetScaler appliance. NITRO exposes its functionality through Representational State Transfer (REST) interfaces. Therefore, NITRO applications can be developed in any programming language. Additionally, for applications that must be developed in Java or .NET or Python, NITRO APIs are exposed through relevant libraries that are packaged as separate Software Development Kits (SDKs). For more information, see NITRO API.

**Configure high availability**

January 6, 2019

You can deploy two NetScaler appliances in a high availability configuration, where one unit actively accepts connections and manages servers while the secondary unit monitors the first. The NetScaler appliance that is actively accepting connections and managing the servers is called a primary unit and
the other one is called a secondary unit in a high availability configuration. If there is a failure in the primary unit, the secondary unit becomes the primary and begins actively accepting connections.

Each NetScaler appliance in a high availability pair monitors the other by sending periodic messages, called heartbeat messages or health checks, to determine the health or state of the peer node. If a health check for a primary unit fails, the secondary unit retries the connection for a specific time period. For more information about high availability, see High Availability. If a retry does not succeed by the end of the specified time period, the secondary unit takes over for the primary unit in a process called failover. The following figure shows two high availability configurations, one in one-arm mode and the other in two-arm mode.

Figure 1. High availability in one-arm mode
Figure 2. High availability in two-arm mode

In one-arm configuration, both NS1 and NS2 and servers S1, S2, and S3 are connected to the switch.

In two-arm configuration, both NS1 and NS2 are connected to two switches. The servers S1, S2, and S3 are connected to the second switch. The traffic between client and the servers passes through either NS1 or NS2.

To set up a high availability environment, configure one ADC appliance as primary and another as secondary. Perform the following tasks on each of the ADC appliances:

- Add a node.
- Disable high availability monitoring for unused interfaces.

### Add a Node

A node is a logical representation of a peer NetScaler appliance. It identifies the peer unit by ID and NSIP. An appliance uses these parameters to communicate with the peer and track its state. When you add a node, the primary and secondary units exchange heartbeat messages asynchronously. The node ID is an integer that must not be greater than 64.

### Through CLI

To add a node by using the command line interface, follow these steps:

At the command prompt, type the following commands to add a node and verify that the node has been added:

- `add HA node <id> <IPAddress>`
- `show HA node <id>`

**Example**
Through GUI

To add a node by using the GUI, follow these steps:

1. Navigate to System > High Availability.
2. Click Add on the Nodes tab.
3. On the Create HA Node page, in the Remote Node IP Address text box, type the NSIP Address (for example, 10.102.29.170) of the remote node.
4. Ensure that the Configure remote system to participate in High Availability setup check box is selected. Provide the login credentials of the remote node in the text boxes under Remote System Login Credentials.
5. Select the Turn off HA monitor on interfaces/channels that are down check box to disable the HA monitor on interfaces that are down.

Verify that the node you added appears in the list of nodes in the Nodes tab.

Disable high availability monitoring for unused interfaces

The high availability monitor is a virtual entity that monitors an interface. You must disable the monitor for interfaces that are not connected or being used for traffic. When the monitor is enabled on an interface whose status is DOWN, the state of the node becomes NOT UP. In a high availability configuration, a primary node entering a NOT UP state might cause a high availability failover. An interface is marked DOWN under the following conditions:

- The interface is not connected
- The interface is not working properly
- The cable connecting the interface is not working properly
**Through CLI**

To disable the high availability monitor for an unused interface by using the command line interface, follow these steps:

At the command prompt, type the following commands to disable the high availability monitor for an unused interface and verify that it is disabled:

- `set interface <id> -haMonitor OFF`
- `show interface <id>`

**Example**

```
1 > set interface 1/8 -haMonitor OFF  
2   Done  
3 > show interface 1/8  
4   Interface 1/8 (Gig Ethernet 10/100/1000 MBits) #2  
5     flags=0x4000 <ENABLED, DOWN, down, autoneg, 802.1q>  
6     MTU=1514, native vlan=1, MAC=00:d0:68:15:fd:3d, downtime  
7             238h55m44s  
8     Requested: media AUTO, speed AUTO, duplex AUTO, fctl OFF,  
9          throughput 0  
10    RX: Pkts(0) Bytes(0) Errs(0) Drops(0) Stalls(0)  
11    TX: Pkts(0) Bytes(0) Errs(0) Drops(0) Stalls(0)  
12    NIC: InDisc(0) OutDisc(0) Fctls(0) Stalls(0) Hangs(0)  
13       Muted(0)  
14 Bandwidth thresholds are not set.
```

When the high availability monitor is disabled for an unused interface, the output of the show interface command for that interface does not include “HAMON.”

**Through GUI**

To disable the high availability monitor for unused interfaces by using the GUI, follow these steps:

1. Navigate to System > Network > Interfaces.
2. Select the interface for which the monitor must be disabled.
3. Click Open. The Modify Interface dialog box appears.
4. In HA Monitoring, select the OFF option.
5. Click OK.
6. Verify that, when the interface is selected, “HA Monitoring: OFF” appears in the details at the bottom of the page.
Configure a FIPS appliance for the first time

December 28, 2018

A certificate-key pair is required for HTTPS access to the configuration utility and for secure remote procedure calls. RPC nodes are internal system entities used for system-to-system communication of configuration and session information. One RPC node exists on each appliance. This node stores the password, which is checked against the one provided by the contacting appliance. To communicate with other NetScaler appliances, each appliance requires knowledge of the other appliances, including how to authenticate on the other appliance. RPC nodes maintain this information, which includes the IP addresses of the other NetScaler appliances and the passwords used to authenticate on each.

On a NetScaler MPX appliance virtual appliance, a certificate-key pair is automatically bound to the internal services. On a FIPS appliance, a certificate-key pair must be imported into the hardware security module (HSM) of a FIPS card. To do so, you must configure the FIPS card, create a certificate-key pair, and bind it to the internal services.

Configure secure HTTPS by using the CLI

To configure secure HTTPS by using the CLI, follow these steps:

1. Initialize the hardware security module (HSM) on the FIPS card of the appliance. For information about initializing the HSM, see Configure the HSM.

2. If the appliance is part of a high availability setup, enable the SIM. For information about enabling the SIM on the primary and secondary appliances, see "Configure FIPS appliances in a high availability setup.

3. Import the FIPS key into the HSM of the FIPS card of the appliance. At the command prompt, type:
   import ssl fipskey serverkey -key ns-server.key -inform PEM

4. Add a certificate-key pair. At the command prompt, type:
   add certkey server -cert ns-server.cert -fipskey serverkey

5. Bind the certificate-key created in the previous step to the following internal services. At the command prompt, type:
   bind ssl service nshttps-127.0.0.1-443 -certkeyname server
   bind ssl service nshttps-::11-443 -certkeyname server

Configure secure HTTPS by using the GUI

To configure secure HTTPS by using the GUI, follow these steps:
1. Initialize the hardware security module (HSM) on the FIPS card of the appliance. For information about initializing the HSM, see Configure the HSM.

2. If the appliance is part of a high availability setup, enable the secure information system (SIM). For information about enabling the SIM on the primary and secondary appliances, see Configure FIPS appliances in a high availability setup.

3. Import the FIPS key into the HSM of the FIPS card of the appliance. For more information about importing a FIPS key, see the Import an existing FIPS key section.

4. Navigate to Traffic Management > SSL > Certificates.

5. In the details pane, click Install.

6. In the Install Certificate dialog box, type the certificate details.

7. Click Create, and then click Close.

9. In the details pane, on the Action tab, click Internal Services.

10. Select nshttps-127.0.0.1-443 from the list, and then click Open.

11. On the SSL Settings tab, in the Available pane, select the certificate created in step 7, click Add, and then click OK.

12. Select nshttps-::11-443 from the list, and then click Open.

13. On the SSL Settings tab, in the Available pane, select the certificate created in step 7, click Add, and then click OK.

14. Click OK.

Configure secure RPC by using the CLI

To configure secure RPC by using the CLI, follow these steps:

1. Initialize the hardware security module (HSM) on the FIPS card of the appliance. For information about initializing the HSM, see Configure the HSM.

2. Enable the secure information system (SIM). For information about enabling the SIM on the primary and secondary appliances, see Configure FIPS appliances in a high availability setup.

3. Import the FIPS key into the HSM of the FIPS card of the appliance. At the command prompt, type:
   
   import ssl fipskey serverkey -key ns-server.key -inform PEM

4. Add a certificate-key pair. At the command prompt, type:
   
   add certkey server -cert ns-server.cert -fipskey serverkey
5. Bind the certificate-key pair to the following internal services. At the command prompt, type:

   bind ssl service nsrpcs-127.0.0.1-3008 -certkeyname server
   bind ssl service nskrpcs-127.0.0.1-3009 -certkeyname server
   bind ssl service nsrpcs-::1-3008 -certkeyname server

6. Enable secure RPC mode. At the command prompt, type:

   set ns rpcnode <IP address> -secure YES

**Configure secure RPC by using the GUI**

To configure secure RPC by using the GUI, follow these steps:

1. Initialize the hardware security module (HSM) on the FIPS card of the appliance. For information about initializing the HSM, see Configure the HSM.
2. Enable the secure information system (SIM). For information about enabling the SIM on the primary and secondary appliances, Configure FIPS appliances in a high availability setup.
3. Import the FIPS key into the HSM of the FIPS card of the appliance. For more information about importing a FIPS key, the Import an existing FIPS key section.
4. Navigate to Traffic Management > SSL > Certificates.
5. In the details pane, click Install.
6. In the Install Certificate dialog box, type the certificate details.
7. Click Create, and then click Close.
9. In the details pane, on the Action tab, click Internal Services.
10. Select nsrpcs-127.0.0.1-3008 from the list, and then click Open.
11. On the SSL Settings tab, in the Available pane, select the certificate created in step 7, click Add, and then click OK.
12. Select nskrpcs-127.0.0.1-3009 from the list, and then click Open.
13. On the SSL Settings tab, in the Available pane, select the certificate created in step 7, click Add, and then click OK.
14. Select nsrpcs-::1-3008 from the list, and then click Open.
15. On the SSL Settings tab, in the Available pane, select the certificate created in step 7, click Add, and then click OK.
16. Click OK.
17. Navigate to System > Network > RPC.
18. In the details pane, select the IP address, and click Open.
19. In the Configure RPC Node dialog box, select Secure.
20. Click OK.
Common network topologies

January 6, 2019

As described in the “Physical deployment mode” section in Where does a NetScaler appliance fit in the network?, you can deploy the NetScaler appliance either inline between the clients and servers or in one-arm mode. Inline mode uses a two-arm topology, which is the most common type of deployment.

Set up a common two-arm topology

In a two-arm topology, one network interface is connected to the client network and another network interface is connected to the server network, ensuring that all traffic flows through the appliance. This topology might require you to reconnect your hardware and also might result in a momentary downtime. The basic variations of two-arm topology are multiple subnets, typically with the appliance on a public subnet and the servers on a private subnet, and transparent mode, with both the appliance and the servers on the public network.

Set up a simple two-arm multiple subnet topology

One of the most commonly used topologies has the NetScaler appliance inline between the clients and the servers, with a virtual server configured to handle the client requests. This configuration is used when the clients and servers reside on different subnets. In most cases, the clients and servers reside on public and private subnets, respectively.

For example, consider an appliance deployed in two-arm mode for managing servers S1, S2, and S3, with a virtual server of type HTTP configured on the appliance, and with HTTP services running on the servers. The servers are on a private subnet and a SNIP is configured on the appliance to communicate with the servers. The Use SNIP (USNIP) option must be enabled on the appliance so that it uses the SNIP instead of the MIP.

As shown in the following figure, the VIP is on public subnet 217.60.10.0, and the NSIP, the servers, and the SNIP are on private subnet 192.168.100.0/24.

Figure 1. Topology Diagram for Two-Arm Mode, Multiple Subnets

To deploy a NetScaler appliance in two-arm mode with multiple subnets, follow these steps:

1. Configure the NSIP and default gateway, as described in Configuring the NetScaler IP Address (NSIP).
2. Configure the SNIP, as described in Configuring Subnet IP Addresses.
3. Enable the USNIP option, as described in To enable or disable USNIP mode section.
4. Configure the virtual server and the services, as described in Creating a Virtual Server section and Configuring Services section.
5. Connect one of the network interfaces to a private subnet and the other interface to a public subnet.

**Set up a simple two-arm transparent topology**

Use transparent mode if the clients need to access the servers directly, with no intervening virtual server. The server IP addresses must be public because the clients need to be able to access them. In the example shown in the following figure, a NetScaler appliance is placed between the client and the server, so the traffic must pass through the appliance. You must enable L2 mode for bridging the packets. The NSIP and MIP are on the same public subnet, 217.60.10.0/24.

Figure 2. Topology Diagram for Two-Arm, Transparent Mode

To deploy a NetScaler appliance in two-arm, transparent mode, follow these steps:

1. Configure the NSIP and default gateway, as described in Configuring the NetScaler IP Address (NSIP).
2. Enable L2 mode, as described in Enabling and Disabling Layer 2 Mode.
3. Configure the default gateway of the managed servers as the MIP.
4. Connect the network interfaces to the appropriate ports on the switch.

**Set up common one-arm topologies**

The two basic variations of one-arm topology are with a single subnet and with multiple subnets.

**Set up a simple one-arm single subnet topology**

You can use a one-arm topology with a single subnet when the clients and servers reside on the same subnet. For example, consider a NetScaler appliance deployed in one-arm mode for managing servers S1, S2, and S3. A virtual server of type HTTP is configured on an ADC appliance, and HTTP services are running on the servers. As shown in the following figure, the NetScaler IP address (NSIP), the Mapped IP address (MIP), and the server IP addresses are on the same public subnet, 217.60.10.0/24.

Figure 3. Topology Diagram for One-Arm Mode, Single Subnet

To deploy a NetScaler appliance in one-arm mode with a single subnet, follow these steps:

1. Configure the NSIP and the default gateway, as described in Configuring the NetScaler IP Address (NSIP).
2. Configure the virtual server and the services, as described in Creating a Virtual Server section and Configuring Services section.
3. Connect one of the network interfaces to the switch.
Set up a simple one-arm multiple subnet topology

You can use a one-arm topology with multiple subnets when the clients and servers reside on the different subnets. For example, consider a NetScaler appliance deployed in one-arm mode for managing servers S1, S2, and S3, with the servers connected to switch SW1 on the network. A virtual server of type HTTP is configured on the appliance, and HTTP services are running on the servers. These three servers are on the private subnet, so a subnet IP address (SNIP) is configured to communicate with them. The Use Subnet IP address (USNIP) option must be enabled so that the appliance uses the SNIP instead of a MIP. As shown in the following figure, the virtual IP address (VIP) is on public subnet 217.60.10.0/24; the NSIP, SNIP, and the server IP addresses are on private subnet 192.168.100.0/24.

Figure 4. Topology Diagram for One-Arm Mode, Multiple Subnets

To deploy a NetScaler appliance in one-arm mode with multiple subnets, follow these steps:

1. Configure the NSIP and the default gateway, as described in Configuring the NetScaler IP Address (NSIP).
2. Configure the SNIP and enable the USNIP option, as described in Configuring Subnet IP Addresses.
3. Configure the virtual server and the services, as described in Creating a Virtual Server section and Configuring Services section.
4. Connect one of the network interfaces to the switch.

System management settings

September 24, 2018

Once your initial configuration is in place, you can configure settings to define the behavior of the NetScaler appliance and facilitate connection management. You have a number of options for handling HTTP requests and responses. Routing, bridging, and MAC based forwarding modes are available for handling packets not addressed to the NetScaler appliance. You can define the characteristics of your network interfaces and can aggregate the interfaces. To prevent timing problems, you can synchronize the Citrix clock with a Network Time Protocol (NTP) server. The NetScaler appliance can operate in various DNS modes, including as an authoritative domain name server (ADNS). You can set up SNMP for system management and customize syslog logging of system events. Before deployment, verify that your configuration is complete and correct.

System settings

September 24, 2018
Configuration of system settings includes basic tasks such as configuring HTTP ports to enable connection keep-alive and server offload, setting the maximum number of connections for each server, and setting the maximum number of requests per connection. You can enable client IP address insertion for situations in which a proxy IP address is not suitable, and you can change the HTTP cookie version.

You can also configure a NetScaler appliance to open FTP connections on a controlled range of ports instead of ephemeral ports for data connections. This improves security, because opening all ports on the firewall is insecure. You can set the range anywhere from 1,024 to 64,000.

Before deployment, go through the verification checklists to verify your configuration. To configure HTTP parameters and the FTP port range, use the NetScaler GUI.

You can modify the types of HTTP parameters described in the following table.

**Parameter Type:** HTTP Port Information

**Specifies:** The web server HTTP ports used by your managed servers. If you specify the ports, the appliance performs request switching for any client request that has a destination port matching a specified port.

*Note:* If an incoming client request is not destined for a service or a virtual server that is specifically configured on the appliance, the destination port in the request must match one of the globally configured HTTP ports. This allows the appliance to perform connection keep-alive and server off-load.

**Parameter Type:** Limits

**Specifies:** The maximum number of connections to each managed server, and the maximum number of requests sent over each connection. For example, if you set Max Connections to 500, and the appliance is managing three servers, it can open a maximum of 500 connections to each of the three servers. By default, the appliance can create an unlimited number of connections to any of the servers it manages. To specify an unlimited number of requests per connection, set Max Requests to 0.

*Note:* If you are using the Apache HTTP server, you must set Max Connections equal to the value of the MaxClients parameter in the Apache httpd.conf file. Setting this parameter is optional for other web servers.

**Parameter Type:** Client IP Insertion

**Specifies:** Enable/disable insertion of the client’s IP address into the HTTP request header. You can specify a name for the header field in the adjacent text box. When a web server managed by an appliance receives a mapped IP address or a subnet IP address, the server identifies it as the client’s IP address. Some applications need the client’s IP address for logging purposes or to dynamically determine the content to be served by the web server.

You can enable insertion of the actual client IP address into the HTTP header request sent from the client to one, some, or all servers managed by the appliance. You can then access the inserted ad-
dress through a minor modification to the server (using an Apache module, ISAPI interface, or NSAPI interface).

**Parameter Type:** Cookie Version

**Specifies:** The HTTP cookie version to use when COOKIEINSERT persistence is configured on a virtual server. The default, version 0, is the most common type on the Internet. Alternatively, you can specify version 1.

**Parameter Type:** Requests/Responses

**Specifies:** Options for handling certain types of requests, and enable/disable logging of HTTP error responses.

**Parameter Type:** Server Header Insertion

**Specifies:** Insert a server header in NetScaler-generated HTTP responses.

To configure HTTP parameters by using the GUI, follow these steps:

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Settings**, click **Change HTTP parameters**.
3. In the **Configure HTTP parameters** dialog box, specify values for some or all of the parameters that appear under the headings listed in the table above.
4. Click **OK**.

To set the FTP port range by using the GUI, follow these steps:

1. In the navigation pane, expand **System**, and then click **Settings**
2. In the details pane, under **Settings**, click **Change global system settings**.
3. Under **FTP Port Range**, in the **Start Port** and **End Port** text boxes, type the lowest and highest port numbers, respectively, for the range you want to specify (for example, 5000 and 6000).
4. Click **OK**.

**Packet forwarding modes**

January 6, 2019

The NetScaler appliance can either route or bridge packets that are not destined for an IP address owned by the appliance (that is, the IP address is not the NSIP, a MIP, a SNIP, a configured service, or a configured virtual server). By default, L3 mode (routing) is enabled and L2 mode (bridging) is disabled, but you can change the configuration. The following flow chart shows how the appliance evaluates packets and either processes, routes, bridges, or drops them.

**Figure 1. Interaction between Layer 2 and Layer 3 Modes**

An appliance can use the following modes to forward the packets it receives:
Enable and disable layer 2 mode

Layer 2 mode controls the Layer 2 forwarding (bridging) function. You can use this mode to configure a NetScaler appliance to behave as a Layer 2 device and bridge the packets that are not destined for it. When this mode is enabled, packets are not forwarded to any of the MAC addresses, because the packets can arrive on any interface of the appliance and each interface has its own MAC address.

With Layer 2 mode disabled (which is the default), the appliance drops packets that are not destined for one of its MAC address. If another Layer 2 device is installed in parallel with the appliance, Layer 2 mode must be disabled to prevent bridging (Layer 2) loops. You can use the configuration utility or the command line to enable Layer 2 mode.

Note: The appliance does not support spanning tree protocol. To avoid loops, if you enable L2 mode, do not connect two interfaces on the appliance to the same broadcast domain.

To enable or disable Layer 2 mode by using the CLI

At the command prompt, type the following commands to enable/disable Layer 2 mode and verify that it has been enabled/disabled:

- `enable ns mode <Mode>`
- `disable ns mode <Mode>`
- `show ns mode`

**Examples**

```
> enable ns mode l2
Done
> show ns mode
Mode Acronym Status
———- ——- ——
1) Fast Ramp FR ON
2) Layer 2 mode L2 ON
```

© 1999-2018 Citrix Systems, Inc. All rights reserved.
NetScaler 12.0

Done
>
> disable ns mode l2
Done
> show ns mode

Mode Acronym Status
——- ——- ——
1) Fast Ramp FR ON
2) Layer 2 mode L2 OFF

To enable or disable Layer 2 mode by using the GUI

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Modes** and **Features**, click **Configure modes**.
3. In the **Configure Modes** dialog box, to enable Layer 2 mode, select the **Layer 2 Mode** check box. To disable Layer 2 mode, clear the check box.
4. Click **OK**. The Enable/Disable Mode(s)? message appears in the details pane.
5. Click **Yes**.

Enable and disable layer 3 mode

Layer 3 mode controls the Layer 3 forwarding function. You can use this mode to configure a NetScaler appliance to look at its routing table and forward packets that are not destined for it. With Layer 3 mode enabled (which is the default), the appliance performs route table lookups and forwards all packets that are not destined for any appliance-owned IP address. If you disable Layer 3 mode, the appliance drops these packets.

To enable or disable Layer 3 mode by using the CLI

At the command prompt, type the following commands to enable/disable Layer 3 mode and verify that it has been enabled/disabled:

- enable ns mode <Mode>
- disable ns mode <Mode>
• `show ns mode`

**Examples**

```bash
> enable ns mode l3
Done
> show ns mode

Mode Acronym Status
——— —— ——
1) Fast Ramp FR ON
2) Layer 2 mode L2 OFF
   .
   .
9) Layer 3 mode (ip forwarding) L3 ON
   .
   .
Done
>
> disable ns mode l3
Done
> show ns mode

Mode Acronym Status
——— —— ——
1) Fast Ramp FR ON
2) Layer 2 mode L2 OFF
   .
   .
9) Layer 3 mode (ip forwarding) L3 OFF
   .
   .
Done
>
```

**To enable or disable Layer 3 mode by using the GUI**

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Modes and Features, click Configure modes.

3. In the Configure Modes dialog box, to enable Layer 3 mode, select the Layer 3 Mode (IP Forwarding) check box. To disable Layer 3 mode, clear the check box.

4. Click OK. The Enable/Disable Mode(s)? message appears in the details pane.

5. Click Yes.

**Enable and disable MAC based forwarding mode**

You can use MAC-based forwarding to process traffic more efficiently and avoid multiple-route or ARP lookups when forwarding packets, because the NetScaler appliance remembers the MAC address of the source. To avoid multiple lookups, the appliance caches the source MAC address of every connection for which it performs an ARP lookup, and it returns the data to the same MAC address.

MAC-based forwarding is useful when you use VPN devices because the appliance ensures that all traffic flowing through a particular VPN passes through the same VPN device.

The following figure shows the process of MAC-based forwarding.

**Figure 2. MAC-Based Forwarding Process**

When MAC-based forwarding is enabled, the appliance caches the MAC address of:

- The source (a transmitting device such as router, firewall, or VPN device) of the inbound connection.
- The server that responds to the requests.

When a server responds through an appliance, the appliance sets the destination MAC address of the response packet to the cached address, ensuring that the traffic flows in a symmetric manner, and then forwards the response to the client. The process bypasses the route table lookup and ARP lookup functions. However, when an appliance initiates a connection, it uses the route and ARP tables for the lookup function. To enable MAC-based forwarding, use the configuration utility or the command line.

Some deployments require the incoming and outgoing paths to flow through different routers. In these situations, MAC-based forwarding breaks the topology design. For a global server load balancing (GSLB) site that requires the incoming and outgoing paths to flow through different routers, you must disable MAC-based forwarding and use the appliance’s default router as the outgoing router.

With MAC-based forwarding disabled and Layer 2 or Layer 3 connectivity enabled, a route table can specify separate routers for outgoing and incoming connections. To disable MAC-based forwarding, use the configuration utility or the command line.

**To enable or disable MAC-based forwarding by using the CLI**

At the command prompt, type the following commands to enable/disable MAC-based forwarding mode and verify that it has been enabled/disabled:
- <enable ns mode <Mode> 
- <disable ns mode <Mode> 
- <show ns mode 

**Example**

```
"" pre codeblock

enable ns mode mbf
Done
show ns mode

<table>
<thead>
<tr>
<th>Mode</th>
<th>Acronym</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ramp</td>

<td>MBF</td>
<td>OFF</td>
</tr>
<tr>
<td>forwarding</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Done</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

To enable or disable MAC-based forwarding by using the GUI

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Modes and Features** group, click **Configure modes**.
3. In the **Configure Modes** dialog box, to enable MAC-based forwarding mode, select the **MAC Based Forwarding** check box. To disable MAC-based forwarding mode, clear the check box.
4. Click **OK**. The Enable/Disable Mode(s)? message appears in the details pane.
5. Click **Yes**.

**Network interfaces**

December 28, 2018
The NetScaler interfaces are numbered in slot/port notation. In addition to modifying the characteristics of individual interfaces, you can configure virtual LANs to restrict traffic to specific groups of hosts. You can also aggregate links into high-speed channels.

**Virtual LANs**

The NetScaler appliance supports (Layer 2) port and IEEE802.1Q tagged virtual LANs (VLANs). VLAN configurations are useful when you need to restrict traffic to certain groups of stations. You can configure a network interface to belong to multiple VLANs by using IEEE 802.1q tagging.

You can bind your configured VLANs to IP subnets. The ADC appliance (if it is configured as the default router for the hosts on the subnets) then performs IP forwarding between these VLANs.

The NetScaler appliance supports the following types of VLANs.

- **Default VLAN**
  
  By default, the network interfaces on a NetScaler appliance are included in a single, port-based VLAN as untagged network interfaces. This default VLAN has a VID of 1 and exists permanently. It cannot be deleted, and its VID cannot be changed.

- **Port-Based VLANs**
  
  A set of network interfaces that share a common, exclusive, Layer 2 broadcast domain define the membership of a port-based VLAN. You can configure multiple port-based VLANs. When you add an interface to a new VLAN as an untagged member, it is automatically removed from the default VLAN.

- **Tagged VLAN**
  
  A network interface can be a tagged or untagged member of a VLAN. Each network interface is an untagged member of only one VLAN (its native VLAN). The untagged network interface forwards the frames for the native VLAN as untagged frames. A tagged network interface can be a part of more than one VLAN. When you configure tagging, be sure that both ends of the link have matching VLAN settings. You can use the configuration utility to define a tagged VLAN (nsvlan) that can have any ports bound as tagged members of the VLAN. Configuring this VLAN requires a reboot of the ADC appliance and therefore must be done during initial network configuration.

**Link aggregate channels**

Link aggregation combines incoming data from multiple ports into a single high speed link. Configuring the link aggregate channel increases the capacity and availability of the communication channel between a NetScaler appliance and other connected devices. An aggregated link is also referred to as a channel.
When a network interface is bound to a channel, the channel parameters have precedence over the network interface parameters. A network interface can be bound to only one channel. Binding a network interface to a link aggregate channel changes the VLAN configuration. That is, binding network interfaces to a channel removes them from the VLANs that they originally belonged to and adds them to the default VLAN. However, you can bind the channel back to the old VLAN, or to a new one. For example, if you have bound network interfaces 1/2 and 1/3 to a VLAN with ID 2, and then you bind them to link aggregate channel LA/1, the network interfaces are moved to the default VLAN, but you can bind them to VLAN 2.

Note: You can also use Link Aggregation Control Protocol (LACP) to configure link aggregation. For more information, see Configuring Link Aggregation by Using the Link Aggregation Control Protocol.

Clock synchronization

September 24, 2018

You can configure your NetScaler appliance to synchronize its local clock with a Network Time Protocol (NTP) server. This ensures that its clock has the same date and time settings as the other servers on your network. NTP uses User Datagram Protocol (UDP) port 123 as its transport layer. You have to add NTP servers in the NTP configuration file so that the appliance periodically gets updates from these servers.

If you do not have a local NTP server, you can find a list of public, open access, NTP servers at the official NTP site at http://www.ntp.org.

To configure clock synchronization on your appliance, follow these steps:

1. Log on to the command line and enter the shell command.
2. At the shell prompt, copy the ntp.conf file from the /etc directory to the /nsconfig directory. If the file already exists in the /nsconfig directory, make sure that you remove the following entries from the ntp.conf file:
   restrict localhost
   restrict 127.0.0.2
   These entries are required only if you want to run the device as a time server. However, this feature is not supported on the NetScaler appliance.
3. Edit /nsconfig/ntp.conf by typing the IP address for the desired NTP server under the file's server and restrict entries.
4. Create a file named rc.netscaler in the /nsconfig directory, if the file does not already exist in the directory.
5. Edit `/nsconfig/rc.netscaler` by adding the following entry: `/usr/sbin/ntpd -c /nsconfig/ntp.conf -l /var/log/ntpd.log &

This entry starts the ntpd service, checks the ntp.conf file, and logs messages in the `/var/log` directory.

Note: If the time difference between the NetScaler appliance and the time server is more than 1000 sec, the ntpd service terminates with a message to the ADC log. To avoid this, you need to start ntpd with the `-g` option, which forcibly syncs the time. Add the following entry in `/nsconfig/rc.netscaler`:

`/usr/sbin/ntpd -g -c /nsconfig/ntp.conf -l /var/log/ntpd.log &`

If you do not want to forcibly sync the time when there is a large difference, you can set the date manually and then start ntpd again. You can check the time difference between the appliance and the time server by running the following command in the shell:

```
ntpdate -q <IP address or domain name of the NTP server>
```

6. Reboot the appliance to enable clock synchronization.

Note: If you want to start time synchronization before you restart the appliance, enter the following command (which you added to the rc.netscaler file in step 5) at the shell prompt:

```
/usr/sbin/ntpd -c /nsconfig/ntp.conf -l /var/log/ntpd.log &
```

---

**DNS configuration**

September 24, 2018

You can configure a NetScaler appliance to function as an Authoritative Domain Name Server (ADNS), DNS proxy server, End Resolver, or Forwarder. You can add DNS resource records such as SRV Records, AAAA Records, A Records, MX Records, NS Records, CNAME Records, PTR Records, and SOA Records. Also, the appliance can balance the load on external DNS servers.

A common practice is to configure an appliance as a forwarder. For this configuration, you need to add external name servers. After you have added the external servers, you should verify that your configuration is correct.

You can add, remove, enable, and disable external name servers. You can create a name server by specifying its IP address, or you can configure an existing virtual server as the name server.

When adding name servers, you can specify IP addresses or virtual IP addresses (VIPs). If you use IP addresses, the appliance load balances requests to the configured name servers in a round robin manner. If you use VIPs, you can specify any load balancing method.
Add a name server by using the CLI

At the command prompt, type the following commands to add a name server and verify the configuration:

- `add dns nameServer <IP>
- `show dns nameServer <IP>

**Example**

```
add dns nameServer 10.102.29.10
Done
show dns nameServer 10.102.29.10
1) 10.102.29.10 - State: DOWN
Done
```

Add a name server by using the GUI

1. Navigate to Traffic Management > DNS > Name Servers.
2. In the details pane, click Add.
3. In the Create Name Server dialog box, select IP Address.
4. In the IP Address text box, type the IP address of the name server (for example, 10.102.29.10). If you are adding an external name server, clear the Local check box.
5. Click Create, and then click Close.
6. Verify that the name server you added appears in the Name Servers pane.

SNMP configuration

January 6, 2019

The Simple Network Management Protocol (SNMP) network management application, running on an external computer, queries the SNMP agent on the NetScaler appliance. The agent searches the management information base (MIB) for data requested by the network management application and sends the data to the application.

SNMP monitoring uses traps messages and alarms. SNMP traps messages are asynchronous events that the agent generates to signal abnormal conditions, which are indicated by alarms. For example, if you want to be informed when CPU utilization is above 90 percent, you can set up an alarm for that
NetScaler 12.0

condition. The following figure shows a network with a NetScaler appliance that has SNMP enabled and configured.

Figure 1. SNMP on the NetScaler appliance

The SNMP agent on a NetScaler appliance supports SNMP version 1 (SNMPv1), SNMP version 2 (SNMPv2), and SNMP version 3 (SNMPv3). Because it operates in bilingual mode, the agent can handle SNMPv2 queries, such as Get-Bulk, and SNMPv1 queries. The SNMP agent also sends traps compliant with SNMPv2 and supports SNMPv2 data types, such as counter64. SNMPv1 managers (programs on other servers that request SNMP information from the ADC appliance) use the NS-MIB-smiv1.mib file when processing SNMP queries. SNMPv2 managers use the NS-MIB-smiv2.mib file.

The NetScaler appliance supports the following enterprise-specific MIBs:

- A subset of standard MIB-2 groups
  - Provides MIB-2 groups SYSTEM, IF, ICMP, UDP, and SNMP.

- A system enterprise MIB
  - Provides system-specific configuration and statistics.

To configure SNMP, you specify which managers can query the SNMP agent, add SNMP trap listeners that will receive the SNMP trap messages, and configure SNMP Alarms.

**Add SNMP managers**

You can configure a workstation running a management application that complies with SNMP version 1, 2, or 3 to access an appliance. Such a workstation is called an SNMP manager. If you do not specify an SNMP manager on the appliance, the appliance accepts and responds to SNMP queries from all IP addresses on the network. If you configure one or more SNMP managers, the appliance accepts and responds to SNMP queries from only those specific IP addresses. When specifying the IP address of an SNMP manager, you can use the netmask parameter to grant access from entire subnets. You can add a maximum of 100 SNMP managers or networks. To add an SNMP manager by using the CLI

At the command prompt, type the following commands to add an SNMP manager and verify the configuration:

```
**add snmp manager <IPAddress> … [-netmask <netmask>] **
s**how snmp manager** <IPAddress>
```

**Example:**

```
> add snmp manager 10.102.29.5 -netmask 255.255.255.255
Done
> show snmp manager 10.102.29.5
```
1. In the navigation pane, expand **System**, expand **SNMP**, and then click **Managers**.
2. In the details pane, click **Add**.
3. In the **Add SNMP Manager** dialog box, in the **IP Address** text box, type the IP address of the workstation running the management application (for example, 10.102.29.5).
4. Click **Create**, and then click **Close**.
5. Verify that the SNMP manager you added appears in the **Details** section at the bottom of the pane.

**Add SNMP traps listeners**

After configuring the alarms, you need to specify the trap listener to which the appliance will send the trap messages. Apart from specifying parameters like IP address and the destination port of the trap listener, you can specify the type of trap (either generic or specific) and the SNMP version.

You can configure a maximum of 20 trap listeners for receiving either generic or specific traps.

**To add an SNMP trap listener by using the CLI**

At the command prompt, type the following command to add an SNMP trap and verify that it has been added:

- `add snmp trap specific <IP>`
- `show snmp trap`

**Example**

```
> add snmp trap specific 10.102.29.3
Done
> show snmp trap
Type DestinationIP DestinationPort Version SourceIP Min-Severity Community
--- -------- ------- ------- ------- ------- -------
generic 10.102.29.9 162 V2 NetScaler IP N/A public
generic 10.102.29.5 162 V2 NetScaler IP N/A public
generic 10.102.120.101 162 V2 NetScaler IP N/A public
```

© 1999-2018 Citrix Systems, Inc. All rights reserved.
To add an SNMP trap listener by using the GUI

1. In the navigation pane, expand System, expand SNMP, and then click Traps.
2. In the details pane, click Add.
3. In the Create SNMP Trap Destination dialog box, in the Destination IP Address text box, type the IP address (for example, 10.102.29.3).
4. Click Create and then click Close.
5. Verify that the SNMP trap you added appears in the Details section at the bottom of the pane.

Configure SNMP alarms

You configure alarms so that the appliance generates a trap message when an event corresponding to one of the alarms occurs. Configuring an alarm consists of enabling the alarm and setting the severity level at which a trap is generated. There are five severity levels: Critical, Major, Minor, Warning, and Informational. A trap is sent only when the severity of the alarm matches the severity specified for the trap.

Some alarms are enabled by default. If you disable an SNMP alarm, the appliance will not generate trap messages when corresponding events occur. For example, if you disable the Login-Failure SNMP alarm, the appliance will not generate a trap message when a login failure occurs.

To enable or disable an alarm by using the CLI

At the command prompt, type the following commands to enable or disable an alarm and verify that it has been enabled or disabled:

```
set snmp alarm <trapName> [-state ENABLED | DISABLED ]
```

```
•
• show snmp alarm <trapName>
```

**Example**

```
> set snmp alarm LOGIN-FAILURE -state ENABLED
Done
```
To set the severity of the alarm by using the CLI

At the command prompt, type the following commands to set the severity of the alarm and verify that the severity has been set correctly:

- set snmp alarm <trapName> [-severity <severity>]
- show snmp alarm <trapName>

**Example**

> set snmp alarm LOGIN-FAILURE -severity Major
Done
> show snmp alarm LOGIN-FAILURE
Alarm Alarm Threshold Normal Threshold Time State Severity Logging

1) LOGIN-FAILURE N/A N/A N/A ENABLED - ENABLED
Done
>

To configure alarms by using the GUI

1. In the navigation pane, expand System, expand SNMP, and then click Alarms.
2. In the details pane, select an alarm (for example, LOGIN-FAILURE), and then click Open.
3. In the Configure SNMP Alarm dialog box, to enable the alarm, select Enabled in the State drop-down list. To disable the alarm, select Disabled.
4. In the Severity drop-down list, select a severity option (for example, Major).
5. Click OK, and then click Close.
6. Verify that the parameters for the SNMP alarm you configured are correctly configured by viewing the Details section at the bottom of the pane.

Verify configuration

September 24, 2018
After you've finished configuring your system, complete the following checklists to verify your configuration.

**Configuration checklist**

- The build running is:
  - There are no incompatibility issues. (Incompatibility issues are documented in the build’s release notes.)
- The port settings (speed, duplex, flow control, monitoring) are the same as the switch’s port.
- Enough mapped IP addresses have been configured to support all server-side connections during peak times.
  - The number of configured mapped IP addresses is:____
  - The expected number of simultaneous server connections is:
    - [ ] 62,000
    - [ ] 124,000
    - [ ] Other____

**Topology configuration checklist**

The routes have been used to resolve servers on other subnets.

The routes entered are:

_________________________________________

- If the NetScaler appliance is in a public-private topology, reverse NAT has been configured.
- The failover (high availability) settings configured on the ADC appliance resolve in a one arm or two-arm configuration. All unused network interfaces have been disabled:

_________________________________________

- If the ADC appliance is placed behind an external load balancer, then the load balancing policy on the external load balancer is not “least connection.”
  
  The load balancing policy configured on the external load balancer is:

_________________________________________

- If the ADC appliance is placed in front of a firewall, the session time-out on the firewall is set to a value greater than or equal to 300 seconds.

  Note: The TCP idle connection timeout on a NetScaler appliance is 360 seconds. If the timeout on the firewall is also set to 300 seconds or more, then the appliance can perform TCP connection multiplexing effectively because connections will not be closed earlier.

  The value configured for the session time-out is: ___________________
Server configuration checklist

- “Keep-alive” has been enabled on all the servers.
  The value configured for the keep-alive time-out is: ___________________

- The default gateway has been set to the correct value. (The default gateway should either be a NetScaler appliance or upstream router.) The default gateway is:
  __________________________________________

- The server port settings (speed, duplex, flow control, monitoring) are the same as the switch port settings.
  __________________________________________

- If the Microsoft® Internet Information Server is used, buffering is enabled on the server.

- If an Apache Server is used, the MaxConn (maximum number of connections) parameter is configured on the server and on the NetScaler appliance.
  The MaxConn (maximum number of connections) value that has been set is:
  __________________________________________

- If a Netscape Enterprise Server is used, the maximum requests per connection parameter is set on the NetScaler appliance. The maximum requests per connection value that has been set is:
  __________________________________________

Software features configuration checklist

- Does the Layer 2 mode feature need to be disabled? (Disable if another Layer 2 device is working in parallel with a NetScaler appliance.)
  Reason for enabling or disabling:
  __________________________________________

- Does the MAC-based forwarding feature need to be disabled? (If the MAC address used by return traffic is different, it should be disabled.)
  Reason for enabling or disabling:
  __________________________________________

- Does host-based reuse need to be disabled? (Is there virtual hosting on the servers?)
  Reason for enabling or disabling:
  __________________________________________
Do the default settings of the surge protection feature need to be changed?

Reason for changing or not changing:

-------------------------------------------

Access checklist

- The system IPs can be pinged from the client-side network.
- The system IPs can be pinged from the server-side network.
- The managed server(s) can be pinged through the NetScaler.
- Internet hosts can be pinged from the managed servers.
- The managed server(s) can be accessed through the browser.
- The Internet can be accessed from managed server(s) using the browser.
- The system can be accessed using SSH.
- Admin access to all managed server(s) is working.

Note: When you are using the ping utility, ensure that the pinged server has ICMP ECHO enabled, or your ping will not succeed.

Firewall checklist

The following firewall requirements have been met:

- UDP 161 (SNMP)
- UDP 162 (SNMP trap)
- TCP/UDP 3010 (GUI)
- HTTP 80 (GUI)
- TCP 22 (SSH)

Load balance traffic on a NetScaler appliance

January 6, 2019

The load balancing feature distributes client requests across multiple servers to optimize resource utilization. In a real-world scenario with a limited number of servers providing service to a large number of clients, a server can become overloaded and degrade the performance of the server farm. A NetScaler appliance uses load balancing criteria to prevent bottlenecks by forwarding each client request to the server best suited to handle the request when it arrives.

To configure load balancing, you define a virtual server to proxy multiple servers in a server farm and balance the load among them.
When a client initiates a connection to the server, a virtual server terminates the client connection and
initiates a new connection with the selected server, or reuses an existing connection with the server,
to perform load balancing. The load balancing feature provides traffic management from Layer 4 (TCP
and UDP) through Layer 7 (FTP, HTTP, and HTTPS).

The NetScaler appliance uses a number of algorithms, called load balancing methods, to determine
how to distribute the load among the servers. The default load balancing method is the Least Connections
method.

A typical load balancing deployment consists of the entities described in the following figure.

Figure 1. Load Balancing Architecture

The entities function as follows:

- **Virtual server.** An entity that is represented by an IP address, a port, and a protocol. The virtual
  server IP address (VIP) is usually a public IP address. The client sends connection requests to
  this IP address. The virtual server represents a bank of servers.

- **Service.** A logical representation of a server or an application running on a server. Identifies
  the server’s IP address, a port, and a protocol. The services are bound to the virtual servers.

- **Server object.** An entity that is represented by an IP address. The server object is created when
  you create a service. The IP address of the service is taken as the name of the server object. You
  can also create a server object and then create services by using the server object.

- **Monitor.** An entity that tracks the health of the services. The appliance periodically probes the
  servers using the monitor bound to each service. If a server does not respond within a specified
  response timeout, and the specified number of probes fails, the service is marked DOWN. The
  appliance then performs load balancing among the remaining services.

**Load balancing**

January 6, 2019

To configure load balancing, you must first create services. Then, you create virtual servers and bind
the services to the virtual servers. By default, the NetScaler appliance binds a monitor to each service.
After binding the services, verify your configuration by making sure that all of the settings are correct.

Note: After you deploy the configuration, you can display statistics that show how the entities in
the configuration are performing. Use the statistical utility or the
stat lb vserver <vservername> command.

Optionally, you can assign weights to a service. The load balancing method then uses the assigned
weight to select a service. For getting started, however, you can limit optional tasks to configuring
some basic persistence settings, for sessions that must maintain a connection to a particular server,
and some basic configuration-protection settings.
The following flow chart illustrates the sequence of the configuration tasks.

Figure 1. Sequence of Tasks to Configure Load Balancing

**Enable load balancing**

Before configuring load balancing, make sure that the load balancing feature is enabled.

**To enable load balancing by using the CLI**

At the command prompt, type the following commands to enable load balancing and verify that it is enabled:

- `enable feature lb`
- `show feature`

Configure services and a virtual server

When you have identified the services you want to load balance, you can implement your initial load balancing configuration by creating the service objects, creating a load balancing virtual server, and binding the service objects to the virtual server.

To implement the initial load balancing configuration by using the CLI

At the command prompt, type the following commands to implement and verify the initial configuration:

- `<add service <name> <IPaddress> <serviceType> <port>`
- `<add lb vserver <vServerName> <serviceType> [<IPaddress> <port>]`
- `<bind lb vserver <name> <serviceName>`
- `<show service bindings <serviceName>`

**Example**

```
1> add service service-HTTP-1 10.102.29.5 HTTP 80
Done
2> add lb vserver vserver-LB-1 HTTP 10.102.29.60 80
Done
3> bind lb vserver vserver-LB-1 service-HTTP-1
Done
4> show service bindings service-HTTP-1
   service-HTTP-1 (10.102.29.5:80) - State : DOWN
5
6> show service bindings vserver-LB-1
   vserver-LB-1 (10.102.29.60:80) - State : DOWN
7
8> show service bindings service-HTTP-1
   service-HTTP-1 (10.102.29.5:80) - State : DOWN
9
10> show service bindings vserver-LB-1
   vserver-LB-1 (10.102.29.60:80) - State : DOWN
11
```

To implement the initial load balancing configuration by using the GUI

1. Navigate to Traffic Management > Load Balancing.
2. In the details pane, under Getting Started, click Load Balancing wizard, and follow the instructions to create a basic load balancing setup.
3. Return to the navigation pane, expand Load Balancing, and then click Virtual Servers.
4. Select the virtual server that you configured and verify that the parameters displayed at the bottom of the page are correctly configured.
5. Click Open.
6. Verify that each service is bound to the virtual server by confirming that the Active check box is selected for each service on the Services tab.
Persistence settings

November 14, 2018

You must configure persistence on a virtual server if you want to maintain the states of connections on the servers represented by that virtual server (for example, connections used in e-commerce). The appliance then uses the configured load balancing method for the initial selection of a server, but forwards to that same server all subsequent requests from the same client.

If persistence is configured, it overrides the load balancing methods once the server has been selected. If the configured persistence applies to a service that is down, the appliance uses the load balancing methods to select a new service, and the new service becomes persistent for subsequent requests from the client. If the selected service is in an Out Of Service state, it continues to serve the outstanding requests but does not accept new requests or connections. After the shutdown period elapses, the existing connections are closed. The following table lists the types of persistence that you can configure.

<table>
<thead>
<tr>
<th>Persistence Type</th>
<th>Persistent Connections</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source IP, SSL Session ID, Rule, DESTIP, SRCIPDESTIP</td>
<td>250K</td>
</tr>
<tr>
<td>CookieInsert, URL passive, Custom Server ID</td>
<td>Memory limit. In case of CookieInsert, if time out is not 0, any number of connections is allowed until limited by memory.</td>
</tr>
</tbody>
</table>

Table 1. Limitations on Number of Simultaneous Persistent Connections

If the configured persistence cannot be maintained because of a lack of resources on an appliance, the load balancing methods are used for server selection. Persistence is maintained for a configured period of time, depending on the persistence type. Some persistence types are specific to certain virtual servers. The following table shows the relationship.

<table>
<thead>
<tr>
<th>Persistence Type</th>
<th>HTTP</th>
<th>HTTPS</th>
<th>TCP</th>
<th>UDP/IP</th>
<th>SSL_Bridge</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source IP</td>
<td>YES</td>
<td>YES</td>
<td>YES</td>
<td>YES</td>
<td>YES</td>
</tr>
<tr>
<td>CookieInsert</td>
<td>YES</td>
<td>YES</td>
<td>NO</td>
<td>NO</td>
<td>NO</td>
</tr>
<tr>
<td>SSL Session ID</td>
<td>NO</td>
<td>YES</td>
<td>NO</td>
<td>NO</td>
<td>YES</td>
</tr>
<tr>
<td>URL Passive</td>
<td>YES</td>
<td>YES</td>
<td>NO</td>
<td>NO</td>
<td>NO</td>
</tr>
</tbody>
</table>
Table 2. Persistence Types Available for Each Type of Virtual Server

You can also specify persistence for a group of virtual servers. When you enable persistence on the group, the client requests are directed to the same selected server regardless of which virtual server in the group receives the client request. When the configured time for persistence elapses, any virtual server in the group can be selected for incoming client requests.

Two commonly used persistence types are persistence based on cookies and persistence based on server IDs in URLs.

**Configure persistence based on cookies**

When you enable persistence based on cookies, the NetScaler appliance adds an HTTP cookie into the Set-Cookie header field of the HTTP response. The cookie contains information about the service to which the HTTP requests must be sent. The client stores the cookie and includes it in all subsequent requests, and the ADC uses it to select the service for those requests. You can use this type of persistence on virtual servers of type HTTP or HTTPS.

The NetScaler appliance inserts the cookie `<NSC_XXXX> = <ServiceIP> <ServicePort>` where:

- `<NSC_XXXX>` is the virtual server ID that is derived from the virtual server name.
- `<ServiceIP>` is the hexadecimal value of the IP address of the service.
- `<ServicePort>` is the hexadecimal value of the port of the service.

The ADC encrypts ServiceIP and ServicePort when it inserts a cookie, and decrypts them when it receives a cookie.

**Note:** If the client is not allowed to store the HTTP cookie, the subsequent requests do not have the HTTP cookie, and persistence is not honored.

By default, the ADC appliance sends HTTP cookie version 0, in compliance with the Netscape specification. It can also send version 1, in compliance with RFC 2109.
You can configure a timeout value for persistence that is based on HTTP cookies. Note the following:

- If HTTP cookie version 0 is used, the NetScaler appliance inserts the absolute Coordinated Universal Time (GMT) of the cookie’s expiration (the expires attribute of the HTTP cookie), calculated as the sum of the current GMT time on an ADC appliance, and the timeout value.
- If an HTTP cookie version 1 is used, the ADC appliance inserts a relative expiration time (Max-Age attribute of the HTTP cookie). In this case, the client software calculates the actual expiration time.

Note: Most client software currently installed (Microsoft Internet Explorer and Netscape browsers) understand HTTP cookie version 0; however, some HTTP proxies understand HTTP cookie version 1.

If you set the timeout value to 0, the ADC appliance does not specify the expiration time, regardless of the HTTP cookie version used. The expiration time then depends on the client software, and such cookies are not valid if that software is shut down. This persistence type does not consume any system resources. Therefore, it can accommodate an unlimited number of persistent clients.

An administrator can change the HTTP cookie version.

**To change the HTTP cookie version by using the CLI**

At the command prompt, type;

```
set ns param [-cookieversion ( 0 | 1 )]
```

**Example:**

```
set ns param -cookieversion 1
```

**To change the HTTP cookie version by using the GUI**

1. Navigate to System > Settings.
2. <In the details pane, click Change HTTP Parameters.
3. <In the Configure HTTP Parameters dialog box, under Cookie, select Version 0 or Version 1.

Note: For information about the parameters, see Configuring Persistence Based on Cookies.

**To configure persistence based on cookies by using the CLI**

At the command prompt, type the following commands to configure persistence based on cookies and verify the configuration:
To configure persistence based on cookies by using the GUI

2. In the details pane, select the virtual server for which you want to configure persistence (for example, vserver-LB-1), and then click Open.
3. In the Configure Virtual Server (Load Balancing) dialog box, on the Method and Persistence tab, in the Persistence list, select COOKIEINSERT.
4. In the Time-out (min) text box, type the time-out value (for example, 2).
5. Click OK.
6. Verify that the virtual server for which you configured persistence is correctly configured by selecting the virtual server and viewing the Details section at the bottom of the pane.

Configure persistence based on server IDs in URLs

The NetScaler appliance can maintain persistence based on the server IDs in the URLs. In a technique called URL passive persistence, the ADC extracts the server ID from the server response and embeds it in the URL query of the client request. The server ID is an IP address and port specified as a hexadecimal number. The ADC extracts the server ID from subsequent client requests and uses it to select the server.
URL passive persistence requires configuring either a payload expression or a policy infrastructure expression specifying the location of the server ID in the client requests. For more information about expressions, see “Policy Configuration and Reference.”

Note: If the server ID cannot be extracted from the client requests, server selection is based on the load balancing method.

Example: Payload Expression

The expression, URLQUERY contains sid= configures the system to extract the server ID from the URL query of a client request, after matching token sid=. Thus, a request with the URL http://www.citrix.com/index.asp?\&sid;=c0a864100050 is directed to the server with the IP address 10.102.29.10 and port 80.

The timeout value does not affect this type of persistence, which is maintained as long as the server ID can be extracted from the client requests. This persistence type does not consume any system resources, so it can accommodate an unlimited number of persistent clients.

Note: For information about the parameters, see Load Balancing.

To configure persistence based on server IDs in URLs by using the CLI

At the command prompt, type the following commands to configure persistence based on server IDs in URLs and verify the configuration:

```
1. set lb vserver <name> -persistenceType URLPASSIVE
2. show lb vserver <name>
```

Example:

```
1. set lb vserver vserver-LB-1 -persistenceType URLPASSIVE
2. Done
3. show lb vserver vserver-LB-1
4. vserver-LB-1 (10.102.29.60:80) - HTTP  Type: ADDRESS
5. .
6. .
7. .
8. Persistence: URLPASSIVE
9. Persistence Timeout: 2 min
10. .
11. .
12. .
13. Done
```
To configure persistence based on server IDs in URLs by using the GUI

2. In the details pane, select the virtual server for which you want to configure persistence (for example, vserver-LB-1), and then click Open.
3. In the Configure Virtual Server (Load Balancing) dialog box, on the Method and Persistence tab, in the Persistence list, select URLPASSIVE.
4. In the Time-out (min) text box, type the time-out value (for example, 2).
5. In the Rule text box, enter a valid expression. Alternatively, click Configure next to the Rule text box and use the Create Expression dialog box to create an expression.
6. Click OK.
7. Verify that the virtual server for which you configured persistence is correctly configured by selecting the virtual server and viewing the Details section at the bottom of the pane.

Configure features to protect the load balancing configuration

September 24, 2018

You can configure URL redirection to provide notifications of virtual server malfunctions, and you can configure backup virtual servers to take over if a primary virtual server becomes unavailable.

Configure URL redirection

You can configure a redirect URL to communicate the status of the appliance in the event that a virtual server of type HTTP or HTTPS is down or disabled. This URL can be a local or remote link. The appliance uses HTTP 302 redirect.

Redirects can be absolute URLs or relative URLs. If the configured redirect URL contains an absolute URL, the HTTP redirect is sent to the configured location, regardless of the URL specified in the incoming HTTP request. If the configured redirect URL contains only the domain name (relative URL), the HTTP redirect is sent to a location after appending the incoming URL to the domain configured in the redirect URL.

Note: If a load balancing virtual server is configured with both a backup virtual server and a redirect URL, the backup virtual server takes precedence over the redirect URL. In this case, a redirect is used when both the primary and backup virtual servers are down.

To configure a virtual server to redirect client requests to a URL by using the CLI

At the command prompt, type the following commands to configure a virtual server to redirect client requests to a URL and verify the configuration:
To configure a virtual server to redirect client requests to a URL by using the GUI

2. <In the details pane, select the virtual server for which you want to configure URL redirection (for example, vserver-LB-1), and then click Open.
3. <In the Configure Virtual Server (Load Balancing) dialog box, on the Advanced tab, in the Redirect URL text box, type the URL (for example, http://www.newdomain.com/mysite/maintenance), and then click OK.
4. <Verify that the redirect URL you configured for the server appears in the Details section at the bottom of the pane.

Configure backup virtual servers

If the primary virtual server is down or disabled, the appliance can direct the connections or client requests to a backup virtual server that forwards the client traffic to the services. The appliance can also send a notification message to the client regarding the site outage or maintenance. The backup virtual server is a proxy and is transparent to the client.
You can configure a backup virtual server when you create a virtual server or when you change the optional parameters of an existing virtual server. You can also configure a backup virtual server for an existing backup virtual server, thus creating a cascaded backup virtual server. The maximum depth of cascading backup virtual servers is 10. The appliance searches for a backup virtual server that is up and accesses that virtual server to deliver the content.

You can configure URL redirection on the primary for use when the primary and the backup virtual servers are down or have reached their thresholds for handling requests.

Note: If no backup virtual server exists, an error message appears, unless the virtual server is configured with a redirect URL. If both a backup virtual server and a redirect URL are configured, the backup virtual server takes precedence.

To configure a backup virtual server by using the CLI

At the command prompt, type the following commands to configure a backup server and verify the configuration:

- `<set lb vserver <name> [-backupVserver <string>]`
- `<show lb vserver <name>`

Example

```
set lb vserver vserver-LB-1 -backupVserver vserver-LB-2
Done
show lb vserver vserver-LB-1
vserver-LB-1 (10.102.29.60:80) - HTTP Type: ADDRESS
State: DOWN
Last state change was at Wed Jun 17 08:56:34 2009 (+661 ms)
```

Backup: vserver-LB-2

```
Done
```

To set up a backup virtual server by using the GUI

2. In the details pane, select the virtual server for which you want to configure the backup virtual server (for example, vserver-LB-1), and then click Open.
3. In the Configure Virtual Server (Load Balancing) dialog box, on the Advanced tab, in the Backup Virtual Server list, select the backup virtual server (for example, vserver-LB-2, and then click OK.
4. Verify that the backup virtual server you configured appears in the Details section at the bottom of the pane.
   Note: If the primary server goes down and then comes back up, and you want the backup virtual server to function as the primary server until you explicitly reestablish the primary virtual server, select the Disable Primary When Down check box.

A typical load balancing scenario

January 6, 2019

In a load balancing setup, the NetScaler appliances are logically located between the client and the server farm, and they manage traffic flow to the servers.

The following figure shows the topology of a basic load balancing configuration.

Figure 1. Basic Load Balancing Topology

The virtual server selects the service and assigns it to serve client requests. Consider the scenario in the preceding figure, where the services service-HTTP-1 and service-HTTP-2 are created and bound to the virtual server named virtual server-LB-1. Virtual server-LB-1 forwards the client request to either service-HTTP-1 or service-HTTP-2. The system selects the service for each request by using the Least Connections load balancing method. The following table lists the names and values of the basic entities that must be configured on the system.

Table 1. LB Configuration Parameter Values

The following figure shows the load balancing sample values and required parameters that are described in the preceding table.

Figure 2. Load Balancing Entity Model

The following tables list the commands used to configure this load balancing setup by using the command line interface.
NetScaler 12.0

Table 2. Initial Configuration Tasks
For more information about the initial configuration tasks, see Setting Up Basic Load Balancing.

<table>
<thead>

To configure persistence on a virtual server named vserver-LB-1

set lb vserver vserver-LB-1 -persistenceType SOURCEIP -persistenceMask 255.255.255.255 -timeout 2

© 1999-2018 Citrix Systems, Inc. All rights reserved.
NetScaler 12.0

Task | Command
--- | ---
To configure COOKIEINSERT persistence on a virtual server named vserver-LB-1 | set lb vserver vserver-LB-1 -persistenceType COOKIEINSERT
To configure URLPassive persistence on a virtual server named vserver-LB-1 | set lb vserver vserver-LB-1 -persistenceType URLPASSIVE
To configure a virtual server to redirect the client request to a URL on a virtual server named vserver-LB-1 | set lb vserver vserver-LB-1 -redirectURL http://www.newdomain.com/mysite/maintenance
To set a backup virtual server on a virtual server named vserver-LB-1 | set lb vserver vserver-LB-1 -backupVserver vserver-LB-2

Table 4. Customization Tasks

For more information about configuring persistence, see Choosing and Configuring Persistence Settings. For information about configuring a virtual server to redirect a client request to a URL and setting up a backup virtual server, see Configuring Features to Protect the Load Balancing Configuration.

Accelerate load balanced traffic by using compression

January 6, 2019

Compression is a popular means of optimizing bandwidth usage, and most web browsers support compressed data. If you enable the compression feature, the NetScaler appliance intercepts requests from clients and determines whether the client can accept compressed content. After receiving the HTTP response from the server, the appliance examines the content to determine whether it is compressible. If the content is compressible, the appliance compresses it, modifies the response header to indicate the type of compression performed, and forwards the compressed content to the client.

NetScaler compression is a policy-based feature. A policy filters requests and responses to identify responses to be compressed, and specifies the type of compression to apply to each response. The appliance provides several built-in policies to compress common MIME types such as text/html, text/plain, text/xml, text/css, text/rtf, application/msword, application/vnd.ms-excel, and application/vnd.ms-powerpoint. You can also create custom policies. The appliance does not compress compressed MIME types such as application/octet-stream, binary, bytes, and compressed image formats such as GIF and JPEG.

To configure compression, you must enable it globally and on each service that will provide responses that you want compressed. If you have configured virtual servers for load balancing or content switch-
ing, you should bind the polices to the virtual servers. Otherwise, the policies apply to all traffic that passes through the appliance.

**Compression configuration task sequence**

The following flow chart shows the sequence of tasks for configuring basic compression in a load balancing setup.

Figure 1. Sequence of Tasks to Configure Compression

| Note: The steps in the above figure assume that load balancing has already been configured.

**Enable compression**

By default, compression is not enabled. You must enable the compression feature to allow compression of HTTP responses that are sent to the client.

**To enable compression by using the CLI**

At the command prompt, type the following commands to enable compression and verify the configuration:

- enable ns feature CMP
- show ns feature

```
> enable ns feature CMP

> show ns feature

<table>
<thead>
<tr>
<th>Feature</th>
<th>Acronym</th>

<tr>
<td>7</td>
<td>Compression Control</td>
<td>CMP</td>
<td>ON</td>
</tr>
<tr>
<td>8</td>
<td>Priority Queuing</td>
<td>PQ</td>
<td>OFF</td>
</tr>
</tbody>
</table>

**To enable compression by using the GUI**

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Modes and Features, click Change basic features.
3. In the Configure Basic Features dialog box, select the Compression check box, and then click OK.
4. In the Enable/Disable Feature(s)? dialog box, click Yes.

**Configure services to compress data**

In addition to enabling compression globally, you must enable it on each service that will deliver files to be compressed.

**To enable compression on a service by using the CLI**

At the command prompt, type the following commands to enable compression on a service and verify the configuration:

- `set service <name> -CMP YES`
- `show service <name>`
> show service SVC_HTTP1

SVC_HTTP1 (10.102.29.18:80) - HTTP

State: UP

Last state change was at Tue Jun 16 06:19:14 2009 (+737 ms)

Time since last state change: 0 days, 03:03:37.200

Server Name: 10.102.29.18

Server ID : 0  Monitor Threshold : 0

Max Conn: 0  Max Req: 0  Max Bandwidth: 0 kbits

Use Source IP: NO

Client Keepalive(CKA): NO

Access Down Service: NO

TCP Buffering(TCPB): NO

HTTP Compression(CMP): YES

Idle timeout: Client: 180 sec  Server: 360 sec

Client IP: DISABLED
Cacheable: NO
SC: OFF
SP: OFF
Down state flush: ENABLED

1) Monitor Name: tcp-default

State: DOWN  Weight: 1

Probes: 1095  Failed [Total: 1095 Current: 1095]

Last response: Failure - TCP syn sent, reset received.

Response Time: N/A

Done

To enable compression on a service by using the GUI

1. Navigate to Traffic Management > Load Balancing > Services.
2. In the details pane, select the service for which you want to configure compression (for example, service-HTTP-1), and then click Open.
3. On the Advanced tab, under Settings, select the Compression check box, and then click OK.
4. Verify that, when the service is selected, HTTP Compression(CMP): ON appears in the Details section at the bottom of the pane.
Bind a compression policy to a virtual server

If you bind a policy to a virtual server, the policy is evaluated only by the services associated with that virtual server. You can bind compression policies to a virtual server either from the Configure Virtual Server (Load Balancing) dialog box or from the Compression Policy Manager dialog box. This topic includes instructions to bind compression policies to a load balancing virtual server by using the Configure Virtual Server (Load Balancing) dialog box. For information about how you can bind a compression policy to a load balancing virtual server by using the Compression Policy Manager dialog box, see Configuring and Binding Policies with the Policy Manager.

To bind or unbind a compression policy to a virtual server by using the command line

At the command prompt, type the following commands to bind or unbind a compression policy to a load balancing virtual server and verify the configuration:

```
(bind) lb vserver <name> -policyName <string>
```

•
• show lb vserver <name>

Example:

```
1   bind lb vserver lbvip -policyName ns_cmp_msapp
2   Done
3   > show lb vserver lbvip
4   lbvip (8.7.6.6:80) - HTTP Type: ADDRESS
5   State: UP
6   Last state change was at Thu May 28 05:37:21 2009 (+685 ms)
7   Time since last state change: 19 days, 04:26:50.470
8   Effective State: UP
9   Client Idle Timeout: 180 sec
10  Down state flush: ENABLED
11  Disable Primary Vserver On Down : DISABLED
12  Port Rewrite : DISABLED
13  No. of Bound Services : 1 (Total) 1 (Active)
14  Configured Method: LEASTCONNECTION
15  Current Method: Round Robin, Reason: Bound service’s state changed to UP
16  Mode: IP
17  Persistence: NONE
18  Vserver IP and Port insertion: OFF
```
To bind or unbind a compression policy to a load balancing virtual server by using the GUI

2. In the details pane, select the virtual server to which you want to bind or unbind a compression policy (for example, Vserver-LB-1), and then click Open.
3. In the Configure Virtual Server (Load Balancing) dialog box, on the Policies tab, click Compression.
4. Do one of the following:
   • To bind a compression policy, click Insert Policy, and then select the policy you want to bind to the virtual server.
   • To unbind a compression policy, click the name of the policy you want to unbind from the virtual server, and then click Unbind Policy.
5. Click OK.

Secure load balanced traffic by using SSL

January 6, 2019

The NetScaler SSL offload feature transparently improves the performance of web sites that conduct SSL transactions. By offloading CPU-intensive SSL encryption and decryption tasks from the local web server to the appliance, SSL offloading ensures secure delivery of web applications without the performance penalty incurred when the server processes the SSL data. Once the SSL traffic is decrypted, it can be processed by all standard services. The SSL protocol works seamlessly with various types of HTTP and TCP data and provides a secure channel for transactions using such data.

To configure SSL, you must first enable it. Then, you configure HTTP or TCP services and an SSL virtual server on the appliance, and bind the services to the virtual server. You must also add a certificate-key pair and bind it to the SSL virtual server. If you use Outlook Web Access servers, you must create
an action to enable SSL support and a policy to apply the action. An SSL virtual server intercepts incoming encrypted traffic and decrypts it by using a negotiated algorithm. The SSL virtual server then forwards the decrypted data to the other entities on the appliance for appropriate processing.

For detailed information about SSL offloading, see SSL offload and acceleration.

**SSL configuration task sequence**

To configure SSL, you must first enable it. Then, you must create an SSL virtual server and HTTP or TCP services on the NetScaler appliance. Finally, you must bind a valid SSL certificate and the configured services to the SSL virtual server.

An SSL virtual server intercepts incoming encrypted traffic and decrypts it using a negotiated algorithm. The SSL virtual server then forwards the decrypted data to the other entities on the NetScaler appliance for appropriate processing.

The following flow chart shows the sequence of tasks for configuring a basic SSL offload setup.

**Enable SSL offload**

You should enable the SSL feature before configuring SSL offload. You can configure SSL-based entities on the appliance without enabling the SSL feature, but they will not work until you enable SSL.

**Enable SSL by using the CLI**

At the command prompt, type the following commands to enable SSL Offload and verify the configuration:

- `enable ns feature SSL`
- `show ns feature`

```
> enable ns feature ssl

Done

> show ns feature
```

</tr>
</tbody>
</table>

---

**Enable SSL by using the GUI**

Follow these steps:

1. In the navigation pane, expand System, and then click Settings.
2. In the details pane, under Modes and Features, click Change basic features.
3. Select the SSL Offloading check box, and then click OK.
4. In the Enable/Disable Feature(s)? message box, click Yes.

**Create HTTP services**

A service on the appliance represents an application on a server. Once configured, services are in the disabled state until the appliance can reach the server on the network and monitor its status. This topic covers the steps to create an HTTP service.

Note: For TCP traffic, perform the procedures in this and the following topics, but create TCP services instead of HTTP services.
Add an HTTP service by using the CLI

At the command prompt, type the following commands to add a HTTP service and verify the configuration:

```
add service <name> (<IP>) <servername> <servicetype> <port>
```

•

• `show service <name>`

**Example:**

```
> add service SVC_HTTP1 10.102.29.18 HTTP 80

Done

> show service SVC_HTTP1

SVC_HTTP1 (10.102.29.18:80) - HTTP

State: UP

Last state change was at Wed Jul 15 06:13:05 2009

Time since last state change: 0 days, 00:00:15.350

Server Name: 10.102.29.18

Server ID: 0 Monitor Threshold: 0

Max Conn: 0 Max Req: 0 Max Bandwidth: 0 kbits

Use Source IP: NO
```
Client Keepalive (CKA): NO

Access Down Service: NO

TCP Buffering (TCPB): NO

HTTP Compression (CMP): YES

Idle timeout: Client: 180 sec Server: 360 sec

Client IP: DISABLED

Cacheable: NO

SC: OFF

SP: OFF

Down state flush: Enabled

1) Monitor Name: tcp-default

State: UP Weight: 1

Probes: 4 Failed [Total: 0 Current: 0]

Last response: Success - TCP syn+ack received.
Add an HTTP service by using the GUI

Follow these steps:

1. Navigate to Traffic Management > SSL Offload > Services.
2. In details pane, click Add.
3. In the Create Service dialog box, in the Service Name, Server, and Port text boxes, type the name of the service, IP address, and port (for example, SVC_HTTP1, 10.102.29.18, and 80).
4. In the Protocol list, select the type of the service (for example, HTTP).
5. Click Create, and then click Close. The HTTP service you configured appears in the Services page.
6. Verify that the parameters you configured are correctly configured by selecting the service and viewing the Details section at the bottom of the pane.

Add an SSL based virtual server

In a basic SSL offloading setup, the SSL virtual server intercepts encrypted traffic, decrypts it, and sends the clear text messages to the services that are bound to the virtual server. Offloading CPU-intensive SSL processing to the appliance allows the back-end servers to process a greater number of requests.

Add an SSL-based virtual server by using the CLI

At the command prompt, type the following commands to create an SSL-based virtual server and verify the configuration:

```
• add lb vserver <name> <serviceType> [<IPAddress> <port>]
• show lb vserver <name>
```

Caution: To ensure secure connections, you must bind a valid SSL certificate to the SSL-based virtual server before you enable it.

Example:

```
1 > add lb vserver vserver-SSL-1 SSL 10.102.29.50 443
2```

© 1999-2018 Citrix Systems, Inc. All rights reserved.
Done

> show lb vserver vserver-SSL-1

vserver-SSL-1 (10.102.29.50:443) - SSL Type: ADDRESS

State: DOWN[Certkey not bound] Last state change was at Tue Jun 16 06:33:08 2009 (+176 ms)

Time since last state change: 0 days, 00:03:44.120

Effective State: DOWN Client Idle Timeout: 180 sec

Down state flush: ENABLED

Disable Primary Vserver On Down : DISABLED

No. of Bound Services : 0 (Total) 0 (Active)

Configured Method: LEASTCONNECTION Mode: IP

Persistence: NONE

Vserver IP and Port insertion: OFF

Done
Add an SSL-based virtual server by using the GUI

Follow these steps:

1. Navigate to Traffic Management > SSL Offload > Virtual Servers.
2. In the details pane, click Add.
3. In the Create Virtual Server (SSL Offload) dialog box, in the Name, IP Address, and Port text boxes, type the name of the virtual server, IP address, and port (for example, Vserver-SSL-1, 10.102.29.50, and 443).
4. In the Protocol list, select the type of the virtual server, for example, SSL.
5. Click Create, and then click Close.
6. Verify that the parameters you configured are correctly configured by selecting the virtual server and viewing the Details section at the bottom of the pane. The virtual server is marked as DOWN because a certificate-key pair and services have not been bound to it.

Caution: To ensure secure connections, you must bind a valid SSL certificate to the SSL-based virtual server before you enable it.

Bind services to the SSL virtual server

After decrypting the incoming data, the SSL virtual server forwards the data to the services that you have bound to the virtual server.

Data transfer between the appliance and the servers can be encrypted or in clear text. If the data transfer between the appliance and the servers is encrypted, the entire transaction is secure from end to end. For more information about configuring the system for end-to-end security, see SSL offload and acceleration.

Bind a service to a virtual server by using the CLI

At the command prompt, type the following commands to bind service to the SSL virtual server and verify the configuration:

- bind lb vserver <name> <serviceName>
- show lb vserver <name>

Example:

```
1 > bind lb vserver vserver-SSL-1 SVC_HTTP1
```

© 1999-2018 Citrix Systems, Inc. All rights reserved.
Done

> show lb vserver vserver-SSL-1 vserver-SSL-1 (10.102.29.50:443) -

SSL Type:

ADDRESS State: DOWN[Certkey not bound]

Last state change was at Tue Jun 16 06:33:08 2009 (+174 ms)

Time since last state change: 0 days, 00:31:53.70

Effective State: DOWN Client Idle

Timeout: 180 sec

Down state flush: ENABLED Disable Primary Vserver On Down:

DISABLED No. of Bound Services : 1 (Total) 0 (Active)

Configured Method: LEASTCONNECTION Mode: IP Persistence: NONE Vserver IP and

Port insertion: OFF Push: DISABLED Push VServer: Push Multi Clients: NO Push Label Rule:

1) SVC_HTTP1 (10.102.29.18: 80) - HTTP

State: DOWN Weight: 1
Bind a service to a virtual server by using the GUI

1. Navigate to Traffic Management > SSL Offload > Virtual Servers.
2. In the details pane, select a virtual server, and then click Open.
3. On the Services tab, in the Active column, select the check boxes next to the services that you want to bind to the selected virtual server.
4. Click OK.
5. Verify that the Number of Bound Services counter in the Details section at the bottom of the pane is incremented by the number of services that you bound to the virtual server.

Add a certificate key pair

An SSL certificate is an integral element of the SSL Key-Exchange and encryption/decryption process. The certificate is used during SSL handshake to establish the identity of the SSL server. You can use a valid, existing SSL certificate that you have on the NetScaler appliance, or you can create your own SSL certificate. The appliance supports RSA/DSA certificates of up to 4096 bits.

Note: Citrix recommends that you use a valid SSL certificate that has been issued by a trusted certificate authority. Invalid certificates and self-created certificates are not compatible with all SSL clients.

Before a certificate can be used for SSL processing, you must pair it with its corresponding key. The certificate key pair is then bound to the virtual server and used for SSL processing.

Add a certificate key pair by using the CLI

At the command prompt, type the following commands to create a certificate key pair and verify the configuration:

- `add ssl certKey <certkeyName> -cert <string> [-key <string>]`
- `show sslcertkey <name>`

Example:

```
1 > add ssl certKey CertKey-SSL-1 -cert ns-root.cert -key ns-root.key
2
3
4
5
6 Done
```
Add a certificate key pair by using the GUI

Follow these steps:

1. Navigate to Traffic Management > SSL > Certificates.
2. In the details pane, click Add.
3. In the Install Certificate dialog box, in the Certificate-Key Pair Name text box, type a name for the certificate key pair you want to add, for example, Certkey-SSL-1.
4. Under Details, in Certificate File Name, click Browse (Appliance) to locate the certificate. Both
the certificate and the key are stored in the /nsconfig/ssl/ folder on the appliance. To use a certificate present on the local system, select Local.

5. Select the certificate you want to use, and then click Select.
6. In Private Key File Name, click Browse (Appliance) to locate the private key file. To use a private key present on the local system, select Local.
7. Select the key you want to use and click Select. To encrypt the key used in the certificate key pair, type the password to be used for encryption in the Password text box.
8. Click Install.
9. Double-click the certificate key pair and, in the Certificate Details window, verify that the parameters have been configured correctly and saved.

**Bind an SSL certificate key pair to the virtual server**

After you have paired an SSL certificate with its corresponding key, you must bind the certificate key pair to the SSL virtual server so that it can be used for SSL processing. Secure sessions require establishing a connection between the client computer and an SSL-based virtual server on the appliance. SSL processing is then carried out on the incoming traffic at the virtual server. Therefore, before enabling the SSL virtual server on the appliance, you need to bind a valid SSL certificate to the SSL virtual server.

**Bind an SSL certificate key pair to a virtual server by using the CLI**

At the command prompt, type the following commands to bind an SSL certificate key pair to a virtual server and verify the configuration:

- bind ssl vserver <vServerName> -certkeyName <string>
- show ssl vserver <name>

**Example:**

```
> bind ssl vserver Vserver-SSL-1 -certkeyName CertKey-SSL-1

Done

> show ssl vserver Vserver-SSL-1
```
Advanced SSL configuration for VServer Vserver-SSL-1:

DH: DISABLED

Ephemeral RSA: ENABLED Refresh Count: 0

Session Reuse: ENABLED Timeout: 120 seconds

Cipher Redirect: ENABLED

SSLv2 Redirect: ENABLED

ClearText Port: 0

Client Auth: DISABLED

SSL Redirect: DISABLED

Non FIPS Ciphers: DISABLED

SSLv2: DISABLED SSLv3: ENABLED TLSv1: ENABLED

1) CertKey Name: CertKey-SSL-1 Server Certificate

1) Cipher Name: DEFAULT

Description: Predefined Cipher Alias
Bind an SSL certificate key pair to a virtual server by using the GUI

Follow these steps:

1. Navigate to Traffic Management > SSL Offload > Virtual Servers.
2. Select the virtual server to which you want to bind the certificate key pair, for example, Vserver-SSL-1, and click Open.
3. In the Configure Virtual Server (SSL Offload) dialog box, on the SSL Settings tab, under Available, select the certificate key pair that you want to bind to the virtual server (for example, Certkey-SSL-1), and then click Add.
4. Click OK.
5. Verify that the certificate key pair that you selected appears in the Configured area.

Configure support for Outlook web access

If you use Outlook Web Access (OWA) servers on your NetScaler appliance, you must configure the appliance to insert a special header field, FRONT-END-HTTPS: ON, in HTTP requests directed to the OWA servers, so that the servers generate URL links as https:// instead of http://.

Note: You can enable OWA support for HTTP-based SSL virtual servers and services only. You cannot apply it for TCP-based SSL virtual servers and services.

To configure OWA support, do the following:

- Create an SSL action to enable OWA support.
- Create an SSL policy.
- Bind the policy to the SSL virtual server.

Create an SSL action to enable OWA support

Before you can enable Outlook Web Access (OWA) support, you must create an SSL action. SSL actions are bound to SSL policies and triggered when incoming data matches the rule specified by the policy.

Create an SSL action to enable OWA support by using the CLI

At the command prompt, type the following commands to create an SSL action to enable OWA support and verify the configuration:
Create an SSL action to enable OWA support by using the GUI

Follow these steps:

1. Navigate to Traffic Management > SSL > Policies.
2. In the details pane, on the Actions tab, click Add.
3. In the Create SSL Action dialog box, in the Name text box, type Action-SSL-OWA.
5. Click Create, and then click Close.
6. Verify that Action-SSL-OWA appears in the SSL Actions page.

Create SSL policies

SSL policies are created by using the policy infrastructure. Each SSL policy has an SSL action bound to it, and the action is carried out when incoming traffic matches the rule that has been configured in the policy.
Create an SSL policy by using the CLI

At the command prompt, type the following commands to configure an SSL policy and verify the configuration:

- `add ssl policy <name> -rule <expression> -reqAction <string>`
- `show ssl policy <name>`

**Example:**

```
1 > add ssl policy Policy-SSL-1 -rule ns_true -reqaction Action-SSL-OWA
2 Done
3
5 > show ssl policy Policy-SSL-1
6 Name: Policy-SSL-1 Rule: ns_true
7 Action: Action-SSL-OWA Hits: 0
9 Policy is bound to following entities
11 1) PRIORITY : 0
13 Done
```

Create an SSL policy by using the GUI

Follow these steps:

1. Navigate to Traffic Management > SSL > Policies.
2. In the details pane, click Add.
3. In the Create SSL Policy dialog box, in the Name text box, type the name of the SSL Policy (for example, Policy-SSL-1).
4. In Request Action, select the configured SSL action that you want to associate with this policy (for example, Action-SSL-OWA). The ns_true general expression applies the policy to all successful SSL handshake traffic. However, if you need to filter specific responses, you can create policies with a higher level of detail. For more information about configuring granular policy expressions, see [SSL actions and policies](/en-us/netscaler/12/ssl/ssl-actions-and-policies.html).
5. In Named Expressions, choose the built-in general expression ns_true and click Add Expression. The expression ns_true now appears in the Expression text box.
6. Click Create, and then click Close.
7. Verify that the policy is correctly configured by selecting the policy and viewing the Details section at the bottom of the pane.

**Bind the SSL policy to the SSL virtual server**

After you configure an SSL policy for Outlook Web Access, bind the policy to a virtual server that will intercept incoming Outlook traffic. If the incoming data matches any of the rules configured in the SSL policy, the policy is triggered and the action associated with it is carried out.

**Bind an SSL policy to an SSL virtual server by using the CLI**

At the command prompt, type the following commands to bind an SSL policy to an SSL virtual server and verify the configuration:

- `bind ssl vserver <vServerName> -policyName <string>`
- `show ssl vserver <name>`

**Example**:

```
> bind ssl vserver Vserver-SSL-1 -policyName Policy-SSL-1
Done
> show ssl vserver Vserver-SSL-1
Advanced SSL configuration for VServer Vserver-SSL-1:
DH: DISABLED
Ephemeral RSA: ENABLED
Refresh Count: 0
Session Reuse: ENABLED
Timeout: 120 seconds
Cipher Redirect: ENABLED
SSLv2 Redirect: ENABLED
ClearText Port: 0
Client Auth: DISABLED
```
Bind an SSL policy to an SSL virtual server by using the GUI

Follow these steps:

1. Navigate to Traffic Management > SSL Offload > Virtual Servers.
2. In the details pane, select the virtual server (for example, Vserver-SSL-1), and then click Open.
3. In the Configure Virtual Server (SSL Offload) dialog box, click Insert Policy, and then select the policy that you want to bind to the SSL virtual server. Optionally, you can double-click the Priority field and type a new priority level.
4. Click OK.

Features at a glance

December 28, 2018

NetScaler features can be configured independently or in combinations to address specific needs. Although some features fit more than one category, the numerous NetScaler features can generally be categorized as application switching and traffic management features, application acceleration features, and application security and firewall features, and an application visibility feature.

To understand the order in which the features perform their processing, see Processing Order of Features section.

Application switching and traffic management features

December 28, 2018
Below are the application switching and traffic management features.

**SSL Offloading**

Transparently offloads SSL encryption and decryption from web servers, freeing server resources to service content requests. SSL places a heavy burden on an application’s performance and can render many optimization measures ineffective. SSL offload and acceleration allow all the benefits of Citrix Request Switching technology to be applied to SSL traffic, ensuring secure delivery of web applications without degrading end-user performance.

For more information, see [SSL offload and acceleration](#).

**Access Control Lists**

Compares incoming packets to Access Control Lists (ACLs). If a packet matches an ACL rule, the action specified in the rule is applied to the packet. Otherwise, the default action (ALLOW) is applied and the packet is processed normally. For the appliance to compare incoming packets to the ACLs, you have to apply the ACLs. All ACLs are enabled by default, but you have to apply them in order for the NetScaler appliance to compare incoming packets against them. If an ACL is not required to be a part of the lookup table, but still needs to be retained in the configuration, it should be disabled before the ACLs are applied. An ADC appliance does not compare incoming packets to disabled ACLs.

For more information, see [Access Control List](#).

**Load Balancing**

Load balancing decisions are based on a variety of algorithms, including round robin, least connections, weighted least bandwidth, weighted least packets, minimum response time, and hashing based on URL, domain source IP, or destination IP. Both the TCP and UDP protocols are supported, so the NetScaler appliance can load balance all traffic that uses those protocols as the underlying carrier (for example, HTTP, HTTPS, UDP, DNS, NNTP, and general firewall traffic). In addition, the ADC appliance can maintain session persistence based on source IP, cookie, server, group, or SSL session. It allows users to apply custom Extended Content Verification (ECV) to servers, caches, firewalls and other infrastructure devices to ensure that these systems are functioning properly and are providing the right content to users. It can also perform health checks using ping, TCP, or HTTP URL, and the user can create monitors based on Perl scripts.

To provide high-scale WAN optimization, the CloudBridge appliances deployed at data centers can be load balanced through NetScaler appliances. The bandwidth and number of concurrent sessions can be improved significantly.

For more information, see [Load Balancing](#).
Traffic Domains

Traffic domains provide a way to create logical ADC partitions within a single NetScaler appliance. They enable you to segment network traffic for different applications. You can use traffic domains to create multiple isolated environments whose resources do not interact with each other. An application belonging to a specific traffic domain communicates only with entities, and processes traffic, within that domain. Traffic belonging to one traffic domain cannot cross the boundary of another traffic domain. Therefore, you can use duplicate IP addresses on the appliance as long as an addresses is not duplicated within the same domain.

For more information, see Traffic Domains.

Network Address Translation

Network address translation (NAT) involves modification of the source and/or destination IP addresses, and/or the TCP/UDP port numbers, of IP packets that pass through the NetScaler appliance. Enabling NAT on the appliance enhances the security of your private network, and protects it from a public network such as the Internet, by modifying your network’s source IP addresses when data passes through the NetScaler appliance.

The NetScaler appliance supports the following types of network address translation:

**INAT**: In Inbound NAT (INAT), an IP address (usually public) configured on the NetScaler appliance listens to connection requests on behalf of a server. For a request packet received by the appliance on a public IP address, the ADC replaces the destination IP address with the private IP address of the server. In other words, the appliance acts as a proxy between clients and the server. INAT configuration involves INAT rules, which define a 1:1 relationship between the IP address on the NetScaler appliance and the IP address of the server.

**RNAT**: In Reverse Network Address Translation (RNAT), for a session initiated by a server, the NetScaler appliance replaces the source IP address in the packets generated by the server with an IP address (type SNIP) configured on the appliance. The appliance thereby prevents exposure of the server’s IP address in any of the packets generated by the server. An RNAT configuration involves an RNAT rule, which specifies a condition. The appliance performs RNAT processing on those packets that match the condition.

**Stateless NAT46 Translation**: Stateless NAT46 enables communication between IPv4 and IPv6 networks, by way of IPv4 to IPv6 packet translation and vice versa, without maintaining any session information on the NetScaler appliance. A stateless NAT46 configuration involves an IPv4-IPv6 INAT rule and an NAT46 IPv6 prefix.

**Stateful NAT64 Translation**: The stateful NAT64 feature enables communication between IPv4 clients and IPv6 servers through IPv6 to IPv4 packet translation, and vice versa, while maintaining session
information on the NetScaler appliance. A stateful NAT64 configuration involves an NAT64 rule and an NAT64 IPv6 prefix.

For more information, see Configuring Network Address Translation.

**Multipath TCP Support**

NetScaler appliances support Multipath TCP (MPTCP). MPTCP is a TCP/IP protocol extension that identifies and uses multiple paths available between hosts to maintain the TCP session. You must enable MPTCP on a TCP profile and bind it to a virtual server. When MPTCP is enabled, the virtual server functions as an MPTCP gateway and converts MPTCP connections with the clients to TCP connections that it maintains with the servers.

For more information, see MPTCP (Multi-Path TCP).

**Content Switching**

Determines the server to which to send the request on the basis of configured content switching policies. Policy rules can be based on the IP address, URL, and HTTP headers. This allows switching decisions to be based on user and device characteristics such as who the user is, what type of agent is being used, and what content the user requested.

For more information, see Content Switching.

**Global Server Load Balancing (GSLB)**

Extends the traffic management capabilities of a NetScaler to include distributed Internet sites and global enterprises. Whether installations are spread across multiple network locations or multiple clusters in a single location, the NetScaler maintains availability and distributes traffic across them. It makes intelligent DNS decisions to prevent users from being sent to a site that is down or overloaded. When the proximity-based GSLB method is enabled, the NetScaler can make load balancing decisions based on the proximity of the client’s local DNS server (LDNS) in relation to different sites. The main benefit of the proximity-based GSLB method is faster response time resulting from the selection of the closest available site.

For more information, see Global Server Load Balancing.

**Dynamic Routing**

Enables routers to obtain topology information, routes, and IP addresses from neighboring routers automatically. When dynamic routing is enabled, the corresponding routing process listens to route
updates and advertises routes. The routing processes can also be placed in passive mode. Routing protocols enable an upstream router to load balance traffic to identical virtual servers hosted on two standalone NetScaler units using the Equal Cost Multipath technique.

For more information, see Configuring Dynamic Routes.

**Link Load Balancing**

Load balances multiple WAN links and provides link failover, further optimizing network performance and ensuring business continuity. Ensures that network connections remain highly available, by applying intelligent traffic control and health checks to distribute traffic efficiently across upstream routers. Identifies the best WAN link to route both incoming and outbound traffic based on policies and network conditions, and protects applications against WAN or Internet link failure by providing rapid fault detection and failover.

For more information, see [Link Load Balancing](/en-us/netscaler/12/link-load-balancing.html).

**TCP Optimization**

You can use TCP profiles to optimize TCP traffic. TCP profiles define the way that NetScaler virtual servers process TCP traffic. Administrators can use the built-in TCP profiles or configure custom profiles. After defining a TCP profile, you can bind it to a single virtual server or to multiple virtual servers.

Some of the key optimization features that can be enabled by TCP profiles are:

- TCP keep-alive—Checks the operational status of the peers at specified time intervals to prevent the link from being broken.
- Selective Acknowledgment (SACK)—Improves the performance of data transmission, especially in long fat networks (LFNs).
- TCP window scaling—Allows efficient transfer of data over long fat networks (LFNs).

For more information on TCP Profiles, see Configuring TCP Profiles.

**CloudBridge Connector**

The Citrix NetScaler CloudBridge Connector feature, a fundamental part of the Citrix OpenCloud framework, is a tool used to build a cloud-extended data center. The OpenCloud Bridge enables you to connect one or more NetScaler appliances or NetScaler virtual appliances on the cloud-to your network without reconfiguring your network. Cloud hosted applications appear as though they are running on one contiguous enterprise
network. The primary purpose of the OpenCloud Bridge is to enable companies to move their applications to the cloud while reducing costs and the risk of application failure. In addition, the OpenCloud Bridge increases network security in cloud environments. An OpenCloud Bridge is a Layer-2 network bridge that connects a NetScaler appliance or NetScaler virtual appliance on a cloud instance to a NetScaler appliance or NetScaler virtual appliance on your LAN. The connection is made through a tunnel that uses the Generic Routing Encapsulation (GRE) protocol. The GRE protocol provides a mechanism for encapsulating packets from a wide variety of network protocols to be forwarded over another protocol. Then Internet Protocol security (IPsec) protocol suite is used to secure the communication between the peers in the OpenCloud Bridge.

For more information, see CloudBridge.

**DataStream**

The NetScaler DataStream feature provides an intelligent mechanism for request switching at the database layer by distributing requests on the basis of the SQL query being sent.

When deployed in front of database servers, a NetScaler ensures optimal distribution of traffic from the application servers and Web servers. Administrators can segment traffic according to information in the SQL query and on the basis of database names, user names, character sets, and packet size.

You can configure load balancing to switch requests according to load balancing algorithms, or you can elaborate the switching criteria by configuring content switching to make a decision based on SQL query parameters, such as user name, database names, and command parameters. You can further configure monitors to track the states of database servers.

The advanced policy infrastructure on the NetScaler appliance includes expressions that you can use to evaluate and process the requests. The advanced expressions evaluate traffic associated with MySQL database servers. You can use request-based expressions (expressions that begin with MYSQL.CLIENT and MYSQL.REQ) in advanced policies to make request switching decisions at the content switching virtual server bind point and response-based expressions (expressions that begin with MYSQL.RES) to evaluate server responses to user-configured health monitors.

Note: DataStream is supported for MySQL and MS SQL databases.

For more information, see DataStream.

**Application acceleration features**

December 28, 2018

- AppCompress
Uses the gzip compression protocol to provide transparent compression for HTML and text files. The typical 4:1 compression ratio yields up to 50% reduction in bandwidth requirements out of the data center. It also results in significantly improved end-user response time, because it reduces the amount of data that must be delivered to the user’s browser.

• **Cache Redirection**

  Manages the flow of traffic to a reverse proxy, transparent proxy, or forward proxy cache farm. Inspects all requests, and identifies non-cacheable requests and sends them directly to the origin servers over persistent connections. By intelligently redirecting non-cacheable requests back to the origin web servers, the NetScaler appliance frees cache resources and increases cache hit rates while reducing overall bandwidth consumption and response delays for these requests.

  For more information, see “Cache Redirection.”

• **AppCache**

  Helps optimize web content and application data delivery by providing a fast in-memory HTTP/1.1 and HTTP/1.0 compliant web caching for both static and dynamic content. This on-board cache stores the results of incoming application requests even when an incoming request is secured or the data compressed, and then reuses the data to fulfill subsequent requests for the same information. By serving data directly from the on-board cache, the appliance can reduce page regeneration times by eliminating the need to funnel static and dynamic content requests to the server.

  For more information, see “Integrated Caching.”

• **TCP Buffering**

  Buffers the server’s response and delivers it to the client at the client’s speed, thus offloading the server faster and thereby improving the performance of web sites.

## Application security and firewall features

December 28, 2018

Below are the security and firewall features.

**Denial of service (DoS) attack defense**

Detects and stops malicious distributed denial-of-service (DDoS) attacks and other types of malicious attacks before they reach your servers, preventing them from affecting network and application performance. The NetScaler appliance identifies legitimate clients and elevates their priority, leaving suspect clients unable to consume a disproportionate percentage of resources and cripple your site. The appliance provides application-level protection from the following types of malicious attacks:
• SYN flood attacks
• Pipeline attacks
• Teardrop attacks
• Land attacks
• Fraggle attacks
• Zombie connection attacks

The appliance aggressively defends against these types of attacks by preventing the allocation of server resources for these connections. This insulates servers from the overwhelming flood of packets associated with these events.

The appliance also protects network resources from ICMP based attacks by using ICMP rate limiting and aggressive ICMP packet inspection. It performs strong IP reassembly, drops a variety of suspicious and malformed packets, and applies Access Control Lists (ACLs) to site traffic for further protection.

For more information, see HTTP Denial-of-Service Protection.

Content Filtering

Provides protection from malicious attacks for web sites at the Layer 7 level. The appliance inspects each incoming request according to user-configured rules based on HTTP headers, and performs the action the user configured. Actions can include resetting the connection, dropping the request, or sending an error message to the user’s browser. This allows the appliance to screen unwanted requests and reduces your servers’ exposure to attacks.

This feature can also analyze HTTP GET and POST requests and filter out known bad signatures, allowing it to defend your servers against HTTP-based attacks.

For more information, see Content Filtering.

Responder

Functions like an advanced filter and can be used to generate responses from the appliance to the client. Some common uses of this feature are generation of redirect responses, user defined responses, and resets.

For more information, see Responder.

Rewrite

Modifies HTTP headers and body text. You can use the rewrite feature to add HTTP headers to an HTTP request or response, make modifications to individual HTTP headers, or delete HTTP headers. It also enables you to modify the HTTP body in requests and responses.
When the appliance receives a request or sends a response, it checks for rewrite rules, and if applicable rules exist, it applies them to the request or response before passing it on to the web server or client computer.

For more information, see Rewrite.

**Priority Queuing**

Prioritizes user requests to ensure that the most important traffic is serviced first during surges in request volume. You can establish priority based on request URLs, cookies, or a variety of other factors. The appliance places requests in a three-tier queue based on their configured priority, enabling business-critical transactions to flow smoothly even during surges or site attacks.

For more information, see Priority Queuing.

**Surge Protection**

Regulates the flow of user requests to servers and controls the number of users that can simultaneously access the resources on the servers, queuing any additional requests once your servers have reached their capacity. By controlling the rate at which connections can be established, the appliance blocks surges in requests from being passed on to your servers, thus preventing site overload.

For more information, see Surge Protection.

**Citrix Gateway**

1. Citrix Gateway is a secure application access solution that provides administrators granular application-level policy and action controls to secure access to applications and data while allowing users to work from anywhere. It gives IT administrators a single point of control and tools to help ensure compliance with regulations and the highest levels of information security across and outside the enterprise. At the same time, it empowers users with a single point of access—optimized for roles, devices, and networks—to the enterprise applications and data they need. This unique combination of capabilities helps maximize the productivity of today's mobile workforce.

2

3. For more information, see [Citrix Gateway](https://docs.citrix.com/en-us/netscaler-gateway.html).
NetScaler 12.0

**Application Firewall**

Protects applications from misuse by hackers and malware, such as cross site scripting attacks, buffer overflow attacks, SQL injection attacks, and forceful browsing, by filtering traffic between each protected web server and users that connect to any web site on that web server. The application firewall examines all traffic for evidence of attacks on web server security or misuse of web server resources, and takes the appropriate action to prevent these attacks from succeeding.

For more information, see [Application Firewall](#).

**Application visibility feature**

December 28, 2018

- **NetScaler Insight Center**

  NetScaler Insight Center is a high performance collector that provides end-to-end user experience visibility across Web and HDX (ICA) traffic. It collects HTTP and ICA AppFlow records generated by NetScaler ADC appliances and populates analytical reports covering Layer 3 to Layer 7 statistics. NetScaler Insight Center provides in-depth analysis for the last five minutes of real-time data, and for historical data collected for the last one hour, one day, one week, and one month.

  HDX (ICA) analytic dashboard enables you to drill down from HDX Users, Applications, Desktops, and even from gateway-level information. Similarly, HTTP analytics provide a bird’s eye view of Web Applications, URLs Accessed, Client IP Addresses and Server IP Addresses, and other dashboards. The administrator can drill down and identify the pain points from any of these dashboards, as appropriate for the use case.

- **EdgeSight for NetScaler**

  Support for application performance monitoring based on end user experience. This solution leverages the HTML injection feature to obtain various time values, which are used by EdgeSight server for analysis and report generation. EdgeSight for NetScaler provides a way to monitor the performance benefits of a NetScaler and determine potential bottlenecks in a network.

  For more information, see “[EdgeSight Monitoring for NetScaler.](#)”

- **Enhanced Application Visibility Using AppFlow**

  The NetScaler appliance is a central point of control for all application traffic in the data center. It collects flow and user-session level information valuable for application performance monitoring, analytics, and business intelligence applications. AppFlow transmits this information by using the Internet Protocol Flow Information eXport (IPFIX) format, which is an open Internet Engineering Task Force (IETF) standard defined in RFC 5101. IPFIX (the standardized version...
Cisco's NetFlow) is widely used to monitor network flow information. AppFlow defines new Information Elements to represent application-level information.

Using UDP as the transport protocol, AppFlow transmits the collected data, called flow records, to one or more IPv4 collectors. The collectors aggregate the flow records and generate real-time or historical reports.

AppFlow provides visibility at the transaction level for HTTP, SSL, TCP, and SSL_TCP flows. You can sample and filter the flow types that you want to monitor.

To limit the types of flows to monitor, by sampling and filtering the application traffic, you can enable AppFlow for a virtual server. AppFlow can also provide statistics for the virtual server.

You can also enable AppFlow for a specific service, representing an application server, and monitor the traffic to that application server.

For more information, see “AppFlow.”

- Stream Analytics

The performance of your web site or application depends on how well you optimize the delivery of the most frequently requested content. Techniques such as caching and compression help accelerate the delivery of services to clients, but you need to be able to identify the resources that are requested most frequently, and then cache or compress those resources. You can identify the most frequently used resources by aggregating real-time statistics about website or application traffic. Statistics such as how frequently a resource is accessed relative to other resources and how much bandwidth is consumed by those resources help you determine whether those resources need to be cached or compressed to improve server performance and network utilization. Statistics such as response times and the number of concurrent connections to the application help you determine whether you must enhance server-side resources.

If the web site or application does not change frequently, you can use products that collect statistical data, and then manually analyze the statistics and optimize the delivery of content. However, if you do not want to perform manual optimizations, or if your web site or application is dynamic in nature, you need infrastructure that can not only collect statistical data but can also automatically optimize the delivery of resources on the basis of the statistics. On the NetScaler appliance, this functionality is provided by the Stream Analytics feature. The feature operates on a single NetScaler appliance and collects run-time statistics on the basis of criteria that you define. When used with NetScaler policies, the feature also provides you with the infrastructure that you need for automatic, real-time traffic optimization.

For more information, see “Action Analytics.”
This section provides the frequently asked questions on the following NetScaler features

- Admin Partition
- AppFlow
- Call Home
- Clustering
- Connection Management
- Content Switching
- Debugging
- Hardware
- High Availability
- Integrated Caching
- Installing, Upgrading, and Downgrading
- Load Balancing
- NetScaler GUI
- SSL

AppFlow

September 25, 2018

- **Which build of NetScaler supports AppFlow?**
  
  AppFlow is supported on NetScaler appliances running version 9.3 and above with nCore build.

- **What is the format used by AppFlow to transmit data?**
  
  AppFlow transmits information in the Internet Protocol Flow Information eXport (IPFIX) format, which is an open Internet Engineering Task Force (IETF) standard defined in RFC 5101. IPFIX (the standardized version of Cisco’s NetFlow) is widely used to monitor network flow information.

- **What do AppFlow records contain?**
  
  AppFlow records contain standard NetFlow or IPFIX information, such as time stamps for the beginning and end of a flow, packet count, and byte count. AppFlow records also contain application-level information (such as HTTP URLs, HTTP request methods and response-status codes, server response time, and latency). IPFIX flow records are based on templates that must be sent before sending flow records.
• After an upgrade to NetScaler Version 9.3 Build 48.6 CI, why does an attempt to open a virtual server from the GUI result in the error message “The AppFlow feature is only available on Citrix Netscaler Ncore”?

AppFlow is supported only on nCore appliances. When you open the virtual server configuration tab, clear the AppFlow checkbox.

• What does the transaction ID in an AppFlow records contain?

A transaction ID is an unsigned 32-bit number identifying an application-level transaction. For HTTP, a transaction corresponds to a request and response pair. All flow records that correspond to this request and response pair have the same transaction ID. A typical transaction has four uniflow records. If the NetScaler generates the response by itself (served from the integrated cache or by a security policy), there might be only two flow records for the transaction.

• What is an AppFlow action?

An Appflow action is a set of collectors to which the flow records are sent if the associated AppFlow policy matches.

• What commands can I run on the NetScaler appliance to verify that the AppFlow action is a hit?

The show appflow action. For example:

```
1 > show appflow action
2  1) Name: aFL-act-collector-1
3     Collectors: collector-1
4     Hits: 0
5     Action Reference Count: 2
6  2) Name: apfl-act-collector-2-and-3
7     Collectors: collector-2, collector-3
8     Hits: 0
9     Action Reference Count: 1
10  3) Name: apfl-act-collector-1-and-3
11     Collectors: collector-1, collector-3
12     Hits: 0
13     Action Reference Count: 1
```

• What is an AppFlow collector?

A collector receives flow records generated by the NetScaler appliance. To be able to send flow records, you must specify at least one collector. You can specify up to four. You can remove unused collectors.

• What NetScaler verison is required for using AppFlow?
Use NetScaler version 9.3.49.5 or higher, and remember that AppFlow is available in only the nCore builds.

- **What transport protocol does AppFlow use?**
  AppFlow uses UDP as the transport protocol.

- **What ports need to be opened if I have a firewall in the network?**
  Port 4739. It is the default UDP port the AppFlow collector uses for listening on IPFIX messages. If the user changes the default port, that port should be opened on the firewall.

- **How can I change the default port AppFlow uses?**
  When you add an AppFlow collector by using the add appflowCollector command, you can specify the port to be used.

```
  1  > add appflowCollector coll1 -IPAddress 10.102.29.251 -port 8000
  2  Done
```

- **What does setting clientTrafficOnly do?**
  NetScaler generates AppFlow records only for client-side traffic.

- **How many collectors can be configured at a time?**
  You can configure up to four AppFlow collectors at a time on the NetScaler appliance. Please note that the maximum number of collectors that can be configured on a NetScaler appliance is four.

**Call Home**

September 25, 2018

- **What is Call Home on a NetScaler appliance?**
  Call Home monitors, and notifies critical events on a NetScaler appliance. By enabling Call Home, you can automate the error notification process. You not only avoid calling Citrix support, raise a service request, and upload system data before Citrix support can troubleshoot the issue, but also identify and resolve issues before it occurs.

- **Is Call Home enabled by default on a NetScaler appliance?**
  Yes, Call Home is enabled by default on the appliance. If you upgrade to the latest software from an older version where Call Home was disabled by default, the upgrade process automatically enables the feature. If you later choose to disable it, the updated setting is remembered for all further upgrades. For information, see Call Home.
What are the pre-requisites for Call Home to work?

Access to an Internet connection.

Note: If your NetScaler appliance does not have an Internet connectivity, you can configure a proxy server through which NetScaler can generate system logs and upload it to the Citrix Technical Support server (CIS).

What are the benefits of using Call Home?

- Monitor hardware and software error conditions.
- Notify about the occurrence of critical events that impact your network.
- Send performance data and system logs to Citrix to:
  * Analyze and improve product quality.
  * Provide real-time troubleshooting information for proactive issue identification, and faster issue resolution.

Which release of NetScaler software supports Call Home?

NetScaler release 10.0 and later.

What NetScaler platform models support Call Home?

Call Home feature is enabled by default on all NetScaler platforms and all appliance models (MPX, VPX, and SDX).

- NetScaler MPX: All MPX models.
- NetScaler VPX: All VPX models. In addition, it is supported on VPX appliances that obtain their licenses from external or central licensing pools. However, the feature remains same as for a standard VPX appliance.
- NetScaler SDX: Monitors the disk drive and assigned SSL chips for any errors or failures. The VPX instances, however, do not have access to the Power Supply Unit (PSU) and therefore their status is not monitored. In an SDX platform, you can configure Call Home either directly on an individual instance or through the SVM.

Should I configure SNMP alarm for Call Home to notify error conditions?

No, you need not configure SNMP for Call Home to monitor error conditions, because SNMP and Call Home uploads are independent of each other. If you want to be notified each time an error condition occurs, you can configure the CALLHOME-UPLOAD-EVENT SNMP alarm to generate an SNMP alert whenever a Call Home upload happens. The SNMP alert notifies the local administrator about the occurrences of critical events.

How do I contact a technical support?

For all critical hardware-related events, Call Home automatically creates a service request to Citrix. For other errors, after you review the system logs, you can contact the Citrix Technical Support.
Support team to open a service request for further investigation. For more information, see http://support.citrix.com/article/CTX126172.

- **What error conditions does Call Home monitor in a NetScaler appliance?**

  Call Home supports monitoring of the following events in a NetScaler appliance:
  
  - Compact flash drive errors
  - Hard disk drive errors
  - Power supply unit failure
  - SSL card failure
  - Warm restart
  - Memory anomalies
  - Rate limit drops

- **Do you need a separate license for Call Home?**

  No, Call Home does not require a separate license. You can enable it in all NetScaler platform licenses.

- **What data does Call Home send to Citrix Support server and how frequently is it sent?**

  Call Home collects and sends two types of data to CIS. They are:
  
  - Basic System information (running NetScaler version, deployment mode (standalone, HA, cluster), hardware details and so on). It is sent at the time of Call Home registration and as part of periodic heartbeats. The heartbeat is sent once every 30 days, but you can configure this interval anywhere from 1 to 30 days. However, a value of less than 5 days is not recommended, because frequent uploads are usually not very useful.
  - An abbreviated version of show tech support bundle when there is an error condition. It is sent upon the first occurrence of a particular error condition since the appliance was last started. That is, a reoccurrence of same error condition does not trigger another upload unless the appliance was rebooted after the previous occurrence.

- **Can Call Home generate and upload system logs through a proxy server?**

  Yes. If your NetScaler appliance does not have direct Internet connectivity, you can configure a proxy server and upload system logs to Citrix Technical Support server (CIS).

- **Can I review Call Home data before it is sent to CIS?**

  Unfortunately, you cannot review Call Home data before it is sent to CIS. Call Home does not collect any other data in addition to the data that you will provide when contacting Citrix support team.

- **How secure and private are the Call Home uploads?**

  Call Home provides data security and privacy in the following ways:
- Uses a secure SSL/TLS channel to transfer data to Citrix servers.
- Uploaded data is reviewed only by authorized personnel and is not shared with any third party.

**Clustering**

September 25, 2018

Click [here](#) for FAQs on clustering.

**Connection Management**

November 2, 2018

- **What is an admin connection?**
  An admin connection establishes a connection to the NetScaler IP (NSIP) address and allows administrators to configure and monitor the NetScaler appliance.

- **What are the types of admin connections?**
  There are two types of admin connections:
  - SSH connection – Admin users use an SSH client to logon through the NetScaler IP (NSIP) address.
  - NITRO API connection – Admin users use NITRO API’s to automate the logon process to NetScaler appliance.
    Note: Admin users can also log on through the NetScaler GUI to log on, by using a browser to connect to the NSIP address. The GUI internally opens a NITRO API connection. Therefore, a GUI session is equivalent to a NITRO API connection, and FAQs related to NITRO API apply to GUI.

- **How many concurrent admin connections are allowed on a NetScaler appliance?**
  The appliance allows up to 20 concurrent admin connections.

- **Which login credentials are required for an admin logon?**
  Admin logon requires a user name and a password.
  
  **Note:** An authentication key can be used instead of a password.

- **Which external authentication methods does a NetScaler appliance support?**
  The appliance supports the following external authentication methods:
  - RADIUS
- LDAP
- TACACS

**What is a client?**
A client is a device (laptop or desktop), used by admin user to open an admin connection.

**What is a session token?**
A session token is a unique identifier that the NetScaler appliance issues to a client that sends a NITRO API logon request.

- API clients can reuse the session token, if it has not expired, for subsequent API requests on new TCP connections
- GUI clients internally open NITRO API connections and keep the session token active for the duration of the GUI session.

**What is an active session on a NetScaler appliance?**
A CLI session is considered active if the session has not expired and has an open SSH connection with a NetScaler appliance.

A NITRO API session is considered active if the session token timeout has not expired on the NetScaler appliance.

**How does NetScaler enforce the concurrent connection limit?**
Every time the NetScaler appliance receives an admin connection request (SSH or NITRO API), it checks the number of admin connections it has open. If the number is lower than 20, a new connection is opened.

**Which counter reflects the number of admin connections on a NetScaler appliance?**
The connection counter (`nsconfigd_cur_clients`) reflects the number of active connections. This counter is incremented when a client opens new connection to the appliance, and is decremented when a connection is closed.

**Which counter reflects the number of active tokens on the NetScaler appliance?**
The `configd_cur_tokens` counter reflects the number of active tokens on NetScaler appliance.

**How does NetScaler appliance handle errors on a connection?**
The NetScaler appliance immediately closes the client (CLI, API, and GUI) connection if it encounters errors on a connection.

**Does a CLI or GUI session on a connection to the management address count against the admin connection limit?**
Yes, all CLI and GUI connections are TCP based connections, and every TCP connection to the management address counts against the admin connection limit.
• **Does a NITRO session count against the admin connection limit?**

A NITRO session counts against the admin connection limit if there is an open TCP connection using the session token issued by the NetScaler appliance.

• **What is the default timeout period for API, GUI, and CLI sessions on NetScaler appliance?**

The following table lists the default timeout period for API, GUI and CLI sessions on the NetScaler appliance:

<table>
<thead>
<tr>
<th>NetScaler Releases</th>
<th>CLI default timeout period (min)</th>
<th>API default timeout period (min)</th>
<th>GUI default timeout period (min)</th>
</tr>
</thead>
<tbody>
<tr>
<td>NetScaler 9.3</td>
<td>None</td>
<td>30 Minutes</td>
<td>30 Minutes</td>
</tr>
<tr>

• **How can you set the CLI session timeout on a NetScaler appliance?**

The CLI session timeout can be configured by executing the following command at the CLI prompt:

```
set cli mode -timeout <xx seconds>
```

• **How do you override the default timeout period when using the NITRO API?**

You can override the default timeout period for a NITRO API by setting the timeout duration in the “timeout” field of the login object. If the session timeout is set to zero, the session token has an infinite timeout.

Note: An infinite timeout is not advisable, because sessions that do not time out continue to count against the admin connection count.

• **What happens if a user account is deleted from the NetScaler appliance after an admin session is created?**

For internal system users, NetScaler appliance closes the existing CLI or NITRO API session.

For external system users, session remains active until it expires.

• **Can NITRO API clients use a single session token to open multiple admin connections on the NetScaler appliance?**

Yes. Each such connection counts against the admin connection limit.

• **If management access is enabled for a MIP or SNIP address, do admin connections to that address count against the limit for the number of admin connections?**
Yes, admin connections to management address (MIP or SNIP) count against the admin connection limit on NetScaler appliance.

• **Can a NetScaler admin log on to the NetScaler appliance after the maximum connections limit is reached?**
  Yes. One additional admin connection is allowed after the maximum connection limit is reached.

• **Can NITRO API endpoints open multiple admin connections on NetScaler the appliance?**
  Yes, NITRO API endpoints can open multiple admin connections and exhaust the concurrent admin connection limit on a NetScaler appliance. In such situations, an additional SSH/CLI connection is allowed and the admin can force closure of old API sessions, or reduce the session timeout duration for the existing API sessions.

• **Can same client open multiple API sessions on a NetScaler appliance?**
  Yes, a client can open multiple API session by repeatedly logging on. For example, the client might log back on after a reboot.
  Note: Repeated client logons count against the admin connection limit on NetScaler appliance.

• **Can API clients use the entire API session token limit?**
  Yes, API clients can use the entire API session token limit, provided by repeatedly logging on without using a previously issued token.
  Note: If a client's session timeout is zero, the token is valid forever. Repeated logons using new session tokens can count against the limit for API session tokens.

• **Do CLI sessions count against the API session token limit?**
  No, CLI sessions are not counted against the API session token limit.

• **Can admin users use telnet to open a CLI session?**
  No. Only an SSH client can open a CLI session.

• **What is connection limit and API session limit applicable for various NetScaler releases?**
  The following table lists the maximum concurrent admin connection and active API session limits applicable for various NetScaler releases:
I have installed a non-NetScaler load balancing appliance on the network. However, I would like to use the content switching feature of the NetScaler appliance to direct the client requests to the load balancing appliance. Is it possible to use the Content switching feature of the NetScaler appliance with a non-NetScaler load balancing appliance?

Yes. You can use the Content switching feature of the NetScaler appliance with the load balancing feature of the NetScaler appliance or a non-NetScaler load balancing appliance. However, when using the non-NetScaler load balancing appliance, make sure that you create a load balancing virtual server on the NetScaler appliance and bind it to the non-NetScaler load balancing appliance as a service.

How is a Content switching virtual server different from a load balancing virtual server?

A Content switching virtual server is capable only of sending the client requests to other virtual servers. It does not communicate with the servers.

A Load balancing virtual server balances the client load among servers and communicates with the servers. It monitors server availability and can be used to apply different load balancing algorithms to distribute the traffic load.
Content switching is a method used to direct client requests for specific types of content to targeted servers by way of load balancing virtual servers. You can direct the client requests to the servers best suited to handle them. This result in reduced overheads to process the client requests on the servers.

- **I want to implement the Content switching feature of the NetScaler appliance to direct the client requests. What types of client request can I direct by using the Content switching feature?**

  You can direct only HTTP, HTTPS, FTP, TCP, Secure TCP, and RTSP client requests by using the Content switching feature. To direct HTTPS client requests, you must configure the SSL offload feature on the appliance.

- **I want to create Content switching rules on the NetScaler appliance. What are the various elements of the client request on which I can create a content switching rule?**

  You can create the content switching rules based on the following elements and their values in the client request:
  - URL
  - URL tokens
  - HTTP version
  - HTTP Headers
  - Source IP address of the client
  - Client version
  - Destination TCP port

- **I understand that the content switching feature of the NetScaler appliance helps enhance the performance of the network. Is this correct?**

  Yes. You can direct the client requests you the servers best suited to handle them. The result is reduced overhead for processing the client requests on the servers.

- **Which feature of the NetScaler appliance should I configure on the NetScaler appliance to enhance the site manageability and response time to the client requests?**

  You can configure the content switching feature of the NetScaler appliance to enhance the site manageability and response time to the client request. This feature enables you to create content groups within the same domain name and IP address. This approach is flexible, unlike the common approach of explicitly partitioning the content into different domain names and IP addresses, which are visible to the user.

  Multiple partitions dividing a Web site into various domain names and IP addresses force the browser to create a separate connection for each domain it finds when rendering and fetching the content of a web page. These additional WAN connections degrade the response time for the web page.
I have hosted a web site on a web server farm. What advantages does the NetScaler content switching feature offer for this type of setup?

The content switching feature provides the following advantages on a NetScaler appliance in a site that is based in a web server farm:

- Manage the site content by creating a content group within the same domain and IP address.
- Enhance the response time to client requests by using the content group within the same domain and IP address.
- Avoid the need for full content replication across domains.
- Enable application-specific content partitioning. For example, you can direct client requests to a server that handles only dynamic content or only static content, as appropriate for the request.
- Support multi-homing of multiple domains on the same server and use the same IP address.
- Reuse connections to the servers.

I want to implement the content switching feature on the NetScaler appliance. I want to direct the client requests to the various servers after evaluating the various parameters of each request. What approach should I follow to implement this setup when configuring the content switching feature?

You can use policy expressions to create policies for the content switching feature. An expression is a condition evaluated by comparing the qualifiers of the client request to an operand by using an operator. You can use the following parameters of the client request to create an expression:

- **Method** - HTTP request method.
- **URL** - URL in the HTTP header.
- **URL TOKENS** - Special tokens in the URL.
- **VERSION** - HTTP request version.
- **URL QUERY** - Contains the URL Query LEN, URL LEN, and HTTP header.
- **SOURCEIP** - IP address of the client.

Following is a complete list of the operators that you can use to create an expression:

- == (equals)
- != (not equals)
- EXISTS
- NOT EXISTS
- CONTAINS
- NOT CONTAINS
- GT (greater than)
You can also create various rules, which are logical aggregations of a set of expressions. You can combine multiple expressions to create rules. To combine expressions, you can use the && (AND) and (OR) operators. You can also use parenthesis to create nested and complex rules.

- I want to configure a rule based policy along with a URL based policy for the same content switching virtual server. Is it possible to create both types of policies for the same content switching virtual server?

Yes. You can create both type of policies for the same content switching virtual server. However, be sure to assign priorities to set an appropriate precedence for the policies.

- I want to create content switching policies that evaluate the domain name, along with a prefix and suffix of a URL, and direct the client requests accordingly. Which type of content switching policy should I create?

You can create a Domain and Exact URL policy. When this type of policy is evaluated, the NetScaler appliance selects a content group if the complete domain name and the URL in the client request match the ones configured. The client request must match the configured domain name and exactly match the prefix and suffix of the URL if they are configured.

- I want to create content switching policies that evaluate the domain name, along with a partial prefix and suffix of URL, and direct the client requests accordingly. Which type of content switching policy should I create?

You can create a Domain and Wildcard URL policy for the content switching virtual server. When this type of policy is evaluated, the NetScaler appliance selects a content group if the request matches the complete domain name and partially matches the URL prefix.

- What is a Wildcard URL policy?

You can use wildcards to evaluate partial URLs in client requests to the URL you have configured on the NetScaler appliance. You can use wildcards in the following types of URL-based policies:

- Prefix only. For example, the /sports/* expression matches all URLs available under the /sports URL. Similarly, the /sports* expression matches all URLs whose prefix is /sports.
- Suffix only. For example the */.jsp expression matches all URLs with a file extension of jsp.
- Prefix and Suffix. For example, the /sports/*.jsp expression matches all URLs under the /sports/ URL that also have the jsp file extension. Similarly, the /sports*.jsp expression
matches all URLs with a prefix of /sports* and a file extension of jsp.

- **What is a Domain and Rule policy?**
  When you create a Domain and Rule policy, the client request must match the complete domain and the rule configured on the NetScaler appliance.

- **What is the default precedence set for evaluating policies?**
  By default, the rule based policies are evaluated first.

- **If some of the content is the same for all client requests, what type of precedence should I use for evaluating policies?**
  If some of the content is same for all the users and different content should be served on the basis of client attributes, you can use URL-based precedence for policy evaluation.

- **What policy expression syntaxes are supported in content switching?**
  Content switching supports two types of policy expressions:
  - **Classic Syntax**: Classic syntax in content switching starts with the keyword REQ and is more advanced than the default syntax. Classic policies cannot be bound to an action. Therefore, the target load balancing virtual server can be added only after binding the content switching virtual server.
  - **Default Syntax**: Default syntax generally starts with key word HTTP and is easier to configure. A target load balancing virtual server action can be bound to a Default Syntax policy, and the policy can be used on multiple content switching virtual servers.

- **Can I bind a single content switching policy to multiple virtual servers?**
  Yes. You can bind a single content switching policy to multiple virtual servers by using policies with defined actions. Content switching policies that use an action can be bound to multiple content switching virtual servers because the target load balancing virtual server is no longer specified in the content switching policy. The ability to bind a single policy to multiple content switching virtual servers helps to further reduce the size of the content switching configuration.

  For more information, see the following Knowledge Center articles and eDocs topics:
  - See CTX122918 - How to Bind the Same Content Switching Policy to Two Content Switching vServers on a NetScaler Appliance.
  - See CTX122736 - How to Bind the Same Advanced Policy to Multiple Content Switching Virtual Servers using Policy Labels.
  - Configuring a Content Switching Action.

- **Can I create an action based policy using classic expressions?**
  No. As of now NetScaler does not support policies using classic syntax expressions with actions. The target load balancing virtual server should be added when binding the policy instead of defining it in an action.
Debugging

September 25, 2018

• **How can I determine the interface (CLI, GUI, or API) through which an operation was performed?**

  The NetScaler keeps track of the interfaces through which operations are performed. You can view this information in syslogs (in the NetScaler GUI, navigate to Configuration > System > Auditing > Audit Messages > Syslog messages) or in the ns.log (located at the /var/log/ directory) file.
  
  For example, operations that are performed through the API are flagged as “API CMD_EXECUTED.”

High Availability

September 25, 2018

• **What are the various ports used to exchange the HA-related information between the nodes in an HA configuration?**

  In an HA configuration, both nodes use the following ports to exchange HA related information:
  
  – UDP Port 3003, to exchange heartbeat packets
  – Port 3010, for synchronization and command propagation

• **What configurations are not synced or propagated in an HA configuration in either INC or non-INC mode?**

  Configurations implemented with the following commands are neither propagated nor synced to the secondary node:
  
  – All node specific HA configuration commands. For example, add ha node, set ha node, and bind ha node.
  – All Interface related configuration commands. For example, set interface and unset interface.
  – All channel related configuration commands. For example, add channel, set channel, and bind channel.
For more information about HA Configuration in INC mode, see Configuring High Availability Nodes in Different Subnets.

• **What configurations are not synced or propagated in an HA configuration in INC mode?**

The following configurations are neither synced nor propagated. Each node has its own.

- MIPs
- SNIPs
- VLANs
- Routes (except LLB routes)
- Route monitors
- RNAT rules (except any RNAT rule with VIP as the NAT IP)
- Dynamic routing configurations.

• **What are the conditions that trigger synchronization?**

Synchronization is triggered by any of the following conditions:

- The incarnation number of the primary node, received by the secondary, does not match that of the secondary node.
  
  Note: Both nodes in an HA configuration maintain a counter called *incarnation number*, which counts the number of configurations in the node’s configuration file. Each node sends its incarnation number to each other node in the heartbeat messages. The incarnation number is not incremented for the following commands:
  
  * All HA configuration related commands. For example, add ha node, set ha node, and bind ha node.
  
  * All Interface related commands. For example, set interface and unset interface.
  
  * All channel-related commands. For example, add channel, set channel, and bind channel.

- The secondary node comes up after a restart.
- The primary node becomes secondary after a failover.

• **Does a configuration added to the secondary node get synchronized on the primary?**

No, a configuration added to the secondary node is not synchronized to the primary.

• **What could be the reason for both nodes claiming to be the primary in an HA configuration?**

The most likely reason is that the primary and secondary nodes are both healthy but the secondary does not receive the heartbeat packets from the primary. The problem could be with the network between the nodes.

• **Does an HA configuration run into any issues if you deploy the two nodes with different system clock settings?**

Different system-clock settings on the two nodes can cause the following issues:
The time stamps in the log file entries do not match. This situation makes it difficult to analyze the log entries for any issues.

After a failover, you might have problems with any type of cookie based persistence for load balancing. A significant difference between the times can cause a cookie to expire sooner than expected, resulting in termination of the persistence session.

Similar considerations apply to any time related decisions on the nodes.

**What are the conditions for failure of the `force HA sync` command?**

Forced synchronization fails in any of the following circumstances:

- You force synchronization when synchronization is already in progress.
- The secondary node is disabled.
- HA synchronization is disabled on the current secondary node.
- HA propagation is disabled on the current primary node and you force synchronization from the primary.

**What are the conditions for failure of the `sync HA files` command?**

Synchronizing configuration files fail if the secondary node is disabled.

**In an HA configuration, if the secondary node takes over as the primary, does it switch back to secondary status if the original primary comes back online?**

No. After the secondary node takes over as the primary, it remains as primary even if the original primary node comes back online again. To interchange the primary and secondary status of the nodes, run the `force failover` command.

**What are the conditions for failure of the `force failover` command?**

A forced failover fails in any of the following circumstances:

- The secondary node is disabled.
- The secondary node is configured to remain secondary.
- The primary node is configured to remain primary.
- The state of the peer node is unknown.

### Integrated Caching

September 25, 2018

### Content Groups

- How is a DEFAULT content group different from other content groups?
The behavior of the DEFAULT content group is exactly the same as any other group. The only attribute that makes the DEFAULT content group special is that if an object is being cached and no content group has been created, the object is cached in the DEFAULT group.

**What is the ‘cache-Control’ option of the content group level?**

You can send any cache-control header the browser. There is a content group level option, cacheControl, which enables you to specify the cache-control header that you want to be inserted in the response to the browser.

**What is the ‘Minhit’ option in content group level?**

Minhit is an integer value specifying the minimum number of hits to a cache policy before the object is cached. This value is configurable at the content group level. Following is the syntax to configure this value from the NetScaler command line.

```
add/set cache contentGroup <Content_Group_Name> [-minHits <Integer>]
```

**What is the use of the expireAtLastByte option?**

The expireAtLastByte option enables the integrated cache to expire the object as soon as it has been downloaded. Only requests that are outstanding requests at that time are served from cache. Any new requests are sent to the server. This setting is useful when the object is frequently modified, as in the case of stock quotes. This expiry mechanism works along with the Flash Cache feature. To configure expireAtLastByte option, run the following command from the NetScaler command line:

```
add cache contentGroup <Group_Name> –expireAtLastByte YES
```

**Cache policy**

**What is a caching policy?**

Policies determine which transactions are cacheable and which are not. Additionally, policies add or override the standard HTTP caching behavior. Policies determine an action, such as CACHE or NOCACHE, depending on the specific characteristics of the request or response. If a response matches policy rules, the object in the response is added to the content group configured in the policy. If you have not configured a content group, the object is added to the DEFAULT content group.

**What is a policy hit?**

A hit occurs when a request or response matches a cache policy.

**What is a miss?**

A miss occurs when a request or response does not match any cache policy. A miss can also occur if the request or response matches a cache policy but some override of RFC behavior prevents the object from being stored in the cache.
I have configured Integrated Caching feature of the NetScaler appliance. When adding the following policy, an error message appears. Is there any error in the command?

```
add cache policy image_caching -rule exp1 ns_ext_not_jpeg -action cache
```

> ERROR: No such command

In the preceding command, the expression should be within the quotation marks. Without quotation marks, the operator is considered to be the pipe operator.

Memory Requirements

- What are the commands that I can run on the NetScaler appliance to check the memory allocated to cache?

To display the memory allocated for cache in the NetScaler appliance, run any of the following commands from the NetScaler command line:

- `show cache parameter`
  
  In the output, check the value of the Memory usage limit parameter. This is the maximum memory allocated for cache.

- `show cache <Content_Group_Name>`
  
  In the output, check the values of the Memory usage and Memory usage limit parameters indicating the memory used and allocated for the individual content group.

- My NetScaler appliance has 2 GB of memory. Is there any recommended memory limit for cache?

For any model of the NetScaler appliance, you can allocate half of the memory to the cache. However, Citrix recommends allocating a little less than half of the memory, because of internal memory dependency. You can run the following command to allocate 1 GB of memory to cache:

```
set cache parameter -memLimit 1024
```

- Is it possible to allocate memory for individual content groups?

Yes. Even though you allocate memory for the integrated cache globally by running the `set cache parameter -memLimit<Integer>`, you can allocate memory to individual content groups by running the `set cache <Content_Group_Name> -memLimit <Integer>` command. The maximum memory you can allocate to content groups (combined) cannot exceed the memory you have allocated to the integrated cache.
• **What is the dependency of memory between integrated cache and TCP buffer?**
  
  If the NetScaler appliance has 2 GB memory, then the appliance reserves approximately 800 to 900 MB of memory and remaining is allocated to FreeBSD operating system. Therefore, you can allocate up to 512 MB of memory to integrated cache and the rest is allocated to TCP buffer.

• **Does it affect the caching process if I do not allocate global memory to the integrated cache?**
  
  If you do not allocate memory to integrated cache, all requests are sent to the server. To make sure that you have allocated memory to the integrated cache, run the show cache parameter command. Actually no objects will be cached if global memory is 0, so this needs to be set first.

**Verification commands**

• **What are the options for displaying cache statistics?**
  
  You can use either of the following options to display the statistics for cache:
  
  – stat cache
    
    To display the summary of the cache statistics.
  
  – stat cache –detail
    
    To display the full details of the cache statistics.

• **What are the options for displaying the cached content?**
  
  To display the cached content, you can run the show cache object command.

• **What is the command that I can run to display the characteristics of an object stored in cache?**
  
  If the object stored in the cache is, for example, GET //10.102.12.16:80/index.html, you can display the details about the object by running the following command from the NetScaler command line of the appliance:

  show cache object -url '/index.html' -host 10.102.3.96 -port 80

• **Is it mandatory to specify the group name as a parameter to display the parameterized objects in cache?**
  
  Yes. It is mandatory to specify the group name as a parameter to display the parameterized objects in cache. For example, consider that you have added the following policies with the same rule:
In this case, for the multiple requests, if policy p1 is evaluated, its hit counter is incremented and the policy stores the object in the g1 group, which has hit parameters. Therefore, you have to run the following command to display the objects from the cache:

```bash
show cache object -url "/cgi-bin/setCookie.pl" -host 10.102.18.152 groupName g1
```

Similarly, for another set of multiple requests, if policy p2 is evaluated, its hit counter is incremented and the policy stores the object in the g2 group, which does not have hit parameters. Therefore, you have to run the following command to display the objects from the cache:

```bash
show cache object -url "/cgi-bin/setCookie2.pl" -host 10.102.18.152
```

- **I notice that there are some blank entries in the output of the nscachemgr command. What are those entries?**

Consider the following sample output of the nscachemgr command. The blank entries in this output are highlighted in bold face for your reference:

```bash
root@ns# /netscaler/nscachemgr -a
//10.102.3.89:80/image8.gif
//10.102.3.97:80/staticdynamic.html
//10.102.3.97:80/
//10.102.3.89:80/image1.gif
//10.102.3.89:80/file5.html
//10.102.3.96:80/
//10.102.3.97:80/bg_logo_segue.gif
//10.102.3.89:80/file500.html
//10.102.3.92:80/
//10.102.3.96:80/cgi-bin/rfc/ccProxyReval.pl
Total URLs in IC = 10
```

The blank entries in the output are due to the default caching properties for GET / HTTP/1.1.

**Flush Objects**

- **How can I flush a selective object from the cache?**

You can identify an object uniquely by its complete URL. To flush such object, you can perform any of the following tasks:

  - Flush cache
– Flush content group
– Flush the specific object

To flush the specific object, you have to specify the query parameters. You specify the invalParam parameter to flush the object. This parameter applies only to a query.

• Does any change in the cache configuration trigger flushing of cache?

Yes. When you make any changes to the cache configuration, all the SET cache commands inherently flush the appropriate content groups.

• I have updated the objects on the server. Do I need to flush the cached objects?

Yes. When you update objects on the server, you must flush the cached objects, or at least the relevant objects and content groups. The integrated cache is not affected by an update to the server. It continues to serve the cached objects until they expire.

Flash Cache

• What is Flash Cache feature of the NetScaler appliance?

The phenomenon of Flash crowds occurs when a large number of clients access the same content. The result is a sudden surge in traffic toward the server. The Flash Cache feature enables the NetScaler appliance to improve performance in such situation by sending only one request to the server. All other requests are queued on the appliance and the single response is served to all of the requests. You can use either of the following commands to enable the Fast Cache feature:

– add cache contentGroup <Group_Name> -flashCache YES
– set cache contentGroup <Group_Name> -flashCache YES

• What is the limit for Flash Cache clients?

The number of Flash Cache clients depends on the availability of resources on the NetScaler appliance.

Default Behaviour

• Does the NetScaler appliance proactively receive objects upon expiry?

The NetScaler appliance never proactively receives objects on expiry. This is true even for the negative objects. The first access after expiry triggers a request to the server.

• Does the integrated cache add clients to the queue for serving even before it starts receiving the response?

Yes. The integrated cache adds clients to the queue for serving even before it starts receiving the response.
• **What is the default value for the Verify cached object using parameter of the cache configuration?**

  HOSTNAME_AND_IP is the default value.

• **Does the NetScaler appliance create log entries in the log files?**

  Yes. The NetScaler appliance creates log entries in the log files.

• **Are compressed objects stored in the cache?**

  Yes. Compressed objects are stored in the cache.

### Interoperability with other features

• **What happens to objects that are currently stored in cache and are being accessed though SSL VPN?**

  Objects stored in the cache and accessed regularly are served as cache hits when accessed through SSL VPN.

• **What happens to objects stored in the cache when accessed through SSL VPN and later accessed through a regular connection?**

  The objects stored through the SSL VPN access are served as a hit when accessed through the regular connection.

• **When using weblogging, how do I differentiate entries that indicate response served from cache from those served by the server?**

  For responses served from the integrated cache, the server log field contains the value IC. For responses served from a server, the server log field contains the value sent by the server. Following is a sample log entry for an integrated caching transaction:

  "10.102.1.52 - "Mozilla/4.0 (compatible; MSIE 6.0; Windows NT 4.0; .NET CLR 1.0.3705)" "GET /" 200 0 "IC" 10.102.1.45"

  Along with a client request, the response logged is the one sent to the client and not necessarily the one sent by the server.

### Miscellaneous

• **What do you mean by configuring relexpiry and absexpiry?**

  By configuring relexpiry and absexpiry, it means that you are overriding the header irrespective of what appears in the header. You can configure different expiry setting and the content group level. With relexpiry, expiration of the header is based on the time at which the object
was received by the NetScaler. With absexpiry, expiration is based on the time configured on the NetScaler. Relexpiry is configured in terms of seconds. Absexpiry is a time of day.

- **What do you mean by configuring weakpos and heuristic?**

The weakpos and heuristic are like fall back values. If there is an expiry header, it is considered only if the last-modified header is present. The NetScaler appliance sets expiry on the basis of the last-modified header and the heuristic parameter. The heuristic expiry calculation determines the time to expiry by checking the last-modified header. Some percentage of the duration since the object was last modified is used as time to expiry. The heuristic of an object that remains unmodified for longer periods of time and is likely to have longer expiry periods. The -heurExpiryParam specifies what percentage value to use in this calculation. Otherwise, the appliance uses the weakpos value.

- **What should I consider before configuring dynamic caching?**

If there is some parameter that is in name-value form and does not have the full URL query, or the appliance receives the parameter in a cookie header or POST body, consider configuring dynamic caching. To configure dynamic caching, you have to configure hitParams parameter.

- **How is hexadecimal encoding supported in the parameter names?**

On the NetScaler appliance, the %HEXHEX encoding is supported in the parameter names. In the names that you specify for hitParams or invalParams, you can specify a name that contains %HEXHEX encoding in the names. For example, name, nam%65, and n%61m%65 are equivalent.

- **What is the process for selecting a hitParam parameter?**

Consider the following excerpt of an HTTP header for a POST request:

```
1 POST /data2html.asp?param1=value1&param2=&param3&param4=value4
2 HTTP/1.1
3 Accept: image/gif, image/x-xbitmap, image/jpeg, image/pjpeg, application/vnd.ms-powerpoint, application/vnd.ms-excel, application/msword, application/x-shockwave-flash, */*
4 Referer: http://10.102.3.97/forms.html
5 Accept-Language: en-us
6 Content-Type: application/x-www-form-urlencoded
7 Accept-Encoding: gzip, deflate
8 User-Agent: Mozilla/4.0 (compatible; MSIE 6.0; Windows NT 5.1)
9 Host: 10.102.3.97
10 Content-Length: 153
11 Connection: Keep-Alive
12 Cache-Control: no-cache
13 Cookie: ASPSESSIONIDQGQGGRNY=NNLLKDADEENOFLCCDGFMDMO
```
In the above request, you can use S1 and B1, highlighted in bold face for your reference, as hitParams depending on your requirements. Additionally, if you use -matchCookies YES in the ASPSESSIONIDQGQGGRNY content group, then you can also use these parameters as hitParams.

- **What happens to the queued clients if the response is not cacheable?**

  If the response is not cacheable, all of the clients in the queue receive the same response that the first client receives.

- **Can I enable the Poll every time (PET) and Flash Cache features on the same content group?**

  No. You cannot enable PET and Flash Cache on the same content group. The integrated cache does not perform AutoPET function on Flash Cache content groups. The PET feature ensures that the integrated cache does not serve a stored object without consulting the server. You can configure PET explicitly for a content group.

- **When are the log entries created for the queued clients?**

  The log entries are created for the queued clients soon after the appliance receives the response header. The log entries are created only if the response header does not make the object non-cacheable.

- **What is the meaning of the DNS, HOSTNAME, and HOSTNAME_AND_IP values of the Verify cached object using parameter of the cache configuration?**

  The meanings are as follows:

  - set cache parameter -verifyUsing HOSTNAME
    
    This ignores the destination IP address.

  - set cache parameter -verifyUsing HOSTNAME_AND_IP
    
    This matches the destination IP address.

  - set cache parameter -verifyUsing DNS
    
    This uses the DNS server.

- **I have set weakNegRelExpiry to 600, which is 10 minutes. I noticed that 404 responses are not getting cached. What is the reason?**

  This completely depends on your configuration. By default, 404 responses are cached for 10 minutes. If you want all 404 responses to be fetched form the server, specify --weakNegRelExpiry 0. You can fine tune the --weakNegRelExpiry to a desired value, such as higher or lower to get the
404 responses cached appropriately. If you have configured –absExpiry for positive responses, then it might not yield desired results.

- **When the user accesses the site by using the Mozilla Firefox browser, the updated content is served. However, when the user accesses the site by using the Microsoft Internet Explorer browser, stale content is served. What could be the reason?**

  The Microsoft Internet Explorer browser might be taking the content from its local cache instead of the NetScaler integrated cache. The reason could be that the Microsoft Internet Explorer browser is not respecting the expiry related header in the response.

  To resolve this issue, you can disable the local cache of the Internet Explorer and clear the offline content. After clearing the offline content, the browser should display the updated content.

- **What if Hits are zero?**

  Check to see if the server time and NS time are in sync. And the weakPosrelexpiry limit set should bear the time difference between NS and server as shown below

  root@ns180# date

  Tue May 15 18:53:52 IST 2012

- **Why are policies getting hits but nothing is being cached?**

  Verify that memory is allocated to the integrated cache and that the allocation is greater than zero.

- **Is it possible to zero the cache counters?**

  There is no command line or GUI option for setting the cache counters to zero, and flushing the cache does not do so either. Rebooting the box automatically sets these counters to zero.

### Install, upgrade, and downgrade

October 3, 2018

This is section, you’ll find answers to the following questions. Scroll down to see the answers.

### Install and upgrade

- What is the use of the zebos.conf file available in a NetScaler release?

- I want to change the SSH port (22) on the NetScaler appliance to some other port. Is it possible to change the SSH port on the appliance?

- I want to log on to the NetScaler appliance without entering the password. Is it possible to configure SSH on the appliance to allow that?
• What is the procedure to reset the NetScaler appliance BIOS? Under what circumstances should I reset the BIOS?

• I need to reset the NetScaler appliance to the factory defaults. What procedure should I follow?

• The appliance displays a message similar to the “Jun 21 12:20:18 ns /flash/ns-10.0-47.15: [1/2]dc0: NIC hang condition #663: TX 10000/10000, RX 0, HF 0” message on the console. What is the meaning of this message?

• After I upgraded the Citrix ADC release on the appliance, the appliance still displays the earlier release/build. What could be the reason?

• Since I upgraded the Citrix ADC release on the appliance, the LCD display on the front panel of the appliance displays the out of service message or does not display anything. How can I resolve this issue?

• I have upgraded the Citrix ADC release/build. However, after the upgrade process, the appliance fails to start. Can I downgrade the appliance's software to the previous release/build?

• After upgrading the Citrix ADC release on the appliance, I accidentally deleted the kernel file from the /flash directory. As a result, I am not able to start the appliance. Is there a method for starting the appliance in this situation?

• After upgrading the appliance software to Citrix ADC release 10.0, I am not able to log on to the appliance, and the following message is appears:

  login: nsroot Password: connect: No such file or directory nsnet_connect: No such file or directory Login incorrect

  I tried to resolve this issue by using the password recovery procedure, but I was not successful. Have I done something incorrectly?

• During an upgrade of a high availability pair, the following message appears repeatedly:

  ns sshd[5035]: error: Invalid username or password

  What could be the reason?

• I want to change the netmask of the NetScaler IP address on a Citrix ADC appliance. Can I do so without causing an outage?

• I have configured a High Availability pair of Citrix ADC appliances. After upgrading the software release from a beta release to a final release, I noticed that some of the appliance configurations are missing. Can I retrieve the lost configurations?

• Can I upgrade a Citrix ADC appliance directly from release 10.0 to 10.5, or should I upgrade to 10.1 first and then to 10.5?

• Can the primary appliance and secondary appliance have separate builds?

• Can both the appliances in an High Availability (HA) pair be upgraded at the same time?
Does Citrix support firmware upgrades in the Amazon AWS cloud?

Can I upgrade the Citrix ADC instance independently of the SDX version?

Can I use the FTP server to upgrade the Citrix ADC appliance?

Is the procedure for upgrading the Citrix ADC appliance with GSLB configurations different from an upgrade of an appliance that is not involved in GSLB?

Downgrade

I have received a Citrix ADC appliance with the latest Citrix ADC release installed on it. However, I want to downgrade the software release. Can I do so?

When downgrading the Citrix ADC release, I followed the instructions. However, the appliance displays the following message:

```
root@LBCOL03B# ./installns
installns version (10.0-47.7) kernel (ns-10.0-47.7.gz)
Note:
Installation may pause for up to 3 minutes while data is written to the flash.
Caution:
Do not interrupt the installation process.
Installation will proceed in 5 seconds, CTRL-C to abort
No Valid Netscaler Version Detected
root@LBCOL03B#
```

Am I doing something incorrectly?

• How is the rollback procedure performed on a Citrix ADC appliance?

Install and upgrade

What is the use of the zebos.conf file available in a NetScaler release?

A NetScaler appliance uses Zebos as the routing suite. The zebos.conf file available in a NetScaler release is the configuration file for Zebos.

I want to change the SSH port (22) on the NetScaler appliance to some other port. Is it possible to change the SSH port on the appliance?

Yes. You can change the SSH port on the NetScaler appliance by editing the sshd_config file in the /nsconfig directory. If the file does not exist in the /nsconfig directory, copy it from the /etc directory.
In the `sshd_config` file, edit the entry for Port 22 to Port `<Number>`, where `<Number>` is the target port number. If you do not want to restart the appliance and make the changes effective, terminate the `sshd` process by using the `kill` command, and then restart the process.

**The flash directory is missing from the NetScaler appliance. What procedure should I follow to mount the flash directory?**

To mount the flash directory, do the following:

1. Start the NetScaler appliance in single-user mode.
   
   When the appliance starts, the following message appears:
   
   Hit [Enter] to boot immediately, or any other key for command prompt. Booting [kernel] in 10 seconds…” Hit space and you should see the following prompt:
   
   Type ‘?’ for a list of commands, ‘help’ for more detailed help.

2. Enter the following command to start FreeBSD in single-user mode:
   
   ```bash
   boot -s
   ```
   
   After the appliance starts, the following message appears:
   
   Enter full pathname of shell or RETURN for /bin/sh:

3. Press Enter to display the # prompt.

4. Run the following command to mount the flash directory:
   
   ```bash
   mount /dev/ad0s1a /flash
   ```
   
   **Note:** If the preceding command displays an error message about permissions, run the following command to check the disk for consistency:
   
   ```bash
   fsck /dev/ad0s1a
   ```
   
   Run the `mount` command again to mount the flash directory.

5. Restart the appliance.

6. From the shell prompt, run the following command to verify that the flash directory is mounted:
   
   ```bash
   df -kh
   ```

**I want to log on to the NetScaler appliance without entering the password. Is it possible to configure SSH on the appliance to allow that?**

Yes. You can configure SSH on the NetScaler appliance to log on without a password. However, you must provide your user name. To configure SSH for logging in without a password, do the following:
1. Run the following command to generate the public and private keys:

```bash
# ssh-keygen -t rsa
```

2. Run the following command to copy the id_rsa.pub file to the .ssh directory of the remote host that you want to log on to:

```bash
# scp id_dsa.pub <user>@<remote_host>/.ssh/id_dsa.pub
```

3. Log on to the remote host.
4. Change to the .ssh directory.
5. Run the following commands to add the public key of the client to the known public keys:

```bash
# cat id_dsa.pub >> authorized_keys2
# chmod 640 authorized_keys2
# rm id_dsa.pub
```

**What is the procedure to reset the NetScaler appliance BIOS? Under what circumstances should I reset the BIOS?**

To reset BIOS of the NetScaler appliance, complete the following procedure:

1. Connect to the appliance through the serial port.
2. Start the appliance and press Delete as soon as the boot-up process starts.
   - Pressing Delete during the POST process displays the appliance’s BIOS settings.
3. Activate the Exit page of the BIOS settings.
4. Select the Load Optimal Defaults option. The Load Optimal Settings message box appears.
5. Select OK.
6. Make the following changes to the BIOS settings on the various tabs:
   - Tab
7. Activate the Exit page of the BIOS settings.
8. Select Save changes and Exit.
9. Select OK to confirm.
10. Verify that the appliance starts cleanly and the serial console displays output after the appliance starts.
You need to reset BIOS when the serial console does not respond. This usually happens after you upgrade the appliance and the serial console is disabled. However, you can still access the appliance by using the telnet or SSH utility.

I need to reset the NetScaler appliance to the factory defaults. What procedure should I follow?

To reset the NetScaler appliance to the factory defaults, you need to reset two environments: the NetScaler application environment and the base FreeBSD environment.

To reset the NetScaler application environment of the appliance to the factory defaults, do the following:

1. Make a backup of the appliance's /nsconfig/ns.conf.
2. Delete the /nsconfig/ns.conf file.
3. Restart the appliance.

To reset the FreeBSD environment of the appliance to the factory defaults, do the following:

a) Install a fresh NetScaler code image on the appliance. This overwrites a number of FreeBSD-level configuration files with default values.

b) Delete any users and groups that are added to the appliance, that is, all except the default users.

c) Delete the /etc/resolv.conf file.

d) Delete the entries that you have added to the /etc/hosts file.

f) Open the /etc/nsperm_group_suser file and make sure that all IOCTL entries are comment entries.

g) Open the /etc/rc.conf file and make sure that the syslogd_enable=NO entry is not changed to syslogd_enable=YES.

h) Open the /etc/syslog.conf file and make sure that there are no additional entries in the file.

i) Delete the contents of the /var/nslog, /var/nstrace, and /var/crash files.

j) If the syslog process is enabled on the appliance and the appliance creates log files locally, delete the contents of the log files listed in the /etc/syslog.conf file. The files are created in the /var/log directory. For example, if syslog process writes system events to the /var/log/events file, and sslvpn access events to the /var/log/sslvpnevents file, delete these files.

The appliance displays a message similar to the “Jun 21 12:20:18 ns /flash/ns-10.0-47.15: [1/2]dc0: NIC hang condition #663: TX 10000/10000, RX 0, HF 0” message on the console. What is the meaning of this message?

The message consists of the following components (shown here as examples):

- #663: Number of times this condition has occurred on the appliance.
• **TX 10000/10000**: Number of packets that the appliance attempted to transmit, and number of packets transmitted. If both numbers are the same, as in this example, the NIC transmitted all the packets that the appliance attempted to transmit.
• **RX 0**: Number of packets received. In this example, no packet was received.
• **HFO**: Number of hardware issues reported by the NIC. In this example, the NIC did not report any hardware issue.

If the appliance does not receive any packets, it reports a hang condition, because on a network it is very unlikely not to receive any packets. However, if the appliance is plugged into quite interface, you can ignore this error message.

**After I upgraded the NetScaler release on the appliance, the appliance still displays the earlier release/build. What could be the reason?**

The appliance displays the software version number from the `/flash/boot/loader.conf` file. If the kernel entry for the current NetScaler release is missing from that file, the appliance displays the last NetScaler release version for which the entry was available.

To resolve this issue, do the following:

1. Verify that the kernel file exists in the `/nsconfig` directory.
2. Check the `/flash/boot/loader.conf` file for an entry for the kernel.
   (You can expect the entry for the kernel of the release/build that you just installed to be missing from the file.)
3. Open the `loader.conf` file in a text editor, such as the `vi` editor, and update the kernel entry for the new release/build.
4. Save and close the file.
5. Repeat step 2 through step 4 for the `/flash/boot/loader.conf.local` file.
6. Update the release/build entry in the `ns.conf` file.
7. Restart the appliance.

**Since I upgraded the NetScaler release on the appliance, the LCD display on the front panel of the appliance displays the out of service message or does not display anything. How can I resolve this issue?**

Run the following command from the appliance's shell prompt:

```
1 /netscaler/nsld -k
```

I have upgraded the NetScaler release/build. However, after the upgrade process, the appliance fails to start. Can I downgrade the appliance's software to the previous release/build?
Yes. You can start the appliance with the kernel.old kernel file. When you restart the appliance, press the F1 key as soon as the appliance console displays the Press F1 message. Type kernel.old and press Enter.

After upgrading the NetScaler release on the appliance, I accidentally deleted the kernel file from the /flash directory. As a result, I am not able to start the appliance. Is there a method for starting the appliance in this situation?

Yes. You can start the appliance by using the kernel.GENERIC kernel file, as follows:

1. When you restart the appliance, press the F1 key as soon as the appliance console displays the Press F1 message.
2. Type kernel.GENERIC and press Enter.
3. Login as the root user.
4. Reinstall the NetScaler release.
5. Restart the appliance.

After upgrading the appliance software to NetScaler release 10.0, I am not able to log on to the appliance, and the following message is appears:

```
1 ‘‘
2 login: nsroot
3 Password:
4 connect: No such file or directory
5 nsnet_connect: No such file or directory
6 Login incorrect
7 ‘‘
```

I tried to resolve this issue by using the password recovery procedure, but I was not successful. Have I done something incorrectly?

You cannot resolve this issue by using the password recovery procedure. NetScaler releases 8.0 and later use the new licensing system, based on the Imgrd daemon, which runs during the startup procedure. For this daemon to work properly, the host name of NetScaler appliance, which is set in the /nsconfig/rc.conf file, must be resolved by a name server to the NetScaler IP address. Alternately, you can create a hosts file in the /nsconfig directory and add the 127.0.0.1 <Host_Name> entry in file. Additionally, make sure that you have copied the license files to the /nsconfig/license/ directory.

During an upgrade of a high availability pair, the following message appears repeatedly:

<auth.err> ns sshd[5035]: error: Invalid username or password

What could be the reason?

This error message appears when the appliances involved in the high availability pairing have either a different NetScaler release or a different builds of the same release installed. The appliances can have different version installed if you have upgraded or downgraded one appliance but not the other.
I want to change the netmask of the NetScaler IP address on a NetScaler appliance. Can I do so without causing an outage?

Changing the netmask of the NetScaler IP might result in a short outage. Make sure that you change the netmask on the secondary appliance, and then break the high availability pairing. Check the functionality of the appliance. If everything works as expected, rebuild the high availability pairing.

To change the netmask on the appliance, run the configns command from the CLI prompt, and then choose the second option in the menu.

I have configured a High Availability pair of NetScaler appliances. After upgrading the software release from a beta release to a final release, I noticed that some of the appliance configurations are missing. Can I retrieve the lost configurations?

You can use the following procedure to restore the configuration:

1. Log on to the NetScaler command line of the primary appliance.
2. Run the following commands:

   ```
   1 save config
   2 shell
   3 \#cp /nsconfig/ns.conf /nsconfig/ns.conf.bkup
   4 The ns.conf.bkup file is a backup for the running configuration.
   5
   6
   7
   8
   9
   10
   11
   12
   13
   14
   15
   16
   17
   18
   19
   20
   ```

3. Upgrade software of both the appliances to the final release.
4. Log on to the NetScaler command line of the primary appliance.

Can I upgrade a NetScaler appliance directly from release 10.0 to 10.5, or should I upgrade to 10.1 first and then to 10.5?

You can directly upgrade a NetScaler appliance regardless of the version or the build number.

Can the primary appliance and secondary appliance have separate builds?

Recommended practice is to use the same version and build number on both the primary and the secondary appliance.

Can both the appliances in an High Availability (HA) pair be upgraded at the same time?

No. In an HA pair, first upgrade the secondary node and then upgrade the primary node.

For details, refer Upgrading a High Availability Pair.

Does Citrix support firmware upgrades in the amazon AWS cloud?

Yes.
**Can I upgrade the NetScaler instance independently of the SDX version?**

It is not required to upgrade the SDX version when the NetScaler appliance is upgraded. However, some features might not work.

**Can I use the FTP server to upgrade the NetScaler appliance?**

No. You must first download the firmware from the Citrix download site, save it on your local computer and then upgrade the appliance.

**Is the procedure for upgrading the NetScaler appliance with GSLB configurations different from an upgrade of an appliance that is not involved in GSLB?**

No. The upgrade procedure is similar to the basic upgrade procedure. The only difference is that you can upgrade the standalone or HA appliances on different sites in a phased manner.

## Downgrade

I have received a NetScaler appliance with the latest NetScaler release installed on it. However, I want to downgrade the software release. Can I do so?

No. If you attempt to downgrade the software release, the appliance might not work as expected, because the ns.conf file of the later release might not be compatible with the earlier release, and the appliance might restore to the factory settings.

When downgrading the NetScaler release, I followed the instructions. However, the appliance displays the following message:

```bash
root@LBCOL03B# ./installns
installns version (10.0-47.7) kernel (ns-10.0-47.7.gz)
Note:
Installation may pause for up to 3 minutes while data is written to the flash.
Caution:
Do not interrupt the installation process.
Doing so may cause the system to become unusable.
Installation will proceed in 5 seconds, CTRL-C to abort
No Valid Netscaler Version Detected
root@LBCOL03B#
```

**How is the rollback procedure performed on a NetScaler appliance?**

The rollback procedure is similar to the basic upgrade procedure. Select the target build that you want to roll back to and perform the downgrade. Before rolling back to a different release, Citrix recommends that you create a copy of your current configuration files. To downgrade from a release, see **Downgrading a NetScaler Standalone Appliance**.
**Load Balancing**

September 25, 2018

- **What are the various load balancing policies I can create on the NetScaler appliance?**

  You can create the following types of load balancing policies on the NetScaler appliance:
  - Least Connections
  - Round Robin
  - Least response time
  - Least bandwidth
  - Least packets
  - URL hashing
  - Domain name hashing
  - Source IP address hashing
  - Destination IP address hashing
  - Source IP - Destination IP hashing
  - Token
  - LRTM

- **Can I achieve the Web farm security by implementing load balancing using the NetScaler appliance?**

  Yes. You can achieve Web farm security by implementing load balancing using the NetScaler appliance. NetScaler appliance enables you to implement the following options of the load balancing feature:
  - IP Address hiding: Enables you to install the actual servers to be on private IP address space for security reasons and for IP address conservation. This process is transparent to the end-user because the NetScaler appliance accepts requests on behalf of the server. While in the address hiding mode, the appliance completely isolates the two networks. Therefore, a client can access a service running on the private subnet, such as FTP or a Telnet server, through a different VIP on the appliance for that service.
  - Port Mapping: Enables the actual TCP services to be hosted on non-standard ports for security reasons. This process is transparent to the end-user as the NetScaler appliance accepts requests on behalf of the server on the standard advertised IP address and port number.

- **What are various devices that I can use to load balance with a NetScaler appliance?**

  You can load balance following devices with a NetScaler appliance:
  - Server farms
  - Caches or Reverse Proxies
- Firewall devices
- Intrusion detection systems
- SSL offload devices
- Compression devices
- Content Inspection servers

**Why should I implement the load balancing feature for the website?**

You can implement the Load balancing feature for the website to take the following advantages:

- **Reduce the response time:** When you implement the load balancing feature for the website, one of the major benefits is the boost you can look forward to in load time. With two or more servers sharing the load of the web traffic, each of the servers runs less traffic load than a single server alone. This means there are more resources available to fulfill the client requests. This results in a faster website.
- **Redundancy:** Implementing the load balancing feature introduces a bit of redundancy. For example, if the website is balanced across three servers and one of them does not respond at all, the other two can keep running and the website visitors do not even notice any downtime. Any load balancing solution immediately stops sending traffic to the backend server that is not available.

**Why do I need to disable the Mac Based Forwarding (MBF) option for Link Load Balancing (LLB)?**

- If you enable the MBF option, the NetScaler appliance considers that the incoming traffic from the client and the outgoing traffic to the same client flow through the same upstream router. However, the LLB feature requires that the best path be chosen for the return traffic.
- Enabling the MBF option breaks this topology design by sending the outgoing traffic through the router that forwarded the incoming client traffic.

**What are the various persistence types available on the NetScaler appliance?**

The NetScaler appliance supports the following persistence types:

- Source IP
- Cookie insert
- SSL session ID
- URL passive
- Custom Server ID
- Rule
- DESTIP
NetScaler GUI

January 6, 2019

- **When I use Firefox to compare two NetScaler configurations, the browser seems to freeze?**

  Firefox will eventually display the differences in the configurations, but the process takes a considerable amount of time if there are more than 1000 differences. Use Chrome for a faster response.

- **I am using a MAC Safari browser to upgrade a NetScaler appliance. On the upgrade wizard, when I click the Browse button to choose the build file from the appliance, the dialog box does not show any files or folders. Also, when I navigate back to the root folder, the dialog box displays the top level folder, but I cannot browse it. What should I do?**

  On the Safari browser, click the Settings icon and navigate to Preferences > Security > Manage Website Settings > Java, and then change value of the When visiting other websites setting to Run in unsafe mode.

- **What should I do before accessing the NetScaler GUI?**

  Before accessing a new version of the NetScaler software:
  - Clear browser cache including cookies.
  - Access GUI in browser incognito mode.
  - Access GUI in some other browser.
  - Uncheck ‘Use software acceleration’ option in setting and restart the browser.
  - Access chrome: extensions, uncheck the ‘Enable’ box and restart Chrome browser.

- **I am using HTTP to access the NetScaler GUI. Which port should I open?**

  Open TCP port 80 when using HTTP to access the NetScaler GUI.

- **I am using HTTPS to access the NetScaler GUI. Which port should I open?**

  Open TCP port 443 when using HTTPS to access the NetScaler GUI.

- **With which browsers is the NetScaler GUI compatible for different operating systems?**

  The following table lists the compatible browsers:

<table>
<thead>
<tr>
<th>Operating System</th>
<th>Browser</th>
<th>Versions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows 7</td>
<td>Internet Explorer</td>
<td>8 and 9</td>
</tr>
<tr>
<td>Windows 7</td>
<td>Mozilla Firefox</td>
<td>3.6.25 and above</td>
</tr>
<tr>
<td>Windows 7</td>
<td>Chrome</td>
<td>15 and above</td>
</tr>
<tr>
<td>Windows 64 bit</td>
<td>Internet Explorer</td>
<td>8 and 9</td>
</tr>
<tr>
<td>Windows 64 bit</td>
<td>Chrome</td>
<td>15 and above</td>
</tr>
</tbody>
</table>
When I access the NetScaler GUI by using Internet Explorer version 8 or 9, the browser displays only a grey bar at the top of the screen. What should I do?

The browser might be set in compatibility mode. To disable compatibility mode, go to Tools > Compatibility View Settings and clear the Display all websites in Compatibility View check box.

Even after I disable compatibility mode in Internet Explorer version 8 or 9, the NetScaler GUI does not appear. What should I do?

Make sure that the browser mode and document mode in the browser are set to the same version. To view the configuration, press F12. Set the values to either Internet Explorer 8 or Internet Explorer 9.

After logging into the NetScaler appliance, the page appears blank. What should I do?

Make sure you have disabled the Protected mode in your browser settings. If this is enabled, the Java Script is causing the NetScaler user interface screen to appear blank.

To disable this option:

1. In your IE browser settings, go to Internet Options.
2. Go to Security tab settings, click Restricted sites zone to disable Enable Protected Mode check box.
3. Click Apply and OK.

When I access the NetScaler GUI by using Internet Explorer version 9, the utility displays the following error message: “You are not logged in. Please login.” What should I do?

Make sure that the cookies are not blocked in your Internet Explorer settings. Go to Tools > Internet Options. Click the Privacy tab, and then under Settings, make sure that the slider is set to Medium or any lower value.

Solutions for Telecom Service Providers

September 17, 2018
Information and Communication Technology (ICT) is about bringing the Internet user closer to the apps and data. The latest datacenter technologies have enabled the user, apps and data to be located anywhere. A user can access apps and data from the office or from home, or from a location such as an airport. The apps and data can be located either on the enterprise’s premises, in a public or private cloud, or on a hybrid host. The result has been on only increased productivity, but also reduced costs of ownership and maintenance.

Service providers offer the core infrastructure needed for carrying the user’s apps and data over the network. Because the core infrastructure serves millions of subscribers and a wide variety of apps and data, requirements for scale and protocol support are very high. The core infrastructure handles two major types of traffic: data plane and control plane. Each of these planes has its own scale and protocol-support requirements.

The data plane is the part of the core infrastructure that carries user apps and data from end to end, that is, between end-user equipment and the application server. The number of users accessing apps and data is in the thousands of millions, so throughput and IP-addressing requirements are very high. Every user in the network must be uniquely identifiable. Only then can the service provider control the traffic, monitor network usage, deliver user-specific services, and log information correctly. Many of the today’s client devices and application servers support IPv6 natively. The core infrastructure must not only support a mix of IPv4 and IPv6 clients and servers, but also provide the technologies for cross-communication between IPv4 and IPv6. Finally, a service provider is measured by the quality of service (directly related to end-user experience) and the availability of service without disruptions. The data plane should be resilient enough to provide both quality and availability at the same time.

The control-plane infrastructure manages user traffic and maintains the business and network operations services. The most important of the many protocols that run in this plane are Diameter, Radius, and SMPP. Diameter is a base protocol over which several other function-specific protocols have been developed. For example:

- Gx interface between the Policy and Charging Enforcement Function (PCEF) and the Policy and Charging Rules Function (PCRF)
- Gy interface between the Online Charging System (OCS) and the Cisco Packet Data Network Gateway (PGW)/Policy and Charging Enforcement Function (PCEF)

The volume of control plane traffic is in direct proportion to user activity. To manage the control plane traffic, service providers use several ADC functionalities, such as load balancing and content switching. They need fine-grain control of control plane traffic, which equals data-plane traffic in complexity.

Service providers must meet demanding service-level agreements (SLAs), and are scrutinized thoroughly by regulators for compliance. Adhering to requirements while managing the data and control plane traffic requires a service provider to keep its infrastructure nimble, within budget, easily upgradable, and flexible. As the most powerful and advanced ADCs in the market today, NetScaler ADC products are a natural fit for the service-provider environment.
Large Scale NAT

January 6, 2019

Note

This feature is available with a NetScaler enterprise or platinum edition license.

The Internet’s phenomenal growth has resulted in a shortage of public IPv4 addresses. Large Scale NAT (LSN/CGNAT) provides a solution to this issue, maximizing the use of available public IPv4 addresses by sharing a few public IPv4 addresses among a large pool of Internet users.

LSN translates private IPv4 addresses into public IPv4 addresses. It includes network address and port translation methods to aggregate many private IP addresses into fewer public IPv4 addresses. LSN is designed to handle NAT on a large scale. The NetScaler LSN feature is very useful for Internet Service Providers (ISPs) and carriers providing millions of translations to support a large number of users (subscribers) and at very high throughput.

LSN Architecture

The LSN architecture of an ISP using Citrix products consists of subscribers (Internet users) in private address spaces accessing the Internet through a NetScaler appliance deployed in ISP’s core network. Subscribers are connected to the ISP through the ISP’s access network. Usually, subscribers for commercial use of the Internet are directly connected to the ISP’s access network. Serving those subscribers requires only one level of NAT (NAT44).

Noncommercial subscribers, however, are typically behind customer-premises equipment (CPE), such as routers and modems, that also implements NAT. These two levels of NAT create the NAT444 model. Deploying a NetScaler appliance in an ISP’s core network for LSN functionality is transparent to the subscribers and requires no configuration changes to subscribers or the CPEs.

The NetScaler appliance receives all subscriber packets destined to the Internet. The appliance is configured with a pool of pre-defined NAT IP addresses to use for LSN. The NetScaler appliance uses its LSN feature to translate the source IP address (private) and port of the packet to the NAT IP address (public) and NAT port, and then sends the packet to its destination on the Internet. The appliance maintains a record of all active sessions that use the LSN feature. These sessions are called LSN sessions. The NetScaler appliance also maintains the mappings between subscriber IP address and port, and NAT IP address and port, for each session. These mappings are called LSN mappings. From LSN sessions and LSN mappings, the NetScaler appliance recognizes a response packet (received from the Internet) belonging to a particular session. The appliance translates the destination IP address and port of the response packet from NAT IP address:port to the subscriber IP address:port, and sends the translated packet to the subscriber.
LSN Features Supported on NetScaler appliance

The following describes some of the LSN features supported on NetScaler appliance:

NAT Resource Allocation

The NetScaler appliance allocates NAT IP addresses and ports, from its pre-defined NAT resource pool, to subscribers to translate their packets for transmission to external hosts (Internet). The NetScaler appliance supports the following types of NAT IP address and port allocation for subscribers:

- **Deterministic.** The NetScaler appliance allocates a NAT IP address and a block of ports to each subscriber. The appliance sequentially allocates NAT resources to these subscribers. It assigns the first block of ports on the beginning NAT IP address to the beginning subscriber IP address. The next range of ports is assigned to the next subscriber, and so on, until the NAT address does not have enough ports for the next subscriber. At that point, the first port block on the next NAT address is assigned to the subscriber, and so on.

  The NetScaler appliance logs the allocated NAT IP address and the port block for a subscriber. For a connection, a subscriber can be identified just by its mapped NAT IP address and port block. Because of this reason, the NetScaler appliance does not log any LSN session created or deleted. If the entire block of ports is being used, the NetScaler appliance drops any new connection from the subscriber.

- **Dynamic.** The NetScaler appliance allocates a random NAT IP address and a port from the LSN NAT pool for a subscriber’s connection. When port block allocation is enabled in the configuration, the appliance allocates a random NAT IP address and a block of ports for a subscriber when it initiates a connection for the first time. The NetScaler appliance then allocates this NAT IP address and one of the ports from the allocated block to each subsequent connection from this subscriber. If the entire block of ports is being used, the appliance allocates a new random port block to the subscriber when it initiates a new connection. One of the port in the new port block is allocated for the new connection.

IP Pooling

The following NAT resource allocation options are available for subsequent sessions of a subscriber who was allocated a random NAT IP address and port for an existing session.

- **Paired.** The NetScaler appliance allocates the same NAT IP address for all sessions associated with the same subscriber. When no more ports are available for that address, the appliance drops any new connections from the subscriber. This option is needed for proper functioning of certain applications that require creation of multiple sessions on the same source IP address (for example in peer-to-peer applications that use RTP or RTCP protocol.)
- **Random.** The NetScaler appliance allocates random NAT IP addresses, from the pool, for different sessions associated with the same subscriber.

**Reusing LSN Mappings**

The NetScaler appliance can reuse an existing LSN map for new connections originating from the same subscriber IP address and port. The NetScaler LSN feature supports the following types of LSN mapping reuse:

1. **Endpoint Independent.** The NetScaler appliance reuses the LSN mapping for subsequent packets sent from the same subscriber IP address and port (X:x) to any external IP address and port. This type of LSN map reuse is useful for proper functioning of VOIP and peer-to-peer applications.
2. **Address dependent.** The NetScaler appliance reuses the LSN mapping for subsequent packets sent from the same subscriber IP address and port (X:x) to the same external IP address (Y), regardless of the external port.
3. **Address port dependent.** The NetScaler appliance reuses the LSN mapping for subsequent packets sent from the same internal IP address and port (X:x) to the same external IP address and port (Y:y) while the mapping is still active.

**LSN Filtering**

The NetScaler appliance can filter packets from external hosts based on the active LSN sessions and LSN mappings. Consider an example of an LSN mapping that includes the mapping of subscriber IP:port (X:x), NAT IP:port (N:n), and external host IP:port (Y:y). The NetScaler LSN feature supports the following types of filtering:

1. **Endpoint Independent.** The NetScaler appliance filters out only those packets that are not destined to NAT IP:port (N:n), which represents subscriber IP:port (X:x), regardless of the external host IP address and port source (Z:z). The NetScaler appliance forwards any packets destined to X:x. In other words, sending packets from the subscriber to any external IP address is sufficient to allow packets from any external host to the subscriber. This type of filtering is useful for proper functioning of VOIP and peer-to-peer applications.
2. **Address dependent.** The NetScaler appliance filters out packets not destined to NAT IP:port (N:n), which represents subscriber IP:port (X:x). In addition, the appliance filters out packets from external host IP address and port (Y:y) destined for N:n if the subscriber has not previously sent packets to Y:anyport (external port independent). In other words, receiving packets from a specific external host requires that the subscriber first send packets to that specific external host's IP address.
3. **Address port dependent.** The NetScaler appliance filters out packets not destined to NAT IP:port (N:n), which represents subscriber IP:port (X:x). In addition, the appliance filters out...
packets from external host IP address and port (Y:y) destined for N:n if the subscriber has not previously sent packets to Y:y. In other words, receiving packets from a specific external host requires that the subscriber first send packets to that specific external IP address and port.

**Quotas**

The NetScaler appliance can limit the number of NAT ports and sessions for each subscriber to ensure fair distribution of resources among subscribers. The NetScaler appliance can also limit the number of session for a subscriber group to ensure fair distribution of resources among different subscriber groups.

- **Port quota.** The NetScaler appliance can limit the LSN NAT ports to be used at a time by each subscriber for a specified protocol. For example, you could limit each subscriber to a maximum of 500 TCP NAT ports. When the LSN NAT mappings for a subscriber reach the limit, the NetScaler appliance does not allocate additional NAT ports of the specified protocol to that subscriber.

- **Subscriber Session Limit.** The number of concurrent session for a subscriber can be more than its port quota. The NetScaler appliance can limit the LSN sessions allowed for each subscriber for a specified protocol. When the number of LSN sessions reaches the limit for a subscriber, the NetScaler appliance does not allow the subscriber to open additional sessions of the specified protocol.

- **Group Session Limit.** The NetScaler appliance can limit the total number of LSN sessions allowed for a subscriber group for a specified protocol. When the total number of LSN sessions reaches the limit for a group for a specified protocol, the NetScaler appliance does not allow any subscriber of the group to open additional sessions of the specified protocol. For example, You limit a group to a maximum of 10000 UDP sessions. When the total number of UDP sessions for this group reaches 10000, the NetScaler appliance does not allow any subscriber of the group to open additional UDP sessions.

**Application Layer Gateways**

For some Application layer protocols, the IP addresses and protocol port numbers are also communicated in the packet’s payload. Application Layer Gateway for a protocol parses the packet’s payload and does necessary changes to ensure that the protocol continues to work over LSN.

The NetScaler appliance supports ALG for the following protocols:

- FTP
- ICMP
- TFTP
- PPTP
Hairpin Support

The NetScaler appliance supports communication between subscribers or internal hosts using NAT IP addresses. This type of communication between two subscribers using NAT IP addresses is called hairpin flow. Hairpin flow is enabled by default, and you cannot disable it.

Points to Consider before Configuring LSN

September 17, 2018

Consider the following points before configuring LSN on a NetScaler appliance:

- Make sure that you understand the different components of Large Scale NAT, described in RFCs 6888, 5382, 5508, and 4787.
- Endpoint independent mapping (EIM) and endpoint independent filtering (EIF) are disabled by default. These options must be enabled for proper functioning of VoIP and peer-to-peer (P2P) applications.

Logging LSN: Following are the consideration points for logging LSN information:
  - Citrix recommends logging the LSN information on external log servers instead of on the NetScaler appliance. Logging on external servers facilitates optimal performance when the appliance creates large numbers of LSN log entries (in order of millions).
  - Citrix recommends using SYSLOG over TCP, or NSLOG. By default SYSLOG uses UDP, and NSLOG uses only TCP to transfer log information to the log servers. TCP is more reliable than UDP for transferring complete data.
  - The following limitations apply to SYSLOG over TCP:
    * The Syslog over TCP solution does not provide authentication, integrity check, and privacy.
    * The NetScaler appliance relies on the TCP protocol to provide confirmation of SYSLOG message delivery to external log servers.

High Availability: Following are the consideration points for high availability of NetScaler appliances for LSN:
  - Citrix recommends configuring the LSN feature in a high availability deployment of two NetScaler appliances for uninterrupted and seamless operation of all LSN sessions.
  - In a high availability deployment, Citrix recommends:
    * Setting the SYNC VLAN parameter for dedicating a VLAN for all HA related communication.
* Synchronizing the symmetric RSS key of the primary node to the secondary node for stateful synchronization of a large number of LSN mappings and sessions.
* Binding the subnet of LSN IP addresses to a VLAN to avoid flooding of GARP broadcasts on all VLANs after a failover.
  - In a high availability deployment of NetScaler appliances, ALG-related sessions are not mirrored to the secondary appliance.

**Application Layer Gateways (ALGs):** Following are the consideration points related for ALGs on a NetScaler appliance:

  - The following are not supported for SIP ALG:
    * Multicast IP addresses
    * Encrypted SDP
    * SIP messages over TLS
    * FQDN translation in SIP messages
    * Authentication of SIP messages
    * Traffic domains, admin partitions, and NetScaler clusters.
    * SIP messages with multipart bodies.
  - The following are not supported for RTSP ALG:
    * Multicast RTSP sessions
    * RTSP session over UDP
    * NetScaler traffic domains, admin partitions, and NetScaler clusters
  - The NetScaler appliance does not support ALG for the IPSec protocol.

- If you disable the LSN feature when some LSN sessions exist on the NetScaler appliance, these sessions continue to exist for the duration of the configured timeout interval.
- LSN takes precedence over RNAT. If a packet from a specified LSN subscriber also matches a RNAT rule, the packet is translated according to the LSN configuration.
- Forwarding of packets related only to the LSN sessions is based on the NetScaler appliance’s routing table.
- Unlike with subnet IP addresses, selection of an LSN NAT IP address for a subscriber’s connection is not based on the routing entry for the destination IP address.
- For inbound packets, static LSN mappings take precedence over dynamic LSN mappings.
- For outbound packets, LSN application profiles take precedence over static mapping.
- When a large number of LSN sessions (> 1 million) exist on the NetScaler appliance, Citrix recommends displaying selected LSN sessions instead of all of them. In the command line interface or the configuration utility, use the selection parameters for showing LSN session operation.
- LSN is not supported in a NetScaler cluster.
- To reduce the amount of active memory allocated to the LSN feature, you must warm restart the NetScaler appliance after changing the configured-memory setting. Without a warm restart, you can only increase the amount of active memory.
**Configuration Steps for LSN**

September 17, 2018

Configuring LSN on a NetScaler appliance consists of the following tasks:

1. **Set the global LSN parameters.** Global parameters include the amount of NetScaler memory reserved for the LSN feature and synchronization of LSN sessions in a high availability setup.

2. **Create an LSN client entity and bind subscribers to it.** An LSN client entity is a set of subscribers on whose traffic you want the NetScaler appliance to perform LSN. The client entity includes IPv4 addresses and extended ACL rules for identifying subscribers. An LSN client can be bound to only one LSN group. The command line interface has two commands for creating an LSN client entity and binding a subscriber to the LSN client entity. The configuration utility combines these two operations on a single screen.

3. **Create an LSN pool and bind NAT IP addresses to it.** An LSN pool defines a pool of NAT IP addresses to be used by the NetScaler appliance to perform LSN. The pool is assigned parameters, such as port block allocation and NAT type (Deterministic or Dynamic). An LSN pool bound to an LSN group applies to all subscribers of an LSN client entity bound to the same group. Only LSN Pools and LSN groups with the same NAT type settings can be bound together. Multiple LSN pools can be bound to an LSN group. For Deterministic NAT, an LSN pool can be bound to multiple LSN groups. For Deterministic NAT, pools bound to an LSN group cannot be bound to other LSN groups. The command line interface has two commands for creating an LSN pool and binding NAT IP addresses to the LSN pool. The configuration utility combines these two operations on a single screen.

4. **(Optional) Create an LSN Transport Profile for a specified protocol.** An LSN transport profile defines various timeouts and limits, such as maximum LSN sessions and maximum ports usage, that a subscriber can have for a given protocol. You bind an LSN transport profile for each protocol (TCP, UDP, and ICMP) to an LSN group. A profile can be bound to multiple LSN groups. A profile bound to an LSN group applies to all subscribers of an LSN client bound to the same group. By default, one LSN transport profile with default settings for TCP, UDP, and ICMP protocols is bound to an LSN group during its creation. This profile is called default transport profile. An LSN transport profile that you bind to an LSN group overrides the default LSN transport profile for that protocol.

5. **(Optional) Create an LSN Application Profile for a specified protocol and bind a set of destination ports to it.** An LSN application profile defines the LSN mapping and LSN filtering controls of a group for a given protocol and for a set of destination ports. For a set of destination ports, you bind an LSN profile for each protocol (TCP, UDP, and ICMP) to an LSN group. A profile can be bound to multiple LSN groups. An LSN application profile bound to an LSN group applies to all subscribers of an LSN client bound to the same group. By default, one LSN application profile with default settings for TCP, UDP, and ICMP protocols for all destination ports is bound to an LSN group during its creation. This profile is called a default application profile. When you
bind an LSN application profile, with a specified set of destination ports, to an LSN group, the bound profile overrides the default LSN application profile for that protocol at that set of destination ports. The command line interface has two commands for creating an LSN application profile and binding a set of destination ports to the LSN application profile. The configuration utility combines these two operations on a single screen.

6. **Create an LSN Group and bind LSN pools, (optional) LSN transport profiles, and (optional) LSN application profiles to the LSN group.** An LSN group is an entity consisting of an LSN client, LSN pool(s), LSN transport profile(s), and LSN application profile(s). A group is assigned parameters, such as port block size and logging of LSN sessions. The parameter settings apply to all the subscribers of an LSN client bound to the LSN group. Only LSN Pools and LSN groups with the same NAT type settings can be bound together. Multiples LSN pools can be bound to an LSN group. For Dynamic NAT, an LSN pool can be bound to multiple LSN groups. For Deterministic NAT, pools bound to an LSN group cannot be bound to other LSN groups. Only one LSN client entity can be bound to an LSN group, and an LSN client entity bound to an LSN group cannot be bound to other LSN groups. The command line interface has two commands for creating an LSN group and binding LSN pools, LSN transport profiles, LSN application profiles to the LSN group. The configuration utility combines these two operations in a single screen.

The following table lists the maximum numbers of different LSN entities and bindings that can be created on a NetScaler appliance. These limits are also subject to memory available on the NetScaler appliance.

<table>
<thead>
<tr>
<th>LSN entities and bindings</th>

**Configuration Using the Command Line Interface**

**To create an LSN client by using the command line interface**

At the command prompt, type:

1. `add lsn client <clientname>`
2. `show lsn client`

**To bind a network address or an ACL rule to an LSN client by using the command line interface**

At the command prompt, type:

1. `bind lsn client <clientname> ((-network <ip_addr> [-netmask <netmask>] [-td<positive_integer>]) | -aclname <string>)`
2. `show lsn client`

**To create an LSN pool by using the command line interface**

At the command prompt, type:

1. `add lsn pool <poolname> [-nattype ( DYNAMIC | DETERMINISTIC )] [-portblockallocation ( ENABLED | DISABLED )] [-portrealloctimeout <secs>] [-maxPortReallocTmq <positive_integer>]`
2. `show lsn pool`
To bind an IP address range to an LSN pool by using the command line interface

At the command prompt, type:

1  bind lsn pool <poolname> <lsnip>
2  
3  show lsn pool

**Note:** For removing LSN IP addresses from an LSN pool, use the `unbind lsn pool` command.

To create an LSN transport profile by using the command line interface

At the command prompt, type:

1  add lsn transportprofile <transportprofilename> <transportprotocol> [-sessiontimeout <secs>] [-firsttimeout <secs>] [-portquota < positive_integer>] [-sessionquota <positive_integer>] [-portpreserverarity ( ENABLED | DISABLED )] [-portpreserverange ( ENABLED | DISABLED )] [-syncheck ( ENABLED | DISABLED )]
2  
3  show lsn transportprofile

To create an LSN application profile by using the command line interface

At the command prompt, type:

1  add lsn appsprofile <appsprofilename> <transportprotocol> [-ippooling ( PAIRED | RANDOM )] [-mapping <mapping>] [-filtering <filtering>][-tcpproxy ( ENABLED | DISABLED )] [-td <positive_integer>]
2  
3  show lsn appsprofile

To bind an application protocol port range to an LSN application profile by using the command line interface

At the command prompt, type:

1  bind lsn appsprofile <appsprofilename> <lsnport>
2  
3  show lsn appsprofile
To create an LSN group by using the command line interface

At the command prompt, type:

```
1 add lsn group <groupname> -clientname <string> [-nattype ( DYNAMIC | DETERMINISTIC )] [-portblocksize <positive_integer>] [-logging ( ENABLED | DISABLED )] [-sessionLogging ( ENABLED | DISABLED )][-sessionSync ( ENABLED | DISABLED )] [-snmptraplimit <positive_integer>] [-ftp ( ENABLED | DISABLED )]
2
3 show lsn group
```

To bind LSN profiles and LSN pools to an LSN group by using the command line interface

At the command prompt, type:

```
1 bind lsn group <groupname> (-poolname <string> | -transportprofilename <string> | -appsprofilename <string>)
2
3 show lsn group
```

**Configuration Using the Configuration Utility**

To configure an LSN client and bind an IPv4 network address or an ACL rule by using the configuration utility

Navigate to **System > Large Scale NAT > Clients**, and add a client and then bind an IPv4 network address or an ACL rule to the client.

To configure an LSN pool and bind NAT IP addresses by using the configuration utility

Navigate to **System > Large Scale NAT > Pools**, and add a pool and then bind an NAT IP address or a range of NAT IP addresses to the pool.

To configure an LSN transport profile by using the configuration utility

1. Navigate to **System > Large Scale NAT > Profiles**.
2. On the details pane, click **Transport** tab, and then add a transport profile.

To configure an LSN application profile by using the configuration utility

1. Navigate to **System > Large Scale NAT > Profiles**.
2. On the details pane, click **Application** tab, and then add an application profile.
To configure an LSN group and bind an LSN client, pools, transport profiles, and application profiles by using the configuration utility

Navigate to **System > Large Scale NAT > Groups**, and add a group and then bind an LSN client, pools, transport profiles, and application profiles to the group.

**Parameter Descriptions (of commands listed in the CLI procedure)**

- **add lsn client**
  - **clientname**
    
    Name for the LSN client entity. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN client is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “lsn client1” or ‘lsn client1’).

    This is a mandatory argument. Maximum Length: 127

- **bind lsn client**
  - **clientname**
    
    Name for the LSN client entity. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN client is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “lsn client1” or ‘lsn client1’).

    This is a mandatory argument. Maximum Length: 127
  - **network**
    
    IPv4 address(es) of the LSN subscriber(s) or subscriber network(s) on whose traffic you want the NetScaler appliance to perform Large Scale NAT.
  - **netmask**
    
    Subnet mask for the IPv4 address specified in the Network parameter.

    Default value: 255.255.255.255
- **td**
  
  ID of the traffic domain on which this subscriber or the subscriber network (as specified by the network parameter) belongs.

  If you do not specify an ID, the subscriber or the subscriber network becomes part of the default traffic domain.

  Default value: 0

  Minimum value: 0

  Maximum value: 4094

- **acname**
  
  Name(s) of any configured extended ACL(s) whose action is ALLOW. The condition specified in the extended ACL rule identifies the traffic from an LSN subscriber for which the NetScaler appliance is to perform large scale NAT. Maximum Length: 127

### Parameter Descriptions (of commands listed in the CLI procedure)

- **add lsn pool**
  
  - **poolname**
    
    Name for the LSN pool. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN pool is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “lsn pool1” or ‘lsn pool1’).

    This is a mandatory argument. Maximum Length: 127

  - **nattype**
    
    Type of NAT IP address and port allocation (from the LSN pools bound to an LSN group) for subscribers (of the LSN client entity bound to the LSN group):

    Available options function as follows:

    - **Deterministic**—Allocate a NAT IP address and a block of ports to each subscriber (of the LSN client bound to the LSN group). The NetScaler appliance sequentially allocates NAT resources to these subscribers. The NetScaler appliance assigns the first block of ports (block size determined by the port block size parameter of the LSN group) on the beginning NAT IP address to the beginning subscriber IP address. The next range of ports is assigned to the next subscriber, and so on, until the NAT address
NetScaler 12.0

does not have enough ports for the next subscriber. In this case, the first port block on the next NAT address is used for the subscriber, and so on. Because each subscriber now receives a deterministic NAT IP address and a block of ports, a subscriber can be identified without any need for logging. For a connection, a subscriber can be identified based only on the NAT IP address and port, and the destination IP address and port.

* Dynamic—Allocate a random NAT IP address and a port from the LSN NAT pool for a subscribers connection. If port block allocation is enabled (in LSN pool) and a port block size is specified (in the LSN group), the NetScaler appliance allocates a random NAT IP address and a block of ports for a subscriber when it initiates a connection for the first time. The appliance allocates this NAT IP address and a port (from the allocated block of ports) for different connections from this subscriber. If all the ports are allocated (for different subscribers connections) from the subscribers allocated port block, the appliance allocates a new random port block for the subscriber. Only LSN Pools and LSN groups with the same NAT type settings can be bound together. Multiples LSN pools can be bound to an LSN group.

Possible values: DYNAMIC, DETERMINISTIC

Default value: DYNAMIC

- portblockallocation

Allocate a random NAT port block, from the available NAT port pool of an NAT IP address, for each subscriber when the NAT allocation is set as Dynamic NAT. For any connection initiated from a subscriber, the NetScaler appliance allocates a NAT port from the subscribers allocated NAT port block to create the LSN session.

You must set the port block size in the bound LSN group. For a subscriber, if all the ports are allocated from the subscribers allocated port block, the NetScaler appliance allocates a new random port block for the subscriber.

For Deterministic NAT, this parameter is enabled by default, and you cannot disable it.

Possible values: ENABLED, DISABLED

Default value: DISABLED

- portreallocatetimeout

The waiting time, in seconds, between deallocating LSN NAT ports (when an LSN mapping is removed) and reallocating them for a new LSN session. This parameter is necessary in order to prevent collisions between old and new mappings and sessions. It ensures that all established sessions are broken instead of redirected to a different subscriber. This is not applicable for ports used in:
* Deterministic NAT
* Address-Dependent filtering and Address-Port-Dependent filtering
* Dynamic NAT with port block allocation

In these cases, ports are immediately reallocated.

Default value: 0

Maximum value: 600

- `maxPortReallocTmq`

Maximum number of ports for which the port reallocation timeout applies for each NAT IP address. In other words, the maximum deallocated-port queue size for which the reallocation timeout applies for each NAT IP address.

When the queue size is full, the next port deallocated is reallocated immediately for a new LSN session.

Default value: 65536

Maximum value: 65536

**Parameter Descriptions (of commands listed in the CLI procedure)**

- `bind lsn pool`

  - `poolname`

  Name for the LSN pool. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN pool is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “lsn pool1” or ‘lsn pool1’).

  This is a mandatory argument. Maximum Length: 127

- `lsnip`

  IPv4 address or a range of IPv4 addresses to be used as NAT IP address(es) for LSN.

  After the pool is created, these IPv4 addresses are added to the NetScaler appliance as NetScaler owned IP address of type LSN. An LSN IP address associated with an LSN pool cannot be shared with other LSN pools. IP addresses specified for this parameter must not already exist on the NetScaler appliance as any NetScaler owned IP addresses. In the command line interface, separate the range with a hyphen. For example: 10.102.29.30-10.102.29.189. You can later remove some or all the LSN IP addresses from the pool, and add IP addresses to the LSN pool.
Parameter Descriptions (of commands listed in the CLI procedure)

- `add lsn transportprofile`
  - `transportprofilename`
    Name for the LSN transport profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN transport profile is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “lsn transport profile1” or ‘lsn transport profile1’).
    This is a mandatory argument. Maximum Length: 127
  - `transportprotocol`
    Protocol for which to set the LSN transport profile parameters.
    This is a mandatory argument.
    Possible values: TCP, UDP, ICMP
  - `sessiontimeout`
    Timeout, in seconds, for an idle LSN session. If an LSN session is idle for a time that exceeds this value, the NetScaler appliance removes the session.
    This timeout does not apply for a TCP LSN session when a FIN or RST message is received from either of the endpoints.
    Default value: 120
    Minimum value: 60
  - `finrsttimeout`
    Timeout, in seconds, for a TCP LSN session after a FIN or RST message is received from one of the endpoints.
    If a TCP LSN session is idle (after the NetScaler appliance receives a FIN or RST message) for a time that exceeds this value, the NetScaler appliance removes the session.
    Since the LSN feature of the NetScaler appliance does not maintain state information of any TCP LSN sessions, this timeout accommodates the transmission of the FIN or RST, and ACK messages from the other endpoint so that both endpoints can properly close the connection.
    Default value: 30
- **portquota**
  Maximum number of LSN NAT ports to be used at a time by each subscriber for the specified protocol. For example, each subscriber can be limited to a maximum of 500 TCP NAT ports. When the LSN NAT mappings for a subscriber reach the limit, the NetScaler appliance does not allocate additional NAT ports for that subscriber.

  Default value: 0
  Minimum value: 0
  Maximum value: 65535

- **sessionquota**
  Maximum number of concurrent LSN sessions allowed for each subscriber for the specified protocol. When the number of LSN sessions reaches the limit for a subscriber, the NetScaler appliance does not allow the subscriber to open additional sessions.

  Default value: 0
  Minimum value: 0
  Maximum value: 65535

- **portpreserveparity**
  Enable port parity between a subscriber port and its mapped LSN NAT port. For example, if a subscriber initiates a connection from an odd numbered port, the NetScaler appliance allocates an odd numbered LSN NAT port for this connection. You must set this parameter for proper functioning of protocols that require the source port to be even or odd numbered, for example, in peer-to-peer applications that use RTP or RTCP protocol.

  Possible values: ENABLED, DISABLED

  Default value: DISABLED

- **portpreserverange**
  If a subscriber initiates a connection from a well-known port (0-1023), allocate a NAT port from the well-known port range (0-1023) for this connection. For example, if a subscriber initiates a connection from port 80, the NetScaler appliance can allocate port 100 as the NAT port for this connection.

  This parameter applies to dynamic NAT without port block allocation. It also applies to Deterministic NAT if the range of ports allocated includes well-known ports.

  When all the well-known ports of all the available NAT IP addresses are used in different subscribers connections (LSN sessions), and a subscriber initiates a connection from a well-known port, the NetScaler appliance drops this connection.
Possible values: ENABLED, DISABLED
Default value: DISABLED

- syncheck

   Silently drop any non-SYN packets for connections for which there is no LSN-NAT session present on the NetScaler appliance.

   If you disable this parameter, the NetScaler appliance accepts any non-SYN packets and creates a new LSN session entry for this connection.

   Following are some reasons for the NetScaler appliance to receive such packets:

   * LSN session for a connection existed but the NetScaler appliance removed this session because the LSN session was idle for a time that exceeded the configured session timeout.
   * Such packets can be a part of a DoS attack.

   Possible values: ENABLED, DISABLED
   Default value: ENABLED

**Parameter Descriptions (of commands listed in the CLI procedure)**

- add lsn appsprofile
  
  - appsprofilename

    Name for the LSN application profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN application profile is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “lsn application profile1” or ‘lsn application profile1’).

    This is a mandatory argument. Maximum Length: 127

  - transportprotocol

    Name of the protocol for which the parameters of this LSN application profile applies.

    This is a mandatory argument.

    Possible values: TCP, UDP, ICMP

  - ippooling

    NAT IP address allocation options for sessions associated with the same subscriber.

    Available options function as follows:
**Paired**—The NetScaler appliance allocates the same NAT IP address for all sessions associated with the same subscriber. When all the ports of a NAT IP address are used in LSN sessions (for same or multiple subscribers), the NetScaler appliance drops any new connection from the subscriber.

**Random**—The NetScaler appliance allocates random NAT IP addresses, from the pool, for different sessions associated with the same subscriber.

This parameter is applicable to dynamic NAT allocation only.

Possible values: PAIRED, RANDOM

Default value: RANDOM

- **mapping**

  Type of LSN mapping to apply to subsequent packets originating from the same subscriber IP address and port.

  Consider an example of an LSN mapping that includes the mapping of the subscriber IP:port (X:x), NAT IP:port (N:n), and external host IP:port (Y:y).

  Available options function as follows:

  * **ENDPOINT-INDEPENDENT**—Reuse the LSN mapping for subsequent packets sent from the same subscriber IP address and port (X:x) to any external IP address and port.
  * **ADDRESS-DEPENDENT**—Reuse the LSN mapping for subsequent packets sent from the same subscriber IP address and port (X:x) to the same external IP address (Y), regardless of the external port.
  * **ADDRESS-PORT-DEPENDENT**—Reuse the LSN mapping for subsequent packets sent from the same internal IP address and port (X:x) to the same external IP address and port (Y:y) while the mapping is still active.

  Possible values: ENDPOINT-INDEPENDENT, ADDRESS-DEPENDENT, ADDRESS-PORT-DEPENDENT

  Default value: ADDRESS-PORT-DEPENDENT

- **filtering**

  Type of filter to apply to packets originating from external hosts.

  Consider an example of an LSN mapping that includes the mapping of subscriber IP:port (X:x), NAT IP:port (N:n), and external host IP:port (Y:y).

  Available options function as follows:

  * **ENDPOINT INDEPENDENT**—Filters out only packets not destined to the subscriber IP address and port X:x, regardless of the external host IP address and port source
NetScaler 12.0

(Z:z). The NetScaler appliance forwards any packets destined to X:x. In other words, sending packets from the subscriber to any external IP address is sufficient to allow packets from any external hosts to the subscriber.

* **ADDRESS DEPENDENT**—Filters out packets not destined to subscriber IP address and port X:x. In addition, the appliance filters out packets from Y:y destined for the subscriber (X:x) if the client has not previously sent packets to Y:anyport (external port independent). In other words, receiving packets from a specific external host requires that the subscriber first send packets to that specific external host’s IP address.

* **ADDRESS PORT DEPENDENT** (the default)—Filters out packets not destined to subscriber IP address and port (X:x). In addition, the NetScaler appliance filters out packets from Y:y destined for the subscriber (X:x) if the subscriber has not previously sent packets to Y:y. In other words, receiving packets from a specific external host requires that the subscriber first send packets first to that external IP address and port.

Possible values: ENDPOINT-INDEPENDENT, ADDRESS-DEPENDENT, ADDRESS-PORT-DEPENDENT

Default value: ADDRESS-PORT-DEPENDENT

- **tcpproxy**

Enable TCP proxy, which enables the NetScaler appliance to optimize the TCP traffic by using Layer 4 features.

Possible values: ENABLED, DISABLED

Default value: DISABLED

- **td**

ID of the traffic domain through which the NetScaler appliance sends the outbound traffic after performing LSN.

If you do not specify an ID, the appliance sends the outbound traffic through the default traffic domain, which has an ID of 0.

Default value: 65535

Maximum value: 65535

**Parameter Descriptions (of commands listed in the CLI procedure)**

- **bind lsn appsprofile**

  - **appsprofilename**

    Name for the LSN application profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), pe-
NetScaler 12.0

period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN application profile is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “lsn application profile1” or ‘lsn application profile1’).

This is a mandatory argument. Maximum Length: 127

- lsnport

Port numbers or range of port numbers to match against the destination port of the incoming packet from a subscriber. When the destination port is matched, the LSN application profile is applied for the LSN session. Separate a range of ports with a hyphen. For example, 40-90.

Parameter Descriptions (of commands listed in the CLI procedure)

- add lsn group

  - groupname

  Name for the LSN group. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN group is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “lsn group1” or ‘lsn group1’).

  This is a mandatory argument. Maximum Length: 127

  - clientname

  Name of the LSN client entity to be associated with the LSN group. You can associate only one LSN client entity with an LSN group. You cannot remove this association or replace with another LSN client entity once the LSN group is created.

  This is a mandatory argument. Maximum Length: 127

  - nattype

  Type of NAT IP address and port allocation (from the bound LSN pools) for subscribers:

  Available options function as follows:

  * **Deterministic**—Allocate a NAT IP address and a block of ports to each subscriber (of the LSN client bound to the LSN group). The NetScaler appliance sequentially allocates NAT resources to these subscribers. The NetScaler appliance assigns the first block of ports (block size determined by the port block size parameter of the LSN group) on the beginning NAT IP address to the beginning subscriber IP address. The
next range of ports is assigned to the next subscriber, and so on, until the NAT address
does not have enough ports for the next subscriber. In this case, the first port block on
the next NAT address is used for the subscriber, and so on. Because each subscriber
now receives a deterministic NAT IP address and a block of ports, a subscriber can be
identified without any need for logging. For a connection, a subscriber can be iden-
tified based only on the NAT IP address and port, and the destination IP address and
port.

* Dynamic—Allocate a random NAT IP address and a port from the LSN NAT pool for a
subscriber’s connection. If port block allocation is enabled (in LSN pool) and a port
block size is specified (in the LSN group), the NetScaler appliance allocates a random
NAT IP address and a block of ports for a subscriber when it initiates a connection
for the first time. The appliance allocates this NAT IP address and a port (from the
allocated block of ports) for different connections from this subscriber. If all the ports
are allocated (for different subscribers connections) from the subscribers allocated
port block, the appliance allocates a new random port block for the subscriber.

Possible values: DYNAMIC, DETERMINISTIC

Default value: DYNAMIC

– portblocksize

Size of the NAT port block to be allocated for each subscriber.

To set this parameter for Dynamic NAT, you must enable the port block allocation param-
eter in the bound LSN pool. For Deterministic NAT, the port block allocation parameter is
always enabled, and you cannot disable it.

In Dynamic NAT, the NetScaler appliance allocates a random NAT port block, from the avail-
able NAT port pool of an NAT IP address, for each subscriber. For a subscriber, if all the
ports are allocated from the subscribers allocated port block, the appliance allocates a
new random port block for the subscriber.

– logging

Log mapping entries and sessions created or deleted for this LSN group. The NetScaler
appliance logs LSN sessions for this LSN group only when both logging and session logging
parameters are enabled.

The appliance uses its existing syslog and audit log framework to log LSN information. You
must enable global level LSN logging by enabling the LSN parameter in the related NSLOG
action and SYLOG action entities. When the Logging parameter is enabled, the NetScaler
appliance generates log messages related to LSN mappings and LSN sessions of this LSN
group. The appliance then sends these log messages to servers associated with the NSLOG
action and SYSLOG actions entities.
A log message for an LSN mapping entry consists of the following information:

- NSIP address of the NetScaler appliance
- Time stamp
- Entry type (MAPPING or SESSION)
- Whether the LSN mapping entry is created or deleted
- Subscriber’s IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID might be present, depending on the following conditions:
  - Destination IP address and port are not logged for Endpoint-Independent mapping
  - Only Destination IP address (and not port) is logged for Address-Dependent mapping
  - Destination IP address and port are logged for Address-Port-Dependent mapping

Possible values: ENABLED, DISABLED

Default value: DISABLED

- sessionLogging

Log sessions created or deleted for the LSN group. The NetScaler appliance logs LSN sessions for this LSN group only when both logging and session logging parameters are enabled.

A log message for an LSN session consists of the following information:

- NSIP address of the NetScaler appliance
- Time stamp
- Entry type (MAPPING or SESSION)
- Whether the LSN session is created or removed
- Subscriber’s IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID

Possible values: ENABLED, DISABLED

Default value: ENABLED, DISABLED

- sessionSync

In a high availability (HA) deployment, synchronize information of all LSN sessions related to this LSN group with the secondary node. After a failover, established TCP connections and UDP packet flows are kept active and resumed on the secondary node (new primary).
For this setting to work, you must enable the global session synchronization parameter.

Possible values: ENABLED, DISABLED

Default value: ENABLED

- snmptraplimit

  Maximum number of SNMP Trap messages that can be generated for the LSN group in one minute.

  Default value: 100

  Minimum value: 0

  Maximum value: 10000

- ftp

  Enable Application Layer Gateway (ALG) for the FTP protocol. For some application-layer protocols, the IP addresses and protocol port numbers are usually communicated in the packets payload. When acting as an ALG, the appliance changes the packets payload to ensure that the protocol continues to work over LSN.

  **Note:** The NetScaler appliance also includes ALG for ICMP and TFTP protocols. ALG for the ICMP protocol is enabled by default, and there is no provision to disable it. ALG for the TFTP protocol is disabled by default. ALG is enabled automatically for an LSN group when you bind a UDP LSN application profile, with endpoint-independent-mapping, endpoint-independent filtering, and destination port as 69 (well-known port for TFTP), to the LSN group.

  Possible values: ENABLED, DISABLED

  Default value: ENABLED

**Parameter Descriptions (of commands listed in the CLI procedure)**

- bind lsn group

  - groupname

    Name for the LSN group. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN group is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “lsn group1” or ‘lsn group1’).

    This is a mandatory argument. Maximum Length: 127
- **poolname**

  Name of the LSN pool to bind to the specified LSN group. Only LSN Pools and LSN groups with the same NAT type settings can be bound together. Multiples LSN pools can be bound to an LSN group.

  For Deterministic NAT, pools bound to an LSN group cannot be bound to other LSN groups. For Dynamic NAT, pools bound to an LSN group can be bound to multiple LSN groups. Maximum Length: 127

- **transportprofilename**

  Name of the LSN transport profile to bind to the specified LSN group. Bind a profile for each protocol for which you want to specify settings.

  By default, one LSN transport profile with default settings for TCP, UDP, and ICMP protocols is bound to an LSN group during its creation. This profile is called a default transport.

  An LSN transport profile that you bind to an LSN group overrides the default LSN transport profile for that protocol. Maximum Length: 127

- **appsprofilename**

  Name of the LSN application profile to bind to the specified LSN group. For each set of destination ports, bind a profile for each protocol for which you want to specify settings.

  By default, one LSN application profile with default settings for TCP, UDP, and ICMP protocols for all destination ports is bound to an LSN group during its creation. This profile is called a default application profile.

  When you bind an LSN application profile, with a specified set of destination ports, to an LSN group, the bound profile overrides the default LSN application profile for that protocol at that set of destination ports. Maximum Length: 127

### Sample LSN Configurations

September 17, 2018

The following are examples of configuring LSN through command line interface.

**Create a simple LSN configuration with a single subscriber network, single LSN NAT IP address, and default settings:**

```plaintext
1  add lsn client LSN-CLIENT-1
2
3  Done
```

© 1999-2018 Citrix Systems, Inc. All rights reserved.
Create an LSN configuration with an extended ACL for identifying LSN subscribers:

```
add ns acl LSN-ACL-2 ALLOW -srcIP 192.0.2.10-192.0.2.20
Done
apply acls
Done
add lsn client LSN-CLIENT-2
Done
bind lsn client LSN-CLIENT-2 -aclname LSN-ACL-2
Done
add lsn pool LSN-POOL-2
Done
bind lsn pool LSN-POOL-2 203.0.113.5-203.0.113.10
Done
```
Create an LSN configuration with endpoint-independent mapping for HTTP protocol (port 80) and address-port dependent mapping for SSH protocol (port 22). Also, restrict each subscriber to use a maximum of 1000 NAT ports for TCP protocol and 100 NAT ports for UDP protocol. Restrict each subscriber to have a maximum of 2000 concurrent sessions for TCP protocol. Restrict the group to have a maximum of 30000 concurrent sessions for TCP protocol:

```
add lsn group LSN-GROUP-2 -clientname LSN-CLIENT-2
Done
bind lsn group LSN-GROUP-2 -poolname LSN-POOL-2
Done
add lsn client LSN-CLIENT-3
Done
bind lsn client LSN-CLIENT-3 -network 192.0.3.0 -netmask 255.255.255.0
Done
add lsn pool LSN-POOL-3
Done
bind lsn pool LSN-POOL-3 203.0.113.11
Done
add lsn group LSN-GROUP-3 -clientname LSN-CLIENT-3
Done
bind lsn group LSN-GROUP-3 -poolname LSN-POOL-3
Done
add lsn appsprofile LSN-APPS-HTTPPROFILE-3 TCP -mapping ENDPOINT-INDEPENDENT
Done
```
Create an LSN configuration for a large set of subscribers:

```plaintext
add lsn client LSN-CLIENT-4
```
Done

bind lsn client LSN-CLIENT-4 -network 192.0.4.0 -netmask 255.255.255.0
Done

bind lsn client LSN-CLIENT-4 -network 192.0.5.0 -netmask 255.255.255.0
Done

bind lsn client LSN-CLIENT-4 -network 192.0.6.0 -netmask 255.255.255.0
Done

bind lsn client LSN-CLIENT-4 -network 192.0.7.0 -netmask 255.255.255.0
Done

bind lsn client LSN-CLIENT-4 -network 192.0.8.0 -netmask 255.255.255.0
Done

add lsn pool LSN-POOL-4
Done

bind lsn pool LSN-POOL-4 203.0.113.30-203.0.113.40
Done

bind lsn pool LSN-POOL-4 203.0.113.45-203.0.113.50
Done

bind lsn pool LSN-POOL-4 203.0.113.55-203.0.113.60
Done

add lsn group LSN-GROUP-4 -clientname LSN-CLIENT-4
Done

bind lsn group LSN-GROUP-4 -poolname LSN-POOL-4
Create an LSN configuration with sharing of NAT resources among multiple LSN groups. In this example, LSN pool LSN-POOL-5 is shared with LSN groups LSN-GROUP-5 and LSN-GROUP-6:

```bash
add lsn client LSN-CLIENT-5
Done

bind lsn client LSN-CLIENT-5 -network 192.0.15.0 -netmask 255.255.255.0
Done

add lsn pool LSN-POOL-5
Done

bind lsn pool LSN-POOL-5 203.0.113.12-203.0.113.14
Done

add lsn group LSN-GROUP-5 -clientname LSN-CLIENT-5
Done

bind lsn group LSN-GROUP-5 -poolname LSN-POOL-5
Done

add lsn client LSN-CLIENT-6
```
Create an LSN configuration with deterministic NAT resource allocation:

```
add lsn client LSN-CLIENT-7
Done
bind lsn client LSN-CLIENT-7 -network 192.0.17.0 -netmask 255.255.255.0
Done
add lsn pool LSN-POOL-7
Done
bind lsn pool LSN-POOL-7 203.0.113.19-203.0.113.23
Done
add lsn group LSN-GROUP-7 -clientname LSN-CLIENT-7 -nattype DETERMINISTIC
Done
bind lsn group LSN-GROUP-7 LSN-POOL-7
Done
add lsn group LSN-GROUP-7 LSN-POOL-5
Done
```
Create an LSN configuration with multiple subscriber networks having the same network address but each network belonging to a different traffic domain. Also, restrict the outbound traffic related to HTTP protocol (port 80), sending it through a particular traffic domain (td 5):

```
add lsn client LSN-CLIENT-8
Done
bind lsn client LSN-CLIENT-8 -network 192.0.18.0 -netmask 255.255.255.0 -td 1
Done
bind lsn client LSN-CLIENT-8 -network 192.0.18.0 -netmask 255.255.255.0 -td 2
Done
bind lsn client LSN-CLIENT-8 -network 192.0.18.0 -netmask 255.255.255.0 -td 3
Done
add lsn pool LSN-POOL-8
Done
bind lsn pool LSN-POOL-8 203.0.113.80-203.0.113.86
Done
add lsn group LSN-GROUP-7 -poolname LSN-POOL-7
Done
bind lsn group LSN-GROUP-7 -clientname LSN-CLIENT-8
Done
bind lsn group LSN-GROUP-7 -poolname LSN-POOL-8
Done
```
Create an LSN configuration that restricts the outbound traffic of a specific protocol (TCP), sending it through a particular traffic domain (td 5). With endpoint-independent filtering, receive inbound traffic related to this protocol (TCP) on any traffic domain:

```plaintext
add lsn client LSN-CLIENT-9

bind lsn client LSN-CLIENT-9 -network 192.0.9.0 -netmask 255.255.255.0 -td 1

add lsn pool LSN-POOL-9

bind lsn pool LSN-POOL-9 203.0.113.90

add lsn group LSN-GROUP-9 -clientname LSN-CLIENT-9

bind lsn group LSN-GROUP-9 -poolname LSN-POOL-9

add lsn appsprofile LSN-APPS-PROFILE-9 TCP -filtering ENDPOINT-
```
Create an LSN configuration that restricts outbound HTTP (port 80) traffic, sending it through a particular traffic domain (td 10). With address-dependent filtering, receive inbound traffic related to this protocol (HTTP) on the specified traffic domain (td 10):

```
1 add lsn client LSN-CLIENT-10
2 Done
3
4 bind lsn client LSN-CLIENT-10 -network 192.0.10.0 -netmask 255.255.255.0 -td 1
5 Done
6
7 add lsn pool LSN-POOL-10
8 Done
9
10 bind lsn pool LSN-POOL-10 203.0.113.100
11 Done
12
13 add lsn group LSN-GROUP-10 -clientname LSN-CLIENT-10
14 Done
15
16 bind lsn group LSN-GROUP-10 -poolname LSN-POOL-10
17 Done
18
19 add lsn appsprofile LSN-APPSPROFILE-10 TCP -mapping ENDPOINT -INDEPENDENT -filtering ADDRESS-DEPENDENT -td 10
20 Done
21
22 bind lsn appsprofile LSN-APPSPROFILE-10 80
23 Done
24
25
26
27
28
29
30
31
```
Configuring Static LSN Maps

September 17, 2018

The NetScaler appliance supports manual creation of a one-to-one LSN mapping between a subscriber IP address:port and a NAT IP address:port. Static LSN mappings are useful in cases where you want to ensure that the connections initiated to a NAT IP:Port maps to the subscriber IP address:Port. For example, Web servers located in the internal network.

To create a static LSN mapping by using the command line interface

At the command prompt, type:

```
1   add lsn static <name> <transportprotocol> <subscrIP> <subscrPort> [-td <positive_integer>] [natIP [natPort]] [-destIP <ip_addr> [-dsttd <positive_integer>]]
```

2  - show lsn static

To create a static LSN mapping by using the configuration utility

Navigate to System > Large Scale NAT > Static, and add a new static mapping.

Parameter Descriptions (of commands listed in the CLI procedure)

**add lsn static name**

Name for the LSN static mapping entry. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN group is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “lsn static1” or ‘lsn static1’). This is a mandatory argument. Maximum Length: 127
transportprotocol

Protocol for the LSN mapping entry. This is a mandatory argument. Possible values: TCP, UDP, ICMP

subcriIP

IPv4 address of an LSN subscriber for the LSN mapping entry. This is a mandatory argument.

subscrPort

Port of the LSN subscriber for the LSN mapping entry. This is a mandatory argument. Maximum value: 65535

td

ID of the traffic domain to which the subscriber belongs. If you do not specify an ID, the subscriber is assumed to be a part of the default traffic domain. Default value: 0, Minimum value: 0, Maximum value: 4094

natIP

IPv4 address, already existing on the NetScaler appliance as type LSN, to be used as NAT IP address for this mapping entry.

natPort

NAT port for this LSN mapping entry.

destIP

Destination IP address for the LSN mapping entry.

dsttd

ID of the traffic domain through which the destination IP address for this LSN mapping entry is reachable from the NetScaler appliance. If you do not specify an ID, the destination IP address is assumed to be reachable through the default traffic domain, which has an ID of 0. Default value: 0, Minimum value: 0, Maximum value: 4094
Wildcard Port Static Maps

A static mapping entry is usually a one-to-one LSN mapping between a subscriber IP address:port and a NAT IP address:port. A one-to-one static LSN mapping entry exposes only one port of the subscriber to the Internet.

Some situations might require exposing all ports (64K) of a subscriber to the Internet (for example, a server hosted on an internal network and running a different service on each port). To make these internal services accessible through the Internet, you have to expose all the ports of the server to the Internet.

One way to meet this requirement is to add 64K one-to-one static mapping entries, one mapping entry for each port. Creating 64K entries is very cumbersome and a big task. Also, this large number of configuration entries might lead to performance issues in the NetScaler appliance.

Another simple method is to use wildcard ports in a static mapping entry. You just need to create one static mapping entry with NAT-port and subscriber-port parameters set to the wildcard character (*), and the protocol parameter set to ALL, to expose all the ports of a subscriber to the Internet. For a subscriber’s inbound or outbound connections matching a wildcard static mapping entry, the subscriber’s port does not change after the NAT operation.

When a subscriber-initiated connection to the Internet matches a wildcard static mapping entry, the NetScaler appliance assigns a NAT port that has the same number as the subscriber port from which the connection is initiated. Similarly, an Internet host gets connected to a subscriber’s port by connecting to the NAT port that has the same number as the subscriber’s port.

Configuring the NetScaler appliance to Provide Access to All Ports of an IPv4 Subscriber

To configure the NetScaler appliance to provide access to all ports of an IPv4 subscriber, create a wildcard static map with the following mandatory parameter settings:

- Protocol=ALL
- Subscriber port = *
- NAT port = *

In a wildcard static map, unlike in a one-to-one static map, setting the NAT IP parameter is mandatory. Also, the NAT IP address assigned to a wildcard static map cannot be used for any other subscribers.

To create a wildcard static map by using the command line interface

At the command prompt, type:

```
1 add lsn static <name> ALL <subscrIP> * <natIP> * [-td <positive_integer>] [-destIP <ip_addr> [-dsttd <positive_integer>]]
2
3 show lsn static
```
Sample Configuration

In the following sample configuration of a wildcard static map, all ports of a subscriber whose IP address is 192.0.2.10 are made accessible through NAT IP 203.0.11.33.

Sample configuration:

```
1   add lsn static NAT44-WILDCARD-STATIC-1 ALL   192.0.2.10 * 203.0.113.33 *
2
3   Done
```

Configuring Application Layer Gateways

September 17, 2018

For some Application layer protocols, the IP addresses and protocol port numbers are also communicated in the packet’s payload. Application Layer Gateway for a protocol parses the packet’s payload and does necessary changes to ensure that the protocol continues to work over LSN.

The NetScaler appliance supports ALG for the following protocols:

- FTP
- ICMP
- TFTP
- PPTP
- SIP
- RTSP

Application Layer Gateway for FTP, ICMP, and TFTP Protocols

September 17, 2018

You can enable or disable ALG for the FTP protocol for an LSN configuration by enabling or disabling the FTP option of the LSN group of the LSN configuration.

ALG for the ICMP protocol is enabled by default, and there is no provision to disable it.

ALG for the TFTP protocol is disabled by default. TFTP ALG is enabled automatically for an LSN configuration when you bind a UDP LSN application profile, with endpoint-independent-mapping, endpoint-independent filtering, and destination port as 69 (well-known port for TFTP), to the LSN group.

Sample LSN Configuration for FTP ALG:

In the following sample LSN configuration, FTP ALG is enabled for subscribers that have IP address in the range 192.0.2.30-192.0.2.100.
Sample LSN Configuration for TFTP ALG:

In the following sample LSN configuration, endpoint-independent mapping and endpoint-independent filtering are enabled for TFTP protocol (UDP port 69). The NetScaler appliance automatically enables TFTP ALG for this LSN configuration.
Application Layer Gateway for PPTP Protocol

September 17, 2018

The NetScaler appliance supports Application Layer Gateways (ALGs) for the Point-to-Point Tunneling Protocol (PPTP).

PPTP is a network protocol that enables secure transfer of data from a remote client to an enterprise server by creating a tunnel across TCP/IP-based data networks. PPTP encapsulates PPP packets into IP packets for transmission over the Internet. PPTP establishes a tunnel for each communicating
PPTP network server (PNS)-PPTP Access Concentrator (PAC) pair. After the tunnel is set up, enhanced generic routing encapsulation (GRE) is used to exchange PPP packets. A call ID in the GRE header indicates the session to which a particular PPP packet belongs.

The NetScaler appliance recognizes PPTP packets that arrive on the default TCP port, 1723. The appliance parses PPTP control packets, translates the call ID, and assigns a NAT IP address. For two-way data communication between the client and server, the NetScaler appliance creates an LSN session entry based on the server call ID, and an LSN session based on the client call ID. The appliance then parses the GRE data packets and translates call IDs on the basis of the two LSN session entries.

For PPTP protocol, the NetScaler appliance also includes timeout setting for any idle PPTP LSN sessions. If a PPTP LSN session is idle for a time that exceeds the timeout setting, the NetScaler appliance removes the session.

Limitations:

The following are the limitations of PPTP ALG on a NetScaler appliance:

- PPTP ALG is not supported for hairpin LSN flow.
- PPTP ALG is not supported to work with any RNAT configuration.
- PPTP ALG is not supported in NetScaler clusters.

Configuring PPTP ALG

Configuring PPTP ALG on the NetScaler appliance consist of the following tasks:

- Create an LSN configuration and enable PPTP ALG on it. In an LSN configuration, the LSN group includes the PPTP ALG setting. For instructions on creating an LSN configuration, see Configuration Steps for LSN.
- (Optional) Set the global timeout for idle PPTP LSN sessions.

To enable PPTP ALG for an LSN configuration by using the CLI

At the command prompt, type:

```
1 add lsn group <groupname> -clientname <string> [-pptp ( ENABLED | DISABLED )]
2
3 show lsn group
```

To set the global timeout for idle PPTP LSN sessions by using the CLI

At the command prompt, type:
Example:

In the following sample LSN configuration, PPTP ALG is enabled for subscribers in the 192.0.2.0/24 network.

Also idle PPTP LSN session timeout is set to 200 secs.

```
add lsn client LSN-CLIENT-1
Done
bind lsn client LSN-CLIENT-1 -network 192.0.2.0 -netmask 255.255.255.0
Done
add lsn pool LSN-POOL-1
Done
bind lsn pool LSN-POOL-1 203.0.113.3
Done
add lsn group LSN-GROUP-1 -clientname LSN-CLIENT-1 -pptp ENABLED
Done
bind lsn group LSN-GROUP-1 -poolname pool1 LSN-POOL-1
Done
set appAlgParam -pptpGreIdleTimeout 200
Done
```
Using Large Scale NAT (LSN) with Session Initiation Protocol (SIP) is complicated, because SIP messages contain IP addresses in the SIP headers as well as in the SIP body. When LSN is used with SIP, the SIP headers contain information about the caller and the receiver, and the device translates this information to hide it from the outside network. The SIP body contains the Session Description Protocol (SDP) information, which includes IP addresses and port numbers for transmission of the media.

SIP ALG adheres to the following RFCs:

- RFC 3261
- RFC 3581
- RFC 4566
- RFC 4475

### How SIP ALG Works

How IP address translation is performed depends on the type and direction of the message. A message can be any of the following:

- Inbound request
- Outbound response
- Outbound request
- Inbound response

For an outgoing message, the private IP address and port number of the SIP client are replaced with the NetScaler owned public IP address and port number, called the LSN pool IP address and port number, specified during LSN configuration. For an incoming message, the LSN pool IP address and the port number are replaced with the private address of the client. If the message contains any public IP addresses, the NetScaler SIP ALG retains them. Also, a pinhole is created on the:

- LSN pool IP address and port on behalf of the private client, so that the messages that arrive at this IP address and port from the public network are treated as SIP messages.
- Public IP address and port on behalf of the public clients, so that the messages that arrive at this IP address and port from the private network are treated as SIP messages.

When a SIP message is sent out across the network, the SIP Application Layer Gateway (ALG) collects information from the message and translates the IP addresses in the following headers into LSN pool IP addresses:

- Via
- Contact
- Route
- Record-Route

In the following sample SIP request message, LSN replaces the IP addresses in the header fields to hide them from the outside network.
When a message containing SDP information arrives, the SIP ALG collects information from the message and translates the IP addresses in the following fields into LSN pool IP addresses and port numbers:

- c = (connection information)

This field can appear at the session or media level. It appears in the following format:

\[ \text{\textquoteleft }c=\text{\textless }\text{network-type}\text{\textgreater }\text{\textless }\text{address-type}\text{\textgreater }\text{\textless }\text{connection-address}\text{\textgreater }\text{\textquoteleft} \]

If the destination IP address is a unicast IP address, the SIP ALG creates pinholes by using the IP address and port numbers specified in the m= field.

- m = (media announcement)

This field appears at the media level and contains the description of the media. It appears in the following format:

\[ \text{\textquoteleft }m=\text{\textless }\text{media}\text{\textgreater }\text{\textless }\text{port}\text{\textgreater }\text{\textless }\text{transport}\text{\textgreater }\text{\textless }\text{fmt list}\text{\textgreater }\text{\textquoteleft} \]

- a = (information about the media field)

This field can appear at the session or media level, in the following format:

\[ \text{\textquoteleft }a=\text{\textless }\text{attribute}\text{\textgreater }\text{\textquoteleft} \]

\[ \text{\textquoteleft }a=\text{\textless }\text{attribute}\text{\textgreater }:\text{\textless }\text{value}\text{\textgreater }\text{\textquoteleft} \]

The following excerpt from a sample SDP section shows the fields that are translated for resource allocation.

---

```
o = user 2344234 55234434 IN IP4 10.150.20.3
c = IN IP4 10.150.20.3
m = audio 43249 RTP/AVP 0
```
The following table shows how SIP payload is translated.

## Limitations of SIP ALG

A SIP ALG has the following limitations:

- Only SDP payload is supported.
- The following are not supported:
  - Multicast IP addresses
  - Encrypted SDP
  - SIP TLS
## Tested SIP Clients and Proxy Servers

The following SIP clients and proxy server have been tested with SIP ALG:

- **SIP Clients:** X-Lite, Zoiper, Ekiga, Avaya
- **Proxy Server:** openSIPS

### LSN SIP Scenario: SIP Proxy Outside the Private Network (Public Network)

For a typical SIP call, SIP client must register with the SIP registrar by composing a REGISTER request and sending it to the SIP registrar. The NetScaler appliance’s SIP ALG intercepts the request, replaces the IP address and port number in the request with the LSN pool IP address and port number provided in the LSN configuration, and forwards the request to the SIP registrar. The SIP ALG then opens a pinhole in the NetScaler configuration to allow further SIP communication between the SIP client and the SIP registrar. The SIP registrar sends a 200 OK response to the SIP client over the LSN pool IP address and port number. The NetScaler appliance captures this response in the pinhole, and the SIP ALG replaces the SIP header, putting the original Contact, Via, Route, and Record-Route SIP fields back into the message. The SIP ALG then forwards the message to the SIP client. The following figure shows how SIP ALG uses LSN in a SIP call registration flow. ![](localized image) (/en-us/netscaler/media/img-1.jpg)

### Outgoing Calls

A SIP call is initiated with a SIP INVITE message sent from the internal to the external network. The SIP ALG performs NAT on the IP addresses and port numbers in the Via, Contact, Route, and Record-Route SIP header fields, replacing them with the LSN pool IP address and port number. LSN stores these mappings for subsequent SIP messages in the SIP call. The SIP ALG then opens separate pinholes.
in the NetScaler configuration to allow SIP and media through the
NetScaler appliance on the dynamically assigned ports specified in
the SDP and SIP headers. When a 200 OK message arrives at the
NetScaler, it is captured by one of the created pinholes. The SIP
ALG replaces the SIP header, restoring the original Contact, Via,
Route, and Record-Route SIP fields, and then forwards the message to
the internal SIP client.

### Incoming Calls

A SIP incoming call is initiated with a SIP INVITE message from the
external client to the internal network. The SIP registrar forwards
the INVITE message to the SIP client in the internal network, using
the pinhole that was created when the Internal SIP client registered
with the SIP registrar.

The SIP ALG performs NAT on the LSN IP addresses and port numbers in
the Via, Contact, Route, and Record-Route SIP header fields,
translating them to the IP address and port number of the internal
SIP client, and forwards the request to the SIP client. When the 200
OK response message sent by the internal SIP client arrives at the
NetScaler appliance, the SIP ALG performs NAT on the IP addresses
and port numbers in the Via, Contact, Route, and Record-Route SIP
header fields, translating them to the LSN pool IP address and port
number, forwards the response message to the SIP registrar, and then
opens a pinhole in the outbound direction for further SIP
communication.

### Call Termination

The BYE message terminates a call. When the device receives a BYE
message, it translates the header fields in the message just as it
does for any other message. But because a BYE message must be
acknowledged by the receiver with a 200 OK, the ALG delays call
teardown for 15 seconds to allow time for transmission of the 200 OK.

### Call Between Clients in the Same Network

When both client A and client B in the same network initiate a call,
the SIP messages are routed through the SIP proxy in the outside
network. The SIP ALG processes the INVITE from client A as a normal
outgoing call. Since client B is in the same network, the SIP proxy
sends the INIVITE back to the NetScaler appliance. The SIP ALG
examines the INVITE message, determines that it contains the NAT IP address of client A, and replaces that address with the private IP address of client A before sending the message to client B. Once the call is established between the clients, the NetScaler is not involved in the media transmission between the clients.

## More LSN SIP Scenarios: SIP Proxy Inside the Private Network

If you want to host the SIP Proxy server inside the private network, Citrix recommends that you do one of the following:

- Configure a static LSN Mapping for the private SIP proxy. For more information, see [Configuring Static LSN Maps](/en-us/netscaler/12/netscaler-support-for-telecom-service-providers/lsn-introduction/configuration-steps-lsn.html). Make sure that the NAT port is the same as the port configured in the SIP ALG profile.

- Configure the SIP Proxy server inside a demilitarized zone (DMZ).

![localized image](/en-us/netscaler/media/sip-proxy-inside-private.png)

Figure 1. SIP Call Registration

![localized image](/en-us/netscaler/media/sip-proxy-inside-private-scenario3.png)

Figure 2. SIP Incoming Call Flow

Figures 1 and 2 show the following scenarios:

- Scenario 1—SIP client in the private network registers with the SIP proxy server in the same network. ALG operations are not performed, because the SIP client and SIP proxy server are in the same network.

- Scenario 2—SIP client in the public network registers with the SIP proxy server in the private network. The REGISTER message from the public SIP client is sent to the NetScaler appliance by using the static LSN mapping configured on the appliance, and the appliance creates a pinhole for further SIP operations.

- Scenario 3—SIP Incoming call flow. A SIP incoming call is initiated with a SIP INVITE message from the external to the internal network. The NetScaler appliance receives the INVITE message from SIP client C2, which is in the external network, through the static LSN maps configured on the NetScaler appliance. The appliance creates a pinhole and forwards the INVITE message to the SIP proxy. The SIP proxy then forwards the INVITE message to
SIP client C1 in the internal network. SIP client C1 then sends 180 and 200 OK messages to the SIP proxy, which in turn forwards the message to SIP client C2 through the NetScaler appliance.

When the 200 OK response message sent by internal SIP client C1 arrives at the NetScaler, the SIP ALG performs NAT on the IP addresses and port numbers in the Via, Contact, Route, and Record-Route SIP header fields, and in the SDP fields, replacing them with the LSN pool IP address and port number. The SIP ALG then forwards the response message to SIP client C2 and opens a pinhole in the outbound direction for further SIP communication.

## Support for Audit Logs

You can log ALG information as part of LSN logging by enabling ALG in the LSN audit logging configuration. For more information on LSN logging, see [Logging and Monitoring LSN](/en-us/netscaler/12/netscaler-support-for-telecom-service-providers/lsn-introduction/lsn-logg-monitoring.html). A log message for an ALG entry in the LSN log consists of the following information:

- Time stamp
- Type of SIP message (for example, SIP request)
- Source IP address and port of the SIP client
- Destination IP address and port of the SIP proxy
- NAT IP address and port
- SIP method
- Sequence number
- Whether or not the SIP client is registered
- Caller’s user name and domain
- Receiver’s user name and domain

**Sample audit log:**

**Response:**
07/19/2013:09:49:19 GMT Informational 0-PPE-0 : default ALG ALG_SIP_INFO_PACKET_EVENT 170 0 :
Infomsg: “SIP response” - Group: g2 - Call_ID: NTYOYjywMTjMjNhNDU5ZjhiMmQxOTM5ZTE3Zjc3NjM.

## Configuring SIP ALG

You need to configure the SIP ALG as part of the LSN configuration. For instructions on configuring LSN, see [Configuration Steps for LSN](http://docs.citrix.com/en-us/netscaler/11-1/netscaler-support-for-telecom-service-providers/lsn-introduction/configuration-steps-lsn.html). While configuring LSN, make sure that you:

- Set the following parameters **while** adding the LSN application profile:
  - IP Pooling = PAIRED
  - Address and Port Mapping = ENDPOINT-INDEPENDENT
  - Filtering = ENDPOINT-INDEPENDENT

**Important:** For the SIP ALG to work, a full cone NAT configuration is mandatory.

**Example:**

```bash
add lsn appsprofile app_tcp TCP -ippooling PAIRED -mapping ENDPOINT-INDEPENDENT -filtering ENDPOINT-INDEPENDENT
```

- Create a SIP ALG profile and make sure that you define either the source port range or destination port range.

**Example:**

```bash
add lsn sipalgprofile sipalgprofile_tcp -sipsrcportrange 1-65535 -sipdstportrange 5060 -openViaPinhole ENABLED -openRecordRoutePinhole ENABLED -sipTransportProtocol TCP
```

- Set SIP ALG = ENABLED, **while** creating the LSN group.

**Example:**

```bash
add lsn group g1 -clientname c1 -sipalg ENABLED
```

- Bind the SIP ALG profile to the LSN group.
**Sample SIP ALG Configuration:**

The following sample configuration shows how to create a simple LSN configuration with a single subscriber network, single LSN NAT IP address, SIP ALG specific setting, and configure SIP ALG:

```
add lsn pool p1
Done

bind lsn pool p1 10.102.185.190
Done

add lsn client c1
Done

bind lsn client c1 -network 192.170.1.0 -netmask 255.255.255.0
Done

add lsn appsprofile app_tcp TCP -ippooling PAIRED -mapping ENDPOINT-INDEPENDENT -filtering ENDPOINT-INDEPENDENT
Done

add lsn appsprofile app_udp UDP -ippooling PAIRED -mapping ENDPOINT-INDEPENDENT -filtering ENDPOINT-INDEPENDENT
Done

bind lsn appsprofile app_tcp 1-65535
Done

bind lsn appsprofile app_udp 1-65535
Done

add lsn sipalgprofile sipalgprofile_tcp -sipdstportrange 5060 -openViaPinhole ENABLED -openRecordRoutePinhole ENABLED -sipTransportProtocol TCP
Done

add lsn sipalgprofile sipalgprofile_udp -sipdstportrange 5060 -openViaPinhole ENABLED -openRecordRoutePinhole ENABLED -sipTransportProtocol UDP
Done

add lsn group g1 -clientname c1 -sipalg ENABLED
Done
```
Application Layer Gateway for RTSP Protocol

January 6, 2019

Real Time Streaming Protocol (RTSP) is an application-level protocol for the transfer of real-time media data. Used for establishing and controlling media sessions between end points, RTSP is a control channel protocol between the media client and the media server. The typical communication is between a client and a streaming media server.

Streaming media from a private network to a public network requires translating IP addresses and port numbers over the network. NetScaler functionality includes an Application Layer Gateway (ALG) for RTSP, which can be used with Large Scale NAT (LSN) to parse the media stream and make any necessary changes to ensure that the protocol continues to work over the network.

How IP address translation is performed depends on the type and direction of the message, and the type of media supported by the client-server deployment. Messages are translated as follows:

- Outbound request—Private IP address to NetScaler owned public IP address called an LSN pool IP address.
- Inbound response—LSN pool IP address to private IP address.
- Inbound request—No translation.
- Outbound response—Private IP address to LSN pool IP address.

Limitations of RTSP ALG

The RTSP ALG does not support the following:
• Multicast RTSP sessions
• RTSP session over UDP
• TD/admin partitioning/cluster deployments
• RSTP Authentication
• HTTP tunneling

RTSP and LSN scenario

The following figure shows an RTSP SETUP request flow. Typically, a SETUP request specifies how a single media stream must be transported. The request contains the media stream URL and a transport specifier. This specifier typically includes one local port for receiving RTP data (audio or video), and another for receiving RTCP data (meta information). The server reply usually confirms the chosen parameters and fills in the missing parts, such as the server’s chosen ports. Each media stream must be configured by using the SETUP command before an aggregate play request can be sent.

In a typical RTSP communication, the media client in the public network sends a SETUP request to the media server in the private network. RSTP ALG intercepts the request and, in the media stream, replaces the public IP address and port number with the LSN pool IP address and LSN port number. The following figure shows the translation performed by a NetScaler appliance in the media stream for an outbound request:

The media server in the private network uses the LSN pool IP address and LSN port number to send a 200 OK response to the media client in the public network. The NetScaler RTSP ALG intercepts the response and replaces the LSN pool IP address and LSN port number with the public IP address and port number of the media client. The following figure shows the translation performed by a NetScaler appliance in the media stream for an inbound response:

Configuring RTSP ALG

Configure RTSP ALG as part of the LSN configuration. For instructions on configuring LSN, see Configuration Steps for LSN. While configuring LSN, make sure that you:

• Set the NAT Type as DETERMINISTIC or DYNAMIC while adding the LSN pool.
• Set the following parameters while adding the LSN application profile:
  – IP Pooling = PAIRED
  – Address and Port Mapping = ENDPOINT-INDEPENDENT
  – Filtering = ENDPOINT-INDEPENDENT
• Create a RTSP ALG profile and bind the RTSP ALG profile to the LSN group

Sample RTSP ALG Configuration:

The following sample configuration shows how to create a simple LSN configuration with a single subscriber network, single LSN NAT IP address, and RTSP ALG settings:
1. enable ns feature WL SP LB CS LSN

2. Done

3. add lsn pool pool1 -nattype DETERMINISTIC

4. Done

5. bind lsn pool pool1 10.102.218.246

6. Done

7. add lsn client client1

8. Done

9. bind lsn client client1 -network 200.200.200.11 -netmask 255.255.255.0

10. Done

11. add lsn appsprofile app1 TCP -ippooling PAIRED -mapping ENDPOINT-INDEPENDENT -filtering ENDPOINT-INDEPENDENT

12. Done

13. add lsn appsprofile app2 UDP -ippooling PAIRED -mapping ENDPOINT-INDEPENDENT -filtering ENDPOINT-INDEPENDENT

14. Done

15. bind lsn appsprofile app1 1-65535

16. Done

17. bind lsn appsprofile app2 1-65535

18. Done

19. add lsn rtspalgprofile rtspalgprofiledefault -rtspIdleTimeout 1000 -rtspportrange 554

20. Done

21. add lsn group group1 -clientname client1 -nattype DETERMINISTIC -
Application Layer Gateway for IPSec Protocol

September 17, 2018

If communication between two network devices (for example, client and server) uses the IPSec protocol, IKE traffic (which is over UDP) uses port fields, but Encapsulating Security Payload (ESP) traffic does not. If a NAT device on the path assigns the same NAT IP address (but different ports) to two or more clients at the same destination, the NAT device is unable to distinguish and properly route the return ESP traffic does not contain port information. Therefore, IPSec ESP traffic fails at the NAT device.

NAT-Traversal (NAT-T) capable IPSec endpoints detect the presence of an intermediate NAT device during IKE phase 1 and switch to UDP port 4500 for all subsequent IKE and ESP traffic (encapsulating ESP in UDP). Without NAT-T support on the peer IPSec endpoints, IPSec protected ESP traffic is transmitted without any UDP encapsulation. Therefore, IPSec ESP traffic fails at the NAT device.

The NetScaler appliance supports IPSec application layer gateway (ALG) functionality for large scale NAT configurations. The IPSec ALG processes IPSec ESP traffic and maintains session information so that the traffic does not fail when the IPSec endpoints do no support NAT-T (UDP encapsulation of ESP traffic).
How IPSec ALG Works

An IPSec ALG monitors IKE traffic between a client and the server, and permits only one IKE phase 2 message exchange between the client and the server at any given time.

Once the two-way ESP packets are received for a particular flow, the IPSec ALG creates a NAT session for this particular flow so that subsequent ESP traffic can flow smoothly. The ESP traffic is identified by Security Parameters Indexes (SPIs), which are unique for a flow and for each direction. An IPSec ALG uses ESP SPIs in place of source and destination ports for performing large scale NAT.

If a gate receives no traffic, it times out. After both gates time out, another IKE phase 2 exchange is permitted.

IPSec ALG Timeouts

IPSec ALG on a NetScaler appliance has three timeout parameters:

- **ESP Gate Timeout**: Maximum time that the NetScaler appliance blocks an IPSec ALG gate for a particular client on a specific NAT IP address for a given server if no two-way ESP traffic is exchanged between the client and the server.
- **IKE Session Timeout**: Maximum time that the NetScaler appliance keeps the IKE session information before removing it if there is no IKE traffic for that session.
- **ESP Session Timeout**: Maximum time that NetScaler appliance keeps the ESP session information before removing it if there is no ESP traffic for that session.

Points to Consider before Configuring IPSec ALG

Before you start configuring IPSec ALG, consider the following points:

- You must understand the different components of IPSec protocol.
- IPSec ALG is not supported for DS-Lite and Large scale NAT64 configurations.
- IPSec ALG is not supported for hairpin LSN flow.
- IPSec ALG does not work with RNAT configurations.
- IPSec ALG is not supported in NetScaler clusters.

Configuration Steps

Configuring IPSec ALG for large scale NAT44 on a NetScaler appliance consists of the following tasks:

- **Create an LSN application profile and bind it to the LSN configuration.** Set the following parameters while configuring an application profile:
  - Protocol=UDP
- IP Pooling = PAIRED
- Port=500

Bind the application profile to the LSN group of an LSN configuration. For instructions on creating an LSN configuration, see Configuration Steps for LSN.

• **Create an IPSec ALG profile.** An IPSec profile includes various IPSec timeouts, such as IKE session timeout, ESP session timeout, and ESP gate timeout. You bind an IPSec ALG profile to an LSN group. An IPSec ALG profile has the following default settings:
  - IKE session timeout = 60 minutes
  - ESP session timeout = 60 minutes
  - ESP gate timeout = 30 seconds

• **Bind the IPSec ALG profile to the LSN configuration.** IPSec ALG is enabled for an LSN configuration when you bind an IPSec ALG profile to the LSN configuration. Bind the IPSec ALG profile to the LSN configuration by setting the IPSec ALG profile parameter to the name of the created profile in the LSN group. An IPSec ALG profile can be bound to multiple LSN groups, but an LSN group can have only one IPSec ALG profile.

**To create an LSN application profile by using the command line interface**

At the command prompt, type:

```
1 add lsn appsprofile <appsprofilename> UDP -ippooling PAIRED
2
3 show lsn appsprofile
```

**To bind destination port to the LSN application profile by using the command line interface**

At the command prompt, type:

```
1 bind lsn appsprofile <appsprofilename> <lsnport>
2
3 show lsn appsprofile
```

**To bind an LSN application profile to an LSN group by using the command line interface**

At the command prompt, type:

```
1 bind lsn group <groupname> -appsprofilename <string>
2
3 show lsn group
```
To create an IPSec ALG profile by using the CLI

At the command prompt, type:

```
1 add ipsecalg profile <name> [-ikeSessionTimeout <positive_integer>] [-espSessionTimeout <positive_integer>] [-espGateTimeout <positive_integer>] [-connfailover ( ENABLED | DISABLED)]
2
3 show ipsecalg profile <name>
```

To bind an IPSec ALG profile to an LSN configuration by using the CLI

At the command prompt, type:

```
1 bind lsn group <groupname> -poolname <string> -ipsecAlgProfile <string>
2
3 show lsn group <name>
```

To create an LSN application profile and bind it to an LSN configuration by using the GUI

Navigate to System > Large Scale NAT > Profiles, click Application tab, add an LSN application profile and bind it to an LSN group.

To create an IPSec ALG profile by using the GUI**

Navigate to System > Large Scale NAT > Profiles, click IPSEC ALG tab, and then add an IPSec ALG profile.

To bind an IPSec ALG profile to an LSN configuration by using the GUI**

1. Navigate to System > Large Scale NAT > LSN Group, open the LSN group.
2. In Advanced Settings, click + IPSEC ALG Profile to bind the created IPSec ALG profile to the LSN group.

Sample Configuration

In the following sample large scale NAT44 configuration, IPSec ALG is enabled for subscribers in the 192.0.2.0/24 network. IPSec ALG profile IPSECALGPROFILE-1 with various IPSec timeout settings is created and is bound to LSN group LSN Group -1.
Sample configuration:

```plaintext
add lsn client LSN-CLIENT-1
Done
bind lsn client LSN-CLIENT-1 -network 192.0.2.0 -netmask 255.255.255.0
Done
add lsn pool LSN-POOL-1
Done
bind lsn pool LSN-POOL-1 203.0.113.3-203.0.113.9
Done
add lsn appsprofile LSN-APPSPROFILE-1 UDP -ippooling PAIRED
Done
bind lsn appsprofile LSN-APPSPROFILE-1 500
Done
add ipsecalg profile IPSECALGPROFILE-1 -ikeSessionTimeout 45 -espSessionTimeout 40 -espGateTimeout 20 -connfailover ENABLED
Done
bind lsn group LSN-GROUP-1 -appsprofilename LSN-APPSPROFILE-1
Done
bind lsn group LSN-GROUP-1 -poolname LSN-POOL-1
Done
bind lsn group LSN-GROUP-1 -ipsecAlgProfile IPSECALGPROFILE-1
Done
```
Logging and Monitoring LSN

January 6, 2019

You can log LSN information to diagnose, troubleshoot problems, and to meet legal requirements. You can monitor the performance of the LSN feature by using LSN statistical counters and displaying current LSN sessions.

Logging LSN

Logging LSN information is one of the important functions required by the ISPs to meet legal requirements and for identifying the source of traffic at any given time.

A NetScaler appliance logs LSN mapping entries and the LSN sessions created or deleted for each LSN group. You can control logging of LSN information for an LSN group by using the logging and session logging parameters of the LSN group. These are group level parameters and are disabled by default. The NetScaler appliance logs LSN sessions for an LSN group only when both logging and session logging parameters are enabled.

The following table displays the logging behavior for an LSN group for various settings of logging and session logging parameters.

<table>
<thead>
<tr>
<th>Logging</th>
<th>Session Logging</th>
<th>Logging Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enabled</td>
<td>Enabled</td>
<td>Logs LSN mapping entries as well as LSN sessions.</td>
</tr>
<tr>
<td>Enabled</td>
<td>Disabled</td>
<td>Logs LSN mapping entries but not LSN sessions.</td>
</tr>
<tr>
<td>Disabled</td>
<td>Enabled</td>
<td>Logs neither mapping entries nor LSN sessions.</td>
</tr>
</tbody>
</table>

A log message for an LSN mapping entry consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced.
- Time stamp
- Entry type (MAPPING)
- Whether the LSN mapping entry was created or deleted
- Subscriber’s IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
Destination IP address, port, and traffic domain ID might be present, depending on the following conditions:
- Destination IP address and port are not logged for Endpoint-Independent mapping.
- Only the destination IP address is logged for Address-Dependent mapping. The port is not logged.
- Destination IP address and port are logged for Address-Port-Dependent mapping.

A log message for an LSN session consists of the following information:
- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced.
- Time stamp
- Entry type (SESSION)
- Whether the LSN session is created or removed
- Subscriber’s IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID

The appliance uses its existing syslog and audit log framework to log LSN information. You must enable global level LSN logging by enabling the LSN parameter in the related NSLOG action and SYLOG action entities. When the Logging parameter is enabled, the NetScaler appliance generates log messages related to LSN mappings and LSN sessions of this LSN group. The appliance then sends these log messages to servers associated with the NSLOG action and SYSLOG action entities.

For logging LSN information, Citrix recommends:
- Logging the LSN information on external log servers instead of on the NetScaler appliance. Logging on external servers facilitates optimal performance when the appliance creates large amounts of LSN log entries (in order of millions).
- Using SYSLOG over TCP, or NSLOG. By default SYSLOG uses UDP, and NSLOG uses only TCP to transfer log information to the log servers. TCP is more reliable than UDP for transferring complete data.

Note:
- The SYSLOG generated on NetScaler appliance are dynamically sent to the external log servers.
- When using SYSLOG over TCP, if the TCP connection is down or the SYSLOG server is busy, then the NetScaler appliances stores the logs in buffer and send the data once the connection is active.

For more information about configuring logging, see Audit Logging.

Configuring LSN logging consists of the following tasks:
- **Configuring the NetScaler appliance for logging.** This task involves creating and setting various entities and parameters of the NetScaler appliance:
  - **Create a SYSLOG or NSLOG audit logging configuration.** Creating an audit logging configuration involves the following tasks:
    * Create a NSLOG or SYSLOG audit action and enable the LSN parameter. Audit actions specify the IP addresses of log servers.
    * Create a SYSLOG or NSLOG audit policy and bind the audit action to the audit policy. Audit actions specify the IP addresses of log servers. Optionally, you can set the transport method for log messages that are sent to the external log servers. By default UDP is selected, you can set the transport method as TCP for a reliable transport mechanism. Bind the audit policy to system global.
    * Create a SYSLOG or NSLOG audit policy and bind the audit action to the audit policy.
    * Bind the audit policy to system global.

  **Note:** For an existing audit logging configuration, just enable the LSN parameter for logging LSN information in the server specified by the audit action.

  - **Enable logging and session logging parameters.** Enable logging and session logging parameters either as you add LSN groups or after you have created the groups. The NetScaler appliance generates log messages related to these LSN groups and sends them to the server of those audit actions that have the LSN parameter enabled.

- **Configuring log servers.** This task involves installing SYSLOG or NSLOG packages on the desired servers. This task also involves specifying the NSIP address of the NetScaler appliance in the configuration file of SYSLOG or NSLOG. Specifying the NSIP address enables the server to identify the log information sent by the NetScaler appliance for storing them in a log file.

For more information about configuring logging, see Audit Logging.

**SYSLOG Configuration Using the Command Line Interface**

**To create a SYSLOG server action for LSN logging by using the command line interface**

At the command prompt, type:

```
add audit syslogAction <name> <serverIP> [-serverPort <port>] -logLevel <logLevel>... [-transport (TCP)] [-lsn ( ENABLED | DISABLED )]
```

**To create a SYSLOG server policy for LSN logging by using the command line interface**

At the command prompt, type:

```
add audit syslogPolicy <name> <rule> <action>
```
To bind a SYSLOG server policy to system global for LSN logging by using the command line interface

At the command prompt, type:

```
bind system global [policyName] [-priority positive_integer]
```

SYSLOG Configuration Using the Configuration Utility

To configure a SYSLOG server action for LSN logging by using the configuration utility

1. Navigate to Systems > Auditing > Syslog and, on the Servers tab, add a new auditing server or edit an existing server.
2. To enable LSN logging, select the Large Scale NAT Logging option.
3. (Optional) To enable SYSLOG over TCP, select the TCP Logging option.

To configure a SYSLOG server policy for LSN logging by using the configuration utility

Navigate to Systems > Auditing > Syslog and, on the Policies tab, add a new policy or edit an existing policy.

To bind a SYSLOG server policy to system global for LSN logging by using the configuration utility

1. Navigate to Systems > Auditing > Syslog.
2. On the Policies tab, in the Action list, click Global Bindings to bind the audit global policies.

NSLOG Configuration Using the Command Line Interface

To create a NSLOG server action for LSN logging by using the command line interface

At the command prompt, type:

```
add audit nslogAction <name> <serverIP> [-serverPort <port>] -logLevel <logLevel> ... [-lsn (ENABLED | DISABLED )]
```

To create a NSLOG server policy for LSN logging by using the command line interface

At the command prompt, type:

```
add audit nslogPolicy <name> <rule> <action>
```
To bind a NSLOG server policy to system global for LSN logging by using the command line interface

At the command prompt, type:

```
bind system global [<policyName>]
```

**NSLOG Configuration Using the Configuration Utility**

To configure a NSLOG server action for LSN logging by using the configuration utility

1. Navigate to Systems > Auditing > Nslog and, on the Servers tab, add a new auditing server or, edit an existing server.
2. To enable LSN logging, select the Large Scale NAT Logging option.

To configure a NSLOG server policy for LSN logging by using the configuration utility

Navigate to Systems > Auditing > Nslog and, on the Policies tab, add a new policy or edit an existing policy.

To bind a NSLOG server policy to system global for LSN logging by using the configuration utility

1. Navigate to Systems > Auditing > Nslog.
2. On the Policies tab, in the Action list, click Global Bindings to bind the audit global policies.

**Example**

The following configuration specifies two SYSLOG and two NSLOG servers for storing log entries including LSN logs. LSN Logging is configured for LSN groups LSN-GROUP-2 and LSN-GROUP-3.

The NetScaler appliance generates log messages related to LSN mappings and LSN sessions of these LSN groups, and sends them to the specified log servers.

```
1 add audit syslogAction SYS-ACTION-1 198.51.101.10 -logLevel ALL -lsn ENABLED
2 Done
3 add audit syslogPolicy SYSLOG-POLICY-1 ns_true SYS-ACTION-1
4 Done
5 bind system global SYSLOG-POLICY-1
6 Done
7 8 add audit syslogAction SYS-ACTION-2 198.51.101.20 -logLevel ALL -lsn ENABLED
8 Done
```
The following configuration specifies SYSLOG configuration for sending log messages to the external SYSLOG server 192.0.2.10 using TCP.

```
add audit syslogAction SYS-ACTION-1 192.0.2.10 -logLevel ALL -transport TCP
Done
add audit syslogPolicy SYSLOG-POLICY-1 ns_true SYS-ACTION-1
Done
bind system global SYSLOG-POLICY-1
Done
```

The following table displays sample LSN log entries of each type stored on the configured log servers. These LSN log entries are generated by a NetScaler appliance whose NSIP address is 10.102.37.115.

```
add audit syslogAction SYS-ACTION-1 192.0.2.10 -logLevel ALL -transport TCP
Done
add audit syslogPolicy SYSLOG-POLICY-1 ns_true SYS-ACTION-1
Done
bind system global SYSLOG-POLICY-1
Done
add lsn group LSN-GROUP-3 -clientname LSN-CLIENT-2 -logging ENABLED -sessionLogging ENABLED
Done
set lsn group LSN-GROUP-2 -logging ENABLED -sessionLogging ENABLED
Done
```
### Minimal Logging

Deterministic LSN configurations and Dynamic LSN configurations with port block significantly reduces the LSN log volume. For these two types of configuration, the NetScaler appliance allocates a NAT IP address and a block of ports to a subscriber. The NetScaler appliance generates a log message for a port block at the time of allocation to a subscriber. The NetScaler appliance also generates a log message when a NAT IP address and port block is freed. For a connection, a subscriber can be identified just by its mapped NAT IP address and port block. Because of this reason, the NetScaler appliance does not log any LSN session created or deleted. The appliance also neither logs any mapping entry created for a session nor when the mapping entry gets removed.

The minimal logging feature for deterministic LSN configurations and dynamic LSN configurations with port block is enabled by default and there is no provision to disable it. In other words, the NetScaler appliance automatically do minimal logging for deterministic LSN configurations and dy
namic LSN configurations with port block. There is no option available for disabling this feature. The appliance sends the log messages to all the configured log servers.

A log message for each port block consists of the following information:

- NSIP address of the NetScaler appliance
- Time stamp
- Entry type as DETERMINISTIC or PORTBLOCK
- Whether a port block is allocated or is freed
- Subscriber’s IP address and the assigned NAT IP address and port block
- Protocol name

### Minimal Logging for Deterministic LSN Configuration

Consider an example of a simple deterministic LSN configuration for four subscribers having the IP address 192.0.17.1, 192.0.17.2, 192.0.17.3, and 192.0.17.4.

In this LSN configuration, the port block size is set to 32768 and LSN NAT IP address pool has IP addresses in the range 203.0.113.19-203.0.113.23.

```
1  add lsn client LSN-CLIENT-7
2   Done
3  bind lsn client LSN-CLIENT-7 -network 192.0.17.0 -netmask 255.255.255.253
4   Done
5  add lsn pool LSN-POOL-7 -nattype DETERMINISTIC
6   Done
7  bind lsn pool LSN-POOL-7 203.0.113.19-203.0.113.23
8   Done
9  add lsn group LSN-GROUP-7 -clientname LSN-CLIENT-7 -nattype DETERMINISTIC -portblocksize 32768
10  Done
11 bind lsn group LSN-GROUP-7 -poolname LSN-POOL-7
12  Done
```

The NetScaler appliance sequentially preallocates, from the LSN NAT IP pool and on the basis of the set port block size, an LSN NAT IP address and a block of ports to each subscriber. It assigns the first block of ports (1024-33791) on the beginning NAT IP address (203.0.113.19) to the beginning subscriber IP address (192.0.17.1). The next range of ports is assigned to the next subscriber, and so on, until the NAT address does not have enough ports for the next subscriber. At that point, the first port block on the next NAT IP address is assigned to the subscriber, and so on. The appliance logs the NAT IP address and the block of ports allocated for each subscriber.
The NetScaler appliance does not log any LSN session created or deleted for these subscribers. The appliance generates the following log messages for the LSN configuration.

1) 03/23/2015:00:30:56 GMT Informational 0-PPE-0 : default LSN LSN_DETERMINISTIC 79201453 0 : Dtrstc ALLOC Client 12.0.0.241, NatInfo 50.0.0.2:59904 to 60415
2) 03/23/2015:00:30:56 GMT Informational 0-PPE-0 : default LSN LSN_DETERMINISTIC 79201454 0 : Dtrstc ALLOC Client 12.0.0.242, NatInfo 50.0.0.2:60416 to 60927
3) 03/23/2015:00:30:56 GMT Informational 0-PPE-0 : default LSN LSN_DETERMINISTIC 79201455 0 : Dtrstc ALLOC Client 12.0.0.243, NatInfo 50.0.0.2:60928 to 61439
4) 03/23/2015:00:30:56 GMT Informational 0-PPE-0 : default LSN LSN_DETERMINISTIC 79201455 0 : Dtrstc ALLOC Client 12.0.0.243, NatInfo 50.0.0.2:60928 to 61439

When you remove the LSN configuration, the allocated NAT IP address and block of ports is freed from each subscriber. The appliance logs NAT IP address and block of ports freed from each subscriber. The appliance generates the following log messages for each subscriber when you remove the LSN configuration.

```
1) 03/23/2015:00:33:57 GMT Informational 0-PPE-0 : default LSN LSN_DETERMINISTIC 79201706 0 : Dtrstc FREE Client 12.0.0.238, NatInfo 50.0.0.2:58368 to 58879
2) 03/23/2015:00:33:57 GMT Informational 0-PPE-0 : default LSN LSN_DETERMINISTIC 79201707 0 : Dtrstc FREE Client 12.0.0.239, NatInfo 50.0.0.2:58880 to 59391
3) 03/23/2015:00:33:57 GMT Informational 0-PPE-0 : default LSN LSN_DETERMINISTIC 79201708 0 : Dtrstc FREE Client 12.0.0.240, NatInfo 50.0.0.2:59392 to 59903
```

Consider an example of a simple dynamic LSN configuration with port block for any subscriber in the network 192.0.2.0/24. In this LSN configuration, the port block size is set to 1024 and LSN NAT IP address pool has IP addresses in the range 203.0.113.3-203.0.113.4.

```
set lsn parameter -memLimit 4000
Done
add lsn client LSN-CLIENT-1
Done
bind lsn client LSN-CLIENT-1 -network 192.0.2.0 -netmask 255.255.255.0
Done
add lsn pool LSN-POOL-1
```
The NetScaler appliance allocates a random NAT IP address and a block of ports, from the LSN NAT IP pool and on the basis of the set port block size, for a subscriber when it initiates a session for the first time. The NetScaler logs the NAT IP address and block of ports allocated to this subscriber. The appliance does not log any LSN session created or deleted for this subscriber. If all the ports are allocated (for different subscriber’s sessions) from the subscriber’s allocated port block, the appliance allocates a new random NAT IP address and port block for the subscriber for additional sessions. The NetScaler logs every NAT IP address and port block allocated to a subscriber.

The appliance generates the following log message when the subscriber, having the IP address 192.0.2.1, initiates a session. The log message shows that the appliance has allocated NAT IP address 203.0.113.3 and port block 1024-2047 to the subscriber.

Once there are no more sessions left that is using the allocated NAT IP address and one of the ports in the allocated port block, the allocated NAT IP address and block of ports is freed from the subscriber. The NetScaler logs that the NAT IP address and the block of ports is freed from the subscriber. The appliance generates the following log messages for the subscriber, having the IP address 192.0.2.1, when no more sessions are left that is using the allocated NAT IP address (203.0.113.3) and a port from the allocated port block (1024-2047). The log message shows that the NAT IP address and port block are freed from the subscriber.

The NetScaler appliance sends its SYSLOG events and messages to all the configured external log servers. This results in storing redundant messages and makes monitoring difficult for system administrators. To address this issue, the NetScaler appliance offers load balancing algorithms that can load balance the SYSLOG messages among the external log servers for better maintenance and performance. The supported load balancing algorithms include RoundRobin, LeastBandwidth, CustomLoad, LeastConnection, LeastPackets, and AuditlogHash.

### Load balancing of SYSLOG servers using the command line `interface`

```
add service ( | ) <serviceType (SYSLOGTCP | SYSLOGUDP)>
```

1 Add a load balancing virtual server, specify the service type as SYSLOGTCP or SYSLOGUDP, and load balancing method as AUDITLOGHASH.

```
add lb vserver <serviceType (SYSLOGTCP | SYSLOGUDP)> [-lbMethod ]
```

1 Bind the service to the load balancing virtual server.

Bind lb vserver

```
add syslogaction [-lbVserverName] [-logLevel ]
```

1 Add a SYSLOG action and specify the load balancing server name that has SYSLOGTCP or SYSLOGUDP as service type.

```
add syslogpolicy
```

1 Bind the SYSLOG policy to the system global for the policy to take effect.

bind system global

```
### Load balancing of SYSLOG servers using the configuration utility
```

1. Add a service and specify the service type as SYSLOGTCP or SYSLOGUDP.

4 Navigate to Traffic Management > Services, click Add and select SYSLOGTCP or SYSLOGUDP as protocol.
1. Add a load balancing virtual server, specify the service type as SYSLOGTCP or SYSLOGUDP, and load balancing method as AUDITLOGHASH.

Navigate to Traffic Management > Virtual Servers, click Add and select SYLOGTCP or SYSLOGUDP as protocol.

1. Bind the service to the load balancing virtual server to the service.

Navigate to Traffic Management > Virtual Servers, click Add and select SYLOGTCP or SYSLOGUDP as protocol.

1. Add a SYSLOG action and specify the load balancing server name that has SYSLOGTCP or SYSLOGUDP as service type.

Navigate to System > Auditing, click Servers and add a server by selecting LB Vserver option in Servers.

1. Add a SYSLOG policy by specifying the rule and action.

Navigate to System > Syslog, click Policies and add a SYSLOG policy.

1. Bind the SYSLOG policy to the system global for the policy to take effect.

Navigate to System > Syslog, select a SYSLOG policy and click Action, and then click Global Bindings and bind the policy to system global.

**Example:**

The following configuration specifies load balance of SYSLOG messages among the external log servers using the AUDITLOGHASH as load balancing method. The NetScaler appliance generates SYSLOG events and messages that are load balanced amongst the services, service1, service2, and service3.

```
add service service1 192.0.2.10 SYSLOGUDP 514
Done
add service service2 192.0.2.11 SYSLOGUDP 514
```
NetScaler 12.0

Done

add service service3 192.0.2.11 SYSLOGUDP 514
Done

add lb vserver lbvserver1 SYSLOGUDP -lbMethod AUDITLOGHASH
Done

bind lb vserver lbvserver1 service1
Done

bind lb vserver lbvserver1 service2
Done

bind lb vserver lbvserver1 service3
Done

add syslogaction sysaction1 -lbVserverName lbvserver1 -logLevel All
Done

add syslogpolicy syspol1 ns_true sysaction1
Done

bind system global syspol1
Done

## Logging HTTP Header Information

4 The NetScaler appliance can now log request header information of an HTTP connection that is using the LSN functionality of the NetScaler. The following header information of an HTTP request packet can be logged:

5 - URL that the HTTP request is destined to.
6 - HTTP Method specified in the HTTP request.
7 - HTTP version used in the HTTP request.
8 - IP address of the subscriber that sent the HTTP request.

9 The HTTP header logs can be used by ISPs to see the trends related to the HTTP protocol among a set of subscribers. For example, an ISP can use this feature to find out the most popular websites among a set of subscribers.

11 An HTTP header log profile is a collection of HTTP header attributes (for example, URL and HTTP method) that can be enabled or disabled for logging. The HTTP header log profile is then bound to an LSN group. The NetScaler appliance then logs HTTP header attributes, which are enabled in the bound HTTP header log profile for logging,
of any HTTP requests related to the LSN group. The appliance then sends the log messages to the configured log servers.

An HTTP header log profile can be bound to multiple LSN groups but an LSN group can have only one HTTP header log profile.

### To create an HTTP header log profile by using the command line

At the command prompt, type:

```
add lsn httphdrlogprofile [-logURL ( ENABLED | DISABLED )] [-logMethod ( ENABLED | DISABLED )] [-logVersion ( ENABLED | DISABLED )] [-logHost ( ENABLED | DISABLED )]
```

```
show lsn httphdrlogprofile
```

### To bind an HTTP header log profile to an LSN group by using the command line

At the command prompt, type:

```
bind lsn group -httphdrlogprofilename
```

```
show lsn group
```

### Example

In the following example of an LSN configuration, HTTP header log profile HTTP-HEADER-LOG-1 is bound to LSN group LSN-GROUP-1. The log profile has all the HTTP attributes (URL, HTTP method, HTTP version, and HOST IP address) enabled for logging so that all these attributes are logged for any HTTP requests from subscribers (in the network 192.0.2.0/24) related to the LSN group.

```
add lsn httphdrlogprofile HTTP-HEADER-LOG-1
Done

set lsn parameter -memLimit 4000
Done

add lsn client LSN-CLIENT-1
Done

bind lsn client LSN-CLIENT-1 -network 192.0.2.0 -netmask 255.255.255.0
Done
```
add lsn pool LSN-POOL-1
Done
bind lsn pool LSN-POOL-1 203.0.113.3-203.0.113.4
Done
add lsn group LSN-GROUP-1 -clientname LSN-CLIENT-1 -portblocksize 1024
Done
bind lsn group LSN-GROUP-1 -poolname pool1 LSN-POOL-1
Done
bind lsn group LSN-GROUP-1 -htphdrlogprofilename HTTP-HEADER-LOG-1
Done

The NetScaler generates the following HTTP header log message when one of the subscriber belonging to the LSN configuration example sends an HTTP request.

The log message tells us that a client having the IP address 192.0.2.33 sends an HTTP request to URL example.com using HTTP method GET and HTTP version 1.1.

03/19/2015:16:24:04 GMT Informational 0-PPE-1 : default LSN Message 59 0 : “LSN Client IP:TD 10.102.37.118:0 URL: example.com Host: 192.0.2.33 Version: HTTP1.1 Method: GET”

## Logging MSISDN Information

A Mobile Station Integrated Subscriber Directory Number (MSISDN) is a telephone number uniquely identifying a subscriber across multiple mobile networks. The MSISDN is associated with a country code and a national destination code identifying the subscriber’s operator.

You can configure a NetScaler appliance to include MSISDNs in LSN log entries for subscribers in mobile networks. The presence of MSISDNs in the LSN logs helps the administrator in faster and accurate back tracing of a mobile subscriber who has violated a policy or law, or whose information is required by lawful interception agencies.

The following sample LSN log entries include MSISDN information for a connection from a mobile subscriber in an LSN configuration. The log entries show that a mobile subscriber whose MSISDN is E164:5556543210 was connected to destination IP:port 23.0.0.1:80 through the NAT IP:port 203.0.113.3:45195.
### Perform the following tasks for including MSISDN information in LSN logs

1. **Create an LSN log profile**. An LSN log profile includes the log subscriber ID parameter, which specifies whether to or not to include the MSISDN information in the LSN logs of an LSN configuration. Enable the log subscriber ID parameter when creating the LSN log profile.

2. **Bind the LSN log profile to an LSN group of an LSN configuration**. Bind the created LSN log profile to an LSN group of an LSN configuration by setting the log profile name parameter to the created LSN log profile name. For instructions on configuring Large Scale NAT, see [Configuration Steps for LSN](/en-us/netscaler/12/netscaler-support-for-telecom-service-providers/lsn-introduction/configuration-steps-lsn.html).

### To create an LSN log profile by using the CLI

At the command prompt, type:

```
add lsn logprofile <logprofilename -logSubscriberID ( ENABLED | DISABLED )
```
### To bind an LSN log profile to an LSN group of an LSN configuration by using the CLI

At the command prompt, type:

```bash
bind lsn group -logProfileName
show lsn group
```

**Sample Configuration:**

In this example of LSN configuration, the LSN log profile has the log subscriber ID parameter enabled. The profile is bound to LSN group LSN-GROUP-9. MSISDN information is included in the LSN session and LSN mapping logs for connections from mobile subscribers (in the network 192.0.2.0/24).

```bash
add lsn logprofile LOG-PROFILE-MSISDN-9 -logSubscriberID ENABLED
Done
add lsn client LSN-CLIENT-9
Done
bind lsn client LSN-CLIENT-9 -network 192.0.2.0 -netmask 255.255.255.0
Done
add lsn pool LSN-POOL-9
Done
bind lsn pool LSN-POOL-9 203.0.113.3-203.0.113.4
Done
add lsn group LSN-GROUP-9 -clientname LSN-CLIENT-9
Done
bind lsn group LSN-GROUP-9 -poolname LSN-POOL-9
Done
bind lsn group LSN-GROUP-9 -logprofilename LOG-PROFILE-MSISDN-9
Done
```

### Displaying Current LSN Sessions

You can display the current LSN sessions for detecting any unwanted or inefficient LSN sessions on the NetScaler appliance. You can display all or some LSN sessions on the basis of selection parameters.
Note: When more than a million LSN sessions exist on the NetScaler appliance, Citrix recommends displaying selected LSN sessions instead of all by using the selection parameters.

### Configuration Using the Command Line Interface

#### To display all LSN sessions by using the command line interface

At the command prompt, type:

```bash
show lsn session
```

#### To display selective LSN sessions by using the command line interface

At the command prompt, type:

```bash
show lsn session [-clientname ] [-network [-netmask ] [-td ]] [-natIP [-natPort ]]
```

#### Example

To display all LSN sessions existing on a NetScaler

```
!lsn-session[/en-us/netscaler/media/show-lsn-session1.png]
```

To display all LSN sessions related to an LSN client entity LSN-CLIENT-2

```
!lsn-session2[/en-us/netscaler/media/lsn-session-2.png]
```

Done

To display all LSN sessions that uses 203.0.113.5 as the NAT IP address

```
!lsn-session3[/en-us/netscaler/media/lsn-session-3.png]
```

### Configuration Using the Configuration Utility

#### To display all or selected LSN sessions by using the configuration utility

1. Navigate to System > Large Scale NAT > Sessions, and click the NAT44 tab.

1. For displaying LSN sessions on the basis of selection parameters, click Search.
### Parameter Descriptions (of commands listed in the CLI procedure)

- `show lsn session`
  - `clientname`
    Name of the LSN Client entity. Maximum Length: 127
  - `network`
    IP address or network address of subscriber(s).
  - `netmask`
    Subnet mask for the IP address specified by the network parameter.
    Default value: 255.255.255.255
  - `td`
    Traffic domain ID of the LSN client entity.
    Default value: 0
    Minimum value: 0
    Maximum value: 4094
  - `natIP`
    Mapped NAT IP address used in LSN sessions.

## Displaying LSN Statistics
You can display statistics related to the LSN feature for evaluating the performance of the LSN feature or to troubleshooting problems. You can display a summary of statistics of the LSN feature or of a
particular LSN group. The statistical counters reflect events since the NetScaler appliance was last restarted. All these counters are reset to 0 when the NetScaler appliance is restarted.

To display all LSN statistics by using the command line interface:

At the command prompt, type:

stat lsn

To display statistics for a specified LSN group by using the command line interface:

At the command prompt, type:

stat lsn group []

#### Example

stat lsn

Large Scale NAT statistics
Rate/(s) Total
LSN TCP Received Packets 0 40
LSN TCP Received Bytes 0 3026
LSN TCP Transmitted Packets 0 40
LSN TCP Transmitted Bytes 0 3026
LSN TCP Dropped Packets 0 0
LSN TCP Current Sessions 0 0
LSN UDP Received Packets 0 0
LSN UDP Received Bytes 0 0
LSN UDP Transmitted Packets 0 0
LSN UDP Transmitted Bytes 0 0
LSN UDP Dropped Packets 0 0
LSN UDP Current Sessions 0 0
LSN ICMP Received Packets 0 982
LSN ICMP Received Bytes 0 96236
LSN ICMP Transmitted Packets 0 0
LSN ICMP Transmitted Bytes 0 0
LSN ICMP Dropped Packets 0 982
LSN ICMP Current Sessions 0 0
LSN Subscribers 0 1
LSN Group Statistics
Rate (/s) Total
TCP Translated Pkts 0 40
TCP Translated Bytes 0 3026
TCP Dropped Pkts 0 0
TCP Current Sessions 0 0
UDP Translated Pkts 0 0
UDP Translated Bytes 0 0
UDP Dropped Pkts 0 0
UDP Current Sessions 0 0
ICMP Translated Pkts 0 0
ICMP Translated Bytes 0 0
ICMP Dropped Pkts 0 0
ICMP Current Sessions 0 0
Current Subscribers 0 1

### Parameter Descriptions (of commands listed in the CLI procedure)

- `stat lsn group`
  - `groupname`
    - Name of the LSN Group. Maximum Length: 127
  - `detail`
    - Specifies detailed output (including more statistics). The output can be quite voluminous. Without this argument, the output will show only a summary.
  - `fullValues`
    - Specifies that numbers and strings should be displayed in their full form. Without this option, long strings are shortened and large numbers are abbreviated.
- ntimes

   The number of times, in intervals of seven seconds, the statistics should be displayed.

   Default value: 1

- logFile

   The name of the log file to be used as input.

- clearstats

   Clear the statistics / counters

   Possible values: basic, full

## Compact Logging

Logging LSN information is one of the important functions needed by ISPs to meet legal requirements and be able to identify the source of traffic at any given time. This eventually results in a huge volume of log data, requiring the ISPs to make large investments to maintain the logging infrastructure.

Compact logging is a technique for reducing the log size by using a notational change involving short codes for event and protocol names. For example, C for client, SC for session created, and T for TCP. Compact logging results in an average of 40 percent reduction in log size.

The following examples of NAT44 mapping creation log entries show the advantage of compact logging.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Compact logging format</td>
<td>02/02/2016:01:14:57 GMT Info 0-PE2:default LSN</td>
</tr>
</tbody>
</table>
## Configuration Steps

Perform the following tasks for logging LSN information in compact format:

- **Create an LSN log profile.** An LSN log profile includes the Log Compact parameter, which specifies whether to or not to log information in compact format for an LSN configuration.
- **Bind the LSN log profile to an LSN group of an LSN configuration.** Bind the created LSN log profile to an LSN group of an LSN configuration by setting the Log Profile Name parameter to the created LSN log profile name. All sessions and mappings for this LSN group are logged in compact format.

### To create an LSN log profile by using the CLI

```
add lsn logprofile -logCompact (ENABLED|DISABLED)
show lsn logprofile
```

### To bind an LSN log profile to an LSN group of an LSN configuration by using the CLI

```
bind lsn group -logProfileName
show lsn group
```

**Sample configuration:**

```
add lsn logprofile LOG-PROFILE-COMPACT-9 -logCompact ENABLED
Done
add lsn client LSN-CLIENT-9
Done
bind lsn client LSN-CLIENT-9 -network 192.0.2.0 -netmask 255.255.255.0
Done
add lsn pool LSN-POOL-9
Done
bind lsn pool LSN-POOL-9 203.0.113.3-203.0.113.4
```
The NetScaler appliance supports sending information about LSN events in Internet Protocol Flow Information Export (IPFIX) format to the configured set of IPFIX collector(s). The appliance uses the existing AppFlow feature to send LSN events in IPFIX format to the IPFIX collectors.

IPFIX based logging is available for the following large scale NAT44 related events:

- Creation or deletion of an LSN session.
- Creation or deletion of an LSN mapping entry.
- Allocation or de-allocation of port blocks in the context of deterministic NAT.
- Allocation or de-allocation of port blocks in the context of dynamic NAT.
- Whenever subscriber session quota is exceeded.

### Points to Consider before you Configure IPFIX logging

Before you start configuring IPSec ALG, consider the following points:

- You must configure the AppFlow feature and IPFIX collector(s) on the NetScaler appliance. For instructions, see Configuring the AppFlow feature topic.

### Configuration Steps

Perform the following tasks for logging LSN information in IPFIX format:

- **Enable LSN logging in the AppFlow configuration**. Enable the LSN logging parameter as part of AppFlow configuration.
- **Create an LSN log profile**. An LSN log profile includes the IPFIX parameter that enables or disables the log information in IPFIX.
Bind the LSN log profile to an LSN group of an LSN configuration. Bind the LSN log profile to one or multiple LSN group(s). Events related to the bound LSN group will be logged in IPFIX format.

To enable LSN logging in the AppFlow configuration by using the CLI

At the command prompt, type:

```
set appflow param -lsnLogging ( ENABLED | DISABLED )
show appflow param
```

To create an LSN log profile by using the CLI

At the command prompt, type:

```
set lsn logprofile -logipfix ( ENABLED | DISABLED )
show lsn logprofile
```

To bind the LSN log profile to an LSN group of an LSN configuration by using the CLI

At the command prompt, type:

```
bind lsn group -logProfileName
show lsn group
```

To create an LSN log profile by using the GUI

Navigate to System > Large Scale NAT > Profiles, click Log tab, and then add a log profile.

To bind the LSN log profile to an LSN group of an LSN configuration by using the GUI

1. Navigate to System > Large Scale NAT > LSN Group, open the LSN group.
2. In Advanced Settings, click + Log Profile to bind the created Log profile to the LSN group.

**STUN Timeout**

September 17, 2018
STUN (Session Traversal Utilities for NAT) enables an end host operating behind a NAT device to discover its NAT IP address and NAT port allocated by the NAT device. Interactive communication applications (for example real-time voice, video, and messaging) running on these hosts use the STUN protocol for discovering NAT IP address and port information. This information is used by these applications to connect to their peer applications in the Internet. STUN protocol includes servers, known as STUN servers, residing in the Internet. Using the STUN protocol, an application of an end host sends a request to a known STUN server, which in turn then embeds the NAT IP address and port in the payload of its response packet.

In an LSN deployment of a NetScaler appliance for an ISP, interactive communication applications (for example real-time voice, video, and messaging) running on a subscriber can use the STUN protocol to discover whether it is behind a NAT (NetScaler appliance) device or not. These applications send a request to a known STUN server. On receiving the request, the NetScaler allocates a NAT IP address and a port for this request, creates an LSN session and an LSN mapping entry, translates the packet with the allocated NAT IP address and port, and then forwards the packet to the STUN server. The STUN server embeds the allocated NAT IP address and port in the payload of its response packet. When the subscriber finally receives the packet, from the payload of the packet it learns that it is behind a NAT device, and the NAT IP address and port allocated for the session.

The application then notifies the peer applications that it is reachable at the NAT IP address and the port of the LSN mapping entry created for the STUN session. It notifies by embedding the NAT IP address and port in the payload of the packets sent to the peer applications. For making the application reachable at the same LSN mapping entry for any external application, full Cone NAT (endpoint Independent mapping and Endpoint Independent filtering) is enabled for the LSN configuration on the NetScaler appliance.

The NetScaler detects an LSN session of type STUN if the request packets are destined to TCP or UDP port 3478, and then marks the created mapping entry of type STUN. The NetScaler applies a timeout called, STUN timeout, to the created STUN LSN mapping entry. A STUN timeout is the maximum time that the NetScaler maintains an idle STUN LSN mapping entry since it was last used by any LSN session. If the STUN LSN mapping session is unused for a time that exceeds the STUN timeout, the NetScaler removes the mapping entry.

For an application on a subscriber that use STUN LSN mapping entry to stay available to other peer applications on the Internet, the application periodically sends keep-alive messages to the NetScaler appliance so that the STUN LSN mapping entry does not timeout. A higher frequency of keep-alive messages can have an affect on the performance a subscriber, especially, if the subscriber is a mobile device. A higher value of STUN timeout reduces the frequency of keep-alive messages from a subscriber.

ALGs on the NetScaler appliance do not apply to an LSN session that use a STUN LSN mapping entry because NAT IP address and NAT port are communicated in payload of the packets related to the session.
For subscribers’ applications that use STUN protocol, the LSN configuration must have the following settings:

- STUN timeout. In an LSN configuration, the LSN group includes the STUN timeout setting.
- Endpoint-independent mapping and endpoint-independent filtering for STUN protocol ports.

For instructions on creating an LSN configuration, see Configuration Steps for LSN.

**Example:**

The following sample LSN configuration applies to applications that use STUN protocol over TCP or UDP. STUN timeout is set to 10 mins. Endpoint-independent mapping and endpoint-independent filtering is set for the STUN TCP port (3748) and the STUN UDP port (3748).

```plaintext
add lsn client LSN-CLIENT-1
Done
bind lsn client LSN-CLIENT-1 -network 192.0.2.0 -netmask 255.255.255.0
Done
add lsn pool LSN-POOL-1
Done
bind lsn pool LSN-POOL-1 203.0.113.3
Done
add lsn group LSN-GROUP-1 -clientname LSN-CLIENT-1 -stuntimeout 10
Done
bind lsn group LSN-GROUP-1 -poolname pool1 LSN-POOL-1
Done
add lsn appsprofile LSNAPPSPROFILE-TCP-STUN-1 TCP -mapping ENDPOINT-INDEPENDENT -filtering ENDPOINT-INDEPENDENT
Done
bind lsn appsprofile LSNAPPSPROFILE-TCP-STUN-1 3748
Done
```
TCP SYN Idle Timeout

September 17, 2018

SYN idle timeout is the timeout for establishing TCP connections that use LSN on the NetScaler appliance. If a TCP session is not established within the configured timeout period, the NetScaler removes the session. SYN idle timeout is useful in providing protection against SYN flood attacks. In an LSN configuration, the LSN group entity includes the SYN idle timeout setting.

Example:

In the following sample LSN configuration, SYN idle timeout is set to 30 secs for TCP connections related to subscribers from the 192.0.2.0/24 network.
Overriding LSN configuration with Load Balancing Configuration

September 17, 2018

An LSN configuration takes precedence over any load balancing configuration by default. For overriding the large scale networking (LSN) configuration with the load balancing configuration for traffic matching both configurations, create a net profile with Override LSN parameter enabled and bind this profile to the virtual server of the load balancing configuration. USNIP or USIP settings of the load balancing configuration are applied to the traffic, instead of applying the LSN IP address of the LSN configuration.

This option is useful in an LSN deployment that includes NetScaler appliances and value added services, such as firewall and optimization devices. In this type of deployment, the ingress traffic on the NetScaler appliance is required to pass through these value-added services before an LSN configuration on the appliance is applied to the traffic. For the NetScaler appliance to send the ingress traffic to a value added service, a load balancing configuration is created and override LSN is enabled on the appliance. The load balancing configuration includes value added services, represented as load balancing services, bound to a virtual server of type ANY. The virtual server is configured with listen policies for identifying the traffic to be sent to the value added service.

To enable override lsn in a net profile by using the CLI

To enable override lsn while adding a net profile, at the command prompt, type

```
add netProfile <name> -overrideLsn ( ENABLED | DISABLED )
show netprofile <name>
```
To enable override lsn while adding a net profile, at the command prompt, type

```bash
1 set netProfile <name> -overrideLsn ( ENABLED | DISABLED )
2 show netprofile <name>
```

To enable override lsn in a net profile by using GUI

1. Navigate to System > Network > Net Profiles.
2. Set the Override LSN parameter while adding or modifying net profiles.

In the following sample configuration, net profile NETPROFILE-OVERRIDELSN-1 has override LSN option enabled and is bound to load balancing virtual server LBVS-1.

**Sample configuration:**

```bash
1 add netprofile NETPROFILE-OVERRIDELSN-1 -overrideLsn ENABLED
2 Done
3 set lb vserver LBVS-1 -netprofile NETPROFILE-OVERRIDELSN-1
4 Done
```

Clearing LSN Sessions

September 17, 2018

You can remove any unwanted or inefficient LSN sessions from the NetScaler appliance. The appliance immediately releases resources (such as NAT IP address, port, and memory) allocated for these sessions, making the resources available for new sessions. The appliance also drops all the subsequent packets related to these removed sessions. You can remove all or selected LSN sessions from the NetScaler appliance.

**To clear all LSN sessions by using the command line interface**

At the command prompt, type:

```bash
1 flush lsn session
2 show lsn session
```
To clear selective LSN sessions by using the command line interface

At the command prompt, type:

```
1 flush lsn session [-clientname <string>] [-network <ip_addr> [-netmask <netmask>] [-td <positive_integer>]] [-natIP <ip_addr> [-natPort <port>]]
2
3 show lsn session
```

Example

Clear all LSN sessions existing on a NetScaler

```
1 flush lsn session
2
3 Done
```

Clear all LSN sessions related to LSN client entity LSN-CLIENT-1

```
1 flush lsn session -clientname LSN-CLIENT-1
2
3 Done
```

Clear all LSN sessions related to a subscriber network (192.0.2.0) of LSN client entity LSN-CLIENT-2 belonging to traffic domain 100

```
1 flush lsn session -clientname LSN-CLIENT-2 - network 192.0.2.0 - netmask 255.255.255.0 - td 100
2
3 Done
```

To clear all LSN sessions by using the configuration utility

Navigate to System > Large Scale NAT > Sessions, and click Flush Sessions.

Parameter Descriptions (of commands listed in the CLI procedure)

- flush lsn session
  - clientname

  Name of the LSN Client entity. Maximum Length: 127
- **network**
  IP address or network address of subscriber(s).

- **netmask**
  Subnet mask for the IP address specified by the network parameter.
  Default value: 255.255.255.255

- **td**
  Traffic domain ID of the LSN client entity.
  Default value: 0
  Minimum value: 0
  Maximum value: 4094

- **natIP**
  Mapped NAT IP address used in LSN sessions.

- **natPort**
  Mapped NAT port used in the LSN sessions.

---

**Load Balancing SYSLOG Servers**

September 17, 2018

The NetScaler appliance send its SYSLOG events and messages to all the configured external log servers. This results in storing redundant messages and makes monitoring difficult for system administrators. To address this issue, the NetScaler appliance offers load balancing algorithms that can load balance the SYSLOG messages among the external log servers for better maintenance and performance. The supported load balancing algorithms include RoundRobin, LeastBandwidth, CustomLoad, LeastConnection, LeastPackets, and AuditlogHash.

Load balancing of SYSLOG servers using the command line interface

At the command prompt, type:

Add a service and specify the service type as SYSLOGTCP or SYSLOGUDP.

```bash
1 add service <name>(<IP> | <serverName>) <serviceType> (SYSLOGTCP | SYSLOGUDP) <port>
```

Add a load balancing virtual server, specify the service type as SYSLOGTCP or SYSLOGTCP, and load balancing method as AUDITLOGHASH.
Bind the service to the load balancing virtual server.

```
1 add lb vserver <name> <serviceType> (SYSLOGTCP | SYSLOGUDP) [-lbMethod <AUDITLOGHASH>]
```

1. Add a SYSLOG action and specify the load balancing server name that has SYSLOGTCP or SYSLOGUDP as service type.

```
1 add syslogaction <name> <serverIP> [-lbVserverName <string>] [-logLevel <logLevel>]
```

Add a SYSLOG policy by specifying the rule and action.

```
1 add syslogpolicy <name> <rule> <action>
```

Bind the SYSLOG policy to the system global for the policy to take effect.

```
1 bind system global <policyName>
```

**Load balancing of SYSLOG servers using the configuration utility**

1. Add a service and specify the service type as SYSLOGTCP or SYSLOGUDP.
   
   Navigate to Traffic Management > Services, click Add and select SYLOGTCP or SYSLOGUDP as protocol.

2. Add a load balancing virtual server, specify the service type as SYSLOGTCP or SYSLOGTCP, and load balancing method as AUDITLOGHASH.
   
   Navigate to Traffic Management > Virtual Servers, click Add and select SYLOGTCP or SYSLOGUDPas protocol.

3. Binge the service to the load balancing virtual server to the service.
   
   Binge the service to the load balancing virtual server.
   
   Navigate to Traffic Management > Virtual Servers, select a virtual server and then selectAUDITLOGHASH in the Load Balancing Method.

4. Add a SYSLOG action and specify the load balancing server name that has SYSLOGTCP or SYSLOGUDP as service type.
   
   Navigate to System > Auditing, click Servers and add a server by selecting LB Vserver option inServers.
5. Add a SYSLOG policy by specifying the rule and action.

   Navigate to System > Syslog, click Policies and add a SYSLOG policy.

6. Bind the SYSLOG policy to the system global for the policy to take effect.

   Navigate to System > Syslog, select a SYSLOG policy and click Action, and then click Global Bindings and bind the policy to system global.

Example:

The following configuration specifies load balance of SYSLOG messages among the external log servers using the AUDITLOGHASH as load balancing method. The NetScaler appliance generates SYSLOG events and messages that are load balanced amongst the services, service1, service2, and service 3.

```
1 add service service1 192.0.2.10 SYSLOGUDP 514
2 add service service2 192.0.2.11 SYSLOGUDP 514
3 add service service3 192.0.2.11 SYSLOGUDP 514
4 add lb vserver lbvserver1 SYSLOGUDP -lbMethod AUDITLOGHASH
5 bind lb vserver lbvserver1 service1
6 bind lb vserver lbvserver1 service2
7 bind lb vserver lbvserver1 service3
8 add syslogaction sysaction1 -lbVserverName lbvserver1 -logLevel All
9 add syslogpolicy syspoll ns_true sysaction1
10 bind system global syspoll
```

Limitations:

The NetScaler appliance does not support an external load balancing virtual server load balancing the SYSLOG messages among the log servers.

Port Control Protocol

September 17, 2018
NetScaler appliances now support Port Control Protocol (PCP) for large scale NAT (LSN). Many of an ISP’s subscriber applications must be accessible from Internet (for example, Internet of Things (IOT) devices, such as an IP camera that provides surveillance over the Internet). One way to meet this requirement is to create static large scale NAT (LSN) maps. But for a very large number of subscribers, creating static LSN NAT maps is not a feasible solution.

Port Control Protocol (PCP) enables a subscriber to request specific LSN NAT mappings for itself and/or for other 3rd party devices. The large scale NAT device creates an LSN map and sends it to the subscriber. The subscriber sends the remote devices on the Internet the NAT IP address:NAT port at which they can connect to the subscriber.

Applications usually send frequent keep-alive messages to the large scale NAT device so that their LSN mappings do not time out. PCP helps reduce the frequency of such keep-alive messages by enabling the applications to learn the timeout settings of the LSN mappings. This helps reduce bandwidth consumption on the ISP’s access network and battery consumption on mobile devices.

PCP is a client-server model and runs over the UDP transport protocol. A NetScaler appliance implements the PCP server component and is compliant with RFC 6887.

**Configuration Steps**

Perform the following tasks for configuring PCP:

- (Optional) Create a PCP profile. A PCP profile includes settings for PCP related parameters (for example, to listen for mapping and peer PCP requests). A PCP profile can be bound to a PCP server. A PCP profile bound to a PCP server applies all its settings to the PCP server. A PCP profile can be bound to multiple PCP servers. By default, one PCP profile with default parameters settings is bound to all PCP servers. A PCP profile that you bind to a PCP server overrides the default PCP profile settings for that server. A default PCP profile has the following parameter settings:
  - Mapping: Enabled
  - Peer: Enabled
  - Minimum map life: 120 seconds
  - Maximum max life: 86400 seconds
  - Announce count: 10
  - Third Party: Disabled

- Create a PCP server and bind a PCP profile to it. Create a PCP server on the NetScaler appliance to listen for PCP related requests and messages from the subscribers. A Subnet IP (SNIP) address must be assigned to a PCP server to access it. By default, a PCP server listens on port 5351.

- Bind the PCP server to an LSN group of an LSN configuration. Bind the created PCP server to an LSN group of an LSN configuration by setting the PCP Server parameter to specify the created PCP server. The created PCP server can be accessed only by the subscribers of this LSN group.
**Note**

A PCP server for a large scale NAT configuration does not serve requests from subscribers that are identified from ACL rules.

**To create a PCP profile by using the CLI**

At the command prompt, type:

```
add pcp profile <name> [-mapping ( ENABLED | DISABLED )] [-peer ( ENABLED | DISABLED )] [-minMapLife <secs>] [-maxMapLife <secs>] [-announceMultiCount <positive_integer>] [-thirdParty ( ENABLED | DISABLED )]
```

```
show pcp profile <name>
```

**To create a PCP server by using the CLI**

At the command prompt, type:

```
add pcp server <name> <IPAddress> [-port <portNum|*>] [-pcpProfile <string>]
```

```
show pcp server <name>
```

**Sample Configuration for NAT44**

In the following sample configuration, PCP server PCP-SERVER-9, with default PCP settings, is bound to LSN group LSN-GROUP-9. PCP-SERVER-9 serves PCP requests from subscribers in network 192.0.2.0/24.

**Sample configuration:**

```
add pcp server PCP-SERVER-9 192.0.3.9
Done
add lsn client LSN-CLIENT-9
Done
bind lsn client LSN-CLIENT-9 -network 192.0.2.0 -netmask 255.255.255.0
```
Because of the shortage of IPv4 addresses, and the advantages of IPv6 over IPv4, many ISPs have started transitioning to IPv6 infrastructure. But during the transition, ISPs must continue to support IPv4 along with IPv6, because most of the public Internet still uses only IPv4, and many subscribers do not support IPv6.

Dual Stack Lite (DS-Lite) is an IPv6 transition solution for ISPs with IPv6 infrastructure to connect their IPv4 subscribers to the Internet. DS-Lite uses IPv4-in-IPv6 tunneling to send a subscriber’s IPv4 packet through a tunnel on the IPv6 access network to the ISP. The IPv6 packet is decapsulated to recover the subscriber’s IPv4 packet and is then sent to the Internet after NAT address and port translation and other LSN related processing. The response packets traverse through the same path to the subscriber.

The NetScaler appliance implements the AFTR component of a DS-Lite deployment and is compliant with RFC 6333.
Architecture

The Dual-Stack Lite architecture for an ISP consists of the following components:

- **Basic Bridging Broadband (B4).** Basic Bridging broadband, or B4, is a device or component that resides in the subscriber premises. Typically, B4 is a component in the CPE devices in the subscriber premises. IPv4 subscribers are connected to the IPv6-only ISP access network through the CPE device containing the B4 component. The main function of the B4 is to initiate an IPv6 tunnel between B4 and an address family transition router (AFTR) in order to send or receive subscriber IPv4 request or response packets over the tunnel. B4 includes an IPv6 address known as the B4 tunnel endpoint address. B4 uses this address to source IPv6 packets to AFTR and receive packets from AFTR.

- **Address family transition router (AFTR).** AFTR is a device or component residing in the ISP’s core network. AFTR terminates the IPv6 tunnel from the B4 device. In other words, the IPv6 tunnel is formed between B4 in the subscriber premise and AFTR in ISP core network. AFTR decapsulates IPv6 packets received from B4 to recover the subscribers’ original IPv4 packets. AFTR sends the IPv4 packets to the LSN device or component. LSN routes the IPv4 packets to their destination after performing NAT address and port translation (NAT 44) and other LSN related processing. AFTR includes an IPv6 address known as the AFTR tunnel endpoint address. AFTR uses this address to source IPv6 packets to B4 and receive IPv6 packets from B4. The NetScaler appliance implements the AFTR component.

- **Softwire.** The IPv6 tunnel created between B4 and AFTR is called a softwire.

The DS-Lite architecture of an ISP using a NetScaler appliance consists of subscribers in private address spaces accessing the Internet through a NetScaler appliance deployed in ISP’s core network. IPv4 subscribers are connected to a CPE device that includes the DS-Lite B4 functionality. The CPE device is connected to the ISP core network through ISP’s IPv6-only access network. The NetScaler appliance contains the DS-Lite AFTR and LSN functionality.

IPv4 subscribers connected to the CPE device are assigned private IPv4 addresses either manually or through DHCP server running on the CPE device. On the CPE device, the AFTR tunnel endpoint address is specified manually or through DHCPv6. Configuration of CPE devices is vendor specific and therefore outside the scope of this documentation.

Upon receiving a request packet that is from an IPv4 subscriber and destined to a location on the Internet, the B4 component of the CPE device encapsulates the IPv4 packet in an IPv6 packet and sends it to the NetScaler appliance in the ISP core network. The NetScaler appliance’s AFTR functionality decapsulates the IPv6 packet to recover the subscriber’s original IPv4 packet. The LSN functionality of the NetScaler appliance translates the source IP address and port of the IPv4 packet to an NAT IP address and NAT port selected from the configured NAT pool, and then sends the packet to its destination on the Internet.

The appliance maintains a record of all active sessions that use the AFTR and LSN functionalities.
These sessions are called DS-Lite sessions. The NetScaler appliance also maintains the mappings between B4 IPv6 address, subscriber IPv4 address and port, and NAT IPv4 address and port, for each DS-Lite session. These mappings are called DS-Lite LSN mappings. From DS-Lite session entries and DS-Lite LSN mapping entries, the NetScaler appliance recognizes a response packet (received from the Internet) as belonging to a particular DS-Lite session.

When the NetScaler appliance receives a response packet belonging to a particular DS-Lite session, the appliance’s LSN functionality translates the destination IP address and port of the response packet from NAT IP address and port to the subscriber IP address and port, the AFTR functionality encapsulates the resulting packet in an IPv6 packet and sends it to the CPE device. The B4 functionality of the CPE device decapsulates the IPv6 packet to recover the IPv4 response packet, and then sends the IPv4 packet to the subscriber.

**Example**

Consider an example of a DS-Lite deployment consisting of NetScaler NS-1 in an ISP’s core network, CPE device B4-CPE-1 in a subscriber premise, and a single IPv4 subscriber SUB-1. B4-CPE-1 supports the B4 functionality of DS-Lite feature.

The following table lists the settings used in this example.

<table>
<thead>
<tr>
<th>Entity</th>
<th>Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>IPv4 address of subscriber SUB-1</td>
<td></td>
<td>192.0.2.51</td>
</tr>
<tr>
<td>IPv6 address of softwire endpoint on the B4 device (B4-CPE-1)</td>
<td></td>
<td>2001:DB8::3:4</td>
</tr>
<tr>
<td>IPv6 address of the softwire endpoint on the AFTR device (NS-1)</td>
<td></td>
<td>2001:DB8::5:6</td>
</tr>
</tbody>
</table>

**Settings on NetScaler appliance NS-1:**

<table>
<thead>
<tr>
<th>Entity</th>
<th>Name</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>LSN client</td>
<td>LSN-DSLITE-CLIENT-1</td>
<td>Network6 (Identifying traffic from B4 devices) = 2001:DB8::3:0/100</td>
</tr>
</tbody>
</table>
Following is the traffic flow in this example:

1. IPv4 subscriber SUB-1 sends a request to [http://www.example.com/](http://www.example.com/). The IPv4 packet has:
   - Source IP address = 192.0.2.51
   - Source port = 2552
   - Destination IP address = 198.51.100.250
   - Destination port = 80

2. Upon receiving the IPv4 request packet, B4-CPE-1 encapsulates it in the payload of an IPv6 packet and then sends the IPv6 packet to NS-1. The IPv6 packet has:
   - Source IP address = 2001:DB8::3:4
   - Destination IP address = 2001:DB8::5:6

3. When NS-1 receives the IPv6 packet, the AFTR module decapsulates the packet by removing the IPv6 headers. The resulting packet is SUB-1's original IPv4 request packet.

4. The LSN module of NS-1 translates the source IP address and port of the packet to an NAT IP address and NAT port selected from the configured NAT pool. The translated IPv4 packet has:
   - Source IP address = 203.0.113.61
   - Source port = 3002
   - Destination IP address = 198.51.100.250
   - Destination port = 80

5. The LSN module also creates an LSN mapping and session entry for this DS Lite session. The mapping includes the following information:
6. NS-1 sends the resulting IPv4 packet to its destination on the Internet.

7. The server for www.example.com processes the request packet and sends a response packet. The IPv4 response packet has:
   - Source IP address = 198.51.100.250
   - Source port = 80
   - Destination IP address = 203.0.113.61
   - Destination port = 3002

8. Upon receiving the IPv4 packet, NS-1 examines the LSN mapping and session entries and finds that the IPv4 response packet belongs to a DS Lite session. The LSN module of NS-1 translates the destination IP address and port. The IPv4 packet now has:
   - Source IP address = 198.51.100.250
   - Source port = 80
   - Destination IP address = 192.0.2.51
   - Destination port = 2552

9. The AFTR module of NS-1 encapsulates the IPv4 packet in an IPv6 packet and then sends the IPv6 packet to B4-CPE-1. The IPv6 packet has:
   - Source IP address = 2001:DB8::5:6
   - Destination IP address = 2001:DB8::3:4

10. Upon receiving the packet, B4-CPE-1 decapsulates the IPv6 packet by removing the IPv6 headers, and then sends the resulting IPv4 packet to CL-1.

**Points to Consider before Configuring DS-Lite**

September 17, 2018

Consider the following points before configuring DS-Lite on a NetScaler appliance:

1. You must understand the different components of DS-Lite, described in RFC 6333.

2. A DS-lite configuration on a NetScaler appliance uses the LSN commands sets. In a DS-Lite configuration, the LSN client entity specifies the IPv6 address or IPv6 network address or ACL6 rules for identifying the traffic from the B4 device. A DS-Lite configuration also includes an IPv6 profile, which spec-
defines the IPv6 address AFTR component on a NetScaler appliance. For more information on NetScaler LSN feature, see Large Scale NAT.

3. For a DS-Lite configuration, the NetScaler appliance supports LSN for IPv4 packets that belong to one of the following protocols only. The NetScaler appliance drops IPv4 packets belonging to other protocols:
   - TCP
   - UDP
   - ICMP

4. The NetScaler appliance supports the following ALGs DS-Lite:
   - ICMP
   - FTP
   - TFTP
   - Session Initiation Protocol (SIP)
   - Real Time Streaming Protocol (RTSP)

Configuring DS-Lite

September 20, 2018

A DS-lite configuration on a NetScaler appliance uses the LSN commands sets. In a DS-Lite configuration, the LSN client entity specifies the IPv6 address or IPv6 network address or ACL6 rules for identifying the traffic from the B4 device. For more information on the NetScaler LSN feature, see Large Scale NAT. A DS-Lite configuration also includes an IPv6 profile, which specifies the IPv6 address (of type SNIP6) of the DS-Lite AFTR component on a NetScaler appliance.

Configuring DS-Lite on a NetScaler appliance consists of the following tasks:

Set the global LSN parameters. Global parameters include the amount of NetScaler memory reserved for the LSN feature and synchronization of LSN sessions in a high availability setup.

- Create an LSN client entity for identifying traffic from B4 CPE devices. The LSN client entity refers to a set of DS-Lite B4 devices. The client entity includes IPv6 addresses or IPv6 network address or ACL6 rules for identifying the traffic from these B4 devices. An LSN client can be bound to only one LSN group. The command line interface has two commands for creating an LSN client entity and binding a subscriber to the LSN client entity. The configuration utility combines these two operations on a single screen.

- Create an LSN pool and bind NAT IP addresses to it. An LSN pool defines a pool of NAT IP addresses to be used by the NetScaler appliance to perform LSN. The command line interface has two commands for creating an LSN pool and binding NAT IP addresses to the LSN pool. The configuration utility combines these two operations on a single screen.
• **Create an LSN IP6 profile.** An LSN IP6 profile defines the IPv6 address of the DS-Lite AFTR component on the NetScaler appliance. The IPv6 address must be one of the NetScaler owned IPv6 address of type SNIP6.

• **(Optional) Create an LSN Transport Profile for a specified protocol.** An LSN transport profile defines various timeouts and limits, such as maximum LSN sessions and maximum ports usage that a subscriber can have for a given protocol. You bind an LSN transport profile for each protocol (TCP, UDP, and ICMP) to an LSN group. A profile can be bound to multiple LSN groups. A profile bound to an LSN group applies to all subscribers of an LSN client bound to the same group. By default, one LSN transport profile with default settings for TCP, UDP, and ICMP protocols is bound to an LSN group during its creation. This profile is called the default transport profile. An LSN transport profile that you bind to an LSN group overrides the default LSN transport profile for that protocol.

• **(Optional) Create an LSN Application Profile for a specified protocol and bind a set of destination ports to it.** An LSN application profile defines the LSN mapping and LSN filtering controls of a group for a given protocol and for a set of destination ports. For a set of destination ports, you bind an LSN profile for each protocol (TCP, UDP, and ICMP) to an LSN group. A profile can be bound to multiple LSN groups. An LSN application profile bound to an LSN group applies to all subscribers of an LSN client bound to the same group. By default, one LSN application profile with default settings for TCP, UDP, and ICMP protocols for all destination ports is bound to an LSN group during its creation. This profile is called a default application profile. When you bind an LSN application profile, with a specified set of destination ports, to an LSN group, the bound profile overrides the default LSN application profile for that protocol at that set of destination ports. The command line interface has two commands for creating an LSN application profile and binding a set of destination ports to the LSN application profile. The configuration utility combines these two operations on a single screen.

• **Create an LSN Group and bind LSN pools, LSN IPv6 profile, (optional) LSN transport profiles, and (optional) LSN application profiles to the LSN group.** An LSN group is an entity consisting of an LSN client, an LSN IPv6 profile, LSN pool(s), LSN transport profile(s), and LSN application profiles(s). A group is assigned parameters, such as port block size and logging of LSN sessions. The parameter settings apply to all the subscribers of an LSN client bound to the LSN group. Only one LSN IPv6 profile can be bound to an LSN group, and an LSN IPv6 profile bound to an LSN group cannot be bound to other LSN groups. Only LSN Pools and LSN groups with the same NAT type settings can be bound together. Multiple LSN pools can be bound to an LSN group. Only one LSN client entity can be bound to an LSN group, and an LSN client entity bound to an LSN group cannot be bound to other LSN groups. The command line interface has two commands for creating an LSN group and binding LSN pools, LSN transport profiles, and LSN application profiles to the LSN group. The configuration utility combines these two operations in a single screen.
NetScaler 12.0

Configuration by Using the Command Line

To create an LSN client by using the command line interface:
At the command prompt, type:

```
1 add lsn client <clientname>
2
3 show lsn client
```

To bind an IPv6 network or an ACL6 rule to an LSN client by using the command line interface:
At the command prompt, type:

```
1 bind lsn client <clientname> (-network6 <ipv6_addr>*| -acl6name <string>)
2
3 show lsn client
```

To create an LSN pool by using the command line interface:
At the command prompt, type:

```
1 add lsn pool <poolname> [-nattype ( DYNAMIC )] [-portblockallocation ( ENABLED | DISABLED )] [-portreallocate <secs>] [-maxPortReallocTmq <positive_integer>]
2
3 show lsn pool
```

To bind an IP address range to an LSN pool by using the command line interface:
At the command prompt, type:

```
1 bind lsn pool <poolname> <lsnip>
2
3 show lsn pool
```

Note: For removing LSN IP addresses from an LSN pool, use the unbind lsn pool command.

To configure an LSN IPv6 profile by using the command line interface:
At the command prompt, type:

```
1 add lsn ip6profile <name> - type DS-Lite - network6 < ipv6_addr|*s >
2
3 show lsn ip6profile
```

To create an LSN transport profile by using the command line interface:
At the command prompt, type:

```
1 add lsn transportprofile <transportprofilename> <transportprotocol> [-sessiontimeout <secs>] [-finrsttimeout <secs>] [-portquota <positive_integer>] [-sessionquota <positive_integer>] [-portpreserveparity ( ENABLED | DISABLED )] [-portpreserverange ( ENABLED | DISABLED )] [-syncheck ( ENABLED | DISABLED )]
2
3 show lsn transportprofile
```

To create an LSN application profile by using the command line interface:

At the command prompt, type:

```
1 add lsn appsprofile <appspfilename> <transportprotocol> [-ippooling ( PAIRED | RANDOM )] [-mapping <mapping>] [-filtering <filtering>] [-tcpproxy ( ENABLED | DISABLED )] [-td <positive_integer>]
2
3 show lsn appsprofile
```

To bind an application protocol port range to an LSN application profile by using the command line interface:

At the command prompt, type:

```
1 bind lsn appsprofile <appspfilename> <lsnport>
2
3 show lsn appsprofile
```

To create an LSN group by using the command line interface:

At the command prompt, type:

```
1 add lsn group <groupname> -clientname <string> [-nattype ( DYNAMIC )] [-portblocksize <positive_integer>] [-logging (ENABLED | DISABLED )] [-sessionLogging ( ENABLED | DISABLED )] [-sessionSync ( ENABLED | DISABLED )] [-snmptraplimit<positive_integer>] [-ftp ( ENABLED | DISABLED )] [-pptp ( ENABLED |DISABLED )] [-sipalg ( ENABLED | DISABLED )] [-rtspalg ( ENABLED |DISABLED )] [-ip6profile <string>]
2
3 show lsn group
```

To bind LSN protocol profiles and LSN pools to an LSN group by using the command line interface:

At the command prompt, type:
bind lsn group <groupname> (-poolname <string> | -transportprofilename <string> | -httphdrlogprofilename <string> | -appsprofilename <string> | -sipalgprofilename <string> | rtspalgprofilename <string>)

Configuration by Using the Configuration Utility

To configure an LSN client and bind an IPv6 network address or an ACL6 rule by using the configuration utility:

Navigate to System > Large Scale NAT > Clients, and add a client and then bind an IPv6 network address or an ACL6 rule to the client.

To configure an LSN pool and bind NAT IP addresses by using the configuration utility:

Navigate to System > Large Scale NAT > Pools, and add a pool and then bind an NAT IP address or a range of NAT IP addresses to the pool.

To configure an LSN IPv6 profile by using the configuration utility:

Navigate to System > Large Scale NAT > Profiles, click the IPv6 tab, and assign an IPv6 address for DS-Lite AFTR.

To configure an LSN transport profile by using the configuration utility:

1. Navigate to System > Large Scale NAT > Profiles.
2. On the details pane, click Transport, and then add a transport profile.

To configure an LSN application profile by using the configuration utility:

1. Navigate to System > Large Scale NAT > Profiles.
2. On the details pane, click Application, and then add an application profile.

To configure an LSN group and bind an LSN client, an LSN IPv6 profile, pools, transport profiles, and application profiles by using the configuration utility:

Navigate to System > Large Scale NAT > Groups, and add a group and then bind an LSN client, an LSN IPv6 profile, pools, transport profiles, and application profiles to the group.

> add lsn client LSN-DSLITE-CLIENT-1
Done
> bind lsn client LSN-DSLITE-CLIENT-1 -network6 2001:DB8::3:0/100
Done
> add lsn pool LSN-DSLITE-POOL-1
Done
> bind lsn pool LSN-DSLITE-POOL-1 203.0.113.61 - 203.0.113.70
Done
### Logging and Monitoring DS-Lite

You can log DS-Lite information to diagnose or troubleshoot problems, and to meet legal requirements. The NetScaler appliance supports all LSN logging features for logging DS-Lite information. For configuring DS-Lite logging, use the procedures for configuring LSN logging, described at [Logging and Monitoring LSN](#).

A log message for a DS-Lite LSN mapping entry consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (MAPPING)
- Whether the DS-Lite LSN mapping entry was created or deleted
- IPv6 address of B4
- Subscriber’s IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID might be present, depending on the following conditions:
  - Destination IP address and port are not logged for Endpoint-Independent mapping.
  - Only the destination IP address is logged for Address-Dependent mapping. The port is not logged.
  - Destination IP address and port are logged for Address-Port-Dependent mapping.

A log message for a DS-Lite session consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (SESSION)
- Whether the DS-Lite session is created or removed
- IPv6 address of B4

---

```bash
9  > add lsn ip6profile LSN-DSLITE-PROFILE-1 -type DS-Lite -network6 2001::DB8::5:6
10 Done
11 > add lsn group LSN-DSLITE-GROUP-1 -clientname LSN-DSLITE-CLIENT-1 -portblocksize 1024 -ip6profile LSN-DSLITE-PROFILE-1
12 Done
13 > add lsn group LSN-DSLITE-GROUP-1 -poolname LSN-DSLITE-POOL-1
14 Done
```
The following table shows sample DS-Lite log entries of each type stored on the configured log servers. These log entries are generated by a NetScaler appliance whose NSIP address is 10.102.37.115. You can log DS-Lite information to diagnose or troubleshoot problems, and to meet legal requirements. The NetScaler appliance supports all LSN logging features for logging DS-Lite information. For configuring DS-Lite logging, use the procedures for configuring LSN logging, described at Logging and Monitoring LSN.

A log message for a DS-Lite LSN mapping entry consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (MAPPING)
- Whether the DS-Lite LSN mapping entry was created or deleted
- IPv6 address of B4
- Subscriber’s IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID might be present, depending on the following conditions:
  - Destination IP address and port are not logged for Endpoint-Independent mapping.
  - Only the destination IP address is logged for Address-Dependent mapping. The port is not logged.
  - Destination IP address and port are logged for Address-Port-Dependent mapping.

A log message for a DS-Lite session consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (SESSION)
- Whether the DS-Lite session is created or removed
- IPv6 address of B4
- Subscriber’s IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID

The following table shows sample DS-Lite log entries of each type stored on the configured log servers.
These log entries are generated by a NetScaler appliance whose NSIP address is 10.102.37.115.

<table>
<thead>
<tr>
<th>LSN Log Entry Type</th>
<th>Sample Log Entry</th>
</tr>
</thead>
</table>

**Displaying Current DS-Lite Sessions**

You can display the current DS-Lite sessions for detecting any unwanted or inefficient sessions on the NetScaler appliance. You can display all or some DS-Lite sessions, on the basis of selection parameters.

**Configuration by Using the Command Line Interface**

To display all DS-Lite sessions by using the command line interface:
At the command prompt, type:

```
1 show lsn session - nattype DS-Lite
```

To display selected DS-Lite sessions by using the command line interface:

At the command prompt, type:

```
1 show lsn session - nattype DS-Lite [-clientname <string>] [-network <ip_addr> [-netmask <netmask>] [-td <positive_integer>]] [-natIP <ip_addr> [-natPort <port>]]
```

Example:

The following sample output displays all DS-Lite sessions existing on a NetScaler appliance:

```
1 show lsn session - nattype DS-Lite
2 B4-Address SubscrIP SubscrPort SubscrTD DstIP DstPort DstTD NatIP NatPort Proto Dir
3 1. 2001:DB8::3:4 192.0.2.51 2552 0 198.51.100.250 80 0 203.0.113.61 3002 TCP OUT
5 2. 2001:DB8::3:4 192.0.2.51 3551 0 198.51.100.300 80 0 203.0.113.61 52862 TCP OUT
7 3. 2001:DB8::3:4 192.0.2.100 4556 0 198.51.100.250 0 0 203.0.113.61 48116 ICMP OUT
9 4. 2001:DB8::190 192.0.2.150 3881 0 198.51.100.199 80 0 203.0.113.69 48305 TCP OUT
11 Done
```

Configuration Using the Configuration Utility

To display all or selected DS-Lite sessions by using the configuration utility

1. Navigate to System > Large Scale NAT > Sessions, and click the DS-Lite tab.
2. For displaying DS-Lite sessions on the basis of selection parameters, click Search.

Clearing DS-Lite Sessions

You can remove any unwanted or inefficient DS-Lite sessions from the NetScaler appliance. The appliance immediately releases the resources (such as NAT IP address, port, and memory) allocated for
these sessions, making the resources available for new sessions. The appliance also drops all the sub-
sequent packets related to these removed sessions. You can remove all or selected DS-Lite sessions
from the NetScaler appliance.

**To clear all DS-Lite sessions by using the command line interface:**

At the command prompt, type:

```plaintext
flush lsn session -nattype DS-Lite
show lsn session -nattype DS-Lite
```

**To clear selected DS-Lite sessions by using the command line interface:**

At the command prompt, type:

```
flush lsn session -nattype DS-Lite [-clientname <string>] [-network <ip_addr> [-netmask <netmask>] [-td <positive_integer>]] [-natIP <ip_addr> [-natPort <port>]]
show lsn session -nattype DS-Lite
```

**To clear all or selected DS-Lite sessions by using the configuration utility:**

1. Navigate to System > Large Scale NAT > Sessions, and click the DS-Lite tab.
2. Click **Flush Sessions**.

### Configuring DS-Lite Static Maps

**September 17, 2018**

The NetScaler appliance supports manual creation of DS-Lite LSN mappings, which contain the map-
ning between the following information:

- Subscriber’s IP address and port, and IPv6 address of B4 device or component
- NAT IP address and port

Static DS-Lite LSN mappings are useful in cases where you want to ensure that the connections initi-
ated to a NAT IP address and port map to the subscriber IP address and port through the specified B4
device (for example, web servers located in the internal network).

Note: This feature is supported in release 11.0 build 64.x and later.

**To create a DS-Lite static LSN mapping by using the command line**

At the command prompt, type:
### Parameter Descriptions

#### add lsn static

- **name**
  
  Name for the LSN static mapping entry. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN group is created. The following requirement applies only to the CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “ds-lite lsn static1” or ‘ds-lite lsn static1’). This is a mandatory argument. Maximum Length: 127

- **transportprotocol**
  
  Protocol for the DS-LTE LSN mapping entry.

- **subscrIP**
  
  IPv4 address of a subscriber for the DS-LTE LSN mapping entry.

- **subscrPort**
  
  Port of the subscriber for the DS-LTE LSN mapping entry.

- **Network6**
  
  IPv6 address of the B4 device or component.

- **td**
  
  ID of the traffic domain to which the B4 device belongs. The IPv6 address of the B4 device is specified in the network6 parameter. If you do not specify an ID, the B4 device is assumed to be a part of the default traffic domain.

- **natIP**
  
  IPv4 address, already existing on the NetScaler appliance as type LSN, to be used as NAT IP address for this mapping entry.

- **natPort**
  
  NAT port for this DS-LTE LSN mapping entry.
NetScaler 12.0

- **destIP**
  
  Destination IP address for the DS-Lite LSN mapping entry.

- **dsttd**
  
  ID of the traffic domain through which the destination IP address for this DS-Lite LSN mapping entry is reachable from the NetScaler appliance. If you do not specify an ID, the destination IP address is assumed to be reachable through the default traffic domain, which has an ID of 0.

**To create a DS-Lite static LSN mapping by using the configuration utility**

Navigate to System > Large Scale NAT > Static, and add a new DS-Lite static LSN mapping.

**Configuring Deterministic NAT Allocation for DS-Lite**

September 17, 2018

Deterministic NAT allocation for DS-Lite LSN deployments is a type of NAT resource allocation in which the NetScaler appliance pre-allocates, from the LSN NAT IP pool and on the basis of the specified port block size, an LSN NAT IP address and a block of ports to each subscriber (subscriber behind B4 device).

**Note:** This feature is supported in release 11.0 build 64.x and later.

The appliance sequentially allocates NAT resources to these subscribers. It assigns the first block of ports on the beginning NAT IP address to the beginning subscriber IP address. The next range of ports is assigned to the next subscriber, and so on, until the NAT address does not have enough ports for the next subscriber. At that point, the first port block on the next NAT address is assigned to the subscriber, and so on.

The NetScaler appliance logs the allocated NAT IP address and the port block for a subscriber. For a connection, a subscriber can be identified by just its mapped NAT IP address and port block. For this reason, the NetScaler appliance does not log the creation or deletion of an LSN session.

A DS-Lite subscriber can have only one deterministic port block. If the entire block of ports is being used, the NetScaler appliance drops any new connection from the subscriber.

**Example: Deterministic DS-Lite**

In this example, a deterministic DS-Lite configuration includes four subscribers with IP addresses 192.0.17.5, 192.0.17.6, 192.0.17.7, and 192.0.17.8. These ipv4 subscribers are behind a B4 device having the IPv6 address 2001:DB8::3:4. In this configuration, the port block size is set to 20480 and LSN NAT IP address pool has IP addresses in the range 203.0.113.41-203.0.113.42.
The NetScaler appliance sequentially pre-allocates, from the LSN NAT IP pool and on the basis of the set port block size, an LSN NAT IP address and a block of ports to each subscriber. It assigns the first block of ports (1024-21503) on the beginning NAT IP address (203.0.113.41) to the beginning subscriber IP address (192.0.17.5). The next range of ports is assigned to the next subscriber, and so on, until the NAT address does not have enough ports for the next subscriber. At that point, the first port block on the next NAT IP address is assigned to the subscriber, and so on. The NetScaler logs the NAT IP address and the block of ports allocated for each subscriber.

The NetScaler appliance does not log any LSN session created or deleted for these subscribers.

The following table lists the NAT IP address and blocks of ports allocated to each subscriber in this example:

<table>
<thead>
<tr>
<th>Subscriber IP address</th>
<th>Allocated NAT IP address</th>
<th>Allocated Block of Ports</th>
<th>IPv6 address of B4</th>
</tr>
</thead>
<tbody>
<tr>
<td>192.0.17.5</td>
<td>203.0.113.41</td>
<td>1024 - 21503</td>
<td>2001:DB8::3:4</td>
</tr>
<tr>
<td>192.0.17.6</td>

</table>

**Configuration Steps**

You need to configure deterministic NAT as part of the DS-Lite configuration. For instructions on configuring DS-Lite, see Configuring DS-Lite.

While configuring DS-Lite, make sure that you:

- Set the NAT Type parameter to Deterministic when adding the LSN pool and the LSN group.
- Set the desired port block size parameter when adding the LSN group, unless you can accept the default value.

**Points to Consider before Configuring Deterministic DS-Lite**

Consider the following points before configuring deterministic DS-Lite:

- The complete IP address of each subscriber must be specified in a separate add lsn client command, by setting the Network and Netmask parameters. (Set Netmask to 255.255.255.255.) Also the IPv4 address of the B4 device specified in Network6 parameter must be complete (/128 pre-
NetScaler 12.0

In other words, Network and Network6 parameter do not accept addresses other than /32 bit mask and /128 prefix, respectively.

- The NetScaler appliance drops connections from subscribers that are not specified in any deterministic DS-Lite configuration but are behind B4 devices specified in a deterministic DS-lite configuration.
- The NetScaler appliance recognizes subscribers having the same IPv4 address as different subscribers if they are behind different B4 devices. A combination of subscriber IPv4 address and B4 device defines a unique subscriber in the LSN client entity of a DS-Lite configuration.

**Sample Deterministic DS-Lite Configuration:**

The following configuration uses the settings listed in section Example: Deterministic DS-Lite.

```
1   add lsn client LSN-DSLITE-CLIENT-10
2
3   Done
4   bind lsn client LSN-DSLITE-CLIENT-10 -network 192.0.17.5 -netmask 255.255.255.255 -network6 2001:DB8::3:4/128
5
6   Done
7   bind lsn client LSN-DSLITE-CLIENT-10 -network 192.0.17.6 -netmask 255.255.255.255 -network6 2001:DB8::3:4/128
8
9   Done
10  bind lsn client LSN-DSLITE-CLIENT-10 -network 192.0.17.7 -netmask 255.255.255.255 -network6 2001:DB8::3:4/128
11
12  Done
13  bind lsn client LSN-DSLITE-CLIENT-10 -network 192.0.17.8 -netmask 255.255.255.255 -network6 2001:DB8::3:4/128
14
15  Done
16  add lsn pool LSN-DSLITE-POOL-10 -nattype DETERMINISTIC
17
18  Done
19  bind lsn pool LSN-DSLITE-POOL-10 203.0.113.41-203.0.113.42
20
21  Done
22  add lsn ip6profile LSN-DSLITE-PROFILE-10 -type DS-Lite -network6 2001:DB8::5:6
23
24  Done
25  add lsn group LSN-DSLITE-GROUP-10 -clientname LSN-DSLITE-CLIENT-10 -nattype DETERMINISTIC -portblocksize 20480 -ip6profile LSN-DSLITE-PROFILE-10
```
Configuring Application Layer Gateways for DS-Lite

September 17, 2018

For some application layer protocols, the IP addresses and protocol port numbers are also communicated in the packet’s payload. Application Layer Gateway (AGL) for a protocol parses the packet payload and does necessary changes to ensure that the protocol continues to work over DS-Lite.

The NetScaler appliance supports ALG for the following protocols for DS-Lite:

- FTP
- ICMP
- TFTP
- SIP
- RTSP

Application Layer Gateway for FTP, ICMP, and TFTP Protocols

September 17, 2018

You can enable or disable ALG for the FTP protocol for a DS-Lite configuration by enabling or disabling the FTP ALG option of the LSN group of the configuration.

ALG for the ICMP protocol is enabled by default, and there is no provision to disable it.

ALG for the TFTP protocol is disabled by default. TFTP ALG is enabled automatically for a DS-Lite configuration when you bind a UDP LSN application profile, with endpoint-independent-mapping, endpoint-independent filtering, and destination port as 69 (well-known port for TFTP), to the LSN group.

Application Layer Gateway for SIP Protocol

September 17, 2018

Using DS-Lite with Session Initiation Protocol (SIP) is complicated, because SIP messages contain IP addresses in the SIP headers as well as in the SIP body. When LSN is used with SIP, the SIP headers
NetScaler 12.0

contain information about the caller and the receiver, and the device translates this information to hide it from the outside network. The SIP body contains the Session Description Protocol (SDP) information, which includes IP addresses and port numbers for transmission of the media. SIP ALG for DS-Lite is compliant with RFC 3261, RFC 3581, RFC 4566, and RFC 4475.

**Limitations of SIP ALG**

SIP ALG for DS-Lite has the following limitations:

- Only SDP payload is supported.
- The following are not supported:
  - Multicast IP addresses
  - Encrypted SDP
  - SIP TLS
  - FQDN translation
  - SIP layer authentication
  - Admin partitions
  - NetScaler clusters
  - Multipart body
  - Line folding

**Configuring SIP ALG**

You need to configure the SIP ALG as part of the LSN configuration. For instructions on configuring LSN, see Configuring DS-Lite. While configuring LSN, make sure that you:

- Set the following parameters while adding an LSN application profile:
  - IP Pooling = PAIRED
  - Address and Port Mapping = ENDPOINT-INDEPENDENT
  - Filtering = ENDPOINT-INDEPENDENT

- Create a SIP ALG profile and make sure that you define either the source port range or destination port range. Bind the SIP ALG profile to the LSN group
- Enable SIP ALG in the LSN group

**To enable SIP ALG for an LSN configuration by using the CLI**

At the command prompt, type:
To enable SIP ALG for an LSN configuration by using the CLI

At the command prompt, type:

```
add lsn sipalgprofile <sipalgprofilename> [-dataSessionIdleTimeout <positive_integer>] [-sipSessionTimeout <positive_integer>] [-registrationTimeout <positive_integer>] [-sipsrcportrange <port[-port]>][-sipdstportrange <port[-port]>][-openRegisterPinhole (ENABLED | DISABLED )][-openContactPinhole (ENABLED | DISABLED )][-openViaPinhole (ENABLED | DISABLED )][-openRecordRoutePinhole (ENABLED | DISABLED )][-sipTransportProtocol (TCP | UDP )[[-openRoutePinhole (ENABLED | DISABLED )][-rport (ENABLED | DISABLED )]
```

Sample Configuration

The following sample DS-Lite configuration, SIP ALG is enabled for TCP traffic from B4 devices in the network 2001:DB8::3:0/96.

```
add lsn client LSN-DSLITE-CLIENT-1
Done
bind lsn client LSN-DSLITE-CLIENT-1 -network6 2001:DB8::3:0/96
Done
add lsn pool LSN-DSLITE-POOL-1
Done
bind lsn pool LSN-DSLITE-POOL-1 203.0.113.61 - 203.0.113.70
Done
add lsn ip6profile LSN-DSLITE-PROFILE-1 -type DS-Lite -network6 2001:DB8::5:6
Done
add lsn appsprofile LSN-DSLITE-APPS-PROFILE-1 TCP -ippooling PAIRED -mapping ENDPOINT-INDEPENDENT -filtering ENDPOINT-INDEPENDENT
Done
add lsn sipalgprofile SIPALGPROFILE-1 -sipdstportrange 5060 -sipTransportProtocol TCP
```
Application Layer Gateway for RTSP Protocol

September 17, 2018

Real Time Streaming Protocol (RTSP) is an application-level protocol for the transfer of real-time media data. Used for establishing and controlling media sessions between end points, RTSP is a control channel protocol between the media client and the media server. The typical communication is between a client and a streaming media server.

Streaming media from a private network to a public network requires translating IP addresses and port numbers over the network. NetScaler functionality includes an Application Layer Gateway (ALG) for RTSP, which can be used with Large Scale NAT (LSN) to parse the media stream and make any necessary changes to ensure that the protocol continues to work over the network.

How IP address translation is performed depends on the type and direction of the message, and the type of media supported by the client-server deployment. Messages are translated as follows:

- Outbound request—Private IP address to NetScaler owned public IP address called LSN IP address.
- Inbound response—LSN IP address to private IP address.
- Inbound request—No translation.
- Outbound response—Private IP address to LSN pool IP address.

**Limitations of RTSP ALG**

The RTSP ALG does not support the following:

- Multicast RTSP sessions
- RTSP session over UDP
- Admin partitions
NetScaler 12.0

- NetScaler clusters
- RTSP Authentication
- HTTP tunneling

**Configuring RTSP ALG**

Configure RTSP ALG as part of the LSN configuration. For instructions on configuring LSN, see Configuring DS-Lite. While configuring LSN, make sure that you:

- Set the following parameters while adding an LSN application profile:
  - IP Pooling = PAIRED
  - Address and Port Mapping = ENDPOINT-INDEPENDENT
  - Filtering = ENDPOINT-INDEPENDENT
- Enable RTSP ALG in the LSN group
- Create a RTSP ALG profile and bind the RTSP ALG profile to the LSN group

**To enable RTSP ALG for an LSN configuration by using the CLI**

At the command prompt, type:

```plaintext
1  add lsn group <groupname> -clientname <string> [-rtspalg ( ENABLED | DISABLED )]
2
3  show lsn group <groupname>
```

**To enable RTSP ALG for an LSN configuration by using the CLI**

At the command prompt, type:

```plaintext
1  add lsn rtspalgprofile <rtspalgprofilename> [-rtspIdleTimeout <positive_integer>] -rtspportrange <port[-port]> [-rtspTransportProtocol (TCP|UDP)]
2
3  show lsn rtspalgprofile <rtspalgprofilename>
```

**Sample RTSP ALG Configuration**

The following sample DS-Lite configuration, RTSP ALG is enabled for TCP traffic from B4 devices in the network 2001:DB8::4:0/96.

**Sample RTSP ALG Configuration:**

Logging and Monitoring DS-Lite

September 17, 2018

You can log DS-Lite information to diagnose or troubleshoot problems, and to meet legal requirements. The NetScaler appliance supports all LSN logging features for logging DS-Lite information. For configuring DS-Lite logging, use the procedures for configuring LSN logging, described at Logging and Monitoring LSN.

A log message for a DS-Lite LSN mapping entry consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
• Entry type (MAPPING)
• Whether the DS-Lite LSN mapping entry was created or deleted
• IPv6 address of B4
• Subscriber’s IP address, port, and traffic domain ID
• NAT IP address and port
• Protocol name
• Destination IP address, port, and traffic domain ID might be present, depending on the following conditions:
  – Destination IP address and port are not logged for Endpoint-Independent mapping.
  – Only the destination IP address is logged for Address-Dependent mapping. The port is not logged.
  – Destination IP address and port are logged for Address-Port-Dependent mapping.

A log message for a DS-Lite session consists of the following information:

• NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced
• Time stamp
• Entry type (SESSION)
• Whether the DS-Lite session is created or removed
• IPv6 address of B4
• Subscriber’s IP address, port, and traffic domain ID
• NAT IP address and port
• Protocol name
• Destination IP address, port, and traffic domain ID

The following table shows sample DS-Lite log entries of each type stored on the configured log servers. These log entries are generated by a NetScaler appliance whose NSIP address is 10.102.37.115. You can log DS-Lite information to diagnose or troubleshoot problems, and to meet legal requirements. The NetScaler appliance supports all LSN logging features for logging DS-Lite information. For configuring DS-Lite logging, use the procedures for configuring LSN logging, described at Logging and Monitoring LSN.

A log message for a DS-Lite LSN mapping entry consists of the following information:

• NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced
• Time stamp
• Entry type (MAPPING)
• Whether the DS-Lite LSN mapping entry was created or deleted
• IPv6 address of B4
• Subscriber’s IP address, port, and traffic domain ID
• NAT IP address and port
• Protocol name
• Destination IP address, port, and traffic domain ID might be present, depending on the following conditions:
  – Destination IP address and port are not logged for Endpoint-Independent mapping.
  – Only the destination IP address is logged for Address-Dependent mapping. The port is not logged.
  – Destination IP address and port are logged for Address-Port-Dependent mapping.

A log message for a DS-Lite session consists of the following information:

• NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced
• Time stamp
• Entry type (SESSION)
• Whether the DS-Lite session is created or removed
• IPv6 address of B4
• Subscriber’s IP address, port, and traffic domain ID
• NAT IP address and port
• Protocol name
• Destination IP address, port, and traffic domain ID

The following table shows sample DS-Lite log entries of each type stored on the configured log servers. These log entries are generated by a NetScaler appliance whose NSIP address is 10.102.37.115.

<table>
<thead>
<tr>
<th>LSN Log Entry Type</th>
<th>Sample Log Entry</th>
</tr>
</thead>
</table>
**Displaying Current DS-Lite Sessions**

You can display the current DS-Lite sessions for detecting any unwanted or inefficient sessions on the NetScaler appliance. You can display all or some DS-Lite sessions, on the basis of selection parameters.

**To display all DS-Lite sessions by using the command line interface**

At the command prompt, type:

```
1 show lsn session -nattype DS-Lite
```

**To display selected DS-Lite sessions by using the command line interface**

At the command prompt, type:

```
```

The following sample output displays all DS-Lite sessions existing on a NetScaler appliance:

```
show lsn session –nattype DS-Lite

1  B4-Address SubscrIP SubscrPort SubscrTD DstIP DstPort DstTD NatIP NatPort Proto Dir
```
**Configuration Using the Configuration Utility**

To display all or selected DS-Lite sessions by using the configuration utility

1. Navigate to System > Large Scale NAT > Sessions, and click the **DS-Lite** tab.
2. For displaying DS-Lite sessions on the basis of selection parameters, click **Search**.

**Clearing DS-Lite Sessions**

You can remove any unwanted or inefficient DS-Lite sessions from the NetScaler appliance. The appliance immediately releases the resources (such as NAT IP address, port, and memory) allocated for these sessions, making the resources available for new sessions. The appliance also drops all the subsequent packets related to these removed sessions. You can remove all or selected DS-Lite sessions from the NetScaler appliance.

**To clear all DS-Lite sessions by using the command line interface**

At the command prompt, type:

```
1 flush lsn session - nattype DS-Lite
2 show lsn session - nattype DS-Lite
```

**To clear selected DS-Lite sessions by using the command line interface**

At the command prompt, type:
flush lsn session - nattype DS-Lite [-clientname <string>] [-network <ip_addr> [-netmask <netmask>] [-td <positive_integer>]] [-natIP <ip_addr> [-natPort <port>]]

4 show lsn session - nattype DS-Lite

To clear all or selected DS-Lite sessions by using the configuration utility

1. Navigate to System > Large Scale NAT > Sessions, and click the DS-Lite tab.
2. Click Flush Sessions.

Logging HTTP Header Information

The NetScaler appliance can log request header information of an HTTP connection that is using the DS-Lite functionality. The following header information of an HTTP request packet can be logged:

- URL that the HTTP request is destined to
- HTTP Method specified in the HTTP request
- HTTP version used in the HTTP request
- IPv4 address of the subscriber that sent the HTTP request

The HTTP header logs can be used by ISPs to see the trends related to the HTTP protocol among a set of subscribers. For example, an ISP can use this feature to find out the most popular website among a set of subscribers.

Configuration Steps

Perform the following tasks for configuring the NetScaler appliance to log HTTP header information:

- **Create an HTTP header log profile.** An HTTP header log profile is a collection of HTTP header attributes (for example, URL and HTTP method) that can be enabled or disabled for logging.
- **Bind the HTTP header to an LSN group of a DS-Lite LSN configuration.** Bind the HTTP header log profile to an LSN group of an LSN configuration by setting the HTTP header log profile name parameter to the name of the created HTTP header log profile. The NetScaler appliance then logs HTTP header information of any HTTP requests related to the LSN group. An HTTP header log profile can be bound to multiple LSN groups, but an LSN group can have only one HTTP header log profile.
To create an HTTP header log profile by using the command line interface

At the command prompt, type:

```
add lsn httphdrlogprofile <httphdrlogprofilename> [-logURL ( ENABLED | DISABLED )] [-logMethod ( ENABLED | DISABLED )] [-logVersion ( ENABLED | DISABLED )] [-logHost ( ENABLED | DISABLED )]
```

To bind an HTTP header log profile to an LSN group by using the command line interface

At the command prompt, type:

```
binding lsn group <groupname> <httphdrlogprofilename> <string>
```

Sample Configuration

In the following DS-Lite LSN configuration, HTTP header log profile HTTP-HEADER-LOG-1 is bound to LSN group LSN-DSLITE-GROUP-1. The log profile has all the HTTP attributes (URL, HTTP method, HTTP version, and HOST IP address) enabled for logging, so that all these attributes are logged for any HTTP requests from B4 devices (in the network 2001:DB8:5001::/96).

Sample Configuration:

```
add lsn httphdrlogprofile HTTP-HEADER-LOG-1
Done
add lsn client LSN-DSLITE-CLIENT-1
Done
bind lsn client LSN-DSLITE-CLIENT-1 network6 2001:DB8::3:0/100
Done
add lsn pool LSN-DSLITE-POOL-1
Done
bind lsn pool LSN-DSLITE-POOL-1 203.0.113.61 - 203.0.113.70
```
IPFIX Logging

The NetScaler appliance supports sending information about LSN events in Internet Protocol Flow Information Export (IPFIX) format to the configured set of IPFIX collector(s). The appliance uses the existing AppFlow feature to send LSN events in IPFIX format to the IPFIX collectors.

IPFIX based logging is available for the following DS_Lite related events:

- Creation or deletion of an LSN session.
- Creation or deletion of an LSN mapping entry.
- Allocation or de-allocation of port blocks in the context of deterministic NAT.
- Allocation or de-allocation of port blocks in the context of dynamic NAT.
- Whenever subscriber session quota is exceeded.

Points to Consider before you Configure IPFIX logging

Before you start configuring IPSec ALG, consider the following points:

- You must configure the AppFlow feature and IPFIX collector(s) on the NetScaler appliance. For instructions, see Configuring the AppFlow feature.
**Configuration Steps**

Perform the following tasks for logging LSN information in IPFIX format:

- **Enable LSN logging in the AppFlow configuration.** Enable the LSN logging parameter as part of AppFlow configuration.
- **Create an LSN log profile.** An LSN log profile includes the IPFIX parameter that enables or disables the log information in IPFIX format.
- **Bind the LSN log profile to an LSN group of an LSN configuration.** Bind the LSN log profile to one or multiple LSN group(s). Events related to the bound LSN group will be logged in IPFIX format.

**To enable LSN logging in the AppFlow configuration by using the CLI**

At the command prompt, type:

```
set appflow param -lsnLogging (ENABLED | DISABLED )
show appflow param
```

**To create an LSN log profile by using the CLI**

At the command prompt, type:

```
set lsn logprofile <logProfileName> -logipfix ( ENABLED | DISABLED )
show lsn logprofile
```

**To bind the LSN log profile to an LSN group of an LSN configuration by using the CLI**

At the command prompt, type:

```
bind lsn group <groupName> -logProfileName <lsnlogprofilename>
show lsn group
```

**To create an LSN log profile by using the GUI**

Navigate to **System > Large Scale NAT > Profiles**, click **Log** tab, and then add a log profile.
To bind the LSN log profile to an LSN group of an LSN configuration by using the GUI

1. Navigate to **System > Large Scale NAT > LSN Group**, open the LSN group.
2. In **Advanced Settings**, click **+ Log Profile** to bind the created Log profile to the LSN group.

**Port Control Protocol for DS-Lite**

September 17, 2018

NetScaler appliances now support Port Control Protocol (PCP) for large scale NAT (LSN). Many of an ISP’s subscriber applications must be accessible from Internet (for example, Internet of Things (IoT) devices, such as an IP camera that provides surveillance over the Internet). One way to meet this requirement is to create static large scale NAT (LSN) maps. But for a very large number of subscribers, creating static LSN NAT maps is not a feasible solution.

Port Control Protocol (PCP) enables a subscriber to request specific LSN NAT mappings for itself and/or for other 3rd party devices. The large scale NAT device creates an LSN map and sends it to the subscriber. The subscriber sends the remote devices on the Internet the NAT IP address:NAT port at which they can connect to the subscriber.

Applications usually send frequent keep-alive messages to the large scale NAT device so that their LSN mappings do not time out. PCP helps reduce the frequency of such keep-alive messages by enabling the applications to learn the timeout settings of the LSN mappings. This helps reduce bandwidth consumption on the ISP’s access network and battery consumption on mobile devices.

PCP is a client-server model and runs over the UDP transport protocol. A NetScaler appliance implements the PCP server component and is compliant with RFC 6887.

**Configuration Steps**

Perform the following tasks for configuring PCP:

- (Optional) Create a PCP profile. A PCP profile includes settings for PCP related parameters (for example, to listen for mapping and peer PCP requests). A PCP profile can be bound to a PCP server. A PCP profile bound to a PCP server applies all its settings to the PCP server. A PCP profile can be bound to multiple PCP servers. By default, one PCP profile with default parameters settings is bound to all PCP servers. A PCP profile that you bind to a PCP server overrides the default PCP profile settings for that server. A default PCP profile has the following parameter settings:
  - Mapping: Enabled
  - Peer: Enabled
  - Minimum map life: 120 seconds
Create a PCP server and bind a PCP profile to it. Create a PCP server on the NetScaler appliance to listen for PCP related requests and messages from the subscribers. A Subnet IP (SNIP) address must be assigned to a PCP server to access it. By default, a PCP server listens on port 5351.

Bind the PCP server to an LSN group of an LSN configuration. Bind the created PCP server to an LSN group of an LSN configuration by setting the PCP Server parameter to specify the created PCP server. The created PCP server can be accessed only by the subscribers of this LSN group.

Note: A PCP server for a large scale NAT configuration does not serve requests from subscribers that are identified from ACL rules.

**To create a PCP profile by using the CLI**

At the command prompt, type:

```
1 add pcp profile <name> [-mapping ( ENABLED | DISABLED )] [-peer ( ENABLED | DISABLED )] [-minMapLife <secs>] [-maxMapLife <secs>] [-announceMultiCount <positive_integer>] [-thirdParty ( ENABLED | DISABLED )]
2
3 show pcp profile <name>
```

**To create a PCP server by using the CLI**

At the command prompt, type:

```
1 add pcp server <name> <IPAddress> [-port <portNum|*>] [-pcpProfile <string>]
2
3 show pcp server <name>
```

**Sample Configuration for DS-LITE**

In the following sample configuration, PCP server PCP-SERVER-1, with PCP settings from PCP-DSLITE-PROFILE-1, is bound to LSN group LSN-DSLITE-GROUP-1. PCP-SERVER-9 serves PCP requests from IPv4 subscribers behind B4 devices from network 2001:DB8::3:0/100.

**Sample configuration:**

**Large Scale NAT64**

January 6, 2019

Because of the imminent exhaustion of IPv4 addresses, ISPs have started transitioning to IPv6 infrastructure. But during the transition, ISPs must continue to support IPv4 along with IPv6, because most of the public Internet still uses IPv4. Large scale NAT64 is an IPv6 transition solution for ISPs with IPv6 infrastructure to connect their IPv6-only subscribers to the IPv4 Internet. DNS64 is a solution for enabling discovery of IPv4-only domains by IPv6-only clients. DNS64 is used with large scale NAT64 to enable seamless communication between IPv6-only clients and IPv4-only servers.

A NetScaler appliance implements large scale NAT64 and DNS64 and is compliant with RFCs 6145, 6146, 6147, 6052, 3022, 2373, 2765, and 2464.
NetScaler 12.0

Architecture

The NAT64 architecture of an ISP using a NetScaler appliance consists of IPv6 subscribers accessing the IPv4 Internet through a NetScaler appliance deployed in the ISP’s core network. IPv6 subscribers are connected to the ISP core network through the ISP’s IPv6-only access network.

The large scale NAT64 functionality of a NetScaler appliance enables communication between IPv6 clients and IPv4 servers through IPv6-to-IPv4 packet translation, and vice versa, while maintaining session information on the NetScaler appliance. NetScaler DNS64 functionality represents IPv4-only domains to IPv6-subscribers by synthesizing DNS AAAA records for IPv4-only domains and sending them to the subscribers.

Large scale NAT64 has two main components: NAT64 prefix and NAT IPv4 pool. DNS64 has one main component, DNS64 prefix, which has the same value as NAT64 prefix.

Upon receiving an AAAA request from an IPv6-only subscriber for a domain name that is hosted on an IPv4-only web server on the Internet, the NetScaler DNS64 functionality synthesizes an AAAA record for the domain name and sends it to the subscriber. The AAAA record is synthesized by concatenating the DNS64 prefix (which is set to the NAT64 prefix) and the actual IPv4 address of the domain name.

The subscriber now has an IPv6 destination address that corresponds to the desired domain name. The subscriber sends the request to the synthesized IPv6 address. Upon receiving the IPv6 request, the large scale NetScaler NAT64 functionality translates the IPv6 request packet to an IPv4 request packet. Large scale NAT64 sets the IPv4 request’s destination address to the IPv4 address, which is extracted from the IPv6 request’s destination address by stripping the NAT64 prefix from the IPv6 address. The destination port is retained from the IPv6 request. Large Scale NAT64 also sets the source IP address:source port of the IPv4 packet to the NAT IP address:NAT port selected from the configured NAT pool.

The appliance maintains a record of all active sessions that use the large scale NAT64 functionality. These sessions are called large scale NAT64 sessions. The appliance also maintains the mappings between subscriber IPv6 address and port, and NAT IPv4 address and port, for each large scale NAT64 session. These mappings are called large scale NAT64 mappings. From large scale NAT64 session entries and large scale NAT64 mapping entries, the NetScaler appliance recognizes a response packet (received from the Internet) as belonging to a particular NAT64 session.

When the appliance receives an IPv4 response packet belonging to a particular NAT64 session, it uses the information stored in the NAT64 session to translate the IPv4 packet into an IPv6 packet, and then sends the IPv6 response packet to the subscriber.

Example: Traffic Flow of NAT64 and DNS64 Deployment

Consider an example of a large scale NAT64 and DNS64 deployment consisting of NetScaler appliance NS-1 and two local DNS servers, DNS-1 and DNS-2, in an ISP’s core network, and IPv6 subscriber SUB-1.
SUB-1 is connected to NS-1 through the ISP’s IPv6 access network. NS-1 includes large scale NAT64 and DNS64 configurations for enabling the communication between IPv6 subscriber SUB-1 and IPv4 hosts (internal and external).

Large scale NAT64 configuration includes a NAT64 prefix (2001:DB8:300::/96) and NAT IPv4 pool for translation of IPv6 requests to IPv4 requests and IPv4 responses to IPv6 responses.

DNS64 configuration includes a DNS load balancing virtual server LBVS-DNS64-1 (2001:DB8:9999::99) and a DNS64 prefix (2001:DB8:300::/96). LBVS-DNS64-1 represents local DNS server DNS-1 and DNS-2 to ISP’s subscribers. The DNS64 prefix, which has the same value as the NAT64 prefix, is used for synthesizing DNS AAAA records from DNS A records received from DNS servers DNS-1 and DNS-2. NS-1 responds with a synthesized AAAA record to SUB-1 for a DNS request to resolve an IPv4 host.

DNS64 Traffic Flow

Traffic flows between IPv6 subscriber SUB-1 and site www.example.com, which resides on an IPv4-only web server on the Internet, as follows:

1. IPv6 subscriber SUB-1 sends a DNS AAAA request for www.example.com to its designated DNS server (2001:DB8:9999::99).
2. DNS load balancing virtual server LBVS-DNS64-1 (2001:DB8:9999::99) on NetScaler appliance NS1 receives the AAAA request. LBVS-DNS64-1’s load balancing algorithm selects DNS server DNS-1 and forwards the AAAA request to it.
3. DNS-1 returns an empty record or an error message, because there is no AAAA record available for www.example.com.
4. Because the DNS64 option is enabled on LBVS-DNS64-1 and the AAAA request from CL1 matches the condition specified in DNS64-Policy-1, NS1 sends a DNS A request to DNS-1 for the IPv4 address of www.example.com.
5. DNS-1 responds with the A record of 192.0.2.60 for www.example.com.
6. DNS64 module on NS1 synthesizes an AAAA record for www.example.com by concatenating the DNS64 Prefix (2001:DB8:300::/96) associated with LBVS-DNS64-1, and IPv4 address (192.0.2.60) for www.example.com = 2001:DB8:300::192.0.2.60
7. NS1 sends the synthesized AAAA record to IPv6 client CL1. NS1 also caches the A record into its memory. NS1 uses the cached A record to synthesize AAAA records for subsequent AAAA requests.

NAT64 Traffic Flow

1. IPv6 subscriber SUB-1 sends a request to 2001:DB8:5001:30 www.example.com. The IPv6 packet has:
   • Source IP address = 2001:DB8:5001:30
2. IPv6 subscriber SUB-1 sends a request to 2001:DB8:5001:30 www.example.com. The IPv6 packet has:
   - Source IP address = 2001:DB8:5001:30
   - Source port = 2552
   - Destination IP address = 2001:DB8:300::192.0.2.60
   - Destination port = 80

3. When NS-1 receives the IPv6 packet, the large scale NAT64 module creates a translated IPv4 request packet with:
   - Source IP address = One of the IPv4 addresses available in the configured NAT pool (203.0.113.61)
   - Source port = One of ports available with the allocated NAT IPv4 address (3002)
   - Destination IP address = IPv4 address extracted from the IPv6 request’s destination address by stripping the NAT64 prefix (2001:DB8:300::/96) from the IPv6 address (192.0.2.60)
   - Destination port = IPv6 request’s destination port (80)

4. The large scale NAT64 module also creates mapping and session entries for this large scale NAT64 flow. The session and mapping entries include the following information:
   - Source IP address of the IPv6 packet = 2001:DB8:5001:30
   - Source port of the IPv6 packet = 2552
   - NAT IP address = 203.0.113.61
   - NAT port = 3002
   - NS-1 sends the resulting IPv4 packet to its destination on the Internet.

5. Upon receiving the request packet, the server for www.example.com processes the packet and sends a response packet to NS-1. The IPv4 response packet has:
   - Source IP address = 192.0.2.60
   - Source port = 80
   - Destination IP address = 203.0.113.61
   - Destination port = 3002

6. Upon receiving the IPv4 response packet, NS-1 examines the large scale NAT64 mapping and session entries and finds that the IPv4 response packet belongs to a large scale NAT64 session. The large scale NAT64 module creates a translated IPv6 response packet:
   - Source IP address = 2001:DB8:300::192.0.2.60
   - Source port = 80
   - Destination IP address = 2001:DB8:5001:30
   - Destination port = 2552
7. NS-1 sends the translated IPv6 response to client SUB-1.

Large Scale NAT64 features Supported on NetScaler appliances

Large scale NAT64 on a NetScaler appliance supports the standard LSN feature set. For more information on these LSN features, see LSN Architecture.

Following are some of the large scale NAT64 features supported on NetScaler appliances:

- **ALGs.** Support of application Layer Gateway (ALG) for SIP, RTSP, FTP, ICMP, and TFTP protocols.
- **Deterministic/Fixed NAT.** Support for pre-allocation of blocks of ports to subscribers to minimize logging.
- **Mapping.** Support of Endpoint-independent mapping (EIM), Address-dependent mapping (ADM), and Address-Port dependent mapping (APDM).
- **Filtering.** Support of Endpoint-Independent Filtering (EIF), Address-Dependent Filtering (ADF), and Address-Port-Dependent Filtering (APDF).
- **Quotas.** Configurable limits on number of ports, sessions per subscriber, and sessions per LSN group.
- **Static Mapping.** Support for manually defining a large scale NAT64 mapping.
- **Hairpin Flow.** Support for communication between subscribers or internal hosts using NAT IP addresses.
- **464XLAT connections.** Support for communication between IPv4-only applications on IPv6 subscriber hosts and IPv4 hosts on the Internet through IPv6 network.
- **Variable length NAT64 and DNS64 prefixes.** The NetScaler appliance supports defining NAT64 and DNS64 prefixes of lengths of 32, 40, 48, 56, 64, and 96.
- **Multiple NAT64 and DNS64 prefix.** The NetScaler appliance supports multiple NAT64 and DNS64 prefixes.
- **LSN Clients.** Support for specifying or identifying subscribers for large scale NAT64 by using IPv6 prefixes and extended ACL6 rules.
- **Logging.** Support for logging NAT64 sessions for law enforcement. In addition, the following are also supported for logging.
  - **Reliable SYSLOG.** Support for sending SYSLOG messages over TCP to external log servers for a more reliable transport mechanism.
  - **Load balancing of log servers.** Support for load balancing of external log servers for preventing storage of redundant log messages.
  - **Minimal Logging.** Deterministic LSN configurations or Dynamic LSN configurations with port block significantly reduce the large scale NAT64 log volume.
  - **Logging MSISDN information.** Support for including subscribers' MSISDN information in large scale NAT64 logs to identify and track subscriber activity over the Internet.
Points to Consider for Configuring Large Scale NAT64

Before you start configuring large scale NAT64 and DNS64, consider these points:

1. Make sure you understand the different components of large scale NAT64, described in RFCs.
2. The NetScaler appliance supports only the following ALGs for large Scale NAT64:
   - FTP
   - TFTP
   - ICMP
   - SIP
   - RTSP
3. In a high availability setup of two NetScaler appliances, large NAT64 session synchronization (connection mirroring) is not supported.

Configuring DNS64

Creating the required entities for stateful NAT64 configuration on the NetScaler appliance involves the following procedures:

- Add DNS services. DNS services are logical representations of DNS servers for which the NetScaler appliance acts as a DNS proxy server. For more information on setting optional parameters of a service, see “Load Balancing”.
- Add DNS64 action and DNS64 policy and then bind the DNS64 action to the DNS64 policy. A DNS64 policy specifies conditions to be matched against traffic for DNS64 processing according to the settings in the associated DNS64 action. The DNS64 action specifies the mandatory DNS64 prefix and the optional exclude-rule and mapped-rule settings.
- Create a DNS load balancing virtual server and bind the DNS services and the DNS64 policy to it. The DNS load balancing virtual server acts as a DNS proxy server for DNS servers represented by the bound DNS services. Traffic arriving at the virtual server is matched against the bound DNS64 policy for DNS64 processing. For more information on setting optional parameters of a load balancing virtual server, see “Load Balancing.”

Note

The command line interface has separate commands for these two tasks, but the GUI combines them in a single dialog box.

- Enable caching of DNS records. Enable the global parameter for the NetScaler appliance to cache DNS records, which are obtained through DNS proxy operations. For more information
on enabling caching of DNS records, see “Enabling Caching of DNS Records”.

To create a service of type DNS by using the command line interface

At the command prompt, type:

```
add service <name> <IP> <serviceType> <port> ...
```

To create a DNS64 action by using the command line interface

At the command prompt, type:

```
add dns action64 <actionName> -Prefix <ipv6_addr>* [mappedRule <expression>] [-excludeRule <expression>]
```

To create a DNS64 policy by using the command line interface

At the command prompt, type:

```
add dns policy64 <name> -rule <expression> -action <string>
```

To create a DNS load balancing virtual server by using the command line interface

At the command prompt, type:

```
add lb vserver <name> DNS <IPAddress> <port> -dns64 (ENABLED | DISABLED) [-bypassAAAA (YES | NO)] ...
```

To bind the DNS services and the DNS64 policy to the DNS load balancing virtual server by using the command line interface

At the command prompt, type:

```
bind lb vserver <name> <serviceName> ...
bind lb vserver <name> -policyName <string> -priority <positive_integer>
```

Sample configuration:
Configuring Large Scaler NAT64

December 27, 2018

A large scale NAT64 configuration on a NetScaler appliance uses the LSN commands sets. In a large scale NAT64 configuration, the LSN client entity specifies the IPv6 address or IPv6 network address, or ACL6 rules, for identifying IPv6 subscribers. A NAT64 configuration also includes an IPv6 profile, which specifies a NAT64 prefix.

Configuring NAT64 on a NetScaler appliance consists of the following tasks:

- Set the global LSN parameters. Global parameters include the amount of NetScaler memory reserved for the LSN feature and synchronization of LSN sessions in a high availability setup.
- Create an LSN client entity for identifying traffic from IPv6 subscribers. The LSN client entity refers to a set of IPv6 subscribers. The client entity includes IPv6 addresses or IPv6 network prefixes, or ACL6 rules, for identifying the traffic from these subscribers. An LSN client can be bound to only one LSN group. The command line interface has two commands for creating an LSN client entity and binding a subscriber to the LSN client entity. The GUI combines these two operations on a single screen.
- Create an LSN pool and bind NAT IP addresses to it. An LSN pool defines a pool of NAT IP addresses to be used by the NetScaler appliance to perform large scale NAT64. The command line interface has two commands for creating an LSN pool and binding NAT IP addresses to the LSN pool. The GUI combines these two operations on a single screen.
• Create an LSN IP6 profile. An LSN IP6 profile defines the NAT64 prefix for a large scale NAT64 configuration.

• (Optional) Create an LSN Transport Profile for a specified protocol. An LSN transport profile defines various timeouts and limits, such as maximum large scale NAT64 sessions and maximum ports usage that a subscriber can have for a given protocol. You bind an LSN transport profile for each protocol (TCP, UDP, and ICMP) to an LSN group. A profile can be bound to multiple LSN groups. A profile bound to an LSN group applies to all subscribers of an LSN client bound to the same group. By default, one LSN transport profile with default settings for TCP, UDP, and ICMP protocols is bound to an LSN group during its creation. This profile is called the default transport profile. An LSN transport profile that you bind to an LSN group overrides the default LSN transport profile for that protocol.

• (Optional) Create an LSN Application Profile for a specified protocol and bind a set of destination ports to it. An LSN application profile defines the LSN mapping and LSN filtering controls of a group for a given protocol and for a set of destination ports. For a set of destination ports, you bind an LSN profile for each protocol (TCP, UDP, and ICMP) to an LSN group. A profile can be bound to multiple LSN groups. An LSN application profile bound to an LSN group applies to all subscribers of an LSN client bound to the same group. By default, one LSN application profile with default settings for TCP, UDP, and ICMP protocols for all destination ports is bound to an LSN group during its creation. This profile is called a default application profile. When you bind an LSN application profile, with a specified set of destination ports, to an LSN group, the bound profile overrides the default LSN application profile for that protocol at that set of destination ports. The command line interface has two commands for creating an LSN application profile and binding a set of destination ports to the LSN application profile. The GUI combines these two operations on a single screen.

• Create an LSN Group and bind LSN pools, LSN IPv6 profile, (optional) LSN transport profiles, and (optional) LSN application profiles to the LSN group. An LSN group is an entity consisting of an LSN client, an LSN IPv6 profile, LSN pool(s), LSN transport profile(s), and LSN application profiles(s). A group is assigned parameters, such as port block size and logging of LSN sessions. The parameter settings apply to all the subscribers of an LSN client bound to the LSN group. Only one LSN IPv6 profile can be bound to an LSN group, and an LSN IPv6 profile bound to an LSN group cannot be bound to other LSN groups. Only LSN Pools and LSN groups with the same NAT type settings can be bound together. Multiples LSN pools can be bound to an LSN group. Only one LSN client entity can be bound to an LSN group, and an LSN client entity bound to an LSN group cannot be bound to other LSN groups. The command line interface has two commands for creating an LSN group and binding LSN pools, LSN transport profiles, and LSN application profiles to the LSN group. The GUI combines these two operations in a single screen.
Configuration Using the Command Line

You can create different configurations using the command line interface. Follow the steps given below.

To create an LSN client by using the command line interface

At the command prompt, type:

```
1  add lsn client <clientname>
2
3  show lsn client
```

To bind an IPv6 network or an ACL6 rule to an LSN client by using the command line interface

At the command prompt, type:

```
1  bind lsn client <clientname> (-network6 <ipv6_addr> | -acl6name <string>)
2
3  show lsn client
```

To create an LAN pool by using the command line interface

At the command prompt, type:

```
1  add lsn pool <poolname>
2
3  show lsn pool <poolname>
```

To bind NAT IP addresses to an LSN pool by using the command line interface

At the command prompt, type:

```
1  bind lsn pool <poolname> <lsnip>
2
3  show lsn pool
```
**Note**

For removing NAT IP (LSN IP addresses) addresses from an LSN pool, use the `unbind lsn pool` command.

To configure an LSN IPv6 profile by using the command line interface

At the command prompt, type:

```bash
1  add lsn ip6profile <name> -type NAT64 -natprefix <ipv6_addr|*>  
2  
3  show lsn ip6profile
```

To create an LSN transport profile by using the command line interface

At the command prompt, type:

```bash
1  add lsn transportprofile <transportprofilename> <transportprotocol> [-sessiontimeout <secs>] [-finrsttimeout <secs>] [-portquota <positive_integer>] [-sessionquota <positive_integer>] [-portpreserveparity ( ENABLED | DISABLED )] [-portpreserverange ( ENABLED | DISABLED )] [-syncheck ( ENABLED | DISABLED )]  
2  
3  show lsn transportprofile
```

To create an LSN application profile by using the command line interface

At the command prompt, type:

```bash
1  add lsn appsprofile <appsprofilename> <transportprotocol> [-ippooling (PAIRED | RANDOM)] [-mapping <mapping>] [-filtering <filtering>] [-tcpproxy ( ENABLED | DISABLED )]  
2  
3  show lsn appsprofile
```

To bind an application protocol port range to an LSN application profile by using the command line interface

At the command prompt, type:
To create an LSN group by using the command line interface

At the command prompt, type:

```
add lsn group <dirname> -clientname <string> [-nattype ( DYNAMIC | DETERMINISTIC )] [-portblocksize <positive_integer>] [-logging( ENABLED | DISABLED )] [-sessionLogging ( ENABLED | DISABLED )][-sessionSync ( ENABLED | DISABLED )] [-snmptraplimit<positive_integer>] [-ftp ( ENABLED | DISABLED )] [-sipalg ( ENABLED | DISABLED )] [-rtspalg ( ENABLED |DISABLED )] [-ip6profile <string>]
```

To bind LSN protocol profiles and LSN pools to an LSN group by using the command line interface

At the command prompt, type:

```
bind lsn group <dirname> (-poolname <string> | -transportprofilename <string> | -httphdrlogprofilename <string> | -appsprofilename < string> | -sipalgprofilename <string> | rtspalgprofilename <string>)
```

Sample Large Scale NAT64 Configurations

Here are some sample configurations of large scale NAT64:

Simple large scale NAT64 configuration with default settings:

```
add lsn client LSN-NAT64-CLIENT-1
bind lsn client LSN-NAT64-CLIENT-1 -network6 2001:DB8:5001::/96
add lsn pool LSN-NAT64-POOL-1
bind lsn pool LSN-NAT64-POOL-1 203.0.113.61 - 203.0.113.70
```
Simple large scale NAT64 configuration with an extended ACL6 rule for identifying subscribers:

```plaintext
add lsn ip6profile LSN-NAT64-PROFILE-1 -type NAT64 -natprefix 2001:DB8:300::/96
add lsn group LSN-NAT64-GROUP-1 -clientname LSN-NAT64-CLIENT-1 -ip6profile LSN-NAT64-PROFILE-1
bind lsn group LSN-NAT64-GROUP-1 -poolname LSN-NAT64-POOL-1
```

Large scale NAT64 configuration with deterministic NAT resource allocation:

```plaintext
add lsn client LSN-NAT64-CLIENT-7
bind lsn client LSN-NAT64-CLIENT-7 network6 2001:DB8:1002::7/128
add lsn pool LSN-NAT64-POOL-7 -nattype DETERMINISTIC
bind lsn pool LSN-NAT64-POOL-7 203.0.113.24-203.0.113.27
add lsn ip6profile LSN-NAT64-PROFILE-7 -type NAT64 -natprefix 2001:DB8:307::/96
```
Configuring Application Layer Gateways for Large Scale NAT64

September 17, 2018

For some Application layer protocols, the IP addresses and protocol port numbers are also communicated in the packet payload. Application Layer Gateway for a protocol parses the packet’s payload and does necessary changes to ensure that the protocol continues to work over large scale NAT64.

The NetScaler appliance supports ALG for the following protocols for large scale NAT64:

- FTP
- ICMP
- TFTP
- SIP
- RTSP

Application Layer Gateway for FTP, ICMP, and TFTP Protocols

September 17, 2018

You can enable or disable ALG for the FTP protocol for an large scale NAT64 configuration by enabling or disabling the FTP ALG option of the LSN group of the configuration.

ALG for the ICMP protocol is enabled by default, and there is no provision to disable it.

ALG for the TFTP protocol is disabled by default. TFTP ALG is enabled automatically for an large scale NAT64 configuration when you bind a UDP LSN application profile, with endpoint-independent-mapping, endpoint-independent filtering, and destination port as 69 (well-known port for TFTP), to the LSN group.

Application Layer Gateway for SIP Protocol

September 17, 2018

Using Large Scale NAT64 with Session Initiation Protocol (SIP) is complicated, because SIP messages contain IP addresses in the SIP headers as well as in the SIP body. When LSN is used with SIP, the

```bash
add lsn group LSN-NAT64-GROUP-7 -clientname LSN-NAT64-CLIENT-7 -ip6profile LSN-NAT64-PROFILE-7 -nattype DETERMINISTIC -portblocksize 256
bind lsn group LSN-NAT64-GROUP-7 -poolname LSN-POOL-7
```
SIP headers contain information about the caller and the receiver, and the device translates this information to hide it from the outside network. The SIP body contains the Session Description Protocol (SDP) information, which includes IP addresses and port numbers for transmission of the media. SIP ALG for large scale NAT64 is compliant with RFC 3261, RFC 3581, RFC 4566, and RFC 4475.

Limitations of SIP ALG

SIP ALG for large scale NAT64 has the following limitations:

- Only SDP payload is supported.
- The following are not supported:
  - Multicast IP addresses
  - Encrypted SDP
  - SIP TLS
  - FQDN translation
  - SIP layer authentication
  - Traffic Domains
  - Admin partitions
  - NetScaler clusters
  - Multipart body
  - Line folding

Configuring SIP ALG

You need to configure the SIP ALG as part of the LSN configuration. For instructions on configuring LSN, see Configuration Large Scale NAT64. While configuring LSN, make sure that you:

- Set the following parameters while adding an LSN application profile:
  - IP Pooling = PAIRED
  - Address and Port Mapping = ENDPOINT-INDEPENDENT
  - Filtering = ENDPOINT-INDEPENDENT
- Create a SIP ALG profile and make sure that you define either the source port range or destination port range. Bind the SIP ALG profile to the LSN group.
- Enable SIP ALG in the LSN group.

To enable SIP ALG for an LSN configuration by using the CLI

At the command prompt, type:

```
add lsn group <groupname> -clientname <string> [-sipalg ( ENABLED | DISABLED )]
```
To enable SIP ALG for an LSN configuration by using the CLI

At the command prompt, type:

```
1 add lsn sipalgprofile <sipalgprofilename>[-dataSessionIdleTimeout <positive_integer>] [-sipSessionTimeout <positive_integer>] [-registrationTimeout <positive_integer>] [-sipsrctportrange <port[-port]>] [-sipdstportrange <port[-port]>] [-openRegisterPinhole (ENABLED | DISABLED)] [-openContactPinhole (ENABLED | DISABLED)] [-openViaPinhole (ENABLED | DISABLED)] [-openRecordRoutePinhole (ENABLED | DISABLED)] -sipTransportProtocol (TCP | UDP) [-openRoutePinhole (ENABLED | DISABLED)] [-rport (ENABLED | DISABLED)]
2 show lsn sipalgprofile <sipalgprofilename>
```

Sample Configuration

The following sample large scale NAT64 configuration, SIP ALG is enabled for TCP traffic from subscriber devices in the network 2001:DB8:1003::/96.

```
1 add lsn client LSN-NAT64-CLIENT-9
2 Done
3 bind lsn client LSN-NAT64-CLIENT-9 -network6 2001:DB8:1002::/96
4 Done
5 add lsn pool LSN-NAT64-POOL-9
6 Done
7 bind lsn pool LSN-NAT64-POOL-9 203.0.113.90
8 Done
9 add lsn ip6profile LSN-NAT64-PROFILE-9 -type NAT64 -natprefix 2001:DB8:309::/96
10 Done
11 add lsn appsprofile LSN-NAT64-APPS-PROFILE-9 TCP -ippooling PAIRED -mapping ENDPOINT-INDEPENDENT -filtering ENDPOINT-INDEPENDENT
12 Done
```
Application Layer Gateway for RTSP Protocol

September 17, 2018

Real Time Streaming Protocol (RTSP) is an application-level protocol for the transfer of real-time media data. Used for establishing and controlling media sessions between end points, RTSP is a control channel protocol between the media client and the media server. The typical communication is between a client and a streaming media server.

Streaming media from a private network to a public network requires translating IP addresses and port numbers over the network. NetScaler functionality includes an Application Layer Gateway (ALG) for RTSP, which can be used with Large Scale NAT (LSN) to parse the media stream and make any necessary changes to ensure that the protocol continues to work over the network.

How IP address translation is performed depends on the type and direction of the message, and the type of media supported by the client-server deployment. Messages are translated as follows:

- Outbound request—Private IP address to NetScaler owned public IP address called LSN IP address.
- Inbound response—LSN IP address to private IP address.
- Inbound request—No translation.
- Outbound response—Private IP address to LSN pool IP address.
Limitations of RTSP ALG

The RTSP ALG does not support the following:

- Multicast RTSP sessions
- RTSP session over UDP
- Admin partitions
- NetScaler clusters
- RTSP Authentication
- HTTP tunneling

Configuring RTSP ALG

Configure RTSP ALG as part of the LSN configuration. For instructions on configuring LSN, see Configuring Large Scale NAT64. While configuring, make sure that you:

- Set the following parameters while adding an LSN application profile:
  - IP Pooling = PAIRED
  - Address and Port Mapping = ENDPOINT-INDEPENDENT
  - Filtering = ENDPOINT-INDEPENDENT
- Enable RTSP ALG in the LSN group
- Create a RTSP ALG profile and bind the RTSP ALG profile to the LSN group

To enable RTSP ALG for an LSN configuration by using the CLI

At the command prompt, type:

```
1   add lsn group <groupname> -clientname <string> [-rtspalg ( ENABLED | DISABLED )]
2
3   show lsn group <groupname>
```

To enable RTSP ALG for an LSN configuration by using the CLI

At the command prompt, type:

```
1   add lsn rtspalgprofile <rtspalgprofilename> [-rtspIdleTimeout < positive_integer>] -rtspportrange <port[-port]> [-rtspTransportProtocol (TCP|UDP)]
2
3   show lsn rtspalgprofile <rtspalgprofilename>
```
Sample RTSP ALG Configuration

The following sample large scale NAT64 configuration, RTSP ALG is enabled for TCP traffic from subscriber devices in the network 2001:DB8:1002::/96.

```
1  add lsn client LSN-NAT64-CLIENT-9
2   Done
3  bind lsn client LSN-NAT64-CLIENT-9 -network6 2001:DB8:1002::/96
4   Done
5  add lsn pool LSN-NAT64-POOL-9
6   Done
7  bind lsn pool LSN-NAT64-POOL-9 203.0.113.90
8   Done
9  add lsn ip6profile LSN-NAT64-PROFILE-9 -type NAT64 -natprefix 2001:DB8:309::/96
10  Done
11 add lsn appsprofile LSN-NAT64-APPS-PROFILE-9 TCP -ippooling PAIRED -mapping ENDPOINT-INDEPENDENT -filtering ENDPOINT-INDEPENDENT
12  Done
13 add lsn rtspalgprofile RTSPALGPROFILE-9 -rtspIdleTimeout 1000 -rtspportrange 554
14  Done
15 add lsn group LSN-NAT64-GROUP-9 -clientname LSN-NAT64-CLIENT-9 -ip6profile LSN-NAT64-PROFILE-7 -rtspalm ENABLED
16  Done
17 bind lsn group LSN-NAT64-GROUP-9 -poolname LSN-NAT64-POOL-9
18   Done
19 bind lsn group LSN-NAT64-GROUP-9 -appsprofilename LSN-NAT64-APPSPROFILE-9
20   Done
21 bind lsn group LSN-NAT64-GROUP-9 -rtspalgprofilename RTSPALGPROFILE-9
22   Done
```

Configuring Static Large Scale NAT64 Maps

September 17, 2018

The NetScaler appliance supports manual creation of NAT64 mappings, which contain the mapping between the following information:

- Subscriber’s IP address and port
- NAT IP address and port
Static Large Scale NAT64 mappings are useful in cases where you want to ensure that the IPv4 connections initiated to a NAT IP address:port are IPv6 translated and mapped to the subscriber IP address:port (for example, web servers located in the internal network).

To create a Large Scale NAT64 mapping by using the command line

At the command prompt, type:

```bash
1   add lsn static <name> <transportprotocol> <subscrIP> <subscrPort> [<natIP> [<natPort>]] [-destIP <ip_addr> [-dsttd <positive_integer>]]
2
3   show lsn static
```

Wildcard Port Static Large Scale NAT64 Maps

A static large scale NAT64 mapping entry is usually a one-to-one mapping between a subscriber IPv6 address:port and a NAT IPv4 address:port. A one-to-one static large scale NAT64 mapping entry exposes only one port of the subscriber IP address to the Internet.

Some situations might require exposing all ports (64K - limited to the maximum number of ports of a NAT IPv4 address) of a subscriber IP address to the Internet (for example, a server hosted on an internal network and running a different service on each port). To make these internal services accessible through the Internet, you have to expose all the ports of the server to the Internet.

One way to meet this requirement is to add 64 thousand one-to-one static mapping entries, one mapping entry for each port. Creating those entries is very cumbersome and a big task. Also, this large number of configuration entries might lead to performance issues in the NetScaler appliance.

A simpler method is to use wildcard ports in a static mapping entry. You just need to create one static mapping entry with NAT-port and subscriber-port parameters set to the wildcard character (*), and the protocol parameter set to ALL, to expose all the ports of a subscriber IP address for all protocols to the Internet.

For a subscriber’s inbound or outbound connections matching a wildcard static mapping entry, the subscriber’s port does not change after the NAT operation. When a subscriber-initiated connection to the Internet matches a wildcard static mapping entry, the NetScaler appliance assigns a NAT port that has the same number as the subscriber port from which the connection is initiated. Similarly, an Internet host gets connected to a subscriber’s port by connecting to the NAT port that has the same number as the subscriber’s port.

To configure the NetScaler appliance to provide access to all ports of a subscriber IPv6 address, create a wildcard static map with the following mandatory parameter settings:
NetScaler 12.0

- Protocol=ALL
- Subscriber port = *
- NAT port = *

In a wildcard static map, unlike in a one-to-one static map, setting the NAT IP parameter is mandatory. Also, the NAT IP address assigned to a wildcard static map cannot be used for any other subscribers.

To create a wildcard static map by using the command line interface

At the command prompt, type:

```
 1 add lsn static <name> ALL <subscrIP> * <natIP> * [-td <positive_integer>] [-destIP <ip_addr>
 2
 3 show lsn static
```

In the following sample configuration of a wildcard static map, all ports of a subscriber whose IP address is 2001:DB8:5001::3 are made accessible through NAT IP 203.0.113.33.

```
 1 add lsn static NAT64-WILDCARD-STATIC-1 ALL 2001:DB8:5001::3 * 203.0.113.33 *
 2 Done
```

Logging and Monitoring Large Scale NAT64

September 17, 2018

You can log large scale NAT64 information to diagnose and troubleshoot problems, and to meet legal requirements. You can monitor the performance of the large scale NAT64 deployment by using statistical counters and displaying the related current sessions.

Logging Large Scale NAT64

Logging large scale NAT64 information is required for ISPs to meet legal requirements and identify the source of traffic at any given time.

A log message for a large scale NAT64 mapping entry consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced.
- Time stamp.
- Entry type (MAPPING).
- Whether the mapping entry was created or deleted.
NetScaler 12.0

- Subscriber’s IP address, port, and traffic domain ID.
- NAT IP address and port.
- Protocol name.
- Destination IP address, port, and traffic domain ID might be present, depending on the following conditions:
  - Destination IP address and port are not logged for endpoint-independent mapping.
  - Only the destination IP address is logged for address-dependent mapping. The port is not logged.
  - Destination IP address and port are logged for address-port-dependent mapping.

A log message for a large scale NAT64 session consists of the following information:

- NetScaler owned IP address (NSIP address or SNIP address) from which the log message is sourced
- Time stamp
- Entry type (SESSION)
- Whether the session is created or removed
- Subscriber’s IP address, port, and traffic domain ID
- NAT IP address and port
- Protocol name
- Destination IP address, port, and traffic domain ID

The following table displays sample large scale NAT64 log entries of each type stored on the configured log servers. The log entries show that a subscriber whose IPv6 address is 2001:db8:5001::9 was connected to destination IP:port 23.0.0.1:80 through NAT IP:port 203.0.113.63:45195 on April 7, 2016, from 14:07:57 GMT to 14:10:59 GMT.

</table>
NetScaler 12.0

### Configuration Steps

You can configure logging of large scale NAT64 information for a large scale NAT64 configuration by setting the LSN group's logging and session logging parameters. These are group level parameters and are disabled by default. The NetScaler appliance logs large scale NAT64 sessions for an LSN group only when both logging and session logging parameters are enabled.

The following table displays the logging behavior for an LSN group for various settings of logging and session logging parameters.

<table>
<thead>
<tr>
<th>Logging</th>
<th>Session Logging</th>
<th>Logging Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enabled</td>
<td>Enabled</td>
<td>Logs LSN mapping entries as well as LSN sessions</td>
</tr>
<tr>
<td>Enabled</td>
<td>Disabled</td>
<td>Logs LSN mapping entries but not LSN sessions</td>
</tr>
<tr>
<td>Disabled</td>
<td>Enabled</td>
<td>Logs neither mapping entries nor LSN sessions</td>
</tr>
</tbody>
</table>

### To log large scale NAT64 information by using the CLI

To set the logging and session logging parameters while adding an LSN group, at the command prompt, type:
To set the logging and session logging parameters for an existing LSN group, at the command prompt,
type:

```
set lsn group <groupname> [-logging (ENABLED|DISABLED)] [-sessionLogging (ENABLED|DISABLED)]
```

**Sample Configuration**

In this example of large scale NAT64 configuration, logging and session logging parameters are enabled
for LSN group LSN-NAT64-GROUP-1.

The NetScaler appliance logs large scale NAT64 session and mapping information for connections
from subscribers (in the network 2001:DB8:5001::/96).

**Sample configuration:**

```
add lsn client LSN-NAT64-CLIENT-1 Done
Done
bind lsn client LSN-NAT64-CLIENT-1 -network6 2001:DB8:5001::/96
Done
add lsn pool LSN-NAT64-POOL-1
Done
bind lsn pool LSN-NAT64-POOL-1 203.0.113.61 - 203.0.113.70
Done
add lsn ip6profile LSN-NAT64-PROFILE-1 -type NAT64 -natprefix 2001:DB8::300::/96
Done
add lsn group LSN-NAT64-GROUP-1 -clientname LSN-NAT64-CLIENT-1 -ip6profile LSN-NAT64-PROFILE-1
   -logging ENABLED -sessionLogging ENABLED
Done
bind lsn group LSN-NAT64-GROUP-1 -poolname LSN-NAT64-POOL-1
Done
```
Logging MSISDN Information for Large Scale NAT64

A Mobile Station Integrated Subscriber Directory Number (MSISDN) is a telephone number uniquely identifying a subscriber across multiple mobile networks. The MSISDN is associated with a country code and a national destination code identifying the subscriber’s operator.

You can configure a NetScaler appliance to include MSISDNs in large scale NAT64 LSN log entries for subscribers in mobile networks. The presence of MSISDNs in the LSN logs facilitates faster and accurate back tracing of a mobile subscriber who has violated a policy or law, or whose information is required by lawful interception agencies.

The following sample LSN log entries include MSISDN information for a connection from a mobile subscriber in an LSN configuration. The log entries show that a mobile subscriber whose MSISDN is E164:5556543210 and IPv6 address is 2001:db8:5001::9 was connected to destination IP:port 23.0.0.1:80 through the NAT IP:port 203.0.113.63:45195 on April 7, 2016, from 14:07:57 GMT to 14:10:59 GMT.

<table>
<thead>
<tr>
<th>Log Entry Type</th>
<th>Sample Log Entry</th>
</tr>
</thead>
</table>
Log Entry Type | Sample Log Entry
--- | ---

**Configuration Steps**

Perform the following tasks for including MSISDN information in LSN logs:

- **Create an LSN log profile.** An LSN log profile includes the log subscriber ID parameter, which specifies whether to or not to include the MSISDN information in the LSN logs of an LSN configuration.
- **Bind the LSN log profile to an LSN group of an LSN configuration.** Bind the created LSN log profile to an LSN group of an LSN configuration by setting the log profile name parameter to the created LSN log profile name. MSISDN information is included in all LSN logs related to mobile subscribers of this LSN group.

**To create an LSN log profile by using the CLI**

At the command prompt, type:

```
1 add lsn logprofile <logprofilename> -logSubscriberID ( ENABLED | DISABLED )
2
3 show lsn logprofile
```

**To bind an LSN log profile to an LSN group of an NAT64 LSN configuration by using the CLI**

At the command prompt, type:

```
1 bind lsn group <groupname> -logProfileName <lsnlogprofilename>
2
3 show lsn group
```
Sample Configuration

In this example of NAT64 LSN configuration, the LSN log profile LOG-PROFILE-MSISDN-1 has the log subscriber ID parameter enabled. LOG-PROFILE-MSISDN-1 is bound to LSN group LSN-NAT64-GROUP-1. MSISDN information is included in the LSN session and LSN mapping logs for connections from mobile subscribers (in network 2001:DB8:5001::/96).

```
1  add lsn logprofile LOG-PROFILE-MSISDN-1 -logSubscriberID ENABLED
2  Done
3  add lsn client LSN-NAT64-CLIENT-1
4  Done
5  bind lsn client LSN-NAT64-CLIENT-1 -network6 2001:DB8:5001::/96
6  Done
7  add lsn pool LSN-NAT64-POOL-1
8  Done
9  bind lsn pool LSN-NAT64-POOL-1 203.0.113.61 - 203.0.113.70
10 Done
11 add lsn ip6profile LSN-NAT64-PROFILE-1 -type NAT64 -natprefix 2001:DB8:300::/96
12 Done
13 add lsn group LSN-NAT64-GROUP-1 -clientname LSN-NAT64-CLIENT-1 -ip6profile LSN-NAT64-PROFILE-1
14 Done
15 bind lsn group LSN-NAT64-GROUP-1 -poolname LSN-NAT64-POOL-1
16 Done
17 bind lsn group LSN-NAT64-GROUP-1 -logprofilename LOG-PROFILE-MSISDN-1
18 Done
```

Compact Logging for Large Scale NAT

Logging LSN information is one of the important functions needed by ISPs to meet legal requirements and be able to identify the source of traffic at any given time. This eventually results in a huge volume of log data, requiring the ISPs to make large investments to maintain the logging infrastructure.

Compact logging is a technique for reducing the log size by using a notational change involving short codes for event and protocol names. For example, C for client, SC for session created, and T for TCP. Compact logging results in an average of 40 percent reduction in log size.

Configuration Steps

Perform the following tasks for logging LSN information in compact format:
1. Create an LSN log profile. An LSN log profile includes the Log Compact parameter, which specifies whether to or not to log information in compact format for an LSN configuration.

2. Bind the LSN log profile to an LSN group of an LSN configuration. Bind the created LSN log profile to an LSN group of an LSN configuration by setting the Log Profile Name parameter to the created LSN log profile name. All sessions and mappings for this LSN group are logged in compact format.

**To create an LSN log profile by using the CLI**

At the command prompt, type:

```
1   add lsn logprofile <logprofilename> -logCompact (ENABLED|DISABLED)
2   show lsn logprofile
```

**To bind an LSN log profile to an LSN group of an LSN configuration by using the CLI**

At the command prompt, type:

```
1   bind lsn group <groupname> -logProfileName <lsnlogprofilename>
2   show lsn group
```

**Sample Configuration for NAT64:**

```
1   add lsn logprofile   LOG-PROFILE-COMPACT-1 -logCompact ENABLED
2   Done
3   add lsn client LSN-NAT64-CLIENT-1
4   Done
5   bind lsn client LSN-NAT64-CLIENT-1 -network6 2001:DB8:5001::/96
6   Done
7   add lsn pool LSN-NAT64-POOL-1
8   Done
9   bind lsn pool LSN-NAT64-POOL-1 203.0.113.61 - 203.0.113.70
10  Done
11  add lsn ip6profile LSN-NAT64-PROFILE-1 -type NAT64 -natprefix 2001:DB8:300::/96
12  Done
13  add lsn group LSN-NAT64-PROFILE-1 -clientname LSN-NAT64-CLIENT-1 -ip6profile LSN-NAT64-PROFILE-1
14  Done
15  bind lsn group LSN-NAT64-GROUP-1 -poolname LSN-NAT64-POOL-1
16  Done
17  bind lsn group LSN-NAT64-GROUP-1 -logProfileName LOG-PROFILE-COMPACT-1
```
Logging HTTP Header Information

The NetScaler appliance can log request header information of an HTTP connection that is using the NetScaler large scale NAT64 functionality. The following header information of an HTTP request packet can be logged:

- URL that the HTTP request is destined to
- HTTP Method specified in the HTTP request
- HTTP version used in the HTTP request
- IPv6 address of the subscriber that sent the HTTP request

The HTTP header logs can be used by ISPs to see the trends related to the HTTP protocol among a set of subscribers. For example, an ISP can use this feature to find out the most popular website among a set of subscribers.

Configuration Steps

Perform the following tasks for configuring the NetScaler appliance to log HTTP header information:

- Create an HTTP header log profile. An HTTP header log profile is a collection of HTTP header attributes (for example, URL and HTTP method) that can be enabled or disabled for logging.
- Bind the HTTP header to an LSN group of a large scale NAT64 configuration. Bind the HTTP header log profile to an LSN group of an LSN configuration by setting the HTTP header log profile name parameter to the name of the created HTTP header log profile. The NetScaler appliance then logs HTTP header information of any HTTP requests related to the LSN group. An HTTP header log profile can be bound to multiple LSN groups, but an LSN group can have only one HTTP header log profile.

To create an HTTP header log profile by using the the command line interface

At the command prompt, type:

```
add lsn httphdrlogprofile <httphdrlogprofilename> [-logURL ( ENABLED | DISABLED )] [-logMethod ( ENABLED | DISABLED )] [-logVersion ( ENABLED | DISABLED )] [-logHost ( ENABLED | DISABLED )]
```

```
show lsn httphdrlogprofile
```
To bind an HTTP header log profile to an LSN group by using the command line interface

At the command prompt, type:

```
bind lsn group <groupname> -httphdrlogprofilename <string>
show lsn group <groupname>
```

Sample Configuration

```
add lsn httphdrlogprofile HTTP-HEADER-LOG-1
Done
add lsn client LSN-NAT64-CLIENT-1 Done
Done
bind lsn client LSN-NAT64-CLIENT-1 -network6 2001:DB8:5001::/96
Done
add lsn pool LSN-NAT64-POOL-1
Done
bind lsn pool LSN-NAT64-POOL-1 203.0.113.61 - 203.0.113.70
Done
add lsn ip6profile LSN-NAT64-PROFILE-1 -type NAT64 -natprefix 2001:DB8:300::/96
Done
add lsn group LSN-NAT64-GROUP-1 -clientname LSN-NAT64-CLIENT-1 -
ip6profile LSN-NAT64-PROFILE-1
Done
bind lsn group LSN-NAT64-GROUP-1 -poolname LSN-NAT64-POOL-1
Done
bind lsn group LSN-NAT64-GROUP-1 -httphdrlogprofilename HTTP-HEADER-LOG-1
Done
```

Displaying Current Large Scale NAT64 Sessions

You can display the current large scale NAT64 sessions in order to detect any unwanted or inefficient sessions on the NetScaler appliance. You can display all or some large scale NAT64 sessions on the basis of selection parameters.

**Note**

When more than a million large scale NAT64 sessions exist on the NetScaler appliance, Citrix recommends using the selection parameters to display selected large scale NAT64 sessions instead.
To display all large scale NAT64 sessions by using the command line interface

At the command prompt, type:

```
show lsn session - nattype NAT64
```

To display selective large scale NAT64 sessions by using the command line interface

At the command prompt, type:

```
show lsn session - nattype NAT64 [-network6 <ipv6_addr|*>] [-clientname <string>] [-natIP <ip_addr> [-natPort <port>]]
```

Displaying Large Scale NAT64 Statistics

You can display statistics related to large scale NAT64 module, and evaluate its performance or troubleshoot problems. You can display a summary of statistics of all large scale NAT64 configurations or of a particular large scale NAT64 configuration. The statistical counters reflect events since the NetScaler appliance was last restarted. All these counters are reset to 0 when the NetScaler appliance is restarted.

To display total statistics of large scale NAT64 by using the command line interface

At the command prompt, type:

```
stat lsn nat64
```

To display statistics for a specified large scale NAT64 configuration by using the command line interface

At the command prompt, type:

```
stat lsn group <groupname>
```
Clearing Large Scale NAT64 Sessions

You can remove any unwanted or inefficient large scale NAT64 sessions from the NetScaler appliance. The appliance immediately releases resources (such as NAT IP address, port, and memory) allocated for these sessions, making the resources available for new sessions. The appliance also drops all the subsequent packets related to these removed sessions. You can remove all or selected large scale NAT64 sessions from the NetScaler appliance.

To clear all large scale NAT64 sessions by using the command line interface

At the command prompt, type:

1  flush lsn session  - nattype NAT64
2  show lsn session  - nattype NAT64

To clear selective large scale NAT64 sessions by using the command line interface

At the command prompt, type:

1  flush lsn session  - nattype NAT64 [-network6 <ipv6_addr|*>] [-clientname <string>] [-natIP <ip_addr> [-natPort <port>]]
2  show lsn session  - nattype NAT64 [-network6 <ipv6_addr|*>] [-clientname <string>] [-natIP <ip_addr> [-natPort <port>]]

Sample configuration:

Clear all large scale NAT64 sessions existing on a NetScaler appliance

1  flush lsn session  - nattype NAT64
2  Done

Clear all large scale NAT64 sessions related to client entity LSN-NAT64-CLIENT-1

1  flush lsn session  - nattype NAT64 -clientname LSN-NAT64-CLIENT-1
2  Done

Clear all large scale NAT64 sessions related to a subscriber network (2001:DB8:5001::/96) of LSN client entity LSN-NAT64-CLIENT-2

1  flush lsn session  - nattype NAT64 -network6 2001:DB8:5001::/96 -clientname LSN-NAT64-CLIENT-2

© 1999-2018 Citrix Systems, Inc. All rights reserved.
IPFIX Logging

The NetScaler appliance supports sending information about LSN events in Internet Protocol Flow Information Export (IPFIX) format to the configured set of IPFIX collector(s). The appliance uses the existing AppFlow feature to send LSN events in IPFIX format to the IPFIX collectors.

IPFIX based logging is available for the following NAT64 related events:

- Creation or deletion of an LSN session.
- Creation or deletion of an LSN mapping entry.
- Allocation or de-allocation of port blocks in the context of deterministic NAT.
- Allocation or de-allocation of port blocks in the context of dynamic NAT.
- Whenever subscriber session quota is exceeded.

Points to Consider before you Configure IPFIX logging

Before you start configuring IPSec ALG, consider the following points:

- You must configure the AppFlow feature and IPFIX collector(s) on the NetScaler appliance. For instructions, see Configuring the AppFlow feature.

Configuration Steps

Perform the following tasks for logging LSN information in IPFIX format:

- **Enable LSN logging in the AppFlow configuration.** Enable the LSN logging parameter as part of AppFlow configuration.
- **Create an LSN log profile.** An LSN log profile includes the IPFIX parameter that enables or disables the log information in IPFIX format.
- **Bind the LSN log profile to an LSN group of an LSN configuration.** Bind the LSN log profile to one or multiple LSN group(s). Events related to the bound LSN group will be logged in IPFIX format.

To enable LSN logging in the AppFlow configuration by using the CLI

At the command prompt, type:

```
1  set appflow param -lsnLogging ( ENABLED | DISABLED )
2  show appflow param
```
To create an LSN log profile by using the CLI

At the command prompt, type:

```bash
1 set lsn logprofile <logProfileName> -logipfix ( ENABLED | DISABLED ) 
2 show lsn logprofile
```

To bind the LSN log profile to an LSN group of an LSN configuration by using the CLI

At the command prompt, type:

```bash
1 bind lsn group <groupName> -logProfileName <lsnlogprofilename> 
2 show lsn group
```

To create an LSN log profile by using the GUI

Navigate to System > Large Scale NAT > Profiles, click Log tab, and then add a log profile.

To bind the LSN log profile to an LSN group of an LSN configuration by using the GUI

1. Navigate to System > Large Scale NAT > LSN Group, open the LSN group.
2. In Advanced Settings, click + Log Profile to bind the created Log profile to the LSN group.

Port Control Protocol for Large Scale NAT64

September 17, 2018

NetScaler appliances now support Port Control Protocol (PCP) for large scale NAT (LSN). Many of an ISP’s subscriber applications must be accessible from Internet (for example, Internet of Things (IOT) devices, such as an IP camera that provides surveillance over the Internet). One way to meet this requirement is to create static large scale NAT (LSN) maps. But for a very large number of subscribers, creating static LSN NAT maps is not a feasible solution.

Port Control Protocol (PCP) enables a subscriber to request specific LSN NAT mappings for itself and/or for other 3rd party devices. The large scale NAT device creates an LSN map and sends it to the subscriber. The subscriber sends the remote devices on the Internet the NAT IP address:NAT port at which they can connect to the subscriber.

Applications usually send frequent keep-alive messages to the large scale NAT device so that their LSN mappings do not time out. PCP helps reduce the frequency of such keep-alive messages by enabling
NetScaler 12.0

the applications to learn the timeout settings of the LSN mappings. This helps reduce bandwidth consumption on the ISP’s access network and battery consumption on mobile devices.

PCP is a client-server model and runs over the UDP transport protocol. A NetScaler appliance implements the PCP server component and is compliant with RFC 6887.

**Configuration Steps**

Perform the following tasks for configuring PCP:

- **(Optional) Create a PCP profile.** A PCP profile includes settings for PCP related parameters (for example, to listen for mapping and peer PCP requests). A PCP profile can be bound to a PCP server. A PCP profile bound to a PCP server applies all its settings to the PCP server. A PCP profile can be bound to multiple PCP servers. By default, one PCP profile with default parameters settings is bound to all PCP servers. A PCP profile that you bind to a PCP server overrides the default PCP profile settings for that server. A default PCP profile has the following parameter settings:
  - Mapping: Enabled
  - Peer: Enabled
  - Minimum map life: 120 seconds
  - Maximum max life: 86400 seconds
  - Announce count: 10
  - Third Party: Disabled

- **Create a PCP server and bind a PCP profile to it.** Create a PCP server on the NetScaler appliance to listen for PCP related requests and messages from the subscribers. A Subnet IP (SNIP) or (SNIP6) address must be assigned to a PCP server to access it. By default, a PCP server listens on port 5351.

- **Bind the PCP server to an LSN group of an LSN configuration.** Bind the created PCP server to an LSN group of an LSN configuration by setting the PCP Server parameter to specify the created PCP server. The created PCP server can be accessed only by the subscribers of this LSN group.

**Note**

A PCP server for a large scale NAT configuration does not serve requests from subscribers that are identified from ACL rules.

**To create a PCP profile by using the CLI**

At the command prompt, type:

```
1 add pcp profile <name> [-mapping ( ENABLED | DISABLED )] [-peer ( ENABLED | DISABLED )] [-minMapLife <secs>] [-maxMapLife <secs>] [-
```
To create a PCP server by using the CLI

At the command prompt, type:

```
add pcp server <name> <IPAddress> [-port <portNum|*>] [-pcpProfile <string>] 
show pcp server <name>
```

Sample Configuration for NAT64

In the following sample configuration, PCP server PCP-SERVER-1, with PCP settings from PCP-PROFILE-1, is bound to LSN group LSN-NAT64-GROUP-1. PCP-SERVER-1 serves PCP requests from IPv6 subscribers in network 2001:DB8:5001::/96.

Sample configuration:

```
add pcp profile PCP-PROFILE-1 -minMapLife 400
Done
add pcp server PCP-SERVER-1 2001:DB8:6001::90 -pcpProfile PCP-PROFILE-1
Done
add lsn client LSN-NAT64-CLIENT-1
Done
bind lsn client LSN-NAT64-CLIENT-1 -network6 2001:DB8:5001::/96
Done
add lsn pool LSN-NAT64-POOL-1
Done
bind lsn pool LSN-NAT64-POOL-1 203.0.113.61 - 203.0.113.70
Done
add lsn ip6profile LSN-NAT64-PROFILE-1 -type NAT64 -natprefix 2001:DB8::/66
Done
add lsn group LSN-NAT64-PROFILE-1 -clientname LSN-NAT64-CLIENT-1 -ip6profile LSN-NAT64-PROFILE-1
Done
bind lsn group LSN-NAT64-GROUP-1 -poolname LSN-NAT64-POOL-1
Done
```
Mapping Address and Port using Translation

September 17, 2018

Mapping Address and Port using Translation (MAP-T) is an IPv6 transition solution for ISPs with IPv6 infrastructure to connect their IPv4 subscribers to the IPv4 internet. MAP-T is built on stateless IPv4 and IPv6 address translation technologies. MAP-T is a mechanism that performs double translation (IPv4 to IPv6 and vice versa) on customer edge (CE) devices and border routers (in ISP core network).

In a MAP-T deployment, the CE device implements a combination of stateful NAPT44 translation and stateless NAT46 translation. The CE device obtains NAT-IP and the port-block to be used for translation through DHCPv6 or any other method.

When an IPv4 packet from a subscriber device arrives at the CE device, the CE device performs NAPT44 and stores the NAPT44 binding information. After NAT44 translation, the packet is subjected to NAT46 translation and then forwarded to the border router (BR) device located in the ISP’s core network. The BR device receives the IPv6 packets from the CE device, extracts and validates the NAT-IP and port-block embedded in the IPv6 header, and forwards the IPv4 packet to the IPv4 Internet. When the BR receives the IPv4 packet from the Internet, it translates the IPv4 packet to an IPv6 packet and send the IPv6 packet to the CE device.

MAP-T is stateless on a BR device, so it does not require the BR device to perform NAT on the traffic. Instead, NAT functionality is delegated to the CE devices. This delegation and stateless functionality in BR devices allows the BR deployment to scale in proportion to the volume of traffic.

The NetScaler appliance implements the BR functionality of a MAP-T solution as described by RFC 7599.

Configuring MAP-T

Configuring MAP-T on a NetScaler appliance consists of the following tasks:

- Add a default mapping rule
- Add a basic mapping rule
- Bind an IPv4 NAT address range of CE devices to a basic mapping rule
- Add a map domain and bind a basic mapping rule and default mapping rule to the domain
**To add a default mapping rule by using the CLI**

At the command prompt, type:

```
1    add MapDmr <name> -BRIpv6Prefix ( <ipv6_addr> | <*> )
2
3    show MapDmr <name>
```

**To add a basic mapping rule by using the CLI**

At the command prompt, type:

```
1    add MapBmr <name> -RuleIpv6Prefix <ipv6_addr> | <*> [ -psidoffset <positive_integer> ] [ -EAbitLength <positive_integer> ] [ -psidlength <positive_integer> ]
2
3    show MapBmr <name>
```

**To bind IPv4 NAT address range of CE devices to a basic mapping rule by using the CLI**

At the command prompt, type:

```
1    bind MapBmr <name> ( -network <ip_addr> [ -netmask <netmask> ] )
2
3    show MapBmr <name>
```

**To add a map domain by using the CLI**

At the command prompt, type:

```
1    add MapDomain <name> -MapDmrName <string>
2
3    show MapDomain <name>
```

**To bind a basic mapping rule to a map domain by using the CLI**

At the command prompt, type:

```
1    bind MapDomain <name> -MapBmrName <string>
2
3    show MapDomain <name>
```
**Sample configuration**

```plaintext
add mapdmr DMR-1 -BRIpv6Prefix 2002:db8::/64
Done

add mapbmr BMR-1 -ruleIpv6Prefix 2002:db8:89ab::/48 -eAbitLength 16 -psidlength 8 -psidoffset 6
Done

bind mapbmr BMR-1 -network 192.0.1.0 -netmask 255.255.255.0
Done

add MapDomain MAP-DOMAIN-1 -mapdmrname DMR-1
Done

bind MapDomain MAP-DOMAIN-1 -mapbmrname BMR-1
Done
```

**Telco subscriber management**

January 6, 2019

The number of subscribers in a telco network is increasing at an unprecedented rate, and managing them is becoming a challenge for service providers. Newer, faster, and smarter devices are placing high demand on the network and the subscriber management systems. It is no longer feasible to provide each subscriber the same standard of service, and the need for traffic processing on a per-subscriber basis is imperative.

The NetScaler appliance provides the intelligence to profile subscribers on the basis of their information stored in the Policy and Charging Rules Function (PCRF). When a mobile subscriber connects to the Internet, the packet gateway associates an IP address with the subscriber and forwards the data packet to the appliance. The appliance receives the subscriber information dynamically, or you can configure static subscribers. This information enables the appliance to apply its rich traffic management capabilities, such as content switching, integrated caching, rewrite, and responder, on a per-subscriber basis to manage the traffic.

Before you configure the NetScaler appliance to manage subscribers, you must allocate memory to the module that stores subscriber sessions. For dynamic subscribers, you must configure an interface
through which the appliance receives session information. Static subscribers must be assigned IDs, and you can associate them with policies.

You can also do the following:

- Subscriber policy enforcement and management.
- Configure the appliance to uniquely identify a subscriber by using only the IPv6 prefix instead of the complete IPv6 address.
- Use policies to optimize TCP traffic for both dynamic and static subscribers. These policies associate different TCP profiles with different types of users.
- Manage idle sessions on a NetScaler appliance.
- Enable logging to a log server.
- Remove LSN sessions for deleted subscriber sessions.

**Allocating memory for the subscriber session store module**

Each subscriber session entry consumes 1 KB of memory. Storing 500,000 subscriber sessions at any point in time requires 500 MB of memory. This value must be added to the minimum memory requirement, which is shown as part of the output of the “show extendedmemoryparam” command. In the following example, the output is for a NetScaler VPX instance with 3 packet engines and 8 GB memory.

To store 500,000 subscriber sessions on this appliance, the configured memory must be 2058+500 MB (500,000 x 1 KB = 500 MB.)

**Note**

The configured memory must be in multiples of 2 MB and must not exceed the maximum memory usage limit. The appliance must be restarted for the changes to take effect.

**Example**

```
1  show extendedmemoryparam
2           Extended Memory Global Configuration. This memory is utilized by
3               LSN and Subscriber Session Store Modules:
4               Active Memory Usage: 0 MBytes
5               Configured Memory Limit: 0 MBytes
6               Minimum Memory Required: 2058 MBytes
7               Maximum Memory Usage Limit: 2606 MBytes
8           Done
9  set extendedmemoryparam -memLimit 2558
10          Done
11  show extendedmemoryparam
12           Extended Memory Global Configuration. This memory is
13               utilized by LSN and Subscriber Session Store Modules:
```
Configure an interface for dynamic subscribers

The NetScaler appliance dynamically receives the subscriber information through any of the following types of interface:

- Gx Interface
- RADIUS Interface
- RADIUS and Gx Interface

Note

- Starting with NetScaler release 12.0 build 57.19, Gx interface is supported for a cluster deployment. For more information see Gx interface in a cluster topology.
- In an HA setup, the subscriber sessions are continually synchronized on the secondary node. In the event of a failover, the subscriber information is still available on the secondary node.

Gx interface

A Gx interface (as specified in 3GPP 29.212) is a standard interface based on the Diameter protocol that allows exchange of policy control and charging rules between a PCRF and a Policy and Charging Enforcement Function (PCEF) entity in a Telco network.

As soon as an IP-CAN session is established, the packet gateway forwards the subscriber ID, such as the MSISDN, and Framed-IP address information about the subscriber to the PCRF as a Diameter message. When the data packet arrives at the appliance from packet gateway (PGW), the appliance uses the subscriber IP address to query the PCRF to get the subscriber information. This is also known as secondary PCEF functionality.

The Policy and Charging Control (PCC) rules received by the appliance over the Gx interface are stored on the appliance for the duration of the subscriber session, that is, until the PCRF sends a Re-Auth-Request (RAR) message with a Session-Release-Cause AVP or the subscriber session is terminated from the CLI or the configuration utility. If there are any updates to an existing subscriber, the PCRF sends the updates in an RAR message. A subscriber session is initiated when a subscriber logs on to the network, and terminated when the subscriber logs off.
The following illustration shows the high-level traffic flow. It assumes that the data plane traffic is HTTP. The appliance sends a Credit Control Request (CCR) over a Gx interface to the PCRF server and, in the credit control answer (CCA), receives the PCC rules and, optionally, other information, such as the Radio Access Technology (RAT) type, that applies to the particular subscriber. PCC rules include one or more policy (rule) names and other parameters. The appliance uses this information to retrieve the predefined rules stored on the appliance, and to direct the flow of traffic. It also stores this information in the subscriber policy and enforcement management system for the duration of the subscriber session. After a subscriber session is terminated, the appliance discards all the information about the subscriber.

The following example shows the commands for configuring a Gx interface. The commands are in boldface.

**To set up a Gx interface, perform the following tasks**

Add a DIAMETER service for each Gx interface. For example:

```
1 add service pcrf-svc1 203.0.113.1 DIAMETER 3868
2
3 add service pcrf-svc2 203.0.113.2 DIAMETER 3868
```

Add a non-addressable DIAMETER load balancing virtual sever and bind the services created in step 1 to this virtual server. For more than one service, specify a persistenceType and the persistAVPno so that specific sessions are handled by the same PCRF server. For example:

```
1 add lb vserver vdiam DIAMETER 0.0.0.0 0 -persistenceType DIAMETER - persistAVPno 263
2
3 bind lb vserver vdiam pcrf-svc1
4
5 bind lb vserver vdiam pcrf-svc2
```

Configure NetScaler diameter identity and realm. Identity and realm are used as Origin-Host and Origin-Realm AVPs in diameter messages sent by the Gx client. For example:

```
1 set ns diameter -identity netscaler.com -realm com
```

Configure the Gx interface to use the virtual server created in step 2 as the PCRF virtual server. Specify the PCRF realm to use as Destination-Realm AVP in diameters messages sent by the Gx client. For example:

```
1 set subscriber gxInterface -vServer vdiam -pcrfRealm pcrf.com
```

Set the subscriber interface type to GxOnly. For example:
To see the Gx interface configuration and status, type:

```
1 show subscriber gxinterface
```

Example

```
1 show subscriber gxinterface
2    Gx Interface parameters:
3        PCRF Vserver: vdiam (UP)
4        Gx Client Identity....: netscaler.com
5        Gx Client Realm ..........: com
6        PCRF Realm: pcrf.com
7        Hold Packets On Subscriber Absence: YES
8        CCR Request Timeout: 10 Seconds
9        CCR Request Retry Attempts: 3
10       RevalidationTimeout: 1200 Seconds
11       NegativeTTL: 120 Seconds
12       ServicePath AVP code:262099 ServicePath AVP VendorID: 3845
13       PCRF Connection State: Gx Connection Established with PCRF.
14    Done
```

ARGUMENTS

vServer

Name of the load balancing or content switching virtual server to which the Gx connections are established. The service type of the virtual server must be DIAMETER or SSL_DIAMETER. This parameter is mutually exclusive with the service parameter. Therefore, you cannot set both service and the virtual server in the Gx interface.

Service

Name of DIAMETER or SSL_DIAMETER service corresponding to PCRF to which the Gx connection is established. This parameter is mutually exclusive with the vserver parameter. Therefore, you cannot set both service and the virtual server in the Gx Interface.
**pcrfRealm**

The realm of PCRF to which the message is to be routed. This is the realm used in Destination-Realm AVP by NetScaler Gx client (as a Diameter node).

**holdOnSubscriberAbsence**

Set to Yes to hold packets until the subscriber session information is fetched from the PCRF server. If set to No, the default subscriber profile is applied until the subscriber session information is fetched from the PCRF server. If a default subscriber profile is not configured, an UNDEF is raised for expressions that use subscriber attributes.

**requestTimeout**

Time, in seconds, within which the Gx CCR request must complete. If the request does not complete within this time, the request is retransmitted for the number of times specified in the requestRetryAttempts parameter. If request is not complete even after retransmitting, then the default subscriber profile is applied to this subscriber. If a default subscriber profile is not configured, an UNDEF is raised for expressions that use subscriber attributes. Zero disables the timeout. Default value: 10

**requestRetryAttempts**

Specify the number of times a request must be retransmitted if the request does not complete within the value specified in the requestTimeout parameter. Default value: 3

**revalidationTimeout**

Time, in seconds, after which the Gx CCR-U request is sent after any PCRF activity on a session. Any RAR or CCA message resets the timer. Zero value disables the idle timeout.

**negativeTTL**

Time, in seconds, after which the Gx CCR-I request is resent for sessions that have not been resolved by PCRF because the server is down or there is no response or a failed response is received. Instead of polling the PCRF server constantly, a negative-TTL makes the appliance hold on to an unresolved session. For negative sessions, the appliance inherits the attributes from the default subscriber profile, if one is configured and from the RADIUS accounting message, if one is received. Zero value disables the negative sessions. The appliance does not install negative sessions even if a subscriber session could not be fetched. Default value: 600
**servicePathAVP**

The AVP code in which PCRF sends the service path applicable to a subscriber.

**servicePathVendorid**

The vendor id of the AVP in which PCRF sends the service path applicable to a subscriber.

**To configure Gx interface by using the GUI**

1. Navigate to Traffic Management > Subscriber > Parameters.
2. Click Configure Subscriber Parameters.
3. In Interface Type, select GxOnly.
4. Specify the values for the all required parameters.
5. Click OK.

**Gx interface in a cluster topology**

The NetScaler appliance supports Gx interface in a cluster topology.

The NetScaler nodes in the cluster communicate with an external PCRF server through the Gx interface. When a node receives client traffic, the appliance performs the following:

- Sends a CCR-I request to the PCRF server to fetch subscriber information.
- The PCRF server responds with a CCR-A.
- The NetScaler node then stores the received subscriber information in its subscriber store and applies the rules to the client traffic.

Each node maintains an independent subscriber store and subscriber sessions are not synchronized to other nodes.

As per the Diameter Base Protocol RFC 6733, each peer must be configured with a unique diameter identity to communicate with other peers over the diameter protocol. Hence, in a cluster deployment, configuration of diameter identity is spotted. The diameter parameters (identity, realm, server close propagation) for each node can be configured individually by using the GUI or the CLI.

When a node is added to a cluster, it assumes the default diameter parameters (identity=netscaler.com, realm=com, serverClosePropogation=NO). After the nodes are added, the diameter parameters for each node must be configured.

**To configure the diameter parameters by using the GUI**

1. Navigate to System > Settings.
2. In the details pane, click Change Diameter Parameters.
3. In the Diameter Parameters page, select the NetScaler node for which you want to configure the diameter parameters and then click **Configure**.

4. In the Configure Diameter Parameters page, configure the diameter Identity, diameter Realm, and server Close Propagation for the selected node.

5. Click **OK**.

### To configure the diameter parameters by using the CLI

At the command prompt, type:

```sh
set ns diameter [-identity <string>] [-ownerNode <positive_integer>]
```

**ARGUMENTS**

**Identity**

Diameter Identity is used to identify a Diameter node uniquely. Before setting up diameter configuration, the NetScaler appliance (as a Diameter node) must be assigned a unique diameter identity.

For example, set ns diameter -identity netscaler.com -ownerNode 1. So, whenever NetScaler system needs to use identity in diameter messages, it uses ‘netscaler.com’ as Origin-Host AVP as defined in RFC3588.

Maximum Length: 255

**OwnerNode**

OwnerNode represents the ID of the cluster node for which the diameter ID is set. OwnerNode can be configured only through CLP.

Minimum value: 0

Maximum value: 31

**Example:**

set ns diameter -identity netscaler1.com -ownerNode 1

**Note:**

The OwnerNode option is also added to the show ns diameter command.

**Example:**

```sh
show diameter -ownerNode <0-31>
```
When the show ns diameter command is executed, it displays the diameter parameters for a given node.

To configure a Gx interface for cluster deployment

To set up a Gx interface, perform the following tasks:

Add a DIAMETER service for each Gx interface.

Example:

```
1 add service pcrf-svc1 203.0.113.1 DIAMETER 3868
2 add service pcrf-svc2 203.0.113.2 DIAMETER 3868
```

Add a DIAMETER load balancing virtual server and bind the services created in step 1 to this virtual server.

Example:

```
1 add lb vserver vdiam DIAMETER 0.0.0.0 0 -persistenceType DIAMETER -persistAVPno 263
2
3 bind lb vserver vdiam pcrf-svc1
4
5 bind lb vserver vdiam pcrf-svc2
```

Configure NetScaler diameter identity and realm on all the cluster nodes. Identity and realm are used as Origin-Host and Origin-Realm AVPs in diameter messages sent by the Gx client.

Example:

```
1 set ns diameter -identity node0.netscaler.com -realm netscaler.com -ownerNode 0
2
3 set ns diameter -identity node1.netscaler.com -realm netscaler.com -ownerNode 1
```

Configure the Gx interface to use the virtual server created in step 2 as the PCRF virtual server and set the PCRF realm as well.

Example:

```
1 set subscriber gxInterface -vServer vdiam -pcrfRealm pcrf.com
2
3 Set the subscriber interface type to GxOnly.
```

Example:
To see the Gx interface configuration and status, type:

```
1 show subscriber gxinterface
```

**RADIUS interface**

With a RADIUS interface, the packet gateway forwards the subscriber information in a RADIUS Accounting Start message to the appliance through the RADIUS interface as soon as an IP-CAN session is established. A service of type RADIUSListener processes RADIUS Accounting messages. Add a shared secret for the RADIUS client. If a shared secret is not configured, the RADIUS message is silently dropped. The following example shows the commands for configuring a RADIUS interface. The commands are in boldface.

To set up a RADIUS interface, perform the following tasks:

Create a RADIUS listener service at the SNIP address where the RADIUS messages are received. For example:

```
1 add service srad1 192.0.0.206 RADIUSLISTENER 1813
```

Configure the subscriber RADIUS interface to use this service. For example:

```
1 set subscriber radiusInterface -listeningService srad1
```

Set the subscriber interface type to RadiusOnly. For example:

```
1 set subscriber param -interfaceType RadiusOnly
```

Add a RADIUS client specifying a subnet and shared secret. For example:

```
1 add radius client 192.0.2.0/24 -radkey client123
```

A subnet of 0.0.0.0/0 implies that it is the default shared secret for all clients. To see the RADIUS interface configuration and status, type:

```
1 show subscriber radiusInterface
```

RADIUS Interface parameters:

Radius Listener Service: srad1(UP)

Done

**Example:**
ARGUMENTS

**ListeningService**

Name of the RADIUS listening service that will process the RADIUS accounting requests.

**svrState**

The state of the RADIUS listening service.

The following illustration shows the high-level traffic flow.

**To configure RadiusOnly interface by using the GUI**

1. Navigate to **Traffic Management > Subscriber > Parameters**.
2. Click **Configure Subscriber Parameters**.
3. In Interface Type, select **RadiusOnly**.
4. Specify the values for the all required parameters.
5. Click **OK**.

**RADIUS and Gx interface**

With a RADIUS and Gx interface, as soon as an IP-CAN session is established, the packet gateway forwards the subscriber ID, such as the MSISDN, and Framed-IP address information about the subscriber to the appliance through the RADIUS interface. The appliance uses this subscriber ID to query the PCRF on the Gx interface to get the subscriber information. This is known as primary PCEF functionality. The following example shows the commands for configuring a RADIUS and Gx interface.
The following illustration shows the high-level traffic flow.

To configure RadiusAndGx interface by using the GUI

1. Navigate to Traffic Management > Subscriber > Parameters.
2. Click Configure Subscriber Parameters.
3. In Interface Type, select RadiusAndGx.
4. Specify the values for all required parameters.
5. Click OK.

Configure static subscribers

You can configure the subscribers manually on the NetScaler appliance by using the command line or the configuration utility. You create static subscribers by assigning a unique subscriber ID and optionally associating a policy with each subscriber. The following examples show the commands for configuring a static subscriber.

In the following examples, subscriptionIdvalue specifies the international telephone number, and subscriptionIdType (E164 in this example) specifies the general format for international telephone numbers.

```
1  add subscriber profile 203.0.113.6 -subscriberRules policy1 policy2 -subscriptionIdType E164 -subscriptionIdvalue 98767543211
2  add subscriber profile 2002::a66:e8d3/64 -subscriberRules policy1 policy3 -subscriptionIdType E164 -subscriptionIdvalue 98767543212
```

To view the configured subscriber profiles, type:

```
> show subscriber profile
1)  Subscriber IP: 2002::/64
   Profile Attributes:
      Active Rules:  policy1, policy3
      Subscriber Id Type: E164
      Subscriber Id Value: 98767543212
2)  Subscriber IP: 203.0.113.6
   Profile Attributes:
      Active Rules:  policy1, policy2
      Subscriber Id Type: E164
      Subscriber Id Value: 98767543211
```

© 1999-2018 Citrix Systems, Inc. All rights reserved.
Default subscriber profile

A default subscriber profile is used if the subscriber IP address is not found in the subscriber session store on the appliance. In the following example, a default subscriber profile is added with the subscriber rule policy1.

```
1 > add subscriber profile * -subscriberRules policy1
```

View and clear subscriber sessions

Use the following command to display all the static and dynamic subscriber sessions.

```
1 > show subscriber sessions
```

```
1) Subscriber IP: 2002::/64
   Session Attributes:
   Active Rules: policy1, policy3
   Subscriber Id Type: E164
   Subscriber Id Value: 98767543212
2) Subscriber IP: *
   Session Attributes:
   Active Rules: policy1
3) Subscriber IP: 203.0.113.6
   Session Attributes:
   Active Rules: policy1, policy2
   Subscriber Id Type: E164
   Subscriber Id Value: 98767543211
4) Subscriber IP: 192.168.0.11
   Session Attributes:
   Idle TTL remaining: 361 Seconds
   Active Rules: policy1
   Subscriber Id Type: E164
   Subscriber Id Value: 1234567811
   Service Path: policy1
   AVP(44): 34 44 32 42 42 38 41 43 2D 30 30 30 30 30 30
   AVP(257): 00 01 C0 A8 0A 02
   PCRF-Host: host.pcrf.com
   AVP(280): 74 65 73 74 2E 63 6F 6D
... done
```
Use the following command to clear a single session or the complete session store. If you do not specify an IP address, the complete subscriber session store is cleared.

```bash
1 clear subscriber sessions <ip>
```

**Subscriber policy enforcement & management system**

The NetScaler appliance uses the subscriber’s IP address as the key to the subscriber policy enforcement and management system.

You can add subscriber expressions to read the subscriber information available in the Subscriber Policy Enforcement & Management System. These expressions can be used with policy rules and actions that are configured for NetScaler features, such as integrated caching, rewrite, responder, and content switching.

The following commands are an example of adding a subscriber-based responder action and policy. The policy evaluates to true if the subscriber rule value is “pol1”.

```bash
1 add responder action error_msg respondwith "HTTP/1.1 403 OKrnrn" + "You are not authorized to access Internet"
2 add responder policy no_internet_access "SUBSCRIBER.RULE_ACTIVE("pol1")" error_msg
```

The following example shows the commands to add a subscriber-based rewrite action and policy. The action inserts an HTTP header “X-Nokia-MSISDN” by using the value of AVP(45) in the subscriber session.

```bash
1 > add rewrite action AddHDR-act insert_http_header X-Nokia-MSISDN "SUBSCRIBER.AVP(45).VALUE"
2 > add rewrite policy AddHDR-pol "HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL).EQUALS_ANY("patset-test")" AddHDR-act
```

In the following example, two policies are configured on the appliance. When the appliance checks the subscriber information and the subscriber rule is cache_enable, it performs caching. If the subscriber rule is cache_disable, the appliance does not perform caching.

```bash
1 > add cache policy nocachepol -rule "SUBSCRIBER.RULE_ACTIVE("cache_disable")" - action NOCACHE
2 > add cache policy cachepol -rule "SUBSCRIBER.RULE_ACTIVE("cache_enable")" - action CACHE -storeInGroup cg1
```

For a complete list of expressions starting with “SUBSCRIBER,” see the Policy Configuration Guide.
**IPv6 prefix based subscriber sessions**

A telco user is generally identified by the IPv6 prefix rather than the complete IPv6 address. The NetScaler appliance now uses the prefix instead of the complete IPv6 address (/128) to identify a subscriber in the database (subscriber store). For communicating with the PCRF server (for example, in a CCR-I message), the appliance now uses the framed-IPv6-Prefix AVP instead of the complete IPv6 address. The default prefix length is /64, but you can configure the appliance to use a different value.

**To configure the IPv6 prefix by using the command line**

```
set subscriber param [-ipv6PrefixLookupList ...
```

The first example command below sets a single prefix and the second example command sets multiple prefixes.

```
1  set subscriber param -ipv6PrefixLookupList 64
2  set subscriber param -ipv6PrefixLookupList 64 72 96
```

**To configure the IPv6 prefix by using the configuration utility**

1. Navigate to Traffic Management > Subscriber > Parameters.
2. In the details pane, under Settings, click Configure Subscriber Parameters and in IPv6 Prefix Lookup List, specify one or more prefixes.

**Idle session management of subscriber sessions in a Telco network**

Subscriber session cleanup on a NetScaler appliance is based on control plane events, such as a RADIUS Accounting Stop message, a Diameter RAR (session release) message, or a “clear subscriber session” command. In some deployments, the messages from a RADIUS client or a PCRF server might not reach the appliance. Additionally, during heavy traffic, the messages might be lost. A subscriber session that is idle for a long time continues to consume memory and IP resources on the NetScaler appliance. The idle session management feature provides configurable timers to identify idle sessions, and cleans up these sessions on the basis of the specified action.

A session is considered idle if no traffic from this subscriber is received on the data plane or the control plane. You can specify an update, terminate (inform PCRF and then delete the session), or delete (without informing PCRF) action. The action is taken only after the session is idle for the time specified in the idle timeout parameter.
To configure the idle session timeout and the associated action by using the command line

```
1 set subscriber param [-idleTTL <positive_integer>] [-idleAction <idleAction>]
```

Examples:

```
1 set subscriber param -idleTTL 3600 -idleAction ccrTerminate
2 set subscriber param -idleTTL 3600 -idleAction ccrUpdate
3 set subscriber param -idleTTL 3600 -idleAction delete
```

To disable the idle session timeout, set the idle timeout to zero.

```
set subscriber param -idleTTL 0
```

To configure the idle session timeout and the associated action by using the configuration utility

1. Navigate to Traffic Management > Subscriber > Parameters.
2. In the details pane, under Settings, click Configure Subscriber Parameters and specify an Idle Time and Idle Action.

Subscriber session event logging

If you enable subscriber logging, you can track the RADIUS and Gx control plane messages specific to a subscriber, and use the historical data to analyze subscriber activities. Some of the key attributes are MSISDN and time stamp. The following attributes are also logged:

- Session Event (Install, Update, Delete, Error)
- Gx Message Type (CCR-I, CCR-U, CCR-T, RAR)
- Radius Message Type (Start, Stop)
- Subscriber IP
- SubscriberID Type (MSISDN(E164), IMSI)
- SubscriberID value

By using these logs, you can track users by IP address and, if available, MSISDN.

You can enable subscriber session logging to a local or remote syslog or nslog server. The following example shows how to enable subscriber logging to a remote syslog server.

```
1 > add syslogAction sysact1 192.0.2.0 -loglevel EMERGENCY ALERT CRITICAL ERROR WARNING NOTICE INFORMATIONAL -subscriberlog enabled
```
From these logs, you can learn about any activity related to a user, such as the time when a session was updated, deleted, or created (installed). Additionally, error messages are also logged.

Examples:

1. The following log entries are examples of RADIUS and Gx session creation, session update, and session deletion.

   09/30/2015:16:29:18 GMT Informational 0-PPE-0 : default SUBSCRIBER SESSION EVENT 147 0 : Session Install, GX MsgType: CCR-I, RADIUS MsgType: Start, IP: 100.10.1.1, ID: E164-30000000001

   09/30/2015:16:30:18 GMT Informational 0-PPE-0 : default SUBSCRIBER SESSION EVENT 148 0 : Session Update, GX MsgType: CCR-U, IP: 100.10.1.1, ID: E164-30000000001

   09/30/2015:17:27:56 GMT Informational 0-PPE-0 : default SUBSCRIBER SESSION EVENT 185 0 : Session Delete, GX MsgType: CCR-T, RADIUS MsgType: Stop, IP: 100.10.1.1, ID: E164-30000000001

2. The following log entries are examples of failure messages, such as when a subscriber is not found on the PCRF server and when the appliance cannot connect to the PCRF server.

   09/30/2015:16:44:15 GMT Error 0-PPE-0 : default SUBSCRIBER SESSION_FAILURE 169 0 : Failure Reason: PCRF failure response, GX MsgType: CCR-I, IP: 100.10.1.1

   Sep 30 13:03:01 09/30/2015:16:49:08 GMT 0-PPE-0 : default SUBSCRIBER SESSION_FAILURE 176 0 : Failure Reason: Unable to connect to PCRF, GX MsgType: CCR-I, RADIUS MsgType: Start, IP: 100.10.1.1, ID: E164-30000000001

Subscriber aware LSN session termination

In earlier releases, if a subscriber session is deleted when a RADIUS Accounting STOP or a PCRF-RAR message is received, or as a result of any other event, such as TTL expiry or flush, the corresponding LSN sessions of the subscriber are removed only after the configured LSN timeout period. LSN sessions that are kept open until this timeout expires continue to consume resources on the appliance.

From release 11.1, a new parameter (subscrSessionRemoval) is added. If this parameter is enabled, and the subscriber information is deleted from the subscriber database, LSN sessions corresponding to that subscriber are also removed. If this parameter is disabled, the subscriber sessions are timed out as specified by the LSN timeout settings.

To configure subscriber aware LSN session termination by using the CLI

At the command prompt, type:
set lsn parameter -subscrSessionRemoval (DISABLED)

1. > set lsn parameter -subscrSessionRemoval ENABLED
2. Done
3. > sh lsn parameter
4. LSN Global Configuration:
5. Active Memory Usage: 0 MBytes
6. Configured Memory Limit: 0 MBytes
7. Maximum Memory Usage Limit: 912 MBytes
8. Session synchronization: ENABLED
9. Subscriber aware session removal: ENABLED

To configure subscriber aware LSN session termination by using the GUI

1. Navigate to System > Large Scale NAT.
2. In Getting started, click Set LSN Parameter.
3. Set the Subscriber Aware Session Removal parameter.

Troubleshooting

If your deployment is not working as expected, use the following commands to troubleshoot:

- show subscriber gxinterface
  This command's output can include the following error messages (shown here with suggested responses):
  - Gx Interface Not Configured-Use set subscriber param command to configure the correct interface type.
  - PCRF not configured-Configure a Diameter vServer or Service on GxInterface-Use the set subscriber gx interface command to assign a Diameter virtual server or service to this interface.
  - PCRF is not ready-Check corresponding vserver/service for more details-Use the show LB vserver or show service command to check the state of the service.
  - NetScaler is waiting for CEA from PCRF-Capability negotiation between the PCRF and NetScaler might be failing. This could be an intermittent state. If it persists, check the DIAMETER settings on your PCRF server.
- Memory is not configured to store subscriber sessions. Please use ‘set extendedmemoryparam -memlimit <>’. Use the set extendedmemoryparam command to configure extended memory.

- show subscriber radiusinterface
  If “Not Configured” is the output of this command, use the set subscriber radiusinterface command to specify a RADIUSListener service.

If subscriber logging is enabled, you can get more detailed information from the log files.

### Subscriber aware traffic steering

January 6, 2019

Traffic steering directs subscriber traffic from one point to another. When a subscriber connects to the network, the packet gateway associates an IP address with the subscriber and forwards the data packet to the NetScaler appliance. The appliance communicates with the PCRF server over the Gx interface to get the policy information. Depending on the policy information, the appliance performs one of the following actions:

- Forward the data packet to another set of services (as shown in the following illustration).
- Drop the packet.
- Perform only Large Scale NAT (LSN), if LSN is configured on the appliance.

The values shown in the following figure are configured in the CLI procedure that follows the figure. A content switching virtual server on the NetScaler appliance directs requests to the value added services or skips them, depending on the defined rule, and then sends the packet out to the Internet after performing LSN.

### To configure traffic steering for the above deployment by using the CLI

Add the appliance's subnet IP (SNIP) addresses.

**Example:**

```
1 add ns ip 192.168.10.1 255.255.255.0 -type snip
2 add ns ip 192.168.20.1 255.255.255.0 -type snip
3 add ns ip 100.100.100.1 255.0.0.0 -type snip
4 add ns ip 200.200.200.1 255.0.0.0 -type snip
5 add ns ip 100.1.1.1 255.0.0.0 -type snip
```
Add the VLANs. VLANs help the appliance identify the source of the traffic. Bind the VLANs to the interfaces and subnet IP addresses.

Example:

```bash
add vlan 10
add vlan 20
add vlan 100
add vlan 200
bind vlan 10 -ifnum 1/4 -tagged -IPAddress 192.168.10.1 255.255.255.0
bind vlan 20 -ifnum 1/4 -tagged -IPAddress 192.168.20.1 255.255.255.0
bind vlan 100 -ifnum 1/2 -tagged -IPAddress 100.1.1.1 255.0.0.0
bind vlan 200 -ifnum 1/3 -tagged -IPAddress 200.1.1.1 255.0.0.0
```

Specify the VLAN on which the subscriber traffic arrives on the appliance. Specify the service path AVP that tells the appliance where to look for the service path name within the subscriber session. For primary PCEF functionality, specify the interfaceType as RadiusAndGx.

Example:

```bash
set ns param -servicePathIngressVLAN 100
set subscriber gxinterface -servicepathAVP 1001 1005 -servicepathVendorid 10415
set subscriber param -interfaceType RadiusAndGx
```

Configure a service and virtual server of type Diameter, and bind the service to the virtual server. Then, specify the PCRF realm and subscriber Gx interface parameters. For primary PCEF functionality, configure a RADIUS listener service and RADIUS interface.

Example:

```bash
add service sdl 10.102.232.200 DIAMETER 3868
```
Add service functions to associate a VAS with an ingress VLAN. Add a service path to define the chain, that is, specify the VAS that the packet must be sent to and the order in which it must go to that VAS. The service path name is usually sent by the PCRF. However, the service path of the default subscriber profile (*) applies if any of the following is true:

- PCRF does not have the subscriber information.
- The subscriber information does not include this AVP.
- The appliance is unable to query the PCRF. For example, the service representing the PCRF is DOWN.

The service path AVP that contains this name must already be configured as part of the global configuration. Bind the service function to the service path. The service index specifies the order in which the VAS is added to the chain. The highest number (255) indicates the beginning of the chain.

Example:

```bash
add lb vserver vdiam DIAMETER 0.0.0.0 0 -persistenceType DIAMETER -persistAVPno 263
bind lb vserver vdiam sd1
set ns diameter -identity netscaler.sc1.net -realm pcrf1.net
set subscriber gxInterface -vServer vdiam -pcrfRealm pcrf1.net -holdOnSubscriberAbsence YES -idleTTL 1200 -negativeTTL 120
add service srad1 10.102.232.236 RADIUSListener 1813
set subscriber radiusInterface -listeningService srad1
```

Add the LSN configuration. That is, define the NAT pool and identify the clients for which the appliance must perform LSN.

```bash
add lsn pool pool1
bind lsn pool pool1 200.201.1.1
```
The appliance performs LSN by default. To override LSN, you must create a net profile with the overrideLsn parameter enabled, and bind this profile to all the load balancing virtual servers that are configured for value added services (VASs).

Example:

```plaintext
add lsn client client1
bind lsn client client1 -network 100.0.0.0 -netmask 255.0.0.0
add lsn group group1 -clientname client1
bind lsn group group1 -poolname pool1
```

Configure the VAS on the appliance. This includes creating the services and virtual servers and then binding the services to the virtual servers.

```plaintext
add netprofile np1
set netprofile np1 -overrideLsn ENABLED
set lb vserver vs1 -netprofile np1
add service vas1 192.168.10.2 ANY 80 -usip YES
add service sint 200.10.1.10 ANY 80 -usip YES
add lb vserver vs1 ANY -m MAC -l2Conn ON
add lb vserver vint ANY -m MAC -l2Conn ON
bind lb vserver vs1 vas1
bind lb vserver vint sint
```

Add the content switching (CS) configuration. This includes virtual servers, policies, and their associated actions. The traffic arrives at the CS virtual server and is then redirected to the appropriate load balancing virtual server. Define expressions that associate a virtual server with a service function.

Example:

```plaintext
add cs vserver cs1 ANY * 80 -l2Conn ON
add cs action csact1 -targetLBVserver vs1
```
To configure traffic steering on the appliance by using the GUI

1. Navigate to System> Network> IPs and add the subnet IP addresses.
2. Navigate to System > Network > VLANs and add VLANs, Bind the VLANs to the interfaces and subnet IP addresses.
3. Navigate to Traffic Management> Service Chaining> Configure Service Path Ingress VLAN and specify an ingress VLAN.
4. Navigate to Traffic Management> Subscriber> Parameters> Configure Subscriber Parameters and specify the following:
   • Interface Type: Specify RadiusAndGx.
   • Configure a diameter virtual server, PCRF realm, and the subscriber GX interface parameters.
   • Specify the RADIUS interface parameters.
5. Navigate to Traffic Management> Service Chaining> Service Function and add service functions to associate a value-added service with an ingress VLAN.
6. Navigate to System> Network> Large Scale NAT. Click Pools and add a pool. Click Clients and add a client. Click Groups and add a group and specify the client. Edit the group and bind the pool to this group.
7. Navigate to System> Network> Net Profiles and add a net profile. Select Override LSN. Optionally, navigate to System> Network> Settings> Configure Layer 3 Parameters and verify that Override LSN is not selected.
8. Navigate to Traffic Management> Load Balancing> Virtual Servers and configure the virtual servers and value-added services on the appliance. Bind the services and the net profile to the virtual server.
9. Navigate to Traffic Management> Content Switching> Virtual Servers and configure a virtual server, policy, and action. Specify the target load balancing virtual server.

To configure service chaining on the appliance by using the GUI

1. Navigate to System> Network> IPs and add the subnet IP addresses.
2. Navigate to System > Network > VLANs and add VLANs, Bind the VLANs to the interfaces and subnet IP addresses.
3. Navigate to Traffic Management > Service Chaining > Configure Service Path Ingress VLAN and specify an ingress VLAN.
4. Navigate to Traffic Management > Subscriber > Parameters > Configure Subscriber Parameters and specify the following:
   - Interface Type: Specify RadiusAndGx.
   - Configure a diameter virtual server, PCRF realm, and the subscriber GX interface parameters.
   - Specify the RADIUS interface parameters.
5. Navigate to Traffic Management > Service Chaining > Service Function and add service functions to associate a value-added service with an ingress VLAN.
6. Navigate to System > Network > Large Scale NAT. Click Pools and add a pool. Click Clients and add a client. Click Groups and add a group and specify the client. Edit the group and bind the pool to this group.
7. Navigate to System > Network > Net Profiles and add a net profile. Select Override LSN. Optionally, navigate to System > Network > Settings > Configure Layer 3 Parameters and verify that Override LSN is not selected.
8. Navigate to Traffic Management > Load Balancing > Virtual Servers and configure the virtual servers and value-added services on the appliance. Bind the services and the net profile to the virtual server.
9. Navigate to Traffic Management > Content Switching > Virtual Servers and configure a virtual server, policy, and action. Specify the target load balancing virtual server.

Subscriber aware service chaining

January 6, 2019

With the huge increase in the data traffic passing through telco networks, it is no longer feasible for service providers to steer all the traffic through all the value added services (VAS). A service provider should be able to optimize usage of VAS and intelligently steer traffic to improve the user experience. For example, video optimization is not required for traffic that does not include a video. Moreover, if a subscriber is connected to a 4G network, content can be streamed in high definition (HD), and video optimization might not be needed. However, video optimization improves the experience for a user in a 3G network. Similarly, caching provides a faster and better user experience and can be enabled depending on the subscriber plan. Another example of VAS is parental control. If parents provide a mobile handset to a minor child, they would like some kind of control over the websites that their child visits.

To do the above and more, service providers must be able to provide value-added services on a per-
subscriber basis. In other words, entities in the service provider network must be capable of extracting the subscriber information and intelligently steering the packet on the basis of this information.

Service chaining determines the set of services through which the traffic from a subscriber must pass before going to the Internet. Instead of sending all the traffic to all the services, the NetScaler intelligently routes all requests from a subscriber to a specific set of services on the basis of the policy defined for that subscriber.

The following figure shows the entities involved in service chaining. The values shown are configured in the procedure that follows the figure. A content switching virtual server on the NetScaler appliance directs requests to the value added services or skips them, depending on the defined rule, and then sends the packet out to the Internet after performing LSN.

To configure service chaining for the above deployment by using the CLI

Add the appliance's subnet IP (SNIP) addresses.

Example:

```
1 add ns ip 192.168.10.1 255.255.255.0 -type snip
2 add ns ip 192.168.20.1 255.255.255.0 -type snip
3 add ns ip 192.168.30.1 255.255.255.0 -type snip
4 add ns ip 192.168.40.1 255.255.255.0 -type snip
5 add ns ip 192.168.50.1 255.255.255.0 -type snip
6 add ns ip 192.168.60.1 255.255.255.0 -type snip
7 add ns ip 100.1.1.1 255.0.0.0 -type snip
8 add ns ip 200.201.1.1 255.0.0.0 -type snip
```

Add the VLANs. VLANs help the appliance identify the source of the traffic. Bind the VLANs to the interfaces and subnet IP addresses. Add an ingress and an egress VLAN for each VAS.

Example:

```
1 add vlan 10
2 add vlan 20
3 add vlan 30
```
Specify the VLAN on which the subscriber traffic arrives on the appliance. Specify the service path AVP that tells the appliance where to look for the service path name within the subscriber session. For primary PCEF functionality, specify the interfaceType as RadiusAndGx.

**Example:**

```bash
set ns param -servicePathIngressVLAN 100
set subscriber gxinterface -servicepathAVP 1001 1005 -servicepathVendorid 10415
set subscriber param -interfaceType RadiusAndGx
```

Configure a service and virtual server of type Diameter, and bind the service to the virtual server. Then, specify the PCRF realm and subscriber Gx interface parameters. For primary PCEF functionality, configure a RADIUS listener service and RADIUS interface.

**Example:**

```bash
add vlan 40
add vlan 50
add vlan 60
add vlan 100
add vlan 200
bind vlan 10 -ifnum 1/4 -tagged -IPAddress 192.168.10.1 255.255.255.0
bind vlan 20 -ifnum 1/4 -tagged -IPAddress 192.168.20.1 255.255.255.0
bind vlan 20 -ifnum 1/4 -tagged -IPAddress 192.168.30.1 255.255.255.0
bind vlan 20 -ifnum 1/4 -tagged -IPAddress 192.168.40.1 255.255.255.0
bind vlan 20 -ifnum 1/4 -tagged -IPAddress 192.168.50.1 255.255.255.0
bind vlan 20 -ifnum 1/4 -tagged -IPAddress 192.168.60.1 255.255.255.0
bind vlan 100 -ifnum 1/2 -tagged -IPAddress 100.1.1.1 255.0.0.0
bind vlan 200 -ifnum 1/3 -tagged -IPAddress 200.201.1.1 255.0.0.0
```
Add service functions to associate a VAS with an ingress VLAN. Add a service path to define the chain, that is, specify the VAS that the packet must be sent to and the order in which it must go to that VAS. The service path name is usually sent by the PCRF. However, the service path of the default subscriber profile (*) applies if any of the following is true:

- PCRF does not have the subscriber information.
- The subscriber information does not include this AVP.
- The appliance is unable to query the PCRF. For example, the service representing the PCRF is DOWN.

The service path AVP that contains this name must be configured as part of the global configuration earlier. Bind the service function to the service path. The service index specifies the order in which the VAS is added to the chain. The highest number (255) indicates the beginning of the chain.

**Example:**

```plaintext
add service sdl 10.102.232.200 DIAMETER 3868
add lb vserver vdiam DIAMETER 0.0.0.0 0 -persistenceType DIAMETER -persistAVPno 263
bind lb vserver vdiam sdl
set ns diameter -identity netscaler.sc1.net -realm pcrf1.net
set subscriber gxInterface -vServer vdiam -pcrfRealm pcrf1.net -holdOnSubscriberAbsence YES -idleTTL 1200 -negativeTTL 120
add service sradl 10.102.232.236 RADIUSListener 1813
set subscriber radiusInterface -listeningService sradl
```
Add the LSN configuration. That is, define the NAT pool and identify the clients for which the appliance must perform LSN.

Example:

```bash
add lsn pool pool1
bind lsn pool pool1 200.201.1.1
add lsn client client1
bind lsn client client1 -network 100.0.0.0 -netmask 255.0.0.0
add lsn group group1 -clientname client1
bind lsn group group1 -poolname pool1
```

The appliance performs LSN by default. To override LSN, you must create a net profile with overrideLsn parameter enabled and bind this profile to all the load balancing virtual servers that are configured for value added services (VASs).

Example:

```bash
add netprofile np1
set netprofile np1 -overrideLsn ENABLED
set lb vserver vs1 -netprofile np1
```

Configure the VAS on the appliance. This includes creating the services and virtual servers and then binding the services to the virtual servers.

Example:

```bash
add service vsl 192.168.10.2 ANY 80 -usip YES
```
Add the content switching (CS) configuration. This includes virtual servers, policies, and their associated actions. The traffic arrives at the CS virtual server and is then redirected to the appropriate load balancing virtual server. Define expressions that associate a virtual server with a service function.

**Example:**

```plaintext
add service vas2 192.168.30.2 ANY 80 -usip YES
add service vas3 192.168.50.2 ANY 80 -usip YES
add service sint 200.10.1.10 ANY 80 -usip YES
add lb vserver vs1 ANY -m MAC -l2Conn ON
add lb vserver vs2 ANY -m MAC -l2Conn ON
add lb vserver vs3 ANY -m MAC -l2Conn ON
add lb vserver vint ANY -m MAC -l2Conn ON
bind lb vserver vs1 vas1
bind lb vserver vs2 vas2
bind lb vserver vs3 vas3
bind lb vserver vint sint
```

```plaintext
add cs vserver cs1 ANY * 80 -l2Conn ON
add cs action csact1 -targetLBVserver vs1
add cs action csact2 -targetLBVserver vs2
add cs action csact3 -targetLBVserver vs3
add cs action csactint -targetLBVserver vint
add cs policy cspol1 -rule "$SUBSCRIBER.SERVICEPATH.IS_NEXT("SF1") && SYS.VSERVER("vs1").STATE.EQ(UP)" -action csact1
add cs policy cspol2 -rule "$SUBSCRIBER.SERVICEPATH.IS_NEXT("SF2") && SYS.VSERVER("vs2").STATE.EQ(UP)" -action csact2
```
To configure service chaining on the appliance by using the GUI

1. Navigate to System > Network > IPs and add the subnet IP addresses.
2. Navigate to System > Network > VLANs and add VLANs, Bind the VLANs to the interfaces and subnet IP addresses.
3. Navigate to Traffic Management > Service Chaining > Configure Service Path Ingress VLAN and specify an ingress VLAN.
4. Navigate to Traffic Management > Subscriber > Parameters > Configure Subscriber Parameters and specify the following:
   - Interface Type: Specify RadiusAndGx.
   - Configure a diameter virtual server, PCRF realm, and the subscriber GX interface parameters.
   - Specify the RADIUS interface parameters.
5. Navigate to Traffic Management > Service Chaining > Service Function and add service functions to associate a value-added service with an ingress VLAN.
6. Navigate to System > Network > Large Scale NAT. Click Pools and add a pool. Click Clients and add a client. Click Groups and add a group and specify the client. Edit the group and bind the pool to this group.
7. Navigate to System > Network > Net Profiles and add a net profile. Select Override LSN. Optionally, navigate to System > Network > Settings > Configure Layer 3 Parameters and verify that Override LSN is not selected.
8. Navigate to Traffic Management > Load Balancing > Virtual Servers and configure the virtual servers and value-added services on the appliance. Bind the services and the net profile to the virtual server.
9. Navigate to Traffic Management > Content Switching > Virtual Servers and configure a virtual server, policy, and action. Specify the target load balancing virtual server.
Policy based TCP profile selection

September 17, 2018

You can configure the NetScaler appliance to perform TCP optimization based on subscriber attributes. For example, the appliance can select different TCP profiles at run time, based on the network to which the user equipment (UE) is connected. As a result, you can improve a mobile user’s experience by setting some parameters in the TCP profiles and then using policies to select the appropriate profile.

Create separate TCP profiles for subscribers connecting through a 4G network and for users connecting through any other network. Define a policy rule that is selected on the basis of a subscriber parameter, such as RAT-type. In the following examples, if RAT-Type is EUTRAN, a TCP profile that supports a faster connection is selected (Example 1). For all other RAT-Type values, a different TCP profile is selected (Example 2).

**Note**

The RAT-Type AVP (AVP code 1032) is of type Enumerated and is used to identify the radio access technology that is serving the UE.

The value “1004” indicates that the RAT is EUTRAN. (RFC 29.212).

**Example1:**

```plaintext
1 add ns tcpProfile tcp2 -WS ENABLED -SACK ENABLED -WSVal 8 -initialCwnd 16 - oooQSize 15000 -slowStartIncr 1 -bufferSize 1000000 -flavor BIC - dynamicReceiveBuffering DISABLED -sendBufferSize 1000000 -dsack DISABLED -maxCwnd 4000000 -fack ENABLED -minRTO 500 -maxburst 15
2 add appqoe action appact2 -priority HIGH -tcpprofile tcp2
3 add appqoe policy apppol2 -rule "SUBSCRIBER.AVP(1032).VALUE. GET_UNSIGNED32(0, BIG_ENDIAN).EQ(1004)" -action appact2
4 bind cs vserver <name> -policyname apppol2 -priority 20 -type request
```

**Example2:**

```plaintext
1 add ns tcpProfile tcp1 -WS ENABLED -SACK ENABLED -WSVal 8 -initialCwnd 16 - oooQSize 15000 -slowStartIncr 1 -bufferSize 150000 -flavor BIC - dynamicReceiveBuffering DISABLED -sendBufferSize 1500000 -dsack DISABLED -maxcwnd 4000000 -fack ENABLED -minRTO 200 -maxburst 15
2 add appqoe action appact1 -priority HIGH -tcpprofile tcp1
```
Load Balance Control-Plane Traffic that is based on Diameter, SIP, and SMPP Protocols

September 17, 2018

With the increase in control-plane traffic, the servers can become a bottleneck because the traffic is not optimally distributed among the servers. Therefore, messages must be load balanced. The NetScaler appliance supports Diameter, SIP, and SMPP load balancing.

**SIP**

NetScaler enables you to load balance SIP messages over UDP or over TCP (including TLS) to a group of proxy servers. NetScaler also provides Call-ID based persistence and Call-ID hash load balancing method using which you direct packets for a particular SIP session to the same load balanced SIP server.

The NetScaler default expressions language contains a number of expressions that operate on Session Initiation Protocol (SIP) connections. These expressions are intended to be used in policies for SIP protocol that operates on a request/response basis. These expressions can be used in content switching, rate limiting, responder, and rewrite policies.

For more information, see [Load Balancing a Group of SIP Servers](#).

**SMPP**

Millions of short messages are exchanged daily between individuals and value-added service providers, such as banks, advertisers, and directory services, by using the short message peer to peer (SMPP) protocol. Often, message delivery is delayed because servers are overloaded and traffic is not optimally distributed among the servers.

The NetScaler appliance provides optimal distribution of messages across your servers, preventing poor performance and outages. The NetScaler appliance:

- Load balances messages originating from the server and from the client
- Monitors the health of the message centers
- Provides content switching support for the message centers
• Handles concatenated messages

**Limitation:** Message IDs, from the message center, longer than 59 bytes are not supported. If the message ID length returned by the message center is more than 59 bytes, ancillary operations fail and the NetScaler appliance responds with an error message.

For more information, see [SMPP Load Balancing](#).

**Diameter**

Diameter is a base protocol with more than 50 protocols (also called applications) built over it. Therefore, the diameter traffic generated in a Telco network is high. To optimally maintain this diameter traffic, the NetScaler appliance performs load balancing, content switching, and acts as a relay agent. Additionally, the appliance offers rewrite and responder functionality. The appliance supports rate limiting of Diameter messages.

For more information, see [Configuring Diameter Load Balancing](#).

**Provide DNS Infrastructure/Traffic Services, such as, Load Balancing, Caching, and Logging for Telecom Service Providers**

September 17, 2018

Telecom service providers can configure the NetScaler appliance to function as a DNS proxy. Caching of DNS records, which is an important function of a DNS proxy, is enabled by default on the NetScaler appliance. This enables the NetScaler appliance to provide quick responses for repeated translations and hence enhances the customer experience and also saves the bandwidth. The caches responses from DNS name servers. When the appliance receives a DNS query, it checks for the queried domain in its cache. If the address for the queried domain is present in its cache, the NetScaler appliance returns the corresponding address to the client. Otherwise, it forwards the query to a DNS name server that checks for the availability of the address and returns it to the NetScaler appliance. The NetScaler appliance then returns the address to the client.

For requests for a domain that has been cached earlier, the NetScaler appliance serves the Address record of the domain from the cache without querying the configured DNS server and hence saves the bandwidth.

From 11.0 release onwards, NetScaler also logs the DNS requests that it receives and also the responses that it sends to the client. Telecom service providers can use this log to:

- Audit the DNS responses to the client
- Audit DNS clients
- Detect and prevent DNS attacks
For more information, see 
Domain Name System.

Provide Subscriber Load Distribution Using GSLB Across Core-Networks of a Telecom Service Provider

October 24, 2018

Scalability, high availability and performance are critical to service provider deployments. While many service providers deploy their infrastructure at a single location or multiple locations, these deployments are subject to a number of inherent limitations, such as:

- If the site loses connectivity to all or part of the public Internet, it will be inaccessible to users and customers, which can have significant impact on the business.
- Users accessing the site from geographically distant locations may experience large and highly variable delays, which are exacerbated by the large number of round trips that HTTP requires to transfer content.

NetScaler appliance’s Global Server Load Balancing (GSLB) overcomes these problems by distributing traffic among sites deployed in multiple geographic locations. By serving content from many different points in the Internet, GSLB alleviates the impact of network bandwidth bottlenecks and provides robustness in case of network failures at a particular site. Users can be automatically directed to the nearest or least loaded site at the time of the request, minimizing the likelihood of long download delays and/or service disruptions.

You can use NetScaler appliance’s global server load balancing for:

- Disaster recovery or high availability by configuring an Active-standby data center setup that consists of an active and a standby data center. When a failover occurs as a result of a disaster event, the standby data center becomes operational.
- High availability and speed by configuring an active-active data center setup that consists of multiple active data centers. Client requests are load balanced across active data centers.
- Directing client requests to the data center that is closest in geographical distance or network distance by configuring a proximity setup.
- Full-DNS resolutions, GSLB processes DNS queries of the A, AAAA and CNAME types, and the DNS function option can process DNS queries of all other types, such as MX and PTR. Also, if the recursive resolution is enabled, the appliance will forward DNS queries for domain names that are not configured on the NetScaler appliance.

For more information, see 
Global Server Load Balancing.
Bandwidth Utilization Using Cache Redirection Functionality

September 17, 2018

The volume of web traffic on the Internet is enormous and a large percentage of that traffic is redundant. Multiple clients ask web servers for the same content repeatedly leading to inefficient use of bandwidth. To relieve the origin web server of processing each request, Internet Service Providers (ISPs) can use the cache redirection feature of NetScaler appliance and serve the content from a cache server instead of from the origin server. The NetScaler appliance analyzes incoming requests, sends requests for cacheable data to cache servers, and sends non-cacheable requests and dynamic HTTP requests to origin servers. Cache redirection feature of NetScaler is policy-based, and by default, requests that match a policy are sent to the origin server, and all other requests are sent to a cache server. You can combine content switching with cache redirection to cache selective content and serve content from specific cache servers for specific types of requested content.

For more information, see Cache Redirection.

NetScaler TCP Optimization

September 17, 2018

The NetScaler appliance provides advanced TCP tuning and optimization techniques and capabilities that are well suited to modern 3.5 and 4G networks, improving user experience and perceived download speeds significantly.

This section focuses on detailed instructions relevant to:

- Choosing and inserting an appropriate NetScaler T1000 Series model in a mobile network for TCP optimization
- Full configuration instructions related to not only TCP optimization but also for appropriate Layer-2 and Layer-3 configuration of the T1 device

Getting Started

January 6, 2019

Hardware

Citrix provides a wide breath of NetScaler models that might be loosely based on two factors:

- Capacity, currently ranging from hundreds of Mbps for the low-end VPX appliance to 160Gbps for the high-end 25000 MPX series appliance
• Telco grade, with the availability of the T1000 series for Telco datacenters.

Your Citrix Sales or Support representative can help you select the appropriate hardware for your demo, trial, or production needs.

The remainder of this section uses a NetScaler T1200 as a reference hardware. Note that putting aside superficial differences related to number and notation of available interfaces (see * in note) or well-documented limitations of NetScaler VPX (see ** in note) the instructions should apply mostly verbatim regardless of the NetScaler model selected.

Note

* For instance a the T1010 model only has 12x1GbE typically marked as 1/1-1/12 rather than the 10/x notation used in this document.

** A NetScaler VPX instance typically doesn’t support LACP aggregation; it might also not support VLAN tagging.

Initial Setup

Through Serial Console

After a serial cable is connected, you can log on to the NetScaler appliance with the following credentials:

• Username: nsroot
• Password: nsroot

Once logged in, configure the basic details of the NetScaler appliance as shown in the screen capture below.

Example:

```
1 set ns config -IPAddress <ip_addr> -netmask <netmask>
2 saveconfig
3 reboot -warm
```

After you restart the appliance, you might use SSH for further configuration of the T1100 nodes.

Through LOM

Lights out Management (LOM) port on the front panel of the NetScaler appliance allows operator to remotely monitor and manage the appliance independently of the operating system. Operator can
change the IP address, power cycle, and perform a code dump by connecting to the NetScaler appliance through the LOM port.

Default IP Address of LOM port is 192.168.1.3

Figure. Initial Configuration of LOM Module

Set a static IP on your laptop and plug it directly into the LOM interface with a crossover cable or into a switch in the same broadcast domain as the LOM interface.

For initial configuration, type the port’s default address: http://192.168.1.3 in a web browser and change the LOM port’s default IP address.

Refer to Configuration Guides for further details.

Software

The NetScaler TCP optimization for mobile networks is constantly evolving. The capabilities and tunings outlined in this document require a NetScaler Telco build. Here is an example showing the NetScaler Telco build.

Example:

```
1 show ver
2
3  NetScaler NS11.0: Build 64.957.nc, Date: Aug 26 2016, 02:00:23
```

If the T1000 has not shipped with the appropriate build revision, contact the NetScaler Customer Support.

<table>
<thead>
<tr>
<th>Important</th>
</tr>

<tbody>
<tr>
<td>Both the appliances should have the same software image.</td>
</tr>
</tbody>
</table>

SSH Client

A NetScaler appliance can be configured by using either the CLI or the HTML5 GUI. However, this section provides only CLI-based instructions.

While the CLI is accessible through the NetScaler serial console, an SSH client is normally recommended to allow for remote NetScaler configuration.

Management Network

January 6, 2019
**Connectivity**

Most NetScaler devices offer redundant 1GbE OAM ports, notated as 0/1 and 0/2. To provide for redundancy in case of a switch failure, you should connect the relevant ports to different upstream switches.

A high-level overview of the recommended connectivity is outlined in the following diagram:

After the NetScaler appliance is connected to the management network, subsequent configuration steps can be performed remotely using SSH or web connectivity to the CLI and GUI respectively.

**Routing**

The add route command may be used to configure any routes appropriate to the management network. The relevant gateway should be reachable on the NSIP subnet, as shown below.

**Example:**

```
1 add route <network> <netmask> <gateway>
```

**Licensing**

September 17, 2018

A valid license file should be installed on the NetScaler appliance. The license should support at least as many Gbps as the expected maximum Gi-LAN throughput.

License files should be copied through an SCP client to the /nsconfig/license of the appliance, as shown in the screen capture below.

**Example:**

```
1 shell ls /nsconfig/license/
2
3 CNS_V3000_SERVER_PLT_Retail.lic ssl
```

Do a warm restart to apply the new license, as shown in the screen capture below.

**Example:**

```
1 reboot -warm
2
3 Are you sure you want to restart NetScaler (Y/N)? [N]:y
4
5 Done
```
After the restart completes, verify that the license has been properly applied, by using the show license CLI.

In the example below a 3Gbps Platinum license has been successfully installed.

**Example:**

```
> show license
License status:

Web Logging: YES

... Model Number ID: 3000

License Type: Platinum License

Done
```

**High Availability**

January 6, 2019

High availability (HA) refers to an active-standby operational mode of a NetScaler device pair. Each device has its own dedicated management IP address. All other IP addresses are owned by the active device in the pair.

**Connectivity**

While there are multiple connectivity options for a NetScaler HA pair, the most recommended one is depicted in the following diagram:

In the above diagram, the N+1 red links between each T1000 and the respective switch imply N+1 redundancy - as explained in Connectivity. For instance, considering a 45 Gbps Gi-LAN N=5 is an appropriate value, with 6x10GbE LACP channels between each switch and the respective T1000 as well as between the two switches.

An extra pair of links is recommended between the NetScaler pair, to provide for HA communication isolation from the OAM network.
NetScaler 12.0

Gi-LAN Integration

January 6, 2019

Typically, a NetScaler appliance is inserted as a separate L3 inline node in the Gi-LAN, similarly to an L3 router.

Figure: A simple depiction of a Gi-LAN

Connectivity

A physical NetScaler connectivity to upstream switches is recommended to provide for sufficient redundancy. For example, assuming that a NetScaler appliance is inserted in a Gi-LAN that is handling a total (uplink+downlink) of 24Gbps, connectivity with 4x10GbE or more interfaces is recommended. This effectively provides for N+1 redundancy in case of a link failure.

The relevant ports on the upstream switch should be configured for LACP port aggregation. The relevant configuration on NetScaler is outlined below:

Connectivity Configuration:

```
1 set interface 10/1 - tagall ON - lacpMode ACTIVE - lacpKey 1
2 set interface 10/2 - tagall ON - lacpMode ACTIVE - lacpKey 1
3 set interface 10/3 - tagall ON - lacpMode ACTIVE - lacpKey 1
4 set interface 10/4 - tagall ON - lacpMode ACTIVE - lacpKey 1
```

You can verify the appropriate functionality of LACP using the “show interface” command:

```
show interface:
sh interface LA/1
```

```
1) Interface LA/1 (802.3ad Link Aggregate) #39
2
3   flags=0x4100c020 <ENABLED, UP, AGGREGATE, UP, HAMON, 802.1q>
4
5   MTU=1500, native vlan=1, MAC=02:e0:ed:33:88:b0, uptime 340
   h11m56s
6
7   Requested: media NONE, speed AUTO, duplex NONE, fctl NONE,
8
9   throughput 0
```
Actual: throughput 4000

LLDP Mode: NONE,

RX: Pkts(918446) Bytes(110087414) Errs(0) Drops(795989) Stalls (0)

TX: Pkts(124113) Bytes(15255532) Errs(0) Drops(0) Stalls(0)

NIC: InDisc(0) OutDisc(0) Fctls(0) Stalls(0) Hangs(0) Muted(0)

Bandwidth thresholds are not set.

Disable the remaining unused interfaces and turn off the monitor.

set interface 10/5 –haMonitor OFF

Command:

```
1 set interface 10/24 –haMonitor OFF
2 disable interface 10/5
3 disable interface 10/24
```

Configuration of physical interfaces is not shared across the two NetScaler units. Hence, the above commands must be run across both NetScaler nodes in case of an HA pair deployment.

**HA Configuration**

All other configuration parameters are shared between the NetScaler nodes of an HA pair. Hence, HA sync should be enabled prior to any other configuration commands being run. Basic HA configuration involves the following steps:

1. Using the exact same NetScaler hardware, software, and license: HA pairs are not supported between different models (i.e. a T1100 and an MPX21550) or same models with different firmware levels. Refer to the appropriate instructions on upgrading an existing HA pair - [Upgrading to Release 11.1](#).
2. Establishing the HA pair.

**Example:**

```
1 netscaler-1> add HA node 1 <netscaler-2-NSIP>
2 netscaler-2> add HA node 1 <netscaler-1-NSIP>
```
3. Verify the HA pair establishment running the following command in either node; both nodes should be visible, one of them as Primary (active), the other as a Secondary (standby).

**Example:**
```
show HA node
```

4. Enable failsafe mode and maxFlips. This ensures that in case of a route monitor failure on both nodes at least one node remains active without active/standby status constantly switching.

**Example:**
```
set HA node -failsafe ON
set HA node -maxFlips 3 -maxFlipTime 1200
```

5. Finally, enable HA sync to occur over the dedicated intra-NetScaler ports rather than the OAM network.

**Example:**
```
add vlan 4080 -aliasName syncVlan
set HA node -syncvlan 4080
```

> **Note**

> The VLAN 4080 in the commands in the above example shouldn’t be taken literally. Any unused VLAN-ID might be reserved.

## VLAN Configuration

After the physical interfaces have been appropriately configured, you might configure the appropriate Gi-LAN VLANs. For instance, consider a rather simple Gi-LAN environment with an ingress/egress VLAN pair with 100/101 VLAN-identifier respectively.

The following commands configure the relevant VLANs on top of the LACP channel created in the prior step.

add vlan 100
add vlan 101
bind vlan 100 –ifnum LA/1 –tagged
bind vlan 101 –ifnum LA/1 –tagged

## IPv4 Configuration
Typically, a NetScaler appliance requires one SNIP per VLAN. The example below assumes that the networks outlined in the Gi-LAN integration diagram, given in the beginning of this page, have a /24 subnet mask:

```
add ns ip 192.168.1.254 255.255.255.0 –vserver DISABLED –mgmtAccess DISABLED
add ns ip 192.168.2.254 255.255.255.0 –vserver DISABLED –mgmtAccess DISABLED
```

After the SNIPs have been configured they should be associated with the appropriate VLAN:

```
bind vlan 100 –IPAddress 192.168.1.254 255.255.255.0
bind vlan 101 –IPAddress 192.168.2.254 255.255.255.0
```

## IPv4 Static Routing

The example outlined in the [Management Network](/en-us/netscaler/12/netscaler-support-for-telecom-service-providers/NS_TCP_optimization/NS_TCP_opt_mgmt_network.html) section calls for only a couple of static routing rules:

```
- A 10.0.0.0/8 static route to the clients through the ingress router
- A default route to the internet through the egress router
```

**Example:**

```
add route 0.0.0.0 0.0.0.0 192.168.2.1
add route 10.0.0.0 255.0.0.0 192.168.1.1
```

## IPv4 Policy-Based (VLAN – VLAN) routing

A NetScaler appliance allows for policy-based routing instead of static routing, with routing decisions usually keyed against the incoming interface and/or VLAN rather than destination IP. Policy-based routing is either a convenient alternative, in case the client source IP address range is subject to periodic changes, or a mandatory consideration, in case a packet’s destination IP address is not sufficient by itself to reach a routing decision (i.e. in case of overlapping client IP addresses across multiple VLANs).

**Example:**

```
add ns pbr fromWirelessToInternet ALLOW –nextHop 192.168.2.1 –vlan 100 –priority 10
```
NetScaler 12.0

Done

```
add ns pbr fromInternetToWireless ALLOW –nextHop 192.168.1.1 –vlan 200 –priority 20
Done
apply ns pbrs
```

### IPv6 Configuration

The following commands assign IPv6 SNIP per vlan. The example below assumes that the networks outlined in the Figure: A simple depiction of a Gi-LAN in this page have a /64 subnet mask:

```
add ns ip6 fd00:192:168:1::254/64 -vServer DISABLED –mgmtAccess DISABLED
add ns ip6 fd00:192:168:2::254/64 -vServer DISABLED –mgmtAccess DISABLED
bind vlan 100 -IPAddress fd00:192:168:1::254/64
bind vlan 200 -IPAddress fd00:192:168:2::254/64
```

### IPv6 Routing

After IPv6 addressing is complete, IPv6 static routing might be configured:

```
add route6 fd00:10::/64 fd00:192:168:1::1
add route6 ::/0 fd00:192:168:2::1
```

Or using policy-based routing:

```
add ns pbr6 fromWirelessToInternetv6 ALLOW -vlan 100 -priority 10 -nextHop fd00:192:168:2::1
add ns pbr6 fromInternetToWirelessv6 ALLOW -vlan 200 -priority 20 -nextHop fd00:192:168:1::1
apply ns pbr6
```

### LACP Redundancy and Failover

© 1999-2018 Citrix Systems, Inc. All rights reserved.
In case of an HA configuration, it's recommended to leverage the throughput option to configure a low threshold for the LACP channel. For instance, consider a 25Gbps Gi-LAN and a 4x10GbE channel between each NetScaler appliance in the HA pair and the upstream switch to provide N+1 link redundancy:

**Example:**

```
set interface LA/1 -haMonitor ON -throughput 29000
```

In case of a double-link failure between the primary appliance and the upstream switch the maximum Gi-LAN throughput that can be supported would fall to 20Gbps. A 29Gbps low threshold per the example above would result in a redundancy switchover event to the secondary appliance (which has not suffered similar link failures) so that Gi-LAN traffic is not affected.

## Route Monitors

In addition to LACP redundancy, route monitor checks might be configured and associated with the HA pair configuration. Route monitor checks can be useful to detect failures between the NetScaler appliance and the next-hop routers, especially if said routers are not directly connected but through an upstream switch.

A typical HA route monitor configuration per the sample Gi-LAN in section 2.5.1 is outlined below:

```
add route 192.168.1.0 255.255.255.0 192.168.1.1 -msr ENABLED -monitor arp
add route 192.168.2.0 255.255.255.0 192.168.2.1 -msr ENABLED -monitor arp
bind HA node -routeMonitor 192.168.1.0 255.255.255.0
bind HA node -routeMonitor 192.168.2.0 255.255.255.0
```

## TCP Optimization Configuration

January 6, 2019

Before configuring TCP optimization, apply the following basic configuration settings on the NetScaler appliance:

**Initial configuration:**

```
enable ns feature LB IPv6PT
```
NetScaler 12.0

2 enable ns mode FR L3 USIP MBF Edge USNIP PMTUD
3 disable ns feature SP
4 disable ns mode TCPB
5 set lb parameter -preferDirectRoute NO
6 set lb parameter -vServerSpecificMac ENABLED
7 set l4param -l2ConnMethod Vlan
8 set rsskeytype -rsstype SYMMETRIC
9 set ns param -useproxyport DISABLED

Note
Restart the NetScaler appliance if you change the rsskeytype system parameter.

TCP Termination

For NetScaler T1 to apply TCP optimization it needs to first terminate incoming TCP traffic. Towards this end, a wildcard TCP vserver should be created and configured to intercept ingress traffic and then forward it to the Internet router.

Static/Dynamic Routing Environment

For environments with static or dynamic routing in place, vserver can rely on routing table info to forward packets towards internet router. Default route must point to the internet router and also routing entries for client subnets towards wireless router should be in place:

Example:

1 add lb vserver vsrv-wireless TCP * * -persistenceType NONE -Listenpolicy "CLIENT.VLAN.ID.EQ(100) && SYS.VSERVER("vsrv-wireless \") .STATE.EQ(UP)" -m IP -cltTimeout 9000
2 add route 0.0.0.0 0.0.0.0 192.168.2.1
3 add route 10.0.0.0 255.0.0.0 192.168.1.1

VLAN-to-VLAN (PBR) Environment

There are customer environments where subscriber traffic is segmented to multiple flows and needs to be forwarded to different routers based on incoming traffic parameters. Policy Based Routing (PBR) can be used to route packets based on incoming packet parameters, such as VLAN, MAC address, Interface, source IP, source port, destination IP address, and destination port.

Example:
Using Policy Based Routing to route TCP optimized traffic is a new feature added in release 11.1 50.10. For previous releases, having multiple “mode MAC” vserver entities per VLAN is an alternative solution for multi-VLAN environments. Each vserver has a bound service representing the internet router for the particular flow.

Example:

```bash
1 add lb vserver vsrv-wireless-1 TCP * * -m IP -l2Conn ON -listenpolicy "CLIENT.VLAN.ID.EQ(100) || CLIENT.VLAN.ID.EQ(101) || CLIENT.VLAN.ID.EQ(102)"
2 add lb vserver vsrv-wireless-2 TCP * * -m IP -l2Conn ON -listenpolicy "CLIENT.VLAN.ID.EQ(100) || CLIENT.VLAN.ID.EQ(101) || CLIENT.VLAN.ID.EQ(102)"
```
```
l2Conn ON

add lb vserver vsrv-wireless-3 TCP * * -Listenpolicy "CLIENT.VLAN.ID.EQ(102) && SYS.VSERVER("vsrv-wireless-3").STATE.EQ(UP)" -m MAC -l2Conn ON
bind lb vserver vsrv-wireless-1 svc-internet-1
bind lb vserver vsrv-wireless-2 svc-internet-2
bind lb vserver vsrv-wireless-3 svc-internet-3
```

**Note**

The vserver mode is MAC in contrast to previous examples where it is mode IP. This is required to retain the destination IP information when we have service(s) bound to vserver. Also, the additional PBR configuration need to route non-optimized traffic.

**TCP Optimization**

Out-of-the-box NetScaler TCP termination is configured for TCP pass-through functionality. TCP pass-through essentially means that NetScaler T1 may transparently intercept a client-server TCP stream but does not retain separate client/server buffers or otherwise apply any optimization techniques.

To enable TCP optimization a TCP profile, named as nstcpprofile, is used to specify TCP configurations that is used if no TCP configurations are provided at the service or virtual server level and it should be modified as follows:

**Command:**

```bash
add ns tcpProfile nstcpprofile -WS ENABLED -SACK ENABLED -WSVal 8 -mss 1460 -maxBurst 30 -initialCwnd 16 -oooQSize 15000 -minRTO 800 -bufferSize 4000000 -flavor BIC -dynamicReceiveBuffering ENABLED -KA ENABLED -sendBuffsize 4000000 -rstWindowAttenuate ENABLED -spooFsynDrop ENABLED -ecn ENABLED -frto ENABLED -maxcwnd 1000000 -fack ENABLED -rstMaxAck enABLED -tcpmode ENDPOINT
```

**Note**

If there is not any profile explicitly created and bound to vserver and service, the profile nstcp_default_profile is bound by default.

In case of multiple TCP profiles requirement, extra TCP profiles can be created and associated with the appropriate virtual server.
**Command:**

```
1 add ns tcpProfile custom_profile -WS ENABLED -SACK ENABLED -WSVal 8 -mss 1460 -maxBurst 30 -initialCwnd 16 -oooQSize 15000 -minRTO 800 -bufferSize 4000000 -flavor BIC -dynamicReceiveBuffering ENABLED -KA ENABLED -sendBuffsize 4000000 -rstWindowAttenuate ENABLED -spoofSynDrop ENABLED -ecn ENABLED -frto ENABLED -maxcwnd 1000000 -fack ENABLED -rstMaxAck enABLED -tcpmode ENDPOINT
```

```
2 set lb vserver vsrv-wireless -tcpProfileName custom_profile
```

**Note**

For deployments with vserver -m MAC and service, same profile should be associated with service.

```
1 set service svc-internet -tcpProfileName custom_profile
```

**TCP Optimization Capabilities**

Most of the relevant TCP optimization capabilities of a NetScaler appliance are exposed through a corresponding TCP profile. Typical CLI parameters that should be considered when creating a TCP profile are the following:

1. **Window Scaling (WS):** TCP Window scaling allows increasing the TCP receive window size beyond 65535 bytes. It helps improving TCP performance overall and specially in high bandwidth and long delay networks. It helps with reducing latency and improving response time over TCP.

2. **Selective acknowledgment (SACK):** TCP SACK addresses the problem of multiple packet loss which reduces the overall throughput capacity. With selective acknowledgement the receiver can inform the sender about all the segments which are received successfully, enabling sender to only retransmit the segments which were lost. This technique helps T1 improve overall throughput and reduce the connection latency.

3. **Window Scaling Factor (WSVal):** Factor used to calculate the new window size. It must be configured with a high value in order to allow the advertised window by NS to be at least equal to the buffer size.

4. **Maximum Segment Size (MSS):** MSS of a single TCP segment. This value depends on the MTU setting on intermediate routers and end clients. A value of 1460 corresponds to an MTU of 1500.

5. **maxBurst:** Maximum number of TCP segments allowed in a burst.

6. **Initial Congestion Window size(initialCwnd):** TCP initial congestion window size determines the number of bytes which can be outstanding in beginning of the transaction. It enables T1 to send those many bytes without bothering for congestion on the wire.
7. **Maximum OOO packet queue size (oooQSize):** TCP maintains Out Of Order queue to keep the OOO packets in the TCP communication. This setting impacts system memory if the queue size is long as the packets need to be kept in runtime memory. Thus this needs to be kept at optimized level based on the kind of network and application characteristics.

8. **Minimum RTO (minRTO):** The TCP retransmission timeout is calculated on each received ACK based on internal implementation logic. The default retransmission timeout happens at 1 second to start with and this can be tweaked with this setting. For second retransmission of these packets RTO will be calculated by N*2 and then N*4 ... N*8... goes on till last retransmission attempt.

9. **bufferSize / sendBuffsize:** these refer to the maximum amount of data that the T1 may receive from the server and buffer internally without sending to the client. They should be set to a value larger (at least double) than the Bandwidth Delay Product of the underlying transmission channel.

10. **flavor:** this refers to the TCP congestion control algorithm. Valid values are Default, BIC, CUBIC, Westwood and Nile.

11. **Dynamic receive buffering:** allows the receive buffer to be adjusted dynamically based on memory and network conditions. It will fill up the buffer as much as it’s required to keep the client’s download pipe full instead of filling up, by reading ahead from server, a fixed size buffer, as latter is specified in TCP profile and typically based on criteria such as 2*BDP, for a connection. NetScaler T1 monitors the network conditions to the client and estimates how much it should read ahead from the server.

12. **Keep-Alive (KA):** Send periodic TCP keep-alive (KA) probes to check if peer is still up.

13. rstWindowAttenuate: Defending TCP against spoofing attacks. It will reply with corrective ACK when a sequence number is invalid.

14. **rstMaxAck:** Enable or disable acceptance of RST that is out of window yet echoes highest ACK sequence number.

15. **spoofSynDrop:** Drop of invalid SYN packets to protect against spoofing.

16. **Explicit Congestion Notification (ecn):** It sends notification of the network congestion status to the sender of the data and takes corrective measures for data congestion or data corruption.

17. **Forward RTO-Recovery:** In case of spurious retransmissions, the congestion control configurations are reverted to their original state.

18. **TCP maximum congestion window (maxcwnd):** TCP maximum congestion window size that is user configurable.

19. **Forward acknowledgment (FACK):** To avoid TCP congestion by explicitly measuring the total number of data bytes outstanding in the network, and helping the sender (either T1 or a client) control the amount of data injected into the network during retransmission timeouts.

20. **tcpmode:** TCP optimization modes for specific profile.

For the above parameters please consult [1] for guidance on picking the appropriate values. For the remaining ones, the values outlined in TCP Optimization should apply to most cases.
Silently Dropping Idle Connections

In a Telco network, almost 50 percent of a NetScaler appliance’s TCP connections become idle, and the appliance sends RST packets to close them. The packets sent over radio channels activate those channels unnecessarily, causing a flood of messages that in turn cause the appliance to generate a flood of service-reject messages. The default TCP profile now includes DropHalfClosedConnOnTimeout and DropEstConnOnTimeout parameters, which by default are disabled. If you enable both of them, neither a half closed connection nor an established connection causes a RST packet to be sent to the client when the connection times out. The appliance just drops the connection.

```
1  set ns tcpProfile nstcpprofile -DropHalfClosedConnOnTimeout ENABLED
2  set ns tcpProfile nstcpprofile -DropEstConnOnTimeout ENABLED
```

Analytics and Reporting

September 17, 2018

The TCP Speed Reporting is a NetScaler feature which extracts TCP connection statistics, as a measure of TCP download and upload performance, and is utilized in TCP Insight reports of the Citrix Application Delivery Management (ADM). To achieve this, NetScaler monitors each TCP connection, locates packet bursts on an idle time-out basis and reports key metrics (such as byte count, retransmitted byte count and duration) for the identified maximum burst. TCP Speed Reporting feature is enabled by default, support both TCP and HTTP vServers and depends on the Appflow/ULFD reporting infrastructure.

Real-time Statistics

September 17, 2018

The stat command might be used to verify that TCP optimization is properly applied:

Command:

```
1  > stat lb vserver vsrv-wireless
2  Virtual Server Summary
3  actSvcsvs
4  vsvrv...eless
5     1
     vsrIP  port  Protocol  State  Health
       *    0  TCP       UP     100
```

© 1999-2018 Citrix Systems, Inc. All rights reserved.

The Total counters should constantly increase for an operational system. In addition, the Rate counters should be non-zero.

**Note**

The preceding output is from an operational yet idle lab system, explaining the zero rate.

### SNMP

September 17, 2018

SNMP agent can be queried for system specific information from a remote device (SNMP Manager). Based on the query, the agent searches for the equal object identifier (OID) in the management information base (MIB) for the data requested and sends the information to the SNMP Manager. The following are the most useful SNMP OIDs for Telco deployments:

#### Memory

- **resMemUsage (1.3.6.1.4.1.5951.4.1.1.41.2)**

Percentage of memory utilization on NetScaler.

#### Packet Engine CPU

- **resCpuUsage (1.3.6.1.4.1.5951.4.1.1.41.1)**

CPU utilization percentage.

- **nsCPUTable (1.3.6.1.4.1.5951.4.1.1.41.6)**
This table contains information about each CPU in NetScaler.

Indexed on: nsCPUname

- **nsCPUname** (1.3.6.1.4.1.5951.4.1.1.41.6.1.1)
  The name of the CPU.

- **nsCPUusage** (1.3.6.1.4.1.5951.4.1.1.41.6.1.2)
  CPU utilization percentage.

**Throughput**

- **allNicTotRxMbits** (1.3.6.1.4.1.5951.4.1.1.71.1)
  Number of megabits received by the NetScaler appliance.

- **allNicTotTxMbits** (1.3.6.1.4.1.5951.4.1.1.71.2)
  Number of megabits transmitted by the NetScaler appliance.

- **ipTotRxPkts** (1.3.6.1.4.1.5951.4.1.1.43.25)
  IP packets received.

- **ipTotRxMbits** (1.3.6.1.4.1.5951.4.1.1.43.27)
  Megabits of IP data received.

- **ipTotTxPkts** (1.3.6.1.4.1.5951.4.1.1.43.28)
  IP packets transmitted.

- **ipTotTxMbits** (1.3.6.1.4.1.5951.4.1.1.43.30)
  Megabits of IP data transmitted.

**Connections**

**Active connections:**

- **tcpActiveServerConn** (1.3.6.1.4.1.5951.4.1.1.46.8)
  Connections to a server currently responding to requests.

**Total connections:**

- **tcpCurServerConn** (1.3.6.1.4.1.5951.4.1.1.46.1)
  Server connections, including connections in the Opening, Established, and Closing state.

- **tcpCurClientConn** (1.3.6.1.4.1.5951.4.1.1.46.2)
Client connections, including connections in the Opening, Established, and Closing state.

**Note:** Because of SYN-Cookie, this doesn’t include Client in Opening state

- tcpTotZombieCltConnFlushed (1.3.6.1.4.1.5951.4.1.1.46.26)
  Client connections that are flushed because the client has been idle for some time.

- tcpTotZombieSvrConnFlushed (1.3.6.1.4.1.5951.4.1.1.46.27)
  Server connections that are flushed because there have been no client requests in the queue for some time.

**Errors**

- tcpErrSynGiveUp (1.3.6.1.4.1.5951.4.1.1.46.37)
  Attempts to establish a connection on the NetScaler that timed out.

- tcpErrRetransmitGiveUp (1.3.6.1.4.1.5951.4.1.1.46.60)
  Number of times NetScaler terminates a connection after retransmitting the packet seven times on that connection. Retransmission happens when receiving end doesn’t acknowledges the packet.

- ifInDiscards (1.3.6.1.2.1.2.2.1.13)
  The number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol. One possible reason for discarding such a packet could be to free up buffer space.

- ifOutDiscards (1.3.6.1.2.1.2.2.1.19)
  The number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being transmitted. One possible reason for discarding such a packet could be to free up buffer space.

- ifErrTxOverflow (1.3.6.1.4.1.5951.4.1.54.1.36)
  Number of packets that have passed through the overflow queues, during transmission on the specified interface, since the NetScaler appliance was started or the interface statistics were cleared. This gets incremented only on congested ports.

**Optimized/Bypass connections**

- tcpOptimizationEnabled (1.3.6.1.4.1.5951.4.1.1.46.131)
  Total number of connections enabled with TCP optimization.

- tcpOptimizationBypassed (1.3.6.1.4.1.5951.4.1.1.46.132)
  Total number of connections bypassed TCP Optimization.
Technical Recipes

September 17, 2018

The NetScaler T1 models provide advanced features and a powerful policy configuration language that allow for evaluation of complex decision in runtime.

While it is not possible to evaluate all capabilities that are potentially unlocked by the T1000 features and policy configuration guide, technical receipes consider implementation of various requirements brought in by Telco operators. Feel free to re-use the “recipes” as is or adapt to your environment.

Per-user Connection Limit

The NetScaler T1 model can be configured to limit the number of connections per unique subscriber IP. With the below configuration, N concurrent TCP connections per IP (CLIENT.IP.SRC) is allowed. For every attempt for connection beyond the configured threshold, T1 sends an RST. For maximum 2 concurrent connections per user:

Command:

1. add stream selector streamSel_usrlimit CLIENT.IP.SRC
2. add ns limitIdentifier limitId_usrlimit -threshold 2 -mode CONNECTION -selectorName streamSel_usrlimit
3. add responder policy respPol_usrlimit "SYS.CHECK_LIMIT("limitId_usrlimit")")" RESET
4. bind lb vserver vsrv-wireless -policyName respPol_usrlimit -priority 1 -gotoPriorityExpression END

Smooth Insertion/Deletion of Vserver

Many operators concern about TCP connections disruption when the NetScaler T1 model is activated inline for TCP optimization or when it is disabled for maintenance purposes. To avoid breaking existing connections when vserver is introduced, the following configuration needs to be applied before configuring or activating vserver for TCP optimization:

Command:

1. add ns acl acl-ingress ALLOW -vlan 100
2. add forwardingSession fwd-ingress -aclname acl-ingress
3. apply ns acls

Forwarding sessions are effective on top of routing (either static or dynamic or PBR) and create session entries for traffic that is routed (L3 mode). Any existing connection is handled by forwarding session
NetScaler 12.0

due to corresponding sessions, and upon vserver introduction it starts capturing only new TCP connections.

ACLs can be configured to capture only specific ports like vserver, in order to avoid creating sessions for unnecessary traffic, which is memory consuming. Another option is to remove specific configuration after vserver activation.

For maintenance purposes, vserver should be disabled and its state appears as OUT OF SERVICE. When this happens, the vserver terminates all connections immediately by default. To make vserver to still serve the existing connections and not accept new, the following configuration should be applied:

**Command:**

```
set lb vserver vsrv-wireless -downStateFlush DISABLED
```

New connections go through the routing table, and corresponding session entries are created due to forwarding sessions.

**Policy-Based TCP Profiling**

Policy-based TCP Profile selection allows operators to configure TCP profile dynamically for clients coming from different traffic domains (i.e. 3G or 4G). Some of the QoS metrics are different for these traffic domains, and in order to achieve better performance, you need to change some of the TCP parameter dynamically. Consider a case where clients coming from 3G and 4G hit same vserver and use same TCP profile, which have negative impact on some client’s performance. AppQoE functionality can classify these clients and dynamically change TCP profile on vserver.

**Example:**

```
1 enable feature AppQoE
2 add ns tcpProfile nstcpprofile1 -WS ENABLED -SACK ENABLED -WSVal 8 -mss 1460 -maxBurst 30 -initialCwnd 16 -oooQSize 15000 -minRTO 800 -slowStartIncr 1 -bufferSize 4000000 -flavor BIC -KA ENABLED -sendBuffsize 4000000 -rstWindowAttenuate ENABLED -spoofSynDrop ENABLED -frto ENABLED -maxcwnd 1000000 -fack ENABLED -tcpmode ENDPOINT
3
4 add ns tcpProfile nstcpprofile2 -WS ENABLED -SACK ENABLED -WSVal 8 -mss 1460 -maxBurst 15 -initialCwnd 16 -oooQSize 15000 -minRTO 800 -slowStartIncr 1 -bufferSize 128000 -flavor BIC -KA ENABLED -sendBuffsize 6000000 -rstWindowAttenuate ENABLED -spoofSynDrop ENABLED -frto ENABLED -maxcwnd 64000 -fack ENABLED -tcpmode ENDPOINT
```
The NetScaler T1 model is capable to receive the subscriber information dynamically through Gx or Radius or Radius and Gx interface and apply different TCP profile on a per-subscriber basis.

**Command:**

```bash
add appqoe action action_1 -priority HIGH -tcpprofile nstcpprofile1
add appqoe action action_2 -priority HIGH -tcpprofile nstcpprofile2
add appqoe policy appqoe_4G -rule "CLIENT.VLAN.ID.EQ(100)" -action action_1
add appqoe policy appqoe_3G -rule "CLIENT.VLAN.ID.EQ(200)" -action action_2
bind lb vserver vsrv-wireless -policyName appqoe_4G -priority 100
bind lb vserver vsrv-wireless -policyName appqoe_3G -priority 110
```

For integration of the NetScaler T1 model with operator control-plane network, see Telco Subscriber Management.

**Scalability**

January 6, 2019

Because TCP optimization is resource intensive, a single NetScaler appliance, even a high end appliance, might not be able to sustain high Gi-LAN throughputs. To expand the capacity of your network, you can deploy NetScaler appliances in an N+1 cluster formation. In a cluster deployment, the NetScaler appliances work together as a single system image. The client traffic is distributed across the cluster nodes with the help of external switch device.
NetScaler 12.0

**Topology**

Figure 1 is an example of a cluster consisting of four T1300-40G nodes.

The setup shown in Figure 1 has the following properties:

1. All cluster nodes belong to the same network (also known as an L2 cluster).
2. Data plane and backplane traffic are handled by different switches.
3. Assuming Gi-LAN throughput is 200 Gbps and that a T1300-40G appliance can sustain 80Gbps of throughput, we need three T1300-40G appliances. To provide redundancy in case of single cluster node failure, we deploy four appliances in total.
4. Each node will receive up to 67Gbps of traffic (50Gbps in normal operating conditions and 67Gbps in case of single cluster node failure), so it needs 2x40Gbps connections to the up-stream switch. To provide redundancy in case of switch failure, we deploy a couple of upstream switches and double the number of connections.
5. Cluster Link Aggregation (CLAG) is used to distribute traffic across cluster nodes. A single CLAG handles both client and server traffic. Link Redundancy is enabled on the CLAG, so only one “subchannel” is selected at any given time and handles the traffic. If some link fails or throughput falls below specified threshold, the other subchannel is selected.
6. The upstream switch performs symmetric port-channel load balancing (for example, source-dest-ip-only algorithm of Cisco IOS 7.0(8) N1(1)) so that forward and reverse traffic flows are handled by the same cluster node. This property is desirable because it eliminates packet re-ordering, which would degrade TCP performance.
7. Fifty percent of data traffic is expected to be steered to backplane, which means each node will steer up to 34Gbps to other cluster nodes (25Gbps in normal operating conditions and 34Gbps in case of single cluster node failure). Thus, each node needs at least 4x10G connections to the backplane switch. To provide redundancy in case of switch failure, we deploy a couple of backplane switches and double the number of connections. Link redundancy is not currently supported for backplane, so Cisco VPC or equivalent technology is desired to achieve switch-level redundancy.
8. MTU size of steered packets is 1578 bytes, so backplane switches must support an MTU more than 1500 bytes.

**Note:** The design depicted in Figure 1 is also applicable to T1120 and T1310 appliances. For T1310 we would use 40GbE interfaces for the backplane connections, since it lacks 10GbE ports.

**Note:** While this document uses Cisco VPC as an example, if working with non-Cisco switches alternate equivalent solutions could be used, such as Juniper’s MLAG.

**Note:** While other topologies such as ECMP instead of CLAG are possible, they are not currently supported for this particular use case.
Configuring TCP Optimization in a NetScaler T1000 Cluster

After physical installation, physical connectivity, software installation, and licensing are completed, you can proceed with the actual cluster configuration. The configurations described below apply to the cluster depicted in Figure 1.

Note: For more information about cluster configuration, see “Setting up a NetScaler cluster.”

Assume that the four T1300 nodes in Figure 1 have the following NSIP addresses:

Four T1300 nodes with NSIP address:

<table>
<thead>
<tr>
<th>Node</th>
<th>NSIP Address</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>10.102.29.60</td>
</tr>
<tr>
<td>2</td>
<td>10.102.29.70</td>
</tr>
<tr>
<td>3</td>
<td>10.102.29.80</td>
</tr>
<tr>
<td>4</td>
<td>10.102.29.90</td>
</tr>
</tbody>
</table>

The cluster will be managed through the cluster IP (CLIP) address, which is assumed to be 10.78.16.61.

Setting Up the Cluster

To begin configuring the cluster shown in Figure 1, log on to the first appliance that you want to add to the cluster (for example, T1300-40-1) and do the following.

1. At the command prompt, enter the following commands:

   Command:

   1 > add cluster instance 1
   2 > add cluster node 0 10.102.29.60 -state ACTIVE
   3 > add ns ip 10.102.29.61 255.255.255.255 -type clip
   4 > enable cluster instance 1
   5 > save ns config
   6 > reboot - warm

2. After the appliance restarts, connect to the Cluster IP (CLIP) address and add the rest of the nodes to the cluster:

   Command:

   1 > add cluster node 1 10.102.29.70 -state ACTIVE
   2 > add cluster node 2 10.102.29.80 -state ACTIVE
   3 > add cluster node 3 10.102.29.90 - state ACTIVE
   4 > save ns config

3. Connect to the NSIP address of each of the newly added nodes and join the cluster:

   Command:
4. After the nodes restart, proceed with backplane configuration. On the cluster IP address, enter the following commands to create an LACP channel for the backplane link of each cluster node:

**Command:**

```plaintext
1 > set interface 0/10/[1-8] -lacpkey 1 -lacpmode ACTIVE
2 > set interface 1/10/[1-8] -lacpkey 2 -lacpmode ACTIVE
3 > set interface 2/10/[1-8] -lacpkey 3 -lacpmode ACTIVE
4 > set interface 3/10/[1-8] -lacpkey 4 -lacpmode ACTIVE
```

5. Similarly, configure dynamic LA and VPC on the backplane switches. Make sure the MTU of the backplane switch interfaces is at least 1578 bytes.

6. Verify the channels are operational:

**Command:**

```plaintext
1 > show channel 0/LA/1
2 > show channel 1/LA/2
3 > show channel 2/LA/3
4 > show channel 3/LA/4
```

7. Configure the cluster node backplane interfaces.

**Command:**

```plaintext
1 > set cluster node 0 -backplane 0/LA/1
2 > set cluster node 1 -backplane 1/LA/2
3 > set cluster node 2 -backplane 2/LA/3
4 > set cluster node 3 -backplane 3/LA/4
```

8. Check the cluster status and verify that the cluster is operational:

```plaintext
1 > show cluster instance
2 > show cluster node
```

For more information on cluster setup, see “Setting up a NetScaler cluster”

**Distributing Traffic Across Cluster Nodes**

After you have formed the NetScaler cluster, deploy Cluster Link Aggregation (CLAG) to distribute traffic across cluster nodes. A single CLAG link will handle both client and server traffic.
On the cluster IP address, execute the following commands to create the Cluster Link Aggregation (CLAG) group shown in Figure 1:

**Command:**

```
1 > set interface 0/40/[1-4] -lacpMode active -lacpKey 5 -lagType Cluster
2 > set interface 1/40/[1-4] -lacpMode active -lacpKey 5 -lagType Cluster
3 > set interface 2/40/[1-4] -lacpMode active -lacpKey 5 -lagType Cluster
4 > set interface 3/40/[1-4] -lacpMode active -lacpKey 5 -lagType Cluster
```

Configure dynamic link aggregation on the external switches.

Then, enable Link Redundancy as follows:

**Code:**

```
1 > set channel CLA/1 -linkRedundancy ON -lrMinThroughput 240000
```

Finally, check the channel status by entering:

**Command:**

```
1 > show channel CLA/1
```

The channel should be UP and the actual throughput should be 320000.

For more information about cluster link aggregation, see the following topics:

- Dynamic Cluster Link Aggregation
- Link Redundancy in a Cluster with LACP.

Because we will be using MAC-based forwarding (MBF), configure a linkset and bind it to the CLAG group as follows:

**Command:**

```
1 > add linkset LS/1
2 > bind linkset LS/1 -ifnum CLA/1
```

More information about linksets, see the following topics:

- Configuring Linksets
- Using Cluster LA Channel with Linksets

### Configuring VLAN and IP Addresses

We will be using striped IP configuration, which means that IP addresses are active on all nodes (default setting). See “Striped, Partially Striped, and Spotted Configurations” for more information about this topic.
1. Add the ingress and egress SNIPs:

**Command:**

```plaintext
1 > add ns ip 172.16.30.254 255.255.255.0 - type SNIP
2 > add ns ip 172.16.31.254 255.255.255.0 - type SNIP
3 > add ns ip6 fd00:172:16:30::254/112 - type SNIP
4 > add ns ip6 fd00:172:16:31::254/112 - type SNIP
```

2. Add the corresponding ingress and egress VLANs:

**Command:**

```plaintext
1 > add vlan 30 -aliasName wireless
2 > add vlan 31 -aliasName internet
```

3. Bind VLANs with IPs and linkset:

**Command:**

```plaintext
1 > bind vlan 31 -ifnum LS/1 -tagged
2 > bind vlan 30 -ifnum LS/1 -tagged
3 > bind vlan 30 -IPAddress 172.16.30.254 255.255.255.0
4 > bind vlan 31 -IPAddress 172.16.31.254 255.255.255.0
5 > bind vlan 30 -IPAddress fd00:172:16:30::254/112
6 > bind vlan 31 -IPAddress fd00:172:16:31::254/112
```

More ingress and egress VLANs can be added if needed.

**Configuring TCP Optimization**

At this point, we have applied all cluster specific commands. To complete the configuration, follow the steps described in “[TCP optimization configuration]/en-us/netscaler/12/netscaler-support-for-telecom-service-providers/NS_TCP_optimization/NS_TCP_opt_config.html”.

**Configuring Dynamic Routing**

A NetScaler cluster can be integrated into the dynamic routing environment of the customer’s network. Following is an example of dynamic routing configuration using BGP routing protocol (OSPF is also supported).

1. From the CLIP address, enable BGP and dynamic routing on ingress and egress IP addresses:

**Command:**
2. Open vtysh and configure BGP for the egress side:

**Code:**

```bash
1 > shell
2 root@ns# vtysh
3 ns# configure terminal
4 ns(config)# router bgp 65531
5 ns(config-router)# network 10.0.0.0/24
6 ns(config-router)# neighbor 172.16.31.100 remote-as 65530
7 ns(config-router)# neighbor 172.16.31.100 update-source 172.16.31.254
8 ns(config-router)# exit
9 ns(config)# ns route-install propagate
10 ns(config)# ns route-install default
11 ns(config)# ns route-install bgp
12 ns(config)# exit
```

3. Configure the egress-side BGP peer to advertise the default route to the NetScaler cluster. For example:

**Command:**

```bash
router bgp 65530
bgp router-id 172.16.31.100
network 0.0.0.0/0
neighbor 172.16.31.254 remote-as 65531
```

4. Follow similar steps to configure the ingress side.

5. From vtysh verify that configuration is propagated to all cluster nodes, by entering:

**Command:**

```bash
ns# show running-config
```

6. Finally, log on to NSIP address of each cluster node and verify routes advertised from BGP peer:

**Command:**

```bash
> show route | grep BGP
```
Optimizing TCP Performance using TCP Nile

September 17, 2018

TCP uses the following optimization techniques and congestion control strategies (or algorithms) to avoid network congestion in data transmission.

**Congestion Control Strategies**

The Transmission Control Protocol (TCP) has long been used to establish and manage Internet connections, handle transmission errors, and smoothly connect web applications with client devices. But network traffic has become more difficult to control, because packet loss does not depend only on the congestion in the network, and congestion does not necessarily cause packet loss. Therefore, to measure congestion, a TCP algorithm should focus on both packet loss and bandwidth.

**NILE Algorithm**

Citrix Systems has developed a new congestion-control algorithm, NILE, a TCP optimization algorithm designed for high-speed networks such as LTE, LTE advanced and 3G. Nile addresses unique challenges caused by fading, random or congestive losses, link layer retransmissions and carrier aggregation.

The NILE algorithm:

- Bases queue-latency estimates on round-trip time measurements.
- Uses a congestion-window-increase function that is inversely proportional to the measured queue latency. This method results in approaching the network congestion point more slowly than does the standard TCP method, and reduces the packet losses during congestion.
- Can distinguish between random loss and congestion based loss on the network by using the estimated queue latency.

The telecom service providers can use the NILE algorithm in their TCP infrastructure to:

- Optimize mobile and long-distance networks— The NILE algorithm achieves higher throughput compared to standard TCP. This feature is especially important for mobile and long-distance networks.
- Decrease application perceived latency and enhance subscriber experience— The Nile algorithm uses packet loss information to determine whether the transmission-window size should be increased or decreased, and uses queuing delay information to determine the size of the increment or decrement. This dynamic setting of transmission-window size decreases the application latency on the network.
To configure NILE support using the command line interface

At the command prompt, type the following:

```bash
set ns tcpProfile <name> [-flavor NILE]
```

Configuring NILE support using the configuration utility

1. Navigate to System> Profiles> TCP Profiles and click TCP profiles.
2. From the TCP Flavor drop-down list, select NILE.

Example:

```bash
set ns tcpProfile tcpprofile1 -flavor NILE
```

**Proportional Rate Recovery (PRR) Algorithm**

TCP Fast Recovery mechanisms reduce web latency caused by packet losses. The new Proportional Rate Recovery (PRR) algorithm is a fast recovery algorithm that evaluates TCP data during a loss recovery. It is patterned after Rate-Halving, by using the fraction that is appropriate for the target window chosen by the congestion control algorithm. It minimizes window adjustment, and the actual window size at the end of recovery is close to the Slow-Start threshold (ssthresh).

**TCP Fast Open (TFO)**

TCP Fast Open (TFO) is a TCP mechanism that enables speedy and safe data exchange between a client and a server during TCP's initial handshake. This feature is available as a TCP option in the TCP profile bound to a virtual server of a NetScaler appliance. TFO uses a TCP Fast Open Cookie (a security cookie) that the NetScaler appliance generates to validate and authenticate the client initiating a TFO connection to the virtual server. By using the TFO mechanism, you can reduce an application's network latency by the time required for one full round trip, which significantly reduces the delay experienced in short TCP transfers.

**How TFO works**

When a client tries to establish a TFO connection, it includes a TCP Fast Open Cookie with the initial SYN segment to authenticate itself. If authentication is successful, the virtual server on the NetScaler appliance can include data in the SYN-ACK segment even though it has not received the final ACK.
segment of the three-way handshake. This saves up to one full round-trip compared to a normal TCP connection, which requires a three-way handshake before any data can be exchanged.

A client and a backend server perform the following steps to establish a TFO connection and exchange data securely during the initial TCP handshake.

1. If the client does not have a TCP Fast Open Cookie to authenticate itself, it sends a Fast Open Cookie request in the SYN packet to the virtual server on the NetScaler appliance.
2. If the TFO option is enabled in the TCP profile bound to the virtual server, the appliance generates a cookie (by encrypting the client’s IP address under a secret key) and responds to the client with a SYN-ACK that includes the generated Fast Open Cookie in a TCP option field.
3. The client caches the cookie for future TFO connections to the same virtual server on the appliance.
4. When the client tries to establish a TFO connection to the same virtual server, it sends SYN that includes the cached Fast Open Cookie (as a TCP option) along with HTTP data.
5. The NetScaler appliance validates the cookie, and if the authentication is successful, the server accepts the data in the SYN packet and acknowledges the event with a SYN-ACK, TFO Cookie, and HTTP Response.

Note: If the client authentication fails, the server drops the data and acknowledges the event only with a SYN indicating a session timeout.

1. On the server side, if the TFO option is enabled in a TCP profile bound to a service, the NetScaler appliance determines whether the TCP Fast Open Cookie is present in the service to which it is trying to connect.
2. If the TCP Fast Open Cookie is not present, the appliance sends a cookie request in the SYN packet.
3. When the backend server sends the Cookie, the appliance stores the cookie in the server information cache.
4. If the appliance already has a cookie for the given destination IP pair, it replaces the old cookie with the new one.
5. If the cookie is available in the server information cache when the virtual server tries to reconnect to the same backend server by using the same SNIP address, the appliance combines the data in SYN packet with the cookie and sends it to the backend server.
6. The backend server acknowledges the event with both data and a SYN.

Note: If the server acknowledges the event with only a SYN segment, the NetScaler appliance immediately resends the data packet after removing the SYN segment and the TCP options from the original packet.
Configuring TCP Fast Open

To use the TCP Fast Open (TFO) feature, enable the TCP Fast Open option in the relevant TCP profile and set the TFO Cookie Timeout parameter to a value that suits the security requirement for that profile.

To enable or disable TFO by using the command line

At the command prompt, type one of the following commands to enable or disable TFO in a new or existing profile.

**Note:** The default value is DISABLED.

```
1 add tcpprofile <TCP Profile Name> - tcpFastOpen ENABLED | DISABLED
2 set tcpprofile <TCP Profile Name> - tcpFastOpen ENABLED | DISABLED
3 unset tcpprofile <TCP Profile Name> - tcpFastOpen
```

**Examples:**

add tcpprofile Profile1 – tcpFastOpen
Set tcpprofile Profile1 – tcpFastOpen Enabled
unset tcpprofile Profile1 – tcpFastOpen

To set TCP Fast Open cookie timeout value by using the command line interface

At the command prompt, type:

```
1 set tcpparam - tcpfastOpenCookieTimeout <Timeout Value>
```

**Example:**

```
1 set tcpprofile - tcpfastOpenCookieTimeout 30secs
```

To configure the TCP Fast Open by using the GUI

1. Navigate to Configuration > System > Profiles > and then click Edit to modify a TCP profile.
2. On the Configure TCP Profile page, select the TCP Fast Open checkbox.
3. Click OK and then Done.

To Configure the TCP Fast Cookie timeout value by using the GUI

Navigate to Configuration > System > Settings > Change TCP Parameters and then Configure TCP Parameters page to set the TCP Fast Open Cookie timeout value.
TCP Hystart

A new TCP profile parameter, hystart, enables the Hystart algorithm, which is a slow-start algorithm that dynamically determines a safe point at which to terminate (ssthresh). It enables a transition to congestion avoidance without heavy packet losses. This new parameter is disabled by default.

If congestion is detected, Hystart enters a congestion avoidance phase. Enabling it gives you better throughput in high-speed networks with high packet loss. This algorithm helps maintain close to maximum bandwidth while processing transactions. It can therefore improve throughput.

Configuring TCP Hystart

To use the Hystart feature, enable the Cubic Hystart option in the relevant TCP profile.

To configure Hystart by using the command line interface (CLI)

At the command prompt, type one of the following commands to enable or disable Hystart in a new or existing TCP profile.

```
1  add tcpprofile <profileName> -hystart ENABLED
2  set tcpprofile <profileName> -hystart ENABLED
3  unset tcprofile <profileName> -hystart
```

Examples:

```
1  add tcpprofile Profile1 -tcpFastOpen
2  Set tcpprofile Profile1 -tcpFastOpen Enabled
3  unset tcprofile Profile1 - tcpFastOpen
```

To configure Hystart support by using the GUI

1. Navigate to Configuration > System > Profiles > and click Edit to modify a TCP profile.
2. On the Configure TCP Profile page, select the Cubic Hystart check box.
3. Click OK and then Done.

Optimization Techniques

TCP uses the following optimization techniques and methods for optimized flow controls.
Policy based TCP Profile Selection

Network traffic today is more diverse and bandwidth-intensive than ever before. With the increased traffic, the effect that Quality of Service (QoS) has on TCP performance is significant. To enhance QoS, you can now configure AppQoE policies with different TCP profiles for different classes of network traffic. The AppQoE policy classifies a virtual server’s traffic to associate a TCP profile optimized for a particular type of traffic, such as 3G, 4G, LAN, or WAN.

To use this feature, create a policy action for each TCP profile, associate an action with AppQoE policies, and bind the policies to the load balancing virtual servers.

Configuring Policy Based TCP Profile Selection

Configuring policy based TCP profile selection consists of the following tasks:

- Enabling AppQoE. Before configuring the TCP profile feature, you must enable the AppQoE feature.
- Adding AppQoE Action. After enabling the AppQoE feature, configure an AppQoE action with a TCP profile.
- Configuring AppQoE based TCP Profile Selection. To implement TCP profile selection for different classes of traffic, you must configure AppQoE policies with which your NetScaler appliance can distinguish the connections and bind the correct AppQoE action to each policy.
- Binding AppQoE Policy to Virtual Server. Once you have configured the AppQoE policies, you must bind them to one or more load balancing, content switching, or cache redirection virtual servers.

Configuring using the command line interface

To enable AppQoE by using the command line interface:

At the command prompt, type the following commands to enable the feature and verify that it is enabled:

1. `enable ns feature appqoe`
2. `show ns feature`

To bind a TCP profile while creating an AppQoE action using the command line interface

At the command prompt, type the following AppQoE action command with `tcpprofiletobind` option.

**Binding a TCP Profile:**
To configure an AppQoE policy by using the command line interface

At the command prompt, type:

```
1 add appqoe policy <name> -rule <expression> -action <string>
```

To bind an AppQoE policy to load balancing, cache redirection or content switching virtual servers by using the command line interface

At the command prompt, type:

```
1 bind cs vserver cs1 -policyName <appqoe_policy_name> -priority <priority>
2 bind lb vserver <name> - policyName <appqoe_policy_name> -priority <priority>
3 bind cr vserver <name> -policyName <appqoe_policy_name> -priority <priority>
```

Example:

```
1 add ns tcpProfile tcp1 -WS ENABLED -SACK ENABLED -WSVal 8 -nagle ENABLED -maxBurst 30 -initialCwnd 16 -oooQSize 15000 -minRTO 500 -slowStartIncr 1 -bufferSize 4194304 -flavor BIC -KA ENABLED -sendBuffsize 4194304 -rstWindowAttenuate ENABLED -spoofSynDrop ENABLED -dsack enabled -frto ENABLED -maxcwnd 4000000 -fack ENABLED -tcpmode ENDPOINT
2 add appqoe action appact1 -priority HIGH -tcpProfile tcp1
3 add appqoe policy apppol1 -rule "client.ip.src.eq(10.102.71.31)" -action appact1
```
Configuring Policy based TCP Profiling using the GUI

To enable AppQoE by using the GUI

1. Navigate to System > Settings.
2. In the details pane, click Configure Advanced Features.
3. In the Configure Advanced Features dialog box, select the AppQoE check box.
4. Click OK.

To configure AppQoE policy by using the GUI

1. Navigate to App-Expert > AppQoE > Actions.
2. In the details pane, do one of the following:
3. To create a new action, click Add.
4. To modify an existing action, select the action, and then click Edit.
5. In the Create AppQoE Action or the Configure AppQoE Action screen, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in “Parameters for configuring the AppQoE Action” as follows (asterisk indicates a required parameter):
   a) Name—name
   b) Action type—respondWith
   c) Priority—priority
   d) Policy Queue Depth—polqDepth
   e) Queue Depth—priqDepth
   f) DOS Action—dosAction
6. Click Create.

To bind AppQoE policy by using the GUI

1. Navigate to Traffic Management > Load Balancing > Virtual Servers, select a server and then click Edit.
2. In the Policies section and click (+) to bind an AppQoE policy.
3. In the Policies slider, do the following:
a) Select a policy type as AppQoE from the drop-down list.
b) Select a traffic type from the drop-down list.

4. In the **Policy Binding** section, do the following:
   a) Click **New** to create a new AppQoE policy.
   b) Click **Existing Policy** to select an AppQoE policy from the drop-down list.

5. Set the binding priority and click **Bind** to the policy to the virtual server.
6. Click **Done**.

**SACK Block Generation**

TCP performance slows down when multiple packets are lost in one window of data. In such a scenario, a Selective Acknowledgement (SACK) mechanism combined with a selective repeat retransmission policy overcomes this limitation. For every incoming out-of-order packet, you must generate a SACK block.

If the out-of-order packet fits in the reassembly queue block, insert packet info in the block, and set the complete block info as SACK-0. If an out-of-order packet does not fit into reassembly block, send the packet as SACK-0 and repeat the earlier SACK blocks. If an out-of-order packet is a duplicate and packet info is set as SACK-0 then D-SACK the block.

**Note:** A packet is considered as D-SACK if it is an acknowledged packet, or an out of order packet which is already received.

**Client Reneging**

A NetScaler appliance can handle client reneging during SACK based recovery.

**Memory checks for marking end_point on PCB is not considering total available memory**

In a NetScaler appliance, if the memory usage threshold is set to 75 percent instead of using the total available memory, it causes new TCP connections to bypass TCP optimization.

**Unnecessary retransmissions due to missing SACK blocks**

In a non-endpoint mode, when you send DUPACKS, if SACK blocks are missing for few out of order packets, triggers additional retransmissions from the server.
**SNMP for number of connections bypassed optimization because of overload**

The following SNMP ids have been added to a NetScaler appliance to track number of connections bypassed TCP optimization due to overload.

1. 1.3.6.1.4.1.5951.4.1.1.46.13 (tcpOptimizationEnabled). To track the total number of connections enabled with TCP optimization.
2. 1.3.6.1.4.1.5951.4.1.1.46.132 (tcpOptimizationBypassed). To track the total number of connections bypassed TCP Optimization.

**Dynamic Receive Buffer**

To maximize TCP performance, a NetScaler appliance can now dynamically adjust the TCP receive buffer size.

**CQA and Adaptive TCP Optimization**

October 26, 2018

**Note**

If you are interested in using CQA Reporting and Adaptive TCP, please contact Citrix sales team.

Mobile networks have unique characteristics that might affect TCP performance. By leveraging NetScaler Connection Quality Analytics (CQA) and Adaptive TCP optimization techniques, mobile operators can analyze the overall network behavior to provide an improved user experience and increased levels of subscriber satisfaction.

**Connection Quality Analytics (CQA)**

When a client sends a TCP request, CQA monitors and extracts a large amount of detailed TCP layer data during an active connection. With the extracted data, CQA uses a heuristic learning algorithm to derive important characteristics of the connection, for example, network type (2G, 3G or 4G), congestion level (None, Low, Medium, or High), and signal quality (Excellent, Good, Fair or Poor) on a per-subscriber basis. NetScaler then stores the information in a subscriber store (so that it can be available for the next TCP connections from the same subscriber) and exports the data to the AppFlow collectors. The stored information is as raw values in a composite format that defines the network type, congestion level, and signal quality of the subscriber connection. The detected characteristics can be used for other applications, for example, to intelligently apply different TCP profiles for different network characteristics. For more information, see topic Adaptive TCP.
**Benefit**

Enable mobile operators to:

1. Understand congestion level of a subscriber network.
2. Analyzing overall network behavior of a subscriber.

**Prerequisites**

The CQA feature works on Telco platforms with the purchase of a basic CBM license and CBM Premium license and for other NetScaler platforms, the feature works with the purchase of a CNS Platinum license. Before you configure the TCP optimization feature, your appliance must have a suitable license installed.

License support for Telco platforms:

- `CBM_TXXX_SERVER_Retail.lic`
- `CBM_TPRE_SERVER_Retail.lic`
- `CNS_WEBF_SSERVER_Retail.lic`

Where XXX is the throughput, for example, NetScaler T1000.

License support for other NetScaler platforms:

- `CNS_XXX_SERVER_PLT_Retail.lic`

Where XXX is the throughput.

```
> show license

License status:

...  

Adaptive TCP: YES

Connection Quality Analytics: YES
```
Configuring Connection Quality Analytics (CQA)

To optimize a TCP traffic using CQA technique, begin by enabling CQA and Appflow features on the appliance. When the appliance receives a client TCP connection request, it monitors the incoming traffic and uses the CQA configuration to derive CQA parameters from the raw TCP metrics.

Configure CQA by using the CLI

To configure CQA on a NetScaler appliance, you can perform the following tasks:

1. Enable CQA
2. Enable AppFlow Collector
3. Configure CQA Parameters
4. Verify CQA feature
5. Using CQA-based PI expressions

Enabling CQA

If you want the NetScaler appliance to extract TCP raw metric and derive CQA parameters, you must enable the CQA feature and set adaptive TCP to ON. You must also enable the Appflow feature so that the appliance can send the derived CQA data for network analysis.

To enable CQA:

At the command prompt, type the following command:

```
enable ns feature cqa
```

To enable Appflow collector:

You must have at least one Appflow collector to be running in your appliance. At the command prompt, type the following command:

```
enable ns feature appflow
```

Configuring CQA Parameters

For CQA to derive parameters such as network type, signal quality, and congestion level, you must configure CQA settings on the appliance.

To configure CQA:

At the command prompt, type the following command:

Example:

set ns cqaparam -net1label 2g -net1csqsacle "25,50,75" -net1cclscale "25,50,75"
set ns cqaparam -net1label 3g -net1csqsacle "25,50,75" -net1cclscale "25,50,75"
set ns cqaparam -net1label 4g -net1csqsacle "25,50,75" -net1cclscale "25,50,75"

Where,

net1label is the name of the network label 1. Maximum Length: 15
net1csqsacle is the signal quality score limit, such as Excellent, Good, or Fair. Maximum Length: 63
net1cclscale is the congestion level limit such as None, Low, or Medium. Maximum Length: 63

Note

For proper configuration of CQA parameters, please contact Citrix Customer Support.

Verifying CQA

To verify if the CQA parameters are derived during an active TCP action, execute the following command. Note: You can execute the command only if the TCP connection is open and active.

T1300-10-2> show connectiontable connection.ip.eq(XXX) -detail full+
srcIP : 192.168.134.3 dstIP : 192.168.216.72

Using CQA-based PI Expressions

The NetScaler policy infrastructure is enhanced to use the derived CQA parameters (stored in subscriber store) for string matching operations.

- **NETWORK_TYPE**: String value that matches the detected network type configured through the cqaparam command interface.
- **SIGNAL_QUALITY**: Integer value ranging from 0 to 100 and matching the CQA signal quality parameter stored in the subscriber store (lower values indicate better signal quality).
- **CONGESTION_LEVEL**: Integer value ranging from 0 to 100 and matching CQA raw value of congestion level parameter stored in the subscriber store (lower values indicate lower congestion).

Below are sample PI expressions with CQA parameters such as network type, congestion level, and signal quality, evaluates an incoming traffic of network type 2G, exhibiting good or excellent signal quality with a high congestion level:

```plaintext
1  ANALYTICS.CONNECTION_QUALITY.NETWORK_TYPE.EQ("2G") && ANALYTICS.CONNECTION_QUALITY.SIGNAL_QUALITY.GT(60) && ANALYTICS.CONNECTION_QUALITY.CONGESTION_LEVEL.GT(80)
```

Configure CQA by using the GUI
To configure CQA, you must perform the following tasks:

1. Enable CQA feature
2. Configure CQA reporting parameters.

To enable CQA feature

1. Log on to NetScaler and navigate to Configuration > System > Settings.
2. In the details pane, click Configure Advanced features link under Settings.
3. In Configure Advanced Features page, select CQA and Appflow checkbox.

To configure CQA reporting parameter

1. Log on to NetScaler and navigate to Configuration > System > Appflow.
2. In the details pane, click Change Appflow Setting under Settings.
3. In the Configure Appflow Settings page, select CQA Reporting checkbox.
4. Click OK and Close.

Adaptive TCP Optimization

As subscribers in a telco network increase in an unprecedented rate, it is important to provide a quality user experience to each subscriber. To achieve this, NetScaler uses an advanced optimization technique called Adaptive TCP. The technique optimizes traffic by independently adapting different TCP profiles for each subscriber based on the information stored in a subscriber (UX) store. The UX store contains subscriber’s details (such as network type, signal quality, and congestion level) in a composite format. When a client sends a TCP request, the appliance queries the store for the subscriber information and applies a suitable TCP optimization based on subscriber’s network conditions. The appliance does this by enabling Adaptive TCP feature on a NetScaler TCP profile.

Benefit

Using Adaptive TCP optimization technique, a mobile operator can:

• Extract advanced and detailed insight of network conditions experienced by a mobile subscriber.
• Automatically adapt traffic management actions of NetScaler based on the current network conditions.
Prerequisites

The Adaptive TCP feature works only on telco traffic management platforms (such as NetScaler T1000 series and VPX-T platforms) with a Premium license. The VPX-T software and T1000 hardware appliances are designed to meet the needs of telco mobile operators and service providers. Before you configure the TCP optimization feature, your appliance must have the following license files installed:

1. Adaptive TCP
2. Connection Quality Metrics

For example, `CBM_T1_SERVER_Retail.lic` or `CBM_TPRE_SERVER_Retail.lic`

```
1 > show license
2
3   License status:
4
5     ...
6
7   Adaptive TCP: YES
8
9   Connection Quality Analytics: YES
```

Configuring Adaptive TCP

The configuration begins by enabling CQA, AppFlow, and Adaptive TCP features. Once you enable, you can configure a normal TCP profile with 'applyAdaptiveTcp' option enabled and scrutinizing TCP parameters such as TCP favor, TCP Max congestion window, Burst Rate Control (pacing), TCP Rate, and TCP Rate Maximum Queue. When the appliance receives a TCP request, it applies a TCP profile and Adaptive TCP logic is triggered. The logic queries the subscriber store for the subscriber's CQA information. Based on the derived metrics, the appliance independently adapts the TPC profile to optimize the subscriber traffic.

Configuring Adaptive TCP by using the CLI

To configure Adaptive TCP, you must perform the following tasks:

1. Enable CQA, AppFlow, and Adaptive TCP features
2. Add load balancing virtual server for TCP traffic
3. Add load balancing virtual server for HTTP traffic
4. Set TCP profile parameters
5. Apply TCP Profile either by:
   a) Associating the TCP profile to load balancing virtual server.
Using policy-based TCP optimization.

i. Adding an AppQoE action

ii. Adding an AppQoE policy

iii. Binding AppQoE policy to a TCP loading balancing virtual server

Enabling Adaptive TCP

If you want the appliance to optimize TCP traffic, you must enable CQA, AppFlow, and Adaptive TCP features.

To enable Adaptive TCP feature:

At the command prompt, type the following command

```
enable ns feature adaptiveTCP cqa appflow LB
```

Adding a Virtual Server for TCP Traffic

A NetScaler appliance uses a TCP load balancing virtual servers for optimizing an adaptive TCP traffic.

Note: Adaptive TCP optimization technique works for HTTP traffic also.

To add a load balancing virtual server for TCP traffic:

At the command prompt, type the following:

```
add lbvserver <name> TCP <ip> <port>
```

Example:

```
add lbvserver tcplb TCP 10.102.29.200 80
```

Adding a Virtual Server for HTTP Traffic

A NetScaler appliance uses a HTTP load balancing virtual servers for optimizing HTTP traffic.

To add a load balancing virtual server for HTTP traffic:

At the command prompt, type the following:

```
add lbvserver <name> HTTP <port> -persistenceType <persistenceType> -tcpProfileName <string>
```

Example:

```
add lb vserver httplb HTTP * 80 -persistenceType NONE -tcpProfileName nstcp_default_profile_with_adtcp
```
Configuring TCP Profile for Adaptive TCP optimization

You can configure a normal TCP profile to apply Adaptive TCP optimization. This can be done by either adding a new profile or modifying an existing one.

**Note**

Before you configure TCP profiles to apply Adaptive TCP optimization, please contact Citrix Customer Support.

**To configure a TCP profile:**

At the command prompt, type the following:

```
add ns tcpProfile <name> -tcpmode (TRANSPARENT | ENPOINT) -applyAdaptiveTcp (ENABLED | DISABLE)
```

**Example:**

```
add ns tcpProfile nstcp_profile_with_adtcp -tcpmode ENDPOINT -applyAdaptiveTcp ENABLED
```

**Applying TCP Profile**

You can apply a TCP profile for Adaptive TCP optimization by either of the two ways:

- Associating adaptive TCP profile to a load balancing virtual server.
- Configuring policy-based Adaptive TCP optimization.

**To apply adaptive TCP profile to a load balancing virtual server:**

At the command prompt, type the following:

```
set lb vserver <name> -tcpProfileName <string>
```

**Example:**

```
set lb vserver tcplb -tcpProfileName nstcp_profile_with_adtcp
set lb vserver httplb -tcpProfileName nstcp_profile_with_adtcp
```

**Configuring policy-based Adaptive TCP optimization**

To configuring AppQoE policy-based optimization, you must complete the following tasks:

1. Add AppQoE action
2. Add AppQoE policy
3. Bind AppQoE policy to load balancing virtual server for TCP and HTTP traffic

**To add an AppQoE action:**

At the command prompt, type the following:

```
add appqoe action <name> -priority <priority> -tcpprofile <string>
```

**Example:**

```
add appqoe action appqoeact-adtcp -priority HIGH -tcpprofile nstcp_profile_with_adtcp
```

**To add an AppQoE policy:**

At the command prompt, type the following:

```
add appqoe policy <name> -rule <expression> -action <string>
```

**Example:**

```
add appqoe policy appqoepol-adtcp -rule "CLIENT.VLAN.ID.EQ(401)" -action appqoeact-adtcp
```

**To bind an AppQoE policy to a load balancing virtual server of HTTP and TCP traffic:**

At the command prompt, type the following:

```
bind lb vserver <name> -policyName <string> -priority <positive_integer> -gotoPriorityExpression <expression> -type (REQUEST | RESPONSE)
```

**Example:**

```
bind lb vserver tcplb -policyName appqoepol-adtcp -priority 1 -gotoPriorityExpression END -type REQUEST
bind lb vserver httplb -policyName appqoepol-adtcp -priority 1 -gotoPriorityExpression END -type REQUEST
```

**Configuring Adaptive TCP by using the GUI**

The GUI enables you to:

- Enable CQA and Adaptive TCP features.
- Create load balancing virtual server for TCP traffic.
- Create load balancing virtual server for HTTP traffic.
• Configure TCP profile parameters for Adaptive TCP optimization.
• Apply adaptive TCP profile to load balancing virtual server.
• Create AppQoE action for policy-based Adaptive TCP optimization.
• Create AppQoE policy for policy-based Adaptive TCP optimization.
• Bind AppQoE policy to load balancing virtual server for policy-based Adaptive TCP optimization.

To enable Adaptive TCP feature
1. In the navigation pane, expand System, and then click Settings.
2. On the Settings page, click the Configure Advanced Features link.
3. On the Configure Advanced Features page, select the CQA and Adaptive TCP check box.
4. Click OK, and then click Close.

To create a load balancing virtual server for TCP traffic
2. In the details pane, click Add.
3. On the Load Balancing Virtual Server screen, set the following parameters:
   a) **Name**. Name of the load balancing virtual server.
   b) **Protocol**. Select protocol type as TCP.
   c) **IP Address Type**. IP address type: IPv4 or IPv6.
   d) **IP Address**. IPv4 or IPv6 address assigned to the virtual server.
   e) **Port**. Port number of the virtual server.
4. Click OK to continue with configuration of other, optional, parameters. For more information, see Creating a Virtual Server.
5. Click Create and Close.

To create a load balancing virtual server for HTTP traffic
2. In the details pane, click Add.
3. On the Load Balancing Virtual Server screen, set the following parameters:
   a) **Name**. Name of the load balancing virtual server.
   b) **Protocol**. Select protocol type as HTTP.
   c) **IP Address Type**. IP address type: IPv4 or IPv6.
   d) **IP Address**. IPv4 or IPv6 address assigned to the virtual server.
   e) **Port**. Port number of the virtual server.
4. Click OK to continue with configuration of other, optional, parameters. For more information, see Creating a Virtual Server.
5. Click Create and Close.

To set TCP profile for Adaptive TCP optimization

1. Log on to NetScaler appliance and navigate to the Configuration > System > Profiles page.
2. In the Details pane, click TCP Profiles tab.
3. In the Configure TCP Profiles page, select Apply Adaptive TCP checkbox.
4. Click OK and Close.

To apply adaptive TCP profile to load balancing virtual server for TCP traffic

1. Log on to NetScaler appliance and navigate to the Configuration > Traffic Management > Virtual Servers.
2. In the details page, select a virtual server profile for TCP traffic and click Edit.
3. In the Load Balancing Virtual Server page, go to Profiles section and click pencil icon.
4. Apply the adaptive TCP profile to the virtual server.
5. Click OK and Done.

To apply adaptive TCP profile to load balancing virtual server for HTTP traffic

1. Log on to NetScaler appliance and navigate to the Configuration > Traffic Management > Virtual Servers.
2. In the details page, select a virtual server profile for HTTP traffic and click Edit.
3. In the Load Balancing Virtual Server page, go to Profiles section and click pencil icon.
4. Apply the adaptive TCP profile to the HTTP virtual server.
5. Click OK and Done.

To add AppQoE action for policy-based Adaptive TCP optimization

1. Log on to NetScaler appliance and navigate to the Configuration > AppExpert > AppQoE > Actions.
2. In the details pane, click Add to create an action.
3. In the Create AppQoE Action screen, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in “Parameters for configuring the AppQoE Action” as follows (asterisk indicates a required parameter):
   a) Name—name
   b) Action type—PRIORITY_QUEUING
   c) TCP Profile—Apply a TCP profile by adding a new one or selecting an existing one.
   d) Priority—HIGH
   e) Policy Queue Depth—0
To add AppQoE policy for policy-based Adaptive TCP optimization

1. Log on to NetScaler appliance and navigate to the Configuration > AppExpert > AppQoE > Policy.
2. In the details pane, click Add to create a policy.
3. In the Create AppQoE Policy screen, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in “Parameters for configuring the AppQoE Policy” as follows (asterisk indicates a required parameter):
   a) Name—name
   b) Action—Associate an action to perform when the policy rule matches the TCP connection. You can associate by adding a new action or selecting an existing one.
   c) Expression—in the Rule text box, either enter the policy expression with CQA parameters or use the expression editor to create a rule.
4. Click OK and Close.

To bind AppQoE policy to load balancing virtual server for policy-based Adaptive TCP optimization

1. Log on to NetScaler appliance and navigate to the Configuration > Traffic Management > Load Balancing > Virtual Servers.
2. In the details pane, select a load balancing virtual server of type HTTP or TCP and click Edit.
3. In the Load Balancing Virtual Server page, go to Policies section and click the + icon.
4. In the Policies slider page, do the following:
   a) Choose policy. Policy name.
   b) Choose type. Policy type as request or response.
5. Click Continue to close the slider page and go to the main page.
6. Click Done.

Analytics and Reporting

The TCP Speed Reporting is a NetScaler feature which extracts a rich set of TCP-level statistics, as a measure of TCP download and upload performance, and is utilized in TCP Insight reports of the Citrix Application Delivery Management (ADM). To achieve this, NetScaler monitors each TCP connection, locates packet bursts on an idle time-out basis and reports key metrics (such as byte count, retransmitted byte count, an duration) for the identified maximum burst. In addition to this, the TCP raw metrics such as RTT, BIF, receive window and so forth are also measured based on the optimization
type (endpoint or transparent) that you configure. The TCP Speed Reporting feature is enabled by default, supports both TCP and HTTP vServers and depends on Appflow/ULFD reporting infrastructure. For more information, see Analytics and Reporting.

Troubleshooting Guidelines

January 6, 2019

Technical Support

All troubleshooting and escalation queries require a recent NetScaler techsupport bundle, which captures current configuration, firmware version installed, log files, outstanding cores, and others.

Example:

```
1 show techsupport
2 showtechsupport data collector tool - $Revision: #5 $!
4 ...
5 All the data will be collected under
6 /var/tmp/support/collector_P_192.168.121.117_18Jun2015_09_53
7 ...
8 Archiving all the data into "/var/tmp/support/collector_P_192
  .168.121.117_18Jun2015_09_53.tar.gz" ....
9 Created a symbolic link for the archive with /var/tmp/support/support.
tgz
10 /var/tmp/support/support.tgz ---- points to ---> /var/tmp/support/
   collector_P_192.168.121.117_18Jun2015_09_53.tar.gz
11
12 After a techsupport bundle has been generated, it might be copied using
   SCP.
```

Traces

NetScaler TCP optimization issues normally require NetScaler traces to troubleshoot properly. Note that one should try to capture traces under similar conditions, i.e. on the same cell, during the same time of day, using the same user equipment and application, and others.

The start nstrace and stop nstrace commands might be used to capture traces:

- It’s strongly recommended that the appropriate filter is used to avoid capturing extraneous, unnecessary packets on the trace. For instance use start nstrace -filter ‘IP == 10.20.30.40’ to only
capture packets being sent to or received from IP address 10.20.30.40, which is the user equipment IP address.

- Do not use the -tcpdump option, since it strips the ntrace headers which are required for debugging.

**Trace Analysis**

After a NetScaler trace has been captured, it might be viewed with Wireshark 1.12 or later. Verify that the captured traces include the appropriate NetScaler Packet Trace headers, as shown in the screen capture below:

The additional debug headers are also visible per the illustration below:

**Connection Table**

When the issue is related to TCP optimization and it can be reproduced or it’s on-going, it is best to get also the connection table when the issue occurs from the primary T1 node.

To get the table you shall need to switch to the BSD shell and run the following command:

```bash
1  shell
2  ...
3  nscli -U 127.0.0.1:nsroot:nsroot show connectiontable -detail full link
   > /var/tmp/contable.log
```

**Note**

The command might be executed for a longer time and management CPU might be stressed at that time (depends on the number of connection table entries), but it's not service affecting.

**Frequently Asked Questions**

September 17, 2018

**Timeouts**

**Important**

Before using any nsapimg knob, consult with Citrix Customer Support.
The following is a list of different idle connection timeouts that can be set on NetScaler T1 virtual servers and services. Idle timeout set for client or server connections at the vserver or service level are applicable only for the connections in TCP ESTABLISHED state and are idle.

- Load Balancing virtual server cltTimeout parameter specifies the time in seconds that a connection from a client to a Load Balancing virtual server must be idle, before the appliance closes the connection.
- Service svrTimeout parameter specifies the time in seconds that a connection from the appliance to a service or server must be idle, before the appliance closes the connection.
- Service cltTimeout parameter specifies the time in seconds that a connection from a client to a service must be idle, before the appliance closes the connection.

When a service is bound to a Load Balancing virtual server, then the cltTimeout for the Load Balancing virtual server takes precedence, and the service cltTimeout for service is ignored.

In case of there is not service bound to Load Balancing virtual server, global idle timeout, namely tcpServer, is used for server side connections. It can be configured as follows:

Command:

```bash
set ns timeout -tcpServer 9000
```

Connections in other state have different timeout values:

- Half open connections idle timeout: 120 seconds (hardcoded value)
- TIME_WAIT connections idle timeout: 40 seconds (hardcoded value)
- Half close connections idle timeout. By default it is 10s and can be configured between 1s and 600s using the snippet

Command:

```bash
set ns timeout -halfclose 10
```

When half-close timeout is triggered, connection is moved to zombie state. When zombie timeout expires, zombie cleanup kicks in and T1 sends RST on both client and server side for given connection by default.

- Zombie timeout: Interval at which the zombie cleanup process must run to clean up inactive TCP connections. Default timeout value is 120s and can be configured between 1s and 600s.

Command:

```bash
set ns timeout -zombie 120
```
**Maximum Segment Size Table**

A NetScaler T1 appliance defends against SYN flood attacks by using SYN cookies instead of maintaining half-open connections on the system memory stack. The appliance sends a cookie to each client that requests a TCP connection, but it does not maintain the states of half-open connections. Instead, the appliance allocates system memory for a connection only upon receiving the final ACK packet, or, for HTTP traffic, upon receiving an HTTP request. This prevents SYN attacks and allows normal TCP communications with legitimate clients to continue uninterrupted. Specific function is enabled by default without option to disable.

However, there is caveat as standard SYN cookies limit connections to the use of only eight Maximum Segment Size (MSS) values. If connection MMS does not match with any predefined value, it will pick up the next available lower value towards both client and server side.

The predefined TCP Maximum Segment Size (MSS) values are the following and can be configured through a new nsapimgr knob.

<table>
<thead>
<tr>
<th>1460</th>
<th>1440</th>
<th>1330</th>
<th>1220</th>
<th>956</th>
<th>536</th>
<th>384</th>
<th>128</th>
</tr>
</thead>
</table>

The new MSS table:

- Need not contain Jumbo-Frame support. Even though by default 8 values are reserved in the MSS table for jumbo frames, the table settings can be modified to include standard Ethernet-sized frames only.
- Should have 16 values
- Should have values in descending order
- Should include 128 as the last value

If the new MSS table is valid, the table is stored and the old values are switched out at the SYN-cookie rotation time. Otherwise the new table returns an error. Changes are applied to new connections while existing connections preserve the old MSS table until the connections expire or are terminated.

To display the current MSS table in a NetScaler appliance, type the following command.

**Command:**

```bash
$ shell
# nsapimgr -d mss_table
```

**Example:**
To change the mss table, type the following command:

**Command:**

```
>shell
# nsapimgr -s mss_table=<16 comma seperated values>
```

**Example:**

```
# nsapimgr -s mss_table
   =9176,9156,8192,7168,6144,4196,3072,2048,1460,1400,1330,1212,956,536,384,128

# nsapimgr -d mss_table
MSS table
{
   9176,9156,8192,7168,6144,4196,3072,2048,1460,1400,1330,1212,956,536,384,128
}
Done.
```

An example using standard Ethernet-sized values is depicted below:

**Example:**

```
# nsapimgr -s mss_table
   =1460,1440,1420,1400,1380,1360,1340,1320,1300,1280,1260,1212,956,536,384,128

# nsapimgr -d mss_table
```

© 1999-2018 Citrix Systems, Inc. All rights reserved.
To make this change permanent even after the NetScaler appliance restarts, include the command “#nsapimgr -ys mss_table=<16 comma separated values>” in the “/nsconfig/rc.netscaler” file. If the “rc.netscaler” file doesn’t exist, create it under the “/nsconfig” folder, and then append the command.

### Memory Overload Protection

A NetScaler Packet Processing Engine (PPE) starts bypassing connections from TCP optimization if the memory in use by that one PPE is more than a specified high watermark value. If a PPE memory utilization goes above ~2.6GB, then it starts bypassing any new connections from optimization. The existing connections (ones admitted for optimization previously) continues getting optimization. This watermark value has been purposefully selected and is not recommended for tuning.

**Note**

If you believe that there is a good reason to change that watermark value, contact Customer Support.

### Support for Happy Eyeballs Clients

If the NetScaler appliance receives a SYN for a destination for which the state is unknown, the appliance first checks the reachability of the server and then acknowledges the client. This probing mechanism enables clients with dual IP stacks to discover the reachability of dual-stack internet servers. If the client discovers that both IPv6 and IPv4 access are available, it establishes a connection to the server that responds more quickly, and resets the other. For the connection for the NetScaler appliance receives a reset, it will reset the corresponding server side connection.

**Note:** This feature has no user configurable TCP settings to be disabled/enabled on the NetScaler appliance.

For more information on Happy Eyeballs support, see RFC 6555.
NetScaler 12.0

NetScaler Video Optimization

September 17, 2018

The NetScaler appliance provides optimization techniques and capabilities to optimization ABR video traffic for video traffic over mobile networks. This improves user experience and reduces the overall network bandwidth consumption.

Getting Started

January 6, 2019

Media files have been driving an increasing amount of traffic over mobile networks, and migration to faster networking technologies has dramatically increased the volume of encrypted video traffic. The traditional media delivery technology (Progressive Download) is failing to deliver acceptable quality of experience (QoE) at a high transmission rate. This has led to the introduction of the Adaptive Bit Rate (ABR) protocol. It can adapt the streaming bit rate to the available network bandwidth and restrict streaming quality to match the capability of the handset receiving the video. However, the ABR protocol does not work as well in mobile networks as it does over the internet. Mobile operators must, therefore, optimize ABR traffic.

A NetScaler appliance has unique capabilities to detect incoming video traffic and selectively optimize ABR videos.

How NetScaler Video Optimization Works

A NetScaler appliance can identify and optimize encrypted ABR traffic (including Facebook video traffic) over TCP, and YouTube ABR traffic over QUIC. The appliance has the following capabilities:

1. Detect Progressive Download (PD) videos over HTTP.
2. Detect and optimize ABR videos over HTTP.
3. Detect and optimize ABR videos over HTTPS.
4. Detect and optimize YouTube ABR videos over QUIC.

Also, the appliance uses the following support domains for detecting video traffic over TCP and QUIC protocols.

- Unencrypted ABR videos over TCP. Appliance detects all standard compliant video streaming web sites. The appliance detects ABR sessions by inspecting the response video payload header, URL, and HTTP headers.
- Encrypted ABR video over TCP. Appliance detects ABR sessions using a generic and heuristic algorithm based on domain, SSL header and traffic patterns. Using this, the appliance has a
built-in support to detect top video web sites, with 95 percent accuracy and we continue to add support for new video types. NetScaler also has a program to provide additional verification for top encrypted ABR sites for a region or country to ensure network coverage.

- Encrypted ABR videos over QUIC. The appliance detects ABR sessions for QUIC based video provider, such as YouTube. The detection algorithm is on the basis of a heuristic leveraging the QUIC headers and domain. NetScaler will continue to add support for newer video sites using QUIC.

Benefits

Optimizing the ABR video traffic can provide the following benefits:

- Manage the network during congestion in peak hours.
- Improve video play consistency and reduce video stalling.
- Enable new video service offerings (for example, Binge-on video services).
- Enable customers to select the best sustainable video quality.
- Provide a consistent user experience for the subscriber.

Video Optimization over TCP

NetScaler optimization of ABR traffic over TCP works as follows:

1. HTTP or HTTPS traffic that the appliance receives over TCP is sent to the corresponding load balancing virtual server.
2. The built-in detection policies bound to the virtual server combined with other proprietary detection algorithms evaluate the traffic.
3. The policies use a set of built-in video detection signatures to detect the video type. The policy that matches traffic applies an action that categorizes the video type as one of the following:
   a) Clear-text PD
   b) Clear-text ABR
   c) Encrypted ABR
   d) Other
4. The optimization policies bound to the same virtual server evaluate the traffic and determine the optimization bit rate to apply to the traffic.
5. The optimization bit rate is applied if the traffic is either clear-text ABR or encrypted ABR.

A mobile service provider can improve the quality of experience (QoE) by setting the download speed for 2G, 3G, and 4G mobile traffic. This reduces the video start times or buffering events. Optimization can also reduce the amount of network bandwidth consumed by video sessions.

The optimization techniques include dynamic burst control and random sampling.
**Dynamic Burst Control**

NetScaler ABR optimization adapts dynamically to changing network conditions. It allows an initial burst rate of 1.3 times the configured pacing rate for 15 seconds. The initial burst rate applies to the beginning of every optimized ABR video session, even when multiple sessions use the same TCP connection or group of TCP connections.

The appliance also supports recovery bursts in the event that the bit rate supported by the network drops below the configured pacing rate. For example, if the effective bit rate drops at the 7th second and recovers at 15th second of the initial burst, the appliance recovers the loss during the next burst cycle. By doing so, the appliance dynamically optimizes the network bandwidth for all subscribers so that the quality of video remains consistent per pixel.

Note: When a recovery burst happens during an initial burst, the pacing bit rate must not exceed the maximum recovery-burst and initial-burst rates (you must not add the Recovery Burst factor on top of the Initial Burst factor). Otherwise, it might be so fast that the media player shifts to a higher quality mode. However, if necessary, you can extend the duration of the Initial Burst to compensate the unused bandwidth.

**Random Sampling**

To estimate the savings from video optimization, the NetScaler appliance implements random sampling. With this technique, the appliance randomly selects a configurable percentage of the detected video traffic (the random sampling parameter is an integer number ranging from 0 to 100, so less than 1 percent is not possible). These randomly selected and non-optimized transactions (and sessions) become a reference group, and they are identified in the transaction logs (along with other characteristics, such as byte size and timer fields. The characteristics of the optimized sessions are also logged, and the reporting engine compares statistics of the optimized and reference groups to estimate the savings from optimization (including the savings from ABR Optimization).

**Video Optimization over UDP**

Google has introduced a new transport protocol called QUIC. Google's QUIC protocol is very similar to TCP+TLS+HTTP/2 and is implemented on top of UDP. NetScaler can detect YouTube ABR videos streamed over the QUIC protocol, and apply ABR video optimization in a similar way as ABR over TCP.

**Licensing**

September 17, 2018
The Video Optimization feature works on Telco platforms with the purchase of a basic CBM license and CBM Premium license and for other NetScaler platforms, the feature works with the purchase of a CNS Platinum license. Before you configure the video optimization feature, your appliance must have a suitable license.

License support for Telco platforms:

- CBM_TXXX_SERVER_Retail.lic
- CBM_TPRE_SERVER_Retail.lic
- CNS_WEBF_SSERVER_Retail.lic

Where XXX is the throughput, for example, NetScaler T1000.

License support for other NetScaler platforms:

- CNS_XXX_SERVER_PLT_Retail.lic

Where XXX is the throughput.

To upload a premium license file, follow the steps given below:

1. A valid license file should be installed on the NetScaler appliance. The license should support at least as many Gbps as the expected maximum Gi-LAN throughput.

License files should be copied through an SCP client to the /nsconfig/license of the appliance, as shown in the screen capture below.

```
1 > shell ls /nsconfig/license/
2 CNS_V3000_SERVER_PLT_Retail.lic ssl
```

2. Do a warm restart to apply for the new license, as shown in the screen capture below.

```
1 > reboot -warm
2 Are you sure you want to restart NetScaler (Y/N)? [N]: y
3 Done
```

3. After the restart completes, verify that the license has been properly applied, by using the show license CLI.

In the example below a premium license with premium edition has been successfully installed.

```
1 > show license
2
3 License status:
4
5 Video Optimization: YES
6
7 ...
8
```
Configuring Video Optimization over TCP

September 17, 2018

To optimize video traffic over TCP, begin by enabling the video optimization feature. The appliance then activates the built-in detection policies to detect the incoming video traffic and identify the type of video. User configurable optimization policies for each video type specify the optimization bit rate needed for optimizing the traffic.

Configuring Video Optimization over TCP by using the CLI

To configure video optimization on a NetScaler appliance, you perform the following tasks:

1. Enable the video optimization feature.
2. Add virtual servers for HTTP and HTTPS traffic.
3. Bind all the built-in detection policies to a load balancing virtual server for HTTP traffic.
4. Bind all the built-in detection policies to an SSL-bridge load balancing virtual server for HTTPS traffic.
5. Add the desired optimization policies for HTTP and HTTPS traffic.
6. Bind optimization policies to a load balancing virtual server for HTTP Traffic.
7. Bind optimization policies to an SSL-bridge load balancing virtual server for HTTPS traffic.

Enabling Video Optimization

If you want the NetScaler appliance to detect, optimize, and report video traffic, you must enable the Video Optimization feature and set optimization to ON. After enabling the feature you can use built-in detection policies to identify the incoming video traffic, and you can configure optimization policies to optimize encrypted ABR traffic. To optimize ABR video traffic, you must configure the download bit rate (also called the pacing rate).

You must also enable the load balancing feature, and if you want to use video optimization for HTTPS traffic you must enable the SSL feature.

To enable the video optimization feature

At the command prompt, type the following command:
enables ns feature VideoOptimization

Note
If you want to monitor the video optimization performance and video insight reports you must enable the AppFlow feature and then access the Video Analytics feature on Citrix Application Delivery Management (ADM). For more information, see Video Insight documentation.

Creating Virtual Servers for HTTP and HTTPS Video Traffic

A NetScaler appliance uses different virtual servers for detecting and optimizing the different types of incoming video traffic. The appliance supports the following types of virtual servers for TCP traffic.

- **HTTP Load Balancing virtual server.** For detecting HTTP video traffic, the appliance uses an HTTP load balancing virtual server. It manages HTTP video requests that the appliance receives from clients.
- **SSL-Bridge Load Balancing virtual server.** To detect encrypted video traffic, you must configure an SSL bridge virtual server on the appliance.

To add an HTTP Load Balancing virtual server for detecting HTTP video traffic

At the command prompt, type the following:

```
1 add lb vserver <name> HTTP * 80 -persistenceType NONE
```

Example:

```
1 add lb vserver ProxyVserver-HTTP HTTP * 80 -persistenceType NONE -cltTimeout 120
```

To add an SSL Bridge virtual server for detecting HTTPS video traffic

At the command prompt, type the following:

```
1 add lb vserver <name> SSL_BRIDGE * 443 -persistenceType NONE
```

Example:

```
1 add lb vserver ProxyVserver-SSL SSL_BRIDGE * 443 -persistenceType NONE -cltTimeout 180
```
NetScaler 12.0

Binding Built-In Detection Policies to an HTTP Load Balancing Virtual Server

To detect video traffic over an HTTP connection, you must bind all the built-in detection policies to a load balancing virtual server. You must bind the policies to either request-time or response-time processing, depending on the policy type.

To bind detection policies for different video types to an HTTP load balancing virtual server

At the command prompt, type the appropriate command for each type. The available commands are:

```
bind lb vserver <name> -policyName ns_videoopt_http_abr_netflix -priority <integer> -type (REQUEST | RESPONSE)
bind lb vserver <name> -policyName ns_videoopt_http_abr_netflix2 -priority <integer> -type (REQUEST | RESPONSE)
bind lb vserver <name> -policyName ns_videoopt_http_abr_youtube -priority <integer> -type (REQUEST | RESPONSE)
bind lb vserver <name> -policyName ns_videoopt_http_pd_youtube -priority <integer> -type (REQUEST | RESPONSE)
bind lb vserver <name> -policyName ns_videoopt_http_pd_youtube2 -priority <integer> -type (REQUEST | RESPONSE)
bind lb vserver <name> -policyName ns_videoopt_http_pd_youtube3 -priority <integer> -type (REQUEST | RESPONSE)
bind lb vserver <name> -policyName ns_videoopt_http_abr_generic -priority <integer> -type (REQUEST | RESPONSE)
```

Example:

```
bind lb vserver ProxyVserver-HTTP -policyName ns_videoopt_http_abr_netflix -priority 400 -type RESPONSE
bind lb vserver ProxyVserver-HTTP -policyName ns_videoopt_http_abr_netflix2 -priority 500 -type RESPONSE
bind lb vserver ProxyVserver-HTTP -policyName ns_videoopt_http_abr_youtube -priority 600 -type RESPONSE
bind lb vserver ProxyVserver-HTTP -policyName ns_videoopt_http_pd_youtube -priority 800 -type RESPONSE
```
### Binding the HTTP Body Content Detection Policy to Load Balancing Virtual Server

To detect video traffic over HTTP, you must bind the body content detection policy to the load balancing virtual server. You can use the following command:

```bash
bind lb vserver <name> -policyName ns_videoopt_http_body_detection -priority <integer> -type (REQUEST | RESPONSE)
```

**Example:**

```bash
bind lb vserver ProxyVserver-HTTP -policyName ns_videoopt_http_body_detection -priority 1500 -type REQUEST
```

### Binding Built-In Detection Policies to an SSL-Bridge Load Balancing Virtual Server

To detect video traffic over an HTTPS connection, you must bind built-in detection policies to a SSL Bridge load balancing virtual server.

**To bind a detection policy to an SSL bridge load balancing virtual server**

At the command prompt, type the appropriate command for each type. The available commands are:

```bash
bind lb vserver <name> -policyName ns_videoopt_https_abr_netflix -priority <positive_integer> -type (REQUEST | RESPONSE)
bind lb vserver <name> -policyName ns_videoopt_https_abr_youtube -priority <positive_integer> -type (REQUEST | RESPONSE)
bind lb vserver <name> -policyName ns_videoopt_https_abr_generic -priority <positive_integer> -type (REQUEST | RESPONSE)
```
Example:

1  bind lb vserver ProxyVserver-SSL -policyName ns_videoopt_https_abr_netflix -priority 120 -type REQUEST
2  bind lb vserver ProxyVserver-SSL -policyName ns_videoopt_https_abr_youtube -priority 140 -type REQUEST
4  bind lb vserver ProxyVserver-SSL -policyName ns_videoopt_https_abr-generic -priority 150 -type REQUEST

Adding Optimization Policies for Pacing ABR traffic

To optimize ABR traffic, you have to configure optimization policies and the associated actions. You then bind the policies to the same load balancing virtual servers to which you bound the detection policies. For each policy, create the action first, so that you can include it when you create the policy.

To add an optimization action

At the command prompt, type:

```
1 add videooptimization pacingaction <action Name> -rate <integer> [-comment <string>]
```

Where the rate parameter specifies the rate in Kbps at which to send the traffic (the pacing rate).

Example:

```
1 add videooptimization pacingaction MyOptAct2000 -rate 2000
```

To add an optimization policy

At the command prompt, type:

```
1 add videooptimization pacingpolicy <name> -rule <expression> -action <string>
```

Example:

```
```
NetScaler 12.0

**Binding Optimization Policies to an HTTP Load Balancing Virtual Server**

To optimize ABR video traffic over an HTTP connection, you must bind the optimization policies to a load balancing virtual server to which the detection policies are bound.

**To bind an optimization policy to a Load Balancing virtual server**

At the command prompt, type the following command:

```
bind lb vserver <name> -policyName <policy_name> -priority <positive_integer> -type (REQUEST | RESPONSE)
```

**Example:**

```
bind lb vserver ProxyVserver-HTTP -policyName myOptPolicy2000 -priority 3400 -type REQUEST
```

**Binding Optimization Policies to SSL-bridge Virtual Servers**

To optimize ABR video traffic over an HTTPS connection, you must bind the optimization policies to the SSL Bridge virtual server to which the built-in detection policies are bound.

**To bind an optimization policy to SSL Bridge virtual server for pacing encrypted traffic**

At the command prompt, type the following command:

```
bind lb vserver <name> -policyName <policy_name> -priority <positive_integer> -type (REQUEST | RESPONSE)
```

**Example:**

```
bind lb vserver ProxyVserver-SSL -policyName myOptPolicy2000 -priority 3400 -type REQUEST
```

**Setting video optimization pacing parameters**

The CLI enables you to set the video optimization pacing parameters, such as random sampling percentage.
To set the random sampling percentage

At the command prompt, type the following command:

```
set videooptimization parameter -RandomSamplingPercentage <realNumber>
```

where realNumber is a value from 0.0 to 100.0.

Example:

```
set videooptimization parameter -RandomSamplingPercentage 50
```

Configuring Video Optimization over TCP by using the GUI

The GUI enables you to:

- Enable video optimization feature.
- Create HTTP load balancing virtual server.
- Create SSL-bridge load balancing virtual server.
- Bind built-in detection policies to HTTP load balancing virtual server.
- Bind built-in detection policies to SSL-bridge load balancing virtual server.
- Create optimization policy.
- Create optimization action.
- Configuring optimization pacing parameter.
- Bind optimization policy to load balancing virtual server for HTTP traffic.
- Bind optimization policy to SSL-bridge load balancing virtual server for HTTPS traffic.

To enable video optimization feature

1. In the navigation pane, expand System, and then click Settings.
2. On the Settings page, click the Configure Advanced Features link.
3. On the Configure Advanced Features page, select the Video Optimization check box.
4. Click OK, and then click Close.

To create load balancing virtual server for HTTP traffic

2. In the details pane, click Add.
3. On the Load Balancing Virtual Server screen, set the following parameters:
   a) Name. Name of the load balancing virtual server.
b) **Protocol.** Select protocol type as HTTP
   
c) **IP Address Type.** IP address type: IPv4 or IPv6.
   
d) **IP Address.** IPv4 or IPv6 address assigned to the virtual server.
   
e) **Port.** Port number of the virtual server.

4. Click **OK** to continue with configuration of other, optional, parameters. For more information, see Creating a Virtual Server.

5. Click **Create** and **Close**.

---

**To create load balancing virtual server for HTTPS traffic**

1. Sign in to the NetScaler appliance and navigate to the **Traffic Management > Load Balancing > Virtual Servers** page.

2. In the details pane, click **Add**.

3. On the **Load Balancing Virtual Server** screen, set the following parameters:
   
a) **Name.** Name of the load balancing virtual server.
   
b) **Protocol.** Select protocol type as SSL-bridge.
   
c) **IP Address Type.** IP address type: IPv4 or IPv6.
   
d) **IP Address.** IPv4 or IPv6 address assigned to the virtual server.
   
e) **Port.** Port number of the virtual server.

4. Click **OK** to continue with the configuration of other, optional, parameters. For more information, see Creating a Virtual Server.

5. Click **Create** and then **Close**.

---

**To bind a built-in detection policy to a load balancing virtual server**

1. Sign in to the NetScaler appliance and navigate to **Traffic Management > Load Balancing > Virtual Servers** screen.

2. In the details pane, select the load balancing virtual server and click **Edit**.
   
a) In the **Advanced Setting** section, click **Policies**.
   
b) In the **Policies** section, click the + icon to access the **Policies** slider.
   
c) In the **Policies** section, set the following parameters.
   
d) Choose Policy. Select a video optimization detection policy from the drop-down list.
   
e) Choose Type. Select the policy type as Request.
   
f) Click **Continue**.

3. Select the video detection policy from the list and click **Close**.

---

To bind a built-in detection policy to a SSL-bridge load balancing virtual server

1. Log on to the NetScaler appliance and navigate to the Traffic Management > Load Balancing > Virtual Servers screen.
2. In the details pane, select the SSL-bridge load balancing virtual server and click Edit.
3. In the Advanced Setting section, click Policies.
4. In the Policies section, click the + icon to access the Policies slider.
5. In the Policies section, set the following parameters.
   a) Choose Policy. Select video optimization detection policy from the drop-down list.
   b) Choose Type. Select the policy type as Request.
6. Click Continue.
7. Select the video detection policy from the list and click Close.

To create a video optimization action

1. Log on to the NetScaler appliance and navigate to Configuration > Optimization > Video Optimization > Pacing > Actions.
2. In the details pane, click Add.
3. On the Create Video Optimization Pacing Action page, set the following parameters.
   a) Name. Name of the optimization action.
   b) ABR Optimization Rate (Kbps). Pacing rate at which to send the ABR video traffic. The default rate for ABR optimization is 1000 Kbps. The minimum value is 1, and the maximum value is 2147483647.
   c) Comment. A short description of the action.
4. Click Create and Close.

To create a video optimization policy

1. Log on to the NetScaler appliance and navigate to Configuration > Optimization > Video Optimization > Pacing > Policies.
2. In the details pane, click Add.
3. On the Create Video Optimization Pacing Policy page, set the following parameters.
   a) Name. Name of the optimization policy
   b) Expression. Custom regrex expressions that implement the policy.
   c) Action. Optimization action associated with the policy to handle the incoming video traffic.
   d) UNDEF Action. Undefined event if the incoming request does not match the optimization policy.
f) Log Action. Select the audit log action that creates the desired log messages.
4. Click Create, and then click Close.

To set video optimization pacing parameters

1. Log on to the NetScaler appliance and navigate to Configuration > Optimization > Video Optimization.
2. In the Video Optimization page, click Change Video Optimization Settings link.
3. In the Video Optimization Settings page, set the following parameter.
   a) Random Sampling Percentage (%). Percentage of packets selected for random sampling.
4. Click OK and Close.

To bind a video optimization policy to an HTTP load balancing virtual server

1. Log on to the NetScaler appliance and navigate to Configuration > Optimization > Video Optimization.
2. On the Video Optimization page, click the Video Optimization Pacing Policy Manager link.
3. Set the following parameters.
   a) Bind Point. The point at which to apply the optimization policy during request or response processing.
   b) Connection Type. Connection type as Request or Response.
   c) Virtual Server. The load balancing virtual server to which to bind the policy.
   d) Click Continue.
4. In the Bind Point section, do one of the following:
   a) Select a policy from the list.
   b) Click Add Binding to access the Policies Binding slider.
      i. Select an existing policy or add a new policy.
      ii. Enter binding details and click Bind.
5. Click Close.

To bind a video optimization policy to an SSL-bridge load balancing virtual server

1. Log on to the NetScaler appliance and navigate to Configuration > Optimization > Video Optimization.
2. On the Video Optimization page, click the Video Optimization Pacing Policy Manager link.
3. On the Video Optimization Policy Manager page, set the following parameters.
   a) Bind Point. The point at which to apply the optimization policy during request/response processing.
   b) Connection Type. Connection type as Request or Response.
c) Virtual Server. The SSL-bridge load balancing virtual server to which to bind the policy.

4. Click **Continue**.

5. In the **Bind Point** section, do one of the following:
   a) Select a policy binding from the list.
   b) Click **Add Binding** to access the **Policies Binding** slider.
      i. Select an existing policy or add a new policy.
      ii. Enter binding details and click **Bind**.

6. Click **Close**.

### Configuring Video Optimization over UDP

**September 17, 2018**

To optimize QUIC ABR video traffic over UDP, begin by enabling the video optimization feature. After you complete the configuration, the appliance detects QUIC based ABR video traffic and applies the optimization bit rate that is configured on the appliance.

### Configuring video optimization for QUIC by using the CLI

To configure video optimization for QUIC video traffic over UDP, you must perform the following tasks:

1. Enable Video Optimization.
2. Create a QUIC service.
3. Create a QUIC load balancing virtual server.
4. Bind QUIC web service to the loading balancing virtual server.
5. Create video optimization policy for pacing QUIC based UDP traffic.
6. Bind optimization policy to a QUIC based load balancing virtual server.

### Enabling video optimization for QUIC traffic

If you want the NetScaler appliance to detect, optimize, and report video traffic, you must enable the Video Optimization feature and set optimization ON.

**Note**

If you want to use video optimization for QUIC traffic, you must enable the load balancing and AppFlow features.

### To enable the video optimization

At the command prompt, type the following command:
Creating a service for QUIC traffic

A NetScaler appliance uses a QUIC service for the load balancing virtual server to connect to the egress router in the static routing mode.

Note
Currently, dynamic routing is not supported.

To create a load balancing web service for QUIC video traffic

At the command prompt, type:

```
1 add service <name> <router-IP> <serviceType> <port> -usip yes -useproxyport [yes | no]
```

Example:

```
1 add service svc-quic 10.102.29.200 QUIC 443 -usip yes -useproxyport no
2
3 where IP address is the internet router address.
```

Creating a load balancing virtual server for QUIC traffic

A NetScaler appliance uses a load balancing virtual server for detecting and optimizing QUIC video traffic over UDP.

To create a load balancing virtual server for QUIC video traffic

At the command prompt, type:

```
1 add lb vserver <name> <serviceType> <ip> <port> -m MAC
```

Example:

```
1 add lb vserver vs-quic QUIC * 443 -persistenceType NONE -m MAC -cltTimeout 120
```
Binding a QUIC web service to the load balancing virtual server

After you have created the web services and load balancing virtual server for QUIC traffic, you must bind the services to the virtual server.

To bind a web service to load balancing virtual server for QUIC video traffic

At the command prompt, type:

```
bind lb vserver <name> <serviceName>
```

Example:

```
bind lb vserver vs-quic svc-quic
```

Creating Video Optimization Policy for QUIC based UDP traffic

To optimize QUIC based UDP traffic, you have to configure optimization pacing policies and its actions. You must then, bind the policies to QUIC based load balancing virtual servers. For each policy, create an action first so that you can associate it to the policy.

To add an optimization action

At the command prompt, type:

```
add videooptimization pacingaction <action Name> -rate <integer> [-comment <string>]
```

Where, the `rate` parameter specifies the rate in Kbps at which to send the traffic (the pacing rate).

Example:

```
set videooptimization parameter -QUICPacingRate 1000
```

where 1000 represents the desired pacing rate in Kbits/sec.

To add an optimization policy

At the command prompt, type:

```
add videooptimization pacingpolicy <name> -rule <expression> -action <string>
```
Example:

```
```

**Binding Optimization Policies to a QUIC Load Balancing Virtual Server**

To optimize QUIC video traffic over a UDP connection, you must bind the optimization policies to a QUIC load balancing virtual server.

**To bind an optimization policy to a QUIC Load Balancing virtual server**

At the command prompt, type the following command:

```
bind lb vserver <name> -policyName <policy_name> -priority <positive_integer> -type (REQUEST)
```

**Note**

The pacing policies must be bound to a QUIC load balancing virtual server only at request time.

**Example:**

```
bind lb vserver vs-quic -policyName myOptPolicy2000 -priority 3400 -type REQUEST
```

**Configuring video optimization for QUIC by using the GUI**

To configure the feature on the appliance through the GUI, you must perform the following tasks:

1. Enable video optimization
2. Configure a QUIC servers
3. Configure QUIC service
4. Configure a QUIC load balancing virtual server
5. Bind the QUIC web service to the load balancing virtual server
6. Create optimization policy.
7. Create optimization action.
8. Configuring optimization pacing parameter.
9. Bind optimization policy to load balancing virtual server for QUIC traffic.
To enable video optimization

1. Log on to the NetScaler appliance and navigate to System > Settings.
2. On the details page, select Configure Advanced Features link.
3. On the Configure Advanced Features page, select the Video Optimization check box.

To create a QUIC servers

1. Log on to the NetScaler appliance and navigate to the Traffic Management > Load Balancing > Servers screen.
2. In the details pane, click Add.
3. On the Create Server page, set the following parameters:
   a) Name. Name of the QUIC server.
   b) IP address. IP address of the QUIC server
   c) Traffic Domain. Domain name of the server.
   d) Enabling after creating. Initial state of the server.
   e) Comments. Brief information about the server.
4. Click Create.

To create a QUIC service

1. Log on to the NetScaler appliance and navigate to the Traffic Management > Load Balancing > Services screen.
2. In the details pane, click Add.
3. On the Load Balancing Service page, set the following parameters:
   a) Service Name. Name of the QUIC service.
   b) IP address. IP address assigned to the QUIC service.
   c) Protocol. Select protocol as QUIC.
   d) Port. Port number of the web service.
4. Click OK to continue. You can then configure other, optional, parameters. For more, see Configuring Services.
5. Once you configure the optional parameters, click OK and Close.

To create a load balancing virtual server

1. Log on to the NetScaler appliance and navigate to the Traffic Management > Load Balancing > Virtual Servers screen.
2. In the details pane, click Add.
3. On the Load Balancing Virtual Server page, set the following parameters:
   a) Name. Name of the load balancing virtual server.
b) **Protocol.** The protocol used by the service to send QUIC requests.

c) **IP Address Type.** IP address type: IPv4 or IPv6.

d) **IP Address.** IP 4 or IP6 IP address assigned to the virtual server.

e) **Port.** Port number of the virtual server.

4. Click OK to continue with the configuration of other, optional, parameters. For more information, see Creating a Virtual Server.

---

**To bind a load balancing virtual server to a QUIC service**

2. Click **Services and Service Groups** to access the **Load Balancing Virtual Server Service Binding** screen.
3. Select a QUIC based web service and click **Bind**.
4. Click **Done**.

---

**To create a video optimization action for QUIC traffic**

1. Log on to the NetScaler appliance and navigate to **Configuration > Optimization > Video Optimization > Pacing > Actions**.
2. In the details pane, click **Add**.
3. On the **Create Video Optimization Pacing Action** page, set the following parameters.
   a) **Name.** Name of the optimization action.
   b) **ABR Optimization Rate (Kbps).** Pacing rate at which to send the ABR video traffic. The default rate for ABR optimization is 1000 Kbps. The minimum value is 1, and the maximum value is 2147483647.
   c) **Comment.** A short description of the action.
4. Click **Create** and **Close**.

---

**To create a video optimization policy for QUIC traffic**

1. Log on to the NetScaler appliance and navigate to **Configuration > Optimization > Video Optimization > Pacing > Policies**.
2. In the details pane, click **Add**.

3. On the **Create Video Optimization Pacing Policy** page, set the following parameters.
   a) **Name.** Name of the optimization policy
   b) **Expression.** Custom regrex expressions that implement the policy.
   c) **Action.** Optimization action associated with the policy to handle the incoming video traffic.
   d) **UNDEF Action.** Undefined event if the incoming request does not match the optimization policy.
   e) **Comment.** A short description of the policy.
   f) **Log Action.** Select the audit log action that creates the desired log messages.

4. Click **Create**, and then click **Close**.

---

**To bind a video optimization policy to an QUIC load balancing virtual server**

1. Log on to the NetScaler appliance and navigate to **Configuration > Optimization > Video Optimization**.

2. On the **Video Optimization** page, click the **Video Optimization Pacing Policy Manager** link.

3. On the **Video Optimization Policy Manager** page, set the following parameters.
   a) **Bind Point.** The point at which to apply the optimization policy during request processing. **Note:** The pacing policies must be bound to a QUIC load balancing virtual server only at request time.
   b) **Connection Type.** Connection type as Request or Response.
   c) **Virtual Server.** The load balancing virtual server to which to bind the policy.

4. Click **Continue**.

5. In the **Bind Point** section, do one of the following:
   a) Select a policy from the list.
   b) Click **Add Binding** to access the **Policies Binding** slider.
      i. Select an existing policy or add a new policy.
      ii. Enter binding details and click **Bind**.

6. Click **Close**.

---

**NetScaler URL Filtering**

November 14, 2018

URL Filtering provides policy-based control of websites by using the information contained in URLs. This feature helps network administrators monitor and control user access to malicious websites on mobile networks.
As an administrator, you can configure a URL filtering policy by using either the URL Categorization feature or the URL List feature.

**URL List.** Controls access to blacklisted websites and web pages by blocking access to URLs that are in a URL set imported into the appliance.

**URL Categorization.** Controls access to websites and web pages by filtering traffic on the basis of a predefined list of categories.

### URL List

November 15, 2018

The URL List feature enables you to control access to customized URL lists (up to one million entries). The feature filters websites by applying a URL filtering policy bound to a virtual server.

As an administrator, you must import the URL List into the NetScaler appliance. This imported list is internally stored as a Policy data set called a **URL Set**. The appliance then applies a unique fast URL matching algorithm to the incoming URL requests. If the incoming URL request matches an entry in the set, the appliance applies the associated policy action to control access.

### URL List Types

Each entry in a URL set can include a URL and, optionally, its metadata (URL category, category groups, or any other related data). For URLs with a metadata, the appliance uses a policy expression that evaluates the metadata. For more information, see [URL Sets](#).

A NetScaler appliance supports two types of URL lists: Custom (with or without URL metadata) and IWF (Internet Watch Foundation).

**Custom URL List.** You can create a customized URL set of up to 1,000,000 URL entries and import it as a text file into your appliance. The list can contain URLs with or without metadata (which could be like a URL category). TheNetScaler platform automatically detects whether metadata is present. It also supports storing the imported lists securely. For more information, see [URL Set](#).

**IWF URL List.** You can import an externally managed list maintained by the IWF. To access this list, you need special access credentials, and you have to use a secure procedure. NetScaler has built-in support for the IWF list, making it simple to use.

You can host the URL list and configure the NetScaler appliance to periodically update the list without requiring manual intervention. Once the URL list is updated, the appliance can automatically detect the metadata and the categories by using policy expressions to evaluate each incoming URL and then apply actions such as allow, block, redirect, or notify the user.
URL List Policy Expressions

The following table describes the basic expressions you can use to evaluate incoming traffic. After you import an URL List to the appliance, it is called a URL Set.

<table>
<thead>
<tr>
<th>Expression</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;URL expression&gt;.URLSET_MATCHES_ANY(&lt;URLSET&gt;)</code></td>
<td>Evaluates to TRUE if the URL exactly matches any entry in the URL set.</td>
</tr>
<tr>
<td><code>&lt;URL expression&gt;.GET_URLSET_METADATA(&lt;URLSET&gt;)</code></td>
<td>The GET_URLSET_METADATA() expression returns the associated metadata if the URL exactly matches any pattern within the URL set. An empty string is returned if there is no match.</td>
</tr>
<tr>
<td><code>&lt;URL expression&gt;.GET_URLSET_METADATA(&lt;URLSET&gt;).EQ(&lt;METADATA&gt;)</code></td>
<td>Evaluates to TRUE if the matched metadata is equal to <code>&lt;METADATA&gt;</code>.</td>
</tr>
<tr>
<td><code>&lt;URL expression&gt;.GET_URLSET_METADATA(&lt;URLSET&gt;).TYPECAST_LIST_T(',').GET(0).EQ(&lt;CATEGORY&gt;)</code></td>
<td>Evaluates to TRUE if the matched metadata is at the beginning of the category. This pattern can be used to encode separate fields within metadata, but match only the 1&lt;sup&gt;st&lt;/sup&gt; field.</td>
</tr>
<tr>
<td>HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL)</td>
<td>Joins the host and URL parameters, which can then be used as a <code>&lt;URL expression&gt;</code> for matching.</td>
</tr>
</tbody>
</table>

URL List Policy Actions

The most common enforcement action for URLs that match a URL list is to restrict access. Create a URL list policy with a desired URL list matching expression and enforcement action. The policy group usage depends upon the incoming traffic type (HTTP or HTTPS) and the virtual server configured on the appliance. You can use a Responder policy for HTTP traffic or a Video Optimization policy for HTTPS traffic. Specify actions to apply to the URLs that match the expressions in the policies. The following table lists the available actions.

<table>
<thead>
<tr>
<th>Action Type</th>
<th>Policy</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALLOW</td>
<td>Responder</td>
<td>Allow the request to access the target URL.</td>
</tr>
</tbody>
</table>
### NetScaler 12.0

<table>
<thead>
<tr>
<th>Action Type</th>
<th>Policy</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>REDIRECT</td>
<td>Responder</td>
<td>Redirect the request to the URL specified as the target.</td>
</tr>
<tr>
<td>DENY</td>
<td>Responder</td>
<td>Deny the request.</td>
</tr>
<tr>
<td>RESET</td>
<td>Responder, VideoOptimization</td>
<td>Reset the connection.</td>
</tr>
<tr>
<td>DROP</td>
<td>Responder, VideoOptimization</td>
<td>Drop the connection.</td>
</tr>
</tbody>
</table>

### Prerequisites

To configure URL List feature, make sure you have configured the following server.

### DNS Server for DNS Requests

You must configure a DNS server if you import a URL Set from a hostname URL.

At the command prompt, type:

```
1 add dns nameServer ((<IP> [-local] | <dnsVserverName>) [-state (ENABLED | DISABLED )] [-type <type>] [-dnsProfileName <string>])
```

**Example:**

```
1 add dns nameServer 10.140.50.5
```

### Configuring a URL List

To configure a URL List, do the following:

- Import a custom URL list
- Set up IWF URL list support
- Configure a URL list for HTTP traffic.
  - Add a URL List action.
  - Add a URL List policy.
  - Add an HTTP load balancing virtual server for HTTP traffic.
  - Bind the URL List policy to the HTTP load Balancing virtual server for HTTP traffic.
- Configure a URL list for HTTPS traffic.
- Add a video optimization detection policy.
- Add an SSL-bridge load balancing virtual server for HTTPS traffic.
- Bind the video optimization detection policy to the SSL-bridge load balancing virtual server for HTTPS traffic

**Importing a custom URL list**

To import a URL set, see See URL Set.

**Setting up IWF URL List Support**

To set up IWF URL list support, you need access credentials. The IWF gives each member the unique access credentials required for setup. The access credentials include a user name password.

At the command prompt, type:

```
import urlset iwfset -url https://<IWFUser>:<IWFPass>@servicebak.iwf.org.uk/ -private Done
```

**Note**

If the IWF changes the URL for importing a list, you can contact the NetScaler support team.

**Configuring a URL List for HTTP traffic**

The NetScaler appliance supports HTTP and HTTPS traffic. To configure a load balancing virtual server for HTTP traffic and bind URL list policies to the server, do the following:

- Add URL List actions.
- Add URL List policies.
- Add an HTTP load balancing virtual server for HTTP traffic
- Bind the URL List policies to the HTTP load balancing virtual server for HTTP traffic

**To add a URL list action**

At the command prompt, type the following:

```
add responder action <name> <type> (<target> | <htmlpage>) [-comment <string>] [-responseStatusCode <positive_integer>] [-reasonPhrase <string>]
```

**Example:**
To add a URL list policy

At the command prompt, type the following:

```
add responder action act_iwf_url respondwith "HTTP/1.1 451 Unavailable
For Legal Reasons URL is IWF NOT authorized"
```

Example:

```
add responder policy pol_iwf_http 'HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.
URL).URLSET_MATCHES_ANY("iwfset")' act_iwf_url
```

To add a HTTP load balancing virtual server for HTTP traffic

At the command prompt, type the following:

```
add vserver <name> [-td <positive_integer>] <serviceType> [-cltTimeout <secs>]
```

Example:

```
add lb vserver vsrv-HTTP HTTP * 80 -persistenceType NONE -cltTimeout 120
```

To bind URL list policy to HTTP load balancing virtual server

At the command prompt, type the following:

```
bind lb vserver <vServerName> -policyName <string> [-priority <positive_integer>]
```

Example:

```
bind lb vserver vsrv-HTTP -policyName pol_iwf_http -priority 10 -type REQUEST
```
Configuring URL List for HTTPS traffic

The NetScaler appliance supports HTTP and HTTPS traffic. To configure a SSL-bridge load balancing virtual server for HTTPS traffic and bind URL list policies to the server, do the following:

- Add URL List actions.
- Add URL List policies.
- Add a SSL-bridge load balancing virtual server for HTTP traffic
- Bind the URL List policies to the SSL-bridge load balancing virtual server for HTTP traffic

To add a URL List policy for HTTPS traffic

At the command prompt, type:

```
1 add videooptimization detectionpolicy <name> -rule <expression> -action <string> [-undefAction <string>] [-comment <string>] [-logAction <string>]
```

Example:

```
1 add videooptimization detectionpolicy pol_iwf_https -rule CLIENT.SSL.DETECTED_DOMAIN.URLSET_MATCHES_ANY("iwfset") -action RESET
```

To add a SSL-bridge load balancing virtual server

At the command prompt type:

```
1 add vserver <name> [-td <positive_integer>] <serviceType> [-cltTimeout <secs>]
```

Example:

```
1 add lb vserver vsrv-HTTPS SSL_BRIDGE * 443 -persistenceType NONE -cltTimeout 180
```

To bind URL List policy with SSL-bridge load balancing by using the CLI

At the command prompt type:

```
1 bind lb vserver <vServerName> -policyName <string> [-priority <positive_integer>]
```
Example:

```bash
bind lb vserver vsrv-HTTPS -policyName pol_iwf_https -priority 20 -type REQUEST
```

Configuring a URL List by using the GUI

The GUI enables you to:

- Import a URL list.
- Add a URL list.
- Configure URL list actions.
- Configure URL list policies for HTTP traffic.
- Add an HTTP load balancing virtual server for HTTP traffic.
- Add an SSL-bridge load balancing virtual server for HTTPS traffic.
- Bind URL list policies to the HTTP load balancing virtual server.
- Bind a URL list policies to the SSL-bridge load balancing virtual server.

To import a URL list

1. In the navigation pane, expand **AppExpert > URL Sets**.
2. In the details pane, click **Import**.
3. On the **Configure URL Set** page, set the following parameters.
   a) **Name**. Name of the URL set.
   b) **URL**. Web address of the location at which to access the URL Set.
   c) **Overwrite**. Overwrite a previously imported URL set.
   d) **Delimiter**. Character sequence that delimits a CSV file record.
   e) **Row Separator**. Row separator used in the CSV file.
   f) **Interval**. Interval in seconds, rounded off to the nearest 15 minutes, at which the URL set is updated.
   g) **Private Set**. Option to prevent exporting the URL set
   h) **Canary URL**. Internal URL for testing whether the content of the URL set is to be kept confidential. The maximum length of the URL is 2047 characters
4. Click **Create**, and then **Close**.

To add a URL list

1. In the navigation pane, expand **AppExpert > URL Sets**.
2. In the details pane, click **Add**.
3. On the **Create URL Set** page, set the following parameters.
   a) **Name.** The name of the URL set that was given when it was imported.
   b) **Comments.** A short description about the URL set.
4. Click **Create**.

**To configure a URL list action**

1. In the navigation pane, navigate to **AppExpert > Responder > Action**.
2. In the details pane, click **Add**.
3. On the **Create Responder Action** page, set the following parameters.
   a) **Name.** Name of the URL List policy action.
   b) **Type.** Select an action type.
   c) **Expression.** Use the expression editor to create the policy expression.
   d) **Comments.** A short description about the policy action.
4. Click **Create** and **Close**.

**To configure a URL list policy**

1. In the navigation pane, expand **AppExpert > Responder > Policies**.
2. In the details pane, click **Add**.
3. On the **Create Responder Policy** page, set the following parameters.
   a) **Name.** Name of the URL List policy action.
   b) **Action.** Select the URL List action that you prefer to associate with the policy.
   c) **Log Action.** Select the log action.
   d) **AppFlow.** Select an AppFlow action.
   e) **Expression.** Use the expression editor to create the policy expression.
   f) **Comments.** A short description about the policy.
4. Click **Create** and **Close**.

**To add an HTTP load balancing virtual server**

1. Navigate to the **Traffic Management > Load Balancing > Virtual Servers** page.
2. In the details pane, click **Add**.
3. On the **Load Balancing Virtual Server** screen, set the following parameters:
   a) **Name.** Name of the load balancing virtual server.
   b) **Protocol.** Choose protocol type as HTTP.
   c) **IP Address Type.** IP addressable type.
   d) **IP Address.** IP 4 or IP6 IP address assigned to the virtual server.
   e) **Port.** Port number of the virtual server.
4. Click **OK** to continue with the configuration of other, optional, parameters. For more information, see Creating a Virtual Server.

**To bind a URL List policy to the HTTP load balancing virtual server**

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers** screen.
2. In the details pane, select the load balancing virtual server and click **Edit**.
3. In the **Advanced Setting** section, click **Policies**.
4. In the **Policies** section, click the + icon to access the **Policies** slider.
5. In the **Policies** section, set the following parameters.
   a) **Choose Policy.** Select a URL categorization policy from the drop-down list.
   b) **Choose Type.** Select the policy type as Request.
6. Click **Continue**.
7. Select the URL List policy from the list and click **Close**.

**To add URL List policy for HTTPS traffic**

1. Log on to the NetScaler appliance and navigate to **Configuration > Optimization > Video Optimization > Detection**.
2. On the **Detection** page, click the **Video Optimization Detection Policies** link.
3. On the **Video Optimization Detection Policies** page, click **Add**.
4. On the **Create Video Optimization Detection Policy** page, set the following parameters.
   a) **Name.** Name of the optimization policy
   b) **Expression.** Configure policy using custom expressions.
   c) **Action.** Optimization action associated with the policy to handle the incoming video traffic.
   d) **UNDEF Action.** Undefined event if the incoming request does not match the optimization policy.
   e) **Comment.** A short description of the policy.
   f) **Log Action.** Select an audit log action that specifies the action to be performed for the log messages.
5. Click **Create** and **Close**.

**To add a SSL-bridge load balancing virtual server for HTTPS traffic**

1. Navigate to the **Traffic Management > Load Balancing > Virtual Servers** page.
2. In the details pane, click **Add**.
3. On the **Load Balancing Virtual Server** screen, set the following parameters:
   a) **Name.** Name of the load balancing virtual server.
b) **Protocol.** Select protocol type as SSL-bridge.
c) **IP Address Type.** IP address type: IPv4 or IPv6.
d) **IP Address.** IPv4 or IPv6 IP address assigned to the virtual server.
e) **Port.** Port number of the virtual server.

4. Click **OK** to continue with the configuration of other, optional, parameters. For more information, see “Creating a Virtual Server” topic.

**To bind a URL List Policy to the SSL-bridge load balancing virtual server**

1. Navigate to the **Traffic Management > Load Balancing > Virtual Servers** screen.
2. In the details pane, select the SSL-bridge load balancing virtual server and click **Edit.**
3. In the **Advanced Setting** section, click **Policies.**
4. In the **Policies** section, click the + icon to access the **Policies** slider.
5. Set the following parameters.
   a) **Choose Policy.** Select video detection policy from the drop-down list.
   b) **Choose Type.** Select the policy type as Request.
6. Click **Continue.**
7. Select the video detection policy from the list and click **Close.**

**Configuring Audit Log Messaging**

Audit logging enables you to review a condition or a situation in any phase of URL List process. When a NetScaler appliance receives an incoming URL, if the responder policy has an URL Set advanced policy expression, the audit log feature collects URL Set information in the URL and stores the details as a log message for any target allowed by audit logging.

The log message contains the following information:

1. Timestamp.
2. Log message type.
3. The predefined log levels (Critical, Error, Notice, Warning, Informational, Debug, Alert, and Emergency).
4. Log message information, such as URL set name, policy action, URL.

To configure audit logging for URL List feature, you must complete the following tasks:

1. Enable Audit Log.
2. Create Audit Log message action.
3. Set URL List responder policy with Audit Log message action.

For more information, see **Audit Logging.**
NetScaler 12.0

URL List Semantics

The following table lists the URL Match patterns and describes how the URLs within a URL list are matched against the incoming-request URLs. For example, the pattern www.example.com/bar matches only with one page at www.example.com/bar. To match all the pages whose URL starts with ‘www.example.com/bar’, you would add an asterisk (*) to the end of the URL.

<table>
<thead>
<tr>
<th>Semantics</th>
<th>URL Pattern</th>
<th>Matched</th>
<th>Unmatched</th>
</tr>
</thead>
<tbody>
<tr>
<td>Subdomain matching</td>
<td>domain.com</td>
<td>domain.com;</td>
<td>yourdomain.com;</td>
</tr>
<tr>
<td></td>
<td><a href="http://www.domain.com/">www.domain.com</a></td>
<td>wwwdomain.com</td>
<td></td>

URL Categorization

January 6, 2019

URL Categorization restricts user access to specific websites and website categories. As a subscription service offered by NetScaler T1000, the feature enables customers to filter web traffic by using a commercial categorization database. The database has billions of URLs classified into different categories, such as social networking, gambling, adult content, new media, and shopping. In addition to categorization, each URL has a reputation score kept up to date based on the site’s historical risk profile. To filter your traffic, you can configure advanced policies based on categories, category groups (such as Terrorism, Illegal drugs), or site-reputation scores.

For example, you might block access to dangerous sites, such as sites known to be infected with malware, and selectively restrict access to content such as adult content or entertainment streaming me-
How URL Categorization Works

The following figure shows how NetScaler URL Filtering service is integrated with a commercial URL Categorization database and cloud services for frequent updates.

The components interact as follows:

1. Client sends internet bound URL request.
2. A NetScaler policy attempts to evaluate the request in terms of categorization details (such as category, category group, and site-reputation score) retrieved from the URL categorization database. If the database returns the category details, the process jumps to step 5.
3. If the database does not return categorization details, the request is sent to a cloud-based lookup service maintained by a URL categorization vendor. However, the appliance does not wait for a response. Instead, it marks the URL as Uncategorized and jumps to step 5. However, it continues to monitor the cloud query feedback and uses it to update the cache so that future requests can benefit from the cloud lookup.
4. The NetScaler appliance receives the URL category details (category, category group, and reputation score) from the cloud-based service and stores it in the cloud cache.
5. If the policy allows the URL, the request is sent to the origin server. Otherwise, the appliance drops or redirects the request, or responds with a custom HTML page.
6. The origin server responds with the requested data to the NetScaler appliance.
7. The appliance sends the response to the client.

You can use the URL filtering feature to detect sites that violate safe internet usage mandates issued by the government and implement policies to block these sites. Sites that host adult content, streaming media, or social networking identified as unsafe for children or banned as illegal.

Prerequisites

The feature works on Telco platforms with the purchase of a basic CBM license and CBM Premium license and for other NetScaler platforms, the feature works with the purchase of a CNS Platinum license.

Note: In addition to a Basic CBM license and a CBM Premium license, the appliance must have a URL Threat Intelligence feature license with a subscription service for one year or 3 years. Before enabling and configuring the feature, you must install the following licenses:

License support for Telco platforms:

- CBM_TXXX_SERVER_Retail.lic
- CBM_TPRE_SERVER_Retail.lic
• CNS_WEBF_SSERVER_Retail.lic

Where XXX is the throughput, for example, NetScaler T1000.

License support for other NetScaler platforms:

• CNS Xxx_SERVER_PLT_Retail.lic

Where XXX is the throughput.

**URL Categorization Policy Expressions**

The following table lists the different URL categorization policy expressions that you can use to identify incoming URLs to which to apply an action of allow, redirect, drop, reset the connection, or deny access.

<table>
<thead>
<tr>
<th>Expression</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;text&gt; . URL_CATEGORIZE (&lt;min_reputation&gt;, &lt;max_reputation&gt;)</code></td>
<td>Returns a URL_CATEGORY object. If is greater than 0, the returned object does not contain a category with a reputation lower than . If is greater than 0, the returned object does not contain a category with a reputation higher than . If the category fails to resolve in a timely manner, the undef value is returned.</td>
</tr>
<tr>
<td><code>. CATEGORY</code></td>
<td>Returns the category string for this object. If the URL does not have a category, or if the URL is malformed, the returned value is “Uncategorized”.</td>
</tr>
<tr>
<td><code>. GROUP</code></td>
<td>Returns a string identifying the object’s category group. This is a higher level grouping of categories, which is useful in operations that require less detailed information about the URL category. If the URL does not have a category, or if the URL is malformed, the returned value is “Uncategorized”.</td>
</tr>
<tr>
<td><code>. REPUTATION</code></td>
<td>Returns the reputation score as a number from 1 to 4, where 4 indicates the riskiest reputation. If the category is “Uncategorized”, the reputation value is 2.</td>
</tr>
</tbody>
</table>
### Sample Policy Expressions

<table>
<thead>
<tr>
<th>Policy</th>
<th>Policy Expressions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Policy to select requests for URLs that are in the Search Engine category</td>
<td>add responder policy p1 'HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL).URL_CATEGORIZE(0,0).CATEGORY.EQ(&quot;Search Engine&quot;)'</td>
</tr>
<tr>
<td>Policy to select requests for URLs that are in the Adult category group</td>
<td>add responder policy p1 'HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL).URL_CATEGORIZE(0,0).GROUP.EQ(&quot;Adult&quot;)'</td>
</tr>
<tr>
<td>Policy to select requests for Search Engine URLs with a reputation score equal to 4.</td>
<td>add responder policy p2 'HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL).URL_CATEGORIZE(4,0).CATEGORY.EQ(&quot;Search Engine&quot;)'</td>
</tr>
<tr>
<td>Policy to select requests for Search Engine and Shopping URLs</td>
<td>add policy patset good_categories; bind policy good_categories &quot;Search Engine&quot;; bind policy good_categories &quot;Shopping&quot;; add responder policy p3 'HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL).URL_CATEGORIZE(0,0).CATEGORY.EQUALS_ANY(&quot;good_categories&quot;)'</td>
</tr>
<tr>
<td>Policy to select requests for Search Engine URLs with a reputation score equal to 4.</td>
<td>add responder policy p5 'CLIENT.SSL.DETECTED_DOMAIN.URL_CATEGORIZE(4,0).CATEGORY.EQ(&quot;Search Engine&quot;)'</td>
</tr>
</tbody>
</table>

### URL Categorization Policy Actions

A URL filtering policy evaluates the traffic to identify requests belonging to a particular category. The following table lists the actions that you can assign to a URL filtering policy.

<table>
<thead>
<tr>
<th>Policy Action</th>
<th>Policy Group</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALLOW</td>
<td>Responder</td>
<td>Allow incoming request to access the target URL</td>
</tr>
<tr>
<td>REDIRECT</td>
<td>Responder</td>
<td>Redirect incoming request to the URL specified as the target.</td>
</tr>
<tr>
<td>DENY</td>
<td>Responder</td>
<td>Deny incoming request.</td>
</tr>
<tr>
<td>RESET</td>
<td>Responder, VideoOptimization</td>
<td>Reset connection.</td>
</tr>
</tbody>
</table>
**Setting up URL Categorization**

To set up the feature, you must enable the URL Categorization feature, configure the filtering parameters and set the shared memory limit.

**To enable URL Filtering feature**

At the command prompt, type:
NetScaler 12.0

enable ns feature URLFiltering VideoOptimization Responder IC SSL AppFlow

To configure shared memory limit

At the command prompt, type:

```
set cache parameter [-memLimit <megaBytes>]
```

where memLimit is the memory limit for caching.

Example:

```
set cache parameter -memLimit 10
```

To configure URL categorization parameters

At the command prompt, type:

```
set urlfiltering parameter [-HoursBetweenDBUpdates <positive_integer>] [-TimeOfDayToUpdateDB <HH:MM>]
```

*Example:

```
set urlfiltering parameter -HoursBetweenDBUpdates 3 -TimeOfDayToUpdateDB 03:00
```

Configuring URL categorization for HTTP traffic

To configure the URL categorization feature for HTTP traffic, you must configure a loading balancing virtual server, add URL categorization policies and bind the policies to the virtual server. By doing so, the virtual server receives the HTTP traffic and based on policy evaluation, the system assigns a filtering action.

To add URL categorization action for HTTP traffic

At the command prompt, type:

```
add responder action <name> <type> (<target> | <htmlpage>) [-comment <string>] [-responseStatusCode <positive_integer>] [-reasonPhrase <string>]
```
Example:

```
add responder action act_url_categorize respondwith "HTTP/1.1 200 OK\n\n\n" + HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL).URL_CATEGORIZE
(0,0).CATEGORY + "\n"
```

To add URL categorization policy for HTTP traffic

At the command prompt, type:

```
add responder policy <name> <rule> <action> [undefAction] [-comment <
string>] [-logAction <string>] [-appflowAction <string>]
```

Example:

```
add responder policy pol_url_categorize_http "HTTP.REQ.HOSTNAME.APPEND(
HTTP.REQ.URL).URL_CATEGORIZE(0,0).GROUP.EQ("Adult") || HTTP.REQ.
HOSTNAME.APPEND(HTTP.REQ.URL).URL_CATEGORIZE(0,0).GROUP.EQ (""
Gambling")")" RESET
```

To add a HTTP load balancing virtual server

If a virtual server for HTTP traffic is not already configured, at the command prompt, type:

```
add lb vserver <name> [-td <positive_integer>] <serviceType> [-clt
Timeout <secs>]
```

Example:

```
add lb vserver vsrv-HTTP HTTP * 80 -persistenceType NONE -cltTimeout 120
```

To bind URL categorization policy with load balancing virtual server

At the command prompt, type:

```
bind lb vserver <name> -policyName <string> [-priority <positive_integer>]
```

Example:

```
bind lb vsrv-HTTP -policyName pol_url_categorize_http -priority 10 -
gotoPriorityExpression END -type REQUEST
```
Configuring URL categorization for HTTPS traffic

To configure the URL categorization feature for HTTPS traffic, you must configure a SSL-bridge load balancing virtual server, add URL categorization policies and bind the policies to the SSL-bridge virtual server. By doing so, the server receives the HTTPS traffic and based on policy evaluation, the system assigns a filtering action.

To add URL categorization policy for HTTPS traffic

At the command prompt, type:

```
add videooptimization detectionpolicy <name> -rule <expression> -action <string> [-undefAction <string>] [-comment <string>] [-logAction <string>]
```

Example:

```
add videooptimization detectionpolicy pol_url_categorize_https_block_adult -rule 'CLIENT.SSL.DETECTED_DOMAIN.URL_CATEGORIZE(0,0).CATEGORY.EQ("Adult")' -action RESET
```

To add SSL-Bridge load balancing virtual server

At the command prompt, type:

```
add lb vserver <name> [-td <positive_integer>] <serviceType> [-cltTimeout <secs>]
```

Example:

```
add lb vserver vsrv-HTTPS SSL_BRIDGE * 443 -persistenceType NONE -cltTimeout 180
```

To bind categorization policy with SSL-Bridge virtual server

At the command prompt, type:

```
bind lb vserver <name> -policyName <string> [-priority <positive_integer>]
```

Example:
NetScaler 12.0

```bash
bind lb vserver vsrv-HTTPS -policyName pol_url_categorize_https_block_adult -priority 20 -type REQUEST
```

**Configuring URL Categorization by using the GUI**

The GUI enables you to:

- Enable the URL Categorization feature.
- Add URL Categorization actions for HTTP traffic.
- Add URL Categorization policies for HTTP traffic.
- Add URL Categorization policies for HTTPS traffic.
- Add a load balancing virtual server for HTTP traffic.
- Add an SSL bridge load balancing virtual server for HTTPS traffic.
- Bind URL Categorization policies to the load balancing virtual server.
- Bind URL Categorization policies to the SSL-Bridge load balancing virtual server.
- Configure shared memory limit.
- Configure URL categorization parameters.

**To enable URL categorization**

1. In the navigation pane, expand System and then click Settings.
2. On the Settings page, click Configure Advanced Features link.
3. On the Configure Advanced Features page, select URL Filtering check box.
4. Click OK and Close.

**To add a URL categorization action**

1. In the navigation pane, expand AppExpert > Responder > Action.
2. In the details pane, click Add.
3. On the Create Responder Action page, set the following parameters.
   a) **Name**. Name of the URL categorization policy action.
   b) **Type**. Select an action type.
   c) **Expression**. Use the expression editor to create the policy expression.
   d) **Comments**. A short description of the policy action.
4. Click Create and Close.

**To add a URL categorization policy for HTTP traffic**

1. In the navigation pane, expand AppExpert > Responder > Policies.
2. On the details pane, click **Add**.

3. On the **Create Responder Policy** page, set the following parameters.
   a) **Name.** Name of the URL categorization policy action.
   b) **Action.** Select the URL Categorization action that you prefer to associate with the policy.
   c) **Log Action.** Select the log action.
   d) **AppFlow.** Select an Appflow action.
   e) **Expression.** Use the expression editor to create the policy expression.
   f) **Comments.** A short description about the policy action.

4. Click **Create** and **Close**.

**To add a categorization policy for HTTPS traffic**

1. Log on to the NetScaler appliance and navigate to **Configuration > Optimization > Video Optimization > Detection.**
2. On the **Detection** page, click the **Video Optimization Detection Policies** link.
3. On the Video Optimization Detection Policies page, click **Add**.
4. On the **Create Video Optimization Detection Policy** page, set the following parameters.
   a) **Name.** Name of the optimization policy
   b) **Expression.** Configure policy using custom expressions.
   c) **Action.** Optimization action associated with the policy to handle the incoming video traffic.
   d) **UNDEF Action.** Undefined event if the incoming request does not match the optimization policy.
   e) **Comment.** A short description about the policy.
   f) **Log Action.** Select an audit log action that specifies the action to be performed for the log messages.

5. Click **Create** and **Close**.

**To add a load balancing virtual server for HTTP traffic**

1. Navigate to the **Traffic Management > Load Balancing > Virtual Servers** page.
2. In the details pane, click **Add**.
3. On the **Load Balancing Virtual Server** page set the following parameters:
   a) **Name.** Name of the load balancing virtual server.
   b) **Protocol.** Choose protocol type as HTTP.
   c) **IP Address Type.** IPv4 or IPv6.
   d) **IP Address.** IPv4 or IPv6, VIP address assigned to the virtual server.
   e) **Port.** Port number of the virtual server.
4. Click **OK** to continue with the configuration of other, optional, parameters.
5. Click Create and Close.

To add an SSL-bridge load balancing virtual server

2. On the details pane, click Add.
3. On the Load Balancing Virtual Server page, set the following parameters:
   a) Name. Name of the load balancing virtual server.
   b) Protocol. Select protocol type as SSL-bridge.
   c) IP Address Type. IP addressable type.
   d) IP Address. IP 4 or IP6 IP address assigned to the virtual server.
   e) Port. Port number of the virtual server.
4. Choose OK to continue configuration other optional parameters.
5. Click Create and then Close.

To bind a URL categorization policy to the HTTP load balancing virtual server

2. On the details pane, select the load balancing virtual server and click Edit.
3. In the Advanced Setting section, click Policies.
4. In the Policies section, click the + icon to access the Policies slider.
5. Set the following parameters.
   a) Choose Policy. Select URL categorization policy from the drop-down list.
   b) Choose Type. Select the policy type as Request.
6. Click Continue.
7. Select the URL categorization policy from the list and click Close.

To bind a categorization policy to the SSL-bridge load balancing virtual server

2. In the details pane, select the SSL-bridge load balancing virtual server and click Edit.
3. In the Advanced Setting section, click Policies.
4. In the Policies section, click + icon to access the Policies slider.
5. In the Policies section, set the following parameters.
   a) Choose Policy. Select video detection policy from the drop-down list.
   b) Choose Type. Select the policy type as Request.
6. Click Continue.
7. Select the video detection policy from the list and click Close.
To configure the shared memory limit

1. Sign on to the appliance and navigate to Optimization.
2. In the details pane, click Change cache settings link.
3. On the Cache Global Settings page, set the following parameters.
   a) Memory Usage Limit (MB).
   b) Active memory Usage Limit.
   c) Via Header.
   d) Maximum Post Body Length to be Cached
   e) Global Undefined-Result Action
   f) Enable HA Object Persist
   g) Verify Cached Object Persist
   h) Prefetches
4. Click OK and Close

To configure URL categorization parameters

1. Sign to the appliance and navigate to Security.
2. On the details pane, click Change URL filtering settings link.
3. In the Configuring URL Filtering Params page, set the following parameters.
   a) Hours Between DB Updates. URL Filtering hours between database updates. Minimum value: 0 and Maximum value: 720.
   b) Time of Day to Update DB. URL Filtering time of day to update the database.
4. Click OK and Close.

Configuring Audit Log Messaging

Audit logging enables you to review a condition or a situation in any phase of URL Categorization process. When a NetScaler appliance receives an incoming URL, if the responder policy has an URL Filtering expression, the audit log feature collects URL Set information in the URL and stores it as log messages for any target allowed by audit logging.

Source IP address (the IP address of the client that made the request).

- Destination IP address (the IP address of the requested server).
- Requested URL containing the schema, the host and the domain name (http://www.example.com).
- URL category that the URL filtering framework returns.
- URL category group that the URL filtering framework returned.
- URL reputation number that the URL filtering framework returned.
• Audit log action taken by URL Categorization policy.

To configure audit logging for URL List feature, you must complete the following tasks:

1. Enable Audit Log.
2. Create Audit Log message action.
3. Set URL List responder policy with Audit Log message action.

For more information, see Audit Logging topic.

Storing Failure Errors Using SYSLOG Messaging

At any stage of the URL Filtering process, if there is a system-level failure, the NetScaler appliance uses the audit log mechanism to store logs in the ns.log file. The errors are stored as text messages in SYSLOG format so that, an administrator can view it later in a chronological order of event occurrence. These logs are also sent to an external SYSLOG server for archival. For more information, see article CTX229399.

For example, if a failure occurs when you initialize the URL Filtering SDK, the error message is stored in the following messaging format.

Oct 3 15:43:40 <local0.err> ns URLFiltering[1349]: Error initializing NetStar SDK (SDK error=-1). (status=1).

The NetScaler appliance stores the error messages under four different failure categories:

• Download failure. If an error occurs when you try to download the categorization database.
• Integration failure. If an error occurs when you integrate an update into the existing categorization database.
• Initialization failure. If an error occurs when you initialize the URL Categorization feature, set categorization parameters, or end a categorization service.
• Retrieval failure. If an error occurs when the appliance retrieves the categorization details of the request.

URL Reputation Score

The URL Categorization feature provides policy-based control to restrict blacklisted URLs. You can control access to websites based on URL category, reputation score, or URL category and reputation score. If a network administrator monitors a user accessing highly risky websites, he or she can use a responder policy bound to the URL reputation score to block such risky web sites.

Upon receiving an incoming URL request, the appliance retrieves the category and reputation score from the URL categorization database. Based on the reputation score returned by the database, the
NetScaler 12.0

appliance assigns a reputation rating for websites. The value can range from 1 to 4, where 4 is the riskiest type of websites, as shown in the following table.
<table>
<thead>
<tr>
<th>URL Reputation Rating</th>
<th>Reputation Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Clean site.</td>
</tr>
<tr>
<td>2</td>
<td>Unknown site.</td>
</tr>
<tr>
<td>3</td>
<td>Potentially dangerous or affiliated to</td>
</tr>
<tr>
<td></td>
<td>dangerous site.</td>
</tr>
<tr>
<td>4</td>
<td>Malicious site.</td>
</tr>
</tbody>
</table>

**NetScaler Solutions**

September 17, 2018

NetScaler solutions simplify the task of setting up frequently deployed configurations. Check this space from time to time for additional solutions.

**This section includes the following solutions**

- Setting Up NetScaler for XenApp/XenDesktop
- Global Server Load Balancing (GSLB) Powered Zone Preference
- NetScaler in a Private Cloud Managed by Microsoft Windows Azure Pack and Cisco ACI

**Setting Up NetScaler appliance for XenApp/XenDesktop**

January 6, 2019

A NetScaler appliance can provide load balanced, secure remote access to your XenApp/XenDesktop applications. You can use the NetScaler appliance load balancing feature to distribute traffic across the XenApp/XenDesktop servers, and the NetScaler Gateway feature to provide secure remote access to the servers. NetScaler appliance can also accelerate and optimize the traffic flow and offer visibility features that are useful for XenApp/XenDesktop deployments.

Figure 1. NetScaler appliance in XenApp/XenDesktop Setup

The above figure shows the components involved in this deployment:

- **NetScaler Gateway.** Provides the URL for user access, and provides security by authenticating the users.

- **NetScaler appliance load balancing virtual server.** Load balances the traffic for the Web Interface or StoreFront servers. You can also deploy a load balancing virtual server in front of the
XenApp/XenDesktop servers to load balance key components such as XML Broker and Desktop Delivery Controller (DDC) server.

- **Web Interface or StoreFront or Web Interface on NetScaler appliance.** Provides the interface through which you can access the applications.

  Note: Web Interface on NetScaler (WIonNS) is a customization of the Web Interface product, hosted on the NetScaler appliance.

- **XenApp/XenDesktop.** Provides the applications that your users want to access.

To set up the NetScaler appliance for XenApp/XenDesktop by using the NetScaler appliance GUI

**Prerequisites**

- XenApp/XenDesktop servers are configured and available.
- Web Interface, StoreFront, or Web Interface on NetScaler servers are configured and available.
- You have a working knowledge of NetScaler Gateway, NetScaler, XenApp, XenDesktop, and StoreFront/Web Interface/Web Interface on NetScaler. For more information, see “Citrix eDocs.”
- Make sure that you have configured a virtual server and a service and bound the service to the virtual server.

**Procedure:**

1. Log on to the NetScaler appliance and on the **Configuration** tab click **XenApp and XenDesktop.**
2. On the **Details** pane, click **Get Started.** If the setup exists on the NetScaler, click the **Edit** link corresponding to each of the section that you want to modify.
3. Select the product (StoreFront, Web Interface, or Web Interface on NetScaler appliance) that in your deployment provides the interface for access to the XenApp/XenDesktop applications.
4. Set up secure remote access.
   a) In the NetScaler Gateway Settings** section, specify the details for the VPN virtual server and click **Continue.**
   b) In the **Server Certificate** section, choose an existing certificate or install a new certificate and click **Continue.**
   c) In the **Authentication** section, configure the primary authentication mechanism to be used and specify the server details or use an existing server and click **Continue.**
   d) In the **StoreFront** section, specify the details of the server that provides the interface for accessing the applications and click **Continue.**
   e) You can use one of the following as your StoreFront server.
      i. LB vserver pointing to multiple SF servers.
      ii. Web Interface or StoreFront server directly reachable from the NetScaler appliance.
      iii. Web Interface on NetScaler.
5. Click **Done** to complete the configuration.
Global Server Load Balancing (GSLB) Powered Zone Preference

January 6, 2019

GSLB powered zone preference is a feature that integrates XenApp/XenDesktop, StoreFront, and NetScaler appliance to provide clients access to the most optimized data center on the basis of the client location.

In a distributed XenApp/XenDesktop deployment, StoreFront might not select an optimal datacenter when multiple equivalent resources are available from multiple datacenters. In such cases, StoreFront randomly selects a datacenter. It can send the request to any of the XenApp/XenDesktop servers in any datacenter, regardless of proximity to the client making the request.

With this enhancement, the client IP address is examined when an HTTP request arrives at the NetScaler Gateway appliance, and the real client IP address is used to create the datacenter preference list that is forwarded to StoreFront. If the NetScaler appliance is configured to insert the zone preference header, StoreFront 3.5 or later can use the information provided by the appliance to reorder the list of delivery controllers and connect to an optimal delivery controller in the same zone as the client. StoreFront selects the optimal gateway VPN virtual server for the selected datacenter zone, adds this information to the ICA file with appropriate IP addresses, and sends it to the client. StoreFront then tries to launch applications hosted on the preferred datacenter’s delivery controllers before trying to contact equivalent controllers in other datacenters.

For more information about configuring this solution, click here.

For a video overview about GSLB powered zone preference solution, click https://www.youtube.com/watch?v=Y8DELu0Xp0.

NetScaler appliance in a Private Cloud Managed by Microsoft Windows Azure Pack and Cisco ACI

January 6, 2019

You can use a NetScaler appliance for load balancing in a private cloud that is managed through Microsoft Windows Azure Pack. The network for the private cloud is automated by using Cisco ACI and NetScaler appliance.

This solution involves many integration points, such as Windows Azure Pack (WAP) to Cisco APIC, Cisco APIC to System Center Virtual Machine Manager (SCVMM), and Cisco APIC to NetScaler appliance. As a tenant in the private cloud, you can enable NAT, provision network services, and add a load balancer.

WAP supports tenant and administrator portals where an administrator can perform administrative tasks such as ACI registration, VIP range, NetScaler appliance device association with virtual machine...
cloud, tenant user account creation, and so on. Tenants can log on to the WAP Tenant Portal and configure the network, bridge domains, and Virtual Routing and Forwarding (VRFs), and make use of the NetScaler appliance load balancing and RNAT features.

**Important**

- In this solution, the NetScaler appliance provides only basic load balancing.
- Tenants can deploy multiple VIP addresses with different ports for the same network, but must ensure that the IP and port combination is unique.
- The NetScaler appliance device package supports only single-context deployment. Each Tenant gets a dedicated NetScaler appliance instance.
- WAP supports NetScaler appliance MPX appliances and NetScaler appliance VPX virtual appliances, including NetScaler appliance VPX instances deployed on the NetScaler appliance SDX platform.

The following illustration provides an overview of the solution:

**Prerequisites**

Make sure that:

- You have conceptual knowledge of Cisco ACI components and NetScaler appliances.
  - For more information about the NetScaler appliances, see the NetScaler appliance product documentation at [http://docs.citrix.com/](http://docs.citrix.com/).
- You have installed NetScaler appliance software release 11.1 or later.
- You configure NetScaler appliance software release 11.1 or later.
- Management connectivity of Cisco APIC to NetScaler appliance are established.

© 1999-2018 Citrix Systems, Inc. All rights reserved.
You upload the NetScaler appliance device package version 11.1-52.3 and register the NetScaler appliance device in Cisco ACI by using Cisco APIC.

- You configure the NetScaler appliance in Cisco APIC's common tenant and make sure that there are no faults in Cisco APIC.
- You have configured all the APIC specific configurations such as, VLAN pool, L3OutServicesDom, L3ExtOUt, resource pool, and so on. For more information, see Cisco documentation.

Creating a NetScaler appliance Load Balancer in a Plan in the Service Management Portal (Admin Portal)

January 6, 2019

The Service Management Portal in WAP allows an administrator to register Cisco APIC with WAP and also create a hosting plan. As part of the plan, you can specify the VIP range, associate the NetScaler appliance load balancer with the plan, create tenant user accounts, and so on.

To create a NetScaler appliance Load Balancer in a Plan in the Admin Portal:

2. In the Navigation pane, select PLANS.
3. In the plans pane, select the plan that you want to add a load balancer.
4. In the selected plan’s pane, select Networking (ACI).
5. On the Networking (ACI) pane, in the L4-L7 SERVICE POOL drop-down list, select the L4-L7 resource pool that you had created in Cisco APIC.
6. Create a tenant user account and associate the user with the plan you have created.

Configuring a NetScaler appliance Load Balancer by Using the Service Management Portal (Tenant Portal)

January 6, 2019

In WAP, once the Tenant creates the Bridge Domain (BD), VRF, and a Network, the Tenant can configure NetScaler appliance Load Balancer through the Service Management Portal (Tenant Portal).

To configure NetScaler appliance Load Balancer in Service Management Portal (Tenant Portal)

2. Create a bridge domain and VRF, as follows:
   a. In the navigation pane, select ACI.
b. Click **NEW**.

c. In the **NEW** pane, select **BRIDGE DOMAIN**.

d. In the **BRIDGE DOMAIN** field, enter the bridge domain name (for example, BD01).

e. (Optional) In the **SUBNET’S GATEWAY** field, enter the subnet’s gateway (for example, 192.168.1.1/24).

f. In the **VRF** field, select a VRF that is already part of the subscription or select **Create One** to create a VRF.

g. Click **CREATE**.

3. Create a network and associate it with the bridge domain that you created. Do the following:

a. In the navigation pane, select **ACI**.

b. Click **NEW**.

c. In the **NEW** pane, select **NETWORK**.

d. In the **NETWORKNAME** field, enter the network name (for example, S01).

e. In the **BRIDGE DOMAIN** drop-down list, select the bridge domain you have created. (for example, BD01).

f. In the subnet’s **GATEWAY** field, enter the subnet’s gateway address (for example, 172.23.2.1/24).

g. (Optional) In the **DNSSERVERIP/IP** field, enter the DNS server details.

h. Click **CREATE**.

4. In the **ACI** pane, select **NETWORKS**.

5. Double-click the network that you have created. Then, in the network pane, select **Enable load balancer (public)**. In the **IP ADDRESS** field, a VIP is automatically assigned from the VIP Range that the administrator configured in the Admin Portal. For more information, see [Creating a NetScaler appliance Load Balancer to a Plan in Service Management Portal (Admin Portal)].

6. Double-click the network that you have created. Then, in the network pane, select **Enable load balancer (public)**. In the **IP ADDRESS** field, a VIP is automatically assigned from the VIP Range that the administrator configured in the Admin Portal. For more information, see [Creating a NetScaler appliance Load Balancer to a Plan in Service Management Portal Admin Portal]

6. In the network pane, select the **Load Balancers** tab, and click **ADD**.

7. In the **ADD NETWORK LOAD BALANCER** pane, do the following:

   a. In the **NAME** field, enter the name for the load balancer.

   b. Optionally, in the **VIRTUAL IP ADDRESS** field, assign the load balancer a VIP address from the VIP range that you defined earlier.
c. Optionally, in the **PROTOCOL** field, select **TCP**.

d. In the **PORT** field, enter the port number.

8. Click **CREATE**.

The NetScaler appliance Load Balancer is displayed in the **LOAD BALancers** tab and the NetScaler appliance Load Balancer is data path ready.

### Deleting a NetScaler appliance Load Balancer from the Network

January 6, 2019

Using Service Management Portal (Tenant Portal), from the Network, you can delete the NetScaler appliance load balancer that you created.

**To delete a NetScaler appliance load balancer from the Network:**

2. In the navigation pane, select **ACI**.
3. In the **ACI** pane, on the **NETWORKS** tab, click the network that you created.
4. In the selected network’s pane, select the NetScaler appliance load balancer and click **DELETE**.
5. Click **OK** to delete the NetScaler appliance load balancer.

### Deploy a NetScaler VPX instance

December 7, 2018

The NetScaler VPX product is a virtual appliance that can be hosted on a wide variety of virtualization and cloud platforms:

- Citrix XenServer
- VMware ESX
- Microsoft Hyper-V
- Linux KVM
- Amazon Web Services
- Microsoft Azure

For more information, see the [NetScaler VPX data sheet](#).
NetScaler Management and Analytics for NetScaler VPX instances

NetScaler Management and Analytics Service (MAS) is a centralized management solution that simplifies operations by providing administrators with enterprise-wide visibility and automating management jobs that need to be executed across multiple instances.

You can manage and monitor NetScaler VPX instances as well as other Citrix application networking products such as Citrix Gateway, NetScaler SDX, NetScaler CPX, and Citrix SD-WAN. You can use MAS to manage, monitor, and troubleshoot the entire global application delivery infrastructure from a single, unified console.

For more information, see NetScaler Management and Analytics documentation.

Support matrix and usage guidelines

January 6, 2019

This document lists the different hypervisors and features supported on a NetScaler VPX instance as well as the limitations and usage guidelines that apply.

- Table 1-5 list the different supported hypervisors.
- Table 6 lists the different VPX features and limitations for the different hypervisors supported on a NetScaler VPX instance.
- Table 7 lists the supported web browsers that allow you access the GUI and Dashboard.

Table 1. VPX instance on XenServer

<table>
<thead>
<tr>
<th>XenServer version</th>
<th>SysID</th>
<th>VPX models</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.5, 7.0,7.1</td>
<td>450000</td>
<td>VPX 10, VPX 25, VPX 200, VPX 1000, VPX 3000, VPX 5000, VPX 8000, VPX 10G, VPX 15G, VPX 25G, VPX 40G</td>
</tr>
</tbody>
</table>

Table 2. VPX instance on VMware ESX server
<table>
<thead>
<tr>
<th>VMware ESX version</th>
<th>SysID</th>
<th>VPX models</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.0, build numbers 3620759, 5050593 (supported from NetScaler release 12.0 build 51.x onwards)</td>

</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>450020</td>
<td>VPX 10, VPX 200, VPX 1000, VPX 3000, VPX BYOL</td>
</tr>
</tbody>
</table>
Table 6. VPX feature matrix

*Clustering support is available on SRIOV for client- and server-facing interfaces and not for the backplane.

**Interface DOWN events are not recorded in NetScaler VPX instances.

For Static LA, traffic might still be sent on the interface whose physical status is DOWN.
For LACP, peer device knows interface DOWN event based on LACP timeout mechanism.

Short timeout: 3 seconds
Long timeout: 90 seconds

For LACP, interfaces should not be shared across VMs.

For Dynamic routing, convergence time depends on the Routing Protocol since link events are not detected.

Monitored static Route functionality fails if monitors are not bound to static routes since Route state depends on the VLAN status. The VLAN status depends on the link status.

Partial failure detection does not happen in high availability if there is link failure. High availability-split brain condition might happen if there is link failure.

***When any link event (disable/enable, reset) is generated from a VPX instance, the physical status of the link does not change. For static LA, any traffic initiated by the peer gets dropped on the instance.
For LACP, peer device knows interface DOWN event based on LACP timeout mechanism.

Short timeout: 3 seconds
Long timeout: 90 seconds

For LACP, interfaces should not be shared across VMs.

- For the VLAN tagging feature to work, do the following:

On the VMware ESX, set the port group’s VLAN ID to 1 - 4095 on the vSwitch of VMware ESX server. For more information about setting a VLAN ID on the vSwitch of VMware ESX server, see pdf.

Table 7. Supported browsers

Install a NetScaler VPX instance on XenServer

January 6, 2019

To install VPX instances on Citrix XenServer, you must first install XenServer on a machine with adequate system resources. To perform the NetScaler VPX instance installation, you use Citrix XenCenter, which must be installed on a remote machine that can connect to the XenServer host through the network.

For more information about XenServer, see XenServer documentation.

The following figure shows the bare-metal solution architecture of NetScaler VPX instance on XenServer.

Figure. A NetScaler VPX instance on XenServer

Prerequisites for installing a NetScaler VPX instance on XenServer

Before you begin installing a virtual appliance, do the following:

- Install XenServer version 6.0 or later on hardware that meets the minimum requirements.
- Install XenCenter on a management workstation that meets the minimum system requirements.
- Obtain virtual appliance license files. For more information about virtual appliance licenses, see the NetScaler VPX Licensing Guide at http://support.citrix.com/article/ctx122426.

XenServer hardware requirements

The following table describes the minimum hardware requirements for a XenServer platform running a NetScaler VPX instance.

Table 1. Minimum system requirements for XenServer running a nCore VPX instance
## Component Requirement

<table>
<thead>
<tr>
<th>Component</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>CPU</td>
<td>2 or more 64-bit x86 CPUs with virtualization assist (Intel-VT or AMD-V) enabled. Note: To run NetScaler VPX instance, hardware support for virtualization must be enabled on the XenServer host. Make sure that the BIOS option for virtualization support is not disabled. Consult your BIOS documentation for more details.</td>
</tr>
<tr>
<td>RAM</td>
<td>3 GB</td>
</tr>
<tr>
<td>Disk space</td>
<td>Locally attached storage (PATA, SATA, SCSI) with 40 GB of disk space. Note: XenServer installation creates a 4 GB partition for the XenServer host control domain; the remaining space is available for NetScaler VPX instance and other virtual machines.</td>
</tr>
<tr>
<td>NIC</td>
<td>One 1-Gbps NIC; recommended: two 1-Gbps NICs</td>
</tr>
</tbody>
</table>

The following table lists the virtual computing resources that XenServer must provide for each nCore VPX virtual appliance.

**Table 2. Minimum virtual computing resources required for running a ncore VPX instance**

<table>
<thead>
<tr>
<th>Component</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Memory</td>
<td>2 GB</td>
</tr>
<tr>
<td>Virtual CPU (VCPU)</td>
<td>2</td>
</tr>
<tr>
<td>Virtual network interfaces</td>
<td>2</td>
</tr>
</tbody>
</table>

Note: For production use of NetScaler VPX instance, Citrix recommends that CPU priority (in virtual machine properties) be set to the highest level, in order to improve scheduling behavior and network latency.
XenCenter system requirements

XenCenter is a Windows client application. It cannot run on the same machine as the XenServer host. The following table describes the minimum system requirements.

### Table 3. Minimum system requirements for XenCenter installation

<table>
<thead>
<tr>
<th>Component</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Operating system</td>
<td>Windows 7, Windows XP, Windows Server 2003, or Windows Vista</td>
</tr>
<tr>
<td>.NET framework</td>
<td>Version 2.0 or later</td>
</tr>
<tr>
<td>CPU</td>
<td>750 MHz; recommended: 1 gigahertz (GHz) or faster</td>
</tr>
<tr>
<td>RAM</td>
<td>1 GB, recommended: 2 GB</td>
</tr>
<tr>
<td>NIC</td>
<td>100 Mb/s or faster NIC</td>
</tr>
</tbody>
</table>

For information about installing XenCenter, see the XenServer documentation at [http://support.citrix.com/product/xens/](http://support.citrix.com/product/xens/).

Install NetScaler VPX instances on XenServer by using XenCenter

After you have installed and configured XenServer and XenCenter, you can use XenCenter to install virtual appliances on XenServer. The number of virtual appliances that you can install depends on the amount of memory available on the hardware that is running XenServer.

After you have used XenCenter to install the initial NetScaler VPX instance (.xva image) on XenServer, you have the option to use Command Center to provision NetScaler VPX instance. For more information, see the Command Center documentation.

To install NetScaler VPX instances on XenServer by using XenCenter, follow these steps:

1. Start XenCenter on your workstation.
2. On the Server menu, click Add.
3. In the Add New Server dialog box, in the Hostname text box, type the IP address or DNS name of the XenServer that you want to connect to.
4. In the User Name and Password text boxes, type the administrator credentials, and then click Connect. The XenServer name appears in the navigation pane with a green circle, which indicates that the XenServer is connected.
5. In the navigation pane, click the name of the XenServer on which you want to install NetScaler VPX instance.
6. On the VM menu, click Import.
7. In the Import dialog box, in Import file name, browse to the location at which you saved the NetScaler VPX instance .xva image file. Make sure that the Exported VM option is selected, and then click Next.
8. Select the XenServer on which you want to install the virtual appliance, and then click Next.
9. Select the local storage repository in which to store the virtual appliance, and then click Import to begin the import process.
10. You can add, modify, or delete virtual network interfaces as required. When finished, click Next.
11. Click Finish to complete the import process.
   
   Note: To view the status of the import process, click the Log tab.
12. If you want to install another virtual appliance, repeat steps 5 through 11.

Note

After the initial configuration of the VPX instance, if you want to upgrade the appliance to the latest software release, see Upgrading or Downgrading the System Software.

Configure VPX instances to use single root I/O virtualization (SR-IOV) network interfaces

November 2, 2018

After you have installed and configured a NetScaler VPX instance on XenServer, you can configure the virtual appliance to use SR-IOV network interfaces.

Limitations

XenServer does not support the following features on SRIOV interfaces:

- L2 mode switching
- Clustering
- Admin partitioning [Shared VLAN mode]
- High Availability [Active - Active mode]
- Jumbo frames
- IPv6 protocol in Cluster environment

Prerequisites

On the XenServer host, ensure that you:
• Add the Intel 82599 Network Interface Card (NIC) to the host.
• Blacklist the ixgbevf driver by adding the following entry to the /etc/modprobe.d/blacklist.conf file:
  blacklist ixgbevf
• Enable SR-IOV Virtual Functions (VFs) by adding the following entry to the /etc/modprobe.d/ixgbe file:
  options ixgbe max_vfs=<number_of_VFs>
  where <number_VFs> is the number of SR-IOV VFs that you want to create.
• Verify that SR-IOV is enabled in BIOS.

IXGBE driver version 3.22.3 is recommended.

Assign SR-IOV VFs to the VPX instance by using the XenServer host

To assign SR-IOV network interfaces to NetScaler VPX instance, follow these steps:
1. On the XenServer host, use the following command to assign the SR-IOV VFs to the NetScaler VPX instance:

   xehost-call-plugin plugin=iovirthost-uuid=<XenhostUUID> fn=assign_free_vf args:uuid=<NetscalerVMUUID> args:ethdev=<interfacename> args:mac=<macaddr>

   Where:
   • <XenhostUUID> is the UUID of the XenServer host.
   • <NetscalerVMUUID> is the UUID of the NetScaler VPX instance.
   • <interfacename> is the interface for the SR-IOV VFs.
   • <macaddr> is the mac address of the SR-IOV VF.

   Note
   Specify the mac address that you want use in the args:mac= parameter, if not specified, the iovirt
   script randomly generates and assigns a mac address. Also, if you want use the SR-IOV VFs in Link
   Aggregation mode, make sure that you specify the mac address as 00:00:00:00:00:00.
2. Boot the NetScaler VPX instance.

Unassign SR-IOV VFs to the VPX instance by using the XenServer host

If you have assigned an incorrect SR-IOV VFs or if you want modify the a assigned SR-IOV VFs, you need
 to unassign and reassign the SR-IOV VFs to the NetScaler VPX instance.

To unassign SR-IOV network interface assigned to a NetScaler VPX instance, follow these steps:
1. On the XenServer host, use the following command to assign the SR-IOV VFs to the NetScaler VPX instance and reboot the NetScaler VPX instance:

```
xehost-call-plugin plugin=iovirt host-uuid=<Xen_host_UUID> fn=unassign_all args:uuid=<Netscalar_VM_UUID>
```

Where:
- `<Xen_host_UUID>` - The UUID of the XenServer host.
- `<Netscalar_VM_UUID>` - The UUID of the NetScaler VPX instance

2. Boot the NetScaler VPX instance.

**Configuring VLAN on the SR-IOV Interface**

**Important**

While you are assigning the SR-IOV VFs to the NetScaler VPX instance, make sure that you specify MAC address 00:00:00:00:00:00 for the VFs.

To use the SR-IOV virtual functions in link aggregation mode, you need to disable spoof checking for virtual functions that you have created. On the XenServer host, use the following command to disable spoof checking:

```
ipe link set <interface_name> vf <VF_id> spoofchk off
```

Where:
- `<interface_name>` is the interface name.
- `<VF_id>` is the virtual function ID.

After disabling spoof checking for all the Virtual Function that you have created, restart the NetScaler VPX instance and configure link aggregation. For instructions, see Configure link aggregation.

**Configure VLAN on the SR-IOV interface**

You can configure VLAN on the SR-IOV Virtual Functions, for instructions, see Configuring a VLAN.

**Important**

Make sure that the XenServer host does not contain VLAN settings for the VF interface.

**Install a NetScaler VPX instance on VMware ESX**

September 20, 2018

Before installing NetScaler VPX instances on VMware ESX, make sure that VMware ESX Server is installed on a machine.
with adequate system resources. To install a NetScaler VPX instance on VMware ESXi, you use VMware vSphere client. The client or tool must be installed on a remote machine that can connect to VMware ESX through the network.

This section includes the following topics:

- Prerequisites
- Installing a NetScaler VPX instance on VMware ESX

**Important**

You cannot install standard VMware Tools or upgrade the VMware Tools version available on a NetScaler VPX instance. VMware Tools for a NetScaler VPX instance are delivered as part of the NetScaler software release.

**Prerequisites**

Before you begin installing a virtual appliance, do the following:

- Install VMware ESX on hardware that meets the minimum requirements.
- Install VMware Client on a management workstation that meets the minimum system requirements.
- Download the NetScaler VPX appliance setup files.
- Label the physical network ports of VMware ESX.
- Obtain VPX license files. For more information about NetScaler VPX instance licenses, see the NetScaler VPX Licensing Guide at [http://support.citrix.com/article/ctx131110](http://support.citrix.com/article/ctx131110).

**VMware ESX hardware requirements**

The following table describes the minimum system requirements for VMware ESX servers running NetScaler VPX ncore virtual appliance.

<table>
<thead>
<tr>
<th>Component</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>CPU</td>
<td>2 or more 64-bit x86 CPUs with virtualization assist (Intel-VT or AMD-V) enabled. Note that to run NetScaler VPX instance, hardware support for virtualization must be enabled on the VMware ESX host. Make sure that the BIOS option for virtualization support is not disabled. For more information, see your BIOS documentation.</td>
</tr>
<tr>
<td>RAM</td>
<td>3 GB</td>
</tr>
<tr>
<td>Disk space</td>
<td>40 GB of disk space available</td>
</tr>
</tbody>
</table>
| Network   | One 1-Gbps NIC; Two 1-Gbps NICs recommended (The network interfaces must be Intel
For information about installing VMware ESX, see http://www.vmware.com/.

The following table lists the virtual computing resources that the VMware ESX server must provide for each VPX ncore virtual appliance.

Table 2. Minimum virtual computing resources required for running a NetScaler VPX instance

<table>
<thead>
<tr>
<th>Component</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Memory</td>
<td>2 GB</td>
</tr>
<tr>
<td>Virtual CPU (VCPU)</td>
<td>2</td>
</tr>
<tr>
<td>Virtual network interfaces</td>
<td>1. Note that with ESX, you can install a maximum of 10 virtual network interfaces if the VPX hardware is upgraded version to 7 or higher.</td>
</tr>
<tr>
<td>Disk space</td>
<td>20 GB</td>
</tr>
</tbody>
</table>

For production use of VPX virtual appliance, the full memory allocation must be reserved. CPU cycles (in MHz) equal to at least the speed of one CPU core of the ESX should also be reserved.

**VMware vSphere client system requirements**

VMware vSphere is a client application that can run on Windows and Linux operating systems. It cannot run on the same machine as the VMware ESX server. The following table describes the minimum system requirements.

Table 3. Minimum system requirements for VMware vSphere client installation

<table>
<thead>
<tr>
<th>Component</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Operating system</td>
<td>For detailed requirements from VMware, search for the “vSphere Compatibility Matrixes” PDF file at <a href="http://kb.vmware.com/">http://kb.vmware.com/</a>.</td>
</tr>
<tr>

<td>100 Mbps or faster NIC</td>
</tr>
</tbody>
</table>

**Downloading the NetScaler VPX setup files**

The NetScaler VPX instance setup package for VMware ESX follows the Open Virtual Machine (OVF) format standard. You can download the files from MyCitrix.com. You need a My Citrix account to log on. If you do not have a My Citrix account, access the home page at [http://www.mycitrix.com](http://www.mycitrix.com), click the New Users link, and follow the instructions to create a new My Citrix account.

Once logged on, navigate the following path from the My Citrix home page:

MyCitrix.com > Downloads > NetScaler > Virtual Appliances.

Copy the following files to a workstation on the same network as the ESX server. Copy all three files into the same folder.

- NSVPX-ESX-<release number>-<build number>-disk1.vmdk (for example, NSVPX-ESX-9.3-39.8-disk1.vmdk)
- NSVPX-ESX-<release number>-<build number>.ovf (for example, NSVPX-ESX-9.3-39.8.ovf)
- NSVPX-ESX-<release number>-<build number>.mf (for example, NSVPX-ESX-9.3-39.8.mf )
Label the physical network ports of VMware ESX

Before installing a VPX virtual appliance, label all the interfaces that you plan to assign to virtual appliances, in a unique format, for example, NS_NIC_1_1, NS_NIC_1_2, and so on. In large deployments, labeling in a unique format helps in quickly identifying the interfaces that are allocated to the VPX virtual appliance among other interfaces used by other virtual machines, such as Windows and Linux. Such labeling is especially important when different types of virtual machines share the same interfaces.

To label the physical network ports of VMware ESX server, follow these steps:

1. Log on to the VMware ESX server by using the vSphere client.
2. On the vsphere client, select the Configuration tab, and then click Networking.
3. At the top-right corner, click Add Networking.
4. In the Add Network Wizard, for Connection Type, select Virtual Machine, and then click Next.
5. Scroll through the list of vSwitch physical adapters, and choose the physical port that will map to interface 1/1 on the virtual appliances.
6. Enter the label of the interface, for example, NS_NIC_1_1 as the name of the vSwitch that will be associated with interface 1/1 of the virtual appliances.
7. Click Next to finish the vSwitch creation. Repeat the procedure, beginning with step 2, to add any additional interfaces to be used by your virtual appliances. Label the interfaces sequentially, in the correct format (for example, NS_NIC_1_2).

Install a NetScaler VPX instance on VMware ESX

After you have installed and configured VMware ESX, you can use the VMware vsphere client to install virtual appliances on the VMware ESX server. The number of virtual appliances that you can install depends on the amount of memory available on the hardware that is running VMware ESX.

To install NetScaler VPX instances on VMware ESX by using VMware vsphere Client, follow these steps:

1. Start the VMware vsphere client on your workstation.
2. In the IP address / Name text box, type the IP address of the VMware ESX server that you want to connect to.
3. In the User Name and Password text boxes, type the administrator credentials, and then click Login.
4. On the File menu, click Deploy OVF Template.
5. In the Deploy OVF Template dialog box, in Deploy from file, browse to the location at which you saved the NetScaler VPX instance setup files, select the .ovf file, and click Next.
6. Map the networks shown in the virtual appliance OVF template to the networks that you configured on the ESX host. Click Next to start installing a virtual appliance on VMware ESX. When installation is complete, a pop-up window informs you of the successful installation.
7. You are now ready to start the NetScaler VPX instance. In the navigation pane, select the NetScaler VPX instance that you have just installed and, from the right-click menu, select Power On. Click the Console tab to emulate a console port.
8. If you want to install another virtual appliance, repeat steps 6 through 6.

**Note**

By default, the NetScaler VPX instance uses E1000 network interfaces.

After the installation, you can use vSphere client or vSphere Web Client to manage virtual appliances on VMware ESX.

For more information about installing a NetScaler VPX appliance on VMware ESX, see the following video.

### Configure a NetScaler VPX instance to use VMXNET3 network interface

January 6, 2019

After you have installed and configured the NetScaler VPX instance on the VMware ESX, you can use the VMware vSphere web client to configure the virtual appliance to use VMXNET3 network interfaces.

To configure NetScaler VPX instances to use VMXNET3 network interfaces by using the VMware vSphere Web Client:

1. In the vSphere Web Client, select Hosts and Clusters.
2. Upgrade the Compatibility setting of the NetScaler VPX instance to ESX, as follows:
   a. Power off the NetScaler VPX instance.
   b. Right-click the NetScaler VPX instance and select Compatibility > Upgrade VM Compatibility.
   c. In the Configure VM Compatibility dialog box, select ESXi 5.5 and later from the Compatible with drop-down list and click OK.
3. Right-click on the NetScaler VPX instance and click Edit Settings.
4. In the `<virtual_appliance>` - Edit Settings dialog box, click the CPU section.
5. In the CPU section, update the following:
   - Number of CPUs
   - Number of Sockets
   - Reservations
   - Limit
   - Shares
Set the values as follows:

a. In the CPU drop-down list, select the number of CPUs to assign to the virtual appliance.
b. In the Cores per Socket drop-down list, select the number of sockets.
c. (Optional) In the CPU Hot Plug field, select or unselect the Enable CPU Hot Add checkbox.
   Note: Citrix recommends accepting the default (disabled).
d. In the Reservation drop-down list, select the number that is shown as the maximum value.
e. In the Limit drop-down list, select the number that is shown as the maximum value.
f. In the Shares drop-down lists, select Custom and the number that is shown as the maximum value.

6. In the Memory section, update the following:
   - Size of RAM
   - Reservations
   - Limit
   - Shares

Set the values as follows:

a. In the RAM drop-down list, select the size of the RAM. It should be number of vCPUs x 2 GB. For example, if the number of vCPUs is 4, the RAM should be 4 x 2 GB = 8 GB.
   Note: For an Enterprise or Platinum edition of the NetScaler VPX appliance, make sure that you allocate 4 GB of RAM to each vCPU. For example, if the number of vCPU is 4 then RAM = 4 x 4 GB = 16 GB.
b. In the Reservation drop-down list, enter the value for the memory reservation, and select the Reserve all guest memory (All locked) checkbox. The memory reservation should be the number of vCPUs x 2 GB. For example, if the number of vCPUs is 4, the memory reservation should be 4 x 2 GB = 8 GB.
   Note: For an Enterprise or Platinum edition of the NetScaler VPX appliance, make sure that you allocate 4 GB of RAM to each vCPU. For example, if the number of vCPU is 4 then RAM = 4 x 4 GB = 16 GB.
c. In the Limit drop-down list, select the number that is shown as the maximum value.
d. In the Shares drop-down lists, select Custom and the number that is shown as the maximum value.

7. Add a VMXNET3 network interface. From the New device drop-down list, select Network and click Add.

8. In the New Network section, from the drop-down list, select the network interface, and do the following:
   a. In the Adapter Type drop-down list, select VMXNET3.
Important

The default E1000 network interface and VMXNET3 cannot coexist, make sure that you remove the E1000 network interface and use VMXNET3 (0/1) as the management interface.

9. Click OK.

11. Once the NetScaler VPX instance powers on, you can use the following command to verify the configuration:

```
> show interface summary
```

The output should show all the interfaces that you configured:

```
> show interface summary
```

<table>
<thead>
<tr>
<th>Interface</th>
<th>MTU</th>
<th>MAC</th>
<th>Suffix</th>
</tr>
</thead>
<tbody>
<tr>
<td>0/1</td>
<td>1500</td>
<td>00:0c:29:89:1d:0e</td>
<td>NetScaler VPX...face, VMXNET3</td>
</tr>
<tr>
<td>1/1</td>
<td>9000</td>
<td>00:0c:29:89:1d:18</td>
<td>NetScaler VPX...face, VMXNET3</td>
</tr>
<tr>
<td>1/2</td>
<td>9000</td>
<td>00:0c:29:89:1d:22</td>
<td>NetScaler VPX...face, VMXNET3</td>
</tr>
<tr>
<td>LO/1</td>
<td>9000</td>
<td>00:0c:29:89:1d:0e</td>
<td>Netscaler Loopback</td>
</tr>
</tbody>
</table>

Note

After you add a VMXNET3 interface and restart the NetScaler VPX appliance, the VMWare ESX hypervisor might change the order in which the NIC is presented to the VPX appliance. So, network adapter 1 might not always remain 0/1, resulting in loss of management connectivity to the VPX appliance. To avoid this issue, change the virtual network of the network adapter accordingly.

This is a VMWare ESX hypervisor limitation.

Configure a NetScaler VPX instance to use SR-IOV network interface

January 6, 2019

After you have installed and configured the NetScaler VPX instance on VMware ESX, you can use the
NetScaler 12.0

VMware vSphere web client to configure the virtual appliance to use single root I/O virtualization (SR-IOV) network interfaces.

**Limitations**

A NetScaler VPX configured with SR-IOV network interface has the following limitations:

- The following features are not supported on SR-IOV interfaces using Intel 82599 10G NIC on ESX VPX:
  - L2 mode switching
  - Static Link Aggregation and LACP
  - Clustering
  - Admin partitioning [Shared VLAN mode]
  - High Availability [Active - Active mode]
  - Jumbo frames
  - IPv6

- The following features are not supported for on SR-IOV interface with an Intel 82599 10G NIC on KVM VPX:
  - Static Link Aggregation and LACP
  - L2 mode switching
  - Clustering
  - Admin partitioning [Shared VLAN mode]
  - High Availability [Active – Active mode]
  - Jumbo frames
  - IPv6
  - VLAN configuration on Hypervisor for SR-IOVVF interface through “ip link” command is not supported

**Prerequisite**

Make sure that you:

- Add the Intel 82599 Network Interface Card (NIC) to the ESX Host. IXGBE driver version 3.7.13.7.14iov is recommended.

- Enable SR-IOV on the host physical adapter, as follows:
  1. In the vSphere Web Client, navigate to the Host.
  2. On the Manage > Networking tab, select Physical adapters. The SR-IOV Status field shows whether a physical adapter supports SR-IOV.
  3. Select the physical adapter, and then click the pencil icon to open the Edit Settings dialog box.
4. Under SR-IOV, select **Enabled** from the **Status** drop-down list.

5. In the **Number of virtual functions** field, enter the number of virtual functions that you want to configure for the adapter.

6. Click **OK**.

7. Restart the host.

- Create a Distributed Virtual Switch (DVS) and Portgroups. For instructions, see the VMware Documentation.

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>Citrix has qualified the SR-IOV configuration on DVS and Portgroups only.</td>
</tr>
</tbody>
</table>

**To configure NetScaler VPX instances to use SR-IOV network interface by using VMware vSphere Web Client:**

1. In the vSphere Web Client, select **Hosts and Clusters**.

2. Upgrade the Compatibility setting of the NetScaler VPX instance to ESX 5.5 or later, as follows:
   a. Power off the NetScaler VPX instance.
   b. Right-click the NetScaler VPX instance and select **Compatibility > Upgrade VM Compatibility**.
   c. In the **Configure VM Compatibility** dialog box, select **ESXi 5.5 and later** from the **Compatible with** drop-down list and click **OK**.

3. Right-click on the NetScaler VPX instance and click **Edit Settings**.

4. In the `<virtual_appliance>- Edit Settings` dialog box, click the **CPU** section.

5. In the **CPU** section, update the following settings:

   - **Number of CPUs**
   - **Number of Sockets**
   - **Reservations**
   - **Limit**
   - **Shares**

Set the values as follows:

   a. In the **CPU** drop-down list, select the number of CPUs to assign to the virtual appliance.
   b. In the **Cores per Socket** drop-down list, select the number of sockets.
   c. (Optional) In the **CPU Hot Plug** field, select or clear the **Enable CPU Hot Add** check box.
      
      | Note: Citrix recommends accepting the default (disabled). |

   d. In the **Reservation** drop-down list, select the number that is shown as the maximum value.
e. In the **Limit** drop-down list, select the number that is shown as the maximum value.

f. In the **Shares** drop-down lists, select **Custom** and the number that is shown as the maximum value.

6. In the **Memory** section, update the following settings:
   - Size of RAM
   - Reservations
   - Limit
   - Shares

Set the values as follows:

   a. In the **RAM** drop-down list, select the size of the RAM. It should be number of vCPUs x 2 GB. For example, if the number of vCPU is 4 then RAM = 4 x 2 GB = 8 GB.

   **Note:** For Enterprise or Platinum edition of the NetScaler VPX appliance, make sure that you allocate 4 GB of RAM to each vCPU. For example, if the number of vCPU is 4 then RAM = 4 x 4 GB = 16 GB.

   b. In the **Reservation** drop-down list, enter the value for the memory reservation, and select the **Reserve all guest memory (All locked)** check box. The memory reservation should be number of vCPUs x 2 GB. For example, if the number of vCPUs is 4, the memory reservation should be 4 x 2 GB = 8 GB.

   **Note:** For Enterprise or Platinum edition of the NetScaler VPX appliance, make sure that you allocate 4 GB of RAM to each vCPU. For example, if the number of vCPU is 4 then RAM = 4 x 4 GB = 16 GB.

   c. In the **Limit** drop-down list, select the number that is shown as the maximum value.

   d. In the **Shares** drop-down lists, select **Custom**, and select the number that is shown as the maximum value.

7. Add an SR-IOV network interface. From the **New device** drop-down list, select **Network** and click **Add**.

8. In the **New Network** section. From the drop-down list, select the Portgroup that you created, and do the following:
   a. In the **Adapter Type** drop-down list, select **SR-IOV passthrough**.

   b. In the **Physical function** drop-down list, select the physical adapter mapped with the Portgroup.

   c. In the **Guest OS MTU Change** drop-down list, select **Disallow**.

9. In the `<virtual_appliance> - Edit Settings` dialog box, click the **VM Options** tab.

10. On the **VM Options** tab, select the **Advanced** section. From the **Latency Sensitivity** drop-down list, select **High**.
11. Click OK.

13. Once the NetScaler VPX instance powers on, you can use the following command to verify the configuration:

```bash
> show interface summary
```

The output should show all the interfaces that you configured:

```bash
> show interface summary
--------------------------------------------------------------------------------

Migrating the NetScaler VPX from E1000 to SR-IOV or VMXNET3 Network Interfaces

November 2, 2018

You can configure your existing NetScaler VPX instances that use E1000 network interfaces to use SR-IOV or VMXNET3 network interfaces.

To configure an existing NetScaler VPX instance to use SR-IOV network interfaces, see Configuring NetScaler VPX instances to use Single Root I/O Virtualization (SR-IOV) Network Interface.

To configure an existing NetScaler VPX instance to use VMXNET3 network interfaces, see Configuring NetScaler VPX instances to use VMXNET3 Network Interface.

Configure a NetScaler VPX instance to use PCI passthrough network interface

January 6, 2019

Overview

After you have installed and configured a NetScaler VPX instance on VMware ESX Server, you can use the vSphere Web Client to configure the virtual appliance to use PCI passthrough network interfaces.

The PCI passthrough feature allows a guest virtual machine to directly access physical PCI and PCIe devices connected to a host.

Prerequisites

- The firmware version of the Intel XL710 NIC on the host is 5.04.
- A PCI passthrough device connected to and configured on the host
- Supported NICs:
  - Intel X710 10G NIC
  - Intel XL710 Dual Port 40G NIC
  - Intel XL710 Single Port 40G NIC
Configure passthrough devices on a host

Before configuring a passthrough PCI device on a virtual machine, you should configure it on the host machine. Follow these steps to configure passthrough devices on a host.

1. Select the host from the Navigator panel of the vSphere Web Client.
2. Click Manage > Settings > PCI Devices. All available passthrough devices are displayed.
3. Right-click the device that you want to configure and click Edit.
4. The Edit PCI Device Availability window appears.
5. Select the devices to be used for passthrough and click OK.
6. Restart the host machine.

Configure passthrough devices on a NetScaler VPX instance

Follow these steps to configure a passthrough PCI device on a NetScaler VPX instance.

1. Power off the virtual machine.
2. Right-click the virtual machine and select Edit Settings.
3. On the Virtual Hardware tab, select PCI Device from the New Device drop-down menu, and click Add.
4. Expand New PCI device and select the passthrough device to connect to the virtual machine from the drop-down list and click OK.

   Note

   VMXNET3 network interface and PCI Passthrough Network Interface cannot coexist.

6. Power on the guest virtual machine.

You have completed the steps to configuring NetScaler VPX to use PCI passthrough network interfaces.

Install a NetScaler VPX instance on Microsoft Hyper-V server

November 2, 2018

To install Citrix

NetScaler VPX instances on Microsoft Windows Server, you must first install Windows Server, with the Hyper-V role enabled, on a machine with adequate system resources. While installing the Hyper-V role, be sure to specify the network interface cards (NICs) on the server that Hyper-V will use to create the virtual networks. You can reserve some NICs for the host. Use Hyper-V Manager to perform the NetScaler VPX instance installation.
NetScaler VPX instance for Hyper-V is delivered in virtual hard disk (VHD) format. It includes the default configuration for elements such as CPU, network interfaces, and hard-disk size and format. After you install NetScaler VPX instance, you can configure the network adapters on virtual appliance, add virtual NICs, and then assign the NetScaler IP address, subnet mask, and gateway, and complete the basic configuration of the virtual appliance.

After the initial configuration of the VPX instance, if you want to upgrade the appliance to the latest software release, see Upgrade a NetScaler VPX standalone appliance

**Note**

Intermediate System-to-Intermediate System (ISIS) protocol is not supported on the NetScaler VPX virtual appliance hosted on the HyperV-2012 platform.

**Prerequisites for installing NetScaler VPX instance on Microsoft servers**

Before you begin installing a virtual appliance, do the following:

- Download the virtual appliance setup files.
- Obtain NetScaler VPX instance license files. For more information about NetScaler VPX instance licenses, see the NetScaler VPX Licensing Guide at [http://support.citrix.com/article/ctx131110](http://support.citrix.com/article/ctx131110).

**Microsoft server hardware requirements**

The following table describes the minimum system requirements for Microsoft Servers.

**Table 1. Minimum system requirements for Microsoft servers**

<table>
<thead>
<tr>
<th>Component</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>CPU</td>
<td>1.4 GHz 64-bit processor</td>
</tr>
<tr>
<td>RAM</td>
<td>3 GB</td>
</tr>
<tr>
<td>Disk Space</td>
<td>32 GB or greater</td>
</tr>
</tbody>
</table>

The following table lists the virtual computing resources for each NetScaler VPX instance.

**Table 2. Minimum virtual computing resources required for running a NetScaler VPX instance**
Download the NetScaler VPX setup files

NetScaler VPX instance for Hyper-V is delivered in virtual hard disk (VHD) format. You can download the files from MyCitrix.com. You will need a My Citrix account to log on. If you do not have a My Citrix account, access the home page at http://www.mycitrix.com, click the New Users link, and follow the instructions to create a new My Citrix account.

To download the NetScaler VPX instance setup files, follow these steps:

1. In a Web browser, go to http://www.citrix.com/ and click My Citrix.
2. Type your user name and password.
3. Click Downloads.
4. In Search Downloads by Product, select NetScaler.
5. Under Virtual Appliances, click NetScaler VPX.
6. Copy the compressed file to your server.

Install the NetScaler VPX instance on Microsoft servers

After you have enabled the Hyper-V role on Microsoft Server and extracted the virtual appliance files, you can use Hyper-V Manager to install NetScaler VPX instance. After you import the virtual machine, you need to configure the virtual NICs by associating them to the virtual networks created by Hyper-V.

You can configure a maximum of eight virtual NICs. Even if the physical NIC is DOWN, the virtual appliance assumes that the virtual NIC is UP, because it can still communicate with the other virtual appliances on the same host (server).

| Note |
| You cannot change any settings while the virtual appliance is running. Shut down the virtual appliance and then make changes. |

To install NetScaler VPX instance on Microsoft Server by using Hyper-V Manager:
NetScaler 12.0

1. To start Hyper-V Manager, click Start, point to Administrative Tools, and then click Hyper-V Manager.
2. In the navigation pane, under Hyper-V Manager, select the server on which you want to install NetScaler VPX instance.
4. In the Import Virtual Machine dialog box, in Location, specify the path of the folder that contains the NetScaler VPX instance software files, and then select Copy the virtual machine (create a new unique ID). This folder is the parent folder that contains the Snapshots, Virtual Hard Disks, and Virtual Machines folders.
5. Note: If you received a compressed file, make sure that you extract the files into a folder before you specify the path to the folder.
6. Click Import.
7. Verify that the virtual appliance that you imported is listed under Virtual Machines.
8. To install another virtual appliance, repeat steps 2 through 6.

Important
Make sure that you extract the files to a different folder in step 4.

Auto-provision a NetScaler VPX instance on Hyper-V

Auto-provisioning of NetScaler VPX instance is optional. If auto-provisioning is not done, the virtual appliance provides an option to configure the IP address and so on.

To auto-provision NetScaler VPX instance on Hyper-V, follow these steps.

1. Create an ISO9660 compliant ISO image using the xml file as depicted in the example. Make sure that the name of the xml file is userdata.

```xml
<?xml version="1.0" encoding="UTF-8" standalone="no"?>
<Environment xmlns:oe="http://schemas.dmtf.org.ovf/environment/1"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
oe:id=""
xmlns="http://schemas.dmtf.org.ovf/environment/1">
<PlatformSection>
<Kind>HYPER-V</Kind>
<Version>2013.1</Version>
<Vendor>CISCO</Vendor>
<Locale>en</Locale>
</Environment>
```
2. Copy the ISO image to hyper-v server.

3. Select the virtual appliance that you imported, and then on the **Action** menu, select **Settings**. You can also select the virtual appliance and then right click and select **Settings**. The **Settings** window for the selected virtual appliance is displayed.

4. In the **Settings** window, under the hardware section, click on **IDE Controller**.

5. In the right window pane, select **DVD Drive** and click on **Add**. The DVD Drive is added under the **IDE Controller** section in the left window pane.

6. Select the **DVD Drive** added in step 5. In the right window pane, select the Image file radio button and click on **Browse** and select the ISO image that you copied on Hyper-V server, in step 2.

7. Click **Apply**.

---

**Note**

The virtual appliance instance comes up in the default IP address, when:

- The DVD drive is attached and the ISO file is not provided.
- The ISO file does not include the userdata file.
- The userdata file name or format is not correct.

To configure virtual NICs on the NetScaler VPX instance, follow these steps:

1. Select the virtual appliance that you imported, and then on the **Action** menu, select **Settings**.

2. In the **Settings for <virtual appliance name>** dialog box, click **Add Hardware** in the left pane.

3. In the right pane, from the list of devices, select **Network Adapter**.

4. Click **Add**.

5. Verify that **Network Adapter (not connected)** appears in the left pane.

6. Select the network adapter in the left pane.
7. In the right pane, from the **Network** drop-down list, select the virtual network to connect the adapter to.

8. To select the virtual network for additional network adapters that you want to use, repeat steps 6 and 7.

9. Click **Apply**, and then click **OK**.

**To configure the NetScaler VPX instance:**

1. Right-click the virtual appliance that you previously installed, and then select **Start**.

2. Access the console by double-clicking the virtual appliance.

3. Type the NetScaler IP address, subnet mask, and gateway for your virtual appliance.

You have completed the basic configuration of your virtual appliance. Type the IP address in a Web browser to access the virtual appliance.

---

**Note**

You can also use virtual machine (VM) template to provision NetScaler VPX instance using SCVMM.

---

**Install a NetScaler VPX instance on Linux-KVM platform**

September 20, 2018

To set up a NetScaler VPX for the Linux-KVM platform, you can use the graphical Virtual Machine Manager (Virt-Manager) application. If you prefer the Linux-KVM command line, you can use the virsh program.

The host Linux operating system must be installed on suitable hardware by using virtualization tools such as KVM Module and QEMU. The number of virtual machines (VMs) that can be deployed on the hypervisor depends on the application requirement and the chosen hardware.

After you provision a NetScaler VPX instance, you can add additional interfaces.

---

**Limitations and usage guidelines**

**General recommendations**

To avoid unpredictable behavior, apply the following recommendations:

- Do not change the MTU of the vnet interface associated with the VPX VM. Shut down the VPX VM before modifying any configuration parameters, such as Interface modes or CPU.
- Do not force a shutdown of the VPX VM. That is, do not use the **Force off** command.
- Any configurations done on the host Linux might or might not be persistent, depending on your Linux distribution settings. You can choose to make these configurations persistent to ensure consistent behavior across reboots of host Linux operating system.
The NetScaler package has to be unique for each of the NetScaler VPX instance provisioned.

Limitations

- Live migration of a VPX instance that runs on KVM is not supported.

Prerequisites for installing a NetScaler VPX instance on Linux-KVM platform

December 5, 2018

Check the minimum system requirements for a Linux-KVM serves running a NetScaler VPX instance.

CPU requirement:

- 64-bit x86 processors with the hardware virtualization features included in the AMD-V and Intel VT-X processors.

To test whether your CPU supports Linux host, enter the following command at the host Linux shell prompt:

```
*egrep '^flags.*(vmx|svm)' /proc/cpuinfo*
```

If the BIOS settings for the above extension are disabled, you must enable them in BIOS.

- Provide at least 2 CPU cores to Host Linux.
- There is no specific recommendation for processor speed, but higher the speed, the better the performance of the VM application.

Memory (RAM) requirement:

Minimum 4 GB for the host Linux kernel. Add additional memory as required by the VMs.

Hard disk requirement:

Calculate the space for Host Linux kernel and VM requirements. A single NetScaler VPX VM requires 20 GB of disk space.

Software requirements

The Host kernel used must be a 64-bit Linux kernel, release 2.6.20 or later, with all virtualization tools. Citrix recommends newer kernels, such as 3.6.11-4 and later.

Many Linux distributions such as Red Hat, Centos, and Fedora, have tested kernel versions and associated virtualization tools.
Guest VM hardware requirements

NetScaler VPX supports IDE and virtIO hard disk type. The Hard Disk Type has been configured in the XML file, which is a part of the NetScaler package.

Networking requirements

NetScaler VPX supports virtIO para-virtualized, SR-IOV, and PCI Passthrough network interfaces.

For more information about the supported network interfaces, see:

- Provision the NetScaler VPX instance by using the Virtual Machine Manager
- Configure a NetScaler VPX instance to use SR-IOV network interfaces
- Configure a NetScaler VPX instance to use PCI passthrough network interfaces

Source Interface and Modes

The source device type can be either Bridge or MacVTap. In case of MacVTap, four modes are possible - VEPA, Bridge, Private and Pass-through.

Check the types of interfaces that you can use and the supported traffic types, as given below.

Bridge:

- Linux Bridge.
- EBtables and iptables settings on host Linux might filter the traffic on the bridge if you do not choose the correct setting or disable IPtable services.

MacVTap (VEPA mode):

- Better performance than a bridge.
- Interfaces from the same lower device can be shared across the VMs.
- Inter-VM communication using the same lower device is possible only if upstream or downstream switch supports VEPA mode.

MacVTap (private mode):

- Better performance than a bridge.
- Interfaces from the same lower device can be shared across the VMs.
- Inter-VM communication using the same lower device is not possible.

MacVTap (bridge mode):

- Better as compared to bridge.
- Interfaces out of same lower device can be shared across the VMs.
- Inter-VM communication using the same lower device is possible, if lower device link is UP.
MacVTap (Pass-through mode):

- Better as compared to bridge.
- Interfaces out of same lower device cannot be shared across the VMs.
- Only one VM can use the lower device.

Note: For best performance by the VPX instance, ensure that the gro and lro capabilities are switched off on the source interfaces.

Properties of source interfaces

Make sure that you switch off the generic-receive-offload (gro) and large-receive-offload (lro) capabilities of the source interfaces. To switch off the gro and lro capabilities, run the following commands at the host Linux shell prompt.

`ethtool -K eth6 gro off`

`ethtool -K eth6 lro off`

Example:

```
[root@localhost ~]# ethtool -K eth6

Offload parameters for eth6:

  rx-checksumming: on
  tx-checksumming: on
  scatter-gather: on
  tcp-segmentation-offload: on
  udp-fragmentation-offload: off
  generic-segmentation-offload: on
  generic-receive-offload: off
  large-receive-offload: off
  rx-vlan-offload: on
  tx-vlan-offload: on
  ntuple-filters: off
```
Example:

If the host Linux bridge is used as a source device, as in the following example, gro and lro capabilities must be switched off on the vnet interfaces, which are the virtual interfaces connecting the host to the guest VMs.

```
[root@localhost ~]# brctl show eth6_br
bridge name  bridge id   STP enabled interfaces
eth6_br      8000.00e0ed1861ae  no  eth6
             vnet0
             vnet2
[root@localhost ~]#
```

In the above example, the two virtual interfaces are derived from the eth6_br and are represented as vnet0 and vnet2. Run the following commands to switch off gro and lro capabilities on these interfaces.

```
ethtool -K vnet0 gro off
ethtool -K vnet2 gro off
ethtool -K vnet0 lro off
ethtool -K vnet2 lro off
```

Promiscuous mode

The promiscuos mode has to be enabled for the following features to work:

- L2 mode
- Multicast traffic processing
- Broadcast
- IPV6 traffic
- VMAC
- Dynamic routing

Use the following command to enable the promiscuous mode.
Module required

For better network performance, make sure the vhost_net module is present in the Linux host. To check the existence of vhost_net module, run the following command on the Linux host:

```bash
lsmod | grep "vhost\_net"
```

If vhost_net is not yet running, enter the following command to run it:

```bash
modprobe vhost\_net
```

Provision the NetScaler VPX instance by using OpenStack

January 6, 2019

You can provision a NetScaler VPX instance in an Openstack environment either by using the Nova boot command (OpenStack CLI) or Horizon (OpenStack dashboard).

Provisioning a VPX instance, optionally involves using data from the config drive. Config drive is a special configuration drive that attaches to the instance as a CD-ROM device when it boots. This configuration drive can be used to pass networking configuration such as management IP address, network mask, default gateway, and to inject customer scripts.

In a NetScaler appliance, the default authentication mechanism is password based. Now, SSH key-pair authentication mechanism is supported for NetScaler VPX instances on OpenStack environment.

The key-pair (public key and private key) needs to be generated before using Public Key Cryptography mechanism. You can use different mechanisms, such as Horizon, Puttygen.exe for Windows, and ssh-keygen for Linux environment, to generate the key pair. Refer to online documentation of respective mechanisms for more information about generating key pair.
Once a key pair is available, copy the private key to a secure location to which authorized persons will have access. In OpenStack, public key can be deployed on a VPX instance by using Horizon or Nova boot command. When a VPX instance is provisioned by using OpenStack, it first detects that the instance is booting in an OpenStack environment by reading a specific BIOS string. This string is “OpenStack Foundation” and for Red Hat Linux distributions it is stored in /etc/nova/release. This is a standard mechanism that is available in all OpenStack implementations based on KVM hypervisor platform. The drive should have a specific OpenStack label.

If the config drive is detected, the instance attempts to read the network configuration, custom scripts, and SSH key pair if provided.

**Userdata file**

The NetScaler VPX instance uses a customized OVF file, also known as userdata file, to inject network configuration, custom scripts. This file is provided as part of config drive. Here is an example of a customized OVF file.

```xml
<?xml version="1.0" encoding="UTF-8" standalone="no"?>
  <xmlns="http://schemas.dmtf.org/ovf/environment/1"
  xmlns:cs="http://schemas.citrix.com/openstack">
    <PlatformSection>
      <Kind></Kind>
      <Version>2016.1</Version>
      <Vendor>VPX</Vendor>
      <Locale>en</Locale>
    </PlatformSection>
    <PropertySection>
      <Property oe:key="com.citrix.netscaler.ovf.version" oe:value="1.0"/>
      <Property oe:key="com.citrix.netscaler.platform" oe:value="NSVPX"/>
      <Property oe:key="com.citrix.netscaler.orch_env" oe:value="openstack-orch-env"/>
      <Property oe:key="com.citrix.netscaler.mgmt.ip" oe:value="10.1.2.22"/>
      <Property oe:key="com.citrix.netscaler.mgmt.netmask" oe:value="255.255.255.0"/>
      <Property oe:key="com.citrix.netscaler.mgmt.gateway" oe:value="10.1.2.1"/>
    </PropertySection>
    <cs:ScriptSection>
      <cs:Version>1.0</cs:Version>
      <ScriptSettingSection xmlns="http://schemas.citrix.com/openstack"
      xmlns:i="http://www.w3.org/2001/XMLSchema-instance">
```
In the OVF file above “PropertySection” is used for NetScaler networking configuration while `<cs:ScriptSection>` is used to enclose all scripts. `<Scripts></Scripts>` tags are used to bundle all scripts together. Each script is defined in between `<Script> </Script>` tags. Each script tag has
following fields/tags:

a) <Type>: Specifies value for script type. Possible values: Shell/Perl/Python/NSLCI (for NetScaler CLI scripts)

b) <Parameter>: Provides parameters to the script. Each script can have multiple <Parameter> tags.

c) <BootScript>: Specifies script execution point. Possible values for this tag: before/after. “before” specifies script will be executed before PE comes up. “after” specifies that the script will be executed after PE comes up.

d) <Text>: Pastes content of a script.

Note
Currently the VPX instance does not take care of sanitization of scripts. As an administrator, you should check the validity of the script.

Not all sections need to be present. Use an empty “PropertySection” to only define scripts to execute on first boot or an empty <cs:ScriptSection> to only define networking configuration.

After the required sections of the OVF file (userdata file) are populated, use that file to provision the VPX instance.

**Network configuration**

As part of network configuration, the VPX instance reads:

- Management IP address
- Network mask
- Default gateway

After the parameters are successfully read, they are populated in the NetScaler configuration, to allow managing the instance remotely. If the parameters are not read successfully or the config drive is not available, the instance transitions to the default behavior, which is:

- The instance attempts to retrieve the IP address information from DHCP.
- If DHCP fails or times-out, the instance comes up with default network configuration (192.168.100.1/16).

**Customer script**

The VPX instance allows to execute a custom script during initial provisioning. The appliance supports script of type Shell, Perl, Python, and NetScaler CLI commands.
SSH key pair authentication

The VPX instance copies public key, available within the configuration drive as part of instance meta data, into its “authorized_keys” file. This allows the user to access the instance with private key.

**Note**

When an SSH key is provided, the default credentials (nsroot/nsroot) no longer work. If password-based access is needed, log on with the respective SSH private key and manually set a password.

Before you begin

Before you provision a VPX instance on OpenStack environment, extract the .qcow2 file from the .tgz file and build an OpenStack image from the qcow2 image. Follow these steps:

1. Extract the .qcow2 file from the .tgz file by typing the following command.

   ```
   tar xvf <TAR file>
   tar xvf <NSVPX-KVM-12.0-26.2_nc.tgz>
   NSVPX-KVM.xml
   NSVPX-KVM-12.0-26.2_nc.qcow2
   ```

2. Build an OpenStack image using the .qcow2 file extracted in step 1 by typing the following command.

   ```
   openstack image create --container-format bare --property hw_disk_bus=ide --disk-format qcow2 --file <path to qcow2 file> --public <name of the OpenStack image>
   ```

   ```
   glance image-create --name="NS-VPX-12.0-26.2" --property hw_disk_bus=ide --ispublic=true --container-format=bare --disk-format=qcow2< NSVPX-KVM-12.0-26.2_nc.qcow2
   ```

**Figure 1:** The following illustration provides a sample output for the glance image-create command.

Provisioning the VPX instance

You can provision a VPX instance in two ways by using one of the options:

- Horizon (OpenStack dashboard)
- Nova boot command (OpenStack CLI)
**Provision a VPX instance by using the OpenStack dashboard**

Follow these steps to provision the VPX instance by using Horizon:

1. Log on to the OpenStack dashboard.
2. In the Project panel on the left hand side of the dashboard, select **Instances**.
3. In the Instances panel, click **Launch Instance** to open the Instance Launching wizard.
4. In the Launch Instance wizard, fill in the details, like:
   - Instance Name
   - Instance Flavor
   - Instance Count
   - Instance Boot Source
   - Image Name
5. Deploy a new key pair or an existing key pair through Horizon by completing the following steps:
   a) If you don’t have an existing key pair, create the key by using any existing mechanisms. If you’ve an existing key, skip this step.
   b) Copy the content of public key.
   c) Go to **Horizon > Instances > Create New Instances**.
   d) Click **Access & Security**.
   e) Click the + sign next to the **Key Pair** drop-down menu and provide values for shown parameters.
   f) Paste public key content in **Public key** box, give a name to the key and click **Import Key Pair**.
6. Click the **Post Creation** tab in the wizard. In Customization Script, add the content of the userdata file. The userdata file contains the IP address, Netmask and Gateway details, and customer scripts of the VPX instance.
7. After a key pair is selected or imported, check config-drive option and click **Launch**.

**Provision the VPX instance by using OpenStack CLI**

Follow these steps to provision a VPX instance by using OpenStack CLI.

1. To create an image from qcow2, type the following command:

   ```bash
   openstack image create --container-format bare --property hw_disk_bus=ide --diskformat qcow2 --file NSVPX-OpenStack.qcow2 --public VPX-ToT-Image
   ```

2. To select an image for creating an instance, type the following command:
3. To create an instance of a particular flavor, type the following command to choose a flavor ID/Name of from a list:

```
openstack flavor list
```

4. To attach a NIC to a particular network, type the following command to choose a network ID from a network list:

```
openstack network list
```

5. To create an instance, type the following command:

```
openstack server create --flavor FLAVOR_ID --image IMAGE_ID --key-name KEY_NAME
--user-data USER_DATA_FILE_PATH --config-drive True --nic net-id=net-uuid
INSTANCE_NAME
openstack server create --image VPX-ToT-Image --flavor m1.medium --user-data ovf.xml --config-drive True --nic net-id=2734911b-ee2b-48d0-a1b6-3efd44b761b9
VPX-ToT
```

**Figure 2:** The following illustration provides a sample output.

**Provision the NetScaler VPX instance by using the Virtual Machine Manager**

January 6, 2019

The Virtual Machine Manager is a desktop tool for managing VM guests. It enables you to create new VM guests and various types of storage, and manage virtual networks. You can access the graphical console of VM guests with the built-in VNC viewer and view performance statistics, either locally or remotely.

After installing your preferred Linux distribution, with KVM virtualization enabled, you can proceed with provisioning virtual machines.

While using the Virtual Machine Manager to provision a NetScaler VPX instance, you have two options:

- Enter the IP address, gateway, and netmask manually
NetScaler 12.0

- Assign the IP address, gateway, and netmask automatically (auto-provisioning)

You can use two kinds of images to provision a NetScaler VPX instance:

- RAW
- QCOW2

You can convert a NetScaler VPX RAW image to a QCOW2 image and provision the NetScaler VPX instance. To convert the RAW image to a QCOW2 image, type the following command:

```
qemu-img convert -O qcow2 original-image.raw image-converted.qcow
```

For example:

```
qemu-img convert -O qcow2 NSVPX-KVM-11.1-12.5_nc.raw NSVPX-KVM-11.1-12.5_nc.qcow
```

A typical NetScaler VPX deployment on KVM includes the following steps:

- Checking prerequisites for Auto-Provisioning a NetScaler VPX Instance
- Provisioning the NetScaler VPX Instance by Using a RAW Image
- Provisioning the NetScaler VPX Instance by Using a QCOW2 Image
- Adding Additional Interfaces to a VPX Instance by using Virtual Machine Manager

**Check prerequisites for auto-provisioning a NetScaler VPX instance**

Auto-provisioning is an optional feature, and it involves using data from the CDROM drive. If this feature is enabled, you need not enter the management IP address, network mask, and default gateway of the NetScaler VPX instance during initial setup.

You need to complete the following tasks before you can auto-provision a VPX instance:

1. Create a customized Open Virtualization Format (OVF) XML file or userdata file.
2. Convert the OVF file into an ISO image by using an online application (for example PowerISO).
3. Mount the ISO image on the KVM host by using any secure copy (SCP)-based tools.

**Sample OVF XML file:**

Here's an example of the contents an OVF XML file, which you can use as a sample to create your file.

```xml
<?xml version="1.0" encoding="UTF-8" standalone="no"?>
<Environment xmlns:oe="http://schemas.dmtf.org/ovf/environment/1"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
oe:id=""
xmlns="http://schemas.dmtf.org/ovf/environment/1"
xmels:cs="http://schemas.citrix.com/openstack">
<PlatformSection>
```

© 1999-2018 Citrix Systems, Inc. All rights reserved.
In the OVF XML file above, “PropertySection” is used for NetScaler networking configuration. When you create the file, specify values for the parameters that are highlighted at the end of the example:

- Management IP address
- Netmask
- Gateway

Important
If the OVF file is not properly XML formatted, the VPX instance is assigned the default network configuration, not the values specified in the file.

Provision the NetScaler VPX instance by using a RAW image

The Virtual Machine Manager enables you to provision a NetScaler VPX instance by using a RAW image.

To provision a NetScaler VPX instance by using the Virtual Machine Manager, follow these steps:

1. Open the Virtual Machine Manager (Application > System Tools > Virtual Machine Manager) and enter the logon credentials in the Authenticate window.
2. Click the icon or right-click localhost (QEMU) to create a new NetScaler VPX instance.
3. In the Name text box, enter a name for the new VM (for example, NetScaler-VPX).
4. In the New VM window, under “Choose how you would like to install the operating system,” select Import existing disk image, and then and click Forward.

5. In the Provide the existing storage path field, navigate the path to the image. Choose the OS type as UNIX and Version as FreeBSD 6.x. Then, click Forward.

6. Under Choose Memory and CPU settings select the following settings, and then click Forward:
   - Memory (RAM) — 2048 MB
   - CPUs — 2

7. Select the Customize configuration before install check box. Optionally, under Advanced options you can customize the MAC address. Make sure the Virt Type selected is kvm and the Architecture selected is x86_64. Click Finish.

8. Select a NIC and provide the following configuration:
   - Source device — ethX, macvtap or Bridge
   - Device model — virtio
   - Source mode — Bridge

9. Click Apply.

10. If you want to auto-provision the VPX instance, see the section “Enabling Auto-Provisioning by Attaching a CDROM Drive” in this document. Otherwise, click Begin Installation. After you have provisioned the NetScaler VPX on KVM, you can add additional interfaces.

**Provision the NetScaler VPX instance by using a QCOW2 image**

Using the Virtual Machine Manager, you can provision the NetScaler VPX instance by using a QCOW2 image.

To provision a NetScaler VPX instance by using a QCOW2 image, follow these steps:

1. Follow step 1 to step 8 in Provision the NetScaler VPX instance by using a RAW image.  
   **Note:** Ensure that you select qcow2 image in step 5.
2. Select Disk 1 and click Advanced options.
3. Select qcow2 from the Storage format drop-down list.
4. Click Apply, and then click Begin Installation. After you have provisioned the NetScaler VPX on KVM, you can add additional interfaces.

**Enable auto-provisioning by attaching a CDROM drive**

1. Click Add Hardware > Storage > Device type > CDROM device.
2. Click **Manage** and select the correct ISO file that you mounted in the “Prerequisites for Auto-Provisioning a NetScaler VPX Instance” section, and click **Finish**. A new CDROM under Resources on your NetScaler VPX instance is created.

3. Power on the VPX instance, and it auto-provisions with the network configuration provided in the OVF file, as shown in the example screen capture.

4. If auto-provision fails, the instance comes up with the default IP address (192.168.100.1). In that case, you need to complete the initial configuration manually. For more information, see [Configuring a NetScaler for the First Time](#).

**Add additional interfaces to the NetScaler VPX instance by using Virtual Machine Manager**

After you have provisioned the NetScaler VPX instance on KVM, you can add additional interfaces.

To add additional interfaces, follow these steps.

1. Shut down the NetScaler VPX instance running on the KVM.

2. Right-click the VPX instance and choose **Open** from the pop-up menu.

3. Click the icon in the header to view the virtual hardware details.

4. Click **Add Hardware**. In the **Add New Virtual Hardware window**, select **Network** from the navigation menu.

5. In **Host Device** field, select the physical interface type. The host device type can be either Bridge or MacVTap. In case of MacVTap, four modes possible are VEPA, Bridge, Private and Passthrough.

   a) For Bridge
      i. Host device—Select the “Specify shared device name” option.
      ii. Provide the Bridge name that is configured in the KVM host.
         - Note: Make sure that you have configured a Linux bridge in the KVM host, bound the physical interface to the bridge, and put the bridge in the UP state.
      iii. Device model—virtio.
      iv. Click Finish.

   b) For MacVTap
      i. Host device—Select the physical interface from the menu.
      ii. Device model—virtio.
      iii. Click Finish. You can view the newly added NIC in the navigation pane.
      iv. Select the newly added NIC and select the Source mode for this NIC. The available modes are VEPA, Bridge, Private, and Passthrough. For more details on the interface and modes, see [Source Interface and Modes](#).
v. Click Apply.

6. If you want to auto-provision the VPX instance, see the section “Adding a Config Drive to Enable Auto-Provisioning” in this document. Otherwise, power on the VPX instance to complete the initial configuration manually.

Important

Interface parameter configurations such as speed, duplex, and autonegotiation are not supported.

Configure a NetScaler VPX instance to use SR-IOV network interfaces

January 6, 2019

You can use the Virtual Machine Manager to configure a NetScaler VPX instance running on Linux-KVM to use single root I/O virtualization (SR-IOV) network interfaces with Intel 82599 10G NIC and X710 10G and XL710 40G NICs.

This section describes how to:

• Configure a NetScaler VPX Instance to Use SR-IOV Network Interface
• Configure Static LA/LACP on the SR-IOV Interface
• Configure VLAN on the SR-IOV Interface

Limitations

Keep the limitations in mind while using Intel 82599, X710, XL710 NICs. The following features not supported.

Limitations for Intel 82599 NICs:

• L2 mode switching
• Admin partitioning (shared VLAN mode)
• High availability (active-active mode
• Jumbo Frames.
• IPv6: You can configure only up to 30 unique IPv6 addresses in a VPX instance if you’ve atleast one SR-IOV interface.
• VLAN configuration on Hypervisor for SRIOV VF interface through “ip link” command is not supported.
• Interface parameter configurations such as speed, duplex, and autonegotiations are not supported.

Limitations for X710 10G and XL710 40G NICs:
- L2 mode switching.
- In a cluster, Jumbo Frames are not supported when the XL710 NIC is used as a data interface.
- Interface list re-orders when interfaces are disconnected and reconnected.
- Interface parameter configurations such as speed, duplex, and auto negotiations are not supported.
- Interface name is 40/X for both XL710 and X710 NICs
- Up to 16 Intel XL710/X710 SRIOV or PCI Passthrough interfaces can be supported on a VPX instance.

Note: For IPv6 to work with X710 10G and XL710 40G NICs, you need to enable trust mode on the Virtual Functions (VFs) by typing the following command on the KVM host:

```
## ip link set <PNIC> <VF> trust on
```

For example:

```
## ip link set ens785f1 vf 0 trust on
```

Prerequisites

Before you configure a NetScaler VPX instance to use SR-IOV network interfaces, complete the following prerequisite tasks. See the NIC column for details about about how to complete the corresponding tasks.

<table>
<thead>
<tr>
<th>Task</th>
<th>82599 NIC</th>
<th>X710 and XL710 NICs</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Add the NIC to the KVM host.</td>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>2. Download and install the latest Intel driver.</td>
<td>IXGBE driver</td>
<td>I40E driver</td>
</tr>
<tr>
<td>3. Blacklist the driver on the KVM host.</td>
<td>Add the following entry in the /etc/modprobe.d/blacklist.conf file: blacklist ixgbevf. Use IXGBE driver version 4.3.15 (recommended).</td>
<td>Add the following entry in the /etc/modprobe.d/blacklist.conf file: blacklist i40evf. Use i40e driver version 2.0.26 (recommended).</td>
</tr>
</tbody>
</table>
### Task 82599 NIC  
**4. Enable SR-IOV Virtual Functions (VFs) on the KVM host.** In both the commands in the next two columns:  
- **number_of_VF** = the number of Virtual VFs that you want to create.  
- **device_name** = the interface name.  

- **If you are using earlier version of kernel 3.8:**  
  - Add the following entry to the `/etc/modules.d/ixgbe` file and restart the KVM host:  
  - `*options ixgbe max_vfs=*`. If you are using kernel 3.8 version or later, create VFs using the following command: `*echo > /sys/class/net//device/sriov_numvfs*`. See example in figure 1.  

- **If you are using earlier version of kernel 3.8:**  
  - Add the following entry to the `/etc/modules.d/i40e.conf` file and restart the KVM host:  
  - `*options i40e max_vfs=*`. If you are using kernel 3.8 version or later, create VFs using the following command: `*echo > /sys/class/net//device/sriov_numvfs*`. See example in figure 2.  

- **5. Make the VFs persistent by adding the commands that you used to create VFs, to the rc.local file.**  

### Important  
When you are creating the SR-IOV VFs, ensure that you do not assign MAC addresses to the VFs.

**Figure 1:** Enable SR-IOV VFs on the KVM host for 82599 10G NIC.  
**Figure 2:** Enable SR-IOV VFs on the KVM host for X710 10G and XL710 40G NICs.  
**Figure 3:** Make the VFs persistent.

### Configure a NetScaler VPX instance to use SR-IOV network interface

To configure NetScaler VPX instance to use SR-IOV network interface by using Virtual Machine Manager, complete these steps:  

1. **Power off the NetScaler VPX instance.**  
2. **Select the NetScaler VPX instance and then select Open.**  
   - 1. In the `<virtual_machine on KVM> window, select the i icon.  
   - 1. Select **Add Hardware.**  
   - 5. In the Add New Virtual Hardware dialog box, do the following:  

<table>
<thead>
<tr>
<th>Task</th>
<th>82599 NIC</th>
<th>X710 and XL710 NICs</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.</td>
<td>If you are using earlier version of kernel 3.8, then add the following entry to the /etc/modprobe.d/ixgbe file and restart the KVM host: <em>options ixgbe max_vfs=</em> If you are using kernel 3.8 version or later, create VFs using the following command: <em>echo &gt; /sys/class/net//device/sriov_numvfs</em>. See example in figure 1.</td>
<td>If you are using earlier version of kernel 3.8, then add the following entry to the /etc/modprobe.d/i40e.conf file and restart the KVM host: <em>options i40e max_vfs=</em> If you are using kernel 3.8 version or later, create VFs using the following command: <em>echo &gt; /sys/class/net//device/sriov_numvfs</em>. See example in figure 2.</td>
</tr>
</tbody>
</table>
1. Select PCI Host Device.
2. In the Host Device section, select the VF you have created and click Finish.

**Figure 4**: VF for 82599 10G NIC

**Figure 5**: VF for XL710 NIC

6. Repeat Step 4 and 5 to add the VFs that you have created.
7. Power on the NetScaler VPX instance.
8. After the NetScaler VPX instance powers on, use the following command to verify the configuration:

```
> show interface summary
```

The output shows all the interfaces that you configured.

**Figure 6**: output summary for 82599.

**Figure 7**: Output summary for X710 and XL710 NICs.

**Configure static LA/LACP on the SR-IOV interface**

**Important**

When you are creating the SR-IOV VFs, ensure that you do not assign MAC addresses to the VFs.

To use the SR-IOV VFs in link aggregation mode, disable spoof checking for VFs that you have created.

On the KVM host, use the following command to disable spoof checking:

```
*ip link set \<interface\>_name\> vf \<VF\>_id\> spoofchk off*
```

Where:

- Interface_name – is the interface name.
- VF_id – is the Virtual Function id.

**For example**:

After you disable spoof checking for all the VFs that you have created. Restart the NetScaler VPX instance and configure link aggregation. For detailed instructions, see Configure Link Aggregation.

**Configuring VLAN on the SR-IOV Interface**

You can configure VLAN on SR-IOV VFs. For detailed instructions, see Configuring a VLAN.
Configure a NetScaler VPX instance to use PCI passthrough network interfaces

January 6, 2019

After you have installed and configured a NetScaler VPX instance on the Linux-KVM platform, you can use the Virtual Machine Manager to configure the virtual appliance to use PCI passthrough network interfaces.

Prerequisites

- The firmware version of the Intel XL710 Network Interface Card (NIC) on the KVM Host is 5.04.
- The KVM Host supports input–output memory management unit (IOMMU) and Intel VT-d, and they are enabled in the BIOS of the KVM Host. On the KVM Host, to enable IOMMU, add the following entry to the `/boot/grub2/grub.cfg` file:
  ```
inTEL_iommu=1
  ```
- Execute the following command and reboot the KVM Host:
  ```
Grub2-mkconfig -o /boot/grub2/grub.cfg
  ```

To configure NetScaler VPX instances to use PCI passthrough network interfaces by using the Virtual Machine Manager:

1. Power off the NetScaler VPX instance.
2. Select the NetScaler VPX instance and click Open.
3. In the `<virtual_machine on KVM>` window, click the i icon.
4. Click Add Hardware.
5. In the Add New Virtual Hardware dialog box, do the following:
   a. Select PCI Host Device.
   b. In the Host Device section, select the Intel XL710 physical function.
   c. Click Finish.
6. Repeat steps 4 and 5 to add any additional Intel XL710 physical functions.
7. Power on the NetScaler VPX instance.
8. Once the NetScaler VPX instance powers on, you can use the following command to verify the configuration:

The output should show all the interfaces that you configured:

**Provision the NetScaler VPX instance by using the virsh program**

September 20, 2018

The virsh program is a command line tool for managing VM Guests. Its functionality is similar to that of Virtual Machine Manager. It enables you to change a VM Guest’s status (start, stop, pause, and so on), to set up new Guests and devices, and to edit existing configurations. The virsh program is also useful for scripting VM Guest management operations.

To provision NetScaler VPX by using the virsh program, follow these steps:

1. Use the tar command to untar the the NetScaler VPX package. The NSVPX-KVM-*_nc.tgz package contains following components:
   - The Domain XML file specifying VPX attributes [NSVPX-KVM-*_nc.xml]
   - Check sum of NS-VM Disk Image [Checksum.txt]
   - NS-VM Disk Image [NSVPX-KVM-*_nc.raw]

   Example:

   ```
   1 tar -xvzf NSVPX-KVM-10.1-117_nc.tgz
   2 NSVPX-KVM-10.1-117_nc.xml
   3 NSVPX-KVM-10.1-117_nc.raw
   4 checksum.txt
   ```

2. Copy the NSVPX-KVM-*_nc.xml XML file to a file named `<DomainName>-NSVPX-KVM-*_nc.xml`. The `<DomainName>` is also the name of the virtual machine. Example:

   ```
   1 cp NSVPX-KVM-10.1-117_nc.xml NetScaler-VPX-NSVPX-KVM-10.1-117_nc.xml
   ```

3. Edit the `<DomainName>-NSVPX-KVM-*_nc.xml` file to specify the following parameters:
   - name— Specify the name.
   - mac— Specify the MAC address.
     Note: The domain name and the MAC address have to be unique.
   - sourcefile— Specify the absolute disk-image source path. The file path has to be absolute.
     You can specify the path of the RAW image file or a QCOW2 image file.
     If you want to specify a RAW image file, specify the disk image source path as shown in the following example:
Example:

```xml
<name>NetScaler-VPX</name>
<mac address='52:54:00:29:74:b3'/>
<source file='/root/NSVPX-KVM-10.1-117_nc.raw'/>
```

Specify the absolute QCOW2 disk-image source path and define the driver type as `qcow2`, as shown in the following example:

Example:

```xml
<name>NetScaler-VPX</name>
<mac address='52:54:00:29:74:b3'/>
<driver name='qemu' type='qcow2'/>
<source file='/root/NSVPX-KVM-10.1-117_nc.qcow'/>
```

4. Edit the `<DomainName>-NSVPX-KVM-*_nc.xml` file to configure the networking details:

- `source dev`— specify the interface.
- `mode`— specify the mode. The default interface is `Macvtap Bridge`.

Example: Mode: MacVTap Bridge Set target interface as ethx and mode as bridge Model type as `virtio`

```xml
<interface type='direct'>
    <mac address='52:54:00:29:74:b3'/>
    <source dev='eth0' mode='bridge'/>
    <target dev='macvtap0'/>
    <model type='virtio'/>
    <alias name='net0'/>
    <address type='pci' domain='0x0000' bus='0x00' slot='0x03' function='0x0'/>
</interface>
```

Here, eth0 is the physical interface attached to the VM.

5. Define the VM attributes in the `<DomainName>-NSVPX-KVM-*_nc.xml` file by using the following command: `virsh define <DomainName>-NSVPX-KVM-*_nc.xml` Example:

```bash
virsh define NS-VPX-NSVPX-KVM-10.1-117_nc.xml
```

Start the VM by entering following command: `virsh start [<DomainName>]` Example:

```bash
virsh start NetScaler-VPX
```
Add additional interfaces to NetScaler VPX instance using virsh program

After you have provisioned the NetScaler VPX on KVM, you can add additional interfaces.

To add additional interfaces, follow these steps:

1. Shut down the NetScaler VPX instance running on the KVM.

2. Edit the <DomainName>-NSVPX-KVM-*_nc.xml file using the command: virsh edit [<DomainName>]

3. In the <DomainName>-NSVPX-KVM-*_nc.xml file, append the following parameters:

   a) **For MacVTap**

   - Interface type— Specify the interface type as ‘direct’.
   - Mac address— Specify the Mac address and make sure the MAC address is unique across the interfaces.
   - source dev— Specify the interface name.
   - mode— Specify the mode; the modes supported are - Bridge, VEPA, Private, and Pass-through
   - model type— Specify the model type as virtio

   Example:

   Mode: MacVTap Pass-through

   Set target interface as ethx, Mode as bridge, and model type as virtio

   ```
   <interface type='direct'>
   ```
b) **For Bridge Mode**

Note: Make sure that you have configured a Linux bridge in the KVM host, bound the physical interface to the bridge, and put the bridge in the UP state.

- Interface type— Specify the interface type as 'bridge'.
- Mac address— Specify the Mac address and make sure the MAC address is unique across the interfaces.
- source bridge— Specify the bridge name.
- model type— Specify the model type as virtio

Example: Bridge Mode

```
<interface type='bridge'>
  <mac address='52:54:00:29:74:b3'/>
  <source dev='eth1' mode='passthrough'/>
  <model type='virtio'/>
</interface>
```

---

**Manage the NetScaler VPX guest VMs**

January 6, 2019

You can use the Virtual Machine Manager and the virsh program to perform management tasks such as starting or stopping a VM Guest, setting up new guests and devices, editing existing configurations, and connecting to the graphical console through Virtual Network Computing (VNC).

**Manage the VPX guest VMs by using Virtual Machine Manager**

- List the VM guests

  The main Window of the Virtual Machine Manager displays a list of all the VM Guests for each VM host server it is connected to. Each VM Guest entry contains the virtual machine’s name, along with its status (Running, Paused, or Shutoff) displayed as icon.

- Open a graphical console
Opening a Graphical Console to a VM Guest enables you to interact with the machine like you would with a physical host through a VNC connection. To open the graphical console in the Virtual Machine Manager, right-click the VM Guest entry and select the Open option from the pop-up menu.

- Start and shut down a guest

You can start or stop a VM Guest from the Virtual Machine Manager. To change the state of the VM, right-click the VM Guest entry and select Run or one of the Shut Down options from the pop-up menu.

- Reboot a guest

You can reboot a VM Guest from the Virtual Machine Manager. To reboot the VM, right-click the VM Guest entry, and then select Shut Down > Reboot from the pop-up menu.

- Delete a guest

Deleting a VM Guest removes its XML configuration by default. You can also delete a guest’s storage files. Doing so completely erases the guest.

  1. In the Virtual Machine Manager, right-click the VM Guest entry.
  2. Select Delete from the pop-up menu. A confirmation window opens.
     Note: The Delete option is enabled only when the VM Guest is shut down.
  3. Click Delete.
  4. To completely erase the guest, delete the associated .raw file by selecting the Delete Associated Storage Files check box.

Manage the NetScaler VPX guest VMs using the virsh program

- List the VM Guests and their current states.

  To use virsh to display information about the Guests
  
  ```
  virsh list --all
  ```
  
  The command output displays all domains with their states.

  Example output:

<table>
<thead>
<tr>
<th>Id</th>
<th>Name</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Domain-0</td>
<td>running</td>
</tr>
<tr>
<td>1</td>
<td>Domain-1</td>
<td>paused</td>
</tr>
<tr>
<td>2</td>
<td>Domain-2</td>
<td>inactive</td>
</tr>
<tr>
<td>3</td>
<td>Domain-3</td>
<td>crashed</td>
</tr>
</tbody>
</table>

- Open a virsh console.
Connect the Guest VM through the console

*virsh console* [<DomainID> | <DomainName> | <DomainUUID>]

Example:

*virsh console NetScaler-VPX*

- Start and shut down a guest.

Guests can be started using the DomainName or Domain-UUID.

*virsh start* [<DomainName> | <DomainUUID>]

Example:

*virsh start NetScaler-VPX*

**To shut down a guest:**

*virsh shutdown* [<DomainID> | <DomainName> | <DomainUUID>]

Example:

*virsh shutdown NetScaler-VPX*

- Reboot a guest

*virsh reboot* [<DomainID> | <DomainName> | <DomainUUID>]

Example:

*virsh reboot NetScaler-VPX*

Delete a guest

To delete a Guest VM you need to shut-down the Guest and un-define the

<DomainName>-NSVPX-KVM-*_nc.xml before you run the delete command.

1  *virsh shutdown* [<DomainID> | <DomainName> | <DomainUUID>]
2  *virsh undefine* [<DomainName> | <DomainUUID>]

Example:

1  *virsh shutdown NetScaler-VPX*
2  *virsh undefine NetScaler-VPX*

Note: The delete command doesn’t remove disk image file which needs to be removed manually.

**Provision the NetScaler VPX instance with SR-IOV, on OpenStack**

January 6, 2019

You can deploy high-performance NetScaler VPX instances that use single-root I/O virtualization (SR-IOV) technology, on OpenStack.
You can deploy a NetScaler VPX instance that uses SR-IOV technology, on OpenStack, in three steps:

- Enable SR-IOV Virtual Functions (VFs) on the host.
- Configure and make the VFs available to OpenStack.
- Provision the NetScaler VPX on OpenStack.

**Prerequisites**

Ensure that you:

- Add the Intel 82599 Network Interface Card (NIC) to the host.
- Download and Install the latest IXGBE driver from Intel.
- Blacklist the IXGBEVF driver on the host. Add the following entry in the `/etc/modprobe.d/blacklist.conf` file: `blacklist ixgbevf`

**Note**

The ixgbe driver version should be minimum 5.0.4.

**Enable SR-IOV VFs on the host**

Do one of the following steps to enable SR-IOV VFs:

- If you are using a kernel version earlier than 3.8, add the following entry to the `/etc/modprobe.d/ixgbe` file and restart the host: `options ixgbe max_vfs=<number_of_VFs>`
- If you are using kernel 3.8 version or later, create VFs by using the following command:

```
1 echo <number_of_VFs> > /sys/class/net/<device_name>/device/sriov_numvfs
```

Where:

- `number_of_VFs` is the number of Virtual Functions that you want to create.
- `device_name` is the interface name.

**Important**

While you are creating the SR-IOV VFs, make sure that you do not assign MAC addresses to the VFs.

Here is an example of four VFs being created.

Make the VFs persistent, add the commands that you used to created VFs to the `rc.local` file. Here is an example showing contents of rc.local file.

For more information, see this Intel SR-IOV Configuration Guide.
Configure and make the VFs available to OpenStack

Follow the steps given at the link below to configure SR-IOV on OpenStack: https://wiki.openstack.org/wiki/SR-IOV-Passthrough-For-Networking.

Provision the NetScaler VPX instance on OpenStack

You can provision a NetScaler VPX instance in an Openstack environment by using the OpenStack CLI. Provisioning a VPX instance, optionally involves using data from the config drive. The config drive is a special configuration drive that attaches to the instance when it boots. This configuration drive can be used to pass networking configuration information such as management IP address, network mask, and default gateway etc. to the instance before you configure the network settings for the instance.

When OpenStack provisions a VPX instance, it first detects that the instance is booting in an OpenStack environment, by reading a specific BIOS string (OpenStack Foundation) that indicates OpenStack. For Red Hat Linux distributions, the string is stored in /etc/nova/release. This is a standard mechanism that is available in all OpenStack implementations based on KVM hyper-visor platform. The drive should have a specific OpenStack label. If the config drive is detected, the instance attempts to read the following information from the file name specified in the nova boot command. In the procedures below, the file is called “userdata.txt.”

- Management IP address
- Network mask
- Default gateway

Once the parameters are successfully read, they are populated in the NetScaler stack. This helps in managing the instance remotely. If the parameters are not read successfully or the config drive is not available, the instance transitions to the default behavior, which is:

- The instance attempts to retrieve the IP address information from DHCP.
- If DHCP fails or times-out, the instance comes up with default network configuration (192.168.100.1/16).

Provision the NetScaler VPX instance on OpenStack through CLI

You can provision a VPX instance in an OpenStack environment by using the OpenStack CLI. Here’s the summary of the steps to provision a NetScaler VPX instance on OpenStack:

1. Extracting the .qcow2 file from the .tgz file
2. Building an OpenStack image from the qcow2 image
3. Provisioning a VPX instance
NetScaler 12.0

To provision a VPX instance in an OpenStack environment, do the following steps.

1. Extract the .qcow2 file from the .tqz file by typing the command:

   ```bash
tar xvzf <TAR file>
tar xvzf NSVPX-KVM-12.0-26.2.nc.tgz	nsVPX-KVM.xml
NSVPX-KVM-12.0-26.2.nc.qcow2
```

2. Build an OpenStack image using the .qcow2 file extracted in step 1 by typing the following command:

   ```bash
   glance image-create --name="<name of the OpenStack image>" --
   property hw_disk_bus=ide --is-public=true --container-format=bare --disk-format=qcow2
   <name of the qcow2 file>
   glance image-create --name="NS-VPX-12.0-26.2" --property
   hw_disk_bus=ide --is-public=true --container-format=bare --disk-format=qcow2
   NSVPX-KVM-12.0-26.2.qcow2
   ```

The following illustration provides a sample output for the glance image-create command.

3. After an OpenStack image is created, provision the NetScaler VPX instance instance.

   ```bash
   nova boot --image NSVPX-KVM-12.0-26.2 --config-drive=true --userdata
   ./userdata.txt --flavor m1.medium --nic net-id=3b258725-eaae-455e-a5de-371d6d1f349f
   --nic port-id=218ba819-9f55-4991-adb6-02086a6bdee2 NSVPX-10
   ```

   In the above command, userdata.txt is the file which contains the details like, IP address, netmask, and default gateway for the VPX instance. The userdata file is a user customizable file. NSVPX-KVM-12.0-26.2 is the name of the virtual appliance that you want to provision. –nic port-id=218ba819-9f55-4991-adb6-02086a6bdee2 is the OpenStack VF.

   The following illustration gives a sample output of the nova boot command.

   The following illustration shows a sample of the userdata.txt file. The values within the <PropertySection></PropertySection> tags are the values which is user configurable and holds the information like, IP address, netmask, and default gateway.

   ```xml
   <?xml version="1.0" encoding="UTF-8" standalone="no"?>
   <Environment xmlns:oe="http://schemas.dmtf.org/ovf/environment/1"
   xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
   oe:id=""
   xmlns="http://schemas.dmtf.org/ovf/environment/1">
   ```

© 1999-2018 Citrix Systems, Inc. All rights reserved.
Additional supported Configurations: Creating and Deleting VLANs on SR-IOV VFs from the Host

Type the following command to create a VLAN on the SR-IOV VF:

```
ip link show enp8s0f0 vf 6 vlan 10
```

In the above command “enp8s0f0” is the name of the physical function.

**Example:** vlan 10, created on vf 6

Type the following command to delete a VLAN on the SR-IOV VF:

```
ip link show enp8s0f0 vf 6 vlan 0
```

**Example:** vlan 10, removed from vf 6

These steps complete the procedure for deploying a NetScaler VPX instance that uses SRIOV technology, on OpenStack.
Configure a NetScaler VPX instance on KVM to use OVS DPDK-based host interfaces

November 2, 2018

You can configure a NetScaler VPX instance running on KVM (Fedora and RHOS) to use Open vSwitch (OVS) with Data Plane Development Kit (DPDK) for better network performance. Also, certain NetScaler VPX deployments require the VPX host on KVM to operate on the vhost-user ports exposed by OVS rather than on MacVTap-based vhost interfaces.

OVS is a multilayer virtual switch licensed under the open-source Apache 2.0 license. DPDK is a set of libraries and drivers for fast packet processing.

The following Fedora, RHOS, OVS, and DPDK versions are qualified for configuring a NetScaler VPX instance:

<table>
<thead>
<tr>
<th>Fedora</th>
<th>RHOS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fedora 25</td>
<td>RHOS 7.4</td>
</tr>
<tr>
<td>OVS 2.7.0</td>
<td>OVS 2.6.1</td>
</tr>
<tr>
<td>DPDK 16.11.12</td>
<td>DPDK 16.11.12</td>
</tr>
</tbody>
</table>

Prerequisites

Before you install DPDK, make sure the host has 1 GB hugepages.

For more information, see this DPDK system requirements documentation.

Here is the summary of the steps required to configuring a NetScaler VPX Instance on KVM to use OVS DPDK-based host interfaces:

- Install DPDK.
- Build and Install OVS.
- Create an OVS bridge.
- Attach a physical interface to the OVS bridge.
- Attach vhost-user ports to the OVS data path.
- Provision a KVM-VPX with OVS-DPDK based vhost-user ports.

Install DPDK

To install DPDK, follow the instruction given at this Open vSwitch with DPDK document.
### Build and install OVS

Download OVS from the OVS download page. Next, build and install OVS by using a DPDK datapath. Follow the instructions given in the Installing Open vSwitch document.

For more detailed information, DPDK Getting Started Guide for Linux.

### Create an OVS bridge

Depending on your need, type the Fedora or RHOS command to create an OVS bridge:

**Fedora command:**

```
1 > $OVS_DIR/utilities/ovs-vsctl add-br ovs-br0 -- set bridge ovs-br0 datapath_type=netdev
```

**RHOS command:**

```
1 ovs-vsctl add-br ovs-br0 -- set bridge ovs-br0 datapath_type=netdev
```

### Attach physical interface to the OVS bridge

Bind the ports to DPDK and then attach them to the OVS bridge by typing the following Fedora or RHOS commands:

**Fedora command:**

```
1 > $OVS_DIR/utilities/ovs-vsctl add-port ovs-br0 dpdk0 -- set Interface dpdk0 type=dpdk options:dpdk-devargs=0000:03:00.0
2
3 > $OVS_DIR/utilities/ovs-vsctl add-port ovs-br0 dpdk1 -- set Interface dpdk1 type=dpdk options:dpdk-devargs=0000:03:00.1
```

**RHOS command:**

```
1 ovs-vsctl add-port ovs-br0 dpdk0 -- set Interface dpdk0 type=dpdk options:dpdk-devargs=0000:03:00.0
2
3
4 ovs-vsctl add-port ovs-br0 dpdk1 -- set Interface dpdk1 type=dpdk options:dpdk-devargs=0000:03:00.1
```

The dpdk-devargs shown as part of options specifies the PCI BDF of the respective physical NIC.
**Attach vhost-user ports to the OVS data path**

Type the following Fedora or RHOS commands to attach vhost-user ports to the OVS data path:

**Fedora command:**

```
> $OVS_DIR/utils/ovs-vsctl add-port ovs-br0 vhost-user1 -- set Interface vhost-user1 type=dpdkvhostuser -- set Interface vhost-user1 mtu_request=9000
```

```
> $OVS_DIR/utils/ovs-vsctl add-port ovs-br0 vhost-user2 -- set Interface vhost-user2 type=dpdkvhostuser -- set Interface vhost-user2 mtu_request=9000
```

```
chmod g+w /usr/local/var/run/openvswitch/vhost*
```

**RHOS command:**

```
ovs-vsctl add-port ovs-br0 vhost-user1 -- set Interface vhost-user1 type=dpdkvhostuser -- set Interface vhost-user1 mtu_request=9000
```

```
ovs-vsctl add-port ovs-br0 vhost-user2 -- set Interface vhost-user2 type=dpdkvhostuser -- set Interface vhost-user2 mtu_request=9000
```

```
chmod g+w /var/run/openvswitch/vhost*
```

**Provision a KVM-VPX with OVS-DPDK-based vhost-user ports**

You can provision a VPX instance on Fedora KVM with OVS-DPDK-based vhost-user ports only from CLI by using the following QEMU commands:

**Fedora command:**

```
quem-system-x86_64 -name KVM-VPX -cpu host -enable-kvm -m 4096M \ 
-object memory-backend-file,id=mem,size=4096M,mem-path=/dev/hugepages,share=on -numa node,memdev=mem \ 
-mem-prealloc -smp sockets=1,cores=2 -drive file=<absolute-path-to-disc-image-file>,if=none,id=drive-ide0-0-0,format=<disc-image-format> \ 
-device ide-drive,bus=ide.0,unit=0,drive=drive-ide0-0-0,id=ide0-0-0,bootindex=1 \ 
-netdev type=tap,id=hostnet0,script=no,downscript=no,vhost=on \ 
```
For RHOS, use the following sample XML file to provision the NetScaler VPX instance, by using virsh.

```xml
<domain type='kvm'>
  <name>dpdk-vpx1</name>
  <uuid>aedb844b-f6bc-48e6-a4c6-36577f2d68d6</uuid>
  <memory unit='KiB'>16777216</memory>

</video>

<memballoon model='virtio'>
  <address type='pci' domain='0x0000' bus='0x00' slot='0x02' function='0x0'/>
</memballoon>
</devices>
</domain>
**Points to note**

In the XML file, the hugepage size must be 1 GB, as shown in the sample file.

```xml
<memoryBacking>
  <hugepages>
    <page size='1048576' unit='KiB'/>
  </hugepages>
</memoryBacking>
```

Also, in the sample file vhost-user1 is the vhostuser port bound to ovs-br0.

```xml
@interface type='vhostuser'>
  <mac address='52:54:00:55:55:56'/>
  <source type='unix' path='/var/run/openvswitch/vhost-user1’ mode='client'/>
  <model type='virtio'/>
  <address type='pci' domain='0x0000' bus='0x00' slot='0x04' function='0x0'/>
</interface>
```

To bring up the NetScaler VPX instance, start using virsh command.

**Deploy a NetScaler VPX instance on AWS**

**January 6, 2019**

You can launch a Citrix NetScaler VPX instance on Amazon Web Services (AWS). The NetScaler VPX appliance is available as an Amazon Machine Image (AMI) in AWS marketplace. A NetScaler VPX instance on AWS enables customer like you to leverage AWS Cloud computing capabilities and use NetScaler load balancing and traffic management features for their business needs. The VPX instance supports all the traffic management features of a physical NetScaler appliance, and they can be deployed as standalone instances or in HA pairs.

This section includes the following topics:

- AWS terminology
- How a NetScaler VPX instance on AWS works
- Supported instance type, ENI, and IP addresses

**AWS terminology**

Here is a brief description of the terms used in this document. For more information, see AWS Glossary.
<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amazon Machine Image (AMI)</td>
<td>A machine image, which provides the information required to launch an instance, which is a virtual server in the cloud.</td>
</tr>
<tr>
<td>Elastic Block Store</td>
<td>Provides persistent block storage volumes for use with Amazon EC2 instances in the AWS Cloud.</td>
</tr>
<tr>
<td>Simple Storage Service (S3)</td>
<td>Storage for the Internet. It is designed to make web-scale computing easier for developers.</td>
</tr>
<tr>
<td>Elastic Compute Cloud (EC2)</td>
<td>A web service that provides secure, resizable compute capacity in the cloud. It is designed to make web-scale cloud computing easier for developers.</td>
</tr>
<tr>
<td>Elastic Load Balancing (ELB)</td>
<td>Distributes incoming application traffic across multiple EC2 instances, in multiple Availability Zones. This increases the fault tolerance of your applications.</td>
</tr>
<tr>
<td>Elastic network interface (ENI)</td>
<td>A virtual network interface that you can attach to an instance in a VPC.</td>
</tr>
<tr>
<td>Elastic IP (EIP) address</td>
<td>A static, public IPv4 address that you have allocated in Amazon EC2 or Amazon VPC and then attached to an instance. Elastic IP addresses are associated with your account, not a specific instance. They are elastic because you can easily allocate, attach, detach, and free them as your needs change.</td>
</tr>
<tr>
<td>Instance type</td>
<td>Amazon EC2 provides a wide selection of instance types optimized to fit different use cases. Instance types comprise varying combinations of CPU, memory, storage, and networking capacity and give you the flexibility to choose the appropriate mix of resources for your applications.</td>
</tr>
<tr>
<td>Term</td>
<td>Definition</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Identity and Access Management (IAM)</td>
<td>An AWS identity with permission policies that determine what the identity can and cannot do in AWS. You can use an IAM role to enable applications running on an EC2 instance to securely access your AWS resources. IAM role is required for deploying VPX instances in a high-availability setup.</td>
</tr>
<tr>
<td>Internet Gateway</td>
<td>Connects a network to the Internet. You can route traffic for IP addresses outside your VPC to the Internet gateway.</td>
</tr>
<tr>
<td>Key pair</td>
<td>A set of security credentials that you use to prove your identity electronically. A key pair consists of a private key and a public key.</td>
</tr>
<tr>
<td>Route tables</td>
<td>A set of routing rules that controls the traffic leaving any subnet that is associated with the route table. You can associate multiple subnets with a single route table, but a subnet can be associated with only one route table at a time.</td>
</tr>
<tr>
<td>Security groups</td>
<td>A named set of allowed inbound network connections for an instance.</td>
</tr>
<tr>
<td>Subnets</td>
<td>A segment of the IP address range of a VPC that EC2 instances can be attached to. You can create subnets to group instances according to security and operational needs.</td>
</tr>
<tr>
<td>Virtual Private Cloud (VPC)</td>
<td>A web service for provisioning a logically isolated section of the AWS cloud where you can launch AWS resources in a virtual network that you define.</td>
</tr>
<tr>
<td>Auto Scaling</td>
<td>A web service to launch or terminate Amazon EC2 instances automatically based on user-defined policies, schedules, and health checks.</td>
</tr>
<tr>
<td>CloudFormation</td>
<td>A service for writing or changing templates that create and delete related AWS resources together as a unit.</td>
</tr>
</tbody>
</table>
How a NetScaler VPX instance on AWS works

The NetScaler VPX instance is available as an AMI in AWS marketplace, and it can be launched as an EC2 instance within an AWS VPC. The NetScaler VPX AMI instance requires a minimum of 2 virtual CPUs and 2 GB of memory. An EC2 instance launched within an AWS VPC can also provide the multiple interfaces, multiple IP addresses per interface, and public and private IP addresses needed for VPX configuration. Each VPX instance requires at least three IP subnets:

- A management subnet
- A client-facing subnet (VIP)
- A back-end facing subnet (SNIP, MIP, etc.)

Citrix recommends three network interfaces for a standard VPX instance on AWS installation.

AWS currently makes multi-IP functionality available only to instances running within an AWS VPC. A VPX instance in a VPC can be used to load balance servers running in EC2 instances. An Amazon VPC allows you to create and control a virtual networking environment, including your own IP address range, subnets, route tables, and network gateways.

Note: By default, you can create up to 5 VPC instances per AWS region for each AWS account. You can request higher VPC limits by submitting Amazon's request form http://aws.amazon.com/contact-us/vpc-request.

Figure 1. A Sample NetScaler VPX Instance Deployment on AWS Architecture

Figure 1 shows a simple topology of an AWS VPC with a NetScaler VPX deployment. The AWS VPC has:

1. A single Internet gateway to route traffic in and out of the VPC.
2. Network connectivity between the Internet gateway and the Internet.
3. Three subnets, one each for management, client, and server.
4. Network connectivity between the Internet gateway and the two subnets (management and client).
5. A standalone NetScaler VPX instance deployed within the VPC. The VPX instance has three ENIs, one attached to each subnet.

Supported instance type, ENI, and IP addresses

For more information about Amazon EC2 instances and IP addresses supported per NIC per instance type:

- Instance types
- IP addresses per network interface per instance type

For higher bandwidth, Citrix recommends the following instance types:
Limitations and usage guidelines

November 2, 2018

The following limitations and usage guidelines apply when deploying a NetScaler VPX instance on

AWS:

- Before you start, read the AWS terminology section in Deploy a NetScaler VPX instance on AWS.
- The clustering feature is not supported for VPX.
- For the high availability setup to work effectively, associate a dedicated NAT device to management Interface or associate EIP to NSIP. For more information on NAT, in the AWS documentation, see NAT Instances.
- Data traffic and management traffic must be segregated with ENIs belonging to different subnets.
- Only the NSIP address should be present on the management ENI.
- If a NAT instance is used for security instead of assigning an EIP to the NSIP, appropriate VPC level routing changes are required. For instructions on making VPC level routing changes, in the AWS documentation, see Scenario 2: VPC with Public and Private Subnets.
- A VPX instance can be moved from one EC2 instance type to another (for example, from m3.large to an m3.xlarge).
- For storage options for VPX on AWS, Citrix recommends EBS, because it is durable and the data is available even after it is detached from instance.
- Dynamic addition of ENIs to VPX is not supported. You have to restart the VPX instance to apply the update. Citrix recommends you to stop the standalone or HA instance, attach the new ENI, and then restart the instance.
- You can assign multiple IP addresses to an ENI. The maximum number of IP addresses per ENI is determined by the EC2 instance type, see the section “IP Addresses Per Network Interface Per Instance Type” in Elastic Network Interfaces. You must allocate the IP addresses in AWS before you assign them to ENIs. For more information, see Elastic Network Interfaces.
- Citrix recommends that you avoid using the enable and disable interface commands on NetScaler VPX interfaces.
- The NetScaler “set ha node <NODE_ID> -haStatus STAYPRIMARY” and “set ha node <NODE_ID> -haStatus STAYSECONDARY” commands are disabled by default.
Due to Amazon AWS limitations, these features are not supported:

- IPV6
- Gratuitous ARP (GARP)
- L2 mode
- Tagged VLAN
- Dynamic Routing
- Virtual MAC (VMAC)

For RNAT to work, ensure **Source/Destination Check is disabled.** For more information, see “Changing the Source/Destination Checking” in Elastic Network Interfaces.

In a NetScaler VPX deployment on AWS, in some AWS regions, the AWS infrastructure might not be able to resolve AWS API calls. This happens if the API calls are issued through a nonmanagement interface on the NetScaler VPX instance.

As a workaround, restrict the API calls to the management interface only. To do that, create a nsvlan on the VPX instance and bind the management interface to the nsvlan by using the appropriate command.

For example:

```
set ns config -nsvlan <vlan id> -ifnum 1/1 -tagged NO
save config
```

Restart the VPX instance at the prompt. For more information about configuring nsvlan, see Configuring NSVLAN.

**Prerequisites**

September 20, 2018

Before attempting to create a VPX instance in AWS, ensure you have the following:

- **An AWS Identity and Access Management (IAM) user account**: to securely control access to AWS services and resources for your users. For more information about how to create an IAM user account, see the topic Creating IAM Users (Console).

An IAM role is mandatory for both standalone and high availability deployments. The IAM role must have the following privileges:

- ec2:DescribeInstances
- ec2:DescribeNetworkInterfaces
- ec2:DetachNetworkInterface
- ec2:AttachNetworkInterface
ec2:StartInstances
ec2:StopInstances
e2:RebootInstances
autoscaling:*  
sns:*  
sqs:*  
iam:SimulatePrincipalPolicy
iam:GetRole

If you use the Citrix CloudFormation template, the IAM role is automatically created. The template does not have the option to select an already created IAM role.

- **AWS CLI**: to use all of the functionality provided by the AWS Management Console from your terminal program. For more information, see the AWS CLI user guide. You also need the AWS CLI to change the network interface type to SR-IOV.

## Deploy a NetScaler VPX standalone instance on AWS

January 6, 2019

You can deploy a Citrix NetScaler VPX standalone instance on AWS by using the following options:

1. AWS web console
2. Citrix-authored CloudFormation template
3. AWS CLI

This topic describes the procedure for deploying a NetScaler VPX instance on AWS.

Before you start your deployment, read the following topics:

- **Prerequisites**
- **Limitation and usage guidelines**

## Deploy a NetScaler VPX instance on AWS by using the AWS web console

You can deploy a NetScaler VPX instance on AWS through the AWS web console. The deployment process includes the following steps:

1. Create a Key Pair
2. Create a Virtual Private Cloud (VPC)
3. Add additional subnets
4. Create security groups and security rules
5. Add route tables
6. Create an internet gateway
7. Create a NetScaler VPX instance
8. Create and attach additional network interfaces
9. Attach elastic IPs to the management NIC
10. Connect to the VPX instance

**Step 1: Create a key pair.**

Amazon EC2 uses a key pair to encrypt and decrypt logon information. To log on to your instance, you must create a key pair, specify the name of the key pair when you launch the instance, and provide the private key when you connect to the instance.

When you review and launch an instance by using the AWS Launch Instance wizard, you are prompted to use an existing key pair or create a new key pair. More information about how to create a key pair, see Amazon EC2 Key Pairs.

**Step 2: Create a VPC.**

A NetScaler VPC instance is deployed inside an AWS VPC. A VPC allows you to define virtual network dedicated to your AWS account. For more information about AWS VPC, see Getting Started With Amazon VPC.

While creating a VPC for your NetScaler VPX instance, keep the following points in mind.

- Use the VPC with a Single Public Subnet Only option to create a new AWS VPC in an AWS availability zone.
- Citrix recommends that you create at least three subnets, of the following types:
  - One subnet for management traffic. You place the management IP (NSIP) on this subnet. By default elastic network interface (ENI) eth0 is used for management IP.
  - One or more subnets for client-access (user-to-NetScaler VPX) traffic, through which clients connect to one or more virtual IP (VIP) addresses assigned to NetScaler load balancing virtual servers.
  - One or more subnets for the server-access (VPX-to-server) traffic, through which your servers connect to VPX-owned subnet IP (SNIP) addresses. For more information about NetScaler load balancing and virtual servers, virtual IP addresses (VIPs), and subnet IP addresses (SNIPs), see:
    - All subnets must be in the same availability zone.

**Step 3: Add subnets.**

When you used the VPC wizard, only one subnet was created. Depending on your requirement, you might want to create additional subnets. For more information about how to create additional subnets, see Adding a Subnet to Your VPC.
Step 4: Create security groups and security rules.

To control inbound and outbound traffic, create security groups and add rules to the groups. For more information how to create groups and add rules, see Security Groups for Your VPC.

For NetScaler VPX instances, the EC2 wizard gives default security groups, which are generated by AWS Marketplace and is based on recommended settings by Citrix. However, you can create additional security groups based on your requirements.

Note
Port 22, 80, 443 to be opened on the Security group for SSH, HTTP, and HTTPS access respectively.

Step 5: Add route tables.

Route table contains a set of rules, called routes, that are used to determine where network traffic is directed. Each subnet in your VPC must be associated with a route table. For more information about how to create a route table, see Route Tables.

Step 6: Create an internet gateway.

An internet gateway serves two purposes: to provide a target in your VPC route tables for internet-routable traffic, and to perform network address translation (NAT) for instances that have been assigned public IPv4 addresses.

Create an internet gateway for internet traffic. For more information about how to create an Internet Gateway, see the section Attaching an Internet Gateway.

Step 7: Create a NetScaler VPX instance by using the AWS EC2 service.

To create a NetScaler VPX instance by using the AWS EC2 service, complete the following steps.

1. From the AWS dashboard, go to Compute > EC2 > Launch Instance > AWS Marketplace.

Before you click Launch Instance, ensure your region is correct by checking the note that appears under Launch Instance.

2. In the Search AWS Marketplace bar, search with the keyword NetScaler VPX.

3. Select the version you want to deploy and then click Select. For the NetScaler VPX version, you the following options:
   - A licensed version
   - NetScaler VPX Express appliance (This is a free virtual appliance, which is available from NetScaler 12.0 56.20.)
   - Bring your own device

The Launch Instance wizard starts. Follow the wizard to create an instance. The wizard prompts you to:
NetScaler 12.0

• Choose Instance Type
• Configure Instance
• Add Storage
• Add Tags
• Configure Security Group
• Review

**Step 8: Create and attach additional network interfaces.**

Create two additional network interfaces for VIP and SNIP. For more information about how to create additional network interfaces, see the Creating a Network Interface section.

After you’ve created the network interfaces, you must attach them to the VPX instance. Before attaching the interface, shut down the VPX instance, attach the interface, and power on the instance. For more information about how to attach network interfaces, see the Attaching a Network Interface When Launching an Instance section.

**Step 9: Allocate and associate elastic IPs.**

If you assign a public IP address to an EC2 instance, it remains assigned only until the instance is stopped. After that, the address is released back to the pool. When you restart the instance, a new public IP address is assigned.

In contrast, an elastic IP (EIP) address remains assigned until the address is disassociated from an instance.

Allocate and associate an elastic IP for the management NIC. For more information about how to allocate and associate elastic IP addresses, see these topics:

• Allocating an Elastic IP Address
• Associating an Elastic IP Address with a Running Instance

These steps complete the procedure to create a NetScaler VPX instance on AWS. It can take a few minutes for the instance to be ready. Check that your instance has passed its status checks. You can view this information in the Status Checks column on the Instances page.

**Step 10: Connect to the VPX instance.**

After you’ve created the VPX instance, you connect the instance by using the GUI and an SSH client.

• GUI

The following are the default administrator credentials to access a NetScaler VPX instance

User name: nsroot
Password: The default password for the nsroot account is set to the AWS instance-ID of the NetScaler VPX instance.

• SSH client
From the AWS management console, select the NetScaler VPX instance and click **Connect**. Follow the instructions given on the **Connect to Your Instance** page.

For more information about how to deploy a NetScaler VPX standalone instance on AWS by using the AWS web console, see:

- **Scenario: standalone instance**
- The following video

**Configure a NetScaler VPX instance by using the Citrix CloudFormation template**

You can use the Citrix-provided CloudFormation template to automate VPX instance launch. The template provides functionality to launch a single NetScaler VPX instance, or to create a high availability environment with a pair of NetScaler VPX instances.

You can launch the template from AWS Marketplace or GitHub.

The CloudFormation template requires an existing VPC environment, and it launches a VPX instance with three elastic network interfaces (ENIs). Before you start the CloudFormation template, ensure that you complete the following requirements:

- An AWS virtual private cloud (VPC)
- Three subnets within the VPC: one for management, one for client traffic, and one for back-end servers
- An EC2 key pair to enable SSH access to the instance
- A security group with UDP 3003, TCP 3009-3010, HTTP, SSH ports open

See the “Deploy a NetScaler VPX Instance on AWS by Using the AWS Web Console” section or AWS documentation for more information about how to complete the prerequisites.

Watch this video to learn about how to configure and launch a NetScaler VPX standalone instance by using the Citrix CloudFormation template available in the AWS Marketplace.

Further, you configure and launch a NetScaler VPX Express standalone instance by using the Citrix CloudFormation template available in GitHub:

https://github.com/citrix/netscaler-aws-cloudformation/tree/master/templates/express_single_nic

An IAM role is not mandatory for a standalone deployment. However, Citrix recommends that you create and attach an IAM role with the required privileges to the instance, for future need. The IAM role ensures that the standalone instance is easily converted to a high availability node with SR-IOV, when required.

For more information about the required privileges, see Configuring NetScaler VPX instances to Use SR-IOV Network Interface.
**Configure a NetScaler VPX instance by using the AWS CLI**

You can use the AWS CLI to launch instances. For more information, see the [AWS Command Line Interface Documentation](#).

**Download a NetScaler VPX license**

September 20, 2018

After the initial instance launch, NetScaler VPX for AWS requires a license. If you are bringing your own license (BYOL), see the [VPX Licensing Guide](#) at http://support.citrix.com/article/CTX122426

You have to:

1. Use the licensing portal within MyCitrix to generate a valid license.
2. Upload the license to the instance.

If this is a **paid** marketplace instance, then you do not need to install a license. The correct feature set and performance will activate automatically.

If you use a NetScaler VPX instance with a model number higher than VPX 5000, the network throughput might not be the same as specified by the instance’s license. However, other features, such as SSL throughput and SSL transactions per second, might improve.

5 Gbps network bandwidth is observed in c4.8xlarge instance type.

**Load balancing servers in different availability zones**

September 20, 2018

A VPX instance can be used to load balance servers running in the same availability zone, or in:

- A different availability zone (AZ) in the same AWS VPC
- A different AWS region
- AWS EC2 in a VPC

To enable a VPX instance to load balance servers running outside the AWS VPC that the VPX instance is in, configure the instance to use EIPs to route traffic through the Internet gateway, as follows:

1. Configure a SNIP on the NetScaler VPX instance by using the NetScaler CLI or the GUI.
2. Enable traffic to be routed out of the AZ, by creating a public facing subnet for the server-side traffic.
3. Add an Internet gateway route to the routing table, using the AWS GUI console.
4. Associate the routing table you just updated with the server-side subnet.
5. Associate an EIP with the server-side private IP address that is mapped to a NetScaler SNIP address.

Deploy a high availability pair on AWS

January 6, 2019

You can configure two NetScaler VPX instances on AWS as a high availability active-passive pair. With one instance configured as the primary node and the other as the secondary node, the primary node accepts connections and manages servers while the secondary node monitors the primary. If, for any reason, the primary node is unable to accept connections, the secondary node takes over.

For more information on HA, see High availability.

Before you start your deployment, read the following topics:

- Prerequisites for the required IAM role privileges.
- Limitations and usage guidelines

The following figure shows an example of the HA deployment architecture for NetScaler VPX instances on AWS.

Figure 1. A NetScaler VPX HA Pair on AWS

To deploy HA for two VPX instances on AWS, you either create the instances with IAM Role manually by using the AWS Management Console and then configure HA on them, or you can automate the HA deployment by using the Citrix CloudFormation template.

The CloudFormation template significantly decreases the number of steps involved for creating an HA pair, and it automatically creates an IAM Role. This section shows how to deploy a NetScaler VPX HA (active-passive) pair by using the Citrix CloudFormation template.

Keep the following points in mind while deploying two NetScaler VPX instances as an HA pair.

Points to note

- HA on AWS requires the primary node to have at least two ENIs (one for management and the other for data traffic), and the secondary node to have one management ENI. However, for security purposes, create three ENIs on the primary node, because this setup allows you to segregate private and public network (recommended).
- The secondary node always has one ENI interface (for management) and the primary node can have up to four ENIs.
• The NSIP addresses for each VPX instance in a high availability pair must be configured on the default ENI of the instance.
• Because Amazon does not allow any broadcast/multicast packets in AWS, HA is implemented by migrating data-plane ENIs from the primary to the secondary (new primary) VPX instance when the primary VPX instance fails.
• Because the default (management) ENI cannot be moved to another VPX instance, do not use the default ENI for client and server traffic (data-plane traffic).
• The message AWSCONFIG IOCTL NSAPI_HOTPLUG_INTF success output 0 in the /var/log/ns.log indicates that the two data ENIs have successfully attached to the secondary instance (the new primary).
• Failover might take up to 20 seconds due to the AWS detach/attach ENI mechanism.
• Upon failover, the failed instance always restarts.
• The heartbeat packets are received only on the management interface.
• The configuration file of the primary and secondary VPX instances is synchronized, including the nsroot password. The nsroot password of the secondary node is set to that of the primary node after the HA configuration synchronization.
• To have access to the AWS API servers, either the VPX instance must have a public IP address assigned or routing must be set up correctly at VPC subnet level pointing to internet gateway of the VPC
• Nameservers/DNS servers are configured at VPC level using DHCP options.
• The Citrix CloudFormation template does not create an HA setup between different availability zones.
• The Citrix CloudFormation template does not create an INC mode.
• The AWS debug messages are available in the log file, /var/log/ns.log, on the VPX instance.

Deploy a high availability pair by using the Citrix CloudFormation template

Before start the CloudFormation template, ensure that you complete the following requirements:

• A VPC
• Three subnets within the VPC
• A security group with UDP 3003, TCP 3009-3010, HTTP, SSH ports open
• A key pair

Note
The Citrix CloudFormation template automatically creates an IAM Role. The template has no option to select an existing IAM Role.

To launch the Citrix CloudFormation template:

1. Log on to the AWS marketplace by using your AWS credentials.
2. In the search field, type **NetScaler VPX** to search for the NetScaler AMI, and click **Go**.
3. On the search result page, click the desired NetScaler VPX offering.
4. Under **For Region**, select your region.
5. Select the **Delivery Methods** as **Netscaler AWS-VPX Cluster** and click **Continue**.
6. On the **Launch on EC2** page, under **Version**, select the correct NetScaler. Ensure that the **Region** and **Deployment Options** are correct. Check pricing details.
7. Click **Launch with CloudFormation Console** to launch the Citrix CloudFormation template.
8. The **Select Template** page appears. Click **Next**.
9. The **Specify Details** appears. Enter the following details.
   a. Type a **Stack name**. The name must be within 25 characters.
   b. Under **High Availability Configuration**
      Select **Yes** from the menu for **Create HA pair?**.
   c. Under **Virtual Private Network Configuration**
      Select the VPC that you’ve already created for **VPC ID**.
      Type **Remote SSH CIDR IP**.
      Type **Remote HTTP CIDR IP**.
      Type **Remote HTTPS CIDR IP**.
      Select the key pair that you’ve already created from the drop-down menu for **Key Pair**.
   d. Under **Network Interface Configuration**
      Select **Management Subnetwork**, **Client Subnetwork**, and **Server Subnetwork**. Ensure that you select the correct subnetworks you created within the VPC that you selected under VPC ID in step c.
      Add **Primary Management IP**, **Secondary Management IP**, **Client IP**, and **Server IP**. The IP addresses must belong to the same subnets of the respective subnetworks. Alternatively, you can let the template assign the IP addresses automatically.
   e. Under **Other Parameters**
      Select **m4.large** for **Instant Type**.
      Select **default** for **Tenancy Type**.
   f. Click **Next**.
8. The **Options** page appears. (This is an optional page.) Click **Next**.
9. The **Review** page appears. Take a moment to review the settings and make necessary changes if necessary.
10. Select the **I acknowledge that AWS CloudFormation might create IAM resources** check box, and then click **Create**.

11. The **CREATE-IN-PROGRESS** status appears. Wait until the status is **CREATE-COMPLETE**. If the status does not change to “COMPLETE,” check the **Events** tab for the reason of failure and recreate the instance with proper configurations.

11. After an IAM resource is created, go to **EC2 Management Console > Instances**. You should notice two VPX instances created with IAM role. The primary node is created with three private IP addresses and three network interfaces.

The secondary node is created with one private IP address and one network interface.

**Note**

The secondary node is created with one interface by default in AWS. During failover, the interface from the primary node gets attached to the secondary node (the new primary node) and gets detached from the original primary node (the new secondary node).

13. Log on to the primary node with user name nsroot and the instance ID as the password. From the GUI, go to **System > High Availability**. The NetScaler VPX HA pair appears.

Next, configure the HA pairing on both the instances. Configure the instance with three ENIs before configuring HA on the instance with one ENI). Use the add HA node command, from within the VPX CLI, or from the GUI.

`add HA node <private IP of the first instance>`

`add HA node <private IP of the second instance>`

After you run the “add HA node” commands, the two nodes form an HA pair, and configuration information is synchronized between the two VPX instances.

**Configuring SR-IOV on a high availability setup**

Support for SR-IOV interfaces in a high availability setup is available from NetScaler release 12.0 57.19 onwards. For more information about how to configure SR-IOV, see Configuring NetScaler VPX instances to Use SR-IOV Network Interface.

**Add back-end AWS Auto Scaling service**

January 6, 2019

Efficient hosting of applications in a cloud involves easy and cost-effective management of resources depending on the application demand. To meet increasing demand, you have to scale network resources upward. Whether demand subsides, you need to scale down to avoid the unnecessary cost of
idle resources. To minimize the cost of running the application by deploying only as many instances as are necessary during any given period of time, you have to constantly monitor traffic, memory and CPU use, and so on. However, monitoring traffic manually is cumbersome. For the application environment to scale up or down dynamically, you must automate the processes of monitoring traffic and of scaling resources up and down whenever necessary.

Integrated with AWS Auto Scaling service, the NetScaler VPX instance provides the following advantages:

- **Load balance and management:** Auto configures servers to scale up and scale down, depending on demand. The VPX instance auto detects Auto Scale groups in the back-end subnet and allows user to select the Auto Scale groups to balance the load. All of this is done by auto configuring the virtual and subnet IP addresses on the VPX instance.

- **High availability:** Detects Auto Scale groups that span multiple availability zones and load-balance servers.

- **Better network availability:** The VPX instance supports:
  - Back-end servers on different VPCs, by using VPC peering
  - Back-end servers on same placement groups
  - Back-end servers on different availability zones

- **Graceful connection termination:** Removes Auto Scale servers gracefully, avoiding loss of client connections when scale-down activity occurs, by using the Graceful Timeout feature.

**Diagram:** AWS Auto Scaling Service with a NetScaler VPX Instance

The above diagram illustrates how the AWS Auto Scaling service works with a NetScaler VPX instance (LB virtual server). For more information, see the following AWS topics.

- Auto Scaling groups
- CloudWatch
- Simple Notification Service (SNS)
- Simple Queue Service (Amazon SQS)

**Before you begin**

Before you start using Auto Scaling with your NetScaler VPX instance, you should complete the following tasks.

1. Read the following topics:
   - Prerequisites
   - Limitation and usage guidelines

2. Create a NetScaler VPX instances on AWS according to your requirement.
   - For more information about how to create a NetScaler VPX standalone instance, see Deploy a NetScaler VPX standalone instance on AWS and Scenario: standalone instance
For more information about how to deploy VPX instances in HA mode, see Deploy a high availability pair on AWS.

Citrix recommends CloudFormation template for creating NetScaler VPX instances on AWS.

**Note**

Citrix recommends you create three interfaces: one for management (NSIP), one for client-facing LB virtual server (VIP), and one for subnet IP (NSIP).

3. Create an AWS Auto Scale group. If you don’t have an existing Auto Scaling configuration, you need to:
   a) Create a Launch Configuration
   b) Create an Auto Scaling Group
   c) Verify the Auto Scaling Group

For more information, see [http://docs.aws.amazon.com/autoscaling/latest/userguide/GettingStartedTutorial.html](http://docs.aws.amazon.com/autoscaling/latest/userguide/GettingStartedTutorial.html).

**Add the AWS Auto Scaling service to a NetScaler VPX instance**

You can add the Auto Scaling service to a VPX instance with a single click by using the GUI. Complete these steps to add the Auto Scaling service to the VPX instance:

1. Log on to the VPX instance by using your credentials for nsroot.

2. When you log on to the NetScaler VPX instance for the first time, you see the default Cloud Profile page. Select the AWS auto scaling group from drop-down menu and click **Create** to create a cloud profile. Click **Skip** if you want to create the cloud profile later.

**Points to keep in mind while creating a Cloud Profile:** By default the CloudFormation Template creates and attaches the below IAM Role.

```json
{
   "Version": "2012-17",
   "Statement": [
     {
       "Action": [
         "ec2:DescribeInstances",
         "ec2:DescribeNetworkInterfaces",
         "ec2:DetachNetworkInterface"
       ]
     }
   ]
}
```
“ec2:AttachNetworkInterface”,
"ec2:StartInstances",
"ec2:StopInstances",
"ec2:RebootInstances",
“autoscaling:*”,
"sns:*",
“sqs:*”
“iam: SimulatePrincipalPolicy”
“iam: GetRole”
],
“Resource”: “*”,
“Effect”: “Allow”
}
]
Ensure the IAM Role of instance has proper permissions.

- The virtual server IP address is autopopulated from the free IP address available to the VPX instance. [https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/MultipleIP.html#ManageMultipleIP](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/MultipleIP.html#ManageMultipleIP)

- Auto Scale group is prepopulated from the Auto Scale group configured on your AWS account. [http://docs.aws.amazon.com/autoscaling/latest/userguide/AutoScalingGroup.html](http://docs.aws.amazon.com/autoscaling/latest/userguide/AutoScalingGroup.html).

- While selecting the Auto Scaling Group protocol and port, ensure your servers listen on those protocol and ports and you bind the correct monitor in the service group. By default, TCP monitor is used.

- For SSL Protocol type Autos Scaling, after you create the Cloud Profile the load balance virtual server or service group will be down because of a missing certificate. You can bind the certificate to the virtual server or service group manually.

- Select the Graceful Timeout option to remove Auto Scale servers gracefully. If this option is not selected the server is the Auto Scale group is removed immediately after the load goes down, which might cause service interruption for the existing connected clients. Selecting Graceful and giving a timeout means in the event of scale down. The VPX instance does not remove the server immediately but marks one of the servers for graceful deletion. During this period, the instance does not allow new connections to this server. Existing connection are served till the timeout occurs, and after timeout the VPX instance removes the server.
After first time logon if you want to create Cloud Profile, on the GUI go to System > AWS > Cloud Profile and click Add.

The Create Cloud Profile configuration page appears.

Cloud Profile creates a NetScaler load-balancing (LB) virtual server (virtual server) and a service group with members (servers) as the servers of the Auto Scaling Group. Your back-end servers should be reachable through the SNIP configured on the VPX instance.

Note
To view Auto Scale-related information in the AWS console, go to EC2 > Dashboard > Auto Scaling > Auto Scaling Group.

Configure a NetScaler VPX instance to use SR-IOV network interface

January 6, 2019

Note
Support for SR-IOV interfaces in a high availability setup is available from NetScaler release 12.0 57.19 onwards.

After you have created a NetScaler VPX instance on AWS, you can configure the virtual appliance to use SR-IOV network interfaces, by using AWS CLI.

In all NetScaler VPX models, except NetScaler VPX AWS Marketplace Editions of 3G and 5G, SR-IOV is not enabled in the default configuration of a network interface.

Before you start the configuration, read the following topics:

- Prerequisites
- Limitations and Usage Guidelines

This section includes the following topics:

- Change the Interface Type to SR-IOV
- Configure SR-IOV on a High Availability Setup

Change the interface type to SR-IOV

You can run the show interface summary command to check the default configuration of a network interface.

Example 1: The following CLI screen capture shows the configuration of a network interface where SR-IOV is enabled by default on NetScaler VPX AWS Marketplace Editions of 3G and 5G.
Example 2: The following CLI screen capture shows the default configuration of a network interface where SR-IOV is not enabled.

For more information about changing the interface type to SR-IOV, see http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/sriov-networking.html

To change the interface type to SR-IOV
1. Shut down the NetScaler VPX instance running on AWS.
2. To enable SR-IOV on the network interface, type the following command in the AWS CLI.
   
   ```bash
   $ aws ec2 modify-instance-attribute --instance-id <instance_id> --sriov-net-support simple
   ```
3. To check if SR-IOV has been enabled, type the following command in the AWS CLI.
   
   ```bash
   $ aws ec2 describe-instance-attribute --instance-id <instance_id> --attribute sriovNetSupport
   ```

Example 3: Network interface type changed to SR-IOV, by using AWS CLI.
If SR-IOV is not enabled, value for SriovNetSupport is absent.

Example 4: In the following example, SR-IOV support is not enabled.
3. Power on the VPX instance. To see the changed status of the network interface, type “show interface summary” in CLI.

Example 5: The following screen capture shows the network interfaces with SR-IOV enabled. The interfaces 10/1, 10/2, 10/3 are SR-IOV enabled.

These steps complete the procedure to configure VPX instances to use SR-IOV network interfaces.

Configure SR-IOV on a high availability setup

High availability is supported with SR-IOV interfaces from NetScaler release 12.0 build 57.19 onwards.

If the high availability setup was deployed manually or by using the Citrix CloudFormation template for NetScaler version 12.0 56.20 and lower, the IAM role attached to the high availability setup must have the following privileges:

- ec2:DescribeInstances
- ec2:DescribeNetworkInterfaces
- ec2:DetachNetworkInterface
- ec2:AttachNetworkInterface
- ec2:StartInstances
- ec2:StopInstances
- ec2:RebootInstances
- autoscaling:*
- sns:*
NetScaler 12.0

- sqs:*
  - iam:SimulatePrincipalPolicy
  - iam:GetRole

By default, the Citrix CloudFormation template for NetScaler version 12.0 57.19 automatically adds the required privileges to the IAM role.

**Note**

A high availability setup with SR-IOV Interfaces take around 100 seconds of down time.

**Related resources:**

For more information about IAM roles, see [AWS documentation](#).

**Upgrade a NetScaler VPX instance on AWS**

December 5, 2018

You can upgrade the EC2 instance type, throughput, software edition, and the system software of a NetScaler VPX running on AWS. For certain types of upgrades, Citrix recommends using the High Availability Configuration method to minimize downtime.

**Note:**

- NetScaler software release 10.1.e-124.1308.e or later for a NetScaler VPX AMI (including both utility license and customer license) does not support the M1 and M2 instance families.
- Because of changes in VPX instance support, downgrading from 10.1.e-124 or a later release to 10.1.123.x or an earlier release is not supported.
- Most of the upgrades do not require the launch of a new AMI, and the upgrade can be done on the current NetScaler AMI instance. If you do want to upgrade to a new NetScaler AMI instance, use the high availability configuration method.

**Change the EC2 instance type of a NetScaler VPX instance on AWS**

If your NetScaler VPX instances are running release 10.1.e-124.1308.e or later, you can change the EC2 instance type from the AWS console as follows:

1. Stop the VPX instance.
2. Change the EC2 instance type from the AWS console.
3. Start the instance.

You can also use the above procedure to change the EC2 instance type for a release, earlier than 10.1.e-124.1308.e, unless you want to change the instance type to M3. In that case, you must first follow the
standard NetScaler upgrade procedure, at , to upgrade the NetScaler software to 10.1.e-124 or a later release, and then follow the above steps.

**Upgrade the throughput or software edition of a NetScaler VPX instance on AWS**

To upgrade the software edition (for example, to upgrade from Standard to Platinum edition) or throughput (for example, to upgrade from 200 mbps to 1000mbps), the method depends on the instance’s license.

**Using a customer license (Bring-Your-Own-License)**

If you are using a customer license, you can purchase and download the new license from the Citrix Licensing portal (MyCitrix), and then install the license on the VPX instance. For more information about downloading and installing a license from the MyCitrix portal, see the VPX Licensing Guide.

**Using a utility license (Utility license with hourly fee)**

AWS does not support direct upgrades for fee-based instances. To upgrade the software edition or throughput of a fee based NetScaler VPX instance, launch a new AMI with the desired license and capacity and migrate the older instance configuration to the new instance. This can be achieved by using a NetScaler high availability configuration as described in Upgrade to a new NetScaler AMI instance by using a NetScaler high availability configuration subsection in this page.

**Upgrade the system software of a NetScaler VPX instance on AWS**

If you need to upgrade a VPX instance running 10.1.e-124.1308.e or a later release, follow the standard NetScaler upgrade procedure at .

If you need to upgrade a VPX instance running a release older than 10.1.e-124.1308.e to 10.1.e-124.1308.e or a later release, first upgrade the system software, and then change the instance type to M3 as follows:

1. Stop the VPX instance.
2. Change the EC2 instance type from the AWS console.
3. Start the instance.
Upgrade to a new NetScaler AMI instance by using a NetScaler high availability configuration

To use the high availability method of upgrading to a new NetScaler AMI instance, perform the following tasks:

- Create a new instance with the desired EC2 instance type, software edition, throughput, or software release from the AWS marketplace.
- Configure high availability between the old instance (to be upgraded) and the new instance. After high availability is configured between the old and the new instance, configuration from the old instance is synchronized to the new instance.
- Force an HA failover from the old instance to the new instance. As a result, the new instance becomes primary and starts receiving traffic.
- Stop, and reconfigure or remove the old instance from AWS.

Prerequisites and points to consider

- Ensure you understand how high availability works between two NetScaler VPX instances on AWS. For more information about high availability configuration between two NetScaler VPX instances on AWS, see Deploy a high availability pair on AWS.
- You must create the new instance in the same availability zone as the old instance, having the exact same security group and subnet.
- High availability setup requires access and secret keys associated with the user’s AWS Identity and Access Management (IAM) account for both instances. If the correct key information is not used when creating VPX instances, the HA setup fails. For more information about creating an IAM account for a VPX instance, see Prerequisites.
  - You must use the EC2 console to create the new instance. You cannot use the AWS 1-click launch, because it does not accept the access and secret keys as the input.
  - The new instance should have only one ENI interface.

To upgrade a NetScaler VPX Instance by using a high availability configuration, follow these steps:

1. Configure high availability between the old and the new instance. To configure high availability between two NetScaler VPX instances, at the command prompt of each instance, type:

   - add ha node <nodeID> <IPaddress of the node to be added>
   - save config

   Example:

   At the command prompt of the old instance, type:

   ```
   1  add  ha  node  30  192.0.2.30
   2  Done
   ```
At the command prompt of the new instance, type:

```
1  add  ha  node  10  192.0.2.10
2  Done
```

Note the following:

- In the HA setup, the old instance is the primary node and the new instance is the secondary node.
- The NSIP IP address is not copied from the old instance to the new instance. Therefore, after the upgrade, your new instance has a different management IP address from the previous one.
- The nsroot account password of the new instance is set to that of the old instance after HA synchronization.

For more information about high availability configuration between two NetScaler VPX instances on AWS, see Deploy a high availability pair on AWS.

2. Force an HA failover. To force a failover in a high availability configuration, at the command prompt of either of the instances, type:

```
1  force  HA  failover
```

As the result of forcing a failover, the ENIs of the old instance are migrated to the new instance and traffic flows through the new instance (the new primary node). The old instance (the new secondary node) restarts.

If the following warning message appears, type N to abort the operation:

```
1  [WARNING]:Force Failover may cause configuration loss, peer health not optimum. Reason(s):
2  HA version mismatch
3  HA heartbeats not seen on some interfaces
4  Please confirm whether you want force-failover (Y/N)?
```

The warning message appears because the system software of the two VPX instances is not HA compatible. As a result, the configuration of the old instance cannot be automatically synced to the new instance during a forced failover. Following is the workaround for this issue:

1/. At the NetScaler shell prompt of the old instance, type the following command to create a backup of the configuration file (ns.conf):

```
copy  /nsconfig/ns.conf  to  /nsconfig/ns.conf.bkp
```

2. Remove the following line from the backup configuration file (ns.conf.bkp):

```
•  set  ns  config  -IPAddress  <IP>  -netmask  <MASK>
```
For example, set ns config -IPAddress 192.0.2.10 -netmask 255.255.255.0

3. Copy the old instance's backup configuration file (ns.conf.bkp) to the /nsconfig directory of the new instance.

4. At the NetScaler shell prompt of the new instance, type the following command to load the old instance's configuration file (ns.conf.bkp) on the new instance:
   - batch -f /nsconfig/ns.conf.bkp

5. Save the configuration on the new instance.
   - Save conifg

6. At the command prompt of either of the nodes, type the following command to force a failover, and then type Y for the warning message to confirm the force failover operation:
   - force ha failover

   **Example:**

   ```
   > force ha failover
   WARNING]: Force Failover may cause configuration loss, peer health not optimum.
   Reason(s):
   1 HA version mismatch
   2 HA heartbeats not seen on some interfaces
   Please confirm whether you want force-failover (Y/N)? Y
   ```

3. Remove the HA configuration, so that the two instances are no longer in an HA configuration. First remove the HA configuration from the secondary node and then remove the HA configuration from the primary node.

To remove an HA configuration between two NetScaler VPX instances, at the command prompt of each instance, type:

```
> remove ha node \<nodeID>\>
> save config
```

For more information about high availability configuration between two VPX instances on AWS, see [Deploy a high availability pair on AWS](#).

**Example:**

At the command prompt of the old instance (new secondary node), type:

```
> remove ha node 30
Done
> save config
```
At the command prompt of the new instance (new primary node), type:

```plaintext
1  > remove ha node 10
2     Done
3  > save config
4     Done
```

**Troubleshoot a VPX instance on AWS**

January 6, 2019

Amazon does not provide console access to a NetScaler VPX instance. To troubleshoot, you have to use the AWS GUI to view the activity log. You can debug only if the network is connected. To view an instance’s system log, right-click the instance and select system log.

Citrix provides support for fee based NetScaler VPX instances (utility license with hourly fee) on AWS. To file a support case, find your AWS account number and support PIN code, and call Citrix support. You will also be asked for your name and email address. To find the support PIN, log on to the VPX GUI and navigate to the System page.

Here is an example of a system page showing the support PIN.

**Deploy a NetScaler VPX instance on Microsoft Azure**

January 6, 2019

Microsoft Azure Resource Manager (ARM) is a management framework that allows administrators to deploy, manage, and monitor Azure resources. Azure Resource Manager can handle these tasks as a group, rather than individually, in a single operation.

The NetScaler VPX virtual appliance is available as an image in the Microsoft Azure Marketplace and GitHub. For more information, see the GitHub repository for Citrix NetScaler solution templates for deploying NetScaler VPX instances in Microsoft Azure Cloud Services.

When you deploy NetScaler VPX on Microsoft Azure Resource Manager (ARM), you can leverage the Azure cloud computing capabilities and use NetScaler load balancing and traffic management features for your business needs. You can deploy NetScaler VPX instances on Azure Resource Manager either as standalone instances or as high availability pairs in active-active or active-standby modes.
NetScaler 12.0

This document assumes that you are familiar with Azure terminology and network details. For information, see Azure terminology.

This document also assumes that you have basic knowledge of a NetScaler appliance. For detailed information the NetScaler appliance, see:

- NetScaler
- NetScaler Gateway

Note
The Citrix XenApp and XenDesktop NetScaler Gateway configuration is based on the Azure Service Management mode and not on the Azure Resource Management mode.

Network architecture

In ARM, a NetScaler VPX virtual machine (VM) resides in a virtual network. A virtual Network Interface Card (NIC) is created on each NetScaler VM. The network security group (NSG) configured in the virtual network is bound to the NIC, and together they control the traffic flowing into the VM and out of the VM.

The NSG forwards the requests to the NetScaler VPX instance, and the VPX instance sends them to the servers. The response from a server follows the same path in reverse. The NSG can be configured to control a single VPX VM, or, with subnets and virtual networks, can control traffic in multiple VPX VM deployment.

The NIC contains network configuration details such as the virtual network, subnets, internal IP address, and Public IP address.

While on ARM, it is good to know the following IP addresses that are used to access the VMs deployed with a single NIC and a single IP address:

- Public IP (PIP) address is the internet-facing IP address configured directly on the virtual NIC of the NetScaler VM. This allows you to directly access a VM from the external network.
- NetScaler IP (NSIP) address is internal IP address configured on the VM. It is non-routable.
- Virtual IP address (VIP) is configured by using the NSIP and a port number. Clients access NetScaler services through the PIP address, and when the request reaches the NIC of the NetScaler VPX VM or the Azure load balancer, the VIP gets translated to internal IP (NSIP) and internal port number.
- Internal IP address is the private internal IP address of the VM from the virtual network’s address space pool. This IP address cannot be reached from the external network. This IP address is by
default dynamic unless you set it to static. Traffic from the internet is routed to this address according to the rules created on the NSG. The NSG works with the NIC to selectively send the right type of traffic to the right port on the NIC, which depends on the services configured on the VM.

The following figure shows how traffic flows from a client to a server through a NetScaler VPX instance provisioned in ARM.

**How a NetScaler VPX instance works on Azure**

In an on-premises deployment, a NetScaler VPX instance requires at least three IP addresses:

- Management IP address, called the NetScaler IP (NSIP) address
- Subnet IP (SNIP) address for communicating with the server farm
- Virtual server IP (VIP) address for accepting client requests

In an Azure deployment, you can provision a NetScaler VPX instance on Azure in two ways:

- With a single-IP architecture
- With a multi-NIC, multi-IP architecture

**Note**

VPX virtual appliances can be deployed on any instance type that has two or more cores and more than 2 GB memory.

The following image illustrates how multiple IP addresses are used to perform the functions of NSIP, SNIP, and VIP, with a single NIC in a standalone deployment. According to your requirement, you can configure multiple NICs with different IP addresses.

For more information about NetScaler multi-NIC, multi-IP deployment on Azure, see the following links:

- Configure multiple IP addresses for a NetScaler standalone instance
- Configure multiple IP addresses for a NetScaler VPX instance in standalone mode by using PowerShell commands

The following image illustrates how a single IP address is used to perform the functions of NSIP, SNIP, and VIP.

**Note**

The single IP mode is available only in Azure deployments. This mode is not available for a NetScaler VPX instance on your premises, on AWS, or in other type of deployment.
Traffic flow through port address translation

In an Azure deployment, when you provision the NetScaler VPX instance as a virtual machine (VM), Azure assigns a public IP address and an internal IP address (nonroutable) to the NetScaler VPX instance. Inbound and outbound rules are defined on the NSG for the VPX instance, along with a public port and a private port for each rule defined. The VPX instance listens on the internal IP address and private port.

Any external request is received on the virtual NIC of the NetScaler VPX VM. The NIC is bound to the NSG, which specifies the private IP and private port combination into which to translate the request’s destination address and port (the public IP address and port). ARM performs port address translation (PAT) to map the public IP address and port to the internal IP address and private port of the NetScaler VPX instance, and forwards the traffic to the virtual machine.

The following figure shows how Azure performs port address translation to direct traffic to the NetScaler internal IP address and private port.

In this example, the Public IP address assigned to the VM is 140.x.x.x, and the internal IP address is 10.x.x.x. When the inbound and outbound rules are defined, public HTTP port 80 is defined as the port on which the client requests are received, and a corresponding private port, 10080, is defined as the port on which the NetScaler VPX instance listens. The client request is received on the Public IP address 140.x.x.x at port 80. Azure performs port address translation to map this address and port to internal IP address 10.x.x.x on private port 10080 and forwards the client request.

For information about port usage guidelines while, see the Port usage guidelines section.

For information about NSG and access control lists, see What is a Network Security Group?

Traffic flow through network address translation

You can also request a public IP (PIP) address for your NetScaler VPX instance (instance level). If you use this direct PIP at the VM level, you need not define inbound and outbound rules to intercept the network traffic. The incoming request from the Internet is received on the VM directly. Azure performs network address translation (NAT) and forwards the traffic to the internal IP address of the VPX instance.

The following figure shows how Azure performs network address translation to map the NetScaler internal IP address.

In this example, the Public IP assigned to the NSG is 140.x.x.x and the internal IP address is 10.x.x.x. When the inbound and outbound rules are defined, public HTTP port 80 is defined as the port on which the client requests are received, and a corresponding private port, 10080, is defined as the port on which the NetScaler VPX instance listens. The client request is received on the Public IP ad-
address (140.x.x.x). Azure performs network address translation to map the PIP to the internal IP address 10.x.x.x on port 10080, and forwards the client request.

Note

NetScaler VPX VMs in high availability are controlled by external or internal load balancers that have inbound rules defined on them to control the load balancing traffic. The external traffic is first intercepted by these load balancers and the traffic is diverted according to the load balancing rules configured, which has back-end pools, NAT rules, and health probes defined on the load balancers.

Port usage guidelines

You can configure more inbound and outbound rules in NSG while creating the NetScaler VPX instance or after the virtual machine is provisioned. Each inbound and outbound rule is associated with a public port and a private port.

Before configuring NSG rules, note the following guidelines regarding the port numbers you can use:

1. The NetScaler VPX instance reserves the following ports. You cannot define these as private ports when using the Public IP address for requests from the internet.
   Ports 21, 22, 80, 443, 8080, 67, 161, 179, 500, 520, 3003, 3008, 3009, 3010, 3011, 4001, 5061, 9000, 7000.
   However, if you want internet-facing services such as the VIP to use a standard port (for example, port 443) you have to create port mapping by using the NSG. The standard port is then mapped to a different port that is configured on the NetScaler for this VIP service.
   For example, a VIP service might be running on port 8443 on the VPX instance but be mapped to public port 443. So, when the user accesses port 443 through the Public IP, the request is directed to private port 8443.

2. Public IP address does not support protocols in which port mapping is opened dynamically, such as passive FTP or ALG.

3. High availability does not work for traffic that uses a public IP address (PIP) associated with a VPX instance, instead of a PIP configured on the Azure load balancer. For more information, see Configure a high-availability setup with a single IP address and a single NIC.

4. In a NetScaler Gateway deployment, you need not configure a SNIP address, because the NSIP can be used as a SNIP when no SNIP is configured.
   You must configure the VIP address by using the NSIP address and some nonstandard port number. For call-back configuration on the back-end server, the VIP port number has to be specified along with the VIP URL (for example, url:port).
Note
In Azure Resource Manager, a NetScaler VPX instance is associated with two IP addresses - a public IP address (PIP) and an internal IP address. While the external traffic connects to the PIP, the internal IP address or the NSIP is non-routable. To configure VIP in VPX, use the internal IP address (NSIP) and any of the free ports available. Do not use the PIP to configure VIP.

For example, if NSIP of a NetScaler VPX instance is 10.1.0.3 and an available free port is 10022, then you can configure VIP by providing the 10.1.0.3:10022 (NSIP address+port) combination.

NetScaler VPX licensing

A NetScaler VPX instance on Azure requires a license. The following licensing options are available for NetScaler VPX instances running on Azure.

- **Subscription-based licensing**: NetScaler VPX appliances are available as paid instances on Azure Marketplace. Subscription based licensing is a pay-as-you-go option. Users are charged hourly. The following VPX models and license types are available on Azure Marketplace.

<table>
<thead>
<tr>
<th>VPX model</th>
<th>License Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>VPX10</td>
<td>Standard, Enterprise, Platinum</td>
</tr>
<tr>
<td>VPX200</td>
<td>Standard, Enterprise, Platinum</td>
</tr>
<tr>
<td>VPX1000</td>
<td>Standard, Enterprise, Platinum</td>
</tr>
<tr>
<td>VPX3000</td>
<td>Standard, Enterprise, Platinum</td>
</tr>
</tbody>
</table>

- **Bring your own license (BYOL)**: If you bring your own license (BYOL), see the VPX Licensing Guide at http://support.citrix.com/article/CTX122426. You have to:
  - Use the licensing portal within MyCitrix to generate a valid license.
  - Upload the license to the instance.

- **NetScaler VPX Check-In/Check-Out licensing**: For more information, see NetScaler VPX Check-In/Check-Out Licensing.

Starting with NetScaler release 12.0 56.20, VPX Express for on-premises and cloud deployments does not require a license file. For more information on NetScaler VPX Express see the “NetScaler VPX Express license” section in NetScaler Licensing Overview.

Note
Regardless of the subscription-based hourly license bought from Azure Marketplace, in rare cases, the NetScaler VPX instance deployed on Azure might come up with a default NetScaler
license. This happens due to issues with Azure Instance Metadata Service (IMDS).
Do a warm restart before making any configuration change on the NetScaler VPX instance, to enable the correct NetScaler VPX license.

Limitations

Running the NetScaler VPX load balancing solution on ARM imposes the following limitations:

1. The Azure architecture does not accommodate support for the following NetScaler features:
   - Clustering
   - IPv6
   - Gratuitous ARP (GARP)
   - L2 Mode
   - Tagged VLAN
   - Dynamic Routing
   - Virtual MAC (VMAC)
   - USIP
   - Jumbo Frames

2. If you expect that you might have to shut down and temporarily deallocate the NetScaler VPX virtual machine at any time, assign a static Internal IP address while creating the virtual machine. If you do not assign a static internal IP address, Azure might assign the virtual machine a different IP address each time it restarts, and the virtual machine might become inaccessible.

3. In an Azure deployment, only the following NetScaler VPX models are supported: VPX 10, VPX 200, VPX 1000, and VPX 3000. For for information, see the NetScaler VPX Data Sheet.
If you use a NetScaler VPX instance with a model number higher than VPX 3000, the network throughput might not be the same as specified by the instance’s license. However, other features, such as SSL throughput and SSL transactions per second, might improve.

4. The “deployment ID” that is generated by Azure during virtual machine provisioning is not visible to the user in ARM. You cannot use the deployment ID to deploy NetScaler VPX appliance on ARM.

5. The NetScaler VPX instance supports 20 Mb/s throughput and standard edition features when it’s initialized.

6. For a XenApp and XenDesktop deployment, a VPN virtual server on a VPX instance can be configured in the following modes:
   - Basic mode, where the ICAOnly VPN virtual server parameter is set to ON. The Basic mode works fully on an unlicensed NetScaler VPX instance.
- Smart-Access mode, where the ICAOnly VPN virtual server parameter is set to OFF. The Smart-Access mode works for only 5 NetScaler AAA session users on an unlicensed NetScaler VPX instance.

Note
To configure the Smart Control feature, you must apply a Platinum license to the NetScaler VPX instance.

Configure a NetScaler VPX standalone instance

January 6, 2019

You can provision a single NetScaler VPX instance in Azure Resource Manager (ARM) portal in a standalone mode by creating the virtual machine and configuring other resources.

Before you begin

Ensure that you have the following:

- A Microsoft Azure user account
- Access to Microsoft Azure Resource Manager
- Microsoft Azure SDK
- Microsoft Azure PowerShell

On the Microsoft Azure Portal page, log on to the Azure Resource Manager portal by providing your user name and password.

Note
In ARM portal, clicking an option in one pane opens a new pane to the right. Navigate from one pane to another to configure your device.

Summary of configuration steps

1. Configure a resource group
2. Configure a network security group
3. Configure virtual network and its subnets
4. Configure a storage account
5. Configure an availability set
6. Configure a NetScaler VPX instance.
Configure a resource group

Create a new resource group that is a container for all your resources. Use the resource group to deploy, manage, and monitor your resources as a group.

1. Click New > Management > Resource group.
2. In the Resource group pane, enter the following details:
   - Resource group name
   - Resource group location
3. Click Create.

Configure a network security group

Create a network security group (NSG) to assign inbound and outbound rules to control the incoming and outgoing traffic within the virtual network. NSG allows you to define security rules for a single virtual machine and also to define security rules for a virtual network subnet.

1. Click New > Networking > Network security group.
2. In the Create network security group pane, enter the following details, and then click Create.
   - Name - type a name for the security group
   - Resource group - select the resource group from the drop-down list

   **Note**
   Ensure that you have selected the correct location. The list of resources that appear in the drop-down list is different for different locations.

Configure a virtual network and subnets

Virtual networks in ARM provide a layer of security and isolation to your services. VMs and services that are part of the same virtual network can access each other.

For these steps to create a virtual network and subnets.

1. Click New > Networking > Virtual Network.
2. In the Virtual Network pane, ensure the deployment mode is Resource Manager and click Create.
3. In the Create virtual network pane, enter the following values, and then click Create.
   - Name of the virtual network
   - Address space - type the reserved IP address block for the virtual network
   - Subnet - type the name of the first subnet (you will create the second subnet later in this step)
   - Subnet address range - type the reserved IP address block of the subnet
   - Resource group - select the resource group created earlier from the drop-down list
Configure the second subnet

1. Select the newly created virtual network from All resources pane and in the Settings pane, click Subnets.
2. Click +Subnet and create the second subnet by entering the following details.
   - Name of the second subnet
   - Address range - type the reserved IP address block of the second subnet
   - Network security group - select the NSG from the drop-down list
3. Click Create.

Configure a storage account

The ARM IaaS infrastructure storage includes all services where we can store data in the form of blobs, tables, queues, and files. You can also create applications using these forms of storage data in ARM.

Create a storage account to store all your data.

1. Click +New > Data + Storage > Storage account.
2. In the Create storage account pane, enter the following details:
   - Name of the account
   - Deployment mode - make sure to select Resource Manager
   - Account kind - select General purpose from the drop-down list
   - Replication - select Locally redundant storage from the drop-down list
   - Resource group - select the newly created resource group from the drop-down list
3. Click Create.

Configure an availability set

An availability set guarantees that at least one VM is kept up and running in case of planned or unplanned maintenance. Two or more VMs under the same ‘availability set’ are placed on different fault domains to achieve redundant services.

1. Click +New.
2. Click See all in the MARKETPLACE pane and click Virtual Machines.
3. Search for availability set, and then select Availability set entity from the list displayed.
4. Click Create, and in the Create availability set pane, enter the following details:
   - Name of the set
   - Resource group - select the newly created resource group from the drop-down list
5. Click Create.
Configure a NetScaler VPX instance

Create an instance of NetScaler VPX in the virtual network. Obtain the NetScaler VPX image from the Azure marketplace, and then use the Azure Resource Manager portal to create a NetScaler VPX instance.

Before you begin creating the NetScaler VPX instance, make sure that you have created a virtual network with required subnets in which the instance will reside. You can create virtual networks during VM provisioning, but without the flexibility to create different subnets. For information about creating virtual networks, see http://azure.microsoft.com/en-us/documentation/articles/create-virtual-network/.

Optionally, configure DNS server and VPN connectivity that allows a virtual machine to access Internet resources.

Note

Citrix recommends that you create resource group, network security group, virtual network, and other entities before you provision the NetScaler VPX VM, so that the network information is available during provisioning.

1. Click +New > Networking.
2. Click See All and in the Networking pane, click NetScaler VPX Bring Your Own License.

As a quick way to find any entity on ARM portal, you can also type the name of the entity in the Azure Marketplace search box and press <Enter>. Type NetScaler in the search box to find the Citrix NetScaler images.

Note

Ensure to select the latest image. Your Citrix NetScaler image might have the release number in the name.

3. On the NetScaler VPX Bring Your Own License page, from the drop-down list, select Resource Manager and click Create.

4. In the Create virtual machine pane, specify the required values in each section to create a virtual machine. Click OK in each section to save your configuration.

Basic:

- Name - specify a name for the NetScaler VPX instance
- VM disk type - select SSD (default value) or HDD from the drop-down menu
- User name and Password - specify a user name and password to access the resources in the resource group that you have created
- Authentication Type - select SSH Public Key or Password
- Resource group - select the resource group you have created from the drop-down list
You can create a resource group here, but Citrix recommends that you create a resource group from Resource groups in Azure Resource Manager and then select the group from the drop-down list.

**Size:**

Depending on the VM disk type, SDD or HDD, you selected in Basic settings, the disk sizes are displayed.

- Select a disk size according to your requirement and click *Select*.

**Settings:**

- Select the default (Standard) disk type
- Storage account - select the storage account
- Virtual network - select the virtual network
- Subnet - set the subnet address
- Public IP address - select the type of IP address assignment
- Network security group - select the security group that you have created. Ensure that inbound and outbound rules are configured in the security group.
- Availability Set - select the availability set from the drop-down box

**Summary:**

The configuration settings are validated and the Summary page displays the result of the validation. If the validation fails, the Summary page displays the reason of the failure. Go back to the particular section and make changes as required. If the validation passes, click *OK*.

**Buy:**

Review the offer details and legal terms on the Purchase page and click *Purchase*.

For high availability deployment, create two independent instances of NetScaler VPX in the same availability set and in the same resource group to deploy them in active-standby configuration.

### Configure multiple IP addresses for a NetScaler VPX standalone instance

January 6, 2019

This section explains how to configure a standalone NetScaler VPX instance with multiple IP addresses, in Azure Resource Manager (ARM). The VPX instance can have one or more NIC attached to it, and each NIC can have one or more static or dynamic public and private IP addresses assigned to it. You can assign multiple IP addresses as NSIP, VIP, SNIP, and so on.

For more information, see the Azure documentation [Assign multiple IP addresses to virtual machines using the Azure portal](#).

If you want to use PowerShell commands, see [Configuring multiple IP addresses for a NetScaler VPX instance in standalone mode by using PowerShell commands](#).
Use case

In this use case, a standalone NetScaler VPX appliance is configured with a single NIC that is connected to a virtual network (VNET). The NIC is associated with three IP configurations (ipconfig), each serving a different purpose - as shown in the table.

<table>
<thead>
<tr>
<th>IPconfig</th>
<th>Associated with</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipconfig1</td>
<td>Static public IP address; static private IP address</td>
<td>Serves management traffic</td>
</tr>
<tr>
<td>ipconfig2</td>
<td>Static public IP address; static private address</td>
<td>Serves client-side traffic</td>
</tr>
<tr>
<td>ipconfig3</td>
<td>Static private IP address</td>
<td>Communicates with back-end servers</td>
</tr>
</tbody>
</table>

Note

IPConfig-3 is not associated with any public IP address.

Diagram: Topology

Here is the visual representation of the use case.

Note

In a multi-NIC, multi-IP Azure NetScaler VPX deployment, the private IP associated with the primary (first) IPConfig of the primary (first) NIC is automatically added as the management NSIP of the appliance. The remaining private IP addresses associated with IPConfigs need to be added in the VPX instance as a VIP or SNIP by using the “add ns ip” command, according to your requirement.

Before you begin

Before you begin, create a VPX instance by following the steps given at this link:

Configure a NetScaler VPX standalone instance

For this use case, the NSDoc0330VM VPX instance is created.

Procedure to configure multiple IP addresses for a NetScaler VPX instance in standalone mode.

For configuring multiple IP addresses for a NetScaler VPX appliance in standalone mode:

1. Add IP addresses to the VM
2. Configure NetScaler-owned IP addresses
Step 1: Add IP addresses to the VM

1. In the portal, click More services > type virtual machines in the filter box, and then click Virtual machines.

2. In the Virtual machines blade, click the VM you want to add IP addresses to. Click Network interfaces in the virtual machine blade that appears, and then select the network interface.

In the blade that appears for the NIC you selected, click IP configurations. The existing IP configuration that was assigned when you created the VM, ipconfig1, is displayed. For this use case, make sure the IP addresses associated with ipconfig1 are static. Next, create two more IP configurations: ipconfig2 (VIP) and ipconfig3 (SNIP).

To create additional ipconfigs, create Add.

In the Add IP configuration window, enter a Name, specify allocation method as Static, enter an IP address (192.0.0.5 for this use case), and enable Public IP address.

Note

Before adding a static private IP address, check for IP address availability and make sure the IP address belongs to the same subnet to which the NIC is attached.

Next, click Configure required settings to create a static public IP addresss for ipconfig2.

By default, public IPs are dynamic. To make sure that the VM always uses the same public IP address, create a static Public IP.

In the Create public IP address blade, add a Name, under Assignment click Static. And then click OK.

Note

Even when you set the allocation method to static, you cannot specify the actual IP address assigned to the public IP resource. Instead, it gets allocated from a pool of available IP addresses in the Azure location the resource is created in.

Follow the steps to add one more IP configuration for ipconfig3. Public IP is not mandatory.

Step 2: Configure NetScaler-owned IP addresses

Configure the NetScaler-owned IP addresses by using the GUI or the command “add ns ip.” For more information, see Configuring NetScaler-Owned IP Addresses.

You’ve now configured multiple IP addresses for a NetScaler VPX instance in standalone mode.

Configure a high-availability setup with multiple IP addresses and NICs

January 6, 2019
You can deploy a pair of NetScaler virtual appliances with multiple NICs in an active-passive high availability (HA) setup on Azure. Each NIC can contain multiple IP addresses.

An active-passive deployment requires:

- An HA Independent Network Configuration (INC) configuration
- The Azure Load Balancer (ALB) in Direct Server Return (DSR) mode
  All traffic goes through the primary node. The secondary node remains in standby mode until the primary node fails.

Note
For a Citrix VPX high availability deployment on Azure cloud to work, you need a floating public IP (PIP) that can be moved between the two VPX nodes. The Azure Load Balancer (ALB) provides that floating PIP, which is moved to the second node automatically in the event of a failover.

Diagram: Example of a high availability deployment architecture, using Azure Availability Set

In an active-passive deployment, the ALB floating public IP (PIP) addresses are added as the VIP addresses in each VPX node. In HA-INC configuration, the VIP addresses are floating and SNIP addresses are instance specific.

ALB monitors each VPX instances by sending health probe at every 5 seconds and redirects traffic to that instance only that sends health probes response on regular interval. So in an HA setup, the primary node responds to health probes and secondary does not. If the primary instance misses two consecutive health probes, ALB does not redirect traffic to that instance. On failover, the new primary starts responding to health probes and the ALB redirects traffic to it. The standard VPX high availability failover time is three seconds. The total failover time that might take for traffic switching can be maximum of 13 seconds.

You can deploy a VPX pair in active-passive high availability mode in two ways by using:

- NetScaler VPX standard high availability template: use this option to configure an HA pair with the default option of three subnets and six NICs.
- Windows PowerShell commands: use this option to configure an HA pair according to your subnet and NIC requirements.

This topic describes how to deploy a VPX pair in active-passive HA setup by using the Citrix template. If you want to use PowerShell commands, see Configuring an HA Setup with Multiple IP Addresses and NICs by Using PowerShell Commands.

Configure HA-INC nodes by using the Citrix high availability template

You can quickly and efficiently deploy a pair of VPX instances in HA-INC mode by using the standard template. The template creates two nodes, with three subnets and six NICs. The subnets are for management, client, and server-side traffic, and each subnet has two NICs for both the VPX instances.
You can get the NetScaler 12.0 HA Pair template at the Azure Marketplace.

Complete the following steps to launch the template and deploy a high availability VPX pair, by using Azure Availability Sets.

1. From Azure Marketplace, select and initiate the Citrix solution template. The template appears.
2. Ensure deployment type is Resource Manager and select Create.
3. The Basics page appears. Create a Resource Group and select OK.
4. The General Settings page appears. Type the details and select OK.
5. The Network Setting page appears. Check the vnet and subnet configurations, edit the required settings, and select OK.
6. The Summary page appears. Review the configuration and edit accordingly. Select OK to confirm.
7. The Buy page appears. Select Purchase to complete the deployment.

It might take a moment for the Azure Resource Group to be created with the required configurations. After completion, select the Resource Group in the Azure portal to see the configuration details, such as LB rules, back-end pools, health probes, and so on. The high availability pair appears as ns-vpx0 and ns-vpx1.

If further modifications are required for your HA setup, such as creating more security rules and ports, you can do that from the Azure portal.

Next, you need to configure the load-balancing vserver with the ALB public IP (PIP) address, on each node. To find the ALB PIP, select ALB > Frontend IP configuration.

See the Resources section for more information about how to configure the load-balancing vserver.

**Resources:**

The following links provide additional information related to HA deployment and virtual server (vserver) configuration:

- Configuring high availability nodes in different subnets
- Set up basic load balancing

**Related resources:**

- Configure a high-availability setup with multiple IP addresses and NICs by using PowerShell commands
- Configuring GSLB on Active-Standby HA Deployment on Azure
Configure a high-availability setup with multiple IP addresses and NICs by using PowerShell commands

January 6, 2019

You can deploy a pair of NetScaler VPX instances with multiple NICs in an active-passive high availability (HA) setup on Azure. Each NIC can contain multiple IP addresses.

An active-passive deployment requires:

- An HA Independent Network Configuration (INC) configuration
- The Azure Load Balancer (ALB) in Direct Server Return (DSR) mode

All traffic goes through the primary node. The secondary node remains in standby mode until the primary node fails.

Note

For a NetScaler VPX high availability deployment on Azure cloud to work, you need a floating public IP (PIP) that can be moved between the two high-availability nodes. The Azure Load Balancer (ALB) provides that floating PIP, which is moved to the second node automatically in the event of a failover.

Diagram: Example of an active-passive deployment architecture

In an active-passive deployment, the ALB floating public IP (PIP) addresses are added as the VIP addresses in each VPX node. In HA-INC configuration, the VIP addresses are floating and SNIP addresses are instance specific.

ALB monitors each VPX instances by sending health probe at every 5 seconds and redirects traffic to that instance only that sends health probes response on regular interval. So in an HA setup, the primary node responds to health probes and secondary does not. If the primary instances misses two consecutive health probes, ALB does not redirect traffic to that instance. On failover, the new primary starts responding to health probes and the ALB redirects traffic to it. The standard VPX high availability failover time is three seconds. The total failover time that might take for traffic switching can be maximum of 13 seconds.

You can deploy a VPX pair in active-passive HA setup in two ways by using:

- **NetScaler VPX Standard high availability template**: use this option to configure an HA pair with the default option of three subnets and six NICs.
- **Windows PowerShell commands**: use this option to configure an HA pair according to your subnet and NIC requirements.

This topic describes how to deploy a VPX pair in active-passive HA setup by using PowerShell commands. If you want to use the NetScaler VPX Standard HA template, see Configuring an HA Setup with Multiple IP Addresses and NICs.
Configure HA-INC nodes by using PowerShell Commands

Scenario: HA-INC PowerShell deployment

In this scenario, you deploy a NetScaler VPX pair by using the topology given in the table. Each VPX instance contains three NICs, with each NIC is deployed in a different subnet. Each NIC is assigned an IP configuration.

<table>
<thead>
<tr>
<th>ALB</th>
<th>VPX1</th>
<th>VPX2</th>
</tr>
</thead>
<tbody>
<tr>
<td>–</td>
<td>–</td>
<td>–</td>
</tr>
<tr>
<td>ALB is associated with public IP 3 (pip3)</td>
<td>Management IP is configured with IPConfig1, which includes one public IP (12.5.2.24); nic1; Mgmtsubnet=12.5.2.0/24</td>
<td>Management IP is configured with IPConfig5, which includes one public IP (12.5.2.26); nic4; Mgmtsubnet=12.5.2.0/24</td>
</tr>
<tr>
<td>LB rules and port configured are HTTP (80), SSL (443), health probe (9000)</td>
<td>Client-side IP is configured with IPConfig3, which includes one private IP(12.5.1.27); nic2; FrontEndsubnet=12.5.1.0/24</td>
<td>Client-side IP is configured with IPConfig7, which includes one private IP (12.5.1.28); nic5; FrontEndsubnet=12.5.1.0/24</td>
</tr>
<tr>
<td>-</td>
<td>Server-side IP is configured with IPConfig4, which includes one private IP (12.5.3.24); nic3; BackendSubnet=12.5.3.0/24</td>
<td>Server-side IP is configured with IPConfig8, which includes one private IP (12.5.3.28); nic6; BackendSubnet=12.5.3.0/24</td>
</tr>
<tr>
<td>-</td>
<td>Rules and ports for NSG are SSH (22), HTTP (80), HTTPS (443)</td>
<td>-</td>
</tr>
</tbody>
</table>

Parameter settings

The following parameter settings are used in this scenario.

$locName = “South east Asia”

$rgName = “MuliIP-MultiNIC-RG”

$nicName1 = “VM1-NIC1”

$nicName2 = “VM1-NIC2”

$nicName3 = “VM1-NIC3”

$nicName4 = “VM2-NIC1”

$nicName5 = “VM2-NIC2”

$nicName6 = “VM2-NIC3”

$vNetName = “Azure-MultiIP-ALB-vnet”

$vNetAddressRange = “12.5.0.0/16”

$frontEndSubnetName = “frontEndSubnet”

$frontEndSubnetRange = “12.5.1.0/24”

$mgmtSubnetName = “mgmtSubnet”
To complete the deployment, complete the following steps by using PowerShell commands:
1. Create a resource group, storage account, and availability set
2. Create a network security group and add rules
3. Create a virtual network and three subnets
4. Create public IP addresses
5. Create IP configurations for VPX1
6. Create IP configurations for VPX2
7. Create NICs for VPX1
8. Create NICs for VPX2
9. Create VPX1
10. Create VPX2
11. Create ALB

Create a resource group, storage account, and availability set.

```powershell
New-AzureRmResourceGroup -Name $rgName -Location $locName
$prmStorageAccount = New-AzureRMStorageAccount -Name $prmStorageAccountName -ResourceGroupName $rgName -Type Standard_LRS -Location $locName
$avSet = New-AzureRmAvailabilitySet -Name $avSetName -ResourceGroupName $rgName -Location $locName
```

Create a network security group and add rules.

```powershell
$rule1 = New-AzureRmNetworkSecurityRuleConfig -Name $rule1Name -Description "Allow HTTP" -Access Allow -Protocol Tcp -Direction Inbound -Priority 101
-SourceAddressPrefix Internet -SourcePortRange * -DestinationAddressPrefix * -DestinationPortRange 80
$rule2 = New-AzureRmNetworkSecurityRuleConfig -Name $rule2Name -Description "Allow HTTPS" -Access Allow -Protocol Tcp -Direction Inbound -Priority 110
-SourceAddressPrefix Internet -SourcePortRange * -DestinationAddressPrefix * -DestinationPortRange 443
```
Create a virtual network and three subnets.

```powershell
$frontendSubnet = New-AzureRmVirtualNetworkSubnetConfig -Name $frontendSubnetName -AddressPrefix $frontendSubnetRange (this parameter value should be as per your requirement)

$mgmtSubnet = New-AzureRmVirtualNetworkSubnetConfig -Name $mgmtSubnetName -AddressPrefix $mgmtSubnetRange

$backendSubnet = New-AzureRmVirtualNetworkSubnetConfig -Name $backendSubnetName -AddressPrefix $backendSubnetRange

$vnet = New-AzureRmVirtualNetwork -Name $vNetName -ResourceGroupName $rgName -Location $locName -AddressPrefix $vNetAddressRange -Subnet $frontendSubnet,$backendSubnet,$mgmtSubnet

subnetName = "frontendSubnet"

subnet1=$vnet.Subnets | ?{ $_.Name -eq $subnetName }

subnetName = "backendSubnet"

subnet2=$vnet.Subnets | ?{
```
NetScaler 12.0

```powershell
25  $_.Name -eq $subnetName } 
26  
27  
29  $subnetName="mgmtSubnet"
30  
31  
32  $subnet3=$vnet.Subnets|?{
33  
34  
35  $_.Name -eq $subnetName }

Create public IP addresses.

```powershell
1  $pip1=New-AzureRmPublicIpAddress -Name $pubIPName1 -ResourceGroupName $rgName -DomainNameLabel $domName1 -Location $locName - AllocationMethod Dynamic
2  
3  
4  $pip2=New-AzureRmPublicIpAddress -Name $pubIPName2 -ResourceGroupName $rgName -DomainNameLabel $domName2 -Location $locName - AllocationMethod Dynamic
5  
6  
7  $pip3=New-AzureRmPublicIpAddress -Name $pubIPName3 -ResourceGroupName $rgName -DomainNameLabel $domName3 -Location $locName - AllocationMethod Dynamic

Create IP configurations for VPX1.

```powershell
1  $IpConfigName1 = "IPConfig1"
2  
3  
4  $IPAddress = "12.5.2.24"
5  
6  
7  $IPConfig1=New-AzureRmNetworkInterfaceIpConfig -Name $IpConfigName1 - Subnet $subnet3 -PrivateIpAddress $IPAddress -PublicIpAddress $pip1 -Primary
8  
9  
10 $IpConfigName3= "IPConfig-3"
11  
12  
13 $IPAddress="12.5.1.27"
14  
15

© 1999-2018 Citrix Systems, Inc. All rights reserved.
$IPConfig3 = New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName3 -Subnet $subnet1 -PrivateIpAddress $IPAddress -Primary

$IPConfigName4 = "IPConfig-4"

$IPAddress = "12.5.3.24"

$IPConfig4 = New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName4 -Subnet $subnet2 -PrivateIpAddress $IPAddress -Primary

Create IP configurations for VPX2.

$IpConfigName5 = "IPConfig5"

$IPAddress="12.5.2.26"

$IPConfig5 = New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName5 -Subnet $subnet3 -PrivateIpAddress $IPAddress -PublicIpAddress $pip2 -Primary

$IPConfigName7="IPConfig-7"

$IPAddress="12.5.1.28"

$IPConfig7 = New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName7 -Subnet $subnet1 -PrivateIpAddress $IPAddress -Primary

$IPConfigName8="IPConfig-8"

$IPAddress="12.5.3.28"

$IPConfig8 = New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName8 -Subnet $subnet2 -PrivateIpAddress $IPAddress -Primary
Create NICs for VPX1.

```powershell
$nic1 = New-AzureRmNetworkInterface -Name $nicName1 -ResourceGroupName $rgName -Location $locName -IpConfiguration $IpConfig1 -NetworkSecurityGroupId $nsg.Id

$nic2 = New-AzureRmNetworkInterface -Name $nicName2 -ResourceGroupName $rgName -Location $locName -IpConfiguration $IpConfig3 -NetworkSecurityGroupId $nsg.Id

$nic3 = New-AzureRmNetworkInterface -Name $nicName3 -ResourceGroupName $rgName -Location $locName -IpConfiguration $IpConfig4 -NetworkSecurityGroupId $nsg.Id
```

Create NICs for VPX2.

```powershell
$nic4 = New-AzureRmNetworkInterface -Name $nicName4 -ResourceGroupName $rgName -Location $locName -IpConfiguration $IpConfig5 -NetworkSecurityGroupId $nsg.Id

$nic5 = New-AzureRmNetworkInterface -Name $nicName5 -ResourceGroupName $rgName -Location $locName -IpConfiguration $IpConfig7 -NetworkSecurityGroupId $nsg.Id

$nic6 = New-AzureRmNetworkInterface -Name $nicName6 -ResourceGroupName $rgName -Location $locName -IpConfiguration $IpConfig8 -NetworkSecurityGroupId $nsg.Id
```

Create VPX1.

This step includes the following substeps:

- Create VM config object
- Set credentials, OS, and image
- Add NICs
- Specify OS disk and create VM

```powershell
$suffixNumber = 1

$vmName = $vmNamePrefix + $suffixNumber
```
$vmConfig=New-AzureRMVMConfig -VMName $vmName -VMSize $vmSize -AvailabilitySetId $avSet.Id

$cred=Get-Credential -Message "Type the name and password for VPX login ."

$vmConfig=Set-AzureRMVMOperatingSystem -VM $vmConfig -Linux -ComputerName $vmName -Credential $cred

$vmConfig=Set-AzureRMVMSourceImage -VM $vmConfig -PublisherName $publisher -Offer $offer -Skus $sku -Version $version

$vmConfig=Add-AzureRMVMNetworkInterface -VM $vmConfig -Id $nic1.Id -Primary

$vmConfig=Add-AzureRMVMNetworkInterface -VM $vmConfig -Id $nic2.Id

$vmConfig=Add-AzureRMVMNetworkInterface -VM $vmConfig -Id $nic3.Id

/osDiskName=$vmName + "-" + $osDiskSuffix1

/osVhdUri=$prmStorageAccount.PrimaryEndpoints.Blob.ToString() + "vhds/" + $osDiskName + ".vhd"

$vmConfig=Set-AzureRMVMDisk -VM $vmConfig -Name $osDiskName -VhdUri $osVhdUri -CreateOption fromImage

Set-AzureRmVMPub -VM $vmConfig -Publisher $publisher -Product $offer -Name $sku

New-AzureRMVM -VM $vmConfig -ResourceGroupName $rgName -Location $locName
$suffixNumber = 2

$vmName = $vmNamePrefix + $suffixNumber

$vmConfig = New-AzureRMVMConfig -VMName $vmName -VMSize $vmSize -AvailabilitySetId $avSet.Id

$cred = Get-Credential -Message "Type the name and password for VPX login."

$vmConfig = Set-AzureRMVMOperatingSystem -VM $vmConfig -Linux -ComputerName $vmName -Credential $cred

$vmConfig = Set-AzureRMVMSourceImage -VM $vmConfig -PublisherName $publisher -Offer $offer -Skus $sku -Version $version

$vmConfig = Add-AzureRMVMNetworkInterface -VM $vmConfig -Id $nic4.Id -Primary

$vmConfig = Add-AzureRMVMNetworkInterface -VM $vmConfig -Id $nic5.Id

$vmConfig = Add-AzureRMVMNetworkInterface -VM $vmConfig -Id $nic6.Id

$osDiskName = $vmName + "-" + $osDiskSuffix2

/osVhdUri = $prmStorageAccount.PrimaryEndpoints.Blob.ToString() + "vhds/" + $osDiskName + ".vhd"

$vmConfig = Set-AzureRMVMOSDisk -VM $vmConfig -Name $osDiskName -VhdUri $osVhdUri -CreateOption fromImage
To view private and public IP addresses assigned to the NICs, type the following commands:

```bash
$nic1.IPCFG
$nic2.IPCFG
$nic3.IPCFG
$nic4.IPCFG
$nic5.IPCFG
$nic6.IPCFG
```

Create Azure load balance (ALB).

This step includes the following substeps:

- Create frontend IP config
- Create health probe
- Create backend address pool
- Create load-balancing rules (HTTP and SSL)
- Create ALB with frontend IP config, backend address pool, and LB rule
- Associate IP config with backend pools

```bash
$FrontEndIP1=New-AzureRmLoadBalancerFrontendIpConfig -Name $frontEndConfigName1 -PublicIpAddress $pip3
$healthProbe=New-AzureRmLoadBalancerProbeConfig -Name $healthProbeName -Protocol Tcp -Port 9000 -IntervalInSeconds 5 -ProbeCount 2
```
After you’ve successfully deployed the NetScaler VPX pair, log on to each VPX instance to configure HA-INC, and SNIP and VIP addresses.

1. Type the following command to add HA nodes.

```
add ha node 1 PeerNodeNSIP -inc Enabled
```

2. Add private IP addresses of client-side NICs as SNIPs for VPX1 (NIC2) and VPX2 (NIC5)

```
add nsip privateIPofNIC2 255.255.255.0 -type SNIP
add nsip privateIPofNIC5 255.255.255.0 -type SNIP
```
3. Add load-balancing vserver on the primary node with front-end IP address (public IP) of ALB.

```bash
add lb vserver v1 HTTP FrontEndIPofALB 80
```

[Configuring GSLB on Active-Standby HA Deployment on Azure](#)

**Configure a high-availability setup with a single IP address and a single NIC**

January 6, 2019

In a Microsoft Azure deployment, a high-availability configuration of two NetScaler VPX instances is achieved by using the Azure load balancer, which distributes the client traffic across the virtual servers configured on both the VPX instances.

**Note**

For a Citrix VPX high availability deployment on Azure cloud to work, you need a floating public IP (PIP) that can be moved between the two NetS high availability nodes. The Azure Load Balancer (ALB) provides that floating PIP, which is moved to the second node automatically in the event of a failover.

Two types of Azure load balancers are available for high availability:

- **Azure external load balancer**: If the client traffic originates from the Internet, you have to deploy the external load balancer between the Internet and the NetScaler VPX instances to distribute client traffic.
- **Azure internal load balancer**: If the client traffic originates from within the virtual network, or is forwarded by a gateway or firewall within the virtual network, you have to deploy the internal load balancer to distribute client traffic.

To achieve high availability on Azure, you must add the two VPX instances as a load balanced set and configure the NSG.

When two NetScaler VPX instances are configured in active-active mode, both instances must have the same configuration. The client traffic is distributed across the virtual servers in both the instances by the Azure load balancer. The VIP addresses in both the instances are different and should match the NSIP of that VPX instance.

The active-passive mode provides failover capability. In this mode, the VPX instances synchronize their configuration states. When the primary instance fails, the secondary instance takes over.

For information about high availability in NetScaler appliances, see [High availability](#).
**Before you begin**

Note the following before you begin configuring the VPX instances in high availability mode in the Azure virtual network.

- The two NetScaler VPX instances that you want to add to a load balanced set should be provisioned in the same virtual network.
- A load balanced set applies only to a VM’s default NIC. Therefore the VIP has to be configured on the default NIC of the VPX instance.
- In an active-passive deployment, the Azure load balancer monitors both the primary and the secondary VPX instance by sending them TCP probes. These TCP probes are sent on port 9000.

**Summary of steps to configure a NetScaler VPX instance in a high-availability Mode**

1. Configure a resource group
2. Configure a network security group
3. Configure virtual network and its subnets
4. Configure a storage account
5. Configure an availability set
6. Configure a NetScaler VPX instance
7. Configure internal and external load balancers
8. Configure health probes
9. Configure backend pools
10. Configure NAT rules
11. Configure load balancing rules

After configuring all the resources, you can configure the VMs in high availability mode with either an external load balancer or with an internal load balancer.

This article provides procedures to configure resources specific to high availability mode. For procedures to configure the other resources, see [Configure a NetScaler VPX standalone instance](#).

You need to set up two NetScaler VPX instances for high availability mode. To set up a NetScaler VPX instance, see the “Configuring a NetScaler VPX Instance” section in [Configure a NetScaler standalone instance](#).

**Configure internal and external load balancers**

Create a load balancer to distribute traffic between the virtual machines that are part of the same virtual network. The load balancing features can load balance level 4 traffic and support only TCP and UDP traffic.
Configure an internal load balancer

2. In the Create load balancer pane, enter the following details:
   • Name of the load balancer
   • Scheme - select Internal to configure an internal load balancer
   • Virtual network - select the newly created virtual network from the drop-down list
   • Subnet - select the associated subnet
   • IP address assignment - select Static
   • Private IP address - assign a private IP address for the internal load balancer
   • Resource group - select the newly created resource group from the drop-down list
3. Click Create.

Configuring an external load balancer

1. To create an external load balancer, follow similar steps as creating an internal load balancer
   with the following differences:
   • Schema - select Public
   • Public IP address - assign a public IP address to the external load balancer
2. Click Create.

Configure a health probe on the load balancer

Create custom TCP or HTTP probes to monitor the health of the various server instances. When the
VM fails to respond to the probe for three consecutive times, the Azure load balancer will not send the
traffic to the nonresponsive VM.

1. Click All resources and search for the load balancer that you created by typing the name in the
   search box.
2. In the Settings pane, click Probes.
3. Click +Add and in the Add probe pane, enter the following details:
   • Name of the health probe
   • Protocol - select TCP
   • Port - type 9000
   • Set the Interval and Unhealthy threshold limits
4. Click OK.
Configure a backend pool on the load balancer

Create backend pools, that is, a pool of IP addresses associated with the virtual machine Network Interface Cards (NIC) to which the load is distributed.

1. Click All resources and search for the load balancer that you have created by typing the name in the search box.
2. In the Settings pane, select Backend pools.
3. Click +Add and in the Add backend pool pane, enter the following details:
   - Name of the backend pool
   - Availability set - select the availability set created earlier
   - Virtual machines - select the NetScaler VPX instances that are in high availability deployment. Press <Ctrl> to select multiple instances.
4. Click OK.

Configure a NAT rule on the load balancer

Create custom NAT rules on LB to define the inbound traffic flowing through the front end IP address and distributed to the back end IP address. Make sure that no two NAT rules has the combination of same service and same target port.

Note
A front end IP address is the external IP address on the load balancer that faces the incoming traffic and a back end IP address is the VM facing IP address that receives the traffic from the load balancer.

1. Click All resources and search for the load balancer that you have created by typing the name in the search box.
2. In the Settings pane, select Inbound NAT rules.
3. Click +Add and in the Add inbound NAT rule pane, add a NAT rule for each type of request. You can add multiple NAT rules.
4. Enter the following details, and then click OK.
   - Name of the rule
   - Service - select the required service from the drop-down list
   - Port - type the correct port number
   - Target - select the NetScaler VPX that will be the target of this rule
   - Target port - the target port is automatically populated depending on the service selected

Note
Citrix recommends TCP services for the NetScaler VPX VM on port 9000.
**Configure a load balancing rule on the load balancer**

By creating a load balancer rule, you can define a combination of a front end IP address and port, and back end IP address and port associated with VMs.

For example, create a rule so that all HTTP requests coming on the public IP will be forwarded to the availability set on their port 80.

1. Click **All resources** and search for the load balancer that you have created by typing the name in the search box.
2. In the Settings pane, select **Load balancing rules**.
3. Click **+Add** and in the **Add load balancing rules** pane, create load balancing rules for each type of incoming network traffic.
4. Enter the following details:
   - Name of the rule
   - Protocol - select the protocol
   - Port - type the port number based on the port selected
   - Backend pool - select the backend pool from the drop-down list
   - Probe - select the health probe from the drop-down list
5. Click **OK**.

**Configure NetScaler VPX high availability with the Azure external load balancer**

If your client traffic originates from the Internet, you have to deploy the external load balancer to create a high availability configuration of NetScaler VPX instances in a load-balanced set.

The following figure shows how high availability is achieved in active-active mode by using the external load balancer. The two VPX instances are in a load-balanced set that accepts client traffic from the Internet over port 15000. The Azure external load balancer load balances these client requests between the two virtual machines.

Before you begin configuring the load-balanced set through the Azure portal, do one of the following:

- For an active-passive deployment, configure the NetScaler VPX instances as primary and secondary nodes by using the following command: `add ha node <ID> <IP address>`.
- For an active-active deployment, configure the required services on the two NetScaler VPX instances.

**Configure NetScaler VPX high availability with the Azure internal load balancer**

If your client traffic originates from within the virtual network with a regional scope, you have to deploy the internal load balancer to achieve high availability of NetScaler VPX instances added to a load-balanced set.
The following figure shows how high availability is achieved in an active-active mode by using the internal load balancer. The two NetScaler VPX instances are in a load-balanced set that accepts client traffic from the Internet at port 15001. The Azure internal load balancer load balances these client requests between the two virtual machines.

Before you begin configuring the load-balanced set by using Azure PowerShell, do one of the following:

- For an active-passive deployment, configure the NetScaler VPX instances as primary and secondary nodes by using the following command: `add ha node <ID> <IP address>`.
- For an active-active deployment, configure the required services on the two NetScaler VPX instances.

You can configure the load-balanced set only by using Azure PowerShell.

**Access the NetScaler VPX instance**

You can access the VPX instance either through its graphical user interface (GUI) or through the command line interface (CLI). You can use the PIP to access the NetScaler VPX instance instance.

To log on to the virtual machine, use your username and password specified while creating the virtual machine.

You can change the password after you log on to the instance.

**Access the VPX instance through the GUI**

In a browser’s address field, type the virtual network public IP address provided by Azure during virtual machine provisioning, or type the PIP address.

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>Make sure you have created NSG inbound or outbound rules to allow access to the private port 80 or 443 when accessing the GUI by using the virtual network IP.</td>
</tr>
</tbody>
</table>

**Access the VPX instance through the CLI**

Use any command line access tool (for example, Putty). Specify either the virtual network public IP address provided by Azure during NetScaler VPX provisioning, or specify the PIP address. Use SSH protocol with port 22.

<table>
<thead>
<tr>

Configure GSLB on NetScaler VPX instances

January 6, 2019

NetScaler appliances configured for global server load balancing (GSLB) provide disaster recovery and continuous availability of applications by protecting against points of failure in a wide area network (WAN). GSLB can balance the load across data centers by directing client requests to the closest or best performing data center, or to surviving data centers in case of an outage.

This section describes how to enable GSLB on VPX instances on two sites in a Microsoft Azure environment, by using Windows PowerShell commands.

Note

For more information about GSLB, see Global Server Load Balancing.

You can configure GSLB on a NetScaler VPX instances on Azure, in two steps:

1. Create a VPX instance with multiple NICs and multiple IP addresses, on each site.
2. Enable GSLB on the VPX instances.

Note

For more information about configuring multiple NICs and IP addresses see:

- Configure multiple IP addresses for a NetScaler VPX instance in standalone mode by using PowerShell commands

Scenario

This scenario includes two sites - Site 1 and Site 2. Each site has a VM (VM1 and VM2) configured with multiple NICs, multiple IP addresses, and GSLB.

**Figure.** GSLB setup implemented across two sites - Site 1 and Site 2.

In this scenario, each VM has three NICs - NIC 0/1, 1/1, and 1/2. Each NIC can have multiple private and public IP addresses. The NICs are configured for the following purposes:

- NIC 0/1: to serve management traffic
- NIC 1/1: to serve client-side traffic
- NIC 1/2: to communicate with back-end servers
For information about the IP addresses configured on each NIC in this scenario, see the IP configuration details section.

**Parameters**

Following are sample parameters settings for this scenario in this document. You can use different settings if you wish.

```plaintext
$location="West Central US"
$vnetName="NSVPX-vnet"
$RGName="multiIP-RG"
$prmStorageAccountName="multiipstorageacctnt"
$avSetName="MultiIP-avset"
$vmSize="Standard_DS3_V2"

**Note:** The minimum requirement for a VPX instance is 2 vCPUs and 2GB RAM.

$publisher="citrix"
$offer="netscalervpx111"
$sku="netscalerbyol"
$version="latest"
$vmNamePrefix="MultiIPVPX"
$nicNamePrefix="MultiipVPX"
$osDiskSuffix="osdiskdb"
$numberOfVMs=1
$ipAddressPrefix="10.0.0."
$ipAddressPrefix1="10.0.1."
$ipAddressPrefix2="10.0.2."
$pubIPName1="MultiIP-pip1"
$pubIPName2="MultiIP-pip2"
$IpConfigName1="IPConfig1"
$IPConfigName2="IPConfig-2"
$IPConfigName3="IPConfig-3"
$IPConfigName4="IPConfig-4"
```
Create a VM

Follow steps 1-10 to create VM1 with multiple NICs and multiple IP addresses, by using PowerShell commands:

1. Create resource group
2. Create storage account
3. Create availability set
4. Create virtual network
5. Create public IP address
6. Create NICs
7. Create VM config object
8. Get credentials and set OS properties for the VM
9. Add NICs
10. Specify OS disk and create VM

After you complete all the steps and commands to create VM1, repeat these steps to create VM2 with parameters specific to it.

Create resource group

```
New-AzureRMResourceGroup -Name $RGName -Location $location
```

Create storage account

```
$prmStorageAccount=New-AzureRMStorageAccount -Name $prmStorageAccountName -ResourceGroupName $RGName -Type Standard_LRS -Location $location
```
NetScaler 12.0

**Create availability set**

```
$avSet = New-AzureRMAvailabilitySet -Name $avSetName -ResourceGroupName $RGName -Location $location
```

**Create virtual network**

1. Add subnets.

```
$subnet1 = New-AzureRmVirtualNetworkSubnetConfig -Name $frontendSubnetName -AddressPrefix "10.0.0.0/24"
$subnet2 = New-AzureRmVirtualNetworkSubnetConfig -Name $backendSubnetName1 -AddressPrefix "10.0.1.0/24"
$subnet3 = New-AzureRmVirtualNetworkSubnetConfig -Name $backendSubnetName2 -AddressPrefix "10.0.2.0/24"
```

2. Add virtual network object.

```
$vnet = New-AzureRmVirtualNetwork -Name $vnetName -ResourceGroupName $RGName -Location $location -AddressPrefix 10.0.0.0/16 -Subnet $subnet1, $subnet2, $subnet3
```

3. Retrieve subnets.

```
$frontendSubnet = $vnet.Subnets | ? { $_.Name -eq $frontendSubnetName }
$backendSubnet1 = $vnet.Subnets | ? { $_.Name -eq $backendSubnetName1 }
$backendSubnet2 = $vnet.Subnets | ? { $_.Name -eq $backendSubnetName2 }
```

**Create public IP address**

```
$pip1 = New-AzureRmPublicIpAddress -Name $pubIPName1 -ResourceGroupName $RGName -Location $location -AllocationMethod Dynamic
$pip2 = New-AzureRmPublicIpAddress -Name $pubIPName2 -ResourceGroupName $RGName -Location $location -AllocationMethod Dynamic
```
Create NICs

Create NIC 0/1

```powershell
1 \$nic1Name=$nicNamePrefix + \$suffixNumber + "-Mgmt"
2 \$ipAddress1=$ipAddressPrefix + \$suffixNumber
3 $IPConfig1=New-AzureRmNetworkInterfaceIpConfig -Name \$IPConfigName1 -SubnetId $frontendSubnet.Id -PublicIpAddress \$pip1 -PrivateIpAddress $ipAddress1 -Primary
4 \$nic1=New-AzureRmNetworkInterface -Name \$nic1Name -ResourceGroupName $RGName -Location $location -IpConfiguration $IpConfig1
```

Create NIC 1/1

```powershell
1 \$nic2Name \$nicNamePrefix + \$suffixNumber + "-frontend"
2 \$ipAddress2=$ipAddressPrefix1 + ($suffixNumber)
3 \$ipAddress3=$ipAddressPrefix1 + ($suffixNumber + 1)
4 $IPConfig2=New-AzureRmNetworkInterfaceIpConfig -Name \$IPConfigName2 -PublicIpAddress \$pip2 -SubnetId $backendSubnet1.Id -PrivateIpAddress $ipAddress2 -Primary
5 $IPConfig3=New-AzureRmNetworkInterfaceIpConfig -Name \$IPConfigName3 -SubnetId $backendSubnet1.Id -PrivateIpAddress $ipAddress3
6 \$nic2=New-AzureRmNetworkInterface -Name \$nic2Name -ResourceGroupName $RGName -Location $location -IpConfiguration $IpConfig2, $IpConfig3
```

Create NIC 1/2

```powershell
1 \$nic3Name=$nicNamePrefix + \$suffixNumber + "-backend"
2 \$ipAddress4=$ipAddressPrefix2 + ($suffixNumber)
3 $IPConfig4=New-AzureRmNetworkInterfaceIpConfig -Name \$IPConfigName4 -SubnetId $backendSubnet2.Id -PrivateIpAddress \$ipAddress4 -Primary
4 \$nic3=New-AzureRmNetworkInterface -Name \$nic3Name -ResourceGroupName $RGName -Location $location -IpConfiguration $IpConfig4
```

Create VM config object

```powershell
1 \$vmName=$vmNamePrefix
2 \$vmConfig=New-AzureRmVmConfig -VMName \$vmName -VMSize $vmSize -AvailabilitySetId $avSet.Id
```

Get credentials and set OS properties
NetScaler 12.0

```
1 $cred=Get-Credential -Message "Type the name and password for VPX login."
2 $vmConfig=Set-AzureRMVMOperatingSystem -VM $vmConfig -Linux -
   ComputerName $vmName -Credential $cred
3 $vmConfig=Set-AzureRMVMSourceImage -VM $vmConfig -PublisherName $publisher -Offer $offer -Skus $sku -Version $version

Add NICs

1 $vmConfig=Add-AzureRMVMNetworkInterface -VM $vmConfig -Id $nic1.Id -Primary
2 $vmConfig=Add-AzureRMVMNetworkInterface -VM $vmConfig -Id $nic2.Id
3 $vmConfig=Add-AzureRMVMNetworkInterface -VM $vmConfig -Id $nic3.Id

Specify OS disk and create VM

1 $osDiskName=$vmName + "-" + $osDiskSuffix
2 $osVhdUri=$prmStorageAccount.PrimaryEndpoints.Blob.ToString() + "vhds/"
   +$osDiskName + ".vhd"
3 $vmConfig=Set-AzureRMVMOSDisk -VM $vmConfig -Name $osDiskName -VhdUri $osVhdUri -CreateOption fromImage
4 Set-AzureRmVMPlan -VM $vmConfig -Publisher $publisher -Product $offer -Name $sku
5 New-AzureRMVM -VM $vmConfig -ResourceGroupName $RGName -Location $location

Note
Repeat steps 1-10 listed in “Create Multi-NIC VMs by Using PowerShell Commands” to create VM2 with parameters specific to VM2.

IP configuration details

The following IP addresses are used.

Table 1. IP addresses used in VM1
### NetScaler 12.0

<table>
<thead>
<tr>
<th>NIC</th>
<th>Private IP</th>
<th>Public IP (PIP)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0/1</td>

</tr>
</tbody>
</table>
Here are sample configurations for this scenario, showing the IP addresses and initial LB configurations
as created through the NetScaler VPX CLI for VM1 and VM2.

Here's an example configuration on VM1.

```
1   add ns ip 10.0.1.10 255.255.255.0 -mgmtAccess ENABLED
2  Add nsip 10.0.1.10 255.255.255.0
3  add service svc1 10.0.1.10 ADNS 53
4  add lb vserver v1 HTTP 10.0.1.11 80
5  add service s1 10.0.2.120 http 80
6  Add service s2 10.0.2.121 http 80
7  Bind lb vs v1 s[1-2]
```

Here's an example configuration on VM2.

```
1   add ns ip 20.0.1.10 255.255.255.0 -mgmtAccess ENABLED
2  Add nsip 20.0.1.10 255.255.255.0
3  add service svc1 20.0.1.10 ADNS 53
4  add lb vserver v1 HTTP 20.0.1.11 80
5  Add service s1 20.0.2.90 http 80
6  Add service s2 20.0.2.91 http 80
7  Bind lb vs v1 s[1-2]
```

**Configure GSLB sites and other settings**

Perform the tasks described in the following topic to configure the two GSLB sites and other necessary
settings:

**Global Server Load Balancing**

For more information, see this support article:
https://support.citrix.com/article/CTX110348

Here's an example GSLB configuration on VM1 and VM2.

```
1   enable ns feature LB GSLB
2   add gslb site site1 10.0.1.10 -publicIP PIP2
3   add gslb site site2 20.0.1.10 -publicIP PIP5
4   add gslb service site1_gslb_http_svc1 10.0.1.11 HTTP 80 -publicIP PIP3
       -publicPort 80 -siteName site1
5   add gslb service site2_gslb_http_svc1 20.0.1.11 HTTP 80 -publicIP PIP6
       -publicPort 80 -siteName site2
6   add gslb vserver gslb_http_vip1 HTTP
7   bind gslb vserver gslb_http_vip1 -serviceName site2_gslb_http_svc1
8   bind gslb vserver gslb_http_vip1 -serviceName site1_gslb_http_svc1
9   bind gslb vserver gslb_http_vip1 -domainName www.gslbindia.com -TTL 5
```
You’ve configured GSLB on NetScaler VPX instances running on Azure.

For additional information about how to configure GSLB on NetScaler VPX instances, click the following image to watch the video about Configuring NetScaler GSLB in Microsoft Azure.

Configure GSLB on an active-standby high-availability setup

January 6, 2019

You can configure global server load balancing (GSLB) on active-standby HA deployment on Azure in three steps:

1. Create a VPX HA pair on each GSLB site. See Configure a high-availability setup with multiple IP addresses and NICs for information about how to create an HA pair.

2. Configure the Azure Load Balancer (ALB) with the front-end IP address and rules to allow GSLB and DNS traffic.

This step involves the following substeps. See the scenario in this section for the PowerShell commands used to complete these substeps.
3. Enable GSLB on each HA pair.

**Scenario**

This scenario includes two sites - Site 1 and Site 2. Each site has an HA pair (HA1 and HA2) configured with multiple NICs, multiple IP addresses, and GSLB.

**Figure:** GLSB on Active-Standy HA Deployment on Azure

In this scenario, each VM has three NICs - NIC 0/1, 1/1, and 1/2. The NICs are configured for the following purposes.

NIC 0/1: to serve management traffic

NIC 1/1: to serve client-side traffic

NIC 1/2: to communicate with back-end servers

**Parameter Settings**

Following are sample parameters settings for the ALB. You can use different settings if you want.

```
$locName="South east Asia"
$rgName="MulitIP-MultiNIC-RG"
$pubIPName4="PIPFORGSLB1"
$domName4="vpxgslbdns"
$lbName="MultiPALB"
$frontEndConfigName2="FrontEndIP2"
```
Configure ALB with the front-end IP address and rules to allow GSLB and DNS traffic

Step 1. Create a public IP for GSLB site IP

```powershell
$pip4 = New-AzureRmPublicIpAddress -Name $pubIPName4 -ResourceGroupName $rgName -DomainNameLabel $domName4 -Location $locName - AllocationMethod Dynamic
Get-AzureRmLoadBalancer -Name $lbName -ResourceGroupName $rgName | Add-AzureRmLoadBalancerFrontendIpConfig -Name $frontEndConfigName2 - PublicIpAddress $pip4 | Set-AzureRmLoadBalancer
```

Step 2. Create LB rules and update the existing ALB.

```powershell
$alb = get-AzureRmLoadBalancer -Name $lbName -ResourceGroupName $rgName

$frontendipconfig2=Get-AzureRmLoadBalancerFrontendIpConfig - LoadBalancer $alb -Name $frontEndConfigName2

$backendPool=Get-AzureRmLoadBalancerBackendAddressPoolConfig - LoadBalancer $alb -Name $backendPoolName1

$healthprobe=Get-AzureRmLoadBalancerProbeConfig -LoadBalancer $alb - Name $healthProbeName

$alb | Add-AzureRmLoadBalancerRuleConfig -Name $lbRuleName2 - BackendAddressPool $backendPool -FrontendIpConfiguration $frontendipconfig2 -Protocol "Tcp" -FrontendPort 3011 -BackendPort 3011 -Probe $healthprobe -EnableFloatingIP | Set-AzureRmLoadBalancer
```
$alb | Add-AzureRmLoadBalancerRuleConfig -Name $lbRuleName3 -
  BackendAddressPool $backendPool -FrontendIPConfiguration $frontendipconfig2 -Protocol ”Tcp” -FrontendPort 3010 -BackendPort 3010 -Probe $healthprobe -EnableFloatingIP | Set-AzureRmLoadBalancer

$alb | Add-AzureRmLoadBalancerRuleConfig -Name $lbRuleName4 -
  BackendAddressPool $backendPool -FrontendIPConfiguration $frontendipconfig2 -Protocol ”Udp” -FrontendPort 53 -BackendPort 53 -Probe $healthprobe -EnableFloatingIP | Set-AzureRmLoadBalancer

Enable GSLB on each high availability pair

Now you’ve two front-end IP addresses for each ALB: ALB 1 and ALB 2. One IP address is for the LB virtual server and the other for the GSLB site IP.

HA 1 has the following front-end IP addresses:

- FrontEndIPofALB1 (for LB vserver)
- PIPFORGLSLB1 (GSLB IP)

HA 2 has the following front-end IP addresses:

- FrontEndIPofALB2 (for LB vserver)
- PIPFORGLSLB2 (GSLB IP)

The following commands are used for this scenario.

```bash
enable ns feature LB GSLB
add service dnssvc PIPFORGLSLB1 ADNS 53
add gslb site site1 PIPFORGLSLB1 -publicIP PIPFORGLSLB1
add gslb site site2 PIPFORGLSLB2 -publicIP PIPFORGLSLB2
add gslb service site1_gslb_http_svc1 FrontEndIPofALB1 HTTP 80 -
  publicIP FrontEndIPofALB1 -publicPort 80 -siteName site1
```
add gslb service site2_gslb_http_svc1 FrontEndIPofALB2 HTTP 80 -
   publicIP FrontEndIPofALB2 -publicPort 80 -siteName site2
add gslb vserver gslb_http_vip1 HTTP
bind gslb vserver gslb_http_vip1 -serviceName site2_gslb_http_svc1
bind gslb vserver gslb_http_vip1 -serviceName site1_gslb_http_svc1
bind gslb vserver gslb_http_vip1 -domainName www.gslbindia.com -TTL 5

Configure GSLB on NetScaler VPX instances
Global Server Load Balancing

Configure address pools (IIP) for a Citrix Gateway appliance

January 6, 2019

In some situations, users who connect with the Citrix Gateway Plug-in need a unique IP address for a
NetScaler Gateway appliance. When you enable address pools (also known as IP pooling) for a group,
the Citrix Gateway appliance can assign a unique IP address alias to each user. You configure address
pools by using intranet IP (IIP) addresses.

You can configure address pools on a Citrix Gateway appliance deployed on Azure by following this
2-step procedure:

• Registering the private IP addresses that will be used in the address pool, in Azure
• Configuring address pools in the Citrix Gateway appliance

Register a private IP address in the Azure portal

In Azure, you can deploy a NetScaler VPX instance with multiple IP addresses. You can add IP ad-
dresses to a VPX instance in two ways:

a. While provisioning a VPX instance
For more information about how to add multiple IP addresses while provisioning a VPX instance, see Configure multiple IP addresses for a NetScaler standalone instance. To add IP addresses by using PowerShell commands while provisioning a VPX instance, see Configure multiple IP addresses for a NetScaler VPX instance in standalone mode by using PowerShell commands.

b. After provisioning a VPX instance

After you’ve provisioned a VPX instance, follow these steps to register a private IP address in the Azure portal, which you configure as an address pool in the Citrix Gateway appliance.

1. From Azure Resource Manager (ARM), go to the already created NetScaler VPX instance > Network interfaces. Choose the network interface which is bound to a subnet to which the IIP that you want to register belongs.

2. Click IP Configurations, and then click Add.

3. Provide the required details as shown in the example below and click OK.

Configure address pools in the Citrix Gateway appliance

For more information about how to configure address pools on the Citrix Gateway, see this Configuring Address Pools.

Limitation: You can not bind a range of IIP addresses to users. Every IIP address that is used in an address pool should be registered.

Configure multiple IP addresses for a NetScaler VPX instance in standalone mode by using PowerShell commands

January 6, 2019

In an Azure environment, a NetScaler VPX virtual appliance can be deployed with multiple NICs. Each NIC can have multiple IP addresses. This section describes how to deploy a NetScaler VPX instance with a single NIC and multiple IP addresses, by using PowerShell commands. You can use the same script for multi-NIC and multi-IP deployment.

Note

In this document, IP-Config refers to a pair of IP addresses, public IP and private IP, that is associated with an individual NIC. For more information, see the Azure terminology section.
Use case

In this use case, a single NIC is connected to a virtual network (VNET). The NIC is associated with three IP configurations, as shown in the following table.

<table>
<thead>
<tr>
<th>IPConfig</th>
<th>Associated with</th>
</tr>
</thead>
<tbody>
<tr>
<td>IPConfig-1</td>
<td>Static public IP address; static private IP address</td>
</tr>
<tr>
<td>IPConfig-2</td>
<td>Static public IP address; static private address</td>
</tr>
<tr>
<td>IPConfig-3</td>
<td>Static private IP address</td>
</tr>
</tbody>
</table>

Note
IPConfig-3 is not associated with any public IP address.

Diagram: Topology

Here is the visual representation of the use case.

Note
In a multi-NIC, multi-IP Azure NetScaler VPX deployment, the private IP address associated with the primary (first) IPConfig of the primary (first) NIC is automatically added as the management NSIP address of the appliance. The remaining private IP addresses associated with IPConfigs must be added in the VPX instance as VIPs or SNIPs by using the “add ns ip” command, as determined by your requirements.

Here is the summary of the steps required for configuring multiple IP addresses for a NetScaler VPX virtual appliance in standalone mode:

1. Create Resource Group
2. Create Storage Account
3. Create Availability Set
4. Create NSG
5. Create Virtual Network
6. Create Public IP Address
7. Assign IP Configuration
8. Create NIC
9. Create NetScaler VPX Instance
10. Check NIC Configurations
11. Check VPX-side Configurations
Script

Parameters

Following are sample parameters settings for the use case in this document. You can use different settings if you wish.

$locName="westcentralus"
$rgName="Azure-MultiIP"
$nicName1="VM1-NIC1"
$vNetName="Azure-MultiIP-vnet"
$vNetAddressRange="11.6.0.0/16"
$frontEndSubnetName="frontEndSubnet"
$frontEndSubnetRange="11.6.1.0/24"
$prmStorageAccountName="multiipstorage"
$avSetName="multiip-avSet"
$vmSize="Standard_DS4_V2" (This parameter creates a VM with up to four NICs.)

Note: The minimum requirement for a VPX instance is 2 vCPUs and 2 GB RAM.

$publisher="citrix"
$offer="netscalervpx110-6531" (You can use different offers.)
$sku="netscalerbyol" (According to your offer, the SKU can be different.)
$version="latest"
$pubIPName1="PIP1"
$pubIPName2="PIP2"
$domName1="multiipvpx1"
$domName2="multiipvpx2"
$vmNamePrefix="VPXMultiIP"
$osDiskSuffix="osmultiipalbdiskdb1"

Network Security Group (NSG)-related information:

$nsgName="NSG-MultiIP"
$rule1Name="Inbound-HTTP"
$rule2Name="Inbound-HTTPS"
NetScaler 12.0

$rule3Name="Inbound-SSH"
$IpConfigName1="IPConfig1"
$IPConfigName2="IPConfig-2"
$IPConfigName3="IPConfig-3"

1. Create Resource Group

```powershell
New-AzureRmResourceGroup -Name $rgName -Location $locName
```

2. Create Storage Account

```powershell
$prmStorageAccount = New-AzureRMStorageAccount -Name $prmStorageAccountName -ResourceGroupName $rgName -Type Standard_LRS -Location $locName
```

3. Create Availability Set

```powershell
$avSet = New-AzureRMAvailabilitySet -Name $avSetName -ResourceGroupName $rgName -Location $locName
```

4. Create Network Security Group (NSG)

1. Add rules. You must add a rule to the NSG for any port that serves traffic.

```powershell
$rule1=New-AzureRmNetworkSecurityRuleConfig -Name $rule1Name - Description "Allow HTTP" -Access Allow -Protocol Tcp -Direction Inbound -Priority 101 -SourceAddressPrefix Internet - SourcePortRange * -DestinationAddressPrefix * -DestinationPortRange 80
$rule2=New-AzureRmNetworkSecurityRuleConfig -Name $rule2Name - Description "Allow HTTPS" -Access Allow -Protocol Tcp -Direction Inbound -Priority 110 -SourceAddressPrefix Internet - SourcePortRange * -DestinationAddressPrefix * -DestinationPortRange 443
$rule3=New-AzureRmNetworkSecurityRuleConfig -Name $rule3Name - Description "Allow SSH" -Access Allow -Protocol Tcp -Direction Inbound -Priority 120 -SourceAddressPrefix Internet -SourcePortRange * -DestinationAddressPrefix * -DestinationPortRange 22
```
2. Create NSG object.

```powershell
$nsg = New-AzureRmNetworkSecurityGroup -ResourceGroupName $rgName -Location $locName -Name $nsgName -SecurityRules $rule1,$rule2,$rule3
```

5. Create Virtual Network

1. Add subnets.

```powershell
$frontendSubnet = New-AzureRmVirtualNetworkSubnetConfig -Name $frontEndSubnetName -AddressPrefix $frontEndSubnetRange
```

2. Add virtual network object.

```powershell
$vnet = New-AzureRmVirtualNetwork -Name $vNetName -ResourceGroupName $rgName -Location $locName -AddressPrefix $vNetAddressRange -Subnet $frontendSubnet
```

3. Retrieve subnets.

```powershell
$subnetName = "frontEndSubnet"
$subnet1 = $vnet.Subnets | ?{$_ .Name -eq $subnetName }
```

6. Create Public IP Address

```powershell
$pip1 = New-AzureRmPublicIpAddress -Name $pubIPName1 -ResourceGroupName $rgName -DomainNameLabel $domName1 -Location $locName -AllocationMethod Static
$pip2 = New-AzureRmPublicIpAddress -Name $pubIPName2 -ResourceGroupName $rgName -DomainNameLabel $domName2 -Location $locName -AllocationMethod Static
```

Note

- Check availability of domain names before using.
- Allocation method for IP addresses can be dynamic or static.

7. Assign IP Configuration

In this use case, consider the following points before assigning IP addresses:
NetScaler 12.0

- IPConfig-1 belongs to subnet1 of VPX1.
- IPConfig-2 belongs to subnet 1 of VPX1.
- IPConfig-3 belongs to subnet 1 of VPX1.

**Note**
When you assign multiple IP configurations to a NIC, one configuration must be assigned as primary.

```bash
1 $IPAddress1="11.6.1.27"
2 $IPConfig1=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName1 -Subnet $subnet1 -PrivateIpAddress $IPAddress1 -PublicIpAddress $pip1 -Primary
3 $IPAddress2="11.6.1.28"
4 $IPConfig2=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName2 -Subnet $subnet1 -PrivateIpAddress $IPAddress2 -PublicIpAddress $pip2
5 $IPAddress3="11.6.1.29"
6 $IPConfig3=New-AzureRmNetworkInterfaceIpConfig -Name $IPConfigName3 -Subnet $subnet1 -PrivateIpAddress $IPAddress3 -Primary
```

Use a valid IP address that meets your subnet requirements and check its availability.

### 8. Create NIC

```bash
1 $nic1=New-AzureRmNetworkInterface -Name $nicName1 -ResourceGroupName $rgName -Location $locName -IpConfiguration $IpConfig1,$IpConfig2,$IPConfig3 -NetworkSecurityGroupId $nsg.Id
```

### 9. Create NetScaler VPX Instance

1. Initialize variables.

```bash
1 $suffixNumber = 1
2 $vmName = $vmNamePrefix + $suffixNumber
```

2. Create VM config object.

```bash
1 $vmConfig=New-AzureRMVMConfig -VMName $vmName -VMSize $vmSize -AvailabilitySetId $avSet.Id
```

3. Set credentials, OS, and image.
4. Add NIC.

```powershell
$vmConfig = Add-AzureRMVMNetworkInterface -VM $vmConfig -Id $nic1.Id -Primary
```

**Note**

In a multi-NIC VPX deployment, one NIC should be primary. So, “-Primary” needs to be appended while adding that NIC to the VPX instance.

5. Specify OS disk and create VM.

```powershell
$osDiskName = $vmName + "-" + $osDiskSuffix1
$osVhdUri = $prmStorageAccount.PrimaryEndpoints.Blob.ToString() + "vhds/" + $osDiskName + ".vhd"
$vmConfig = Set-AzureRMVMOSDisk -VM $vmConfig -Name $osDiskName -VhdUri $osVhdUri -CreateOption fromImage
Set-AzureRmVMPlan -VM $vmConfig -Publisher $publisher -Offer $offer -Skus $sku
New-AzureRmVM -VM $vmConfig -ResourceGroupName $rgName -Location $locName
```

10. Check NIC Configurations

After the VPX instance starts, you can check the IP addresses allocated to IPConfigs of the VPX NIC by using the following command.

```powershell
$nici.IPConfig
```

11. Check VPX-side Configurations

When the NetScaler VPX instance starts, a private IP address associated with primary IPconfig of the primary NIC is added as the NSIP address. The remaining private IP addresses must be added as VIP or SNIP addresses, as determined by your requirements. Use the following command.

```powershell
add nsip <Private IPAddress><netmask> -type VIP/SNIP
```
You’ve now configured multiple IP addresses for a NetScaler VPX instance in standalone mode. For additional information about how to configure multiple IP addresses for a NetScaler VPX instance in standalone mode, see the NetScaler VPX deployments in Microsoft Azure video.

**Configure multiple Azure VIPs for a standalone or high availability VPX instance**

January 6, 2019

In Azure Resource Manager (ARM), configure multiple public virtual IP addresses (VIPs) for both single NetScaler VPX deployment, and also for high availability (HA) deployment.

**Note:** Multiple VIPs can be configured for external load balancers only.

For deploying NetScaler VPX instances in both single mode and high availability mode, you have to use PowerShell commands alone, as you can create multiple front-end IP addresses (FIP) through PowerShell only.

**Deploy a NetScaler VPX in standalone mode**

This section provides PowerShell commands to deploy a NetScaler VPX in a standalone mode with multiple front-end IPs mapped to a single back-end pool.

Configure multiple FIPs, back-end pools, LB rules, and inbound NAT rules as part of configuring Azure load balancer.

Make sure that the following conditions are met in a single NetScaler VPX deployment:

1. A back-end pool contains only one NetScaler VPX instance.
2. Two load balancer rules are defined and are mapped to the following two VIPs:
   a) VIP1:80 > Back-end Pool 1:10080
   b) VIP2:80 > Back-end Pool 1:10081
3. A load balancer rule is defined to map VIP1:10080 > Back-end Pool 1:80, to access NetScaler VPX user interface.
4. An inbound NAT rule is defined to map VIP1:22 > Back-end Pool 1:22 to access NetScaler VPX through SSH.

The following image illustrates how you can configure multiple cloud service IP addresses on Azure Resource Manager for NetScaler virtual servers.

Run the following PowerShell commands to deploy a NetScaler VPX instance in a standalone mode:
1. Create resource group

$rgName="<resource group name>"
$locName="<location name, such as West US>"

Command:

New-AzureRmResourceGroup -Name $rgName -Location $locName

For example:

```
1 $rgName = "ARM-LB-NS"
2 $locName = "East Asia"
5 New-AzureRmResourceGroup -Name $rgName -Location $locName
```

2. Create storage account

You must select a globally unique name for your storage account that contains only lowercase letters and numbers.

$saName="<storage account name>"
$saType="<storage account type, specify one: Standard_LRS, Standard_GRS, Standard_RAGRS, or Platinum_LRS>"

Command

```
1 New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -Type $saType -Location $locName
```

For example:

```
1 $saName="vpxstorage"
2 $saType="Standard\_LRS"
5 New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -Type $saType -Location $locName
```

3. Create availability set

$avName="<availability set name>"

Command:
1. Create availability set

```
New-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName -Location $locName
```

For example:

```
$avName="avNSSet"
```

**4. Create virtual network and subnet**

Add new virtual network with at least one subnet, if it is not created previously.

$vnetName = “LBVnet”

Commands:

Create subnets:

```
$frontendSubnet = New-AzureRmVirtualNetworkSubnetConfig -Name frontendSubnet -AddressPrefix 10.0.1.0/24
```

(Configure this parameter value as per your requirement)

```
$backendSubnet = New-AzureRmVirtualNetworkSubnetConfig -Name backendSubnet -AddressPrefix 10.0.2.0/24
```

Create virtual network:

```
New-AzureRmVirtualNetwork -Name $vnetName -ResourceGroupName $rgName -Location $locName -AddressPrefix 10.0.0.0/16 -Subnet $frontendSubnet,$backendSubnet
```

**5. Create public IP address**

The number of public IPs created should be equal to number of External VIPs required.

- Before using, check for the availability of the value for DomainNameLabel.
- Create two VIPs.

Commands:

```
$pubName1 ="PublicIp1"
$dnsName1="nsvpx1"
```
6. Create front-end IP for specified public IP addresses

$FIPName1 ="VIP1"
$FIPName2="VIP2"

Commands:

1 $frontendIP1 = New-AzureRmLoadBalancerFrontendIpConfig -Name $FIPName1 -PublicIpAddress $publicIP1
2 $frontendIP2 = New-AzureRmLoadBalancerFrontendIpConfig -Name $FIPName2 -PublicIpAddress $publicIP2

7. Create back-end pool

$BEPool1 = “backend-Pool1”

Command:

1 $beaddresspool1= New-AzureRmLoadBalancerBackendAddressPoolConfig -Name $BEPool1

8. Create health probe

Create TCP health probe with port 9000 and interval 5 seconds.

Command:

1 $healthProbe = New-AzureRmLoadBalancerProbeConfig -Name HealthProbe -Protocol Tcp -Port 9000 -IntervalInSeconds 5 -ProbeCount 2
9. Create load balancer rule

For each front end IP and service, we need to create lbRule. Here back-end address pool can contain set of virtual machines. For single VPX deployment only single VPX instance will be part of this pool.

**Note:** Combined values for front-end IP configuration, back-end address pool, front-end port, back-end port parameters should not be same for any two rules.

For example, every FIP/VIP access, and HTTP service uses front-end port 80. As back-end pool is same, back-end port needs to be used differently for each load balancer rule.

**Commands**

```
$lbrule1 = New-AzureRmLoadBalancerRuleConfig -Name "HTTP1" -FrontendIpConfiguration $frontendIP1 -BackendAddressPool $beAddressPool1 -Probe $healthProbe -Protocol Tcp -FrontendPort 80 -BackendPort 10080

$lbrule2 = New-AzureRmLoadBalancerRuleConfig -Name "HTTP2" -FrontendIpConfiguration $frontendIP2 -BackendAddressPool $beAddressPool1 -Probe $healthProbe -Protocol Tcp -FrontendPort 80 -BackendPort 10081
```

LB rule to access http service of NS can be added in the following way:

**Command**

```
$lbrule3 = New-AzureRmLoadBalancerRuleConfig -Name "HTTPNS" -FrontendIpConfiguration $frontendIP1 -BackendAddressPool $beAddressPool1 -Probe $healthProbe -Protocol Tcp -FrontendPort 80 -BackendPort 10080
```

10. Create Inbound NAT Rules

Create NAT rules for services that does not require to be load balanced.

For example, create an ssh access to VPX instance.

Protocol - FrontEndPort - BackendPort triplet should not be same for two NAT rules belonging to same front-end IP.

**Command**

```
$inboundNATRule1 = New-AzureRmLoadBalancerInboundNatRuleConfig -Name SSH1 -FrontendIpConfiguration $frontendIP1 -Protocol TCP -FrontendPort 22 -BackendPort 22
```
11. Create Load Balancer

Create load balancer with all of the above defined rules, front-end IPs, and a back-end pool.

Command:

```bash
$lbName = "NSALB"
$NRPLB = New-AzureRmLoadBalancer -ResourceGroupName $rgName -Name $lbName -Location $locName -InboundNatRule $inboundNATRule1 -FrontendIpConfiguration $frontendIP1, $frontendIP2 -LoadBalancingRule $lbrule1, $lbrule2, $lbrule3 -BackendAddressPool $beAddressPool1 -Probe $healthProbe
```

12. Create NIC

Create a NIC and associate it with the NetScaler VPX instance.

Commands:

```bash
$nicName="NIC1"
$lbName="NSALB"
$bePoolIndex=0
$natRuleIndex=0
$subnetIndex=0 & Frontend subnet index
$lb=Get-AzureRmLoadBalancer -Name $lbName -ResourceGroupName $rgName
$nic1=New-AzureRmNetworkInterface -Name $nicName -ResourceGroupName $rgName -Location $locName -Subnet $vnet.Subnets[{$subnetIndex}] -LoadBalancerBackendAddressPool $lb.BackendAddressPools[{$bePoolIndex}] -LoadBalancerInboundNatRule $lb.InboundNatRules[{$natRuleIndex}]
```

13. Create NetScaler VPX Instance

Create NetScaler VPX instance from MarketPlace image and attach the NIC to the virtual instance.

Commands:

```bash
$vmName="VPX1"
```
NetScaler 12.0

```powershell
$vmSize = "Standard\_A3" / "Standard\_DS4"
$pubName = "citrix"
$skuName = "netscalerbyol"
$offerName = "netscalervpx110-6531"
$avSet = Get-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName
$vm1 = New-AzureRmVMConfig -VMName $vmName -VMSize $vmSize -AvailabilitySetId $avset.Id
$cred = Get-Credential -Message "Type Credentials which will be used to login to VPX instance"
$vm1 = Set-AzureRmVMOperatingSystem -VM $vm1 -Linux -ComputerName $vmName -Credential $cred -Verbose
$vm1 = Set-AzureRmVMSourceImage -VM $vm1 -PublisherName $pubName -Offer $offerName -Skus $skuName -Version "latest"
$vm1 = Add-AzureRmVMNetworkInterface -VM $vm1 -Id $nic1.Id
$diskName = "dynamic"
$storageAcc = Get-AzureRmStorageAccount -ResourceGroupName $rgName -Name $saName
$osDiskUri1 = $storageAcc.PrimaryEndpoints.Blob.ToString() + "vhds1/" + $diskName + ".vhd"
$vm1 = Set-AzureRmVMOSDisk -VM $vm1 -Name $diskName -VhdUri $osDiskUri1 -CreateOption fromImage
Set-AzureRmVMPlan -VM $vm1 -Publisher $pubName -Product $offerName -Name $skuName
New-AzureRmVM -ResourceGroupName $rgName -Location $locName -VM $vm1
```

The above commands creates a NetScaler VPX instance, then add virtual servers to the NetScaler VPX instance for the specified front end services.
Deploying NetScaler VPX in High Availability Mode

This section provides PowerShell commands to deploy a NetScaler VPX in HA deployment with multiple front-end IPs mapped to a single back-end pool.

Configure multiple FIPs, backend pools, load balance rules, and inbound NAT rules as part of the Azure load balancer.

Make sure that the following conditions are met in HA deployment of NetScaler VPX instances:

1. A back-end pool contains two NetScaler VPX instances, which are part of HA.
2. Two load balancer rules are defined and are mapped to following two VIPs:
   a) VIP1:80 > Back-end Pool 1:10080
   b) VIP2:80 > Back-end Pool 1:10081
3. A load balancer rule is defined, which maps VIP1:10080 > Back-end Pool 1:80, to access NetScaler VPX GUI.
4. Two inbound NAT rules are defined to map the following two VIPs:
   a) VIP1:22 > Back-end Pool 1:22 to access NetScaler VPX Primary
   b) VIP1:10022 > Back-end Pool-1:22 to access NetScaler VPX Secondary through SSH

All services that are defined as part of Azure load balancer rules will get load balanced. That is, if the primary VPX fails, the secondary VPX will take care of all of the services in Active-Passive HA deployment.

The following image illustrates how you can configure multiple cloud service IP addresses on Azure Resource Manager for NetScaler virtual servers in HA mode.

1. Create Resource Group

   $rgName="<resource group name>"
   $locName="<location name, such as West US>"

   Commands:

   ```powershell
   New-AzureRmResourceGroup -Name $rgName -Location $locName
   ```

   For example:

   ```powershell
   $rgName = "ARM-Mult-VIP-HA"
   $locName = "East Asia"
   New-AzureRmResourceGroup -Name $rgName -Location $locName
   ```
2. Create Storage Account

You must select a globally unique name for your storage account that contains only lowercase letters and numbers.

$saName="<storage account name>"

$saType="<storage account type, specify one: Standard_LRS, Standard_GRS, Standard_RAGRS, or Platinum_LRS>"

Commands:

```
1 New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -Type $saType -Location $locName
```

For example:

```
1 $saName="vpxstorage1"
2 $saType="Standard\_LRS"
3 New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -Type $saType -Location $locName
```

3. Create Availability Set

$avName="<availability set name>"

Command:

```
1 New-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName -Location $locName
```

For example:

$avName="avNSSetARM"

4. Create Virtual Network and Subnet

Add new virtual network with at least one subnet if it is not created previously.

$vnetName = “LBVnet”

Commands:

Create subnets:
1 $frontendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name frontendSubnet -AddressPrefix 10.0.7.0/24

(this parameter value should be as per your requirement)

1 $backendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name backendSubnet -AddressPrefix 10.0.8.0/24

Create Virtual Network:

1 New-AzureRmVirtualNetwork -Name $vnetName -ResourceGroupName $rgName -Location $locName -AddressPrefix 10.0.0.0/16 -Subnet $frontendSubnet,$backendSubnet

5. Create Public IP Address

The number of public IP addresses created should be equal to the number of external VIPs required.

- Before using, check for the availability of the value for Domain.Name.Label.
- Create two VIPs.

Commands:

$pubName1 ="PublicIp1"
$dnsName1="nsvp1"
$pubName2 ="PublicIp2"
$dnsName2="nsvp2"

1 $publicIP1 = New-AzureRmPublicIpAddress -Name $pubName1 -ResourceGroupName $rgName -Location $locName -AllocationMethod Static -DomainNameLabel $dnsName1
2 $publicIP2 = New-AzureRmPublicIpAddress -Name $pubName2 -ResourceGroupName $rgName -Location $locName -AllocationMethod Static -DomainNameLabel $dnsName2

6. Create Front-end IP Addresses

$FIPName1 = “VIP1”
$FIPName2=”VIP2”

Commands:
7. Create back-end pool

$BEPool1 = “backend-Pool1”

Command:

```
1 $beaddresspool1 = New-AzureRmLoadBalancerBackendAddressPoolConfig -Name $BEPool1
```

8. Create health probe

Create TCP health probe with port 9000 and interval 5 seconds.

Command:

```
1 $healthProbe = New-AzureRmLoadBalancerProbeConfig -Name HealthProbe -Protocol Tcp -Port 9000 -IntervalInSecs 5 -ProbeCount 2
```

9. Create Load Balancer Rules

For each front-end IP and service, you have to create a separate load balancer rule.

Back-end address pool can contain set of virtual machines. For a single NetScaler VPX deployment, only single NetScaler VPX instance will be part of this pool.

**Note:** Combined values for front-end IP configuration, back-end address pool, front-end port, back-end port parameters should not be the same for any two rules.

**Examples:**

Each FIP/VIP access and HTTP service uses front-end port 80. As back-end pool is same, back-end port has to be used differently for each load balancer rule.

Command:
Load balancer configuration rule to access the HTTP service of a NetScaler VPX instance can be added in the following way:

**Command:**

```
1 $lbrule1 = New-AzureRmLoadBalancerRuleConfig -Name "HTTP1" -FrontendIpConfiguration $frontendIP1 -BackendAddressPool $beAddressPool1 -Probe $healthProbe -Protocol Tcp -FrontendPort 80 -BackendPort 10080
```

```
2 $lbrule2 = New-AzureRmLoadBalancerRuleConfig -Name "HTTP2" -FrontendIpConfiguration $frontendIP2 -BackendAddressPool $beAddressPool1 -Probe $healthProbe -Protocol Tcp -FrontendPort 80 -BackendPort 10081
```

10. Create Inbound NAT Rules

Create NAT rules for services that does not require to be load balanced.

For example, create an ssh access to VPX instance.

**Note:** Protocol - Front-end Port - Back-end Port triplet should not be the same for two NAT rules belonging to the same front-end IP address.

**Commands:**

```
1 $inboundNATRule1= New-AzureRmLoadBalancerInboundNatRuleConfig -Name SSH1 -FrontendIpConfiguration $frontendIP1 -Protocol TCP -FrontendPort 22 -BackendPort 22
```

```
2 $inboundNATRule2= New-AzureRmLoadBalancerInboundNatRuleConfig -Name SSH2 -FrontendIpConfiguration $frontendIP1 -Protocol TCP -FrontendPort 10022 -BackendPort 22
```

11. Create Load Balancer

Create load balancer with all of the above defined rules, front-end IPs, and a back-end pool.

**Command:**
12. Create NIC

Create a NIC and associate it with the NetScaler VPX instance.

Commands:

```bash
$nicName="NIC1"
$lbName="NSALB"
$bePoolIndex=0
$natRuleIndex=0
$subnetIndex=0 & Frontend subnet index
$lb=Get-AzureRmLoadBalancer -Name $lbName -ResourceGroupName $rgName
$nic1=New-AzureRmNetworkInterface -Name $nicName -ResourceGroupName $rgName -Location $locName -Subnet $vnet.Subnets[[get-index $subnetIndex]] -LoadBalancerBackendAddressPool $lb.BackendAddressPools[[get-index $bePoolIndex]] -LoadBalancerInboundNatRule $lb.InboundNatRules[[get-index $natRuleIndex]]

$nicName="NIC2"
$lbName="NSALB"
$bePoolIndex=0
$natRuleIndex=1 & 2nd SSH rule
$subnetIndex=0
```
13. Create NetScaler VPX Instances

Create a NetScaler VPX instance from MarketPlace image and attach a NIC to it.

Commands:

```
$vmName = "VPX1"
$vmSize = "Standard\_A3"
$pubName = "citrix"
$skuName = "netscalerbyol"
$offerName = "netscalervpx110-6531"
$avSet = Get-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName
$vm1 = New-AzureRmVMConfig -VMName $vmName -VMSize $vmSize -AvailabilitySetId $avset.Id
$cred = Get-Credential -Message "Type Credentials which will be used to login to VPX instance"
$vm1 = Set-AzureRmVMOperatingSystem -VM $vm1 -Linux -ComputerName $vmName -Credential $cred -Verbose
$vm1 = Set-AzureRmVMSourceImage -VM $vm1 -PublisherName $pubName -Offer $offerName -Skus $skuName -Version "latest"
$vm1 = Add-AzureRmVMNetworkInterface -VM $vm1 -Id $nic1.Id
$diskName = "dynamic"
$storageAcc = Get-AzureRmStorageAccount -ResourceGroupName $rgName -Name $saName
$osDiskUri1 = $storageAcc.PrimaryEndpoints.Blob.ToString() + "vhds1/" + $diskName + ".vhd"
```
```
$vm1=Set-AzureRmVMOSDisk -VM $vm1 -Name $diskName -VhdUri $osDiskUri1 -CreateOption fromImage
Set-AzureRmVMPPlan -VM $vm1 -Publisher $pubName -Product $offerName -Name $skuName
New-AzureRmVM -ResourceGroupName $rgName -Location $locName -VM $vm1
$vmName="VPX2"
$vmSize="Standard\_A3"
$pubName="citrix"
$skuName = ”netscalerbyol"
$offerName="netscalervpx110-6531"
$avSet=Get-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName
$vm2=New-AzureRmVMConfig -VMName $vmName -VMSize $vmSize -AvailabilitySetId $avset.Id
$cred=Get-Credential -Message ”Type Credentials which will be used to login to VPX instance”
$vm2=Set-AzureRmVMOOperatingSystem -VM $vm2 -Linux -ComputerName $vmName -Credential $cred -Verbose
$vm2=Set-AzureRmVMSourceImage -VM $vm2 -PublisherName $pubName -Offer $offerName -Skus $skuName -Version ”latest”
$vm2=Add-AzureRmVMNetworkInterface -VM $vm2 -Id $nic2.Id
$diskName="dynamic"
$storageAcc=Get-AzureRmStorageAccount -ResourceGroupName $rgName -Name $saName
$osDiskUri2=$storageAcc.PrimaryEndpoints.Blob.ToString() + ”vhds2/” + $diskName + ”.vhd"
$vm1=Set-AzureRmVMOSDisk -VM $vm1 -Name $diskName -VhdUri $osDiskUri2 -CreateOption fromImage
```
14. Create high availability

When both NetScaler VPX instances are running, connect to both VPX instances through SSH to configure the virtual machines.

1. To configure Active-Passive HA, run “add HA node #nodeID” command on both nodes, and then run configuration commands on Primary VPX instance.

2. To configure Active-Active HA, run same set of configuration commands on both nodes.

Azure ARM components

This table lists those of the Azure Resource Manager (ARM) components that can be created using PowerShell, and those that can be created using the Azure Resource Manager portal.

<table>
<thead>
<tr>
<th>Component</th>
<th>PowerShell</th>
<th>ARM Portal</th>
</tr>
</thead>
<tbody>
<tr>

### Additional PowerShell scripts for Azure deployment

November 2, 2018

This section provides the PowerShell cmdlets with which you can perform the following configurations in Azure PowerShell:

- Provision a NetScaler VPX standalone instance
- Provision a NetScaler VPX pair in a high availability setup with an Azure external load balancer
- Provision a NetScaler VPX pair in a high availability setup with Azure internal load balancer

Also see the following topics for configurations that you can perform by using PowerShell commands:

- Configure a high-availability setup with multiple IP addresses and NICs by using PowerShell commands
- Configure GSLB on NetScaler VPX instances
- Configure GSLB on a NetScaler active-standby high-availability setup
- Configure multiple IP addresses for a NetScaler VPX instance in standalone mode by using PowerShell commands
- Configure multiple Azure VIPs for a standalone VPX instance

### Provision a NetScaler VPX standalone instance

1. Create a resource group
NetScaler 12.0

The resource group can include all the resources for the solution, or only those resources that you want to manage as a group. The location specified here is the default location for resources in that resource group. Make sure all commands to create a load balancer use the same resource group.

$rgName="<resource group name>"

$locName="<location name, such as West US>"

New-AzureRmResourceGroup -Name $rgName -Location $locName

For example:

```
1  $rgName = "ARM-VPX"
2
3  $locName = "West US"
4
5  New-AzureRmResourceGroup -Name $rgName -Location $locName
```

2. **Create a storage account**

Choose a unique name for your storage account that contains only lowercase letters and numbers.

$saName="<storage account name>"

$saType="<storage account type, specify one: Standard_LRS, Standard_GRS, Standard_RAGRS, or Platinum_LRS>"

New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -Type $saType -Location $locName

For example:

```
1  $saName="vpxstorage"
2
3  $saType="Standard\_LRS"
4
5  New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -Type $saType -Location $locName
```

3. **Create an availability set**

Availability set helps to keep your virtual machines available during downtime, such as during maintenance. A load balancer configured with an availability set ensures that your application is always available.

$avName="<availability set name>"

New-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName -Location $locName

4. **Create a virtual network**
Add a new virtual network with at least one subnet, if the subnet was not created previously.

$FrontendAddressPrefix="10.0.1.0/24"

$BackendAddressPrefix="10.0.2.0/24"

$vnetAddressPrefix="10.0.0.0/16"

$frontendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name frontendSubnet -AddressPrefix $FrontendAddressPrefix

$backendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name backendSubnet -AddressPrefix $BackendAddressPrefix

New-AzureRmVirtualNetwork -Name TestNet -ResourceGroupName $rgName -Location $locName -AddressPrefix $vnetAddressPrefix -Subnet $frontendSubnet,$backendSubnet

For example:

```powershell
1 $frontendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name frontendSubnet -AddressPrefix $FrontendAddressPrefix
2 $backendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name backendSubnet -AddressPrefix $BackendAddressPrefix
3 New-AzureRmVirtualNetwork -Name TestNet -ResourceGroupName $rgName -Location $locName -AddressPrefix $vnetAddressPrefix -Subnet $frontendSubnet,$backendSubnet
```

5. **Create a NIC**

Create a NIC and associate the NIC with the NetScaler VPX instance. The front end Subnet created in the above procedure is indexed at 0 and the back end Subnet is indexed at 1. Now create NIC in one of the three following ways:

a) *NIC with Public IP address*

$nicName=”<name of the NIC of the VM>”

$nic = New-AzureRmNetworkInterface -Name $nicName -ResourceGroupName $rgName -Location $locName -AllocationMethod Dynamic

$b) *NIC with Public IP and DNS label*

$nicName=”<name of the NIC of the VM>”

$domName=”<domain name label>”
$pip = New-AzureRmPublicIpAddress -Name $nicName -ResourceGroupName $rgName -DomainNameLabel $domName -Location $locName -AllocationMethod Dynamic

Before assigning $domName, check it is available or not by using command:

Test-AzureRmDnsAvailability -DomainQualifiedNames $domName -Location $locName

$nic = New-AzureRmNetworkInterface -Name $nicName -ResourceGroupName $rgName -Location $locName -SubnetId $vnet.Subnets[$subnetIndex].Id -PublicIpAddressId $pip.Id

For example:

```
1 $nicName = "frontendNIC"
2 $domName = "vpxazure"
3 $pip = New-AzureRmPublicIpAddress -Name $nicName -ResourceGroupName $rgName -DomainNameLabel $domName -Location $locName -AllocationMethod Dynamic
4 $nic = New-AzureRmNetworkInterface -Name $nicName -ResourceGroupName $rgName -Location $locName -SubnetId $vnet.Subnets[$subnetIndex].Id -PublicIpAddressId $pip.Id
```

c) NIC with Dynamic Public Address and Static Private IP address

Make sure that the private (static) IP address you add to the VM should be the same range as that of the subnet specified.

$nicName = "<name of the NIC of the VM>"
$staticIP = "<available static IP address on the subnet>"

$pip = New-AzureRmPublicIpAddress -Name $nicName -ResourceGroupName $rgName -Location $locName -AllocationMethod Dynamic

$nic = New-AzureRmNetworkInterface -Name $nicName -ResourceGroupName $rgName -Location $locName -SubnetId $vnet.Subnets[$subnetIndex].Id -PublicIpAddressId $pip.Id -PrivateIpAddress $staticIP

6. Create a virtual object

$vmName = "<VM name>"
$vmSize = "<VM size string>"

$avSet = Get-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName

$vm = New-AzureRmVMConfig -VMName $vmName -VMSize $vmSize -AvailabilitySetId $avset.Id

7. Get the NetScaler VPX image
NetScaler 12.0

$pubName="<Image publisher name>"
$offerName="<Image offer name>"
$skuName="<Image SKU name>"
$cred=Get-Credential -Message “Type the name and password of the local administrator account.”

Provide your credentials that is used to login into VPX

$vm=Set-AzureRmVMOperatingSystem -VM $vm -Linux -ComputerName $vmName -Credential $cred -Verbose

$vm=Set-AzureRmVMSourceImage -VM $vm -PublisherName $pubName -Offer $offerName -Skus $skuName -Version “latest”

$vm=Add-AzureRmVMNetworkInterface -VM $vm -Id $nic.Id

For example:

```
1 $pubName="citrix"
```

The following command is used for displaying all offers from Citrix:

```
1 Get-AzureRMVMImageOffer -Location $locName -Publisher $pubName | Select Offer
2 $offerName="netscalervpx110-6531"
```

The following command is used to know sku offered by publisher for specific offer name:

```
Get-AzureRMVMImageSku -Location $locName -Publisher $pubName -Offer $offerName
```

8. Create a virtual machine

$diskName="<name identifier for the disk in Azure storage, such as OSDisk>"

For example:

```
1 $diskName="dynamic"
2 $pubName="citrix"
3 $offerName="netscalervpx110-6531"
4 $skuName="netscalerbyol"
```
When you create VM from Images present in marketplace, use the following command to specify the VM plan:

```powershell
Set-AzureRmVMPlan -VM $vm -Publisher $pubName -Product $offerName -Name $skuName
New-AzureRmVM -ResourceGroupName $rgName -Location $locName -VM $vm
```

**Provision a NetScaler VPX pair in a high availability setup with an Azure external load balancer**

Log on to AzureRmAccount using your Azure user credentials.

1) **Create a resource group**

The location specified here is the default location for resources in that resource group. Make sure that all commands used to create a load balancer use the same resource group.

```
$rgName="<resource group name>"
$locName="<location name, such as West US>"
New-AzureRmResourceGroup -Name $rgName -Location $locName
```

*For example:*

```powershell
1 $rgName = "ARM-LB-NS"
2 $locName = "West US"
5 New-AzureRmResourceGroup -Name $rgName -Location $locName
```

2) **Create a storage account**

Choose a unique name for your storage account that contains only lowercase letters and numbers.

```
$saName="<storage account name>"
$saType="<storage account type, specify one: Standard_LRS, Standard_GRS, Standard_RAGRS, or Platinum_LRS>"
```

© 1999-2018 Citrix Systems, Inc. All rights reserved.
New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -Type $saType -Location $locName

For example:

```powershell
$saName="vpxstorage"
$saType="Standard\_LRS"
New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -Type $saType -Location $locName
```

3) **Create an availability set**

A load balancer configured with an availability set ensures that your application is always available.

$avName="<availability set name>"

New-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName -Location $locName

4) **Create a virtual network**

Add a new virtual network with at least one subnet, if the subnet was not created previously.

```powershell
$vnetName = "LBVnet"
$FrontendAddressPrefix="10.0.1.0/24"
$BackendAddressPrefix="10.0.2.0/24"
$vnetAddressPrefix="10.0.0.0/16"
$frontendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name frontendSubnet -AddressPrefix $FrontendAddressPrefix
$backendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name backendSubnet -AddressPrefix $BackendAddressPrefix
$vnet=New-AzureRmVirtualNetwork -Name $vnetName -ResourceGroupName $rgName -Location $locName -AddressPrefix $vnetAddressPrefix -Subnet $frontendSubnet,$backendSubnet
```

**Note:** Choose the AddressPrefix parameter value as per your requirement.

Assign front end and back end subnet to the virtual network that you created earlier in this step.

If the front end subnet is the first element of array vnet, subnetId should be $vnet.Subnets[0].Id.

If the front end subnet is the second element in the array, the subnetId should be $vnet.Subnets[1].Id, and so on..
5) **Configure front end IP address and create back end address pool**

Configure a front end IP address for the incoming load balancer network traffic and create a back end address pool to receive the load balanced traffic.

```powershell
$pubName = "PublicIp1"
publicIP1 = New-AzureRmPublicIpAddress -Name $pubName -ResourceGroupName $rgName -Location $locName -AllocationMethod Static -DomainNameLabel nspx

Note: Check for the availability of the value for DomainNameLabel.

$FIPName = "ELBFIP"
frontendIP1 = New-AzureRmLoadBalancerFrontendIpConfig -Name $FIPName -PublicIpAddress $publicIP1

$BEPool = "LB-backend-Pool"
beaddresspool1 = New-AzureRmLoadBalancerBackendAddressPoolConfig -Name $BEPool
```

8) **Create a health probe**

Create a TCP health probe with port 9000 and interval 5 seconds.

```powershell
$healthProbe = New-AzureRmLoadBalancerProbeConfig -Name HealthProbe -Protocol Tcp -Port 9000 -IntervalInSeconds 5 -ProbeCount 2
```

9) **Create a load balancing rule**

Create a LB rule for each service that you are load balancing.

*For example:*

You can use the following example to load balance http service.

```powershell
$lbrule1 = New-AzureRmLoadBalancerRuleConfig -Name "HTTP-LB" -FrontendIpConfiguration $frontendIP1 -BackendAddressPool $beAddressPool1 -Probe $healthProbe -Protocol Tcp -FrontendPort 80 -BackendPort 80
```

10) **Create inbound NAT rules**

Create NAT rules for services that you are not load balancing.

*For example, when creating a SSH access to a NetScaler VPX instance.*
**Note:** Protocol-FrontEndPort-BackendPort triplet should not be the same for two NAT rules.

1) **Create a load balancer entity**

Create the load balancer adding all objects (NAT rules, load balancer rules, probe configurations) together.

```powershell
$lbName="ELB"
$NRPLB = New-AzureRmLoadBalancer -ResourceGroupName $rgName -Name $lbName -Location $locName -InboundNatRule $inboundNATRule1, $inboundNATRule2 -FrontendIpConfiguration $frontendIP1 -Protocol TCP -LoadBalancingRule $lbrule1 -BackendAddressPool $beAddressPool1 -Probe $healthProbe
```

2) **Create a NIC**

Create two NICs and associate each NIC with each VPX instance

a) NIC1 with VPX1

*For example:*

```powershell
$nativeName="NIC1"
$natRuleIndex=0
$subnetIndex=0

\* Rule indexes starts from 0.

$lb=Get-AzureRmLoadBalancer -Name $lbName -ResourceGroupName $rgName
```
b) NIC2 with VPX2

_For example:_.

```
1 $nicName="NIC2"
2
3 $lbName="ELB"
4
5 $bePoolIndex=0
6
7 $natRuleIndex=1
```

* Second Inbound NAT (SSH) rule we need to use

$subnetIndex=0

* Frontend subnet index

```
1 $lb=Get-AzureRmLoadBalancer -Name $lbName -ResourceGroupName $rgName
2
```

13) **Create NetScaler VPX instances**

Create two NetScaler VPX instances as part of the same resource group and availability set, and attach it to the external load balancer.

**a) NetScaler VPX instance 1**

_For example:_.

```
1 $vmName="VPX1"
2
3 $vmSize="Standard\_A3"
4
5 $pubName="citrix"
6
7 $offerName="netscalervpx110-6531"
8
9 $skuName="netscalerbyol"
```
b) **NetScaler VPX instance 2**

*For example:*

```powershell
$vmName="VPX2"
$vmSize="Standard_A3"
$avSet=Get-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName
```
NetScaler 12.0

```powershell
$vm2=New-AzureRmVMConfig -VMName $vmName -VMSize $vmSize -AvailabilitySetId $avset.Id
$cred=Get-Credential -Message "Type Credentials which will be used to login to VPX instance"
$vm2=Set-AzureRmVMOperatingSystem -VM $vm2 -Linux -ComputerName $vmName -Credential $cred -Verbose
$vm2=Set-AzureRmVMSourceImage -VM $vm2 -PublisherName $pubName -Offer $offerName -Skus $skuName -Version "latest"
$vm2=Set-AzureRmVMMemoryProfile -VM $vm2 -Size 4
$vm2=Add-AzureRmVMNetworkInterface -VM $vm2 -Id $nic2.Id
$diskName="dynamic"
$storageAcc=Get-AzureRmStorageAccount -ResourceGroupName $rgName -Name $saName
$osDiskUri1=$storageAcc.PrimaryEndpoints.Blob.ToString() + "vhds2/" + $diskName + ".vhd"
$vm2=Set-AzureRmVMDisk -VM $vm2 -Name $diskName -VhdUri $osDiskUri1 -CreateOption fromImage
Set-AzureRmVMPlan -VM $vm2 -Publisher $pubName -Product $offerName -Name $skuName
New-AzureRmVM -ResourceGroupName $rgName -Location $locName -VM $vm2
```

14) **Configure the virtual machines**

When both the NetScaler VPX instances start, then connect to both NetScaler VPX instances using the SSH protocol to configure the virtual machines.

a) **Active-Active:** Run the same set of configuration commands on the command line of both the NetScaler VPX instances.

b) **Active-Passive:** Run this command on the command line of both the NetScaler VPX instances.

```
add ha node #nodeID <nsip of other NetScaler VPX>
```

In Active-Passive mode, run configuration commands on the primary node only.

© 1999-2018 Citrix Systems, Inc. All rights reserved.
Provision a NetScaler VPX pair in a high availability setup with Azure internal load balancer

Log on to AzureRmAccount using your Azure user credentials.

1) Create a resource group

The location specified here is the default location for resources in that resource group. Make sure all commands to create a load balancer use the same resource group.

$rgName="<resource group name>"
$locName="<location name, such as West US>"

New-AzureRmResourceGroup -Name $rgName -Location $locName

For example:

```powershell
1 $rgName = "ARM-LB-NS"
2 $locName = "West US"
3 New-AzureRmResourceGroup -Name $rgName -Location $locName
```

2) Create a storage account

Choose a unique name for your storage account that contains only lowercase letters and numbers.

$saName="<storage account name>"
$saType="<storage account type, specify one: Standard_LRS, Standard_GRS, Standard_RAGRS, or Platinum_LRS>"

New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -Type $saType -Location $locName

For example:

```powershell
1 $saName="vpxstorage"
2 $saType="Standard\_LRS"
3 New-AzureRmStorageAccount -Name $saName -ResourceGroupName $rgName -Type $saType -Location $locName
```

3) Create an availability set

A load balancer configured with an availability set ensures that your application is always available.

$avName="<availability set name>"
New-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName -Location $locName

4) **Create a virtual network**

Add a new virtual network with at least one subnet, if the subnet was not created previously.

```
$vnetName = "LBVnet"
$vnetAddressPrefix="10.0.0.0/16"
$FrontendAddressPrefix="10.0.1.0/24"
$BackendAddressPrefix="10.0.2.0/24"
$vnet=New-AzureRmVirtualNetwork -Name $vnetName -ResourceGroupName $rgName -Location $locName -AddressPrefix $vnetAddressPrefix -Subnet $frontendSubnet,$backendSubnet
$frontendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name frontendSubnet -AddressPrefix $FrontendAddressPrefix
$backendSubnet=New-AzureRmVirtualNetworkSubnetConfig -Name backendSubnet -AddressPrefix $BackendAddressPrefix
```

**Note:** Choose the AddressPrefix parameter value as per your requirement.

Assign front end and back end subnet to the virtual network that you created earlier in this step.

If the front end subnet is the first element of array vnet, subnetId should be $vnet.Subnets[0].Id.
If the front end subnet is the second element in the array, the subnetId should be $vnet.Subnets[1].Id, and so on..

5) **Create an back end address pool**

```
$beaddresspool= New-AzureRmLoadBalancerBackendAddressPoolConfig -Name " LB-backend"
```

6) **Create NAT rules**

Create NAT rules for services that you are not load balancing.

```
$inboundNATRule1= New-AzureRmLoadBalancerInboundNatRuleConfig -Name " Inboundnatrule1" -FrontendIpConfiguration $frontendIP -Protocol TCP -FrontendPort 3441 -BackendPort 3389
$inboundNATRule2= New-AzureRmLoadBalancerInboundNatRuleConfig -Name " RDP2" -FrontendIpConfiguration $frontendIP -Protocol TCP -FrontendPort 3442 -BackendPort 3389
```
NetScaler 12.0

Use front end and back end ports as per your requirement.

7) Create a health probe

Create a TCP health probe with port 9000 and interval 5 seconds.

```bash
$healthProbe = New-AzureRmLoadBalancerProbeConfig -Name "HealthProbe" -Protocol tcp -Port 9000 -IntervalInSeconds 5 -ProbeCount 2
```

8) Create a load balancing rule

Create a LB rule for each service that you are load balancing.

For example:

You can use the following example to load balance http service.

```bash
$lbrule = New-AzureRmLoadBalancerRuleConfig -Name "lbrule1" -FrontendIpConfiguration $frontendIP -BackendAddressPool $beAddressPool -Probe $healthProbe -Protocol Tcp -FrontendPort 80 -BackendPort 80
```

Use front end and back end ports as per your requirement.

9) Create a load balancer entity

Create the load balancer adding all objects (NAT rules, load balancer rules, probe configurations) together.

```bash
$NRPLB = New-AzureRmLoadBalancer -ResourceGroupName $rgname -Name "InternalLB" -Location $locName -FrontendIpConfiguration $frontendIP -InboundNatRule $inboundNATRule1,$inboundNATRule2 -LoadBalancingRule $lbrule -BackendAddressPool $beAddressPool -Probe $healthProbe
```

10) Create a NIC

Create two NICs and associate each NIC with each NetScaler VPX instance

```bash
$backendnic1= New-AzureRmNetworkInterface -ResourceGroupName $rgName -Name lb-nic1-be -Location $locName -PrivateIpAddress 10.0.2.6 -Subnet $backendSubnet -LoadBalancerBackendAddressPool $nrplb. BackendAddressPools\[0\] -LoadBalancerInboundNatRule $nrplb. InboundNatRules\[0\]
```

This NIC is for NetScaler VPX 1. The Private IP should be in same subnet as that of subnet added.

```bash
$backendnic2= New-AzureRmNetworkInterface -ResourceGroupName $rgName -Name lb-nic2-be -Location $locName -PrivateIpAddress 10.0.2.7 -Subnet $backendSubnet -LoadBalancerBackendAddressPool $nrplb.
```
This NIC is for NetScaler VPX 2. The parameter Private IPAddress can have any private IP as per your requirement.

11) **Create NetScaler VPX instances**

Create two VPX instances part of same resource group and availability set and attach it to the internal load balancer.

a) NetScaler VPX instance 1

*For example:*

```plaintext
$vmName="VPX1"
$vmSize="Standard\_A3"
$avSet=Get-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName
$vm1=New-AzureRmVMConfig -VMName $vmName -VMSize $vmSize -AvailabilitySetId $avset.Id
$cred=Get-Credential -Message "Type Credentials which will be used to login to VPX instance"
$vm1=Set-AzureRmVMOperatingSystem -VM $vm1 -Linux -ComputerName $vmName -Credential $cred -Verbose
$vm1=Set-AzureRmVMSourceImage -VM $vm1 -PublisherName $pubName -Offer $offerName -Skus $skuName -Version "latest"
$vm1=Add-AzureRmVMNetworkInterface -VM $vm1 -Id $backendnic1.Id
$diskName="dynamic"
$storageAcc=Get-AzureRmStorageAccount -ResourceGroupName $rgName -Name $saName
/osDiskUri1=$storageAcc.PrimaryEndpoints.Blob.ToString() + "vhds1/" + $diskName + ".vhd"
$vm1=Set-AzureRmVMSOSDisk -VM $vm1 -Name $diskName -VhdUri $osDiskUri1 -CreateOption fromImage
```
b) NetScaler VPX instance 2

For example:

```powershell
$vmName = "VPX2"
$vmSize = "Standard\_A3"
$avSet = Get-AzureRmAvailabilitySet -Name $avName -ResourceGroupName $rgName
$vm2 = New-AzureRmVMConfig -VMName $vmName -VMSize $vmSize -AvailabilitySetId $avset.Id
$cred = Get-Credential -Message "Type Credentials which will be used to login to VPX instance"
$vm2 = Set-AzureRmVMOperatingSystem -VM $vm2 -Linux -ComputerName $vmName -Credential $cred -Verbose
$vm2 = Set-AzureRmVMSourceImage -VM $vm2 -PublisherName $pubName -Offer $offerName -Skus $skuName -Version "latest"
$vm2 = Add-AzureRmVMNetworkInterface -VM $vm2 -Id $backendnic2.Id
$diskName = "dynamic"
$storageAcc = Get-AzureRmStorageAccount -ResourceGroupName $rgName -Name $saName
$osDiskUri1 = $storageAcc.PrimaryEndpoints.Blob.ToString() + "vhds2/" + $diskName + ".vhd"
$vm2 = Set-AzureRmVMDisk -VM $vm2 -Name $diskName -VhdUri $osDiskUri1 -CreateOption fromImage
Set-AzureRmVMPlan -VM $vm2 -Publisher $pubName -Product $offerName -Name $skuName
New-AzureRmVM -ResourceGroupName $rgName -Location $locName -VM $vm2
```
12) **Configure the virtual machines**

When both the NetScaler VPX instances start, then connect to both NetScaler VPX instances using the SSH protocol to configure the virtual machines.

a) **Active-Active**: Run the same set of configuration commands on the command line of both the NetScaler VPX instances.

b) **Active-Passive**: Run this command on the command line of both the NetScaler VPX instances.

```
add ha node #nodeID <nsip of other NetScaler VPX>
```

In Active-Passive mode, run configuration commands on the primary node only.

**Azure terminology**

January 6, 2019

Some of the Azure terms that are used in the NetScaler VPX Azure documentation are listed below.

1. **Azure Load Balancer** – Azure load balancer is a resource that distributes incoming traffic among computers in a network. Traffic is distributed among virtual machines defined in a load-balancer set. A load balancer can be external or internet-facing, or it can be internal.

2. **Azure Resource Manager (ARM)** – ARM is the new management framework for services in Azure. Azure Load Balancer is managed using ARM-based APIs and tools.

3. **Back-End Address Pool** – These are IP addresses associated with the virtual machine Network Interface Card (NIC) to which load will be distributed.

4. **BLOB - Binary Large Object** – Any binary object like a file or an image that can be stored in Azure storage.

5. **Front-End IP Configuration** – An Azure Load balancer can include one or more front-end IP addresses, also known as a virtual IPs (VIPs). These IP addresses serve as ingress for the traffic.

6. **Instance Level Public IP (ILPIP)** – An ILPIP is a public IP address that you can assign directly to your virtual machine or role instance, rather than to the cloud service that your virtual machine or role instance resides in. This does not take the place of the VIP (virtual IP) that is assigned to your cloud service. Rather, it’s an additional IP address that you can use to connect directly to your virtual machine or role instance.

   **Note**: In the past, an ILPIP was referred to as a PIP, which stands for public IP.

7. **Inbound NAT Rules** – This contains rules mapping a public port on the load balancer to a port for a specific virtual machine in the back end address pool.
8. IP-Config - It can be defined as an IP address pair (public IP and private IP) associated with an individual NIC. In an IP-Config, the public IP address can be NULL. Each NIC can have multiple IP-Config associated with it, which can be up to 255.

9. Load Balancing Rules – A rule property that maps a given front-end IP and port combination to a set of back-end IP addresses and port combination. With a single definition of a load balancer resource, you can define multiple load balancing rules, each rule reflecting a combination of a front end IP and port and back end IP and port associated with virtual machines.

10. Network Security Group (NSG) – NSG contains a list of Access Control List (ACL) rules that allow or deny network traffic to your virtual machine instances in a virtual network. NSGs can be associated with either subnets or individual virtual machine instances within that subnet. When a NSG is associated with a subnet, the ACL rules apply to all the virtual machine instances in that subnet. In addition, traffic to an individual virtual machine can be restricted further by associating a NSG directly to that virtual machine.

11. Private IP addresses – Used for communication within an Azure virtual network, and your on-premises network when you use a VPN gateway to extend your network to Azure. Private IP addresses allow Azure resources to communicate with other resources in a virtual network or an on-premises network through a VPN gateway or ExpressRoute circuit, without using an Internet-reachable IP address. In the Azure Resource Manager deployment model, a private IP address is associated with the following types of Azure resources – virtual machines, internal load balancers (ILBs), and application gateways.

12. Probes – This contains health probes used to check availability of virtual machines instances in the back end address pool. If a particular virtual machine does not respond to health probes for some time, then it is taken out of traffic serving. Probes enable you to keep track of the health of virtual instances. If a health probe fails, the virtual instance will be taken out of rotation automatically.

13. Public IP Addresses (PIP) – PIP is used for communication with the Internet, including Azure public-facing services and is associated with virtual machines, Internet-facing load balancers, VPN gateways, and application gateways.

14. Region - An area within a geography that does not cross national borders and that contains one or more datacenters. Pricing, regional services, and offer types are exposed at the region level. A region is typically paired with another region, which can be up to several hundred miles away, to form a regional pair. Regional pairs can be used as a mechanism for disaster recovery and high availability scenarios. Also referred to generally as location.

15. Resource Group - A container in Resource Manager holds related resources for an application. The resource group can include all of the resources for an application, or only those resources that are logically grouped together.

16. Storage Account – An Azure storage account gives you access to the Azure blob, queue, table, and file services in Azure Storage. Your storage account provides the unique namespace for your Azure
storage data objects.

17. Virtual Machine – The software implementation of a physical computer that runs an operating system. Multiple virtual machines can run simultaneously on the same hardware. In Azure, virtual machines are available in a variety of sizes.

18. Virtual Network - An Azure virtual network is a representation of your own network in the cloud. It is a logical isolation of the Azure cloud dedicated to your subscription. You can fully control the IP address blocks, DNS settings, security policies, and route tables within this network. You can also further segment your VNet into subnets and launch Azure IaaS virtual machines and cloud services (PaaS role instances). Additionally, you can connect the virtual network to your on-premises network using one of the connectivity options available in Azure. In essence, you can expand your network to Azure, with complete control on IP address blocks with the benefit of enterprise scale Azure provides.

Jumbo frames on NetScaler VPX instances

November 2, 2018

NetScaler VPX appliances support receiving and transmitting jumbo frames containing up to 9216 bytes of IP data. Jumbo frames can transfer large files more efficiently than it is possible with the standard IP MTU size of 1500 bytes.

A NetScaler appliance can use jumbo frames in the following deployment scenarios:

- Jumbo to Jumbo. The appliance receives data as jumbo frames and sends it as jumbo frames.
- Non-Jumbo to Jumbo. The appliance receives data as regular frames and sends it as jumbo frames.
- Jumbo to Non-Jumbo. The appliance receives data as jumbo frames and sends it as regular frames.

For more information, see Configuring Jumbo Frames Support on a NetScaler Appliance.

Jumbo Frames support is available on NetScaler VPX appliances running on the following virtualization platforms:

- VMware ESX
- Linux-KVM Platform
- Citrix XenServer
- Amazon Web Services (AWS)

Jumbo frames on VPX appliances works similar to Jumbo frames on MPX appliances. For more information on Jumbo Frames and its use cases, see Configuring Jumbo Frames on MPX appliances. The use cases of Jumbo Frames on MPX appliances also apply to VPX appliances.
NetScaler 12.0

Configure jumbo frames for a VPX instance running on VMware ESX

Perform the following tasks for configuring Jumbo Frames on a NetScaler VPX appliance running on VMware ESX server:

1. Set the MTU of the interface or channel of the VPX appliance to a value in the range 1501-9000. Use the CLI or GUI to set the MTU size. Note that NetScaler VPX appliances running on VMware ESX support receiving and transmitting jumbo frames containing up to only 9000 bytes of IP data.
2. Set the same MTU size on the corresponding physical interfaces of the VMware ESX server by using its management applications. For more information about setting the MTU size on the physical interfaces of VMware ESX, see http://vmware.com/.

Configure jumbo frames for a VPX instance running on Linux-KVM server

Perform the following tasks for configuring Jumbo Frames on a NetScaler VPX appliance running on a Linux-KVM Server:

1. Set the MTU of the interface or channel of the VPX appliance to a value in the range 1501-9216. Use the NetScaler VPX CLI or GUI to set the MTU size.
2. Set the same MTU size on the corresponding physical interfaces of a Linux-KVM Server by using its management applications. For more information about setting the MTU size on the physical interfaces of Linux-KVM, see http://www.linux-kvm.org/.

Configure jumbo frames for a VPX instance running on Citrix XenServer

Perform the following tasks for configuring Jumbo Frames on a NetScaler VPX appliance running on Citrix XenServer:

1. On the Networking tab, select the network - network 0/1/2.
2. Select Properties and edit MTU. The drop-down selection menu for MTU is unavailable unless all the VPXs that use the network are shutdown.

Configure jumbo frames for a VPX instance running on AWS

Host-level configuration is not required for VPX on Azure. To configure Jumbo Frames on VPX, follow the steps given in Configuring Jumbo Frames Support on a NetScaler Appliance.

Licensing

September 17, 2018

© 1999-2018 Citrix Systems, Inc. All rights reserved.
The following topics describe the migration instructions for setting up a new version of a NetScaler appliance with a list of all new and deprecated commands, parameters, and SNMP OIDs.

This document includes the following information:

- NetScaler Licensing Overview
- NetScaler Gateway Universal License

**NetScaler licensing overview**

January 6, 2019

The process of allocating your NetScaler licenses has been greatly simplified. The new licensing framework allows you to focus on getting maximum value from Citrix products.

In the NetScaler GUI, you can use your hardware serial number (HSN) or your license access code to allocate your licenses. Alternatively, if a license is already present on your local computer, you can upload it to the appliance.

For all other functionality, such as returning or reallocating your license, you must use the licensing portal. Optionally, you can still use the licensing portal for license allocation. For more information about the licensing portal, see [http://support.citrix.com/article/CTX131110](http://support.citrix.com/article/CTX131110).

**Note:** Purchase separate licenses for each appliance in a high availability pair. Ensure that the same types of licenses are installed on both the appliances. For example, if you purchase a platinum license for one appliance, you must purchase another platinum license for the other appliance.

**Prerequisites**

To use the hardware serial number or license access code to allocate your licenses:

- You must be able to access public domains through the appliance. For example, the appliance should be able to access www.citrix.com. The license allocation software internally accesses the Citrix licensing portal for your license. To access a public domain:
  - Use a proxy server or set up a DNS server.
  - Configure a NetScaler IP (NSIP) address or a subnet IP (SNIP) address on your NetScaler appliance.

- Your license must be linked to your hardware, or you must have a valid license access code. Citrix sends your license access code by email when you purchase a license.
Allocate a license by using the GUI

If your license is already linked to your hardware, the license allocation process can use the hardware serial number. Otherwise, you must type the license access code.

You can partially allocate licenses as required for your deployment. For example, if your license file contains 10 licenses, but your current requirement is for only six licenses, you can allocate six licenses now, and allocate more licenses later. You cannot allocate more than the total number of licenses present in your license file.

To allocate your license

1. In a web browser, type the IP address of the NetScaler appliance (for example, http://192.168.100.1).

2. In User Name and Password, type the administrator credentials.

3. On the Configuration tab, navigate to System > Licenses.

4. In the details pane, click Manage Licenses, click Add New License, and then select one of the following options:
   - Use Serial Number. The software internally fetches the serial number of your appliance and uses this number to display your licenses.
   - Use license access code. Citrix emails the license access code for the license that you purchased. Enter the license access code in the text box.

   If you do not want to configure internet connectivity on the NetScaler appliance, you can use a proxy server. Select the Connect through Proxy Server check box and specify the IP address and port of your proxy server.

5. Click Get Licenses. Depending on the option that you selected, one of the following dialog boxes appears.
   - The following dialog box appears if you selected Hardware Serial Number.
   - The following dialog box appears if you selected license access code.

6. Select the license file that you want to use to allocate your licenses.

7. In the Allocate column, enter the number of licenses to be allocated. Then click Get.
   - If you selected Hardware Serial Number, enter the number of licenses, as shown in the following screenshot.
   - If you selected license access code, enter the number of licenses, as shown in the following screenshot.
8. Click restart for the license to take effect.

9. In the restart dialog box, click OK to proceed with the changes, or click Close to cancel the changes.

Install a license

If you downloaded your license file to your local computer by accessing the licensing portal, you must upload the license to the appliance.

To install a license file by using the GUI

1. In a web browser, type the IP address of the NetScaler appliance (for example, http://192.168.100.1).
2. In User Name and Password, type the administrator credentials.
3. On the Configuration tab, navigate to System Licenses.
4. In the details pane, click Manage Licenses.
5. Click Add New License, then select Upload license files from a local computer.
6. Click Browse. Navigate to the location of the license files, select the license file, and then click Open.
7. Click restart to apply the license.
8. In the restart dialog box, click OK to proceed with the changes, or click Close to cancel the changes.

To install the licenses by using the CLI:

1. Open an SSH connection to the ADC appliance by using an SSH client, such as PuTTY.
2. Log on to the ADC appliance by using the administrator credentials.
3. Switch to the shell prompt, create a license subdirectory in the nsconfig directory, if it does not exist, and copy one or more new license files to this directory.

Example

```
1 login: nsroot
2 Password: nsroot
3 Last login: Mon Aug  4 03:37:27 2008 from 10.102.29.9
4 Done
5 > shell
6 Last login: Mon Aug  4 03:51:42 2008 from 10.103.25.64
7 root@ns# mkdir /nsconfig/license
8 root@ns# cd /nsconfig/license
```
Copy one or more new license files to this directory.

**Note:** The NetScaler appliance does not prompt for a reboot option when you use the command line interface to install the licenses. Run the reboot -w command to warm restart the system, or run the restart command to restart the system normally.

**Verify licensed features**

Before using a feature, ensure that your license supports the feature.

**To verify the licensed features by using the CLI**

1. Open an **SSH connection** to the ADC appliance by using an SSH client, such as PuTTY.
2. Log on to the ADC appliance by using the administrator credentials.
3. At the command prompt, enter the `sh ns license` command to display the features supported by the license.

   **Example**

   ```
   1  sh ns license
   2       License status:
   3       Web Logging: YES
   4       Surge Protection: YES
   5       .......
   6       HTML Injection: YES
   7  Done
   ```

**To verify the licensed features by using the GUI**

1. In a web browser, type the IP address of the ADC appliance, such as `http://192.168.100.1`.
2. In User Name and Password, type the administrator credentials.
3. Provide the User name and Password and click **Login**.
4. In the navigation pane, expand **System**, and then click **Licenses**. You see a green check mark next to the licensed features.
Enable or disable a feature

When you use the NetScaler appliance for the first time, you must enable a feature before you can use its functionality. If you configure a feature before it is enabled, a warning message appears. The configuration is saved but it applies only after the feature is enabled.

To enable a feature by using the CLI

At the command prompt, type the following commands to enable a feature and verify the configuration:

- `enable feature <FeatureName>`
- `show feature`

Example

```
1   enable feature lb cs
2   done
3   >show feature
4
5     Feature       Acronym
6      Status       ----       -----       
7  1)  Web Logging  WL         OFF
8  2)  Surge Protection  SP       ON
9  3)  Load Balancing  LB       ON
10  4)  Content Switching  CS       ON
11  5)  Cache Redirection  CR       ON
12 .
13 .
14 .
15  24)  NetScaler Push  push     OFF
16   Done
```

The example shows how to enable load balancing (lb) and content switching (cs).

If the license key is not available for a particular feature, the following error message appears for that feature:

ERROR: feature(s) not licensed

Note: To enable an optional feature, you must have a feature-specific license. For example, you have purchased and installed the Citrix NetScaler Enterprise Edition license. However, to enable the Integrated Caching feature, you must purchase and install the AppCache license.
**To disable a feature by using the CLI**

At the command prompt, type the following commands to disable a feature and verify the configuration:

- `disable feature <FeatureName>`
- `show feature`

**Example**

The following example shows how to disable load balancing (LB).

```
1 > disable feature lb
2   Done
3 > show feature
4
5         Feature     Acronym
6         Status      -------
7 1)       Web Logging WL       OFF
8 2)       Surge Protection SP      ON
9 3)       Load Balancing  LB      OFF
10 4)      Content Switching CS      ON
11
12
13
14 24)     NetScaler Push push     OFF
15   Done
16 >
```

**Check license expiration information**

You can check NetScaler license expiration information through GUI or CLI.

**NetScaler VPX Express license**

Starting with NetScaler release 12.0 56.20, VPX Express for on-premise and cloud deployments does not require a license file and it comes with the following features:

- 20 Mbps bandwidth
- All ADC standard license features, except Citrix Gateway
- Maximum 250 SSL sessions
NetScaler 12.0

- 20 Mbps SSL throughput

You can upgrade the VPX Express License to the following two options:

1. A standalone NetScaler VPX license

2. NetScaler Pooled Capacity license for VPX instances. For more information, see NetScaler Pooled Capacity.

Citrix Gateway Universal License

September 21, 2018

The Citrix Gateway universal license limits the number of concurrent user sessions to the number of licenses purchased. If you purchase 100 licenses, you can have 100 concurrent sessions at any time. When a user ends a session, that license is released for the next user. A user who logs on to the Citrix Gateway from more than one computer occupies a license for each session.

If all licenses are occupied, no additional connections can be opened until a user ends a session or the administrator terminates the session using the configuration utility. When a connection is closed, the license is released and can be used for a new user.

This document includes the following information:

- Obtaining the Universal License
- Installing the Universal License
- Verifying Installation of the Universal License

Obtaining the Universal License

You need the following information before going to the Citrix Web site for the universal license.

- Your user ID and password for My Citrix
  
  Register at My Citrix (www.mycitrix.com) to receive your user ID and password.
  
  Note: If you cannot locate either the license code or your user ID and password, contact Citrix Customer Service.

- The host name of the Citrix Gateway
  
  The entry field for this name on My Citrix is case-sensitive, so make sure that you copy the host name exactly as it is configured on the NetScaler appliance.

- The number of licenses you want to include in the license file
You do not have to download all of the licenses you are entitled to at once. For example, if your company purchased 100 licenses, you can choose to download 50. You can allocate the rest in another license file at a later time. Multiple license files can be installed on the Citrix Gateway.

**Note:** Before obtaining your licenses, make sure you configure the host name of the NetScaler appliance using the Setup Wizard and then restart the appliance.

**To obtain your universal license**

2. Enter your user name and password. If this is the first time you are logging on to the site, you are asked for additional background information.
3. Under My Tools, point to Choose a toolbox, and click Activation System/Manage Assets.
4. In the Current Tool drop-down menu, select Activate/Allocate and follow the directions to obtain your license file.

**Installing the Universal License**

To install the license, see “Installing the License”. After installation, verify that the license was installed correctly.

**Verifying Installation of the Universal License**

Before proceeding, verify that your universal license is installed correctly.

**To verify installation of the universal license by using the command line interface**

1. Open an SSH connection to the NetScaler appliance by using an SSH client, such as PuTTY.
2. Log on to the NetScaler appliance by using the administrator credentials.
3. Use the show license command to verify that “SSL VPN = YES” and that Maximum Users has increased from 5 to the expected number of concurrent users.

**To verify installation of the universal license by using the configuration utility**

1. In a Web browser, type the IP address of the NetScaler appliance, such as [http://192.168.100.1](http://192.168.100.1).
2. In User Name and Password, type the administrator credentials.
3. In the navigation pane, expand System, and then click Licenses.
4. In the Licenses pane, you will see a green check mark next to NetScaler Gateway. The field Maximum Citrix Gateway Users Allowed displays the number of concurrent user sessions licensed on the NetScaler appliance.

**NetScaler Pooled Capacity**

September 21, 2018

NetScaler pooled capacity is a licensing framework that comprises a common bandwidth and instance pool that is hosted on and served by Citrix Application Delivery Management.

For complete information, see NetScaler Pooled Capacity “NetScaler Pooled Capacity”.

**Upgrade and downgrade a NetScaler appliance**

November 2, 2018

NetScaler 12.0 offers new and updated features with increased functionality. A comprehensive list of enhancements is listed in the release notes accompanying the release announcement. Read the release notes document before you upgrade your software.

This section provides information about upgrading and downgrading a NetScaler appliance (MPX and VPX) firmware. It includes the following topics:

- Before you begin
- Upgrade a NetScaler standalone appliance
- Downgrade a NetScaler standalone appliance
- Upgrade a high availability pair
- Downgrade a high availability Pair
- Troubleshooting
- FAQs
- New and Deprecated Commands, Parameters, and SNMP OIDs

For information about upgrading a NetScaler SDX appliance, see Single Bundle Upgrade.

**Before you begin**

November 15, 2018

Before you start the upgrade or downgrade process, make sure you check the following:
• The licensing framework and types of licenses. A software edition upgrade might require new licenses, such as upgrading from the standard edition to the enterprise edition, the standard edition to the platinum edition, or the enterprise edition to the platinum edition. Existing Citrix NetScaler licenses continue to work when you upgrade to version 12.0. For more information, see Licensing.

• Check for New and deprecated commands, parameters, and SNMP OIDs.

• Check for Citrix NetScaler Hardware and Software Compatibility Matrix.

• If the Citrix NetScaler Gateway logon page is customized, then make sure that the UI theme is set to default.

• Review the LOM Firmware Upgrade page, if you are upgrading LOM.

• Download the Citrix NetScaler firmware from the download page. For the detailed steps to download the Citrix NetScaler firmware, see the “How to download and update the NetScaler Firmware” section in this article CTX205476.

• Perform a back up of the configuration file, customization file, certificates, monitor scripts, license files, and so on either manually or refer to the following documentation for back up using Citrix NetScaler CLI or GUI - Backup and restore.

• Validate the integrity of the Citrix NetScaler and check available space before performing an upgrade. For more information about how to free up storage space, see https://support.citrix.com/article/CTX133588.

• Check the Citrix ADC VPX Support matrix and usage guidelines.

• Check the FAQ section.

For more information about prerequisites for upgrading or downgrading the Citrix NetScaler firmware, see these support articles:

• CTX126793: Best Practices for Upgrading Citrix NetScaler or Citrix NetScaler Gateway Appliances
• CTX220371: Must Read Articles Before and After Upgrading Citrix NetScaler

Upgrade a Citrix NetScaler standalone appliance

January 6, 2019

Before upgrading the system software, make sure that you read the Before you begin section and complete the necessary prerequisites such as backing up the necessary files and downloading the Citrix NetScaler firmware.

When upgrading from 10.0 and higher releases you have the option to use the GUI or the CLI.

You cannot upgrade to release 12.0 from the following builds by using the Upgrade Wizard of the GUI:
NetScaler 12.0

- All builds of release 10.1
- Any build before Build 57.x of release 10.5

If your Citrix NetScaler runs any 9.x or lower release, visit the Product matrix site for more information.

Upgrade a Citrix NetScaler standalone appliance by using the GUI

Follow these steps to upgrade a standalone Citrix NetScaler to release 12.0 by using the GUI.

1. In a web browser, type the IP address of the Citrix NetScaler, for example http://10.102.29.50.
2. In User Name and Password, type the administrator credentials (nsroot/nsroot) and then click Log On.
3. From the GUI, click System Upgrade.
4. From the Choose File drop-down menu choose the appropriate option: Local or Appliance. If you want to use the Appliance option, the firmware needs to be uploaded to the Citrix NetScaler first. You can use any file transfer method such as WinSCP to upload the Citrix NetScaler firmware to the appliance.
5. Select the correct file and click Upgrade.
6. Follow the instructions to upgrade the software.
7. When prompted, select Reboot.

After the upgrade, close all browser instances and clear your computer’s cache before accessing the appliance.

Upgrade a Citrix NetScaler standalone appliance by using the CLI

Follow these steps to upgrade a standalone Citrix NetScaler to release 12.0 by using the CLI:

In the following procedure, <release> and <releasenumber> represent the release version you are upgrading to, and <targetbuildnumber> represents the build number that you are upgrading to. The procedure includes optional steps to avoid losing any updates that are pushed to the /etc directory during the upgrade.

1. Use an SSH client, such as PuTTY, to open an SSH connection to the appliance.
2. Log on to the appliance by using the administrator credentials. Save the running configuration.
   At the prompt, type: save config
3. Create a copy of the ns.conf file. At the shell prompt, type:
   a) cd /nsconfig
b) \texttt{cp ns.conf ns.conf.NS<currentreleasenumber><currentbuildnumber>}

You should backup the configuration file to another computer.

4. (Optional) If you have modified some of the following files in the /etc directory, and copied them to /nsconfig to maintain persistency, any updates that are pushed to the /etc directory during the upgrade might be lost:

- ttys
- resolv.conf
- sshd_config
- host.conf
- newsyslog.conf
- host.conf
- httpd.conf
- rc.conf
- syslog.conf
- crontab
- monitrc

To avoid losing these updates, create a /var/nsconfig\_backup directory, and move the customized files to this directory. That is, move any files that you modified in /etc directory and copied to /nsconfig by running the following command:

\texttt{cp /nsconfig/<filename> /var/nsconfig\_backup}

Example:

\texttt{cp /nsconfig/syslog.conf /var/nsconfig\_backup}

5. Create a location for the installation package. At the shell prompt type:

- \texttt{cd /var/nsinstall}
- \texttt{mkdir <releasenumber>nsinstall}
- \texttt{cd <releasenumber>nsinstall}
- \texttt{mkdir build_<targetbuildnumber>}
- \texttt{cd build_<targetbuildnumber>}

6. Copy the already downloaded Citrix NetScaler firmware to the directory that you created for it in step 5, by using any file transferring method such as WinSCP. See the Before You Begin section for more information about downloading the Citrix NetScaler firmware.

7. Extract the contents of the installation package. Example:

\texttt{tar –xvzf build-12.0-32.2\_nc_32.tgz}

8. Run the installns script to install the new version of the system software. The script updates the /etc directory. Example: ./installns
9. When prompted, restart the Citrix NetScaler.

10. (Optionally) If you’ve created a copy of the ns.conf file in the Before You Begin section, do the following:

   1. Manually compare the files in /var/nsconfig\_backup and /etc and make appropriate changes in /etc.
   2. To maintain persistency, move the updated files in /etc to /nsconfig.
   3. Restart the appliance to put the changes into effect.

Below is an example of Citrix NetScaler firmware upgrade.

```
login: nsroot
Password: nsroot
Last login: Mon Apr 17 15:05:05 2018 from 10.252.243.134

Done

> save config

> shell

Last login: Mon Apr 17 15:05:05 2018 from 10.252.243.134

root@NSnnn# cd /var/nsinstall

root@NSnnn# cd 12.0nsinstall

root@NSnnn# mkdir build_41.16

root@NSnnn# cd build_41.16
```
root@NSnnn# ftp <FTP server IP address>

ftp> mget build-12.0-41.16_nc.tgz

ftp> bye

root@NSnnn# tar xzvf build-12.0-41.16_nc.tgz

root@NSnnn# ./installns

installns version (12.0-41.16) kernel (ns-12.0-41.16_nc.gz)

... ...

Copying ns-12.0-41.16_nc.gz to /flash/ns-12.0-41.16_nc.gz ...

Installation has completed.

Reboot NOW? [Y/N] Y
Upgrade a Citrix NetScaler standalone appliance by using NITRO API

To use NITRO API to upgrade or downgrade a Citrix NetScaler, see Automate Citrix NetScaler Upgrade and Downgrade with a Single API.

Directory locations of script files for user monitors

In release 10.1 build 122.17, the script files for user monitors are at a new location. If you upgrade an appliance or virtual appliance to release 10.1 build 122.17 or later, the changes are as follows:

• A new directory named conflicts is created in /nsconfig/monitors/ and all the built-in scripts of the previous builds are moved to this directory.
• All new built-in scripts are available in the /netscaler/monitors/ directory. All custom scripts are available in the /nsconfig/monitors/ directory.
• You must save a new custom script in the /nsconfig/monitors/ directory.
• After the upgrade is completed, if a custom script is created and saved in the /nsconfig/monitors/ directory with the same name as that of a built-in script, the script in the /netscaler/monitors/ directory takes priority. That is, the custom script is not run.

If you provision a virtual appliance running release 10.1 build 122.17 or later, the changes are as follows:

• All built-in scripts are available in the /netscaler/monitors/ directory
• The directory /nsconfig/monitors/ is empty.
• If you create a new custom script, you must save it in the /nsconfig/monitors/ directory.

For more information about user monitors, see “Understanding user monitors.”

Check and install Citrix NetScaler 12.0 software update

Update the Citrix NetScaler software when an update is available, for better performance. A Citrix NetScaler update can include feature improvements, performance fixes, or enhancements. Make sure you read the release notes to see what fixes and enhancements are available in the update. To check and install a software update, do the following.

1. In the Citrix NetScaler home page, click Check for Update from the nsroot drop-down menu at the top right corner of the page.
2. In the Latest System Software Updates Available page, check the available software update that you can install.
3. Click Download to download the installation package from the Citrix download website.
4. After you have downloaded the software package, install the update through either CLI or GUI procedure.
NetScaler 12.0

Note

The **Check for Update** link is accessible only if you log into the GUI through HTTP protocol and not through HTTPS protocol.

**Downgrade a Citrix NetScaler standalone appliance**

January 6, 2019

You can downgrade to any earlier release on a standalone Citrix NetScaler by using the CLI. Downgrading using the GUI is not supported.

**Note**

Loss in configuration might occur when downgrading. You should compare the configurations before and after the downgrade, and then manually reenter any missing entries.

**Procedure to downgrade a standalone Citrix NetScaler**

Follow the steps given below to downgrade a Citrix NetScaler standalone appliance running release 12.0 to an earlier release.

In this procedure, `<release>` and `<releasenumber>` represent the release version you are downgrading to, and `<targetbuildnumber>` represents the build number that you are downgrading to.

1. Open an SSH connection to the Citrix NetScaler by using an SSH client, such as PuTTY.

2. Log on to the Citrix NetScaler by using the administrator credentials. Save the running configuration. At the prompt, type:

   ```
   save config
   ```

3. Create a copy of the ns.conf file. At the shell prompt, type:

   a) `cd /nsconfig`

   b) `cp ns.conf ns.conf.NS<currentbuildnumber>`

   You should backup a copy of the configuration file on another computer.

4. Copy the `<releasenumber>` configuration file (ns.conf.NS<releasenumber>) to ns.conf. At the shell prompt, type:

   ```
   cp ns.conf.NS<releasenumber> ns.conf
   ```

   Note: ns.conf.NS<releasenumber> is the backup configuration file that is automatically created when the system software is upgraded from release version `<releasenumber>` to the current release version. There may be some loss in configuration when downgrading. After the appliance...
restarts, compare the configuration saved in step 3 with the running configuration, and make any adjustments for features and entities configured before the downgrade. Save the running configuration after making the changes.

Important: If routing is enabled, perform step 5. Otherwise, skip to step 6.

5. If routing is enabled, the ZebOS.conf file will contain the configuration. At the shell prompt, type:
   a) cd /nsconfig
   b) cp ZebOS.conf ZebOS.conf.NS
   c) cp ZebOS.conf.NS<targetreleasenumber> ZebOS.conf

6. Change directory to /var/nsinstall/<releasenumber>nsinstall, or create one if it does not exist.

7. Change directory to build_<targetbuildnumber>, or create one if it does not exist.

8. Download or copy the installation package (build-<release>-<targetbuildnumber>.tgz) to this directory and extract the contents of the installation package.

9. Run the installNs script to install the new version of the system software. The script updates the /etc directory.

   If the configuration file for the build that you are downgrading to exists on the appliance, you are prompted to load that configuration, as shown in the following figure.

Figure 1. Downgrade menu if configuration file exists

   If the free space available on the flash drive is insufficient to install the new build, the Citrix NetScaler aborts the installation. Manually clean up the flash drive and restart the installation.

Example:

```
1 login: nsroot
2 Password: nsroot
3 Last login: Mon Apr 24 02:06:52 2017 from 10.102.29.9
4 Done
5 > save config
6 > shell
7 root@NSnnn# cp ns.conf.NS10.5 ns.conf
8 root@NSnnn# cd /var/nsinstall
```
Upgrade a high availability pair

January 6, 2019

One of the requirements of Citrix NetScaler appliances in a high availability setup is to install the same
Citrix NetScaler software release on both appliances of the setup. Therefore, when software on one appliance is upgraded, ensure that the software is upgraded on both the appliances.

You can follow the same procedure to upgrade a standalone appliance or each appliance in a high availability pair, although additional considerations apply to upgrading a high availability pair.

Before you start a Citrix NetScaler firmware upgrade on an HA pair, read the prerequisites mentioned in the Before you begin section. Also, you need to consider a few HA-specific points.

**Points to note**

- First upgrade the secondary node, and then the primary node. Upgrading software on the secondary appliance before the primary appliance ensures that the upgrade process is completed without any issues.

- If the two nodes in an HA configuration are running different Citrix NetScaler software releases, the following information does not get synchronized on the primary and secondary nodes:
  - Configuration propagation and synchronization
  - States of the services
  - Connection failover sessions
  - Persistence sessions

- The above information might not get synchronized on the primary and secondary nodes if the two nodes are running different builds of the same release. Refer to the Known Issues section of the release notes to check if your Citrix NetScaler build has this issue.

- Synchronization of the files in the All mode of the Sync HA files command works successfully if the two nodes in an HA configuration are running different Citrix NetScaler software releases, or the two nodes are running different builds of the same release. For more information, see Synchronising Configuration Files in High Availability Setup.

**Figure.** Upgrade a high availability pair

You can upgrade using the Citrix NetScaler CLI or GUI.

**Upgrade a high availability pair by using the CLI**

The upgrade process includes the following steps:

1. Upgrade software on the secondary appliance
2. Upgrade software on the upgrade appliance
3. Synchronize secondary appliance
Upgrade software on the secondary appliance

The following illustration depicts the procedure to upgrade software on the secondary appliance:

1. Log on to the secondary NetScaler appliance using an SSH utility, such as PuTTY and specifying the NetScaler IP (NSIP). Use the nsroot credentials to log on to the appliance.

2. From the command line interface of the appliance, type the following command to save the existing configuration: save config

3. Switch to the shell prompt.

   1 login as: username
   2 Using keyboard-interactive authentication.
   3 Password:
   5 Done
   6 > shell
   7 Copyright (c) 1992-20

4. Run the following command to change to the default installation directory: # cd /var/nsinstall

5. Run the following command to create a temporary subdirectory of the nsinstall directory: # mkdir x_xnsinstall

   Note: The text x_x is used to name the NetScaler version for future configurations. For example, the directory for the installation files of NetScaler 9.3 us called 9_3nsinstall. Do not use a period (.) in the folder name, it can cause failed upgrades.

6. Change to the x_xnsinstall directory.

7. Download the required installation package and documentation bundle, such as “ns-x.0-xx.x-doc.tgz,” to the temporary directory created in Step 4.

   Notes:
   - Some builds do not have a documentation bundle as it does not have to be installed.
   - Click the Documentation tab from the GUI to access the documentation.

8. Before you run the install script, the files must be extracted and placed on the appliance. Use the following command to uncompress the bundle downloaded from Citrix website: tar -zxvf ns-x.0-xx.x-doc.tgz. The following is a quick explanation of the parameters used.

   x: Extract files
   v: Print the file names as they are extracted one by one
   z: The file is a “gzipped” file
   f: Use the following tar archive for the operation
9. Run the following command to install the downloaded software: 
   # ./installns
   
   Note: If the appliance does not have sufficient disk space to install the new kernel files, the installation process performs an automatic cleanup of the flash drive.

10. After the installation process is complete, the process prompts to restart the appliance. Press y to restart the appliance.

11. Log on to the appliance Command Line Interface using the nsroot credentials.

12. Run the following command from to display the state of the NetScaler appliance: show ha node
   The output of the preceding command should indicate that the appliance is a secondary node and synchronization is disabled.

13. Run the following command to disable synchronization on the appliance if synchronization is not disabled: set ha node -hasync disabled

14. Ensure that the configuration is complete and as expected.

15. Run the following command to perform a force failover and takeover as primary appliance: force failover

Here’s a sample configuration in the new primary node.

```
1 login: nsroot
2 Password: nsroot
3 Last login: Monday Apr 17 08:37:26 2017 from 10.102.29.9
4 Done
5 show ha node
6   2 nodes:
7 1)  Node ID: 0
8     IP: 10.0.4.2
9     Node State: UP
10    Master State: Primary
11    ...
12    Sync State: AUTO DISABLED
13    Propagation: AUTO DISABLED
14    ...
15 Done
```

Upgrade software on the primary appliance

The following illustration depicts the procedure to upgrade software on the primary appliance:

Note: After completing the “Upgrade software on the secondary appliance” procedure, the original primary appliance is now a secondary appliance.
1. Log on to the secondary NetScaler appliance using an SSH utility, such as PuTTY. Use the nsroot credentials to log on to the appliance. Follow the same steps as mentioned in the above section to complete the installation process. We have to follow the same steps as mentioned in step 2 to step 9 in the previous section (Upgrade software of the secondary appliance).

2. After the installation process is complete, the process prompts to restart the appliance. Press y to restart the appliance.

3. Log on to the appliance Command Line Interface using the nsroot credentials.

4. Run the following command to display the state of the NetScaler appliance: show ha node. The output of the preceding command should indicate that the appliance is a primary node and the status of the node state is marked as UP.

5. If the appliance is not a primary appliance, run the following command to perform a force failover to ensure that the appliance is a primary appliance: force failover

6. Verify that the appliance is a primary appliance.

**Enable synchronization on the secondary appliance**

To enable synchronization on the secondary appliance, complete the following procedure:

1. Run the following command to verify that the appliance is a secondary appliance: show node

2. Run the following command to enable synchronization on the appliance: set ha node -hasync enabled

3. Run the following command to verify that the configuration of the secondary appliance is synchronized with that of the primary appliance: show ns runningconfig

Here’s an example configuration of the new primary node and the new secondary node.

```
1 show ha node
2    Node ID:  0
3    IP:   10.0.4.11
4    Node State: UP
5    Master State: Primary
6    ...
7    ...
8    INC State: DISABLED
9    Sync State: ENABLED
10   Propagation: ENABLED
11   Enabled Interfaces : 1/1
12   Disabled Interfaces : None
13   HA MON ON Interfaces : 1/1
14   ...
```
Upgrade a high availability pair by using the GUI

Follow these steps to upgrade a Citrix NetScaler pair in a high availability setup, by using the GUI:

1. Log on to the secondary node and perform the upgrade as described in the section “Upgrade a Citrix NetScaler standalone appliance by using the GUI” in Upgrade a Citrix NetScaler standalone appliance.

2. Log on to the primary node and perform the upgrade as described in the section “Upgrade a Citrix NetScaler standalone appliance by using the GUI” in Upgrade a Citrix NetScaler standalone appliance.

Downgrade a high availability pair

January 6, 2019

You can downgrade to any release on a high availability pair by using the command line interface. The GUI does not support the downgrade process.
To downgrade the system software on a Citrix NetScaler pair in a high availability pair, you need to
downgrade the software first on the secondary node and then on the primary node. For instructions
on downgrading each node separately, see Downgrade a Citrix NetScaler standalone appliance.

Important
Loss in configuration might occur when downgrading. You should compare the configurations
before and after the downgrade, and then manually re-enter any missing entries.

Troubleshooting

November 20, 2018

If the appliance does not work as expected after you complete the installation, upgrade, or downgrade
process, the first thing to do is to check for the most common causes of the problem.

Resources for troubleshooting

For best results, use the following resources to troubleshoot an issue related to installing, upgrading,
or downgrading a Citrix NetScaler:

- The configuration files from the appliance. In case of a High Availability pair, the configuration
  files from both appliances.
- The following files from the appliance(s):
  - The relevant newnslog files.
  - The ns.log file.
  - The messages file.
- A network topology diagram.

Troubleshooting issues related to the installation, upgrade, and downgrade processes

Following are the most common installation, upgrade, and downgrade issues, and tips for resolving
them:

- Issue
  The Citrix NetScaler is not accessible after the software downgrade

  Cause
  During the software downgrade process, if the configuration file of the existing release and build
does not match the configuration file of the earlier release and build, the appliance cannot load
the configuration, and the default IP address is assigned to the appliance.
Resolution

– Verify that the appliance is accessible from the console.
– Verify the NSIP address and the routes on the appliance.
  * If the IP address has changed to the default 192.168.100.1 IP address, change the IP address as required.
  * Verify that the appliance is accessible.

• Issue

Configuration of the appliance is lost after you upgrade the software across multiple releases.

Cause

Some migration commands are built in for upgrading to the next release. Such commands might not be available across releases.

Resolution

– Verify the path of the upgrade process. Citrix recommends upgrading by one release at a time. For example, if the software needs to be upgraded from Citrix NetScaler (previously NetScaler) release 9.2 to release 10.1, the following is the recommended path for the upgrade:
  * Release 9.2 to release 9.3
  * Release 9.3 to release 10
  * Release 10 to release 10.1
– Verify that the appliance has appropriate license files.
– Verifying the configuration at each step of the upgrade process can give you pointers to the issue.

• Issue

During an upgrade, if I run the command for synchronizing, the following message appears:
Command failed on the secondary node but succeeded on the primary node.

Resolution

Do not run any dependent commands (set /unset /bind /unbind) when High Availability (HA) synchronization is in progress.

• Issue

During an upgrade process, traffic does not pass through the new primary node when you run the force failover command.

Resolution

– Check for problems with the network topology and the switch configurations.
– Run the set L2param -garpreply ENABLED command to enable the GARP reply.
- Try using VMAC if not already used.
- Run the sendarp –a command from the primary node.

**Issue**

In an HA pair, after you run the force HA failover command the devices keep rebooting. The secondary device does not come up after an upgrade.

**Resolution**

Check to see if the /var directory is full. If so, remove the old installation files. Run the df –h command to show the available disk space.

**Issue**

After upgrading an HA pair, one of the nodes is listed as state UNKNOWN.

**Resolution**

- Check to see if both nodes are running the same build. If the builds are not same and HA nodes have a version mismatch, some of the fields are shown as UNKNOWN when you run the show ha node command.
- Check to see if the secondary appliance is reachable.

**Issue**

After you upgrade the Citrix NetScaler, the interface shows most of the load balancing virtual servers and services are DOWN.

**Resolution**

Verify that the SNIP address is active on the secondary appliance. Also, type the show service command to see if the service is running.

**Issue**

After performing an upgrade, all virtual servers are down on the secondary appliance.

**Resolution**

Enable the HA state and HA synchronization by running the following commands:

- set node hastate enable
- set node hasync enable

Disabling HA is not recommended.

**Issue**

After performing a downgrade, the Citrix NetScaler does not boot up properly.

**Resolution**

Check to see if the correct license has been installed.
• **Issue**

In an HA pair, some features do not get synchronized after an upgrade is performed.

**Resolution**

Run the sync ha file misc command to synchronize the configurations files from the primary node to secondary node.

• **Issue**

During reboot, the following error message appears:

One or more commands in ns.conf failed. What should I do?

**Resolution**

Make sure that no command in the ns.conf file exceeds the 255 byte limit. In commands that create policies that are too long for the 255-byte limit, you can use pattern sets to shorten the policies.

Example:

```
"" pre codeblock
add cs policy p11 -rule 'HTTP.REQ.URL.ENDSWITH_ANY("ctx_file_extensions")'
Done
```

Note: Patsets are supported only in release 9.3 or later.

• **Issue**

When upgrading a Citrix NetScaler VPX appliance, I am told to free up space in /var. What files do I remove?

**Resolution**

Remove the old installation files from /var/tmp/ directory. Also remove unwanted files from /flash.

• **Issue**

There is no connectivity to the graphical user interface (GUI) when you run the force HA failover command on the secondary appliance.
Resolution

Log on to the secondary appliance using the command line interface and enable the access to GUI by running the set ns ip <IP> -gui enabled command.

• Issue

After performing an upgrade, and when I click on any link on the GUI that has to load a java applet (Upgrade Wizard or license Wizard), the following error message appears: **GUI version does not match with the kernel version. Please close this instance, clear java plug-in cache and reopen.**

Resolution

– Log on to the Citrix NetScaler using the GUI.
– Navigate to Citrix NetScaler Gateway > Global Settings.
– Click Change Global Settings under Settings.
– In the details pane, under Client Experience, select Default from the UI theme list.
– Click OK.

Note

These troubleshooting steps also apply to issues with configuration loss when downgrading the software across multiple releases.

For any other issue, see the release notes, Knowledge Center articles, and FAQs.

FAQs

November 15, 2018

For answers to the questions that you might have about upgrading the Citrix NetScaler firmware, see the *Installing, Upgrading, and Downgrading* FAQs.

New and deprecated commands, parameters, and SNMP OIDs

September 21, 2018

This section lists the new and deprecated commands, parameters, and SNMP OIDs.

New commands

The following table lists the new commands in release 12.0.

<table>
<thead>
<tr>
<th>Command group</th>
<th>Command</th>
</tr>
</thead>
</table>
NetScaler 12.0

| GSLB | rename gslb serviceGroup |
| LSN | stat lsn pool |
| Network | stat rnat6 and stat MapBmr |
| User | enable user vserver and disable user vserver |

**New parameters**

**Command group: AAA**

**Command:**

- show aaa session [-sessionKey]
- kill aaa session [-sessionKey]
- set aaa radiusParams [-tunnelEndpointClientIP]
- show aaa radiusParams [-tunnelEndpointClientIP]
- set aaa parameter [-maxSamlDeflateSize] [-persistentLoginAttempts] [-pwdExpiryNotificationDays]
- unset aaa parameter [-maxSamlDeflateSize] [-persistentLoginAttempts] [pwdExpiryNotificationDays]
- show aaa parameter [maxSamlDeflateSize] [persistentLoginAttempts] [pwdExpiryNotificationDays]

**Command group: AppFlow**

**Command:**

- set appflow param [-lsnLogging] [-emailAddress]
- show appflow param [lsnLogging] [-emailAddress]

**Command group: Application Firewall**

**Command:**

- bind appfw [-logExpression]
- unbind appfw profile [-logExpression]
- show appfw profile [-logExpression] [expression]
- show appfw xmlerrorpage [-src]
- show appfw signatures [-src]

**Command group: Audit**

**Command:**

- add audit syslogAction [-urlFiltering]
- set audit syslogAction [-urlFiltering]
- unset audit syslogAction [-urlFiltering]
- show audit syslogAction [-urlFiltering]
• add audit nslogAction [-urlFiltering]
• set audit nslogAction [-urlFiltering]
• unset audit nslogAction [-urlFiltering]
• show audit nslogAction [-urlFiltering]
• set audit syslogParams [-urlFiltering]
• unset audit syslogParams [-urlFiltering]
• show audit syslogParams [-urlFiltering]
• set audit nslogParams [-urlFiltering]
• unset audit nslogParams [-urlFiltering]
• show audit nslogParams [-urlFiltering]

Command group: Authentication

Command:

• dd authentication radiusAction [-tunnelEndpointClientIP]
• set authentication radiusAction [-tunnelEndpointClientIP]
• show authentication radiusAction [-tunnelEndpointClientIP]
• add authentication ldapAction [-Attributes] [-sshPublicKey] [-pushService] [-email]
• set authentication ldapAction [-Attributes] [-sshPublicKey] [-pushService] [-email]
• show authentication ldapAction [-Attributes] [-sshPublicKey] [-pushService] [-email]
• add authentication samlAction [-groupNameField] [-audience] [-metadataUrl] [-metadataRefreshInterval]
• set authentication samlAction [-groupNameField] [-audience] [-metadataUrl] [-metadataRefreshInterval]
• show authentication samlAction [-groupNameField] [-audience] [-metadataUrl] [-metadataRefreshInterval]
• add authentication samlIdPProfile [-metadataUrl] [-metadataRefreshInterval]
• set authentication samlIdPProfile [-metadataUrl] [-metadataRefreshInterval]
• set authentication samlIdPProfile [-metadataUrl] [-metadataRefreshInterval]
• show authentication samlIdPProfile [-metadataUrl] [-metadataRefreshInterval]
• show authentication samlIdPProfile [-metadataUrl] [-metadataRefreshInterval]
• show authentication samlIdPProfile [-metadataUrl] [-metadataRefreshInterval]
• add authentication OAuthAction [-UserInfoURL] [-CertFilePath] [-grantType]
• set authentication OAuthAction [-UserInfoURL] [-CertFilePath] [-grantType]
• show authentication OAuthAction [-UserInfoURL] [-CertFilePath] [-grantType]
• add authentication OAuthIdPProfile [-relyingPartyMetadataURL] [-refreshInterval] [-encryptToken]
• set authentication OAuthIdPProfile [-relyingPartyMetadataURL] [-refreshInterval] [-encryptToken]
• how authentication OAuthIdPProfile [-relyingPartyMetadataURL] [-refreshInterval] [-encryptToken]

Command group: Cache Redirection

Command:

• show cr vserver [-ipset]

Command group: Content Switching
Command:

- add cs vserver [-ipset]
- set cs vserver [-ipset]
- bind cs vserver [-analyticsProfile]
- unbind cs vserver [-analyticsProfile]
- show cs vserver [-ipset] [-analyticsProfile]

Command group: GSLB

Command:

- show gslb site [-svcitmnum] [-svcgrnm]
- bind gslb vserver [-serviceGroupName]
- unbind gslb vserver [-serviceGroupName]
- show gslb vserver [-svcitmnum] [-svcgrnm] [-serverName] [-serviceGroupName]
- show gslb domain [-serviceGroupName]
- show gslb syncStatus [-summary]
- add gslb serviceGroup [-sitePersistence]
- set gslb serviceGroup [-sitePersistence]
- unset gslb serviceGroup [-sitePersistence]
- bind gslb serviceGroup [-sitePrefix]
- show gslb serviceGroup [-sitePersistence] [-sitePrefix]

Command group: Load Balancing

Command:

- add lb vserver [-ipset]
- set lb vserver [-ipset]
- bind lb vserver [-analyticsProfile]
- unbind lb vserver [-analyticsProfile]
- show lb vserver [-ipset] [-analyticsProfile]

Command group: LSN

Command:

- add lsn pool [-totalpoolipsbound]
- bind lsn pool [-ownerNode] [-lastip]
- unbind lsn pool [-ownerNode] [-firstip] [-lastip]
- show lsn pool [-ownerNode] [-firstip] [-lastip] [-totalpoolipsbound]
- add lsn client [-clientType]
- show lsn client [-clientType]
- add lsn logprofile [-logipfix]
- set lsn logprofile [-logipfix]
• show lsn logprofile [-logipfix]
• bind lsn appsprofile [-firstport] [-lastport]
• unbind lsn appsprofile [-firstport] [-lastport]
• show lsn appsprofile [-firstport] [-lastport]

Command group: Network

Command:
• add netProfile [-MBF]
• set netProfile [-MBF]
• show netProfile [-MBF]
• set L3Param [-allowClassEIPv4]
• show L3Param [-allowClassEIPv4]

Command group: Network

Command:
• add ns acl [-type] [-dfdhash] [-stateful]
• set ns acl [-dfdhash] [-stateful]
• unset ns acl [-stateful]
• show ns acl [-type] [-dfdhash] [-stateful]
• set ns acl6 [-logstate] [ratelimit] [-dfdhash] [-dfdprefix] [-stateful]
• unset ns acl6 [-logstate] [ratelimit] [-stateful]
• show ns acl6 [-type] [-logstate] [-ratelimit] [-dfdhash] [-dfdprefix] [-stateful]
• add ns ip6 [-decrementHopLimit]
• set ns ip6 [-decrementHopLimit]
• show ns ip6 [-decrementHopLimit]
• add ns ip [-decrementTTL]
• set ns ip [-decrementTTL]
• show ns ip [-decrementTTL]
• add ns tcpProfile [-tcpFastOpenCookieSize]
• set ns tcpProfile [-tcpFastOpenCookieSize]
• show ns tcpProfile [-tcpFastOpenCookieSize]
• renumber ns acls [-type]
• clear ns acls [-type]
• apply ns acls [-type]
• show ns license [-isSWGLic] [-RemoteContentInspection]
• show ns config [-primaryIP6]
• clear ns acls6 [-type]
• apply ns acls6 [-type]
• renumber ns acls6 [-type]
• show ns feature [-CI]
• set ns diameter [-ownerNode]
• show ns diameter [-ownerNode]
• show ns hardware [-bmcRevision]
• set ns capacity [-vcpu]
• unset ns capacity [-vcpu]
• show ns capacity [-vcpuCount] [-maxVcpuCount]

Command group: RDP

Command:
• add rdp clientprofile [-randomizeRDPFilename] [-rdpLinkAttribute]
• set rdp clientprofile [-randomizeRDPFilename] [-rdpLinkAttribute]
• show rdp clientprofile [-randomizeRDPFilename] [-rdpLinkAttribute]
• add rdp serverprofile [-rdpRedirection]
• set rdp serverprofile [-rdpRedirection]
• show rdp serverprofile [-rdpRedirection]

Command group: SSL

Command:
• show ssl certKey [-ocspBindReferences]
• add ssl action [-ssllogProfile]
• show ssl action [-ssllogProfile]
• add ssl ocspResponder [-ocspUrlResolveTimeout] [-httpMethod]
• set ssl ocspResponder [-ocspUrlResolveTimeout] [-httpMethod]
• show ssl ocspResponder [-ocspUrlResolveTimeout] [-httpMethod]
• create ssl certReq [-subjectAltName]
• create ssl cert [-subjectAltName]
• set ssl vserver [-zeroRttEarlyData] [-tls13SessionTicketsPerAuthContext] [-dheKeyExchangeWithPsk]
• show ssl vserver [-zeroRttEarlyData] [-tls13SessionTicketsPerAuthContext] [-dheKeyExchangeWithPsk]
• add ssl profile [-ssllogProfile] [-zeroRttEarlyData] [-tls13SessionTicketsPerAuthContext] [-dheKeyExchangeWithPsk]
• set ssl profile [-ssllogProfile] [-zeroRttEarlyData] [-tls13SessionTicketsPerAuthContext] [-dheKeyExchangeWithPsk]
• show ssl profile [-ssllogProfile] [-zeroRttEarlyData] [-tls13SessionTicketsPerAuthContext] [-dheKeyExchangeWithPsk]

Command group: Stream

Command:
• add stream identifier [-trackAckOnlyPackets]
• set stream identifier [-trackAckOnlyPackets]
• show stream identifier [-trackAckOnlyPackets]

**Command goup:** System

**Command:**
• set system parameter [-allowDefaultPartition] [-reauthOnAuthParamChange] [-removeSensitiveFiles]
• show system parameter [-allowDefaultPartition] [-reauthOnAuthParamChange] [-removeSensitiveFiles]

**Command goup:** Subscriber

**Command:**
• add subscriber profile [-vlan]
• set subscriber profile [-vlan]
• rm subscriber profile [-vlan]
• show subscriber profile [-vlan]
• clear subscriber sessions [-vlan]
• show subscriber sessions [-vlan]

**Command goup:** Tunnel

**Command:**

**Command goup:** User

**Command:**
• add user vserver [-state]
• enable user vserver [-state]
• disable user vserver [-state]
• show user vserver [-state]

**Command goup:** User

**Command:**
• bind vpn vserver [-analyticsProfile]
• unbind vpn vserver [-analyticsProfile]
• show vpn vserver [-ipset] [-analyticsProfile]
• show vpn trafficPolicy [-piHits]
• add vpn samISSOProfile [-signatureService]
• set vpn samISSOProfile [-signatureService]
• show vpn samISSOProfile [-signatureService]
• add vpn url [-appJson]

New SNMP OIDs

For more information, see the SNMP OID Reference guide.

Deprecated features and functionalities

January 6, 2019

Some of the NetScaler functionalities are deprecated in 12.0 and in its subsequent releases. Citrix recommends that you do not use these features through the NetScaler command interface, NetScaler GUI, or Nitro automation. However, to ease the transition to new alternatives, the deprecated features are usable for a limited time and will be removed in future releases. Citrix recommends you to use the below alternatives for the following set of deprecated functionalities.

Deprecated features and Its alternatives in NetScaler 12.0

A list of NetScaler features and functionalities are deprecated. For complete information, You can refer to Deprecated List pdf.

Using NSPEPI conversion tool

You can use the nspepi tool to convert commands, expressions, and configurations. For more information, see Converting Expressions by Using NSPEPI Tool topic.
Here is a list of conversion from Classic expressions to Advanced expressions.

- ns_true -> true
- ns_false -> false
- REQ.HTTP -> HTTP.REQ
- RES.HTTP -> HTTP.RES
AppQoE Use Cases

When using AppQoE as an alternative for SureConnect feature, you can refer to the following use case configurations.

Use Case 1: To limit simultaneous download of huge files and display loading screen:

```
1 add appqoe action NS_RESP -respondWith NS -maxConn 50
2 3 add appqoe policy POL_DWN_PKG -rule "HTTP.REQ.URL.CONTAINS(\"tar.gz\")" -action NS_RESP
4 5 bind lb vserver v1 -policyName POL_DWN_PKG -priority 8
```

Use Case 2: To limit simultaneous download of huge files and display loading screen with alternate content:

```
1 add appqoe action ACS_RESP -respondWith ACS -altContentsvcName s2 -altContentPath /netscaler/alt.html -maxConn 50
2 3 add appqoe policy POL_DWN_ACS -rule "HTTP.REQ.URL.CONTAINS(\"tar.gz\")" -action ACS_RESP
4 5 bind lb vserver v1 -policyName POL_DWN_ACS -priority 9
```

Use Case 3: Custom loading screen:

```
1 import appqoCe customResp [http://<location>][local:<file>]
simple_custom_resp
2
```
AAA application traffic

September 28, 2018

Many companies restrict web site access to valid users only, and control the level of access permitted to each user. The AAA feature allows a site administrator to manage access controls with the NetScaler appliance instead of managing these controls separately for each application. Doing authentication on the appliance also permits sharing this information across all web sites within the same domain that are protected by the appliance.

The AAA feature supports authentication, authorization, and auditing for all application traffic. To use AAA, you must configure authentication virtual servers to handle the authentication process and traffic management virtual servers to handle the traffic to web applications that require authentication. You also configure your DNS to assign FQDNs to each virtual server. After configuring the virtual servers, you configure a user account for each user that will authenticate via the NetScaler appliance, and optionally you create groups and assign user accounts to groups. After creating user accounts and groups, you configure policies that tell the appliance how to authenticate users, which resources to allow users to access, and how to log user sessions. To put the policies into effect, you bind each policy globally, to a specific virtual server, or to the appropriate user accounts or groups. After configuring your policies, you customize user sessions by configuring session settings and binding your session policies to the traffic management virtual server. Finally, if your intranet uses client certs, you set up the client certificate configuration.

Before configuring AAA, you should be familiar with and understand how to configure load balancing, content switching, and SSL on the NetScaler appliance.

How AAA works

January 6, 2019

AAA provides security for a distributed internet environment by allowing any client with the proper credentials to connect securely to protected application servers from anywhere on the Internet. This
feature incorporates the three security features of AAA. Authentication enables the NetScaler appliance to verify the client’s credentials, either locally or with a third-party authentication server, and allow only approved users to access protected servers. Authorization enables the ADC to verify which content on a protected server it should allow each user to access. Auditing enables the ADC to keep a record of each user’s activity on a protected server.

To understand how AAA works in a distributed environment, consider an organization with an intranet that its employees access in the office, at home, and when traveling. The content on the intranet is confidential and requires secure access. Any user who wants to access the intranet must have a valid user name and password. To meet these requirements, the ADC does the following:

- Redirects the user to the login page if the user accesses the intranet without having logged in.
- Collects the user’s credentials, delivers them to the authentication server, and caches them in a directory that is accessible through LDAP.
- Verifies that the user is authorized to access specific intranet content before delivering the user’s request to the application server.
- Maintains a session timeout after which users must authenticate again to regain access to the intranet. (You can configure the timeout.)
- Logs the user accesses, including invalid login attempts, in an audit log.

Authentication requires that several entities: the client, the NetScaler appliance, the external authentication server if one is used, and the application server, respond to each other when prompted by performing a complex series of tasks in the correct order. If you are using an external authentication server, this process can be broken down into the following fifteen steps.

1. The client sends a GET request for a URL on the application server.
2. The NetScaler appliance’s traffic management virtual server redirects the request to the application server.
3. The application server determines that the client has not been authenticated, and therefore sends an HTTP 200 OK response via the TM vserver to the client. The response contains a hidden script that causes the client to issue a POST request for /cgi/tm.
4. The client sends a POST request for /cgi/tm.
5. The NetScaler appliance’s authentication virtual server redirects the request to the authentication server.
6. The authentication server creates an authentication session, sets and caches a cookie that consists of the initial URL and the domain of the traffic management virtual server, and then sends an HTTP 302 response via the authentication virtual server, redirecting the client to /vpn/index.html.
7. The client sends a GET request for /vpn/index.html.
8. The authentication virtual server redirects the client to the authentication server login page.
9. The client sends a GET request for the login page, enters credentials, and then sends a POST
request with the credentials back to the login page.

10. The authentication virtual server redirects the POST request to the authentication server.

11. If the credentials are correct, the authentication server tells the authentication virtual server to log the client in and redirect the client to the URL that was in the initial GET request.

12. The authentication virtual server logs the client in and sends an HTTP 302 response that redirects the client to the initially requested URL.

13. The client sends a GET request for their initial URL.

14. The traffic management virtual server redirects the GET request to the application server.

15. The application server responds via the traffic management virtual server with the initial URL.

If you use local authentication, the process is similar, but the authentication virtual server handles all authentication tasks instead of forwarding connections to an external authentication server. The following figure illustrates the authentication process.

Figure 1. Authentication Process Traffic Flow

When an authenticated client requests a resource, the ADC, before sending the request to the application server, checks the user and group policies associated with the client account, to verify that the client is authorized to access that resource. The ADC handles all authorization on protected application servers. You do not need to do any special configuration of your protected application servers.

AAA traffic management handles password changes for users by using the protocol-specific method for the authentication server. For most protocols, neither the user nor the administrator needs to do anything different than they would without AAA traffic management. Even when an LDAP authentication server is in use, and that server is part of a distributed network of LDAP servers with a single designated domain administration server, password changes are usually handled seamlessly. When an authenticated client of an LDAP server changes his or her password, the client sends a credential modify request to AAA traffic management, which forwards it to the LDAP server. If the user’s LDAP server is also the domain administration server, that server responds appropriately and AAA traffic management then performs the requested password change. Otherwise, the LDAP server sends AAA traffic management an LDAP_REFERRAL response to the domain administration server. AAA traffic management follows the referral to the indicated domain administration server, authenticates to that server, and performs the password change on that server.

When configuring AAA traffic management with an LDAP authentication server, the system administrator must keep the following conditions and limitations in mind:

- AAA traffic management assumes that the domain administration server in the referral accepts the same bind credentials as the original server.
- AAA traffic management only follows LDAP referrals for password change operations. In other cases AAA traffic management refuses to follow the referral.
- AAA traffic management only follows one level of LDAP referrals. If the second LDAP server also returns a referral, AAA traffic management refuses to follow the second referral.
The ADC supports auditing of all states and status information, so you can see the details of what each user did while logged on, in chronological order. To provide this information, the appliance logs each event, as it occurs, either to a designated audit log file on the appliance or to a syslog server. Auditing requires configuring the appliance and any syslog server that you use.

**Enabling AAA**

September 14, 2018

To use the AAA - Application Traffic feature, you must enable it. You can configure AAA entities—such as the authentication and traffic management virtual servers—before you enable the AAA feature, but the entities will not function until the feature is enabled.

**To enable AAA by using the command line interface**

At the command prompt, type the following commands to enable AAA and verify the configuration:

- enable ns feature AAA
- show ns feature

**Example**

- enable feature AAA

Done

- show ns feature

<table>
<thead>
<tr>
<th>Feature</th>
<th>Acronym</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>1) Web Logging</td>
<td>WL</td>
<td>OFF</td>
</tr>
<tr>
<td>2) Surge Protection</td>
<td>SP</td>
<td>ON</td>
</tr>
<tr>
<td>15) AAA</td>
<td>AAA</td>
<td>ON</td>
</tr>
<tr>
<td>23) HTML Injection</td>
<td>HTMLInjection</td>
<td>ON</td>
</tr>
<tr>
<td>24) NetScaler Push</td>
<td>push</td>
<td>OFF</td>
</tr>
</tbody>
</table>
To enable AAA by using the configuration utility

1. Navigate to System > Settings.
2. In the details pane, under Modes and Features, click Change basic features.
3. In the Configure Basic Features dialog box, select the Authentication, Authorization and Auditing check box.
4. Click OK.

Setting up an authentication virtual server

December 21, 2018

All authentication requests are redirected by the traffic management virtual server (load balancing or content switching) to the authentication virtual server. This virtual server processes the associated authentication policies and accordingly provides access to the application.

Note
You cannot bind traffic management policies to AAA virtual servers.

To set up an authentication virtual server by using the CLI

1. Enable the AAA feature.
   
   `ns-cli-prompt> enable ns feature AAA`

2. Configure an authentication virtual server. It must be of type SSL and make sure to bind SSL certificate-key pair to the virtual server.
   
   `ns-cli-prompt> add authentication vserver <name> SSL <ipaddress> <port>`

   `ns-cli-prompt> bind ssl certkey <auth-vserver-name> <certkey>`

3. Specify the FQDN of the domain for the authentication virtual server.
   
   `ns-cli-prompt> set authentication vserver <name> -authenticationDomain <FQDN>`

4. Associate the authentication virtual server to the relevant traffic management virtual server.

   **Note:**
   
   The FQDN of the traffic management virtual server must be in the same domain as the FQDN of the authentication virtual server for the domain session cookie to function correctly.

On the traffic management virtual server:

- Enable authentication.
- Specify the FQDN of the authentication virtual server as the authentication host of the traffic management virtual server.
- [Optional] Specify the authentication domain on the traffic management virtual server.

**Note:**

If you do not configure the authentication domain, the appliance assigns an FQDN that consists of the FQDN of the authentication virtual server without the hostname portion. For example, if domain name of the authentication virtual server is `tm.xyz.bar.com`, the appliance assigns `xyz.bar.com` as the authentication domain.

**For load balancing:**

```bash
ns-cli-prompt> set lb vserver <name> -authentication ON -authenticationhost <FQDN> [-authenticationdomain <authdomain>]
```

**For content switching:**

```bash
ns-cli-prompt> set cs vserver <name> <protocol> <IPAddress> <port>
```

1. Verify that both the virtual servers are UP and configure correctly.

```bash
ns-cli-prompt> show authentication vserver <name>
```

**To set up an authentication virtual server by using the GUI**

1. Enable the AAA feature.

   Navigate to **System > Settings**, click **Configure Basic features**, and enable **Authentication, Authorization and Auditing**.

2. Configure the authentication virtual server.

   Navigate to **Security > AAA - Application Traffic > Virtual Servers**, and configure as required (refer to the configurations provided in the CLI procedure provided above).

3. Configure the traffic management virtual server for authentication.

   **For load balancing:**

   Navigate to **Traffic Management > Load Balancing > Virtual Servers**, and configure the virtual server as required (refer to the configurations provided in the CLI procedure provided above).

   **For content switching:**

   Navigate to **Traffic Management > Content Switching > Virtual Servers**, and configure the virtual server as required (refer to the configurations provided in the CLI procedure provided above).

4. Verify the authentication setup.
Navigate to Security > AAA - Application Traffic > Virtual Servers, and check the details of the relevant authentication virtual server.

Configuring the authentication virtual server

September 21, 2018

To configure AAA, first configure an authentication virtual server to handle authentication traffic. Next, bind an SSL certificate-key pair to the virtual server to enable it to handle SSL connections. For additional information about configuring SSL and creating a certificate-key pair, see SSL certificates.

To configure an authentication virtual server by using the command line interface

To configure an authentication virtual server and verify the configuration, at the command prompt type the following commands in the order shown:

- add authentication vserver <name> ssl <ipaddress>
- show authentication vserver <name>
- bind ssl certkey <certkeyName>
- show authentication vserver <name>
- set authentication vserver <name> -authenticationDomain <FQDN>
- show authentication vserver <name>

Example

```
1 > add authentication vserver Auth-Vserver-2 SSL 10.102.29.77 443
2 Done
3 > show authentication vserver Auth-Vserver-2
   Auth-Vserver-2 (10.102.29.77:443) - SSL Type: CONTENT
   State: DOWN[Certkey not bound]
   Client Idle Timeout: 180 sec
   Down state flush: DISABLED
   Disable Primary Vserver On Down: DISABLED
   Authentication: ON
   Current AAA Users: 0
3 Done
4 > bind ssl certkey Auth-Vserver-2 Auth-Cert-1
5 Done
6 > show authentication vserver Auth-Vserver-2
   Auth-Vserver-2 (10.102.29.77:443) - SSL Type: CONTENT
```
<p>| | |</p>
<table>
<thead>
<tr>
<th></th>

<tr>
<td>34</td>
<td>Authentication Domain: myCompany.employee.com</td>
</tr>
<tr>
<td>35</td>
<td>Done</td>
</tr>
</tbody>
</table>

**To configure an authentication virtual server by using the configuration utility**

1. Navigate to **Security > AAA - Application Traffic > Virtual Servers**.

2. In the details pane, do one of the following:
   - To create a new authentication virtual server, click **Add**.
   - To modify an existing authentication virtual server, select the virtual server, and then click **Edit**. The Configuration dialog opens with the Basic Settings area expanded.

3. Specify values for the parameters as follows (asterisk indicates a required parameter):
   - Name*—name (Cannot be changed for a previously created virtual server)
   - IP Address*—ipaddress
   - Domain*—authenticationDomain
   - Failed login timeout—failedLoginTimeout (Seconds allowed before login fails and user must start login process again.)
   - Max login attempts—maxLoginAttempts (Number of login attempts allowed before user is locked out)
Note: The authentication virtual server uses only the SSL protocol and port 443, so those options are greyed out. Any options that are not mentioned are not relevant and should be ignored.

4. Click Continue to display the Certificates area.

5. In the Certificates area, configure any SSL certificates you want to use with this virtual server.
   - To configure a CA certificate, click the arrow on the right of CA Certificate to display the CA Cert Key dialog box, select the certificate you want to bind to this virtual server, and click Save.
   - To configure a server certificate, click the arrow on the right of Server Certificate, and follow the same process as for CA certificate.

6. Click Continue to display the Advanced Authentication Policies area.

7. If you want to bind an advanced authentication policy to the virtual server, click the arrow on the right side of the line to display the Authentication Policy dialog box, choose the policy that you want to bind to the server, set the priority, and then click OK.

8. Click Continue to display the Basic Authentication Policies area.

9. If you want to create a basic authentication policy and bind it to the virtual server, click the plus sign to display the Policies dialog box, and follow the prompts to configure the policy and bind it to this virtual server.

10. Click Continue to display the 401-Based Virtual Servers area.

11. In the 401-Based Virtual Servers area, configure any load balancing or content switching virtual servers that you want to bind to this virtual server.
   - To bind a load balancing virtual server, click the arrow to the right of LB virtual server to display the LB Virtual Servers dialog box, and follow the prompts.
   - To bind a content switching virtual server, click the arrow to the right of CS virtual server to display the CS Virtual Servers dialog box, and follow the same process as to bind an LB virtual server.

12. If you want to create or configure a group, in the Groups area click the arrow to display the Groups dialog box, and follow the prompts.

13. Review your settings, and when you are finished, click Done. The dialog box closes. If you created a new authentication virtual server, it now appears in the Configuration window list.

**Configuring a traffic management virtual server**

September 21, 2018
After you have created and configured your authentication virtual server, you next create or configure a traffic management virtual server and associate your authentication virtual server with it. You can use either a load balancing or content switching virtual server for a traffic management virtual server. For more information about creating and configuring either type of virtual server, see the Citrix Traffic Management Guide at Traffic Management.

**Note**

The FQDN of the traffic management virtual server must be in the same domain as the FQDN of the authentication virtual server for the domain session cookie to function correctly.

You configure a traffic management virtual server for AAA by enabling authentication and then assigning the FQDN of the authentication server to the traffic management virtual server. You can also configure the authentication domain on the traffic management virtual server at this time. If you do not configure this option, the NetScaler appliance assigns the traffic management virtual server an FQDN that consists of the FQDN of the authentication virtual server without the hostname portion. For example, if domain name of the authentication virtual server is tm.xyz.bar.com, the appliance assigns xyz.bar.com. as the authentication domain.

**To configure a TM virtual server for AAA by using the command line interface**

At the command prompt, type one of the following sets of commands to configure a TM virtual server and verify the configuration:

- `set lb vserver <name> -authentication ON -authenticationhost <FQDN> [-authenticationdomain <authdomain>]`
- `show lb vserver <name>`
- `set cs vserver <name> -authentication ON -authenticationhost <FQDN> [-authenticationdomain <authdomain>]`
- `show cs vserver <name>`

**Example**

```
> set lb vserver vs-cont-sw -Authentication ON -AuthenticationHost mywiki.index.com
  Done
> show lb vserver vs-cont-sw
 vs-cont-sw (0.0.0.0:0) - TCP   Type: ADDRESS
  State: DOWN
  Last state change was at Wed Aug 19 10:03:15 2009 (+410 ms)
  Time since last state change: 5 days, 20:00:40.290
  Effective State: DOWN
  Client Idle Timeout: 9000 sec
```
<p>| | |</p>
<table>

To configure a TM virtual server for AAA by using the configuration utility

1. In the navigation pane, do one of the following.
   - Navigate to Traffic Management > Load Balancing > Virtual Servers.
   - Navigate to Traffic Management > Content Switching > Virtual Servers
   - In the details pane, select the virtual server on which you want to enable authentication, and then click Edit.
   - In the Domain text box, type the authentication domain.
   - In the Advanced menu on the right, select Authentication.
   - Choose either Form Based Authentication or 401 Based Authentication, and fill in the Authentication information.
     - For Form Based Authentication, enter the Authentication FQDN (the fully-qualified domain name of the authentication server), the Authentication VServer (the IP address of the authentication virtual server), and the Authentication Profile (the profile to use for authentication).
     - For 401 Based Authentication, enter the Authentication VServer and the Authentication Profile only.
   - Click OK. A message appears in the status bar, stating that the vserver has been configured successfully.

Simplified login protocol support for AAA

The login protocol between AAA traffic management virtual servers and AAA virtual servers is simplified to use internal mechanisms as opposed to sending the encrypted data through query parameters. By leveraging this feature, the replay of requests is prevented.

Configuring DNS

September 14, 2018
For the domain session cookie used in the authentication process to function correctly, you must configure DNS to assign both the authentication and the traffic management virtual servers to FQDNs in the same domain. For information about how to configure DNS address records, see Domain Name System.

Verifying your setup for AAA

September 21, 2018

After you configure authentication and traffic management virtual servers and before you create user accounts, you should verify that both virtual servers are configured correctly and are in the UP state.

To verify authentication virtual server setup by using the command line interface

At the command prompt, type the following command:

```
show authentication vserver <name>
```

<table>
<thead>
<tr>
<th></th>
<th>show authentication vserver Auth-Vserver-2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td></td>
</tr>
<tr>
<td>6</td>
<td></td>
</tr>
<tr>
<td>7</td>
<td></td>
</tr>
<tr>
<td>8</td>
<td></td>
</tr>
</tbody>
</table>

To verify your AAA virtual server setup by using the configuration utility

2. Review the information in the AAA Virtual Servers pane to verify that your configuration is correct and your authentication virtual server is accepting traffic. You can select a specific virtual server to view detailed information in the details pane.

Creating an authentication profile

September 14, 2018
When you want the same authentication settings to be used by multiple traffic management virtual servers, you can create an authentication profile which specifies the authentication virtual server, the authentication host, the authentication domain, and authentication level.

This authentication profile can be associated with the relevant traffic management virtual servers.

**To configure an authentication profile by using the CLI**

1. Create the authentication profile and set the required parameters.
   For example, to create a profile with an authentication virtual server named “authVS”.

   ```
   ns-cli-prompt> add authentication authnProfile authProfile1 -authnVsName authVS -
   authenticationHost authnVS.example.com -authenticationDomain example.com -authenticationLevel
   ```

   **Note:**
   The authentication weight or level will depend on the virtual server to which the traffic will bind. A session that is created by authenticating against traffic management virtual server at given level cannot be used to access traffic management virtual server at a higher level.

2. Bind the authentication profile to the relevant traffic management virtual servers.
   For example, to bind authProfile1 to a load balancing virtual server named “vserver1”.

   ```
   ns-cli-prompt> set lb vserver vserver1 -authnProfile authProfile1
   ```

**To configure an authentication profile by using the GUI**

In the **Configuration** tab, navigate to **Security > AAA - Application Traffic > Authentication Profile**, and configure the authentication profile as required.

**Configuring users and groups**

September 21, 2018

After configuring the AAA basic setup, you create users and groups. You first create a user account for each person who will authenticate via the NetScaler appliance. If you are using local authentication controlled by the NetScaler appliance itself, you create local user accounts and assign passwords to each of those accounts.

You also create user accounts on the NetScaler appliance if you are using an external authentication server. In this case, however, each user account must exactly match an account for that user on the external authentication server, and you do not assign passwords to the user accounts that you create.
on the NetScaler appliance. The external authentication server manages the passwords for users that authenticate with the external authentication server.

If you are using an external authentication server, you can still create local user accounts on the NetScaler appliance if, for example, you want to allow temporary users (such as visitors) to log in but do not want to create entries for those users on the authentication server. You assign a password to each local user account, just as you would if you were using local authentication for all user accounts.

Each user account must be bound to policies for authentication and authorization. To simplify this task, you can create one or more groups and assign user accounts to them. You can then bind policies to groups instead of individual user accounts.

**To create a local AAA user account by using the command line interface**

At the command prompt, type the following commands to create a local AAA user account and verify the configuration:

- `add aaa user <username> [-password <password>]`
- `show aaa user`

**Example**

```
1 > add aaa user user-2 -password emptybag
2   Done
3 > show aaa user
4 1) UserName: user-1
5 2) UserName: user-2
6   Done
```

**To change the password for an existing AAA local user account by using the command line interface**

At the command prompt, type the following command and, when prompted, type the new password:

- `set aaa user <username>`

**Example**

```
1 > set aaa user user-2
2   Enter password:
3   Done
```
To configure AAA local users by using the configuration utility

1. Navigate to Security > AAA - Application Traffic > Users
2. In the details pane, do one of the following:
   • To create a new user account, click Add.
   • To modify an existing user account, select the user account, and then click Open.
3. In the Create AAA User dialog box, in the User Name text box, type a name for the user.
4. If creating a locally authenticated user account, clear the External Authentication check box and provide a local password that the user will use to log on
5. Click Create or OK, and then click Close. A message appears in the status bar, stating that the user has been configured successfully.

To create AAA local groups and add users to them by using the command line interface

At the command prompt, type the following commands. Type the first command one time, and type the second command once for each user:

• add aaa group <groupname>

• show aaa group

Example

```
1  > add aaa group group-2
2  Done
3  > show aaa group
4  1) GroupName: group-1
5  2) GroupName: group-2
6  Done
```

• bind aaa group <groupname> -username <username>

Example

```
1  > bind aaa group group-2 -username user-2
2  Done
3  > show aaa group group-2
4  GroupName: group-2
5
6  UserName: user-2
7  Done
```
To remove users from an AAA group by using the command line interface

At the command prompt, unbind users from the group by typing the following command once for each user account that is bound to the group:

• unbind aaa group <groupname> -username <username>

Example

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>unbind aaa group group-hr -username user-hr-1</td>
</tr>
<tr>
<td>2</td>
<td>Done</td>
</tr>
</tbody>
</table>

To remove an AAA group by using the command line interface

First remove all users from the group. Then, at the command prompt, type the following command to remove an AAA group and verify the configuration:

• rm aaa group <groupname>

• show aaa group

Example

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>rm aaa group group-hr</td>
</tr>
<tr>
<td>2</td>
<td>Done</td>
</tr>
<tr>
<td>3</td>
<td>show aaa group</td>
</tr>
<tr>
<td>4</td>
<td>1) GroupName: group-1</td>
</tr>
<tr>
<td>5</td>
<td>2) GroupName: group-finance</td>
</tr>
<tr>
<td>6</td>
<td>Done</td>
</tr>
</tbody>
</table>

To configure AAA local groups and add users to them by using the configuration utility

1. Navigate to Security > AAA - Application Traffic > Groups

2. In the details pane, do one of the following:
   • To create a new group, click Add.
   • To modify an existing group, select the group, and then click Edit.

3. If you are creating a new group, in the Create AAA Group dialog box, in the Group Name text box, type a name for the group.

4. In the Advanced area to the right, click AAA Users.
   • To add a user to the group, select the user, and then click Add.
   • To remove a user from the group, select the user, and then click Remove.
• To create a new user account and add it to the group, click the **Plus** icon, and then follow the instructions in “To configure AAA local users by using the configuration utility.”

5. Click **Create** or **OK**. The group that you created appears in the **AAA Groups** page.

## Configuring AAA policies

September 14, 2018

After you set up your users and groups, you next configure authentication policies, authorization policies, and audit policies to define which users are allowed to access your intranet, which resources each user or group is allowed to access, and what level of detail AAA will preserve in the audit logs. An authentication policy defines the type of authentication to apply when a user attempts to log on. If external authentication is used, the policy also specifies the external authentication server. Authorization policies specify the network resources that users and groups can access after they log on. Auditing policies define the audit log type and location.

You must bind each policy to put it into effect. You bind authentication policies to authentication virtual servers, authorization policies to one or more user accounts or groups, and auditing policies both globally and to one or more user accounts or groups.

When you bind a policy, you assign a priority to it. The priority determines the order in which the policies you define are evaluated. You can set the priority to any positive integer. In the NetScaler appliance operating system, policy priorities work in reverse order: the higher the number, the lower the priority. For example, if you have three policies with priorities of 10, 100, and 1000, the policy assigned a priority of 10 is performed first, then the policy assigned a priority of 100, and finally the policy assigned an order of 1000. The AAA feature implements only the first of each type of policy that a request matches, not any additional policies of that type that a request might also match, so policy priority is important for getting the results you intend.

You can leave yourself plenty of room to add other policies in any order, and still set them to evaluate in the order you want, by setting priorities with intervals of 50 or 100 between each policy when you bind the policies. You can then add additional policies at any time without having to reassign the priority of an existing policy.

For additional information about binding policies on the NetScaler appliance, see the *Citrix Traffic Management Guide* at Traffic Management.

## Authentication policies

September 21, 2018
The NetScaler appliance can authenticate users with local user accounts or by using an external authentication server. The appliance supports the following authentication types:

- **LOCAL**
  
  Authenticates to the NetScaler appliance by using a password, without reference to an external authentication server. User data is stored locally on the NetScaler appliance.

- **RADIUS**
  
  Authenticate to an external Radius server.

- **LDAP**
  
  Authenticates to an external LDAP authentication server.

- **TACACS**
  
  Authenticates to an external Terminal Access Controller Access-Control System (TACACS) authentication server.

After a user authenticates to a TACACS server, the NetScaler appliance connects to the same TACACS server for all subsequent authorizations. When a primary TACACS server is unavailable, this feature prevents delays while the ADC waits for the first TACACS server to time out before resending the authorization request to the second TACACS server.

**Note**

When authenticating through a TACACS server, AAA traffic management logs only successfully executed TACACS commands, to prevent the logs from showing TACACS commands that were entered by users who were not authorized to execute them.

Starting from NetScaler 12.0 Build 57.x, the Terminal Access Controller Access-Control System (TACACS) is not blocking the AAA daemon while sending the TACACS request. The AAA daemon allows LDAP, and RADIUS authentication to proceed with the request. The TACACS authentication request resumes once TACACS server acknowledges the TACACS request.

- **CERT**
  
  Authenticates to the NetScaler appliance by using a client certificate, without reference to an external authentication server.

- **NEGOTIATE**
  
  Authenticates to a Kerberos authentication server. If there is an error in Kerberos authentication, NetScaler appliance uses NTLM authentication.

- **SAML**
  
  Authenticates to a server that supports the Security Assertion Markup Language (SAML).
NETSCALER 12.0

- **SAML IDP**

  Configures the NetScaler appliance to serve as a Security Assertion Markup Language (SAML) Identity Provider (IdP).

- **WEB**

  Authenticates to a web server, providing the credentials that the web server requires in an HTTP request and analyzing the web server response to determine that user authentication was successful.

An authentication policy is comprised of an expression and an action. Authentication policies use NetScaler appliance expressions.

After creating an authentication action and an authentication policy, bind it to an authentication virtual server and assign a priority to it. When binding it, also designate it as either a primary or a secondary policy. Primary policies are evaluated before secondary policies. In configurations that use both types of policy, primary policies are normally more specific policies while secondary policies are normally more general policies intended to handle authentication for any user accounts that do not meet the more specific criteria.

**To add an authentication action by using the command line interface**

If you do not use LOCAL authentication, you need to add an explicit authentication action. To do this, at the command prompt, type the following command:

```
add authentication tacacsAction <name> -serverip <IP> [-serverPort <port>] [-authTimeout <positive_integer>] [...]
```

Example

```
```

After creating an authentication action and an authentication policy, bind it to an authentication virtual server and assign a priority to it. When binding it, also designate it as either a primary or a secondary policy. Primary policies are evaluated before secondary policies. In configurations that use both types of policy, primary policies are normally more specific policies while secondary policies are normally more general policies intended to handle authentication for any user accounts that do not meet the more specific criteria.

**To configure an authentication action by using the command line interface**

To configure an existing authentication action, at the command prompt, type the following command:

```
set authentication tacacsAction <name> -serverip <IP> [-serverPort <port>] [-authTimeout <positive_integer>] [...]
```

Example
To remove an authentication action by using the command line interface

To remove an existing RADIUS action, at the command prompt, type the following command:

```
rm authentication radiusAction <name>
```

Example

```
1 > rm authentication tacacsaction Authn-Act-1
2 Done
```

To configure an authentication server by using the configuration utility

Note

In the configuration utility, the term server is used instead of action, but refers to the same task.

2. In the details pane, on the Servers tab, do one of the following:
   - To create a new authentication server, click Add.
   - To modify an existing authentication server, select the server, and then click Open.
3. In the Create Authentication Server or Configure Authentication Server dialog box, type or select values for the parameters.
   - Name*—radiusActionName (Cannot be changed for a previously configured action)
   - Authentication Type*—authtype (Set to RADIUS, cannot be changed)
   - IP Address*—serverip </IP>
   - IPV6*—Select the checkbox if the server IP is an IPv6 IP. (No command line equivalent.)
   - Port*—serverPort
   - Time-out (seconds)*—authTimeout
4. Click Create or OK, and then click Close. The policy that you created appears in the Authentication Policies and Servers page.
To create and bind an authentication policy by using the command line interface

At the command prompt, type the following commands in the order shown to create and bind an authentication policy and verify the configuration:

- add authentication negotiatePolicy <name> <rule> <reqAction>
- “show authentication localPolicy
- “bind authentication vserver -policy [-priority] [-secondary]]
- show authentication vserver <name>

Example

```
1 > add authentication localPolicy Authn-Pol-1 ns_true Done
2 > show authentication localPolicy
3   1) Name: Authn-Pol-1 Rule: ns_true Request action: LOCAL Done
4 > bind authentication vserver Auth-Vserver-2 -policy Authn-Pol-1
5   Done
6 > show authentication vserver Auth-Vserver-2
      Auth-Vserver-2 (10.102.29.77:443) - SSL Type: CONTENT State: UP Client Idle Timeout: 180 sec Down state flush: DISABLED Disable Primary Vserver On Down : DISABLED Authentication : ON
       Current AAA Users: 0 Authentication Domain: myCompany.employee.com
7   1) Primary authentication policy name: Authn-Pol-1 Priority: 0
8   Done
```

To modify an existing authentication policy by using the command line interface

At the command prompt, type the following commands to modify an existing authentication policy:

```
set authentication localPolicy <name> <rule> [-reqaction <action>]
```

Example

```
1 > set authentication localPolicy Authn-Pol-1 'ns_true' Done
```

To remove an authentication policy by using the command line interface

At the command prompt, type the following command to remove an authentication policy:

```
rm authentication localPolicy <name>
```

Example
To configure and bind authentication policies by using the configuration utility

1. Navigate to Security > AAA - Application Traffic > Policies > Authentication, and then select the type of policy that you want to create.
2. In the details pane, on the Policies tab, do one of the following:
   - To create a new policy, click Add.
   - To modify an existing policy, select the action, and then click Edit.
3. In the Create Authentication Policy or Configure Authentication Policy dialog, type or select values for the parameters.
   - Name*—policyname (Cannot be changed for a previously configured action)
   - Authentication Type*—authtype
   - Server*—authVsName
   - Expression*—rule (You enter expressions by first choosing the type of expression in the leftmost drop-down list beneath the Expression window, and then by typing your expression directly into the expression text area, or by clicking Add to open the Add Expression dialog box and using the drop-down lists in it to construct your expression.)
4. Click Create or OK. The policy that you created appears in the Policies page.
5. Click the Servers tab, and in the details pane do one of the following:
   - To use an existing server, select it, and then click .
   - To create a new server, click Add, and follow the instructions.
6. If you want to designate this policy as a secondary authentication policy, on the Authentication tab, click Secondary. If you want to designate this policy as a primary authentication policy, skip this step.
7. Click Insert Policy.
8. Choose the policy you want to bind to the authentication virtual server from the drop-down list.
9. In the Priority column to the left, modify the default priority as needed to ensure that the policy is evaluated in the proper order.
10. Click OK. A message appears in the status bar, stating that the policy has been configured successfully.

LDAP authentication policies

September 14, 2018
As with other types of authentication policies, a Lightweight Directory Access Protocol (LDAP) authentication policy is comprised of an expression and an action. After creating an authentication policy, you bind it to an authentication virtual server and assign a priority to it. When binding it, you also designate it as either a primary or a secondary policy. In addition to standard authentication functions, LDAP can search other active directory (AD) servers for user accounts for users that do not exist locally. This function is called referral support or referral chasing.

Normally you configure the NetScaler appliance to use the IP address of the authentication server during authentication. With LDAP authentication servers, you can also configure the ADC to use the FQDN of the LDAP server instead of its IP address to authenticate users. Using an FQDN can simplify an otherwise much more complex AAA configuration in environments where the authentication server might be at any of several IP addresses, but always uses a single FQDN. To configure authentication by using a server’s FQDN instead of its IP address, you follow the normal configuration process except when creating the authentication action. When creating the action, you use the serverName parameter instead of the serverIP parameter, and substitute the server’s FQDN for its IP address.

Before you decide whether to configure the ADC to use the IP or the FQDN of your LDAP server to authenticate users, consider that configuring AAA to authenticate to an FQDN instead of an IP address adds an extra step to the authentication process. Each time the ADC authenticates a user, it must resolve the FQDN. If a great many users attempt to authenticate simultaneously, the resulting DNS lookups might slow the authentication process.

LDAP referral support is disabled by default and cannot be enabled globally. It must be explicitly enabled for each LDAP action. You must also make sure that the AD server accepts the same binddn credentials that are used with the referring (GC) server. To enable referral support, you configure an LDAP action to follow referrals, and specify the maximum number of referrals to follow.

If referral support is enabled, and the NetScaler appliance receives an LDAP_REFERRAL response to a request, AAA follows the referral to the active directory (AD) server contained in the referral and performs the update on that server. First, AAA looks up the referral server in DNS, and connects to that server. If the referral policy requires SSL/TLS, it connects via SSL/TLS. It then binds to the new server with the binddn credentials that it used with the previous server, and performs the operation which generated the referral. This feature is transparent to the user.

Note

These instructions assume that you are already familiar with the LDAP protocol and have already configured your chosen LDAP authentication server.

For more information about setting up authentication policies in general, see Authentication Policies. For more information about NetScaler appliance expressions, which are used in the policy rule, see Policies and Expressions.
To enable LDAP referral support by using the command line interface

At the command prompt, type the following commands:

- `set authentication ldapAction <name> -followReferrals ON`
- `set authentication ldapAction <name> -maxLDAPReferrals <integer>`

Example

1. `> set authentication ldapAction ldapAction-1 -followReferrals ON`
2. `> set authentication ldapAction ldapAction-1 -maxLDAPReferrals 2`

To enable LDAP referral support by using the configuration utility

Note

In the configuration utility, the term server is used instead of action, but refers to the same task.

1. Navigate to Security > AAA - Application Traffic > Policies > LDAP.
2. In the details pane, on the Servers tab, select the LDAP server that you want to configure, and then click Edit.
3. In the Configure Authentication Server dialog, scroll down to the Referrals check box, and select it.
4. In the Maximum Referral Level text box, type the maximum number of referrals to allow.
5. Click OK, and then click Close.

Key-based authentication support for LDAP users

With key-based authentication, you can now fetch the list of public keys that are stored on the user object in LDAP server through SSH. The NetScaler appliance during role-based authentication (RBA) process must extract public SSH keys from the LDAP server. The retrieved public key, which is compatible with SSH, must allow you to log in through RBA method.

A new attribute “sshPublicKey” is introduced in the “add authentication ldapAction” and “set authentication ldapAction” commands. By using this attribute, you can obtain the following benefits:

- Can store the retrieved public key, and the LDAP action uses this attribute to retrieve SSH key information from LDAP server.
- Can extract attribute names of up to 24 KB.

Note

The external authentication server, such as LDAP is used only to retrieve SSH key information. It is not used for authentication purpose.
Following is an example of the flow of events through SSH:

- SSH daemon sends an AAA_AUTHENTICATE request with password field empty to AAA daemon port.
- If LDAP is configured to store the SSH public key, AAA responds with “sshPublicKey” attribute along with other attributes.
- SSH daemon verifies these keys with the client keys.
- SSH daemon passes user name in the request payload, and AAA returns the keys specific to this user along with generic keys.

To configure the sshPublicKey attribute, at the command prompt type the following commands:

- With add operation, you can add “sshPublicKey” attribute while configuring ldapAction command.

```
add authentication ldapAction <name> { -serverIP <ip_addr|ipv6_addr |*> | { -servername <string> } } [-serverPort <port>] … [-Attribute1 < string>] … [-Attribute16 <string>][-sshPublicKey <string>][-authentication off]
```

- With set operation, you can configure “sshPublicKey” attribute to an already added ldapAction command.

```
set authentication ldapAction <name> [-sshPublicKey <string>][-authentication off]
```

Negotiate authentication policies

September 14, 2018

As with other types of authentication policies, a Negotiate authentication policy is comprised of an expression and an action. After creating an authentication policy, you bind it to an authentication virtual server and assign a priority to it. When binding it, you also designate it as either a primary or a secondary policy.

In addition to standard authentication functions, the Negotiate Action command can now extract user information from a keytab file instead of requiring you to enter that information manually. If a keytab has more than one SPN, AAA selects the correct SPN. You can configure this feature at the command line, or by using the configuration utility.

Note: These instructions assume that you are already familiar with the LDAP protocol and have already configured your chosen LDAP authentication server.
To configure AAA to extract user information from a keytab file by using the command line interface

At the command prompt, type the appropriate command:

- `add authentication negotiateAction <name> [-keytab <string>]`
- `set authentication negotiateAction <name> [-keytab <string>]`

Example

```
1 > set authentication negotiateAction negotiateAction-1 -keytab keytab-1
```

To configure AAA to extract user information from a keytab file by using the configuration utility

Note

In the configuration utility, the term server is used instead of action, but refers to the same task.

2. In the details pane, on the Servers tab, do one of the following:
   - If you want to create a new Negotiate action, click Add.
   - If you want to modify an existing Negotiate action, in the data pane select the action, and then click Edit.
3. If you are creating a new Negotiate action, in the Name text box, type a name for your new action. The name can be from one to 127 characters in length and can consist of upper- and lowercase letters, numbers, and the hyphen (-) and underscore (_) characters. If you are modifying an existing Negotiate action, skip this step. The name is read-only; you cannot change it.
4. Under Negotiate, if the Use Keytab file check box is not already checked, check it.
5. In the Keytab file path text box, type the full path and filename of the keytab file that you want to use.
6. In the Default authentication group text box, type the authentication group that you want to set as default for this user.
7. Click Create or OK to save your changes.

RADIUS authentication policies

September 14, 2018

As with other types of authentication policies, a Remote Authentication Dial In User Service (RADIUS) authentication policy is comprised of an expression and an action. After creating an authentication policy, you bind it to an authentication virtual server and assign a priority to it. When binding it, you
also designate it as either a primary or a secondary policy. However, setting up a RADIUS authentication policy has certain special requirements that are described below.

Normally you configure the NetScaler appliance to use the IP address of the authentication server during authentication. With RADIUS authentication servers, you can now configure the ADC to use the FQDN of the RADIUS server instead of its IP address to authenticate users. Using an FQDN can simplify an otherwise much more complex AAA configuration in environments where the authentication server might be at any of several IP addresses, but always uses a single FQDN. To configure authentication by using a server’s FQDN instead of its IP address, you follow the normal configuration process except when creating the authentication action. When creating the action, you substitute the `serverName` parameter for the `serverIP` parameter.

Before you decide whether to configure the NetScaler appliance to use the IP or the FQDN of your RADIUS server to authenticate users, consider that configuring AAA to authenticate to an FQDN instead of an IP address adds an extra step to the authentication process. Each time the ADC authenticates a user, it must resolve the FQDN. If a great many users attempt to authenticate simultaneously, the resulting DNS lookups might slow the authentication process.

Note

These instructions assume that you are already familiar with the RADIUS protocol and have already configured your chosen RADIUS authentication server.

For more information about setting up authentication policies in general, see Authentication Policies. For more information about NetScaler appliance expressions, which are used in the policy rule, see Policies and Expressions.

To add an authentication action for a RADIUS server by using the command line interface

If you authenticate to a RADIUS server, you need to add an explicit authentication action. To do this, at the command prompt, type the following command:

```
add authentication radiusAction <name> [-serverIp <IP> | -serverName <FQDN>] [-serverPort <port>] [-authTimeout <positive_integer>] { -radKey } [-radNASip ( ENABLED | DISABLED |)] [-radNASid <string>] [-radVendorID <positive_integer>] [-radAttributeType <positive_integer>] [-radGroupsPrefix <string>] [-radGroupSeparator <string>] [-passEncoding <passEncoding>] [-ipVendorID <positive_integer>] [-ipAttributeType <positive_integer>] [-accounting ( ON | OFF )][-pwdVendorID <positive_integer> [-pwdAttributeType <positive_integer>]] [-defaultAuthenticationGroup <string>] [-callingstationid ( ENABLED | DISABLED )]
```
The following example adds a RADIUS authentication action named `Authn-Act-1`, with the server IP `10.218.24.65`, the server port `1812`, the authentication timeout `15` minutes, the radius key `WareTheLorax`, NAS IP disabled, and NAS ID `NAS1`.

```bash
> add authentication radiusaction Authn-Act-1 -serverip 10.218.24.65 -serverport 1812 -authtimeout 15 -radkey WareTheLorax -radNASip DISABLED -radNASid NAS1
2 Done
```

The following example adds the same RADIUS authentication action, but using the server FQDN `rad01.example.com` instead of the IP.

```bash
> add authentication radiusaction Authn-Act-1 -servername rad01.example.com -serverport 1812 -authtimeout 15 -radkey WareTheLorax -radNASip DISABLED -radNASid NAS1
2 Done
```

To configure an authentication action for an external RADIUS server by using the command line

To configure an existing RADIUS action, at the command prompt, type the following command:

```
set authentication radiusAction <name> [-serverip <IP> | -servername <FQDN>][-serverPort <port>][ -authtimeout <positive_integer>] { -radKey } [-radNASip ( ENABLED | DISABLED )][ -radVendorID < positive_integer>][ -radAttributeType <positive_integer>][ -radGroupsPrefix <string>][ -radVendorID <positive_integer>][ -ipVendorID <positive_integer>][ -ipAttributeType <positive_integer>][ -ipVendorID <positive_integer>][ -ipAttributeType <positive_integer>][ -accounting ( ON | OFF )][ -pwdVendorID <positive_integer>][ -pwdAttributeType <positive_integer>][ -pwdVendorID <positive_integer>][ -pwdAttributeType <positive_integer>][ -defaultAuthenticationGroup <string>][ -callingstationid ( ENABLED | DISABLED )]
```

To remove an authentication action for an external RADIUS server by using the command line interface

To remove an existing RADIUS action, at the command prompt, type the following command:

```
rm authentication radiusAction <name>
```

Example

```bash
> rm authentication radiusaction Authn-Act-1
2 Done
```
**To configure a RADIUS server by using the configuration utility**

**Note**

In the configuration utility, the term server is used instead of action, but refers to the same task.

1. Navigate to Security > AAA - Application Traffic > Policies > Authentication > Radius
2. In the details pane, on the Servers tab, do one of the following:
   - To create a new RADIUS server, click Add.
   - To modify an existing RADIUS server, select the server, and then click Edit.
3. In the Create Authentication RADIUS Server or Configure Authentication RADIUS Server dialog, type or select values for the parameters. To fill out parameters that appear beneath Send Calling Station ID, expand Details.
   - Name*—radiusActionName (Cannot be changed for a previously configured action)
   - Authentication Type*—authtype (Set to RADIUS, cannot be changed)
   - Server Name / IP Address*—Choose either Server Name or Server IP
     - Server Name*—servername <FQDN>
     - IP Address*—serverIp <IP> If the server is assigned an IPv6 IP address, select the IPv6 check box.
   - Port*—serverPort
   - Time-out (seconds)*—authTimeout
   - Secret Key*—radKey (RADIUS shared secret.)
   - Confirm Secret Key*—Type the RADIUS shared secret a second time. (No command line equivalent.)
   - Send Calling Station ID—callingstationid
   - Group Vendor Identifier—radVendorID
   - Group Attribute Type—radAttributeType
   - IP Address Vendor Identifier—ipVendorID
   - pwdVendorID—pwdVendorID
   - Password Encoding—passEncoding
   - Default Authentication Group—defaultAuthenticationGroup
   - NAS ID—radNASid
   - Enable NAS IP address extraction—radNASip
   - Group Prefix—radGroupsPrefix
   - Group Separator—radGroupSeparator
   - IP Address Attribute Type—ipAttributeType
   - Password Attribute Type—pwdAttributeType
   - Accounting—accounting
4. Click Create or OK. The policy that you created appears in the Servers page.
SAML authentication policies

September 14, 2018

For information on NetScaler appliance as a SAML SP and IdP, see SAML Authentication.

Web authentication policies

September 21, 2018

AAA is now able to authenticate a user to a web server, providing the credentials that the web server requires in an HTTP request and analyzing the web server response to determine that user authentication was successful. As with other types of authentication policies, a Web authentication policy is comprised of an expression and an action. After creating an authentication policy, you bind it to an authentication virtual server and assign a priority to it. When binding it, you also designate it as either a primary or a secondary policy.

To set up web-based authentication with a specific web server, first you create a web authentication action. Since authentication to web servers does not use a rigid format, you must specify exactly which information the web server requires and in which format when creating the action. To do this, you create an expression in NetScaler appliance default syntax that contains the following items:

- **Server IP**—The IP address of the authentication Web server.
- **Server Port**—The port of the authentication Web server.
- **Authentication Rule**—An expression in NetScaler appliance default syntax that contains the user’s credentials in the format that the Web server expects.
- **Scheme**—HTTP (for unencrypted web authentication) or HTTPS (for encrypted web authentication).
- **Success Rule**—An expression in NetScaler appliance default syntax that matches the web server response string that signifies that the user authenticated successfully.

For all other parameters, follow the normal rules for the add authentication action command.

Next you create a policy associated with that action. The policy is similar to an LDAP policy, and like LDAP policies uses NetScaler appliance syntax.

**Note**

These instructions assume that you are already familiar with the authentication requirements of the web server(s) to which you want to authenticate, and have already configured the web authentication server.
To configure a Web authentication action by using the command line interface

To create a web authentication action at the command line, at the command line type the following command:

```
add authentication webAuthAction <name> -serverIP <ip_addr|ipv6_addr|*> -serverPort <port|*> [-fullReqExpr <string>] -scheme (http | https) -successRule <expression> [-defaultAuthenticationGroup <string>][-Attribute1 <string>][-Attribute2 <string>][-Attribute3 <string>][-Attribute4 <string>][-Attribute5 <string>][-Attribute6 <string>][-Attribute7 <string>][-Attribute8 <string>][-Attribute9 <string>][-Attribute10 <string>][-Attribute11 <string>][-Attribute12 <string>][-Attribute13 <string>][-Attribute14 <string>][-Attribute15 <string>][-Attribute16 <string>]
```

Example

```
1 > add authentication webAuthAction webauth1 -serverIP 10.214.56.31 -serverPort 80 -
```

To configure a Web authentication action by using the configuration utility

Note

In the configuration utility, the term server is used instead of action, but refers to the same task.

1. Navigate to Security > AAA - Application Traffic > Policies > LDAP.
2. In the details pane, on the Servers tab, do one of the following:
   • If you want to create a new web authentication action, click Add.
   • If you want to modify an existing web authentication action, in the data pane select the action, and then click Edit.
3. If you are creating a new web authentication action, in the Create Authentication Web server dialog box, Name text box, type a name for the new web authentication action. The name can be from one to 127 characters in length, and can consist of upper- and lowercase letters, numbers, and the hyphen (-) and underscore (_) characters. If you are modifying an existing web authentication action, skip this step. The name is read-only; you cannot change it.
4. In the Web Server IP Address text box, type the IPv4 or IPv6 IP address of the authentication web server. If the address is an IPv6 IP address, select the IPv6 check box first.
5. In the Port text box, type the port number on which the web server accepts connections.
6. Select HTTP or HTTPS in the Protocol drop-down list.
7. In the HTTP Request Expression text area, type a PCRE-format regular expression that creates the web server request that contains the user’s credentials in the exact format expected by the authentication web server.
8. In the Expression to validate the Authentication text area, type a NetScaler appliance default syntax expression that describes the information in the web server response that indicates that user authentication was successful.
9. Fill out the remaining fields as described in the general authentication action documentation.
10. Click OK.

**Configuring advanced authentication policies**

September 14, 2018

If you know exactly how you want an authentication policy to be configured, you can use the advanced authentication policy dialog to create the policy quickly.

**To configure an advanced authentication policy by using the configuration utility**

2. In the details pane do one of the following:
   - To create a new policy, click Add.
   - To modify an existing policy, select the policy, and then click Edit.
3. In the Create Authentication Policy or Configure Authentication Policy dialog box, type or select values for the parameters.
   - Name*—The policy name. Cannot be changed for a previously configured policy.
   - Action Type*—The policy type: Cert, Negotiate, LDAP, RADIUS, SAML, SAMLIDP, TACACS, or WEBAUTH.
   - Action*—The authentication action (profile) to associate with the policy. You can choose an existing authentication action, or click the plus and create a new action of the proper type.
   - Log Action—The audit action to associate with the policy. You can choose an existing audit action, or click the plus and create a new action.
   - Expression*—The rule that selects connections to which you want to apply the action that you specified. The rule can be simple (“true” selects all traffic) or complex. You enter expressions by first choosing the type of expression in the leftmost drop-down list beneath the Expression window, and then by typing your expression directly into the expression text area, or by clicking Add to open Add Expression dialog box and using the drop-down lists in it to construct your expression.)
   - Comment—You can type a comment that describes the type of traffic that this authentication policy will apply to. Optional.
4. Click Create or OK, and then click Close. If you created a policy, that policy appears in the Authentication Policies and Servers page.

Authorizing user access to application resources

November 6, 2018

You can control the resources that an authenticated user can access within an application.

To do this, associate an authorization policy to each of the users, either individually or by associating the policy to a group of users. The authorization policy must specify the following:

- **Rule.** The resource to which access must be authorized. This can be specified by using basic or advanced expressions.
- **Action.** Whether access to the resource must be allowed or denied.

By default, access to all resources within an application is **DENIED** to all users. However, you can change this default authorization action to **ALLOW** access to all users (by setting the session parameters in session profile or by setting the global session parameters).

**Warning**

For optimum security, Citrix recommends that you do not to change the default authorization action from **DENY** to **ALLOW**. Instead, it is advised to create specific authorization policies for users who need access to specific resources.

To configure authorization by using the CLI

1. Configure the authorization policy.

   ```bash
   ns-cli-prompt> add authorization policy <name> <rule> <action>
   ```

2. Associate the policy with the appropriate user or group.

   - Bind the policy to a specific user.
     ```bash
     ns-cli-prompt> bind aaa user <username> -policy <policyname>
     ```
   - Bind the policy to a specific group.
     ```bash
     ns-cli-prompt> bind aaa group <groupName> -policy <policyname>
     ```

To configure authorization by using the GUI (Configuration tab)

1. Create the authorization policy.

   Navigate to **Security > AAA - Application Traffic > Policies > Authorization**, click Add and then define the policy as required.
2. Associate the policy with the appropriate user or group.

Navigate to Security > AAA - Application Traffic > Users or Groups, and edit the relevant user or group to associate it with the authorization policy.

Sample authorization configurations

Here are some example configurations to authorize user access to some application resources. Note that these are CLI commands. You can do similar configurations using the GUI, although you must not enclose the expression within quotes (".

- add authorization policy authzpol1 "HTTP.REQ.URL.SUFFIX.EQ("gif")" ALLOW
- bind aaa user user1 -policy authzpol1
- add authorization policy authzpol2 "HTTP.REQ.URL.SUFFIX.EQ("png")" DENY
- bind aaa group group1 -policy authzpol2

Auditing authenticated sessions

September 14, 2018

You can configure the NetScaler appliance to keep a log of all the events that are triggered in an authenticated session. Using this information, you can audit state and status information, to see the history for users in chronological order.

To do this, define an audit policy that specifies the following:

- **Log type.** The logs can be stored remotely (syslog) or locally on the NetScaler appliance (nslog).
- **Rule.** The conditions on which the logs are stored.
- **Action.** Details of the log server and other details for creating the log entries.

This audit policy can be configured at different levels: user-level, group-level, AAA virtual server, and global system level. The policies configured at the user-level have the highest priority.

**Note**

This topic details steps for using syslog. Make necessary changes to use nslog.

**To configure syslog auditing by using the CLI**

1. Configure the audit server with the relevant log settings.
ns-cli-prompt> add audit syslogAction <name> <serverIP> …

2. Configure the audit policy by associating the audit server.

ns-cli-prompt> add audit syslogPolicy <name> <rule> <action>

3. Associate the audit policy with one of the following entities:
   - Bind the policy to a specific user.
     ns-cli-prompt> bind aaa user <userName> -policy <policyname> …
   - Bind the policy to a specific group.
     ns-cli-prompt> bind aaa group <groupName> -policy <policyname> …
   - Bind the policy to a AAA virtual server.
     ns-cli-prompt> bind authentication vserver <name> -policy <policyname> …
   - Bind the policy globally to the NetScaler appliance.
     ns-cli-prompt> bind tm global -policyName <policyname> …

To configure syslog auditing by using the GUI (Configuration tab)

1. Configure the audit server and policy.

   Navigate to Security > AAA - Application Traffic > Policies > Auditing > Syslog, and configure
   the server and the policy in the relevant tabs.

2. Associate the policy with one of the following:
   - Bind the policy to a specific user.
     Navigate to Security > AAA - Application Traffic > Users, and associate the authorization
     policy with the relevant user.
   - Bind the policy to a specific group.
     Navigate to Security > AAA - Application Traffic > Groups, and associate the authorization
     policy with the relevant group.
   - Bind the policy to a AAA virtual server.
     Navigate to Security > AAA - Application Traffic > Virtual Servers, and associate the au-
     thorization policy with the relevant virtual server.
   - Bind the policy globally to the NetScaler appliance.
     Navigate to Security > AAA - Application Traffic > Policies > Auditing > Syslog or Nslog,
     select the authorization policy, and click Action > Global Bindings to bind the policy glob-
     ally.
Session settings

September 14, 2018

After you configure your AAA profiles, you configure session settings to customize your user sessions. The session settings are:

- **The session timeout.**
  Controls the period after which the user is automatically disconnected and must authenticate again to access your intranet.

- **The default authorization setting.**
  Determines whether the NetScaler appliance will by default allow or deny access to content for which there is no specific authorization policy.

- **The single sign-on setting.**
  Determines whether the NetScaler appliance will log users onto all web applications automatically after they authenticate, or will pass users to the web application logon page to authenticate for each application.

- **The credential index setting.**
  Determines whether the NetScaler appliance will use primary or the secondary authentication credentials for single signon.

To configure the session settings, you can take one of two approaches. If you want different settings for different user accounts or groups, you create a profile for each user account or group for which you want to configure custom sessions settings. You also create policies to select the connections to which to apply particular profiles, and you bind the policies to users or groups. You can also bind a policy to the authentication virtual server that handles the traffic to which you want to apply the profile.

If you want the same settings for all sessions, or if you want to customize the default settings for sessions that do not have specific profiles and policies configured, you can simply configure the global session settings.

Session profiles

September 21, 2018

To customize your user sessions, you first create a session profile. The session profile allows you to override global settings for any of the session parameters.
NetScaler 12.0

Note
The terms “session profile” and “session action” mean the same thing.

To create a session profile by using the command line interface

At the command prompt, type the following commands to create a session profile and verify the configuration:

- `add tm sessionAction <name> [-sessTimeout <mins>] [-defaultAuthorizationAction (ALLOW | DENY)] [-SSO (ON | OFF)] [-ssoCredential (PRIMARY | SECONDARY)] [-ssoDomain <string>] [-httpOnlyCookie (YES | NO)] [-persistentCookie (ENABLED | DISABLED)] [-persistentCookieValidity <minutes>]`
- `show tm sessionAction <name>`

Example

```
1 > add tm sessionAction session-profile -sessTimeout 30 -defaultAuthorization ALLOW
2   Done
3 > show tm sessionAction session-profile
4 1) Name: session-profile
5    Authorization action : ALLOW
6    Session timeout: 30 minutes
7   Done
```

To modify a session profile by using the command line interface

At the command prompt, type the following commands to modify a session profile and verify the configuration:

- `set tm sessionAction <name> [-sessTimeout <mins>] [-defaultAuthorizationAction (ALLOW | DENY)] [-SSO (ON | OFF)] [-ssoCredential (PRIMARY | SECONDARY)] [-ssoDomain <string>] [-httpOnlyCookie (YES | NO)] [-persistentCookie (ENABLED | DISABLED)] [-persistentCookieValidity <minutes>]`
- `show tm sessionAction`

Example

```
1 > set tm sessionAction session-profile -sessTimeout 30 -defaultAuthorization ALLOW
```
To remove a session profile by using the command line interface

At the command prompt, type the following command to remove a session profile:

```
rm tm sessionAction <name>
```

To configure session profiles by using the configuration utility

3. In the details pane, click the Profiles tab.
4. On the Profiles tab, do one of the following:
   - To create a new session profile, click Add.
   - To modify an existing session profile, select the profile, and then click Edit.
5. In the Create TM Session Profile or Configure TM Session Profile dialog, type or select values for the parameters.
   - Name*—actionname (Cannot be changed for a previously configured session action.)
   - Session Time-out—sesstimeout
   - Single Signon to Web Applications—sso
   - Credential Index—ssocredential
   - Single Sign-on Domain—ssoDomain
   - HTTPOnly Cookie—httpOnlyCookie
   - Enable Persistent Cookie—persistentCookie
   - Persistent Cookie Validity—persistentCookieValidity
6. Click Create or OK. The session profile that you created appears in the Session Policies and Profiles pane.

Session policies

September 21, 2018
After you create one or more session profiles, you create session policies and then bind the policies globally or to an authentication virtual server to put them into effect.

To create a session policy by using the command line interface

At the command prompt, type the following commands to create a session policy and verify the configuration:

```
1 - add tm sessionPolicy <name> <rule> <action>
2 - show tm sessionPolicy <name>
```

Example

```
1 > add tm sessionPolicy session-pol "URL == /*.gif" session-profile
2 Done
3 > show tm sessionPolicy session-pol
4 1) Name: session-pol   Rule: URL == ’/*.gif’
5     Action: session-profile
6 Done
```

To modify a session policy by using the command line interface

At the command prompt, type the following commands to modify a session policy and verify the configuration:

```
1 - set tm sessionPolicy <name> [-rule <expression>] [-action <action>]
2 - show tm sessionPolicy <name>
```

Example

```
1 > set tm sessionPolicy session-pol "URL == /*.gif" session-profile
2 Done
3 > show tm sessionPolicy session-pol
4 1) Name: session-pol   Rule: URL == ’/*.gif’
5     Action: session-profile
6 Done
```

To globally bind a session policy by using the command line interface

At the command prompt, type the following commands to globally bind a session policy and verify the configuration:
bind tm global -policyName <policyname> [-priority <priority>]

Example

1  > bind tm global -policyName session-pol
2       Done
3
4  > show tm sessionPolicy session-pol
5 1)    Name: session-pol    Rule: URL == '/*.gif'
6    Action: session-profile
7    Policy is bound to following entities
8      1) TM GLOBAL    PRIORITY : 0
9       Done

To bind a session policy to an authentication virtual server by using the command line interface

At the command prompt, type the following command to bind a session policy to an authentication virtual and verify the configuration:

bind authentication vserver <name> -policy <policyname> [-priority <priority>]

Example

1  > bind authentication vserver auth-vserver-1 -policyName Session-Pol-1
2       -priority 1000
3       Done

To unbind a session policy from an authentication virtual server by using the command line interface

At the command prompt, type the following commands to unbind a session policy from an authentication virtual server and verify the configuration:

unbind authentication vserver <name> -policy <policyname>

Example

1  > unbind authentication vserver auth-vserver-1 -policyName Session-Pol-1
2       Done
To unbind a globally bound session policy by using the command line interface

At the command prompt, type the following commands to unbind a globally-bound session policy:

unbind tm global -policyName <policyname>

Example

```
1 > unbind tm global -policyName Session-Pol-1
2  Done
```

To remove a session policy by using the command line interface

First unbind the session policy from global, and then, at the command prompt, type the following commands to remove a session policy and verify the configuration:

rm tm sessionPolicy <name>

Example

```
1 > rm tm sessionPolicy Session-Pol-1
2  Done
```

To configure and bind session policies by using the configuration utility

3. In the details pane, on the Policies tab, do one of the following:
   • To create a new session policy, click Add.
   • To modify an existing session policy, select the policy, and then click Edit.
4. In the Create Session Policy or Configure Session Policy dialog, type or select values for the parameters.
   • Name*—policyname (Cannot be changed for a previously configured session policy.)
   • Request Profile*—actionname
   • Expression*—rule (You enter expressions by first choosing the type of expression in the leftmost drop-down list beneath the Expression text area and then typing your expression directly into the expression text area, or by clicking Add to open the Add Expression dialog box and using the drop-down lists in it to construct your expression.)
5. Click Create or OK. The policy that you created appears in the details pane of the Session Policies and Profiles page.
6. To globally bind a session policy, in the details pane, select Global Bindings from the Action drop-down list, and fill in the dialog.
NetScaler 12.0

- Select the name of the session policy you want to globally bind.
- Click **OK**.

7. To bind a session policy to an authentication virtual server, in the navigation pane, click **Virtual Servers**, and add that policy to the policies list.
   - In the details pane, select the virtual server, and then click **Edit**.
   - In the **Advanced Selections** to the right of the detail area, click **Policies**.
   - Select a policy, or click the **plus** icon to add a policy.
   - In the **Priority** column to the left, modify the default priority as needed to ensure that the policy is evaluated in the proper order.
   - Click **OK**.

   A message appears in the status bar, stating that the policy has been configured successfully.

**Global session settings**

September 21, 2018

In addition to or instead of creating session profiles and policies, you can configure global session settings. These settings control the session configuration when there is no explicit policy overriding them.

**To configure the session settings by using the command line interface**

At the command prompt, type the following commands to configure the global session settings and verify the configuration:

```bash
set tm sessionParameter [-sessTimeout <mins>] [-defaultAuthorizationAction (ALLOW | DENY)] [-SSO (ON | OFF)] [-ssoCredential (PRIMARY | SECONDARY)] [-ssoDomain <string>] [-httpOnlyCookie (YES | NO)] [-persistentCookie (ENABLED | DISABLED)] [-persistentCookieValidity <minutes>]
```

**Example**

```bash
1 > set tm sessionParameter -sessTimeout 30
   Done
2 > set tm sessionParameter -defaultAuthorizationAction DENY
   Done
3 > set tm sessionParameter -SSO ON
   Done
4 > set tm sessionParameter -ssoCredential PRIMARY
   Done
```
To configure the session settings by using the configuration utility

1. Navigate to Security > AAA - Application Traffic
2. In the details pane, under Settings, click Change global settings.
3. In the Global Session Settings dialog, type or select values for the parameters.
   • Session Time-out—sessTimeout
   • Single Sign-on to Web Applications—sso
   • Credential Index—ssoCredential
   • Single Sign-on Domain—ssoDomain
   • HTTPOnly Cookie—httpOnlyCookie
   • Enable Persistent Cookie—persistentCookie
   • Persistent Cookie Validity (minutes)—persistentCookieValidity
   • Home Page—homepage
4. Click OK.

Traffic Settings

September 14, 2018

If you use forms-based or SAML single sign-on (SSO) for your protected applications, you configure that feature in the Traffic settings. SSO enables your users to log on once to access all protected applications, rather than requiring them to log on separately to access each one.

Forms-based SSO allows you to use a web form of your own design as the sign-on method instead of a generic pop-up window. You can therefore put your company logo and other information you might want your users to see on the logon form. SAML SSO allows you to configure one NetScaler appliance or virtual appliance instance to authenticate to another NetScaler appliance on behalf of users who have authenticated with the first appliance.

To configure either type of SSO, you first create a forms or SAML SSO profile. Next, you create a traffic profile and link it to the SSO profile you created. Next, you create a policy, link it to the traffic profile. Finally, you bind the policy globally or to an authentication virtual server to put your configuration into effect.

Traffic profiles

September 21, 2018

After creating at least one forms or SAML sso profile, you must next create a traffic profile.
NetScaler 12.0

Note
In this feature, the terms “profile” and “action” mean the same thing.

To create a traffic profile by using the command line interface

At the command prompt, type:

```plaintext
add tm trafficAction <name> [-appTimeout <mins>] [-SSO ( ON | OFF ) [-formSSOAction <string>] [-persistentCookie ( ENABLED | DISABLED )] [-InitiateLogout ( ON | OFF )]
```

Example

```plaintext
1 add tm trafficAction Traffic-Prof-1 - appTimeout 10 -SSO ON - formSSOAction SSO-Prof-1
```

To modify a session profile by using the command line interface

At the command prompt, type:

```plaintext
set tm trafficAction <name> [-appTimeout <mins>] [-SSO ( ON | OFF ) [-formSSOAction <string>] [-persistentCookie ( ENABLED | DISABLED )] [-InitiateLogout ( ON | OFF )]
```

Example

```plaintext
1 set tm trafficAction Traffic-Prof-1 - appTimeout 10 -SSO ON - formSSOAction SSO-Prof-1
```

To remove a session profile by using the command line interface

At the command prompt, type:

```plaintext
rm tm trafficAction <name>
```

Example

```plaintext
1 rm tm trafficAction Traffic-Prof-1
```
To configure traffic profiles by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic > Traffic.**
2. Navigate to **Security > AAA - Application Traffic > Policies > Traffic.**
3. In the details pane, click the Profiles tab.
4. On the Profiles tab, do one of the following:
   - To create a new traffic profile, click **Add.**
   - To modify an existing traffic profile, select the profile, and then click **Edit.**
5. In the **Create Traffic Profile** or **Configure Traffic Profile** dialog box, specify values for the parameters.
   - Name*—name (Cannot be changed for a previously configured session action.)
   - AppTimeout—appTimeout
   - Single Sign-On—SSO
   - Form SSO Action—formSSOAction
   - SAML SSO Action—samlSSOAction
   - Enable Persistent Cookie—persistentCookie
   - Initiate Logout—InitiateLogout
6. Click **Create** or **OK.** The traffic profile that you created appears in the Traffic Policies, Profiles, and either the Form SSO Profiles or SAML SSO Profiles pane, as appropriate.

Traffic policies

September 21, 2018

After you create one or more form SSO and traffic profiles, you create traffic policies and then bind the policies, either globally or to a traffic management virtual server, to put them into effect.

To create a traffic policy by using the command line interface

At the command prompt, type:

```
add tm trafficPolicy <name> <rule> <action>
```

Example

```
add tm trafficPolicy Traffic-Pol-1 "HTTP.REQ.HEADER("Cookie") . CONTAINS( "login=true")" Traffic-Prof-1
```
To modify a traffic policy by using the command line interface

At the command prompt, type:

```
set tm trafficPolicy <name> <rule> <action>
```

Example

```
set tm trafficPolicy Traffic-Pol-1 "HTTP.REQ.HEADER("Cookie").CONTAINS("login=true")" Traffic-Prof-1
```

To globally bind a traffic policy by using the command line interface

At the command prompt, type:

```
bind tm global -policyName <string> [-priority <priority>]
```

Example

```
bind tm global -policyName Traffic-Pol-1
```

To bind a traffic policy to a load balancing or content switching virtual server by using the command line interface

At the command prompt, type one of the following commands:

- `bind lb vserver <name> -policy <policyName> [-priority <priority>]`
- `bind cs vserver <name> -policy <policyName> [-priority <priority>]`

Example

```
bind authentication vserver auth-vserver-1 -policyName Traffic-Pol-1 -priority 1000
```

To unbind a globally bound traffic policy by using the command line interface

At the command prompt, type:

```
unbind tm global -policyName <policyname>
```
To.unbind a traffic policy from a load balancing or content switching virtual server by using the command line interface

At the command prompt, type one of the following commands:

- `unbind lb vserver <name> -policy <policyname>`
- `unbind cs vserver <name> -policy <policyname>`

Example

```
unbind tm global -policyName Traffic-Pol-1
```

To remove a traffic policy by using the command line interface

First unbind the session policy from global, and then, at the command prompt, type:

```
rm tm trafficPolicy <name>
```

Example

```
rm tm trafficPolicy Traffic-Pol-1
```

To configure and bind traffic policies by using the configuration utility

1. Navigate to `Security > AAA - Application Traffic > Traffic`
3. In the details pane, do one of the following:
   - To create a new session policy, click `Add`.
   - To modify an existing session policy, select the policy, and then click `Edit`.
4. In the `Create Traffic Policy` or `Configure Traffic Policy` dialog, specify values for the parameters:
   - `Name`—`policyName` (Cannot be changed for a previously configured session policy.)
   - `Profile`—`actionName`
NetScaler 12.0

- Expression—rule (You enter expressions by first choosing the type of expression in the left-
  most drop-down list beneath the Expression text area and then typing your expression
directly into the expression text area, or by clicking Add to open the Add Expression dialog
box and using the drop-down lists in it to construct your expression.)

5. Click Create or OK. The policy that you created appears in the details pane of the Session Poli-
cies and Profiles page.

Form SSO profiles

September 21, 2018

To enable and configure forms-based SSO, you first create an SSO profile.

Note

- Forms-based single sign-on does not work if the form is customized to include Javascript.
- In this feature, the terms “profile” and “action” mean the same thing.

To create a form SSO profile by using the command line interface

At the command prompt, type:

```
• add tm formSSOAction <name> -actionURL <URL> -userField <string> -
  passwdField <string> -ssoSuccessRule <expression> [-nameValuePair <
  string>] [-responsesize <positive_integer>] [-nvtype ( STATIC | DYNAMIC
  )][-submitMethod ( GET | POST )]
• show tm formSSOAction [<name>]
```

Example

```
1. add tm formSSOAction SSO-Prof-1 -actionURL "/logon.php"
2. -userField "loginID" -passwdField "passwd"
3. -nameValuePair "loginID passwd" -responsesize "9096"
4. -ssoSuccessRule "HTTP.RES.HEADER("Set-Cookie").CONTAINS("LogonID")"
5. -nvtype STATIC -submitMethod GET
6. - sessTimeout 10 -defaultAuthorizationAction ALLOW
```

To modify a form SSO by using the command line interface

At the command prompt, type:
set tm formSSOAction <name> -actionURL <URL> -userField <string> -passwdField <string> -ssoSuccessRule <expression> [-nameValuePair <string>] [-responsesize <positive_integer>] [-nvtype (STATIC | DYNAMIC)] [-submitMethod (GET | POST)]

**Example**

```bash
1 set tm formSSOAction SSO-Prof-1 -actionURL "/logon.php"
2 -userField "loginID" -passwdField "passwd"
3 -ssoSuccessRule "HTTP.RES.HEADER("Set-Cookie").CONTAINS("LogonID")"
4 -nameValuePair "loginID passwd" -responsesize 9096
5 -nvtype STATIC -submitMethod GET
6 -sessTimeout 10 -defaultAuthorizationAction ALLOW
```

**To remove a form SSO profile by using the command line interface**

At the command prompt, type:

```bash
rm tm formSSOAction <name>
```

**Example**

```bash
1 rm tm sessionAction SSO-Prof-1
```

**To configure form SSO profiles by using the configuration utility**

2. In the details pane, click the Form SSO Profiles tab.
3. On the Form SSO Profiles tab, do one of the following:
   - To create a new form SSO profile, click Add.
   - To modify an existing form SSO profile, select the profile, and then click Edit.
4. In the Create Form SSO Profile or Configure Form SSO Profile dialog, specify values for the parameters:
   - Name*—name (Cannot be changed for a previously configured session action.)
   - Action URL*—actionURL
   - User Name Field*—userField
   - Password Field*—passField
   - Expression*—ssoSuccessRule
To enable and configure SAML-based SSO, you first create a SAML SSO profile.

To create a SAML SSO profile by using the command line interface

At the command prompt, type:

```
add tm samlSSOProfile <name> -samlSigningCertName <string> -assertionConsumerServiceURL <URL> -relaystateRule <expression> -sendPassword (ON | OFF)[-samlIssuerName <string>]
```

**Example**

```
add tm samlSSOProfile saml-SSO-Prof-1 -samlSigningCertName "Example, Inc." -assertionConsumerServiceURL "https://service.example.com" -relaystateRule "true" -sendPassword "ON" -samlIssuerName "Example, Inc."
```

To modify a SAML SSO by using the command line interface

At the command prompt, type:

```
set tm samlSSOProfile <name> -samlSigningCertName <string> -assertionConsumerServiceURL <URL> -relaystateRule <expression> -sendPassword (ON | OFF)[-samlIssuerName <string>]
```

**Example**
To remove a SAML SSO profile by using the command line interface

At the command prompt, type:

```
rm tm samlSSOProfile <name>
```

Example

```
rm tm sessionAction saml-SSO-Prof-1
```

To configure a SAML SSO profile by using the configuration utility

2. In the details pane, click the SAML SSO Profiles tab.
3. On the SAML SSO Profiles tab, do one of the following:
   • To create a new SAML SSO profile, click Add.
   • To modify an existing SAML SSO profile, select the profile, and then click OpenEdit.
4. In the Create SAML SSO Profiles or the Configure SAML SSO Profiles dialog box, set the following parameters:
   • Name*
   • Signing Certificate Name*
   • ACS URL*
   • Relay State Rule*
   • Send Password
   • Issuer Name
5. Click Create or OK, and then click Close. The SAML SSO profile that you created appears in the Traffic Policies, Profiles, and SAML SSO Profiles pane.

Session timeout for OWA 2010

September 21, 2018
You can now force OWA 2010 connections to time out after a specified period of inactivity. OWA sends repeated keepalive requests to the server to prevent timeouts. Keeping the connections open can interfere with single sign-on.

**To force OWA 2010 to timeout after a specified period by using the command line interface**

At the command prompt, type the following commands:

1. `add tm trafficAction <actname> [-forcedTimeout <forcedTimeout> -forcedTimeoutVal <mins>]`
   
   For `<actname>`, substitute a name for your traffic policy. For `<mins>`, substitute the number of minutes after which to initiate a forced timeout. For `<forcedTimeout>`, substitute one of the following values:
   
   - **START**—Starts the timer for forced timeout if a timer has not already been started. If a running timer exists, has no effect.
   - **STOP**—Stops a running timer. If no running timer is found, has no effect.
   - **RESET**—Restarts a running timer. If no running timer is found, starts a timer just as if the START option had been used.

2. `add tm trafficPolicy <polname> <rule> <actname>`
   
   For `<polname>`, substitute a name for your traffic policy. For `<rule>`, substitute a rule in NetScaler appliance default syntax.

3. `bind lb vserver <vservername> -policyName <name> -priority <number>`
   
   For `<vservername>`, substitute the name of the AAA traffic management virtual server. For `<priority>`, substitute an integer that designates the policy’s priority.

**Example**

```
1 add tm trafficAction act-owa2010timeout -forcedTimeout RESET -forcedTimeoutVal 10
2 add tm trafficPolicy pol-owa2010timeout true act-owa2010timeout
3 bind lb vserver vs-owa2010 -policyName pol-owa2010timeout -priority 10
```

**Authenticating with client certificates**

September 14, 2018
Web sites that contain sensitive content, such as online banking websites or websites with employee personal information, sometimes require client certificates for authentication. To configure AAA to authenticate users on the basis of client-side certificate attributes, you first enable client authentication on the traffic management virtual server and bind the root certificate to the authentication virtual server. Then, you implement one of two options. You can configure the default authentication type on the authentication virtual server as CERT, or you can create a certificate action that defines what the NetScaler appliance must do to authenticate users on the basis of a client certificate. In either case, your authentication server must support CRLs. You configure the ADC to extract the user name from the SubjectCN field or another specified field in the client certificate.

When the user tries to log on to an authentication virtual server for which an authentication policy is not configured, and a global cascade is not configured, the user name information is extracted from the specified field of the certificate. If the required field is extracted, the authentication succeeds. If the user does not provide a valid certificate during the SSL handshake, or if the user name extraction fails, authentication fails. After it validates the client certificate, the ADC presents a logon page to the user.

The following procedures assume that you have already created a functioning AAA configuration, and therefore they explain only how to enable authentication by using client certificates. These procedures also assume that you have obtained your root certificate and client certificates and have placed them on the ADC in the /nsconfig/ssl directory.

**To configure the AAA client certificate parameters by using the command line interface**

At the command prompt, type the following commands, in the order shown, to configure the certificate and verify the configuration:

- `add ssl certKey <certkeyName> -cert <certFile> -key <keyFile> -password -inform <inform> -expiryMonitor <expiryMonitor> -notificationPeriod <notificationPeriod>`
- `bind ssl certKey <certkeyName> -vServer <certkeyName> -CA -crlCheck Mandatory`
- `show ssl certKey [certkeyName]`
- `set aaa parameter -defaultAuthType CERT`
- `show aaa parameter`
- `set aaa certParams -userNameField "Subject:CN"`
- `show aaa certParams`
To configure the AAA client certificate parameters by using the configuration utility

2. In the details pane, select the virtual server that you want to configure to handle client certificate authentication, and then click Edit.
3. On the Configuration page, under Certificates, click the right arrow (>) to open the CA Cert Key installation dialog.
4. In the CA Cert Key dialog box, click Insert.
5. In the CA Cert Key - SSL Certificates dialog box, click Install.
6. In the Install Certificate dialog box, set the following parameters, whose names correspond to the CLI parameter names as shown:
   - Certificate-Key Pair Name*—certkeyName
   - Certificate File Name—certFile
   - Key File Name—keyFile
   - Certificate Format—inform
   - Password—password
   - Certificate Bundle—bundle
   - Notify When Expires—expiryMonitor
   - Notification Period—notificationPeriod
7. Click Install, and then click Close.
8. In the CA Cert Key dialog box, in the Certificate list, select the root certificate.
9. Click Save.
10. Click Back to return to the main configuration screen.
12. In the details pane, select the policy you want to configure to handle client certificate authentication, and then click Edit.
13. In the Configure Authentication CERT Policy dialog, Server drop-down list, select the virtual server you just configured to handle client certificate authentication.
14. Click OK. A message appears in the status bar, stating that the configuration completed successfully.

Support to notify number of unsuccessful login attempts

The NetScaler appliance can now log the number of unsuccessful login attempts made from the last successful log on. The feature works only if the persistentLoginAttempts option is enabled on the appliance. By default, the option is disabled on the NetScaler appliance.

A NetScaler administrator can use this information to verify if any unauthorized attempts have occurred on a secured external user account.

To use this feature, at the NetScaler appliance command prompt, type:
set aaa parameter [-maxLoginAttempts <value> [-failedLoginTimeout <value>]]
-persistentLoginAttempts (ENABLED | DISABLED)

Example:
set aaa parameter -maxLoginAttempts 4 -failedLoginTimeout 3 -persistentLoginAttempts ENABLED

Client certificate pass-through

September 21, 2018

The NetScaler appliance can now be configured to pass client certificates through to protected applications that require client certificates for user authentication. The ADC first authenticates the user, then inserts the client certificate into the request and sends it to the application. This feature is configured by adding appropriate SSL policies.

The exact behavior of this feature when a user presents a client certificate depends upon the configuration of the VPN virtual server.

- If the VPN virtual server is configured to accept client certificates but not require them, the ADC inserts the certificate into the request and then forwards the request to the protected application.
- If the VPN virtual server has client certificate authentication disabled, the ADC renegotiates the authentication protocol and reauthenticates the user before it inserts the client certificate in the header and forwards the request to the protected application.
- If the VPN virtual server is configured to require client certificate authentication, the ADC uses the client certificate to authenticate the user, then inserts the certificate in the header and forwards the request to the protected application.

In all of these cases, you configure client certificate pass-through as follows.

To create and configure client certificate pass-through by using the command line interface

At the command prompt, type the following commands:

- add vpn vserver <name> SSL <IP> 443

For <name>, substitute a name for the virtual server. The name must contain from one to 127 ASCII characters, beginning with a letter or underscore (_), and containing only letters, numbers, and the underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. For <IP>, substitute the IP address assigned to the virtual server."
• set ssl vserver <name> -clientAuth ENABLED -clientCert <clientcert>
  For <name>, substitute the name of the virtual server that you just created. For <clientCert>, substitute one of the following values:
  – disabled—disables client certificate authentication on the VPN virtual server.
  – mandatory—configures the VPN virtual server to require client certificates to authenticate.
  – optional—configures the VPN virtual server to allow client certificate authentication, but not to require it.

• bind vpn vserver \<name\> -policy local
  For <name>, substitute the name of the VPN virtual server that you created.

• bind vpn vserver \<name\> -policy cert
  For <name>, substitute the name of the VPN virtual server that you created.

• bind ssl vserver \<name\> -certkeyName \<certkeyname\>
  For <name>, substitute the name of the virtual server that you created. For <certkeyName>, substitute the client certificate key.

• bind ssl vserver \<name\> -certkeyName \<certkeyname\> -CA -ocspCheck
  Optional
  For <name>, substitute the name of the virtual server that you created. For <cacertkeyName>, substitute the CA certificate key.

• add ssl action \<actname\> -clientCert ENABLED -certHeader CLIENT-CERT
  For <actname>, substitute a name for the SSL action.

• add ssl policy \<polname\> -rule true -action \<actname\>
  For <polname>, substitute a name for your new SSL policy. For <actname>, substitute the name of the SSL action that you just created.

• bind ssl vserver \<name\> -policyName \<polname\> -priority 10
  For <name>, substitute the name of the VPN virtual server.

Example

1  add vpn vserver vs-certpassthru SSL 10.121.250.75 443
2  set ssl vserver vs-certpassthru -clientAuth ENABLED -clientCert optional
3  bind vpn vserver vs-certpassthru -policy local
4  bind vpn vserver vs-certpassthru -policy cert
5  bind ssl vserver vs-certpassthru -certkeyName mycertKey
6  bind ssl vserver vs-certpassthru -certkeyName mycertKey -CA -ocspCheck
    Optional
7  add ssl action act-certpassthru -clientCert ENABLED -certHeader CLIENT-CERT
Configuring AAA with commonly used protocols

September 14, 2018

Configuring the NetScaler appliance for AAA needs a specific setup on the NetScaler appliance and clients’ browsers. The configuration varies with the protocol used for AAA.

For more information about configuring the NetScaler appliance for Kerberos authentication, see Handling Authentication, Authorization and Auditing with Kerberos/NTLM.

Handling authentication, authorization and auditing with Kerberos/NTLM

January 6, 2019

Kerberos, a computer network authentication protocol, provides secure communication over the Internet. Designed primarily for client-server applications, it provides for mutual authentication by which the client and server can each ensure the other’s authenticity. Kerberos uses a trusted third party, referred to as Key Distribution Center (KDC). A KDC consists of an Authentication Server (AS), which authenticates a user, and a Ticket Granting Server (TGS).

Each entity on the network (client or server) has a secret key that is known only to itself and the KDC. The knowledge of this key implies authenticity of the entity. For communication between two entities on the network, the KDC generates a session key, referred to as the Kerberos ticket or service ticket. The client makes a request to the AS for credentials for a specific server. The client then receives a ticket, referred to as Ticket Granting Ticket (TGT). The client then contacts the TGS, using the TGT it received from the AS to prove its identity, and asks for a service. If the client is eligible for the service, the TGS issues a Kerberos ticket to the client. The client then contacts the server hosting the service (referred to as the service server), using the Kerberos ticket to prove that it is authorized to receive the service. The Kerberos ticket has a configurable lifetime. The client authenticates itself with the AS only once. If it contacts the physical server multiple times, it reuses the AS ticket.

The following figure shows the basic functioning of the Kerberos protocol.

Figure 1. Functioning of Kerberos

Kerberos authentication has the following advantages:
- Faster authentication. When a physical server gets a Kerberos ticket from a client, the server has enough information to authenticate the client directly. It does not have to contact a domain controller for client authentication, and therefore the authentication process is faster.
- Mutual authentication. When the KDC issues a Kerberos ticket to a client and the client uses the ticket to access a service, only authenticated servers can decrypt the Kerberos ticket. If the virtual server on the NetScaler appliance is able to decrypt the Kerberos ticket, you can conclude that both the virtual server and client are authenticated. Thus, the authentication of the server happens along with the authentication of the client.
- Single sign-on between Windows and other operating systems that support Kerberos.

**Kerberos authentication may have the following disadvantages:**

- Kerberos has strict time requirements; the clocks of the involved hosts must be synchronized with the Kerberos server clock to ensure that the authentication does not fail. You can mitigate this disadvantage by using the Network Time Protocol daemons to keep the host clocks synchronized. Kerberos tickets have an availability period, which you can configure.
- Kerberos needs the central server to be available continuously. When the Kerberos server is down, no one can log on. You can mitigate this risk by using multiple Kerberos servers and fallback authentication mechanisms.
- Because all the authentication is controlled by a centralized KDC, any compromise in this infrastructure, such as the user’s password for a local workstation being stolen, can allow an attacker to impersonate any user. You can mitigate this risk to some extent by using only a desktop machine or laptop that you trust, or by enforcing preauthentication by means of a hardware-token.

To use Kerberos authentication, you must configure it on the NetScaler appliance and on each client.

**Optimizing Kerberos authentication on AAA**

The NetScaler appliance now optimizes and improves the system performance while Kerberos authentication. The AAA daemon remembers the outstanding Kerberos request for the same user to avoid load on Key Distribution Center (KDC), which will avoid duplicate requests.

**How NetScaler appliance implements Kerberos for client authentication**

January 28, 2019

**Important**

Kerberos/NTLM authentication is supported only in the NetScaler 9.3 nCore release or later, and it can be used only for AAA traffic management virtual servers.

NetScaler appliance handles the components involved in Kerberos authentication in the following way:
**Key Distribution Center (KDC)**

In the Windows 2000 Server or later versions, the Domain Controller and KDC are part of the Windows Server. If the Windows Server is UP and running, it indicates that the Domain Controller and KDC are configured. The KDC is also the Active Directory server.

**Note**

All Kerberos interactions are validated with the Windows Kerberos Domain Controller.

**Authentication service and protocol negotiation**

A NetScaler appliance supports Kerberos authentication on the AAA traffic management authentication virtual servers. If the Kerberos authentication fails, the NetScaler appliance uses the NTLM authentication.

By default, Windows 2000 Server and later Windows Server versions use Kerberos for AAA. If you create an authentication policy with NEGOTIATE as the authentication type, the NetScaler appliance attempts to use the Kerberos protocol for AAA and if the client’s browser fails to receive a Kerberos ticket, the NetScaler appliance uses the NTLM authentication. This process is referred to as negotiation.

The client may fail to receive a Kerberos ticket in any of the following cases:

- Kerberos is not supported on the client.
- Kerberos is not enabled on the client.
- The client is in a domain other than that of the KDC.
- The Access Directory on the KDC is not accessible to the client.

For Kerberos/NTLM authentication, the NetScaler appliance does not use the data that is present locally on the NetScaler appliance.

**Authorization**

The traffic management virtual server can be a load balancing virtual server or a content switching virtual server.

**Auditing**

The NetScaler appliance supports auditing of Kerberos authentication with the following audit logging:

- Complete audit trail of the traffic management end-user activity
- SYSLOG and high performance TCP logging
- Complete audit trail of system administrators
- All system events
- Scriptable log format

**Supported Environment**

Kerberos authentication does not need any specific environment on the NetScaler appliance. The client (browser) must provide support for Kerberos authentication.

**High Availability**

In a high availability setup, only the active NetScaler appliance joins the domain. In case of a failover, the NetScaler appliance lwagent daemon joins the secondary NetScaler appliance to the domain. No specific configuration is required for this functionality.

**Kerberos authentication process**

The following figure shows a typical process for Kerberos authentication in the NetScaler appliance environment.

Figure 1. Kerberos Authentication Process on NetScaler appliance

The Kerberos authentication occurs in the following stages:

**Client authenticates itself to the KDC**

1. The NetScaler appliance receives a request from a client.
2. The traffic management (load balancing or content switching) virtual server on the NetScaler appliance sends a challenge to the client.
3. To respond to the challenge, the client gets a Kerberos ticket.
   - The client sends the Authentication Server of the KDC a request for a ticket-granting ticket (TGT) and receives the TGT. (See 3, 4 in the figure, Kerberos Authentication Process.)
   - The client sends the TGT to the Ticket Granting Server of the KDC and receives a Kerberos ticket. (See 5, 6 in the figure, Kerberos Authentication Process.)

**Note**

The above authentication process is not necessary if the client already has a Kerberos ticket whose lifetime has not expired. In addition, clients such as Web Services, .NET, or J2EE, which support SPNEGO, get a Kerberos ticket for the target server, create an SPNEGO token, and insert the token in the HTTP header when they send an HTTP request. They do not go through the client...
authentication process.

**Client requests a service.**

1. The client sends the Kerberos ticket containing the SPNEGO token and the HTTP request to the traffic management virtual server on the NetScaler appliance. The SPNEGO token has the necessary GSSAPI data.
2. The NetScaler appliance establishes a security context between the client and the NetScaler appliance. If the NetScaler appliance cannot accept the data provided in the Kerberos ticket, the client is asked to get a different ticket. This cycle repeats till the GSSAPI data is acceptable and the security context is established. The traffic management virtual server on the NetScaler appliance acts as an HTTP proxy between the client and the physical server.

**NetScaler appliance completes the authentication.**

1. After the security context is complete, the traffic management virtual server validates the SPNEGO token.
2. From the valid SPNEGO token, the virtual server extracts the user ID and GSS credentials, and passes them to the authentication daemon.
3. A successful authentication completes the Kerberos authentication.

**Note**

The NetScaler appliance can only support Kerberos (NEGOTIATE) SSO with backend.

**Configuring kerberos authentication on the NetScaler appliance**

September 14, 2018

This topic provides the detailed steps to configure Kerberos authentication on the NetScaler appliance by using the CLI and the GUI.

**Configuring Kerberos authentication on the CLI**

1. Enable the AAA feature to ensure the authentication of traffic on the appliance.

```
ns-cli-prompt> enable ns feature AAA
```

2. Add the keytab file to the NetScaler appliance. A keytab file is necessary for decrypting the secret received from the client during Kerberos authentication. A single keytab file contains authentication details for all the services that are bound to the traffic management virtual server on the NetScaler appliance.

First generate the keytab file on the Active Directory server and then transfer it to the NetScaler appliance.
a) Log on to the Active Directory server and add a user for Kerberos authentication. For example, to add a user named “Kerb-SVC-Account”:

```
net user Kerb-SVC-Account freebsd!@#456 /add
```

Note
In the User Properties section, ensure that the “Change password at next logon option” is not selected and the “Password does not expire” option is selected.

b) Map the HTTP service to the above user and export the keytab file. For example, run the following command on the Active Directory server:

```
ktpass /out keytabfile /princ HTTP/owa.newacp.com@NEWACP.COM /pass freebsd!@#456 /mapuser newacp\dummy /ptype KRB5_NT_PRINCIPAL
```

Note
You can map more than one service if authentication is required for more than one service. If you want to map more services, repeat the above command for every service. You can give the same name or different names for the output file.

c) Transfer the keytab file to the NetScaler appliance by using the unix `ftp` command or any other file transfer utility of your choice.

d) Log on to the NetScaler appliance, and run the `ktutil` utility to verify the keytab file. The keytab file has an entry for the HTTP service after it is imported.

The `ktutil` interactions are as follows:

```
root@ns# ktutil
ktutil: rkt /var/keytabfile
ktutil: list
slot KVNO Principal

ktutil: wkt /etc/krb5.keytab
ktutil: list
slot KVNO Principal

1 2 HTTP/owa.newacp.com@NEWACP.COM

ktutil: quit
```

3. The NetScaler appliance must obtain the IP address of the domain controller from the fully qualified domain name (FQDN). Therefore, Citrix recommends configuring the NetScaler appliance with a DNS server.

```
ns-cli-prompt> add dns nameserver <ip-address>
```
4. Configure the authentication action and then associate it to an authentication policy.
   a) Configure the negotiate action.
      
      `ns-cli-prompt> add authentication negotiateAction <name> -domain <domainName> -domainUser <domainUsername> -domainUserPasswd <domainUserPassword>`
      
      b) Configure the negotiate policy and associate the negotiate action to this policy.
      
      `ns-cli-prompt> add authentication negotiatePolicy <name> <rule> <reqAction>`

5. Create an authentication virtual server and associate the negotiate policy with it.
   a) Create an authentication virtual server.
      
      `ns-cli-prompt> add authentication vserver <name> SSL <ipAuthVserver> 443 -authenticationDomain <domainName>`
      
   b) Bind the negotiate policy to the authentication virtual server.
      
      `ns-cli-prompt> bind authentication vserver <name> -policy <negotiatePolicyName>`

6. Associate the authentication virtual server with the traffic management (load balancing or content switching) virtual server.

   `ns-cli-prompt> set lb vserver <name> -authn401 ON -authnVsName <string>`

   **Note**
   Similar configurations can also be done on the content switching virtual server.

7. Verify the configurations by doing the following:
   a) Access the traffic management virtual server, using the FQDN. For example, Sample
   b) View the details of the session on the CLI.
      
      `ns-cli-prompt> show aaa session`

**Configuring Kerberos authentication on the GUI**

1. Enable the AAA feature.
   
   Navigate to System > Settings, click Configure Basic Features and enable the AAA feature.

2. Add the keytab file as detailed in step 2 of the CLI procedure mentioned above.
3. Add a DNS server.
   Navigate to **Traffic Management > DNS > Name Servers**, and specify the IP address for the DNS server.

4. Configure the **Negotiate** action and policy.
   Navigate to **Security > AAA - Application Traffic > Policies > Authentication > Advanced Policies > Policy**, and create a policy with **Negotiate** as the action type.

5. Bind the negotiate policy to the authentication virtual server.
   Navigate to **Security > AAA - Application Traffic > Virtual Servers**, and associate the **Negotiate** policy with the authentication virtual server.

6. Associate the authentication virtual server with the traffic management (load balancing or content switching) virtual server.
   Navigate to **Traffic Management > Load Balancing > Virtual Servers**, and specify the relevant authentication settings.

   **Note**
   Similar configurations can also be done on the content switching virtual server.

7. Verify the configurations as detailed in step 7 of the CLI procedure mentioned above.

### Configuring kerberos authentication on a client

September 14, 2018

Kerberos support must be configured on the browser to use Kerberos for authentication. You can use any Kerberos-compliant browser. Instructions for configuring Kerberos support on Internet Explorer and Mozilla Firefox follow. For other browsers, see the documentation of the browser.

**To configure Internet Explorer for Kerberos authentication**

1. In the **Tools** menu select **Internet Options**.
2. On the **Security** tab, click **Local Intranet**, and then click **Sites**.
3. In the **Local Intranet** dialog box, make sure that the Automatically detect intranet network option is selected, and then click **Advanced**.
4. In the **Local Intranet** dialog box, add the web sites of the domains of the traffic management virtual server on the NetScaler appliance. The specified sites become local intranet sites.
5. Click **Close** or **OK** to close the dialog boxes.
**To configure Mozilla Firefox for Kerberos authentication**

1. Make sure that you have Kerberos properly configured on your computer.
2. Type about:config in the URL bar.
3. In the filter text box, type network.negotiate.
4. Change network.negotiate-auth.delegation-uris to the domain that you want to add.
5. Change network.negotiate-auth.trusted-uris to the domain that you want to add.

   Note: If you are running Windows, you also need to enter sspi in the filter text box and change the network.auth.use-sspi option to False.

**Offloading Kerberos authentication from physical servers**

January 6, 2019

The NetScaler appliance can offload authentication tasks from servers. Instead of the physical servers authenticating the requests from clients, the NetScaler appliance authenticates all the client requests before it forwards them to any of the physical servers bound to it. The user authentication is based on Active Directory tokens.

There is no authentication between the NetScaler appliance and the physical server, and the authentication offload is transparent to the end users. After the initial logon to a Windows computer, the end user does not have to enter any additional authentication information in a pop-up or on a logon page.

In the current NetScaler appliance release, Kerberos authentication is available only for AAA traffic management virtual servers. Kerberos authentication is not supported for SSL VPN in the Citrix Gateway Enterprise Edition appliance or for NetScaler appliance management.

Kerberos authentication requires configuration on the NetScaler appliance and on client browsers.

**To configure Kerberos authentication on the NetScaler appliance**

1. Create a user account on Active Directory. When creating a user account, verify the following options in the User Properties section:
   - Make sure that you do not select the Change password at next logon option.
   - Be sure to select the Password does not expire option.
2. On the AD server, at the CLI command prompt, type:
   - `ktpass -princ HTTP/kerberos.crete.lab.net@crete.lab.net -ptype KRB5_NT_PRINCIPAL -mapuser kerbuser@crete.lab.net -mapop set -pass Citrix1 -out C:\kerstabfile.txt`
3. Upload the kerbtabfile.txt file to the /etc directory of the NetScaler appliance by using a Secure Copy (SCP) client.

4. Run the following command to add a DNS server to the NetScaler appliance.
   ```shell
def dns nameserver 1.2.3.4
```
   The NetScaler appliance cannot process Kerberos requests without the DNS server. Be sure to use the same DNS server that is used in the Microsoft Windows domain.

5. Switch to the shell prompt and run the following commands from the shell prompt:
   ```shell
   • ktutil # rkt /etc/kerbtabfile.txt
   • # wkt /etc/krb5.keytab
   • # list
   ```
   The list command displays the user account details that you created in the Active Directory. A sample screen of the output of the list command is shown below.

   Figure 1. Sample Output of the list Command

6. Switch to the command line interface of NetScaler appliance.

7. Run the following command to create a Kerberos authentication server:
   ```shell
   • add authentication negotiateAction KerberosServer -domain "crete.lab.net" -domainUser kerbuser -domainUserPasswd Citrix1
   ```

8. Run the following command to create a negotiation policy:
   ```shell
   • add authentication negotiatePolicy Kerberos-Policy "REQ.IP.DESTIP == 192.168.17.200"KerberosServer
   ```

9. Run the following command to create an authentication virtual server.
   ```shell
   • add authentication vserver Kerb-Auth SSL 192.168.17.201 443 - AuthenticationDomain crete.example.com
   ```

10. Run the following command to bind the Kerberos policy to the authentication virtual server:
    ```shell
    • bind authentication vserver Kerb-Auth -policy Kerberos-Policy - priority 100
    ```

11. Run the following command to bind an SSL certificate to the authentication virtual server. You can use one of the test certificates, which you can install from the GUI NetScaler appliance. Run the following command to use the ServerTestCert sample certificate.
12. Create an HTTP load balancing virtual server with the IP address, 192.168.17.200.

Ensure that you create a virtual server from the command line interface for NetScaler 9.3 releases if they are older than 9.3.47.8.

13. Run the following command to configure an authentication virtual server:

```bash
set lb vserver <name>-authn401 ON -authnVsName Kerb-Auth
```

14. Enter the host name `Example` in the address bar of the Web browser.

The Web browser displays an authentication dialog box because the Kerberos authentication is not set up in the browser.

**Note**

Kerberos authentication requires a specific configuration on the client. Ensure that the client can resolve the hostname, which results in the Web browser connecting to an HTTP virtual server.

15. Configure Kerberos on the Web browser of the client computer.

   - For configuring on Internet Explorer, see Configuring Internet Explorer for Kerberos authentication.
   - For configuring on Mozilla Firefox, see Configuring Internet Explorer for Kerberos authentication.

16. Verify whether you can access the backend physical server without authentication.

### To configure Internet Explorer for Kerberos authentication

1. Select **Internet Options** from the **Tools** menu.
2. Activate the **Security** tab.
3. Select **Local Intranet** from the Select a zone to view change security settings section.
4. Click **Sites**.
5. Click **Advanced**.
6. Specify the URL, `Example` and click **Add**.
7. Restart **Internet Explorer**.

### To configure Mozilla Firefox for Kerberos authentication

1. Enter `about:config` in the address bar of the browser.
2. Click the warning disclaimer.
3. Type `Network.Negotiate-auth.trusted-uris` in the Filter box.

5. In the Enter String Value dialog box, specify www.crete.example.com.

6. Restart Firefox.

### NetScaler appliance kerberos single sign-on

September 14, 2018

NetScaler appliances now support single sign-on (SSO) using the Kerberos 5 protocol. Users log on to a proxy, the Application Delivery Controller (ADC), which then provides access to protected resources.

The NetScaler appliance Kerberos SSO implementation requires the user’s password for SSO methods that rely on basic, NTLM, or forms-based authentication. The user’s password is not required for Kerberos SSO, although if Kerberos SSO fails and the NetScaler appliance has the user’s password, it uses the password to attempt NTLM SSO.

If the user’s password is available, the KCD account is configured with a realm, and no delegated user information is present, the NetScaler AD Kerberos SSO engine impersonates the user to obtain access to authorized resources. Impersonation is also called unconstrained delegation.

The NetScaler appliance Kerberos SSO engine can also be configured to use a delegated account to obtain access to protected resources on the user’s behalf. This configuration requires delegated user credentials, a keytab, or a delegated user certificate and matching CA certificate. Configuration that uses a delegated account is called constrained delegation.

### An overview of NetScaler appliance kerberos SSO

January 6, 2019

To use the NetScaler appliance Kerberos SSO feature, users first authenticate with Kerberos or a supported third-party authentication server. Once authenticated, the user requests access to a protected web application. The web server responds with a request for proof that the user is authorized to access that web application. The user’s browser contacts the Kerberos server, which verifies that the user is authorized to access that resource, and then provides the user’s browser with a service ticket that provides proof. The browser resends the user’s request to the web application server with the service ticket attached. The web application server verifies the service ticket, and then allows the user to access the application.

AAA traffic management implements this process as shown in the following diagram. The diagram illustrates the flow of information through the NetScaler appliance and AAA traffic management, on a
secure network with LDAP authentication and Kerberos authorization. AAA traffic management environments that use other types of authentication have essentially the same information flow, although they might differ in some details.

Figure 1. A Secure Network with LDAP and Kerberos

The AAA traffic management with authentication and authorization in a Kerberos environment requires that the following actions take place.

1. The client sends a request for a resource to the traffic management virtual server on the NetScaler appliance.
2. The traffic management virtual server passes the request to the authentication virtual server, which authenticates the client and then passes the request back to the traffic management virtual server.
3. The traffic management virtual server sends the client’s request to the web application server.
4. The web application server responds to the traffic management virtual server with a 401 Unauthorized message that requests Kerberos authentication, with fallback to NTLM authentication if the client does not support Kerberos.
5. The traffic management virtual server contacts the Kerberos SSO daemon.
6. The Kerberos SSO daemon contacts the Kerberos server and obtains a ticket-granting ticket (TGT) allowing it to request service tickets authorizing access to protected applications.
7. The Kerberos SSO daemon obtains a service ticket for the user and sends that ticket to the traffic management virtual server.
8. The traffic management virtual server attaches the ticket to the user’s initial request and sends the modified request back to the web application server.
9. The web application server responds with a 200 OK message.

These steps are transparent to the client, which just sends a request and receives the requested resource.

Integration of NetScaler appliance Kerberos SSO with authentication methods

All AAA traffic management authentication mechanisms support NetScaler appliance Kerberos SSO. AAA traffic management supports the Kerberos SSO mechanism with the Kerberos, CAC (Smart Card) and SAML authentication mechanisms with any form of client authentication to the NetScaler appliance. It also supports the HTTP-Basic, HTTP-Digest, Forms-based, and NTLM (versions 1 and 2) SSO mechanisms if the client uses either HTTP-Basic or Forms-Based authentication to log on to the NetScaler appliance.

The following table shows each supported client-side authentication method, and the supported server-side authentication method for that client-side method.

Table 1. Supported Authentication Methods
Setting up NetScaler appliance SSO

September 14, 2018

You can configure NetScaler appliance SSO to work in one of two ways: by impersonation or by delegation. SSO by impersonation is a simpler configuration than SSO by delegation, and is therefore usually preferable when your configuration allows it. To configure NetScaler appliance SSO by impersonation, you must have the user’s user name and password.

To configure NetScaler appliance SSO by delegation, you must have the delegated user’s credentials in one of the following formats: the user’s user name and password, the keytab configuration that includes the user name and an encrypted password, or the delegated user certificate and the matching CA certificate.

Prerequisites

September 21, 2018

Before you configure NetScaler appliance SSO, you need to have your NetScaler appliance fully configured to manage traffic to and authentication for your web application servers. Therefore, you must
configure either load balancing or content switching, and then AAA, for these web application servers. You should also verify routing between the appliance, your LDAP server, and your Kerberos server.

If your network is not already configured in this manner, perform the following configuration tasks:

- Configure a server and service for each web application server.
- Configure a traffic management virtual server to handle traffic to and from your web application server.

Following are brief instructions and examples for performing each of these tasks from the NetScaler appliance command line. For further assistance, see Setting up an Authentication Virtual Server.

### To create a server and service by using the command line

For NetScaler appliance SSO to obtain a TGS (service ticket) for a service, either the FQDN assigned to the server entity on the NetScaler appliance must match the FQDN of the web application server, or the server entity name must match the NetBios name of the web application server. You can take either of the following approaches:

- Configure the NetScaler appliance server entity by specifying the FQDN of the web application server.
- Configure the NetScaler appliance server entity by specifying the IP address of the web application server, and assign the server entity the same name as the NetBios name of the web application server.

At the command prompt, type the following commands:

```
1 - add server name <serverFQDN>
2
3 - add service name serverName serviceType port
```

For the variables, substitute the following values:

- **serverName**: A name for the NetScaler appliance to use to refer to this server.
- **serverFQDN**: The FQDN of the server. If the server has no domain assigned to it, use the server's IP address and make sure that the server entity name matches the NetBios name of the web application server.
- **serviceName**: A name for the NetScaler appliance to use to refer to this service.
- **type**: The protocol used by the service, either HTTP or MSSQLSVC.
- **port**: The port on which the service listens. HTTP services normally listen on port 80. Secure HTTPS services normally listen on port 443.
Example

The following examples add server and service entries on the NetScaler appliance for the web application server was1.example.com. The first example uses the FQDN of the web application server; the second uses the IP address.

To add the server and service using the web application server FQDN, was1.example.com, you would type the following commands:

```
1 add server was1 was1.example.com
2 add service was1service was1 HTTP 80
```

To add the server and service using the web application server IP and NetBios name, where the web application server IP is 10.237.64.87 and its NetBios name is WAS1, you would type the following commands:

```
1 add server WAS1 10.237.64.87
2 add service was1service WAS1 HTTP 8
```

To create a traffic management virtual server by using the command line

The traffic management virtual server manages traffic between the client and the web application server. You can use either a load balancing or a content switching virtual server as the traffic management server. The SSO configuration is the same for either type.

To create a load balancing virtual server, at the command prompt, type the following command:

```
add lb vserver <vserverName> <type> <IP> <port>
```

For the variables, substitute the following values:

- **vserverName**—A name for the NetScaler appliance to use to refer to this virtual server.
- **type**—The protocol used by the service, either HTTP or MSSQLSVC.
- **IP**—The IP address assigned to the virtual server. This would normally be an IANA-reserved, non-public IP address on your LAN.
- **port**—The port on which the service listens. HTTP services normally listen on port 80. Secure HTTPS services normally listen on port 443.

Example

To add a load balancing virtual server called tmvserver1 to a configuration that manages HTTP traffic on port 80, assigning it a LAN IP address of 10.217.28.20 and then binding the load balancing virtual server to the wasservice1 service, you would type the following commands:
To create an authentication virtual server by using the command line

The authentication virtual server manages authentication traffic between the client and the authentication (LDAP) server. To create an authentication virtual server, at the command prompt type the following commands:

```
1 - add authentication vserver <authvservername> SSL <IP> 443
2 - set authentication vserver <authvservername> -authenticationdomain <domain>
```

For the variables, substitute the following values:

- **authvservername** — A name for the NetScaler appliance to use to refer to this authentication virtual server. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.), pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Can be changed after the authentication virtual server is added by using the rename authentication vserver command.
- **IP** — The IP address assigned to the authentication virtual server. As with the traffic management virtual server, this address would normally be an IANA-reserved, non-public IP on your LAN.
- **domain** — The domain assigned to the virtual server. This would usually be the domain of your network. It is customary, though not required, to enter the domain in all capitals when configuring the authentication virtual server.

**Example**

To add an authentication virtual server called authvserver1 to your configuration and assign it the LAN IP 10.217.28.21 and the domain EXAMPLE.COM, you would type the following commands:

```
1 add authentication vserver authvserver1 SSL 10.217.28.21 443
2 set authentication vserver authvserver1 -authenticationdomain EXAMPLE.COM
```

To configure a traffic management virtual server to use an authentication profile

The authentication virtual server can be configured to handle authentication for a single domain or for multiple domains. If it is configured to support authentication for multiple domains, you must
also specify the domain for NetScaler appliance SSO by creating an authentication profile, and then configuring the traffic management virtual server to use that authentication profile.

**Note**

The traffic management virtual server can be either a load balancing (lb) or content switching (cs) virtual server. The following instructions assume that you are using a load balancing virtual server. To configure a content switching virtual server, simply substitute set cs vserver for set lb vserver. The procedure is otherwise the same.

To create the authentication profile, and then configure the authentication profile on a traffic management virtual server, type the following commands:

```
1 add authentication authnProfile <authnProfileName> {  
2     authvserverName <string> }  
3 }  
4     authenticationHost <string> }  
5 }  
6     authenticationDomain <string> }  
7 }  
8 - set lb vserver \<vserverName\> -authProfile <authnprofileName>
```

For the variables, substitute the following values:

- **authnprofileName**—A name for the authentication profile. Must begin with a letter, number, or the underscore character (_), and must consist of from one to thirty-one alphanumeric or hyphen (-), period (.), pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters.
- **authvserverName**—The name of the authentication virtual server that this profile uses for authentication.
- **authenticationHost**—Host name of the authentication virtual server.
- **authenticationDomain**—Domain for which NetScaler appliance SSO handles authentication. Required if the authentication virtual server performs authentication for more than one domain, so that the correct domain is included when the NetScaler appliance sets the traffic management virtual server cookie.

**Example**

To create an authentication profile named authnProfile1 for authentication of the example.com domain, and to configure the load balancing virtual server vserver1 to use the authentication profile authnProfile1, you would type the following commands:

```
add authentication authnProfile authnProfile1 -authnvsName authvserver1
```
Configuring SSO

September 14, 2018

Configuring NetScaler appliance SSO to authenticate by impersonation is simpler than configuring SSO to authenticate by delegation, and is therefore usually preferable when your configuration allows it. You just create a KCD account. You can use the user’s password.

If you do not have the user’s password, you can configure NetScaler appliance SSO to authenticate by delegation. Although somewhat more complex than configuring SSO to authenticate by impersonation, the delegation method provides flexibility in that a user’s credentials might not be available to the NetScaler appliance in all circumstances.

For either impersonation or delegation, you must also enable integrated authentication on the web application server.

Enabling integrated authentication on the web application server

September 14, 2018

To set up NetScaler appliance Kerberos SSO on each web application server that Kerberos SSO will manage, use the configuration interface on that server to configure the server to require authentication. Select Kerberos (negotiate) authentication by preference, with fallback to NTLM for clients that do not support Kerberos.

Following are instructions for configuring Microsoft Internet Information Server (IIS) to require authentication. If your web application server uses software other than IIS, consult the documentation for that web server software for instructions.

To configure Microsoft IIS to use integrated authentication

1. Log on to the IIS server and open Internet Information Services Manager.
2. Select the web site for which you want to enable integrated authentication. To enable integrated authentication for all IIS web servers managed by IISM, configure authentication settings for the Default Web Site. To enable integrated authentication for individual services (such as Exchange, Exadmin, ExchWeb, and Public), configure these authentication settings for each service individually.
3. Open the **Properties** dialog box for the default web site or for the individual service, and click the **Directory Security** tab.
4. Beside **Authentication** and **Access Control**, select **Edit**.
5. Disable anonymous access.
6. Enable Integrated Windows authentication (only). Enabling integrated Windows authentication should automatically set protocol negotiation for the web server to Negotiate, NTLM, which specifies Kerberos authentication with fallback to NTLM for non-Kerberos capable devices. If this option is not automatically selected, manually set protocol negotiation to Negotiate, NTLM.

**Setting up SSO by impersonation**

December 5, 2018

You can configure the KCD account for NetScaler appliance SSO by impersonation. In this configuration, the NetScaler appliance obtains the user’s username and password when the user authenticates to the authentication server and uses those credentials to impersonate the user to obtain a ticket-granting ticket (TGT). If the user’s name is in UPN format, the appliance obtains the user’s realm from UPN. Otherwise, it obtains the user’s name and realm by extracting it from the SSO domain used during initial authentication, or from the session profile.

When configuring the KCD account, you must set the realm parameter to the realm of the service that the user is accessing. The same realm is also used as the user’s realm if the user’s realm cannot be obtained from authentication with the NetScaler appliance or from the session profile.

**To create the KCD account for SSO by impersonation with a password**

At the command prompt, type the following command:

```
add aaa kcdaccount <accountname> -realmStr <realm>
```

For the variables, substitute the following values:

- **accountname**. The KCD account name.
- **realm**. The domain assigned to NetScaler appliance SSO.

**Example**

To add a KCD account named kcdaccount1, and use the keytab named kcdvserver.keytab, you would type the following command:

```
add aaa kcdAccount kcdaccount1 -keytab kcdvserver.keytab
```

For information on configuring Kerberos impersonation through Citrix ADC GUI, see Citrix Support.
Configuring SSO by delegation

January 10, 2019

To configure SSO by Delegation, you need to perform the following tasks:

- If you are configuring delegation by delegated user certificate, install the matching CA certi-
ficates on the NetScaler appliance and add them to the NetScaler appliance configuration.
- Create the KCD account on the appliance. The appliance uses this account to obtain service
tickets for your protected applications.
- Configure the Active Directory server.

Note

For more information on creating KCD account and configuring on the NetScaler appliance, refer
to the following topics:

- Handling authentication, authorization and auditing with Kerberos/NTLM
- How NetScaler appliance implements Kerberos for client authentication
- Configuring kerberos authentication on the NetScaler appliance

Installing the client CA certificate on the NetScaler appliance

If you are configuring NetScaler appliance SSO with a client certificate, you must copy the matching
CA certificate for the client certificate domain (the client CA certificate) to the NetScaler appliance,
and then install the CA certificate. To copy the client CA certificate, use the file transfer program of
your choice to transfer the certificate and private-key file to the NetScaler appliance, and store the
files in /nsconfig/ssl.

To install the client CA certificate on the NetScaler appliance

At the command prompt, type the following command:

```
add ssl certKey <certKeyName> -cert <cert> [(-key <key> [-password]])
-fipsKey <fipsKey>][-inform ( DER | PEM )][-expiryMonitor ( ENABLED | DISABLED | UNSET )][-notificationPeriod <positive_integer>] [-bundle ( YES | NO )]
```

For the variables, substitute the following values:

- **certKeyName**. A name for the client CA certificate. Must begin with an ASCII alphanumeric or
underscore (_) character, and must consist of from one to thirty-one characters. Allowed char-
acters include the ASCII alphanumerics, underscore, hash (#), period(,), space, colon (:), at (@),
equals (=), and hyphen (-) characters. Cannot be changed after the certificate-key pair is created. If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “my cert” or ‘my cert’).

- **cert**. Full path name and file name of the X509 certificate file used to form the certificate-key pair. The certificate file must be stored on the NetScaler appliance, in the /nsconfig/ssl/ directory.

- **key**. Full path name and file name of the file that contains the private key to the X509 certificate file. The key file must be stored on the NetScaler appliance in the /nsconfig/ssl/ directory.

- **password**. If a private key is specified, the passphrase used to encrypt the private key. Use this option to load encrypted private keys in PEM format.

- **fipsKey**. Name of the FIPS key that was created inside the Hardware Security Module (HSM) of a FIPS appliance, or a key that was imported into the HSM.

**Note**
You can specify either a key or a fipsKey, but not both.

- **inform**. Format of the certificate and private-key files, either PEM or DER.

- **passplain**. Pass phrase used to encrypt the private key. Required when adding an encrypted private-key in PEM format.

- **expiryMonitor**. Configure the NetScaler appliance to issue an alert when the certificate is about to expire. Possible values: ENABLED, DISABLED, UNSET.

- **notificationPeriod**. If expiryMonitor is ENABLED, number of days before the certificate expires to issue an alert.

- **bundle**. Parse the certificate chain as a single file after linking the server certificate to its issuer’s certificate within the file. Possible values: YES, NO.

**Example**

The following example adds the specified delegated user certificate customer-cert.pem to the NetScaler appliance configuration along with the key customer-key.pem, and sets the password, certificate format, expiration monitor, and notification period.

To add the delegated user certificate, you would type the following commands:

```
1 "add ssl certKey customer -cert "/nsconfig/ssl/customer-cert.pem"
2 -key "/nsconfig/ssl/customer-key.pem" -password "
donUseDefaultPWs!"
3 -inform PEM -expiryMonitor ENABLED [-notificationPeriod 14]
```
Creating the KCD account

If you are configuring NetScaler appliance SSO by delegation, you can configure the KCD account to use the user’s log-on name and password, to use the user’s log-on name and keytab, or to use the user’s client certificate. If you configure SSO with user name and password, the NetScaler appliance uses the delegated user account to obtain a Ticket Granting Ticket (TGT), and then uses the TGT to obtain service tickets for the specific services that each user requests. If you configure SSO with keytab file, the NetScaler appliance uses the delegated user account and keytab information. If you configure SSO with a delegated user certificate, the NetScaler appliance uses the delegated user certificate.

To create the KCD account for SSO by delegation with a password

At the command prompt, type the following commands:

```
add aaa kcdaccount <accountname> -delegatedUser root -kcdPassword <password> -realmStr <realm>
```

For the variables, substitute the following values:

- **accountname.** A name for the KCD account.
- **password.** A password for the KCD account.
- **realm.** The realm of the KCD account, usually the domain for which SSO is active.

Example (UPN Format)

To add a KCD account named kcdaccount1 to the NetScaler appliance configuration with a password of password1 and a realm of EXAMPLE.COM, specifying the delegated user account in UPN format (as root), you would type the following commands:

```
1 add aaa kcdaccount kcdaccount1 -delegatedUser root
2 -kcdPassword password1 -realmStr EXAMPLE.COM
```

Example (SPN Format)

To add a KCD account named kcdaccount1 to the NetScaler appliance configuration with a password of password1 and a realm of EXAMPLE.COM, specifying the delegated user account in SPN format, you would type the following commands:

```
1 add aaa kcdAccount kcdaccount1 -realmStr EXAMPLE.COM
2 -delegatedUser "host/kcdvserver.example.com" -kcdPassword password1
```
Creating the KCD account for SSO by delegation with a keytab

If you plan to use a keytab file for authentication, first create the keytab. You can create the keytab file manually by logging onto the AD server and using the ktpass utility, or you can use the NetScaler appliance configuration utility to create a batch script, and then run that script on the AD server to generate the keytab file. Next, use FTP or another file transfer program to transfer the keytab file to the NetScaler appliance and place it in the /nsconfig/krb directory. Finally, configure the KCD account for NetScaler appliance SSO by delegation and provide the path and file name of the keytab file to the NetScaler appliance.

To create the keytab file manually

Log on to the AD server command line and, at the command prompt, type the following command:

```
ktpass princ <SPN> ptype KRB5_NT_PRINCIPAL mapuser <DOMAIN><username> pass <password> -out <File_Path>
```

For the variables, substitute the following values:

- **SPN**: The service principal name for the KCD service account.
- **DOMAIN**: The domain of the Active Directory server.
- **username**: The KSA account username.
- **password**: The KSA account password.
- **path**: The full path name of the directory in which to store the keytab file after it is generated.

To use the NetScaler appliance configuration utility to create a script to generate the keytab file

2. In the data pane, under Kerberos Constrained Delegation, click Batch file to generate Keytab.
3. In the Generate KCD (Kerberos Constrained Delegation) Keytab Script dialog box, set the following parameters:
   - **Domain User Name**: The KSA account username.
   - **Domain Password**: The KSA account password.
   - **Service Principal**: The service principal name for the KSA.
   - **Output File Name**: The full path and file name to which to save the keytab file on the AD server.
4. Clear the Create Domain User Account check box.
5. Click Generate Script.
6. Log on to the Active Directory server and open a command line window.
7. Copy the script from the Generated Script window and paste it directly into the Active Directory server command-line window. The keytab is generated and stored in the directory under the file

© 1999-2018 Citrix Systems, Inc. All rights reserved.
name that you specified as **Output File Name**.

8. Use the file transfer utility of your choice to copy the keytab file from the Active Directory server to the NetScaler appliance and place it in the /nsconfig/krb directory.

### To create the KCD account

At the command prompt, type the following command:

```bash
add aaa kcdaccount <accountname> -keytab <keytab>
```

**Example**

To add a KCD account named kcdaccount1, and use the keytab named kcdvserver.keytab, you would type the following commands:

```bash
1  add aaa kcdaccount kcdaccount1 -keytab kcdvserver.keytab
```

### To create the KCD account for SSO by delegation with a delegated user cert

At the command prompt, type the following command:

```bash
add aaa kcdaccount <accountname> -realmStr <realm> -delegatedUser <user_nameSPN> -usercert <cert> -cacert <cacert>
```

For the variables, substitute the following values:

- **accountname**: A name for the KCD account.
- **realmStr**: The realm for the KCD account, usually the domain for which SSO is configured.
- **delegatedUser**: The delegated user name, in SPN format.
- **usercert**: The full path and name of the delegated user certificate file on the NetScaler appliance. The delegated user certificate must contain both the client certificate and the private key, and must be in PEM format. If you use smart card authentication, you might need to create a smart card certificate template to allow certificates to be imported with the private key.
- **cacert**: The full path to and name of the CA certificate file on the NetScaler appliance.

**Example**

To add a KCD account named kcdaccount1, and use the keytab named kcdvserver.keytab, you would type the following command:

```bash
1  add aaa kcdaccount kcdaccount1 -realmStr EXAMPLE.COM
2    -delegatedUser "host/kcdvserver.example.com" -usercert /certs/usercert
3      -cacert /cacerts/cacert
```

"© 1999-2018 Citrix Systems, Inc. All rights reserved. 868"
Setting up Active Directory for NetScaler appliance SSO

When you configure SSO by delegation, in addition to creating the KCDAccount on the NetScaler appliance, you must also create a matching Kerberos Service Account (KSA) on your LDAP active directory server, and configure the server for SSO. To create the KSA, use the account creation process on the active directory server. To configure SSO on the active directory server, open the properties window for the KSA. In the Delegation tab, enable the following options: Trust this user for delegation to specified services only and Use any Authentication protocol. (The Kerberos only option does not work, because it does not enable protocol transition or constrained delegation.) Finally, add the services that NetScaler appliance SSO will manage.

Note
If the Delegation tab is not visible in the KSA account properties dialog box, before you can configure the KSA as described, you must use the Microsoft setspn command-line tool to configure the active directory server so that the tab is visible.

To configure delegation for the Kerberos service account

1. In the LDAP account configuration dialog box for the Kerberos service account that you created, click the Delegation tab.
2. Choose “Trust this user for delegation to the specified services only”.
3. Under “Trust this user for delegation to the specified services only,” choose “Use any authentication protocol”.
4. Under “Services to which this account can present delegated credentials,” click Add.
5. In the Add Services dialog box, click Users or Computers, choose the server that hosts the resources to be assigned to the service account, and then click OK.

Note
- Constrained delegation does not support services hosted in domains other than the domain assigned to the account, even though Kerberos might have a trust relationship with other domains.
- Use the following command to create the setspn if a new user is created in active directory: setspn -A host/kcdvserver.example.com example\kcdtest

6. Back in the Add Services dialog box, in the Available Services list, choose the services assigned to the service account. NetScaler appliance SSO supports the HTTP and MSSQLSVC services.
7. Click OK.
Generating the KCD keytab script

September 14, 2018

The KCD Keytab Script dialog box generates the keytab script, which in turn generates the keytab file necessary to configure KCD on the NetScaler appliance.

To generate the KCD keytab script by using the configuration utility

2. In the details pane, under Kerberos Constrained Delegation, click Batch file to generate keytab.
3. In the Generate KCD (Kerberos Constrained Delegation) Keytab Script dialog box, fill out the fields as described below.
   - Domain UserName: The name of the domain user.
   - Domain Password: The password for the domain user.
   - Service Principal: The service principal.
   - Output FileName: A filename for the KCD script file.
   - Create Domain User Account: Select this check box to create the specified domain user account.
4. Click Generate Script to generate the script. The script is generated, and appears in the Generated Script text box below the Generate Script button.
5. Copy the script, and save it as a file on your AD domain controller. You must now run this script on the domain controller to generate the keytab file, and then copy the keytab file to the /nsconfig/krb/ directory on the NetScaler appliance.
6. Click OK.

SAML authentication

January 6, 2019

Security Assertion Markup Language (SAML) is an XML-based authentication mechanism that provides single sign-on capability and is defined by the OASIS Security Services Technical Committee.

Why SAML?

Consider a scenario in which a service provider (LargeProvider) hosts a number of applications for a customer (BigCompany). BigCompany has users that must seamlessly access these applications. In a traditional setup, LargeProvider would need to maintain a database of users of BigCompany. This raises some concerns for each of the following stakeholders:

- LargeProvider must ensure security of user data.
• BigCompany must validate the users and keep the user data up-to-date, not just in its own
database, but also in the user database maintained by LargeProvider. For example, a user re-
moved from the BigCompany database must also be removed from the LargeProvider database.
• A user has to log on individually to each of the hosted applications.

The SAML authentication mechanism provides an alternative approach. The following deployment
diagram shows how SAML works.

The concerns raised by traditional authentication mechanisms are resolved as follows:

• LargeProvider does not have to maintain a database for BigCompany users. Freed from identity
management, LargeProvider can concentrate on providing better services.
• BigCompany does not bear the burden of making sure the LargeProvider user database is kept
in sync with its own user database.
• A user can log on once, to one application hosted on LargeProvider, and be automatically logged
on to the other applications that are hosted there.

The NetScaler appliance can be deployed as a SAML Service Provider (SP) and a SAML Identity Provider
(IdP). Read through the relevant topics to understand the configurations that must be performed on
the NetScaler appliance.

A NetScaler appliance configured as a SAML service provider can now enforce an audience restriction
check. The audience restriction condition evaluates to “Valid” only if the SAML replying party is a
member of at least one of the specified audiences.

You can configure a NetScaler appliance to parse attributes in SAML assertions as group attributes.
Parsing them as group attributes enables the appliance to bind policies to the groups.

Note
A NetScaler appliance MPX FIPS appliance used as a SAML service provider now supports en-
crypted assertions. Also, a NetScaler appliance MPX FIPS appliance functioning as a SAML ser-
vice provider or a SAML identity provider can now be configured to use the SHA2 algorithms on
FIPS hardware.

Configuring FIPS offload support using the command line interface:

1. Add SSL FIPS

   add ssl fipsKey fips-key

2. Create a CSR and use it at CA server to generate a certificate. You can then copy the certificate
   in /nsconfig/ssl. Let’s assume that the file is fips3cert.cer.

   add ssl certKey fips-cert -cert fips3cert.cer -fipsKey fips-key

3. Specify this certificate in the SAML action for SAML SP module

   set samlAction <name> -samlSigningCertName fips-cert
4. Use the certificate in samlIdpProfile for SAML IDP module

   set samlidpprofile fipstest -samlIdpCertName fips-cert

The following table lists some articles that are specific to deployments where the NetScaler appliance is used as a SAML SP or a SAML IdP.

**NetScaler appliance as a SAML SP**

September 14, 2018

The SAML Service Provider (SP) is a SAML entity that is deployed by the service provider. When a user tries to access a protected application, the SP evaluates the client request. If the client is unauthenticated (does not have a valid NSC_TMAA or NSC_TMAS cookie), the SP redirects the request to the SAML Identity Provider (IdP).

The SP also validates SAML assertions that are received from the IdP.

When the NetScaler appliance is configured as an SP, all user requests are received by a traffic management virtual server (load balancing or content switching) that is associated with the relevant SAML action.

The NetScaler appliance also supports POST and Redirect bindings during logout.

**Note**

A NetScaler appliance can be used as a SAML SP in a deployment where the SAML IdP is configured either on the appliance or on any external SAML IdP.

When used as a SAML SP, a NetScaler appliance:
• Can extract the user information (attributes) from the SAML token. This information can then be used in the policies that are configured on the NetScaler appliance. For example, if you want to extract the GroupMember and emailaddress attributes, in the SAMLAction, specify the `Attribute2` parameter as GroupMember and the `Attribute3` parameter as emailaddress.

**Note**
Default attributes such as username, password, and logout URL must not be extracted in attributes 1 to 16, because they are implicitly parsed and stored in the session.

• Can extract attribute names of up to 127 bytes from an incoming SAML assertion. The previous limit was 63 bytes. Support introduced in NetScaler 11.0 Build 64.x.

• Supports post, redirect, and artifact bindings. Support for redirect and artifact bindings is introduced in NetScaler 11.0 Build 55.x.

**Note**
Redirect binding should not be used for large amounts of data, when the assertion after inflate or decoding is greater than 10K.

• Can decrypt assertions. Support introduced in NetScaler 11.0 Build 55.x.

• Can extract multi-valued attributes from a SAML assertion. These attributes are sent in nested XML tags such as:

```
<AttributeValue><AttributeValue>Value1</AttributeValue>
<AttributeValue>Value2</AttributeValue>
</AttributeValue>
```

When presented with above XML, the NetScaler appliance can extract both Value1 and Value2 as values of a given attribute, as opposed to the old firmware that extracts only Value1.

**Note**
Support introduced in NetScaler 11.0 Build 64.x.

• Can specify the validity of a SAML assertion.

If the system time on NetScaler appliance SAML IdP and the peer SAML SP is not in sync, the messages might get invalidated by either party. To avoid such cases, you can now configure the time duration for which the assertions will be valid.

This duration, called the “skew time,” specifies the number of minutes for which the message should be accepted. The skew time can be configured on the SAML SP and the SAML IdP.

**Note**
Support introduced in NetScaler 11.0 Build 64.x.
NetScaler 12.0

- Can send additional attribute called ‘ForceAuth’ in the authentication request to external IDP (Identity Provider). By default, the ForceAuthn is set to ‘False’. It can be set to ‘True’ to suggest IDP to force authentication despite existing authentication context. Additionally, NetScaler appliance SP does authentication request in query parameter when configured with artifact binding.

To configure the NetScaler appliance as a SAML SP by using the command line interface

1. Configure a SAML SP action.
   **Example**
   The following command adds a SAML action that redirects unauthenticated user requests.
   ```bash
   add authentication samlAction SamlSPAct1 -samlIdPCertName nssp -samlRedirectUrl https://auth1.example.com
   ```

2. Configure the SAML policy.
   **Example**
   The following command defines a SAML policy that applies the above defined SAML action to all traffic.
   ```bash
   add authentication samlPolicy SamlSPPol1 ns_true SamlSPAct1
   ```

3. Bind the SAML policy to the authentication virtual server.
   **Example**
   The following command binds the SAML policy to a authentication virtual server named “av_saml”.
   ```bash
   bind authentication vserver av_saml -policy SamlSPPol1
   ```

4. Bind the authentication virtual server to the appropriate traffic management virtual server.
   **Example**
   The following command adds a load balancing virtual server named “lb1_ssl” and associates the authentication virtual server named “av_saml” to the load balancing virtual server.
   ```bash
   add lb vserver lb1_ssl SSL 10.217.28.224 443 -persistenceType NONE -cltTimeout 180 -AuthenticationHost auth1.example.com -Authentication ON -authnVsName av_saml
   ```

To configure a NetScaler appliance as a SAML SP by using the graphical user interface

1. Configure the SAML action and policy.
Navigate to **Security > AAA - Application Traffic > Policies > Authentication > Advanced Policies > Policy**, create a policy with SAML as the action type, and associate the required SAML action with the policy.

2. Associate the SAML policy with an authentication virtual server.

Navigate to **Security > AAA - Application Traffic > Virtual Servers**, and associate the SAML policy with the authentication virtual server.

3. Associate the authentication server with the appropriate traffic management virtual server.

Navigate to **Traffic Management > Load Balancing (or Content Switching) > Virtual Servers**, select the virtual server, and associate the authentication virtual server with it.

### NetScaler appliance as a SAML IdP

September 14, 2018

The SAML IdP (Identity Provider) is a SAML entity that is deployed on the customer network. The IdP receives requests from the SAML SP and redirects users to a logon page, where they must enter their credentials. The IdP authenticates these credentials with the user directory (external authentication server, such as LDAP) and then generates a SAML assertion that is sent to the SP.

The SP validates the token, and the user is then granted access to the requested protected application.

When the NetScaler appliance is configured as an IdP, all requests are received by an authentication virtual server that is associated with the relevant SAML IdP profile.

**Note**

A NetScaler appliance can be used as a IdP in a deployment where the SAML SP is configured either on the appliance or on any external SAML SP.

When used as a SAML IdP, a NetScaler appliance:

- Supports all authentication methods that it supports for traditional logons.

- Digitally signs assertions. Support for the SHA256 algorithm is introduced in NetScaler 11.0 Build 55.x.

- Supports single-factor and two-factor authentication. SAML must not be configured as the secondary authentication mechanism.

- Can encrypt assertions by using the public key of the SAML SP. This is recommended when the assertion includes sensitive information. Support introduced in NetScaler 11.0 Build 55.x.

- Can be configured to accept only digitally signed requests from the SAML SP. Support introduced in NetScaler 11.0 Build 55.x.
• Can log on to the SAML IdP by using the following 401-based authentication mechanisms: Negotiate, NTLM, and Certificate. Support introduced in NetScaler 11.0 Build 55.x.

• Can be configured to send 16 attributes in addition to the NameId attribute. The attributes must be extracted from the appropriate authentication server. For each of them, you can specify the name, the expression, the format, and a friendly name in the SAML IdP profile. Support introduced in NetScaler 11.0 Build 55.x.

• If the NetScaler appliance is configured as a SAML IdP for multiple SAML SP, a user can gain access to applications on the different SPs without explicitly authenticating every time. The NetScaler appliance creates a session cookie for the first authentication, and every subsequent request uses this cookie for authentication. Support introduced in NetScaler 11.0 Build 55.x.

• Can send multi-valued attributes in a SAML assertion. Support introduced in NetScaler 11.0 Build 64.x.

• Supports post and redirect bindings. Support for redirect bindings is introduced in NetScaler 11.0 Build 64.x.

• Can specify the validity of a SAML assertion.

  If the system time on NetScaler appliance SAML IdP and the peer SAML SP is not in sync, the messages might get invalidated by either party. To avoid such cases, you can now configure the time duration for which the assertions will be valid.

  This duration, called the “skew time,” specifies the number of minutes for which the message should be accepted. The skew time can be configured on the SAML SP and the SAML IdP.

  Support introduced in NetScaler 11.0 Build 64.x.

• Can be configured to serve assertions only to SAML SPs that are pre-configured on or trusted by the IdP. For this configuration, the SAML IdP must have the service provider ID (or issuer name) of the relevant SAML SPs. Support introduced in NetScaler 11.0 Build 64.x.

  Before proceeding, make sure that you have an authentication virtual server that is linked to an LDAP authentication server.

To configure a NetScaler appliance as a SAML IdP by using the command line interface

1. Configure a SAML IdP profile.

  Example

  Adding NetScaler appliance as an IdP with SiteMinder as the SP.
add authentication samlIdPProfile samlIDPProf1 -samlSPCertName siteminder -cert -encryptAssertion ON -samlIDPCertName ns-cert -assertionConsumerServiceURL http://sm-proxy.nsi-test.com:8080/affwebservices/public/saml2assertionconsumer -rejectUnsignedRequests ON -signatureAlg RSA-SHA256 -digestMethod SHA256

2. Configure the SAML authentication policy and associate the SAML IdP profile as the action of the policy.

    add authentication samlIdPPolicy samlIDPPol1 -rule ns\_true -action samlIDPProf1

3. Bind the policy to the authentication virtual server.

    bind authentication vserver saml-auth-vserver -policy samlIDPPol1 -priority 100

To configure a NetScaler appliance as a SAML IdP by using the graphical user interface

1. Configure the SAML IdP profile and policy.

   Navigate to Security > AAA - Application Traffic > Policies > Authentication > Advanced Policies > Policy, and create a policy with SAML IdP as the action type, and associate the required SAML IdP profile with the policy.

2. Associate the SAML IdP policy with an authentication virtual server.

   Navigate to Security > AAA - Application Traffic > Virtual Servers, and associate the SAML IdP policy with the authentication virtual server.

Configuring SAML single sign-on

September 14, 2018

To provide single sign-on capabilities across applications that are hosted on the service provider, you can configure SAML single sign-on on the SAML SP.

Configuring SAML single sign-on by using the command line interface

1. Configure the SAML SSO profile.

   Example
In the following command, **Example** is the load balancing virtual server that has a web link from the SharePoint portal. Nssp.example.com is the Traffic Management virtual server that is load balancing the SharePoint server.

```
add tm samlSSOProfile tm-saml-sso -samlSigningCertName nssp -assertionConsumerServiceURL "https://nssp2.example.com/cgi/samlauth"-relaystateRule "https://nssp2.example.com/samlsso.html" -sendPassword ON -samlIssuerName nssp.example.com
```

2. **Associate the SAML SSO profile with the traffic action.**

   **Example**

   The following command enables SSO and binds the SAML SSO profile created above to a traffic action.

   ```
   add tm trafficAction html\_act -SSO ON -samlSSOProfile tm-saml-sso
   ```

3. **Configure the traffic policy that specifies when the action must be executed.**

   **Example**

   The following command associates the traffic action with a traffic policy.

   ```
   add tm trafficPolicy html_pol "HTTP.REQ.URL.CONTAINS(\"abc.html\")" html_act
   ```

4. **Bind the traffic policy created above to a traffic management virtual server (load balancing or content switching). Alternatively, the traffic policy can be associated globally.**

   **Note**

   This traffic management virtual server must be associated with the relevant authentication virtual server that is associated with the SAML action.

   ```
   bind lb vserver lb1_ssl -policyName html_pol -priority 100 -gotoPriorityExpression END -type REQUEST
   ```

**Configuring SAML single sign-on by using the graphical user interface**

1. **Define the SAML SSO profile, the traffic profile, and the traffic policy.**

   Navigate to **Security > AAA - Application Traffic > Policies > Traffic**, select the appropriate tab, and configure the settings.

2. **Bind the traffic policy to a traffic management virtual server or globally to the NetScaler appliance.**
OAuth authentication

September 14, 2018

The AAA traffic management feature now supports OAuth and OpenID-Connect mechanisms for authenticating and authorizing users to applications that are hosted on applications such as Google, Facebook, and Twitter.

The authentication mechanism facilitates the inline verification of OpenID tokens. The NetScaler appliance can be configured to obtain certificates and verify signatures on the token.

A major advantage of using the OAuth and OpenID-Connect mechanisms is that the user information is not sent to the hosted applications and therefore the risk of identity theft is considerably reduced.

The NetScaler appliance configured for AAA now accepts incoming tokens that are signed using HMAC HS256 algorithm. In addition, the public keys of the SAML Identity Provider (IdP) are read from a file, instead of learning from an URL endpoint.

In the NetScaler appliance implementation, the application to be accessed is represented by the AAA traffic management virtual server. So, to configure OAuth, you must configure an OAuth policy which must then be associated with a AAA traffic management virtual server.

**Note**

OAuth on NetScaler appliance is currently qualified for all SAML IdPs that are compliant with “OpenID connect 2.0”.

**To configure OAuth by using the configuration utility:**

1. Configure the OAuth action and policy.
   
   Navigate to Security > AAA - Application Traffic > Policies > Authentication > Advanced Policies > Policy, and create a policy with OAuth as the action type, and associate the required OAuth action with the policy.

2. Associate the OAuth policy with an authentication virtual server.
   
   Navigate to Security > AAA - Application Traffic > Virtual Servers, and associate the OAuth policy with the authentication virtual server.

**Note**

Attributes (1 to 16) can be extracted in the OAuth response. Currently these attributes are not evaluated. They are added for the future reference.

**To configure OAuth by using the command line interface:**

1. Define an OAuth action.

   ```
   add authentication OAuthAction <name> -authorizationEndpoint <URL> -tokenEndpoint <URL> [-idtokenDecryptEndpoint <URL>] -clientID <
   ```
string> -clientSecret <string> [-defaultAuthenticationGroup <string>]
[-tenantID <string>] [GraphEndpoint <string>][-refreshInterval
<positive_integer>] [-CertEndpoint <string>] [-audience <string>]
[-userNameField <string>] [-skewTime <mins>] [-issuer <string>]
[-Attribute1 <string>] [-Attribute2 <string>] [-Attribute3 <string>]
...

2. Associate the action with an advanced authentication policy.
add authentication Policy** <name> -rule <expression> -action <string>

**Example**
preblock add authentication oauthAction a
-authorizationEndpoint https://example.com/
-tokenEndpoint https://example.com/
-clientID sadf -clientsecret df

For more information on authentication OAuthAction parameters, see “authentication OAuthAction”.

**Note**
When a certEndpoint is specified, the NetScaler appliance polls that endpoint at the configured
frequency to learn the keys. To configure a NetScaler appliance to read the local file and parse
keys from that file, a new configuration option is introduced as follows.

set authentication OAuthAction <> -**CertFilePath** <path to local file
with jwks>

Multi-Factor (nFactor) authentication

September 14, 2018

**Important**
Supported from NetScaler 11.0 Build 62.x onwards.

Starting from NetScaler 12.0 Build 51.x, NetScaler appliance used as a SAML Service Provider (SP)
with Multi-Factor (nFactor) authentication now prepopulates the user-name field on the login
page. The appliance sends a NameID attribute as part of a SAML authorization request, retrieves
the NameID attribute value from the NetScaler appliance SAML Identity Provider (IdP), and pre-
populates the user-name field.

Multi-factor authentication enhances the security of an application by requiring users to provide mul-
tiple proofs of identify to gain access. The NetScaler appliance provides an extensible and flexible
approach to configuring multi-factor authentication. This approach is called *nFactor authentication*.

With nFactor authentication you can:

• Configure any number of authentication factors.
• Base the selection of the next factor on the result of executing the previous factor.
• Customize the login interface. For example, you can customize the label names, error messages, and help text.
• Extract user group information without doing authentication.
• Configure pass-through for an authentication factor. This means that no explicit login interaction is required for that factor.
• Configure the order in which different types of authentication are applied. Any of the authentication mechanisms that are supported on the NetScaler appliance can be configured as any factor of the nFactor authentication setup. These factors are executed in the order in which they are configured.
• Configure the NetScaler appliance to proceed to an authentication factor that must be executed when authentication fails. To do so, you configure another authentication policy with the exact same condition, but with the next highest priority and with the action set to “NO_AUTH”. You must also configure the next factor, which must specify the alternative authentication mechanism to apply.

For a nFactor benefit, see One Public IP for AAA-TM Deployments on NetScaler.

Sample deployments using nFactor authentication:

• Getting two passwords up-front, pass-through in next factor. Read
• Group extraction followed by certificate or LDAP authentication, based on group membership. Read
• SAML followed by LDAP or certificate authentication, based on attributes extracted during SAML. Read
• SAML in first factor, followed by group extraction, and then LDAP or certificate authentication, based on groups extracted. Read
• Prefilling user name from certificate. Read
• Certificate authentication followed by group extraction for 401 enabled traffic management virtual servers. Read
• Username and 2 passwords with group extraction in third factor. Read
• Certificate fallback to LDAP in same cascade; one virtual server for both certificate and LDAP authentication. Read
• LDAP in first factor and WebAuth in second factor. Read
• Domain drop down in first factor, then different policy evaluations based on group. Read

How to configure nFactor authentication

January 6, 2019

The primary entity used for nFactor authentication is called a login schema.
A login schema specifies an authentication schema XML file that defines the manner in which the login form will be rendered. Considering the interaction that the user must have when logging in to the application, you can create a single file for multiple factors or different files for different factors. View sample XML file.

- **Single file for multiple factors.** User will be provided a single form in which to provide credentials for multiple authentication factors.

- **Different files for different factors.** User will be provided a different form for each authentication factor.

Next, you must associate the XML file(s) with login schema(s). You can also specify expressions to extract the user name and the password from the login form.

**Tip**

You can configure an authentication factor to be pass-through. This means that the user is not required to provide credentials explicitly and there is no login form for that factor. The credentials are either taken from the previous factor or the user name and/or password are dynamically extracted by using the username/password expressions that are configured for that login schema. You must set the login schema to “NOSCHEMA”, instead of an XML file.

Now that the login schemas are configured, you must specify the manner in which they must be invoked. A login schema can be invoked by using either a login schema policy or an authentication policy label. The decision depends on the following:

- **Login schema policy.**
  - Specifies the condition on which the login form must be presented to the user.
  - Must be bound to an authentication virtual server.
  - In an authentication virtual server that has multiple login schema policies, the policy with the highest priority that evaluates to true is executed. That is, the login form associated with that policy is presented to the user.
  - The login schema policy is only used to present the first login form.

- **Authentication policy label.**
  - Specifies a collection of authentication policies for a particular factor. Each policy label corresponds to a single factor.
  - Specifies the login form that must be presented to the user.
  - Must be bound as the next factor of an authentication policy or of another authentication policy label.
  - Typically, a policy label includes authentication policies for a specific authentication mechanism. However, you can also have a policy label that has authentication policies for different authentication mechanisms.

To summarize, the configurations you must perform to set up nFactor authentication are as follows:
1. Create the authentication schema XML files.
2. Associate each XML file with a login schema.
3. Associate each login schema with a login schema policy or authentication policy label.
4. Bind login schema policy to an authentication virtual server.
5. Bind authentication policy label, as next factor, to an authentication policy.

How nFactor authentication works

September 14, 2018

Imagine a user requesting access to an application that requires user credentials. As is the case in NetScaler appliance deployments, the request arrives at the NetScaler appliance through a traffic management virtual server (in this case, a load balancing virtual server). Since the user must provide authentication credentials, the load balancing virtual server redirects the request to the authentication virtual server, which does the following:

1. Checks to determine whether any login schema policies are associated with the authentication virtual server.

   - If yes, the user is presented the login form associated with the login schema policy with the highest priority that evaluates to true.

   - If no, the default login form is presented to the user.

   **Note**
   
   The default login schema files are available in the `/nsconfig/loginschema/LoginSchema/` directory of the NetScaler appliance. Citrix recommends that you copy these files to the `/nsconfig/loginschema/` directory before using them, so that changes made to the files are preserved post reboot.

2. The authentication policies that are associated with the authentication virtual server are evaluated. For the policies that are evaluated to true, the actions are executed in order of priority until one of the actions succeeds.

3. The policy label that is associated as the next factor is invoked.

4. The authentication policies that are associated with the authentication policy label are evaluated. For the policies that are evaluated to true, the actions are executed in order of priority until one of the actions succeeds.

5. The policy label that is associated as the next factor is invoked.

6. Steps 4 and 5 are performed repetitively till all the configured next factors are executed.
Configuring nFactor authentication

January 6, 2019

To understand the step-wise configurations for nFactor authentication, let us consider a 2-factor authentication deployment where the 1st factor is LDAP authentication and the 2nd factor is RADIUS authentication.

This sample deployment requires the user to login to both factors using a single login form. Therefore, we define a single login form that accepts two passwords. The first password is used for LDAP authentication and the other for RADIUS authentication. View XML file.

Here are the configurations that are performed.

1. Configure the load balancing virtual server for authentication

   add lb vserver lvb55 HTTP 1.217.193.55 80 -AuthenticationHost auth56.aaatm.com -Authentication ON

2. Configure the authentication virtual server.

   add authentication vserver auth56 SSL 1.217.193.56 443 -AuthenticationDomain aaatm.com

3. Configure the login schema for the login form and bind it to a login schema policy.

   add authentication loginSchema login1 -authenticationSchema login-2passwd.xml -userCredentialIndex 1 -passwordCredentialIndex 2

   add authentication loginSchemaPolicy login1 -rule true -action login1

4. Configure a login schema for the pass-through and bind it to a policy label

   add authentication loginSchema login2 -authenticationSchema noschema

   add authentication policyLabel label1 -loginSchema login2

5. Configure the LDAP and RADIUS policies.

   add authentication ldapAction ldapAct1 -serverIP 1.217.28.180 -ldapBase “dc=aaatm, dc=com”
   -ldapBindDn administrator@aaatm.com -ldapBindDnPassword 71ca2b11ad800ce2787fb7deb54842875b8f3c7
   -encrypted -encryptmethod ENCMTHD_3 -ldapLoginName samAccountName -groupAttrName memberOf -subAttributeName CN

   add authentication Policy ldap -rule true -action ldapAct1

   add authentication radiusAction radius -serverIP 1.217.22.20 -radKey a740d6a0aeb3288fa0a6fbeb932d329ad
   -encrypted -encryptmethod ENCMTHD_3 -radNASip ENABLED -radNASid NS28.50 -radAttributeType 11 -ipAttributeType 8

   add authentication Policy radius -rule true -action radius
6. Bind the login schema policy to the authentication virtual server

   `bind authentication vserver auth56 -policy login1 -priority 1 -gotoPriorityExpression END`

7. Bind the LDAP policy (first factor) to the authentication virtual server.

   `bind authentication vserver auth56 -policy ldap -priority 1 -nextFactor label1 -gotoPriorityExpression next`

8. Bind the RADIUS policy (second factor) to the authentication policy label.

   `bind authentication policylabel label1 -policyName radius -priority 2 -gotoPriorityExpression end`

## Configuring the OpenID Connect protocol

September 14, 2018

A NetScaler appliance can now be configured as an identity provider by using OpenID Connect protocol. OpenID Connect protocol strengthens identity providing capabilities of the NetScaler appliance. You can now access enterprise wide hosted application with a single sign-on as OpenID Connect offers more security by not transferring user password but works with tokens with specific lifetime. OpenID also is designed to integrate with non-browser clients such as apps and services. Therefore, OpenID Connect has been widely adopted by many implementations.

### Advantages of having the OpenID Connect support

- OpenID eliminates overhead of maintaining multiple authentication passwords as the user has a single identity across organization.
- OpenID provides a robust security for your password as the password is shared only with your identity provider and not with any application you access.
- OpenID has vast interoperability with various systems making it easier for the hosted applications to accept OpenID.
- OpenID is a simple protocol that enables native clients to easily integrate with servers.

## To configure NetScaler appliance as an IdP using the OpenID Connect protocol with the GUI

2. Click **Profile** and click **Add**.

   On the Create Authentication OAuth IDP Profile screen, set values for the following parameters and click **Create**.
- **Name** – Name of the authentication profile.
- **Client ID** – Unique string that identifies SP.
- **Client Secret** – Unique secret that identifies SP.
- **Redirect URL** – Endpoint on SP to which code/token has to be posted.
- **Issuer Name** – String that identifies IdP.
- **Audience** – Target recipient for the token being sent by IdP. This might be checked by the recipient.
- **Skew Time** – The time for which the token remains valid.
- **Default Authentication Group** – A group added to the session for this profile to simplify policy evaluation and help in customizing policies.

3. Click **Policies** and click **Add**.

4. On the **Create Authentication OAuth IDPPolicy** screen, set values for the following parameters and click **Create**.
   - **Name** – The name of the authentication policy.
   - **Action** – Name of profile created above.
   - **Log Action** – Name of messagelog action to use when a request matches this policy. This is not mandatory filed.
   - **Undefined-Result Action** – Action to perform if the result of policy evaluation is undefined(UNDEF). This is not mandatory field.
   - **Expression** – Default syntax expression that the policy uses to respond to specific request. For example, true.
   - **Comments** – Any comments about the policy.

**Binding the OAuth IDP policy and LDAP policy to the authentication virtual server**

1. Navigate to **Configuration > Security > AAA-Application Traffic > Policies >Authentication > Advanced Policies > Actions > LDAP**.

2. On **LDAP Actions** screen, click **Add**.

3. On **Create Authentication LDAP Server** screen, set the values for the following parameters, and click **Create**.
   - **Name** – The name of the ldap action**
   - **ServerName/ServerIP** – Provide FQDN or IP of the LDAP server**
   - Choose appropriate values for **Security Type, Port, Server Type, Time-Out**
   - Make sure **Authentication** is checked
   - **Base DN** – Base from which to start LDAP search. For example, dc=aaa,dc=local.
   - **Administrator Bind DN**: Username of the bind to LDAP server. For example, admin@aaa.local.
• \textbf{Administrator Password/Confirm Password: **Password to bind LDAP}
• Click \texttt{Test Connection} to test your settings.
• \textbf{Server Logon Name Attribute:} Choose “\texttt{sAMAccountName}”
• Other fields are not mandatory and hence can be configured as required.

5. On \texttt{Authentication Policies} screen, click \texttt{Add}.

6. On \texttt{Create Authentication Policy} page, set the values for the following parameters and click \texttt{Create}.
   • \textbf{Name} – Name of the LDAP Authentication Policy.**
   • \textbf{Action Type} – Choose LDAP.
   • \textbf{Action} – Choose the LDAP action created above.**
   • \textbf{Expression} – Default syntax expression that the policy uses to respond to specific request. For example, true.

\textbf{To configure the NetScaler appliance as an IdP using the OpenID Connect protocol with the command line}

At the command prompt, type the following commands:

• \texttt{add authentication OAuthIdPPolicy <name> -rule <expression> [-action <string> [-undefAction <string>] [-comment <string>] [-logAction <string>]}

• \texttt{add authentication ldapAction aaa-ldap-act -serverIP 10.0.0.10 -ldapBase "dc=aaa,dc=local"}

• \texttt{ldapBindDn <administrator@aaa.local> -ldapBindDnPassword <password> - ldapLoginName sAMAccountName}

• \texttt{add authentication policy aaa-ldap-adv-pol -rule true -action aaa-ldap-act}

• \texttt{bind authentication vserver auth_vs -policy ldap_policy_name -priority 100 -gotoPriorityExpression NEXT}
Admin Partitioning

January 6, 2019

A NetScaler appliance can be partitioned into logical entities called admin partitions, where each partition can be configured and used as a separate NetScaler appliance. The following figure shows the partitions of a NetScaler being used by different customers and departments:

A partitioned NetScaler appliance has a single default partition and one or more admin partitions.

The following table provides further details on the two partition types:

<table>
<thead>
<tr>
<th>Default Partition</th>
<th>Admin Partitions</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Availability:</strong></td>
<td></td>
</tr>
<tr>
<td>The NetScaler appliance ships with a single partition, which is called a default partition. The default partition is retained even after the NetScaler appliance is partitioned.</td>
<td></td>
</tr>
<tr>
<td><strong>Must be explicitly created as described in Configure admin partitions.</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Number of Partitions:</strong></td>
<td>One</td>
</tr>
<tr>
<td>A NetScaler appliance can have one or more (maximum of 512) admin partitions.</td>
<td></td>
</tr>
<tr>
<td><strong>User Access and Roles:</strong></td>
<td></td>
</tr>
<tr>
<td>The default partition can be accessed and configured by all NetScaler users who are not associated with a partition-specific command policy. As always, the operations that a user can perform are restricted by the associated command policy.</td>
<td></td>
</tr>
</tbody>
</table>

Note

You can bind more than one key. Public parts of certificates bound are sent in response to jwks_uri query (https://gw/oauth/idp/certs).
Can be created only by NetScaler superusers who also specify the users for that partition. Only superusers and associated users of the partition can access and configure the admin partition. 

Note: Partition users do not have shell access.

**File Structure:**

All files in a default partition are stored in the default NetScaler file structure. 

For example, the NetScaler configuration file is stored in the `/nsconfig` directory and NetScaler logs are stored in the `/var/log` directory.

All files in an admin partition are stored in directory paths that have the name of the admin partition. 

For example, the NetScaler configuration file (ns.conf) is stored in the `/nsconfig/partitions/<partitionName>` directory. Other partition-specific files are stored in the `/var/partitions/<partitionName>` directories.

Some other paths in an admin partition:

- **Downloaded files:** `/var/partitions/<partitionName>/download/`
- **Log files:** `/var/partitions/<partitionName>/log/`

**Note:** Currently, logging is not supported at partition-level. Therefore, this directory is empty and all logs are stored in the `/var/log` directory.

- **SSL CRL certificate related files:** `/var/partitions/<partitionName>/netscaler/ssl`

**Resources Available:**

All NetScaler resources.

NetScaler resources that are explicitly assigned to the admin partition.

**User access and roles**

In authenticating and authorizing a partitioned NetScaler appliance, a root administrator can assign a partition administrator to one or more partitions. The partition administrator can authorize users to that partition without affecting other partitions. These are partition users and they are authorized to access only that partition using SNIP address. Both the root administrator and the partition administrator can configure role based access (RBA by authorizing users to access different applications.

Administrators and user roles can be described as follows:

**Root Administrator.** Accesses the partitioned appliance through its NSIP address and can grant user access to one or more partitions. The administrator can also assign partition administrators to one or more partitions. The administrator can create a partition administrator from the default partition using a NSIP address or switch to a partition and then create a user and assign partition admin access using a SNIP address.
**Partition Administrator.** Accesses the specified partition through a NSIP address assigned by the root administrator. The administrator can assign role-based access to partition user access to that partition and also configure external server authentication using partition specific configuration.

**System User.** Accesses partitions through the NSIP address. Has access to the partitions and resources specified by the root administrator.

**Partition User.** Accesses a partition through a SNIP address. This user account is created by the partition administrator and the user has access to resources, only within the partition.

**Points to remember**

Following are some points to remember when providing role-based access in a partition.

1. NetScaler users accessing the GUI through NSIP address will use default partition authentication configuration to log on to the appliance.
2. Partition system users accessing the GUI through partition SNIP address will use partition specific authentication configuration to log on to the appliance.
3. Partition user created in a partition cannot login using NSIP address.
4. NetScaler user bound to a partition cannot login using partition SNIP address.
5. External users accessing a partition through external server configuration as LDAP, Radius, or TACACS added in the partition. The user must access using SNIP address to directly log onto the partition.

**Use case for managing role Based access in an partitioned setup**

Consider a scenario where an enterprise organization, www.example.com has multiple business units and a centralized administrator who manages all instances in their network. However, they want to provide exclusive user privileges and environment for each business unit.

Following are the administrators and users managed by default partition authentication configuration and partition specific configuration in a partitioned appliance.

**John:** Root Administrator

**George:** Partition Administrator

**Adam:** System User

**Jane:** Partition User

John, is the root administrator of a partitioned NetScaler appliance. John manages all user accounts and administrative user accounts across partitions (for example, P1, P2, P3, P4, and P5) within the
appliance. He provides granular role-based access to entities from the default partition of the appliance. John creates user accounts and assigns partition access to each account. George being a network engineer within the organization prefers to have a role based access to few applications running on partition P2. Based on user management, John creates a partition administrator role for George and associates his user account with partition-admin command policy in P2 partition. Adam being another network engineer prefers to access an application running on P2. John creates a system user account for Adam and associates his user account to P2 partition. Once his account is created, Adam can log into the appliance to access the NetScaler Management interface through NSIP address and can switch to partition P2 based on user/group binding.

Suppose, Jane who is another network engineer wants to directly access an application running only on partition P2, George (partition administrator) can create a partition user account for her and associate her account with command policies for authorization privileges. Jane's user account created within the partition is now directly associated with P2. Now Jane can access the NetScaler Management interface through SNIP address and cannot switch to any other partition.

**Note**

If Jane’s user account is created by a partition administrator in partition P2, she can access the NetScaler Management interface only through SNIP address (created within the partition) and not permitted to access the interface through NSIP address. Similarly, if Adam's user account is created by a root administrator in the default partition and is bound to P2 partition, he can access the NetScaler Management interface only through NSIP address or SNIP address created in the default partition (with management access enabled) and not permitted to access the partition interface through SNIP address created in the administrative partition.

**Configure roles and responsibilities for partition administrators**

Following are the configurations performed by a root administrator in a default partition.

Creating administrative partitions and system users – A root administrator creates administrative partitions and system users in the default partition of the appliance. The administrator then associates the users to different partitions. If you are bound to one or more partitions, you can switch from one partition to another based on user bindings. Also, your access to one or more bound partitions is authorized only by the root administrator.

Authorizing system user as partition administrator for a specific partition – Once a user account is created, the root administrator switches to a specific partition and authorizes the user as the partition administrator. This is done by assigning partition-admin command policy to the user account. Now, the user can access the partition as partition administrator and manage entities within the partition.

Following are the configurations perform by a partition administrator in an administrative partition.
NetScaler 12.0

Configuring SNIP address in an administrative partition- The partition administrator logs on to the partition and creates a SNIP address and provides management access to the address.

Creating and Binding a Partition System User with Partition Command Policy -The partition administrator creates partition users and defines the scope of user access. This is done by binding the user account to partition command policies.

Creating and Binding a Partition System User Groups with Partition Command Policy -The partition administrator creates partition user groups and defines the scope of user group access. This is done by binding the user group account to partition command policies.

Configuring External Server authentication for external users (optional)-This configuration is done for authenticating external TACACS users accessing the partition using SNIP address.

Following are the tasks performed in configuring role-based access for partition users in an Administrative Partition.

1. Creating an Administrative Partition – Before you create partition users in an administrative partition, you must first create the partition. As a root administrator, you can create a partition from the default partition using the configuration utility or a command line interface.

2. Switching user access from default partition to partition P2 – If you are partition administrator accessing the appliance from the default partition, you can switch from default partition to a specific partition (for example, partition P2) based on user binding.

3. Adding SNIP address to the Partition user account with Management access enabled-Once you have switched your access to an administration partition, you must create a SNIP address and provide management access to the address.

4. Creating and Binding a Partition System User with Partition Command Policy-If you are a partition administrator, you can create partition users and define the scope of user access. This is done by binding the user account to partition command policies.

5. Creating and Binding Partition user group with Partition Command Policy-If you are a partition administrator, you can create partition user groups and define the scope of user access control. This is done by bind the user group account to partition command policies.

Configuring External Server authentication for external users (optional)-This configuration is done for authenticating external TACACS users accessing the partition using SNIP address.

Benefits of using admin partitions

You can avail the following benefits by using admin partitions for your deployment:

- Allows delegation of administrative ownership of an application to the customer.
- Reduces the cost of ADC ownership without compromising on performance and ease-of-use.
- Safeguards from unwarranted configuration changes. In a non-partitioned NetScaler appliance, authorized users of other application could intentionally or unintentionally change configura-
tions that are required for your application. This could lead to undesirable behavior. This possibility is reduced in a partitioned NetScaler appliance.
- Isolates traffic between different applications by the use of dedicated VLANs for each partition.
- Accelerates and allows to scale application deployments.
- Allows application-level or localized management and reporting.

Let us analyze a couple of cases to understand the scenarios in which you can use admin partitions.

User case 1: How Admin partition is used in an enterprise network

Let us consider a scenario faced by a company named Foo.com.

- Foo.com has a single NetScaler.
- There are five departments and each department has one application that requires to be deployed with the NetScaler.
- Each application must be managed independently by a different set of users or administrators.
- Other users must be restricted from accessing the configurations.
- The application or back-end must be able to share resources like IP addresses.
- The global IT department must be able to control NetScaler-level settings which must be common to all partitions.
- Applications must be independent of one another. An error in configuration of one application must not affect the other.

A non-partitioned NetScaler would not be able to satisfy these requirements. However, you can achieve all these requirements by partitioning a NetScaler.

Simply create a partition for each of the applications, assign the required users to the partitions, specify a VLAN for each partition, and define global settings on the default partition.

Use case 2: How an admin partition is used by a service provider

Let us consider a scenario faced by a service provider named BigProvider:

- BigProvider has 5 customers: 3 small enterprises and 2 large enterprises.
- SmallBiz, SmallerBiz, and StartupBiz need only the most basic NetScaler functionality.
- BigBiz and LargeBiz are larger enterprises and have applications that attract a lot of traffic. They would like to use some of the more complex NetScaler functionality.

In a non-partitioned approach, the NetScaler administrator would typically use a NetScaler SDX appliance and provision a NetScaler instance for each customer.

This solution suits BigBiz and LargeBiz because their applications need the undiminished power of the entire non-partitioned NetScaler appliance. However, this solution might not be as cost effective for servicing SmallBiz, SmallerBiz, and StartupBiz.
Therefore, **BigProvider** decides on the following solution:

- Using a NetScaler SDX appliance to bring up dedicated NetScaler instances for **BigBiz** and **LargeBiz**.
- Using a single NetScaler which is partitioned into three partitions, one each for **SmallBiz**, **SmallerBiz**, and **StartupBiz**.

The NetScaler administrator (superuser) creates an admin partition for each of these customers, specifies the users for the partitions, specifies the NetScaler resources for the partitions, and specifies the VLAN to be used by the traffic that is destined for each of the partitions.

### Supported NetScaler configurations

**January 6, 2019**

Depending on the NetScaler configuration and the partition in which the configuration is performed, NetScaler configurations can be categorized into three types of configurations as given below.

**Note**

- Admin partitions cannot be set up on a NetScaler cluster. This means that a NetScaler cluster cannot be partitioned.
- Admin partitions cannot be set up on a NetScaler MPX-FIPS appliance.
- **Case 3** lists the NetScaler features that are not supported in admin partitions.

#### Case 1 (global configurations)

Configurations that can be performed ONLY in the default partition and which are available or impact all the admin partitions.

- Updates to built-in entities for monitors, TCP profiles, HTTP profiles, and so on.
- Updates to global parameters for syslog, nslog, weblog, content switching, IPSEC, SIP, DHCP, Surge protection, TCP buffering, and system collection.
- High availability (HA) configurations
- Interface and VLAN changes
- User configurations

#### Case 2 (partition-specific configurations)

Configurations that can be performed independently in default and admin partitions. These configurations are applicable only to the partition in which they are performed.

- Getting traffic level statistics for a partition.
NetScaler 12.0

- Partition admin can update IP bindings for VLAN which is bound to that partition. But cannot update the interface bindings.
- Clearing NetScaler configurations.
- Feature-specific parameters for the following features: AppFlow, AppQoE, HTTP compression, DNS, TCP, HTTP, encryption, responder, rewrite, and SSL.
- Feature-specific configurations such as virtual servers, services, monitors, and so on.

**Case 3**

Configurations that cannot be performed on admin partitions. These features can be configured in the default partition, but there is no impact on admin partitions.

**Note**

Configurations that are supported on admin partitions for a particular release are marked as **Yes**.

## Configure admin partitions

December 5, 2018

**Important**
- Only superusers are authorized to create and configure admin partitions.
- Unless specified otherwise, configurations to set up an admin partition must be done from the default partition.

By partitioning a NetScaler appliance, you are in-effect creating multiple instances of a single NetScaler appliance. Each instance has its own configurations and the traffic of each of these partitions is isolated from the other by assigning each partition a dedicated VLAN or a shared VLAN.

A partitioned NetScaler has one default partition and the admin partitions that are created. To set up an admin partition, you must first create a partition with the relevant resources (memory, maximum bandwidth, and connections). Then, specify the users that can access the partition and the level of authorization for each of the users on the partition.

Accessing a partitioned NetScaler is the same as accessing a non-partitioned NetScaler: through the NSIP address or any other management IP address. As a user, after you provide your valid logon cre-
dentials, you are taken to the partition to which you are bound. Any configurations that you create are saved to that partition. If you are associated with more than one partition, you are taken to the first partition with which you were associated. If you want to configure entities on one of your other partitions, you must explicitly switch to that partition.

After accessing the appropriate partition, configurations that you perform are saved to that partition and are specific to that partition.

Note

- NetScaler superusers and other non-partition users are taken to the default partition.
- Users of all the 512 partitions can log in simultaneously.

Tip

To access a partitioned NetScaler appliance over HTTPS by using the SNIP (with management access enabled), make sure that each partition has the certificate of its partition administrator. Within the partition, the partition admin must do the following:

1. Add the certificate to the NetScaler.

   ```
   add ssl certKey ns-server-certificate -cert ns-server.cert -key ns-server.key
   ```

2. Bind it to a service named “nskrpcs-<SNIP>-3009”, where <SNIP> must be replaced with the SNIP address, in this case 100.10.10.1.

   ```
   bind ssl service nskrpcs-100.10.10.1-3009 -certkeyName ns-server-certificate
   ```

Partition resource limiting

In a partitioned NetScaler appliance, a network administrator can create a partition with partition resources such as memory, bandwidth, and connection limit configured as unlimited. This is done by specifying Zero as the partition resource value, where Zero indicates the resource is unlimited on the partition and it can be consumed up to system limits. Partition resource configuration is useful when you migrate a traffic domain deployment to an administrative partition or if you do not know about resource allocation limit for a partition in a given deployment.

Resource limit for an administrative partition is as follows:

1. Partition memory. This is the maximum allocated memory for a partition. You must make sure to specify the values when creating a partition.

   Note

   From NetScaler 12.0 onwards, when you create a partition, you must set the memory limit as Zero or if a partition is already created with a specific memory limit, you can reduce
the limit to any value or set the limit as Zero.

Parameter: maxMemLimit

Maximum memory is allocated in megabytes in a partition. A zero value indicates the memory is unlimited on the partition and it can consume up to the system limits.

Default value: 10

2. Partition bandwidth. Maximum allocated bandwidth for a partition. If you specify a limit, make sure it is within the appliance's licensed throughput. Otherwise, you are not limiting the bandwidth that can be used by the partition. The specified limit is accountable for the bandwidth that the application requires. If the application bandwidth exceeds the specified limit, packets are dropped.

Note

From NetScaler 12.0 onwards, when you can create a partition, you can set the partition bandwidth limit to Zero or if a partition is already created with a specific bandwidth, you can reduce bandwidth or set the limit as Zero.

Parameter: maxBandwidth

Maximum bandwidth is allocated in Kbps in a partition. A zero value indicates the bandwidth is unrestricted. That is, the partition can consume up to the system limits.

Default value: 10240

Maximum Value: 4294967295

3. Partition connection. Maximum number of concurrent connections that can be open in a partition. The value must accommodate the maximum simultaneous flow expected within the partition. The partition connections are accounted from the partition quota memory. Previously, the connections were accounted from the default partition quota memory. It is configured only on the client-side, not on the back-end server-side TCP connections. New connections cannot be established beyond this configured value.

Note

From NetScaler 12.0 onwards, you can create a partition with number of open connections set to Zero or if you have already created a partition with a specific number of open connections, you can reduce the connection limit or set the limit as Zero.

Parameter: maxConnections

Maximum number of concurrent connections that can be open in the partition. A zero value indicates no limit on number of open connections.

Default value: 1024

Minimum value: 0
**Configure an admin partition**

To configure an admin partition, complete the following tasks.

**Access an admin partition**

**To access in an admin partition by using the command line interface**

1. Log on to the NetScaler appliance.
2. Check if you are in the correct partition. The command prompt displays the name of the currently selected partition.
3. If yes, skip to the next step.
4. If no, get a list of the partitions with which you are associated and switch over to the appropriate partition.
   - `show system user <username>`
   - `switch ns partition <partitionName>`
5. Now, you can perform the required configurations just as a non-partitioned NetScaler.

**To access an admin partition by using the configuration utility**

1. Log on to the NetScaler appliance.
2. Check if you are in the correct partition. The top bar of the graphical user interface displays the name of the currently selected partition.
   - If yes, skip to the next step.
   - If no, navigate to **Configuration > System > Administrative Partitions > Partitions**, right-click the partition to which you want to switch, and select **Switch**.
3. Now, you can perform the required configurations just as a non-partitioned NetScaler.

**Add an admin partition**

The root administrator adds an administrative partition from the default partition and binds the partition with VLAN 2.
**To create an administrative partition by using the command line interface**

At the command prompt, type:

```
1  add partition <partitionname>
```

**Switch user access from default partition to an admin partition**

Now switch user access from default partition to partition Par1.

**To switch a user account from default partition to an admin partition by using the command line interface:**

At the command prompt, type:

```
1  Switch ns partition <pname>
```

**Adding SNIP address to a partition user account with management access enabled**

In the partition, create SNIP address with management access enabled.

**To add SNIP address to the partition user account with management access enabled by using the command line interface:**

At the command prompt, type:

```
1  >  add ns ip <ip address> <subnet mask> -mgmtAccess enabled
```

**Create and Bind a partition user with partition command policy**

In partition, create a partition system user and bind the user with partition-admin command policies.

**To create and bind a partition system user with partition command policy by using the command line interface:**

At the command prompt, type:

```
1  >  add system user <username> <password>
2  Done
```
Creating and binding partition user group with partition command policy

In Partition Par1, create a partition system user group and bind the group with partition command policy such as partition admin, partition read-only, partition-operator, or partition-network.

To create and bind a partition user group with partition command policy by using the command line interface:

```
1 > add system group <groupName>
2 > bind system group <groupName> (-userName | -policyName <cmdpolicy> <priority> | -partitionName)
```

Configuring external server authentication for external users

In partition Par1 you can configure an external server authentication to authenticate external TACACS users accessing the partition through SNIP address.

To configure external server authentication for external users by using the command line interface:

At the command prompt, type:

```
1 add authentication tacacsaction <name> -serverip <IP> -tacacsSecret <secret key> -authorization ON -accounting ON
2 add authentication policy <policyname> -rule true -action <name>
3 bind system global <policyname> -priority <value>1
```

Configure a Partition System User Accounts in a Partition by using the GUI

To configure a partition user account in an administrative partition, you must create a partition user or a partition user group and bind it partition command policies. Also, you can configure the external server authentication for an external user.

To create a partition user account in a partition by using the GUI

Navigate to System > User Administration, click Users to add a partition system user and bind the user to command policies (partitionadmin/partitionread-only/partition-operator/partition-network).

To create a partition user group account in a partition by using the GUI

Navigate to System > User Administration, click Groups to add a partition system user group and bind the user group to command policies (partitionadmin/partitionread-only/partition-operator/partition-network).
To configure External server authentication for external users by using the GUI

Navigate to System > Authentication > Basic Actions and click TACACS to configure TACACS server for authenticating external users accessing the partition.

Sample Configuration

The following configuration shows how to create a partition user or a partition user group and bind it partition command policies. Also, how to configure the external server authentication for authenticating an external user.

```
1 add partition Par1
2 switch ns partition Par1
3 > add ns ip 10.102.29.203 255.255.255.0 -mgmtAccessenabled
4 > add system user John Password
5 > bind system user Jane partition-read-only -priority 1
6 > add system group Retail
7 > bind system group Retail -policynname partition-network 1 (where 1 is the priority number)
8 > bind system group Retail -username Jane
9 > add authentication tacacssaaction tacuser -serverip 10.102.29.200 -
tacaccSecret Password -authorization ON -accounting ON
10 > add authentication policy polname -rule true -action tacacsAction
11 > bind system global polname -priority 1
```

Configure an LACP ethernet channel on the default admin partition

With Link Aggregation Control Protocol (LACP), you can combine multiple ports into a single, high-speed link (also called a channel). An LACP-enabled appliance exchanges LACP Data Units (LACPDU) over the channel.

There are three LACP configuration modes that you can enable in the default partition of a NetScaler appliance:

1. **Active.** A port in active mode sends LACPDU. Link aggregation is formed if the other end of the Ethernet link is in the LACP active or passive mode.
2. **Passive.** A port in passive mode sends LACPDU only when it receives LACPDU. The link aggregation is formed if the other end of the Ethernet link is in the LACP active mode.
3. **Disable.** Link aggregation is not formed.

**Note**

By default, the link aggregation is disabled in the default partition of the appliance.

LACP exchanges LACPDU between devices connected by an Ethernet link. These devices are typically referred as an actor or partner.

A LACPDU data unit contains the following parameters:

- **LACP Mode.** Active, passive or disable.
- **LACP timeout.** The waiting period before timing out the partner or actor. Possible values: Long and Short. Default: Long.
- **Port Key.** To distinguish between the different channel. When key is 1, LA/1 is created. When key is 2, LA/2 is created. Possible values: Integer from 1 through 8. 4 through 8 is for cluster CLAG.
- **System Priority.** Uses this priority along with system MAC to form the system ID to uniquely identify the system during LACP negotiation with the partner. Sets system priority from 1 and 65535. The default value is set to 32768.
• Interface. Supports 8 interfaces per channel on NetScaler 10.1 appliance and supports 16 interfaces per channel on NetScaler 10.5 and 11.0 appliances.

After exchanging LACPDUs, the actor and partner negotiate the settings and decide whether to add the ports to the aggregation.

**Configure and verify LACP**

**To configure and verify LACP on a NetScaler appliance by using the command line**

1. Enable LACP on each interface.

   At the command prompt, type:
   ```
   set interface <Interface_ID> -lacpMode PASSIVE -lacpKey 1
   ```

   When you enable LACP on an interface, the channels are dynamically created. Additionally, when you enable LACP on an interface and set lacpKey to 1, the interface is automatically bound to channel LA/1.

   **Note**

   When you bind an interface to a channel, the channel parameters take precedence over the interface parameters, so the interface parameters are ignored. If a channel was created dynamically by LACP, you cannot perform add, bind, unbind, or remove operations on the channel. A channel dynamically created by LACP is automatically deleted when you disable LACP on all interfaces of the channel.

2. Set the system priority.

   At the command prompt, type:
   ```
   set lacp -sysPriority <Positive_Integer>
   ```

3. Verify that LACP is working as expected.

   ```
   show interface <Interface_ID>
   show channel
   show LACP
   ```

   **Note**

   In some versions of Cisco IOS, running the switchport trunk native vlan <VLAN_ID> command causes the Cisco switch to tag LACP PDUs. This causes the LACP channel between the Cisco switch and the NetScaler appliance to fail. However, this issue does not affect the static link aggregation channels configured in the above procedure.
VLAN configuration for admin partitions

January 6, 2019

VLANs can be bound to a partition as a “Dedicated” VLAN or a “Shared” VLAN. Based on your deployment, you can bind a VLAN to a partition to isolate its network traffic from other partitions.

**Dedicated VLAN** – A VLAN bound only to one partition with “Sharing” option disabled and must be a tagged VLAN. For example, in a client-server deployment, for security reasons a system administrator creates a dedicated VLAN for each partition on the server side.

**Shared VLAN** – A VLAN bound (shared across) to multiple partitions with “Sharing” option enabled. For example, in a client-server deployment, if the system administrator does not have control over the client side network, a VLAN is created and shared across multiple partitions.

Shared VLAN can be used across multiple partitions. It is created in the default partition and you can bind a shared VLAN to multiple partitions. By default, a shared VLAN is bound to the default partition implicitly and hence it cannot be bound explicitly.

**Note**

If a NetScaler Virtual Appliance is deployed on an ESX platform, you must enable the Promiscuous mode for shared VLANs with partition. Otherwise, if the traffic is through a dedicated VLAN, you must enable the VLAN with Portgroup properties of the virtual switch.

In a partitioned (multi-tenant) NetScaler appliance, a system administrator can isolate the traffic flowing to a particular partition or partitions by binding one or more VLANs to each partition. A VLAN can be dedicated to one partition or Shared across multiple partitions.

**Dedicated VLANs**

To isolate the traffic flowing into a partition, create a VLAN and associate it with the partition. The VLAN is then visible only to the associated partition, and the traffic flowing through the VLAN is classified and processed only in the associated partition.

To implement a dedicated VLAN for a particular partition, do the following.

1. Add a VLAN (V1).
2. Bind a network interface to VLAN as a tagged network interface.
3. Create a partition (P1).
4. Bind partition (P1) to the dedicated VLAN (V1).

**To add a VLAN by using the command line interface**

At the command prompt, type:
To bind a VLAN by using the command line interface

At the command prompt, type:

```
bind vlan <id> -ifnum <interface> -tagged
```

```
bind vlan V1 -ifnum 1/8 -tagged
```

To create a partition by using the command line interface

At the command prompt, type:

```
Add ns partition <partition name> [-maxBandwidth <positive_integer>] [-maxConn <positive_integer>] [-maxMemLimit <positive_integer>]
```

```
Add ns partition P1 -maxBandwidth 200 -maxconn 50 -maxmemlimit 90
```

To bind a partition to a VLAN by using the NetScaler CLI

At the command prompt, type:

```
bind partition <partition-id> -vlan <vlan>
```

```
bind partition P1 - vlan V1
```

To configure a dedicated VLAN by using the NetScaler GUI

1. Navigate to Configuration > System > Network > VLANs* and click Add to create a VLAN.
2. On the Create VLAN page, set the following parameters:
   - VLAN ID
   - Alias Name
   - Maximum Transmission Unit
   - Dynamic Routing
3. In the **Interface Bindings** section, select one or more interfaces and bind it to the VLAN.
4. In the **IP Bindings** section, select one or more IP addresses and bind to the VLAN.
5. Click **OK** and **Done**.

**Shared VLAN**

In a shared VLAN configuration, each partition has a MAC address, and traffic received on the shared VLAN is classified by MAC address. Only a Layer3 VLAN is recommended because it can restrict the subnet traffic. A partition MAC address is applicable and important only for a shared VLAN deployment.

---

**Note**

Shared VLAN in a partitioned appliance does not support dynamic routing protocol.

The following diagram shows how a VLAN (VLAN 10) is shared across two partitions.

To deploy a shared VLAN configuration, do the following:

1. Create a VLAN with the sharing option ‘enabled’, or enable the sharing option on an existing VLAN. By default, the option is ‘disabled’.
2. Bind partition interface to shared VLAN.
3. Create the partitions, each with its own PartitionMAC address.
4. Bind the partitions to the shared VLAN.

**To configure a shared VLAN by using the command line interface**

At the command prompt, type one of the following commands to add a new VLAN or set the sharing parameter of an existing VLAN:

```plaintext
1 add vlan <id> [-sharing (ENABLED | DISABLED)]
2 set vlan <id> [-sharing (ENABLED | DISABLED)]
```

5 add vlan V1 -sharing ENABLED
6 set vlan V1 -sharing ENABLED

**To bind a partition to a Shared VLAN by using the command line interface**

At the command prompt, type:
To configure a Partition MAC Address

At the command prompt, type:

```
set ns partition <partition name> [-partitionMAC<mac_addr>]
```

To bind partitions to a shared VLAN by using the command line interface

At the command prompt, type:

```
bind partition <partition-id> -vlan <id>
bind partition P1 -vlan
Add ns partition P1 -maxBandwidth 200 -maxconn 50 -maxmemlimit 90
-partitionMAC<mac_addr>
Done
```

To configure Shared VLAN by using the NetScaler GUI

1. Navigate to Configuration > System > Network > VLANs and then select a VLAN profile and click Edit to set the partition sharing parameter.
2. On the Create VLAN page, select the Partitions Sharing checkbox.
3. Click OK and then Done.
VXLAN support for admin partitions

November 6, 2018

In a partitioned NetScaler appliance, similar to configuring a VLAN, you can configure a VXLAN in the default partition. After configuring a VXLAN, you can bind it to an administrative partition or if a VXLAN is extending a VLAN that is bound to a partition, the appliance binds the VXLAN to the partition under the same broadcasting domain. This is applicable in unbinding a VLAN that unbinds a VXLAN from the partition.

For more information about how VXLAN works in a NetScaler appliance, see VXLAN.

Also, for more information on how VLAN works in a partitioned NetScaler appliance, see Configure admin partitions.

Points to remember before configuring a VXLAN

Remember the following points before you configure a VXLAN in a partitioned NetScaler appliance:

• When you extend a VLAN over VXLAN, make sure VLAN is bound to the partition.
• Only a partition administrator must configure the IP and dynamic routing for the VXLAN in the administrative partition.

A shared VXLAN is not supported in a partitioned appliance and so a VXLAN cannot be tagged to a shared VLAN or you cannot make a VLAN a shared one when it is tagged to a VXLAN.

Supportable VXLAN configurations

Following are the supportable VXLAN configurations.

Case 1: Extending VLAN over a VXLAN in the same broadcast domain**

Follow the steps given below to extend a VLAN over a VXLAN and vice versa within the same broadcast domain:

1. Add a VLAN in the default partition
   At the command prompt, type:
   ```bash
   Add vlan <id>
   ```

2. Extend VLAN over a VXLAN within the same broadcast domain.
   At the command prompt, type:
   ```bash
   Add vxlan <vxlan id> -vlan <id>
   ```
3. Configure a peer vtep to carry all BUM (broadcast unknown multicast) traffic.

Note
The vtep address can be a multicast address.

At the command prompt, type:

```bash
add bridgetable -mac <mac_addr> -vxlans <positive_integer> -vtep <ip_addr> [-vni <positive_integer>][deviceVlan <positive_integer>]
```

4. Bind IP addresses to VXLAN.

At the command prompt, type:

```bash
Bind vxlan <id> [-srcIP <ip_addr>][-IPAddress <ip_addr|ipv6_addr|*> [<netmask>]]
```

5. Bind VLAN to an administrative partition.

At the command prompt, type:

```
1 Bind partition <partition-id> -vxlan <id>
2 3 Add vlan 3000
4 Add vxlan 3000 -vlan 10
5 Add bridgetable -mac 00:00:00:00:00:00 -vxlans 3000 -vtep 10.102.58.8 -vni 11
6 Bind vxlan 3000 - srcIP 10.102.101.15
7 Bind partition p1 -vlan 10
```

**SNMP support for admin partitions**

September 18, 2018

A partitioned NetScaler appliance uses SNMP infrastructure for partition rate limiting and for monitoring partition resource utilization details.

**SNMP traps for admin partition rate limiting**

On a partitioned NetScaler appliance, a PARTITION-RATE-LIMIT alarm can generate nine SNMP traps for notifying a partition resource (such as bandwidth, connection, or memory) has reached its limit or returned to normal.

The following nine SNMP traps are generated when:
• **partitionCONNThresholdReached.** The number of active connections for a partition exceeds its high threshold percentage.

• **partitionCONNThresholdNormal.** The number of active connections is less than or equal to the normal threshold percentage.

• **partitionBWThresholdReached.** The partition's bandwidth usage reaches its high threshold percentage.

• **partitionMEMThresholdReached.** The current memory usage of the partition exceeds its high threshold percentage.

• **partitionMEMThresholdNormal.** The current memory usage of the partition becomes less than or equal to the normal threshold percentage.

• **partitionMEMLimitExceeded.** The current memory usage of the partition exceeds its memory limit percentage.

• **partitionCONNLimitExceeded.** The number of active connections for a partition exceeds its configured limit and new connections are being dropped.

• **partitionCONNLimitNormal.** The number of active connections for a partition goes below its configured limit and the partition can now accept a new connection.

• **partitionBWLimitExceeded.** The current bandwidth usage for a partition has exceeded its configured limit.

The threshold values for the SNMP traps are non-configurable and are as follows:

- High threshold = 80% (applicable for all partition rate limit traps)
- Low threshold = 60% (applicable for all partition rate limit traps)
- Memory limit = 95% (applicable only for partition memory traps)

**Configuring PARTITION-RATE-LIMIT alarm**

To configure PARTITION-RATE-LIMIT alarm in a specific partition and enable generation of the SNMP trap messages:

1. Enable PARTITION-RATE-LIMIT Alarm
2. Configure PARTITION-RATE-LIMIT Alarm
3. Configure SNMP Trap Destination

**To enable PARTITION-RATE-LIMIT alarm by using the NetScaler CLI**

At the command prompt, type the following commands:

```plaintext
1 enable snmp alarm PARTITION-RATE-LIMIT
2
3 show snmp alarm PARTITION-RATE-LIMIT
```
To configure PARTITION-RATE-LIMIT Alarm by using the NetScaler CLI

At the command prompt, type the following command:

```
set snmp alarm PARTITION-RATE-LIMIT [-state ( ENABLED | DISABLED )] [-severity <severity>] [-logging ( ENABLED | DISABLED )]
```

To configure SNMP trap destination by using the NetScaler CLI

At the command prompt, type the following command:

```
add snmp trap <trapClass> <trapDestination> [-version <version>] [-td < positive_integer>] [-destPort <port>] [-communityName <string>] [-srcIP <ip_addr|ipv6_addr>] [-severity <severity>] [-allPartitions ( ENABLED | DISABLED )]
```

To configure PARTITION-Rate-Limit alarm by using the NetScaler GUI

Navigate to System > SNMP > Alarms, select PARTITION-RATE-LIMIT alarm and configure the alarm parameters.

To configure SNMP trap destination by using the NetScaler GUI

Navigate to System > SNMP > Trap, specify the IP address of the destination device.

SNMP monitoring for partition resource utilization

Using SNMP, you can monitor a partition’s resource (such as bandwidth, connection, and memory) utilization details at real time on a NetScaler appliance. This is done by sending a SNMP request (such as SNMP GET, SNMP GET BULK, SNMP GETNEXT, or SNMP WALK) from the SNMP Manager.

**Note**

In order to monitor partition resources, you must configure the SNMP community in the default partition. Wherein, the partitionTable is maintained in the default partition, and the SNMP communication is done through the NSIP address of the appliance.

Consider a scenario where a NetScaler administrator wants to know the bandwidth usage of partition P1 on the appliance. The SNMP Manager retrieves this information by sending an SNMP GET request on the corresponding OID (partitionCurrentBandwidth) to the NSIP address of the appliance. The SNMP agent on the default partition retrieves and sends the current bandwidth usage of P1 to the SNMP Manager through the NSIP address.

The following table lists the SNMP counters which are part of partitionTable and its description:
Audit log support for admin partitions

September 18, 2018

On a partitioned NetScaler appliance, for enhanced data security, you can configure audit logging in an administrative partition by using advanced policies. For example, you might want to view logs (states and status information) of a specific partition that has multiple users accessing different sets of features on the basis of their levels of authorization in the partition.

Points to remember

1. The audit logs generated from the partition will be stored as a single log file (/var/log/ns.log).
2. You must configure the audit log server’s (syslog or nslog) subnet address as the source IP address in the partition for sending the audit-log messages.
3. The default partition uses the NSIP as the source IP address for the audit log messages by default.
4. You can display the audit-log message by using the “show audit messages” command.

For information on audit-log configuration, see Configuring the NetScaler Appliance for Audit Logging.

Configuring audit logging in partitioned NetScaler appliance

Complete the following tasks to configure audit logging in an administrative partition.

1. Configure partition subnet IP address. An IPv4 SNIP address of an administrative partition.
2. Configure audit-log (syslog and nslog) action. An Audit action is a collection of information that specifies the messages to be logged and how to log the messages on the external log server.
3. Configure audit-log (syslog and nslog) policies. Audit-log policies define log messages for the source partition to the syslog or nslog server.

© 1999-2018 Citrix Systems, Inc. All rights reserved.
4. Bind audit-log policy to sysGlobal and nsGlobal entity. You must bind an audit-log policy to a system global entity.
5. Review audit-log statistics. Display the audit-log statistics and evaluate the configuration.

To configure the partition’s subnet IP address by using the command line interface
At the command prompt, type:

```
1 add ns ip <ip address> <subnet mask>
```

To configure a syslog action by using the command line interface
At the command prompt, type:

```
1 add audit syslogAction <name> <serverIP> [-serverPort <port>] -logLevel <logLevel> [-dateFormat (MMDDYYYY | DDMMY YYYY)] [-transport (TCP | UDP)]
```

To configure an nslog action by using the command line interface
At the command prompt, type:

```
1 add audit nslogAction <name> <serverIP> [-serverPort <port>] -logLevel <logLevel> [-dateFormat (MMDDYYYY | DDMMY YYYY)]
```

To configure syslog audit-log policies by using the command line interface
At the command prompt, type:

```
1 add audit syslogpolicy syslog-poll true audit-action1
```

To configure nslog audit-log policies by using the command line interface.
At the command prompt, type:

```
1 add audit nslogpolicy nslog-poll true audit-action1
```

To bind audit-log policy to syslogGlobal entity by using the command line interface.

```
1 bind audit syslogglobal -policyName <name> -priority <priority_integer> -globalBindType SYSTEM_GLOBAL
```

To bind audit-log policy to nslogGlobal entity by using the command line interface.
At the command prompt, type:

```
1 bind audit nslogglobal -policyName <name> -priority <priority_integer> -globalBindType SYSTEM_GLOBAL
```
To display audit-log statistics by using the command line interface.

At the command prompt, type:

```
stat audit -detail
```

**Example**

```
1 add ns ip 10.102.1.1 255.255.255.0
2 add audit syslogAction syslog_action1 10.102.1.2 -logLevel INFORMATIONAL -dateFormat MMDDYYYY -transport UDP
3 add audit syslogpolicy syslog-poll true syslog_action1
4 bind audit syslogglobal -policyName syslog-poll -priority 1 -globalBindType SYSTEM_GLOBAL
```

**Configuring audit-log by using the NetScaler GUI**

**Storing logs**

When SYSLOG or NSLOG server collects log information from all partitions, it is stored as log messages in ns.log file. The log messages contain the following information:

- Partition Name.
- The IP address.
- A time stamp.
- The message type
- The predefined log levels (Critical, Error, Notice, Warning, Informational, Debug, Alert, and Emergency)
- The message information.

**AppExpert**

September 17, 2018

The following topics provide a conceptual reference and configuration instructions for the AppExpert and other features of the NetScaler appliance.

**Note**

For information about policy extensions, see Policy Extensions.
• **Action Analytics**: Collects run-time statistics on the basis of pre-defined criteria. When used with policies, the feature also provides you with the infrastructure for automatic, real-time traffic optimization.

• **AppExpert Applications and Templates**: Simplify configuration steps for the Citrix® NetScaler® appliance by using applications, application templates, Citrix Gateway applications, and entity templates.

• **AppQoE**: Application level Quality of Experience (AppQoE) integrates several existing policy-based security features of the NetScaler appliance into a single integrated feature that takes advantage of a new queuing mechanism, fair queuing.

• **Entity Template**: Describes how to use entity templates to set up and configure individual NetScaler entities, such as a policy or virtual server. An entity template provides a specification and a set of defaults for the object.

• **HTTP Callouts**: An HTTP request that the NetScaler appliance generates and sends to an external application when certain criteria are met during policy evaluation.

• **Pattern Sets**: Allow string matching during the evaluation of a default syntax policy.

• **Policies and Expressions**: Rules that determine the operations that the NetScaler appliance must perform.

• **Rate Limiting**: Defines the maximum load for a given network entity or virtual entity on the NetScaler appliance.

• **Responder**: Bases responses on who sends the request, where it is sent from, and other criteria with security and system management implications.

• **Rewrite**: Rewrites information in the requests or responses handled by the NetScaler appliance.

• **String Maps**: Perform pattern matching in all NetScaler features that use the default policy syntax.

**Action analytics**

September 24, 2018

The performance of your website or application depends on how well you optimize the delivery of the most frequently requested content. Techniques such as caching and compression help accelerate the delivery of services to clients, but you need to be able to identify the resources that are requested most frequently, and then cache or compress those resources. You can identify the most frequently used resources by aggregating real-time statistics about website or application traffic. Statistics such as how frequently a resource is accessed relative to other resources and how much bandwidth is consumed by those resources help you determine whether those resources need to be cached or compressed.
to improve server performance and network utilization. Statistics such as response times and the number of concurrent connections to the application help you determine whether you must enhance server-side resources.

If the website or application does not change frequently, you can use products that collect statistical data, and then manually analyze the statistics and optimize the delivery of content. However, if you do not want to perform manual optimizations, or if your website or application is dynamic in nature, you need infrastructure that can not only collect statistical data but can also automatically optimize the delivery of resources on the basis of the statistics. On the NetScaler appliance, this functionality is provided by the action analytics feature. The feature operates on a single NetScaler appliance and collects run-time statistics on the basis of criteria that you define. When used with NetScaler policies, the feature also provides you with the infrastructure that you need for automatic, real-time traffic optimization.

When configuring the action analytics feature, you specify the request attributes for which you want to collect statistical data, for example, URLs and HTTP methods by configuring default syntax expressions in an entity called a selector. Then, you configure an identifier to configure settings such as the sampling interval and sample count. You also configure a policy that enables the appliance to evaluate traffic as specified by the selector-identifier pair. Finally, you bind the policy to a bind point to begin collecting statistics.

The appliance also provides you with a set of built-in selectors, identifiers, and responder policies that you can use to get started with the feature.

The appliance aggregates the following statistics:

- The number of requests.
- The bandwidth consumed by the requests.
- The response time.
- The number of concurrent connections.

You can configure the feature to perform run-time sorting of the records on an attribute of your choice. You can view the statistical data by using either the command-line interface or the Stream Sessions tool in the GUI.

**Configure a selector**

January 6, 2019

A selector is a filter for identifying requests. It consists of up to five individual default syntax expressions that identify request attributes such as the client IP address and the URL in the request. Each expression is a non-compound default syntax expression and is considered to be in an AND relationship with the other expressions. Following are some examples of selector expressions:
Selectors are used in rate limiting and action analytics configurations. A selector is optional in a rate limiting configuration but is required in an action analytics configuration.

The order in which you specify parameters is significant. For example, if you configure an IP address and a domain (in that order) in one selector, and then specify the domain and the IP address (in the reverse order) in another selector, the NetScaler considers these values to be unique. This can lead to the same transaction being counted twice. Also, if multiple policies invoke the same selector, the NetScaler, again, can count the same transaction more than once.

If you modify an expression in a selector, you may get an error if any policy that invokes it is bound to a new policy label or bind point. For example, suppose that you create a selector named myLimitSelector1, invoke it from myLimitID1, and invoke the identifier from a DNS policy named dnsRateLimit1. If you change the expression in myLimitSelector1, you might receive an error when binding dnsRateLimit1 to a new bind point. The workaround is to modify these expressions before creating the policies that invoke them.

The NetScaler appliance provides built-in selectors for some of the most common use cases. Refer to the pdf.

You can also configure a selector with expressions that identify the request attributes of your choice. For example, you might want to create a record for a request that arrives with a specific header. To evaluate the header, you can add HTTP.REQ.HEADER("") to the selector that you intend to use.

**To configure a selector by using the command line interface:**

At the command prompt, type the following commands to configure a selector and verify the configuration:

- add stream selector <name> <rule> ...
- show stream selector

**Example**

```
> add stream selector myselector HTTP.REQ.URL CLIENT.IP.SRC
Done
> show stream selector myselector
   Name: myselector
   Expressions:
      1) HTTP.REQ.URL
      2) CLIENT.IP.SRC
```
To modify or remove a selector by using the command line interface:

- To modify a selector, type the set stream selector command, the name of the selector, and the rule parameter with the expressions. Enter the existing expressions that you want to retain, along with the new expressions that you want to add.
- To remove a selector, type the rm stream selector command and the name of the selector.

To configure a selector by using the GUI:

2. In the details pane, do one of the following:
   - To create a selector, click Add.
   - To modify a selector, select the selector, and then click Edit.
3. In the Create Selector or Configure Selector page, set the following parameters:
   - Name
   - Expressions
     To add the expression to the selector configuration, click Add. To remove an expression from the selector configuration, in the Expression box, select the expression, and then click Delete.
     Note: In the Expressions box, enter a valid parameter. For example, enter HTTP. Then, enter a period after this parameter. A drop-down menu appears. The contents of this menu provide the keywords that can follow the initial keyword that you entered. To select the next keyword in this expression prefix, double-click the selection in the drop-down menu. The Expressions text box displays both the first and second keywords for the expression prefix, for example, HTTP.REQ. Continue adding expression components until the complete expression is formed.
4. Click Add.
5. Continue adding up to five non-compound expressions.
6. Click OK and then Close.

Configure a stream identifier

September 24, 2018

You configure a stream identifier to specify parameters for collecting statistical data from requests
identified by a given selector. An identifier specifies the selector to be used, the statistics collection interval, the sample count, and the field on which the records are to be sorted.

The NetScaler appliance includes the following built-in stream identifiers for common use cases. All the built-in identifiers specify a sample count of 1 and an interval of 1 minute. Additionally, they sort the data on the REQUESTS attribute. They differ only in being associated with different built-in selectors. Each built-in identifier is associated with a built-in selector of the same name (for example, the built-in identifier Top_URL is associated with the built-in selector Top_URL). Following are the built-in identifiers:

- Top_URL
- Top_CLIENTS
- Top_URL_CLIENTS_LBVSERVER
- Top_URL_CLIENTS_CSVSERVER
- Top_MSSQL_QUERY_DB_LBVSERVER
- Top_MYSQL_QUERY_DB_LBVSERVER

For more information about the built-in selectors, see Configuring a Selector.

Note: The maximum length for storing string results of selectors (for example, HTTP.REQ.URL) is 60 characters. If the string (for example, URL) is 1000 characters long, of which 50 characters are enough to uniquely identify a string, use an expression to extract only the required 50 characters.

You cannot modify a built-in identifier’s configuration. However, you can create an identifier with a configuration of your choice.

To configure a stream identifier by using the command line interface

At the command prompt, type the following commands to configure a stream identifier and verify the configuration:

```
• add stream identifier <name> <selectorName> [-interval <positive_integer>] [-SampleCount <positive_integer>] [-sort <sort>]
• show stream identifier <name>
```

Example

```
1 > add stream identifier myidentifier Top_URL -interval 10 -sampleCount 100
2   Done
```

To configure a stream identifier by using the GUI

2. In the details pane, do one of the following:
   • To create a stream identifier, click **Add**.
   • To modify a stream identifier, select the identifier, and then click **Edit**.
3. In the Configure Stream Identifier page, set the following parameters:
   • Name
   • Selector
   • Interval
   • Sample Count
   • Sort
4. Click **OK**, and then click **Close**.

**View statistics**

September 24, 2018

You can view the collected statistics in tabular format in the command-line interface and in graphical format in the GUI.

The following table describes the collected statistics:

<table>
<thead>
<tr>
<th>Statistics</th>
<th>Column name in the output of the stat stream identifier command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of requests</td>
<td>Req</td>
<td>The number of requests for which records were created in the last (&lt;interval&gt;) number of minutes.</td>
</tr>
</tbody>
</table>
### Statistics Command Description

<table>
<thead>
<tr>
<th>Column name in the output of the stat stream identifier &lt;identifier name&gt;</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bandwidth consumed</td>
<td>BandW</td>
</tr>
<tr>
<td>Response time</td>
<td>RspTime</td>
</tr>
<tr>
<td>Concurrent connections</td>
<td>Conn</td>
</tr>
</tbody>
</table>

- **Bandwidth consumed (BandW)**: The total bandwidth consumed by the requests that were received in the last `<interval>` number of minutes. The total bandwidth of a request is the bandwidth consumed by the request and its response. The value is rounded off to the next higher or next lower integer value. Consequently, it might differ slightly from the expected value. For example, if a request's total bandwidth consumption is 2.2 KB, one instance of the request might be shown as having consumed 2 KB and two instances might be shown as having consumed 4 KB, but three instances might be shown as having consumed 7 KB.

- **Response time (RspTime)**: The average response time for all the requests received in the last `<interval>` number of minutes.

- **Concurrent connections (Conn)**: The total number of concurrent connections that are currently open.

---

To view the statistical data collected for a stream identifier by using the command line:

At the command prompt, type:
NetScaler 12.0

```
stat stream identifier <name> [<pattern> ...] [-detail] [-fullValues] [-ntimes <positive_integer>] [-logFile <input_filename>] [-sortBy <sortBy>] [<sortOrder>]
```

**Examples**

Example 1 sorts the output on the BandW column, in the descending order. Example 2 sorts the output in Example 1, on the Req column, and in the ascending order

**Example 1**

```
> stat stream identifier myidentifier -sortBy BandW Descending -fullValues
Stream Session statistics
  Req    BandW
User1    508 125924
User2    5020 12692
User3    2025  4316

RspTime    Conn
User1    5694    0
User2    109     0
User3     3      0
Done
```

**Example 2**

```
> stat stream identifier myidentifier -sortBy Req Ascending -fullValues
Stream Session statistics
  Req    BandW
User1    508 125924
User3    2025  4316
User2    5020 12692

RspTime    Conn
User1    5694    0
User3     3      0
User2    109     0
Done
```

To view the statistical data collected for a stream identifier by using the GUI

1. Navigate to **AppExpert > Action Analytics > Stream Identifiers**.
2. Select the stream identifier whose sessions you want to view, and then click Statistics For information about how you can group the output on the basis of the values collected for various selector expressions.

**Grouping records on attribute values**

September 26, 2018

Statistical information such as the number of times a particular URL has been accessed overall and per client, and the total number of GET and POST requests per client can provide valuable insights into whether any of your resources need to be expanded to meet the demand or be optimized for delivery. To obtain such statistics, you must use an appropriate set of selector expressions, and then use the pattern parameter in the stat stream identifier command. The grouping is based on the pattern that is specified in the command. Grouping can be performed concurrently on the values of multiple expressions.

In the command-line interface, you can group the output by using patterns of your choice. In the GUI, the pattern depends on the choices you make when drilling down through the values of various selector expressions. For example, consider a selector that has the expressions HTTP.REQ.URL, CLIENT.IP.SRC, and HTTP.REQ.LB_VSERVER.NAME, in that order. The statistics home page displays icons for each of these expressions. If you click the icon for CLIENT.IP.SRC, the output is based on the patterns ? . The output displays statistics for each client IP address. If you click an IP address, the output is based on the patterns * <IP address> ? and ? <IP address> * where <IP address> is the IP address you selected. In the resulting output, if you click a URL, the pattern used is <URL> <IP address> ?.

**To group the records on the values of selector expressions by using the command line interface**

At the command prompt, enter the following command to group the records on the basis of a selector expression:

```
stat stream identifier <name> [<pattern> ...]
```

**Examples**

Each example uses a different pattern to demonstrate the effect of the pattern on the output of the stat stream identifier command. The selector expressions are HTTP.REQ.URL and HTTP.REQ.HEADER("UserHeader"), in that order. The requests contain a custom header whose name is UserHeader. Note that in the examples, a given statistical value changes as determined by the grouping, but the sum total of the values for a given field remains the same.
Example 1

In the following command, the pattern used is ? ?. The appliance groups the output on the values collected for both selector expressions. The row headers consist of the expression values separated by a question mark (?). The row with the header /mysite/mypage1.html?Ed displays statistics for requests made by user Ed for the URL /mysite/mypage1.html.

```
1 > stat stream identifier myidentifier ? ? -fullValues
2 Stream Session statistics
3                      Req    BandW
4 /mysite/mypage2.html?Grace 1       2553
5 /mysite/mypage1.html?Grace 2       4
6 /mysite/mypage1.html?Ed     8       16
7 /mysite/mypage2.html?Joe   1       2554
8 /mysite/mypage1.html?Joe   5       10
9 /mysite/?Joe               1       4
10 Done
```

Example 2

In the following command, the pattern used is * ?. The appliance groups the output on the values accumulated for the second expression HTTP.REQ.HEADER("UserHeader"). The rows display statistics for all requests made by users Grace, Ed, and Joe.

```
1 > stat stream identifier myidentifier * ?
2 Stream Session statistics
3                      Req    BandW    RspTime    Conn
4 /mysite/mypage2.html?Grace 3       2557    0       0
5 /mysite/mypage1.html?Grace 2       16    0       0
6 /mysite/mypage1.html?Ed   8       16    0       0
7 /mysite/mypage2.html?Joe  0       2554    6       0
8 /mysite/mypage1.html?Joe  0       2568    6       0
9 Done
```

Example 3

In the following command, the pattern used is ? *, which is the default pattern. The output is grouped on the values collected for the first selector expression. Each row displays statistics for one URL.

```
1 > stat stream identifier myidentifier ? * -fullValues
```
Example 4

In the following command, the pattern used is \\*. The appliance displays one set of collective statistics for all the requests received, with no row title.

```
> stat stream identifier myidentifier * *
Stream Session statistics
<table>
<thead>
<tr>
<th>Req</th>
<th>BandW</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>5107</td>
</tr>
<tr>
<td>15</td>
<td>30</td>
</tr>
<tr>
<td>1</td>
<td>4</td>
</tr>
</tbody>
</table>
```

Example 5

In the following command, the pattern is /mysite/mypage1.html *. The appliance displays one set of collective statistics for all the requests received for the URL /mysite/mypage1.html, with no row title.

```
> stat stream identifier myidentifier /mysite/mypage1.html *
Stream Session statistics
<table>
<thead>
<tr>
<th>Req</th>
<th>BandW</th>
<th>RspTime</th>
<th>Conn</th>
</tr>
</thead>
<tbody>
<tr>
<td>15</td>
<td>30</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>
```

To group the records on the values of selector expressions by using the GUI

2. In the details pane, click the stream identifier for which you want to view statistics, and then click Stream Sessions.
3. On the Home page, click the icon for the stream selector by which you want to group the output.
4. To return to the Home page from the statistics page for a selector expression, click Home.
5. To view statistics for the value of a given selector expression, click the value. You can repeat this step for a selector expression value in each subsequent output until you obtain the statistics you want.
Clearing a stream session

September 24, 2018

You can flush all the records that have been accumulated for a stream identifier.

To clear a stream session by using the command line interface

At the command prompt, enter the following commands to clear a stream session and verify the results:

• clear stream session
• stat stream identifier

Example

This example uses the stat stream identifier command first, so that a comparison can be made with the stat stream identifier command that is used for verifying the result of the clear stream session command.

```
1 >stat stream identifier myidentifier
2 Stream Session statistics
3 Req    BandW  RspTime  Conn
4 /aed....html  2    0       0    0
5 /       636   303      12   0
6 Done
7 >clear stream session myidentifier
8 Done
9 >stat stream identifier myidentifier
10 Done
```

To clear a stream session by using the GUI

2. Select the stream identifier whose sessions you want to clear, and then click Clear Sessions.

Configure policy for optimizing traffic

September 24, 2018
To put the selector-identifier pair in your action analytics configuration into effect, you must associate
the pair with the point in the traffic flow at which you want to collect statistics. You can do so by
configuring a default syntax policy and referencing the stream identifier from the policy rule. You can
use compression policies, caching policies, rewrite policies, application firewall policies, responder
policies, and any other policies whose action is based on a Boolean expression.

The action analytics feature introduces a set of default syntax expressions and functions for collecting
and evaluating data. The expression `ANALYTICS.STREAM(<identifier_name>)` is used for refer-
cencing the identifier that you want to use. The expression `COLLECT_STATS` is used to collect statistical
data. Functions such as `IS_TOP(<uint>)` and `IS_TOP_FREQUENTS(<uint>)` are used for making
automatic, real-time traffic optimization decisions.

- **IS_TOP().** Finds if a given object is in the top of elements. For example, is the element among
  the top 10 elements. When multiple elements have the count, they are considered to be similar
  in nature. The sort function must be turned on to avoid an undef condition.

- **IS_TOP_FREQUENTS().** Finds if a given object is in the top of the elements that are in the top
  elements. For example, is the element among the top 50% of all the top elements maintained.
  Elements having the same values are considered similar in nature. The sort function must be
  turned on to avoid an undef condition.

It is your policy configuration that determines whether the NetScaler appliance must only collect data
from traffic or also perform an action. If the appliance must only collect statistical data, you can con-
figure a policy with the rule `ANALYTICS.STREAM().COLLECT_STATS` and the action `NOOP`. The NOOP
policy must be the policy with the highest priority at the bind point. This policy is sufficient if you are
only collecting statistics. Traffic optimization decisions, such as what to compress or cache, must be
based on manual, periodic evaluation of the statistical data.

If, in addition to collecting statistics, the appliance must also perform an action on the traffic, you must
configure the `gotoPriorityExpression` parameter of the NOOP policy such that another policy that has
the desired rule and action is evaluated subsequently. This second policy must have a rule that begins
with the `ANALYTICS.STREAM()` prefix and a function that evaluates the data.

Following is an example of two responder policies that are configured and bound globally. The policy
`responder_stat_collection` enables the appliance to collect statistics based on the identifier, `myidentifier`. The policy `responder_notify` evaluates the data that is collected.

**Example**

```sh
1 > add responder action send_notification respondwith "You are in the Top 10 list for bandwidth consumption"
2   Done
3 > add responder policy responder_stat_collection ANALYTICS.STREAM("myidentifier").COLLECT_STATS' NOOP
```

How to limit bandwidth consumption for user or client device

September 24, 2018

Your web site, application, or file hosting service has finite network and server resources available to it to serve all its users. One of the most important resources is bandwidth. Substantial bandwidth consumption by only a subset of the user base can result in network congestion and reduced resource availability to other users. To prevent network congestion, you might have to limit a client’s bandwidth consumption by using temporary service denial techniques such as responding to a client request with an HTML page if it has exceeded a preconfigured bandwidth value over a fixed time period leading up to the request.

In general, you can regulate bandwidth consumption either per client device or per user. This use case demonstrates how you can limit bandwidth consumption per client to 100 MB over a time period of one hour. The use case also demonstrates how you can regulate bandwidth consumption per user to 100 MB over a time period of one hour, by using a custom header that provides the user name. In both cases, the tracking of bandwidth consumption over a moving time period of one hour is achieved by setting the interval parameter in the stream identifier to 60 minutes. The use cases also demonstrate how you can import an HTML page to send to a client that has exceeded the limit. Importing an HTML page not only simplifies the configuration of the responder action in these use cases, but also simplifies the configuration of all responder actions that need the same response.

To limit bandwidth consumption per user or client device by using the command line interface

In the command-line interface, perform the following tasks to configure action analytics for limiting a client’s or user’s bandwidth consumption. Each step includes sample commands and their output.

1. **Set up your load balancing configuration.** Configure load balancing virtual server mysitevip, and then configure all the services that you need. Bind the services to the virtual server. The following example creates ten services and binds the services to mysitevip.

   ```
   1  \textgreater add lb vserver mysitevip HTTP 192.0.2.17 80
   2  Done
   3  \textgreater add service service[1-10] 192.0.2.[240-249] HTTP 80
   ```
2. **Configure the stream selector.** Configure one of the following stream selectors:

   - To limit bandwidth consumption per client, configure a stream selector that identifies the client IP address.
     
     ```
     > add stream selector myselector CLIENT.IP.SRC
     > bind lb vserver vserver1 service[1-10]
     > service "service1" bound
     > service "service2" bound
     > service "service3" bound
     > service "service10" bound
     > add stream selector myselector HTTP.REQ.HEADER("UserHeader")
     > add stream identifier myidentifier myselector -interval 60 -sampleCount 1 -sort BANDWIDTH
     ```

   - To limit bandwidth consumption per user on the basis of the value of a request header that provides the user name, configure a stream selector that identifies the header. In the following example, the name of the header is UserHeader.

   ```
   > add stream selector myselector HTTP.REQ.HEADER("UserHeader")
   > add stream identifier myidentifier myselector -interval 60 -sampleCount 1 -sort BANDWIDTH
   > done
   ```

3. **Configure a stream identifier.** Configure a stream identifier that uses the stream selector. Set the interval parameter to 60 minutes.

   ```
   > add stream identifier myidentifier myselector -interval 60 -sampleCount 1 -sort BANDWIDTH
   ```

4. **Configure the responder action.** Import the HTML page that you want to send to users or clients that have exceeded the bandwidth consumption limit, and then use the page in responder action crossed_limits.

   ```
   ```
5. **Configure the responder policies.** Configure responder policy myrespol1 with the rule ANALYTICS.STREAM("myidentifier").COLLECT_STATS and the action NOOP. Then, configure policy myrespol2 for determining whether a client or user has crossed the 100 MB limit. The policy myrespol2 is configured with the responder action crossed_limits.

6. **Bind the responder policies to the load balancing virtual server.** The policy myrespol1, which only collects statistical data, must have the higher priority and a GOTO expression of NEXT.

7. **Test the configuration.** Test the configuration by sending test HTTP requests, from multiple clients or users, to the load balancing virtual server and using the stat stream identifier command to view the statistics that are collected for the specified identifier. The following output displays statistics for clients.
AppExpert applications and templates

September 24, 2018

An AppExpert application is a collection of configuration information that you set up on the NetScaler appliance for securing and optimizing traffic for a Web application, such as Microsoft SharePoint. Managing AppExpert applications is simplified by a graphical user interface (GUI) that allows you to specify application traffic subsets and a distinct set of security and optimization policies for processing each traffic subset. Additionally, it consolidates all deployment tasks in one view, so you can quickly configure target IP addresses for clients and specify host servers.

Prebuilt application templates for widely used Web applications, such as Microsoft Outlook Web Access and Microsoft SharePoint, are available on the AppExpert Templates page of the Citrix Community website at “http://community.citrix.com/display/ns/AppExpert+Templates.”

Each prebuilt template provides you with an initial configuration for managing the associated Web application. You can customize prebuilt application templates for your organization. If a prebuilt application template does not suit your requirements, you can create a custom application without using a template.

Regardless of whether you use a prebuilt application template or you create a custom application, you can export the configuration to a template file. You can then share the template with other administrators or import the template to other NetScaler appliances that require a similar AppExpert application configuration.

To get started with an AppExpert application, you must first obtain the appropriate application template and import the template to the NetScaler appliance. After the AppExpert application is set up, you must verify that the application is working correctly. If required, you can customize the configuration to suit your requirements.

Periodically, you can verify and monitor the configuration by viewing the hit counters for various application components, statistics, and the Application Visualizer. You can also configure authentication, authorization, and auditing (AAA) policies for the application.
AppExpert application terminology

Following are the terms used in the AppExpert applications feature and the descriptions of the entities for which the terms are used:

**Public endpoint.** The IP address and port combination at which the NetScaler appliance receives client requests for the associated web application. A public endpoint can be configured to receive either HTTP or secure HTTP (HTTPS) traffic. All client requests for the web application must be sent to a public endpoint. An AppExpert application can be assigned multiple endpoints. You configure public endpoints after you import a template.

**Application unit.** An AppExpert application entity that processes a subset of web application traffic and load balances a set of services that host the associated content. The subset of traffic that an application unit must manage is defined by a rule. Each application unit also defines its own set of traffic optimization and security policies for the requests and responses that it manages. The NetScaler services associated with these policies are Compression, Caching, Rewrite, Responder, and application firewall.

By default, every AppExpert application with at least one application unit includes a default application unit, which cannot be deleted. The default application unit is not associated with a rule for identifying requests and is always placed last in the order of application units. It defines a set of policies for processing any request that does not match the rules that are configured for the other application units, thereby ensuring that all client requests are processed.

Application units and their associated rules, policies, and actions are included in AppExpert application templates.

**Service.** The combination of the IP address of the server that hosts the web application instance and the port to which the application is mapped on the server, in the format <IP address>:<Port>. A web application that serves a large number of requests is usually hosted on multiple servers. Each server is said to host an instance of the web application, and each such instance of the web application is represented by a service on the NetScaler appliance. Services are deployment-specific and are therefore not included in templates. You must configure services after you import a template.

**Application unit rule.** Either a classic expression or a default syntax expression that defines the characteristics of a traffic subset for an application unit. The following example rule is a default syntax expression that identifies a traffic subset that consists of four image types:

```
HTTP.REQ.URL.SUFFIX.EQ("bmp")
HTTP.REQ.URL.SUFFIX.EQ("gif")
HTTP.REQ.URL.SUFFIX.EQ("png")
HTTP.REQ.URL.SUFFIX.EQ("jpg")
```

For more information about default syntax expressions and classic policy expressions, see Policies and Expressions.

**Traffic Subset.** A set of client requests that require a common set of traffic optimization and security
policies. A traffic subset is managed by an application unit and is defined by a rule.

**How AppExpert Application Works**

January 6, 2019

When the endpoint receives a client request, the NetScaler appliance evaluates the request against the rule that is configured for the topmost application unit. If the request satisfies this rule, the request is processed by the policies that are configured for the application unit, and then forwarded to a service. The choice of service depends on which services are configured for the application, and on settings such as the load balancing algorithm and persistence method configured for the application unit.

If the request does not satisfy the rule, the request is evaluated against the rule for the next topmost application unit. In this order, the request is evaluated against each application unit rule until the request satisfies a rule. If the request does not satisfy any of the configured rules, it is processed by the default application unit, which is always the last application unit.

You can configure multiple public endpoints for an AppExpert application. In such a configuration, by default, each application unit processes requests received by all the public endpoints and load balances all the services that are configured for the application. However, you can specify that an application unit processes traffic from only a subset of the public endpoints and load balances only a subset of the services that are configured for the AppExpert application.

The following flow diagram illustrates the AppExpert Application flow sequence for using a built-in application template.

If you prefer to create a customized application without using a template, do the following:

1. Create a custom application.
2. Configure application and deployment settings.
3. Export the configuration to new template files (optional).
4. Import the template files to other NetScaler appliances that require a similar AppExpert application configuration.

**Get started with AppExpert**

September 24, 2018

To get started with an AppExpert application, you must first obtain an application template and import the template to a NetScaler appliance. After the AppExpert application is set up, you must verify that the application is working correctly. If required, you can customize the configuration to suit your requirements.
Periodically, you can verify and monitor the configuration by viewing the hit counters for various application components. You can also configure authentication, authorization, and auditing (AAA) policies for the application.

The process of setting up an application can be done in two ways:

- Using a prebuilt application template
- Creating a custom application without using a template.

If you prefer to set up the application by using a prebuilt application template, do the following:

1. Download an application template.
2. Import template files to NetScaler appliance.
3. Verify application setup.
4. Configure application and deployment settings.
5. Export the configuration to new template files (optional).
6. Import the template files to other NetScaler appliances that require a similar AppExpert application configuration.

NetScaler’s video tutorials enable you to understand NetScaler features in easy and simple way. Watch https://www.youtube.com/watch?v=aqayflvCR_0 video to learn how to set up an application using AppExpert Application template.

**Downloading an Application Template**

September 24, 2018

AppExpert application setup begins with downloading an application template from the Citrix Community Web site at [http://community.citrix.com/display/ns/AppExpert+Templates](http://community.citrix.com/display/ns/AppExpert+Templates) to your local computer or NetScaler appliance. The application templates are designed to be imported and exported, so that you can easily share application-specific configurations within an organization or across organizations. An application template includes the following set of entities:

1. Application components (for example, web pages, files, archives, and web services)
2. Traffic management entities (for example, virtual server IP addresses and associated load-balancing algorithms, and SSL offload settings) for the application components.
3. NetScaler policies used for optimizing the application traffic.

**Note:** Application templates are available in different versions for configuring different types of NetScaler appliances.
Importing an Application Template

September 24, 2018

For NetScaler software version 9.3 or later, each AppExpert template has two XML files: a Template file and a Deployment file. You must import both files from your local computer to a NetScaler appliance. You can either import the template files from your computer to the AppExpert application templates directory in NetScaler appliance or upload files to a NetScaler appliance and then import them from the appliance.

Note: When you import a template from an appliance, you have to provide the variable value available in the template. By default, the pre-configured value is display https://docs.citrix.com/en-us/netscaler/11/appexpert/appexpert-application-templates/creating-managing-templates/netscaler-application-template-deployment-files.html

After you import the template files, the application-configuration and deployment information populates the target application automatically. The appliance imports all the configuration from the template files through the NITRO API. If you do not import the deployment file, the system generates an application populated with content switching virtual server configuration. For more information about the format of application templates and deployment files, see Understanding NetScaler Application Templates and Deployment Files.

When you import a template, if you do not include a deployment file, you have to configure the public endpoints in the application that the system automatically generates from the template. One endpoint for HTTP and another endpoint for HTTPS. When configuring a public endpoint of type HTTPS, make sure you enable the SSL feature, bind the server certificate, and include the server-certificate and certificate-key files.

For more information about configuring endpoints after you import a template, see Configuring Public Endpoints.

To import AppExpert application template files to a NetScaler appliance by using the GUI:

1. Navigate to AppExpert > Applications.
2. In the details pane, click Import Template.
3. On the Import page, set the following parameters:
   a) Application Name (mandatory)
   b) Template File (mandatory)
   c) Use deployment file
4. Click Continue to auto populate application-configuration and deployment information into an application.

NetScaler’s video tutorials enable you to understand NetScaler features in an easy and simply way. Watch https://www.youtube.com/watch?v=AR9TwSD9uJM video to learn how to import an application template.
The GUI includes icons that indicate the states of the entities in the AppExpert application. These icons are displayed for applications and application units and are based on the health checks that the NetScaler appliance performs periodically on services and entities. The following table lists the icons and describes their meanings.

<table>
<thead>
<tr>
<th>Icon</th>
<th>Entity</th>
<th>Indicates that</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application</td>
<td>Application</td>
<td>At least one public endpoint is up. The application will accept client requests from the public endpoints that are up.</td>
</tr>
<tr>
<td>Application unit</td>
<td>Application unit</td>
<td>The application unit is up. The application unit is up when at least one service or service group is up.</td>
</tr>
<tr>
<td>Application</td>
<td>Application</td>
<td>The public endpoint is out of service (disabled). This indicator is displayed when only one public endpoint is configured for the AppExpert application.</td>
</tr>
<tr>
<td>Application</td>
<td>Application</td>
<td>All the endpoints that are configured for the application are out of service. This indicator is displayed only when multiple endpoints are configured for the application.</td>
</tr>
<tr>
<td>Application unit</td>
<td>Application unit</td>
<td>All the services configured for the application unit are down.</td>
</tr>
</tbody>
</table>

You must ensure that the icons for each application and its application units are green at all times. If the icon that is displayed for an application is not green, verify that you have configured the public endpoints correctly. If the icon that is displayed for an application unit is not green, verify that the
services are configured correctly. However, note that a green indicator does not mean that the state of all associated entities is UP. It only means that the application has sufficient resources (endpoints and services) to serve client requests. To verify that the state of all associated entities is UP, check the health of all the entities on the statistics page for the application.

**Customizing the configuration**

September 24, 2018

After you verify that the AppExpert application is working correctly, you can customize the configuration to suit your requirements.

After you verify that the AppExpert application configuration is working correctly, you can configure the application and the deployment settings to suit your requirements. When you import an application template and deployment file, the system automatically populates the target application with the available configuration settings (such as application units, application unit rules, policies, persistence settings, load balancing methods, profiles, and traffic settings). In this application, you can configure deployment settings such as public endpoints, services, and service groups for each traffic subset. If you want the AppExpert application to manage a traffic subset that is not included in the template, you can either add an application unit for a traffic subset or modify the existing application unit. After you customize the configuration, you can also specify the order of evaluation for each traffic subset that the application manages.

Configuring an AppExpert application consists of the following steps:

1. **Configuring Public Endpoints**
2. **Configuring Application Units**
3. **Specifying the Order of Evaluation**
4. **Viewing Application Configuration using Visualizer**

Also, you can configure the policies that the template provided. If the AppExpert application template does not include policies for a particular NetScaler feature, such as Rewrite or application firewall, you can configure your own policies.

**Configure public endpoints**

September 24, 2018

If you did not specify a public endpoint when importing an AppExpert application, you can specify public endpoints after you create the application. You can configure one public endpoint of type HTTP and one public endpoint of type HTTPS for your AppExpert application.
If endpoints are already configured for the application, you can dissociate endpoints from the AppExpert application and delete any endpoints that you no longer need. Note that when you dissociate a public endpoint from the AppExpert application, the endpoint is automatically unbound from the associated application unit, but it is not deleted from the system.

To configure public endpoints for an AppExpert application:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, right-click the application for which you want to configure public endpoints, and then click **Edit**.
3. In the **Applications** page, go to **Public Endpoint** section and click the pencil icon.
4. In the **Public Endpoint** slider, set the following parameters.
   a) Public endpoint type. Select the radio button to define the endpoint type.
   b) Name. Name of the public endpoint.
   c) IP address. IP address of the public endpoint.
   d) Port. Port number of the public endpoint.
   e) Protocol. Select a protocol type as HTTP or HTTPS.
5. Click **Continue**.
6. In the **Application Units** section, select an application unit from the list.
7. Click **Continue** to set the policy and server details.
8. Click **OK** and then **Done**.
9. Click **Close**.

For more information about the parameters in the **Configure Public Endpoint** dialog box, see **Content Switching**.

**Configure services and service groups for an application unit**

September 24, 2018

When you configure a service or service group, you either modify an existing service or service group, or add new services to the AppExpert application. You add services or service groups if you did not specify them when you imported the application template. You also add services and service groups when you increase the number of servers that host instances of the application. You can configure a service and service group for an application unit only after you configure the service or service group for the AppExpert application.

To configure a service or service group for the AppExpert application:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, right-click the application and then click **Edit**.
3. In the **Applications** page, select an application unit and then click **Continue**.
4. In the **Services and Service Groups** section, do the following:
a) In the Service Binding slider, set the following parameters.
   i. Service. Select a load balancing service from the list or create a new service.
   ii. Weight. Provide a weight value for the service.
b) Click **Bind** and then **Done**.
c) In the ServiceGroup Binding slider, set the following parameters:
   i. Service Group Name. Select a load balancing service group or create a new service group.
   ii. Click **Bind** and then **Done**.
d) Click **Done**.

5. Click **Continue** to set other configurations.

**Create application units**

September 24, 2018

You might need to add application units for traffic subsets that are either specific to your web application implementation or not defined in the template. When creating an application unit, you must configure a rule for the application unit.

To create an application unit for the AppExpert application:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, right-click the application for which you want to add an application unit, and then click **Add**.
3. In the Applications page, go to Application Units section and click the pencil icon.

To configure policy expressions for an application unit:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, right-click the application for which you want to add an application unit, and then click **Add**.
3. In the Applications page, go to Application Units section and click the + icon to create a unit and add policy expressions.
4. To specify the format of the new expression, do one of the following:
   a) To specify that you want to configure a classic expression in the Rule box, click Classic Syntax.
   b) To specify that you want to configure an advanced expression in the Rule box, click Default Syntax.
   c) In the Rule box, configure the expression.
5. Click **OK**.
Configuring application unit rules

September 24, 2018

You might want to configure an application unit rule to include or exclude certain types of traffic. When you configure the rule, you can also define the syntax of the expression.

To configure an application unit rule:

1. In the navigation pane of the GUI, expand **AppExpert**, and then click **Applications**.
2. In the details pane, right-click the application unit for which you want to modify the rule, and then click **Open**.
3. In the **Configure Application Unit** dialog box, do the following:
   a) To specify the format of the new expression, do one of the following:
      • To specify that you want to configure a classic expression in the Rule box, click **Classic Syntax**.
      • To specify that you want to configure an advanced expression in the Rule box, click **Default Syntax**.
   b) In the Rule box, configure the expression.
4. Click **OK**.

Configuring policies for application units

September 24, 2018

For an AppExpert application, you can configure policies for Compression, Caching, Rewrite, Responder, and Application Firewall. The templates that you download from the Citrix Community web site provide you with a set of policies that fulfill the most common application management requirements. You might want to fine-tune or customize these policies. If the set of policies provided for a given application unit does not include policies for a particular feature, you can create and bind your own policies for that feature.

If you create an AppExpert application without using a template, you must configure all the policies that the web application needs.

The GUI uses various icons to indicate whether or not policies are configured for a feature. For an application unit, if a policy is configured for a given feature, an icon that represents the feature is displayed. For example, if a compression policy is configured for an application unit, a compression icon is displayed in the Compression column for the application unit. For features for which no policy is configured, an icon depicting a plus sign (+) is displayed.

Note: When configuring policies for application units, you might need to configure policies and expressions that are either in the classic or
default syntax. Additionally, when you configure default syntax policies, you might need to specify parameters such as Goto expressions and invoke policy banks.
For information about configuring policies and expressions in both formats, see Policies and Expressions.

**Configuring compression policies**

You can use either classic policies or advanced policies to configure compression, but you cannot bind compression policies of both types to the same application unit.

To configure a compression policy for an application unit:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Compression column.
3. In the Configure Compression Policies dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
   - Click **Switch to Default Syntax** if you want to configure a default syntax compression policy. If you want to bind or configure classic compression policies, and if you are in the default syntax view, you can click **Switch to Classic Syntax** to return to the classic policy view and begin modifying bound classic policies or create and bind new classic compression policies.
     Important: This setting also determines what policies are displayed when you want to insert a policy. For example, if you are in the default syntax view, when you click Insert Policy, the list that appears in the Policy Name column will include only default syntax policies. You cannot bind policies of both types to an application unit.
   - If you want to configure classic policies, click either **Request** or **Response**, depending on whether you want the policy to be evaluated at request-time or at response-time.
     You can configure both request-time and response-time classic compression policies for an application unit. After evaluating all of the request-time policies, if no match is found, the appliance evaluates response-time policies.
   - To modify a compression policy that is already bound to the application unit, click the name of the policy, and then click **Modify Policy**. Then, in the Configure Compression Policy dialog box, modify the policy, and then click **OK**.
     For information about modifying a compression policy, see Compression.
   - To unbind a policy, click the name of the policy, and then click **Unbind Policy**.
   - To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
• To regenerate assigned priorities, click **Regenerate Priorities**.
• To insert a new policy, click **Insert Policy** and, in the list that is displayed in the **Policy Name** column, click **New Policy**. Then, in the **Create Compression Policy** dialog box, configure the policy, and then click **Create**.

For information about modifying a compression policy, see **Compression**.

• If you are configuring a default syntax expression, do the following:
  – In the **Goto Expression** column, select a Goto expression.
  – In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.

4. Click **Apply Changes**, and then click **Close**.

### Configuring Caching Policies

You can use only default syntax policies and expressions to configure Caching policies.

To configure Caching policies for an application unit:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Caching column.
3. In the **Configure Cache Policies** dialog box, do one or more of the following, depending on the configuration tasks you want to perform:

   • Click either Request or Response, depending on whether you want the policy to be evaluated at request-time or at response-time.
   You can configure both request-time and response-time Caching policies for an application unit. After evaluating all of the request-time policies, if no match is found, the appliance evaluates response-time policies.

   • To modify a Caching policy that is already bound to the application unit, click the name of the policy, and then click **Modify Policy**. Then, in the **Configure Cache Policy** dialog box, modify the policy, and then click **OK**.
   For information about modifying a Caching policy, see **Integrated Caching**.

   • To unbind a policy, click the name of the policy, and then click **Unbind Policy**.

   • To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.

   • To regenerate assigned priorities, click **Regenerate Priorities**.

   • To insert a new policy, click **Insert Policy** and, in the list that is displayed in the Policy Name column, click **New Policy**. Then, in the **Create Cache Policy** dialog box, configure the policy, and then click **Create**.
   For information about modifying a Caching policy, see **Integrated Caching**.

   • In the Goto Expression column, select a Goto expression.
In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.

4. Click **Apply Changes**, and then click **Close**.

**Configuring Rewrite policies**

You can use only default syntax policies and expressions to configure Rewrite policies.

To configure Rewrite policies for an application unit:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Rewrite column.
3. In the **Configure Rewrite Policies** dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
   - Click either Request or Response, depending on whether you want the policy to be evaluated at request-time or at response-time.
     You can configure both request-time and response-time Rewrite policies for an application unit. After evaluating all of the request-time policies, if no match is found, the appliance evaluates response-time policies.
   - To modify a Rewrite policy that is already bound to the application unit, click the name of the policy, and then click **Modify Policy**. Then, in the Configure Rewrite Policy dialog box, modify the policy, and then click **OK**.
     For information about modifying a Rewrite policy, see **Rewrite**.
   - To unbind a policy, click the name of the policy, and then click **Unbind Policy**.
   - To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
   - To regenerate assigned priorities, click **Regenerate Priorities**.
   - To insert a new policy, click **Insert Policy** and, in the list that is displayed in the **Policy Name** column, click **New Policy**. Then, in the **Create Rewrite Policy** dialog box, configure the policy, and then click **Create**.
     For information about modifying a Rewrite policy, see **Rewrite**.
   - In the Goto Expression column, select a Goto expression.
   - In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.
4. Click **Apply Changes**, and then click **Close**.

**Configuring Responder policies**

You can use only default syntax policies and expressions to configure Responder policies.
To configure Responder policies for an application unit:

1. Navigate to AppExpert > Applications.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Responder column.
3. In the Configure Responder Policies dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
   - To modify a Filter policy that is already bound to the application unit, click the name of the policy, and then click Modify Policy. Then, in the Configure Responder Policy dialog box, modify the policy, and then click OK.
   - To unbind a policy, click the name of the policy, and then click Unbind Policy.
   - To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
   - To regenerate assigned priorities, click Regenerate Priorities.
   - To insert a new policy, click Insert Policy and, in the list that is displayed in the Policy Name column, click New Policy. Then, in the Create Responder Policy dialog box, configure the policy, and then click Create.
   For information about modifying a Responder policy, see Responder.
   - In the Goto Expression column, select a Goto expression.
   - In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.
4. Click Apply Changes, and then click Close.

Configuring Application Firewall policies

You can configure both classic and default syntax policies and expressions for Application Firewall. However, if a policy of one type is already bound globally or to a virtual server that is configured on the appliance, you cannot bind a policy of the other type to an application unit. For example, if a default syntax policy is already bound either globally or to a virtual server, you cannot bind a classic policy to an application unit.

To configure Application Firewall policies for an application unit:

1. Navigate to AppExpert > Applications.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Application Firewall column.
3. In the Configure Application Firewall Policies dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
   - Click either Classic Expression or Advanced Expression depending on the type of expression you want to configure for the Application Firewall policy.
Important: This setting also determines what policies are displayed when you want to insert a policy. For example, if you select Advanced Expression, when you click Insert Policy, the list that appears in the Policy Name column will include only default syntax policies. You cannot bind policies of both types to an application unit. This option is not available if a policy of either type is already bound either globally or to a virtual server.

- To modify an application firewall policy that is already bound to the application unit, click the name of the policy, and then click Modify Policy. Then, in the Configure Application Firewall Policy dialog box, modify the policy, and then click OK. For information about modifying a application firewall policy, see Policies.
- To unbind a policy, click the name of the policy, and then click Unbind Policy.
- To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
- To regenerate assigned priorities, click Regenerate Priorities.
- To insert a new policy, click Insert Policy and, in the list that is displayed in the Policy Name column, click New Policy. Then, in the Create Application Firewall Policy dialog box, configure the policy, and then click Create. For information about modifying a application firewall policy, see Policies.

4. Click Apply Changes, and then click Close.

Configuring Application Units

September 24, 2018

To configure an application unit by using the GUI:

1. Navigate to AppExpert > Applications > Application Unit section and then click the plus icon to add a new application unit for a traffic subset.

2. In the Application Unit slider, set the following parameters:
   - Name
   - Expression

You can insert an expression either by adding the expression components manually or by using the Expression Editor link. To manually add an expression, enter a selector component and then type a period (.) to display a list from which you can select the next component. For example, type HTTP and then type a period. A drop-down menu appears. The contents of this menu provide the keywords that can follow the initial keyword that you entered. Select a component from the drop-down menu. The Expression* text box now displays the components that you
have added to the expression (for example, HTTP.REQ). Continue adding components until the complete expression is formed.

If you prefer assistance to form the expression, you can use the Expression Editor link. On the Expression Editor page, you can form an expression by selecting components from the drop-down boxes. Select the components and click Done to insert the expression on the Application Unit page.

3. Click **Continue** to bind services and service groups.

4. Click the **Service** section to select or add a virtual service and bind it to the application unit.

5. Click **Continue** and click the **Service Group** section to select or add a virtual service group and bind it to the application unit.

6. Click **Bind** and **Continue** to configure Advanced Settings (such as Policies, Method, Persistence, Protection, Profiles, Push, Authentication, and Traffic Settings) for the application unit.

7. Click the **plus** icon in each section to set the configuration parameters.

8. Click **OK** and then **Done**.

To edit an application unit for an application by using the GUI:

Navigate to **AppExpert > Applications**, select an application and click **Edit**. In the **Application Unit** section, select an entity, click the edit icon and modify the application unit settings.

**Note:** You cannot modify the name and rule expression for an existing application unit.

NetScaler’s video tutorials enable you to understand NetScaler features in an easy and simple way. Watch <https://www.youtube.com/watch?v=bJ5_i8fV2hc> video to learn how configure an application unit.

### Configuring public endpoints for an application

September 24, 2018

To configure public endpoints for an application by using the GUI:

1. Navigate to **AppExpert > Applications**, select an application entity, and then click **Edit**.

2. In the **Public Endpoint** section, click + to configure a new public endpoint.

3. In the **Public Endpoint** slider, do one of the following:
   a) Click **New** to create a new endpoint.
   b) Click **Existing Public Endpoint** to select an endpoint from the drop-down list.

4. Set the following endpoint parameters:
   a) Name
   b) IP address
c) Protocol
d) Port
5. Click **Continue** to configure additional settings such as application units, GSLB server bindings, policies, profiles, push, traffic settings, and authentication.
6. Click **OK** and then **Done**.
7. Click **Continue** and then **Done**.

To edit a public endpoint for an application by using the GUI:

Navigate to **AppExpert > Applications**, select an application, and click **Edit**. In the **Public Endpoint** section, select an endpoint, click the pen icon, and modify the endpoint settings.

To delete a public endpoint for an application by using the GUI:

Navigate to **AppExpert > Applications > Public Endpoint**, click the pen icon to view the delete icon next to the entity.

NetScaler's video tutorials enable you to understand NetScaler features in an easy and simply way. Watch [video](https://www.youtube.com/watch?v=z4v-edQiVpw) to learn how to configure a public endpoint.

### Specifying the Order of Evaluation of Application Units

September 24, 2018

Application unit rules are evaluated in the order in which they are placed in the GUI. The rule that is configured for the topmost application unit is always configured first, followed by the rule that is configured for the second topmost application unit, and so on. The default application unit is always evaluated last.

When a request matches the rule that is configured for an application unit, the request is processed by the application unit, and no further matching is performed. Therefore, the order of evaluation of application units becomes an important factor if the traffic subsets for two or more application units overlap. If the traffic subsets for two or more application units overlap, you must specify the order in which an incoming request is matched against the application unit rules.

To specify the order of evaluation of application units:

1. Navigate to **AppExpert > Applications**, select an application and click **Edit**. In the **Application Unit** section, click the **Pencil** icon and then hover the cursor over the check box to the left of the name of the application unit. Click the icon that appears next to the check box and hold down the mouse to drag the application up or down to a new location in the priority list.
Configuring Persistency Groups for Application Units

September 24, 2018

You can configure a persistency group for the application units in an AppExpert application. In the context of an AppExpert application, a persistency group is a group of application units that you can treat as a single entity for the purpose of applying common persistence settings. When the application is exported to an application template file, the persistency group settings are included, and they are automatically applied to the application units when you import the AppExpert application.

To configure a persistency group for an application by using the GUI:

1. Navigate to **AppExpert > Applications**.
2. In the **Applications View** dialog box, click the name of the application for whose application units you want to configure a persistency group, and then click **Configure Persistency Groups**.
3. In the **Configure Persistency Groups** dialog box, do one of the following:
   - To add a persistency group, click **Add**.
   - To modify a persistency group, click **Open**.
4. In the **Create Persistency Group** or **Configure Persistency Group** dialog box, set the following parameters:
   - **Group Name**—Name of the persistency group. For the NetScaler appliance to recognize the persistency group as part of the application’s configuration, the name of the AppExpert application must be included in the name of the persistency group, as a prefix. Therefore, by default, the appliance displays the prefix in the Group Name box, and you cannot remove that prefix. Enter a name of your choice after the prefix.
   - **Persistence**—Type of persistence for the virtual server. If you select SOURCEIP, in the IPv4 Netmask box, enter a network mask that specifies the number of bits that the appliance must consider when creating persistence sessions. If you select COOKIEINSERT, in the Cookie Domain and Cookie Name boxes, specify a domain attribute to send in the Set-Cookie directive, and a name for the cookie, respectively.
   - **Timeout**—Time period for which a persistence session is in effect.
   - **Backup Persistence**—Type of backup persistence for the group.
   - **Backup Timeout**—Time period, in minutes, for which backup persistence is in effect.
   - **Application Units**—To add an application unit to the persistency group, in the Available Application Units box, click the application unit, and then click **Add**. To remove an application unit from the persistency group, in the Configured Application Units box, click the application unit, and then click **Remove**.
5. Click **OK**.
Viewing AppExpert Applications and Configuring Entities by Using the Application Visualizer

September 24, 2018

The Visualizer feature shows you a graphical representation of an application's configuration. It includes the name of the public endpoint, application units assigned to the public endpoint, and the number of policies and services bound to the application. You can use the Visualizer to obtain a visual overview of an AppExpert application’s configuration and configure some of the displayed entities. By default, the Visualizer displays application units, services, and monitors for the selected application.

To view an AppExpert application by using the Application Visualizer:

1. Navigate to **AppExpert > Applications**, select an application entity, and click **Visualizer**.

Configuring User Authentication, Authorization, and Auditing

September 24, 2018

You can configure authorization for users and groups to enable them to access an AppExpert application. If the AAA user or group for which you want to configure permissions has not already been created, you can create it from AppExpert and then configure permissions for application access.

To configure AAA users and AAA user groups for an application by using the configuring utility

1. Navigate to **AppExpert > Applications**, select an application entity, and then click **Edit**.
2. In the **Advanced Settings** section, click **Authorization**, and configure authorized users and user groups.
3. Click the **AAA** user section to bind authorized users to the application.
4. In the **AAA User** slider, set the parameters.
5. Click **Continue**, and then click **Authorization Policies** in the **Advanced Settings** section.
6. In the **Authorization Policy** slider, bind an authorization policy to the application.
7. Click **Continue**, and then click the **Authorization Group** section in the **Advanced Settings** section.
8. In the **AAA Group Binding** slider, bind an authorization user group to the application.
9. Click **Continue**, and then click **Policies** in the **Advanced Settings** section.
10. In the **Policies** **slider, bind an** **Audit Syslog** or **Audit NSlog** policy to the application.
11. Click **Continue** and then **Done**.

To edit AAA users and AAA user groups for an application by using the GUI:

Navigate to **AppExpert > Applications > Advanced Settings** and click **Authorization**. Then click the edit icon and specify values for user or user-group authorization settings.
To delete AAA users and AAA user groups by using the GUI:

Navigate to **AppExpert > Applications**, select an application and click **Edit**. In the **Applications** page, click **Advanced Settings** and click **Authorization**. Click the delete icon next to the entity.

### Monitoring a NetScaler Application

September 24, 2018

After you customize the AppExpert application, you can view application statistics to make sure that the application and all its entities are working correctly. You can also use the Application Visualizer to monitor statistics associated with certain entities such as policies and virtual servers.

You can also view the hit counters for various entities at regular intervals to make sure that counters are being updated.

### Viewing Application Statistics

In the **Applications** node, you can select an application and view the Statistics page for the application. On the Statistics page, you can monitor the health and states of public endpoints and application units, and view the following statistical information:

- Requests and responses per second for each of the public endpoints and application units.
- Bytes per second, at each endpoint, for incoming and outgoing traffic.
- Application unit hit counters and the number of client and server connections for each application unit.
- Statistics for the services that are bound to the application units.

On the Statistics page, you can also view CPU usage, memory usage, and system logs.

To view statistics for an application:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, click the application for which you want to view statistics, and then click **Statistics**.

### Monitoring an Application by Using the Application Visualizer

You can use the Application Visualizer to monitor the number of requests received per second at a given point in time by the vservers and the number of hits per second at a given point in time for Rewrite, Responder, and Cache policies.

To view statistical information for vservers, Rewrite policies, Responder policies, and Cache policies in the Visualizer:
1. Navigate to **AppExpert > Applications**.
2. In the details pane, select the application for which you want to view statistical information, and then click **Visualizer**.
3. In the **Application Visualizer** window, do the following:
   - To view the statistics, click **Show Stats**. The statistical information is displayed on the respective nodes in the Visualizer. This information is not updated in real time and has to be refreshed manually.
   - To refresh the statistical information, click **Refresh Stats**.

### Viewing Hits

The hit counters that are provided for various AppExpert application entities enable you to monitor the functioning of public endpoints and application units. For an application, the Hits dialog box displays the total number of requests received by each configured public endpoint. For an application unit, the Hits dialog box displays the number of requests that the application unit processed from each of the public endpoints and the total hit count. For instructions on viewing hit counters, see **Verifying and Testing the Configuration**.

### Deleting an Application

September 24, 2018

If you no longer need an application and its application units, you can delete it. When you delete an AppExpert application, backend services are not deleted, and any public endpoints that the application used become available for use by other applications.

When deleting an application, you are also prompted to specify whether you want to delete any bound policies and actions that are not used elsewhere.

To delete an application unit for an application by using the GUI:

Navigate to **AppExpert > Applications**, select an application and click **Edit**. In the **Application Unit** section, click the delete icon next to the entity

### Configure application authentication, authorization, and auditing

September 24, 2018

You can configure Authentication, Authorization, and Auditing (AAA) for the applications that you configure on the appliance. An authentication policy that is configured for an application defines the type
of authentication to apply when a user or group attempts to access the application. If external authentication is used, the policy also specifies the external authentication server. Authorization policies configured for an application specify whether a particular user or group can access the application. Auditing policies define the audit log type, the level at which logging is performed, and other audit server settings. Authentication and auditing policies use the classic policy format.

Authentication policies, authorization policies, and auditing policies can be configured in any order. However, before you configure AAA for an application, you must configure a public endpoint for the application.

Configuring authentication for an application involves specifying an authentication FQDN, an authentication virtual server, a server certificate, and authentication and session policies. Authentication policies are automatically bound to the authentication virtual server specified for the application.

To configure authentication for an AppExpert application:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, do one of the following:
   a) Click Add to add an authentication for a new application.
   b) Click Edit to modify an existing application.
3. In the **Applications** page, select an Application Unit.
4. In the **Application Unit** slider page, click Authentication from the **Advanced Settings** section.
5. In the **Authentication** section, select the authentication type as follows:
   a) Form based authentication
   b) 401 based authentication
   c) None
6. Click **OK** and then click **Done**.

### Configure application authorization

You can configure authorization for users and groups to enable them to access an AppExpert application. If the AAA user or group for which you want to configure permissions has not already been created, you can create it from AppExpert and then configure permissions for application access.

To configure permissions for a AAA user or group to access an AppExpert application:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, click the AppExpert application for which you want to configure a user or group access.
3. In the **Applications** page, and then click **Authorization** from the **Advanced Settings** section.
4. Do one of the following:
   - If the AAA user or group for which you want to configure permissions are already in the Groups/Users tree, drag the user or group from the Groups/Users tree to the Users or
Groups node in the application tree. Then, right-click the user or group and click Allow.

- If the AAA user or group for which you want to configure permissions is not configured on the appliance, in the application tree, right-click Users or Groups, and then click Add. In the Create AAA Group or Create AAA User dialog box, fill in the values, click Create, and then click Close.

The user or group is created with the permission set to Allow. To change the permission setting, right-click the group or user, and then click the permission setting.

5. Click Done and then click Close.

**Configure application auditing**

When you configure auditing policies for an application, you must specify the server to which the log messages must be directed, the format of the messages logged, and the log level. Optionally, you can configure other settings, such as the log facility and date format. Auditing policies are automatically bound to all the AppExpert application's public endpoints.

To configure auditing policies for an application:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, click the application for which you want to configure auditing policies.
3. In the Application Unit slider page, click + icon in the **Policies** section to configure the auditing policies.
4. In the **Policies** slider page, select policy type as Syslog auditing or Nslog auditing and click **Continue**.
5. In the **Policy binding** section, set the following parameters.
   a) Select a policy for binding. If you do not have a policy for binding, click + to create a new policy.
   b) To create a new auditing policy, under Policy Name, click **New Policy**, and then, in the Policy page do the following:
      i. In the Name box, type a name for the policy.
      ii. The Name box already contains the string that is required at the beginning of the server name. You cannot modify the string.
      iii. From the Auditing Type list, select the auditing type (either SYSLOG or NSLOG).
      iv. If the audit server you want to specify is already listed in the Server list, select the server from the list, and then, if you want to modify the server settings, click Modify. In the Configure Auditing Server dialog box, modify the settings as appropriate, and then click OK. For more information about the settings in the Configure Auditing Server dialog box, see Auditing Authenticated Sessions.
      v. If you want to configure a new audit server, click New, and then, in the Create Auditing Server dialog box, type a name for the server, specify the server IP address, port number, and other settings as appropriate. When finished, click **OK**.
vi. Click **Create**.
   c) To change the priorities for the new auditing policies you created, under Priority, for each policy for which you want to change the priority, double-click the priority value and type new priority value.
   d) To regenerate priorities, click **Regenerate Priorities**.
   e) To unbind a policy, click the policy, and then click **Unbind Policy**.
   f) To modify a policy, click the policy, and then click **Modify Policy**.

6. Click **Apply Changes**, and then click **Close**.

**Disabling AAA for an Application**

After you configure AAA for an application, you can disable the AAA configuration for that application. When you disable AAA for an application, the configuration is not lost. You can enable AAA for the application when you want to reapply the configuration.

To enable or disable AAA for an application:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, click the application for which you want to enable or disable AAA, and then do one of the following:
3. To disable AAA for the application, click **Turn Off AAA**.
4. To enable AAA for the application, click **Turn On AAA**.

**Setting Up a Custom NetScaler Application**

**November 13, 2018**

If an AppExpert application template is not available for the Web application that you want to manage through the NetScaler appliance, or if available AppExpert application templates do not suit your requirements, you can create an AppExpert application without a template.

To create an AppExpert application without a template, you must first create an application and application units. Then, you configure public endpoints, services, and service groups. Finally, you configure the policies that determine how application traffic is evaluated and processed.

After you create the application and application units and configure policies, you must verify the configuration and test it to make sure that it is working correctly, just as you would when you configure an application by using a prebuilt AppExpert application template. Then, you must monitor the application to make sure that the application and its entities are working correctly.
Creating an Application

When you create an AppExpert application, the appliance creates a container to which you can add application units. The default application unit is not created until you create the first application unit.

To create an AppExpert application by using the GUI:

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click Applications, and then click Add.
3. In the Create Application dialog box, in Name, enter a name for the application, and then click OK.

Creating Application Units

For each subset of traffic associated with your web application, you must create an application unit.

To create an application unit for the AppExpert application by using the GUI:

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click the application for which you want to add an application unit, and then click Add.
3. Click Create.

Configuring Public Endpoints for an AppExpert Application

After you have created all the application units that you require, you must configure one or more public endpoints to enable clients to access the web application through the NetScaler appliance.

To configure public endpoints for an AppExpert application by using the GUI:

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click the application for which you want to configure public endpoints, and then click Configure Public Endpoints.
3. In the Choose Public Endpoints dialog box for the application, do one of the following:
   - If the endpoints you want are listed in the dialog box, click the corresponding check boxes.
   - If you want to specify all the public endpoints, click Activate All.
   - If you want to dissociate endpoints from the AppExpert application, clear the corresponding check boxes.
   - If you want to create a new public endpoint, click Add. Then, in the Create public endpoint dialog box, configure endpoint settings, and then click OK.

In the Create public endpoint dialog box, you can specify only the name, IP address, port, and protocol for the endpoint. You can specify additional endpoint settings after you create the public endpoint. To specify additional endpoint settings, after you create the endpoint, in the Choose Public Endpoints dialog box, click the endpoint, and then click Open.
Then, in the Configure Public Endpoint dialog box, provide additional settings, and then click OK.
For more information about the parameters in the Create public endpoint and Configure Public Endpoint dialog boxes, see Content Switching.
• If you want to modify a public endpoint, click the endpoint, and then click Open. Then, in the Configure Public Endpoint dialog box, modify settings for the endpoint, and then click OK.
For more information about the parameters in the Configure Public Endpoint dialog box, see Content Switching.
4. Click Close.

Configuring Public Endpoints for an Application Unit

For an application unit, you specify public endpoints in the same way as you would specify public endpoints for an application that is created from an AppExpert application template. For more information about specifying a subset of the endpoints for an application unit, see Configuring Endpoints for an Application Unit.

To configure endpoints for an application unit by using the GUI:

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click the application unit for which you want to specify public endpoints, and then click Configure Public Endpoints.
3. In the Choose Public Endpoints dialog box for the application unit, do one of the following:
   • If you are specifying endpoints for the application unit for the first time, clear the check boxes that correspond to the endpoints that you do not want to be bound to the application unit.
   • If you want to specify endpoints that are listed in the dialog box but not currently bound to the application unit, click the corresponding check boxes.
4. Click OK.

Configuring Services and Service Groups for an AppExpert Application

Services and service groups are available for application units only after you configure the services and service groups for the AppExpert application. Therefore, you must configure services and service groups for the AppExpert application before you configure the services for the application units. All the services and service groups that you configure for an AppExpert application must use the same protocol (either HTTP or HTTPS). The procedure for configuring services and service groups for an AppExpert application that is not created from a template is the same as that for an application created from a template.
To configure a service or service group for the AppExpert application by using the GUI:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, right-click the application for which you want to configure services or service groups, and then click **Configure Backend Services**.
3. In the **Configure Backend Services** dialog box, do one of the following:
   - To configure services, click the **Services** tab.
   - To configure service groups, click the **Service Groups** tab.
4. On the Service or **Service Groups** tab, do one of the following:
   - If the services or service groups that you want are listed on the tab, click the corresponding check boxes.
   - If you want to specify all the services or service groups, click **Activate All**.
   - If you want to create a new service or service group, click **Add**. Then, in the **Create Service** dialog box or **Create Service Group** dialog box, configure settings for the service or service group, respectively, and then click **Create**.
   - If you want to modify a service, click the service, and then click **Open**. Then, in the Configure Service dialog box or Create Service Group dialog box, configure settings for the service or service group, respectively, and then click **OK**.

For information about the settings in the Create Service, Configure Service, and Create Service Group dialog boxes, see Load Balancing.

**Configuring services and service groups for an application Unit**

After you configure services and service groups, you must configure services and service groups for each application unit. However, this step is not necessary if each backend service hosts all the content associated with the web application. You configure services and service groups for an application unit if the content associated with the application unit is hosted on only a subset of the backend servers.

To configure services or service groups for an application unit by using the GUI:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, right-click the application unit for which you want to configure a service or service group, and then click **Configure Backend Services**.
3. In the **Configure Backend Services** dialog box, do one of the following:
   - To configure services, click the **Services** tab.
   - To configure service groups, click the **Service Groups** tab.
4. In the **Services** or **Service Groups** tab, do one of the following:
   - Clear the check boxes that correspond to the services or service groups that you do not want configured for the application unit. Make sure that the check boxes that correspond to the services or service groups that you want configured for the application unit are selected. Then, in the Weight column, specify the weight that you want to assign to each
configured service.

- To specify all services or service groups, click Activate All.

5. On the Method and Persistence and Advanced tabs, specify the desired parameters.
6. Click OK.

**Configuring Policies**

The procedures for configuring policies for an AppExpert application that is created without using a template are the same as those for an AppExpert application that was created from a template. For more information, see Configuring Policies for Application Units.

**Creating and managing template files**

September 24, 2018

After you set up an AppExpert application and customize it to suit your requirements, you can create a template from the configuration and then share the template with other administrators. Or, you can create a template and then import the template to other NetScaler appliances that require a similar AppExpert application configuration. This simplifies and expedites the process of setting up similar applications on other appliances.

AppExpert application template files can be exported either to the template directory on the NetScaler appliance or to a folder on your local computer. You can then upload and download the templates to and from the NetScaler appliance and rename the templates that are stored in the AppExpert application templates directory on your appliance.

Exporting an appExpert application to a template file

September 24, 2018

When you export an appExpert application, all application-configuration information is exported to a template file, and all deployment-specific information is exported to a deployment file. The string _deployment is automatically appended to the name of the template file to create the name of the deployment file. Both files are in XML format. If you choose to export the application template file to the NetScaler appliance, the template file is stored in the /nsconfig/nstemplates/applications directory.
and the deployment file is stored in the /nsconfig/nstemplates/applications/deployment_files/ directory. If you have configured a NetScaler Gateway application, you can choose to include the NetScaler Gateway policies in the template.

To export an AppExpert application to a template file by using the GUI:

1. Navigate to **AppExpert > Application**, select an application entity, and then click **Edit**.
2. On the **Applications** page, click the **Export** as a Template link to export the application configuration and deployment settings as a template.
3. In the **Export Application** slider, set the following parameters:
   a) Template Filename
   b) Deployment Filename
4. Click **Continue** and **Done**.
5. Navigate to **AppExpert > Application** and click **Manage Templates** to show the exported configuration as files on the **Template File** and **Deployment File** tabs.

### Exporting a Content Switching Virtual Server Configuration to a Template File

September 24, 2018

You can also export a content switching configuration as an application template. You can export a content switching virtual server configuration to an application template either from the Content Switching Virtual Servers pane or from the Content Switching Visualizer. Configuration information, which includes the content switching virtual server, all associated load balancing virtual servers, services, service groups, and policies, is exported to a template file and all deployment-specific information is exported to a deployment file. The string "_deployment" is automatically appended to the name of the template file to create the name of the deployment file. Both files are in XML format. If you choose to export the application template file to the NetScaler appliance, the template file is stored in the /nsconfig/nstemplates/applications directory on the NetScaler appliance and the deployment file is stored in the /nsconfig/nstemplates/applications/deployment_files/ directory.

For more information about the format of application templates and deployment files, see **Understanding NetScaler Application Templates and Deployment Files**. The configuration information that is exported includes the content switching virtual server, all associated load balancing virtual servers, services, service groups, and policies.

However, if the content switching virtual server is already configured as the public endpoint for an AppExpert application, you cannot export the configuration to a template file. In this scenario, you must export the associated AppExpert application to a template.

For more information about exporting an AppExpert application to a template file, see **Exporting an**
AppExpert Application to a Template File.

To export a content switching configuration to an application template file from the Content Switching Visualizer by using the GUI:

1. Navigate to Traffic Management > Content Switching > Virtual Servers.
2. In the details pane, click the name of the content switching virtual server whose configuration you want to export as a template file, and then click Visualizer.
3. In the Content Switching Visualizer, click the icon for the content switching vserver, click Related Tasks, and then click Create Template.
4. In the Export…as Template dialog box, enter a name for the template file, and then do one of the following:
   - To export the template file to the appliance, make sure that Browse (Appliance) is displayed.
   - To export the template file to your computer, click the Browse (Appliance) drop-down menu, click Local, browse to the location to which you want to save the file, and then click Save.
5. Provide the following information:
   - Introduction Description—Any text that introduces the AppExpert application template during import. This text is displayed on the Specify Application Name page of the AppExpert Template Wizard when the template is imported.
   - Summary Description—Any summary that you might want to display on the Summary page of the AppExpert Template Wizard when the template is imported.
   - Author—The name of the author of the template.
   - Major—The major version number of the template.
   - Minor—The minor version number of the template. This number is appended to the major version number and displayed on the Summary page of the AppExpert Template Wizard, during import, in the format Major.Minor.
6. Click OK.

To export a content switching configuration to an application template file from the Content Switching Virtual Servers pane by using the GUI:

1. Navigate to Traffic Management > Content Switching > Virtual Servers.
2. In the details pane, click the name of the content switching virtual server whose configuration you want to export as a template file, and then click Create AppExpert Template.
3. Perform steps 4 through 6 described in To export a content switching configuration to an application template file from the Content Switching Visualizer procedure.
Creating Variables in Application Templates

January 6, 2019

Application templates support the declaration of variables in the policy expressions and actions that are configured for an application. The ability to declare variables in policy expressions and actions enables you to replace preconfigured values in expressions (for example, configurable parameters such as the host name of a server or the target for a Rewrite action) with values that suit the environment into which you are importing the template. If variables have been configured for an AppExpert application template, the AppExpert Template Wizard, which appears when you import an AppExpert application template, includes a Specify Variable Values page on which you can specify appropriate values for the variables that are configured for the template.

As an example, consider the following policy expression that is configured to evaluate the value of the Host header in an HTTP request:

```
HTTP.REQ.HEADER("Host").CONTAINS("server1")
```

If you want the server name to be configurable at import time, you can specify the string “server1” as a variable. When importing the template, you can specify a new value for the variable on the Variables tab.

After you create a variable, you can do the following:

- Assign additional strings to an existing variable. After you create a variable for a string, you can select and assign other parts of the same or different expression to the variable. The strings you assign to a variable need not be the same. At import time, all the strings that are assigned to the variable are replaced with the value that you provide.
- View the string or strings that are assigned to the variable.
- View a list of all the entities and parameters that use the variable.

In the export application template wizard, you can define variables in certain fields (fields with an adjacent button) for the following entities:

- Cache policies
- Rewrite policies
- Rewrite actions
- Responder policies
- Responder actions

To configure a variable in a policy expression or action by using the GUI:

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click the application that you want to export to a template file, and then click Export.
3. In the Export…as Template dialog box, modify the default template file name if required, specify
   the location where you want to save the template, and then click Configure Variables.

4. In the Configure Variables dialog box, click the tab that lists the policy expression or action for
   which you want to configure a variable, select the expression, and then click Configure Vari-
   ables.

5. In the Variables dialog box, click the button next to the expression or value in which you want
   to create a variable.

6. In the Variables dialog box, do the following:
   • To create a variable, in the text box that displays the configured expression or value, se-
     lect the string that you want to be configurable at import time, and then click Add. In the
     Add Variable dialog box, specify a name and a description for the variable, and then click
     Create.
   • The name of the variable, its value, and the description you provided appear in the Avail-
     able Variables listing in the dialog box. The name you provide will be the name of the
     associated field in the template import wizard, and the description will appear as alt text
     when the user positions the mouse pointer over the field.
   • To modify a variable, in the Available Variables list, click the variable, and then click Open.
     In the Add Variable dialog box, modify the value and the description, and then click OK.
   • To view all the strings that are assigned to a given variable, in the Available Variables listing,
     click the name of the variable. The strings that are assigned to the variable are highlighted.
   • To view a list of all the entities and parameters in which the variable is used, in the Available
     Variables listing, click the variable whose references you want to view, and then click Show
     References.
   • To assign a string to an existing variable, in the text box that displays the expression you
     configured, select the string you want to assign to an existing variable, right-click the se-
     lection, click Use Existing Selection, and then click the name of the variable to which you
     want to assign the string.

     If a variable has multiple strings assigned to it, when you specify a new value for the vari-
     able during import, all strings assigned to the variable are replaced with the new value.

7. Click Close.

**Uploading and downloading template files**

September 24, 2018
Template files can be uploaded from your local computer to the NetScaler appliance or downloaded from the appliance to your local computer. On the appliance, AppExpert application templates are always stored in the AppExpert application templates directory, which is /nsconfig/nstemplates/applications/.

To upload an AppExpert application template from your local computer to the NetScaler appliance:

1. Navigate to AppExpert > Templates.
2. In the details pane, click Manage Templates.
3. In the Manage Application Templates dialog box, click Application Templates, and then click Upload.
4. In the Upload Application Template dialog box, browse to the directory in which the template file is stored, click the template file, and then click Select.

   The template file is uploaded to the AppExpert application template directory on the appliance.

To download an AppExpert application template from the NetScaler appliance to your local computer:

1. Navigate to AppExpert > Templates.
2. In the details pane, click Manage Templates.
3. In the Manage Application Templates dialog box, click the AppExpert application template that you want to download, and click Download.
4. In the Download Application Template dialog box, browse to the location to which you want to save the file, and then click Save.

Understanding NetScaler application templates and deployment files

September 24, 2018

When you export a NetScaler application, the following two files are automatically created:

- **NetScaler application template file.** Contains application-configuration information such as application units, rules, and configured policies.
- **Deployment file.** Contains deployment-specific information such as public endpoints, services, associated IP addresses, and configured variables.

In a template file or deployment file, each unit of application-configuration information is encapsulated in a specific XML element that is meant for that unit type. For example, each public endpoint and associated endpoint details are encapsulated within the `<appendpoint>` and `<appendpoint>` tags, and all the endpoint elements are encapsulated within the `<appendpoint_list>` and `<appendpoint_list>` tags.

**Note:** After you export a NetScaler application, you can add elements, remove elements, and modify existing elements before importing the application to a NetScaler appliance.
Example of a NetScaler Application Template

Following is an example of a template file that was created from a NetScaler application called **SharePoint_Team_Site**:

```xml
<?xml version="1.0" encoding="UTF-8" ?>
<template>
<template_info>
<application_name>SharePoint_Team_Site</application_name>
<templateversion_major>1</templateversion_major>
<templateversion_minor>1</templateversion_minor>
<author>Ed</author>
<introduction>An application for managing a SharePoint team site with images, reports, and, XML content.</introduction>
<summary>This template includes variables</summary>
<version_major>9</version_major>
<version_minor>3</version_minor>
<build_number>38</build_number>
</template_info>
<apptemplate>
<rewrite>
<rewriteaction_list>
<rewriteaction>
<name>Rw_name</name>
<type>replace</type>
<target>HTTP.REQ.BODY(10000).AFTER_REGEX(re/number/).
BEFORE_REGEX(re/address/)</target>
<stringbuilderexpr>"NA"</stringbuilderexpr>
<allow_unsafe_pi1>NO</allow_unsafe_pi1>
</rewriteaction>
<rewriteaction>
.
.
</rewriteaction>
<rewriteaction_list>
<rewritepolicy_list>
<rewritepolicy>
<name>Rw_number_NA</name>
<rule>HTTP.REQ.BODY(100000).CONTAINS("admin")</rule>
<action>Rw_name</action>
</rewritepolicy>
</rewritepolicy_list>
</rewrite>
</apptemplate>
</template>
```
<rewritepolicy>
  
  
  </rewritepolicy>

</rewritepolicy_list>
</rewrite>
<appunit_list>
  <appunit>
    <name>SharePoint_Team_Sitedefault</name>
    <rule />
    <expressiontype>PE</expressiontype>
    <servicetype>HTTP</servicetype>
    <ipv46>0.0.0.0</ipv46>
    <ipmask>**</ipmask>
    <port>0</port>
    <range>1</range>
    <persistencetype>NONE</persistencetype>
    <timeout>2</timeout>
    <persistencebackup>NONE</persistencebackup>
    <backuppersistencetimeout>2</backuppersistencetimeout>
    <lbmethod>LEASTCONNECTION</lbmethod>
    <persistmask>255.255.255.255</persistmask>
    <v6persistmasklen>128</v6persistmasklen>
    <pq>OFF</pq>
    <sc>OFF</sc>
    <m>IP</m>
    <datalength>0</datalength>
    <dataoffset>0</dataoffset>
    <sessionless>DISABLED</sessionless>
    <state>ENABLED</state>
    <connfailover>DISABLED</connfailover>
    <clttimeout>180</clttimeout>
    <somethod>NONE</somethod>
    <sopersistence>DISABLED</sopersistence>
    <redirectportrewrite>DISABLED</redirectportrewrite>
    <downstateflush>DISABLED</downstateflush>
    <gt2gb>DISABLED</gt2gb>
    <ipmapping>0.0.0.0</ipmapping>
    <disableprimaryondown>DISABLED</disableprimaryondown>
    <insertvserveripport>OFF</insertvserveripport>
    <authentication>OFF</authentication>
  </appunit>
</appunit_list>
<authn401>OFF</authn401>
<push>DISABLED</push>
<pushlabel>none</pushlabel>
<l2conn>OFF</l2conn>
</appunit>
</appunit>

<appunit>

</appunit>
</appunit_list>
</apptemplate>
<parameters>

<property_list>

<property>

<variable_definition_list>

<variable_definition>

<name>body_size</name>
<defaultvalue>10000</defaultvalue>
<description>Evaluation Scope</description>
<startIndex>14</startIndex>
<length>5</length>
</variable_definition>

</variable_definition_list>
<object_type>rewriteaction</object_type>
<object_name>Rw_name</object_name>
<name>target</name>
</property>

</property_list>
</parameters>
</template>
Example of a deployment file

Following is the deployment file associated with the **SharePoint_Team_Site** application in the preceding example:

```xml
<?xml version="1.0" encoding="UTF8" ?>
<template_deployment>
  <template_info>
    <application_name>SharePoint_Team_Site</application_name>
    <templateversion_major>1</templateversion_major>
    <templateversion_minor>1</templateversion_minor>
    <author>Ed</author>
    <introduction>An application for managing a SharePoint team site with images, reports, and XML content.</introduction>
    <summary>This template includes variables</summary>
    <version_major>9</version_major>
    <version_minor>3</version_minor>
    <build_number>38</build_number>
  </template_info>
  <appendpoint_list>
    <appendpoint>
      <ipv46>10.111.111.1</ipv46>
      <port>80</port>
      <servicetype>HTTP</servicetype>
    </appendpoint>
  </appendpoint_list>
  <service_list>
    <service>
      <ip>10.102.29.5</ip>
      <port>80</port>
      <servicetype>HTTP</servicetype>
    </service>
  </service_list>
  <variable_list>
    <variable>
      <name>body_size</name>
      <description>Evaluation Scope</description>
    </variable>
  </variable_list>
</template_deployment>
```
Deleting a Template File

September 24, 2018

If you no longer need an application template and its configuration, you can delete it. When you delete a template, the template XML file that is stored in the application template directory gets deleted. When you delete a template file, you are prompted to confirm the deletion. Click Yes to confirm and delete the selected file from the directory.

To delete a template file from the application template directory by using the GUI:

1. Navigate to AppExpert > Applications and then click Manage Template. Select a file from Template Files tab page or Deployment Files tab page and click Delete.

NetScaler Gateway Applications

September 24, 2018

When you configure an AppExpert application to manage a web application through the Citrix® NetScaler® appliance, you also create a set of application units and configure a set of traffic optimization and security policies for each unit. The policies that you configure for each application unit (policies for features such as Compression, Caching, and Rewrite) evaluate traffic that is meant only for that unit. In addition to these policies, you might want to configure Access Gateway policies for the application as a whole to optimize the application traffic when accessed through the Access Gateway. The Access Gateway Applications feature enables you to configure Access Gateway policies (Authorization, Traffic, Clientless Access, and TCP Compression) for an AppExpert application. After you configure NetScaler Gateway policies for AppExpert applications, you can include the policy configuration in the AppExpert application templates that you create.
You can also configure NetScaler Gateway policies for intranet subnets, file shares, and other network resources. Finally, you can create bookmarks for AppExpert applications and certain resources if you want users to be able to access them from the NetScaler Gateway home page.

You can configure the entities in the NetScaler Gateway Applications feature only by using the GUI.

**How an NetScaler Gateway Application Works**

When you create an AppExpert application in the Applications node in the GUI, a corresponding Access Gateway application is automatically created in the Access Gateway Applications node. Additionally, a rule that uses the AppExpert application’s configured public endpoint is automatically created for the Access Gateway application entry. If multiple endpoints are configured for the AppExpert application, the rule includes all the configured public endpoints. The NetScaler appliance uses this rule to apply any configured Access Gateway policies to the traffic received at the AppExpert application’s public endpoint. Traffic received at the AppExpert application’s public endpoint is first evaluated against the NetScaler Gateway policies and then evaluated against the policies configured for AppExpert application’s application units.

The rule that is created for the Clientless Access policies for an Access Gateway application is an advanced expression that also uses the public endpoint that is configured for the AppExpert application. Therefore, before you configure NetScaler Gateway policies for an AppExpert application, you must configure public endpoints for the AppExpert application.

When you include the NetScaler Gateway configuration in an application template, deployment-specific information, such as IP address and port information, and the rule that is created from this information are not included in the template.

**How a NetScaler Configuration for a File Share Works**

On the NetScaler appliance, you can configure Authorization policies for a file share that is hosted on your organization’s network.

When you create a file share, you specify a name for the file share and the network path to the file share. In the network path, you can specify either the name of the server or the server IP address. A rule that uses the components of the file share path is automatically created for the file share. This rule enables the appliance to identify requests for files hosted on the file share server. Any Authorization policies that are configured for the file share are applied to incoming requests.

The NetScaler configuration for a file share cannot be saved in AppExpert application templates.
How a NetScaler Configuration for an Intranet Subnet Works

For the intranet subnets that form a part of your network, you can configure policies for Authorization, Traffic, and TCP Compression on the NetScaler appliance. When adding an intranet subnet, you specify the IP address and the netmask of the intranet subnet. A rule that uses these two parameters is automatically created for the intranet subnet. The appliance applies the configured policies to any request that has a destination IP address and netmask set to the subnet’s IP address and netmask, respectively.

The NetScaler configuration for an intranet subnet cannot be saved in AppExpert application templates.

How the Other Resources Category Works

The Other Resources category enables you to configure Access Gateway policies for any network resource by using a rule of your choice. When you configure the NetScaler appliance to process requests for the network resource, you configure a classic expression to identify the requests that are associated with the network resource. You can configure Authorization, Traffic, Clientless Access, and TCP Compression policies for a network resource in Other Resources. The NetScaler appliance applies the configured NetScaler Gateway policies to any requests that match the configured rule.

The NetScaler configuration for a network resource in Other Resources cannot be saved in AppExpert application templates.

Entity Naming Conventions

The NetScaler Gateway Applications feature enforces a naming convention for some of the entities that you create in this feature. For example, the names of the profiles that you create for Traffic policies for an intranet subnet always begin with a string that consists of the name of the intranet subnet followed by an underscore (_). The name that you provide for the entity is appended to this string. If the name of a subnet is “subnet1,” the name of the profile begins with “subnet1_.” When such a naming convention is required (in the text box in which you type the name of an entity, for example), the user interface automatically inserts the string with which the name of the entity must begin and does not allow you to modify it.

Adding Intranet Subnets

September 24, 2018
You can specify authorization and Traffic policies for traffic that is bound for the intranet subnets that are configured in your network. The rules for these policies are automatically created by using the parameters you specify for the subnet.

To configure an intranet subnet by using the GUI:

1. In the navigation pane of the GUI, expand AppExpert, and then click Access Gateway Applications.
2. In the details pane, do one of the following:
   - To add an intranet subnet, click Intranet Subnets, and then click Add.
   - To modify an intranet subnet, click an intranet subnet, and then click Open.
3. In the Create Intranet Subnet or Configure Intranet Subnet dialog box, do the following:
   a) In the Name box, type a name for the intranet subnet you are adding. This parameter cannot be changed for an existing intranet subnet.
   b) In the IP Address box, type the IP address of the intranet subnet.
   c) In the Netmask box, type the netmask that will be used for the intranet subnet.
   d) Click Create or OK, and then click Close.

Adding Other Resources

September 24, 2018

For a network resource that you add to Other Resources, you must configure a classic expression that identifies the subset of traffic associated with the resource. For more information about configuring a classic expression, see the.

To configure a resource in Other Resources by using the GUI:

1. In the navigation pane of the GUI, expand AppExpert, and then click Access Gateway Applications.
2. In the details pane, do one of the following:
   - To add a resource, click Other Resources, and then click Add.
   - To modify a resource, click a resource, and then click Open.
3. In the Create Resource or Configure Resource dialog box, do the following:
   a) In the Name box, type a name for the resource you are adding. This parameter cannot be changed for an existing resource.
   b) In the Rule box, type the rule that will identify the subset of traffic that is associated with the resource you are adding. Alternatively, click Configure, and then create the rule in the Create Expression dialog box.
   c) Click Create or OK, and then click Close.
Configuring Authorization Policies

September 26, 2018

You can configure NetScaler Gateway authorization policies for AAA users and groups to access a resource.

To configure permissions for a AAA user or group to access a resource by using the GUI:

1. In the navigation pane of the GUI, expand AppExpert, and then click **Access Gateway Applications**.
2. In the details pane, in the Authorization column, click the icon for the application, file share, intranet subnet, or resource for which you want to configure authorization policies for AAA users and groups.
3. Do one of the following:
   - If the AAA user or group for which you want to configure permissions is already in the Groups/Users tree, drag the user or group from the Groups/Users tree to the Users or Groups node in the `<application name>` tree. Then, right-click the user or group and click **Allow**.
   - If the AAA user or group for which you want to configure permissions is not configured on the appliance, in the `<application name>` tree, right-click Users or Groups, and then click **Add**. In the Create AAA Group or Create AAA User dialog box, fill in the values, click **Create**, and then click **Close**.

   The user or group is created with the permission set to Allow. To change the permission setting, right-click the group or user, and then click the permission setting.
4. Click **Close**.

Configuring Traffic Policies

September 24, 2018

The traffic policies that you configure for the resources in the NetScaler Gateway Applications node control client connections to the application. You do not have to configure a rule for the resource. The rule created automatically when you create the resource. You only need to associate a request profile with the traffic policy. In the traffic profile, you specify parameters such as the protocol, application time-out, and file type association.

To configure traffic policies for a resource

1. In the navigation pane of the GUI, expand AppExpert, and then click **Access Gateway Applications**.
2. In the details pane, in the Traffic column, click the icon provided for the application, file share, intranet subnet, or resource for which you want to configure traffic policies.
3. In the **Configure Traffic Policies** dialog box, do the following:
   - To specify an existing traffic policy, click **Insert Policy**, and then, in the Policy Name column, click the name of the policy.
   - To configure a new policy, click Insert Policy, and then, in the Policy Name column, click New Policy. In the Create Traffic Policy dialog box, in the Name box, after the underscore (_), type a name for the policy. Then, in Request Profile, either select an existing request profile or click New to configure a new request profile. You can also select an existing profile and then click Modify to modify the profile.
   
   For more information about configuring a traffic policy or profile, see *NetScaler Gateway*.
   - To modify a policy that you have inserted, in the Policy Name column, click the policy name, and then click Modify Policy. To modify only the associated profile, in the Profile column, click the name of the profile, and then click **Modify Profile**.
   - To regenerate the priorities assigned to the policies, click **Regenerate Priorities**.
   - To specify a new priority value for a policy, in the Priority column, double-click the assigned priority, and then enter the value you want.
   - To unbind a policy, click the policy, and then click **Unbind Policy**.

4. Click **Apply Changes**, and then click **Close**.

---

### Configuring Clientless Access Policies

September 24, 2018

Clientless access, when configured for a resource on the NetScaler appliance, allows end-users to access the resource without using the NetScaler Gateway client software. Users can use web browsers to access resources such as Outlook Web Access. You configure clientless access for a resource by configuring a clientless access policy that is associated with a clientless access profile.

To configure a clientless access policy for a resource in the NetScaler Gateway Applications node:

1. In the navigation pane of the GUI, expand **AppExpert**, and then click **Access Gateway Applications**.
2. In the details pane, in the **Clientless Access** column, click the icon for the application, file share, intranet subnet, or resource for which you want to configure a clientless access policy.
3. In the **Configure Clientless Access Policies** dialog box, do the following:
   - To specify an existing clientless access policy, click **Insert Policy**, and then, in the **Policy Name** column, click the name of the policy.
   - To configure a new clientless access policy, click Insert Policy, and then, in the Policy Name column, click New Policy. In the Create Clientless Access Policy dialog box, in the Name box, after the underscore (_), type a name for the policy. Then, in Profile, either select an existing profile or click New to configure a new profile. You can also select an existing profile and then click Modify to modify the profile.
For more information about configuring a clientless access policy or profile, see NetScaler Gateway.

- To modify a policy that you have inserted, in the Policy Name column, click the policy name, and then click Modify Policy. To modify only the associated profile, in the Profile column, click the name of the profile, and then click Modify Profile.
- To specify a new priority value for a policy, in the Priority column, double-click the assigned priority, and then enter the value you want.
- To unbind a policy, click the policy, and then click Unbind Policy.

4. Click Apply Changes, and then click Close.

Configuring TCP Compression Policies

September 24, 2018

You can configure TCP compression policies for an application to increase the performance of the application. TCP compression reduces network latency, reduces bandwidth requirements, and increases the speed of transmission. When configuring a TCP compression policy, you associate a compression action with the policy. The compression action specifies either Compress, GZIP, Deflate, or NoCompress as the compression type. For more information about the compression policies, and compression actions, see NetScaler Gateway.

To configure a TCP compression policy for a resource in the NetScaler Gateway Applications node

1. In the navigation pane of the GUI, expand AppExpert, and then click Access Gateway Applications.
2. In the details pane, in the TCP Compression column, click the icon for the application, file share, intranet subnet, or resource for which you want to configure a TCP compression policy.
3. In the Configure TCP Compression Policies dialog box, do the following:
   - To specify an existing TCP compression policy, click Insert Policy, and then, in the Policy Name column, click the name of the policy.
   - To create a new TCP compression policy, click Insert Policy, and then, in the Policy Name column, click New Policy. In the Create TCP Compression Policy dialog box, in the Policy Name box, after the underscore (“_”), type a name for the policy. Then, in Action, either select an existing action or click New and configure a new action. You can also click View to view the configured compression type.
   - To modify a policy that you have inserted, in the Policy Name column, click the policy name, and then click Modify Policy.
   - To regenerate the priorities assigned to the policies, click Regenerate Priorities.
• To specify a new priority value for a policy, in the Priority column, double-click the assigned priority, and then enter the value you want.
• To unbind a policy, click the policy, and then click **Unbind Policy**.

4. Click **Apply Changes**, and then click **Close**.

## Configuring Bookmarks

**September 24, 2018**

You can configure bookmarks for an application or for a resource that you configure in the Other Resources category if you want the application or resource to be accessible from the NetScaler Gateway home page.

To configure a bookmark for a NetScaler Gateway application or a resource in the Other Resources category:

1. In the navigation pane of the GUI, expand AppExpert, and then click Access Gateway Applications.
2. In the details pane, click the application or resource for which you want to configure a bookmark, and then click **Configure Bookmark**.
3. In the Create Bookmark dialog box, configure values for the parameters.
   
   For more information about the parameters in the Create Bookmark dialog box, see **NetScaler Gateway**.

4. Click Create, and then click Close.

## Customizing the configuration

**September 24, 2018**

After you verify that the AppExpert application is working correctly, you can customize the configuration to suit your requirements.

After you verify that the AppExpert application configuration is working correctly, you can configure the application and the deployment settings to suit your requirements. When you import an application template and deployment file, the system automatically populates the target application with the available configuration settings (such as application units, application unit rules, policies, persistence settings, load balancing methods, profiles, and traffic settings). In this application, you can configure deployment settings such as public endpoints, services, and service groups for each traffic subset. If you want the AppExpert application to manage a traffic subset that is not included in the template, you can either add an application unit for a traffic subset or modify the existing application unit. After
you customize the configuration, you can also specify the order of evaluation for each traffic subset that the application manages.

Configuring an AppExpert application consists of the following steps:

1. Configuring Public Endpoints
2. Configuring Application Units
3. Specifying the Order of Evaluation
4. Viewing Application Configuration using Visualizer

Also, you can configure the policies that the template provided. If the AppExpert application template does not include policies for a particular NetScaler feature, such as Rewrite or application firewall, you can configure your own policies.

Configure public endpoints

September 24, 2018

If you did not specify a public endpoint when importing an AppExpert application, you can specify public endpoints after you create the application. You can configure one public endpoint of type HTTP and one public endpoint of type HTTPS for your AppExpert application.

If endpoints are already configured for the application, you can dissociate endpoints from the AppExpert application and delete any endpoints that you no longer need. Note that when you dissociate a public endpoint from the AppExpert application, the endpoint is automatically unbound from the associated application unit, but it is not deleted from the system.

To configure public endpoints for an AppExpert application:

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click the application for which you want to configure public endpoints, and then click Edit.
3. In the Applications page, go to Public Endpoint section and click the pencil icon.
4. In the Public Endpoint slider, set the following parameters.
   a) Public endpoint type. Select the radio button to define the endpoint type.
   b) Name. Name of the public endpoint.
   c) IP address. IP address of the public endpoint.
   d) Port. Port number of the public endpoint.
   e) Protocol. Select a protocol type as HTTP or HTTPS.
5. Click Continue.
6. In the Application Units section, select an application unit from the list.
7. Click Continue to set the policy and server details.
8. Click OK and then Done.
9. Click Close.

For more information about the parameters in the Configure Public Endpoint dialog box, see Content Switching.

Configuring Endpoints for an Application Unit

September 24, 2018

When you configure multiple public endpoints for an AppExpert application, by default, all endpoints are bound to each application unit, and each application unit processes the requests received by all the endpoints. However, you can specify that a given application unit manages the traffic that is received by only a subset of the endpoints that are configured for the AppExpert application.

To configure endpoints for an application unit:

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click the application unit for which you want to specify public endpoints, and then click Configure Public Endpoints.
3. In the Choose Public Endpoints dialog box for the application unit, do one of the following:
   • If you are specifying endpoints for the application unit for the first time, clear the check boxes that correspond to the endpoints that you do not want to be bound to the application unit.
   • If you want to specify endpoints that are listed in the dialog box but not currently bound to the application unit, click the corresponding check boxes.
4. Click OK.

Configure services and service groups for an application unit

September 24, 2018

When you configure a service or service group, you either modify an existing service or service group, or add new services to the AppExpert application. You add services or service groups if you did not specify them when you imported the application template. You also add services and service groups when you increase the number of servers that host instances of the application. You can configure a service and service group for an application unit only after you configure the service or service group for the AppExpert application.

To configure a service or service group for the AppExpert application:

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click the application and then click Edit.
3. In the **Applications** page, select an application unit and then click **Continue**.

4. In the **Services and Service Groups** section, do the following:
   a) In the Service Binding slider, set the following parameters.
      i. Service. Select a load balancing service from the list or create a new service.
      ii. Weight. Provide a weight value for the service.
   b) Click **Bind** and then **Done**.
   c) In the ServiceGroup Binding slider, set the following parameters:
      i. Service Group Name. Select a load balancing service group or create a new service group.
      ii. Click **Bind** and then **Done**.
   d) Click **Done**.

5. Click **Continue** to set other configurations.

---

**Configuring services, service groups, and load balancing Parameters for an application unit**

September 24, 2018

When you configure services and service groups for an AppExpert application, by default, all the services and service groups are bound to each application unit. However, depending on how you have configured your web application, the application resources that are managed by an application unit might be hosted on only some of the servers that are configured as services for the AppExpert application. Or, a set of servers might host content that is meant for the requests received at one or more specific public endpoints. In such scenarios, if all the services and service groups that are configured for the AppExpert application are associated with the application unit, a request that is forwarded to a server that does not host the requested content might not be served or might be served incorrect content. Therefore, you must ensure that each application unit is configured to manage only those services that can serve the requested content.

When configuring services and service groups for an application unit, you might choose to specify load balancing settings such as the weights that services must be assigned and the desired load balancing, persistence, and spillover methods. For more information about these settings, see [Load Balancing](#).

To configure services or service groups for an application unit:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, right-click the application unit for which you want to configure a service or service group, and then click **Configure Backend Services**.
3. In the **Configure Backend Services** dialog box, do one of the following:
   - To configure services, click the **Services** tab.
   - To configure service groups, click the **Service Groups** tab.
4. In the Services or Service Groups tab, do one of the following:
   • Clear the check boxes that correspond to the services or service groups that you do not want configured for the application unit. Make sure that the check boxes that correspond to the services or service groups that you want configured for the application unit are selected. Then, in the Weight column, specify the weight that you want to assign to each configured service.
   • To specify all services or service groups, click Activate All.
5. On the Method and Persistence and Advanced tabs, specify the desired parameters.
6. Click OK.

Create application units

September 24, 2018

You might need to add application units for traffic subsets that are either specific to your web application implementation or not defined in the template. When creating an application unit, you must configure a rule for the application unit.

To create an application unit for the AppExpert application:

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click the application for which you want to add an application unit, and then click Add.
3. In the Applications page, go to Application Units section and click the pencil icon.

To configure policy expressions for an application unit:

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click the application for which you want to add an application unit, and then click Add.
3. In the Applications page, go to Application Units section and click the pencil icon to create a unit and add policy expressions.
4. To specify the format of the new expression, do one of the following:
   a) To specify that you want to configure a classic expression in the Rule box, click Classic Syntax.
   b) To specify that you want to configure an advanced expression in the Rule box, click Default Syntax.
   c) In the Rule box, configure the expression.
5. Click OK.
Configuring application unit rules

September 24, 2018

You might want to configure an application unit rule to include or exclude certain types of traffic. When you configure the rule, you can also define the syntax of the expression.

To configure an application unit rule:

1. In the navigation pane of the GUI, expand AppExpert, and then click Applications.
2. In the details pane, right-click the application unit for which you want to modify the rule, and then click Open.
3. In the Configure Application Unit dialog box, do the following:
   a) To specify the format of the new expression, do one of the following:
      • To specify that you want to configure a classic expression in the Rule box, click Classic Syntax.
      • To specify that you want to configure an advanced expression in the Rule box, click Default Syntax.
   b) In the Rule box, configure the expression.
4. Click OK.

Configuring policies for application units

September 24, 2018

For an AppExpert application, you can configure policies for Compression, Caching, Rewrite, Responder, and Application Firewall. The templates that you download from the Citrix Community web site provide you with a set of policies that fulfill the most common application management requirements. You might want to fine-tune or customize these policies. If the set of policies provided for a given application unit does not include policies for a particular feature, you can create and bind your own policies for that feature.

If you create an AppExpert application without using a template, you must configure all the policies that the web application needs.

The GUI uses various icons to indicate whether or not policies are configured for a feature. For an application unit, if a policy is configured for a given feature, an icon that represents the feature is displayed. For example, if a compression policy is configured for an application unit, a compression icon is displayed in the Compression column for the application unit. For features for which no policy is configured, an icon depicting a plus sign (+) is displayed.

Note: When configuring policies for application units, you might need to configure policies and expressions that are either in the classic or
default syntax. Additionally, when you configure default syntax policies, you might need to specify parameters such as Goto expressions and invoke policy banks.
For information about configuring policies and expressions in both formats, see Policies and Expressions.

**Configuring compression policies**

You can use either classic policies or advanced policies to configure compression, but you cannot bind compression policies of both types to the same application unit.

To configure a compression policy for an application unit:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Compression column.
3. In the Configure Compression Policies dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
   - Click **Switch to Default Syntax** if you want to configure a default syntax compression policy. If you want to bind or configure classic compression policies, and if you are in the default syntax view, you can click **Switch to Classic Syntax** to return to the classic policy view and begin modifying bound classic policies or create and bind new classic compression policies.
     Important: This setting also determines what policies are displayed when you want to insert a policy. For example, if you are in the default syntax view, when you click Insert Policy, the list that appears in the Policy Name column will include only default syntax policies. You cannot bind policies of both types to an application unit.
   - If you want to configure classic policies, click either Request or Response, depending on whether you want the policy to be evaluated at request-time or at response-time. You can configure both request-time and response-time classic compression policies for an application unit. After evaluating all of the request-time policies, if no match is found, the appliance evaluates response-time policies.
   - To modify a compression policy that is already bound to the application unit, click the name of the policy, and then click **Modify Policy**. Then, in the Configure Compression Policy dialog box, modify the policy, and then click OK.
     For information about modifying a compression policy, see Compression.
   - To unbind a policy, click the name of the policy, and then click **Unbind Policy**.
   - To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
To regenerate assigned priorities, click **Regenerate Priorities**.

To insert a new policy, click **Insert Policy** and, in the list that is displayed in the **Policy Name** column, click **New Policy**. Then, in the **Create Compression Policy** dialog box, configure the policy, and then click **Create**.

For information about modifying a compression policy, see **Compression**.

If you are configuring a default syntax expression, do the following:

- In the **Goto Expression** column, select a Goto expression.
- In the **Invoke** column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.

4. Click **Apply Changes**, and then click **Close**.

**Configuring Caching Policies**

You can use only default syntax policies and expressions to configure Caching policies.

To configure Caching policies for an application unit:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Caching column.
3. In the **Configure Cache Policies** dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
   - Click either Request or Response, depending on whether you want the policy to be evaluated at request-time or at response-time.
     
     You can configure both request-time and response-time Caching policies for an application unit. After evaluating all of the request-time policies, if no match is found, the appliance evaluates response-time policies.
   - To modify a Caching policy that is already bound to the application unit, click the name of the policy, and then click **Modify Policy**. Then, in the **Configure Cache Policy** dialog box, modify the policy, and then click **OK**.
     
     For information about modifying a Caching policy, see **Integrated Caching**.
   - To unbind a policy, click the name of the policy, and then click **Unbind Policy**.
   - To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
   - To regenerate assigned priorities, click **Regenerate Priorities**.
   - To insert a new policy, click **Insert Policy** and, in the list that is displayed in the Policy Name column, click **New Policy**. Then, in the **Create Cache Policy** dialog box, configure the policy, and then click **Create**.
     
     For information about modifying a Caching policy, see **Integrated Caching**.
   - In the Goto Expression column, select a Goto expression.
• In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.

4. Click **Apply Changes**, and then click **Close**.

**Configuring Rewrite policies**

You can use only default syntax policies and expressions to configure Rewrite policies.

To configure Rewrite policies for an application unit:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Rewrite column.
3. In the **Configure Rewrite Policies** dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
   • Click either Request or Response, depending on whether you want the policy to be evaluated at request-time or at response-time.
     You can configure both request-time and response-time Rewrite policies for an application unit. After evaluating all of the request-time policies, if no match is found, the appliance evaluates response-time policies.
   • To modify a Rewrite policy that is already bound to the application unit, click the name of the policy, and then click **Modify Policy**. Then, in the Configure Rewrite Policy dialog box, modify the policy, and then click **OK**.
     For information about modifying a Rewrite policy, see **Rewrite**.
   • To unbind a policy, click the name of the policy, and then click **Unbind Policy**.
   • To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
   • To regenerate assigned priorities, click **Regenerate Priorities**.
   • To insert a new policy, click **Insert Policy** and, in the list that is displayed in the **Policy Name** column, click **New Policy**. Then, in the **Create Rewrite Policy** dialog box, configure the policy, and then click **Create**.
     For information about modifying a Rewrite policy, see **Rewrite**.
   • In the Goto Expression column, select a Goto expression.
   • In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.
4. Click **Apply Changes**, and then click **Close**.

**Configuring Responder policies**

You can use only default syntax policies and expressions to configure Responder policies.
To configure Responder policies for an application unit:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Responder column.
3. In the **Configure Responder Policies** dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
   - To modify a Filter policy that is already bound to the application unit, click the name of the policy, and then click **Modify Policy**. Then, in the **Configure Responder Policy** dialog box, modify the policy, and then click **OK**. For information about modifying a Responder policy, see **Responder**.
   - To unbind a policy, click the name of the policy, and then click **Unbind Policy**.
   - To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
   - To regenerate assigned priorities, click **Regenerate Priorities**.
   - To insert a new policy, click **Insert Policy** and, in the list that is displayed in the **Policy Name** column, click **NewPolicy**. Then, in the **Create Responder Policy** dialog box, configure the policy, and then click **Create**. For information about modifying a Responder policy, see **Responder**.
   - In the Goto Expression column, select a Goto expression.
   - In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.
4. Click **Apply Changes**, and then click **Close**.

**Configuring Application Firewall policies**

You can configure both classic and default syntax policies and expressions for Application Firewall. However, if a policy of one type is already bound globally or to a virtual server that is configured on the appliance, you cannot bind a policy of the other type to an application unit. For example, if a default syntax policy is already bound either globally or to a virtual server, you cannot bind a classic policy to an application unit.

To configure Application Firewall policies for an application unit:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Application Firewall column.
3. In the **Configure Application Firewall Policies** dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
   - Click either Classic Expression or Advanced Expression depending on the type of expression you want to configure for the Application Firewall policy.
Important: This setting also determines what policies are displayed when you want to insert a policy. For example, if you select Advanced Expression, when you click Insert Policy, the list that appears in the Policy Name column will include only default syntax policies. You cannot bind policies of both types to an application unit. This option is not available if a policy of either type is already bound either globally or to a virtual server.

- To modify an application firewall policy that is already bound to the application unit, click the name of the policy, and then click Modify Policy. Then, in the Configure Application Firewall Policy dialog box, modify the policy, and then click OK.
  For information about modifying a application firewall policy, see Policies.
- To unbind a policy, click the name of the policy, and then click Unbind Policy.
- To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
- To regenerate assigned priorities, click Regenerate Priorities.
- To insert a new policy, click Insert Policy and, in the list that is displayed in the Policy Name column, click New Policy. Then, in the Create Application Firewall Policy dialog box, configure the policy, and then click Create.
  For information about modifying a application firewall policy, see Policies.

4. Click Apply Changes, and then click Close.

Create application units

September 24, 2018

You might need to add application units for traffic subsets that are either specific to your web application implementation or not defined in the template. When creating an application unit, you must configure a rule for the application unit.

To create an application unit for the AppExpert application:

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click the application for which you want to add an application unit, and then click Add.
3. In the Applications page, go to Application Units section and click the pencil icon.

To configure policy expressions for an application unit:

1. Navigate to AppExpert > Applications.
2. In the details pane, right-click the application for which you want to add an application unit, and then click Add.
3. In the Applications** page, go to Application Units** section and click the **+ icon. to create a unit and add policy expressions.
4. To specify the format of the new expression, do one of the following:
   a) To specify that you want to configure a classic expression in the Rule box, click Classic Syntax.
   b) To specify that you want to configure an advanced expression in the Rule box, click Default Syntax.
   c) In the Rule box, configure the expression.
5. Click **OK**.

**Configuring public endpoints for an application**

September 24, 2018

To configure public endpoints for an application by using the GUI:

1. Navigate to AppExpert > Applications, select an application entity, and then click **Edit**.
2. In the Public Endpoint section, click + to configure a new public endpoint.
3. In the Public Endpoint slider, do one of the following:
   a) Click **New** to create a new endpoint.
   b) Click **Existing Public Endpoint** to select an endpoint from the drop-down list.
4. Set the following endpoint parameters:
   a) Name
   b) IP address
   c) Protocol
   d) Port
5. Click **Continue** to configure additional settings such as application units, GSLB server bindings, policies, profiles, push, traffic settings, and authentication.
6. Click **OK** and then **Done**.
7. Click **Continue** and then **Done**.

To edit a public endpoint for an application by using the GUI:

Navigate to AppExpert > Applications, select an application, and click **Edit**. In the Public Endpoint section, select an endpoint, click the pen icon, and modify the endpoint settings.

To delete a public endpoint for an application by using the GUI:

Navigate to AppExpert > Applications > Public Endpoint, click the pen icon to view the delete icon next to the entity.

NetScaler’s video tutorials enable you to understand NetScaler features in an easy and simply way. Watch <https://www.youtube.com/watch?v=z4v-edQiVpw> video to learn how to configure a public endpoint.
Specifying the Order of Evaluation of Application Units

September 24, 2018

Application unit rules are evaluated in the order in which they are placed in the GUI. The rule that is configured for the topmost application unit is always configured first, followed by the rule that is configured for the second topmost application unit, and so on. The default application unit is always evaluated last.

When a request matches the rule that is configured for an application unit, the request is processed by the application unit, and no further matching is performed. Therefore, the order of evaluation of application units becomes an important factor if the traffic subsets for two or more application units overlap. If the traffic subsets for two or more application units overlap, you must specify the order in which an incoming request is matched against the application unit rules.

To specify the order of evaluation of application units:

1. Navigate to AppExpert > Applications, select an application and click Edit. In the Application Unit section, click the Pencil icon and then hover the cursor over the check box to the left of the name of the application unit. Click the icon that appears next to the check box and hold down the mouse to drag the application up or down to a new location in the priority list.

Configuring Persistency Groups for Application Units

September 24, 2018

You can configure a persistency group for the application units in an AppExpert application. In the context of an AppExpert application, a persistency group is a group of application units that you can treat as a single entity for the purpose of applying common persistence settings. When the application is exported to an application template file, the persistency group settings are included, and they are automatically applied to the application units when you import the AppExpert application.

To configure a persistency group for an application by using the GUI:

1. Navigate to AppExpert > Applications.
2. In the Applications View dialog box, click the name of the application for whose application units you want to configure a persistency group, and then click Configure Persistency Groups.
3. In the Configure Persistency Groups dialog box, do one of the following:
   • To add a persistency group, click Add.
   • To modify a persistency group, click Open.
4. In the Create Persistency Group or Configure Persistency Group dialog box, set the following parameters:
NetScaler 12.0

• Group Name—Name of the persistency group. For the NetScaler appliance to recognize the persistency group as part of the application’s configuration, the name of the AppExpert application must be included in the name of the persistency group, as a prefix. Therefore, by default, the appliance displays the prefix in the Group Name box, and you cannot remove that prefix. Enter a name of your choice after the prefix.

• Persistence—Type of persistence for the virtual server. If you select SOURCEIP, in the IPv4 Netmask box, enter a network mask that specifies the number of bits that the appliance must consider when creating persistence sessions. If you select COOKIEINSERT, in the Cookie Domain and Cookie Name boxes, specify a domain attribute to send in the Set-Cookie directive, and a name for the cookie, respectively.

• Timeout—Time period for which a persistence session is in effect.

• Backup Persistence—Type of backup persistence for the group.

• Backup Timeout—Time period, in minutes, for which backup persistence is in effect.

• Application Units—To add an application unit to the persistency group, in the Available Application Units box, click the application unit, and then click Add. To remove an application unit from the persistency group, in the Configured Application Units box, click the application unit, and then click Remove.

5. Click OK.

Viewing AppExpert Applications and Configuring Entities by Using the Application Visualizer

September 24, 2018

The Visualizer feature shows you a graphical representation of an application’s configuration. It includes the name of the public endpoint, application units assigned to the public endpoint, and the number of policies and services bound to the application. You can use the Visualizer to obtain a visual overview of an AppExpert application’s configuration and configure some of the displayed entities. By default, the Visualizer displays application units, services, and monitors for the selected application.

To view an AppExpert application by using the Application Visualizer:

1. Navigate to AppExpert > Applications, select an application entity, and click Visualizer.

AppQoE

September 24, 2018

Application level Quality of Experience (AppQoE) integrates several existing policy-based security features of the NetScaler appliance into a single integrated feature that takes advantage of a new queuing
mechanism, fair queuing. Fair queuing manages requests to load-balanced web servers and applications at the virtual server level instead of at the service level, allowing it to handle queuing of all requests to a web site or application as one group before load balancing, instead of as separate streams after load balancing.

The features that are integrated into AppQoE are HTTP Denial-of-Service Protection (HDOSP), Priority Queuing (PQ), and SureConnect. Collectively these services provide protection against a number of problems:

- **Simple overload.** Any server, no matter how robust, can accept only a limited number of connections at one time. When a protected web site or application receives too many requests at once, the Surge Protection feature detects the overload and queues the excess connections till the server can accept them. The Priority Queuing feature ensures that whoever most needs access to a resource is provided access without having to wait behind other lower-priority requests. The SureConnect feature displays an alternate web page that notifies users that the resource that they requested is not available.

- **Denial-of-Service (DOS) attacks.** Any public-facing resource is vulnerable to attacks whose purpose is to bring that service down and deny legitimate users access to it. The Surge Protection, Priority Queuing, and SureConnect features help manage DOS attacks as well as other types of high load. In addition, the HTTP Denial-of-Service Protection feature targets DOS attacks against your web sites, sending challenges to suspected attackers and dropping connections if the clients do not send an appropriate response.

Until the current version of the NetScaler operating system, these features were implemented at the service level, which means that each service was assigned its own queues. While service-level queues work, they also have some disadvantages, most of which are due to the NetScaler appliance having to load balance requests before implementing any of the protection features that rely on queuing. Implementing protection features before queuing has a number of advantages, some of which are listed below:

- Absolute priority of connections as configured in the priority queuing feature can be maintained.
- Connections are not flushed if a service transitions state, as they are in a service-level queue.
- During periods of high load, such as a denial-of-service attack, HTTP DoS and SureConnect come into play before load balancing, allowing these features to detect and divert unwanted or lower-priority traffic from the load balancer before the load balancer must cope with it.

In addition to implementing fair queuing, AppQoE integrates a set of features that each provide a different set of tools to achieve a common goal: protecting your networked resources from excessive or inappropriate demand. Putting these features into a common framework enables you to configure and implement them more easily.
Enabling AppQoE

September 24, 2018

To configure AppQoE, you must first enable the feature.

To enable AppQoE by using the command line

At the command prompt, type the following commands:

- enable ns feature appqoe
- show ns feature

Example:

```
1 > enable ns feature appqoe
2   Done
3 > show ns feature
4
5   Feature   Acronym   Status
6   ------   -------   -----
7   1) Web Logging   WL   ON
8   2) Surge Protection   SP   ON
9   3) Load Balancing   LB   ON
10  ...
11  1) AppQoE   AppQoE   ON
12  Done
```

To enable AppQoE by using the GUI

1. Navigate to System > Settings.
2. In the details pane, click Configure Advanced Features.
3. In the Configure Advanced Features dialog box, select the AppQoE check box.
4. Click OK.

AppQoE actions

September 24, 2018

After enabling the AppQoE feature, you must configure one or more actions for handling requests.
Important: No specific individual parameters are required to create an action, but you must include at least one parameter or you cannot create the action.

To configure an AppQoE action by using the command line

At the command prompt, type the following commands:

- `show appqoe action`

Example

To configure priority queuing with policy queue depths of 10 and 1000 for medium and lowest priority queues, respectively:

```
1 > add appqoe action appqoe-act-basic-prhigh -priority HIGH
2  Done

4 > add appqoe action appqoe-act-basic-prmedium -priority MEDIUM -polqDepth 10
5  Done

7 > add appqoe action appqoe-act-basic-prlow -priority LOW -polqDepth 1000
8  Done

10 > show appqoe action
11 1) Name: appqoe-act-basic-prhigh
12     ActionType: PRIORITY_QUEUING
13    Priority: HIGH
14    PolicyQdepth: 0
15       Qdepth: 0
16
17 2) Name: appqoe-act-basic-prmedium
18    ActionType: PRIORITY_QUEUING
19    Priority: MEDIUM
20    PolicyQdepth: 10
21       Qdepth: 0
22
23 3) Name: appqoe-act-basic-prlow
```
To modify an existing AppQoE action by using the command line

At the command prompt, type the following commands:

- `show appqoe action`

To remove an AppQoE action by using the command line

At the command prompt, type the following commands:

- `rm appqoe action <name>`
- `show appqoe action`

Parameters for configuring an AppQoE action

- **name**
  A name for the new action, or the name of the existing action that you want to modify. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols.
- **priority**
  The priority queue to which the request is assigned. When a protected web server or application is heavily loaded and cannot accept additional requests, specifies the order in which waiting requests are to be fulfilled when resources are available. The choices are:
  1. **HIGH.** Fulfills the request as soon as resources are available.
  2. **MEDIUM.** Fulfills the request after it has fulfilled all requests in the HIGH priority queue.
  3. **LOW.** Fulfills the request after it has fulfilled all requests in the HIGH and MEDIUM priority queues.
4. **LOWEST.** Fulfills the request only after it has fulfilled all requests in higher-priority queues.

If priority is not configured, then the NetScaler appliance assigns the request to the LOWEST priority queue by default.

- **respondWith**

  Configures the NetScaler to take the specified Responder action when the specified threshold is reached. Must be used with one of the following settings:

  - **ACS:** Serves content from an alternate content service. Threshold: maxConn (maximum connections) or delay.
  - **NS:** Serves a built-in response from the NetScaler. Threshold: maxConn (maximum connections) or delay.
  - **NO ACTION:** Serves no alternative content. Assigns connections to the LOWEST priority queue if the maxConn (maximum connections) or delay threshold is reached.

- **altContentSvcName**

  If
  
  -responseWith ACS is specified, the name of the alternative content service, usually an absolute URL to the web server that hosts the alternate content.

- **altContentPath**

  If
  
  -responseWith ( ACS | NS ) is specified, the path to the alternative content.

- **polqDepth**

  Policy queue depth threshold value for the policy queue associated with this action. When the number of connections in the policy queue associated with this action increases to the specified number, subsequent requests are assigned to the LOWEST policy queue. Minimum value: 1 Maximum value: 4,294,967,294

- **priqDepth**

  Policy queue depth threshold value for the specified priority queue. If the number of requests in the specified queue on the virtual server to which the policy associated with the current action is bound increases to the specified number, subsequent requests are assigned to the LOWEST priority queue. Minimum value: 1 Maximum value: 4,294,967,294

- **maxConn**

  The maximum number of connections that can be open for requests that match the policy rule. Minimum value: 1 Maximum value: 4,294,967,294

- **delay**
The delay threshold, in microseconds, for requests that match the policy rule. If a matching request has been delayed for longer than the threshold, the NetScaler appliance performs the specified action. If NO ACTION is specified, then the appliance assigns requests to the LOWEST priority queue. Minimum value: 1 Maximum value: 599999,999

- dosTrigExpression
  Adds an optional second-level check to trigger DoS actions.

- dosAction
  Action to take when the ADC determines that it or a protected server is under DoS attack. Possible values: SimpleResponse, HICResponse.

These values specify HTTP challenge-response methods for validating the authenticity of incoming requests to mitigate an HTTP-DDoS attack.

In the HTTP challenge-response generation and validation process, AppQoE uses cookies to validate the client’s response and verify that the client seems to be genuine. When sending a challenge, a NetScaler appliance generates two cookies:

Header cookie (_DOSQ). Contains client-specific information, so that the NetScaler appliance can verify the response.

Body cookie (_DOSH). Information used to validate the client machine. The client’s browser (or the user, in the case of HIC) computes a value for this cookie. The NetScaler appliance compares that value with the expected value to verify the client.

The information that the appliance sends to the client for computing the _DOSH value is based on the DoS Action configuration.

1. SimpleResponse: In this case, a NetScaler appliance splits the value and generates a JavaScript code to combine the final value. A client machine capable of computing the original value is considered genuine.

2. HICResponse: in this case, a NetScaler appliance generates two single-digit numbers and generates images for those numbers. Then, using a backpatch framework, the appliance inserts those images as base64 strings.

Limitations:

1. This is not a trivial CAPTCHA implementation, which is why that term not used.

2. The validation number is based on a NetScaler-generated number that does not change for 120s. This number should be dynamic or client specific.

To configure an AppQoE action by using the GUI

1. Navigate to App-Expert > AppQoE > Actions.
2. In the details pane, do one of the following:
   • To create a new action, click **Add**.
   • To modify an existing action, select the action, and then click **Edit**.

3. In the **Create AppQoE Action** or the **Configure AppQoE Action** screen, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in “Parameters for configuring the AppQoE Action” as follows (asterisk indicates a required parameter):
   • Name—name
     • Action type—respondWith
   • Priority—priority
   • Policy Queue Depth—polqDepth
   • Queue Depth—priqDepth
   • DOS Action—dosAction

4. Click **Create** or **OK**.

**AppQoE parameters**

September 24, 2018

In the AppQoE parameters, you configure the session life of an AppQoE session, the file name of the file containing the customized response, and the number of client connections that can be placed in a queue.

**To configure the AppQoE parameter settings by using the command line**

At the command prompt, type the following commands:

```plaintext
• set appqoe parameter [-sessionLife <secs>] [-avgwaitingclient <positive_integer>]
  [-MaxAltRespBandWidth <positive_integer>] [-dosAttackThresh <positive_integer>]
• show appqoe parameter
```

**Parameters for configuring the AppQoE parameters**

- **sessionLife**
  
  Number of seconds to wait after displaying alternate content before the ADC displays the same content again. Default value: 300 Maximum Minimum value: 1 Maximum value: 4,294,967,294

- **avgwaitingclient**
The average number of client requests that can be in the service waiting queue. Default value: 1000000 Maximum value: 4,294,967,294

- MaxAltRespBandWidth

The maximum bandwidth to consume when sending alternate responses. If the maximum is reached, the ADC quits sending the alternate content till bandwidth consumption drops. Default value: 100 Minimum value: 1 Maximum value: 4,294,967,294

- dosAtckThrsh

The denial-of-service attack threshold. The number of connections that must be waiting in queues before the ADC responds with DoS protection measures. Default value: 2000 Minimum value: 0 Maximum value: 4,294,967,294

To configure the AppQoE parameter settings by using the GUI

1. Navigate to AppExpert > AppQoE.
2. In the details pane, click Configure AppQoE Parameters.
3. In the Configure AppQoE params screen, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in “Parameters for configuring the AppQoE Parameters” as follows (asterisk indicates a required parameter):
   - Session Life (secs) — sessionLife
   - Average waiting client — avgwaitingclient
   - Alternate Response Bandwidth Limit (Mbps) — MaxAltRespBandWidth
   - DOS Attack Threshold — dosAttckThresh
4. Click OK.

AppQoE Policies

September 24, 2018

To implement AppQoE, you must configure at least one policy to tell your NetScaler how to distinguish the connections to be queued in a specific queue.

To configure an AppQoE policy by using the command line

At the command prompt, type the following command:

```
add appqoe policy <name> -rule <expression> -action <string>
```

Example:
The following example selects requests with a User-Agent header that contains “Android”, and assigns them to the medium priority queue. These requests come from smartphones and tablets that run the Google Android operating system.

```
1 > add appqoe action appqoe-act-primd -priority MEDIUM
2 Done
3 > add appqoe policy appqoe-pol-primd -rule "HTTP.REQ.HEADER("User-Agent ").CONTAINS("Android")" -action appqoe-act-primd
4 Done
5 > sh appqoe policy appqoe-pol-primd
6 Name: appqoe-pol-primd
7 Rule: HTTP.REQ.HEADER("User-Agent").CONTAINS("Android")
8 Action: appqoe-act-primd
9 Hits: 0
10 Done
```

### Parameters for configuring an AppQoE policy

- **name**
  
  A name for the AppQoE policy. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. You should chose a name that helps identify the type of action.

- **rule**
  
  A NetScaler expression that tells the appliance which connections it should handle. For complete information about policy expressions, see the [NetScaler Policy Configuration and Reference Guide](#).

- **action**
  
  The AppQoE action to perform when a connection matches the policy.

### To configure an AppQoE policy by using the GUI

1. Navigate to **App-Expert > AppQoE > Policies**.
2. In the details pane, do one of the following:
   - To create a new policy, click **Add**.
To modify an existing policy, select the policy, and then click Edit.

3. If you are creating a new policy, in the Create AppQoE Policy dialog, in the Name text box, type a name for your new policy. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.), pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) symbols. You should choose a name that helps identify the purpose and effect of this policy. If you are modifying an existing policy, skip this step. You cannot change the name of an existing policy.

4. In the Action drop-down list, choose the AppQoE action to perform when the policy matches a connection. Click the plus (+) to open the Add AppQoE Action dialog and add a new action.

5. In the Rule text box, either enter the policy expression directly, or click New to create a policy expression. If you click New, perform the following steps:
   a) In the Create Expression dialog box, click Add.
   b) In the Add Expression dialog box, select a common expression from the Frequently Used Expressions drop-down list, or use the Construct Expression drop-down lists to create the expression that defines which traffic to filter.
      If you choose to create your own expression, you start by selecting the first term from the first drop-down list on the left side of the Construct Expression area. The choices in that list are:
      - HTTP: All traffic to port 80 and port 443.
      - SYS:
      - CLIENT:
      - SERVER:
      - ANALYTICS:
      - TEXT:
      The default choice is HTTP. After you make a choice in the first drop-down list (or accept the default), you can choose the next term in your expression from the drop-down list to the right of it. The terms in that list and other lists that follow change depending on your previous choices; the lists offer only terms that are valid choices. Continue to select terms until you have finished the expression.
      Use the Help and Preview Expression areas for assistance when creating the expression. For a complete description of the available choices, see the NetScaler Policy Configuration and Reference Guide at .
   c) When you have created the expression that you want, click OK. The expression is added in the Expression text box.
6. Click **Create**. The expression appears in the **Rule** text box.

**Entity templates**

September 24, 2018

An entity template is a collection of configuration information for an individual entity on a NetScaler® appliance. It provides a specification and a set of defaults for a configurable NetScaler entity, such as a policy, virtual server, service, or action. By using a template that defines a set of defaults, you can quickly configure multiple entities that require a similar configuration while eliminating several configuration steps.

Entity templates are available only in the GUI. You use the NetScaler GUI to create, manage, and use any type of entity template. You can share entity templates with other administrators and manage local folders that contain the templates. You can also import entity templates from and export entity templates to your local computer.

Before creating a template, you should be familiar with the configuration of the entity.

Note: You use entity templates to configure individual entities. To configure multiple entities related to a particular Web application, you must use an application template. For more information, see “**AppExpert Applications and Templates**.”

**How Entity Templates Work:**

When you create a template for a NetScaler entity, you specify default values for the entity. You specify what values must be read-only, what values must not be displayed, and what values users can configure. You also configure the pages that compose the template import wizard. All the information and settings you provide are stored in the template file.

When a user imports the entity template to a NetScaler appliance, a wizard guides the user through the various pages that you configured for the template. The wizard displays the read-only parameter values and prompts the user to specify values for the configurable parameters. After the user follows the instructions in the wizard, the appliance creates the entity with the configured values.

For example, you can create an entity template for HTTP services that provides a text box for a service name and assigns preset values for the service protocol, timeouts, thresholds, and monitors. Later, when you use the template to create new HTTP services, a wizard prompts you for a service name and supplies the preset values that you would otherwise have configured manually.

The procedure for creating entity templates for load balancing virtual servers is different than the App-Expert procedure for creating other entity templates. For more information, see “**Creating an Entity Template**.”

In addition, the procedure for using the template to create the load balancing virtual server entity is different. For more information, see “**Creating an Entity from a Template**.”
Configuring an entity template

September 24, 2018

You can create or modify an entity template either from the AppExpert feature node or from the associated NetScaler feature node for the entity. For example, you can create a content switching virtual server entity template in either the AppExpert feature node or the content switching feature node in the GUI.

If you create a template that is not based on an existing entity, you can specify the following options and settings for the template:

- The default value of a parameter.
- Whether the default values are visible to users.
- Whether the default values can be changed by users.
- The number of pages in the entity import wizard, including the page names, text, and available parameters.
- The entities that must be bound to the entity for which the template is being created.

For example, when you are creating a cache redirection virtual server template, you can specify the policies that you want to bind to the cache redirection virtual servers that you create from the template. However, only binding information is included in the template. The bound entities are not included. If the entity template is imported to another NetScaler appliance, the bound entities must exist on the appliance at import time for the binding to succeed. If none of the bound entities exist on the target appliance, the entity (for which the template was configured) is created without any bindings. If only a subset of the bound entities exist on the target appliance, they are bound to the entity that is created from the template.

When you create a template based on an existing entity, the configuration settings of the entity appear in the template. All bound entities are selected by default, but you can modify bindings as necessary. As in the case of a template that is not based on an existing entity, only binding information is included and not the entities. You can either save the template with the existing configuration settings or use the settings as a basis for creating a new configuration for a template.

Configuring variables in load balancing virtual server templates

January 6, 2019

Load balancing virtual server templates support the declaration of variables in the configured load balancing parameters and in bound policies and actions. The ability to declare variables enables you to replace preconfigured values with values that suit the environment into which you are importing
the template. The Entity Template Wizard, which appears when you import a template, includes a Specify Variable Values page on which you can specify appropriate values for the variables that are configured for the entity template. This wizard page appears only when you import a template that is configured with existing variables.

As an example, consider the following expression configured for a policy that is bound to a load balancing virtual server for which you are creating a template. The expression evaluates the value of the Accept-Language header in an HTTP request.

```
HTTP.REQ.HEADER("Accept-Language").CONTAINS("en-us")
```

If you want the value of the header to be configurable at import time, you can specify the string en-us as a variable. When importing the template, you can specify a new value for the variable on the Specify Variable Values page.

After you create a variable, you can do the following:

- Assign additional strings to an existing variable. After you create a variable for a string, you can select and assign other parts of the same or different expression to the variable. The strings you assign to a variable need not be the same. At import time, all the strings that are assigned to the variable are replaced with the value that you provide.
- View the string or strings that are assigned to the variable.
- View a list of all the entities and parameters that use the variable.

**To configure variables in a load balancing virtual server template**

1. Navigate to Traffic Management > Load Balancing > Virtual Servers
2. In the details pane, right-click the virtual server that you want to export to a template file, and then click Create Template.
3. In the Create Template dialog box, modify the default template file name if required, specify the location where you want to save the template, and then click Configure Variables.
4. In the Configure Variables dialog box, click the tab that lists the entity for which you want to configure a variable, select the entity, and then click Configure Variables.
5. In the Variables for Entity Type: Entity Name dialog box, click the button next to the parameter value or expression in which you want to create a variable.
6. In the variables for Field Name dialog box, do the following:
   - To create a variable, in the text box that displays the configured expression or value, select the string that you want to be configurable at import time, and then click Add. In the Create Variable dialog box, specify a name and a description for the variable, and then click Create.
The name of the variable, its value, and the description you provided appear in the Available Variables listing in the dialog box. The name you provide will be the name of the associated field in the template import wizard, and the description will appear as alt text when the user positions the mouse pointer over the field.

- To modify a variable, in the Available Variables list, click the variable, and then click **Open**. In the **Create Variable** dialog box, modify the value and the description, and then click **OK**.

The new value that you specify will not replace the text selected in the text box that displays the configured expression or value. However, when you import the template, the new value will be displayed as the default value for the variable in the template import wizard.

- To view all the strings that are assigned to a given variable, in the Available Variables listing, click the name of the variable. The strings that are assigned to the variable are highlighted.

- To view a list of all the parameters, expressions, and actions in which the variable is used, in the Available Variables listing, click the variable whose references you want to view, and then click **Show References**.

- To assign a string to an existing variable, in the text box that displays the expression you configured, select the string you want to assign to an existing variable, right-click the selection, click **Use existing Variable**, and then click the name of the variable to which you want to assign the string.

If a variable has multiple strings assigned to it, when you specify a new value for the variable during import, all strings assigned to the variable are replaced with the new value.

7. Click **Close**.

---

**Modifying an entity template**

September 24, 2018

You can modify only the parameters, bindings, and pages configured for a template. The name and location of the template specified when the template was created cannot be changed. The NetScaler appliance does not provide you with the option of modifying a load balancing virtual server template.

**To modify an entity template by using the AppExpert feature node**

1. Navigate to **AppExpert > Templates**.
2. In the details pane, on the **Entity Templates** tab, select the template you want to change, and then click **Open**.
3. In the **Modify…Template** dialog box, follow the instructions to modify a template.
4. Click Finish, and then click Exit.

**To modify an entity template by using its corresponding feature node**

1. Navigate to Traffic Management, select the feature (for example, Content Switching), and then select the entity (for example, Virtual Servers) for which you want to modify the entity template.
2. At the top of the details pane, click Entity Templates, and then click Manage Template.
3. In the Manage <feature entity name> Entity Templates dialog box, select the template that you want to modify, and then click Modify.
4. In the Modify <template name> Template dialog box, follow the instructions to modify a template.
5. Click Finish, and then click Exit.
6. Click Close.

**Deleting an entity template**

September 24, 2018

Deleting an entity template does not affect any objects that have been created by using the template. You can delete a load balancing virtual server template only from the AppExpert feature node.

**To delete an entity template by using the AppExpert feature node**

1. Navigate to AppExpert > Templates.
2. In the details pane, on the Entity Templates tab, click the template you want to delete, and then click Remove.

**To delete an entity template by using its corresponding feature node**

1. Navigate to Traffic Management, and select the feature (for example, Content Switching) and then select the entity (for example, Virtual Servers), for which you want to delete the entity template.
2. At the top of the details pane, click Entity Templates, and then click Manage Template.
3. In the Manage…Entity Templates dialog box, select the template that you want to delete, and then click Delete.
NetScaler 12.0

Creating an entity from a template

September 24, 2018

You can create an entity from an entity template either from the AppExpert feature node in the NetScaler GUI or from the NetScaler feature node that corresponds to the type of entity that you want to create. For example, you can create a content switching virtual server from a template with either the AppExpert feature node or the content switching feature node in the GUI.

The procedure for creating a load balancing virtual server from a template is different than the App-Expert procedure for creating other entities from templates.

After you create an instance of an entity using an entity template, you can configure it in the same way that you would any other object of that type, such as by using the GUI or the command line.

To create an entity from a template by using the AppExpert feature node

1. Navigate to AppExpert > Templates.
2. In the details pane, do one of the following:
   a) To create any entity other than a load balancing virtual server from a template, on the Entity Templates tab, click the template that you want to use, and then click Use Template.
   b) To create a load balancing virtual server from a template, on the LB Templates tab, click the template that you want to use, and then click Use Template.
3. In the <Entity Template Name> wizard, follow the instructions to create the entity on the NetScaler.
4. Click Finish, and then click Exit.

To create an entity from a template by using its corresponding feature node

1. Navigate to Traffic Management, and expand a feature node (for example, Content Switching), and then click an entity subnode (for example, Virtual Servers).
2. At the top of the details pane, click Entity Templates, and then click Use Template.
3. Click the name of the template that you want to use.
4. In the Use <template name> Template wizard, follow the instructions to create the entity.
   Only templates that match the current context are displayed. For example, in the details pane for content switching virtual servers, only entity templates for content switching virtual servers appear, if configured.
5. Click Finish, and then click Exit.
To create a load balancing virtual server by using a load balancing virtual server template

2. In the details pane, click Use Template.
3. In the Entity Template Wizard, follow the instructions to create a load balancing virtual server on the NetScaler.
   
   Only templates that match the current context are displayed. For example, when you click Browse (Appliance), only entity templates for load balancing virtual servers appear, if configured.
4. Click Finish, and then click Exit.

   Note: The Entity Template Wizard includes a Specify Variable Values page on which you can specify new values for variables. For more information about configuring variables in load balancing virtual server templates, see Configuring Variables in Load Balancing Virtual Server Templates.”

Managing entity template folders

September 24, 2018

You can organize only load balancing virtual server template folders.

To organize load balancing virtual server template folders

1. Navigate to AppExpert > Templates > LB Templates.
2. In the Manage LB Templates dialog box do one of the following:
   
   • To change the name of a folder, select the folder and click Rename.
     
     You can also click the folder that you want to rename, and then press F2. You cannot rename the top-level default folder.
   
   • To remove the folder, select the folder and click Delete.

   1 You can also click the folder that you want to remove, and then press the Delete key. You cannot remove the top-level default folder.

3. Click Close.
Uploading and downloading entity templates

September 28, 2018

You can import the entity templates that are stored on your local computer. You can also download entity templates from the NetScaler appliance to your local computer and then import them to other NetScaler appliances.

To upload an entity template to the NetScaler appliance

1. Navigate to Traffic Management, and expand a feature node (for example, Content Switching), and then click a subnode (for example, Virtual Servers) for which you want to upload an entity template.
2. At the top of the details pane, click Entity Templates, and then click Manage Template.
3. In the Manage…Entity Templates dialog box, click the top-level folder, and then click Upload.
4. In the Upload Entity Template dialog box, navigate to the template file that you want to upload, and then click Select.
5. Click Close.

To download an entity template from the NetScaler appliance

1. Navigate to Traffic Management, and expand a feature node (for example, Content Switching), and then click a subnode (for example, Virtual Servers) for which you want to upload an entity template.
2. At the top of the details pane, click Entity Templates, and then click Manage Template.
3. In the Manage…Entity Templates dialog box, click the template that you want to download, and then click Download.
4. In the Download Entity Template dialog box, navigate to the location at which you want to save the template on your local computer, enter a file name, and then click Save.
5. Click Close.

Understanding load balancing entity templates and deployment files

September 24, 2018

Load balancing entity templates are created in the same way that NetScaler application templates are created. When you export a load balancing virtual server to a template file, the following two files are automatically created:
- **Load balancing virtual server template file.** Contains XML elements that store the values of the parameters that are configured for the load balancing virtual server. The file also contains XML elements for storing information about bound policies.
- **Deployment file.** Contains XML elements that store deployment-specific information such as services, service groups, and configured variables.

In the template and deployment files, each unit of configuration information is encapsulated in a specific XML element that is meant for that unit type. For example, the load balancing method parameter, `lbMethod`, is encapsulated within the `<lbmethod>` and `</lbmethod>` tags.

Note: After you export a load balancing virtual server, you can add elements, remove elements, and modify existing elements before importing the configuration information to a NetScaler appliance.

**Example of a load balancing virtual server template**

Following is an example of a template file that was created from a load balancing virtual server called “Lbvip”:

```xml
<?xml version="1.0" encoding="UTF-8" ?>
<template>
  <template_info>
    <entity_name>Lbvip</entity_name>
    <version_major>10</version_major>
    <version_minor>0</version_minor>
    <build_number>40.406</build_number>
  </template_info>
  <entitytemplate>
    <lbvserver_list>
      <lbvserver>
        <name>Lbvip</name>
        <servicetype>HTTP</servicetype>
        <ipv46>0.0.0.0</ipv46>
        <ipmask>*</ipmask>
        <port>0</port>
        <range>1</range>
        <persistencetype>NONE</persistencetype>
        <timeout>2</timeout>
        <persistencebackup>NONE</persistencebackup>
        <backuppersistencetimeout>2</backuppersistencetimeout>
        <lbmethod>LEASTCONNECTION</lbmethod>
        <persistmask>255.255.255.255</persistmask>
        <v6persistmasklen>128</v6persistmasklen>
      </lbvserver>
    </lbvserver_list>
  </entitytemplate>
</template>
```
Example of a deployment file

Following is the deployment file associated with the virtual server in the preceding example:

```xml
<?xml version="1.0" encoding="UTF-8" ?>
```
<template_deployment>
  <template_info>
    <entity_name>Lbvip</entity_name>
    <version_major>10</version_major>
    <version_minor>0</version_minor>
    <build_number>40.406</build_number>
  </template_info>
  <service_list>
    <service>
      <ip>1.2.3.4</ip>
      <port>80</port>
      <servicetype>HTTP</servicetype>
    </service>
  </service_list>
  <servicegroup_list>
    <servicegroup>
      <name>svcgrp</name>
      <servicetype>HTTP</servicetype>
      <servicegroup_servicegroupmember_binding_list>
        <servicegroup_servicegroupmember_binding>
          <ip>1.2.3.90</ip>
          <port>80</port>
        </servicegroup_servicegroupmember_binding>
        <servicegroup_servicegroupmember_binding>
          <ip>1.2.8.0</ip>
          <port>80</port>
        </servicegroup_servicegroupmember_binding>
        <servicegroup_servicegroupmember_binding>
          <ip>1.2.8.1</ip>
          <port>80</port>
        </servicegroup_servicegroupmember_binding>
        <servicegroup_servicegroupmember_binding>
          <ip>1.2.9.0</ip>
          <port>80</port>
        </servicegroup_servicegroupmember_binding>
      </servicegroup_servicegroupmember_binding_list>
    </servicegroup>
    <servicegroup>
    </servicegroup>
  </servicegroup_list>
</template_deployment>
For certain types of requests, or when certain criteria are met during policy evaluation, you might want to stall policy evaluation briefly, retrieve information from a server, and then perform a specific action that depends on the information that is retrieved. At other times, when you receive certain types of requests, you might want to update a database or the content hosted on a Web server. HTTP callouts enable you to perform all these tasks.

An HTTP callout is an HTTP or HTTPS request that the NetScaler appliance generates and sends to an external application when certain criteria are met during policy evaluation. The information that is retrieved from the server can be analyzed by default syntax policy expressions, and an appropriate action can be performed. You can configure HTTP callouts for HTTP content switching, TCP content switching, rewrite, responder, and for the token-based method of load balancing.

Before you configure an HTTP callout, you must set up an application on the server to which the callout will be sent. The application, which is called the **HTTP callout agent**, must be configured to respond to the HTTP callout request with the required information. The HTTP callout agent can also be a Web server that serves the data for which the NetScaler appliance sends the callout. You must make sure that the format of the response to an HTTP callout does not change from one invocation to another.

After you set up the HTTP callout agent, you configure the HTTP callout on the NetScaler appliance. Finally, to invoke the callout, you include the callout in a default syntax policy in the appropriate NetScaler feature and then bind the policy to the bind point at which you want the policy to be evaluated.

After you have configured the HTTP callout, you must verify the configuration to make sure that the callout is working correctly.

### How an HTTP callout works

January 6, 2019

When the NetScaler appliance receives a client request, the appliance evaluates the request against the policies bound to various bind points. During this evaluation, if the appliance encounters the HTTP callout expression, SYS.HTTP_CALLOUT(<name>), it stalls policy evaluation briefly and sends a request to the HTTP callout agent by using the parameters configured for the specified HTTP callout. Upon receiving the response, the appliance inspects the specified portion of the response, and then either performs an action or evaluates the next policy, depending on whether the evaluation of the response from the HTTP callout agent evaluates to TRUE or FALSE, respectively. For example, if the HTTP callout is included in a responder policy, if the evaluation of the response evaluates to TRUE, the appliance performs the action associated with the responder policy.

If the HTTP callout configuration is incorrect or incomplete, or if the callout invokes itself recursively, the appliance raises an UNDEF condition, and updates the undefined hits counter.
The following figure illustrates the working of an HTTP callout that is invoked from a globally bound responder policy. The HTTP callout is configured to include the IP address of the client that is associated with an incoming request. When the NetScaler appliance receives a request from a client, the appliance generates the callout request and sends it to the callout server, which hosts a database of blacklisted IP addresses and an HTTP callout agent that checks whether the client’s IP address is listed in the database. The HTTP callout agent receives the callout request, checks whether the client’s IP address is listed, and sends a response that the NetScaler appliance evaluates. If the response indicates that the client’s IP address is not blacklisted, the appliance forwards the response to the configured service. If the client’s IP address is blacklisted, the appliance resets the client connection.

Figure 1. HTTP Callout Entity Model

Notes on the format of HTTP requests and responses

September 24, 2018

The NetScaler appliance does not check for the validity of the HTTP callout request. Therefore, before you configure HTTP callouts, you must know the format of an HTTP request. You must also know the format of an HTTP response, because configuring an HTTP callout involves configuring expressions that evaluate the response from the HTTP callout agent.

This section includes the following sections:

- Format of an HTTP Request
- Format of an HTTP Response

Format of an HTTP request

An HTTP request contains a series of lines that each end with a carriage return and a line feed, represented as either `<CR><LF>` or `
`.

The first line of a request (the message line) contains the HTTP method and target. For example, a message line for a GET request contains the keyword GET and a string that represents the object that is to be fetched, as shown in the following example:

```
GET /mysite/mydirectory/index.html HTTP/1.1\r\n
```

The rest of the request contains HTTP headers, including a required Host header and, if applicable, a message body.

The request ends with a blank line (an extra `<CR><LF>` or `
`).

Following is an example of a request:
Format of an HTTP Response

An HTTP response contains a status message, response HTTP headers, and the requested object or, if the requested object cannot be served, an error message.

Following is an example of a response:

```
HTTP/1.1 200 OK
Content-Length: 55
Content-Type: text/html
Last-Modified: Wed, 12 Aug 1998 15:03:50 GMT
Accept-Ranges: bytes
ETag: "04f97692cbd1:377"
Date: Thu, 19 Jun 2008 19:29:07 GMT

<55-character response>
```

Configuring an HTTP callout

November 2, 2018

When configuring an HTTP callout, you specify the type of request (HTTP or HTTPS), destination and format of the request, the expected format of the response, and, finally, the portion of the response that you want to analyze.

For the destination, you either specify the IP address and port of the HTTP callout agent or engage a load balancing, content switching, or cache redirection virtual server to manage the HTTP callout requests. In the first case, the HTTP callout requests will be sent directly to the HTTP callout agent. In the second case, the HTTP callout requests will be sent to the virtual IP address (VIP) of the specified virtual server. The virtual server will then process the request in the same way as it processes a client request. For example, if you expect a large number of callouts to be generated, you can configure instances of the HTTP callout agent on multiple servers, bind these instances (as services) to a load balancing virtual server, and then specify the load balancing virtual server in the HTTP callout configuration. The load balancing virtual server then balances the load on those configured instances as determined by the load balancing algorithm.
For the format of the HTTP callout request, you can specify the individual attributes of the HTTP callout request (an attribute-based HTTP callout), or you can specify the entire HTTP callout request as a default syntax expression (an expression-based HTTP callout).

Note: The appliance does not check for the validity of the request. You must make sure that the request is a valid request. An incorrect or incomplete HTTP callout configuration results in a runtime UNDEF condition that is not associated with an action. The UNDEF condition merely updates the Undefined Hits counter, which enables you to troubleshoot an incorrectly configured HTTP callout. However, the appliance parses the HTTP callout request to enable you to configure certain NetScaler features for the callout. This can lead to an HTTP callout invoking itself. For information about callout recursion and how you can avoid it, see “Avoiding HTTP Callout Recursion.”

Finally, regardless of whether you use HTTP request attributes or an expression to define the format of the HTTP callout request, you must specify the format of the response from the HTTP callout agent and the portion of the response that you want to evaluate. The response can be a Boolean value, a number, or text. The portion of the response that you want to evaluate is specified by an expression. For example, if you specify that the response contains text, you can use HTTP.RESP.BODY(<unit>) to specify that the appliance must evaluate only the first <unit> bytes of the response from the callout agent.

At the command line, you first create an HTTP callout by using the add command. When you add a callout, all parameters are set to a default value of NONE, except the HTTP method, which is set to a default value of GET. You then configure the callout’s parameters by using the set command. The set command is used to configure both types of callouts (attribute-based and expression-based). The difference lies in the parameters that are used for configuring the two types of callouts. Accordingly, the command-line instructions that follow include a set command for configuring an attribute-based callout and a set command for configuring an expression-based callout. In the GUI, all of these configuration tasks are performed in a single dialog box.

**Note:** Before you put an HTTP callout into a policy, you can modify all configured parameters except the return type. Once an HTTP callout is in a policy, you cannot completely modify an expression that is configured in the callout. For example, you cannot change

```
1 HTTP.REQ.HEADER("myval") to
2 CLIENT.IP.SRC. However, you can modify the operators and arguments that
   are passed to the expression. For example, you can change
3 HTTP.REQ.HEADER("myVal1") to
4 HTTP.REQ.HEADER("myVal2"), or
5 HTTP.REQ.HEADER("myVal") to
6 HTTP.REQ.HEADER("myVal").AFTER_STR(<string>). If the set command fails,
   create a new HTTP callout.
```
HTTP callout configuration involves configuring default syntax expressions.

To configure an HTTP callout by using the command line interface

At the command prompt, do the following:

1. Create a HTTP callout.

   ```bash
   add policy httpCallout <name>
   ```

   **Example**

   ```bash
   add policy httpCallout mycallout
   ```

1. Configure the details of the HTTP callout.

   - To configure an attribute-based HTTP callout, type:

     ```bash
     set policy httpCallout <name> [-vServer <string>] [-returnType <returnType>] [-httpMethod ( GET | POST )] [-hostExpr <string>] [-urlStemExpr <string>] [-headers <name=value> ...] [-parameters <name=value> ...] [-resultExpr <string>]
     ```

   **Example:**

   ```bash
   > set policy httpCallout mycallout -vserver lbv1 -returnType num -
   httpMethod GET -hostExpr 'http.req.header("Host")'
   > urlStemExpr "http.req.url" -parameters Name("My Name") -headers Name("MyHeader")
   > resultExpr "http.res.body(10000).length"
   ```

   - To configure an expression-based HTTP callout, type:

     ```bash
     set policy httpCallout <name> [-vServer <string>] [-returnType <returnType>] [-httpMethod ( GET | POST )] [-fullReqExpr <string>] [-resultExpr <string>]
     ```

   **Example:**

   ```bash
   > set policy httpCallout mycallout1 -vserver lbv1 -returnType num -
   httpMethod GET
   > fullReqExpr q{
   ```
3. Verify the configurations of the HTTP callout.

```bash
show policy httpCallout <name>
```

**To configure an HTTP callout by using the GUI**

1. Navigate to AppExpert > HTTP Callouts.
2. In the details pane, click Add.
3. In the Create HTTP Callout dialog box, configure the parameters of the HTTP callout. For a description of the parameter, hover the mouse cursor over the check box.
4. Click Create and then click Close.

**Verifying the Configuration**

January 6, 2019

For an HTTP callout to work correctly, all the HTTP callout parameters and the entities associated with the callout must be configured correctly. While the NetScaler appliance does not check the validity of the HTTP callout parameters, it indicates the state of the bound entities, namely the server or virtual server to which the HTTP callout is sent. The following table lists the icons and describes the conditions under which the icons are displayed.

<table>
<thead>
<tr>
<th>Icon</th>
<th>Indicates that</th>
</tr>
</thead>
<tbody>
<tr>
<td>![Icon]</td>
<td>The state of the server that hosts the HTTP callout agent, or the load balancing, content switching, or cache redirection virtual server to which the HTTP callout is sent is UP.</td>
</tr>
<tr>
<td>![Icon]</td>
<td>The state of the server that hosts the HTTP callout agent, or the load balancing, content switching, or cache redirection virtual server to which the HTTP callout is sent is OUT OF SERVICE.</td>
</tr>
</tbody>
</table>
NetScaler 12.0

<table>
<thead>
<tr>
<th>Icon</th>
<th>Indicates that</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The state of the server that hosts the HTTP callout agent, or the load balancing, content switching, or cache redirection virtual server to which the HTTP callout is sent is DOWN.</td>
</tr>
</tbody>
</table>

Table 1. Icons That Indicate the States of Entities Bound to an HTTP Callout

For an HTTP callout to function correctly, the icon must be green at all times. If the icon is not green, check the state of the callout server or virtual server to which the HTTP callout is sent. If the HTTP callout is not working as expected even though the icon is green, check the parameters configured for the callout.

You can also verify the configuration by sending test requests that match the policy from which the HTTP callout is invoked, checking the hits counter for the policy and the HTTP callout, and verifying the responses that the NetScaler appliance sends to the client.

Note: An HTTP callout can sometimes invoke itself recursively a second time. If this happens, the hits counter is incremented by two counts for each callout that is generated by the appliance. For the hits counter to display the correct value, you must configure the HTTP callout in such a way that it does not invoke itself a second time. For more information about how you can avoid HTTP callout recursion, see Avoiding HTTP Callout Recursion.

To view the hits counter for an HTTP callout

1. Navigate to AppExpert > HTTP Callouts.
2. In the details pane, click the HTTP callout for which you want to view the hits counter, and then view the hits in the Details area.

Invoking an HTTP Callout

September 24, 2018

After you configure an HTTP callout, you invoke the callout by including the `SYS.HTTP_CALLOUT(<name>)` expression in a default syntax policy rule. In this expression, `<name>` is the name of the HTTP callout that you want to invoke.

You can use default syntax expression operators with the callout expression to process the response and then perform an appropriate action. The return type of the response from the HTTP callout agent...
Determines the set of operators that you can use on the response. If the part of the response that you want to analyze is text, you can use a text operator to analyze the response. For example, you can use the CONTAINS(<string>) operator to check whether the specified portion of the response contains a particular string, as in the following example:

```csh
SYS.HTTP_CALLOUT(mycallout).contains("Good IP address")
```

If you use the preceding expression in a responder policy, you can configure an appropriate responder action.

Similarly, if the part of the response that you want to evaluate is a number, you can use a numeric operator such as GT(int). If the response contains a Boolean value, you can use a Boolean operator.

Note: An HTTP callout can invoke itself recursively. HTTP callout recursion can be avoided by combining the HTTP callout expression with a default syntax expression that prevents recursion. For information about how you can avoid HTTP callout recursion, see Avoiding HTTP Callout Recursion.

You can also cascade HTTP callouts by configuring policies that each invoke a callout after evaluating previously generated callouts. In this scenario, after one policy invokes a callout, when the NetScaler appliance is parsing the callout before sending the callout to the callout server, a second set of policies can evaluate the callout and invoke additional callouts, which can in turn be evaluated by a third set of policies, and so on. Such an implementation is described in the following example.

First, you could configure an HTTP callout called myCallout1, and then configure a responder policy, Pol1, to invoke myCallout1. Then, you could configure a second HTTP callout, myCallout2, and a responder policy, Pol2. You configure Pol2 to evaluate myCallout1 and invoke myCallout2. You bind both responder policies globally.

To avoid HTTP callout recursion, myCallout1 is configured with a unique custom HTTP header called “Request1.” Pol1 is configured to avoid HTTP callout recursion by using the default syntax expression, but excludes the .NOT operator so that the policy evaluates myCallout1 when the NetScaler appliance is parsing it. Note that myCallout2 identifies its own unique header called “Request2,” and Pol2 includes a default syntax expression to prevent myCallout2 from invoking itself recursively.

**Example:**

```csh
> add policy httpCallout myCallout1
```

© 1999-2018 Citrix Systems, Inc. All rights reserved.
```bash
> set policy httpCallout myCallout1 -IPAddress 10.102.3.95 -port 80 -returnType TEXT
   -hostExpr "10.102.3.95" -urlStemExpr "\cgi-bin/check_clnt_from_database.pl" -headers Request1
   ("Callout Request") -parameters cip(CLIENT.IP.SRC) -resultExpr "HTTP.RES.BODY(100)"

Done

> add responder policy Pol1 "HTTP.REQ.HEADER("Request1")".EQ("Callout Request") .NOT & & SYS.HTTP_CALLOUT(myCallout1).CONTAINS("IP Matched")" RESET

Done

> bind responder global Pol1 100 END -type OVERRIDE

Done

> add policy httpCallout myCallout2

Done

> set policy httpCallout myCallout2 -IPAddress 10.102.3.96 -port 80 -returnType TEXT
   -hostExpr "10.102.3.96" -urlStemExpr "\cgi-bin/check_clnt_location_from_database.pl" -headers Request2
   ("Callout Request") -parameters cip(CLIENT.IP.SRC) -resultExpr "HTTP.RES.BODY(200)"

Done

> add responder policy Pol2 "HTTP.REQ.HEADER("Request2")".EQ("Callout Request") .NOT & & HTTP.REQ.HEADER("Request1") .EQ("Callout Request") .& & SYS.HTTP_CALLOUT(myCallout2).CONTAINS ("APAC")" RESET

Done

> bind responder global Pol2 110 END -type OVERRIDE

Done
```
Avoiding HTTP callout recursion

September 24, 2018

Even though the NetScaler appliance does not check for the validity of the HTTP callout request, it
parses the request once before it sends the request to the HTTP callout agent. This parsing allows
the appliance to treat the callout request as any other incoming request, which in turn allows you
to configure several useful NetScaler features (such as integrated caching, SureConnect, and Priority
Queuing) to work on the callout request.

However, during this parsing, the HTTP callout request can hit the same policy and therefore invoke
itself recursively. The appliance detects the recursive invocation and raises an undefined (UNDEF)
condition. However, the recursive invocation results in the policy and HTTP callout hit counters being
incremented by two counts each instead of one count each.

To prevent a callout from invoking itself, you must identify at least one unique characteristic of the
HTTP callout request, and then exclude all requests with this characteristic from being processed by
the policy rule that invokes the callout. You can do so by including another default syntax expression
in the policy rule. The expression must precede the
SYS.HTTP_CALLOUT(<name>) expression so that it is evaluated before the callout expression is eval-
uated. For example:

```
<Expression that prevents callout recursion> && SYS.HTTP_CALLOUT(<name>)
```

When you configure a policy rule in this way, when the appliance generates the request and parses it,
the compound rule evaluates to FALSE, the callout is not generated a second time, and the hit counters
are incremented correctly.

One way by which you can assign a unique characteristic to an HTTP callout request is to include a
unique custom HTTP header when you configure the callout. Following is an example of an HTTP
callout called “myCallout.” The callout generates an HTTP request that checks whether a client’s IP
address is present in a database of blacklisted IP addresses. The callout includes a custom header
called “Request,” which is set to the value “Callout Request.” A globally bound responder policy,
“Poll,” invokes the HTTP callout but excludes all requests whose Request header is set to this value,
thus preventing a second invocation of myCallout. The expression that prevents a second invocation
is HTTP.REQ.HEADER("Request").EQ("Callout Request").NOT.

Example:

```
> add policy httpCallout myCallout
Done

> set policy httpCallout myCallout -IPAddress 10.102.3.95 -port 80 -
   returnType TEXT -hostExpr "10.102.3.95" -urlStemExpr "/cgi-bin"
```
NetScaler 12.0

/check_clnt_from_database.pl" -headers Request("Callout Request")
-parameters cip(CLIENT.IP.SRC) -resultExpr "HTTP.RES.BODY(100)"

> add responder policy Poll1 "HTTP.REQ.HEADER("Request")".EQ("Callout Request") .NOT & & SYS.HTTP_CALLOUT(myCallout).CONTAINS("IP Matched ")" RESET

> bind responder global Poll1 100 END -type OVERRIDE

Note:
You can also configure an expression to check whether the URL of the request includes the URL stem expression that is configured for the HTTP callout. If you want to implement this scenario, make sure that the HTTP callout agent is dedicated to respond only to HTTP callouts and not to other client requests directed through the appliance. If the HTTP callout agent is an application or Web server that serves other client requests, such an expression will prevent the appliance from processing those client requests. Instead, use a unique custom header as described earlier.

Caching HTTP Callout Responses

September 24, 2018

For improved performance while using callouts, you can use the integrated caching feature to cache callout responses. The responses are stored in an integrated caching content group named callout-ContentGroup for a specified time duration.

Note: To cache callout responses, make sure that the integrated caching feature is enabled.

To set the cache duration by using the command line interface

At the command prompt, type:

set policy httpCallout <name> -cacheForSecs <secs>

Example:

> set httpcallout httpcallout1 -cacheForSecs 120
To set the cache duration by using the GUI

1. Navigate to **AppExpert > HTTP Callouts**.
2. In the details pane, select the HTTP callout for which you want to set the cache duration and click **Open**.
3. In the **Configure HTTP Callout** dialog box, specify the **Cache Expired Time**.
4. Verify that you have entered the correct time duration, and then click **OK**.

Use Case: Filtering Clients by Using an IP Blacklist

January 6, 2019
May 24, 2018

HTTP callouts can be used to block requests from clients that are blacklisted by the administrator. The list of clients can be a publicly known blacklist, a blacklist that you maintain for your organization, or a combination of both.

The NetScaler appliance checks the IP address of the client against the pre-configured blacklist and blocks the transaction if the IP address has been blacklisted. If the IP address is not in the list, the appliance processes the transaction.

To implement this configuration, you must perform the following tasks:

1. Enable responder on the NetScaler appliance.
2. Create an HTTP callout on the NetScaler appliance and configure it with details about the external server and other required parameters.
3. Configure a responder policy to analyze the response to the HTTP callout, and then bind the policy globally.
4. Create an HTTP callout agent on the remote server.

Enabling Responder

You must enable responder before you can use it.

To enable responder by using the GUI

1. Make sure that you have installed the responder license.
2. In the GUI, expand **AppExpert**, and right-click **Responder**, and then click **Enable Responder feature**.
Creating an HTTP Callout on the NetScaler Appliance

Create an HTTP callout, HTTP_Callout, with the parameter settings shown in the following table. For more information about creating an HTTP callout, see Configuring an HTTP Callout.pdf.

Configuring a Responder Policy and Binding it Globally

After you configure the HTTP callout, verify the callout configuration, and then configure a responder policy to invoke the callout. While you can create a responder policy in the Policies sub-node and then bind it globally by using the Responder Policy Manager, this demonstration uses the Responder Policy Manager to create the responder policy and bind the policy globally.

To create a responder policy and bind it globally by using the GUI

1. Navigate to AppExpert > Responder.
2. In the details pane, under Policy Manager, click Policy Manager.
3. In the Responder Policy Manager dialog box, click Override Global.
4. Click Insert Policy, and then, under Policy Name, click **New Policy.
5. In the CreateResponderPolicy dialog box, do the following:
   a) In Name, type PolicyResponder1.
   b) In Action, select RESET.
   c) In Undefined-Result Action, select Global undefined-result action.
   d) In Expression, type the following default syntax expression:

   ```
   "HTTP.REQ.HEADER("Request")".EQ("Callout Request") && SYS.HTTP_CALLOUT(HTTP_Callout).CONTAINS("IP Matched")"
   ```
   e) Click Create, and then click Close.
6. Click Apply Changes, and then click Close.

Creating an HTTP Callout Agent on the Remote Server

You must now create an HTTP callout agent on the remote callout server that will receive callout requests from the NetScaler appliance and respond appropriately. The HTTP callout agent is a script that is different for each deployment and must be written with the server specifications in mind, such as the type of database and the scripting language supported.

Following is a sample callout agent that verifies whether the given IP address is part of an IP blacklist. The agent has been written in the Perl scripting language and uses a MYSQL database.
The following CGI script checks for a given IP address on the callout server.

```perl
#!/usr/bin/perl -w
print "Content-type: text/html\n\n";
use DBI;
use CGI qw(:standard);
# Take the Client IP address from the request query
my $ip_to_check = param('cip');
# Where a MYSQL database is running
my $dsn = 'DBI:mysql:BAD_CLIENT:localhost';
# Database username to connect with
my $db_user_name = 'dbuser';
# Database password to connect with
my $db_password = 'dbpassword';
my ($id, $password);
# Connecting to the database
my $dbh = DBI->connect($dsn, $db_user_name, $db_password);
my $sth = $dbh->prepare(qq{
    select * from bad_clnt
});
    $sth->execute();
while (my ($ip_in_database) = $sth->fetchrow_array()) {
    chomp($ip_in_database);
    # Check for IP match
    if ($ip_in_database eq $ip_to_check) {
        print "\n IP Matched\n";
        $sth->finish();
        exit;
    }
}
print "\n IP Failed\n";
$sth->finish();
exit;
```

**Use Case: ESI Support for Fetching and Updating Content Dynamically**

January 6, 2019

Edge Side Includes (ESI) is a markup language for edge-level dynamic Web content assembly. It helps
NetScaler 12.0

in accelerating dynamic Web-based applications by defining a simple markup language to describe cacheable and non-cacheable Web page components that can be aggregated, assembled, and delivered at the network edge. By using HTTP callouts on the NetScaler appliance, you can read through the ESI constructs and aggregate or assemble content dynamically.

To implement this configuration, you must perform the following tasks:

1. Enable rewrite on the NetScaler appliance.
2. Create an HTTP callout on the appliance and configure it with details about the external server and other required parameters.
3. Configure a rewrite action to replace the ESI content with the callout response body.
4. Configure a rewrite policy to specify the conditions under which the action is performed, and then bind the rewrite policy globally.

Enabling Rewrite

Rewrite must be enabled before it is used on the NetScaler appliance. The following procedure describes the steps to enable the rewrite feature.

To enable rewrite by using the GUI

1. Make sure that you have installed the rewrite license.
2. In the GUI, expand AppExpert, and right-click Rewrite, and then click Enable Rewrite feature.

Creating an HTTP Callout on the NetScaler Appliance

For more information about creating an HTTP callout, see Configuring an HTTP Callout.
For more information about the parameter values, see Parameters and Values for HTTP-Callout-2 pdf.

Configuring the rewrite action

Create a rewrite action, Action-Rewrite-1, to replace the ESI content with the callout response body. Use the parameter settings shown in the following table.

Table 2. Parameters and Values for Action-Rewrite-1

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Action-Rewrite-1</td>
</tr>
<tr>
<td>Type</td>
<td>Replace</td>
</tr>
</tbody>
</table>
NetScaler 12.0

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
</table>
| Expression to choose target text reference | “HTTP.RES.BODY(500).AFTER_STR (\"

<example>\").BEFORE_STR (\"</example>\")” |
| String expression for replacement text | “SYS.HTTP_CALLOUT(HTTP-Callout-2)”                                       |

**To configure the rewrite action by using the GUI**

1. Navigate to **AppExpert** > **Rewrite** > **Actions**.
2. In the details pane, click **Add**.
3. In the **Create Rewrite Action** dialog box, in Name, type **Action-Rewrite-1**.
4. In Type, select **REPLACE**.
5. In **Expression** to choose target text reference, type the following default syntax expression:

   ```
   "HTTP.RES.BODY(500).AFTER_STR (\"<example>\").BEFORE_STR (\"</example>\")"
   ```

1. In the String expression for replacement text, type the following string expression:

   ```
   "SYS.HTTP_CALLOUT(HTTP-Callout-2)"
   ```

1. Click **Create**, and then click **Close**.

**Creating the rewrite policy and binding it globally**

Create a rewrite policy, Policy-Rewrite-1, with the parameter settings shown in the following table. You can create a rewrite policy in the Policies subnode and then bind it globally by using the Rewrite Policy Manager. Alternatively, you can use the Rewrite Policy Manager to perform both these tasks simultaneously. This demonstration uses the Rewrite Policy Manager to perform both tasks.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Policy-Rewrite-1</td>
</tr>
<tr>
<td>Action</td>
<td>Action_Rewrite-1</td>
</tr>
<tr>
<td>Undefined Result Action</td>
<td>-Global undefined-result action-</td>
</tr>
</tbody>
</table>
### Table 3. Parameters and Values for Policy-Rewrite-1

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Expression</td>
<td>“HTTP.REQ.HEADER(&quot;Name&quot;).CONTAINS (&quot;Callout&quot;).NOT”</td>
</tr>
</tbody>
</table>

**To configure a rewrite policy and bind it globally by using the GUI**

1. Navigate to AppExpert > Rewrite.
2. In the details pane, under Policy Manager, click Rewrite Policy Manager.
3. In the Rewrite Policy Manager dialog box, click Override Global.
4. Click Insert Policy, and then, in the Policy Name column, click New Policy.
5. In the Create Rewrite Policy dialog box, do the following:
   a) In Name, type Policy-Rewrite-1.
   b) In Action, select Action-Rewrite-1.
   c) In Undefined-Result Action, select Global undefined-result action.
   d) In Expression, type the following default syntax expression:

```
"HTTP.REQ.HEADER("Name") . CONTAINS ("Callout") . NOT"
```

5. Click Create, and then click Close.
6. Click Apply Changes, and then click Close.

**Use Case: Access control and authentication**

September 24, 2018

In high security zones, it is mandatory to externally authenticate the user before a resource is accessed by clients. On the NetScaler appliance, you can use HTTP callouts to externally authenticate the user by evaluating the credentials supplied. In this example, the assumption is that the client is sending the user name and password through HTTP headers in the request. However, the same information could be fetched from the URL or the HTTP body.

To implement this configuration, you must perform the following tasks:

1. Enable the responder feature on the NetScaler appliance.
2. Create an HTTP callout on the appliance and configure it with details about the external server and other required parameters.
3. Configure a responder policy to analyze the response, and then bind the policy globally.
4. Create a callout agent on the remote server.

**Enabling responder**

The responder feature must be enabled before it is used on the NetScaler appliance.

**To enable responder by using the GUI**

1. Make sure that the responder license is installed.
2. In the GUI, expand *AppExpert*, and right-click *Responder*, and then click *Enable Responder* feature.

**Creating an HTTP Callout on the NetScaler Appliance**

Create an HTTP callout, HTTP-Callout-3, with the parameter settings shown in the following table. For more information about creating an HTTP callout, see [Configuring an HTTP Callout](#).

Table 1. Parameters and Values for HTTP-Callout-3

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>HTTP-Callout-3</td>
</tr>
<tr>
<td><strong>Server to receive callout request:</strong></td>
<td></td>
</tr>
<tr>
<td>IP Address</td>
<td>10.103.9.95</td>
</tr>
<tr>
<td>Port</td>
<td>80</td>
</tr>
<tr>
<td><strong>Request to send to the server:</strong></td>
<td></td>
</tr>
<tr>
<td>Method</td>
<td>GET</td>
</tr>
<tr>
<td>Host Expression</td>
<td>10.102.3.95</td>
</tr>
<tr>
<td>URL Stem Expression</td>
<td>“/cgi-bin/authenticate.pl”</td>
</tr>
</tbody>
</table>
**Headers:**
Name
Request
Value-expression
Callout Request

**Parameters:**
Name
Username
Value-expression
HTTP.REQ.HEADER("Username").VALUE(0)
Name
Password
Value-expression
HTTP.REQ.HEADER("Password").VALUE(0)

**Server Response:**
Return Type
TEXT
Expression to extract data from the response
HTTP.RES.BODY(100)

**Creating a Responder policy to analyze the response**

Create a responder policy, Policy-Responder-3, that will check the response from the callout server and RESET the connection if the source IP address has been blacklisted. Create the policy with the parameters settings shown in the following table. While you can create a responder policy in the Policies subnode and then bind it globally by using the Responder Policy Manager, this demonstration uses the Responder Policy Manager to create the responder policy and bind the policy globally.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Policy-Responder-3</td>
</tr>
<tr>
<td>Action</td>
<td>RESET</td>
</tr>
</tbody>
</table>
### To create a responder policy and bind it globally by using the GUI

1. Navigate to **AppExpert > Responder**.
2. In the details pane, under **Policy Manager**, click **Responder Policy Manager**.
3. In the **Responder Policy Manager** dialog box, click **Override Global**.
4. Click **Insert Policy**, and then, in the Policy Name column, click **New Policy**.
5. In the **Create Responder Policy** dialog box, do the following:
   a) In **Name**, type **Policy-Responder-3**.
   b) In **Action**, select **RESET**.
   c) In Undefined-Result Action, select Global undefined-result action.
   d) In the **Expression** text box, type:

   ```plaintext
   "HTTP.REQ.HEADER("Request").EQ("Callout Request").NOT && SYS.HTTP_CALLOUT(HTTP-Callout-3).CONTAINS("Authentication Failed")"
   ```

   e) Click **Create**, and then click **Close**.
6. Click **Apply Changes**, and then click **Close**.

### Creating an HTTP Callout agent on the remote server

You now need to create an HTTP callout agent on the remote callout server. The HTTP callout agent receives callout requests from the NetScaler appliance and responds appropriately. The callout agent is a script that is different for each deployment and must be written with server specifications in mind, such as the type of database and the scripting language supported.

Following is sample callout agent pseudo-code that verifies whether the supplied user name and password are valid. The agent can be implemented in any programming language of your choice. The pseudo-code is to be used only as a guideline for developing the callout agent. You can build additional functionality into the program.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Undefined-Result-Action</td>
<td>-Global undefined-result action-</td>
</tr>
<tr>
<td>Expression</td>
<td>“HTTP.REQ.HEADER(&quot;Request&quot;).EQ(&quot;Callout Request&quot;).NOT &amp;&amp; SYS.HTTP_CALLOUT(HTTP-Callout-3).CONTAINS(&quot;Authentication Failed&quot;)”</td>
</tr>
</tbody>
</table>

Table 2. Parameters and Values for Policy-Responder-3
To verify the supplied user name and password by using pseudo-code

1. Accept the user name and password supplied in the request and format them appropriately.
2. Connect to the database that contains all the valid user names and passwords.
3. Check the supplied credentials against your database.
4. Format the response as required by the HTTP callout.
5. Send the response to the NetScaler appliance.

Use Case: OWA-Based Spam Filtering

January 6, 2019

Spam filtering is the ability to dynamically block emails that are not from a known or trusted source or that have inappropriate content. Spam filtering requires an associated business logic that indicates that a particular kind of message is spam. When the NetScaler appliance processes Outlook Web Access (OWA) messages based on the HTTP protocol, HTTP callouts can be used to filter spam.

You can use HTTP callouts to extract any portion of the incoming message and check with an external callout server that has been configured with rules that are meant for determining whether a message is legitimate or spam. In case of spam email, for security reasons, the NetScaler appliance does not notify the sender that the email is marked as spam.

The following example conducts a very basic check for various listed keywords in the email subject. These checks can be more complex in a production environment.

To implement this configuration, you must perform the following tasks:

1. Enable the responder feature on the NetScaler appliance.
2. Create an HTTP callout on the NetScaler appliance and configure it with details about the external server and other required parameters.
3. Create a responder policy to analyze the response, and then bind the policy globally.
4. Create a callout agent on the remote server.

Enabling Responder

The responder feature must be enabled before it can be used on the NetScaler appliance.

To enable responder by using the GUI

1. Make sure that the responder license is installed.
2. In the GUI, expand AppExpert, and right-click Responder, and then click Enable Responder feature.
Creating an HTTP Callout on the NetScaler Appliance

Create an HTTP callout, HTTP-Callout-4, with the parameter settings shown in the following table. For more information about creating an HTTP callout, see Configuring an HTTP Callout.

For more information, see Parameters and Values for HTTP-Callout-4.pdf.

Creating a Responder Action

Create a responder action, Action-Responder-4. Create the action with the parameter settings shown in the following table.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Action-Responder-4</td>
</tr>
<tr>
<td>Type</td>
<td>Respond with</td>
</tr>
</tbody>
</table>
| Target    | ""HTTP/1.1 200 OK\nServer: Microsoft-IIS/6.0\nX-Powered-By: ASP.NET\nContent-Length: 0\nMS-WebStorage: 6.5.6944\nCache-Control: no-cache\n\n"

Table 2. Parameters and Values for Action-Responder-4

To create a responder action by using the GUI

2. In the details pane, click Add.
3. In the Create Responder Action dialog box, in Name, type Action-Responder-4.
4. In Type, click Respond with.
5. In Target, type:

   ""HTTP/1.1 200 OK\nServer: Microsoft-IIS/6.0\nX-Powered-By: ASP.NET\nContent-Length: 0\nMS-WebStorage: 6.5.6944\nCache-Control: no-cache\n\n"

6. Click Create, and then click Close.
Creating a Responder Policy to Invoke the HTTP Callout

Create a responder policy, Policy-Responder-4, that will check the request body and, if the body contains the word “subject,” invoke the HTTP callout to verify the email. Create the policy with the parameter settings shown in the following table. While you can create a responder policy in the Policies subnode and then bind it globally by using the Responder Policy Manager, this demonstration uses the Responder Policy Manager to create the responder policy and bind it globally.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Policy-Responder-4</td>
</tr>
<tr>
<td>Action</td>
<td>Action-Responder-4</td>
</tr>
<tr>
<td>Undefined-Result-Action</td>
<td>-Global undefined-result action-</td>
</tr>
<tr>
<td>Expression</td>
<td>“HTTP.REQ.BODY(1000).CONTAINS(&quot;urn:schemas:httpmail:subject&quot;) &amp;&amp; SYS.HTTP_CALLOUT(HTTP-Callout-4)”</td>
</tr>
</tbody>
</table>

To create a responder policy by using the GUI

1. Navigate to AppExpert > Responder.
2. In the details pane, under Policy Manager, click Responder policy manager.
3. In the Responder Policy Manger dialog box, click Override Global.
4. Click Insert Policy, and then, in the Policy Name column, click New Policy.
5. In the Create Responder Policy dialog box, do the following:
   a) In Name, type Policy-Responder-4.
   b) In Action, click Action-Responder-4.
   c) In Undefined-Result Action, click Global undefined-result action.
   d) In the Expression text box, type:

   ```javascript
   "HTTP.REQ.BODY(1000).CONTAINS("urn:schemas:httpmail:subject") && SYS.HTTP_CALLOUT(HTTP-Callout-4)"
   ```

   e) Click Create, and then click Close.
6. Click Apply Changes, and then click Close.
Creating an HTTP Callout Agent on the Remote Server

You will now need to create an HTTP callout agent on the remote callout server. The HTTP callout agent receives callout requests from the NetScaler appliance and responds accordingly. The callout agent is a script that is different for each deployment and must be written with server specifications in mind, such as the type of database and the scripting language supported.

The following pseudo-code provides instructions for creating a callout agent that checks a list of words that are generally understood to indicate spam mails. The agent can be implemented in any programming language of your choice. The pseudo-code is to be used only as a guideline for developing the callout agent. You can build additional functionality into the program.

To identify spam email by using pseudo-code

1. Accept the email subject provided by the NetScaler appliance.
2. Connect to the database that contains all the terms against which the email subject is checked.
3. Check the words in the email subject against the spam word list.
4. Format the response as required by the HTTP callout.
5. Send the response to the NetScaler appliance.

Use Case: Dynamic Content Switching

September 24, 2018

May 24, 2018

This use case provides dynamic content switching by using an HTTP callout to get the name of the load balancing virtual server to which the request is forwarded.

1. Add a content switching virtual server.

```
1 > add cs vserver cs_vserver1 HTTP 10.102.29.196 80
```

2. Create an HTTP callout.

```
1 > add policy httpCallout http_callout1
```

3. Configure the HTTP callout to respond with the name of the load balancing virtual server from a request that contains the client IP address in the HTTP header “X-CLIENT-IP”.

```
```
4. Configure the content switching action to retrieve the callout response.

```
> add cs action cs_action1 -targetVserverExpr 'SYS.HTTP_CALLOUT(http_callout1)'
```

Note: You must bind a load balancing virtual server to the content switching virtual server to account for:

- The non-availability of the load balancing virtual server that the callout resolves to.
- A UNDEF condition that results from the execution of the callout.

```
> bind cs vserver cs_vserver1 -lbvserver default_lbvip
```

5. Configure the content switching policy.

```
> add cs policy cs_policy1 -rule true -action cs_action1
```

6. Binding the content switching policy to the content switching virtual server.

```
> bind cs vserver cs_vserver1 -policyName cs_policy1 -priority 10
```

**Pattern sets and data sets**

September 24, 2018

Policy expressions for string matching operations on a large set of string patterns tend to become long and complex. Resources consumed by the evaluation of such complex expressions are significant in terms of processing cycles, memory, and configuration size. You can create simpler, less resource-intensive expressions by using pattern matching.

Depending on the type of patterns that you want to match, you can use one of the following features to implement pattern matching:

- A pattern set is an array of indexed patterns used for string matching during default syntax policy evaluation. Example of a pattern set: imagetypes {svg, bmp, png, gif, tiff, jpg}.
- A data set is a specialized form of pattern set. It is an array of patterns of types number (integer), IPv4 address, or IPv6 address.

In many cases, you can use either pattern sets or data sets. However, in cases where you want specific matches for numerical data or IPv4 and IPv6 addresses, you must use data sets.
NetScaler 12.0

Note:
Pattern sets and data sets can be used only in default syntax policies.

To use pattern sets or data sets, first create the pattern set or data set and bind patterns to it. Then, when you configure a policy for comparing a string in a packet, use an appropriate operator and pass the name of the pattern set or data set as an argument.

How string matching works with pattern sets and data sets

January 6, 2019

A pattern set or data set contains a set of patterns, and each pattern is assigned a unique index. When a policy is applied to a packet, an expression identifies a string to be evaluated, and the operator compares the string to the patterns defined in the pattern set or data set until a match is found or all patterns have been compared. Then, depending on its function, the operator returns either a boolean value that indicates whether or not a matching pattern was found or the index of the pattern that matches the string.

Note: This topic explains the working of a pattern set. Data sets work the same way. The only difference between pattern sets and data sets is the type of patterns defined in the set.

Consider the following use case to understand how patterns can be used for string matching.

You want to determine whether the URL suffix (target text) contains any of the image file extensions. Without using pattern sets, you would have to define a complex expression, as follows:

```
1 HTTP.REQ.URL.SUFFIX.CONTAINS("svg") || HTTP.REQ.URL.SUFFIX.CONTAINS("bmp") || HTTP.REQ.URL.SUFFIX.CONTAINS("png") ||
2 HTTP.REQ.URL.SUFFIX.CONTAINS("gif") || HTTP.REQ.URL.SUFFIX.CONTAINS("tiff") || HTTP.REQ.URL.SUFFIX.CONTAINS("jpg")
```

If the URL has a suffix of “jpg,” with the above compound expression, the Citrix ADC appliance has to iterate through the entire compound expression sequentially, from one sub expression to the next, to determine that the request refers to a jpg image. The following figure shows the steps in the process.

When a compound expression includes hundreds of sub expressions, the above process is resource intensive. A better alternative is an expression that invokes a pattern set, as shown in the following figure.

During policy evaluation as shown above, the operator (CONTAINS ANY) compares the string identified in the request with the patterns defined in the pattern set until a match is found. With the Sample_Patset expression, the multiple iterations through six sub expressions are reduced to just one.
By eliminating the need to configure compound expressions that perform string matching with multiple OR operations, pattern sets or data sets simplify configuration and accelerate processing of requests and responses.

**Configuring a Pattern Set**

**October 26, 2018**

To configure a pattern set, you must specify the strings that are to serve as patterns. You can manually assign a unique index value to each of these patterns, or you can allow the index values to be assigned automatically.

Note: Pattern sets are case sensitive (unless you specify the expression to ignore case). Therefore, the string pattern “product1,” for example, is not the same as the string pattern “Product1.”

**Points to remember about index values:**

- You cannot bind the same index value to more than one pattern.
- An automatically assigned index value is one number larger than the highest index value of the existing patterns within the pattern set. For example, if the highest index value of existing patterns in a pattern set is 104, the next automatically assigned index value will be 105.
- If you do not specify an index for the first pattern, index value 1 is automatically assigned to that pattern.
- Index values are not regenerated automatically if one or more patterns are deleted or modified. For example, if the set contains five patterns, with indexes from 1 through 5, and if the pattern with an index of 3 is deleted, the other index values in the pattern set are not automatically regenerated to produce values from 1 through 4.
- The maximum index value that can be assigned to a pattern is 4294967290. If that value is already assigned to a pattern in the set, you must manually assign index values to any newly added patterns. An unused index value that is lower than a currently used value cannot be assigned automatically.

**To configure a pattern set by using the command line interface**

At the command prompt, do the following:

1. Create a pattern set.

   ```
   add policy patset <name>
   ```

   **Example:**

   ```
   1 > add policy patset samplepatset
   ```
2. Bind patterns to the pattern set.

```
bind policy patset <name> <string> [-index <positive_integer>]
```

**Example:**

```
> bind policy patset samplepatset product1 -index 1
```

**Note:** Repeat this step for all the patterns you want to bind to the pattern set.

3. Verify the configuration.

```
show policy patset <name>
```

---

**To configure a pattern set by using the configuration utility**

1. Navigate to **AppExpert > Pattern Sets**.
2. In the details pane, click **Add** to open the **Create Pattern Set** dialog box.
3. Specify a name for the pattern set in the Name text box.
4. Under **Specify Pattern**, type the first pattern and, optionally, specify values for the following parameters:
   - **Treat back slash as escape character**—Select this check box to specify that any backslash characters that you might include in the pattern are to be treated as escape characters.
   - **Index**—A user assigned index value, from 1 through 4294967290.
5. Verify that you have entered the correct characters, and then click **Add**.
6. Repeat steps 4 and 5 to add additional patterns, and then click **Create**.

---

**Configuring a data set**

October 26, 2018

To configure a data set, you must specify the strings that are to serve as patterns, and assign a type (number, IPv4 address, or IPv6 address) to each pattern. You can manually assign a unique index value to each of these patterns, or you can allow the index values to be assigned automatically. Dataset is not related to HTTP or any 7 layer protocol. It works only on text/string. There are different types of dataset such as num, ulong, ipv4, and ipv6. To use a dataset on IP, we have to convert the input into text/string.

**Note:** Data sets are case sensitive (unless you specify the expression to ignore case). Therefore, the string pattern “product1,” for example, is not the same as the string pattern “Product1.”

The rules applied for index values of data sets are the same as those applied for pattern sets. For information about index values, see **Configuring a Pattern Set**.
**To configure a data set by using the command line interface**

At the command prompt, do the following:

1. Create a data set.

   ```
   add policy dataset <name> <type>
   ```

   **Example:**

   ```
   > add policy dataset sampledataset ipv4
   ```

1. Bind patterns to the data set.

   ```
   bind policy dataset <name> <value> [-index <positive_integer>]
   ```

   **Example:**

   ```
   > bind policy dataset sampledataset 10.102.29.1 -index 1
   ```

   Note: Repeat this step for all the patterns you want to bind to the data set.

2. add policy expression sampleexpression client.ip.src.typecast_text_t.equals_any("sampledataset")

3. Verify the configuration.

   ```
   show policy dataset <name>
   ```

**To configure a data set by using the configuration utility**

Navigate to **AppExpert > Data Sets**, click **Add** and specify the relevant details.

**Using pattern sets and data sets**

January 6, 2019

Default syntax policy expressions that take pattern sets or data sets as an argument can be used to perform string matching operations.

The usage is as follows:

```
<text>.<operator>("<name>")
```
NetScaler 12.0

- `<text>` is the expression that identifies a string in a packet. Example: HTTP.REQ.HEADER(“Host”).
- `<operator>` is one of the operators described in the Pattern Set Types table pdf.

For sample usage, see Sample Usage.

Sample usage

October 26, 2018

To understand the usage of pattern sets in expressions, consider the example of a pattern set named “imagetypes.”

<table>
<thead>
<tr>
<th>Patterns</th>
<th>Index value</th>
</tr>
</thead>
<tbody>
<tr>
<td>svg</td>
<td>1</td>
</tr>
<tr>
<td>bmp</td>
<td>2</td>
</tr>
<tr>
<td>png</td>
<td>3</td>
</tr>
<tr>
<td>gif</td>
<td>4</td>
</tr>
<tr>
<td>tiff</td>
<td>5</td>
</tr>
<tr>
<td>jpg</td>
<td>6</td>
</tr>
</tbody>
</table>

Table 1. Pattern set “imagetypes”

Example 1: Determine whether the suffix of an HTTP request is one of the file extensions defined in the “imagetypes” pattern set.

- Expression. HTTP.REQ.URL.SUFFIX.EQUALS_ANY(“imagetypes”)
- Sample URL. http://www.example.com/homepageicon.jpg
- Result. TRUE

Example 2: Determine whether the suffix of an HTTP request is one of the file extensions defined in the “imagetypes” pattern set, and return the index of that pattern.

- Expression. HTTP.REQ.URL.SUFFIX.EQUALS_INDEX(“imagetypes”)
- Sample URL. http://www.example.com/mylogo.gif
- Result. 4 (The index value of the pattern “gif”)

Example 3: Use the index value of a pattern to determine whether the URL suffix is within a specified index-value range.

- Expression. HTTP.REQ.URL.SUFFIX.EQUALS_INDEX(“imagetypes”).GE(3) & HTTP.REQ.URL.SUFFIX.EQUALS_INDEX(“imagetypes”).LE(5)
- Sample URL. http://www.example.com/mylogo.gif
• **Result.** TRUE (The index value of gif file types is 4.)

**Example 4:** Implement one set of policies for file extensions bmp, jpg, and png, and a different set of policies for gif, tiff, and svg files.

An expression that returns the index of a matched pattern can be used to define traffic subsets for a web application. The following two expressions could be used in content switching policies for a content switching virtual server:

- HTTP.REQ.URL.SUFFIX.EQUALS_INDEX(“imagetypes”).LE(3)
- HTTP.REQ.URL.SUFFIX.EQUALS_INDEX(“imagetypes”).GE(4)

**Variables**

September 24, 2018

Variables are named objects that store information in the form of tokens. These tokens are used within and across different transactions on the NetScaler Appliance for internal computation and policy processing.

The NetScaler appliance supports creation of variables of the following types:

- **Singleton variables.** Can have a single value of one of the following types: ulong and text (max-size). The ulong type is an unsigned 64-bit integer, the text type is a sequence of bytes, and max-size is the maximum number of bytes in the sequence.

- **Map variables.** Maps hold values associated with keys: each key-value pair is called a map entry. The key for each entry is unique within the map. Maps are specified as follows:

  map (key_type, value_type, max-values).

  where,

  - `key_type` is the data type of the key. It is of type text (max-size).

  - `*value_type*` is the data type of the values of the map. It can be of type ulong or text (max-size).

  - `*max-values*` is the maximum number of entries that the map can contain. It is of type ulong.

Values for these variables are set using assignments which must be invoked on policy actions.

- **Note:** Variables are not yet supported in a high-availability setup or in a cluster.
Variables Scope

A map variable or a singleton variable can have a global scope. Alternatively, the scope of a singleton variable can be limited to a single transaction.

- Global Scope Variable - A variable with global scope (the default) has only one instance, and that instance has the same value(s) across all cores of a NetScaler appliance and across all nodes of a cluster or HA configuration. Global variable values exist until they are explicitly deleted, until they expire, or until a standalone appliance is restarted or all nodes of a cluster or HA configuration are restarted.

- Transaction Scope Variable - A variable with transaction scope has a separate instance, with its own value, for each transaction processed by the NetScaler appliance. When the transaction processing is complete, the transaction variable value is deleted.

Note: Transaction scope variables are available in NetScaler release 10.5.e or later.

Configuring and using Variables

September 24, 2018

You must first create a variable and then assign a value or specify the operation that must be performed on the variable. After performing these operations, you can use the assignment as a policy action.

Note: Once configured, a variable's settings cannot be modified or reset. If the variable needs to be changed, the variable and all references to the variable (expressions and assignments) must be deleted. The variable can then be re-added with new settings, and the references (expressions and assignments) can be re-added.

To configure variables by using the command line interface

1. Create a variable.

```
1 add ns variable <name> -type <string> [-scope global] [-ifFull ( undef | lru )] [-ifValueTooBig ( undef | truncate )] [-ifNoValue ( undef | init )] [-init <string>] [-expires <positive_integer>] [-comment <string>]
```

Note: Refer to the man page “man add ns variable” for description of the command parameters.

Example 1: Create a ulong variable named “my_counter” and initialize it to 1.

```
1 add ns variable my_counter -type ulong -init 1
```
Example 2: Create a map named “user_privilege_map”. The map will contain keys of maximum length 15 characters and text values of maximum length 10 characters, with a maximum of 10000 entries.

```plaintext
add ns variable user_privilege_map -type map(text(15), text(10), 10000)
```

**Note:** If the map contains 10000 unexpired entries, assignments for new keys reuse one of the least recently used entries. By default, an expression trying to get a value for a non-existent key will initialize an empty text value.

Assign the value or specify the operation to be performed on the variable. This is done by creating an assignment.

```plaintext
add ns assignment <name> -variable <expression> [-set <expression> | -add <expression> | -sub <expression> | -append <expression> | -clear ] [-comment <string>]
```

Note: A variable is referenced by using the variable selector ($). Therefore, `$variable1` is used to refer to text or ulong variables. Similarly, `$variable2[key-expression]` is used to refer to map variables.

Example 1: Define an assignment named “inc_my_counter” that automatically adds 1 to the “my_counter” variable.

```plaintext
add ns assignment inc_my_counter -variable $my_counter -add 1
```

Example 2: Define an assignment named “set_user_privilege” that adds to the “user_privilege_map” variable an entry for the client’s IP address with the value returned by the “get_user_privilege” HTTP callout.

```plaintext
add ns assignment set_user_privilege -variable $user_privilege_map[client.ip.src.typecast_text_t] -set sys.http.callout(get_user_privilege)
```

**Note:** If an entry for that key already exists, the value will be replaced. Otherwise a new entry for the key and value will be added. Based on the previous declaration for user_privilege_map, if the map already has 10000 entries, one of the least recently used entries will be reused for the new key and value.

1. Invoke the variable assignment in a policy.

There are two functions that can operate on map variables.

- **$name.valueExists(key-expression)**. Returns true if there is a value in the map selected by the key-expression. Otherwise returns false. This function will update the expiration and LRU information if the map entry exists, but will not create a new map entry if the value does not exist.
• `$name.valueCount`. Returns the number of values currently held by the variable. This is the number of entries in a map. For a singleton variable, this is 0 if the variable is uninitialized or 1 otherwise.

**Example:** Invoke the assignment named “set_user_privilege” with a compression policy.

```
add cmp policy set_user_privilege_pol -rule $user_privilege_map.valueExists(client.ip.src.typecast_text_t).not -resAction set_user_privilege
```

**Use Case to insert HTTP header in the response side**

The following example shows an example of a singleton variable.

Add a singleton variable of type text. This variable can hold maximum 100 Bytes data.

```
add ns variable http_req_data -type text(100) -scope transaction
```

Add an assignment action, which will be used to store the HTTP request data into the variable.

```
add ns assignment set_http_req_data -variable $http_req_data -set http.req.body(100)
```

Add a rewrite action to insert HTTP header, whose value will be fetched from the variable.

```
add rewrite action act_ins_header insert_http_header user_name $http_req_data.after_str("user_name").before_str("password")
```

Add a rewrite policy which will evaluate in the request time, and take assignment action to store data. When we hit this policy, we’ll take assignment action and store the data into the ns variable (http_req_data)

```
add rewrite policy pol_set_variable true set_http_req_data
2
3 bind rewrite global pol_set_variable 10 -type req_dEFAULT
```

Add a rewrite policy which will evaluate in the response time, and add an HTTP header in the response.

```
add rewrite policy pol_ins_header true act_ins_header
2
3 bind rewrite global pol_ins_header 10 -type res_dEFAULT
```
To configure variables by using the GUI

1. Navigate to AppExpert > NS Variables, to create a variable.
2. Navigate to AppExpert > NS Assignments, to assign value(s) to the variable.
3. Navigate to the appropriate feature area where you want to configure the assignment as an action.

Use Case: Caching User Privileges

September 24, 2018

In this use case, user privileges (“GOLD”, “SILVER”, and so on) must be retrieved from an external web service.

To achieve this use case, perform the following operations

Create an HTTP callout to fetch the user privileges from the external web service.

```bash
1 add policy httpcallout <name> [-IPAddress <ip_addr|ipv6_addr>] [-port <port>] [-vServer <string>] [-returnType <returnType>] [-httpMethod (GET | POST)] [-hostExpr <string>] [-urlStemExpr <string>] [-headers <name(value)> ...] [-parameters <name(value)> ...] [-bodyExpr <string>][-fullReqExpr <string>] [-scheme ( http | https )] [-resultExpr <string>] [-cacheForSecs <secs>] [-comment <string>]

2 add policy httpcallout get_user_privilege -ipaddress 10.217.193.84 -port 80 -returnType text -httpMethod GET -hostExpr '/get_user_privilege' -resultExpr 'http.res.body(5)'

Store the privileges in a variable.

```bash
1 add ns variable <name> -type <string> [-scope ( global | transaction )]
   [-ifFull ( undef | lru )] [-ifValueTooBig ( undef | truncate )][-ifNoSuchValue ( undef | init )] [-init <string>] [-expires <positive_integer>] [-comment <string>]
2 add ns variable user_privilege_map -type map(text(15),text(10),10000) -expires 1200
3 add ns assignment set_user_privilege -variable $user_privilege_map[client.ip.src] -set sys.http_callout(get_user_privilege)
```
Create a policy to check if there is already a cached entry for the client’s IP address; if not, it calls the HTTP callout to set a map entry for the client.

```
add cmp policy <name> -rule <expression> -resAction <string>
add cmp policy set_user_privilege_pol -rule $user_privilege_map.
  valueExists(client.ip.src).not -resAction set_user_privilege
```

Create a policy that compresses if the cached privilege entry for the client is “GOLD”.

```
add cmp policy <name> -rule <expression> -resAction <string>
add cmp policy compress_if_gold_privilege_pol -rule 
  $user_privilege_map[client.ip.src].eq("GOLD")' -resAction compress
```

Bind the compression policies globally.

```
bind cmp global <policyName> [-priority <positive_integer>] [-state ( 
  ENABLED | DISABLED )] [-gotoPriorityExpression <expression>] [-type 
  <type>] [-invoke (<labelType> <labelName>) ]
bind cmp global set_user_privilege_pol -priority 10 NEXT
bind cmp global compress_if_gold_privilege_pol -priority 20 END
```

**Use Case: Limiting the Number of Sessions**

September 24, 2018

In this use case, the requirement is to limit the number of active backend sessions. In the deployment, each session login has login in the URL and each session logout has logout in the URL. On successful login, the backend sets a sessionid cookie with a unique 10 character value.

**To achieve this use case, perform the following operations:**

1. Create a map variable that can store each active session. The key of the map is the sessionid. The expiry time for the variable is set to 600 seconds (10 minutes).

   ```
   add ns variable session_map -type map(text(10),ulong,100) - 
   expires 600
   ```

2. Create the following assignments for the map variable:

   • Create an entry for the sessionid and set that value to 1 (this value is not actually used).
1. Add NS assignment:

```
1 > add ns assignment add_session -variable '$session_map[http.req.cookie.value("sessionid")]' -set 1
```

- Deallocate the entry for a session ID, which implicitly decrements the value count for session_map.

```
1 > add ns assignment delete_session -variable '$session_map[http.req.cookie.value("sessionid")]' -clear
```

3. Create responder policies for the following:

- To check if a map entry exists for that sessionid in the HTTP request. The add_session assignment is executed if the map entry does not exist.

```
1 > add responder policy add_session_pol 'http.req.url.contains("twbkwbis.P_SabanciLogin") || $session_map.valueExists(http.req.cookie.value("netsuis"))' add_session
```

Note: The valueExists() function in the add_session_pol policy counts as a reference to the session's map entry, so each request resets the expiration timeout for its session. If no requests for a session are received after 10 minutes, the session's entry will be deallocated.

- To check when the session is logged out. The delete_session assignment is executed.

```
1 add responder policy delete_session_pol "http.req.url.contains("Logout")" delete_session
```

- To check for login requests and if the number of active sessions exceed 100. If these conditions are satisfied, in order to limit the number of sessions, the user is redirected to a page that indicates that the server is busy.

```
1 add responder action redirect_too_busy redirect "/too_busy.html"
2 add responder policy check_login_pol "http.req.url.contains ("twbkwbis.P_SabanciLogin") && $session_map.valueCount > 100" redirect_too_busy
```

4. Bind the responder policies globally:

```
bind responder global add_session_pol 30 next
bind responder global delete_session_pol 10
bind responder global check_login_pol 20
```
Policies and expressions

September 24, 2018

The following topics provide the conceptual and reference information that you require for configuring advanced policies on the Citrix® NetScaler® appliance.

You can also download a list of all the expressions supported on the NetScaler appliance and the hierarchical order in which they can be invoked. The reference is in a zip file which you can download from:

- For more information, see Citrix support article CTX137705
- For NetScaler 10.1, see Citrix support article CTX137705

Introduction to policies and expressions

September 24, 2018

For many NetScaler features, policies control how a feature evaluates data, which ultimately determines what the feature does with the data. A policy uses a logical expression, also called a rule, to evaluate requests, responses, or other data, and applies one or more actions determined by the outcome of the evaluation. Alternatively, a policy can apply a profile, which defines a complex action.
Some NetScaler features use default syntax policies, which provide greater capabilities than do the older, classic, policies. If you migrated to a newer release of the NetScaler software and have configured classic policies for features that now use default syntax policies, you might have to manually migrate policies to the default syntax.

This document contains the following details:

- Classic and Default Syntax Policies
- Classic and Default Syntax Expressions
- Converting Classic Expressions to the Newer Default Expression Syntax
- Before You Proceed

Classic and advanced policies

September 24, 2018

Warning
Classic policy expressions are no longer supported from NetScaler 12.0 build 56.20 onwards and as an alternative, Citrix recommends you to use Advanced policies. For more information, see Advanced Policies

Classic policies evaluate basic characteristics of traffic and other data. For example, classic policies can identify whether an HTTP request or response contains a particular type of header or URL.

Advanced policies can perform the same type of evaluations as classic policies. In addition, default syntax policies enable you to analyze more data (for example, the body of an HTTP request) and to configure more operations in the policy rule (for example, transforming data in the body of a request into an HTTP header).

In addition to assigning a policy an action or profile, you bind the policy to a particular point in the processing associated with the NetScaler features. The bind point is one factor that determines when the policy will be evaluated.

Benefits of using advanced policies

Default syntax policies use a powerful expression language that is built on a class-object model, and they offer several options that enhance your ability to configure the behavior of various NetScaler features. With default syntax policies, you can do the following:

- Perform fine-grained analyses of network traffic from layers 2 through 7.
- Evaluate any part of the header or body of an HTTP or HTTPS request or response.
- Bind policies to the multiple bind points that the default syntax policy infrastructure supports at the default, override, and virtual server levels.
- Use goto expressions to transfer control to other policies and bind points, as determined by the result of expression evaluation.
- Use special tools such as pattern sets, policy labels, rate limit identifiers, and HTTP callouts, which enable you to configure policies effectively for complex use cases.

Additionally, the GUI extends robust graphical user interface support for default syntax policies and expressions and enables users who have limited knowledge of networking protocols to configure policies quickly and easily. The GUI also includes a policy evaluation feature for default syntax policies. You can use this feature to evaluate a default syntax policy and test its behavior before you commit it, thus reducing the risk of configuration errors.

**Basic components of an advanced policy**

Following are a few characteristics of an Advanced policy:

- **Name.**
  
  Each policy has a unique name.

- **Rule.**
  
  The rule is a logical expression that enables the NetScaler feature to evaluate a piece of traffic or another object.

  For example, a rule can enable the NetScaler to determine whether an HTTP request originated from a particular IP address, or whether a Cache-Control header in an HTTP request has the value “No-Cache.”

  Advanced policies can use all of the expressions that are available in a classic policy, with the exception of classic expressions for the SSL VPN client. In addition, Advanced policies enable you to configure more complex expressions.

- **Bindings.**
  
  To ensure that the NetScaler can invoke a policy when it is needed, you associate the policy, or bind it, to one or more bind points.

  You can bind a policy globally or to a virtual server. For more information, see “About policy bindings.”

- **An associated action.**
  
  An action is a separate entity from a policy. Policy evaluation ultimately results in the NetScaler performing an action.

  For example, a policy in the integrated cache can identify HTTP requests for .gif or .jpeg files. An action that you associate with this policy determines that the responses to these types of requests are served from the cache.
For some features, you configure actions as part of a more complex set of instructions known as a profile.

How different NetScaler features use policies

The NetScaler supports a variety of features that rely on policies for operation. The following table summarizes how the NetScaler features use policies.

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Policy Type</th>
<th>How You Use Policies in the Feature</th>
</tr>
</thead>
<tbody>
<tr>
<td>System</td>
<td>Classic</td>
<td>For the Authentication function, policies contain authentication schemes for different authentication methods. For example, you can configure LDAP and certificate-based authentication schemes. You also configure policies in the Auditing function.</td>
</tr>
<tr>
<td>DNS</td>
<td>Advanced</td>
<td>To determine how to perform DNS resolution for requests.</td>
</tr>
<tr>
<td>SSL</td>
<td>Classic and Advanced</td>
<td>To determine when to apply an encryption function and add certificate information to clear text. To provide end-to-end security, after a message is decrypted, the SSL feature re-encrypts clear text and uses SSL to communicate with Web servers.</td>
</tr>
<tr>
<td>Compression</td>
<td>Classic and Advanced</td>
<td>To determine what type of traffic is compressed.</td>
</tr>
<tr>
<td>Integrated Caching</td>
<td>Advanced</td>
<td>To determine whether HTTP responses are cacheable.</td>
</tr>
<tr>
<td>Responder</td>
<td>Advanced</td>
<td>To configure the behavior of the Responder function.</td>
</tr>
<tr>
<td>Feature Name</td>
<td>Policy Type</td>
<td>How You Use Policies in the Feature</td>
</tr>
<tr>

</tr>
<tr>
<td>Protection Features</td>
<td>Classic</td>
<td>To configure the behavior of the Filter, SureConnect, and Priority Queuing functions.</td>
</tr>
<tr>
<td>Content Switching</td>
<td>Classic and Advanced</td>
<td>To determine what server or group of servers is responsible for serving responses, based on characteristics of an incoming request. Request characteristics include device type, language, cookies, HTTP method, content type, and associated cache server.</td>
</tr>
<tr>
<td>AAA - Traffic Management</td>
<td>Classic. Exceptions: Traffic policies support only default syntax policies and authorization policies support both classic and default syntax policies.</td>
<td>To check for client-side security before users log in and establish a session. Traffic policies, which determine whether single sign-on (SSO) is required, use only the default syntax. Authorization policies authorize users and groups that access intranet resources through the appliance.</td>
</tr>
<tr>
<td>Cache Redirection</td>
<td>Classic</td>
<td>To determine whether responses are served from a cache or from an origin server.</td>
</tr>
<tr>
<td>Feature Name</td>
<td>Policy Type</td>
<td>How You Use Policies in the Feature</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>----------------------</td>
<td>-------------------------------------</td>
</tr>
<tr>
<td>Rewrite</td>
<td>Advanced</td>
<td>To identify HTTP data that you want to modify before serving. The policies provide rules for modifying the data. For example, you can modify HTTP data to redirect a request to a new home page, or a new server, or a selected server based on the address of the incoming request, or you can modify the data to mask server information in a response for security purposes. The URL Transformer function identifies URLs in HTTP transactions and text files for the purpose of evaluating whether a URL should be transformed.</td>
</tr>
<tr>
<td>Application Firewall</td>
<td>Classic and Advanced</td>
<td>To identify characteristics of traffic and data that should or should not be admitted through the firewall.</td>
</tr>
<tr>
<td>NetScaler Gateway, Clientless Access function</td>
<td>Advanced</td>
<td>To define rewrite rules for general Web access using the NetScaler Gateway.</td>
</tr>
<tr>
<td>NetScaler Gateway</td>
<td>Classic</td>
<td>To determine how the NetScaler Gateway performs authentication, authorization, auditing, and other functions.</td>
</tr>
</tbody>
</table>
About actions and profiles

Policies do not themselves take action on data. Policies provide read-only logic for evaluating traffic. To enable a feature to perform an operation based on a policy evaluation, you configure actions or profiles and associate them with policies.

**Note:** Actions and profiles are specific to particular features. For information about assigning actions and profiles to features, see the documentation for the individual features.

About actions

Actions are steps that the NetScaler takes, depending on the evaluation of the expression in the policy. For example, if an expression in a policy matches a particular source IP address in a request, the action that is associated with this policy determines whether the connection is permitted.

The types of actions that the NetScaler can take are feature specific. For example, in Rewrite, actions can replace text in a request, change the destination URL for a request, and so on. In Integrated Caching, actions determine whether HTTP responses are served from the cache or an origin server.

In some NetScaler features actions are predefined, and in others they are configurable. In some cases, (for example, Rewrite), you configure the actions using the same types of expressions that you use to configure the associated policy rule.

About profiles

Some NetScaler features enable you to associate profiles, or both actions and profiles, with a policy. A profile is a collection of settings that enable the feature to perform a complex function. For example, in the application firewall, a profile for XML data can perform multiple screening operations, such as examining the data for illegal XML syntax or evidence of SQL injection.

Use of actions and profiles in particular features

The following table summarizes the use of actions and profiles in different NetScaler features. The table is not exhaustive. For more information about specific uses of actions and profiles for a feature, see the documentation for the feature.
<table>
<thead>
<tr>
<th>Feature</th>
<th>Use of an Action</th>
<th>Use of a Profile</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application firewall</td>
<td>Synonymous with a profile</td>
<td>All application firewall features use profiles to define complex behaviors, including pattern-based learning. You add these profiles to policies.</td>
</tr>
<tr>
<td>NetScaler Gateway</td>
<td>The following features of the NetScaler Gateway use actions: Pre-Authentication. Uses Allow and Deny actions. You add these actions to a profile., Authorization. Uses Allow and Deny actions. You add these actions to a policy. TCP Compression. Uses various actions. You add these actions to a policy.</td>
<td>The following features use a profile: Pre-Authentication, Session, Traffic, and Clientless Access. After configuring the profiles, you add them to policies.</td>
</tr>

<td>Not used.</td>
</tr>
<tr>
<td>Cache Redirection</td>
<td>The action is implied. If a request matches the policy, the request is directed to the origin server.</td>
<td>Not used.</td>
</tr>
</tbody>
</table>

**About policy bindings**

A policy is associated with, or bound to, an entity that enables the policy to be invoked. For example, you can bind a policy to request-time evaluation that applies to all virtual servers. A collection of policies that are bound to a particular bind point constitutes a policy bank.

Following is an overview of different types of bind points for a policy:

- Request time global.
  
  A policy can be available to all components in a feature at request time.

- Response time global.
A policy can be available to all components in a feature at response time.

- **Request time, virtual server-specific.**
  
  A policy can be bound to request-time processing for a particular virtual server. For example, you can bind a request-time policy to a cache redirection virtual server to ensure that particular requests are forwarded to a load balancing virtual server for the cache, and other requests are sent to a load balancing virtual server for the origin.

- **Response time, virtual server-specific.**
  
  A policy can also be bound to response-time processing for a particular virtual server.

- **User-defined policy label.**
  
  For default syntax policies, you can configure custom groupings of policies (policy banks) by defining a policy label and collecting a set of related policies under the policy label.

- **Other bind points.**
  
  The availability of additional bind points depends on type of policy (classic or default syntax), and specifics of the relevant NetScaler feature. For example, classic policies that you configure for the NetScaler Gateway have user and group bind points.

For additional information about default syntax policy bindings, see “Bind policies that use the default syntax” and Configure a policy bank for a virtual server. For additional information about classic policy bindings, see “Configure a classic policy.”

### About evaluation order of policies

For classic policies, policy groups and policies within a group are evaluated in a particular order, depending on the following:

- **The bind point for the policy,** for example, whether the policy is bound to request-time processing for a virtual server or global response-time processing. For example, at request time, the NetScaler evaluates all request-time classic policies before evaluating any virtual server-specific policies.

- **The priority level for the policy.** For each point in the evaluation process, a priority level that is assigned to a policy determines the order of evaluation relative to other policies that share the same bind point. For example, when the NetScaler evaluates a bank of request-time, virtual server-specific policies, it starts with the policy that is assigned to the lowest priority value. In classic policies, priority levels must be unique across all bind points.

For Advanced policies, as with classic policies, the NetScaler selects a grouping, or bank, of policies at a particular point in overall processing. Following is the order of evaluation of the basic groupings, or banks, of Advanced policies:
1. Request-time global override
2. Request-time, virtual server-specific (one bind point per virtual server)
3. Request-time global default
4. Response-time global override
5. Response-time virtual server-specific
6. Response-time global default

However, within any of the preceding banks of policies, the order of evaluation is more flexible than in classic policies. Within a policy bank, you can point to the next policy to be evaluated regardless of the priority level, and you can invoke policy banks that belong to other bind points and user-defined policy banks.

**Order of evaluation based on traffic flow**

As traffic flows through the NetScaler and is processed by various features, each feature performs policy evaluation. Whenever a policy matches the traffic, the NetScaler stores the action and continues processing until the data is about to leave the NetScaler. At that point, the NetScaler typically applies all matching actions. Integrated Caching, which only applies a final Cache or NoCache action, is an exception.

Some policies affect the outcome of other policies. Following are examples:

- If a response is served from the integrated cache, some other NetScaler features do not process the response or the request that initiated it.
- If the Content Filtering feature prevents a response from being served, no subsequent features evaluate the response.

If the application firewall rejects an incoming request, no other features can process it.

**Classic and advanced policy expressions**

September 24, 2018

One of the most fundamental components of a policy is its rule. A policy rule is a logical expression that enables the policy to analyze traffic. Most of the policy’s functionality is derived from its expression.

An expression matches characteristics of traffic or other data with one or more parameters and values. For example, an expression can enable the NetScaler to accomplish the following:

- Determine whether a request contains a certificate.
- Determine the IP address of a client that sent a TCP request.
- Identify the data that an HTTP request contains (for example, a popular spreadsheet or word processing application).
- Calculate the length of an HTTP request.

**About classic expressions**

Classic expressions enable you to evaluate basic characteristics of data. They have a structured syntax that performs string matching and other operations.

Following are a few simple examples of classic expressions:

- An HTTP response contains a particular type of Cache Control header.
  
  `res.http.header Cache-Control contains public`

- An HTTP response contains image data.
  
  `res.http.header Content-Type contains image/`

- An SSL request contains a certificate.
  
  `req.ssl.client.cert exists`

**About advanced policy expressions**

Any feature that uses default syntax policies also uses Advanced expressions. For information about which features use Advanced policies, see the table `NetScaler Feature, Policy Type, and Policy Usage`.

Advanced policy expressions have a few other uses. In addition to configuring Advanced expressions in policy rules, you configure Advanced expressions in the following situations:

- Integrated Caching:
  
  You use Advanced policy expressions to configure a selector for a content group in the integrated cache.

- Load Balancing:
  
  You use Advanced policy expressions to configure token extraction for a load balancing virtual server that uses the TOKEN method for load balancing.

- Rewrite:
  
  You use Advanced policy expressions to configure rewrite actions.

- Rate-based policies:
  
  You use Advanced policy expressions to configure limit selectors when configuring a policy to control the rate of traffic to various servers.

Following are a few simple examples of Advanced policy expressions:
- An HTTP request URL contains no more than 500 characters.
\[ \text{http.req.url.length} \leq 500 \]
- An HTTP request contains a cookie that has fewer than 500 characters.
\[ \text{http.req.cookie.length} < 500 \]
- An HTTP request URL contains a particular text string.
\[ \text{http.req.url.contains(”html”)} \]

**Converting policy expressions using NSPEPI tool**

November 5, 2018

You can convert a classic expression to the Advanced policy expression by using the nspepi conversion tool. You can also use the tool to convert all the classic expressions in the NetScaler configuration to the Advanced policy (with the exception of NetScaler entities that currently support only classic expressions).

The conversion tool does not convert policies configured for the following features because the features currently support only classic policies:

- Authentication, Pre-authentication
- SSL
- Cache redirection
- VPN (session, traffic, and tunnel traffic)
- Content filtering (The responder feature not only provides you with functionality that is equivalent to that provided by the content filtering feature but also surpasses the content filtering feature in the use cases that it supports. Additionally, responder supports the more powerful default syntax for policy expressions.)

The following NetScaler features support both classic and Advanced policy expression and, therefore, support the conversion of classic expressions to Advanced policy expressions:

- Application firewall policies
- Authorization policies
- Named expressions
- Compression policies
- Content switching policies
- User-defined, rule-based tokens/persistency (the –rule parameter value that is specified for a load balancing virtual server)
About the conversion process

When parsing a NetScaler configuration file, the conversion tool performs the following actions:

1. In commands that create classic named expressions, the conversion tool replaces the names of the classic expressions with Advanced policy expression.
2. In commands that support only the classic policy, if classic named expressions are used, the conversion tool replaces the names of the classic expressions with the actual classic expressions they represent. This action ensures that the names of expressions in classic-only features do not reference the Advanced policy expression created from Step 1.
3. In commands associated with entities that support both the classic syntax and the Advanced policies, the conversion tool replaces all classic expressions in commands with Advanced policy expressions.

Example:

Consider the following sample configuration commands:

```
1  add policy expression ne_c1 "METHOD == GET"
2  add policy expression ne_c2 "ne_c1 || URL == /*.htm"
3  add filter policy pol1 -rule "ne_c2" -reqAction YES
4  add cmp policy pol2 -rule "REQ.HTTP.HEADER Accept CONTAINS 'text/html'" -resAction COMPRESS
5  add cmp policy pol3 -rule "ne_c1 || ne_c2" -resAction GZIP
```

In the commands that create the classic named expressions ne_c1 and ne_c2, the tool replaces the names of the expressions with actual Advanced policy expression. This action, which corresponds to Step 1 described earlier, results in the following commands:

```
1  add policy expression ne_c2 "HTTP.REQ.METHOD.EQ("GET")"
2
3  add policy expression ne_c1 "HTTP.REQ.URL.SUFFIX.EQ("htm")"
```

The filter policy command supports only the classic syntax. Therefore, the conversion tool replaces the classic named expression ne_c1 with the actual classic expression it represents. Note that the tool replaces ne_c1 in the expression for ne_c2, and then replaces ne_c2 in the filter policy with the classic expression. This action, which corresponds to Step 2 described earlier, results in the following command:

```
add filter policy pol1 -rule "METHOD == GET || URL == /*.htm"-reqAction YES
```

The compression feature supports both classic and Advanced policy expression. Therefore, in the command that creates the compression policy pol2, the conversion tool replaces the expression with
Advanced policy expression. This action, which corresponds to Step 3 described earlier, results in the following command:

```
add cmp policy pol2 -rule "HTTP.REQ.HEADER("Accept").AFTER_STR("text/html").LENGTH.GT(0)" -resAction COMPRESS
```

The command that creates the compression policy pol3 is unaffected by the conversion process because, after the conversion process is complete, ne_c1 and ne_c2 reference the Advanced policy expression that results from Step 1.

Client security messages are not supported in the newer default policy format and, therefore, are lost. The SYS.EVAL_CLASSIC_EXPR function is replaced with a Advanced policy expression. The following entities support the SYS.EVAL_CLASSIC_EXPR function:

- DNS policies
- Rate limit selectors
- Cache selectors
- Cache policies
- Content switching policies
- Rewrite policies
- URL transformation policies
- Responder policies
- Application firewall policies
- Authorization policies
- Compression policies
- CVPN access policies

After performing the conversion, the tool saves the changes in a new configuration file. The new configuration file is created in the directory in which the input file exists. The name of the new configuration file is the same as the name of the input configuration file except for the string new_ used as a prefix.

Conversion warnings are reported in a warning line at the end of the screen output. Additionally, a warning file is created in the directory in which the input configuration file resides. For more information about the warning file and the types of warnings that are reported, see “Conversion warnings.”

**Convert expressions**

You can use the nspepi tool to convert a single classic expression to the Advanced policy expression. The nspepi tool must be run from the shell prompt on the NetScaler appliance.
**Convert a classic expression to the Advanced policy by using the CLI**

At the shell prompt, type:

```
'nspepi -e "<classic expression>"
```

**Example:**

```plaintext
1 root@NS# nspepi -e "REQ.HTTP.URL == /*.htm"
2 "HTTP.REQ.URL.REGEX_MATCH(re#/(.*).htm#)"
```

**Convert a NetScaler configuration file**

You can use the nspepi tool to convert all the classic expressions in a NetScaler configuration file to the Advanced policy (except for those commands that do not support the Advanced policy). The nspepi tool must be run from the shell prompt on the NetScaler appliance.

**Convert all the classic expressions in a NetScaler configuration file to the default syntax by using the CLI**

At the shell prompt, type:

```
nspepi -f "<ns config file>" -v
```

**Example:**

```plaintext
1 root@NS# nspepi -f ns.conf
2 OUTPUT: New configuration file created: new_ns.conf
3 OUTPUT: New warning file created: warn_ns.conf
4 WARNINGS: Total number of warnings due to bind commands: 18
5 WARNINGS: Line numbers which has bind command issues: 305, 306, 706, 707, 708, 709, 710, 711, 712, 713, 714, 715, 767, 768, 774, 775, 776, 777
6 root@NS#
```

**Conversion warnings**

When classic expressions that are included in CLI commands are upgraded to the Advanced policy, the number of characters in the expression might exceed the 1499-character limit. The commands that include expressions longer than 1499 characters fail when the configuration is being applied. You must manually update these commands.
In addition, multiple classic policies can be bound to a given bind point with priority 0 or with equal priority, but the Advanced policy infrastructure does not support a priority value of 0 or policies with the same priority at a given bind point. These commands fail when the configuration is being applied. The commands must be updated manually with the correct priority values.

The line numbers of lines that threw a warning during conversion are listed at the end of the output in a warning line. In addition, a warning file is created in the same directory as the one in which the old and new configuration files reside. The name of the warning file is the same as the name of the input configuration file except that the string warn_ is added as a prefix.

**Before you proceed**

September 24, 2018

Before configuring expressions and policies, be sure you understand the relevant NetScaler feature and the structure of your data, as follows:

- Read the documentation on the relevant feature.
- Look at the data stream for the type of data that you want to configure.

You may want to run a trace on the type of traffic or content that you want to configure. This will give you an idea of the parameters and values, and operations on these parameters and values, that you need to specify in an expression.

**Note:** The NetScaler supports either classic or Advanced policy within a feature. You cannot have both types in the same feature. Over the past few releases, some NetScaler features have migrated from using classic policies and expressions to Advanced policy and expressions. If a feature of interest to you has changed to the Advanced policy format, you may have to manually migrate the older information. Following are guidelines for deciding if you need to migrate your policies:

- If you configured classic policies in a version of the Integrated Caching feature prior to release 9.0 and then upgrade to version 9.0 or later, there is no impact. All legacy policies are migrated to the Advanced policy format.
- For other features, you need to manually migrate classic policies and expressions to the Advanced syntax if the feature has migrated to the Advanced policy.

**Configure advanced policy infrastructure**

September 24, 2018

You can create advanced policies for various NetScaler features, including DNS, Rewrite, Responder, and Integrated Caching, and the clientless access function in the NetScaler Gateway. Policies control the behavior of these features.
When you create a policy, you assign it a name, a rule (an expression), feature-specific attributes, and an action that is taken when data matches the policy. After creating the policy, you determine when it is invoked by binding it globally or to either request-time or response-time processing for a virtual server.

Policies that share the same bind point are known as a policy bank. For example, all policies that are bound to a virtual server constitute the policy bank for the virtual server. When binding the policy, you assign it a priority level to specify when it is invoked relative to other policies in the bank. In addition to assigning a priority level, you can configure an arbitrary evaluation order for policies in a bank by specifying Goto expressions.

In addition to policy banks that are associated with a built-in bind point or a virtual server, you can configure policy labels. A policy label is a policy bank that is identified by an arbitrary name. You invoke a policy label, and the policies in it, from a global or virtual-server-specific policy bank. A policy label or a virtual-server policy bank can be invoked from multiple policy banks.

For some features, you can use the policy manager to configure and bind policies.

**Rules for names in identifiers used in policies**

September 24, 2018

The names of identifiers in the named expression, HTTP callout, pattern set, and rate limiting features must begin with an ASCII alphabet or an underscore (_). The remaining characters can be ASCII alphanumeric characters or underscores (_).

The names of these identifiers must not begin with the following reserved words:

- The words ALT, TRUE, or FALSE or the Q or S one-character identifier.
- The special-syntactic indicator RE (for regular expressions) or XP (for XPath expressions).
- Expression prefixes, which currently are the following:
  - CLIENT
  - EXTEND
  - HTTP
  - SERVER
  - SYS
  - TARGET
  - TEXT
  - URL
  - MYSQL
  - MSSQL
Additionally, the names of these identifiers cannot be the same as the names of enumeration constants used in the policy infrastructure. For example, the name of an identifier cannot be IGNORE-CASE, YEAR, or LATIN2_CZECH_CS (a MySQL character set).

**Note:** The NetScaler appliance performs a case-insensitive comparison of identifiers with these words and enumeration constants. For example, names of the identifiers cannot begin with TRUE, True, or true.

### Create or modify a policy

September 24, 2018

All policies have some common elements. Creating a policy consists, at minimum, of naming the policy and configuring a rule. The policy configuration tools for the various features have areas of overlap, but also differences. For the details of configuring a policy for a particular feature, including associating an action with the policy, see the documentation for the feature.

To create a policy, begin by determining the purpose of the policy. For example, you may want to define a policy that identifies HTTP requests for image files, or client requests that contain an SSL certificate. In addition to knowing the type of information that you want the policy to work with, you need to know the format of the data that the policy is analyzing.

Next, determine whether the policy is globally applicable, or if it pertains to a particular virtual server. Also consider the effect that the order in which your policies are evaluated (which will be determined by how you bind the policies) will have on the policy that you are about to configure.

### Create a policy by using the CLI

At the command prompt, type the following commands to create a policy and verify the configuration:

```
1 - add responder|dns|cs|rewrite|cache policy <policyName> -rule <expression> [feature-specific information]
2
3 - show rewrite policy <name>
```

**Example 1:**

```
1 add rewrite policy "pol_remove-ae" true "act_remove-ae"
2 Done
3 > show rewrite policy pol_remove-ae
4 Name: pol_remove-ae
```
Example 2:

1. add cache policy BranchReportsCachePolicy -rule q{
   2. http.req.url.query.value("actionoverride").contains("branchReports")
}
3. -action cache
4. Done
5. show cache policy BranchReportsCachePolicy
   6. Name: BranchReportsCachePolicy
   7. Rule: http.req.url.query.value("actionoverride").contains("branchReports")
   8. CacheAction: CACHE
   9. Stored in group: DEFAULT
10. UndefAction: Use Global
11. Hits: 0
12. Undef Hits: 0
13. Done

**Note:** At the command line, quote marks within a policy rule (the expression) must be escaped or delimited with the q delimiter. For more information, see [Configure advanced policy expressions: Get started](#).

**Create or modify a policy by using the GUI**

1. In the navigation pane, expand the name of the feature for which you want to configure a policy, and then click Policies. For example, you can select Content Switching, Integrated Caching, DNS, Rewrite, or Responder.
2. In the details pane, click Add, or select an existing policy and click Open. A policy configuration dialog box appears.
3. Specify values for the following parameters. (An asterisk indicates a required parameter. For a term in parentheses, see the corresponding parameter in “Parameters for creating or modifying a policy.”)
4. Click Create, and then click Close.
5. Click Save. A policy is added.
   Note: After you create a policy, you can view the policy’s details by clicking the policy entry in the configuration pane. Details that are highlighted and underlined are links to the corresponding entity (for example, a named expression).

Policy configuration examples

September 24, 2018

These examples show how policies and their associated actions are entered at the command line interface. In the GUI, the expressions would appear in the Expression window of the feature-configuration dialog box for the integrated caching or rewrite feature.

Following is an example of creating a caching policy. Note that actions for caching policies are built in, so you do not need to configure them separately from the policy.

```plaintext
1 add cache policy BranchReportsCachePolicy -rule q{
2   http.req.url.query.value("actionoverride").contains("branchReports") }
3 -action cache
```

Following is an example of a rewrite policy and action:

```plaintext
1 add rewrite action myAction1 INSERT_HTTP_HEADER "myHeader" "valueForMyHeader"
2 add rewrite policy myPolicy1 "http.req.url.contains("myURLstring")" myAction1
```

Note: At the command line, quote marks within a policy rule (the expression) must be escaped or delimited with the q delimiter. For more information, see Configure advanced policy expressions: Get started.

Bind policies using advanced policy

September 24, 2018

After defining a policy, you indicate when the policy is to be invoked by binding the policy to a bind point and specifying a priority level. You can bind a policy to only one bind point. A bind point can be global, that is, it can apply to all virtual servers that you have configured. Or, a bind point can be specific to a particular virtual server, which can be either a load balancing or a content switching virtual server. Not all bind points are available for all features.
The order in which policies are evaluated determines the order in which they are applied, and features typically evaluate the various policy banks in a particular order. Sometimes, however, other features can affect the order of evaluation. Within a policy bank, the order of evaluation depends on the values of parameters configured in the policies. Most features apply all of the actions associated with policies whose evaluation results in a match with the data that is being processed. The integrated caching feature is an exception.

**Feature-specific differences in policy bindings**

You can bind policies to built-in, global bind points (or banks), to virtual servers, or to policy labels. However, the NetScaler features differ in terms of the types of bindings that are available. The following table summarizes how you use policy bindings in various NetScaler features that use policies.

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Virtual Servers Configured in the Feature</th>
<th>Policies Configured in the Feature</th>
<th>Bind Points Configured for the Policies</th>
<th>Use of Policies in the Feature</th>
</tr>
</thead>
<tbody>
<tr>
<td>DNS</td>
<td>none</td>
<td>DNS policies</td>
<td>Global</td>
<td>To determine how to perform DNS resolution for requests.</td>
</tr>
<tr>
<td>Content Switching</td>
<td>Content Switching (Note: This feature can support either or classic or Advanced policies, but not both.)</td>
<td>Content Switching policies</td>
<td>Content switching or cache redirection virtual server; Policy label</td>
<td>To determine what server or group of servers is responsible for serving responses, based on characteristics of an incoming request. Request characteristics include device type, language, cookies, HTTP method, content type, and associated cache server.</td>
</tr>
<tr>

<td>Clientless Access policies</td>
<td>VPN Global, VPN server</td>
<td>To determine how the NetScaler Gateway performs authentication, authorization, auditing, and other functions, and to define rewrite rules for general Web access using the NetScaler Gateway.</td>
</tr>
</tbody>
</table>

**Bind points and order of evaluation**

For a policy to take effect, you must ensure that the policy is invoked at some point during processing. To do so, you associate the policy with a bind point. The collection of policies that is bound to a bind point is known as a policy bank.

Following are the bind points that the NetScaler evaluates, listed in the typical order of evaluation within a policy bank:

1. **Request-time override.** When a request flows through a feature, the NetScaler first evaluates request-time override policies for the feature.
2. **Request-time Load Balancing virtual server.** If policy evaluation cannot be completed after all the request-time override policies have been evaluated, the NetScaler processes request-time policies for load balancing virtual servers.
3. **Request-time Content Switching virtual server.** If policy evaluation cannot be completed after all the request-time policies for load balancing virtual servers have been evaluated, the NetScaler processes request-time policies for content switching virtual servers.
4. **Request-time default.** If policy evaluation cannot be completed after all request-time, virtual server-specific policies have been evaluated, the NetScaler processes request-time Advanced policies.
5. **Response-time override.** At response time, the NetScaler starts with policies that are bound to the response-time override bind point.

6. **Response-time Load Balancing virtual server.** If policy evaluation cannot be completed after all response-time override policies have been evaluated, the NetScaler processes the response-time policies for load balancing virtual servers.

7. **Response-time Content Switching virtual server.** If policy evaluation cannot be completed after all policies have been evaluated for load balancing virtual servers, the NetScaler processes the response-time policies for content switching virtual servers.

8. **Response-time default.** If policy evaluation cannot be completed after all response-time, virtual-server-specific policies have been evaluated, the NetScaler processes response-time Advanced policies.

**Policy evaluation across features**

In addition to attending to evaluation of policies within a feature, if you have bound policies to a content switching virtual server, note that these policies are evaluated before other policies. Binding a policy to a content switching vserver produces a different result in NetScaler versions 9.0.x and later than in 8.x versions. In NetScaler 9.0 and later versions, evaluation occurs as follows:

- Content switching policies are evaluated before other policies. If a content switching policy evaluates to TRUE, the target load balancing vserver is selected.
- If all content switching policies evaluate to FALSE, the default load balancing vserver under the content switching VIP is selected.

After a target load balancing vserver is selected by the content switching process, policies are evaluated in the following order:

1. Policies that are bound to the global override bind point.
2. Policies that are bound to the default load balancing vserver.
3. Policies that are bound to the target content switching vserver.
4. Policies that are bound to the global default bind point.

To be sure that the policies are evaluated in the intended order, follow these guidelines:

- Make sure that the default load balancing vserver is not directly reachable from the outside; for example, the vserver IP address can be 0.0.0.0.
- To prevent exposing internal data on the load balancing default vserver, configure a policy to respond with a “503 Service Unavailable” status and bind it to the default load balancing vserver.

**Entries in a policy bank**

Each entry in a policy bank has, at minimum, a policy and a priority level. You can also configure entries that change the priority-based evaluation order, and you can configure entries that invoke
external policy banks.

The following table summarizes each entry in a policy bank.

<table>
<thead>
<tr>
<th>Policy Name</th>
<th>Priority</th>
<th>Goto Expression</th>
<th>Invocation Type</th>
<th>Policy Bank to Be Invoked</th>
</tr>
</thead>
<tbody>
<tr>
<td>The policy name, or a “dummy” policy named NOPOLICY. The NOPOLICY entry controls evaluation flow without processing a rule.</td>
<td>An integer.</td>
<td>Optional. Identifies the next policy in the bank to evaluate, or ends any further evaluation</td>
<td>Optional. Indicates that an external policy bank will be invoked. This field restricts the choices to a global policy label or a virtual server.</td>
<td>Optional. Used with Invocation Type. This is the label for a policy bank or a virtual server name. The NetScaler returns to the current bank after processing the external bank.</td>
</tr>
</tbody>
</table>

If the policy evaluates to TRUE, the NetScaler stores the action that is associated with the policy. If the policy evaluates to FALSE, the NetScaler evaluates the next policy. If the policy is neither TRUE nor FALSE, the NetScaler uses the associated Undef (undefined) action.

**Evaluation order within a policy bank**

Within a policy bank, the evaluation order depends on the following items:

- **A priority.**
  
  The most minimal amount of information about evaluation order is a numeric priority level. The lower the number, the higher the priority.

- **A Goto expression.**
  
  If supplied, the Goto expression indicates the next policy to be evaluated, typically within the same policy bank. Goto expressions can only proceed forward in a bank. To prevent looping, a policy bank configuration is not valid if a Goto statement points backwards in the bank.

- **Invocation of other policy banks.**
  
  Any entry can invoke an external policy bank. The NetScaler provides a built-in entity named NOPOLICY that does not have a rule. You can add a NOPOLICY entry in a policy bank when you
want to invoke another policy bank, but do not want to process any other rules prior to the invocation. You can have multiple NOPOLICY entries in multiple policy banks.

Values for a Goto expression are as follows:

- **NEXT.**
  
  This keyword selects the policy with the next higher priority level in the current policy bank.

- **An integer.**
  
  If you supply an integer, it must match the priority level of another policy in the current policy bank.

- **END.**
  
  This keyword stops evaluation after processing the current policy, and no additional policies in this bank are processed.

- **Blank.**
  
  If the Goto expression is empty, it is the same as specifying END.

- **A numeric expression.**
  
  This is an advanced policy expression that resolves to a priority number for another policy in the current bank.

- **USE_INVOCATION_RESULT.**
  
  This phrase can be used only if you are invoking an external policy bank. Entering this phrase causes the NetScaler to perform one of the following actions:
  
  - If the final Goto in the invoked policy bank has a value of END or is empty, the invocation result is END, and evaluation stops.
  
  - If the final Goto expression in the invoked policy bank is anything other than END, the NetScaler performs a NEXT.

The following table illustrates a policy bank that uses Goto statements and policy bank invocations.

<table>
<thead>
<tr>
<th>Policy Name</th>
<th>Priority</th>
<th>Goto</th>
<th>Invocation</th>
<th>Policy Bank to Be Invoked</th>
</tr>
</thead>
<tbody>
<tr>

How policy evaluation ends

Evaluation of a policy bank ends when one of the following takes place:

- A policy evaluates to TRUE and its Goto statement value is END.
  No further policies or policy banks in this feature are evaluated.

- An external policy bank is invoked, its evaluation returns an END, and the Goto statement uses a value of USE_INVOCATION_RESULT or END.
  Evaluation continues with the next policy bank for this feature. For example, if the current bank is the request-time override bank, the NetScaler next evaluates request-time policy banks for the virtual servers.

- The NetScaler has walked through all the policy banks in this feature, but has not encountered an END.
  If this is the last entry to be evaluated in this policy bank, the NetScaler proceeds to the next feature.
**How features use actions after policy evaluation**

After evaluating all relevant policies for a particular data point (for example, an HTTP request), the NetScaler stores all the actions that are associated with any policy that matched the data.

For most features, all the actions from matching policies are applied to a traffic packet as it leaves the NetScaler. The Integrated Caching feature only applies one action: CACHE or NOCACHE. This action is associated with the policy with the lowest priority value in the “highest priority” policy bank (for example, request-time override policies are applied before virtual server-specific policies).

**Bind a policy globally**

September 24, 2018

The following binding procedures are typical. However, refer to the documentation for the feature of interest to you for complete instructions.

**Bind an integrated caching policy globally by using the CLI**

At the command prompt, type the following commands to bind an Integrated Caching policy and verify the configuration:

```
1 - bind cache global <policy> -priority <positiveInteger> [-type REQ_OVERRIDE | REQ_DEFAULT | RES_OVERRIDE | RES_DEFAULT]
2
3 - show cache global
```

**Example:**

```
1 > bind cache global _nonPostReq -priority 100 -type req_default
 Done
3 > show cache global
4  1) Global bindpoint: REQ_DEFAULT
  Number of bound policies: 2
6
7  2) Global bindpoint: RES_DEFAULT
  Number of bound policies: 1
9 Done
```

The type argument is optional to maintain backward compatibility. If you omit the type, the policy is bound to REQ_DEFAULT or RES_DEFAULT, depending on whether the policy rule is a response-time or a request-time expression.
**Bind a rewrite policy globally by using the CLI**

At the command prompt, type the following commands to bind a Rewrite policy and verify the configuration:

```
1 - bind rewrite global <policyName> <priority> [-type REQ_OVERRIDE | REQ_DEFAULT | RES_OVERRIDE | RES_DEFAULT]
2
3 - show rewrite global
```

**Example:**

```
1 bind rewrite global pol_remove-pdf 100
2 Done
3 > show rewrite global
4 1) Global bindpoint: REQ_DEFAULT
5 Number of bound policies: 1
6
7 2) Global bindpoint: REQ_OVERRIDE
8 Number of bound policies: 1
9
10 Done
```

The type argument is optional for globally bound policies, to maintain backward compatibility. If you omit the type, the policy is bound to REQ_DEFAULT or RES_DEFAULT, depending on whether the policy rule is a response-time or a request-time expression.

**Bind a compression policy globally by using the CLI**

At the command prompt, type the following commands to bind a compression policy and verify the configuration:

```
1 - bind cmp global <policyName> -priority <positiveInteger> [-type REQ_OVERRIDE | REQ_DEFAULT | RES_OVERRIDE | RES_DEFAULT]
2
3 - show cmp global
```

**Example:**

```
1 > bind cmp global cmp_pol_1 -priority 100
2 Done
3 > show cmp policy cmp_pol_1
4  Name:  cmp_pol_1
5  Rule:  HTTP.REQ.URL.SUFFIX.EQ(“BMP”)
```
Bind a responder policy globally by using the CLI

At the command prompt, type the following commands to bind a Responder policy and verify the configuration:

```
1 - bind responder global <policyName> <priority> [-type OVERRIDE | DEFAULT ]
2
3 - show responder global
```

Example:
```
1 bind responder global pol404Error1 200
2 Done
3 > show responder global
4 1) Global bindpoint: REQ_DEFAULT
5 Number of bound policies: 1
6
7 Done
```

Bind a DNS policy globally by using the CLI

At the command prompt, type the following commands to bind a DNS policy and verify the configuration:

```
1 - bind dns global <policyName> <priority>
2
3 - show dns global
```

Example:
```
1 > bind dns global pol_ddos_drop1 150
2 Done
```
Bind an integrated caching, responder, rewrite, or compression policy globally by using the GUI

1. In the navigation pane, click the name of the feature for which you want to bind the policy.
2. In the details pane, click <Feature Name> policy manager.
3. In the Policy Manager dialog box, select the bind point to which you want to bind the policy (for example, for Integrated Caching, Rewrite, or Compression, you could select Request and Default Global). The Responder does not differentiate between request-time and response-time policies.
4. Click Insert Policy and, from the Policy Name pop-up menu, select the policy name. A priority is assigned automatically to the policy, but you can click the cell in the Priority column and drag it anywhere within the dialog box if you want the policy to be evaluated after other policies in this bank. The priority is automatically reset. Note that priority values within a policy bank must be unique.
5. Click Apply Changes.
6. Click Close. A message in the status bar indicates that the policy is bound successfully.

Bind a DNS policy globally by using the GUI

1. Navigate to Traffic Management > DNS > Policies.
2. In the details pane, click Global Bindings.
3. In the global bindings dialog box, click Insert Policy, and select the policy that you want to bind globally.
4. Click in the Priority field and enter the priority level.
5. Click OK. A message in the status bar indicates that the policy is bound successfully.

Bind a policy to a virtual server

September 24, 2018

A globally bound policy applies to all load balancing and content switching virtual servers.
NetScaler 12.0

Note that when binding a policy to a virtual server, you must identify it as a request-time or a response-time policy.

**Bind a policy to a load balancing or content switching virtual server by using the CLI**

At the command prompt, type the following commands to bind a policy to a load balancing or content switching virtual server and verify the configuration:

```bash
1 - bind lb|cs vserver <virtualServerName> -policyName <policyName> -priority <positiveInteger> -type REQUEST|RESPONSE
2 - show lb vserver <name>
```

**Example:**

```
1 > bind lb vserver lbvip -policyName ns_cmp_msapp -priority 50
2 Done
3 > show lb vserver lbvip
   lbvip (8.7.6.6:80) - HTTP        Type: ADDRESS
   State: DOWN
   Last state change was at Wed Jul 15 05:54:24 2009 (+226 ms)
   Time since last state change: 28 days, 01:57:26.350
   Effective State: DOWN
   Client Idle Timeout: 180 sec
   Down state flush: ENABLED
   Disable Primary Vserver On Down : DISABLED
   Port Rewrite : DISABLED
   No. of Bound Services : 0 (Total)      0 (Active)
   Configured Method: LEASTCONNECTION
   Mode: IP
   Persistence: NONE
   Vserver IP and Port insertion: OFF
   Push: DISABLED   Push VServer:
   Push Multi Clients: NO
   Push Label Rule: none

22 1) Policy : ns_cmp_msapp Priority:50
23 2) Policy : cf-pol Priority:1     Inherited
24 Done
```
Bind a policy to an SSL offload virtual server by using the CLI

At the command prompt, type the following commands to bind a policy to an SSL offload virtual server and verify the configuration:

```
bind ssl vserver <vServerName>@ -policyName <policyName> -priority <positiveInteger>
```

Bind a policy to a virtual server by using the GUI

1. In the navigation pane, expand Traffic Management > Load Balancing, Traffic Management > Content Switching, Traffic Management > SSL Offload, Security > AAA- Application Traffic, or NetScaler Gateway, and then click Virtual Servers.
2. In the details pane, double-click the virtual server to which you want to bind the policy, and then click Open.
3. On the Policies tab, click the icon for the type of policy that you want to bind (the choices are feature-specific), and then click the name of the policy. Note that for some features, you can bind both classic policies and policies that use the default syntax to the virtual server.
4. If you are binding a policy to a Content Switching virtual server, in the Target field select a load balancing virtual server to which traffic that matches the policy is sent.
5. Click OK. A message in the status bar indicates that the policy is bound successfully.

Display policy bindings

September 24, 2018

You can display policy bindings to verify that they are correct.

Display policy bindings by using the CLI

At the command prompt, type the following commands to display policy bindings and verify the configuration:

```
show rewrite policy <name>
```

Example:

```
1 > show rewrite policy pol_remove-pdf
2     Name: pol_remove-pdf
3     Rule: http.req.url.contains(".pdf")
4     RewriteAction: act_remove-ae
5     UndefAction: Use Global
```
Display global policy bindings for integrated caching, rewrite, or responder by using the GUI

1. In the navigation pane, expand the feature that contains the policy that you want to view, and then click Policies.
2. In the details pane, click the policy. Bound policies have a check mark next to them.
3. At the bottom of the page, under Details, next to Bound to, view the entity to which the policy is bound.

Display global policy bindings for DNS or clientless access in the NetScaler Gateway by using the GUI

1. Navigate to Traffic Management > DNS > Policies.
2. In the details pane, click Global Bindings.

Display global policy bindings for content switching by using the GUI

1. Navigate to Traffic Management > Content Switching > Policies.
2. In detailed pane, select policy.
3. In the details pane, click Show Bindings.

Unbind a policy

September 24, 2018

If you want to re-assign a policy or delete it, you must first remove its binding.
Unbind an integrated caching, rewrite, or compression advanced policy globally by using the CLI

At the command prompt, type the following commands to unbind an integrated caching, rewrite, or compression Advanced policy globally and verify the configuration:

```
1 - unbind cache|rewrite|cmp global <policyName> [-type req_override| req_default|res_override|res_default] [-priority <positiveInteger>]
2
3 - show cache|rewrite|cmp global
```

Example:

```
1 > unbind cache global_nonPostReq
2   Done
3 > show cache global
4   1) Global bindpoint: REQ_DEFAULT
5       Number of bound policies: 1
6
7   2) Global bindpoint: RES_DEFAULT
8       Number of bound policies: 1
9
10  Done
```

The priority is required only for the “dummy” policy named NOPOLICY.

Unbind a responder policy globally by using the CLI

At the command prompt, type the following commands to unbind a responder policy globally and verify the configuration:

```
1 - unbind responder global <policyName> [-type override|default] [-priority <positiveInteger>]
2
3 - show responder global
```

Example:

```
1 > unbind responder global pol404Error
2   Done
3 > show responder global
4   1) Global bindpoint: REQ_DEFAULT
5       Number of bound policies: 1
6   Done
```
The priority is required only for the “dummy” policy named NOPOLICY.

**Unbind a DNS policy globally by using the CLI**

At the command prompt, type the following commands to unbind a DNS policy globally and verify the configuration:

1. `unbind responder global <policyName>`
2. `unbind responder global`

**Example:**

1. `unbind dns global dfgdfg`
2. `Done`
3. `show dns global`
4. `Policy name : dfgdfggfhg`
5. `Priority : 100`
6. `Goto expression : END`
7. `Done`

**Unbind an advanced policy from a virtual server by using the CLI**

At the command prompt, type the following commands to unbind an Advanced policy from a virtual server and verify the configuration:

1. `unbind cs vserver <name> -policyName <policyName> [-priority <positiveInteger>] [-type REQUEST|RESPONSE]`
2. `show lb vserver <name>`

**Example:**

1. `unbind cs vserver vs-cont-switch -policyName poll`
2. `Done`
3. `show cs vserver vs-cont-switch`
4. `vs-cont-switch (10.102.29.10:80) - HTTP Type: CONTENT`
5. `State: UP`
6. `Last state change was at Wed Aug 19 08:56:55 2009 (+18 ms)`
7. `Time since last state change: 0 days, 02:47:55.750`
8. `Client Idle Timeout: 180 sec`
9. `Down state flush: ENABLED`
10. `Disable Primary Vserver On Down : DISABLED`
The priority is required only for the “dummy” policy named NOPOLICY.

Unbind an integrated caching, responder, rewrite, or compression Advanced policy globally by using the GUI

1. In the navigation pane, click the feature with the policy that you want to unbind (for example, Integrated Caching).
2. In the details pane, click <Feature Name> policy manager.
3. In the Policy Manager dialog box, select the bind point with the policy that you want to unbind, for example, Advanced Global.
4. Click the policy name that you want to unbind, and then click Unbind Policy.
5. Click Apply Changes.
6. Click Close. A message in the status bar indicates that the policy is unbound successfully.

Unbind a DNS policy globally by using the GUI

1. Navigate to Traffic Management > DNS > Policies.
2. In the details pane, click Global Bindings.
3. In the Global Bindings dialog box, select policy and click unbind policy.
4. Click OK. A message in the status bar indicates that the policy is unbinded successfully.

Unbind an advanced policy from a load balancing or content switching virtual server by using the GUI

1. Navigate to Traffic Management, and expand Load Balancing or Content Switching, and then click Virtual Servers.
2. In the details pane, double-click the virtual server from which you want to unbind the policy.
3. On the Policies tab, in the Active column, clear the check box next to the policy that you want to unbind.
4. Click OK. A message in the status bar indicates that the policy is unbinded successfully.
Create policy labels

September 24, 2018

In addition to the built-in bind points where you set up policy banks, you can also configure user-defined policy labels and associate policies with them.

Within a policy label, you bind policies and specify the order of evaluation of each policy relative to others in the bank of policies for the policy label. The NetScaler also permits you to define an arbitrary evaluation order as follows:

- You can use “goto” expressions to point to the next entry in the bank to be evaluated after the current one.
- You can use an entry in a policy bank to invoke another bank.

Each feature determines the type of policy that you can bind to a policy label, the type of load balancing virtual server that you can bind the label to, and the type of content switching virtual server from which the label can be invoked. For example, a TCP policy label can only be bound to a TCP load balancing virtual server. You cannot bind HTTP policies to a policy label of this type. And you can invoke a TCP policy label only from a TCP content switching virtual server.

After configuring a new policy label, you can invoke it from one or more banks for the built-in bind points.

Create a caching policy label by using the CLI

At the command prompt, type the following commands to create a Caching policy label and verify the configuration:

```
1 - add cache policylabel <labelName> -evaluates req|res
2
3 - show cache policylabel <labelName>
```

Example:

```
1 > add cache policylabel lbl-cache-pol -evaluates req
Done
3
4 > show cache policylabel lbl-cache-pol
   Label Name: lbl-cache-pol
   Evaluates: REQ
6   Number of bound policies: 0
7   Number of times invoked: 0
9 Done
```
Create a content switching policy label by using the CLI

At the command prompt, type the following commands to create a Content Switching policy label and verify the configuration:

```
1 - add cs policylabel <labelName> http|tcp|rtsp|ssl
2
3 - show cs policylabel <labelName>
```

Example:

```
1 > add cs policylabel lbl-cs-pol http
2   Done
3 > show cs policylabel lbl-cs-pol
4   Label Name: lbl-cs-pol
5   Label Type: HTTP
6   Number of bound policies: 0
7   Number of times invoked: 0
8   Done
```

Create a rewrite policy label by using the CLI

At the command prompt, type the following commands to create a Rewrite policy label and verify the configuration:

```
1 - add rewrite policylabel <labelName> http_req|http_res|url|text|clientless_vpn_req|clientless_vpn_res
2
3 - show rewrite policylabel <labelName>
```

Example:

```
1 > add rewrite policylabel lbl-rewrt-pol http_req
2   Done
3
4 > show rewrite policylabel lbl-rewrt-pol
5   Label Name: lbl-rewrt-pol
6   Transform Name: http_req
7   Number of bound policies: 0
8   Number of times invoked: 0
9   Done
```
Create a responder policy label by using the CLI

At the command prompt, type the following commands to create a Responder policy label and verify the configuration:

```plaintext
1 - add responder policylabel <labelName>
2
3 - show responder policylabel <labelName>
```

**Example:**

```plaintext
1 > add responder policylabel lbl-respndr-pol
2 Done
3
4 > show responder policylabel lbl-respndr-pol
5 Label Name: lbl-respndr-pol
6 Number of bound policies: 0
7 Number of times invoked: 0
8 Done
```

**Note:** Invoke this policy label from a policy bank. For more information, see the “Binding a Policy to a Policy Label” section.

Create a policy label by using the GUI

1. In the navigation pane, expand the feature for which you want to create a policy label, and then click Policy Labels. The choices are Integrated Caching, Rewrite, Content Switching, or Responder.
2. In the details pane, click Add.
3. In the Name box, enter a unique name for this policy label.
4. Enter feature-specific information for the policy label. For example, for Integrated Caching, in the Evaluates drop-down menu, you would select REQ if you want this policy label to contain request-time policies, or select RES if you want this policy label to contain response-time policies. For Rewrite, you would select a Transform name.
5. Click Create.
6. Configure one of the built-in policy banks to invoke this policy label. For more information, see the “Binding a Policy to a Policy Label” section. A message in the status bar indicates that the policy label is created successfully.
Bind a policy to a policy label

As with policy banks that are bound to the built-in bind points, each entry in a policy label is a policy that is bound to the policy label. As with policies that are bound globally or to a vserver, each policy that is bound to the policy label can also invoke a policy bank or a policy label that is evaluated after the current entry has been processed. The following table summarizes the entries in a policy label.

- **Name.** The name of a policy, or, to invoke another policy bank without evaluating a policy, the “dummy” policy name NOPOLICY.

  You can specify NOPOLICY more than once in a policy bank, but you can specify a named policy only once.

- **Priority.** An integer. This setting can work with the Goto expression.

- **Goto Expression.** Determines the next policy to evaluate in this bank. You can provide one of the following values:
  - **NEXT.** Go to the policy with the next higher priority.
  - **END.** Stop evaluation.
  - **USE_INVOCATION_RESULT.** Applicable if this entry invokes another policy bank. If the final Goto in the invoked bank has a value of END, evaluation stops. If the final Goto is anything other than END, the current policy bank performs a NEXT.
  - **Positive number:** The priority number of the next policy to be evaluated.
  - **Numeric expression.** An expression that produces the priority number of the next policy to be evaluated.

  The Goto can only proceed forward in a policy bank.

  If you omit the Goto expression, it is the same as specifying END.

- **Invocation Type.** Designates a policy bank type. The value can be one of the following:
  - **Request Vserver.** Invokes request-time policies that are associated with a virtual server.
  - **Response Vserver.** Invokes response-time policies that are associated with a virtual server.
  - **Policy label.** Invokes another policy bank, as identified by the policy label for the bank.

- **Invocation Name.** The name of a virtual server or a policy label, depending on the value that you specified for the Invocation Type.

Configure a policy label or virtual server policy bank

September 24, 2018
After you have created policies, and created policy banks by binding the policies, you can perform additional configuration of policies within a label or policy bank. For example, before you configure invocation of an external policy bank, you might want to wait until you have configured that policy bank.

This topic includes the following sections:

- Configure a policy label
- Configure a policy bank for a virtual server

**Configure a policy label**

A policy label consists of a set of policies and invocations of other policy labels and virtual server-specific policy banks. An Invoke parameter enables you to invoke a policy label or a virtual server-specific policy bank from any other policy bank. A special-purpose NoPolicy entry enables you to invoke an external bank without processing an expression (a rule). The NoPolicy entry is a “dummy” policy that does not contain a rule.

For configuring policy labels from the NetScaler command line, note the following elaborations of the command syntax:

- gotoPriorityExpression is configured as described in Table 2. Format of Each Entry in a Policy Bank of the section “Entries in a Policy Bank” in *Bind policies using advanced policy*.
- The type argument is required. This is unlike binding a conventional policy, where this argument is optional.
- You can invoke the bank of policies that are bound to a virtual server by using the same method as you use for invoking a policy label.

**Configure a policy label by using the CLI**

At the command prompt, type the following commands to configure a policy label and verify the configuration:

```
1 - bind cache|rewrite|responder policylabel <policylabelName> -policyName <policyName> -priority <priority> [-gotoPriorityExpression <gotopriorityExpression>] [-invoke reqvserver |resvserver|policylabel <policyLabelName>|<vserverName>]
2
3 - show cache|rewrite|responder policylabel <policylabelName>
```

**Example:**

```
bind cache policylabel _reqBuiltinDefaults -policyName _nonGetReq -priority 100
```
Invoke a policy label from a rewrite policy bank with a NOPOLICY entry by using the CLI

At the command prompt, type the following commands to invoke a policy label from a Rewrite policy bank with a NOPOLICY entry and verify the configuration:

```
1 - bind rewrite global <policyName> <priority> <gotoPriorityExpression>
   -type REQ_OVERRIDE|REQ_DEFAULT|RES_OVERRIDE|RES_DEFAULT -invoke
   reqvserver|resvserver|policylabel <policyLabelName>|<vserverName>
2
3 - show rewrite global
```

Example:

```
1 > bind rewrite global NOPOLICY 100 -type REQ_DEFAULT -invoke
   policylabel lbl-rewrt-pol
   Done
3 > show rewrite global
   1) Global bindpoint: REQ_DEFAULT
      Number of bound policies: 1
   2) Global bindpoint: REQ_OVERRIDE
      Number of bound policies: 1
   Done
```
Invoke a policy label from an Integrated Caching policy bank by using the CLI

At the command prompt, type the following commands to invoke a policy label from an Integrated Caching policy bank and verify the configuration:

```
1 - bind cache global NOPOLICY -priority <priority> -
gotoPriorityExpression <gotopriorityExpression> -type REQ_OVERRIDE|
REQ_DEFAULT|RES_OVERRIDE|RES_DEFAULT -invoke reqvserver|resvserver|policylabel <policyLabelName>|<vserverName>
2
3 - show cache global
```

Example:

```
1 bind cache global NOPOLICY -priority 100 -gotopriorityExpression END -
type REQ_DEFAULT -invoke policylabel lbl-cache-pol
2 Done
3 > show cache global
4 1) Global bindpoint: REQ_DEFAULT
   Number of bound policies: 2
5
6 2) Global bindpoint: RES_DEFAULT
   Number of bound policies: 1
7
8 Done
```

Invoke a policy label from a Responder policy bank by using the CLI

At the command prompt, type the following commands to invoke a policy label from a Responder policy bank and verify the configuration:

```
1 - bind responder global NOPOLICY <priority> <gotopriorityExpression> -
type OVERRIDE|DEFAULT -invoke vserver|policylabel <policyLabelName>
> |<vserverName>
2
3 - show responder global
```

Example:

```
1 > bind responder global NOPOLICY 100 NEXT -type DEFAULT -invoke
   policylabel lbl-respndr-pol
2 Done
3 > show responder global
4 1) Global bindpoint: REQ_DEFAULT
```
Configure a policy label by using the GUI

1. In the navigation pane, expand the feature for which you want to configure a policy label, and then click Policy Labels. The choices are Integrated Caching, Rewrite, or Responder.

2. In the details pane, double-click the label that you want to configure.

3. If you are adding a new policy to this policy label, click Insert Policy, and in the Policy Name field, select New Policy. For more information about adding a policy, see Create or modify a policy. Note that if you are invoking a policy bank, and do not want a rule to be evaluated prior to the invocation, click Insert Policy, and in the Policy Name field select NOPOLICY.

4. For each entry in this policy label, configure the following:
   - **Policy Name:**
     This is already determined by the Policy Name, new policy, or NOPOLICY entry that you inserted in this bank.
   - **Priority:**
     A numeric value that determines either an absolute order of evaluation within the bank, or is used in conjunction with a Goto expression.
   - **Expression:**
     The policy rule. Policy expressions are described in detail in the following chapters. For an introduction, see Configure advanced policy expressions: Get started.
   - **Action:**
     The action to be taken if this policy evaluates to TRUE.
   - **Goto Expression:**
     Optional. Used to augment the Priority level to determine the next policy or policy bank to evaluate. For more information on possible values for a Goto expression, see Table 2. Format of Each Entry in a Policy Bank of the section “Entries in a Policy Bank” in Bind policies using advanced policy.
   - **Invoke:**
     Optional. Invokes another policy bank.

5. Click OK. A message in the status bar indicates that the policy label is configured successfully.
Configure a policy bank for a virtual server

You can configure a bank of policies for a virtual server. The policy bank can contain individual policies, and each entry in the policy bank can optionally invoke a policy label or a bank of policies that you configured for another virtual server. If you invoke a policy label or policy bank, you can do so without triggering an expression (a rule) by selecting a NOPOLICY “dummy” entry instead of a policy name.

Add policies to a virtual server policy bank by using the CLI

At the command prompt, type the following commands to add policies to a virtual server policy bank and verify the configuration:

```
1 - bind lb|cs vserver <virtualServerName> <serviceType> [-policyName <policyName>] [-priority <positiveInteger>] [-gotoPriorityExpression <expression>] [-type REQUEST|RESPONSE]
2
3 - show lb|cs vserver <virtualServerName>
```

Example:

```
1 add lb vserver vs-cont-sw TCP
Done
3 show lb vserver vs-cont-sw
  vs-cont-sw (0.0.0.0:0) - TCP    Type: ADDRESS
  State: DOWN
  Last state change was at Wed Aug 19 10:04:02 2009 (+279 ms)
  Time since last state change: 0 days, 00:02:14.420
  Effective State: DOWN
  Client Idle Timeout: 9000 sec
  Down state flush: ENABLED
  Disable Primary Vserver On Down : DISABLED
  No. of Bound Services : 0 (Total)    0 (Active)
  Configured Method: LEASTCONNECTION
  Mode: IP
  Persistence: NONE
  Connection Failover: DISABLED
Done
```

Invoke a policy label from a virtual server policy bank with a NOPOLICY entry by using the CLI

At the command prompt, type the following commands to invoke a policy label from a virtual server policy bank with a NOPOLICY entry and verify the configuration:
### Bind commands

1. `bind lb|cs vserver <virtualServerName> -policyName NOPOLICY_REWRITE|NOPOLICY_CACHE|NOPOLICY_RESPONDER -priority <integer> -type REQUEST|RESPONSE -gotoPriorityExpression <gotopriorityExpression> -invoke reqVserver|resVserver|policyLabel <vserverName>|<labelName>`

2. `show lb vserver`

### Example:

1. `> bind lb vserver vs-cont-sw -policyName NOPOLICY-REWRITE -priority 200 -type REQUEST -gotoPriorityExpression NEXT -invoke policyLabel lbl-rewrt-pol`
2. `Done`

### Configure a virtual server policy bank by using the GUI

1. In the left navigation pane, expand **Traffic Management > Load Balancing, Traffic Management > Content Switching, Traffic Management > SSL Offload, Security > AAA - Application Traffic**, or **NetScaler Gateway**, as appropriate, and then click Virtual Servers.
2. In the details pane, select the virtual server that you want to configure, and then click Open.
3. In the Configure Virtual Server dialog box click the Policies tab.
4. To create a new policy in this bank, click the icon for the type of policy or policy label that you want to add to the virtual server’s bank of policies, click Insert Policy. Note that if you want to invoke a policy label without evaluating a policy rule, select the NOPOLICY “dummy” policy.
5. To configure an existing entry in this policy bank, enter the following:
   - **Priority:**
     A numeric value that determines either an absolute order of evaluation within the bank or is used in conjunction with a Goto expression.
   - **Expression:**
     The policy rule. Policy expressions are described in detail in the following chapters. For an introduction, see Configuring Advanced Policy Expressions: Getting Started.
   - **Action:**
     The action to be taken if this policy evaluates to TRUE.
   - **Goto Expression:**
     Optional. Determines the next policy or policy bank evaluate. For more information on possible values for a Goto expression, see the section “Entries in a Policy Bank” in Bind policies using advanced policy.
   - **Invoke:**
Optional. To invoke another policy bank, select the name of the policy label or virtual server policy bank that you want to invoke.

6. Click **OK**. A message in the status bar indicates that the policy is configured successfully.

## Invoke or remove a policy label or virtual server policy bank

September 24, 2018

Unlike a policy, which can only be bound once, you can use a policy label or a virtual server's policy bank any number of times by invoking it. Invocation can be performed from two places:

- From the binding for a named policy in a policy bank.
- From the binding for a NOPOLICY “dummy” entry in a policy bank.

Typically, the policy label must be of the same type as the policy from which it is invoked. For example, you would invoke a responder policy label from a responder policy.

Note: When binding or unbinding a global NOPOLICY entry in a policy bank at the command line, you specify a priority to distinguish one NOPOLICY entry from another.

### Invoke a rewrite or integrated caching policy label by using the CLI

At the command prompt, type the one of the following commands to invoke a rewrite or integrated caching policy label and verify the configuration:

```
1 - bind cache global <policy> -priority <positive_integer> [-gotoPriorityExpression <expression>] -type REQ_OVERRIDE|REQ_DEFAULT|RES_OVERRIDE|RES_DEFAULT] -invoke reqvserver|resvserver|policylabel <label_name>
2
3 - bind rewrite global<policy> -priority <positive_integer> [-gotoPriorityExpression <expression>] -type REQ_OVERRIDE|REQ_DEFAULT|RES_OVERRIDE|RES_DEFAULT] -invoke reqvserver|resvserver|policylabel <label_name>
4
5 - show cache global|show rewrite global
```

**Example:**

```
1 > bind cache global _nonPostReq2 -priority 100 -type req_override -invoke policylabel lbl-cache-pol
2   Done
3 > show cache global
```

© 1999-2018 Citrix Systems, Inc. All rights reserved.
Invoke a responder policy label by using the CLI

At the command prompt, type the following commands to invoke a responder policy label and verify the configuration:

```bash
1 - bind responder global <policy_Name> <priority_as_positive_integer> [<gotoPriorityExpression>] -type REQ_OVERRIDE|REQ_DEFAULT|OVERRIDE|DEFAULT -invoke vserver|policylabel <label_name>
2
3 - show responder global
```

Example:

```bash
1 > bind responder global pol404Error1 300 -invoke policylabel lbl-respndr-pol
2 Done
3 > show responder global
4 1) Global bindpoint: REQ_DEFAULT
5 Number of bound policies: 2
6
7 Done
```

Invoke a virtual server policy bank by using the CLI

At the command prompt, type the following commands to invoke a Virtual Server Policy Bank and verify the configuration:

```bash
1 - bind lb vserver <vserver_name> -policyName <policy_Name> -priority <positive_integer> [-gotoPriorityExpression <expression>] -type REQUEST|RESPONSE -invoke reqvserver|resvserver|policylabel <policy_Label_Name>
```
**Example:**

```plaintext
> bind lb vserver lbvip -policyName ns_cmp_msapp -priority 100
Done

> show lb vserver lbvip
lbvip (8.7.6.6:80) - HTTP         Type: ADDRESS
  State: DOWN
  Last state change was at Wed Jul 15 05:54:24 2009 (+166 ms)
  Time since last state change: 28 days, 06:37:49.250
  Effective State: DOWN
  Client Idle Timeout: 180 sec
  Down state flush: ENABLED
  Disable Primary Vserver On Down : DISABLED
  Port Rewrite : DISABLED
  No. of Bound Services : 0 (Total)     0 (Active)
  Configured Method: LEASTCONNECTION
  Mode: IP
  Persistence: NONE
  Vserver IP and Port insertion: OFF
  Push: DISABLED   Push VServer:
  Push Multi Clients: NO
  Push Label Rule: none

  1) CSPolicy: pol-cont-sw   CSVserver: vs-cont-sw   Priority: 100   Hits: 0

  2) Policy : pol-ssl Priority:0
  3) Policy : ns_cmp_msapp Priority:100
  4) Policy : cf-pol Priority:1   Inherited

Done
```

**Remove a rewrite or integrated caching policy label by using the CLI**

At the command prompt, type one of the following commands to remove a rewrite or integrated caching policy label and verify the configuration:

```plaintext
- unbind rewrite global <policyName> -priority <positiveInteger> -type
  REQ_OVERRIDE|REQ_DEFAULT|RES_OVERRIDE|RES_DEFAULT
```
Example:

```bash
1 > unbind rewrite global NOPOLICY -priority 100 -type REQ_OVERRIDE
2 > show rewrite global
3 Done
4 1) Global bindpoint: REQ_DEFAULT
5 Number of bound policies: 1
6
7 Done
```

Remove a responder policy label by using the CLI

At the command prompt, type the following commands to remove a responder policy label and verify the configuration:

```bash
1 - unbind responder global <policyName> -priority <positiveInteger> -type OVERRIDE|DEFAULT
2
3 - show responder global
```

Example:

```bash
1 > unbind responder global NOPOLICY -priority 100 -type REQ_DEFAULT
2 Done
3 > show responder global
4 1) Global bindpoint: REQ_DEFAULT
5 Number of bound policies: 1
6
7 Done
```

Remove a virtual server policy label by using the CLI

At the command prompt, type one of the following commands to remove a Virtual Server policy label and verify the configuration:

```bash
1 - unbind lb vserver <virtualServerName> -policyName NOPOLICY-REWRITE|NOPOLICY-RESPONDER|NOPOLICY-CACHE -type REQUEST|RESPONSE -priority <positiveInteger>
```
NetScaler 12.0

- `unbind cs vserver <virtualServerName> -policyName NOPOLICY-REWRITE|NOPOLICY-RESPONDER|NOPOLICY-CACHE -type REQUEST|RESPONSE -priority < positiveInteger>

- `show lb vserver|show cs vserver`

Example:

```
> unbind lb vserver lbvip -policyName ns_cmp_msapp -priority 200
Done
> show lb vserver lbvip
lbvip (8.7.6.6:80) - HTTP       Type: ADDRESS
    State: DOWN
    Last state change was at Wed Jul 15 05:54:24 2009 (+161 ms)
    Time since last state change: 28 days, 06:47:54.600
    Effective State: DOWN
    Client Idle Timeout: 180 sec
    Down state flush: ENABLED
    Disable Primary Vserver On Down : DISABLED
    Port Rewrite : DISABLED
    No. of Bound Services : 0 (Total)    0 (Active)
    Configured Method: LEASTCONNECTION
    Mode: IP
    Persistence: NONE
    Vserver IP and Port insertion: OFF
    Push: DISABLED   Push VServer:
    Push Multi Clients: NO
    Push Label Rule: none
    1)     CSPolicy: pol-cont-sw  CSVserver: vs-cont-sw  Priority: 100  Hits: 0
    2)     Policy : pol-ssl Priority:0
    2) Policy : cf-pol Priority:1     Inherited
Done
```

**Invoke a policy label or virtual server policy bank by using the GUI**

1. Bind a policy, as described in Bind a policy globally, Bind a policy to a virtual server, or Bind a policy to a policy label. Alternatively, you can enter a NOPOLICY “dummy” entry instead of a policy name. You do this if you do not want to evaluate a policy before evaluating the policy bank.

© 1999-2018 Citrix Systems, Inc. All rights reserved.
2. In the Invoke field, select the name of the policy label or virtual server policy bank that you want to evaluate if traffic matches the bound policy. A message in the status bar indicates that the policy label or virtual server policy bank is invoked successfully.

Remove a policy label invocation by using the GUI

1. Open the policy and clear the Invoke field. Unbinding the policy also removes the invocation of the label. A message in the status bar indicates that the policy label is removed successfully.

Configure and bind policies with the policy manager

September 24, 2018

Warning:

Classic policy expressions are no longer supported from NetScaler 12.0 build 56.20 onwards and as an alternative, Citrix recommends you to use Advanced policies. For more information, see Advanced Policies.

Some applications provide a specialized Policy Manager in the NetScaler GUI to simplify configuring policy banks. It also lets you find and delete policies and actions that are not being used.

The Policy Manager is currently available for the Rewrite, Integrated Caching, Responder, and Compression features.

The following are keyboard equivalents for the procedures in this section:

- For editing a cell in the Policy Manager, you can tab to the cell and click F2 or press the SPACE bar on the keyboard.
- To select an entry in a drop-down menu, you can tab to the entry, press the space bar to view the drop-down menu, use the UP and DOWN ARROW keys to navigate to the entry that you want, and press the space bar again to select the entry.
- To cancel a selection in a drop-down menu, press the Escape key.
- To insert a policy, tab to the row above the insertion point and press Control + Insert, or click Insert Policy.
- To remove a policy, tab to the row that contains the policy and press Delete.

Note: Note that when you delete the policy, the NetScaler searches the Goto Expression values of other policies in the bank. If any of these Goto Expression values match the priority level of the deleted policy, they are removed.
Configure policy bindings by using the policy manager

1. In the navigation pane, click the feature for which you want to configure policies. The choices are Responder, Integrated Caching, Rewrite or Compression.

2. In the details pane, click Policy Manager.

3. If you are configuring classic policy bindings for compression, in the Compression Policy Manager dialog box, click **Switch to Classic Syntax**. The dialog box switches to the classic syntax view and displays the Switch to Advanced Policy button. At any time before you complete configuring policy bindings, if you want to configure bindings for policies that use the Advanced Policy click the Switch to Advanced Policy button.

4. For features other than Responder, to specify the bind point, click Request or Response, and then click one of the request-time or response-time bind points. The options are Override Global, LB Virtual Server, CS Virtual Server, Default Global, or Policy Label. If you are configuring the Responder, the Request and Response flow types are not available.

5. To bind a policy to this bind point, click Insert Policy, and select a previously configured policy, a NOPOLICY label, or the New policy option. Depending on the option that you select, you have the following choices:
   - **New policy**: Create the policy as described in “Create or modify a policy,” and then configure the priority level, GoTo expression, and policy invocation as described in the table, “Format of each entry in a policy bank.”
   - **Existing policy, NOPOLICY, or NOPOLICY<feature name>:** Configure the priority level, GoTo expression, and policy invocation as described in the table, “Format of each entry in a policy bank.” The NOPOLICY or NOPOLICY<feature name> options are available only for policies that use Advanced Policies.

6. Repeat the preceding steps to add entries to this policy bank.

7. To modify the priority level for an entry, you can do any of the following:
   - Double-click the Priority field for an entry and edit the value.
   - Click and drag a policy to another row in the table.
   - Click Regenerate Priorities.

   In all three cases, priority levels of all other policies are modified as needed to accommodate the new value. Goto Expressions with integer values are also updated automatically. For example, if you change a priority value of 10 to 100, all policies with a Goto Expression value of 10 are updated to the value 100.

8. To change the policy, action, or policy bank invocation for an row in the table, click the down arrow to the right of the entry and do one of the following:
• To change the policy, select another policy name or select New Policy and follow the steps in Create or modify a policy.
• To change the Goto Expression, select Next, End, USE_INVOCATION_RESULT, or select more and enter an expression whose result returns the priority level of another entry in this policy bank.
• To modify an invocation, select an existing policy bank, or click New Policy Label and follow the steps in Bind a policy to a policy label.

9. To unbind a policy or a policy label invocation from this bank, click any field in the row that contains the policy or policy label, and then click Unbind Policy.

10. When you are done, click Apply Changes. A message in the status bar indicates that the policy is bound successfully.

Remove unused policies by using the policy manager

1. In the navigation pane, click the feature for which you want to configure the policy bank. The choices are Responder, Integrated Caching, or Rewrite.
2. In the details pane, click <Feature Name> policy manager.
3. In the <Feature Name> Policy Manager dialog box, click Cleanup Configuration.
4. In the Cleanup Configuration dialog box, select the items that you want to delete, and then click Remove.
5. In the Remove dialog box, click Yes.
6. Click Close. A message in the status bar indicates that the policy is removed successfully.

Configuring advanced policy expression: getting started

September 24, 2018

Advanced policies evaluate data on the basis of information that you supply in Advanced policy expressions. An Advanced policy expression analyzes data elements (for example, HTTP headers, source IP addresses, the NetScaler system time, and POST body data). In addition to configuring an Advanced policy expression in a policy, in some NetScaler features, you configure Advanced policy expression outside of the context of a policy.

To create an Advanced policy expression, you select a prefix that identifies a piece of data that you want to analyze, and then you specify an operation to perform on the data. For example, an operation can match a piece of data with a text string that you specify, or it can transform a text string into an HTTP header. Other operations match a returned string with a set of strings or a string pattern. You configure compound expressions by specifying Boolean and arithmetic operators, and by using parentheses to control the order of evaluation.
Advanced policy expression can also contain classic expressions. You can assign a name to a frequently used expression to avoid having to build the expression repeatedly.

Policies and a few other entities include rules that the NetScaler uses to evaluate a packet in the traffic flowing through it, to extract data from the NetScaler system itself, to send a request (a “callout”) to an external application, or to analyze another piece of data. A rule takes the form of a logical expression that is compared against traffic and ultimately returns values of TRUE or FALSE.

The elements of the rule can themselves return TRUE or FALSE, string, or numeric values.

Before configuring an Advanced policy expression, you need to understand the characteristics of the data that the policy or other entity is to evaluate. For example, when working with the Integrated Caching feature, a policy determines what data can be stored in the cache. With Integrated Caching, you need to know the URLs, headers, and other data in the HTTP requests and responses that the NetScaler receives. With this knowledge, you can configure policies that match the actual data and enable the NetScaler to manage caching for HTTP traffic. This information helps you determine the type of expression that you need to configure in the policy.

Basic elements of an advanced policy expression

November 5, 2018

An Advanced policy expression consists of, at a minimum, a prefix (or a single element used in place of a prefix). Most expressions also specify an operation to be performed on the data that the prefix identifies. You format an expression of up to 1,499 characters as follows:

```
<prefix>.<operation> [<compound-operator> <prefix>.<operation> . . ]
```

where

- `<prefix>`

  is an anchor point for starting an expression.

  The prefix is a period-delimited key that identifies a unit of data. For example, the following prefix examines HTTP requests for the presence of a header named Content-Type:

  `http.req.header("Content-Type")`

  Prefixes can also be used on their own to return the value of the object that the prefix identifies.

- `<operation>`

  identifies an evaluation that is to be performed on the data identified by the prefix.

  For example, consider the following expression:

  `http.req.header("Content-Type").eq("text/html")`
In this expression, the following is the operator component:

```
eq("text/html")
```

This operator causes the NetScaler to evaluate any HTTP requests that contain a Content-Type header, and in particular, to determine if the value of this header is equal to the string “text/html.” For more information, see Operations.

- `<compound-operator>`

is a Boolean or arithmetic operator that forms a compound expression from multiple prefix or prefix.operation elements.

For example, consider the following expression:

```
http.req.header("Content-Type").eq("text/html") && http.req.url.contains(".html")
```

### Prefixes

An expression prefix represents a discrete piece of data. For example, an expression prefix can represent an HTTP URL, an HTTP Cookie header, or a string in the body of an HTTP POST request. An expression prefix can identify and return a wide variety of data types, including the following:

- A client IP address in a TCP/IP packet
- NetScaler system time
- An external callout over HTTP
- A TCP or UDP record type

In most cases, an expression prefix begins with one of the following keywords:

- **CLIENT:**
  - Identifies a characteristic of the client that is either sending a request or receiving a response, as in the following examples:
    - The prefix `client.ip.dst` designates the destination IP address in the request or response.
    - The prefix `client.ip.src` designates the source IP address.

- **HTTP:**
  - Identifies an element in an HTTP request or a response, as in the following examples:
    - The prefix `http.req.body(integer)` designates the body of the HTTP request as a multiline text object, up to the character position designated in integer.
    - The prefix `http.req.header("header_name")` designates an HTTP header, as specified in header_name.
    - The prefix `http.req.url` designates an HTTP URL in URL-encoded format.

- **SERVER:**
  - Identifies an element in the server that is either processing a request or sending a response.
NetScaler 12.0

- SYS:
  Identifies a characteristic of the NetScaler that is processing the traffic.

  **Note:** Note that DNS policies support only SYS, CLIENT, and SERVER objects.

In addition, in the NetScaler Gateway, the Clientless VPN function can use the following types of prefixes:

- TEXT:
  Identifies any text element in a request or a response.

- TARGET:
  Identifies the target of a connection.

- URL:
  Identifies an element in the URL portion of an HTTP request or response.

As a general rule of thumb, any expression prefix can be a self-contained expression. For example, the following prefix is a complete expression that returns the contents of the HTTP header specified in the string argument (enclosed in quotation marks):

```
http.res.header.("myheader")
```

Or you can combine prefixes with simple operations to determine TRUE and FALSE values. For example, the following returns a value of TRUE or FALSE:

```
http.res.header.("myheader").exists
```

You can also use complex operations on individual prefixes and multiple prefixes within an expression, as in the following example:

```
http.req.url.length + http.req.cookie.length <= 500
```

Which expression prefixes you can specify depends on the NetScaler feature. The following table describes the expression prefixes that are of interest on a per-feature basis:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Types of Expression Prefix Used in the Feature</th>
</tr>
</thead>
<tbody>
<tr>
<td>DNS</td>
<td>SYS, CLIENT, SERVER</td>
</tr>
<tr>
<td>Responder in Protection Features</td>
<td>HTTP, SYS, CLIENT</td>
</tr>
<tr>

<td>NetScaler Gateway, Clientless Access</td>
<td>HTTP, SYS, CLIENT, SERVER, URL, TEXT, TARGET, VPN</td>
</tr>
</tbody>
</table>

Table 1. Permitted Types of Expression Prefixes in Various NetScaler Features

**Note:** For details on the permitted expression prefixes in a feature, see the documentation for that feature.

### Single-element expressions

The simplest type of Advanced policy expression contains a single element. This element can be one of the following:

- **true.** An Advanced policy expression can consist simply of the value true. This type of expression always returns a value of TRUE. It is useful for chaining policy actions and triggering Goto expressions.
- **false.** An Advanced policy expression can consist simply of the value false. This type of expression always returns a value of FALSE.
- **A prefix for a compound expression.** For example, the prefix HTTP.REQ.HOSTNAME is a complete expression that returns a host name and HTTP.REQ.URL is a complete expression that returns a URL. The prefix could also be used in conjunction with operations and additional prefixes to form a compound expression.

### Operations

In most expressions, you also specify an operation on the data that the prefix identifies. For example, suppose that you specify the following prefix:

`http.req.url`

This prefix extracts URLs in HTTP requests. This expression prefix does not require any operators to be used in an expression. However, when you configure an expression that processes HTTP request URLs, you can specify operations that analyze particular characteristics of the URL. Following are a few possibilities:

- Search for a particular host name in the URL.
- Search for a particular path in the URL.
- Evaluate the length of the URL.
- Search for a string in the URL that indicates a time stamp and convert it to GMT.
The following is an example of a prefix that identifies an HTTP header named Server and an operation that searches for the string IIS in the header value:

\[
\text{http.res.header(}\text{"Server"}\text{).contains(}\text{"IIS"}\text{)}
\]

Following is an example of a prefix that identifies host names and an operation that searches for the string “www.mycompany.com” as the value of the name:

\[
\text{http.req.hostname.eq(}\text{"www.mycompany.com"}\text{)}
\]

**Basic operations on expression prefixes**

The following table describes a few of the basic operations that can be performed on expression prefixes.

<table>
<thead>
<tr>
<th>Operation</th>
<th>Determines Whether or Not</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONTAINS(&lt;string&gt;)</td>
<td>The object matches &lt;string&gt;. Following is an example: http.req.header(“Cache-Control”).contains(“no-cache”)</td>
</tr>
<tr>
<td>EXISTS</td>
<td>A particular item is present in an object. Following is an example: http.res.header(“MyHdr”).exists</td>
</tr>
<tr>
<td>EQ(&lt;text&gt;)</td>
<td>A particular non-numeric value is present in an object. Following is an example: http.req.method.eq(post)</td>
</tr>
<tr>
<td>EQ(&lt;integer&gt;)</td>
<td>A particular numeric value is present in an object. Following is an example: client.ip.dst.eq(10.100.10.100)</td>
</tr>
<tr>
<td>LT(&lt;integer&gt;)</td>
<td>An object’s value is less than a particular value. Following is an example: http.req.content_length.lt(5000)</td>
</tr>
<tr>
<td>GT(&lt;integer&gt;)</td>
<td>An object’s value is greater than a particular value. Following is an example: http.req.content_length.gt(5)</td>
</tr>
</tbody>
</table>

The following table summarizes a few of the available types of operations.
### Operation Type

<table>
<thead>
<tr>
<th>Operation Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Text operations</strong></td>
<td>Match individual strings and sets of strings with any portion of a target. The target can be an entire string, the start of a string, or any portion of text in between the start and the end of the string. For example, you can extract the string “XYZ” from “XYZSomeText”. Or, you can compare an HTTP header value with an array of different strings. You can also transform text into another type of data. Following are examples: Transform a string into an integer value, create a list from the query strings in a URL, and transform a string into a time value.</td>
</tr>
<tr>
<td><strong>Numeric operations</strong></td>
<td>Numeric operations include applying arithmetic operators, evaluating content length, the number of items in a list, dates, times, and IP addresses.</td>
</tr>
</tbody>
</table>

### Compound advanced policy expressions

September 24, 2018

You can configure an Advanced policy expression that contains Boolean or arithmetic operators and multiple atomic operations. The following compound expression contains a boolean AND:

```plaintext
http.req.hostname.eq("mycompany.com") && http.req.method.eq(post)
```

The following expression adds the value of two targets, and compares the result to a third value:

```plaintext
http.req.url.length + http.req.cookie.length <= 500
```

A compound expression can contain any number of logical and arithmetic operators. The following expression evaluates the length of an HTTP request on the basis of its URL and cookie, evaluates text in the header, and performs a Boolean AND on these two results:

```plaintext
http.req.url.length + http.req.cookie.length <= 500 && http.req.header.contains("some text")
```

You can use parentheses to control the order of evaluation in a compound expression.
Booleans in compound expressions

You configure compound expressions with the following operators:

• &&.

  This operator is a logical AND. For the expression to evaluate to TRUE, all components that are joined by the And must evaluate to TRUE. Following is an example:

  http.req.url.hostname.eq(“myHost”) && http.req.header(“myHeader”).exists

• ||.

  This operator is a logical OR. If any component of the expression that is joined by the OR evaluates to TRUE, the entire expression is TRUE.

• !.

  Performs a logical NOT on the expression.

In some cases, the NetScaler GUI offers AND, NOT, and OR operators in the Add Expression dialog box. However, these are of limited use. Citrix recommends that you use the operators &&, ||, and ! to configure compound expressions that use Boolean logic.

Parentheses in compound expressions

You can use parentheses to control the order of evaluation of an expression. The following is an example:

http.req.url.contains(“myCompany.com”) || (http.req.url.hostname.eq(“myHost”) && http.req.header(“myHeader”).exists)

The following is another example:

### Compound operations for strings

The following table describes operators that you can use to configure compound operations on string data.

<table>
<thead>
<tr>
<th>Operations that produce a string value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str + str</td>
<td>Concatenates the value of the expression on the left of the operator with the value on the right. Following is an example: <code>http.req.hostname + http.req.url.protocol</code></td>
</tr>
<tr>
<td>str + num</td>
<td>Concatenates the value of the expression on the left of the operator with a numeric value on the right. Following is an example: <code>http.req.hostname + http.req.url.content_length</code></td>
</tr>
<tr>
<td>num + str</td>
<td>Concatenates the numeric value of the expression on the left side of the operator with a string value on the right. Following is an example: <code>http.req.url.content_length + http.req.url.hostname</code></td>
</tr>
<tr>
<td>str + ip</td>
<td>Concatenates the string value of the expression on the left side of the operator with an IP address value on the right. Following is an example: <code>http.req.hostname + 10.00.000.00</code></td>
</tr>
<tr>
<td>ip + str</td>
<td>Concatenates the IP address value of the expression on the left of the operator with a string value on the right. Following is an example: <code>client.ip.dst + http.req.url.hostname</code></td>
</tr>
<tr>
<td>str1 ALT str2</td>
<td>Uses the string1 or string2 value that is derived from the expression on either side of the operator, as long as neither of these expressions is a compound expression. Following is an example: <code>http.req.hostname alt client.ip.src</code></td>
</tr>
<tr>
<td>Operation</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>------------------------------------------------------------------</td>
</tr>
<tr>
<td><code>str == str</code></td>
<td>Evaluates whether the strings on either side of the operator are the same. Following is an example: <code>http.req.header(&quot;myheader&quot;) == http.res.header(&quot;myheader&quot;)</code></td>
</tr>
<tr>
<td><code>str &lt;= str</code></td>
<td>Evaluates whether the string on the left side of the operator is the same as the string on the right, or precedes it alphabetically.</td>
</tr>
<tr>
<td><code>str &gt;= str</code></td>
<td>Evaluates whether the string on the left side of the operator is the same as the string on the right, or follows it alphabetically.</td>
</tr>
<tr>
<td><code>str &lt; str</code></td>
<td>Evaluates whether the string on the left side of the operator precedes the string on the right alphabetically.</td>
</tr>
<tr>
<td><code>str &gt; str</code></td>
<td>Evaluates whether the string on the left side of the operator follows the string on the right alphabetically.</td>
</tr>
<tr>
<td><code>str != str</code></td>
<td>Evaluates whether the strings on either side of the operator are different.</td>
</tr>
