Introduction

In a distributed Citrix Virtual Apps and Desktops deployment, Citrix StoreFront might not select an optimal datacenter when multiple equivalent resources are available from multiple datacenters. In such cases, Citrix StoreFront randomly selects a datacenter. It can send the request to any of the Citrix Virtual Apps and Desktops servers in any datacenter, regardless of proximity to the client making the request.

Proximity-based GSLB might not choose the best site, because of a discrepancy caused by using the Local Domain Name Server (LDNS) to determine the client location. When clients make Domain Name System (DNS) requests, the requests are typically made to the respective LDNS server. Most LDNS servers are configured to perform recursive lookups, and therefore the Citrix ADC appliance does not receive the actual client IP address. It receives only the LDNS IP address. Internet service providers, such as AT&T, might have only one LDNS for a country. As a result, the datacenter might be chosen on the basis of an LDNS that is not in the user’s geographical area, and it might not be the datacenter closest to the client.

Solution

Note: This enhancement is available with Citrix ADC release 11.0 build 65.x or later, Citrix StoreFront release 3.5 or later, and Citrix Virtual Apps and Desktops release 7.7 or later.

With this enhancement, the client IP address is examined when an HTTP request arrives at the Citrix Gateway appliance, and the real client IP address can be used to create the datacenter preference list that is forwarded to Citrix StoreFront. Citrix StoreFront uses this list to connect to the delivery controller closest to the client. Citrix StoreFront selects the optimal gateway VPN virtual server for the selected datacenter zone, adds this information to the ICA file, with appropriate IP addresses, and sends it to the client. If the Citrix ADC appliance is configured to insert the zone preference header, Citrix StoreFront 3.5 or later can use the information provided by the appliance to reorder the list of delivery controllers. Citrix StoreFront then tries to launch applications hosted on
delivery controllers of the preferred datacenter before trying to contact equivalent controllers in other datacenters.

Notes:

1. Citrix recommends that when you deploy GSLB powered zone preference, you also create optimal gateway mappings between datacenters (zones) and Citrix gateways. For information about configuring Citrix StoreFront, see https://docs.citrix.com/en-us/storefront.

2. Citrix Gateway must be set to clientless VPN (cVPN) or ICA Proxy mode. The sample deployment includes commands for cVPN mode. For information about configuring ICA Proxy mode, see https://www.citrix.com/content/dam/citrix/en_us/documents/products-solutions/deploying-netcaler-gateway-in-ica-proxy-mode.pdf.

3. The initial DNS query in a GSLB-Citrix Gateway setup is processed similar to a GSLB-LB setup. However, HTTP redirect persistence in a GSLB-Citrix Gateway persistence deployment functions as follows:
   When the first request reaches a Citrix Gateway virtual server, the request is redirected to a site-specific URL by using HTTP 302 redirect. Because the URL is now site-specific, all further requests go directly to that site.

Deployment topology

Some key components of this deployment are Citrix ADC and Citrix Gateway appliances, and Citrix StoreFront and Citrix Virtual Apps and Desktops servers. The following diagram shows how a user, who is logged on to Citrix Workspace App to access his or her applications, is directed to the most optimal site on the basis of location.
High-level request flow

Configure the Gateway to extract the client IP address and find the nearest datacenter:

1. Create a non-addressable load balancing virtual server, with static proximity as the load balancing method, that creates a list of preferred datacenter zones. Configure the datacenter zones as back-end services and bind them to this virtual server.

2. Create a rewrite policy with an action that causes the above virtual server to perform load balancing and insert the list of preferred services into an HTTP header.

3. Bind this policy to the Gateway VPN virtual server that acts on the incoming HTTP traffic.

When a request matches the policy:

4. The load balancing virtual server finds the closest datacenter to the client’s IP address and prepares a datacenter zone preference, comma-separated list of up to three zones.
5. A new HTTP header, called "X-Citrix-ZonePreference," containing this list is inserted into the request sent to the Citrix StoreFront connected to the gateway VPN virtual server.

6. Citrix StoreFront extracts this list from the X-Citrix-ZonePreference header and uses it to connect to the appropriate datacenter zone.

7. Because Optimal Gateway Routing is configured, Citrix StoreFront selects the optimal gateway VPN virtual server for the connected datacenter, creates an ICA file with appropriate IP addresses, and sends it to the client. All HDX traffic from client to VDA then passes through the optimal gateway during the session.

8. When clients receive an ICA file, they connect to resources published in the nearest datacenter through the optimal gateway virtual server.

Configuration

A GSLB powered zone-preference setup requires a non-addressable load balancing server with services representing the datacenter zones. Also configure a rewrite action and policy, in addition to the other entities required in a typical GSLB-Citrix StoreFront setup.

The Citrix ADC command line and GUI steps for configuring the entities specific to the zone-preference are shown below. For information about configuring the other entities, see Appendix B: Configure GSLB entities, servers, services, monitors, VPN virtual servers, and SSL certificates.

Configure the load balancing virtual server and the services

Create a non-addressable load balancing virtual server that uses the static proximity load balancing method, with round robin (the default) as the backup method. Add services to specify the datacenter zones, and bind them to the load balancing virtual server. The service IP address is just a placeholder for the zone that the service is representing. Bind monitors to the service, with each monitor monitoring a delivery
controller for that zone. That is, the destination IP address in the monitor must be the delivery-controller IP address.

To configure a non-addressable load balancing virtual server by using the Citrix ADC command line

At the command prompt, type:

```shell
add lb vserver <name> <serviceType> <IPAddress> <port> -lbMethod <lbMethod>
```

To configure a non-addressable load balancing virtual server by using the Citrix ADC GUI

2. Add an HTTP virtual server.

![Load Balancing Virtual Server](image)

To configure services to represent the datacenter zones by using the Citrix ADC command line
At the command prompt, type:

```
add service <name> <IP> <serviceType> <port> -monThreshold <positive_integer> -comment <string>
```

To configure services to represent the datacenter zones by using the Citrix ADC GUI

1. Navigate to Traffic Management > Load Balancing > Services.
2. Add an HTTP service.
Note: The zone name (Comments) must be the same on Citrix StoreFront and Citrix Virtual Apps and Desktops. For information about configuring the zone name on StoreFront, see http://docs.citrix.com/en-us/storefront/3-5/sf-configure-ha.html.

To bind a monitor to a service by using the Citrix ADC command line

At the command prompt, type:
bind service <name> -monitorName <string> -weight <positive_integer>

To bind a monitor to a service by using the Citrix ADC GUI

1. Navigate to Traffic Management > GSLB > Services.
2. Select a service and click Edit.
3. In Advanced Settings, click Monitors and bind a monitor to the service.

![Load Balancing Monitor Binding](image)

**Note:** The monitor IP address must match the desktop delivery controller (DDC) IP address. Citrix StoreFront might use the FQDN instead of the DDC IP address.

Add a rewrite policy

Add a rewrite policy for incoming traffic, with an action that inserts the preferred zone description (ZoneName) into an HTTP header. The ZoneName is then used by Citrix StoreFront to send the request to the optimal VDA.

To configure a rewrite action and policy by using the Citrix ADC command line

At the command prompt, type:
**add rewrite action** `<name> <type> <target> <stringBuilderExpr>

**add rewrite policy** `<name> <rule> <action>

To configure a rewrite action and policy by using the Citrix ADC GUI

1. Navigate to **AppExpert** > **Rewrite** > **Actions**.
2. Add the rewrite action.

![Configure Rewrite Action](Image)

3. Navigate to **AppExpert** > **Rewrite** > **Policies**.
4. Add the rewrite policy.

Appendix A: Sample deployment

The following sample deployment shows the configuration on the Citrix ADC appliance and assumes that Citrix StoreFront and Citrix Virtual Apps and Desktops are already configured at three sites: Bangalore (BGL), Cambridge (CAM), and Fort Lauderdale (FTL).

Note: This example is a complete GSLB Citrix StoreFront configuration that includes the entities configured for GSLB powered zone preference.

**BGL Site**

```
### GSLB Site IP address - BGL site
add ns ip 203.0.113.1 255.255.255.255 -type GSLBsiteIP

# SSL certificates for gateway virtual server
add ssl certKey Domain-CA -cert "/nsconfig/ssl/Domain-CA.cer"
add ssl certKey wildcard.domain.com -cert wildcard.domain.com -key wildcard.domain.com

# LDAP authentication policy for gateway logon
add authentication ldapAction "domain.com LDAP" -serverIP 192.168.1.100 -ldapBase "CN=Users,DC=domain,DC=com" -ldapBindDn "CN=administrator,CN=Users,DC=domain,DC=com" -ldapBindDnPassword Pa55word -encrypted -encryptmethod ENCMTHD_3 -ldapLoginName samAccountName -groupAttrName memberOf -subAttributeName CN

# Policy to insert the HTTP X-Citrix-ZonePreference header into all traffic passing through the gateway virtual server
add policy expression InsertZonePreferenceExpression "sys.vserver("ZonePreference")".determine_services(description, ",", ")"
```
add rewrite action InsertZonePreferenceAction insert_http_header X-Citrix-ZonePreference InsertZonePreferenceExpression
add rewrite policy InsertZonePreferencePolicy TRUE InsertZonePreferenceAction

# Static proximity zone locations for ZonePreference virtual server
add location 192.0.0.1 192.0.0.255 "Europe.UK.FTL.*.*.*"
add location 198.51.100.1 198.51.100.255 "NorthAmerica.US.CAM.*.*.*"
add location 203.0.113.1 203.0.113.255 "Asia.India.BGL.*.*.*"

# StoreFront server
add server StorefrontBGL 203.0.113.178

# XD 7.8 servers
add server XenDesktopA 192.0.0.206
add server XenDesktopB 192.0.0.207
add server XenDesktopC 198.51.100.208
add server XenDesktopD 198.51.100.209
add server XenDesktopE 203.0.113.210
add server XenDesktopF 203.0.113.211

# ZonePreference services

Note: The zone name (comment) in the following command must be the same on Citrix StoreFront and Citrix Virtual Apps and Desktops also.
add service FTL 192.0.0.2 HTTP 80 -monThreshold 1 -comment FTLZone
add service CAM 198.51.100.2 HTTP 80 -monThreshold 1 -comment CAMZone
add service BGL 203.0.113.2 HTTP 80 -monThreshold 1 -comment BGLZone

# ZonePreference virtual server (non-addressable)

# Monitors to check the connectivity of each Citrix Virtual Desktops Delivery Controller
**Note:** The monitor IP address in the following commands must match the Desktop Delivery Controller (DDC) IP address. Citrix StoreFront might use the FQDN instead of the DDC IP address.

```plaintext
add lb monitor XenDesktopA-Mon CITRIX-XD-DDC -destIP 192.0.0.206 -destPort 80
add lb monitor XenDesktopB-Mon CITRIX-XD-DDC -destIP 192.0.0.207 -destPort 80
add lb monitor XenDesktopC-Mon CITRIX-XD-DDC -destIP 198.51.100.208 -destPort 80
add lb monitor XenDesktopD-Mon CITRIX-XD-DDC -destIP 198.51.100.209 -destPort 80
add lb monitor XenDesktopE-Mon CITRIX-XD-DDC -destIP 203.0.113.210 -destPort 80
add lb monitor XenDesktopF-Mon CITRIX-XD-DDC -destIP 203.0.113.211 -destPort 80

Appendix B: Configure GSLB entities, servers, services, monitors, VPN virtual servers, and SSL certificates

The Citrix ADC command line and GUI procedures for configuring a GSLB-Citrix StoreFront setup are as follows:

To configure a GSLB site and custom location by using the Citrix ADC command line

At the command prompt, type:

```bash
add gslb site <siteName> <siteIPAddress>
add location <IPfrom> <IPto> <preferredLocation>
```

To configure a GSLB site by using the Citrix ADC GUI

1. Navigate to Traffic Management > GSLB > Sites.
2. Add a GSLB site.

To configure a custom location by using the Citrix ADC GUI

1. Navigate to AppExpert > Location.
2. Create a custom entry or location file (static databases).

To configure a GSLB virtual server by using the Citrix ADC command line

At the command prompt, type:

```bash
add gslb vserver <name> <serviceType> -lbMethod -backupLBMetho
```
To configure a GSLB service and bind it to a GSLB virtual server by using the Citrix ADC command line

At the command prompt, type:

```
add gslb service <serviceName> <IP> <serviceType> <port> -siteName
bind gslb vserver <name> -serviceName <string>
```

To configure a domain by using the Citrix ADC command line

At the command prompt, type:

```
set gslb vserver <name> -domainName <string>
```

To configure a GSLB virtual server, service, and domain by using the Citrix ADC GUI

1. Navigate to Traffic Management > GSLB > Virtual Servers.
2. Add a GSLB virtual server of type SSL.
3. Click OK.
4. In Advanced Settings select Service, and add or bind a service of type SSL.
5. Select Domains, and bind a domain to the virtual server.
6. Click Done.

To configure a VPN virtual server by using the Citrix ADC command line

At the command prompt, type:

```
add vpn vserver <name> SSL <IPAddress> <port>
```

To configure a VPN session policy by using the Citrix ADC command line

At the command prompt, type:
add vpn sessionPolicy <name> <rule> <action>

To configure an SSL certificate by using the Citrix ADC command line

At the command prompt, type:

add ssl certkey <certkeyname> -cert <string> -key <string>

To configure a VPN virtual server and bind an SSL certificate and a policy by using the Citrix ADC GUI

1. Navigate to Citrix Gateway > Virtual Servers.
2. Add a virtual server.
3. In Certificates, add or select a certificate to bind to this virtual server.
4. In Policies, add or select a policy to bind to this virtual server.
5. Click Done.

For information about configuring LDAP authentication on Citrix Gateway, see http://docs.citrix.com/en-us/netscaler-gateway/11/authentication-authorization/configure-ldap.html

To configure a server by using the Citrix ADC command line

At the command prompt, type:

add server <name> <IPAddress>
To configure a server by using the Citrix ADC GUI

1. Navigate to **Citrix Gateway > Servers**.
2. Add a server.

To configure an ADNS service by using the Citrix ADC command line

At the command prompt, type:

```
add service <name> <IP> ADNS <port>
```

To configure an ADNS service by using the Citrix ADC GUI

1. Navigate to **Traffic Management > Load Balancing > Services**.
2. Add an ADNS service.

To configure a CITRIX-XD-DDC monitor and bind it to a service by using the Citrix ADC command line

At the command prompt, type:

```
add lb monitor <monitorName> CITRIX-XD-DDC
bind service <name> -monitorName <string>
```

To configure a CITRIX-XD-DDC monitor by using the Citrix ADC GUI

1. Navigate to **Traffic Management > Load Balancing > Services**.
2. Add a CITRIX-XD-DDC monitor.

To bind a monitor to a service by using the Citrix ADC GUI

1. Navigate to **Traffic Management > GSLB > Services**.
2. Select a service and click **Edit**.
3. In **Advanced Settings**, click **Monitors** and bind a monitor to the service.

**To add a pattern set and bind a pattern to it by using the Citrix ADC command line**

At the command prompt, type:

```
add policy patset <name>
bind policy patset <name> <string> [-index <positive_integer>]
```

**To add a pattern set by using the Citrix ADC GUI**

1. Navigate to **AppExpert > Pattern Sets**.
2. Add a pattern set and insert a pattern.
