3 <!--NeedCopy-->
```

- **Why are policies getting hits but nothing is being cached?**

Verify that memory is allocated to the integrated cache and that the allocation is greater than zero.

- **Is it possible to zero the cache counters?**

There is no command line or GUI option for setting the cache counters to zero, and flushing the cache does not do so either. Rebooting the box automatically sets these counters to zero.

Install, upgrade, and downgrade

November 22, 2023

Install and upgrade

How to download a specific NetScaler release build package?

For information on downloading a specific NetScaler release build package, see [Download a NetScaler release package](#).

How to upgrade the system software of a NetScaler appliance?

For information on upgrading the system software of a NetScaler appliance, see [Upgrade a NetScaler standalone appliance](#).

Where do I find the release notes for a NetScaler release build?

The release notes document for a NetScaler release build lists the following for the release build:

- Enhancements
- Fixed issues

- Known issues

The release notes document for a NetScaler release build is found at the following locations:

- [NetScaler firmware or virtual appliance downloads page](#) of a specific release build.
- [ADC release notes page](#) in NetScaler docs site

Where do I find security updates for NetScaler appliances?

NetScaler security team regularly releases security bulletins on Common Vulnerabilities and Exposures (CVE) for all related NetScaler products. This information can be found at [security bulletin](#). Alternatively, you can search for a specific CVE at [NetScaler support site](#).

What is the use of the zebos.conf file available in a NetScaler release?

A NetScaler appliance uses ZebOS as the routing suite. The zebos.conf file available in a NetScaler release is the configuration file for ZebOS.

I want to change the SSH port (22) on the NetScaler appliance to some other port. Is it possible to change the SSH port on the appliance?

Yes. You can change the SSH port on the NetScaler appliance by editing the sshd_config file in the /nsconfig directory. If the file does not exist in the /nsconfig directory, copy it from the /etc directory.

In the sshd_config file, edit the entry for Port 22 to Port <Number>, where <Number> is the target port number. If you do not want to restart the appliance and make the changes effective, terminate the sshd process by using the kill command, and then restart the process.

The flash directory is missing from the NetScaler appliance. What procedure must I follow to mount the flash directory?

To mount the flash directory, do the following:

1. Start the NetScaler appliance in single-user mode.

When the appliance starts, the following message appears:

Select [Enter] to boot immediately, or any other key for the command prompt. Booting [kernel] in 10 seconds..."Select space and you must see the following prompt:

Type '?' for a list of commands, 'help' for more detailed help.

2. Enter the following command to start FreeBSD in single-user mode:

```
boot -s
```

After the appliance starts, the following message appears:

Enter full pathname of shell or RETURN for /bin/sh:

3. Press Enter to display the # prompt.
4. Run the following command to mount the flash directory:

```
1 mount /dev/ad0s1a /flash
2
3 Note: If the preceding command displays an error message about
  permissions, run the following command to check the disk for
  consistency:
4
5 fsck /dev/ad0s1a
6
7 Run the mount command again to mount the flash directory.
```

5. Restart the appliance.
6. From the shell prompt, run the following command to verify that the flash directory is mounted:

```
1 df -kh
```

I want to log on to the NetScaler appliance without entering the password. Is it possible to configure SSH on the appliance to allow that?

Yes. You can configure SSH on the NetScaler appliance to log on without a password. However, you must provide your user name. To configure SSH for logging in without a password, do the following:

1. Run the following command to generate the public and private keys:

```
1 \# ssh-keygen -t rsa
```

2. Run the following command to copy the id_rsa.pub file to the .ssh directory of the remote host that you want to log on to:

```
1 \# scp id_dsa.pub \<user>@\<remote_host>/.ssh/id_dsa.pub
```

3. Log on to the remote host.
4. Change to the .ssh directory.
5. Run the following commands to add the public key of the client to the known public keys:

```
1 \# cat id_dsa.pub >> authorized_keys2
2
```

```
3 \# chmod 640 authorized_keys2
4
5 \# rm id_dsa.pub
```

What is the procedure to reset the NetScaler appliance BIOS? Under what circumstances must I reset the BIOS?

To reset the BIOS of the NetScaler appliance, complete the following procedure:

1. Connect to the appliance through the serial port.
2. Start the appliance and press Delete when the boot-up process starts.
Pressing Delete during the POST process displays the appliance's BIOS settings.
3. Activate the Exit page of the BIOS settings.
4. Select the Load Optimal Defaults option. The Load Optimal Settings message box appears.
5. Select OK.
6. Make the following changes to the BIOS settings on the various tabs:
Tab
7. Activate the Exit page of the BIOS settings.
8. Select Save changes and Exit.
9. Select OK to confirm.
10. Verify that the appliance starts cleanly and the serial console displays output after the appliance starts.

You must reset BIOS when the serial console does not respond. This usually happens after you upgrade the appliance and the serial console is disabled. However, you can still access the appliance by using the telnet or SSH utility.

I need to reset the NetScaler appliance to the factory defaults. What procedure must I follow?

To reset the NetScaler appliance to the factory defaults, you need to reset two environments: the NetScaler application environment and the base FreeBSD environment.

To reset the NetScaler application environment of the appliance to the factory defaults, do the following:

1. Make a backup of the appliance's `/nsconfig/ns.conf`.
2. Delete the `/nsconfig/ns.conf` file.

3. Restart the appliance. To reset the FreeBSD environment of the appliance to the factory defaults, do the following:
 - a) Install a fresh NetScaler code image on the appliance. This overwrites several FreeBSD-level configuration files with default values.
 - b) Delete any users and groups that are added to the appliance, that is, all except the default users.
 - c) Delete the `/etc/resolv.conf` file.
 - d) Delete the entries that you have added to the `/etc/hosts` file.
 - e) If the `/etc/rc.netscaler` file exists, delete it.
 - f) Open the `/etc/nsperm_group_suser` file and make sure that all IOCTL entries are comment entries.
 - g) Open the `/etc/rc.conf` file and make sure that the `syslogd_enable=NO` entry is not changed to `syslogd_enable=YES`.
 - h) Open the `/etc/syslog.conf` file and make sure that there are no additional entries in the file.
 - i) Delete the contents of the `/var/nslog`, `/var/nstrace`, and `/var/crash` files.
 - j) If the syslog process is enabled on the appliance and the appliance creates log files locally, delete the contents of the log files listed in the `/etc/syslog.conf` file. The files are created in the `/var/log` directory. For example, if the syslog process writes system events to the `/var/log/events` file, and `sslvpn` access events to the `/var/log/sslvpnevents` file, delete these files.

The appliance displays a message similar to the “Jun 21 12:20:18 ns /flash/ns-10.0-47.15: [1/2]dc0: NIC hangs condition #663: TX 10000/10000, RX 0, HF 0”message on the console. What is the meaning of this message?

The message consists of the following components (shown here as examples):

- #663: Number of times this condition has occurred on the appliance.
- TX 10000/10000: Number of packets that the appliance attempted to transmit, and number of packets transmitted. If both numbers are the same, as in this example, the NIC transmitted all the packets that the appliance attempted to transmit.
- RX 0: Number of packets received. In this example, no packet was received.
- HF0: Number of hardware issues reported by the NIC. In this example, the NIC did not report any hardware issue.

If the appliance does not receive any packets, it reports a hang condition, because on a network it is unlikely not to receive any packets. However, if the appliance is plugged into quite the interface, you can ignore this error message.

After I upgraded the NetScaler release on the appliance, the appliance still displays the earlier release/build. What can be the reason?

The appliance displays the software version number from the `/flash/boot/loader.conf` file. If the kernel entry for the current NetScaler release is missing from that file, the appliance displays the last NetScaler release version for which the entry was available.

To resolve this issue, do the following:

1. Verify that the kernel file exists in the `/nsconfig` directory.
2. Check the `/flash/boot/loader.conf` file for an entry for the kernel.
(You can expect the entry for the kernel of the release/build that you installed to be missing from the file.)
3. Open the `loader.conf` file in a text editor, such as the `vi` editor, and update the kernel entry for the new release/build.
4. Save and close the file.
5. Repeat step 2 through step 4 for the `/flash/boot/loader.conf.local` file.
6. Update the release/build entry in the `ns.conf` file.
7. Restart the appliance.

Since I upgraded the NetScaler release on the appliance, the LCD display on the front panel of the appliance displays the out of service message or does not display anything. How can I resolve this issue?

Run the following command from the appliance's shell prompt:

```
1 /netscaler/nslcd -k
```

I have upgraded the NetScaler release/build. However, after the upgrade process, the appliance fails to start. Can I downgrade the appliance's software to the previous release/build?

Yes. You can start the appliance with the `kernel.old` kernel file. When you restart the appliance, press the `F1` key when the appliance console displays the `Press F1` message. Type `kernel.old` and press **Enter**.

After upgrading the NetScaler release on the appliance, I accidentally deleted the kernel file from the /flash directory. As a result, I am not able to start the appliance. Is there a method for starting the appliance in this situation?

Yes. You can start the appliance by using the `kernel.GENERIC` kernel file, as follows:

1. When you restart the appliance, press the F1 key when the appliance console displays the Press F1 message.
2. Type `kernel.GENERIC` and press Enter.
3. Log in as the root user.
4. Reinstall the NetScaler release.
5. Restart the appliance.

After upgrading the appliance software, I am not able to log on to the appliance, and the following message appears. I tried to resolve this issue by using the password recovery procedure, but I was not successful. Have I done something incorrectly?

```
1  ```
2  login: nsroot
3  Password:
4  connect: No such file or directory
5  nsnet_connect: No such file or directory
6  Login incorrect
7  <!--NeedCopy-->  ```
```

You cannot resolve this issue by using the password recovery procedure. NetScaler release 12.1 or later use the new licensing system, based on the `Imgird` daemon, which runs during the startup procedure. For this daemon to work properly, the host name of NetScaler appliance, which is set in the `/nsconfig/rc.conf` file, must be resolved by a name server to the NSIP address. Alternately, you can create a hosts file in the `/nsconfig` directory and add the `127.0.0.1 <Host_Name>` entry in file.

Also, make sure that you have copied the license files to the `/nsconfig/license/` directory.

During an upgrade of a high availability pair, the following message appears repeatedly. What can be the reason?

```
<auth.err> ns sshd[5035]: error: Invalid user name or password
```

This error message appears when the appliances involved in the high availability pairing have either a different NetScaler release or a different build of the same release installed. The appliances can have different version installed if you have upgraded or downgraded one appliance but not the other.

I want to change the netmask of the NSIP address on a NetScaler appliance. Can I do so without causing an outage?

Changing the netmask of the NetScaler IP might result in a short outage. Make sure that you change the netmask on the secondary appliance, and then break the high availability pairing. Check the functionality of the appliance. If everything works as expected, rebuild the high availability pairing.

To change the netmask on the appliance, run the `config ns` command from the CLI prompt, and then choose the second option in the menu.

I have configured a High Availability pair of NetScaler appliances. After upgrading the software release from a preview release to a final release, I noticed that some of the appliance configurations are missing. Can I retrieve the lost configurations?

You can use the following procedure to restore the configuration:

1. Log on to the NetScaler command line of the primary appliance.
2. Run the following commands:

```
1 save config
2
3 shell
4
5 \#cp /nsconfig/ns.conf /nsconfig/ns.conf.bkup
6
7 The ns.conf.bkup file is a backup for the running configuration.
```

3. Upgrade software of both the appliances to the final release.
4. Log on to the NetScaler command line of the primary appliance.

Can the primary appliance and secondary appliance have separate builds?

Recommended practice is to use the same version and build number on both the primary and the secondary appliance.

Can both the appliances in a High Availability (HA) pair be upgraded at the same time?

No. In an HA pair, first upgrade the secondary node and then upgrade the primary node.

For details, refer [Upgrading a High Availability Pair](#).

Does NetScaler support firmware upgrades in the Amazon Web Services cloud?

Yes.

Can I upgrade the NetScaler instance independently of the SDX version?

It is not required to upgrade the SDX version when the NetScaler appliance is upgraded. However, some features might not work.

Can I use the FTP server to upgrade the NetScaler appliance?

No. You must first download the firmware from the NetScaler site, save it on your local computer, and then upgrade the appliance.

Is the procedure for upgrading the NetScaler appliance with GSLB configurations different from an upgrade of an appliance that is not involved in GSLB?

No. The upgrade procedure is similar to the basic upgrade procedure. The only difference is that you can upgrade the standalone or HA appliances on different sites in a phased manner.

Upgrade fails with a warning “Many deprecated features, parameters, and functionalities, and use of classic expressions have been removed”. How do I fix this issue?

Starting from NetScaler 13.1 release, classic expressions aren't supported in some features. Similarly, some deprecated features are also removed. For more information on deprecated features and commands, see [Notice of Status Change Announcement for NetScaler Classic Policy Based Features and Functionalities](#).

If the configuration contains any command related to the removed features, then the upgrade fails. The removed commands throw errors in releases 13.1 or later and therefore configuration can be lost. Use the `nspepi` tool to convert the invalid or classic configuration to valid or advanced configuration. For information on the `nspepi` tool, see [Converting policy expressions using the NSPEPI tool](#).

Note:

If you see an invalid configuration error, we recommend you to use the `-M` option to convert classic policies to advanced policies.

```

***** WARNING *****
In the 13.1 release many deprecated features, parameters, functionalities, and use of Classic expressions have been removed; please convert the configuration which will throw error in 13.1 or later releases to non-deprecated prior to upgrade; the nspepi tool can be used to help with this.
*****

Checking invalid config in ns.conf file
installns: [82335]:
Checking invalid config in ns.conf file
Installing files to check for invalid config...
installns: [82335]:
Installing files to check for invalid config...

The following configuration lines will get errors in 13.1 and both they and dependent configuration will be removed from the configuration:
enable ns feature LB CS CR CMP SSL CF IC SSLVPN AAA REWRITE AppFw RESPONDER AppFlow AppOe FEO VideoOptimization CI
add filter action f_act_1 errorcode 405
add filter policy fpol_1 -rule ns_true -resAction f_act_1
add filter policy fpol_2 -rule ns_true -resAction f_act_1
add cs policy cs_pol_1 -rule ns_true
add cs policy cs_pol_2 -url "/abcd"
add cs policy cs_pol_3 -url "/abcd*"
add appfw policy appfw_pol_ns_true APPFW_BYPASS
add ssl policy ssl_pol -rule ns_true -action CLIENTAUTH

The nspepi upgrade tool can be useful in converting your configuration - see the documentation at https://docs.citrix.com/en-us/citrix-adc/current-release/appexpert/policies-and-expressions/introduction-to-policies-and-exp/convert-policy-expressions-nspepi-tool.html. Use nspepi tool available at https://github.com/citrix/ADC-scripts/tree/master/nspepi for the most complete and up-to-date version.
NOTE: the nspepi tool doesn't convert the following configurations:
1. SureConnect commands
2. PriorityQueuing commands
3. HTTP Denial of Service Protection commands
4. HTMLInjection commands.

Installation cancelled; if you wish to run the NSEPEPI tool during installation, then use the -M option; or if you wish to force the installation use the -Y option but invalid configuration will be lost.
installns: [82335]:
Installation cancelled; if you wish to run the NSEPEPI tool during installation, then use the -M option; or if you wish to force the installation use the -Y option but invalid configuration will be lost.
root@ns#

```

We do **NOT** recommend you to use the **Y** option while running the `installns` script. If you use the **Y** option, then configuration check does not happen and the invalid configuration can be lost.

Downgrade

I have received a NetScaler appliance with the latest NetScaler release installed on it. However, I want to downgrade the software release. Can I do so?

No. If you attempt to downgrade the software release, the appliance might not work as expected, because the `ns.conf` file of the later release might not be compatible with the earlier release, and the appliance might restore to the factory settings.

When downgrading the NetScaler release, I followed the instructions. However, the appliance displays the following message. How is the rollback procedure performed on a NetScaler appliance?

```

1 root@LBCOL03B# ./installns
2 installns version (10.0-47.7) kernel (ns-10.0-47.7.gz)
3 Note:
4 Installation may pause for up to 3 minutes while data is written to the
  flash.
5 Caution:
6 Do not interrupt the installation process.
7 Doing so may cause the system to become unusable.
8 Installation will proceed in 5 seconds, CTRL-C to abort
9 No Valid NetScaler Version Detected
10 root@LBCOL03B#

```

The rollback procedure is similar to the basic upgrade procedure. Select the target build that you want to roll back to and perform the downgrade. Before rolling back to a different release, it is recom-

mended that you create a copy of your current configuration files. To downgrade from a release, see [Downgrading a NetScaler Standalone Appliance](#).

Load Balancing

May 2, 2023

- **What are the various load balancing policies I can create on the NetScaler appliance?**

You can create the following types of load balancing policies on the NetScaler appliance:

- Least Connections
- Round Robin
- Least response time
- Least bandwidth
- Least packets
- URL hashing
- Domain name hashing
- Source IP address hashing
- Destination IP address hashing
- Source IP - Destination IP hashing
- Token
- LRTM

- **Can I achieve the Web farm security by implementing load balancing using the NetScaler appliance?**

Yes. You can achieve Web farm security by implementing load balancing using the NetScaler appliance. NetScaler appliance enables you to implement the following options of the load balancing feature:

- IP Address hiding: Enables you to install the actual servers to be on private IP address space for security reasons and for IP address conservation. This process is transparent to the end-user because the NetScaler appliance accepts requests on behalf of the server. While in the address hiding mode, the appliance completely isolates the two networks. Therefore, a client can access a service running on the private subnet, such as FTP or a Telnet server, through a different VIP on the appliance for that service.
- Port Mapping: Enables the actual TCP services to be hosted on non-standard ports for security reasons. This process is transparent to the end-user as the NetScaler appliance accepts requests on behalf of the server on the standard advertised IP address and port number.

- **What are various devices that I can use to load balance with a NetScaler appliance?**

You can load balance the following devices with a NetScaler appliance:

- Server farms
- Caches or Reverse Proxies
- Firewall devices
- Intrusion detection systems
- SSL offload devices
- Compression devices
- Content Inspection servers

- **Why should I implement the load balancing feature for the website?**

You can implement the Load balancing feature for the website to take the following advantages:

- Reduce the response time: When you implement the load balancing feature for the website, one of the major benefits is the boost you can look forward to in load time. With two or more servers sharing the load of the web traffic, each of the servers runs less traffic load than a single server alone. This means there are more resources available to fulfill the client requests. This results in a faster website.
- Redundancy: Implementing the load balancing feature introduces a bit of redundancy. For example, if the website is balanced across three servers and one of them does not respond at all, the other two can keep running and the website visitors do not even notice any downtime. Any load balancing solution immediately stops sending traffic to the back-end server that is not available.

- **Why do I need to disable the Mac Based Forwarding (MBF) option for Link Load Balancing (LLB)?**

- If you enable the MBF option, the NetScaler appliance considers that the incoming traffic from the client and the outgoing traffic to the same client flow through the same upstream router. However, the LLB feature requires that the best path be chosen for the return traffic.
- Enabling the MBF option breaks this topology design by sending the outgoing traffic through the router that forwarded the incoming client traffic.

- **What are the various persistence types available on the NetScaler appliance?**

The NetScaler appliance supports the following persistence types:

- Source IP
- Cookie insert
- SSL session ID
- URL passive
- Custom Server ID

- Rule
- DESTIP

GUI

May 2, 2023

- **When I use Firefox to compare two NetScaler configurations, the browser seems to freeze?**

Firefox eventually displays the difference in the configurations, but the process takes a considerable amount of time if there are more than 1000 differences. Use Chrome for a faster response.

- **I am using a MAC Safari browser to upgrade a NetScaler. On the upgrade wizard, when I click the Browse button to choose the build file from the appliance, the dialog box does not show any files or folders. Also, when I navigate back to the root folder, the dialog box displays the top level folder, but I cannot browse it. What should I do?**

On the Safari browser, click the Settings icon and navigate to **Preferences > Security > Manage Website Settings > Java**. Change the value of the **When visiting other websites** setting to Run in unsafe mode.

- **What should I do before accessing the GUI?**

Before accessing a new version of the NetScaler software:

- Clear browser cache including cookies.
- Access GUI in browser incognito mode.
- Access GUI in some other browser.
- Clear the **Use software acceleration** option in setting and restart the browser.
- Access **chrome: extensions**, clear the **Enable** box and restart the Chrome browser.

- **Which port should I open to access GUI using HTTP or HTTPS?**

The following lists the default port numbers for HTTP and HTTPS management services (GUI) in the NetScaler MPX, VPX, and CPX appliances:

- NetScaler MPX and VPX appliances: 80 (HTTP) and 443 (HTTPS)
- NetScaler CPX appliances: 9080 (HTTP) and 9443 (HTTPS)

Also, you can configure ports for HTTP and HTTPS management services (GUI) other than port 80 and 443. For more information, see [Configure HTTP and HTTPS management ports](#).

- **With which browsers is the GUI compatible for different operating systems?**

The following table lists the compatible browsers for NetScaler GUI version 12.1, 13.0, and 13.1:

Operating System	Browser	Versions
Windows 10 and later	Edge	110.1587.63 and later
Windows 10 and later	Mozilla Firefox	102 and later
Windows 10 and later	Chrome	108 and later
MAC	Mozilla Firefox	110.0.1 and later
MAC	Safari	15.5 and later

SSL

Click [here](#) for FAQs about SSL.

Authentication, authorization, and auditing application traffic

May 2, 2023

Many companies restrict website access to valid users only, and control the level of access permitted to each user. The authentication, authorization, and auditing feature allows a site administrator to manage access controls with the NetScaler appliance instead of managing these controls separately for each application. Doing authentication on the appliance also permits sharing this information across all websites within the same domain that are protected by the appliance.

To use authentication, authorization, and auditing, you must configure authentication virtual servers to handle the authentication process and traffic management virtual servers to handle the traffic to web applications that require authentication. You also configure your DNS to assign FQDNs to each virtual server. After configuring the virtual servers, you configure a user account for each user that will authenticate via the NetScaler appliance, and optionally you create groups and assign user accounts to groups. After creating user accounts and groups, you configure policies that tell the appliance how to authenticate users, which resources to allow users to access, and how to log user sessions. To put the policies into effect, you bind each policy globally, to a specific virtual server, or to the appropriate user accounts or groups. After configuring your policies, you customize user sessions by configuring session settings and binding your session policies to the traffic management virtual server. Finally, if your intranet uses client certs, you set up the client certificate configuration.

To understand how authentication, authorization, and auditing works in a distributed environment, consider an organization with an intranet that its employees access in the office, at home, and when traveling. The content on the intranet is confidential and requires secure access. Any user who wants to access the intranet must have a valid user name and password. To meet these requirements, the ADC does the following:

- Redirects the user to the login page if the user accesses the intranet without having logged in.
- Collects the user's credentials, delivers them to the authentication server, and caches them in a directory that is accessible through the Lightweight Directory Access Protocol (LDAP). For more information, see [Determining Attributes in Your LDAP Directory](#).
- Verifies that the user is authorized to access specific intranet content before delivering the user's request to the application server.
- Maintains a session timeout after which users must authenticate again to regain access to the intranet. (You can configure the timeout.)
- Logs the user accesses, including invalid login attempts, in an audit log.

Supported authentication types

- Local
- LDAP
- RADIUS
- SAML
- TACACS+
- Client certificate authentication (including smart card authentication)
- Web
- Advanced authentication
- Forms based authentication
- 401 based authentication
- Native OTP
- Push notification
- Email OTP
- reCaptcha

NetScaler Gateway also supports RSA SecurID, Gemalto Protiva, and SafeWord. You use a RADIUS server to configure these types of authentication.

Before configuring authentication, authorization, and auditing, you must be familiar with and understand how to configure load balancing, content switching, and SSL on the NetScaler appliance.

Authentication without authorization

Authorization specifies the network resources to which users have access when they log on to the appliance. The default setting for authorization is to deny access to all network resources. Citrix recommends using the default global setting and then creating authorization policies to define the network resources users can access.

You configure authorization on the appliance by using an authorization policy and expressions. After you create an authorization policy, you can bind it to the users or groups that you configured on the appliance.

You can configure the appliance to use authentication only, without authorization. When you configure authentication without authorization, the appliance does not perform a group authorization check. The policies that you configure for the user or group are assigned to the user.

Enabling authentication, authorization, and auditing

To use the authentication, authorization, and auditing feature, you must enable it. You can configure authentication, authorization, and auditing entities—such as the authentication and traffic management virtual servers—before you enable the authentication, authorization, and auditing feature, but the entities do not function until the feature is enabled.

To enable authentication, authorization, and auditing by using the CLI

At the command prompt, type the following commands to enable authentication, authorization, and auditing and verify the configuration:

```
1 enable ns feature AAA
2 <!--NeedCopy-->
```

To enable authentication, authorization, and auditing by using the GUI

1. Navigate to **System > Settings**.
2. In the details pane, under **Modes and Features**, click **Change Basic Features**.
3. In the **Configure Basic Features** dialog box, select the **Authentication, Authorization and Auditing** check box.
4. Click **OK**.

Disabling Authentication

If your deployment does not require authentication, you can disable it. You can disable authentication for each virtual server that does not require authentication.

Important:

Important: Citrix recommends disabling authentication with caution. If you are not using an external authentication server, create local users and groups to allow the appliance to authenticate users. Disabling authentication stops the use of authentication, authorization, and accounting features that control and monitor connections to the appliance. When users type a web address to connect to the appliance, the logon page does not appear.

To disable authentication

1. Navigate to **Configuration > NetScaler Gateway > Virtual Servers**.
2. In the details pane, click a virtual server, and then click **Open**.
3. In the **Basic Settings** page, clear the **Enable Authentication** check box.

How authentication, authorization, and auditing works

May 2, 2023

Authentication, authorization, and auditing provides security for a distributed internet environment by allowing any client with the proper credentials to connect securely to protected application servers from anywhere on the Internet. This feature incorporates the three security features of authentication, authorization, and auditing. Authentication enables the NetScaler to verify the client's credentials, either locally or with a third-party authentication server, and allow only approved users to access protected servers. Authorization enables the ADC to verify which content on a protected server it allows each user to access. Auditing enables the ADC to keep a record of each user's activity on a protected server.

To understand how authentication, authorization, and auditing works in a distributed environment, consider an organization with an intranet that its employees access in the office, at home, and when traveling. The content on the intranet is confidential and requires secure access. Any user who wants to access the intranet must have a valid user name and password. To meet these requirements, the ADC does the following:

- Redirects the user to the login page if the user accesses the intranet without having logged in.

- Collects the user's credentials, delivers them to the authentication server, and caches them in a directory that is accessible through LDAP. For more information, see [Determining Attributes in Your LDAP Directory](#).
- Verifies that the user is authorized to access specific intranet content before delivering the user's request to the application server.
- Maintains a session timeout after which users must authenticate again to regain access to the intranet. (You can configure the timeout.)
- Logs the user accesses, including invalid login attempts, in an audit log.

Configure authentication authorization and auditing policies

After you set up your users and groups, you next configure authentication policies, authorization policies, and audit policies to define which users are allowed to access your intranet, which resources each user or group is allowed to access, and what level of detail authentication, authorization, and auditing will preserve in the audit logs. An authentication policy defines the type of authentication to apply when a user attempts to log on. If external authentication is used, the policy also specifies the external authentication server. Authorization policies specify the network resources that users and groups can access after they log on. Auditing policies define the audit log type and location.

You must bind each policy to put it into effect. You bind authentication policies to authentication virtual servers, authorization policies to one or more user accounts or groups, and auditing policies both globally and to one or more user accounts or groups.

When you bind a policy, you assign a priority to it. The priority determines the order in which the policies you define are evaluated. You can set the priority to any positive integer. In the NetScaler operating system, policy priorities work in reverse order: the higher the number, the lower the priority. For example, if you have three policies with priorities of 10, 100, and 1000, the policy assigned a priority of 10 is performed first, then the policy assigned a priority of 100, and finally the policy assigned an order of 1000. The authentication, authorization, and auditing feature implements only the first of each type of policy that a request matches, not any additional policies of that type that a request might also match, so policy priority is important for getting the results you intend.

You can leave yourself plenty of room to add other policies in any order, and still set them to evaluate in the order you want, by setting priorities with intervals of 50 or 100 between each policy when you bind the policies. You can then add additional policies at any time without having to reassign the priority of an existing policy.

For additional information about binding policies on the NetScaler appliance, see the [NetScaler product documentation](#).

Configure the No_Auth policy to bypass certain traffic

You can now configure No_Auth policy to bypass certain traffic from authentication when 401-based authentication is enabled on traffic management virtual server. For such traffic, you must bind a “No_Auth” policy.

To configure the No_Auth policy to bypass certain traffic by using the CLI

At the command prompt, type:

```
1 add authentication policy <name> -rule <expression> -action <string>
2 <!--NeedCopy-->
```

Example:

```
1 add authentication policy ldap -rule ldapAct1 -action No_Auth
2 <!--NeedCopy-->
```

Basic components of authentication, authorization, and auditing configuration

May 2, 2023

The basic components of the authentication, authorization, and auditing configuration are as follows:

- **Authentication virtual server** - All authentication requests are redirected by the traffic management virtual server (load balancing or content switching) to the authentication virtual sever. This virtual server processes the associated authentication policies and accordingly provides access to the application. For details, see [Authentication virtual server](#).
- **Authentication profiles** - An authentication profile specifies the authentication virtual server, the authentication host, the authentication domain, and an authentication level.

You can create one or more authentication profiles to specify different authentication settings and bind these authentication profiles to relevant traffic management servers based on your requirements. For details, see [Authentication profiles](#).

- **Authentication policies** - When users log on to the NetScaler or NetScaler Gateway appliance, they are authenticated according to a policy that you create. An authentication policy comprises of an expression and an action. Authentication policies use NetScaler expressions. For details, see [Authentication policies](#).

- **Authorization policies** - When you configure an authorization policy, you can set it to allow or deny access to network resources in the internal network. For details, see [Authorization policies](#).
- **Users and groups:** - After configuring the authentication, authorization, and auditing basic setup, you create users and groups. You first create a user account for each person who will authenticate via the NetScaler appliance. If you are using local authentication controlled by the NetScaler appliance itself, you create local user accounts and assign passwords to each of those accounts. For details, see [Users and groups](#).

Authentication virtual server

January 9, 2024

The traffic management virtual server (load balancing or content switching) redirects all authentication requests to the authentication virtual server. This virtual server processes the associated authentication policies and accordingly provides access to the application.

Note: You cannot bind traffic management policies to authentication, authorization, and auditing virtual servers.

Set up authentication virtual server

The steps involved in setting up an authentication virtual server are;

1. Enable the authentication, authorization, and auditing feature.

```
1 enable ns feature AAA
2 <!--NeedCopy-->
```

2. Configure an authentication virtual server. It must be of type SSL and make sure to bind the SSL certificate-key pair to the virtual server.

```
1 add authentication vserver <name> SSL <ipaddress> <port>
2
3 bind ssl certkey <auth-vserver-name> <certkey>
4 <!--NeedCopy-->
```

3. Specify the FQDN of the domain for the authentication virtual server.

```
1 set authentication vserver <name> -authenticationDomain <FQDN>
2 <!--NeedCopy-->
```

4. Associate the authentication virtual server to the relevant traffic management virtual server.

Points to Note:

- The FQDN of the traffic management virtual server must be in the same domain as the FQDN of the authentication virtual server for the domain session cookie to function correctly. On the traffic management virtual server:
 - Enable authentication.
 - Specify the FQDN of the authentication virtual server as the authentication host of the traffic management virtual server.
 - [Optional] Specify the authentication domain on the traffic management virtual server.
 - If you do not configure the authentication domain, the appliance assigns an FQDN that consists of the FQDN of the authentication virtual server without the host name portion. For example, if the domain name of the authentication virtual server is **tm.xyz.bar.com**, the appliance assigns **xyz.bar.com** as the authentication domain.
 - * For load balancing:

```
1 set lb vserver <name> -authentication ON -
   authenticationhost <FQDN> [-authenticationdomain <
   authdomain>]
2 <!--NeedCopy-->
```

- * For content switching:

```
1 set cs vserver <name> <protocol> <IPAddress> <port>
2 <!--NeedCopy-->
```

- If you have to set a domain wide cookie for an authentication domain, you must enable authentication profile on a load balancing virtual server.

5. Verify that both the virtual servers are UP and configured correctly.

```
1 show authentication vserver <name>
2 <!--NeedCopy-->
```

To set up an authentication virtual server by using the GUI

1. Enable the authentication, authorization, and auditing feature.

Navigate to **System > Settings**, click **Configure Basic features**, and enable **Authentication, Authorization and Auditing**.

2. Configure the authentication virtual server.

Navigate to **Security > AAA - Application Traffic > Virtual Servers**, and configure as required.

3. Configure the traffic management virtual server for authentication.
 - **For load balancing:**

Navigate to **Traffic Management > Load Balancing > Virtual Servers**, and configure the virtual server as required.
 - **For content switching:**

Navigate to **Traffic Management > Content Switching > Virtual Servers**, and configure the virtual server as required.
4.
 - Verify the authentication setup.

Navigate to **Security > AAA - Application Traffic > Virtual Servers**, and check the details of the relevant authentication virtual server.

Configure the authentication virtual server

To configure authentication, authorization, and auditing, first configure an authentication virtual server to handle authentication traffic. Next, bind an SSL certificate-key pair to the virtual server to enable it to handle SSL connections.

For additional information about configuring SSL and creating a certificate-key pair, see [SSL certificates](#).

Configure an authentication virtual server by using the CLI

To configure an authentication virtual server and verify the configuration, at the command prompt type the following commands in the same order:

```
1 add authentication vserver <name> ssl <ipaddress>
2
3 show authentication vserver <name>
4
5 bind ssl certkey <certkeyName>
6
7 show authentication vserver <name>
8
9 set authentication vserver <name>
10
11 show authentication vserver <name>
12 <!--NeedCopy-->
```

Example:

```
1 add authentication vserver Auth-Vserver-2 SSL 10.102.29.77 443 Done
2
```

```
3 show authentication vserver Auth-Vserver-2 Auth-Vserver-2
  (10.102.29.77:443) - SSL Type: CONTENT State: DOWN[Certkey not bound
  ] Client Idle Timeout: 180 sec Down state flush: DISABLED Disable
  Primary Vserver On Down : DISABLED Authentication : ON Current AAA
  Users: 0 Done
4
5 bind ssl certkey Auth-Vserver-2 Auth-Cert-1 Done
6
7 show authentication vserver Auth-Vserver-2 Auth-Vserver-2
  (10.102.29.77:443) - SSL Type: CONTENT State: UP Client Idle Timeout
  : 180 sec Down state flush: DISABLED Disable Primary Vserver On Down
  : DISABLED Authentication : ON Current AAA Users: 0 Done
8
9 set authentication vserver Auth-Vserver-2
10
11 show authentication vserver Auth-Vserver-2 Auth-Vserver-2
  (10.102.29.77:443) - SSL Type: CONTENT State: DOWN[Certkey not bound
  ] Client Idle Timeout: 180 sec Down state flush: DISABLED Disable
  Primary Vserver On Down : DISABLED Authentication : ON Current AAA
  Users: 0 Done
12 <!--NeedCopy-->
```

Note

The Authentication Domain parameter is deprecated. Use Authentication Profile for setting domain wide cookies.

Configure an authentication virtual server by using the GUI

1. Navigate to **Security > AAA - Application Traffic > Virtual Servers**.
2. In the details pane, do one of the following:
 - To create a new authentication virtual server, click **Add**.
 - To modify an existing authentication virtual server, select the virtual server, and then click **Edit**. The Configuration dialog opens with the Basic Settings area expanded.
3. Specify values for the parameters as follows (asterisk indicates a required parameter):
 - Name*—name (Cannot be changed for a previously created virtual server)
 - IP Address Type*—IP address type of the authentication virtual server
 - IP Address*—IP address of the authentication virtual server
 - Port*—TCP port on which the virtual server accepts connections.
 - Failed login timeout—failedLoginTimeout (Seconds allowed before login fails, and user must start login process again.)
 - Max login attempts—maxLoginAttempts (Number of login attempts allowed before user is locked out)

Note:

The authentication virtual server uses only the SSL protocol and port 443, so those options are grayed out. Any options that are not mentioned can be ignored.

4. Click **Continue** to display the Certificates area.
5. In the **Certificates** area, configure any SSL certificates you want to use with this virtual server.
 - To configure a CA certificate, click the arrow on the right of CA Certificate to display the CA Cert Key dialog box, select the certificate you want to bind to this virtual server, and click **Save**.
 - To configure a server certificate, click the arrow on the right of Server Certificate, and follow the same process as for the CA certificate.
6. Click **Continue** to display the **Advanced Authentication Policies** area.
7. If you want to bind an advanced authentication policy to the virtual server, click the arrow on the right side of the line to display the **Authentication Policy** dialog box, choose the policy that you want to bind to the server, set the priority, and then click **OK**.
8. Click **Continue** to display the **Basic Authentication Policies** area.
9. If you want to create a basic authentication policy and bind it to the virtual server, click the plus sign to display the **Policies** dialog box, and follow the prompts to configure the policy and bind it to this virtual server.
10. Click **Continue** to display the 401-Based Virtual Servers area.
11. In the 401-Based Virtual Servers area, configure any load balancing or content switching virtual servers that you want to bind to this virtual server.
 - To bind a load balancing virtual server, click the arrow to the right of load balancing virtual server to display the Load Balancing Virtual Servers dialog box, and follow the prompts.
 - To bind a content switching virtual server, click the arrow to the right of content switching virtual server to display the Content Switching Virtual Servers dialog box, and follow the same process as to bind an LB virtual server.
12. If you want to create or configure a group, in the Groups area click the arrow to display the Groups dialog box, and follow the prompts.
13. Review your settings, and when you are finished, click **Done**. The dialog box closes. If you created a new authentication virtual server, it now appears in the **Configuration** window list.

Traffic management virtual server

After you have created and configured your authentication virtual server, you next create or configure a traffic management virtual server and associate your authentication virtual server with it. You can use either a load balancing or content switching virtual server for a traffic management virtual server. For more information about creating and configuring either type of virtual server, see the *Citrix Traffic Management Guide* at [Traffic Management](#).

Note:

The FQDN of the traffic management virtual server must be in the same domain as the FQDN of the authentication virtual server for the domain session cookie to function correctly.

You configure a traffic management virtual server for authentication, authorization, and auditing by enabling authentication and then assigning the FQDN of the authentication server to the traffic management virtual server. You can also configure the authentication domain on the traffic management virtual server currently. If you do not configure this option, the NetScaler appliance assigns the traffic management virtual server an FQDN that consists of the FQDN of the authentication virtual server without the host name portion. For example, if the domain name of the authentication virtual server is tm.xyz.bar.com, the appliance assigns xyz.bar.com. as the authentication domain.

To configure a traffic management virtual server by using the CLI

At the command prompt, type one of the following sets of commands:

```
1 set lb vserver <name> - authentication ON -authenticationhost <FQDN> [-
  authenticationdomain <authdomain>]
2 show lb vserver <name>
3 set cs vserver <name> - authentication ON -authenticationhost <FQDN> [-
  authenticationdomain <authdomain>]
4 show cs vserver <name>
5 <!--NeedCopy-->
```

Example:

```
1 set lb vserver vs-cont-sw -Authentication ON -AuthenticationHost mywiki
  .index.com Done
2
3 show lb vserver vs-cont-sw vs-cont-sw (0.0.0.0:0) - TCP Type: ADDRESS
  State: DOWN Last state change was at Wed Aug 19 10:03:15 2009 (+410
  ms) Time since last state change: 5 days, 20:00:40.290 Effective
  State: DOWN Client Idle Timeout: 9000 sec Down state flush: ENABLED
  Disable Primary Vserver On Down : DISABLED No. of Bound Services : 0
  (Total) 0 (Active) Configured Method: LEASTCONNECTION Mode: IP
  Persistence: NONE Connection Failover: DISABLED Authentication: ON
  Host: mywiki.index.com
4 Done
```

To configure a traffic management virtual server by using the GUI

1. In the navigation pane, do one of the following.
 - Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
 - Navigate to **Traffic Management > Content Switching > Virtual Servers**
 - In the details pane, select the virtual server on which you want to enable authentication, and then click **Edit**.
 - In the Domain text box, type the authentication domain.
 - In the **Advanced** menu on the right, select **Authentication**.
 - Choose either **Form Based Authentication** or **401 Based Authentication**, and fill in the Authentication information.
 - For Form Based Authentication, enter the Authentication FQDN (the fully qualified domain name of the authentication server), the Authentication virtual server (the IP address of the authentication virtual server), and the Authentication Profile (the profile to use for authentication).
 - For 401 Based Authentication, enter the Authentication virtual server and the Authentication Profile only.
 - Click **OK**. A message appears in the status bar, stating that the virtual server has been configured successfully.

Simplified login protocol support for authentication, authorization, and auditing

The login protocol between authentication, authorization, and auditing traffic management virtual servers and authentication, authorization, and auditing virtual servers is simplified to use internal mechanisms as opposed to sending the encrypted data through query parameters. Using this feature, the replay of requests is prevented.

Configure DNS

For the domain session cookie used in the authentication process to function correctly, you must configure DNS to assign both the authentication and the traffic management virtual servers to FQDNs in the same domain. For information about how to the configure DNS address records, see [Domain Name System](#).

Verify authentication virtual server

After you configure authentication and traffic management virtual servers and before you create user accounts, you must verify that both virtual servers are configured correctly and are in the UP state.

Configure a noAuth authentication by using the CLI

At the command prompt, type the following command:

```
1 show authentication vserver <name>
2 <!--NeedCopy-->
```

Example:

```
1 show authentication vserver Auth-Vserver-2
2 Auth-Vserver-2 (10.102.29.77:443) - SSL Type: CONTENT
3 State: UP
4 Client Idle Timeout: 180 sec
5 Down state flush: DISABLED
6 Disable Primary Vserver On Down : DISABLED
7 Authentication : ON
8 Current AAA Users: 0
9 Authentication Domain: myCompany.employee.com
10 Done
11 <!--NeedCopy-->
```

Configure a noAuth authentication by using the GUI

1. Navigate to **Security > NetScaler AAA - Application Traffic > Virtual Servers**.
Note: From NetScaler Gateway, navigate to **NetScaler Gateway > Virtual Servers**.
2. Review the information in the **AAA Virtual Servers** pane to verify that your configuration is correct and your authentication virtual server is accepting traffic. You can select a specific virtual server to view detailed information in the details pane.

Authorization policies

May 10, 2024

When you configure an authorization policy, you can set it to allow or deny access to network resources in the internal network. For example, to allow users access to the 10.3.3.0 network, use the following expression:

```
CLIENT.IP.DST.IN_SUBNET(10.3.0.0/16)
```

Authorization policies are applied to users and groups. After a user is authenticated, NetScaler Gateway performs a group authorization check by obtaining the user's group information from either an RADIUS, LDAP, or TACACS+ server. If group information is available for the user, NetScaler Gateway checks the network resources allowed for the group.

To control which resources users can access, you must create authorization policies. If you do not need to create authorization policies, you can configure default global authorization.

If you create an expression within the authorization policy that denies access to a file path, you can only use the subdirectory path and not the root directory. For example, use `fs.path` contains `"\\dir1\\dir2"` instead of `fs.path` contains `"\\rootdir\\dir1\\dir2"`. If you use the second version in this example, the policy fails.

After you configure the authorization policy, you then bind it to a user or group.

By default, authorization policies are validated first against policies that you bind to the virtual server and then against policies bound globally. If you bind a policy globally and want the global policy to take precedence over a policy that you bind to a user, group, or virtual server, you can change the priority number of the policy. Priority numbers start at zero. A lower priority number gives the policy higher precedence.

For example, if the global policy has a priority number of one and the user has a priority of two, the global authentication policy is applied first.

Important:

- Classic authorization policies are applied only on TCP traffic.
- Advanced authorization policy can be applied on all types of traffic (TCP/UDP/ICMP/DNS).
 - To apply policy on UDP/ICMP/DNS traffic, policies must be bound at type `UDP_REQUEST`, `ICMP_REQUEST`, and `DNS_REQUEST` respectively.
 - While binding, if `"type"` is not explicitly mentioned or `"type"` is set to `REQUEST`, the behavior does not change from earlier builds, that is these policies are applied only to TCP traffic.
 - The policies bound at `UDP_REQUEST` do not apply for DNS traffic. For DNS, policies must be explicitly bound to `DNS_REQUEST` `TCP_DNS` is similar to other TCP requests.

For more details on advanced authorization policies, see article <https://support.citrix.com/article/CTX232237>.

Configure and bind an authorization policy

Configure an authorization policy by using the GUI

1. Navigate to **NetScaler Gateway > Policies > Authorization**.
2. In the details pane, click **Add**.
3. In **Name**, type a name for the policy.
4. In **Action**, select **Allow** or **Deny**.
5. In **Expression**, click **Expression Editor**.
6. To configure the expressions, click **Select** and choose the necessary elements.

Following are a few expression examples,

- `HTTP.REQ.USER.IS_MEMBER_OF("AllowedGroup")` - You can allow or deny access to a user if the user is member of the user group “AllowedGroup”.
- `CLIENT.IP.DST.BETWEEN(10.102.75.10,10.102.75.20)` - You can allow or deny access if the client destination IP address is within a certain range.
- `HTTP.REQ.HOSTNAME.CONTAINS("portal-srv") || CLIENT.IP.DST.IN_SUBNET(10.102.75.0/25)` - You can allow or deny access to the user if the hostname of their HTTP request contains the text “portal-srv” or if the client device destination IP address is in the subnet 10.102.75.0/25.

7. Click **Done** when your expression is complete.
8. Click **Create**.

Bind an authorization policy to a user by using the GUI

1. Navigate to **NetScaler Gateway > User Administration**.
2. Click **AAA Users**.
3. In the details pane, select a user and then click **Edit**.
4. In **Advanced Settings**, click **Authorization Policies**.
5. In **Policy Binding** page, select a policy or create a policy.
6. In **Priority**, set the priority number.
7. In **Type**, select the request type and then click **OK**.

Bind an authorization policy to a group by using the GUI

1. Navigate to **NetScaler Gateway > User Administration**.
2. Click **AAA Groups**.
3. In the details pane, select a group and then click **Edit**.
4. In **Advanced Settings**, click **Authorization Policies**.
5. In **Policy Binding** page, select a policy or create a policy.

6. In **Priority**, set the priority number.
7. In **Type**, select the request type and then click **OK**.

Authorization specifies the network resources to which users have access when they log on to NetScaler Gateway. The default setting for authorization is to deny access to all network resources. Citrix recommends using the default global setting and then creating authorization policies to define the network resources users can access.

You configure authorization on NetScaler Gateway by using an authorization policy and expressions. After you create an authorization policy, you can bind it to the users or groups that you configured on the appliance.

Default global authorization

To define the resources to which users have access on the internal network, you can configure default global authorization. You configure global authorization by allowing or denying access to network resources globally on the internal network.

Any global authorization action you create is applied to all users who do not already have an authorization policy associated with them, either directly or through a group. A user or group authorization policy always overrides the global authorization action. If the default authorization action is set to Deny, you must apply authorization policies for all users or groups to make network resources accessible to those users or groups. This requirement helps to improve security.

To set default global authorization:

1. In the configuration utility, on the Configuration tab, in the navigation pane, expand NetScaler Gateway and then click Global Settings.
2. In the details pane, under Settings, click Change global settings.
3. On the Security tab, next to Default Authorization Action, select Allow or Deny then and click OK.

Authentication profiles

May 2, 2023

When you want the same authentication settings to be used by multiple traffic management virtual servers, you can create an authentication profile which specifies the authentication virtual server, the authentication host, the authentication domain, and the authentication level.

This authentication profile can be associated with the relevant traffic management virtual servers.

Configure an authentication profile

Configure an authentication profile by using the CLI

- Create the authentication profile and set the required parameters.

For example, to create a profile with an authentication virtual server named “authVS”.

```
1  add authentication authnProfile authProfile1 -authnVsName authVS
   -authenticationHost authnVS.example.com -authenticationDomain
   example.com -authenticationLevel
2  <!--NeedCopy-->
```

Note:

The authentication weight or level depends on the virtual server to which the traffic is bound. A session that is created by authenticating against the traffic management virtual server at a given level cannot be used to access the traffic management virtual server at a higher level.

- Bind the authentication profile to the relevant traffic management virtual servers.

For example, to bind authProfile1 to a load balancing virtual server named “vserver1”.

```
1  set lb vserver vserver1 -authnProfile authProfile1
2  <!--NeedCopy-->
```

Configure an authentication profile by using the GUI

In the **Configuration** tab, navigate to **Security > AAA - Application Traffic > Authentication Profile**, and configure the authentication profile as required.

Note:

- You can create an authentication profile by using the NetScaler Gateway wizard as well. The profile contains all the settings for the authentication policy. You configure the profile when you create the authentication policy.
- With the NetScaler Gateway wizard, you can use the chosen authentication type to configure authentication. If you want to configure other authentication policies after running the wizard, you can use the configuration utility. For more information about the NetScaler Gateway wizard, see [Configuring Settings by Using the NetScaler Gateway Wizard](#)].

Authentication policies

January 10, 2024

When users log on to NetScaler or NetScaler Gateway, they are authenticated according to a policy that you create. An authentication policy comprises an expression and an action. Authentication policies use NetScaler expressions.

After creating an authentication action and an authentication policy, bind it to an authentication virtual server and assign a priority to it. When binding it, also designate it as either a primary or a secondary policy. Primary policies are evaluated before secondary policies. In configurations that use both types of policy, primary policies are normally more specific policies while secondary policies are normally more general policies. It is intended to handle authentication for any user accounts that do not meet the more specific criteria. The policy defines the authentication type. A single authentication policy can be used for simple authentication needs and is typically bound at the global level. You can also use the default authentication type, which is local. If you configure local authentication, you must also configure users and groups on NetScaler.

You can configure multiple authentication policies and bind them to create a detailed authentication procedure and virtual servers. For example, you can configure cascading and two-factor authentication by configuring multiple policies. You can also set the priority of the authentication policies to determine which servers and the order in which NetScaler checks user credentials. An authentication policy includes an expression and an action. For example, if you set the expression to True value, when users log on, the action evaluates user logon to true and then users have access to network resources.

After you create an authentication policy, you bind the policy at either the global level or to virtual servers. When you bind at least one authentication policy to a virtual server, any authentication policies that you bound to the global level are not used when users log on to the virtual server, unless the global authentication type has a higher precedence than the policy bound to the virtual server.

When a user logs on to NetScaler, authentication is evaluated in the following order:

- The virtual server is checked for any bound authentication policies.
- If authentication policies are not bound to the virtual server, NetScaler checks for global authentication policies.
- If an authentication policy is not bound to a virtual server or globally, the user is authenticated through the default authentication type.

If you configure LDAP and RADIUS authentication policies and want to bind the policies globally for two-factor authentication, you can select the policy in the configuration utility and then select if the policy is the primary or secondary authentication type. You can also configure a group extraction policy.

Note:

NetScaler or NetScaler Gateway encodes only UTF-8 characters for authentication, and it is not compatible with servers that use ISO-8859-1 characters.

On the GUI**Create or modify an advanced authentication policy**

1. Navigate to **Security > AAA - Application Traffic > Policies > Authentication > Advanced Policies > Policy**.
2. On the **Authentication Policies** page, perform one of the following tasks:
 - To create an authentication policy, click **Add**. The **Create Authentication Policy** page appears.
 - Update the required fields and click **Create**.
 - To modify an authentication policy, select the action, and then click **Edit**. The **Configure Authentication Policy** page is displayed. Modify the required fields and click **OK**.
 - **Name:** Name of the advanced authentication policy.
 - **Action Type:** Type of the authentication action for which the policy is being created.
 - **Action:** Name of the authentication action (LDAP, RADIUS, SAML) to be performed if the policy matches. If there is no authentication action in the drop-down list, click **Add**.
 - **Expression:** Name of the NetScaler named rule or expression that the policy uses to determine whether to attempt to authenticate the user with the authentication virtual server. For more information about advanced policy expressions, see [Advanced policy expressions](#).
 - **Log Action:** Name of message log action to use when a request matches this policy.

**Remove an authentication policy**

If you have changed or removed an authentication server from your network, remove the corresponding authentication policy from NetScaler.

1. Navigate to **Security > AAA - Application Traffic > Policies > Authentication > Advanced Policies > Policy**.

2. On the **Authentication Policies** page, select the policy that you want to remove and click **Delete**.
3. Click **Yes** to confirm your action.

Bind the authentication policy

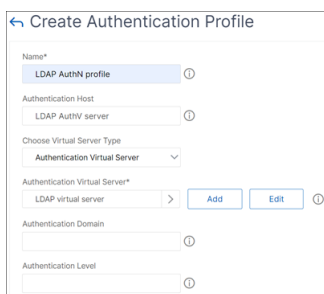

You must bind advanced authentication policies to an authentication virtual server and link the authentication virtual server to a VPN virtual server by using an authentication profile.

1. Create an authentication virtual server.
 - Navigate to **Security > AAA - Application Traffic > Virtual Servers**.
 - On the **Authentication Virtual Servers** page, and click **Add**. Update the required fields and click **OK**.
 - If an authentication virtual server exists, select the relevant server on the **Authentication Virtual Servers** page.
 - In the **Advanced Authentication Policies** section, select the authentication policy.
 - On the **Policy Binding** page, select the policy and click **Add**. Provide the binding details such as the priority, GoTo expression, and the next factor, and then click **Bind**.

1. Create a VPN virtual server.
 - Navigate to **NetScaler Gateway > Virtual servers**.
 - On the **NetScaler Gateway Virtual Servers** page, click **Add**.
 - On the **VPN Virtual Server** page, update the required fields and click **OK**.

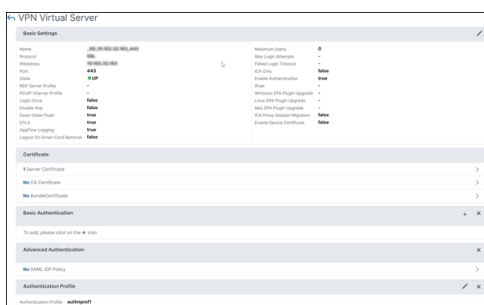

2. Create an authentication profile.

- Navigate to **Security > AAA - Application Traffic > Authentication Profile**.
- On the **Authentication Profile** page, click **Add**.
- Update the required fields and click **Create**.

3. Link the authentication virtual server to the VPN virtual server by using the authentication profile.

- Navigate to **NetScaler Gateway > NetScaler Gateway Virtual Servers** and select the VPN virtual server. The **VPN Virtual Server** page appears.
- In the **Authentication profile** section, select the authentication profile from the drop-down list and click **OK**.
- Alternatively, you can navigate to the **Advanced settings** section on the **VPN Virtual server** page, click **+ Authentication Profile**, select the authentication profile from the drop-down list, and click **OK**.
- Click **Done**.

On the CLI

At the command prompt, type the following commands:

```

1 add authentication policy <name> -rule <expression> -action <string>
2
3 show authentication policy <name>
4

```

```

5 bind authentication vserver <name> -policy <polycname> [-priority <
  priority>][-secondary]
6
7 show authentication vserver <name>
8 <!--NeedCopy-->

```

Example:

```

1 add authentication policy Authn-Pol-1 true
2
3
4 show authentication policy Authn-Pol-1
5 Name: Authn-Pol-1      Rule: true      Request action: LOCAL
6
7 bind authentication vserver Auth-Vserver-2 -policy Authn-Pol-1
8
9 show authentication vserver Auth-Vserver-2
10 Auth-Vserver-2 (10.102.29.77:443) - SSL Type: CONTENT State: UP Client
    Idle
11 Timeout: 180 sec Down state flush: DISABLED
12 Disable Primary Vserver On Down : DISABLED
13 Authentication : ON
14 Current AAA Users: 0
15 Authentication Domain: myCompany.employee.com
16 Primary authentication policy name: Authn-Pol-1 Priority: 0
17 <!--NeedCopy-->

```

Modify an authentication policy At the command prompt, type the following commands to modify an existing authentication policy:

```

1 set authentication policy <name> [-rule <expression>] [-action <string
  >] [-undefAction <string>] [-comment <string>] [-logAction <string
  >]
2 <!--NeedCopy-->

```

Example

```

1 set authentication policy Authn-Pol-1 -rule true
2 <!--NeedCopy-->

```

Remove an authentication policy At the command prompt, type the following command to remove an authentication policy:

```

1 rm authentication policy <name>
2 <!--NeedCopy-->

```

Example

```

1 rm authentication localPolicy Authn-Pol-1

```

```
2 <!--NeedCopy-->
```

Bind the authentication policy For advanced policies, create an authentication profile and associate the profile to an authentication virtual server. Once the authentication profile is created, associate the authentication profile to a VPN virtual server.

Create an authentication profile and set an authentication virtual server to the profile:

```
1 add authentication authnProfile <name> {
2   -authnVsName <string> }
3   {
4   -AuthenticationHost <string> }
5   {
6   -AuthenticationDomain <string> }
7   [-AuthenticationLevel <positive_integer>]
8
9 <!--NeedCopy-->
```

Example

```
1 add authentication authnProfile Authn-Prof-1 -authnVsName Auth-Vserver
   -2 -AuthenticationDomain "myCompany.employee.com"
2
3 <!--NeedCopy-->
```

Create a VPN virtual server and add the corresponding authentication profile:

Example

```
1 add vpn vserver VPN-Vserver-2 ssl -authentication ON -authnprofile
   Authn-Prof-1
2 <!--NeedCopy-->
```

Add an authentication action

If you do not use LOCAL authentication, you need to add an explicit authentication action. At the command prompt, type the following command:

```
1 add authentication tacacsAction <name> -serverip <IP> [-serverPort <
   port>][ -authTimeout <positive_integer>][ ... ]
2 <!--NeedCopy-->
```

Example

```
1 add authentication tacacsaction Authn-Act-1 -serverip 10.218.24.65 -
   serverport 1812 -authtimeout 15 -tacacsSecret "minotaur" -
   authorization OFF -accounting ON -auditFailedCmds OFF -
   defaultAuthenticationGroup "users"
2 <!--NeedCopy-->
```

Configure an authentication action

To configure an existing authentication action, at the command prompt, type the following command:

```
1 set authentication tacacsAction <name> -serverip <IP> [-serverPort <
  port>][-authTimeout <positive_integer>][ ... ]
2 <!--NeedCopy-->
```

Example

```
1 set authentication tacacsaction Authn-Act-1 -serverip 10.218.24.65 -
  serverport 1812 -authtimeout 15 -tacacsSecret "minotaur" -
  authorization OFF -accounting ON -auditFailedCmds OFF -
  defaultAuthenticationGroup "users"
2 <!--NeedCopy-->
```

Remove an authentication action

To remove an existing RADIUS action, at the command prompt, type the following command:

```
1 rm authentication radiusAction <name>
2 <!--NeedCopy-->
```

Example

```
1 rm authentication tacacsaction Authn-Act-1
2 <!--NeedCopy-->
```

The noAuth authentication

NetScaler supports noAuth authentication capability that enables the customer to configure a default-AuthenticationGroup parameter in the `noAuthAction` command, when a user performs this policy. The administrator can check for the presence of this group in the user's group to determine the user's navigation through the noAuth policy.

To configure a noAuth authentication

At the command prompt, type;

```
1 add authentication noAuthAction <name> [-defaultAuthenticationGroup <
  string>]
2 <!--NeedCopy-->
```

Example

```
1 add authentication noAuthAction noauthact - defaultAuthenticationGroup
   mynoauthgroup
2 <!--NeedCopy-->
```

Default global authentication types

When you installed NetScaler Gateway and ran the NetScaler Gateway wizard, you configured authentication within the wizard. This authentication policy is bound automatically to the NetScaler Gateway global level. The authentication type that you configure within the NetScaler Gateway wizard is the default authentication type. You can change the default authorization type by running the NetScaler Gateway wizard again or you can modify the global authentication settings in the configuration utility.

If you need to add other authentication types, you can configure authentication policies on NetScaler Gateway and bind the policies to NetScaler Gateway by using the configuration utility. When you configure authentication globally, you define the type of authentication, configure the settings, and set the maximum number of users that can be authenticated.

After configuring and binding the policy, you can set the priority to define which authentication type takes precedence. For example, you configure LDAP and RADIUS authentication policies. If the LDAP policy has a priority number of 10 and the RADIUS policy has a priority number of 15, the LDAP policy takes precedence, regardless of where you bind each policy. This is called cascading authentication.

You can select to deliver logon pages from the NetScaler Gateway in-memory cache or from the HTTP server running on NetScaler Gateway. If you choose to deliver the logon page from the in-memory cache, the delivery of the logon page from NetScaler Gateway is faster than from the HTTP server. Choosing to deliver the logon page from the in-memory cache reduces the wait time when many users log on at the same time. You can only configure the delivery of logon pages from the cache as part of a global authentication policy.

You can also configure the network address translation (NAT) IP address that is a specific IP address for authentication. This IP address is unique for authentication and is not the NetScaler Gateway subnet, mapped, or virtual IP addresses. This is an optional setting.

Note:

- You cannot use the NetScaler Gateway wizard to configure SAML authentication.
- You can use the Quick Configuration wizard to configure LDAP, RADIUS, and client certificate authentication. When you run the wizard, you can select from an existing LDAP or RADIUS server configured on NetScaler Gateway. You can also configure the settings for LDAP or RADIUS. If you use two-factor authentication, it is recommended that you use LDAP as the

primary authentication type.

Configure default global authentication types

1. In the GUI, on the Configuration tab, in the navigation pane, expand **NetScaler Gateway**, and then click **Global Settings**.
2. In the details pane, under Settings, click **Change authentication settings**.
3. In **Maximum Number of Users**, type the number of users who can be authenticated by using this authentication type.
4. In **NAT IP address**, type the unique IP address for authentication.
5. Select **Enable static caching to deliver logon pages faster**.
6. Select **Enable Enhanced Authentication Feedback to provide a message to users if authentication fails**. The message users receive include the password errors, the account disabled or locked, or the user is not found, to name a few.
7. In **Default Authentication Type**, select the authentication type.
8. Configure the settings for your authentication type, and then click **OK**.

Support to retrieve current login attempts for a user

NetScaler provides an option to retrieve the value of current login attempts for a user by an expression `aaa.user.login_attempts`. This expression takes either one argument (user name) or no argument. If there is no argument, the expression fetches the user name from the `aaa_session` or `aaa_info`.

You can use the `aaa.user.login_attempts` expression with authentication policies for further processing.

To configure the number of login attempts per user

At the command prompt, type:

```
add expression er aaa.user.login_attempts
```

Note:

The `aaa.user.login_attempts` expression does not work if the Persistent Login Attempts parameter is enabled. For details about the Persistent Login Attempts parameter, see [System user account lockout](#).

The following CLI examples describe the login attempt configurations for different scenarios:

- Authentication virtual server

```
set authentication vserver av_vs -maxLoginAttempts 5 -failedLoginTimeout 100
```

For details about the authentication virtual server and its supported parameters, see [Authentication virtual server](#).

- NetScaler Gateway virtual server

```
set vpn vserver vpn_vs -maxLoginAttempts 5 -failedLoginTimeout 100
```

For details about a NetScaler Gateway virtual server, see [Virtual servers](#) section.

- Lockout a system user account

```
set aaa parameter -maxloginAttempts 3 -failedLoginTimeout 10
```

For details about the system user account lockout, see [Lock system user account for management access](#).

Parameter descriptions:

- `maxLoginAttempts`: Maximum number of login attempts allowed before a user is locked out.
- `failedLoginTimeout`: Number of seconds allowed before the login fails. The user must restart the login process.

Users and groups

May 2, 2023

After configuring the authentication, authorization, and auditing basic setup, you create users and groups. You first create a user account for each person who authenticates via the NetScaler appliance. If you are using local authentication controlled by the NetScaler appliance itself, you create local user accounts and assign passwords to each of those accounts.

You also create user accounts on the NetScaler appliance if you are using an external authentication server. In this case, however, each user account must exactly match an account for that user on the external authentication server, and you do not assign passwords to the user accounts that you create on the NetScaler. The external authentication server manages the passwords for users that authenticate with the external authentication server.

If you are using an external authentication server, you can still create local user accounts on the NetScaler appliance if, for example, you want to allow temporary users (such as visitors) to log in

but do not want to create entries for those users on the authentication server. You assign a password to each local user account, just as you would if you were using local authentication for all user accounts.

Each user account must be bound to policies for authentication and authorization. To simplify this task, you can create one or more groups and assign user accounts to them. You can then bind policies to groups instead of individual user accounts.

Configure policies with groups

After you configure groups, you can use the **Group** dialog box to apply policies and settings that specify user access. If you are using local authentication, you create users and add them to groups that are configured on NetScaler Gateway. The users then inherit the settings for that group.

You can configure the following policies or settings for a group of users in the **Group** dialog box:

- Users
- Authorization policies
- Auditing policies
- Session policies
- Traffic policies
- Bookmarks
- Intranet applications
- Intranet IP addresses

In your configuration, you might have users that belong to more than one group. In addition, each group might have one or more bound session policies, with different parameters configured. Users that belong to more than one group inherit the session policies assigned to all the groups to which the user belongs. To ensure which session policy evaluation takes precedence over the other, you must set the priority of the session policy.

For example, you have group1 that is bound with a session policy configured with the home page `www.homepage1.com`. Group2 is bound with a session policy configured with home page `www.homepage2.com`. When these policies are bound to respective groups without a priority number or with a same priority number, the home page that appears to users who belong to both the groups depends on which policy is processed first. By setting a lower priority number, which gives higher precedence, for the session policy with home page `www.homepage1.com`, you can ensure that users who belong to both the groups receive the home page `www.homepage1.com`.

If session policies do not have a priority number assigned or have the same priority number, precedence is evaluated in the following order:

- User

- Group
- Virtual server
- Global

If policies are bound to the same level, without a priority number or if the policies have the same priority number, the order of evaluation is per the policy bind order. Policies that are bound first to a level receive precedence over policies bound later.

If we have a user bound to multiple groups with each group having IIP bound, the user can get free IP from any of the bound groups.

Create users and groups

Configure authentication, authorization, and auditing local users by using the GUI

1. Navigate to **Security > AAA - Application Traffic > Users**
From NetScaler Gateway, expand **NetScaler Gateway > User Administration**, and then click **AAA Users**.
2. In the details pane, do one of the following:
 - To create a new user account, click **Add**.
 - To modify an existing user account, select the user account, and then click **Open**.
3. In the **Create AAA User** dialog box, in the **User Name** text box, type a name for the user.
4. If creating a locally authenticated user account, clear the **External Authentication** check box and provide a local password that the user uses to log on.
5. Click **Create** or **OK**, and then click **Close**. A message appears in the status bar, stating that the user has been configured successfully.

Configure authentication, authorization, and auditing local groups and add users to them by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic > Groups**
From NetScaler Gateway, expand **NetScaler Gateway > User Administration**, and then click **AAA Groups**.
2. In the details pane, do one of the following:
 - To create a new group, click **Add**.
 - To modify an existing group, select the group, and then click **Edit**.

3. If you are creating a new group, in the **Create AAA Group** dialog box, in the **Group Name** text box, type a name for the group.
4. In the **Advanced** area to the right, click **AAA Users**.
 - To add a user to the group, select the user, and then click **Add**.
 - To remove a user from the group, select the user, and then click **Remove**.
 - To create a new user account and add it to the group, click the **Plus** icon, and then follow the instructions in “To configure authentication, authorization, and auditing local users by using the configuration utility.”
5. Click **Create** or **OK**. The group that you created appears in the **AAA Groups** page.

Delete a group by using the GUI

You can also delete user groups from NetScaler Gateway.

1. Navigate to **Security > AAA - Application Traffic > Groups**
From NetScaler Gateway, expand Citrix **Gateway > User Administration**, and then click **AAA Groups**.
In the details pane, select the group, and then click **Remove**.

Configure authentication, authorization, and auditing local users by using the CLI

At the command prompt, type the following commands:

```
1 add aaa group <groupname>
2
3 bind aaa group <groupname> -username <username>
4 <!--NeedCopy-->
```

Example:

```
1 add aaa group group-2
2
3 bind aaa group group-2 -username user-2
4 <!--NeedCopy-->
```

Remove users from an authentication, authorization, and auditing group by using the command line interface

At the command prompt, unbind users from the group by typing the following command once for each user account that is bound to the group:

```
1 unbind aaa group <groupname> -username <username><!--NeedCopy-->
```

```
1 **Example:**
2
3 <!--NeedCopy-->
```

unbind aaa group group-hr -username user-hr-1

```
1 ### Remove an authentication, authorization, and auditing group by
   using the command line interface
2
3 First remove all users from the group. Then, at the command prompt,
   type the following command to remove a NetScaler AAA group and
   verify the configuration:
4
5 <!--NeedCopy-->
```

rm aaa group

```
1 **Example:**
2
3 <!--NeedCopy-->
```

rm aaa group group-hr

```
1 > **Note**
2 >
3 >You cannot add a user name with domain if the user name is already
   added without domain. If the user name with domain is added first
   followed by the same user name without domain, then the NetScaler
   appliance adds the user name to the user list.
4
5 The following example shows adding a user name with domain is not
   permitted if the same user name is added without domain.
6
7 <!--NeedCopy-->
```

```
add aaa user u47985
Done
show aaa users
1) UserName: u47985
Done
add aaa user u47985@domain.com
ERROR: User already exists
""
```

The following example shows if the user name with domain is added first followed by the same user name without domain, then the NetScaler appliance adds the user name to the user list.

```
1 > add aaa user u47985@domain.com
2 Done
3 > add aaa user u47985
4 Done
5 > sh aaa user
6 1)  UserName: u47985@domain.com
7 2)  UserName: u47985
```

““

Authentication methods

November 14, 2023

The NetScaler appliance can authenticate users with local user accounts or by using an external authentication server. The appliance supports the following authentication types:

- **LOCAL:** Authenticates to the NetScaler appliance by using a password, without reference to an external authentication server. User data is stored locally on the NetScaler appliance.
- **RADIUS:** Authenticate to an external RADIUS server.
- **LDAP:** Authenticates to an external LDAP authentication server.
- **TACACS:** Authenticates to an external Terminal Access Controller Access-Control System (TACACS) authentication server.
- **CERT:** Authenticates to the NetScaler appliance by using a client certificate, without reference to an external authentication server.
- **NEGOTIATE:** Authenticates to a Kerberos authentication server. If there is an error in Kerberos authentication, NetScaler uses NTLM authentication.
- **SAML:** Authenticates to a server that supports the Security Assertion Markup Language (SAML).
- **SAML IDP:** Configures the NetScaler to serve as a Security Assertion Markup Language (SAML) Identity Provider (IdP).
- **WEB:** Authenticates to a web server, providing the credentials that the web server requires in an HTTP request and analyzing the web server response to determine that the user authentication was successful.
- **Native OTP:** NetScaler appliance supports one-time passwords (OTPs) without having to use a third-party server.
- **Push notification:** NetScaler Gateway supports push notifications for OTP. Users do not have to manually enter the OTP received on their registered devices to log in to NetScaler Gateway.

Admins can configure NetScaler Gateway such that login notifications are sent to users' registered devices using push notification services.

- **Email OTP:** The Email OTP method enables you to authenticate using the one-time password (OTP) that is sent to the registered email address. When you try to authenticate on any service, the server sends an OTP to the registered email address of the user.
- **reCaptcha authentication** - NetScaler Gateway supports a new first class action 'captchaAction' that simplifies reCaptcha configuration. As reCaptcha is a first class action, it can be a factor of its own. You can inject reCaptcha anywhere in the nFactor flow.
- **nFactor authentication:** Multifactor authentication enhances the security of an application by requiring users to provide multiple proofs of identity to gain access. The NetScaler appliance provides an extensible and flexible approach to configuring multifactor authentication. This approach is called nFactor authentication.
- **OAuth authentication:** OAuth authentication authorizes and authenticates users to services that are hosted on applications such as Google, Facebook, and Twitter.

nFactor authentication

October 23, 2023

Important

- nFactor authentication is supported from NetScaler 11.0 Build 62.x onwards.
- For nFactor authentication to work with NetScaler, an Advanced license or a Premium license is required.
- Starting from release 13.0 build 67.x, nFactor authentication is supported with Standard license only for Gateway/VPN virtual server. For more information about nFactor authentication with NetScaler Gateway, see [nFactor for Gateway Authentication](#).
- nFactor authentication is not supported for Linux client.

Multifactor authentication enhances the security of an application by requiring users to provide multiple proofs of identity to gain access. The NetScaler appliance provides an extensible and flexible approach to configuring multifactor authentication. This approach is called *nFactor authentication*.

How nFactor authentication works

Each authentication factor performs the following tasks:

- Collects credentials from the user. NetScaler supported authentication mechanisms include LDAP, RADIUS, SAML assertion, Client Certificate, OAuth OpenID Connect, Kerberos, and so on.
- Evaluates the supplied credentials to decide whether the authentication succeeded, failed or the actions like Group extraction, Attribute extraction is to be performed.
- Based on the evaluation results, access is either granted, denied, or a next factor is selected.
- Repeat these steps, until there are no more next factors to evaluate.

With nFactor authentication you can:

- Configure any number of authentication factors.
- Base the selection of the next factor on the result of executing the previous factor.
- Customize the login interface. For example, you can customize the label names, error messages, and help text.
- Extract user group information without doing authentication.
- Configure pass-through for an authentication factor. This means that no explicit login interaction is required for that factor.
- Configure the order in which different types of authentication are applied. Any of the authentication mechanisms that are supported on the NetScaler appliance can be configured as any factor of the nFactor authentication setup. These factors are executed in the order in which they are configured.
- Configure the NetScaler appliance to proceed to an authentication factor that must be executed when authentication fails. To do so, you configure another authentication policy with the same condition, but with the next highest priority and with the action set to “NO_AUTH”. You must configure the next factor, which must specify the alternative authentication mechanism to apply.

Encryption of NetScaler Gateway login information for nFactor authentication

NetScaler Gateway with nFactor authentication can encrypt the login request fields submitted by a client (browser or SSO apps) during authentication process. The encrypted login request fields provide an extra layer of security to protect the user’s sensitive data from being disclosed.

Compatible browsers

The following table lists the browsers along with version details that support login encryption.

Browsers	Version
Chrome	78 and above

Browsers	Version
Firefox	69 and above
Edge	42 and above
Safari	11.0 and above
Opera	66

Compatible clients

The following section lists the clients along with version details that support encryption of NetScaler Gateway login information.

- Citrix Workspace app in Mac supports encryption only when OS version is 10.14.x and above.
- Citrix SSO app in Mac supports encryption only when OS version is 10.14.x and above.
- Windows SSO app does not have restrictions on the compatibility.

To enable the login encryption by using the CLI

At the command prompt, type:

```
1 set aaa parameter \[-loginEncryption \{ENABLED | DISABLED\}
```

Note

The loginEncryption parameter is DISABLED by default. You must ENABLE it.

To enable the login encryption by using the GUI

1. Navigate to **Security > AAA –Application Traffic**, click **Change authentication AAA settings** under **Authentication Settings** section.
2. On the **Configure AAA Parameter** page, scroll down to the **Login Encryption** option, and enable it.

Important note about login encryption:

When you try logging on to NetScaler Gateway, you see an error message that the password encryption has failed and that you must disable password encryption to continue with the logon, in the following scenarios:

- Login encryption is enabled.

- Unsupported browser is used.

You can ignore the suggestion to disable login encryption. But, ensure that you use a supported browser for a successful logon.

nFactor concepts, entities, and terminology

May 2, 2023

This topic captures some of the major entities involved in nFactor authentication and their significance.

Login schema

nFactor decouples the ‘view’, the user interface, with the ‘model’ that is the runtime handling. nFactor’s view is defined by the login schema. Login schema is an entity that defines what the user sees and specifies how to extract the data from the user.

For defining a view, the login schema points to a file on disk that defines the logon form. This file must be according to the specification of the “Citrix Common Forms Protocol.” This file is essentially an XML definition of the logon form.

In addition to the XML file, the login schema contains advanced policy expressions to glean user name and password from the user’s login request. These expressions are optional, and can be omitted if user name and password from user arrive with expected form variable names.

Login schema also defines, whether the current set of credentials must be used as default Single-SignOn credentials.

Login schema can be created by running the following CLI command:

```
1   add authentication loginSchema <name> -authenticationSchema <string>
    [-userExpression <string>] [-passwdExpression <string>] [-
    userCredentialIndex <positive_integer>] [-passwordCredentialIndex
    <positive_integer>] [-authenticationStrength <positive_integer>]
    [-SSOCredentials ( YES | NO )]
2 <!--NeedCopy-->
```

Note:

SSOCredentials indicate whether the current factor credentials are the default SSO credentials. Default value is NO.

In the nFactor authentication configuration, last factor credentials are used for SSO by default.

By using the **SSOCredentials** configuration, current factor credentials can be used. In case this configuration is set in different factors, the final factor which has this configuration set takes the priority.

For details about each parameter, see <https://developer-docs.citrix.com/projects/citrix-adc-command-reference/en/latest/authentication/authentication-loginSchema/#add-authentication-loginschema>.

Policy label

A policy label is a collection of policies. It is a construct not alien to NetScaler's policy infrastructure. Policy label defines an authentication factor. That is, it contains all the policies necessary to determine whether credentials from the user are satisfied. All the policies in a policy label can be assumed as homogenous. Policy label for authentication cannot take policies of different type, say rewrite. To put in a different way, all the policies in a policy label validate the same password/credential from the user, mostly. The result of policies in a policyLabel follows the logical OR condition. Hence, if the authentication specified by the first policy succeeds, other policies following it are skipped.

Policy label can be created by running the following CLI command:

```
1 add authentication policy label mylabel - loginSchema <>
2 <!--NeedCopy-->
```

A policy label takes the login schema as the property. Login schema defines the view for that policy label. If the login schema is not specified, an implicit login schema, LSCHEMA_INT, is associated with that policy label. Login schema decides whether a policy label becomes a passthrough or not.

Virtual server label

In NetScaler's advanced policy infrastructure, a virtual server is also an implicit policy label. That's because the virtual server can also be bound with more than one policy. However, a virtual server is special because it is the entry point for client traffic and can take policies of a different type. Each of the policies it put under its own label within the virtual server. Hence, the virtual server is a conglomeration of labels.

Next factor

Whenever a policy is bound to a virtual server or a policy label, it can be specified with the next factor. Next factor determines what must be done if a given authentication succeeds. If there is no next factor, that concludes the authentication process for that user.

Each policy bound to a virtual server or policy label can have a different next factor. This allows for ultimate flexibility where in every policy's success can define a new path for user's authentication. Administrator can take advantage of this fact and craft clever fallback factors for users who do not meet certain policies.

No-Auth policy

nFactor introduces a special built-in policy called NO_AUTHN. NO_AUTHN policy always returns success as the authentication result. The `no-auth` policy can be created by running the following CLI command:

```
1 add authentication policy noauthpolicy -rule <> -action NO_AUTHN
2 <!--NeedCopy-->
```

As per the command, the `no-authentication` policy takes a rule that can be any advanced policy expression. Authentication result is always success from NO_AUTHN.

A `no-auth` policy in itself does not seem to add value. However, when used along with passthrough policy labels, it offers great flexibility to make logical decisions to drive user authentication flow. NO_AUTHN policy and passthrough factors offer a new dimension to nFactor's flexibility.

Note: Check the examples that depict the usage of `no-auth` and passthrough in subsequent sections.

Passthrough factor/label

Once the user has passed the authentication at the virtual server (for the first factor), subsequent authentications happen at policy labels or user defined (secondary) factors.

Every policy label/factor is associated with a login schema entity to display the view for that factor. This allows for customizing views based on the path the user would have taken to arrive at a given factor.

There are specialized kinds of policy labels which do not point explicitly to a login schema. Specialized policy labels point to a login schema that does not actually point to the XML file for the view. These policy labels/factors are called 'passthrough' factors.

Passthrough factors can be created by running the following CLI commands:

Example 1:

```
1 add authentication policylabel example1
2 <!--NeedCopy-->
```

Example 2:

```
1 add loginschema passthrough_schema - authenticationSchema noschema
2
3 add authentication policylabel example2 - loginschema
  passthrough_schema
4 <!--NeedCopy-->
```

Passthrough factor implies that the authentication, authorization, and auditing subsystem must not go back to the user to get the credential set for that factor. Instead, it is a hint for authentication, authorization, and auditing to continue with already obtained credentials. This is useful in cases where user intervention is not desired. For example,

- When the user is presented two password fields, after the first factor, the second factor does not need user intervention.
- When authentication of a type (say certificate) is done, and the administrator must extract groups for that user.

Passthrough factor can be used with [NO_AUTH](#) policy to make conditional jumps.

nFactor authentication flow

Authentication always begins at the virtual server in nFactor. Virtual server defines the first factor for the user. The first form that the user sees is served by the virtual server. The logon form that the user sees can be customized at the virtual server using login schema policies. If there are no login schema policies, a single user name and password field are displayed to the user.

If more than one password fields must be displayed to the user on customized form, login schema policies must be used. They allow for displaying different forms based on the configured rules (such as intranet user versus external user, service provider A versus service provider B).

Once user credentials are posted, authentication begins at the authentication virtual server, the first factor. Because the authentication virtual server can be configured with multiple policies, each of them is evaluated in a sequence. At any given point, if an authentication policy succeeds, the next factor specified against it is taken. If there is no next factor, the authentication process ends. If the next factor exists, it is checked if that factor is a passthrough factor or a regular factor. If that is passthrough, authentication policies on that factor are evaluated without user intervention. Otherwise, the login schema associated with that factor is displayed to the user.

Example of using passthrough factor and no-auth policies to make logical decisions

Administrator would like to decide nextFactor based on groups.

```
1 add authentication policylabel group check
2
```

```
3 add authentication policy admin group -rule http.req.user.is_member_of
  ("Administrators") -action NO_AUTHN
4
5 add authentication policy nonadmins -rule true -action NO_AUTHN
6
7 bind authentication policy label group check -policy admingroup -pri
  1 -nextFactor factor-for-admin
8
9 bind authentication policy label groupcheck -policy nonadmins -pri 10
  -nextfactor factor-for-others
10
11 add authentication policy first_factor_policy -rule <> -action <>
12
13 bind authentication vserver <> -policy first_factor_policy -priority
  10 -nextFactor groupcheck
14 <!--NeedCopy-->
```

Configuring nFactor authentication

November 7, 2023

You can configure multiple authentication factors using the nFactor configuration. The nFactor configuration is supported only in NetScaler Advanced and Premium editions.

Methods to configure nFactor

You can configure nFactor authentication by one of the following methods:

- **nFactor Visualizer:** nFactor visualizer enables you to easily link factors or policy labels together in a single pane and also change the linking of the factors in the same pane. You can create an nFactor flow using the visualizer and bind that flow to an authentication, authorization, and auditing virtual server. For details about nFactor Visualizer and an example nFactor configuration using the visualizer, see [nFactor Visualizer for simplified configuration](#).
- **NetScaler GUI:** For details, see section **Configuration elements involved in nFactor configuration**.
- **NetScaler CLI:** For a sample snippet on nFactor configuration using the NetScaler CLI, see [Sample snippet on nFactor configuration by using the NetScaler CLI](#).

Important: This topic contains details about configuring nFactor by using the NetScaler GUI.

Configuration elements involved in nFactor configuration

The following elements are involved in configuring nFactor. For detailed steps, refer to the appropriate sections in this topic.

Configuration element	Tasks to be performed
AAA virtual server	Create a AAA virtual server
Login schema	Configure a login schema profile
Advanced authentication policies	Create advanced authentication policies
Authentication policy label	Create authentication policy label
nFactor for NetScaler Gateway	Create authentication profile to link a NetScaler AAA virtual server with NetScaler Gateway virtual server

How nFactor works

When a user connects to the authentication, authorization, and auditing or NetScaler Gateway virtual server, the sequence of events that occur are as follows:

1. If forms-based authentication is used, the login schema bound to the authentication, authorization, and auditing virtual server is displayed.
2. Advanced authentication policies bound to the authentication, authorization, and auditing virtual server are evaluated.
 - If the advanced authentication policy succeeds, and if the next factor (authentication policy label) is configured, the next factor is evaluated. If Next Factor is not configured, then authentication is complete and successful.

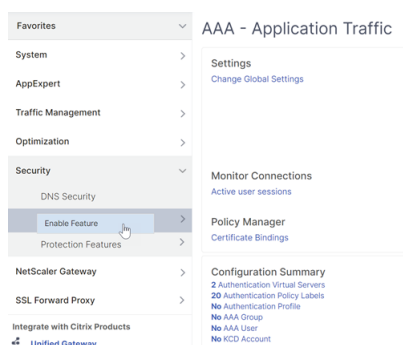

- If the advanced authentication policy fails, and if Goto Expression is set to Next, then the next bound advanced authentication policy is evaluated. If none of the advanced authentication policies succeed, then authentication fails.
3. If the next factor authentication policy label has a Login Schema bound to it, it is displayed to the user.
 4. The advanced authentication policies bound to the next factor authentication policy label are evaluated.
 - If the Advanced authentication policy succeeds, and if the next factor (authentication policy label) is configured, the next factor is evaluated.
 - If Next Factor is not configured, then authentication is complete and successful.
 5. If the Advanced authentication policy fails, and if Goto Expression is Next, then the next bound advanced authentication policy is evaluated.
 6. If the policies succeed, then authentication fails.

Authentication, authorization, and auditing virtual server

To use nFactor with NetScaler Gateway, you first configure it on an authentication, authorization, and auditing virtual server. Then you later link the authentication, authorization, and auditing virtual server to the NetScaler Gateway virtual server.

Create authentication, authorization, and auditing Virtual Server

1. If the Authentication, authorization, and auditing feature is not already enabled, navigate to, **Security > AAA –Application Traffic**, and right-click to enable the feature.

2. Navigate to **Configuration > Security > AAA - Application Traffic > Virtual Servers**.
3. Click **Add** to create an authentication virtual server.

4. Enter the following information and click **OK**.

Parameter name	Parameter Description
Name	Name for the authentication, authorization, and auditing virtual server.
IP address Type	Change the IP address Type to Non Addressable if this virtual server is used only for NetScaler Gateway.

← Authentication Virtual Server

5. Under Certificate, select **No Server Certificate**.

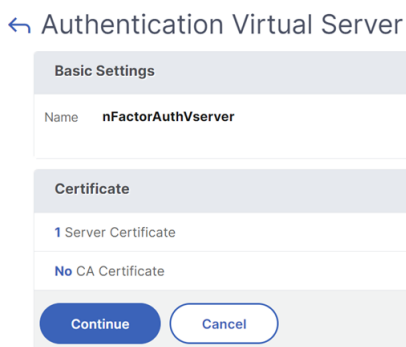

6. Click the text, **Click to select** to select the server certificate.

7. Click the radio button next to a certificate for the authentication, authorization, and auditing Virtual Server, and click **Select**. The chosen certificate doesn't matter because this server is not directly accessible.

	NAME	CERTIFICATE TYPE	COMMON NAME
<input type="radio"/>	ns-server-certificate	CLNT_CERT, SRVR_CERT	default BOUQUV
<input checked="" type="radio"/>	aaa_local_cer_CERT_KEY	CLNT_CERT, SRVR_CERT	*ksaaa.local

8. Click **Bind**.

9. Click **Continue** to close the **Certificate** section.

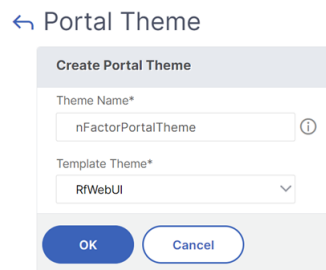

10. Click **Continue**.

Bind the portal theme to the authentication, authorization, and auditing virtual server

1. Navigate to **NetScaler Gateway > Portal Themes**, and add a theme. You create the theme under NetScaler Gateway, and then later bind it to the authentication, authorization, and auditing virtual server.
2. Create a theme based on the RfWebUI template theme.

3. After adjusting the theme as desired, at the top of the portal theme editing page, click **Click to**

Bind and View Configured Theme.

4. Change the selection to Authentication. From the **Authentication Virtual Server Name** drop-down menu, select the authentication, authorization, and auditing virtual server, and click **Bind and Preview** and close the preview window.

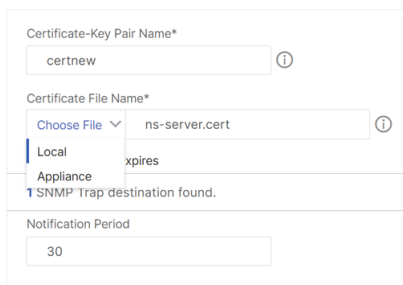

Enable the client certificate authentication

If one of your authentication factors is the client certificate, then you must perform some SSL configuration on the authentication, authorization, and auditing virtual server:

1. Navigate to **Traffic Management > SSL > Certificates > CA Certificates**, and install the root certificate for the issuer of the client certificates. Root certificates do not have a key file.

Install CA Certificate

2. Navigate to **Traffic Management > SSL > Change advanced SSL settings**.

- a) Scroll down to check whether **Default Profile** is **ENABLED**. If yes, then you must use an SSL Profile to enable Client Certificate Authentication. Otherwise, you can enable Client Certificate Authentication directly on the authentication, authorization, and auditing virtual server in the SSL Parameters section.

3. If default SSL Profiles are not enabled:

- a) Navigate to **Security > AAA - Application > Virtual Servers**, and edit an existing authentication, authorization, and auditing virtual server.
- b) In the **SSL Parameters** section, click the pencil icon.

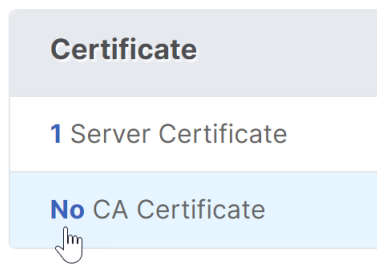

- a) Enable the **Client Authentication** option.
- b) Set **Client Certificate** to **Optional** and click **OK**.

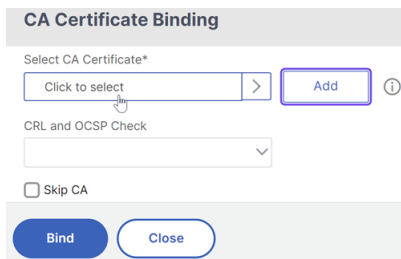

4. If Default SSL Profiles are enabled, then create an SSL Profile with Client Authentication enabled:

- a) On the left menu, expand System, and click Profiles.
- b) On the top right, switch to the SSL Profile tab.
- c) Right-click the ns_default_ssl_profile_frontend profile, and click Add. This copies settings from the default profile.
- d) Give the Profile a name. The purpose of this profile is to enable Client Certificates.
- e) Scroll down and find the Client Authentication check box. Check the box.
- f) Change the Client Certificate drop-down menu to OPTIONAL.
- g) Copying the default SSL Profile does not copy the SSL Ciphers. You must redo them.
- h) Click Done when done creating the SSL Profile.
- i) Navigate to **Security > AAA –Application Traffic > Virtual Servers**, and edit an authentication, authorization, and auditing virtual server.
- j) Scroll down to the SSL Profile section and click the pencil.
- k) Change the SSL Profile drop-down menu to the profile that has Client Certificates enabled. Click OK.
- l) Scroll down this article until you reach the instructions to bind the CA certificate.

5. On the left, in the **Certificate** section, click **No CA Certificate**.

6. Click the text, **Click to select**.

7. Click the radio button next to the root certificate for the issuer of the client certificates, and click **Select**.

8. Click **Bind**.

Login schema XML file

Login Schema is an XML file providing the structure of forms-based authentication logon pages.

nFactor implies multiple authentication factors that are chained together. Each Factor can have different Login Schema pages/files. In some authentication scenarios, users can be presented with multiple logon screens.

Configure a login schema profile

To configure a Login Schema Profile:

1. Create or Edit a Login Schema .XML file based on your nFactor design.
2. Navigate to **Security > AAA - Application Traffic > Login Schema**.
3. On the right, switch to the **Profiles** tab, and click **Add**.
4. In the **Authentication Schema** field, click the pencil icon.

← Create Authentication Login Schema

5. Click the **LoginSchema** folder to see the files in it.

6. Select one of the files. You can see a preview on the right. The labels can be changed by clicking the **Edit** button on the top right.

7. When you Save the changes, a new file is created under /nsconfig/LoginSchema.
8. On the top right, click **Select**.

9. Give the Login Schema a name, and click **More**.

← Create Authentication Login Schema

10. Use the user name and the password entered in the login schema for single sign-on (SSO) to a back-end service, for example StoreFront.

You can use the credentials entered in the login schema as your Single Sign-On credentials by using any of the following methods.

- Click **More** at the bottom of the **Create Authentication Login Schema** page and select **Enable Single Sign On Credentials**.
- Click **More** at the bottom of the **Create Authentication Login Schema** page and enter unique values for the user credential index and password credential index. These values can be between 1 and 16. Later you reference these index values in a traffic policy/profile by using the expression AAA.USER.ATTRIBUTE(#).

Create Close

11. Click **Create** to create the login schema profile.

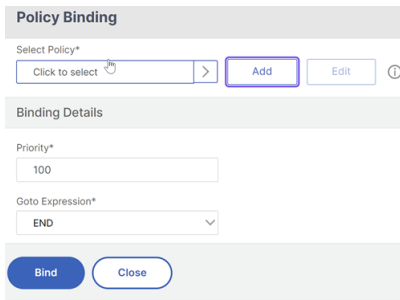

Note: If you edit the login schema file (.xml) later, for changes to be reflected you must edit the login schema profile and select the login schema (.xml) file again.

Create and bind a login schema policy

To bind a login schema profile to an authentication, authorization, and auditing virtual server, you must first create a login schema policy. Login schema policies are not required when binding the login schema profile to an authentication policy label, as detailed later.

To create and bind a login schema policy:

1. Navigate to **Security > AAA - Application Traffic > Login Schema**.
2. On the **Policies** tab, click **Add**.
3. Use the **Profile** drop-down menu to select the Login Schema Profile you already created.
4. Enter an advanced policy expression in the **Rule** box, and click **Create**.
5. Navigate to **Security > AAA - Application Traffic > Virtual Servers**, and click edit to an existing authentication, authorization, and auditing virtual server.
6. In the Advanced Settings column, click **Login Schemas**.
7. In the Login Schemas section, click **No Login Schema**.
8. Select an authentication policy from the **Select Policy** drop-down list.

- On the **Authentication Policies** page, click the radio button next to the authentication policy, and click **Select**. Only login schema policies appear in this list. Login schema profiles (without a policy) do not appear.

- Click **Bind**.

Advanced authentication policies

Authentication policies are a combination of policy expression, and policy action. If the expression is true, then evaluate the authentication action.

Create advanced authentication policies

Authentication policies are a combination of policy expression and policy action. If the expression is true, then evaluate the authentication action.

You need authentication actions/servers (for example LDAP, RADIUS, CERT, SAML, and so forth)

When creating an advanced authentication policy, there's a plus (Add) icon that lets you create authentication actions/servers.

Or you can create authentication actions (servers) before creating the advanced authentication policy. The authentication servers are located under **Authentication > Dashboard**. On the right, click Add and select a Server Type. The instructions for creating these Authentication Servers are not detailed here. See the Authentication –NetScaler 12 / NetScaler 12.1 procedures.

To create an Advanced Authentication Policy:

- Navigate to **Security > AAA - Application Traffic > Policies > Authentication > Advanced Policies > Policy**

2. In the details pane do one of the following:

- To create a policy, click **Add**.
- To modify an existing policy, select the policy, and then click **Edit**.

3. In the **Create Authentication Policy** or **Configure Authentication Policy** dialog box, type or select values for the parameters.

▶ More

- **Name** - The policy name. Cannot be changed for a previously configured policy.
- **Action Type** - The policy type: Cert, Negotiate, LDAP, RADIUS, SAML, SAMLIDP, TACACS, or WEBAUTH.
- **Action** - The authentication action (profile) to associate with the policy. You can choose an existing authentication action, or click the plus and create an action of the proper type.
- **Log Action** - The audit action to associate with the policy. You can choose an existing audit action, or click the plus and create an action.
 You don't have any Actions configured, or to create an action, click **Add** and complete the steps.
- **Expression** - The rule that selects connections to which you want to apply the action that you specified. The rule can be simple ("true" selects all traffic) or complex. You enter expressions by first choosing the type of expression in the leftmost drop-down list beneath the Expression window, and then by typing your expression directly into the expression text area, or by clicking Add to open Add Expression dialog box and using the drop-down lists in it to construct your expression.)
- **Comment** - You can type a comment that describes the type of traffic that this authentica-

tion policy applies to. Optional.

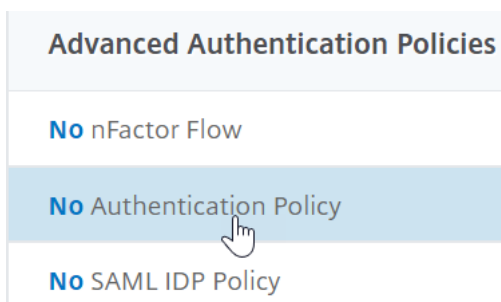

4. Click **Create** and then click **Close**. If you created a policy, that policy appears in the Authentication Policies and Servers page.

Create additional advanced authentication policies as required based on your nFactor design.

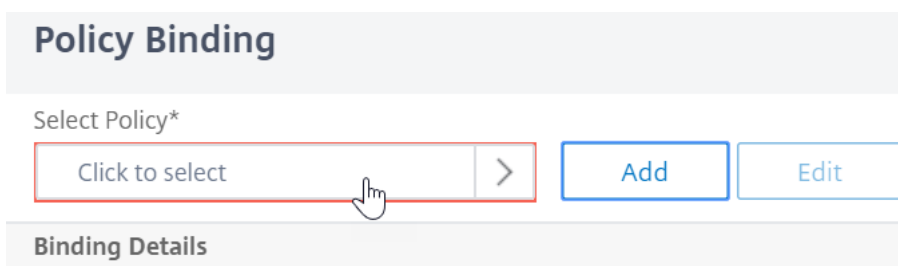

Bind first factor advanced authentication policy to authentication, authorization, and auditing

You can directly bind advanced authentication policies for the first Factor the authentication, authorization, and auditing virtual server. For the next factors, you must bind the advanced authentication policies to the authentication policy labels.

1. Navigate to **Security > AAA - Application Traffic > Virtual Servers**. Edit an existing virtual server.
2. On the left, in the Advanced Authentication Policies section, click **No Authentication Policy**.

3. In **Select Policy**, click the text, **Click to select**.

4. Click the radio button next to the **Advanced Authentication Policy**, and click **Select**.

Use extracted LDAP groups to select the next authentication Factor

You can use extracted LDAP groups to select the next authentication factor without actually authentication with LDAP.

1. When creating or editing an LDAP server or LDAP action, clear the **Authentication** check box.
2. In **Other Settings**, select appropriate values in **Group Attribute** and **Sub Attribute Name**.

Authenticate the policy label

When you bind an advanced authentication policy to the authentication, authorization, and auditing Virtual Server and have selected a next factor, the next factor is evaluated only if the advanced authentication policy succeeds. The next factor that is evaluated is an authentication policy label.

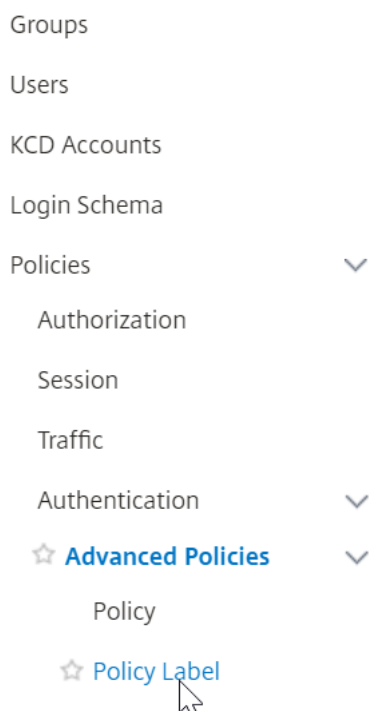

The authentication policy label specifies a collection of authentication policies for a particular factor. Each policy label corresponds to a single factor. It also specifies the login form that must be presented to the user. The authentication policy label must be bound as the next factor of an authentication policy or of another authentication policy label.

Note: Every factor does not need a login schema. Login schema profile is required only if you are binding a login schema to an Authentication Policy Label.

Create an authentication policy label

A policy label specifies the authentication policies for a particular factor. Each policy label corresponds to a single factor. The policy label specifies the login form that must be presented to the user. The policy label must be bound as the next factor of an authentication policy or of another authentication policy label. Typically, a policy label includes authentication policies for a specific authentication mechanism. However, you can also have a policy label that has authentication policies for different authentication mechanisms.

1. Navigate to **Security > AAA – Application Traffic > Policies > Authentication > Advanced Policies > Policy Label.**

2. Click the **Add** button.

Bind Close

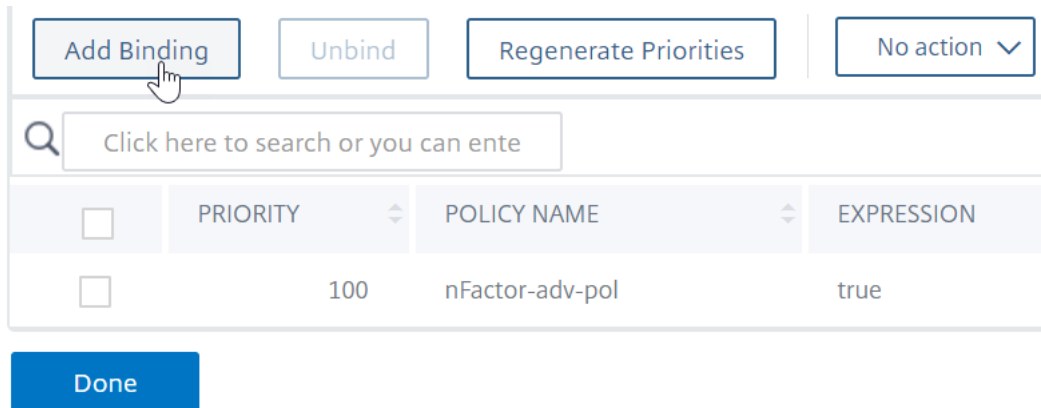

7. In **Select Next Factor**, if you want to add another factor, click to select and bind the next authentication policy label (next factor).

If you do not select the next factor, and if this advanced authentication policy succeeds, then authentication is successful and complete.

8. Click **Bind**.

9. You can click **Add Binding** to add more advanced authentication policies to this policy label

(factor). Click **Done** upon completion.

Bind authentication policy label

After you create the policy label, you bind it to an existing advanced authentication policy binding to chain the factors together.

You can select the next factor when editing an existing authentication, authorization, and auditing virtual server that has an advanced authentication policy bound or when editing a different policy label to include the next factor.

To edit an existing authentication, authorization, and auditing virtual server that has an advanced authentication policy already bound to it

1. Navigate to **Security > AAA –Application Traffic > Virtual Servers**. Select the virtual server and click **Edit**.
2. On the left, in the **Advanced Authentication Policies** section, click an existing authentication policy binding.
3. In **Select Action**, click **Edit Binding**.

4. Click **Select Next Factor** and select an existing authentication policy label (next factor).

- Click **Bind** in the **Policy Binding** page. You can see the **NEXT FACTOR** column with the next factor details on the extreme right.

To add a policy label next factor to a different policy label

- Navigate to **Security > AAA –Application Traffic > Policies > Authentication > Advanced Policies > PolicyLabel**.
- On the **Authentication Policy Labels** page, select an authentication policy label and click **Edit**.
- On the **Authentication Policies** page, select an authentication policy label and in **Select Action**, click **Edit Binding**.

- In **Binding Details > Select Next Factor**, click to select the next factor.
- Choose the policy label for the next factor and click the **Select** button.
- Click **Bind** in the **Policy Binding** page. On the **Authentication Policy Label** page, you can see the **NEXT FACTOR** column with the next factor details on the extreme right.

nFactor for NetScaler Gateway

To enable nFactor on the NetScaler Gateway, an authentication profile must be linked to an authentication, authorization, and auditing virtual server.

Create authentication profile to link an authentication, authorization, and auditing virtual server with NetScaler Gateway virtual server

- Navigate to **NetScaler Gateway > Virtual Servers** and select an existing gateway virtual server to edit.
- In **Advanced Settings**, click **Authentication Profile**.

3. Click **Add** under **Authentication Profile**

4. Enter the name for the authentication profile and click where it says **Click to select**.

5. In **Authentication Virtual Server**, select an existing server that has login schema, advanced authentication policy, and authentication policy labels configured. You can also create an authentication virtual server. The authentication, authorization, and auditing virtual server does not need an IP address. Click **Select**.

6. Click **Create**.

7. Click **OK** to close the Authentication Profile section.

Note: If you have configured one of the factors as client certificates, then must configure the SSL parameters and CA certificate.

After you have completed linking the authentication profile to an authentication, authorization, and auditing virtual server, and when you browse to your NetScaler Gateway, you can view the nFactor authentication screens.

Configure SSL parameters and CA certificate

If one of the authentication factors is a certificate, then you must perform some SSL configuration on the NetScaler Gateway virtual server.

1. Navigate to **Traffic Management > SSL > Certificates > CA Certificates**, and install the root certificate for the issuer of the client certificates. Certificate Authority certificates do not need key files.

If default SSL Profiles are enabled, then you have already created an SSL Profile that has Client Authentication enabled.

2. Navigate to **NetScaler Gateway > Virtual Servers**, and edit an existing NetScaler Gateway virtual server that is enabled for nFactor.
 - If default SSL Profiles are enabled, click the edit icon.
 - In the SSL Profile list, select the SSL Profile that has Client Authentication enabled and set to OPTIONAL.
 - If default SSL Profiles are not enabled, click the edit icon.
 - Check the Client Authentication check box.
 - Ensure that Client Certificate is set to Optional
3. Click OK.
4. In Certificates section, click **No CA Certificate**.
5. In Select CA Certificate, click to select and select the root certificate for the issuer of the client certificates.
6. Click Bind.

Note: You might have to also bind any Intermediate CA Certificates that issued the client certificates.

Configure NetScaler Gateway traffic policy for nFactor single sign-on to StoreFront

For single sign-on to StoreFront, nFactor defaults to using the last entered password. If LDAP is not the last entered password, then you must create a traffic policy/profile to override the default nFactor behavior.

1. Navigate to **NetScaler Gateway > Policies > Traffic**.
2. In the **Traffic Profiles** tab, click **Add**.
3. Enter a name for the traffic profile. Select the **HTTP** protocol.
In **Single Sign-on**, select **ON**.

← Create Citrix Gateway Traffic Profile

4. In the **SSO Expression**, enter a AAA.USER.ATTRIBUTE(#) expression that matches the indexes specified in the login schema and click **Create**.

Note

AAA.USER expression is now implemented to replace the deprecated HTTP.REQ.USER expressions.

5. Click **Traffic Policies** tab, and click **Add**.
6. Enter a name for the policy. Select the traffic profile created in the previous step. In **Expression**, enter an advanced expression, and click **Create**.

← Create Citrix Gateway Traffic Policy

7. Navigate to **NetScaler Gateway > NetScaler Gateway Virtual Server**.
 - Select an existing virtual server and click **Edit**.

- In the **Policies** section, click the **+** sign.
- In **Choose Policy**, select **Traffic**.
- In **Choose Type**, select **Request**.
- Select the traffic policy that you have created and then click **Bind**.

Sample snippet on nFactor configuration by using the CLI

To understand the step-wise configurations for nFactor authentication, let us consider a two-factor authentication deployment where the first factor is LDAP authentication and the second factor is RADIUS authentication.

This sample deployment requires the user to log in to both factors using a single login form. Therefore, we define a single login form that accepts two passwords. The first password is used for LDAP authentication and the other for RADIUS authentication.

Here are the configurations that are performed:

1. Configure the load balancing virtual server for authentication

```
add lb vsrver lbvs89 HTTP 1.136.19.55 80 -AuthenticationHost auth56.aatm.com -  
Authentication ON
```

2. Configure the authentication virtual server.

```
add authentication vsrver auth56 SSL 10.106.30.223 443 -AuthenticationDomain aatm.com
```

3. Configure the login schema for the login form and bind it to a login schema policy.

```
add authentication loginSchema login1 -authenticationSchema login-2passwd.xml -  
userCredentialIndex 1 -passwordCredentialIndex 2
```

Note:

Use the user name and one of the passwords entered in the login schema for single sign-on (SSO) to a back-end service, for example StoreFront. You can reference these index values in the traffic action by using the expression AAA.USER.ATTRIBUTE(#). The values can be between 1 and 16.

Alternatively, you can use the credentials entered in the login schema as your Single Sign-On credentials by using the following command.

```
1 add authentication loginSchema login1 -authenticationSchema login  
-2passwd.xml -SSOCredentials YES  
2  
3 add authentication loginSchemaPolicy login1 -rule true -action  
login1  
4 <!--NeedCopy-->
```

4. Configure a login schema for the pass-through and bind it to a policy label

```

1 add authentication loginSchema login2 -authenticationSchema
  noschema
2
3 add authentication policylabel label1 -loginSchema login2
4 <!--NeedCopy-->

```

5. Configure the LDAP and RADIUS policies.

```

1 add authentication ldapAction ldapAct1 -serverIP 10.17.103.28 -
  ldapBase "dc=aaatm, dc=com" -ldapBindDn administrator@aaatm.com
  -ldapBindDnPassword 81
  qw1b99ui971mn1289op1abc12542389b1f6c111n0d98e1d78ae90c8545901 -
  encrypted -encryptmethod ENCMTHD\_3 -ldapLoginName
  samAccountName -groupAttrName memberOf -subAttributeName CN
2
3 add authentication Policy ldap -rule true -action ldapAct1
4
5 add authentication radiusAction radius -serverIP 10.101.14.3 -
  radKey
  n231d9a8cao8671or4a9ace940d8623babca0f092gfv4n5598ngc40b18876hj32
  -encrypted -encryptmethod ENCMTHD\_3 -radNASip ENABLED -
  radNASid NS28.50 -radAttributeType 11 -ipAttributeType 8
6
7 add authentication Policy radius -rule true -action radius
8 <!--NeedCopy-->

```

6. Bind the login schema policy to the authentication virtual server

```

1 bind authentication vserver auth56 -policy login1 -priority 1 -
  gotoPriorityExpression END
2 <!--NeedCopy-->

```

7. Bind the LDAP policy (first factor) to the authentication virtual server.

```

1 bind authentication vserver auth56 -policy ldap -priority 1 -
  nextFactor label1 -gotoPriorityExpression next
2 <!--NeedCopy-->

```

8. Bind the RADIUS policy (second factor) to the authentication policy label.

```

1 bind authentication policylabel label1 -policyName radius -
  priority 2 -gotoPriorityExpression end
2 <!--NeedCopy-->

```

nFactor Visualizer for simplified configuration

October 23, 2023

Starting from NetScaler release 13.0 build 36.27, nFactor configuration through the GUI is simplified by using the nFactor Visualizer. The nFactor Visualizer helps admins add multiple factors without losing track of each factor. The group of factors that are built in the flow are displayed in one place. Admins can add authentication success and failure paths separately. After creating the flow, admins have to bind the nFactor flow to an authentication virtual server.

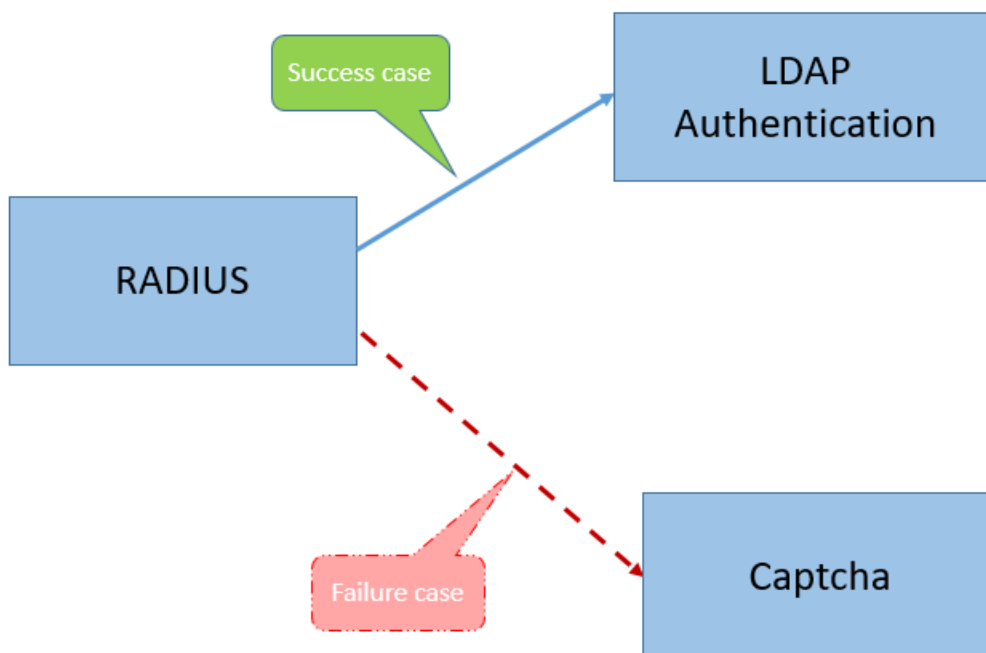

Note

- All factors created by an admin in the nFactor flow are retained for any future use.
- From NetScaler feature release 13.0 build 64.35 and above, using the nFactor visualizer, you can start the nFactor flow with a decision block.

Previously, nFactor configuration was cumbersome wherein the admins had to visit many pages to configure it. If a change was required, the admins had to revisit the configured sections each time. Also, there was no option to view the complete configuration in one place.

Use Case 1: RADIUS followed by LDAP authentication, else fallback to Captcha through nFactor Visualizer

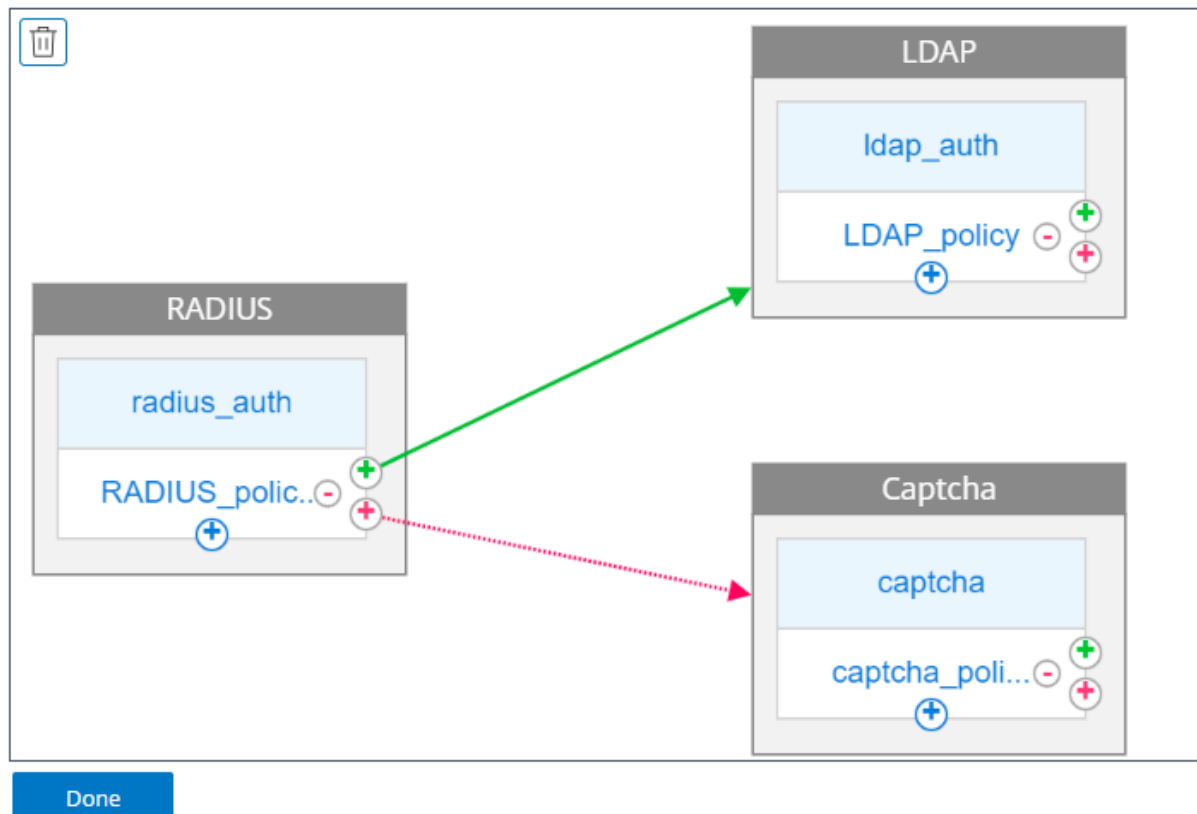

Achieve RADIUS authentication as the first-level authentication followed by LDAP authentication. In case RADIUS fails, authentication must fallback to Captcha.

To achieve this use case, you can use the nFactor Visualizer. The Visualizer provides various controls that can be used to add this flow and the related items.

The following figure displays the nFactor flow created for the previous mentioned use case by using the visualizer.

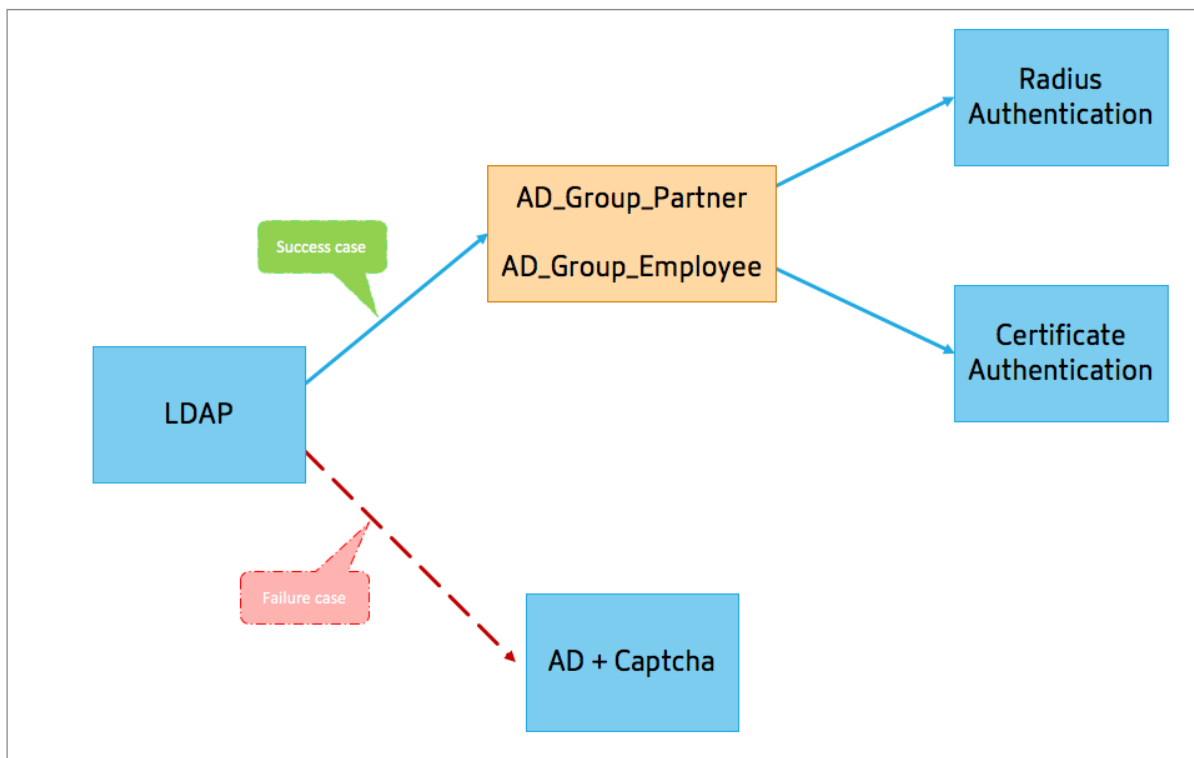

← nFactor Flow

- **RADIUS.** You configure RADIUS as the first factor. You add a login schema and a policy. In this example, radius_auth and RADIUS_policy are the login schema and policy that is added. For the RADIUS_Policy, you can add another factor for the success case. In this example, an LDAP factor block is added for the success case. For the failure case, you can add a Captcha factor.
- **LDAP.** You configure LDAP authentication as the second factor. You add a login schema and a policy. In this example, ldap_auth and LDAP_policy are the login schema and policy that is added.
- **Captcha.** For the RADIUS policy failure case, you create a Captcha factor. In this example, captcha and captcha_policy are the login schema and policy that is added.

Use Case 2: LDAP followed by RADIUS/Certificate authentication with Captcha based on LDAP Group Membership through nFactor Visualizer

Achieve RADIUS authentication as the first-level authentication followed by LDAP authentication. In case RADIUS fails, authentication must fall back to Captcha.

The following figure displays the nFactor flow created for the previous mentioned use case by using the visualizer.

← nFactor Flow

- **LDAP.** You configure LDAP as the first factor. You add a login schema and a policy. In this example SingleAuth and LDAP_Policy are the login schema and policy that is added. For the

LDAP_Policy, you can add another factor for the success case. In this example, a decision block is added for the success case. For the failure case, you can add Captcha followed by AD factor.

- **Group Extraction LDAP.** Is the decision block added for the LDAP success case. The decision block is used as a branch out factor to branch out the users based on the policy rules. Visualizer allows configuring only a NO_AUTHN policy for the decision block.

In this example, Group_Extraction_LDAP is the decision block. You add two policies (AD_Group_Partner and AD_Group_Employee) to this decision block. As explained in the use cases, all requests routed through AD_Group_Partner policy use RADIUS authentication. Therefore, you connect the success case of this policy to the next factor that is RADIUS factor. Similarly, all requests routed through AD_Group_Employee policy use certification authentication. Therefore, you connect the success case of this policy to the next factor that is the certification authentication factor.

- **RADIUS.** For the AD_Group_Partner policy success case, you create the RADIUS authentication factor.
 - **Certificate.** For the AD_Group_Employee policy success case, you create the certificate authentication factor.
- **Captcha.** For the LDAP policy failure case, you create two next factors, Captcha and AD factor.

Note

- If you have a use case to branch out as a first thing, then you can either create two flows and bind separately or create one flow with the first one as branch out, and bind it to the virtual server.
- If you have multiple blocks, and to view the entire flow in the nFactor Flow screen, click the visualizer and drag the flow to the extreme left.
- We recommend that you modify the nFactor flows using the nFactor Flows page only.

To configure nFactor by using the nFactor Visualizer

Note

The following nFactor configuration is a simple example that helps you accomplish the Use Case 1 scenario configurations.

1. Navigate to **Security > AAA –Application Traffic > nFactor Visualizer > nFactor Flows.**
2. Click **Add.**
3. On the **nFactor Flows** page, click **+** to add a first factor for the flow. The first factor also serves as an identifier for this nFactor flow.

4. Enter the factor name and click **Create**.

Add Factor

This factor name will also serve as the name of the nFactor flow.

Create Factor Create decision block

Factor Name

Comment

The factor name appears on the factor block in the nFactor Flow page.

Note

We recommend that you do not use policy label names such as, `__root` and `__<flow_name>` as suffix and `_db_` as prefix. It is used as the factor names that are created in the nFactor flow.

5. Once the RADIUS factor is created, the Add Schema and Add Policy must be created.

nFactor Flow

Note

For more information, see [nFactor concepts, entities, and terminology](#).

6. Click **Add Schema**. You can either add a new login schema or select an existing login schema from the **Authentication Login Schema** list.

Choose Login Schema

Login schema is a login form which is displayed to the user for this factor.

Authentication Login Schema*

- To create a login schema, click **Add** and in the **Create Authentication Login Schema** page, enter the name for the schema. Click **Edit** (pencil icon) to select the **Login Schema Files** from the list.

Create Authentication Login Schema

Name*
radius_auth

Authentication Schema*
/nsconfig/loginschema/LoginSchema/SingleAuthDeviceID.xml

More

Create Close

- Click **Add Policy**. You can either create a new policy or choose an existing authentication policy.

Create Close

- After you add a login schema and policy to the factor, the login schema and policy appear on the factor in the Visualizer as displayed in the following figure. For any given factor, you can add multiple policies and define the next factor for the success and failure of each policy. You can also remove the policies that are part of the factor.

11. After you create the flow, you can then bind the nFactor flow to an authentication virtual server.

Adding the next factor

To add the next factor, you can select one of the following options as per your requirement:

- **Create Factor.** Create a factor. Each factor that is created in a flow is exclusive to that flow.
- **Create a decision block.** Create a decision block to serve as a branch-out factor. You cannot add a login schema to the decision block. Visualizer allows configuring only a NO_AUTHN policy for the decision block.

Note

You can only add or edit the decision block through the NetScaler GUI. There is no option to configure the decision block from the CLI command.

- **Connect to an existing Factor.** Select an existing factor as your next factor. All the factors that appear in the existing list are created exclusively for that flow.
- **None.** Remove an existing connection.

To bind the nFactor flow to authentication server

1. On the **nFactor Flows** page, select an nFactor flow that you prefer to bind to an authentication virtual server.
2. Click the horizontal ellipsis and select **Bind to Authentication Server** or on the **nFactor Flows** page, click **Bind to Authentication Server**.

3. On the **Bind to Authentication Server** page, you can perform the following actions:
 - To add a **Authentication Virtual Server**, click **Add**.
 - To select an existing authentication server from the list, click **Authentication Server** field.
4. Click **Show Bindings** from the hamburger icon to view the bindings.
5. To unbind the authentication server from the specific nFactor flow, perform the following steps:
 - On the **nFactor Flows** page, click **Show Bindings** from the hamburger icon.
 - On the **Authentication Server Bindings** page, select the authentication server to unbind and click **Unbind**. Click **Close**.

For more information on nFactor authentication, see the following topics:

- Concept: [Multi-Factor \(nFactor\) authentication](#).
- Workflow: [How nFactor authentication works](#).
- Configuration: [Configuring nFactor authentication](#).

Enhancements to the nFactor Visualizer

Starting from NetScaler release 13.0 build 41.20, the following enhancements are made in the nFactor Visualizer.

- Admins can move the created factors to the trash icon.
- View the nFactor flows in the Authentication Virtual server page.

Trash icon. Admins can only delete the nodes that have no connections. However, the underlying policies or the schemas that are created for the factor are not deleted if the factor is moved to trash.

To view the trash icon,

1. Navigate to **Security > AAA –Application Traffic > nFactor Visualizer > nFactor Flows**. You can view the trash icon on the top left corner.
2. To delete the factor, click the factor block and drag it to trash.

View nFactor flow from Authentication Virtual Server. Admins can also view the created nFactor flows from the Authentication Virtual Server page.

To view the nFactor flow from Authentication Virtual Server page,

1. Navigate to **Security > AAA –Application Traffic > Virtual Servers**. On the **Authentication Virtual Servers** page, you can perform the following steps:
 - To add an authentication virtual server, click **Add**.
 - To edit an existing authentication virtual server, click **Edit** option from the details pane.
2. On the **Authentication Virtual Server** page, you can view the **nFactor Flow** option under **Advanced Authentication Policies**.
3. If there is no nFactor flow bound to the virtual server, you can click **No nFactor Flow** option under **Advanced Authentication Policies** section to either add a new nFactor flow or select the existing nFactor flow from the list.

nFactor Extensibility

May 2, 2023

nFactor authentication framework provides the flexibility of adding customizations to make the logon interface more intuitive for rich user experience. You can add custom login labels, custom login credentials, customizing UI displays and so on.

With nFactor, each factor can have its own logon screen. In each logon screen you can present any information from any of the previous factors or more information that is invisible in other factors. For example, your last factor can be an informative page where the user reads the instructions and clicks continue.

Before nFactor, custom login pages were limited and customizations and needed support. It was possible to replace the tmindex.html or apply rewrite rules to change some of its behavior. However, it was not possible to achieve the underlying functionality.

The following nFactor related customizations are captured in detail in this topic.

- Customize login labels
- Customize UI to display images
- Customize NetScaler nFactor logon form

Assumptions

You are familiar with nFactor, Shell commands, XML, and text editors.

Prerequisites

- Customization described in this topic is possible only when the RfWeb UI theme (or theme based) is configured on NetScaler.
- Authentication policy must be bound to the authentication, authorization, and auditing virtual server, else the flow does not work as intended.
- You have the following items related to nFactor
 - XML schema
 - JavaScript
 - Authentication actions
 - Authentication virtual server
 - NetScaler version 11.1 and later

Customize logon labels

To customize logon labels, you need the following:

- The XML schema that describes how the logon page looks.
- The script.js file that contains the JavaScript that is used to change the rendering process.

Note:

The script.js file can be found in the directory `/var/netscaler/logon/themes/<custom_theme>/`.

How it works

The JavaScript parses the XML file, rendering each item inside the `<Requirements>` tag. Each element corresponds to a line in the HTML form. For example, a login field is a line, the password field is another line, and so is the logon button. To introduce new lines, you must specify them in the XML schema file using the StoreFront SDK. The StoreFront SDK allows the logon page with an XML schema to use the `<Requirement>` tag and define elements on it. These elements allow to use JavaScript to introduce in that space whatever HTML elements are required. In this case, a line is created with some text in the form of HTML.

The XML that can be used is as follows:

```
1 <Requirement>
2 <Credential>
3 <Type>nsg-custom-cred</Type>
4 <ID>passwd</ID>
5 </Credential>
6 <Label>
7 <Type>nsg-custom-label</Type>
8 </Label>
9 </Requirement>
10 <!--NeedCopy-->
```

<Requirement>: Space provided in the logon page. The credential fills the space, and the other parts route the engine into the correct information. In this case, type `nsg-custom-cred`. This is defined as plain text and the label is defined for its body.

The requirement XML is paired with the JavaScript code to achieve the required results.

```
1 // Custom Label Handler for Self Service Links
2 CTXS.ExtensionAPI.addCustomAuthLabelHandler({
3
4   getLabelTypeName: function () {
5     return "nsg-custom-label"; }
6   ,
7   getLabelTypeMarkup: function (requirements) {
8
9     return $("< Enter your HTML codes here>");
10  }
11  ,
12  // Instruction to parse the label as if it was a standard type
13  parseAsType: function () {
14
15    return "plain";
16  }
17
18  }
19  );
20 //Custom Credential Handler for Self Service Links
21 CTXS.ExtensionAPI.addCustomCredentialHandler({
22
23   getCredentialTypeName: function () {
24     return "nsg-custom-cred"; }
25   ,
26   getCredentialTypeMarkup: function (requirements) {
27
28     return $("<div/>");
29   }
30   ,
31   }
32  );
33 <!--NeedCopy-->
```

Important:

When you are adding the HTML code, ensure that the return value starts with an HTML tag.

The XML portion indicates the logon page what to display, and the JavaScript code provides the actual text. The credential handler opens up the space and the label fills the space. Because all authentication traffic is now invisible to rewrite and responder, you can change the look and feel of the page.

Configuration to customize login labels

1. Create and bind a theme based on RfWeb.

```
1 add vpn portaltheme RfWebUI_MOD -basetheme RfWebUI
2
3 bind vpn vserver TESTAAA -portaltheme RfWebUI_MOD
4 <!--NeedCopy-->
```

The path for the files based on the theme is available in the directory; `/var/netscaler/logon/themes/RfWebUI_MOD`

2. Add the following snippet to the end of the script.js file:

Note:

Failing to include the preceding lines inside the correct file or missing to include any JavaScript functions prevent the XML from being loaded. The error can only be seen in the Developer Console of the browser with the following text: “Undefined Type `nsg-custom-cred`.”

```
1 // Custom Label Handler for Self Service Links
2 CTXS.ExtensionAPI.addCustomAuthLabelHandler({
3
4   getLabelTypeName: function () {
5     return "nsg-custom-label"; }
6   ,
7   getLabelTypeMarkup: function (requirements) {
8
9     return $("<a href=\"https://identity.test.com/identity/faces/register\" style=\"font-size: 16px;\" style=\"text-align: center;\">Self Registration</a><br><a href=\"https://identity.test.com/identity/faces/forgotpassword\" style=\"font-size: 16px;\" style=\"text-align: center;\">Forgot Password</a><br><a href=\"https://identity.test.com/identity/faces/forgotuserlogin\" style=\"font-size: 16px;\" style=\"text-align: center;\">Forgot User Login</a>");
10  }
11  ,
12  // Instruction to parse the label as if it was a standard type
13  parseAsType: function () {
14
15    return "plain";
```

```
16  }
17
18  }
19  );
20  //Custom Credential Handler for Self Service Links
21  CTXS.ExtensionAPI.addCustomCredentialHandler({
22
23  getCredentialTypeName: function () {
24      return "nsg-custom-cred"; }
25  ,
26  getCredentialTypeMarkup: function (requirements) {
27
28  return $("<div/>");
29  }
30  ,
31  }
32  );
33  <!--NeedCopy-->
```

Important:

When you are adding the HTML code, ensure that the return value starts with an HTML tag.

Login schema used in this example

```
1  <?xml version="1.0" encoding="utf-8"?>
2  <AuthenticateResponse xmlns="http://citrix.com/authentication/response
3  /1">
4  <Status>success</Status>
5  <Result>more-info</Result>
6  <StateContext/>
7  <AuthenticationRequirements>
8  <PostBack>/nf/auth/doAuthentication.do</PostBack>
9  <CancelButtonText>Cancel</CancelButtonText>
10 <Requirements>
11 <Requirement>
12 <Credential>
13 <ID>login</ID>
14 <SaveID>Username</SaveID>
15 <Type>username</Type>
16 </Credential>
17 <Label>
18 <Text>User name</Text>
19 <Type>plain</Type>
20 </Label>
21 <Input>
22 <AssistiveText>Please supply either domain\username or user@fully.
23 <Text>
```

```
24 <Secret>false</Secret>
25 <ReadOnly>false</ReadOnly>
26 <InitialValue></InitialValue>
27 <Constraint>.+</Constraint>
28 </Text>
29 </Input>
30 </Requirement>
31 <Requirement>
32 <Credential>
33 <ID>passwd</ID>
34 <SaveID>Password</SaveID>
35 <Type>password</Type>
36 </Credential>
37 <Label>
38 <Text>Password:</Text>
39 <Type>plain</Type>
40 </Label>
41 <Input>
42 <Text>
43 <Secret>true</Secret>
44 <ReadOnly>false</ReadOnly>
45 <InitialValue/>
46 <Constraint>.+</Constraint>
47 </Text>
48 </Input>
49 </Requirement>
50 <Requirement>
51 <Credential>
52 <Type>nsg-custom-cred</Type>
53 <ID>passwd</ID>
54 </Credential>
55 <Label>
56 <Type>nsg-custom-label</Type>
57 </Label>
58 </Requirement>
59 <Requirement>
60 <Credential>
61 <ID>loginBtn</ID>
62 <Type>none</Type>
63 </Credential>
64 <Label>
65 <Type>none</Type>
66 </Label>
67 <Input>
68 <Button>Please Log On</Button>
69 </Input>
70 </Requirement>
71 </Requirements>
72 </AuthenticationRequirements>
73 </AuthenticateResponse>
74 <!--NeedCopy-->
```

Run the following commands to load the custom schema to config.

```

1 add authentication loginSchema custom -authenticationSchema custom.xml
2
3 add authentication loginSchemaPolicy custom -rule true -action custom
4
5 bind authentication vserver AAATEST -policy custom -priority 100 -
  gotoPriorityExpression END
6 <!--NeedCopy-->
  
```

The following figure displays the login page that is rendered with this configuration.

Customize UI to display images

nFactor allows for customized display with the use of login schema files. There might be a requirement for further customizations other than those offered by the built-in login schema files. For example, displaying a hyperlink or writing custom logic in the UI. These can be achieved using ‘custom credentials’ that comprises the login schema extension and corresponding javascript file.

Login schema files can be found in the `/nsconfig/loginschema/LoginSchema` directory.

For UI customization to display images, a deployment flow in the “NetScaler-Swivel” integration is used as an example.

There are two factors in this flow.

- First factor: Checks user’s AD credentials.
- Second factor: Prompts for user logon based on group membership.

In this flow, all users go through the first factor. Before the second factor, there is a pseudo factor to check if some users can be omitted from the “swivel” factor. If the user requires the “swivel” factor, an image and a text box are displayed to enter the code.

Solution

The solution for customizing the UI to display images contains two parts;

- Login schema extension.
- Custom script to process the login schema extension.

Login schema extension To control form rendering, a custom ‘id’/‘credential’ is injected into the login schema. This can be done by reusing the existing schema and modifying as per the requirement.

In the example, a login schema that has only one text field (such as `/nsconfig/loginschema/LoginSchema/OnlyPassword.xml`) is considered.

The following snippet is added to the login schema.

```
1 <Requirement><Credential><ID>swivel_cred</ID><Type>swivel_cred</Type><
  Input><Text><Hidden>true</Hidden><InitialValue>${
2   http.req.user.name }
3 </InitialValue></Text></Input></Credential></Requirement>
4 <!--NeedCopy-->
```

In the snippet, “swivel_cred” is specified as the “Type” of the credential. Because this is not recognized as a built-in ‘credential,’ UI looks for a handler for this type, and calls it if it exists.

An initial value is sent for this credential which is an expression that NetScaler dynamically fills. In the example, it is the user’s name used to notify the swivel server of the user name. It might not be needed all the time or it can be augmented with some other data. Those details must be added as required.

Javascript to handle custom credential When the UI finds a custom credential, it looks for a handler. All custom handlers are written in `/var/netscaler/logon/LogonPoint/custom/script.js` for the default portal theme.

For the custom portal themes, `script.js` can be found in the directory `/var/netscaler/logon/themes/<custom_theme>/`.

The following script is added to render markup for custom credentials.

```
1 CTXS.ExtensionAPI.addCustomCredentialHandler({
2
```

```

3     // The name of the credential, must match the type returned by the
      server
4     getCredentialTypeName: function () {
5     return "swivel_cred"; }
6     ,
7     // Generate HTML for the custom credential
8     getCredentialTypeMarkup: function (requirements) {
9
10        var div = $("<div></div>");
11        var image = $("<img/>");
12        var username = requirements.input.text.initialValue; //Get the
          secret from the response
13        image.attr({
14
15            "style" : "width:200px;height:200px;",
16            "id" : "qrcodeimg",
17            "<Enter your server URL here>"
18        }
19    );
20    div.append(image);
21    return div;
22    }
23
24 }
25 );
26 <!--NeedCopy-->

```

This snippet is for handling the mark-up for ‘swivel_cred’. Credential name highlighted must match the ‘type’ specified earlier in the login schema extension.

To generate mark-up, an image whose source points to the swivel server needs to be added. Once this is done, UI loads the image from the specified location. Because this login schema also has a textbox, UI renders that text box.

Note:

Administrator can modify the “style” of the image element to resize the image. Currently it configured for 200x200 pixels.

Configuration for customizing UI to display images

nFactor configuration is better constructed bottom-up, that is the last factor first because when you try to specify ‘nextFactor’ for the previous factors, you require the subsequent factor’s name.

Swivel factor configuration:

```

1 add loginschema swivel_image - authenticationSchema /nsconfig/
  loginschema/SwivelImage.xml
2
3 add authentication policylabel SwivelFactor - loginSchema swivel_image
4

```

```

5 bind authentication policylabel SwivelFactor -policy <policy-to-check-
  swivel-image> -priority 10
6 <!--NeedCopy-->

```

Note:

Download SwivelImage.xml from the login schema used in the example.

Pseudo factor for group check configuration:

```

1 add authentication policylabel GroupCheckFactor
2
3 add authentication policy contractors_auth_policy -rule ' http.req.
  user.is_member_of( " contractors " ) ' -action NO_AUTHN
4
5 add authentication policy not_contractors_auth_policy -rule true -
  action NO_AUTHN
6
7 bind authentication policylabel GroupCheckFactor -policy
  contractors_auth_policy -pri 10 -nextFactor SwivelFactor
8
9 bind authentication policylabel GroupCheckFactor -policy
  not_contractors_auth_policy -pri 20
10 <!--NeedCopy-->

```

First factor for Active Directory login:

```

1 add ldapAction <>
2
3 add authentication policy user_login_auth_policy -rule true -action
  <>
4
5 bind authentication vserver <> -policy user_login_auth_policy -pri 10
  -nextFactor GroupCheckFactor
6 <!--NeedCopy-->

```

In the configuration, three factors are specified of which one is implicit/pseudo.

Login schema used in this example

The following is an example schema with swivel credential and a text box.

Note:

When copying data for a web browser, quotes might be displayed differently. Copy data in editors like notepad before saving them to files.

```

1 <?xml version="1.0" encoding="UTF-8"?>
2 <AuthenticateResponse xmlns="http://citrix.com/authentication/response
  /1">

```

```
3 <Status>success</Status>
4 <Result>more-info</Result>
5 <StateContext></StateContext>
6 <AuthenticationRequirements>
7 <PostBack>/nf/auth/doAuthentication.do</PostBack>
8 <CancelPostBack>/nf/auth/doLogoff.do</CancelPostBack>
9 <CancelButtonText>Cancel</CancelButtonText>
10 <Requirements>
11 <Requirement><Credential><ID>swivel_cred</ID><Type>swivel_cred</Type><
    Input><Text><Hidden>true</Hidden><InitialValue>${
12 http.req.user.name }
13 </InitialValue></Text></Input></Credential></Requirement>
14 <Requirement><Credential><ID>passwd</ID><SaveID>ExplicitForms-Password
    </SaveID><Type>password</Type></Credential><Label><Text>Password:</
    Text><Type>plain</Type></Label><Input><Text><Secret>true</Secret><
    ReadOnly>false</ReadOnly><InitialValue></InitialValue><Constraint
    >.+</Constraint></Text></Input></Requirement>
15 <Requirement><Credential><Type>none</Type></Credential><Label><Text>
    Hello ${
16 http.req.user.name }
17 , Please enter passcode from above image.</Text><Type>confirmation</
    Type></Label><Input /></Requirement>
18 <Requirement><Credential><ID>saveCredentials</ID><Type>savecredentials
    </Type></Credential><Label><Text>Remember my password</Text><Type>
    plain</Type></Label><Input><CheckBox><InitialValue>false</
    InitialValue></CheckBox></Input></Requirement>
19 <Requirement><Credential><ID>loginBtn</ID><Type>none</Type></Credential
    ><Label><Type>none</Type></Label><Input><Button>Log On</Button></
    Input></Requirement>
20 </Requirements>
21 </AuthenticationRequirements>
22 </AuthenticateResponse>
23 <!--NeedCopy-->
```

Output Once the configuration is performed, the following image is displayed.

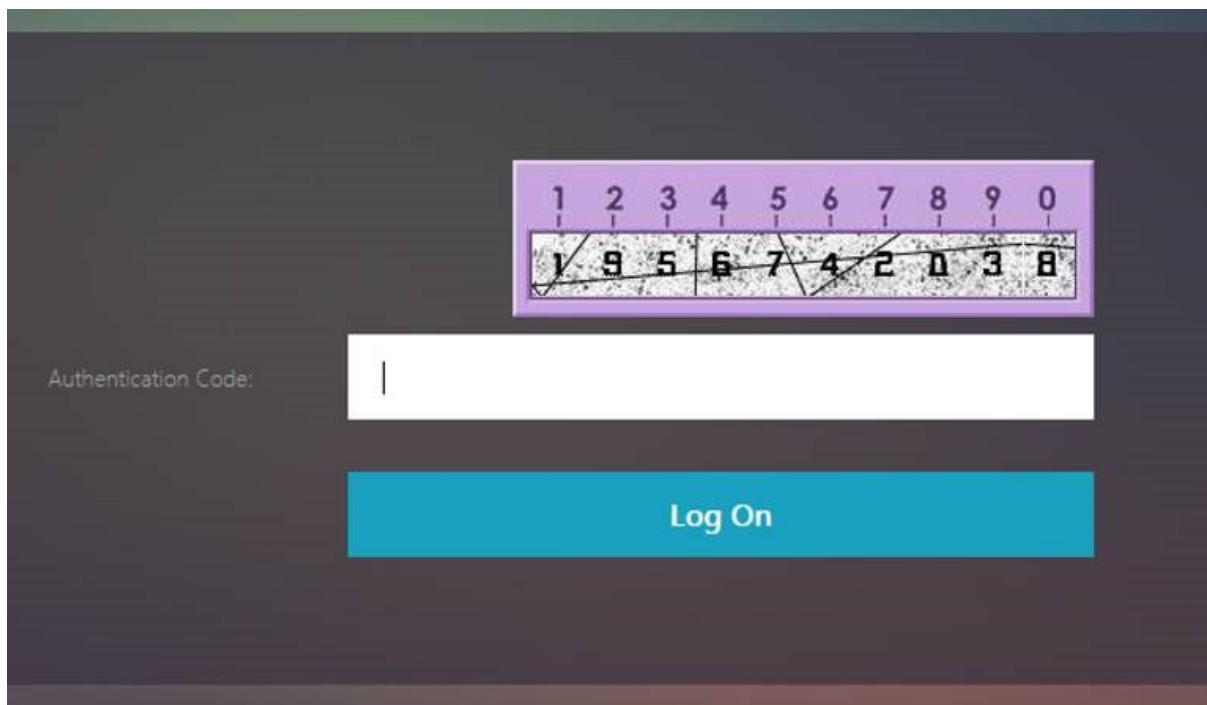

**Note:**

Image height and placement can be altered in the JavaScript.

Customize NetScaler nFactor logon form to show or hide fields

NetScaler Gateway's RfWeb UI allows for wide variety of customizations. This capability when combined with the nFactor authentication framework lets customers configure complex flows without compromising existing workflows.

In this example, two authentication options, OAuth and LDAP are available from the Logon Type list. When the form is first loaded, the user name and password fields (LDAP is shown first) are displayed. If OAuth is selected, all the fields are hidden because OAuth implies an offload of authentication to a third party server. This way, an administrator can configure intuitive workflows as per user convenience.

Note:

- The values in the Logon Type list can be modified with simple modifications to the script file.
- This section describes only the UI part of the flow. The run time handling of the authentication is outside the scope of this article. Users are recommended to refer to the nFactor documentation for authentication configuration.

How to customize nFactor logon form

Customizing nFactor logon form can be classified into two parts

- Sending the right login schema to the UI
- Writing a handler to interpret login schema and user selections

Send the correct login schema to the UI In this example, a simple claim/requirement is sent in the login schema.

For this, the SingleAuth.xml file is modified. The SingleAuth.xml is shipped with NetScaler firmware and can be found in the `/nsconfig/loginschema/LoginSchema` directory.

Steps to send login schema:

1. Log in via SSH and drop to shell (type 'shell').
2. Copy SingleAuth.xml to a different file for modification.

Note:

The destination folder is different from the default NetScaler login schemas folder.

```
cp /nsconfig/loginschema/LoginSchema/SingleAuth.xml /nsconfig/loginschema/SingleAuthDynamic.xml
```

3. Add the following claim to SingleAuthDynamic.xml.

```
1 <Requirement><Credential><ID>nsg_dropdown</ID><Type>nsg_dropdown</Type></Credential><Label><Text>Logon Type:</Text><Type>plain</Type></Label></Requirement>
2 <!--NeedCopy-->
```

4. Configure NetScaler to send this login schema to load the first form.

```
1 add loginschema single_auth_dynamic - authenticationSchema
  SingleAuthDynamic.xml
2
3 add loginschemaPolicy single_auth_dynamic - rule true - action
  single_auth_dynamic
4
5 bind authentication vserver aaa_nfactor - policy
  single_auth_dynamic - pri 10
6 <!--NeedCopy-->
```

Script changes to load form and handle user events You can modify the JavaScript that enables an administrator to customize the display for the logon form. In this example, the user name and

password field are displayed if LDAP is chosen and are hidden if OAuth is chosen. Administrator can also hide only the password.

Admins must append the following snippet to “script.js” that is at “/var/netscaler/logon/LogonPoint/-custom” directory.

Note:

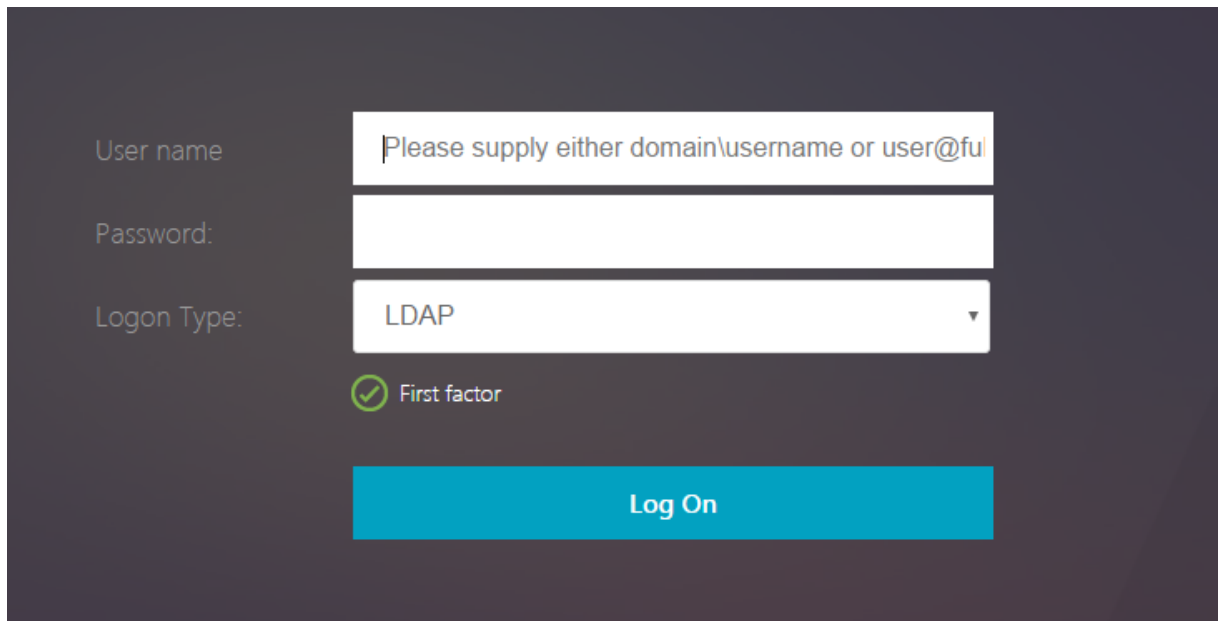

Because this directory is a global directory, create a portal theme and edit the “script.js” file within that folder, at `"/var/netscaler/logon/themes/<THEME_NAME>".`

```
1 CTXS.ExtensionAPI.addCustomCredentialHandler({
2
3     // The name of the credential, must match the type returned by the
4     // server
5     getCredentialTypeName: function () {
6         return "nsg_dropdown"; }
7
8     // Generate HTML for the custom credential
9     getCredentialTypeMarkup: function (requirements) {
10
11         var div = $("<div></div>");
12         var select = $("<select name='nsg_dropdown'></select>").attr("
13             id", "nsg_dropdown");
14
15         var rsa = $("<option></option>").attr("selected", "selected").
16             text("LDAP").val("LDAP");
17         var OAuthID = $("<option></option>").text("OAuth").val("OAuth")
18             ;
19         select.append(rsa, OAuthID);
20
21         select.change(function(e) {
22
23             var value = $(this).val();
24             var ldapPwd = $(".credentialform").find(".
25                 CredentialTypepassword")[0];
26             var ldapUname = $(".credentialform").find(".
27                 CredentialTypeusername");
28             if(value == "OAuth") {
29
30                 if (ldapPwd.length)
31                     ldapPwd.hide();
32                 if (ldapUname.length)
33                     ldapUname.hide();
34             }
35             else if(value == "LDAP") {
36
37                 if (ldapPwd.length)
38                     ldapPwd.show();
39                 if (ldapUname.length)
40                     ldapUname.show();
41             }
42         });
43     }
44 }
```

```
36
37     }
38 );
39     div.append(select);
40     return div;
41 }
42
43 }
44 );
45 <!--NeedCopy-->
```

End-user experience

When an end user loads the logon page first time, the following screen appears.

If **OAuth** is selected in **Logon Type**, user name and password fields are hidden.

Logon Type:

First factor

If **LDAP** is selected, user name and password are displayed. This way, the logon page can be dynamically loaded based on user selection.

Login schema used in this example

```

Note:

For more details about various nFactor related topics, see [nFactor authentication](#).

Set a cookie using nFactor

May 2, 2023

You can apply the nFactor custom labels and set a cookie as a factor of the authentication flow. Through custom labels, you can use JavaScript to manipulate the login schema.

To set a cookie as a factor, you do not need to display any information to the user, which is performed with a no schema login. Instead, you must interact with the user's browser to instruct the login schema to store the desired data. A login schema is required to set the cookie when the page is loaded. The cookie is set with a custom label and JavaScript code.

To implement a factor that sets a cookie, create an XML file called cookie.xml to store the schema in the /nsconfig/loginschema/ directory with the following content:

```

1 <?xml version="1.0" encoding="UTF-8"?>
2 <AuthenticateResponse xmlns="http://citrix.com/authentication/response
  /1">
3 <Status>success</Status>
4 <Result>more-info</Result>
5 <StateContext></StateContext>
6 <AuthenticationRequirements>
7 <PostBack>/nf/auth/doAuthentication.do</PostBack>
8 <CancelPostBack>/nf/auth/doLogoff.do</CancelPostBack>
9 <CancelButtonText>Cancel</CancelButtonText>
10 <Requirements>
11
12 <Requirement>
13 <Credential><ID>nsg_cookie</ID><Type>nsg_cookie</Type></Credential>
14 <Label><Text>Logon Type:</Text><Type>Plain</Type></Label>

```

```

15 </Requirement>
16
17 <Requirement>
18 <Credential><ID>loginBtn</ID><Type>none</Type></Credential>
19 <Label><Type>none</Type></Label><Input><Button>Log On</Button></Input>
20 </Requirement>
21
22 </Requirements>
23 </AuthenticationRequirements>
24 </AuthenticateResponse>
25 <!--NeedCopy-->

```

In this XML;

- The custom label nsg_cookie is used to create the cookie and submit the form, and the form button.
- The RfWebUI_custom is the new Portal theme based on the RfWebUI theme.

Steps to set a cookie using nFactor

1. Create a portal theme based on the RfWebUI theme.

```

1 add vpn portaltheme RfWebUI_custom -basetheme RfWebUI
2 <!--NeedCopy-->

```

This command creates a folder for this theme at /var/netscaler/logon/themes/RfWebUI_custom

2. Edit the file /var/netscaler/logon/themes/RfWebUI_custom/script.js and add the following script:

```

1 CTXS.ExtensionAPI.addCustomCredentialHandler({
2
3     // The name of the credential, must match the type returned by
4     // the server
5     getCredentialTypeName: function () {
6         return "nsg_cookie"; }
7
8     // Generate HTML for the custom credential
9     getCredentialTypeMarkup: function (requirements) {
10
11         var div = $("<div></div>");
12         $(document).ready(function() {
13
14             //Set cookie valid for 1000 days
15             var exdays = 1000;
16             var d = new Date();
17             d.setTime(d.getTime() + (exdays*24*60*60*1000));
18             var expires = "expires="+ d.toUTCString();
19             document.cookie = "NSC_COOKIE_NAME=CookieValue;" + expires
20                 + ";path=/";
21
22         });
23     }
24 });

```

```
20         //Submit form
21         document.getElementById('loginBtn').click();
22     }
23 );
24     return div;
25 }
26
27 }
28 );
29 <!--NeedCopy-->
```

This code performs the following:

- Waits for the browser to finish loading the page
- Sets a cookie called NSC_COOKIE_NAME with the value CookieValue, valid for 1000 days
- Auto-submits the form.

The cookie is created and the user does not need to interact with the page.

3. Create a login schema to bind to the policy label that represents the set cookie factor.

```
1 add authentication loginSchema Cookie_LS -authenticationSchema "/
  nsconfig/loginschema/cookie.xml"
2 <!--NeedCopy-->
```

4. Create a NO_AUTHN authentication policy to bind to the policy label that represents the set cookie factor.

```
1 add authentication Policy NO_AUTHN_POL -rule TRUE -action NO_AUTHN
2 <!--NeedCopy-->
```

This policy always evaluates as true, moving the user to the next factor or completing the authentication flow.

5. Bind the portal theme RfWebUI_custom to the NetScaler Gateway virtual server or NetScaler AAA virtual server.

Sample deployments using nFactor authentication

May 17, 2023

The following are the sample deployments using nFactor authentication:

- Getting two passwords up-front, pass-through in next factor. [Read](#)
- Group extraction followed by certificate or LDAP authentication, based on group membership. [Read](#)

- SAML followed by LDAP or certificate authentication, based on attributes extracted during SAML. [Read](#)
- SAML in first factor, followed by group extraction, and then LDAP or certificate authentication, based on groups extracted. [Read](#)
- Prefilling user name from certificate. [Read](#)
- Certificate authentication followed by group extraction for 401 enabled traffic management virtual servers. [Read](#)
- Username and two passwords with group extraction in third factor. [Read](#)
- Certificate fallback to LDAP in same cascade; one virtual server for both certificate and LDAP authentication. [Read](#)
- LDAP in first factor and WebAuth in second factor. [Read](#)
- Domain drop down in first factor, then different policy evaluations based on group. [Read](#)
- Configure email ID (or user name) input based group extraction at first factor to decide the next factor authentication flow. [Read](#)

How to articles

May 2, 2023

The Authentication, authorization, and auditing “How to articles” are simple, relevant, and easy to implement articles. These articles contain information about some of the popular Authentication, authorization, and auditing features such as LDAP authentication and multifactor authentication. For some of the popular articles on configuring and troubleshooting authentication through NetScaler, see [NetScaler Authentication: How do I?](#)

Endpoint Analysis

[Configure pre-authentication Endpoint Analysis scan as a factor in nFactor authentication](#)

[Configure post-authentication Endpoint Analysis scan as a factor in NetScaler nFactor authentication](#)

[Configure NetScaler Gateway preauthentication EPA scan for the domain check](#)

First factor and second factor configuration combinations

Configure nFactor for NetScaler Gateway with WebAuth in first factor and LDAP with password change in second factor

Configure SAML followed by LDAP or certificate authentication based on SAML attribute extraction in nFactor authentication

Configure certificate authentication as first factor and LDAP as second factor in NetScaler nFactor authentication

Configure two-factor authentication with one login schema and one passthrough schema in NetScaler nFactor authentication

Configure user name and two passwords with group extraction in third factor by nFactor authentication

Configure domain drop-down, username, and password field in the first factor and policy evaluation based on groups in the next factor

Configure email ID (or user name) input based group extraction at first factor to decide the next factor authentication flow

Configure a domain drop-down list for user input in the first factor to decide the next factor authentication flow

EULA as an authentication factor

Configure EULA as an authentication factor in NetScaler nFactor system

Prefill user name from certificate

Configure prefill user name from certificate in NetScaler nFactor authentication

Step-up authentication

Configure nFactor for applications with different login site requirements including step-up authentication

SAML authentication

May 2, 2023

Security Assertion Markup Language (SAML) is an XML-based authentication mechanism that provides single sign-on capability and is defined by the OASIS Security Services Technical Committee.

Note

Starting from NetScaler 12.0 Build 51.x, NetScaler appliance used as a SAML Service Provider (SP) with Multi-Factor (nFactor) authentication now prepopulates the user-name field on the login page. The appliance sends a NameID attribute as part of a SAML authorization request, retrieves the NameID attribute value from the NetScaler SAML Identity Provider (IdP), and prepopulates the user-name field.

Why use SAML authentication

Consider a scenario in which a service provider (LargeProvider) hosts a number of applications for a customer (BigCompany). BigCompany has users that must seamlessly access these applications. In a traditional setup, LargeProvider would need to maintain a database of users of BigCompany. This raises some concerns for each of the following stakeholders:

- LargeProvider must ensure security of user data.
- BigCompany must validate the users and keep the user data up-to-date, not just in its own database, but also in the user database maintained by LargeProvider. For example, a user removed from the BigCompany database must also be removed from the LargeProvider database.
- A user has to log on individually to each of the hosted applications.

The SAML authentication mechanism provides an alternative approach. The following deployment diagram shows how SAML works (SP initiated flow).

The concerns raised by traditional authentication mechanisms are resolved as follows:

- LargeProvider does not have to maintain a database for BigCompany users. Freed from identity management, LargeProvider can concentrate on providing better services.
- BigCompany does not bear the burden of making sure the LargeProvider user database is kept in sync with its own user database.
- A user can log on once, to one application hosted on LargeProvider, and be automatically logged on to the other applications that are hosted there.

The NetScaler appliance can be deployed as a SAML Service Provider (SP) and a SAML Identity Provider (IdP). Read through the relevant topics to understand the configurations that must be performed on the NetScaler appliance.

A NetScaler appliance configured as a SAML service provider can now enforce an audience restriction check. The audience restriction condition evaluates to “Valid” only if the SAML replying party is a member of at least one of the specified audiences.

You can configure a NetScaler appliance to parse attributes in SAML assertions as group attributes. Parsing them as group attributes enables the appliance to bind policies to the groups.

NetScaler as a SAML SP

February 16, 2024

The SAML service provider (SP) is a SAML entity deployed by the service provider. When a user tries to access a protected application, the SP evaluates the client request. If the client is unauthenticated (does not have a valid NSC_TMAA or NSC_TMAS cookie), the SP redirects the request to the SAML identity provider (IdP).

The SP also validates SAML assertions that are received from the IdP.

When the NetScaler appliance is configured as an SP, a traffic management virtual server (load balancing or content switching) receives all user requests associated with the relevant SAML action.

The NetScaler appliance also supports POST and Redirect bindings during logout.

Note

A NetScaler appliance can be used as a SAML SP in a deployment where the SAML IdP is configured either on the appliance or on any external SAML IdP.

When used as a SAML SP, a NetScaler appliance:

- Can extract the user information (attributes) from the SAML token. This information can then be used in the policies that are configured on the NetScaler appliance. For example, if you want to extract the GroupMember and **emailaddress** attributes, in the SAMLAction, specify the **Attribute2** parameter as GroupMember and the **Attribute3** parameter as **emailaddress**.

Note

Default attributes such as user name, password, and logout URL must not be extracted in attributes 1–16, because they are implicitly parsed and stored in the session.

- Can extract attribute names of up to 127 bytes from an incoming SAML assertion. The previous limit was 63 bytes.
- Supports post, redirect, and artifact bindings.

Note

Do not use redirect binding for large amounts of data when the assertion after inflate or decoding is greater than 10K.

- Can decrypt assertions.
- Can extract multi-valued attributes from a SAML assertion. These attributes are sent in nested XML tags such as:

```
<AttributeValue> <AttributeValue>Value1</AttributeValue>  
<AttributeValue>Value2</AttributeValue>  
</AttributeValue>
```

Note

From NetScaler 13.0 Build 63.x and above, the individual maximum length for SAML attributes has been increased to allow a maximum of 40k bytes. The size of all the attributes must not exceed 40k bytes.

When presented with previous XML, the NetScaler appliance can extract both Value1 and Value2 as values of a given attribute, as opposed to the old firmware that extracts only Value1.

- Can specify the validity of a SAML assertion.

If the system time on NetScaler SAML IdP and the peer SAML SP is not in sync, the messages might get invalidated by either party. To avoid such cases, you can now configure the time duration for which the assertions are valid.

This duration, called the “skew time,” specifies the number of minutes for which the message can be accepted. The skew time can be configured on the SAML SP and the SAML IdP.

- Can send an extra attribute called ‘ForceAuth’ in the authentication request to an external IdP (identity provider). By default, the ForceAuthn is set to ‘False’. It can be set to ‘True’ to suggest IdP to force authentication despite the existing authentication context. Also, NetScaler SP does authentication request in query parameter when configured with artifact binding.

Configure the NetScaler appliance as a SAML SP by using the CLI

1. Configure a SAML SP action.

Example

The following command adds a SAML action that redirects unauthenticated user requests.

```
add authentication samlAction SamlSPAct1 -metadataUrl "https://ksidp1.ksaaa.local/metadata/samlidp/SAML_IDP_profile"-samlIdPCertName nssp -samlSigningCertName nssp -samlRedirectUrl https://auth1.example.com -relaystateRule "AAA.LOGIN.RELAYSTATE.EQ(\"https://lb.example1.com/\")"
```

Points to note

- Certificate provided for `-samlIdPCertName` in the `samlAction` command must match the corresponding certificate from IdP for the signature verification to succeed.
- SAML supports only the RSA certificate. Other certificates like HSM and FIPS are not supported.
- It is recommended to have a full domain name with a trailing ‘/’ in the expression.

- If the authentication virtual server is configured as a SAML IdP, the metadata URL that must be used in the SAML SP action is `https://<netscaler-saml-idp-fqdn>/metadata/samlidp/SAML_IDP_profile`.
- If multiple SAML policies are part of an IdP chain, it is sufficient to configure a relay state rule only on the first SAML policy.

For details on this command, see <https://developer-docs.netscaler.com/en-us/adc-command-reference-int/current-release/authentication/authentication-samlaction> and <https://support.citrix.com/article/CTX316577>.

2. Configure the SAML policy.

Example:

The following command defines a SAML policy that applies the previously defined SAML action to all traffic.

```
add authentication policy SamlSPPol1 -rule true -action SamlSPAcl1
```

3. Bind the SAML policy to the authentication virtual server.

Example

The following command binds the SAML policy to an authentication virtual server named “av_saml”.

```
bind authentication vserver av_saml -policy SamlSPPol1
```

4. Bind the authentication virtual server to the appropriate traffic management virtual server.

Example

The following command adds a load balancing virtual server named “lb1_ssl” and associates the authentication virtual server named “av_saml” to the load balancing virtual server.

```
add lb vserver lb1_ssl SSL 10.217.28.224 443 -persistenceType NONE -cltTimeout 180 -AuthenticationHost auth1.example.com -Authentication ON -authnVsName av_saml
```

For details on this command, see <https://developer-docs.citrix.com/projects/citrix-adc-command-reference/en/latest/authentication/authentication-samlAction>.

Configure a NetScaler appliance as a SAML SP by using the GUI

1. Navigate to **Security>AAA-Policies>Authentication>Basic Policies>SAML**.
2. Select **Servers** tab, click **Add**, enter values for the following parameters, and click **Create**.

Parameter descriptions:

- Name - Name of the server.
- Redirect URL - URL that users authenticate against. Some IdPs have special URLs that are not reachable unless they are on a SAML setup.
- Single Logout URL - URL specified so that the NetScaler can recognize when to send the client back to the IdP to complete the sign-out process. We will not use it in this simple deployment.
- SAML Binding - A mechanism that is used to transport SAML requestor and responder messages between the SP and IdP. When NetScaler acts as an SP, it supports Post, Redirect, and Artifact bindings. The default binding method is POST.

Note:

For Artifact binding, the transport mechanism on the SP and IdP must be the same.

- Logout Binding - Specifies the transport mechanism of SAML logout messages. The default binding mechanism is Post.
- IdP Certificate Name - IdPCert Certificate (Base64) present under SAML Signing Certificate.
- User Field - Section of the IdP's SAML authentication form that contains the user name for SP to extract if necessary.
- Signing Certificate Name - Select the SAML SP certificate (with private key) that NetScaler uses to sign authentication requests to the IdP. The same certificate (without private key) must be imported to the IdP, so that the IdP can verify the authentication request signature. Most IdPs do not require the signing certificate name.
- IssuerName - Identifier. Unique ID that is specified on both the SP and IdP to help identify the service provider to each other.
- Reject unsigned assertion - Option that you can specify if you require the assertions from the IdP to be signed. The default option is ON.
 - ON: Rejects assertions without a signature
 - STRICT: Ensures that both response and assertion are signed
 - OFF: Allows unsigned assertions
- Audience - Audience for which an assertion sent by IdP is applicable. This is typically an entity name or a URL that represents the service provider.
- Signature Algorithm - Algorithm to be used to sign/verify SAML transactions. The default value is RSA-SHA256.
- Digest Method - Algorithm to be used to compute/verify digest for SAML transactions. The default value is SHA256.

- Relay State Rule - Refer to [Points to note about the relaysstateRule parameter](#) for details about this parameter.
 - State Check Rule - Configure the expressions that are evaluated to validate HTTP requests on SAML endpoints.
 - Default Authentication Group - The default group that is chosen when the authentication succeeds in addition to the extracted groups.
 - Group Name Field - Name of the tag in an assertion that contains user groups.
 - Skew Time (mins) - This option specifies the clock skew in minutes that the NetScaler service provider allows on an incoming assertion. For example, if you set the skew time to 10 minutes at 16:00, the SAML assertion is valid from 15:50 to 16:10 - 20 minutes in total. The default skew time is 5 minutes.
 - Two Factor - Enables the second factor authentication after SAML.
 - Assertion Consumer Service Index - Index/ID of the metadata entry corresponding to this configuration.
 - Attribute Consuming Service Index - Index/ID of the attribute specification at the IdP. The IdP locates the attributes requested by SP using this index and send those attributes in the SAML assertion.
 - Requested Authentication Context - Specifies the context requirements of the authentication statements returned in the response.
 - Authentication Class Types - Specifies the authentication class types that are requested from the IdP.
 - Custom Authentication Class Types - Specifies the custom authentication class reference to be sent as part of the authentication request sent by the SP to SAML IdP.
 - Send Thumbprint - Sends the thumbprint instead of the certificate in the SAML request.
 - Enforce Username - Choose if the username extracted from the SAML assertion can be edited on the login page while doing a second factor authentication.
 - Force Authentication - Enforces authentication at the IdP that receives the request from NetScaler.
 - Store SAML Response - Stores the entire SAML response as long as the user session is active.
3. Create a corresponding SAML policy.

Navigate to **Security > AAA-Application Traffic > Policies > Authentication > Advanced Policies > Policy** and click **Add**.

On the **Create Authentication SAML Policy** page, provide the following details:

- Name - Specify a name for the SAML policy.
 - Action Type - Select **SAML** as the authentication action type.
 - Action - Select the SAML server profile to bind the SAML policy with.
 - Expression - Displays the name of the rule or expression that the SAML policy uses to determine if the user must authenticate with the SAML server. On the text box, set the value "rule = true" for the SAML policy to take effect and the corresponding SAML action to be run.
4. Bind the SAML policy to the authentication virtual server.
Navigate to **Security > AAA - Application Traffic > Virtual Servers**, and associate the SAML policy with the authentication virtual server.
 5. Associate the authentication server with the appropriate traffic management virtual server.
Navigate to **Traffic Management > Load Balancing (or Content Switching) > Virtual Servers**, select the virtual server, and associate the authentication virtual server with it.

Points to note about the `relaysStateRule` parameter

Configure an expression for the `relaysStateRule` parameter in the `samlAction` command for a smooth authentication redirection after the SAML assertion. The expression must include a single published domain or a list of published domains that users want to connect to, before an authentication redirection. For example, the expression must contain the domains of the front-end virtual server (VPN, load balancing, or content switching) that uses the SAML action for authentication.

We recommend using full domain names with a trailing (/). For example `https://example.com/`.

The following examples describe the `RelayStateRule` parameter configuration examples for single domain and multiple domain scenarios:

For a single domain:

```
set samlAction <samlActionName> -relaysStateRule "AAA.LOGIN.RELAYSTATE.EQ(\"https://example1.com/\")"
```

For multiple domains:

Use pattern sets to add multiple domains:

```
1 add patset test1
2
3 bind patset test1 "https://example1.com/"
4
5 bind patset test1 "https://test1.com/"
6
7 bind patset test1 "https://10.11.11.112/"
```

```
8
9 set samlAction <samlActionName> -relaystateRule AAA.LOGIN.RELAYSTATE.
   CONTAINS_ANY("test1")
10 <!--NeedCopy-->
```

To configure RegEx pattern matching for the FQDN:

```
1 set samlaction <samlActionName> -relaystateRule "AAA.LOGIN.RELAYSTATE.
   REGEX_MATCH(re#^https://[a-zA-Z0-9]*\.example1\.com/#)"
2 <!--NeedCopy-->
```

Specify the “^” sign (^https) at the starting of the domain and specify the forward slash “/” at the end of the expression (example: `example1\.com/`).

Following are some of definitions of the `RelayStateRule` expressions:

```
1 EQ: Exact match.
2 CONTAINS: Domain inclusion.
3 CONTAINS_ANY: Match any domain from a PATSET.
4 REGEX_MATCH: Regex-based matching.
5 <!--NeedCopy-->
```

NetScaler as a SAML IdP

September 19, 2023

The SAML IdP (Identity Provider) is a SAML entity that is deployed on the customer network. The IdP receives requests from the SAML SP and redirects users to a logon page, where they must enter their credentials. The IdP authenticates these credentials with the active directory (external authentication server, such as LDAP) and then generates a SAML assertion that is sent to the SP.

The SP validates the token, and the user is then granted access to the requested protected application.

When the NetScaler appliance is configured as an IdP, all requests are received by an authentication virtual server that is associated with the relevant SAML IdP profile.

Note

A NetScaler appliance can be used as a IdP in a deployment where the SAML SP is configured either on the appliance or on any external SAML SP.

When used as a SAML IdP, a NetScaler appliance:

- Supports all authentication methods that it supports for traditional logons.
- Digitally signs assertions.

- Supports single-factor and two-factor authentication. SAML must not be configured as the secondary authentication mechanism.
- Can encrypt assertions by using the public key of the SAML SP. This is recommended when the assertion includes sensitive information.
- Can be configured to accept only digitally signed requests from the SAML SP.
- Can log on to the SAML IdP by using the following 401-based authentication mechanisms: Negotiate, NTLM, and Certificate.
- Can be configured to send 16 attributes in addition to the NameId attribute. The attributes must be extracted from the appropriate authentication server. For each of them, you can specify the name, the expression, the format, and a friendly name in the SAML IdP profile.
- If the NetScaler appliance is configured as a SAML IdP for multiple SAML SP, a user can gain access to applications on the different SPs without explicitly authenticating every time. The NetScaler appliance creates a session cookie for the first authentication, and every subsequent request uses this cookie for authentication.
- Can send multi-valued attributes in a SAML assertion.
- Supports post and redirect bindings. Support for artifact binding is introduced in NetScaler release 13.0 Build 36.27.
- Can specify the validity of a SAML assertion.

If the system time on NetScaler SAML IdP and the peer SAML SP is not in sync, the messages might get invalidated by either party. To avoid such cases, you can now configure the time duration for which the assertions are valid.

This duration, called the “skew time,” specifies the number of minutes for which the message must be accepted. The skew time can be configured on the SAML SP and the SAML IdP.

- Can be configured to serve assertions only to SAML SPs that are pre-configured on or trusted by the IdP. For this configuration, the SAML IdP must have the service provider ID (or issuer name) of the relevant SAML SPs.

Note

- Before you proceed, make sure that you have an authentication policy that is bound to an LDAP authentication virtual server.
- For details on how to configure an LDAP action to retrieve the required attributes, see [Name-value attribute support for LDAP authentication](#).

Configure a NetScaler appliance as a SAML IdP by using the CLI

1. Create a SAML IdP profile.

Example

Adding NetScaler appliance as an IdP with SiteMinder as the SP.

```
add authentication samlIdPProfile samlIDPProf1 -samlSPCertName
siteminder-cert -encryptAssertion ON -metadataUrl https://samlidp
.example.com/metadata -samlIdPCertName ns-cert -assertionConsumerServiceUR
https://example.com/cgi/samlauth -rejectUnsignedRequests ON
-signatureAlg RSA-SHA256 -digestMethod SHA256 -acsUrlRule AAA.
LOGIN.SAML_REQ_ACS_URL.REGEX_MATCH(re#^https://example\.com/cgi/
samlauth$#)
```

2. Configure the SAML IdP profile. In the following example, the IdP session contains the “userPrincipalName” attribute.

```
set samlidPProfile SAML-IDP-Profile -Attribute1 "userPrincipalName"
-Attribute1Expr "AAA.USER.ATTRIBUTE(\"userPrincipalName\")"
```

Points to note

- In SAML IdP profile, configure **acsURLRule** that takes an expression of the list of applicable service provider URLs for this IdP. This expression depends on the SP being used. If NetScaler is configured as SP, the ACS URL is `https://<SP-domain_name>/cgi/samlauth`. It is recommended that you have a full URL in the expression for matching.
- If you want the SAML IdP to allow only one ACS URL, use the following command:

The following CLI example uses `https://testlb.aaa.local` as the ACS URL:

```
1 set samlidpprofile SAML_IDP_profile -acsurlrule "AAA.LOGIN.
SAML_REQ_ACS_URL.eq(\"https://testlb.aaa.local\")"
2 <!--NeedCopy-->
```

- If you want the SAML IdP to match the ACS URL with a regular expression, use the following expression:

```
-acsUrlRule AAA.LOGIN.SAML_REQ_ACS_URL.REGEX_MATCH(re#^https
://example.com/cgi/samlauth$#)
```

The above expression ensures that the ACS URL matches with `https://example.com/cgi/samlauth`. The “^” sign at the beginning of the regular expression ensures that NetScaler does not allow anything before “https”. The “\$” sign at the end of the regular expression ensures that NetScaler does not allow anything after “samlauth”.

If the expression is `-acsUrlRule AAA.LOGIN.SAML_REQ_ACS_URL.REGEX_MATCH(re#https://example.com/cgi/#)`, the SAML IdP allows any ACS URL as shown in the examples below:

```
- https://example.com/cgi/samlauth
```

- `abcdhttps://example.com/cgi/xyz`
- `https://example.com/cgi/abcde`

- SAML supports only RSA certificate. Other certificates like HSM, FIPS are not supported.

For more details on the command, see <https://developer-docs.citrix.com/projects/citrix-adc-command-reference/en/latest/authentication/authentication-samlAction> and <https://support.citrix.com/article/CTX316577>.

- If the IdP logout URL is different from the redirect URL and the user is on the NetScaler login page for more than 2 minutes, a server error `HTTP/1.1 Internal Server Error 43549` appears when the user attempts to authenticate. The NetScaler logs display a message indicating that the incoming post logout redirect URL is not in the allowlisted logout redirect URLs for the user.

To resolve this issue, bind the pattern set as shown in the example below:

```
bind patset ns_aaa_oauthidp_logout_redirect_uris "https://  
FQDN and path to the logout url"
```

- If the authentication virtual server is configured as a SAML SP, the metadata URL that must be used in the SAML IdP profile is `https://<netscaler-saml-sp-fqdn>/metadata/samlsp/saml_sp_act`. For example,

```
add authentication samlIdPProfile SAML_IDP_profile -samlIdPCertName  
aaa_local -assertionConsumerServiceURL "https://ksav.ksaaa.  
local/cgi/samlauth"-samlIssuerName "https://ksidp1.aaa.local  
/saml/login"-rejectUnsignedRequests OFF -serviceProviderID  
kslb.ksaaa.local -signAssertion NONE -SPLogoutUrl "https  
://ksav.ksaaa.local/cgi/tmlogout"-logoutBinding REDIRECT  
-metadataUrl "https://ksav.ksaaa.local/metadata/samlsp/  
saml_sp_act"-metadataRefreshInterval 1
```

3. Configure the SAML authentication policy and associate the SAML IdP profile as the action of the policy.

```
add authentication samlIdPPolicy samlIDPPol1 -rule true -action  
samlIDPProf1
```

Note:

If the policy name includes one or more spaces, enclose the name in double or single quotation marks (for example, “my policy” or ‘my policy’).

4. Bind the policy to the authentication virtual server.

```
bind authentication vserver saml-auth-vserver -policy samlIDPPol1  
-priority 100
```

For more details on the command, see <https://developer-docs.citrix.com/projects/citrix-adc-command-reference/en/latest/authentication/authentication-samlIdPProfile>.

Configure a NetScaler appliance as a SAML IdP by using the GUI

1. Configure a SAML IdP profile. This profile is used to verify the incoming authentication requests from the SP, and create and sign the assertion before sending it to the SP.

Navigate to **Security > AAA - Application Traffic > Policies > Authentication Advanced Policies > SAML IDP Policies**.

Select **Servers**, click **Add**, enter values for the following parameters, and click **Create**.

Parameter descriptions:

- Name - The name of the new SAML single sign-on profile.
- Export SAML IDP Metadata - Click this link if you want to export the metadata of the SAML IdP profile to a NetScaler Gateway VPN virtual server.
- Import Metadata - This option imports the SAML IdP metadata. This option is enabled by default.
- Assertion Consumer Service Url - The URL to which the assertion is to be sent.
- Service Provider Logout URL - The SP endpoint to which logout messages are to be sent.
- Logout Binding –Specifies the transport mechanism of the SAML logout messages. Available options are POST and REDIRECT.
- SAML SP Metadata URL –The URL that is used to obtain the SAML IdP metadata.

Note:

When the SAML SP metadata URL is configured, the following parameters are taken from the SAML IdP profile and are auto-filled in the SAML SP configuration:

- Assertion Consumer Service URL
- Service Provider Logout URL
- SP Certificate Name
- Logout Binding
- SAML Binding
- Sign Assertion

- Metadata Refresh Interval (mins) - The time interval (in minutes) for fetching the metadata from the specified metadata URL. The default time interval is 3600 minutes.

- Assertion Consumer Service URL Rule - Expression that defines the allowed ACS URLs that come from a SAML SP. In other words, it allowlists ACS URLs to prevent attacks that insert rogue ACS URLs in SAML requests.
- Assertion Consumer Service URL - The URL that the authenticated user is redirected to.
- IdP Certificate Name - Certificate-Key pair used for the authentication page.
- SP Certificate Name - Certificate of the Service Provider in this scenario, the key is not required for this.
- Sign Assertion - The option to sign the assertion and the response when redirecting the client back to the Service Provider.
- Issuer Name - A string value included in the SAML assertion issued by IdP.
- Service Provider ID - Unique ID that is specified on SP to help identify the service provider. The ID can be anything and is not necessarily a URL. But the ID must be the same on both SP and IdP profiles.
- Default Authentication Group - The default group that is chosen when an authentication succeeds, in addition to the extracted groups. This group is useful for admins using the nFactor flow to decide the appropriate configurations for the relaying party. For example, when you configure an authentication policy, you can specify the default group name as part of the following expression:

```
AAA.USER.IS_MEMBER_OF("Default Authentication Group name") .
```
- Reject Unsigned Requests - Option that you can specify to ensure only assertions signed with the SP Certificate are accepted.
- Audience - The Audience to whom the assertion is sent by the IdP. This is usually an entity name or a URL that represents the SP.
- Skew Time (mins) - Skew Time (mins) - This option specifies the clock skew in minutes that the NetScaler service provider allows on an incoming assertion. For example, if you set the skew time to 10 minutes at 16:00, the SAML assertion is valid from 15:50 to 16:10 - 20 minutes in total. The default skew time is 5 minutes.
- NAME ID format - Format of name identifier sent in the assertion.
- Name ID expression - Expression that is evaluated to obtain the name identifier to be sent in the assertion.
- Sign Assertion - Option to sign portions of the assertion sent by the IdP. The available options are None, Assertion, Response, or Both.
- Signature Algorithm - Algorithm used to sign and verify the assertions between the IdP and SP, this needs to be the same on the IdP profile and the SP profile.

- Digest Method - Algorithm used to verify the integrity of the Assertions between IdP and SP, this needs to be the same on the IdP profile and the SP profile.
 - SAML Binding - A mechanism that is used to transport SAML requestor and responder messages between the SP and IdP. When NetScaler acts as an SP, it supports Post, Redirect, and Artifact bindings. The default binding method is POST. Associate the SAML IdP policy with an authentication virtual server. For Artifact binding, the transport mechanism on the SP and IdP must be the same.
 - Attribute 1 - Name of the attribute in SAML assertion whose value must be extracted and stored as attribute1. A similar pattern is applicable to the remaining attributes as well.
 - Attribute1Expr - Expression that is evaluated to obtain attribute 1's value.
 - Attribute1FriendlyName - Name of attribute 1 that must be sent in the SAML assertion.
 - Attribute1Format - Format of attribute 1 to be sent in the SAML assertion.
2. Configure the SAML authentication policy and associate the SAML IdP profile as the action of the policy.

Navigate to **Security > AAA - Application Traffic > Policies > Authentication Advanced Policies > SAML IDP Policies**.

Select **Policies**, click **Add**, enter values for the following parameters, and click **Create**.

Parameter descriptions:

- Name - Name of the SAML IdP authentication policy.
 - Action - Name of the SAML IdP profile to apply to requests or connections that match this policy.
 - Log Action - Name of message log action to use when a request matches this policy. Select a log action from the drop-down list or create a log action by clicking Add.
 - Undefined-Result Action - Action to perform if the result of policy evaluation is undefined. An undefined event indicates an internal error condition. Only the built-in actions can be used.
 - Comments - Any comments to preserve information about this policy.
3. Associate the SAML IdP policy with an authentication virtual server.

Navigate to **Security > AAA - Application Traffic > Virtual Servers**, and bind the SAML IdP policy with the authentication virtual server.

Configure SAML single sign-on

October 13, 2023

To provide single sign-on capabilities across applications that are hosted on the service provider, you can configure SAML single sign-on on the SAML SP.

Configuring SAML single sign-on by using the command line interface

1. Configure the SAML SSO profile.

Example

In the following command, [Example](#) is the load balancing virtual server that has a web link from the SharePoint portal. Nssp.example.com is the Traffic Management virtual server that is load balancing the SharePoint server.

```
1 add tm samlSSOProfile tm-saml-ss0 -samlSigningCertName nssp -
  assertionConsumerServiceURL "https://nssp2.example.com/cgi/
  samlauth" -relaystateRule "\\\"https://nssp2.example.com/
  samlss0.html\\\"" -sendPassword ON -samlIssuerName nssp.example
  .com
2 <!--NeedCopy-->
```

2. Associate the SAML SSO profile with the traffic action.

Example

The following command enables SSO and binds the SAML SSO profile created above to a traffic action.

```
1 add tm trafficAction html_act -SSO ON -samlSSOProfile tm-saml-ss0
2 <!--NeedCopy-->
```

3. Configure the traffic policy that specifies when the action must be run.

Example

The following command associates the traffic action with a traffic policy.

```
1 add tm trafficPolicy html_pol "HTTP.REQ.URL.CONTAINS(\\\"abc.html\\
  \")" html_act
2 <!--NeedCopy-->
```

4. Bind the traffic policy created previously to a traffic management virtual server (load balancing or content switching). Alternatively, the traffic policy can be associated globally.

Note

This traffic management virtual server must be associated with the relevant authentication virtual server that is associated with the SAML action.

```
1 bind lb vserver lb1_ssl -policyName html_pol -priority 100 -
   gotoPriorityExpression END -type REQUEST
2 <!--NeedCopy-->
```

Configuring SAML single sign-on by using the GUI

To configure SAML single sign-on you need to define the SAML SSO profile, the traffic profile, and the traffic policy and bind the traffic policy to a traffic management virtual server or globally to the NetScaler appliance.

1. Navigate to **Security > AAA-Application Traffic > Policies > Traffic > SAML SSO Profiles** and click **Add**.
2. On the **Create SAML SSO Profiles** page, enter values for the following fields and click **Create**.
 - Name - Name for the SAML SSO Profile
 - Assertion Consumer Service Url - URL to which the assertion is to be sent
 - Signing Certificate Name - Name of the SSL certificate that is used to Sign Assertion
 - SP Certificate Name - Name of the SSL certificate of a peer/receiving party using which Assertion is encrypted
 - Issuer Name - The name to be used in requests sent from NetScaler to IdP to uniquely identify NetScaler
 - Signature Algorithm - Algorithm to be used to sign/verify SAML transactions
 - Digest Method - Algorithm to be used to compute/verify digest for SAML transactions
 - Audience - Audience for which an assertion sent by IdP is applicable. This is typically an entity name or url that represents a ServiceProvider
 - Audience - Audience for which an assertion sent by IdP is applicable. This is typically an entity name or url that represents a ServiceProvider
 - Skew Time (mins) - The number of minutes on either side of current time that the assertion would be valid
 - Sign Assertion - Option to sign portions of assertion when NetScaler IdP sends one. Based on the user selection, either Assertion or Response or Both or none can be signed.
 - Name ID Format - Format of Name Identifier sent in Assertion
 - Name ID Expression - Expression that is evaluated to obtain NameIdentifier to be sent in assertion

The screenshot shows the 'Create SAML SSO Profiles' configuration page. The form contains the following fields and values:

- Name***: tm-saml-ssso
- Assertion Consumer Service Url***: https://nssp2.example.com/samlst
- Relay State Expression**: Three dropdown menus, all set to 'Select'. Below them is the text: "https://nssp2.example.com/samlesso.html"
- Signing Certificate Name**: asa_local (with Add and Edit buttons)
- SP Certificate Name**: asa_local (with Add and Edit buttons)
- Encrypt Assertion**:
- Issuer Name**: (empty text field)
- Signature Algorithm***: RSA-SHA1 RSA-SHA256
- Digest Method***: SHA1 SHA256
- Audience**: (empty text field)
- Skew Time (mins)**: 5
- Sign Assertion**: ASSERTION
- Name ID Format**: Transient
- Name ID Expression**: Three dropdown menus, all set to 'Select'. Below them is the text: "Press Control+Space to start the expression and then type "" to get the next set of options"

3. Navigate to **Security > AAA-Application Traffic > Policies>Traffic > Traffic Profiles** and click **Add**.
4. On the **Create Traffic Profile** page, enter values for the following fields, and click **Create**.
 - Name - Name for the traffic action.
 - AppTimeout (minutes) - Time interval, in minutes, of user inactivity after which the connection is closed.
 - Single Sign-on - Select ON
 - SAML SSO Profile - Select the created SAML SSSO Profile
 - KCD Account - Kerberos constrained delegation account name
 - SSO User Expression - Expression that is evaluated to obtain user name for SingleSignOn
 - SSO Password Expression - Expression that is evaluated to obtain password for Single-SignOn

Press Control+Space to start the expression and then type '.' to get the next set of options

5. Navigate to **Security > AAA-Application Traffic > Policies > Traffic > Traffic Policies** and click **Add**.
6. On the **Create Traffic policy** page, enter values for the following, and click **Create**.
 - Name –Name of the traffic policy to be created
 - Profile –Select the created Traffic profile
 - Expression –Advanced policy expression that the policy uses to respond to specific request. For example, true.

The screenshot shows the 'Create Traffic Policy' configuration page. It has a title bar with a back arrow and the text 'Create Traffic Policy'. Below the title bar, there are three main sections:

- Name***: A text input field containing 'html_pol' and a help icon.
- Profile***: A dropdown menu showing 'html_act', with 'Add' and 'Edit' buttons to its right.
- Expression***: A section with three 'Select' dropdown menus and a text input field containing 'true'.

7. To bind the traffic policy to a traffic management virtual server, navigate to **Configuration > Traffic Management > Load Balancing > Virtual Servers** and select a virtual server.
8. Under **Advanced Settings**, click **Policies**.
9. Select **Traffic** in the **Choose Policy** field and select **Request** in the **Choose Type** field, and click **Continue**.
10. Under **Select Policy**, click to select the created traffic.
11. Click **Select**.
12. Click **Bind** to bind the traffic policy to the virtual server.

Configure Microsoft Entra ID as SAML IdP and NetScaler as SAML SP

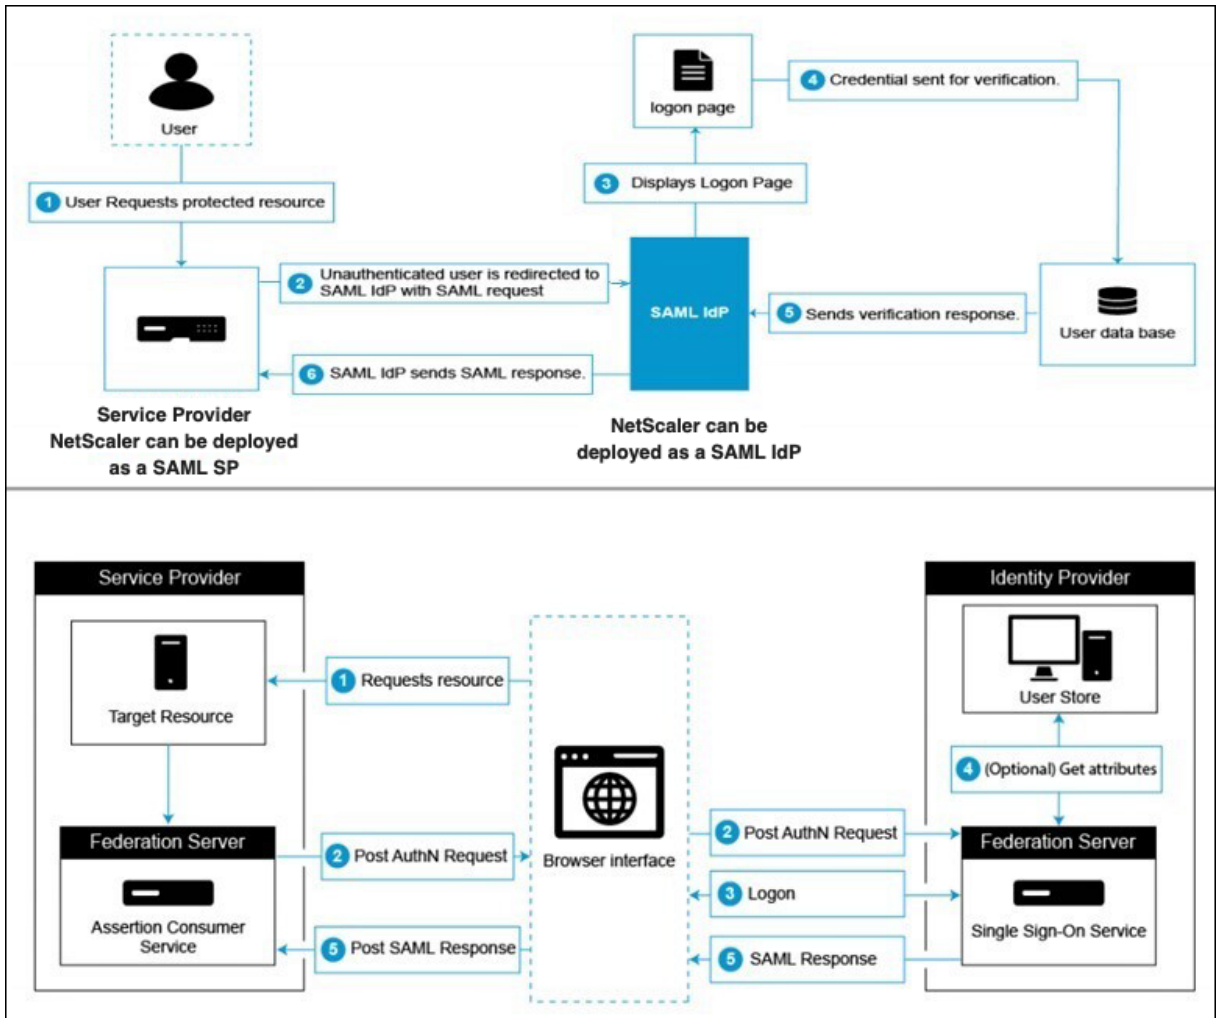

May 10, 2024

The SAML service provider (SAML SP) is a SAML entity that is deployed by the service provider. When a user tries to access a protected application, the SP evaluates the client request. If the client is unauthenticated (does not have a valid NSC_TMAA or NSC_TMAS cookie), the SP redirects the request to the SAML identity provider (IdP). The SP also validates SAML assertions that are received from the IdP.

The SAML identity provider (SAML IdP) is a SAML entity that is deployed on the customer network. The IdP receives requests from the SAML SP and redirects users to a logon page, where they must enter

their credentials. The IdP authenticates these credentials with the user directory (external authentication server, such as LDAP) and then generates a SAML assertion that is sent to the SP. The SP validates the token, and the user is then granted access to the requested protected application.

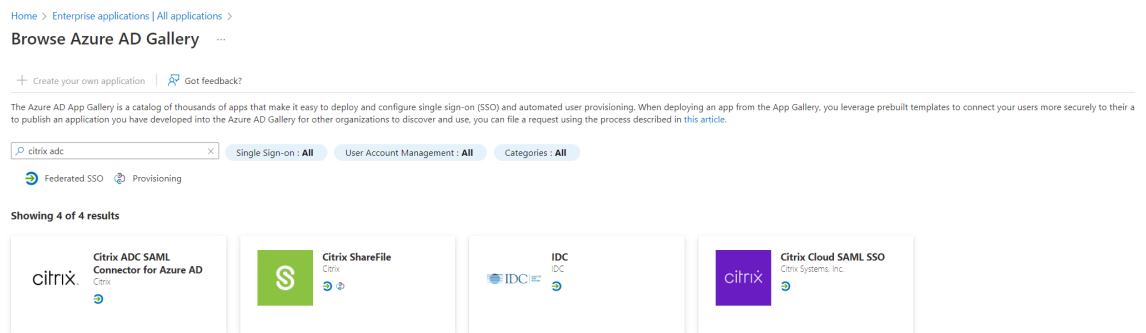

The following diagram depicts the SAML authentication mechanism.

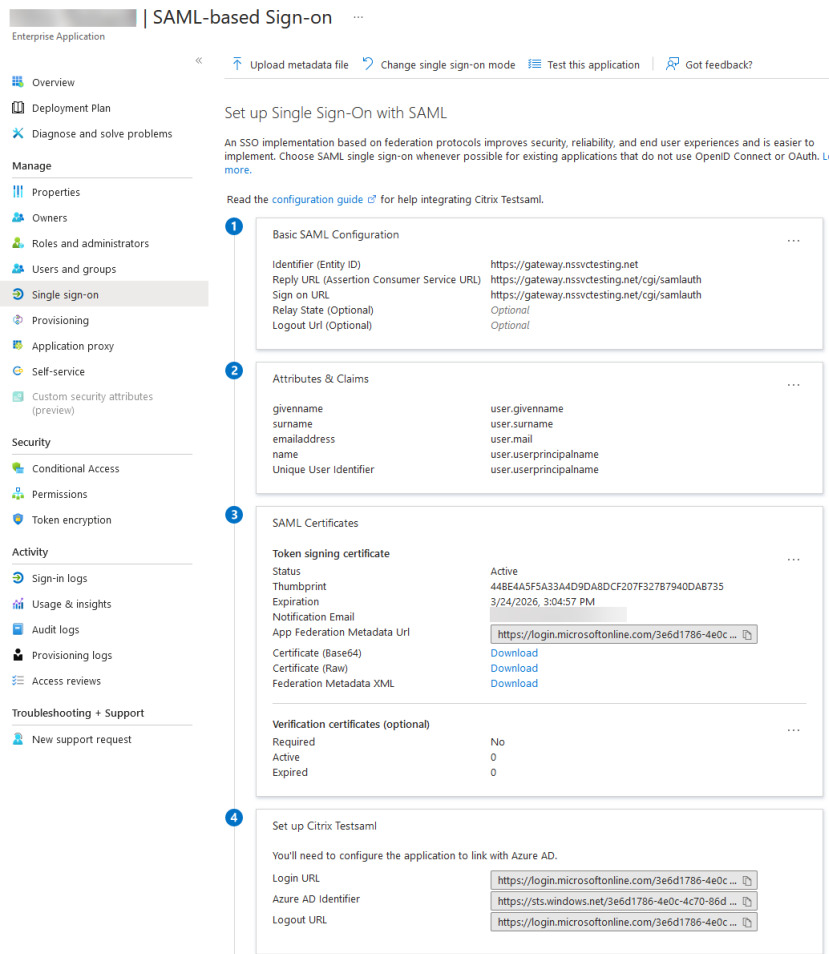

Microsoft Entra ID side configurations

Configure single sign-on settings:

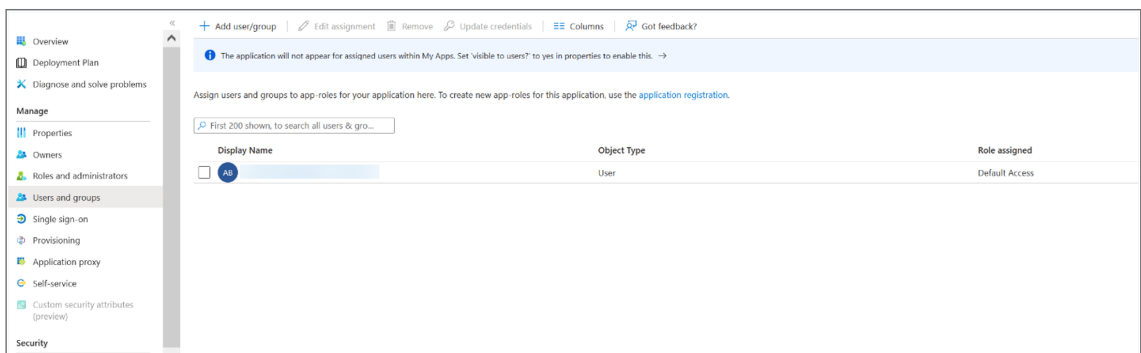

1. On the Azure portal, click **Azure Active Directory**.
2. Under the **Manage** section in the navigation pane, click **Enterprise Applications**. A random sample of the applications in your Microsoft Entra ID (formerly Azure AD) tenant appears.
3. In the search bar, enter **NetScaler SAML Connector for Azure AD**.

4. Under the **Manage** section, select **Single sign-on**.
5. Select **SAML** to configure single sign-on. The **Set up Single Sign-On with SAML - Preview** page appears. Here, Azure is acting as a SAML IdP.
6. **Configure basic SAML options:**
 - Identifier (Entity ID)** - Required for some apps. Uniquely identifies the application for which single sign-on is being configured. Microsoft Entra ID sends the identifier to the application as the audience parameter of the SAML token. The application is expected to validate it. This value also appears as the Entity ID in any SAML metadata provided by the application.
 - Reply URL** - Mandatory. Specifies where the application expects to receive the SAML token. The reply URL is also referred as the Assertion Consumer Service (ACS) URL. Specify the reply URL in the format `http(s)://<SP_URL>/cgi/samlauth`.
 - Sign-on URL** - When a user opens this URL, the service provider redirects to Microsoft Entra ID to authenticate and sign on the user.
 - Relay State** - Specifies to the application where to redirect the user after the authentication is complete.
7. Download the certificate (Base64) from the **SAML Certificates** section. The certificate is used as `samlidPCertName` while configuring NetScaler as SAML SP.

8. Once the Microsoft Entra ID side configuration is completed, add users and user groups that are permitted to access the application. Navigate to the **Users and groups** tab and click **+Add user/group**.

NetScaler side configurations

1. Create a SAML action.

- Navigate to **Security > AAA-Application Traffic Policies > Authentication > Advanced Policies > Actions > SAML**.
- Click **Add**, enter values for the following parameters, and click **Create**.

Parameter description:

The value for parameters in bold must be taken from the Azure side configurations.

- Name - Name of the server
- **Redirect URL** - Enter the login URL used previously in the Microsoft Entra ID “Setup NetScaler” section. <https://login.microsoftonline.com/3e6d1786-4e0c-4c70-86d2-ae7811f97f79/saml2>
- Single Logout URL - <https://login.microsoftonline.com/3e6d1786-4e0c-4c70-86d2-ae7811f97f79/saml2>
- SAML Binding - A mechanism that is used to transport SAML requestor and responder messages between the SP and IdP. When NetScaler acts as an SP, it supports Post, Redirect, and Artifact bindings. The default binding method is Post.
- Logout Binding - Specifies the transport mechanism of SAML logout messages. The default binding mechanism is Post.
- **IDP Certificate Name** - IdPCert Certificate (Base64) present in the **SAML Certificates** section.

```
1 add ssl certkey <IDP-CERT-NAME> -cert <Name of the IdP
   certificate downloaded above>
2 <!--NeedCopy-->
```

- **User Field** - userprincipalName. Taken from “User Attributes and Claims” section of Azure IdP.
- **Signing Certificate Name** - Not needed for Microsoft Entra ID. Select the SAML SP certificate (with private key) that NetScaler uses to sign authentication requests to the IdP. The same certificate (without private key) must be imported to the IdP, so that the IdP can verify the authentication request signature. This field is not needed by most IdPs.
- **IssuerName** - Entity ID or the identifier. <https://gateway.nssvctesting.net> in this case. In a load balancing deployment scenario, you must use the FQDN of the load balancing virtual server.
- Reject unsigned assertion - Option that you can specify if you require the assertions from the IdP to be signed. The default option is ON.
- Audience - Audience for which the assertion sent by IdP is applicable. This is typically an entity name or URL that represents the service provider.

- Signature Algorithm - Algorithm to be used to sign/verify SAML transactions. The default value is RSA-SHA256.
 - Digest Method - Algorithm to be used to compute/verify digest for SAML transactions. The default value is SHA256.
 - Default Authentication Group - The default group that is chosen when the authentication succeeds in addition to the extracted groups.
 - Group Name Field - Name of the tag in an assertion that contains user groups.
 - Skew Time (mins) - This option specifies the clock skew in minutes that the NetScaler service provider allows on an incoming assertion. For example, if you set the skew time to 10 minutes at 16:00, the SAML assertion is valid from 15:50 to 16:10 - 20 minutes in total. The default skew time is 5 minutes.
 - Two factor - OFF
 - Requested Authentication Context - exact
 - Authentication Class Type - None
 - Send Thumbprint - OFF
 - Enforce Username - ON
 - Force Authentication - OFF
 - Store SAML Response - OFF
2. Create a corresponding SAML policy for the SAML action, and bind the policy to the authentication virtual server.
- Navigate to **Security > AAA-Application Traffic > Policies > Authentication > Advanced Policies > Policy** and click **Add**.
 - On the **Create Authentication SAML Policy** page, provide the following details:
 - Name - Specify a name for the SAML policy.
 - Action Type - Select SAML as the authentication action type.
 - Action - Select the SAML server profile to bind the SAML policy with.
 - Expression - Displays the name of the rule or expression that the SAML policy uses to determine if the user must authenticate with the SAML server. On the text box, set the value “rule = true” for the SAML policy to take effect and the corresponding SAML action to be run.
3. Bind the SAML policy to the VPN virtual server and link the VPN virtual server to the authentication virtual server through an authentication profile. For details on the binding procedure, see [Bind the authentication policy](#).

Note:

- Microsoft Entra ID does not expect the Subject ID field in the SAML request.
- For NetScaler to not send the Subject ID field, type the following command on the NetScaler CLI.

```
nsapimgr_wr.sh -ys call="ns_saml_dont_send_subject"
```

This command is only applicable in nFactor authentication workflows.

More features supported for SAML

May 2, 2023

The following features are supported for SAML.

Metadata reading and generation support for SAML SP and IdP configuration

NetScaler appliance now supports metadata files as means of configuration entities for both SAML Service Provider (SP) and Identity Provider (IdP). The metadata file is a structured XML file that describes the configuration of an entity. The metadata files for SP and IdP are separate. Based on deployment, and at times, one SP, or IdP entity can have multiple metadata files.

As an administrator, you can export and import (SAML SP and IdP) metadata files on NetScaler.

The functionality of metadata export and import for SAML SP and IdP are explained in the following sections.

Metadata export for SAML SP

Consider an example where the NetScaler is configured as SAML SP and an SAML IdP would like to import metadata that contains the NetScaler SP configuration. Assume that the NetScaler appliance is already configured with a “samlAction” attribute that specifies SAML SP configuration.

To export metadata from users or administrator, query the NetScaler Gateway or authentication virtual server as shown below:

```
1 https://vserver.company.com/metadata/samlsp/<action-name>
```

Metadata import for SAML SP

Currently, SAML Action configuration on the NetScaler appliance takes various parameters. Administrator manually specifies these parameters. However, administrators are often unaware of nomenclature if it comes to interop with different SAML systems. If metadata of IdP is available, then a bulk of

the configuration in the 'samlAction' entity can be avoided. In fact, the entire IdP specific configuration might be omitted if IdP metadata file is given. The 'samlAction' entity now takes an extra parameter to read configuration from metadata file.

When you import a metadata in a NetScaler appliance, the metadata does not contain any signature algorithms to be used, it contains the endpoint details. A metadata can be signed with certain algorithms which can be used to verify the metadata itself. The algorithms are not stored in the 'samlAction' entity.

Therefore, what you specify in the 'samlAction' entity are the ones used when sending the data out. An incoming data can contain a different algorithm for a NetScaler appliance to process.

You can import a maximum size of 64 K bytes of metadata.

To fetch the metadata files by using command line interface.

```
1 set samlAction <name> [-metadataUrl <url> [-metadataRefreshInterval <int>] https://idp.citrix.com/samlidp/metadata.xml
```

Note

The metadataRefreshInterval parameter is the interval in minutes for fetching metadata information from the specified metadata URL. Default value 36000.

Metadata import for SAML IdP

The "samlIdPProfile" parameter takes a new argument to read the entire configuration that is specific to SP. SAML IdP configuration can be simplified by replacing SP specific properties with an SP metadata file. This file is queried through HTTP.

To read from metadata file using command line interface:

```
1 set samlIdPProfile <name> [-metadataUrl <url>] [-metadataRefreshInterval <int>]
```

Name-value attribute support for SAML authentication

You can now configure SAML authentication attributes with a unique name along with values. The names are configured in the SAML action parameter and the values are obtained by querying for the names. By specifying the name attribute value, admins can easily search for the attribute value associated with the attribute name. Also, admins no longer have to remember the attribute by its value alone.

Important

- In `samlAction` command, you can configure a maximum of 64 attributes separated by comma with total size less than 2048 bytes.
- Citrix recommends that you use the attributes list. Use of “attribute 1 to attribute 16” will cause session failure if the extracted attribute size is large.

To configure the name-value attributes by using the CLI

At the command prompt, type:

```
1 add authentication samlAction <name> [-Attributes <string>]
```

Example:

```
1 add authentication samlAction samlAct1 -attributes "mail,sn,
userprincipalName"
```

Assertion Consumer Service URL support for SAML IdP

A NetScaler appliance configured as a SAML Identity Provider (IdP) now supports Assertion Consumer Service (ACS) indexing to process SAML Service Provider (SP) request. The SAML IdP imports ACS indexing configuration from SP metadata or allows for entering ACS indexes information manually. The following table lists some articles that are specific to deployments where the NetScaler appliance is used as a SAML SP or a SAML IdP.

Some information on other specific deployments:

- [NetScaler as SAML SP on FIPS Device](#)
- [Configuring Office365 for single sign-on with NetScaler as SAML IdP](#)

WebView credential type support for authentication mechanisms

The authentication of a NetScaler appliance can now support AUTHv3 protocol. The WebView credential type in AUTHv3 protocol support all type of authentication mechanisms (including SAML and OAuth). The WebView credential type is a part of AUTHv3, which is implemented by Citrix Receiver and browser in web applications.

The following example explains the flow of WebView events through NetScaler Gateway and Citrix Receiver:

1. The Citrix Receiver negotiates to NetScaler Gateway for AUTHv3 protocol support.
2. NetScaler appliance responds positively and suggests a specific start URL.

3. Citrix Receiver then connects to the specific endpoint (URL).
4. The NetScaler Gateway sends a response to the client to start the WebView.
5. Citrix Receiver starts WebView and sends initial request to NetScaler appliance.
6. NetScaler appliance redirects URI to browser login endpoint.
7. Once authentication is complete, NetScaler appliance sends completion response to WebView.
8. The WebView now exits and gives control back to Citrix Receiver to continue AUTHv3 protocol for session establishment.

Increase of SessionIndex size in SAML SP

The SessionIndex size of the SAML Service Provider (SP) is increased to 96 bytes. Previously, the default maximum size of SessionIndex was 63 bytes.

Note

Support introduced in NetScaler 13.0 Build 36.x

Custom authentication class reference support for SAML SP

You can configure custom authentication class reference attribute in the **SAML action** command. Using the custom authentication class reference attribute, you can customize the class names in the appropriate SAML tags. The custom authentication class reference attribute along with namespace is sent to the SAML IdP as part of SAML SP authentication request.

Previously, using SAML action command, you might configure only a set of predefined classes defined in authnCtxClassRef attribute.

Important

While configuring customAuthnCtxClassRef attribute, ensure the following:

- The names of the classes must include alphanumeric characters or a valid URL with proper XML tags.
- If you have to configure multiple custom classes, each class must be separated by commas

To configure the customAuthnCtxClassRef attributes by using the CLI

At the command prompt, type:

- add authentication samlAction <name> [-customAuthnCtxClassRef <string>]
- set authentication samlAction <name> [-customAuthnCtxClassRef <string>]

Example:

- `add authentication samlAction samlact1 -customAuthnCtxClassRef http://www.class1.com/LoA1,http://www.class2.com/LoA2`
- `set authentication samlAction samlact2 -customAuthnCtxClassRef http://www.class3.com/LoA1,http://www.class4.com/LoA2`

To configure the `customAuthnCtxClassRef` attributes by using the GUI

1. Navigate to **Security > AAA - Application Traffic > Policies > Authentication > Advanced Policies > Actions > SAML**.
2. On the SAML page, select **Servers** tab and Click **Add**.
3. On the **Create Authentication SAML Server** page, enter the name for SAML action.
4. Scroll down to configure the class types in **Custom Authentication Class Types** section.

Support for artifact binding in SAML IdP

NetScaler appliance configured as SAML Identity Provider (IdP) supports artifact binding. The artifact binding enhances the security of SAML IdP and restricts the malicious users from inspecting the assertion.

Assertion Consumer Service URL support for SAML IdP

A NetScaler appliance configured as a SAML Identity Provider (IdP) now supports Assertion Consumer Service (ACS) indexing to process SAML Service Provider (SP) request. The SAML IdP imports ACS indexing configuration from SP metadata or allows for entering ACS indexes information manually.

FIPS offload support

A NetScaler MPX FIPS appliance used as a SAML service provider now supports encrypted assertions. Also, a NetScaler MPX FIPS appliance functioning as a SAML service provider or a SAML identity provider can now be configured to use the SHA2 algorithms on FIPS hardware.

Note

In FIPS mode, only RSA-V1_5 algorithm is supported as key transport algorithm.

Configuring FIPS offload support using the command line interface:

1. Add SSL FIPS

add ssl fipsKey fips-key

2. Create a CSR and use it at CA server to generate a certificate. You can then copy the certificate in **/nsconfig/ssl**. Let's assume that the file is *fips3cert.cer*.

```
add ssl certKey fips-cert -cert fips3cert.cer -fipsKey fips-key  
<!--NeedCopy-->
```

3. Specify this certificate in the SAML action for SAML SP module

```
set samlAction <name> -samlSigningCertName fips-cert<!--NeedCopy  
-->
```

4. Use the certificate in samlIdpProfile for SAML IdP module

```
set samlidpprofile fipstest -samlIdpCertName fips-cert<!--NeedCopy  
-->
```

Common SAML terminologies

The following are some common SAML terminologies:

- **Assertion:** A SAML assertion is an XML document returned by the Identity Provider to the Service Provider after authentication of the user. The assertion has a specific structure, as defined by the SAML standard.
- **Types of Assertions:** The following are the types of assertion.
 - Authentication - the user is authenticated by a particular means at a particular time
 - Authorization - the user was granted or denied access to a specified resource
 - Attributes - the user is associated with the supplied attributes
- **Assertion Consumer Service (ACS):** The service provider's endpoint (URL) that is responsible for receiving and parsing a SAML assertion
- **Audience Restriction:** A value within the SAML assertion that specifies who (and only who) the assertion is intended for. The "audience" will be the service provider and is typically a URL but can technically be formatted as any string of data.

- **Identity Provider (IdP):** In terms of SAML, the Identity Provider is the entity that verifies the identity of the user, in response to a request by the Service Provider.

The Identity Provider is responsible for maintaining and authenticating the user's identity

- **Service Provider (SP):** In terms of SAML, the Service Provider (SP) offers a service to the user and allows the user to sign in by using SAML. When the user attempts to sign in, the SP sends a SAML authentication request to the Identity Provider (IdP)
- **SAML Binding:** SAML requestors and responders communicate by exchanging messages. The mechanism to transport these messages is called a SAML binding.
- **HTTP Artifact:** One of the binding options supported by the SAML protocol. HTTP Artifact is useful in scenarios where the SAML requester and responder are using an HTTP User-Agent and do not want to transmit the entire message, either for technical or security reasons. Instead, a SAML Artifact is sent, which is a unique ID for the full information. The IdP can then use the Artifact to retrieve the full information. The artifact issuer must maintain state while the artifact is pending. An Artifact Resolution Service (ARS) must be set up.

HTTP Artifact sends the artifact as a query parameter.

- **HTTP POST:** One of the binding options supported by the SAML protocol.

HTTP POST sends the message content as a POST parameter, in the payload.

- **HTTP Redirect:** One of the binding options supported by the SAML protocol.

When HTTP Redirect is used, the Service Provider redirects the user to the Identity Provider where the login happens, and the Identity Provider redirects the user back to the Service Provider. HTTP Redirect requires intervention by the User-Agent (the browser).

HTTP Redirect sends the message content in the URL. Because of this, it cannot be used for the SAML response, because the size of the response will typically exceed the URL length allowed by most browsers.

Note: The NetScaler appliance supports POST and Redirect bindings during logout.

- **Metadata:** Metadata is the configuration data in SP and IdP to know how to communicate to each other which will be in XML standards

OAuth authentication

May 2, 2023

The authentication, authorization, and auditing traffic management feature supports OAuth and OpenID Connect (OIDC) authentication. It authorizes and authenticates users to services that are hosted on applications such as Google, Facebook, and Twitter.

Points to note

- NetScaler Advanced Edition and higher is required for the solution to work.
- A NetScaler appliance must be on version 12.1 or later for the appliance to work as an OAuth IdP using OIDC.
- OAuth on a NetScaler appliance is qualified for all SAML IdPs that are compliant with “OpenID connect 2.0”.

A NetScaler appliance can be configured to behave as a Service Provider (SP) or an Identity Provider (IdP), using SAML and OIDC. Previously, a NetScaler appliance configured as IdP supported only SAML protocol. Starting from NetScaler 12.1 version, NetScaler supports the OIDC as well.

OIDC is an extension to OAuth authorization/delegation. A NetScaler appliance supports OAuth and OIDC protocols in the same class of other authentication mechanisms. OIDC is an add-on to OAuth as it provides a way for getting user information from the authorization server as opposed to OAuth that gets only a token which cannot be gleaned for user information.

The authentication mechanism facilitates the inline verification of OpenID tokens. A NetScaler appliance can be configured to obtain certificates and verify signatures on the token.

A major advantage of using the OAuth and OIDC mechanisms is that the user information is not sent to the hosted applications. Therefore, the risk of identity theft is considerably reduced.

The NetScaler appliance configured for authentication, authorization, and auditing now accepts incoming tokens that are signed using the HMAC HS256 algorithm. In addition, the public keys of the SAML Identity Provider (IdP) are read from a file, instead of learning from a URL endpoint.

In the NetScaler implementation, the application is accessed by the authentication, authorization, and auditing traffic management virtual server. So, to configure OAuth, you must configure an OAuth policy which must then be associated with an authentication, authorization, and auditing traffic management virtual server.

Configure the OpenID Connect protocol

A NetScaler appliance can now be configured as an identity provider by using OIDC protocol. OIDC protocol strengthens the identity providing capabilities of the NetScaler appliance. You can now access the enterprise wide hosted application with a single sign-on. The OIDC offers more security by not transferring user password but works with tokens with specific lifetime. OIDC also is designed to integrate with non-browser clients such as apps and services. Therefore, many implementations adopt OIDC widely.

Advantages of having the OpenID Connect support

- OIDC eliminates the overhead of maintaining multiple authentication passwords as the user has a single identity across the organization.
- OIDC provides a robust security for your password as the password is shared only with your identity provider and not with any application you access.
- OIDC has vast interoperability with various systems making it easier for the hosted applications to accept OpenID.
- OIDC is a simple protocol that enables native clients to easily integrate with servers.

To configure a NetScaler appliance as an IdP using the OpenID Connect protocol by using GUI

1. Navigate to **Configuration > Security > AAA-Application Traffic > Policies > Authentication > Advanced Policies > OAuth IdP**.
2. Click **Profile** and click **Add**.

On the **Create Authentication OAuth IDP Profile** screen, set values for the following parameters and click **Create**.

- **Name** –Name of the authentication profile.
- **Client ID** –Unique string that identifies SP.
- **Client Secret** –Unique secret that identifies SP.
- **Redirect URL** –Endpoint on SP to which code/token has to be posted.
- **Issuer Name** –String that identifies IdP.
- **Audience** –Target recipient for the token being sent by IdP. This might be checked by the recipient.
- **Skew Time** –The time for which the token remains valid.
- **Default Authentication Group** –A group added to the session for this profile to simplify policy evaluation and help in customizing policies.

3. Click **Policies** and click **Add**.

4. On the **Create Authentication OAuth IDP Policy** screen, set values for the following parameters and click **Create**.

- **Name** – The name of the authentication policy.
- **Action** –Name of profile created earlier.
- **Log Action** –Name of message log action to use when a request matches this policy. Not a mandatory field.
- **Undefined-Result Action** –Action to perform if the result of policy evaluation is undefined(UNDEF). Not a mandatory field.
- **Expression** –Advanced policy expression that the policy uses to respond to specific request. For example, true.
- **Comments** –Any comments about the policy.

Binding the OAuthIDP policy and LDAP policy to the authentication virtual server

1. Navigate to **Configuration > Security > AAA-Application Traffic > Policies >Authentication > Advanced Policies > Actions > LDAP**.

2. On **LDAP Actions** screen, click **Add**.

3. On **Create Authentication LDAP Server** screen, set the values for the following parameters, and click **Create**.

- **Name** – The name of the LDAP action
- **ServerName/ServerIP** – Provide FQDN or IP of the LDAP server
- Choose appropriate values **for Security Type, Port, Server Type, Time-Out**
- Make sure **Authentication** is checked
- **Base DN** – Base from which to start LDAP search. For example, dc=aaa,dc=local.
- **Administrator Bind DN:** User name of the bind to LDAP server. For example, admin@aaa.local.
- **Administrator Password/Confirm Password: Password to bind LDAP**
- Click **Test Connection** to test your settings.
- **Server Logon Name Attribute:** Choose “sAMAccountName”
- Other fields are not mandatory and hence can be configured as required.

4. Navigate to **Configuration > Security > AAA-Application Traffic > Policies >Authentication > Advanced Policies > Policy**.

5. On **Authentication Policies** screen, click **Add**.

6. On **Create Authentication Policy** page, set the values for the following parameters, and click **Create**.

- **Name** – Name of the LDAP Authentication Policy.

- **Action Type** – Choose **LDAP**.
- **Action** – Choose the LDAP action.
- **Expression** – Advanced policy expression that the policy uses to respond to specific request. For example, `true**`.

To configure the NetScaler appliance as an IdP using the OpenID Connect protocol by using CLI

At the command prompt, type the following commands:

- `add authentication OAuthIDPProfile <name> [-clientID <string>][-clientSecret][-redirectURL <URL>][-issuer <string>][-audience <string>][-skewTime <mins>] [-defaultAuthenticationGroup <string>]<!--NeedCopy-->`
- `add authentication OAuthIdPPolicy <name> -rule <expression> [-action <string> [-undefAction <string>] [-comment <string>] [-logAction <string>]<!--NeedCopy-->`
- `add authentication ldapAction aaa-ldap-act -serverIP 10.0.0.10 -ldapBase "dc=aaa,dc=local"<!--NeedCopy-->`
- `ldapBindDn <administrator@aaa.local> -ldapBindDnPassword <password> -ldapLoginName sAMAccountName<!--NeedCopy-->`
- `add authentication policy aaa-ldap-adv-pol -rule true -action aaa-ldap-act<!--NeedCopy-->`
- `bind authentication vserver auth_vs -policy <ldap_policy_name> -priority 100 -gotoPriorityExpression NEXT<!--NeedCopy-->`
- `bind authentication vserver auth_vs -policy <OAuthIDPPolicyName> -priority 5 -gotoPriorityExpression END<!--NeedCopy-->`
- `bind vpn global -certkey <><!--NeedCopy-->`

Note

You can bind more than one key. Public parts of certificates bound are sent in response to `jwt\uri query (https://gw/oauth/idp/certs)`.

NetScaler as an OAuth SP

January 9, 2024

The authentication, authorization, and auditing traffic management feature supports OAuth authentication for authenticating users to applications that are hosted on applications such as Google, Facebook, and Twitter.

Points to note

- NetScaler Advanced Edition and higher is required for the solution to work.
- OAuth on NetScaler is qualified for all SAML IdPs that are compliant with “OpenID connect 2.0”.

Important:

NetScaler might respond with a CSRF error when a content-heavy website sends multiple authentication requests on session expiry. As a workaround, it is recommended that when you configure the OAuth policy, ensure that the policy is configured for both the host name and the path which are the main entry points.

Configure OAuth by using the GUI

1. Configure the OAuth action and policy.

Navigate to **Security > AAA - Application Traffic > Policies > Authentication > Advanced Policies > Policy**, and create a policy with OAuth as the action type, and associate the required OAuth action with the policy.

2. Associate the OAuth policy with an authentication virtual server.

Navigate to **Security > AAA - Application Traffic > Virtual Servers**, and associate the OAuth policy with the authentication virtual server.

Note:

Attributes (1 to 16) can be extracted in the OAuth response. Currently these attributes are not evaluated. They are added for the future reference.

Configure OAuth by using the CLI

1. Define an OAuth action.

```
1 add authentication OAuthAction <name> [-OAuthType <OAuthType>] [-
  authorizationEndpoint <URL>] [-tokenEndpoint <URL>] [-
  idtokenDecryptEndpoint <URL>] [-clientID <string>][-
  clientSecret ] [-defaultAuthenticationGroup <string>] [-
  Attribute1 <string>] [-Attribute2 <string>] [-Attribute3 <
  string>] [-Attributes <string>] [-tenantID <string>] [-
  GraphEndpoint <string>] [-refreshInterval <positive_integer>]
```

```

[-CertEndpoint <string>][-audience <string>] [-userNameField <
string>] [-skewTime <mins>] [-issuer <string>] [-UserInfoURL <
URL>] [-CertFilePath <string>] [-grantType ( CODE | PASSWORD )]
[-authentication ( ENABLED | DISABLED )] [-introspectURL <URL
>][-allowedAlgorithms <allowedAlgorithms> ...] [-PKCE ( ENABLED
| DISABLED )] [-tokenEndpointAuthMethod <
tokenEndpointAuthMethod>] [-metadataUrl <URL>] [-resourceUri <
URL>]
2
3 <!--NeedCopy-->

```

2. Associate the action with an advanced authentication policy.

```

1 add authentication Policy <name> -rule <expression> -action <
string>
2 <!--NeedCopy-->

```

Example:

```

1 add authentication oauthAction a -authorizationEndpoint https://
example.com/ -tokenEndpoint https://example.com/ -clientId sadf
-clientsecret df
2 <!--NeedCopy-->

```

For more information on authentication OAuthAction parameters, see [authentication OAuthAction](#).

Note:

- When a certEndpoint is specified, NetScaler polls that endpoint at the configured frequency to learn the keys.

To configure a NetScaler to read the local file and parse keys from that file, a new configuration option is introduced as follows:

```

1 set authentication OAuthAction <name> -CertFilePath <path to local file
with jwks>
2 <!--NeedCopy-->

```

OAuth feature now supports the following capabilities in the token API from the Relying Party (RP) side and from the IdP side of NetScaler Gateway and NetScaler.

- PKCE (Proof Key for Code Exchange) support
- Support for client_assertion

Name-value attribute support for OAuth authentication

You can now configure OAuth authentication attributes with a unique name along with the values. The names are configured in the OAuth action parameter either as “Attributes” and the values are

obtained by querying for the names. The extracted attributes are stored in the authentication, authorization, and auditing session. Admins can query these attributes either using `http.req.user.attribute("attribute name")` or `http.req.user.attribute(1)`, based on the chosen method of specifying attribute names.

By specifying the name of the attribute, admins can easily search for the attribute value associated with that attribute name. Also, admins no longer have to remember the “attribute1 to attribute16” by its number alone.

Important

In an OAuth command, you can configure a maximum of 64 attributes separated by comma with a total size less than 1024 bytes.

Note

The session failure can be avoided if the total value size of “attribute 1 to attribute 16” and the values of attributes specified in “Attributes” are not more than 10 KB.

To configure the name-value attributes by using the CLI

At the command prompt, type:

```
1 add authentication OAuthAction <name> [-Attributes <string>]
2
3 set authentication OAuthAction <name> [-Attributes <string>]
4 <!--NeedCopy-->
```

Examples:

```
1 add authentication OAuthAction a1 - attributes "email,company" -
  attribute1 email
2
3 set authentication OAuthAction oAuthAct1 -attributes "mail,sn,
  userprincipalName"
4 <!--NeedCopy-->
```

NetScaler as an OAuth IdP

March 18, 2024

NetScaler can now be configured as an identity provider by using the OpenID-Connect (OIDC) protocol. OIDC protocol strengthens the identity providing capabilities of NetScaler. You can now access the enterprise wide-hosted application with a single sign-on as OIDC offers more security by not transferring the user password but using tokens with specific lifetime. OpenID is also designed to integrate

with non-browser clients such as apps and services. Therefore, the OIDC protocol is widely adopted by many implementations.

Note

NetScaler must be on version 12.1 or later to work as an OAuth IdP using the OIDC protocol.

Advantages of having NetScaler as an OAuth IdP

- Eliminates the overhead of maintaining multiple authentication passwords as the user has a single identity across an organization.
- Provides a robust security for your password as the password is shared only with your identity provider and not with any application you access.
- Provides vast interoperability with various systems, making it easier for the hosted applications to accept OpenID.

Note

NetScaler Advanced Edition and higher is required for the solution to work.

To configure NetScaler as an OAuth IdP using the GUI

1. Create an authentication OAuth IdP policy.
 - Navigate to **Security > AAA - Application Traffic > Policies > Authentication > Advanced Policies > OAuth IDP > Policies**.
 - Under **Policies**, click **Add**.
 - On the **Create Authentication OAuth IDP Policy** page, set values for the following parameters and click **Create**.
 - Name: The name of the authentication policy.
 - Action: Name of authentication OAuth IdP profile to apply to requests or connections that match this policy. See step 2 for detailed steps.
 - Log Action: Name of the message log action to use when a request matches this policy. See step 3 for detailed steps. This field is optional.
 - Undefined-Result Action: Action to perform if the result of the policy evaluation is undefined. An undefined event indicates an internal error condition. Available actions are DROP and RESET. This field is optional.
 - Expression: Advanced expression that the policy uses to respond to specific requests. For more information about policies and expressions, see [Policies and expressions](#).
2. Create an authentication OAuth IdP action.

- On the **Create Authentication OAuth IDP Policy** page, click **Add** in the **Action** field.
- On the **Create Authentication OAuth IDP Profile** page that appears, set values for the following parameters and click **Create**.
 - Name: Name for the new OAuth IdP single sign-on profile.
 - Client ID: Unique identity of the relying party requesting for authentication. Maximum allowed length is 127 characters.
 - Client Secret: Unique secret string to authorize the relying party at the authorization server. Maximum allowed length is 239 characters.
 - Redirect URL: The relying party URL endpoint to which the OAuth token needs to be sent. Maximum allowed length is 255 characters.
 - Issuer Name: The name to be used in requests sent from NetScaler to the IdP to uniquely identify NetScaler. Maximum allowed length is 127 characters.
 - Audience: Target recipient for the token being sent by the IdP. This is the entity name or the URL that represents the recipient. Maximum allowed length is 127 characters.
 - Skew Time: This option specifies the duration for which the token sent by the NetScaler IdP is valid. For example, if the skew time is set to 10 minutes, then the token would be valid from (current time minus 10) minutes to (current time plus 10) minutes; 20 minutes in total. Default duration is 5 minutes.
 - Default Authentication Group: Group added to the session's internal group list. This is useful for admins to determine the configuration for the relying party in an nFactor flow. It can be used in the expression `AAA.USER.IS_MEMBER_OF("group name")` for authentication policies to identify the relying party-related nFactor flow. Maximum allowed length is 63 characters.
 - Relying Party metadata URL: Endpoint where the NetScaler IdP can get details about the relying party being configured. Metadata response must include endpoints for `jwks_uri` for the relying party public keys. Maximum allowed length is 255 characters.
 - Refresh Interval: Intervals at which the relying party metadata is refreshed.
 - Signature Service: Select this option to encrypt the token when the NetScaler IdP sends one.
 - Attributes: Name-Value pairs of attributes to be inserted in the ID token. Configuration format is `name=value_expr@@@name2=value2_expr@@@`. The `@@@` format is used as a delimiter between the name-value pairs.
 - Send Password: Select this option to send the encrypted password in the ID token.

3. Create an audit message action.

- On the **Create Authentication OAuth IDP Policy** page, click **Add** in the **Log Action** field.
- On the **Create Audit Message Action** page, set values for the following parameters and click **Create**.

- Name: Name of the audit message action.
- Log Level: Audit log level, which specifies the severity level of the log message being generated.
- Expression: Default-syntax expression that defines the format and content of the log message.
- Log in newnslog: Sends the message to the new NSLOG server.

4. Create an authentication OAuth server.

- Navigate to **Security > AAA - Application Traffic > Policies > Authentication > Advanced Policies > Actions > OAUTH Actions** and click **Add**.
- On the **Create Authentication OAuth Server** page, set values for the required parameters and click **Create**.

5. Bind the OAuth IdP policy to the authentication OAuth server.

OAuth feature now supports the following capabilities in the token API from the Relying Party (RP) side and from the IdP side of NetScaler Gateway and NetScaler.

- PKCE (Proof Key for Code Exchange) support
- Support for client_assertion

To configure NetScaler as an IdP using the OIDC protocol by using the CLI

At the command prompt, type the following commands:

```

1 add authentication OAuthIDPPProfile <name> [-clientID <string>][ -
  clientSecret ][-redirectURL <URL>][-issuer <string>][-audience <
  string>][-skewTime <mins>] [-defaultAuthenticationGroup <string>]
2
3 add authentication OAuthIdPPolicy <name> -rule <expression> [-action <
  string>] [-undefAction <string>] [-comment <string>][-logAction <
  string>]
4
5 add authentication ldapAction aaa-ldap-act -serverIP 10.0.0.10 -
  ldapBase "dc=aaa,dc=local"
6
7 ldapBindDn <administrator@aaa.local> -ldapBindDnPassword <password> -
  ldapLoginName sAMAccountName
8
9 add authentication policy aaa-ldap-adv-pol -rule true -action aaa-ldap-
  act
10
11 bind authentication vserver auth_vs -policy <ldap_policy_name> -
  priority 100 -gotoPriorityExpression NEXT
12
13 bind authentication vserver auth_vs -policy <OAuthIDPPolicyName> -
  priority 5 -gotoPriorityExpression END

```

```
14
15 bind vpn global -certkey <>
16 <!--NeedCopy-->
```

Notes:

- You can bind more than one key. Public parts of certificates bound are sent in response to `jwtks__uri query (https://gw/oauth/idp/certs)`.
- The OAuth IdP introspective endpoint supports the property `active: true`.
- If the authentication virtual server is configured as an OAuth IdP, the well-known OAuth IdP discovery endpoint URL must be `https://<netscaler-oauth-idp-fqdn>/oauth/idp/.well-known/openid-configuration`.
- NetScaler configured as an OAuth IdP does not display the `client_secret_post`, `client_secret_jwt`, `private_key_jwt`, and `client_secret_basic` token endpoint authentication methods in the `.well-known-Endpoint` response sent to the OAuth SP.

Encrypted tokens support on OIDC protocol

NetScaler with the OIDC mechanism now supports the sending of encrypted tokens along with signed tokens. NetScaler uses JSON web encryption specifications to compute the encrypted tokens and supports only compact serialization of encrypted tokens. To encrypt an OpenID token, NetScaler requires the public key of the relying party (RP). The public key is obtained dynamically by polling the relying party's well-known configuration endpoint.

A new "relyingPartyMetadataURL" option is introduced in the "authentication OAuthIDPProfile." profile.

To configure the relying party's endpoint by using CLI

At the command prompt, type:

```
1 set authentication OAuthIDPProfile <name> [-relyingPartyMetadataURL <
  URL>] [-refreshInterval <mins>] [-status < >]
2 <!--NeedCopy-->
```

- **relyingPartyMetadataURL** - Endpoint at which NetScaler IdP can get details about the relying party being configured. Metadata response must include endpoints for `jwtks_uri` for RP public keys.
- **refreshInterval** - Defines the rate at which this endpoint must be polled to update the certificates in minutes.

- **status** - Reflects the status of the polling operation. The status is complete once NetScaler successfully obtains the public keys.

Example,

```
1 set authentication OAuthIDPProfile sample_profile -  
   relyingPartyMetadataURL https://rp.customer.com/metadata -  
   refreshInterval 50 -status < >  
2 <!--NeedCopy-->
```

After the endpoint is configured, NetScaler first polls the relying party's well-known endpoint to read the configuration. Currently, NetScaler processes only the 'jwks_uri' endpoint.

- If the 'jwks_uri' is absent in the response, the status of the profile is not complete.
- If the 'jwks_uri' is present in the response, NetScaler polls that endpoint also to read the public keys of the relying party.

Note:

Only RSAES-OAEP and AES256 GCM encryption type algorithms are supported for token encryption.

Custom attributes support on OpenID Connect

The [OpenID](#) relying parties might require more than a user name or a user principal name (UPN) in the token to create the user profile or make authorization decisions. Most commonly, the user groups are required to apply authorization policies for the user. Sometimes, more details, such as the first or the last name is required for provisioning a user account.

NetScaler configured as an IdP can be used to send extra attributes in the `OIDCid_token` using expressions. Advanced policy expressions are used to send the custom attributes as per the requirement. The NetScaler OAuth IdP evaluates the expressions corresponding to the attributes and then computes the final token.

NetScaler automatically applies `JSONify` in the output data. For example, numbers (such as SSN) or boolean values (true or false) are not surrounded by quotes. Multi-valued attributes, such as groups are placed within an array marker (“[” and “]”). The complex type attributes are not automatically computed, and you can configure the PI expression of those complex values as per your requirement.

To configure the relying party's endpoint by using CLI

At the command prompt, type:

```
1 set oauthidpprofile <name> -attributes <AAA-custom-attribute-pattern>  
2 <!--NeedCopy-->
```

The `<AAA-custom-attribute-pattern>` can be described as:

```
Attribute1=PI-Expression@@@attribute2=PI-Expression@@@
```

‘attribute1’, ‘attribute2’ are literal strings that represent the name of the attribute to be inserted in the ID token.

Note:

In the following example, the maximum value of the `"q{ myname=http.req.user.name@@@ssn="123456789"@@@jit="false"@@@groups=http.req.user.groups } "` expression can be 2000 bytes. It contains 4 custom attributes (myname, ssn, jit, groups). The maximum value of each custom attribute is 10000 bytes. For example, the groups attribute (evaluated based on the PI expression `http.req.user.groups`) can contain upto 10000 bytes of data in the `OIDCid_token`.

Example:

```
set oauthidpprofile sample_1 -attributes "q{ myname=http.req.user.name@@@ssn="123456789"@@@jit="false"@@@groups=http.req.user.groups } "
```

- Preceding PI expression is an advanced policy expression that represents the value to be used against the attribute. The PI expression can be used to send a string literal, such as “hardcoded string”. The string literal is surrounded by double quotes around single quotes or double quotes around a start pattern (the start pattern is `"q()"`). If the value of the attribute is not a string literal, the expression is evaluated at runtime and its value is sent in token. If the value at runtime is empty, the corresponding attribute is not added to the ID token.
- As defined in the example, “false” is a literal string for the attribute “jit”. Also, “ssn” has hardcoded value for reference. Groups and “myname” are PI expressions that yield strings.

Support for active-active GSLB deployments on NetScaler Gateway

NetScaler Gateway configured as an Identity Provider (IdP) using the OIDC protocol can support active-active GSLB deployments. The active-active GSLB deployment on NetScaler Gateway IdP provides the capability to load balance an incoming user login request across multiple geographic locations.

Important

We recommend you to bind CA certificates to the SSL service and enable certificate validation on the SSL service for enhanced security.

For more information on configuring a GSLB setup, see [Example of a GSLB setup and configuration](#).

API authentication with the NetScaler appliance

August 29, 2023

There is a paradigm shift in the way modern applications interact with their clients. Traditionally, browser clients were used to access services. Applications set session cookies to track user context. Modern and distributed applications make it hard to maintain user sessions across microservices. Due to this, most of the application accesses have become API based.

Clients that communicate with these distributed services have also evolved. Most clients obtain tokens from a trusted entity called Authorization Server to prove user identity and access. These clients then present the token to the application with each access request. Therefore, traditional proxy devices like NetScaler need to evolve to support these clients. A NetScaler appliance provides a way for administrators to handle such traffic. NetScaler can be deployed as an API Gateway to front-end all the traffic that destined to the published services. An API Gateway can be deployed for traditional (Hybrid Multi Cloud or HMC) or Cloud native environments. The API Gateway terminates all the inbound traffic to offer several services such as authentication, authorization, rate limiting, routing, caching, SSL offload, application firewall, and so on. Therefore, it becomes a critical component in the infrastructure.

Token types

Tokens exchanged during the API access mostly conform to the OAuth/OpenID Connect (OIDC) protocol. Access tokens that are used only for ‘delegated access’ conform to the OAuth protocol, whereas ID Tokens that comply with OIDC carry user information as well.

Access tokens are normally an opaque or random blob of data. However, they can sometimes be signed tokens conforming to JWT (JSON Web Token) standards. ID Tokens are always signed JWTs.

API Access with OAuth

OAuth authentication type on a NetScaler appliance can be used to handle both OAuth and OIDC protocols. OIDC is an extension to the OAuth protocol.

OAuthAction on a NetScaler appliance can be used to handle interactive clients such as browsers and native clients such as client apps. Interactive clients are redirected to the identity provider for login using the OIDC protocol. Native clients can obtain tokens out of band and can present those tokens at a NetScaler appliance for access.

Note:

The access token obtained from endpoints can be cached for subsequent requests, thereby en-

hancing the API performance.

To configure token caching support by using the command line interface, type the following command at the command prompt:

```
1 set aaaparameter -APITokenCache <ENABLED>
2 <!--NeedCopy-->
```

The following sections describe the API access method performed by native clients.

Virtual server for API Access

To deploy a NetScaler appliance for an API access, a Traffic Management (TM) virtual server is deployed with 401 Authentication. It is associated with an authentication (authentication, authorization, and auditing) virtual server to hold the authentication and session policies. Following configuration snippet creates one such virtual server.

```
1 Add lb vsrver lb-api-access SSL <IP> 443 -authn401 On -AuthnVsName
   auth-api-access
2
3 Bind ssl vsrver lb-api-access -certkeyName <ssl-cert-entity>
4
5 Add authentication vsrver auth-api-access SSL
6 <!--NeedCopy-->
```

Note:

You would need to bind a service to the traffic management virtual server, and an authentication policy (with OAuthAction described as follows) to the authentication virtual server to complete the configuration.

After creating the virtual server, one needs to add an OAuthAction along with corresponding policy. There are several other options within an OAuth action depending on the token type, and other security mechanisms.

OAuth Configuration for ID Tokens

ID Tokens are always signed JWTs. That is, they carry header, payload and signature. Since these are self-contained tokens, a NetScaler appliance can validate these tokens locally. To validate these tokens, the appliance would need to know the public key of the corresponding private key used to sign these tokens.

Following is an example of OAuthAction with certain mandatory arguments along with “certEndpoint”

```
1  Add authentication OAuthAction oauth-api-access -clientid <your-
    client-id> -clientsecret <your-client-secret> -
    authorizationEndpoint <URL to which users would be redirected for
    login> -tokenEndpoint <endpoint at which tokens could be obtained>
    -certEndpoint <URL at which public keys of IdP are published>
2  <!--NeedCopy-->
```

Where,

- **Client ID** –Unique string that identifies SP. Authorization server infers client configuration using this ID. Maximum Length: 127.
- **Client Secret** –Secret string established by user and authorization server. Maximum Length: 239.
- **authorizationEndpoint** - URL at which users would normally log in (when using interactive clients).
- **tokenEndpoint** - URL on Authorization Server at which tokens/code are obtained/exchanged
- **certEndpoint** - URL at which Authorization Server publishes public keys used to sign the tokens. Authorization Server can publish more than one key and choose one of them to sign tokens.

Note:

Client ID/Client Secret/authorizationEndpoint/TokenEndpoint are optional parameters for API Access. However, it is a good practice to provide values for these parameters as the action entity can be reused for different purposes.

In the preceding configuration ‘certEndpointpoint’is essential for ID Token validation. This endpoint contains public keys of the certificate used to sign the tokens. These public keys must correspond to JWKs (JSON Web Keys) specification.

Once the certEndpoint is configured at the NetScaler appliance, it polls the endpoint periodically (with the default interval of 1 day that can be customizable in the configuration) to keep the public keys up to date. After the public keys are available, ADC can perform local validation of the incoming ID Tokens.

OAuth Configuration for opaque access tokens

Opaque tokens cannot be verified locally on the NetScaler appliance. These need to be validated on the Authorization server. A NetScaler appliance uses ‘introspection protocol’ mentioned in the OAuth specifications to verify these tokens. A new option, introspectURL, is provided in the OAuth configuration for verifying opaque tokens.

```
1 set oauthAction oauth-api-access -introspectURL <URL of the
  Authorization Server for introspection>
2 <!--NeedCopy-->
```

The format of the introspection API conforms to the specification at <https://tools.ietf.org/html/rfc7662#section-2.1> as follows:

```
1 POST /introspect HTTP/1.1
2 Host: server.example.com
3 Accept: application/json
4 Content-Type: application/x-www-form-urlencoded
5 Authorization: Basic czZCaGRSa3F0MzpnWDFmQmF0M2JW
6 token=mF_9.B5f-4.1JqM&token_type_hint=access_token
7 <!--NeedCopy-->
```

Binding policy to Authentication virtual server

Once OAuthAction is created, a corresponding policy needs to be created for invoking it.

```
1 add authentication policy oauth-api-access -rule <> -action <oauth-
  api-access>
2
3 bind authentication vserver auth-api-access -policy oauth-api-access
  -pri 100
4 <!--NeedCopy-->
```

Additional security settings on a NetScaler appliance

Token validation includes token lifetime checks. Tokens outside of acceptable time are rejected. Following are the additional settings for extra security. Some of these are recommended to be configured always.

Audience: OAuth Action can be configured with an intended recipient of the token. All tokens are matched against this configured URL. A NetScaler appliance has an additional capability where the audience field actually points to a pattern set on the appliance. Using this pattern set, an administrator can configure more than one URL for the audience.

```
1 add policy patset oauth_audiences
2
3 bind patset oauth_audiences https://app1.company.com
4
5 bind patset oauth_audiences https://app2.company.com
6
7 bind patset oauth_audiences https://app1.company.com/path1
8
9 set oAuthAction oauth-api-access -audience oauth_audiences
10 <!--NeedCopy-->
```

In the preceding example, more than one audience is specified in a pattern set. Therefore, an incoming token is allowed only if it contains any of the configured URLs in the pattern set.

Issuer: Identity of the server whose tokens are to be accepted. Maximum Length: 127. It is a good practice to configure the issuer of the tokens in OAuth action. This ensures that tokens issued by the wrong authorization server are not allowed.

SkewTime: Specifies the allowed clock skew in number of minutes that a NetScaler appliance allows on an incoming token. For example, if skewTime is 10, then the token would be valid from (current time - 10) min to (current time + 10) min, that is 20 min in all. Default value: 5

AllowedAlgorithms: This option allows administrator to restrict certain algorithms in the incoming tokens. By default, all the supported methods are allowed. However, these can be controlled using this option.

The following configuration ensures only tokens that use RS256 and RS512 are allowed:

```
1 set oAuthAction oauth-api-access -allowedAlgorithms RS256 RS512
2 <!--NeedCopy-->
```

After the preceding configuration is performed, only tokens that use RS256 and RS512 are allowed.

Bypassing certain traffic from authentication

In many instances, there are some discovery APIs that are publicly accessible to the clients. These APIs typically reveal configuration and capabilities of the service itself. AN administrator can configure the NetScaler appliance to bypass authentication from these metadata URLs using ‘No Authentication’ policy described as follows:

```
1 add authentication policy auth-bypass-policy -rule <> -action
   NO_AUTHN
2
3 bind authentication vserver auth-api-access -policy auth-bypass-
   policy -pri 110
4 <!--NeedCopy-->
```

NO_AUTHN is an implicit action that results in authentication to be completed when the rule matches. There are other uses of NO_AUTHN action beyond the scope of API access.

LDAP authentication

October 13, 2023

As with other types of authentication policies, a Lightweight Directory Access Protocol (LDAP) authentication policy comprises an expression and an action. After creating an authentication policy, you

bind it to an authentication virtual server and assign a priority to it. When binding it, you also designate it as either a primary or a secondary policy. In addition to standard authentication functions, LDAP can search other active directory (AD) servers for user accounts for users that do not exist locally. This function is called referral support or referral chasing.

Normally you configure the NetScaler to use the IP address of the authentication server during authentication. With LDAP authentication servers, you can also configure the ADC to use the FQDN of the LDAP server instead of its IP address to authenticate users. Using an FQDN can simplify an otherwise much more complex authentication, authorization, and auditing configuration in environments where the authentication server might be at any of several IP addresses, but always uses a single FQDN. To configure authentication by using a server's FQDN instead of its IP address, you follow the normal configuration process except when creating the authentication action. When creating the action, you use the **serverName** parameter instead of the **serverIP** parameter, and substitute the server's FQDN for its IP address.

Before you decide whether to configure the ADC to use the IP or the FQDN of your LDAP server to authenticate users, consider that configuring authentication, authorization, and auditing to authenticate to an FQDN instead of an IP address adds an extra step to the authentication process. Each time the ADC authenticates a user, it must resolve the FQDN. If a great many users attempt to authenticate simultaneously, the resulting DNS lookups might slow the authentication process.

LDAP referral support is disabled by default and cannot be enabled globally. It must be explicitly enabled for each LDAP action. Make sure that the AD server accepts the same `binddn credentials` that are used with the referring (GC) server. To enable referral support, you configure an LDAP action to follow referrals, and specify the maximum number of referrals to follow.

If referral support is enabled, and the NetScaler receives an LDAP_REFERRAL response to a request, authentication, authorization, and auditing follows the referral to the active directory (AD) server contained in the referral and performs the update on that server. First, authentication, authorization, and auditing looks up the referral server in DNS, and connects to that server. If the referral policy requires SSL/TLS, it connects via SSL/TLS. It then binds to the new server with the `binddn credentials` that it used with the previous server, and performs the operation which generated the referral. This feature is transparent to the user.

The port numbers for LDAP connections are:

- 389 for unsecured LDAP connections (for plain text LDAP)
- 636 for secure LDAP connections (for SSL LDAP)
- 3268 for Microsoft unsecure LDAP connections (for plain text Global Catalog Server)
- 3269 for Microsoft secure LDAP connections (for SSL Global Catalog Server)

The following table contains examples of user attribute fields for LDAP servers:

LDAP server	User attribute	Case sensitive
Microsoft Active Directory Server	sAMAccountName	No
Novell eDirectory	ou	Yes
IBM Directory Server	uid	Yes
Lotus Domino	CN	Yes
Sun ONE directory (formerly iPlanet)	uid or cn	Yes

This table contains examples of the base DN:

LDAP server	Base DN
Microsoft Active Directory Server	DC=citrix,DC=local
Novell eDirectory	ou=users,ou=dev
IBM Directory Server	cn=users
Lotus Domino	OU=City,O=Citrix,C=US
Sun ONE directory (formerly iPlanet)	ou=People,dc=citrix,dc=com

The following table contains examples of bind DN:

LDAP server	Bind DN
Microsoft Active Directory Server	CN=Administrator, CN=Users, DC=citrix, DC=local
Novell eDirectory	cn=admin, o=citrix
IBM Directory Server	LDAP_dn
Lotus Domino	CN=Notes Administrator, O=Citrix, C=US
Sun ONE directory (formerly iPlanet)	uid=admin,ou=Administrators, ou=TopologyManagement,o=NetscapeRoot

For more information about setting up authentication policies in general, see [Authentication Policies](#). For more information about NetScaler expressions, which are used in the policy rule, see [Policies and Expressions](#).

To create an LDAP authentication server by using the CLI

At the command prompt, type the following commands:

```
1 add authentication ldapAction <name> {
2   -serverIP }
3   <ip\_addr|ipv6\_addr|> | {
4   -serverName <string> }
5   }
```

Example

```
1 add authentication ldapAction ldap_server -serverip 1.1.1.1 -serverName
   ldap_test
```

To create an LDAP authentication server by using the GUI

1. Navigate to **System > Authentication > Basic Policies > LDAP > Servers > Add**.
2. On the **Create Authentication LDAP Server** page, configure the parameters for the LDAP server.
3. Click **Create**.

To enable an authentication policy by using the CLI

```
1 add authentication ldappolicy <name> <rule> [<reqAction>]
```

Example:

```
1 add authentication ldappolicy ldap-service-policy ns_true ldap_Server
```

To create an LDAP authentication policy by using the GUI

1. Navigate to **System > Authentication > Basic Policies > LDAP > Policies > Add**.
2. On the **Create Authentication LDAP Policy** page, configure the parameters for LDAP policy.
3. Click **Create**.

Note

You can configure LDAP servers/policies through the **Security** tab. Navigate to **Security > AAA - Application Traffic > Policies > Authentication > Basic Policies > LDAP > Servers / Policies**.

To enable LDAP referral support by using the CLI

At the command prompt, type the following commands:

```
1 set authentication ldapAction <name> -followReferrals ON
2 set authentication ldapAction <name> -maxLDAPReferrals <integer>
3 <!--NeedCopy-->
```

Example

```
1 set authentication ldapAction ldapAction-1 -followReferrals ON
2 set authentication ldapAction ldapAction-1 -maxLDAPReferrals 2
3 <!--NeedCopy-->
```

Key-based authentication support for the LDAP users

With key-based authentication, you can now fetch the list of public keys that are stored on the user object in the LDAP server through SSH. The NetScaler appliance during the role-based authentication (RBA) process must extract public SSH keys from the LDAP server. The retrieved public key, which is compatible with SSH, must allow you to log in through the RBA method.

A new attribute “sshPublicKey” is introduced in the “add authentication ldapAction” and “set authentication ldapAction” commands. By using this attribute, you can obtain the following benefits:

- Can store the retrieved public key, and the LDAP action uses this attribute to retrieve SSH key information from the LDAP server.
- Can extract attribute names of up to 24 KB.

Note

The external authentication server, such as LDAP is used only to retrieve SSH key information. It is not used for the authentication purpose.

Following is an example of the flow of events through SSH:

- SSH daemon sends an AAA_AUTHENTICATE request with password field empty to authentication, authorization, and auditing daemon port.
- If LDAP is configured to store the SSH public key, authentication, authorization, and auditing responds with the “sshPublicKey” attribute along with other attributes.
- SSH daemon verifies these keys with the client keys.
- SSH daemon passes the user name in the request payload, and authentication, authorization, and auditing returns the keys specific to this user along with generic keys.

To configure the sshPublicKey attribute, at the command prompt type the following commands:

- With add operation, you can add the “sshPublicKey” attribute while configuring ldapAction command.

```

1  add authentication ldapAction <name> {
2  -serverIP <ip_addr|ipv6_addr|*> | {
3  -serverName <string> }
4  }
5  [-serverPort <port>] ... [-Attribute1 <string>] ... [-Attribute16
   <string>][-sshPublicKey <string>][-authentication off]
6  <!--NeedCopy-->

```

- With set operation, you can configure “sshPublicKey” attribute to an already added ldapAction command.

```

1  set authentication ldapAction <name> [-sshPublicKey <string>][-
   authentication off]
2  <!--NeedCopy-->

```

Name-value attribute support for LDAP authentication

You can now configure the attributes of LDAP authentication with a unique name along with values. The names are configured in the LDAP action parameter and the values are obtained by querying for the name. By using this feature, a NetScaler appliance administrator can now achieve the following benefits:

- Minimizes the effort for administrators by remembering the attribute by name (not just by value)
- Enhances the search to query the attribute value associated with a name
- Provides an option to extract multiple attributes

To configure this feature at the NetScaler appliance command prompt, type:

```

1  add authentication ldapAction <name> [-Attributes <string>]
2  <!--NeedCopy-->

```

Example

```

1  add authentication ldapAction ldapAct1 -attributes "company, mail"
2  <!--NeedCopy-->

```

Support for validating end-to-end LDAP authentication

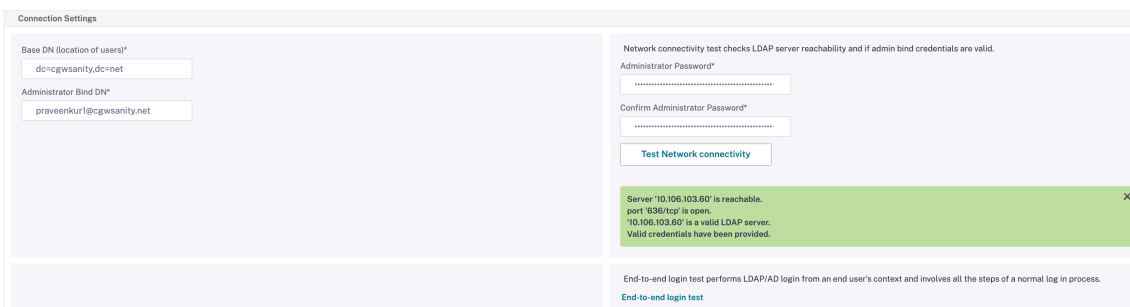

The NetScaler appliance can now validate end-to-end LDAP authentication through the GUI. To validate this feature, a new “test” button is introduced in the GUI. A NetScaler appliance administrator can use this feature to achieve the following benefits:

- Consolidates the complete flow (packet engine –NetScaler AAA daemon –external server) to provide better analysis
- Reduces time on validating and troubleshooting issues related to individual scenarios

You have two options to configure and view the test results of LDAP end-to-end authentication by using the GUI.

From system option

1. Navigate to **System > Authentication > Basic Policies > LDAP**, click **Servers** tab.
2. Select the available **LDAP action** from the list.
3. On the **Configure Authentication LDAP Server** page, scroll down to the **Connections Settings** section.
4. Click **Test Network connectivity** to check the LDAP server connection. You can view a pop-up message of successful connection to the LDAP server with TCP port details and authenticity of valid credentials.

5. To view the end-to-end LDAP authentication, click **End-to-end login test** link.
6. In the **End-to-end login test** page, click **Test**.
 - On the authentication page, enter the valid credentials to log in. The success screen is displayed.

- If the authentication fails, the error screen is displayed.

From the Authentication option

1. Navigate to **Authentication > Dashboard**, select the available LDAP action from the list.
2. On the **Configure Authentication LDAP Server** page, you have two options under **Connections Settings** section.
3. To check the LDAP server connection, click **Test LDAP Reachability** tab. You can view a pop-up message of successful connection to the LDAP server with TCP port details and authenticity of valid credentials.
4. To view the end-to-end LDAP authentication status, click **Test End User Connection** link.
5. On the **Test End User Connection** page, click **Test**.
 - On the authentication page, enter the valid credentials to log in. The success screen is displayed.

- If the authentication fails, the error screen is displayed.

14-day password expiry notification for LDAP authentication

The NetScaler appliance now supports 14-day password expiry notification for LDAP based authentication. By using this feature, administrators can notify the end users about the password expiry threshold time in days. The 14-day password expiry notification is a precursor to self-service password reset (SSPR).

Note

The maximum value or threshold time in days for password expiry notification is 255 days.

Advantages of password expiry notification

- Permit users to reset their passwords on their own and provide administrators a flexible way to notify the end user about their password expiry in days.
- Eliminates end user dependence to track their password expiration days.
- Sends notifications to the VPN portal page to the users (based on the number of days) to change their password before expiry.

Note

This feature is applicable only for LDAP based authentication schemes, not for RADIUS or TACACS.

Understanding the 14-day password notification

The NetScaler appliance fetches two attributes (`Max-Pwd-Age` and `Pwd-Last-Set`) from the LDAP authentication server.

- **Max-Pwd-Age.** This attribute denotes the maximum amount of time, in 100-nanosecond intervals, until the password is valid. The value is stored as a large integer that represents the number of 100-nanosecond intervals from the time the password was set before the password expires.
- **Pwd-Last-Set.** This attribute determines the date and time at which the password for an account was last changed.

By fetching the two attributes from the LDAP authentication server, the NetScaler appliance determines the time left for the password to expire for a particular user. This information is collected when any user credentials are validated on the authentication server and a notification is sent back to the user.

A new parameter “`pwdExpiryNotification`” is introduced in the `set aaa parameter` command. By using this parameter, an administrator can keep track the number of days left for password expiry. The NetScaler appliance can now start notifying the end user about their password expiry.

Note

Currently, this feature works only for authentication servers having Microsoft AD servers with LDAP implementation. Support for OpenLDAP based servers is targeted later.

Following is an example of the flow of events for setting a 14-day password expiry notification:

1. An administrator, by using the NetScaler appliance, sets a time (14-days) for password expiration.
2. The user sends an HTTP or HTTPS request to access a resource on the back-end server.

3. Before providing access, the NetScaler appliance validates the user credentials with what is configured on the LDAP authentication server.
4. Along with this query to the authentication server, the NetScaler appliance carries the request to fetch the details of the two attributes (`Max-Pwd-Age` and `Pwd-Last-Set`).
5. Based on the time left for the password to expire, an expiry notification is displayed.
6. The user then takes appropriate action to update the password.

To configure 14-day expiry notification by using the command line interface

Note

14-day expiry notification can be configured for clientless VPN and Full VPN use cases and not for ICA Proxy.

At the command prompt, type the following commands:

```
1 set aaa parameter -pwdExpiryNotificationDays <positive_integer>
2
3 show aaa parameter
4 <!--NeedCopy-->
```

Example

```
1 > set aaa parameter -pwdExpiryNotificationDays 14
2 Done
3 > show aaa parameter Configured AAA
  parameters EnableStaticPageCaching: YES
  EnableEnhancedAuthFeedback: NO DefaultAuthType: LOCAL
  MaxAAAUsers: Unlimited
                                     AAAD nat ip: None
  EnableSessionStickiness : NO  aaaSessionLogLevel :
  INFORMATIONAL                AAAD Log Level : INFORMATIONAL
  Dynamic address: OFF
4 GUI mode: ON
5 Max SAML Deflate Size: 1024 Password Expiry
  Notification Days: 14
6 <!--NeedCopy-->
```

To configure 14-day expiry notification by using GUI

1. Navigate to **Security > AAA - Application Traffic > Authentication Settings**.
2. Click **Change authentication AAA settings**.
3. On the **Configure AAA Parameter** page, specify the days in the **Password Expiry Notification(days)** field.

Configure LDAP authentication on the NetScaler appliance for management purposes

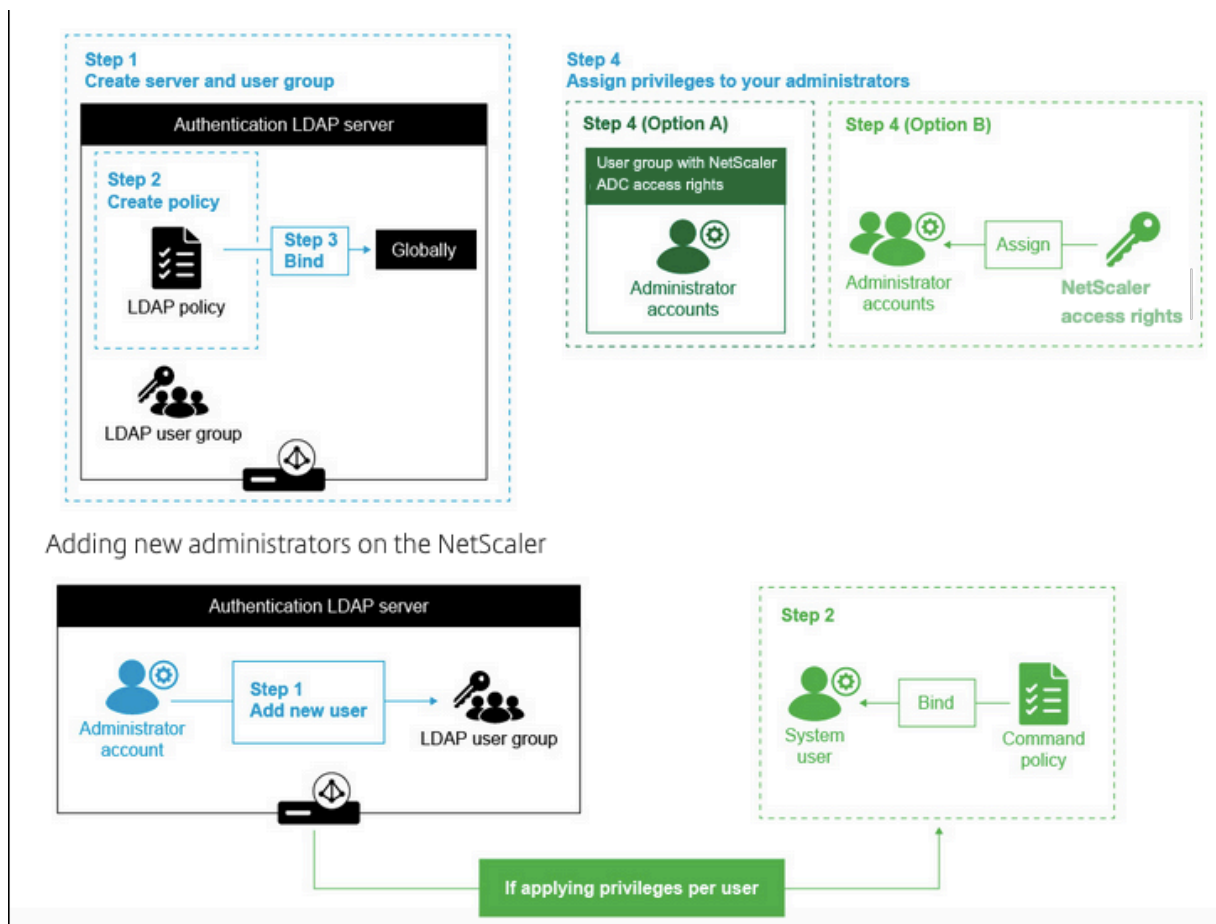

October 13, 2023

You can configure user logon to the NetScaler appliance using the active directory credentials (user name and password) for management purposes (superuser, read-only, network privileges and all others).

Prerequisites

- Windows Active Directory domain controller servers
- A dedicated domain group for NetScaler administrators
- NetScaler Gateway 10.1 and later versions

The following figures illustrate the LDAP authentication on the NetScaler appliance.

High level configuration steps

1. Create an LDAP server
2. Create an LDAP policy
3. Bind the LDAP policy
4. Assign privileges to your administrators by one of the following ways

- Apply privileges on group
- Apply privileges individually for each user

Create an authentication LDAP server

1. Navigate to **System > Authentication > LDAP**.
2. Click the **Server** tab and then click **Add**.
3. Complete the configuration, and then click **Create**.

Note:

In this example, the access is limited to the NetScaler appliance by filtering the authentication on the user group membership by setting Search Filter. The value used for this example is - &(mem-

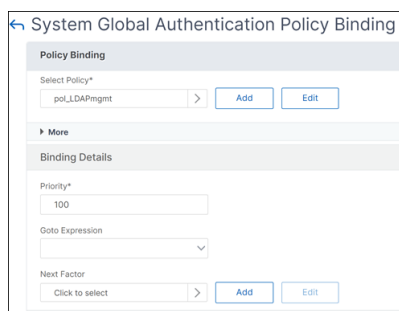

berof=CN=NSG_Admin,OU=AdminGroups,DC=Citrix,DC=lab)

Create an LDAP Policy

1. Navigate to **System > Authentication > Advanced Policies > Policy**.
2. Click **Add**.
3. Enter a name for the policy, select the server that you created in the previous steps.
4. In the Expression text field, enter the appropriate expression, and then click **Create**.

Bind the LDAP policy globally

1. Navigate to **System > Authentication > Advanced Policies > Policy**.
2. In the Authentication Policies page, click **Global Bindings**.
3. Select the policy you created (in this example, pol_LDAPmgmt).
4. Choose a priority accordingly (the lower the number, the higher the priority)
5. Click **Bind**, and then **Done**. A green checkmark appears in the **Globally Bound** column.

Assign privileges to your administrators

You can choose one of the following two options.

- **Apply privileges on a group:** Add a group in the NetScaler appliance and assign the same access rights for each user who is a member of this group.
- **Apply privileges individually for each user:** Create each user administrator account and assign rights for each of them.

Apply privileges on a group

When you apply privileges on a group, users who are member of the Active Directory group configured in the Search filter (in this example, NSG_Admin) can connect to the NetScaler Management interface and have superuser command policy.

1. Navigate to **System > User Administration > Groups**.
2. Enter the details as per the requirement, and then click **Create**.

You have defined the active directory group that the users belong to and also the command policy level that must be associated to the account when logging in. You can add new administrator users to the LDAP group you configured on the search filter.

Note:

The group name must match the active directory record.

Apply privileges individually for each user

In this scenario, users who are member of your Active Directory group configured in the search filter (in this example, NSG_Admin) can connect to the NetScaler management interface but do not have any privileges until you create the specific user on the NetScaler appliance and bind the command policy to it.

1. Navigate to **System > User Administration > Users**.
2. Click **Add**.
3. Enter the details as per the requirement.

Note: Make sure to select **Enable External Authentication**.

1. Click **Continue**.

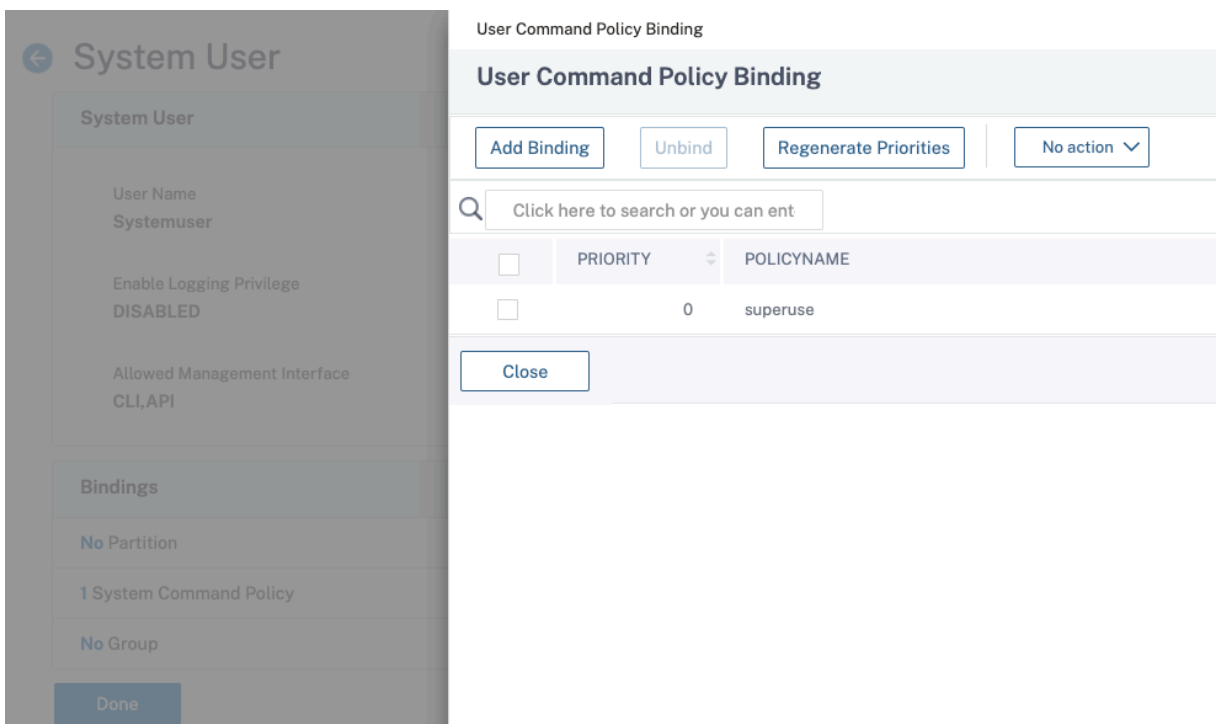

You have defined the active directory user and the command policy level that must be associated to the account when logging in.

Note:

- The user name must match the existing user’s active directory record.
- When you add a user to the NetScaler for external authentication, you must provide a password, if the external authentication is not available. For the external authentication to work properly, the internal password must not be the same as the user account LDAP password.

Add command policy to the user

1. Navigate to **System > User Administration > Users**.
2. Select the user that you created, and then click **Edit**.
3. In Bindings, click **System Command Policy**.
4. Select the correct command policy to apply to your user.
5. Click **Bind**, then click **Close**.

To add more administrators;

- Add the administrator users to the LDAP group you configured on the search filter.
- Create the system user in NetScaler and assign the correct command policy.

To configure LDAP authentication on the NetScaler appliance for management purposes by using the CLI

Use the following commands as a reference to configure log on for a group with superuser privileges on the NetScaler appliance CLI.

1. Create an LDAP server

```
1 add authentication ldapAction LDAP_mgmt -serverIP myAD.citrix.lab
  -serverPort 636 -ldapBase "DC=citrix,DC=lab" -ldapBindDn
  readonly@citrix.lab -ldapBindDnPassword -ldapLoginName
  sAMAccountName -searchFilter "&(memberof=CN=NSG_Admin,OU=
  AdminGroups,DC=citrix,DC=lab)" -groupAttrName memberOf
2 <!--NeedCopy-->
```

2. Create and LDAP policy

```
1 add authentication ldapPolicy pol_LDAPmgmt ns_true LDAP_mgmt
2 <!--NeedCopy-->
```

3. Binding the LDAP policy

```
1 bind system global pol_LDAPmgmt -priority 110
2 <!--NeedCopy-->
```

4. Assign privileges to your administrators

- To apply privileges on the group

```
1 add system group NSG_Admin
2 bind system group NSG_Admin -policyName superuser 100
3 <!--NeedCopy-->
```

- To apply privileges individually for each user

```
1 add system user admyoa
2 bind system user admyoa superuser 100
3 <!--NeedCopy-->
```

Configure LDAP after offloading SSL to a load balancing virtual server

October 13, 2023

In a NetScaler appliance, the AAA process is used for performing basic authentication like LDAP, RADIUS, TACACS for management access or authentication authorization and gateway access. As AAA runs on the management CPU, there might be issues with intermittent authentication failures. To

avoid these failures, the load balancing virtual server can be used to offload the SSL functionality from AAAD.

Advantages of offloading SSL to a load balancing virtual server

- Enhanced AAAD performance. In AAAD, for every authentication request for the LDAP server of SSL type, a new SSL session is established. As the AAAD process runs on the management CPU, establishing the SSL session impacts performance during high requests to the AAAD. Offloading SSL functionality to load balancing virtual server enhances performance of the AAAD process.
- Render client certificate to server. Client LDAP library in AAAD only performs server certificate validation, there is no support for rendering client certificate to server. Because SSL mutual authentication requires rendering the client certificate for establishing the SSL connection, offloading SSL functionality to the load balancing virtual server enables rendering of the client certificate to the server.

Configure LDAP after offloading SSL to the load balancing virtual server

Note: After you create a load balancing virtual server IP address for LDAP and point the LDAP request server to the virtual server IP address, the traffic is sourced from the SNIP.

Prerequisites

- Ensure that secure LDAP is enabled on the domain controllers which the NetScaler appliance uses for authentication. By default, with an enterprise CA, all the domain controllers enroll for a certificate using the domain controller certificate template.
- Ensure that secure LDAP is working by using the `ldp.exe` and connecting to the domain controller over port 636 and SSL.

Configure LDAP after offloading SSL to the load balancing virtual server by using the GUI

1. Create a load balancing service with the protocol set to `SSL_TCP`.
 - Navigate to **Traffic management > Load Balancing > Services** and click **Add**.
 - Specify the IP address of the domain controller and set the port number to 636.
 - Click **OK**.

← Load Balancing Service

Basic Settings

Service Name*
ldaps ⓘ

New Server Existing Server

IP Address*
ⓘ

Protocol*
SSL_TCP ⓘ

Port*
443 ⓘ

▶ More

2. Create a load balancing virtual server for LDAPS load balancing service.

- a) Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
- b) Set the protocol to TCP, enter the IP address, set the port to 636, and click **OK**.

← Load Balancing Virtual Server

Basic Settings

Create a virtual server by specifying a name, an IP address, a port, and a protocol. VIP is usually a private (RFC1918 non-routable) IP address. You can configure multiple virtual servers to receive client requests.

Name*
LDAPS-virtual server ⓘ

Protocol*
TCP ⓘ

IP Address Type*
IP Address ⓘ

IP Address*
ⓘ

Port*
636 ⓘ

▶ More

3. Bind the LDAPS service to the load balancing virtual server.

- Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
- Select the LDAP virtual server. The **Load Balancing Virtual Server** page appears.
- In the **Services and Service Groups** section, click **No Load Balancing Virtual Server Service Binding**. The **Service Binding** page appears.
- Select the load balancing service. Update the other required fields and click **Bind**.
- Click **Done**.

4. Now change the LDAP authentication policy server to point to the load balancing virtual server for secure LDAP. The security type must be PLAINTEXT.

- a) Navigate to **NetScaler Gateway > Policies > Authentication > LDAP**.
- b) Select the LDAP server and click **Edit**.
- c) Change the IP address to the LDAPS VIP hosted on the NetScaler appliance created earlier.
- d) Change Security type to **PLAINTEXT**, Change port to 636, select the **Allow Password Change** check box, if necessary (LDAP allows password changes).
- e) Click **Test Network Connectivity** to verify connectivity.
- f) Click **OK**.

You can check the authentication dashboard to confirm that the status of the LDAP server is UP. Also, check the authentication logs to confirm that the authentication is working as intended.

Configure LDAP after offloading SSL to the load balancing virtual server by using the CLI

1. Configure an LDAP server for the AAAD process. The following sample configuration establishes the SSL connection with a load balancing virtual server without SSL mutual authentication.

```
1 add authentication ldapAction ldap_act -serverIP 1.1.12.12 -
  serverPort 636 -secTYPE PLAINTEXT -ldapBase "dc=aaatm-test,dc=
  com" -ldapBindDn administrator@aaatm-test.com -
  ldapBindDnPassword <password> -ldapLoginName samAccountName
2 <!--NeedCopy-->
```

2. Configure a load balancing virtual server for the LDAP virtual server. The load balancing virtual server is of type TCP.

```
1 add lb vserver ldaps TCP 1.1.1.12 636 -persistenceType NONE -
  cltTimeout 9000
2 <!--NeedCopy-->
```

3. Configure a service for the load balancing virtual server. The service type is SSL-TCP.

```
1 add service ldaps 1.1.10.1 SSL_TCP 636
2 <!--NeedCopy-->
```

4. Configure a CA certificate for the service and set the “serverAuth” parameter for the server certificate validation.

```
1 bind ssl service ldaps -certkeyName ca-cert -CA
2 set ssl service ldaps -serverAuth enabled
3 <!--NeedCopy-->
```

5. Attach the certificate to the service that is rendered to the LDAP server.

```
1 bind ssl service ldaps -certkeyName usr_cert [client-certificate
  for client-authentication]
2 <!--NeedCopy-->
```

6. Bind the service to the load balancing virtual server.

```
1 bind lb vserver ldaps ldaps
2 <!--NeedCopy-->
```

RADIUS authentication

May 2, 2023

As with other types of authentication policies, a Remote Authentication Dial In User Service (RADIUS) authentication policy is comprised of an expression and an action. After creating an authentication policy, you bind it to an authentication virtual server and assign a priority to it. When binding it, you also designate it as either a primary or a secondary policy. However, setting up a RADIUS authentication policy has certain special requirements that are described below.

Normally you configure the NetScaler to use the IP address of the authentication server during authentication. With RADIUS authentication servers, you can now configure the ADC to use the FQDN of the RADIUS server instead of its IP address to authenticate users. Using an FQDN can simplify an otherwise much more complex authentication, authorization, and auditing configuration in environments where the authentication server might be at any of several IP addresses, but always uses a single FQDN. To configure authentication by using a server's FQDN instead of its IP address, you follow the normal configuration process except when creating the authentication action. When creating the action, you substitute the **serverName** parameter for the **serverIP** parameter.

Before you decide whether to configure the NetScaler to use the IP or the FQDN of your RADIUS server to authenticate users, consider that configuring authentication, authorization, and auditing to authenticate to an FQDN instead of an IP address adds an extra step to the authentication process. Each time the ADC authenticates a user, it must resolve the FQDN. If a great many users attempt to authenticate simultaneously, the resulting DNS lookups might slow the authentication process.

Note

These instructions assume that you are already familiar with the RADIUS protocol and have already configured your chosen RADIUS authentication server.

To add an authentication action for a RADIUS server by using the command line interface

If you authenticate to a RADIUS server, you need to add an explicit authentication action. To do this, at the command prompt, type the following command:

```
1 add authentication radiusAction <name> [-serverip <IP> | -serverName] <
  FQDN>][-serverPort <port>] [-authTimeout <positive_integer>] {
```

```

2  -radKey  }
3  [-radNASip ( ENABLED | DISABLED )][-radNASid <string>] [-radVendorID
   <positive_integer>][-radAttributeType <positive_integer>][-
   radGroupsPrefix <string>] [-radGroupSeparator <string>][-
   passEncoding <passEncoding>][-ipVendorID <positive_integer>] [-
   ipAttributeType <positive_integer>][-accounting ( ON | OFF )][-
   pwdVendorID <positive_integer> [-pwdAttributeType <
   positive_integer>]] [-defaultAuthenticationGroup <string>] [-
   callingstationid ( ENABLED | DISABLED )]
4
5  <!--NeedCopy-->

```

The following example adds a RADIUS authentication action named **Authn-Act-1**, with the server IP **10.218.24.65**, the server port **1812**, the authentication timeout **15** minutes, the radius key **WareTheLorax**, NAS IP disabled, and NAS ID **NAS1**.

```

1  add authentication radiusaction Authn-Act-1 -serverip 10.218.24.65 -
   serverport 1812 -authtimeout 15 -radkey WareTheLorax -radNASip
   DISABLED -radNASid NAS1
2  Done
3
4  <!--NeedCopy-->

```

The following example adds the same RADIUS authentication action, but using the server FQDN **rad01.example.com** instead of the IP.

```

1  add authentication radiusaction Authn-Act-1 -serverName rad01.example.
   com -serverport 1812 -authtimeout 15 -radkey WareTheLorax -radNASip
   DISABLED -radNASid NAS1
2  Done
3
4  <!--NeedCopy-->

```

To configure an authentication action for an external RADIUS server by using the command line

To configure an existing RADIUS action, at the command prompt, type the following command:

```

1  set authentication radiusAction <name> [-serverip <IP> | -serverName] <
   FQDN>][-serverPort <port>] [-authTimeout <positive_integer>] {
2  -radKey  }
3  [-radNASip ( ENABLED | DISABLED )][-radNASid <string>] [-radVendorID
   <positive_integer>][-radAttributeType <positive_integer>][-
   radGroupsPrefix <string>] [-radGroupSeparator <string>][-
   passEncoding <passEncoding>][-ipVendorID <positive_integer>] [-
   ipAttributeType <positive_integer>][-accounting ( ON | OFF )][-
   pwdVendorID <positive_integer> [-pwdAttributeType <
   positive_integer>]] [-defaultAuthenticationGroup <string>] [-
   callingstationid ( ENABLED | DISABLED )]
4

```

```
5 <!--NeedCopy-->
```

To remove an authentication action for an external RADIUS server by using the command line interface

To remove an existing RADIUS action, at the command prompt, type the following command:

```
1 rm authentication radiusAction <name>
2
3 <!--NeedCopy-->
```

Example

```
1 rm authentication radiusaction Authn-Act-1
2 Done
3
4 <!--NeedCopy-->
```

To configure a RADIUS server by using the configuration utility

Note

In the configuration utility, the term server is used instead of action, but refers to the same task.

1. Navigate to **Security > AAA - Application Traffic > Policies > Authentication > Radius**
2. In the details pane, on the **Servers** tab, do one of the following:
 - To create a new RADIUS server, click **Add**.
 - To modify an existing RADIUS server, select the server, and then click **Edit**.
3. In the **Create Authentication RADIUS Server** or **Configure Authentication RADIUS Server** dialog, type or select values for the parameters. To fill out parameters that appear beneath **Send Calling Station ID**, expand **Details**.
 - Name*—radiusActionName (Cannot be changed for a previously configured action)
 - Authentication Type*—authtype (Set to RADIUS, cannot be changed)
 - Server Name / IP Address*—Choose either Server Name or Server IP
 - Server Name*—serverName <FQDN>
 - IP Address*—serverIp <IP> If the server is assigned an IPv6 IP address, select the IPv6 check box.
 - Port*—serverPort
 - Time-out (seconds)*—authTimeout

- Secret Key*—radKey (RADIUS shared secret.)
- Confirm Secret Key*—Type the RADIUS shared secret a second time. (No command line equivalent.)
- Send Calling Station ID—callingstationid
- Group Vendor Identifier—radVendorID
- Group Attribute Type—radAttributeType
- IP Address Vendor Identifier—ipVendorID
- pwdVendorID—pwdVendorID
- Password Encoding—passEncoding
- Default Authentication Group—defaultAuthenticationGroup
- NAS ID—radNASid
- Enable NAS IP address extraction—radNASip
- Group Prefix—radGroupsPrefix
- Group Separator—radGroupSeparator
- IP Address Attribute Type—ipAttributeType
- Password Attribute Type—pwdAttributeType
- Accounting—accounting

4. Click **Create** or **OK**. The policy that you created appears in the Servers page.

Support to pass through RADIUS attribute 66 (Tunnel-Client-Endpoint)

The NetScaler appliance now allows the pass-through of RADIUS attribute 66 (Tunnel-Client-Endpoint) during RADIUS authentication. By applying this feature, the clients IP address is received by second-factor authentication from entrusting to make risk-based authentication decisions.

A new attribute “tunnelEndpointClientIP” is introduced in both “add authentication radiusAction” and “set radiusParams” command.

To use this feature, at the NetScaler appliance command prompt, type:

```
1 add authentication radiusAction <name> {
2   -serverIP <ip_addr|ipv6_addr|*> | {
3     -serverName <string> }
4   }
5   [-serverPort <port>] ... [-tunnelEndpointClientIP (ENABLED|DISABLED)]
6
7 set radiusParams {
```

```

8  -serverIP <ip_addr|ipv6_addr|*> |{
9  -serverName <string> }
10 }
11 [-serverPort<port>] ... [-tunnelEndpointClientIP(ENABLED|DISABLED)]
12
13 <!--NeedCopy-->

```

Example

```

1  add authentication radiusAction radius -serverIP 1.217.22.20 -serverName
   FQDN -serverPort 1812 -tunnelEndpointClientIp ENABLED
2
3  set radiusParams -serverIp 1.217.22.20 -serverName FQDN1 -serverPort
   1812 -tunnelEndpointClientIP ENABLED
4
5  <!--NeedCopy-->

```

Support for validating end-to-end RADIUS authentication

The NetScaler appliance can now validate end-to-end RADIUS authentication through a GUI. To validate this feature, a new “test” button is introduced in GUI. A NetScaler appliance administrator can leverage this feature to achieve the following benefits:

- Consolidates the complete flow (packet engine –aaa daemon –external server) to provide better analysis
- Reduces time on validating and troubleshooting issues related to individual scenarios

You have two options to configure and view the test results of RADIUS end-to-end authentication by using the GUI.

From system option

1. Navigate to **System > Authentication > Basic Policies > RADIUS**, click **Servers** tab.
2. Select the available **RADIUS action** from the list.
3. On the **Configure Authentication RADIUS Server** page, you have two options under **Connections Settings** section.
4. To check the RADIUS server connection, click **Test RADIUS Reachability** tab.
5. To view the end-to-end RADIUS authentication, click **Test End User Connection** link.

From Authentication option

1. Navigate to **Authentication > Dashboard**, select the available RADIUS action from the list.
2. On the **Configure Authentication RADIUS Server** page, you have two options under **Connections Settings** section.

3. To check the RADIUS server connection, click **Test RADIUS Reachability** tab.
4. To view the end-to-end RADIUS authentication status, click **Test End User Connection** link.

RADIUS authentication using TCP or TLS

October 13, 2023

Starting from release 13.1–27.59, RADIUS authentication is supported on TCP and TLS protocols as well.

Note:

- The **Test RADIUS Reachability** option is not supported for RADIUS on TCP and TLS transport types.
- RADIUS authentication using UDP is not supported on FIPS appliances.

Configure RADIUS over TCP by using the CLI

At the command prompt type:

```
1 add authentication radiusAction <name> [-serverIP] [-serverPort ] [-  
   transport <transport>]  
2 <!--NeedCopy-->
```

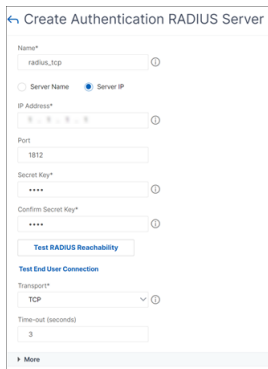

Example:

```
1 add authentication radiusAction RadAction -serverIP 1.1.1.1 -radkey 123  
   -transport TCP  
2 <!--NeedCopy-->
```

Configure RADIUS over TCP by using the GUI

1. Navigate to **Security > AAA - Application Traffic > Policies > Authentication > Advanced Policies > Actions > RADIUS**.
2. Select an existing server or create a server.

For details on creating a server, see [To configure a RADIUS server by using the GUI](#).

3. In **Transport**, select **TCP**.
4. Click **Create**.

Configure RADIUS over TLS by using the CLI

At the command prompt type:

```
1 add authentication radiusAction <name> [-serverIP] [-serverPort ] [-
  transport <transport>] [-targetLBVserver <string>]
2 <!--NeedCopy-->
```

Example

```
1 add authentication radiusAction RadAction -serverIP 1.1.1.1 -radkey 123
  -transport TLS -targetLBVserver rad-lb
2 <!--NeedCopy-->
```

Note:

- Server name is not supported for TLS transport type.
- For the TLS transport type, configure a target load balancing virtual server of type TCP and bind a service of type SSL_TCP to this virtual server.
- The IP address and the port number configured for RADIUS action must match the IP address and port number of the configured target load balancing virtual server.

Configure RADIUS over TLS by using the GUI

1. Navigate to **Security > AAA - Application Traffic > Policies > Authentication > Advanced Policies > Actions > Servers**.
2. Select an existing server or create a server.
For details about creating a server, see [To configure a RADIUS server by using the GUI](#).
3. In **Transport**, select **TLS**.

4. In **Target Load Balancing Virtual Server**, select the virtual server. For details on creating a load balancing virtual server, see [Creating a virtual server](#).

Note:

- Server name is not supported for TLS transport type.
- For the TLS transport type, configure a target load balancing virtual server of type TCP and bind a service of type SSL_TCP to this virtual server.
- The IP address and the port number configured for RADIUS action must match the IP address and port number of the configured target load balancing virtual server.

5. Click **Create**.

TACACS authentication

May 9, 2023

TACACS authentication policy authenticates to an external Terminal Access Controller Access-Control System (TACACS) authentication server.

After a user authenticates to a TACACS server, the NetScaler connects to the same TACACS server for all subsequent authorizations. When a primary TACACS server is unavailable, this feature prevents any delay while the ADC waits for the first TACACS server to time out. It happens before resending the authorization request to the second TACACS server.

Note:

TACACS authorization server does not support commands whose string length exceeds 255 characters.

Workaround: Use local authorization instead of a TACACS authorization server.

When authenticating through a TACACS server, authentication, authorization, and auditing traffic management logs only successfully runs TACACS commands. It prevents the logs from showing TACACS commands that are entered by the users who were not authorized to run them.

Starting from NetScaler 12.0 Build 57.x, the Terminal Access Controller Access-Control System (TACACS) is not blocking the authentication, authorization, and auditing daemon while sending the TACACS request. The allow LDAP, and RADIUS authentication to proceed with the request. The TACACS authentication request resumes once the TACACS server acknowledges the TACACS request.

Important:

- Citrix recommends you do not modify any TACACS related configurations when you run a “clear ns config” command.
- TACACS related configuration related to advanced policies is cleared and reapplied when the “RBAconfig” parameter is set to NO in “clear ns config” command for advanced policy.

Name-value attribute support for TACACS authentication

You can now configure TACACS authentication attributes with a unique name along with values. The names are configured in the TACACS action parameter and the values are obtained by querying for the names. By specifying the name attribute value, admins can easily search for the attribute value associated with the attribute name. Also, admins no longer have to remember the attribute by its value alone.

Important

- In the tacacsAction command, you can configure a maximum of 64 attributes separated by comma with total size less than 2048 bytes.

To configure the name-value attributes by using the CLI

At the command prompt, type:

```
1 add authentication tacacsAction <name> [-Attributes <string>]
2 <!--NeedCopy-->
```

Example:

```
1 add authentication tacacsAction tacacsAct1 -attributes "mail,sn,
  userprincipalName"
2 <!--NeedCopy-->
```

To add an authentication action by using the command line interface

If you do not use LOCAL authentication, you need to add an explicit authentication action. At the command prompt, type the following command:

```
1 add authentication tacacsAction <name> -serverip <IP> [-serverPort <
  port>][ -authTimeout <positive_integer>][ ... ]
2 <!--NeedCopy-->
```

Example

```
1 add authentication tacacsaction Authn-Act-1 -serverip 10.218.24.65 -
  serverport 1812 -authtimeout 15 -tacacsSecret "
  minotaur" -authorization OFF -accounting ON -auditFailedCmds OFF -
  defaultAuthenticationGroup "users"
2 <!--NeedCopy-->
```

To configure an authentication action by using the command line interface

To configure an existing authentication action, at the command prompt, type the following command:

```
1 set authentication tacacsAction <name> -serverip <IP> [-serverPort <
  port>][-authTimeout <positive_integer>][ ... ]
2 <!--NeedCopy-->
```

Example

```
1 > set authentication tacacsaction Authn-Act-1 -serverip
  10.218.24.65 -serverport 1812 -authtimeout 15
  -tacacsSecret "minotaur" -authorization OFF -accounting ON -
  auditFailedCmds OFF -defaultAuthenticationGroup "users" Done
2 <!--NeedCopy-->
```

To remove an authentication action by using the command line interface

To remove an existing RADIUS action, at the command prompt, type the following command:

```
1 rm authentication radiusAction <name>
2 <!--NeedCopy-->
```

Example

```
1 rm authentication tacacsaction Authn-Act-1
2 <!--NeedCopy-->
```

Client certificate authentication

June 19, 2023

Websites that contain sensitive content, such as online banking websites or websites with employee personal information, sometimes require client certificates for authentication. To configure authentication, authorization, and auditing to authenticate users based on client-side certificate attributes,

you first enable client authentication on the traffic management virtual server and bind the root certificate to the authentication virtual server. Then, you implement one of two options. You can configure the default authentication type on the authentication virtual server as CERT, or you can create a certificate action that defines what the NetScaler must do to authenticate users based on a client certificate. In either case, your authentication server must support CRLs. You configure the ADC to extract the user name from the **SubjectCN** field or another specified field in the client certificate.

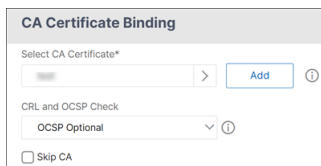

When the user tries to log on to an authentication virtual server for which an authentication policy is not configured, and a global cascade is not configured, the user name information is extracted from the specified field of the certificate. If the required field is extracted, the authentication succeeds. If the user does not provide a valid certificate during the SSL handshake, or if the user name extraction fails, authentication fails. After it validates the client certificate, the ADC presents a logon page to the user.

The following procedures assume that you have already created a functioning authentication, authorization, and auditing configuration, and therefore they explain only how to enable authentication by using client certificates. These procedures also assume that you have obtained your root certificate and client certificates and have placed them on the ADC in the `/nsconfig/ssl` directory.

Configure client certificate authentication

Configure client certificate parameters by using the GUI

1. Install a CA certificate and bind it to an authentication virtual server.
 - a) Navigate to **Security > AAA - Application Traffic > Virtual Servers**.
 - b) In the **Authentication Virtual Servers** page that appears, select the virtual server that you want to configure to handle client certificate authentication, and then click **Edit**.
 - c) On the **Authentication Virtual Server** page, navigate to the **Certificate** section and click the right arrow “>”.
 - d) On the **CA Certificate Binding** page, select a CA certificate, update the other required fields, and click **Bind**.

The screenshot shows the 'CA Certificate Binding' configuration page. It features a 'Select CA Certificate*' dropdown menu with an 'Add' button and a help icon. Below this is a 'CRL and OCSP Check' section with an 'OCSP Optional' dropdown menu and a help icon. At the bottom, there is a checkbox labeled 'Skip CA'.

- e) If a CA certificate is not available, then select **Add**.
- f) On the **Install Certificate** page, update the following fields and click **Install** and then click **Close**.

- **Certificate-Key Pair Name:** Name for the certificate and private-key pair
- **Certificate File Name:** The name of the certificate file that is used to form the certificate-key pair. The certificate file must be present on the NetScaler’s hard-disk drive or solid-state drive. Storing a certificate in any location other than the default might cause inconsistency in a high availability setup. The default path is `/nsconfig/ssl/`.
- **Notification Period:** Number of days before certificate expiration at which NetScaler notifies the admin that the certificate is about to expire.
- **Notify When Expires:** Enable this option to receive an alert when the certificate is about to expire.

- g) Once the CA certificate is installed, go to the **CA Certificate Binding** page, bind it to an authentication virtual server.
2. Return to the **Security > AAA - Application Traffic > Virtual Servers** page.
 3. Navigate to **Security > AAA - Application Traffic > Policies > Authentication > Basic Policies > CERT**.
 4. Select the policy that you want to configure to handle client certificate authentication, and then click **Edit**.
 5. On the **Configure Authentication CERT Policy** page, go to the **Server** drop-down list and select the virtual server that is configured to handle client certificate authentication.
 6. Click **OK**.

Configure client certificate parameters by using the CLI

At the command prompt, type the following commands, in the order shown, to configure the certificate and verify the configuration:

```
1 add ssl certKey <certkeyName> -cert <certFile> -key <keyFile> -password
  -inform <inform> -expiryMonitor <expiryMonitor> -notificationPeriod
  <notificationPeriod>
2
3 bind ssl certKey [<certkeyName>] [-ocspResponder <string>] [-priority <
  positive_integer>]
4
5 show ssl certKey [<certkeyName>]
6
7 set aaa parameter -defaultAuthType CERT
8
9 show aaa parameter
10
11 set aaa certParams -userNameField "Subject:CN"
12
13 show aaa certParams
14 <!--NeedCopy-->
```

Configure client certificate advanced authentication policies by using the GUI

1. Install CA certificate and bind it to a certificate-key pair.
 - a) Navigate to **Security > AAA - Application Traffic > Virtual Servers**.
 - b) In the **Authentication Virtual Servers** page that appears, select the virtual server that you want to configure to handle client certificate authentication, and then click **Edit**.
 - c) On the **Authentication Virtual Server** page, navigate to the **Certificate** section and click the right arrow ">".
 - d) On the **CA Certificate Binding** page, select a CA certificate, update the other required fields, and click **Bind**.
 - e) If a CA certificate is not available, then select **Add**.
 - f) On the **Install Certificate** page, update the following fields and click **Install** and then click **Close**.
 - Certificate-Key Pair Name: Name for the certificate and private-key pair
 - Certificate File Name: The name of the certificate file that is used to form the certificate-key pair. The certificate file must be present on the NetScaler's hard-disk drive or solid-state drive. Storing a certificate in any location other than the default might cause inconsistency in a high availability setup. The default path is /nsconfig/ssl/.
 - Notification Period: Number of days before certificate expiration at which NetScaler notifies the admin that the certificate is about to expire.

- Notify When Expires: Enable this option to receive an alert when the certificate is about to expire.
- g) Once the CA certificate is installed, go to the **CA Certificate Binding** page and repeat step 4.
2. Return to the **Security > AAA - Application Traffic > Virtual Servers** page.

Note:

If you have imported a valid CA certificate and server certificate for the virtual server you can skip **steps 1 and 2**.

3. Navigate to **Security > AAA - Application Traffic > Policies > Authentication > Advanced Policies**, and then select **Policy**.
4. On the **Authentication Policies** page, do one of the following:
- To create a policy, click **Add**.
 - To modify an existing policy, select the policy, and then click **Edit**.
5. On the **Create Authentication Policy** or **Configure Authentication Policy** page, type or select values for the parameters.
- Name: Policy name. You cannot change the name of a previously configured policy.
 - Action Type: Type of the authentication action.
 - Action: Name of the authentication action to be performed if the policy matches. You can choose an existing authentication action, or click **Add** and create an action.
 - Expression: The rule that selects connections to which you want to apply the action that you specified. The rule can be simple (“true”selects all traffic) or complex. You enter expressions by first choosing the type of expression in the leftmost drop-down list beneath the Expression window, and then by typing your expression directly into the expression text area, or by clicking Add to open Add Expression dialog box and using the drop-down lists in it to define your expression.
 - Log Action: Name of the audit action to use when an authentication request matches this policy. You can choose an existing audit action, or click **Add** to create an action.
 - Comment: You can type a comment that describes the type of traffic that this authentication policy applies to. This field is optional.
6. Click **Create** or **OK**, and then click **Close**.

Client certificate pass-through

The NetScaler can now be configured to pass client certificates through to protected applications that require client certificates for user authentication. The ADC first authenticates the user, then inserts the

client certificate into the request and sends it to the application. This feature is configured by adding appropriate SSL policies.

The exact behavior of this feature when a user presents a client certificate depends upon the configuration of the VPN virtual server.

- If the VPN virtual server is configured to accept client certificates but not require them, the ADC inserts the certificate into the request and then forwards the request to the protected application.
- If the VPN virtual server has client certificate authentication disabled, the ADC renegotiates the authentication protocol and reauthenticates the user before it inserts the client certificate in the header and forwards the request to the protected application.
- If the VPN virtual server is configured to require client certificate authentication, the ADC uses the client certificate to authenticate the user, then inserts the certificate in the header and forwards the request to the protected application.

In all of these cases, you configure the client certificate pass-through as follows.

Create and configure client certificate pass-through by using the CLI

At the command prompt, type the following commands:

```
1 add vpn vserver <name> SSL <IP> 443
2 <!--NeedCopy-->
```

For **name**, substitute a name for the virtual server. The name must contain from one to 127 ASCII characters, beginning with a letter or underscore (`_`), and containing only letters, numbers, and the underscore, hash (`#`), period (`.`), space, colon (`:`), at (`@`), equals (`=`), and hyphen (`-`) characters. For `<IP>`, substitute the IP address assigned to the virtual server.

```
1 set ssl vserver <name> -clientAuth ENABLED -clientCert <clientcert>
2 <!--NeedCopy-->
```

For `<name>`, substitute the name of the virtual server that you created. For `<clientCert>`, substitute one of the following values:

- `disabled`—disables client certificate authentication on the VPN virtual server.
- `mandatory`—configures the VPN virtual server to require client certificates to authenticate.
- `optional`—configures the VPN virtual server to allow client certificate authentication, but not to require it.

```
1 bind vpn vserver <name> -policy local
2 <!--NeedCopy-->
```

For `<name>`, replace the name of the VPN virtual server that you created.

```
1 bind vpn vserver <name> -policy cert
2 <!--NeedCopy-->
```

For <name>, substitute the name of the VPN virtual server that you created.

```
1 bind ssl vserver <name> -certkeyName <certkeyname>
2 <!--NeedCopy-->
```

For <name>, substitute the name of the virtual server that you created. For <certkeyName>, substitute the client certificate key.

```
1 bind ssl vserver <name> -certkeyName <cacertkeyname> -CA -ocspCheck
  Optional
2 <!--NeedCopy-->
```

For <name>, substitute the name of the virtual server that you created. For <cacertkeyName>, substitute the CA certificate key.

```
1 add ssl action <actname> -clientCert ENABLED -certHeader CLIENT-CERT
2 <!--NeedCopy-->
```

For <actname>, substitute a name for the SSL action.

```
1 add ssl policy <polname> -rule true -action <actname>
2 <!--NeedCopy-->
```

For <polname>, substitute a name for your new SSL policy. For <actname>, substitute the name of the SSL action that you created.

```
1 bind ssl vserver <name> -policyName <polname> -priority 10
2 <!--NeedCopy-->
```

For <name>, replace the name of the VPN virtual server.

Example

```
1 add vpn vserver vs-certpassthru SSL 10.121.250.75 443
2 set ssl vserver vs-certpassthru -clientAuth ENABLED -clientCert
  optional
3 bind vpn vserver vs-certpassthru -policy local
4 bind vpn vserver vs-certpassthru -policy cert
5 bind ssl vserver vs-certpassthru -certkeyName mycertKey
6 bind ssl vserver vs-certpassthru -certkeyName mycertKey -CA -ocspCheck
  Optional
7 add ssl action act-certpassthru -clientCert ENABLED -certHeader CLIENT-
  CERT
8 add ssl policy pol-certpassthru -rule true -action act-certpassthru
9 bind ssl vserver vs-certpassthru -policyName pol-certpassthru -priority
  10
10 <!--NeedCopy-->
```

Negotiate authentication

May 2, 2023

As with other types of authentication policies, a Negotiate authentication policy is comprised of an expression and an action. After creating an authentication policy, you bind it to an authentication virtual server and assign a priority to it. When binding it, you also designate it as either a primary or a secondary policy.

In addition to standard authentication functions, the Negotiate Action command can now extract user information from a keytab file instead of requiring you to enter that information manually. If a keytab has more than one SPN, authentication, authorization, and auditing selects the correct SPN. You can configure this feature at the command line, or by using the configuration utility.

Note

These instructions assume that you are already familiar with the LDAP protocol and have already configured your chosen LDAP authentication server.

To configure authentication, authorization, and auditing to extract user information from a keytab file by using the command line interface

At the command prompt, type the appropriate command:

```
1 add authentication negotiateAction <name> {
2   -domain <string> }
3   {
4   -domainUser <string> }
5   {
6   -domainUserPasswd }
7   [-defaultAuthenticationGroup <string>] [-keytab <string>] [-NTLMPath
   <string>]
8
9 set authentication negotiateAction <name> {
10  -domain <string> }
11  {
12  -domainUser <string> }
13  {
14  -domainUserPasswd }
15  [-defaultAuthenticationGroup <string>] [-keytab <string>] [-NTLMPath
   <string>]
16 <!--NeedCopy-->
```

Parameter description

- **name** - Name of the negotiate action to be used.

- **domain** - Domain name of the service principal that represents NetScaler.
- **domainUser** - User name of the account that is mapped with NetScaler principal. This can be given along with domain and password when keytab file is not available. If username is given along with keytab file, then that keytab file will be searched for this user's credentials. Maximum Length: 127
- **domainUserPasswd** - Password of the account that is mapped to the NetScaler principal.
- **defaultAuthenticationGroup** - This is the default group that is chosen when the authentication succeeds in addition to extracted groups. Maximum Length: 63
- **keytab** - The path to the keytab file that is used to decrypt kerberos tickets presented to NetScaler. If keytab is not available, domain/username/password can be specified in the negotiate action configuration. Maximum Length: 127
- **NTLMPath** - The path to the site that is enabled for NTLM authentication, including FQDN of the server. This is used when clients fallback to NTLM. Maximum Length: 127

To configure authentication, authorization, and auditing to extract user information from a keytab file by using the configuration utility

Note

In the configuration utility, the term server is used instead of action, but refers to the same task.

1. Navigate to **Security > AAA - Application Traffic > Authentication > Advanced Policies > Actions > NEGOTIATE Actions**.
2. In the details pane, on the **Servers** tab, do one of the following:
 - If you want to create a new **Negotiate** action, click **Add**.
 - If you want to modify an existing **Negotiate** action, in the data pane select the action, and then click **Edit**.
3. If you are creating a new **Negotiate** action, in the **Name** text box, type a name for your new action. The name can be from one to 127 characters in length and can consist of upper- and lowercase letters, numbers, and the hyphen (-) and underscore (_) characters. If you are modifying an existing Negotiate action, skip this step. The name is read-only; you cannot change it.
4. Under **Negotiate**, if the Use Keytab file check box is not already checked, check it.
5. In the Keytab file path text box, type the full path and filename of the keytab file that you want to use.
6. In the Default authentication group text box, type the authentication group that you want to set as default for this user.

7. Click **Create** or **OK** to save your changes.

Points to note when advanced encryptions is used for Kerberos authentication

- **Sample configuration when keytab is used:** add authentication negotiateAction neg_act_aes256 -keytab “/nsconfig/krb/lbvs_aes256.keytab”
- **Use the following command when keytab has multiple encryption types.** The command additionally captures domain user parameters: add authentication negotiateAction neg_act_keytab_all -keytab “/nsconfig/krb/lbvs_all.keytab”-domainUser “HTTP/lbvs.aaa.local”
- **Use the following commands when user credential are used:** add authentication negotiateAction neg_act_user -domain AAA.LOCAL -domainUser “HTTP/lbvs.aaa.local” -domainUserPasswd <password>
- Ensure that the correct **domainUser** information is provided. You can look for the user logon name in AD.

Web authentication

May 2, 2023

Authentication, authorization, and auditing is now able to authenticate a user to a web server, providing the credentials that the web server requires in an HTTP request and analyzing the web server response to determine that user authentication was successful. As with other types of authentication policies, a Web authentication policy is comprised of an expression and an action. After creating an authentication policy, you bind it to an authentication virtual server and assign a priority to it. When binding it, you also designate it as either a primary or a secondary policy.

To set up web-based authentication with a specific web server, first you create a web authentication action. Since authentication to web servers does not use a rigid format, you must specify exactly which information the web server requires and in which format when creating the action. To do this, you create an expression in NetScaler appliance Advanced policy that contains the following items:

- **Server IP**—The IP address of the authentication Web server.
- **Server Port**—The port of the authentication Web server.
- **Authentication Rule**—An expression in NetScaler appliance Advanced policy that contains the user’s credentials in the format that the Web server expects.
- **Scheme**—HTTP (for unencrypted web authentication) or HTTPS (for encrypted web authentication).

- **Success Rule**—An expression in NetScaler appliance Advanced policy that matches the web server response string that signifies that the user authenticated successfully.

For all other parameters, follow the normal rules for the add authentication action command.

Next you create a policy associated with that action. The policy is similar to an LDAP policy, and like LDAP policies uses NetScaler appliance syntax.

Note

These instructions assume that you are already familiar with the authentication requirements of the web server(s) to which you want to authenticate, and have already configured the web authentication server.

To configure a Web authentication action by using the command line interface

To create a web authentication action at the command line, at the command line type the following command:

```
1 add authentication webAuthAction <name> -serverIP <ip_addr|ipv6_addr|*>
  -serverPort <port|*> [-fullReqExpr <string>] -scheme ( http | https
  ) -successRule <expression> [-defaultAuthenticationGroup <string
  >][-Attribute1 <string>][-Attribute2 <string>] [-Attribute3 <string
  >][-Attribute4 <string>] [-Attribute5 <string>][-Attribute6 <string
  >] [-Attribute7 <string>][-Attribute8 <string>] [-Attribute9 <string
  >][-Attribute10 <string>] [-Attribute11 <string>][-Attribute12 <
  string>] [-Attribute13 <string>][-Attribute14 <string>] [-
  Attribute15 <string>][-Attribute16 <string>]
2 <!--NeedCopy-->
```

Example

```
1 add policy expression post_data "\"username=\" + http.REQ.BODY(1000).
  SET_TEXT_MODE(IGNORECASE).AFTER_STR(\"login=\").BEFORE_STR(\"&\") +
  \"&password=\" + http.REQ.BODY(1000).SET_TEXT_MODE(IGNORECASE).
  AFTER_STR(\"passwd=\")"
2
3 add policy expression length_post_data "(\"username= \" + http.REQ.BODY
  (1000).SET_TEXT_MODE(IGNORECASE).AFTER_STR(\"login=\").BEFORE_STR
  (\"&\") + \"password=\" + http.REQ.BODY(1000).SET_TEXT_MODE(
  IGNORECASE).AFTER_STR(\"passwd=\")).length"
4
5 add authentication webAuthAction webAuth_POST -serverIP 10.106.187.54 -
  serverPort 80 -fullReqExpr q{
6 "POST /MyPHP/auth.php HTTP/" + http.req.version.major + "." + http.req
  .version.major + "\r\nAccept:*/*\r\nHost: 10.106.187.54\r\nReferer:
  http://10.106.187.54/MyPHP/auth.php\r\nAccept-Language: en-US\r\
  nUser-Agent: Mozilla/5.0 (compatible; MSIE 9.0; Windows NT 6.1;
  Trident/5.0)\r\nContent-Type: application/x-www-form-urlencoded\r\n
  " + "Content-Length: " + length_post_data + "\r\nConnection: Keep-
  Alive\r\n\r\n" + post_data }
```

```
7  -scheme http -successRule "http.res.status.eq(200)"
8  <!--NeedCopy-->
```

To configure a Web authentication action by using the configuration utility

Note

In the configuration utility, the term server is used instead of action, but refers to the same task.

1. Navigate to **Security > AAA - Application Traffic > Policies > LDAP**.
2. In the details pane, on the **Servers** tab, do one of the following:
 - If you want to create a new web authentication action, click **Add**.
 - If you want to modify an existing web authentication action, in the data pane select the action, and then click **Edit**.
3. If you are creating a new web authentication action, in the **Create Authentication Web** server dialog box, **Name** text box, type a name for the new web authentication action. The name can be from one to 127 characters in length, and can consist of upper- and lowercase letters, numbers, and the hyphen (-) and underscore (_) characters. If you are modifying an existing web authentication action, skip this step. The name is read-only; you cannot change it.
4. In the **Web Server IP Address** text box, type the IPv4 or IPv6 IP address of the authentication web server. If the address is an IPv6 IP address, select the IPv6 check box first.
5. In the Port text box, type the port number on which the web server accepts connections.
6. Select **HTTP** or **HTTPS** in the **Protocol** drop-down list.
7. In the HTTP Request Expression text area, type a PCRE-format regular expression that creates the web server request that contains the user's credentials in the exact format expected by the authentication web server.
8. In the Expression to validate the Authentication text area, type a NetScaler appliance Advanced policy expression that describes the information in the web server response that indicates that user authentication was successful.
9. Fill out the remaining fields as described in the general authentication action documentation.
10. Click **OK**.

Configure SMS OTP for Web authentication

January 30, 2024

NetScaler can now be integrated with a third party SMS provider to provide an extra layer of authentication.

NetScaler appliance can be configured to send an OTP on the user's mobile as a second factor of authentication. The appliance presents the user with a logon form to enter the OTP after successful AD login. It is only after the successful validation of SMS OTP authentication that the user is presented with the requested resource.

To achieve SMS OTP authentication, the NetScaler appliance relies on the following factors in the back end.

1. Authenticate the user using LDAP authentication and extract the user's mobile number.
2. Create OTP and store it in the NS variable. [Configuring and using variables](#).
3. Send the OTP via WebAuth authentication method to the mobile number extracted from LDAP.
4. Validate the OTP.

Prerequisites

Enable features and add SNIP

Run the following commands to enable the features required for this configuration:

```
1 enable ns feature LB SSL SSLVPN AAA
2
3 add ns ip <SNIP-IP> <subnet mask> -type SNIP
4 <!--NeedCopy-->
```

Configure OTP store

Admins must set up a database/store to save OTPs used for SMS authentication.

The recommended configuration range for the `expires` parameter (OTP expiration) is 30 to 180 seconds. Any value outside this range might result in a failed SMS OTP configuration and nFactor flow.

```
1 add ns variable otp_store -type "map(text(65),text(6),100000)" -
   ifValueTooBig undef -ifNoValue undef -expires 60
2 <!--NeedCopy-->
```

Generate random OTP per user session

Use the following command to generate a 6-digit random OTP per user session and save it in the OTP store.

```

1 add ns assignment generate_otp -variable "$otp_store[AAA.USER.SESSIONID
  ]" -set ("0000000" + SYS.RANDOM.MUL(1000000)).
  TYPECAST_UNSIGNED_LONG_AT.TYPECAST_TEXT_T).SUFFIX(6)
2 <!--NeedCopy-->

```

Configure SMS OTP authentication with NetScaler

- Before you configure the SMS two factor authentication feature, you must have an LDAP authentication configured on a NetScaler appliance as first factor with authentication enabled. For instructions to configure LDAP authentication, see [To configure LDAP authentication by using the configuration utility](#).
- Configure LDAP and extract the mobile number to be used for SMS OTP authentication.

Sample first factor configuration

Configure LDAP as the first factor for authentication.

```

1 add authentication ldapAction ldap_extraction_action -serverIP <
  IP_Address> -ldapBase OU=Sanity,dc=aaa,dc=local -ldapBindDn
  administrator@aaa.local -ldapBindDnPassword <password> -
  ldapLoginName samaccountname -groupAttrName memberof -
  subAttributeName CN -authentication disabled
2
3 add authentication Policy ldap_extraction_policy -rule true -action
  ldap_extraction_action
4 <!--NeedCopy-->

```

Note

Mobile number can be extracted using `AAA.USER.ATTRIBUTE(1)` and can be included while sending it to the back-end server.

Sample second factor configuration

Using the following sample configuration, an OTP that is to be sent to the end user is generated.

```

1 add authentication Policy set_otp -rule true -action generate_otp
2
3 add authentication policylabel set_otp_label -loginSchema LSCHEMA_INT
4
5 bind authentication policylabel set_otp_label -policyName set_otp -
  priority 1
6
7 add authentication Policy cascade_noauth -rule true -action NO_AUTHN
8 <!--NeedCopy-->

```

Web authentication policy and action

Now, configure the web authentication action to send the OTP to any third party SMS sender along with the mobile number fetched from the LDAP policy.

Check the OTP and send the generated OTP to a third party SMS provider or any web server as configured below:

```

1 add policy expression otp_exp_post "\"Message: OTP is \" + $otp_store[
  AAA.USER.SESSIONID] + \" for login into secure access gateway.
  Valid till EXPIRE_TIME. Do not share the OTP with anyone for
  security reasons&Mobile:\" + AAA.USER.ATTRIBUTE(1)\"
2
3 add authentication webAuthAction sms_post -serverIP <web_application_ip
  > -serverPort 80 -fullReqExpr q{
4   \"POST /MyPHP/auth.php HTTP/\" + http.req.version.major + \".\" + http.req
  .version.major + \"\r\nAccept:*/*\r\nHost: <web_application_ip> \r\
  nContent-Length:100\r\n\r\n\" + otp_exp_post }
5   -scheme http -successRule true
6
7 add authentication Policy post_wpp -rule true -action sms_post
8 <!--NeedCopy-->

```

Check the OTP

Add the following policy and policy label to check if the OTP exists for the user session:

```

1 add authentication policylabel check_otp_label -loginSchema LSCHEMA_INT
2
3 add authentication Policy check_otp -rule \"$otp_store.valueExists(AAA.
  USER.SESSIONID)\" -action NO_AUTHN
4 <!--NeedCopy-->

```

OTP verification by comparing the user-provided value and the OTP store value

Run the following commands to verify the OTP by comparing the user-provided value and the OTP store value:

```

1 add authentication loginSchema onlypassword -authenticationSchema \"/
  nsconfig/loginschema/LoginSchema/OnlyPassword.xml\"
2
3 add authentication policylabel otp_verify_label -loginSchema
  onlypassword
4
5 add authentication Policy otp_verify -rule \"AAA.LOGIN.PASSWORD.EQ(
  $otp_store[AAA.USER.SESSIONID])\" -action NO_AUTHN
6 <!--NeedCopy-->

```

Bind the policy to the authentication policy label

```
1 bind authentication policylabel set_otp_label -policyName
  cascade_noauth -priority 2 -gotoPriorityExpression NEXT -nextFactor
  check_otp_label
2
3 bind authentication policylabel check_otp_label -policyName post_wpp -
  priority 1 -gotoPriorityExpression NEXT -nextFactor otp_verify_label
4
5 bind authentication policylabel otp_verify_label -policyName otp_verify
  -priority 1 -gotoPriorityExpression NEXT
6 <!--NeedCopy-->
```

Create an authentication virtual server and a load balancing virtual server

```
1 add authentication vserver avs SSL <ipadresss> 443
2
3 add ssl certKey aaa_local -cert aaatm_wild.cer -key aaatm_wild.key
4
5 bind ssl vserver avs -certkeyName aaa_local
6
7 bind authentication vserver avs -policy ldap_extraction_policy -
  priority 1 -nextFactor set_otp_label -gotoPriorityExpression NEXT
8
9 add lb vserver lb HTTP <ip_adresss> 80 -persistenceType NONE -
  cltTimeout 180 -AuthenticationHost <auth_server> -Authentication ON
10
11 add service svc <Ip_adresss> HTTP 80
12
13 bind lb vserver lb svc
14 <!--NeedCopy-->
```

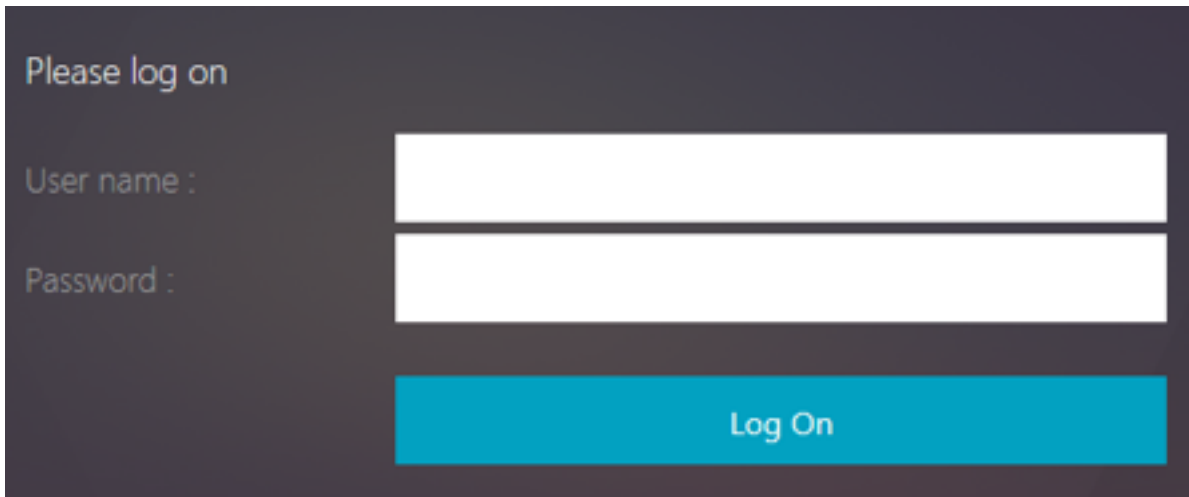

Note:

The policy for cascading authentication is added to enable reliable and continuous authentication for the end users. If the current factor fails, the next factor is evaluated such that there is no impact on the user experience.

Forms based authentication

October 30, 2020

With Forms based authentication, a logon form is presented to the end-user. This type of authentication form supports both multifactor (nFactor) authentication and Classic authentication.

Ensure the following for the Forms based authentication to work:

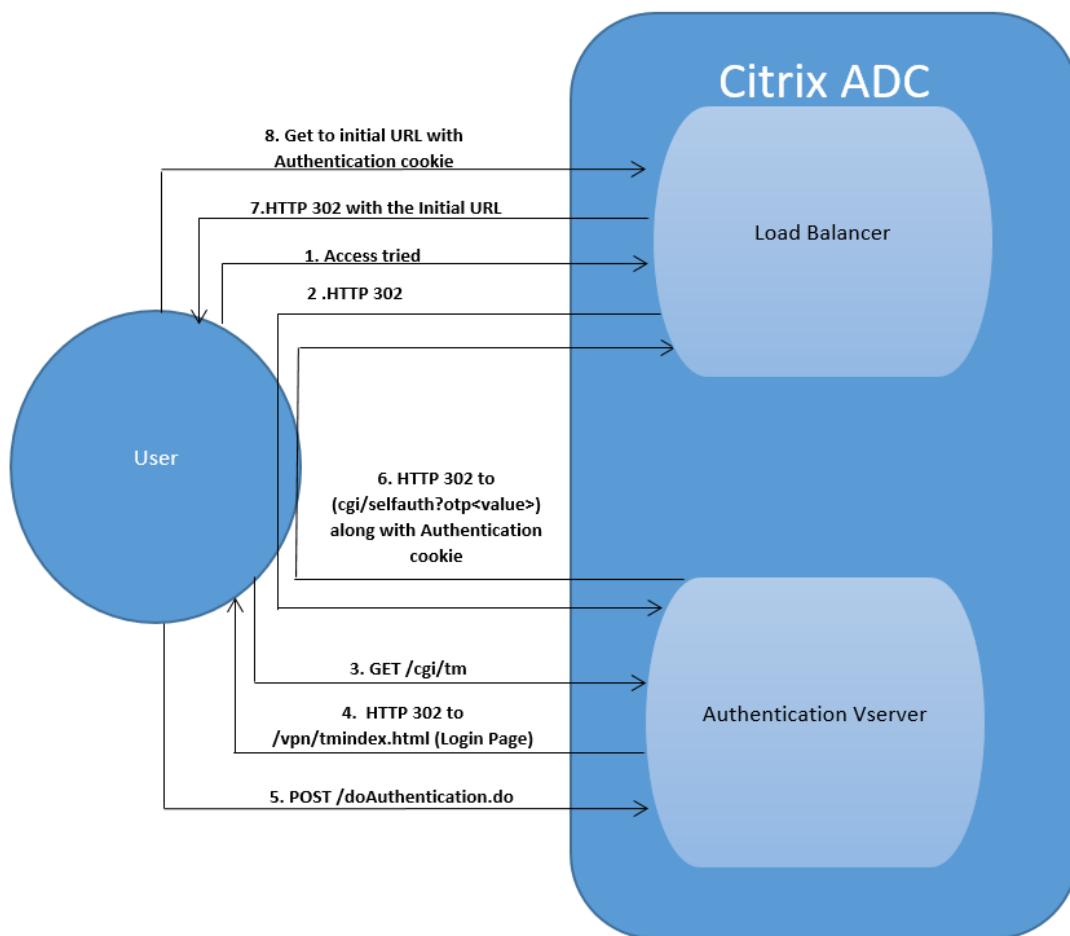

- The load balancing virtual server must have authentication turned **ON**.
- ‘authenticationHost’ parameter must be specified to which the user must be redirected for authentication. The command for configuring the same is as follows:

```
1 set lb vs lb1 -authentication on -authenticationhost aaavs-ip/  
fdn
```

- Form based authentication is compatible with browser that supports HTML

The following steps walk through how the Forms based authentication works:

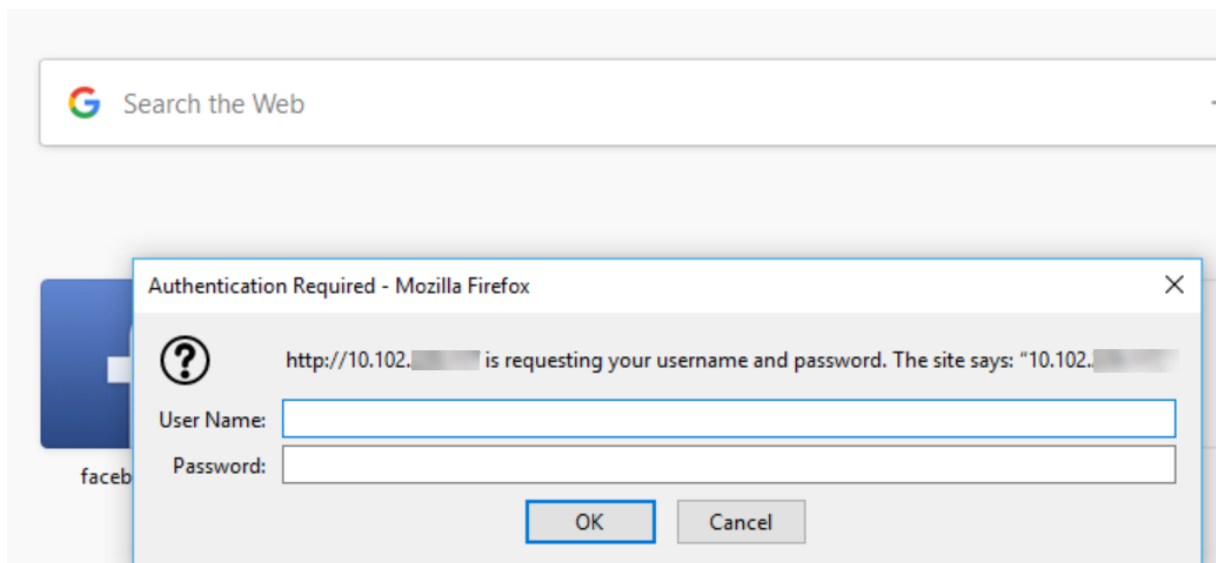

1. The client (browser) sends a GET request for a URL on the TM (load balancing/CS) virtual server.
2. The TM virtual server determines that the client has not been authenticated, and sends an HTTP 302 response to the client. The response contains a hidden script that causes the client to issue a GET request for /cgi/tm to the authentication virtual server.
3. The client sends GET /cgi/tm containing the target URL to the authentication virtual server.
4. The authentication virtual server sends out a redirect to the login page.
5. The user sends out its credentials to the authentication virtual server with a POST /doAuthentication.do. Authentication is done by the authentication virtual server.
6. If the credentials are correct, the authentication virtual server sends an HTTP 302 response to the cgi/selfauth url on the load balancing server with a one time token (OTP).
7. The load balancing server sends HTTP 302 to the client.
8. The client sends a GET request for their initial URL target URL along with a 32 byte cookie.

401 based authentication

May 2, 2023

With 401 based Authentication, the NetScaler appliance presents a pop-up dialog box to the end user.

Form based AAA-TM works on the redirect messages. Some applications do not support redirects, in such cases the 401 authentication enabled AAA-TM is used.

Enable the following parameters for 401 Authentication AAA-TM to work.

- 'authnVsName' parameter value for the load balancing virtual server must be the name of the authentication virtual server to be used to authenticate users.
- 'authn401' parameter must be enabled. The command for configuring the same is as follows:

```
1 set lb vs lb1 - authn401 on - authnvsName <aaavs-name>
```

The following steps walk through how the 401 Authentication works:

1. User tries to access a particular URL using the load balancing virtual server.
2. The load balancing virtual server sends a 401 HTTP response back to the user indicating that authentication is required for the access.
3. The user sends its credentials to the load balancing virtual server in the authorization header.
4. The load balancing virtual server authenticates the user and then connects the user to the back end servers.

Important:

For a load balancing virtual server with 401 authentication ON, several authentication and authorization sessions might be created for the same user in a short time. This configuration might lead to a spike in the memory. You can apply the following configuration on the NetScaler appliance to debug and identify the end client application.

```

1 set syslogparams -userDefinedAuditlog yes
2
3 add audit messageaction 401_log_act INFORMATIONAL '"LB-401 accessed:
  User: <" + AAA.USER.NAME + "> SessionID <" + AAA.USER.SESSIONID + ">
  Client :<" + CLIENT.IP.SRC + "> accessed URL: <" + HTTP.REQ.URL +
  ">"
4
5 add rewritepolicy rewrite_401_log true NOREWRITE -logAction 401_log_act
6
7 bind lb vserver <lb_name> -policyName rewrite_401_log -priority 100 -
  type reqUEST
8 <!--NeedCopy-->
  
```

re-Captcha configuration for nFactor authentication

May 10, 2024

NetScaler Gateway supports a new first-class action `captchaAction` that simplifies re-Captcha configuration. As re-Captcha is a first-class action, it can be a factor of its own. You can inject re-Captcha anywhere in the nFactor flow.

Previously, you had to write custom WebAuth policies with changes to the RfWebUI as well. With the introduction of `captchaAction`, you do not have to modify the JavaScript.

Important:

If re-Captcha is used along with the user name or password fields in the schema, the **Submit** button is disabled until re-Captcha is met.

re-Captcha configuration

re-Captcha configuration involves two parts.

1. Configuration on Google for registering re-Captcha.
2. Configuration on NetScaler appliance to use re-Captcha as part of login flow.

re-Captcha configuration on Google

Register a domain for re-Captcha at <https://www.google.com/recaptcha/admin#l1ist>.

1. When you navigate to this page, the following screen appears.

← Register a new site

Label ⓘ

e.g. example.com 0 / 50

reCAPTCHA type ⓘ

reCAPTCHA v3 Verify requests with a score

reCAPTCHA v2 Verify requests with a challenge

Domains ⓘ

+ Add a domain, e.g. example.com

Accept the reCAPTCHA Terms of Service

By accessing or using the reCAPTCHA APIs, you agree to the Google APIs [Terms of Use](#), Google [Terms of Use](#), and to the Additional Terms below. Please read and understand all applicable terms and policies before accessing the APIs.

reCAPTCHA Terms of Service ▾

Send alerts to owners ⓘ

CANCEL
SUBMIT

Note

Use reCAPTCHA v2 only. Invisible re-Captcha is still in preview.

2. After a domain is registered, the “SiteKey” and “SecretKey” are displayed.

ⓘ Adding reCAPTCHA to your site

▾ Keys

<p>Site key Use this in the HTML code your site serves to users.</p> <div style="border: 1px solid #ccc; padding: 5px; background-color: #f0f0f0;">6Ld..._B</div>	<p>Secret key Use this for communication between your site and Google. Be sure to keep it a secret.</p> <div style="border: 1px solid #ccc; padding: 5px; background-color: #f0f0f0;">6I..._C</div>
--	--

▾ Step 1: client-side integration

Note

The “SiteKey” and “SecretKey” are grayed out for security reasons. “SecretKey” must be kept safe.

re-Captcha configuration on a NetScaler appliance

The re-Captcha configuration on the NetScaler appliance can be divided into three parts:

- Display re-Captcha screen
- Post the re-Captcha response to Google server
- LDAP configuration is second factor for user logon (optional)

Display re-Captcha screen The login form customization is done through the SingleAuth-Captcha.xml login schema. This customization is specified at authentication virtual server and is sent to UI for rendering the login form. The built-in login schema, SingleAuthCaptcha.xml, is at the `/nsconfig/loginSchema/LoginSchema` directory on the NetScaler appliance.

Important

- The SingleAuthCaptcha.xml login schema can be used when LDAP is configured as the first factor.
- Based on your use case and different schemas, you can modify the existing schema. For instance if you need only re-Captcha factor (without user name or password) or dual authentication with re-Captcha.
- If any custom modifications are done or the file is renamed, Citrix recommends copying all loginSchemas from the `/nsconfig/loginschema/LoginSchema` directory to the parent directory, `/nsconfig/loginschema`.

To configure display of re-Captcha using CLI

```
1 add authentication loginSchema singleauthcaptcha -authenticationSchema
  /nsconfig/loginschema/SingleAuthCaptcha.xml
2
3 add authentication loginSchemaPolicy singleauthcaptcha -rule true -
  action singleauthcaptcha
4
5 add authentication vserver auth SSL <IP> <Port>
6
7 add ssl certkey vserver-cert -cert <path-to-cert-file> -key <path-to-
  key-file>
8
9 bind ssl vserver auth -certkey vserver-cert
10
11 bind authentication vserver auth -policy singleauthcaptcha -priority 5
  -gotoPriorityExpression END
```

```
12 <!--NeedCopy-->
```

Post the re-Captcha response to Google server After you have configured the re-Captcha that must be displayed to the users, the admins add the configuration to the Google server to verify the re-Captcha response from the browser.

To verify re-Captcha response from the browser

```
1 add authentication captchaAction myrecaptcha -sitekey <sitekey-copied-
  from-google> -secretkey <secretkey-from-google>
2
3 add authentication policy myrecaptcha -rule true -action myrecaptcha
4
5 bind authentication vserver auth -policy myrecaptcha -priority 1
6 <!--NeedCopy-->
```

NetScaler contacts <https://www.google.com/recaptcha/api/siteverify> to validate the Captcha information. So, ensure that the site is reachable from NetScaler.

To verify if the Google site is reachable, run the script `curl -vvv https://www.google.com/recaptcha/api/siteverify`.

The following commands are required to configure if AD authentication is desired. Else, you can ignore this step.

```
1 add authentication ldapAction ldap-new -serverIP x.x.x.x -serverPort
  636 -ldapBase "cn=users,dc=aaatm,dc=com" -ldapBindDn adminuser@aaatm
  .com -ldapBindDnPassword <password> -encrypted -encryptmethod
  ENCMTHD_3 -ldapLoginName sAMAccountName -groupAttrName memberof -
  subAttributeName CN -secType SSL -passwdChange ENABLED -
  defaultAuthenticationGroup ldapGroup
2
3 add authenticationpolicy ldap-new -rule true -action ldap-new
4 <!--NeedCopy-->
```

LDAP configuration is second factor for user logon (optional) The LDAP authentication happens after re-Captcha, you add it to the second factor.

```
1 add authentication policylabel second-factor
2
3 bind authentication policylabel second-factor -policy ldap-new -
  priority 10
4
5 bind authentication vserver auth -policy myrecaptcha -priority 1 -
  nextFactor second-factor
6 <!--NeedCopy-->
```

Administrator needs to add appropriate virtual servers depending on whether load balancing virtual

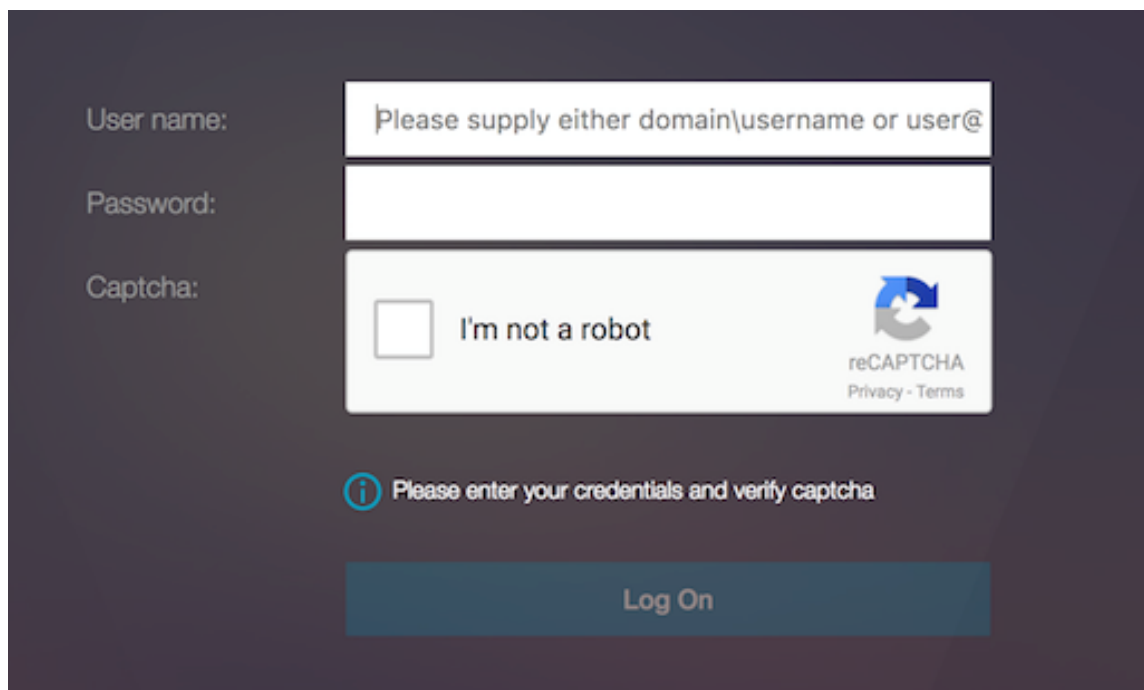

server or NetScaler Gateway appliance is used for access. Administrator must configure the following command if a load balancing virtual server is required:

```
1 add lb vserver lbtest HTTP <IP> <Port> -authentication ON -  
  authenticationHost nssp.aaatm.com  
2 <!--NeedCopy-->
```

****nssp.aaatm.com**** –Resolves to authentication virtual server.

User validation of re-Captcha Once you have configured all the steps mentioned in the previous sections, you must see the following UI.

1. Once the authentication virtual server loads the login page, the logon screen is displayed. **Log On** is disabled until re-Captcha is complete.

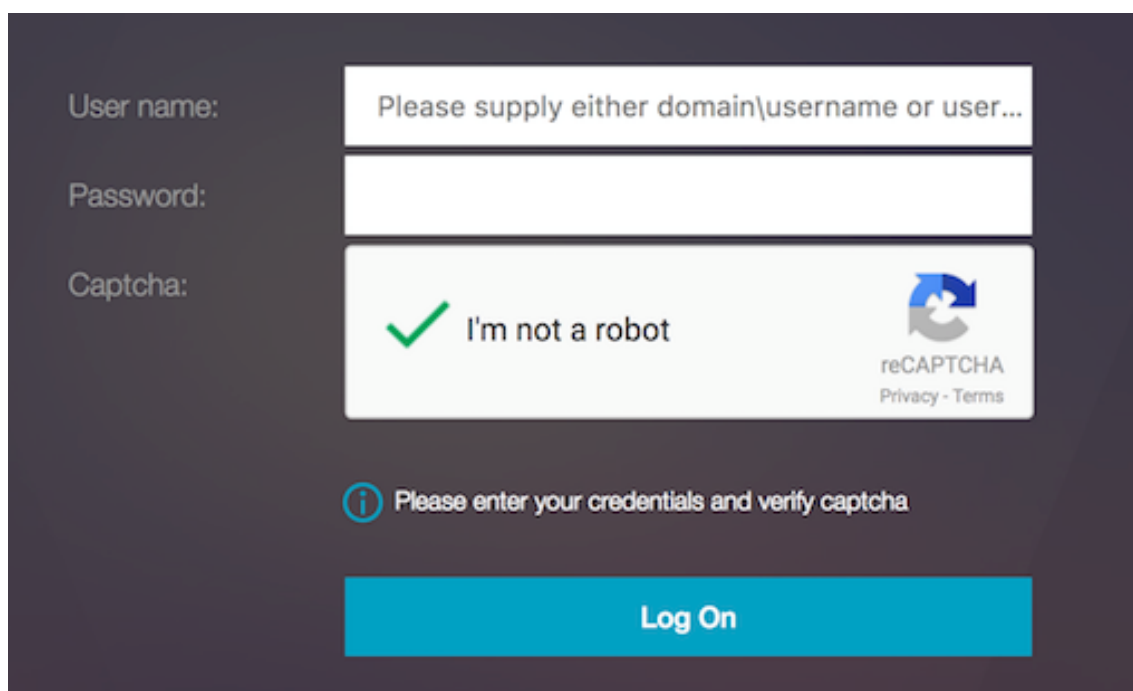

The screenshot shows a login interface on a dark background. On the left, there are labels for 'User name:', 'Password:', and 'Captcha:'. The 'User name:' field contains the placeholder text 'Please supply either domain\username or user@'. The 'Password:' field is empty. The 'Captcha:' field contains a reCAPTCHA widget with the text 'I'm not a robot' and a checkbox. To the right of the widget is the reCAPTCHA logo and the text 'reCAPTCHA Privacy - Terms'. Below the widget is an information icon and the text 'Please enter your credentials and verify captcha'. At the bottom of the form is a 'Log On' button, which is currently disabled (greyed out).

2. Select I'm not a robot option. The re-Captcha widget is displayed.

3. You are navigated through a series of re-Captcha images, before the completion page is displayed.
4. Enter the AD credentials, select the **I'm not a robot** check box and click **Log On**. If authentication succeeds, you are redirected to the desired resource.

The image shows a login form on a dark background. It has three input fields: 'User name:' with a placeholder 'Please supply either domain\username or user...', 'Password:', and 'Captcha:'. The captcha field contains a green checkmark, the text 'I'm not a robot', and the reCAPTCHA logo with 'reCAPTCHA Privacy - Terms' below it. Below the captcha field is an information icon and the text 'Please enter your credentials and verify captcha'. At the bottom is a large blue 'Log On' button.

Notes:

- If re-Captcha is used with AD authentication, the **Submit** button for credentials is disabled until re-Captcha is complete.
- The re-Captcha happens in a factor of its own. Therefore, any subsequent validations like AD must happen in the `next factor` of re-Captcha.

Native OTP support for authentication

May 13, 2024

NetScaler supports one-time passwords (OTPs) without having to use a third-party server. One-time password is a highly secure option for authenticating to secure servers as the number or passcode generated is random. Previously, specialized firms, such as RSA with specific devices that generate random numbers offered the OTPs.

In addition to reducing capital and operating expenses, this feature enhances the administrator's control by keeping the entire configuration on the NetScaler appliance.

Note:

Because third-party servers are no longer needed, the NetScaler administrator has to configure an interface to manage and validate user devices.

User must be registered with a NetScaler virtual server to use the OTP solution. Registration is required only once per unique device, and can be restricted to certain environments. Configuring and validation of a registered user is similar to configuring an extra authentication policy.

Advantages of native OTP support

- Reduces operating cost by eliminating the need to have an extra infrastructure on an authenticating server in addition to the Active Directory.
- Consolidates configuration only to NetScaler appliance thus offering great control to administrators.
- Eliminates the client's dependence on an extra authentication server for generating a number expected by clients.

Native OTP workflow

The native OTP solution is a two-fold process and the workflow is classified as the following:

- Device registration
- End user login

Important:

You can skip the registration process if you are using third-party solutions or managing other devices apart from the NetScaler appliance. The final string that you add must be in the NetScaler specified format.

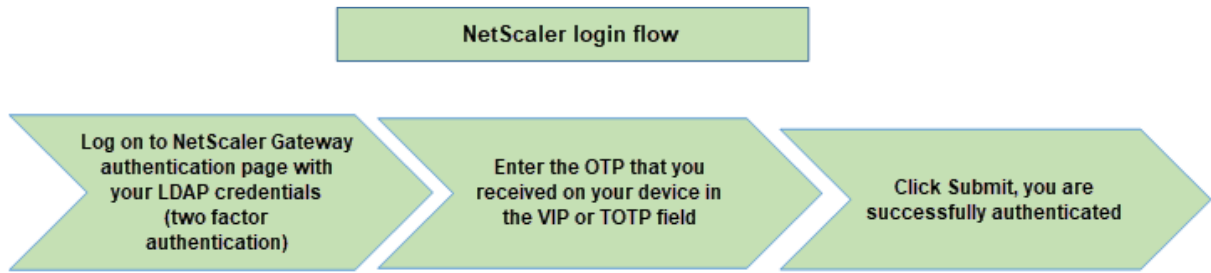

The following figure depicts the device registration flow to register a new device to receive OTP.

Note:

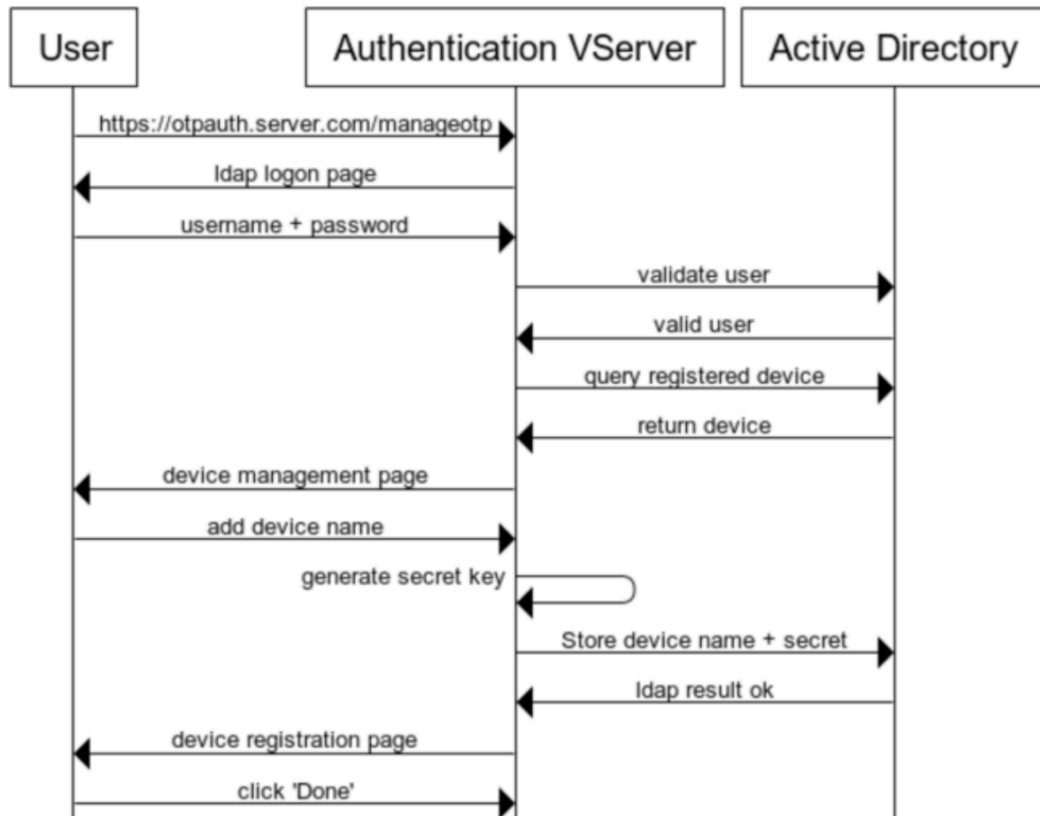

The device registration can be done using any number of factors. The single factor (as specified in the previous figure) is used as an example to explain the device registration process. For more details, see [Recommended native OTP configurations for device registration](#).

The following figure depicts the verification of OTP through the registered device.

The following figure depicts the device registration and management flow.

Device Registration and Management

The following figure depicts the end user flow for the Native OTP feature.

Prerequisites

To use the native OTP feature, make sure that the following prerequisites are met.

- NetScaler feature release version is 12.0 build 51.24 and later.
- Advanced or Premium edition license is installed on NetScaler Gateway.
- NetScaler is configured with management IP and the management console is accessible both using a browser and command line.
- NetScaler is configured with authentication, authorization, and auditing virtual server to authenticate users. For more information, see [Authentication virtual server](#)
- NetScaler appliance is configured with Unified Gateway and the authentication, authorization, and auditing profile is assigned to the Gateway virtual server.
- Native OTP solution is restricted to nFactor authentication flow. Advanced policies are required to configure the solution. For more details, see [Configuring nFactor authentication](#).

Also ensure the following for Active Directory:

- A minimum attribute length of 256 characters.
- Attribute type must be 'DirectoryString' such as UserParameters. These attributes can hold string values.
- Attribute string type must be Unicode, if device name is in non-English characters.
- NetScaler LDAP administrator must have write access to the selected AD attribute.
- NetScaler appliance and client machine must be synced to a common Network Time Server.

Configure Native OTP using the GUI

The native OTP registration is not just a single factor authentication. The following sections help you to configure the single and second factor authentication.

Create Login Schema for first factor

1. Navigate to **Security > AAA-Application Traffic > Login Schema**.
2. Go to **Profiles** and click **Add**.
3. On the **Create Authentication Login Schema** page, enter *lschema_single_auth_manage_otp* under the **Name** field and click **Edit** next to **noschema**.
4. Click the **LoginSchema** folder.
5. Scroll down to select **SingleAuthManageOTP.xml** and click **Select**.
6. Click **Create**.
7. Click **Policies** and Click **Add**.
8. On the **Create Authentication Login Schema Policy** screen, enter the following values.
Name: `lpol_single_auth_manage_otp_by_url`
Profile: Select *lschema_single_auth_manage_otp* from the list.
Rule: `HTTP.REQ.COOKIE.VALUE("NSC_TASS").EQ("manageotp")`

Configure authentication, authorization, and auditing virtual server

1. Navigate to **Security > AAA –Application Traffic > Authentication Virtual Servers**. Click to edit the existing virtual server. For more information, see [Authentication virtual server](#)
2. Click the + icon next to **Login Schemas** under **Advanced Settings** in the right pane.
3. Select **No Login Schema**.
4. Click the arrow and select the **lpol_single_auth_manage_otp_by_url** Policy, click **Select**, and click **Bind**.
5. Scroll up and select **1 Authentication Policy** under **Advanced Authentication Policy**.
6. Right-click the **nFactor Policy** and select **Edit Binding**. Right-click the already configured nFactor Policy or refer to [nFactor](#) to create one and select Edit Binding.
7. Click the arrow under **Select Next Factor** to select an existing configuration or click **Add** to create a factor.

8. On the **Create Authentication PolicyLabel** screen, enter the following, and click **Continue**:
Name: manage_otp_flow_label
Login Schema: Lschema_Int
9. On the **Authentication PolicyLabel** screen, click **Add** to create a Policy.
Create a policy for a normal LDAP server.
10. On the **Create Authentication Policy** screen, enter the following:
Name: auth_pol_ldap_native_otp
11. Select the Action type as **LDAP** using the **Action Type** list.
12. In the **Action** field, click **Add** to create an action.
Create the first LDAP action with authentication enabled to be used for single factor.
13. In the **Create Authentication LDAP server** page, select the **Server IP** radio button, clear the checkbox next to **Authentication**, enter the following values, and select **Test Connection**. The following is a sample configuration.
Name: ldap_native_otp
IP Address: 192.8.xx.xx
Base DN: DC=training, DC=lab
Administrator: Administrator@training.lab
Password: xxxxx
Create a policy for OTP .
14. On the **Create Authentication Policy** screen, enter the following:
Name: auth_pol_ldap_otp_action
15. Select the Action type as **LDAP** using the **Action Type** list.
16. In the **Action** field, click **Add** to create an action.
Create the second LDAP action to set OTP authenticator with OTP secret configuration and authentication unchecked.
17. In the **Create Authentication LDAP server** page, select the **Server IP** radio button, clear the checkbox next to **Authentication**, enter the following values, and select **Test Connection**. The following is a sample configuration.
Name: ldap_otp_action
IP Address: 192.8.xx.xx

Base DN: DC=training, DC=lab

Administrator: Administrator@training.lab

Password: xxxxx

18. Scroll down to the **Other Settings** section. Use the drop-down menu to select the following options.

Server Logon Name Attribute as **New** and type **userprincipalname**.

19. Use the drop-down menu to select **SSO Name Attribute** as **New** and type **userprincipalname**.

20. Enter “UserParameters” in the **OTP Secret** field and click **More**.

21. Enter the following Attributes.

Attribute 1 = mail

Attribute 2 = objectGUID

Attribute 3 = immutableID

22. Click **OK**.

23. On the **Create Authentication Policy** page, set the Expression to **true** and click **Create**.

24. On the **Create Authentication Policylabel** page, click **Bind**, and click **Done**.

25. On the **Policy Binding** page, click **Bind**.

26. On the **Authentication policy** page, click **Close** and click **Done**.

Create OTP for OTP verification.

27. On the **Create Authentication Policy** screen, enter the following:

Name: auth_pol_ldap_otp_verify

28. Select the Action type as **LDAP** using the **Action Type** list.

29. In the **Action** field, click **Add** to create an action.

Create the third LDAP action to verify OTP.

30. In the **Create Authentication LDAP server** page, select the **Server IP** radio button, clear the checkbox next to **Authentication**, enter the following values, and select **Test Connection**. The following is a sample configuration.

Name: ldap_verify_otp

IP Address: 192.168.xx.xx

Base DN: DC=training, DC=lab

Administrator: Administrator@training.lab

Password: xxxxx

31. Scroll down to the **Other Settings** section. Use the drop-down menu to select the following options.
Server Logon Name Attribute as **New** and type **userprincipalname**.
32. Use the drop-down menu to select **SSO Name Attribute** as **New** and type **userprincipalname**.
33. Enter “UserParameters” in the **OTP Secret** field and click **More**.
34. Enter the following Attributes.
Attribute 1 = mail
Attribute 2 = objectGUID
Attribute 3 = immutableID
35. Click **OK**.
36. On the **Create Authentication Policy** page, set the Expression to **true** and click **Create**.
37. On the **Create Authentication Policylabel** page, click **Bind**, and click **Done**.
38. On the **Policy Binding** page, click **Bind**.
39. On the **Authentication policy** page, click **Close** and click **Done**.

You probably don't already have an Advanced Authentication Policy for your normal LDAP server. Change the Action Type to LDAP. Select your normal LDAP server, which is the one that has Authentication enabled. Enter true as the expression. This uses Advanced policy instead of Classic Syntax. Click **Create**.

Note:

The authentication virtual server must be bound to the RFWebUI portal theme. Bind a server certificate to the server. The server IP '1.2.3.5' must have a corresponding FQDN that is, otpauth.server.com, for later use.

Create login schema for second factor OTP

1. Navigate to **Security > AAA-Application Traffic > Virtual Servers**. Select the virtual server to be edited.
2. Scroll down and select **1 Login Schema**.
3. Click **Add Binding**.
4. Under the **Policy Binding** section, click **Add** to add a policy.
5. On the **Create Authentication Login Schema Policy** page, enter the name of the policy, and click **Add**.
6. On the **Create Authentication Login Schema** page, enter the name of the login schema and click the pencil icon next to **noschema**.

7. Click the **LoginSchema** folder, select **DualAuthManageOTP.xml**, and then click **Select**.
8. Click **More** and scroll down.
9. In the **Password Credential Index** field, enter 1. This causes nFactor to save the user's password into authentication, authorization, and auditing Attribute #1, which can be used later in a Traffic Policy to single sign-on to StoreFront. If you don't do this, then NetScaler Gateway tries to use the Passcode to authenticate to StoreFront, which does not work.
10. Click **Create**.
11. In the **Rule** section, enter **True**. Click **Create**.
12. Click **Bind**.
13. Notice the two factors of authentication. Click **Close** and click **Done**.

Traffic Policy for single sign-on

1. Navigate to **NetScaler Gateway > Policies > Traffic**
2. On the **Traffic Profiles** tab, click **Add**.
3. Enter a name for the traffic profile.
4. Scroll down, in the SSO Password Expression box, enter the following, and click **Create**. This is where we use the login schema password attribute specified for the second factor OTP.
`AAA.USER.ATTRIBUTE(1)`
5. On the **Traffic Policies** tab, click **Add**.
6. In the **Name** field, enter a name for the traffic policy.
7. In the **Request Profile** field, select the traffic profile you created.
8. In the Expression box, enter **True**. If your NetScaler Gateway virtual server allows full VPN, change the expression to the following.
`http.req.method.eq(post) || http.req.method.eq(get)&& false`
9. Click **Create**.
10. Bind the traffic policy to a VPN virtual server.
 - Navigate to **Security > AAA - Application Traffic > Authentication Profile**.
 - Configure the authentication profile by selecting the NetScaler Gateway virtual server and then click **OK**.
 - Navigate to **NetScaler Gateway > NetScaler Gateway Virtual Servers** and select the NetScaler Gateway virtual server. The **VPN Virtual Server** page appears.
 - In the **Policies** section, click the + icon.
 - Select the policy type as **Traffic** and click **Continue**.
 - Select the traffic policy and click **Bind**.
 - Click **Done**.

Configure content switching policy for manage OTP

The following configurations are required if you are using Unified Gateway.

1. Navigate to **Traffic Management > Content Switching > Policies**. Select the content switching policy, right click, and select **Edit**.
2. Edit the expression to evaluate the following OR statement and click **OK**:

```
is_vpn_url || HTTP.REQ.URL.CONTAINS("manageotp")
```

Configure Native OTP using the CLI

You must have the following information to configure the OTP device management page:

- IP assigned to authentication virtual server
- FQDN corresponding to the assigned IP
- Server certificate for authentication virtual server

Note:

Native OTP is a web-based solution only.

To configure the OTP device registration and management page

Create authentication virtual server

```
1  ```
2  add authentication vserver authvs SSL 1.2.3.5 443
3  bind authentication vserver authvs -portaltheme RFWebUI
4  bind ssl vserver authvs -certkeyname otpauthcert
5  <!--NeedCopy--> ```
```

Note:

The authentication virtual server must be bound to the RFWebUI portal theme. Bind a server certificate to the server. The server IP '1.2.3.5' must have a corresponding FQDN that is, otpauth.server.com, for later use.

To create LDAP logon action

```
1  add authentication ldapAction <LDAP ACTION NAME> -serverIP <SERVER IP>
   - serverPort <SERVER PORT> -ldapBase <BASE> -ldapBindDn <AD USER> -
   ldapBindDnPassword <PASSWO> -ldapLoginName <USER FORMAT>
```

Example:

```
1 add authentication ldapAction ldap_logon_action -serverIP 1.2.3.4 -
  serverPort 636 -ldapBase "OU=Users,DC=server,DC=com" -ldapBindDn
  administrator@ctxnsdev.com -ldapBindDnPassword PASSWORD -
  ldapLoginName userprincipalname
```

To add authentication policy for LDAP Logon

```
1 add authentication Policy auth_pol_ldap_logon -rule true -action
  ldap_logon_action
```

To present UI via LoginSchema

Show user name field and password field to users upon logon

```
1 add authentication loginSchema lschema_single_auth_manage_otp -
  authenticationSchema "/nsconfig/loginschema/LoginSchema/
  SingleAuthManageOTP.xml"
```

Display device registration and management page

We recommend two ways of displaying the device registration and management screen: URL or host name.

Note:

Currently, device registration and device management can be performed only using a browser.

- **Using URL**

When the URL contains '/manageotp'

```
- add authentication loginSchemaPolicy lpol_single_auth_manage_otp_by_ur
  -rule "http.req.cookie.value("NSC_TASS").contains("manageotp
  ")"-action lschema_single_auth_manage_otp
- bind authentication vserver authvs -policy lpol_single_auth_manage_otp
  -priority 10 -gotoPriorityExpression END
```

- **Using hostname**

When the host name is 'alt.server.com'

```
- add authentication loginSchemaPolicy lpol_single_auth_manage_otp_by_ho
  -rule "http.req.header("host").eq("alt.server.com)"-action
  lschema_single_auth_manage_otp
```

```
- bind authentication vserver authvs -policy lpol_single_auth_manage_otp
  -priority 20 -gotoPriorityExpression END
```

To configure the user login page using the CLI

You must have the following information to configure the User Logon page:

- IP for a load balancing virtual server
- Corresponding FQDN for the load balancing virtual server
- Server certificate for the load balancing virtual server

```
1 bind ssl virtual server lbvs_https -certkeyname lbvs_server_cert
2 <!--NeedCopy-->
```

Back-end service in load balancing is represented as follows:

```
1 ```
2 add service iis_backendsso_server_com 1.2.3.210 HTTP 80
3 bind lb vserver lbvs_https iis_backendsso_server_com
4 <!--NeedCopy--> ```
```

To create OTP passcode validation action

```
1 add authentication ldapAction <LDAP ACTION NAME> -serverIP <SERVER IP>
  -serverPort <SERVER PORT> -ldapBase <BASE> -ldapBindDn <AD USER> -
  ldapBindDnPassword <PASSWORD> -ldapLoginName <USER FORMAT> -
  authentication DISABLED -OTPSecret <LDAP ATTRIBUTE>`
```

Example:

```
1 add authentication ldapAction ldap_otp_action -serverIP 1.2.3.4 -
  serverPort 636 -ldapBase "OU=Users,DC=server,DC=com" -ldapBindDn
  administrator@ctxnsdev.com -ldapBindDnPassword PASSWORD -
  ldapLoginName userprincipalname -authentication DISABLED -OTPSecret
  userParameters
```

Important:

The difference between the LDAP logon and OTP action is the need to disable the authentication and introduce a new parameter `OTPSecret`. Do not use the AD attribute value.

To add authentication policy for OTP passcode validation

```
1 add authentication Policy auth_pol_otp_validation -rule true -action
  ldap_otp_action
```

To present the two-factor authentication through LoginSchema Add the UI for two factor authentication.

```
1 add authentication loginSchema lscheme_dual_factor -
   authenticationSchema "/nsconfig/loginschema/LoginSchema/DualAuth.xml"
2 add authentication loginSchemaPolicy lpol_dual_factor -rule true -
   action lscheme_dual_factor
```

To create passcode validation factor via the policy label Create a manage OTP flow policy label for the next factor (first factor is LDAP logon)

```
1 add authentication loginSchema lschema_noschema -authenticationSchema
   noschema
2 add authentication policylabel manage_otp_flow_label -loginSchema
   lschema_noschema
```

To bind the OTP policy to the policy label

```
1 bind authentication policylabel manage_otp_flow_label -policyName
   auth_pol_otp_validation -priority 10 -gotoPriorityExpression NEXT
```

To bind the UI flow Bind the LDAP logon followed by the OTP validation with the authentication virtual server.

```
1 bind authentication vserver authvs -policy auth_pol_ldap_logon -
   priority 10 -nextFactor manage_otp_flow_label -
   gotoPriorityExpression NEXT
2 bind authentication vserver authvs -policy lpol_dual_factor -priority
   30 -gotoPriorityExpression END
```

To create a traffic policy for single sign-on and bind it to a VPN virtual server

```
1 add vpn trafficAction vpn_html_pol http -userExpression aaa.user.
   attribute(1) -passwdExpression aaa.user.attribute(2)
2
3 add vpn trafficpolicy tf1 'http.req.method.eq(post)||http.req.method.eq
   (get) && false' vpn_html_pol
4
5 bind vpn vserver vpn1 -policy tf1 -priority 10
6 <!--NeedCopy-->
```

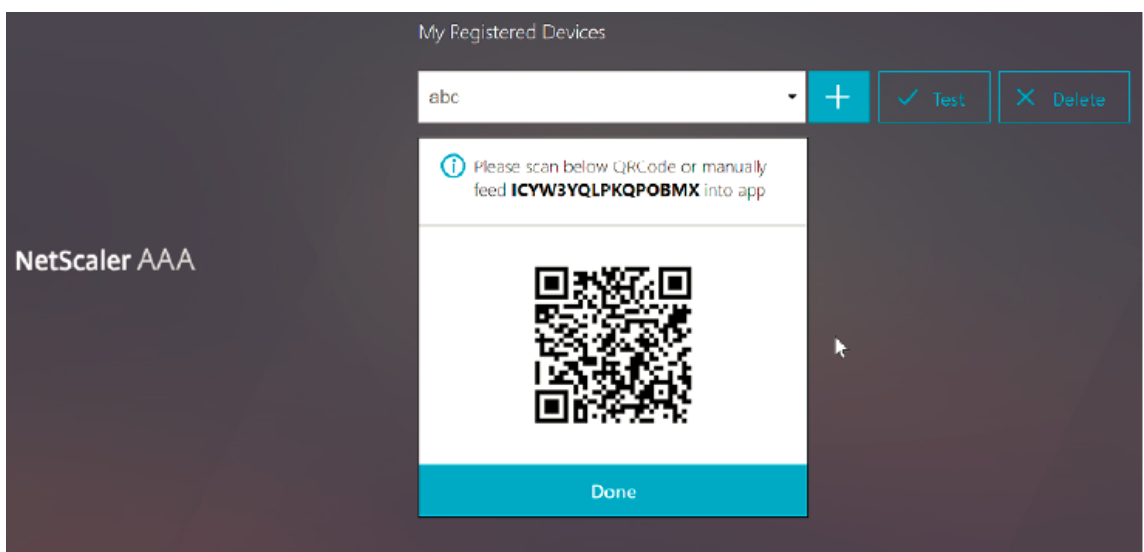

Register your device with NetScaler

1. On your browser, navigate to your NetScaler FQDN (first public facing IP), with a /manageotp suffix. For example, <https://otpauth.server.com/manageotp> Login with user credentials.

2. Click the + icon to add a device.

3. Enter a device name and press **Go**. A barcode appears on the screen.
4. Click **Begin Setup** and then click **Scan Barcode**.
5. Hover the device camera over the QR code. You can optionally enter the code.

Note:

The displayed QR code is valid for 3 minutes.

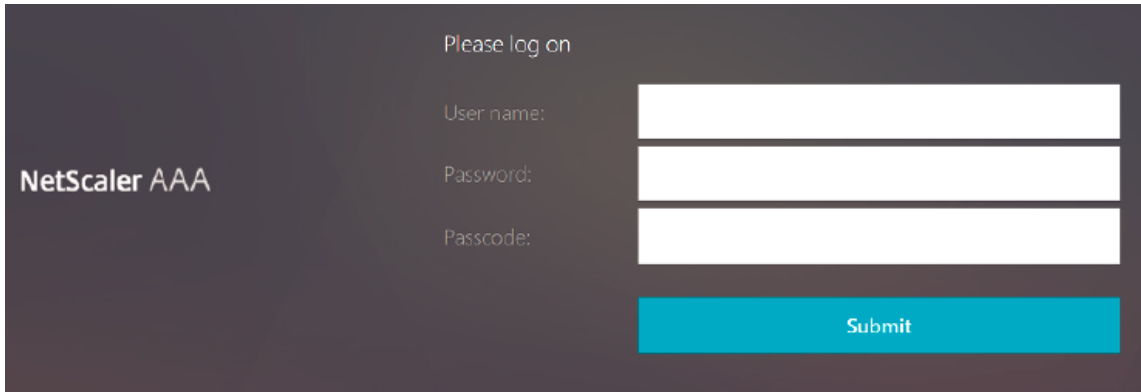

6. Upon successful scan, you are presented with a 6 digit time sensitive code that can be used to log in.

7. To test, click **Done** on the QR screen, then click the green check mark on the right.
8. Select your device from the drop-down menu and enter the code from Google Authenticator (must be blue, not red) and click **Go**.
9. Make sure to log out using the drop-down menu at the top right corner of the page.

Log in to NetScaler using the OTP

1. Navigate to your first public-facing URL and enter your OTP from Google Authenticator to log on.
2. Authenticate to the NetScaler splash page.

The image shows a dark-themed login splash page for NetScaler AAA. On the left side, the text "NetScaler AAA" is displayed in a light color. On the right side, there is a "Please log on" section with three input fields: "User name:", "Password:", and "Passcode:". Below these fields is a prominent blue "Submit" button.

Store OTP secret data in an encrypted format

October 13, 2023

Starting from NetScaler release 13.0 build 41.20, the OTP secret data can be stored in an encrypted format instead of plain text.

Previously, the NetScaler appliance stored OTP secret as a plain text in AD. Storing OTP secret in plain text poses a security threat as a malicious attacker or an admin might exploit the data by viewing the shared secret of other users.

The encryption parameter enables encryption of OTP secret in AD. When you register a new device with NetScaler version 13.0 build 41.20, and enable the encryption parameter, the OTP secret is stored in an encrypted format, by default. However, if the encryption parameter is disabled, the OTP secret is stored in plain text format.

For devices registered prior to 13.0 build 41.20, you must perform the following as a best practice:

1. Upgrade the 13.0 NetScaler appliance to 13.0 build 41.20.
2. Enable the encryption parameter on the appliance.
3. Use the OTP secret migration tool to migrate OTP secret data from plain text format to encrypted format.

For details about the OTP secret migration tool, see [OTP encryption tool](#).

Important

Citrix recommends you as an admin to ensure the following criteria is met:

- A new certificate must be configured to encrypt OTP secrets if you are not using KBA as part of self-service password reset feature.
 - To bind the certificate to VPN global, you can use the following command:

```
bind vpn global -userDataEncryptionKey <certificate name>
```
- If you are already using a certificate to encrypt KBA, you can use the same certificate to encrypt OTP secrets.
- New OTP registrations always happen with the last bound certificate, as it gets the highest priority. In the example shown below, if you bind a certificate (cert1) and then bind another certificate (cert2), then cert2 is considered for device registration. If the certificate required for device registration is missing, the end user login fails.

```
1 bind vpn global -userDataEncryptionKey otp-cert1
2 bind vpn global -userDataEncryptionKey otp-cert2
3 <!--NeedCopy-->
```

In the following example, the `cert2` certificate is displayed as the first entry on the output of the `show vpn global` command:

```
1 show vpn global
2
3 Portal Theme: RfWebUI
4 Userdata Encryption Certificate: cert2
5 Userdata Encryption Certificate: cert1
6 1) VPN Clientless Access Policy Name:
   ns_cvpn_owa_policy Priority: 95000
7 Bindpoint: REQ_DEFAULT
8 2) VPN Clientless Access Policy Name: ns_cvpn_sp_policy
   Priority: 96000
9 Bindpoint: REQ_DEFAULT
10 3) VPN Clientless Access Policy Name:
   ns_cvpn_sp2013_policy Priority: 97000
11 Bindpoint: REQ_DEFAULT
12 4) VPN Clientless Access Policy Name: ns_cvpn_default_policy
   Priority: 100000
13 Bindpoint: REQ_DEFAULT
14 <!--NeedCopy-->
```

To enable OTP encryption data by using the CLI

At the command prompt, type:

```
set aaa otpparameter [-encryption ( ON | OFF )]
```

Example

```
set aaa otpparameter -encryption ON
```

To configure the OTP encryption by using the GUI

1. Navigate to **Security > AAA –Application Traffic** and click **Change authentication AAA OTP Parameter** under **Authentication Settings** section.
2. On the **Configure AAA OTP Parameter** page, select **OTP Secret encryption**.
3. Click **OK**.

Configuring the number of end-user devices for receiving OTP notifications

Administrators can now configure the number of devices that an end user can register to receive OTP notification or authentication.

To configure the number of devices in OTP by using the CLI

At the command prompt, type:

```
set aaa otpparameter [-maxOTPDevices <positive_integer>]
```

Example

```
set aaa otpparameter -maxOTPDevices 4
```

To configure the number of devices by using the GUI

1. Navigate to **Security > AAA –Application Traffic**.
2. In the **Authentication Settings** section, click **Change authentication AAA OTP Parameter**.
3. On the **Configure AAA OTP Parameter** page, enter the value for **Max OTP device Configured**.
4. Click **OK**.

OTP encryption tool

November 7, 2023

Starting from NetScaler release 13.0 build 41.20, the OTP secret data is stored in an encrypted format instead of plain text for enhanced security. Storing of an OTP secret in encrypted format is automatic and does not require manual intervention.

Previously, the NetScaler appliance stored an OTP secret as a plain text in the active directory. Storing an OTP secret in a plain text format posed a security threat as a malicious attacker or an admin can exploit the data by viewing the shared secret of other users.

The OTP encryption tool provides the following advantages:

- Does not result in any data loss even if you have old devices that are using an old format (plain text).
- The backward compatibility support with an old NetScaler Gateway version, helps to integrate and support the existing devices, along with the new device.
- The OTP encryption tool helps admins migrate all the OTP secret data of all users at once.

Note

The OTP encryption tool does not encrypt or decrypt KBA registration or Email registration data.

Uses of OTP encryption tool

The OTP encryption tool can be used for the following:

- **Encryption.** Store the OTP secret in encrypted format. The tool extracts the OTP data of the devices registered with NetScaler, and then converts the OTP data in plain text format to encrypted format.
- **Decryption.** Revert the OTP secret to the plain text format.
- **Update certificates.** Administrators can update the certificate to a new certificate at any time. Admins can use the tool to enter the new certificate and update all the entries with the new certificate data. The certificate path must either be an absolute path or a relative path.

Important

- You must enable the encryption parameter in the NetScaler appliance to use the OTP encryption tool.
- For devices registered with NetScaler before build 41.20, you must perform the following:
 - Upgrade the 13.0 NetScaler appliance to 13.0 build 41.20.
 - Enable the encryption parameter on the appliance.
 - Use the OTP Secret migration tool to migrate OTP secret data from plain text format to encrypted format.

- The OTP encryption tool supports only single-valued user attributes. It does not support multi-valued user attributes.

OTP secret data in plain text format

Example:

```
#@devicename=<16 or more bytes>&tag=<64bytes>&,&
```

As you can see, the starting pattern for an old format is always “#@” and an ending pattern is always “&”. All the data between “devicename=” and end pattern, constitutes user OTP data.

OTP secret data in encrypted format

The new encrypted format of OTP data is of the following format:

Example:

```
1      {
2
3          "otpdata" : {
4
5              "devices" : {
6
7                  "device1" : "value1" ,
8                  "device2" : "value2" , ...
9              }
10
11          }
12
13      }
14
15 <!--NeedCopy-->
```

Where, value1 is a base64 encoded value of KID + IV + cipher data

Cipher data is structured as the following:

```
1      {
2
3          secret:<16-byte secret>,
4          tag : <64-byte tag value>
5          alg: <algorithm used> (not mandatory, default is sha1, specify
6              the algorithm only if it is not default)
7      }
8 <!--NeedCopy-->
```

- In “devices”, you have value against each name. The value is base64encode(KID).base64encode(IV).base64en

- KID is the key ID value that is used to identify the certificate used for OTP secret data encryption. The key ID is useful especially when multiple certificates are used for the OTP secret data encryption.
- In standard AES algorithms, IV is always sent as first 16 or 32 bytes of cipher data. You can follow the same model.
- IV differs for each device though key remains the same.

Note:

The encrypted format of the OTP data is stored in a user attribute AD.

OTP encryption tool setup

Note

To run the OTP encryption tool, Citrix recommends you to use an alternative platform with Python environment instead of the NetScaler appliance.

The OTP encryption tool is located in the directory `\var\netscaler\otptool`. You must download the code from the NetScaler source and run the tool with the required AD credentials.

- Prerequisites for using the OTP encryption tool:
 - Install python 3.5 or higher version in the environment where this tool is run.
 - Install pip3 or later versions.
- Run the following commands:
 - **pip install -r requirements.txt**. Automatically installs the requirements.
 - **python main.py**. Invokes the OTP encryption tool. You must provide the required arguments as per your need for the migration of OTP secret data.
- The tool can be located at `\var\netscaler\otptool` from a shell prompt.
- Run the tool with the required AD credentials.

OTP encryption tool interface

The following figure displays a sample OTP encryption tool interface. The interface contains all the arguments that must be defined for encryption/decryption/certificate upgrade. Also, a brief description of each argument is captured.

OPERATION argument

You must define the OPERATION argument to use the OTP encryption tool for encryption, decryption, or certificate upgrade.

The following table summarizes some of the scenarios in which you can use the OTP encryption tool and the corresponding OPERATION argument values.

Scenario	Operation argument value and other arguments
Convert plaintext OTP secret to encrypted format in the same attribute	Enter the OPERATION argument value as 0 and provide the same value for the source and target attribute. Example: <code>python3 main.py -Host 192.0.2.1 -Port 636 -username ldapbind_user@aaa.local -search_base cn=users,dc=aaa,dc=local -source_attribute unixhomedirectory -target_attribute unixhomedirectory -operation 0 -cert_path aaatm_wild_all.cert</code>
Convert plaintext OTP secret to encrypted format in a different attribute	Enter the OPERATION argument value as 0 and provide the corresponding values for the source and target attribute. Example: <code>python3 main.py -Host 192.0.2.1 -Port 636 -username ldapbind_user@aaa.local -search_base cn=users,dc=aaa,dc=local -source_attribute unixhomedirectory -target_attribute userparameters -operation 0 -cert_path aaatm_wild_all.cert</code>

Scenario	Operation argument value and other arguments
Convert the encrypted entries back to plaintext	Enter the OPERATION argument value as 1 and provide the corresponding values for the source and target attribute. Example: <code>python3 main.py -Host 192.0.2.1 -Port 636 -username ldapbind_user@aaa.local -search_base cn=users,dc=aaa,dc=local -source_attribute unixhomedirectory -target_attribute userparameters -operation 1 -cert_path aaatm_wild_all.cert</code>
Update the certificate to a new certificate	Enter the OPERATION argument value as 2 and provide all the previous certificate and the new certificate details in the corresponding arguments. Example: <code>python3 main.py -Host 192.0.2.1 -Port 636 -username ldapbind_user@aaa.local -search_base cn=users,dc=aaa,dc=local -source_attribute unixhomedirectory -operation 2 -cert_path aaatm_wild_all.cert -new_cert_path aaatm_wild_all_new.cert</code>

CERT_PATH argument

The CERT_PATH argument is a file containing the certificate which is used in the NetScaler for encrypting the data. The user must provide this argument for all the three operations namely **Encryption**, **Decryption**, and **Update certificates**.

The CERT_PATH argument file must contain both the certificate and the associated private key in the PEM or CERT format (pfx is non supported).

For example, if the certificate.cert and certificate.key files correspond to the certificate file and its private key, in a Unix like system the following command creates the file `certkey.merged` that can be used as the value for the cert_path flag.

```
1 $ cat certificate.cert certificate.key > certkey.merged
2 $
```

3 <!--NeedCopy-->

Points to note about the certificate

- The user must provide the same certificate which is bound globally in the NetScaler appliance for user data encryption.
- The certificate must contain the Base64 encoded public certificate and its corresponding RSA private key in the same file.
- The format of the certificate has to be either PEM or CERT. The certificate must adhere to X509 format.
- Password protected certificate format and *.pfx* file are not accepted by this tool. The user must convert the PFX certificates to *.cert* before providing the certificates to the tool.

SEARCH_FILTER argument

The SEARCH_FILTER argument is used to filter the Active Directory domains or users.

Examples:

- `-search_filter "(sAMAccountName=OTP*)"`: Filters users whose samAccountNames (user logon names) start with "OTP".
- `-search_filter "(objectCategory=person)"`: Filters the object category of type person.
- `-search_file "(objectclass=*)"`: Filters all the objects.

Enabling encryption option in the NetScaler appliance

To encrypt the plain text format, you must enable the encryption option in the NetScaler appliance.

To enable OTP encryption data by using the CLI, at the command prompt, type:

```
set aaa otpparameter [-encryption ( ON | OFF )]
```

Example:

```
set aaa otpparameter -encryption ON
```

OTP encryption tool use cases

The OTP encryption tool can be used for the following use cases.

Register new devices with NetScaler appliance version 13.0 build 41.20

When you register your new device with NetScaler appliance version 13.0 build 41.x, and if the encryption option is enabled, then the OTP data is saved in an encrypted format. You can avoid manual intervention.

If the encryption option is not enabled, the OTP data is stored in the plain text format.

Migrate OTP data for the devices registered previous to 13.0 build 41.20

You must perform the following to encrypt the OTP secret data for the devices that are registered with the NetScaler appliance before 13.0 build 41.20.

- Use the conversion tool to migrate OTP data from plain text format to encrypted format.
- Enable the “Encryption” parameter on the NetScaler appliance.
 - To enable the encryption option by using the CLI:
 - * `set aaa otpparameter -encryption ON`
 - To enable encryption options by using the GUI:
 - * Navigate to **Security > AAA –Application Traffic** and click **Change authentication AAA OTP Parameter** under **Authentication Settings** section.
 - * On the **Configure AAA OTP Parameter** page, select **OTP Secret encryption**, and click **OK**.
 - Log in with the valid AD credentials.
 - If it is required, register more devices (optional).

Migrate encrypted data from old certificate to new certificate

If admins want to update the certificate to a new certificate, the tool provides an option to update the new certificate data entries.

To update the certificate to a new certificate by using the CLI

At the command prompt, type:

Example:

```
python3 main.py -Host 192.0.2.1 -Port 636 -username ldapbind_user@aaa.local -search_base cn=users,dc=aaa,dc=local -source_attribute unixhomedirectory -target_attribute userparameters -operation 2 -cert_path aaatm_wild_all.cert -new_cert_path aaatm_wild_all_new.cert
```

Note

- The certificates must have both private and public keys.
- Currently, the functionality is provided only for OTP.

Re-encrypt or migrate to new certificate for devices registered after the appliance is upgraded to 13.0 build 41.20 with encryption

Admin can use the tool on the devices that are already encrypted with a certificate, and can update that certificate with a new certificate.

Convert encrypted data back to plain text format

Admin can decrypt the OTP secret and revert them to the original plain text format. The OTP encryption tool scans through all the users for an OTP secret in encrypted format and converts them to decrypted format.

To update the certificate to a new certificate by using the CLI

At the command prompt, type:

Example:

```
1 python3 main.py -Host 192.0.2.1 -Port 636 -username ldapbind_user@aaa
   .local -search_base cn=users,dc=aaa,dc=local -source_attribute
   unixhomedirectory -target_attribute userparameters -operation 1
2 <!--NeedCopy-->
```

Troubleshooting

The tool generates the following log files.

- **app.log.** Logs all the major steps of execution and information about errors, warnings, and failures.
- **unmodified_users.txt.** Contains a list of User DNs that was not upgraded from plain text to encrypted format. These logs are generated to an error in format or might be due to some other reason.

Recommended native OTP configurations for device registration

May 13, 2024

This section describes the native OTP configurations that you can perform for device registration in the following scenarios:

- New users who are registering their devices
- Registered users who have lost their devices

Pre-requisite

Configure the authentication virtual server using the NetScaler CLI.

```

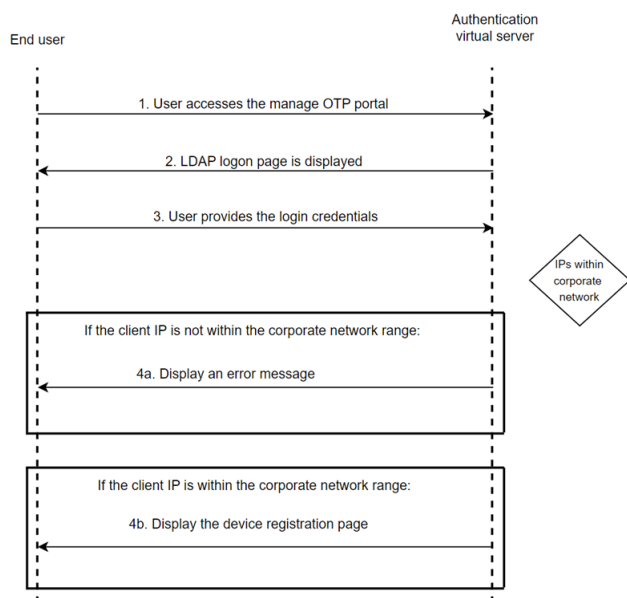

1 add authentication vsrver authvs_otp SSL 1.2.3.5 443
2
3 bind authentication vsrver authvs_otp -portaltheme RFWebUI
4
5 bind ssl vsrver authvs_otp -certkeyname otpauthcert
6 <!--NeedCopy-->

```

Native OTP configurations for enhanced OTP security

- Approach 1: Client IP address restriction

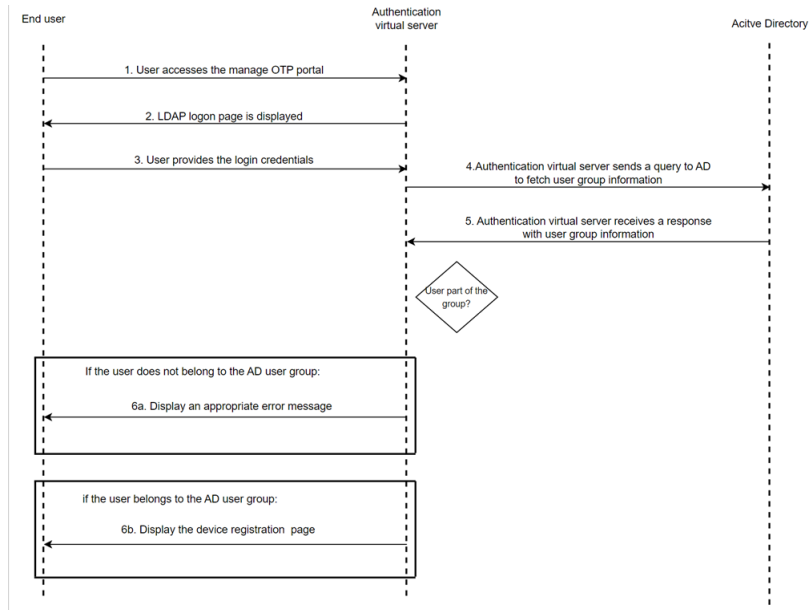

In this approach, the validity of the user access is evaluated using the client source IP address. The user must be present in the office network or the branch office to register or remove their device. User requests for device registration from outside the office subnets are not approved.

- Approach 2: User group membership based restriction

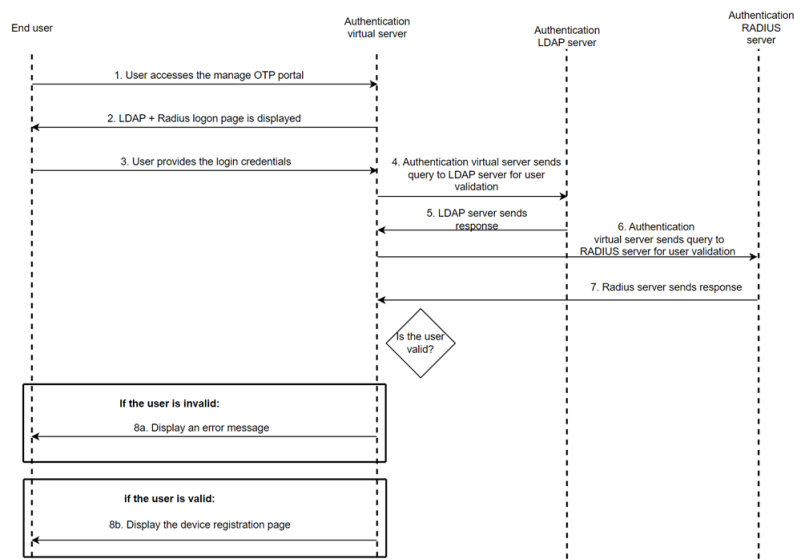

In this approach, the validity of the user’s access is evaluated based on their membership of the AD group. A user is added to a special group whenever a new registration is required or when

the user has lost their mobile device.

- Approach 3: Introduce an additional factor along with LDAP authentication

In this approach, an additional validation factor is configured along for authentication. In this example, LDAP and RADIUS authentication methods are used for configuration.

Approach 1: Client IP address restriction

1. Configure the first factor. The first factor determines whether the client device is accessing the device registration page or attempting the native OTP multi-factor logon.
 - Create an authentication policy for the device registration request.

```
add authentication Policy check_request_for_manageotp -rule "  
HTTP.REQ.COOKIE.VALUE(\"NSC_TASS\").EQ(\"manageotp\")"-action  
NO_AUTHN
```

2. This factor determines whether the access is legitimate or not. NetScaler verifies if the client IP address is within the range of the configured corporate network IP addresses.

- Create a login schema for the device registration flow.

```
add authentication loginSchema lschema_single_manage_otp  
-authenticationSchema "/nsconfig/loginschema/LoginSchema/  
SingleAuthManageOTP.xml"
```

- Create a device registration flow policy label for the second factor.

```
add authentication policylabel otp_manage_flow -loginSchema  
lschema_single_manage_otp
```

- Create an LDAP action for user validation.

```
add authentication ldapAction ldap_otp_action_for_manageotp  
-serverIP <LDAPServerIP> -ldapBase <LdapBase> -ldapBindDn  
<LdapAdminUser> -ldapBindDnPassword <LdapAdminPassword>  
-ldapLoginName samAccountName -groupAttrName memberOF -  
subAttributeName CN
```

- Create an authentication policy for user validation. The rule is based on the end user's office network.

```
add authentication Policy ldap_otp_policy_for_manageotp -rule  
"CLIENT.IP.SRC.APPLY_MASK(255.255.255.0).EQ(10.140.200.0)"-  
action ldap_otp_action_for_manageotp
```

3. Configure the third factor. Based on the policy evaluation from the previous factor, the user is either allowed to access the device registration page or denied access with an appropriate error message.

- Create an authentication policy for an invalid user access.

```
add authentication Policy noauthnotallowed -rule true -action  
NO_AUTHN
```

- Create a login schema for an invalid user access. You can customise the login schema based on your requirement for displaying the relevant message.

```
add authentication loginSchema notallowed -authenticationSchema  
"/nsconfig/loginschema/LoginSchema/InvalidFlow.xml"
```

- Create a policy label for the invalid user access and add a login schema.

```
add authentication policylabel notallowed -loginSchema notallowed
```

- Bind the policy to the `otp_manage_flow` policy label to complete the invalid user access flow.

```
bind authentication policylabel otp_manage_flow -policyName  
noauthnotallowed -priority 1000 -gotoPriorityExpression NEXT  
-nextFactor notallowed
```

4. Configure the fourth factor. In this factor, the user can add or remove their OTP device in the device registration page.

- Create an LDAP action for valid user access, The user can register the devices in this factor.

```
add authentication ldapAction ldap_otp_register_action -  
serverIP <LDAPServerIP> -ldapBase <LdapBase> -ldapBindDn  
<LdapAdminUser> -ldapBindDnPassword <LdapAdminPassword>  
-ldapLoginName samAccountName -authentication DISABLED -  
OTPSecret userParameters
```

- Create an LDAP policy for valid user access.

```
add authentication Policy ldap_otp_register_policy -rule true  
-action ldap_otp_register_action
```

- Add an authentication policy label for valid user access.

```
1 add authentication loginSchema lschema_noschema -  
authenticationSchema noschema  
2  
3 add authentication policylabel otp_manage_register_factor -  
loginSchema lschema_noschema  
4 <!--NeedCopy-->
```

- Bind the LDAP policy to the label for valid user access.

```
bind authentication policylabel otp_manage_register_factor -  
policyName ldap_otp_register_policy -priority 10
```

- Bind the policy to the previous factor.

```
bind authentication policylabel otp_manage_flow -policyName  
ldap_otp_policy_for_manageotp -priority 1 -gotoPriorityExpression  
NEXT -nextFactor otp_manage_register_factor
```

5. Bind the device registration flow to the authentication virtual server to complete the flow.

```
bind authentication vserver authvs_otp -policy check_request_for_manageotp
-priority 10 -nextFactor otp_manage_flow -gotoPriorityExpression
NEXT
```

Examples:

- A user accesses the device registration page from outside the office network and therefore denied access.

- A user accesses the device registration page from the office network and therefore allowed access.

Use the following login schema to display an appropriate error message:

- **InvalidFlow.xml**

```
1 <AuthenticateResponse
2 xmlns="http://citrix.com/authentication/response/1">
3 <Status>success</Status>
4 <Result>more-info</Result>
5 <StateContext/>
6 <AuthenticationRequirements>
7   <PostBack>/nf/auth/doAuthentication.do</PostBack>
8   <CancelPostBack>/nf/auth/doLogoff.do</CancelPostBack>
9   <CancelButtonText>Cancel</CancelButtonText>
10  <Requirements>
11    <Req<AuthenticateResponse
12      xmlns="http://citrix.com/authentication/response/1">
13        <Status>success</Status>
14        <Result>more-info</Result>
15        <StateContext/>
16        <AuthenticationRequirements>
17          <PostBack>/nf/auth/doAuthentication.do</PostBack>
18          <CancelPostBack>/nf/auth/doLogoff.do</CancelPostBack>
19          <CancelButtonText>Cancel</CancelButtonText>
20          <Requirements>
21            <Requirements>
22              <Requirement>
23                <Credential>
24                  <Type>none</Type>
25                </Credential>
26                <Label>
27                  <Text>You are not allowed to access this
28                    application, Please close the browser</
29                    Text>
30                  <Type>error</Type>
31                </Label>
32                <Input/>
33              </Requirement>
34              <Requirement>
35                <Credential>
36                  <ID>error_okBtn</ID>
37                  <Type>error_okBtn</Type>
38                </Credential>
39                <Label>
40                  <Type>none</Type>
41                </Label>
42              </Requirement>
43            </Requirements>
44          </AuthenticationRequirements>
45        </AuthenticateResponse>
46      <!--NeedCopy-->
```

Approach 2: User group membership based restriction

1. Configure the first factor. This factor determines whether the client device is accessing the device registration page or attempting a native OTP multi-factor login.

- Configure an authentication policy for the device registration request.

```
add authentication Policy check_request_for_manageotp -rule "
HTTP.REQ.COOKIE.VALUE(\"NSC_TASS\").EQ(\"manageotp\")"-action
NO_AUTHN
```

2. Configure the second factor. This factor determines if the access is legitimate. NetScaler fetches the group information from the LDAP server and verifies if the user belongs to a specific group configured for device registration. In the following example, the “allowmanageotp” group is used.

- Create a login schema for the device registration flow.

```
add authentication loginSchema lschema_single_manage_otp
-authenticationSchema "/nsconfig/loginschema/LoginSchema/
SingleAuthManageOTP.xml"
```

- Create a device registration flow policy label for the second factor.

```
add authentication policylabel otp_manage_flow -loginSchema
lschema_single_manage_otp
```

- Create an LDAP action for user validation.

```
add authentication ldapAction ldap_otp_action_for_manageotp
-serverIP <LDAPServerIP> -ldapBase <LdapBase> -ldapBindDn
<LdapAdminUser> -ldapBindDnPassword <LdapAdminPassword>
-ldapLoginName samAccountName -groupAttrName memberOF -
subAttributeName CN
```

- Create an authentication policy for user validation. The rule is based on the end user’s office network.

```
add authentication Policy ldap_otp_policy_for_manageotp -
rule "AAA.USER.GROUPS.CONTAINS(\"allowedmanageotp\")"-action
ldap_otp_action_for_manageotp
```

3. Configure the third factor. Based on the policy evaluation from the previous factor, NetScaler verifies the group membership based on the LDAP server’s response. If a valid group membership is found, then the user is allowed to access the device registration page or is denied access with an appropriate error message.

- Create an authentication policy for invalid user access.

```
add authentication Policy noauthnotallowed -rule true -action
NO_AUTHN
```

- Create a login schema for invalid user access. You can customise the login schema based on your requirement for displaying the relevant message.

```
add authentication loginSchema notallowed -authenticationSchema
"/nsconfig/loginschema/LoginSchema/InvalidFlow.xml"
```

- Create a policy label for invalid user access and add the login schema.

```
add authentication policylabel notallowed -loginSchema notallowed
```

- Bind the policy to the `otp_manage_flow` policy label to complete the invalid user access flow.

```
bind authentication policylabel otp_manage_flow -policyName
noauthnotallowed -priority 1000 -gotoPriorityExpression NEXT
-nextFactor notallowed
```

4. Configure the fourth factor. This factor determines where the user can add or remove their OTP device on the device registration page. Based on the policy evaluation of the previous factor, the actual user device registration happens in this factor.

- Create an LDAP action for valid user access. The user registers their device in this factor.

```
add authentication ldapAction ldap_otp_register_action -
serverIP <LDAPServerIP> -ldapBase <LdapBase> -ldapBindDn
<LdapAdminUser> -ldapBindDnPassword <LdapAdminPassword>
-ldapLoginName samAccountName -authentication DISABLED -
OTPSecret userParameters
```

- Create an LDAP policy for valid user access.

```
add authentication Policy ldap_otp_register_policy -rule true
-action ldap_otp_register_action
```

- Add an authentication policy label for valid user access.

```
1 add authentication loginSchema lschema_noschema -
authenticationSchema noschema
2
3 add authentication policylabel otp_manage_register_factor -
loginSchema lschema_noschema
4 <!--NeedCopy-->
```

- Bind the LDAP policy to the policy label for valid user access.

```
bind authentication policylabel otp_manage_register_factor -
policyName ldap_otp_register_policy -priority 10
```

- Bind the policy to the previous factor.

```
bind authentication policylabel otp_manage_flow -policyName
ldap_otp_policy_for_manageotp -priority 1 -gotoPriorityExpression
NEXT -nextFactor otp_manage_register_factor
```

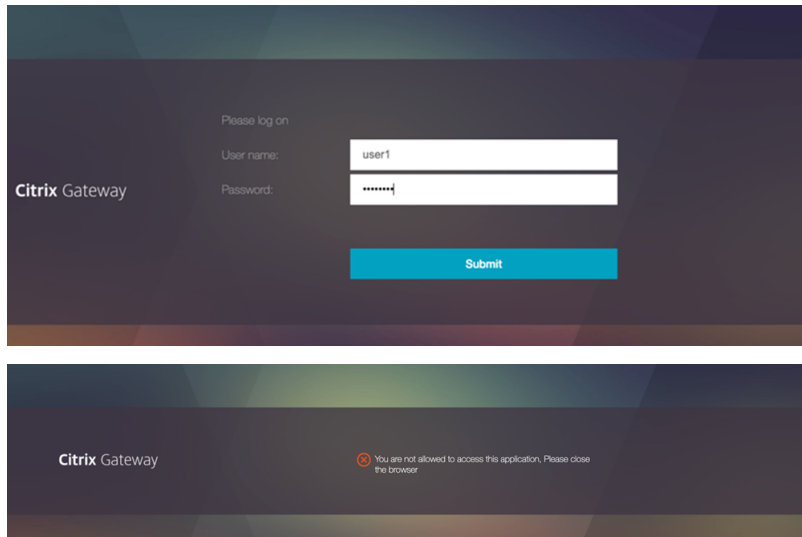

- Bind the device registration flow to the authentication virtual server to complete the over-all flow.

```
bind authentication vserver authvs_otp -policy check_request_for_manage
-otp -priority 10 -nextFactor otp_manage_flow -gotoPriorityExpression
NEXT
```

Example:

A user who is outside of the allowed device registration group attempts to access the device registration page through the office network. The user is denied access to the portal.

For details about the login schema to be used for this configuration, refer to Approach 1: Client IP address restriction.

Approach 3: Introduce an additional factor along with LDAP authentication

1. Configure the first factor. This factor determines whether the user is accessing the device registration page or attempting a native OTP multifactor logon.
 - Authentication policy for the device registration request.

```
add authentication Policy check_request_for_manageotp -rule "
HTTP.REQ.COOKIE.VALUE(\"NSC_TASS\").EQ(\"manageotp\")"-action
NO_AUTH
```

2. Configure the second factor. In this factor, NetScaler verifies if the client IP address belongs to the office network.

In this example, the `DualAuthManageOTP.xml` login schema is used. This login schema requests the user for the LDAP and RADIUS credentials.

- Create a login schema for the device registration flow.

```
1 `add authentication loginSchema dualauth_manageOTP -
authenticationSchema "/nsconfig/loginschema/LoginSchema/
DualAuthManageOTP.xml"`
```

- Add a policy label for the device registration flow.

```
add authentication policylabel otp_manage_flow -loginSchema
dualauth_manageOTP
```

- Add an LDAP authentication action for user validation.

```
add authentication ldapAction ldap_otp_action_for_manageotp
-serverIP <LDAPServerIP> -ldapBase <LdapBase> -ldapBindDn
<LdapAdminUser> -ldapBindDnPassword <LdapAdminPassword> -
ldapLoginName samAccountName
```

- Add an LDAP authentication policy for user validation.

```
add authentication Policy ldap_pol_for_manageOTP -rule true -
action ldap_action_for_manageOTP
```

3. Configure the third factor, an additional factor after LDAP, to further secure access to the device registration page. In this factor, the RADIUS policy is added to verify the user identity with the RADIUS server. If the user's client IP address matches the office subnet range, then the user is allowed to access the device registration page. If not, the user is denied access with an appropriate error message. Based on the policy evaluation of the previous factor, the actual user device registration happens in this factor.

- Add the `noschema` login schema.

```
add authentication loginSchema lschema_noschema -authenticationSchema
noschema
```

- Add a policy label for RADIUS authentication.

```
add authentication policylabel radius_label_for_mangeOTP -
loginSchema lschema_noschema
```

- Add an authentication policy for RADIUS authentication.

```
add authentication Policy rad_pol_for_manageOTP -rule true -  
action rad_act_for_manageOTP
```

- Add an authentication action for RADIUS authentication.

```
add authentication radiusAction rad_act_for_manageOTP -serverIP  
<RADIUS Server IP> -radKey <RADIUSKEY>
```

- Bind the RADIUS factor to the previous policy label.

```
bind authentication policylabel otp_manage_flow -policyName  
ldap_pol_for_manageOTP -priority 10 -gotoPriorityExpression  
NEXT -nextFactor radius_label_for_mangeOTP
```

4. Configure the fourth factor. This factor is where the user can add or remove their OTP device on the device registration page.

- Add a policy label for device registration.

```
add authentication policylabel ldap_label_for_mangeOTP_registration  
-loginSchema lschema_noschema
```

- Add an authentication LDAP action for OTP device registration.

```
add authentication ldapAction ldap_action_for_manageOTP_registration  
-serverIP <LDAPServerIP> -ldapBase <LdapBase> -ldapBindDn  
<LdapAdminUser> -ldapBindDnPassword <LdapAdminPassword>  
-ldapLoginName samAccountName -authentication DISABLED -  
OTPSecret userParameters
```

- Add an authentication policy for OTP device registration.

```
add authentication Policy ldap_pol_for_manageOTP_registration  
-rule true -action ldap_action_for_manageOTP_registration
```

- Bind the authentication policy to the policy label.

```
bind authentication policylabel ldap_label_for_manageOTP_registration  
-policyName ldap_pol_for_manageOTP_registration -priority 10
```

- Bind the policy label to the previous factor.

```
bind authentication policylabel radius_label_for_mangeOTP -  
policyName rad_pol_for_manageOTP -priority 1 -gotoPriorityExpression  
NEXT -nextFactor ldap_label_for_mangeOTP_registration
```

5. Complete the nFactor flow by binding the first factor to the authentication virtual server.

```
bind authentication vserver authvs_otp -policy check_OTP_manageRequest
-priority 10 -nextFactor otp_manage_flow
```

Examples:

- A user accesses the device registration page and is prompted to provide the LDAP credentials and the RADIUS password.

- A user provides the required fields and therefore is allowed to access the device registration page.

Use the following login schema in this configuration where an additional authentication method is introduced after AD based authentication:

- **DualAuthManageOTP.xml**

```

1  <?xml version="1.0" encoding="UTF-8" standalone="yes"?>
2  <AuthenticateResponse
3  xmlns="http://citrix.com/authentication/response/1">
4  <Status>success</Status>
5  <Result>more-info</Result>
6  <StateContext/>
7  <AuthenticationRequirements>
8      <PostBack>/nf/auth/doAuthentication.do</PostBack>
9      <CancelPostBack>/nf/auth/doLogoff.do</CancelPostBack>
10     <CancelButtonText>Cancel</CancelButtonText>
11     <Requirements>
12         <Requirement>
13             <Credential>
14                 <Type>none</Type>
15             </Credential>
16             <Label>
17                 <Text>dualauth_please_log_on</Text>
```

```
18         <Type>nsg-login-label</Type>
19     </Label>
20     <Input/>
21 </Requirement>
22 <Requirement>
23     <Credential>
24         <ID>login</ID>
25         <SaveID>login</SaveID>
26         <Type>username</Type>
27     </Credential>
28     <Label>
29         <Text>dualauth_user_name</Text>
30         <Type>nsg-login-label</Type>
31     </Label>
32     <Input>
33         <Text>
34             <ReadOnly>false</ReadOnly>
35             <InitialValue/>
36             <Constraint>.+</Constraint>
37         </Text>
38     </Input>
39 </Requirement>
40 <Requirement>
41     <Credential>
42         <ID>passwd</ID>
43         <SaveID>passwd</SaveID>
44         <Type>password</Type>
45     </Credential>
46     <Label>
47         <Text>dualauth_password</Text>
48         <Type>nsg-login-label</Type>
49     </Label>
50     <Input>
51         <Text>
52             <Secret>>true</Secret>
53             <Constraint>.+</Constraint>
54         </Text>
55     </Input>
56 </Requirement>

NetScaler login

To configure the NetScaler login flow:

1. Configure the first factor. This factor determines whether this is a login request or a device registration request.

- Add an authentication policy for OTP login flow.

```
add authentication Policy otp_login_pol -rule true -action
NO_AUTHN
```

2. Configure the second factor. In this factor, a login schema that prompts the user for the credentials (user name, password, and OTP passcode) is added. To validate the user identity, an LDAP action is added in this factor.

- Add a login schema to display the user login page.

```
add authentication loginSchema dualauth_login -authenticationSchema
"LoginSchema/DualAuth.xml"
```

- Add a policy label for user login and attach the login schema.

```
add authentication policylabel otp_login_flow -loginSchema
dualauth_login
```

- Add an LDAP action for user login.

```
1 add authentication ldapAction ldap_act_for_validation -
  serverIP <LDAPServerIP> -ldapBase <LdapBase> -ldapBindDn <
  LdapAdminUser> -ldapBindDnPassword <LdapAdminPassword> -
  ldapLoginName samAccountName -groupAttrName memberOF -
  subAttributeName CN
2
3 add authentication Policy ldap_pol_for_validation -rule true
  -action ldap_act_for_validation
4 <!--NeedCopy-->
```

3. Configure the third factor. Validation of OTP is done in this factor. An LDAP action that is used for OTP passcode validation is added here.

- Add a policy label for the user OTP validation.

```
add authentication policylabel otp_validation_login_factor -
loginSchema LSCHEMA_INT
```

- Add an LDAP action for user OTP validation.

```
add authentication ldapAction ldap_otp_validate_action -
serverIP <LDAPServerIP> -ldapBase <LdapBase> -ldapBindDn
<LdapAdminUser> -ldapBindDnPassword <LdapAdminPassword>
-ldapLoginName samAccountName -authentication DISABLED -
OTPSecret userParameters
```

- Add an authentication policy for user OTP validation.

```
add authentication policy ldap_otp_validate_pol -action
ldap_otp_validate_action -rule true
```

- Bind the policy to the policy label.

```
bind authentication policylabel otp_validation_login_factor -
policyName ldap_otp_validate_pol -priority 100
```

- Bind the current policy label as the next factor for the OTP login flow.

```
bind authentication policylabel otp_login_flow -policyName
aaa_local_pwd_pol -priority 100 -nextFactor otp_validation_login_factor
```

4. Complete the login flow by binding the first factor to the authentication virtual server.

```
bind authentication vserver authvs_otp -policy otp_login_pol -
nextfactor otp_login_flow -priority 100
```

For more information about NetScaler login, see [Native OTP workflow](#).

Push notification for OTP

May 2, 2023

NetScaler Gateway supports push notifications for OTP. Users do not have to manually enter the OTP received on their registered devices to log in to NetScaler Gateway. Admins can configure NetScaler Gateway such that login notifications are sent to users' registered devices using push notification services. When users receive the notification, they have to simply tap Allow on the notification to log in to NetScaler Gateway. When the gateway receives acknowledgment from the user, it identifies the source of the request, and sends a response to that browser connection.

If the notification response is not received within the timeout period (30 seconds), users are redirected to the NetScaler Gateway login page. The users can then enter the OTP manually or click **Resend Notification** to receive the notification again on the registered device.

Admins can make push notification authentication as the default authentication by using the login schemas created for push notification.

Important:

Push notification feature is available with a NetScaler Premium edition license.

Advantages of push notifications

- Push notifications provide a more secure multifactor authentication mechanism. Authentication to NetScaler Gateway is not successful until the user approves the login attempt.
- Push notification is easy to administer and use. Users have to download and install the Citrix SSO mobile app that does not require any administrator assistance.
- Users do not have to copy or remember the code. They have to simply tap on the device to get authenticated.
- Users can register multiple devices.

How push notifications work

The push notification workflow can be classified into two categories:

- Device registration
- End user login

Prerequisites for using push notification

- Complete the Citrix Cloud onboarding process.
 1. Create a Citrix Cloud company account or join an existing one. For detailed processes and instructions on how to proceed, see Signing Up for Citrix Cloud.
 2. Log in to <https://citrix.cloud.com>, and select the customer.
 3. From Menu, select **Identity and Access Management** and then navigate to the **API Access** tab to create a client for the account.
 4. Copy the ID, secret, and customer ID. The ID and secret are required to configure the push service in NetScaler as “ClientID” and “ClientSecret” respectively.

Important:

- Same API credentials can be used on multiple data centers.
- On-premises NetScaler appliances must be able to resolve server addresses `mfa.cloud.com` and `trust.citrixworkspacesapi.net` and are accessible from the appliance. This is to ensure that there are no firewalls or IP address blocks for these servers over port 443.
- Download the Citrix SSO mobile app from the App Store and Play Store for iOS devices and Android devices respectively. Push notification is supported on iOS from build 1.1.13 on Android from 2.3.5.
- Ensure the following for the Active Directory.
 - Minimum attribute length must be at least 256 characters.

- Attribute type must be 'DirectoryString' such as UserParameters. These attributes can hold string values.
- Attribute string type must be Unicode, if device name is in non-English characters.
- NetScaler LDAP administrator must have write access to the selected AD attribute.
- NetScaler and the client machine must be synchronized to a common Network Time Server.

Push notification configuration

The following are the high-level steps that must be completed to use the push notification functionality.

- The NetScaler Gateway administrator must configure the interface to manage and validate users.
 1. Configure a push service.
 2. Configure NetScaler Gateway for OTP management and end user login.

Users must register their devices with the gateway for logging in to NetScaler Gateway.
 3. Register your device with NetScaler Gateway.
 4. Log in to NetScaler Gateway.

Create a push service

1. Navigate to **Security > AAA-Application Traffic > Policies > Authentication > Advanced Policies > Actions > Push Service** and click **Add**.
2. In **Name**, enter the name of the push service.
3. In **Client ID**, enter the unique identity of the relying party for communicating with the NetScaler Push server in cloud.
4. In **Client Secret**, enter the unique secret of the relying party for communicating with the NetScaler Push server in cloud.
5. In **Customer ID**, enter the customer ID or name of the account in cloud that is used to create the Client ID and the Client Secret pair.

Important

The TLS 1.2 version is required for push service. For more information, see [TLS 1.2 configuration details](#).

Configure NetScaler Gateway for OTP management and end user login

Complete the following steps for OTP management and end user login.

- Create login schema for OTP management
- Configure authentication, authorization, and auditing virtual server
- Configure VPN or load balancing virtual servers
- Configure policy label
- Create login schema for end user login

For details on configuration, see [Native OTP support](#).

Important: For push notification, admins must explicitly configure the following:

- Create a push service.
- While creating a login schema for OTP management, select the SingleAuthManageOTP.xml login schema or equivalent as per the need.
- While creating a login schema for end user login, select the DualAuthOrPush.xml login schema or equivalent as per the need.

Register your device with NetScaler Gateway

Users must register their devices with NetScaler Gateway to use the push notification functionality.

1. In your web browser, browse to your NetScaler Gateway FQDN, and suffix **/manageotp** to the FQDN.

This loads the authentication page.

Example: <https://gateway.company.com/manageotp>

2. Log in using your LDAP credentials or appropriate two-factor authentication mechanisms, as required.

3. Click **Add Device**.
4. Enter a name for your device, then click **Go**.

A QR code is displayed on the NetScaler Gateway browser page.

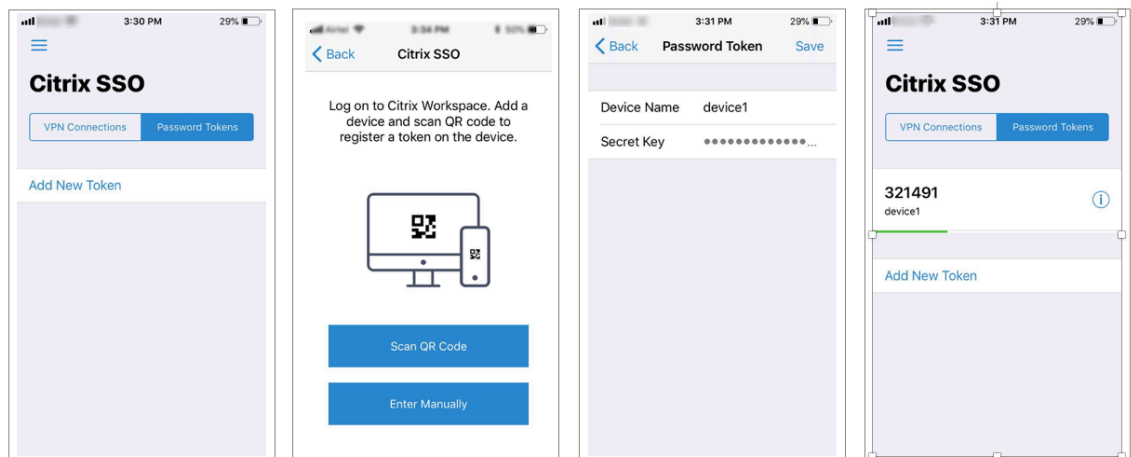

5. Scan this QR code using the Citrix SSO app from the device to be registered.

Citrix SSO validates the QR code and then registers with the gateway for push notifications. If there are no errors in the registration process, the token is successfully added to the password tokens page.

Important:

The login fails if you manually enter the secret key provided in the QR code.

6. If there are no additional devices to add/manage log out using the list at the top right corner of the page.

Test one-time password authentication

1. To test the OTP, click your device from the list and then click **Test**.
2. Enter the OTP that you have received on your device and click **Go**.
The OTP verification successful message appears.
3. Log out using the list at the top right corner of the page.

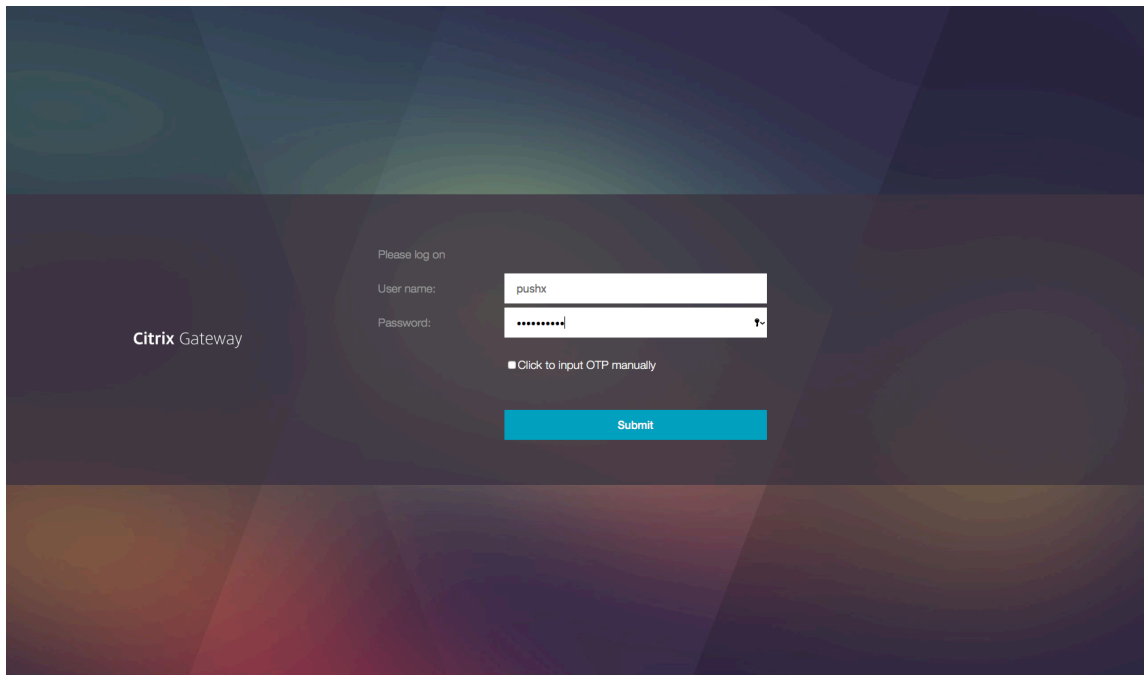

Note: You can use the OTP management portal anytime to test authentication, remove registered devices, or register more devices.

Log in to NetScaler Gateway

After registering their devices with NetScaler Gateway, users can use the push notification functionality for authentication.

1. Navigate to your NetScaler Gateway authentication page (for example: <https://gateway.comp.any.com>)

You are prompted to enter only your LDAP credentials depending on the login schema configuration.

2. Enter your LDAP user name and password, then select **Submit**.

A notification is sent to your registered device.

Note: If you want to enter the OTP manually, you must select **Click** to input OTP manually and enter the OTP in the **TOTP** field.

3. Open the Citrix SSO app on your registered device and tap **Allow**.

Note:

- In an iOS device, you are prompted for Touch-ID/Face-ID/Passcode as an extra factor of authentication.
- The authentication server waits for the push server notification response until the configured timeout period expires. After the timeout, NetScaler Gateway displays the login page. The users can then enter the OTP manually or click **Resend Notification** to receive the notification again on the registered device. Based on your selected option, the gateway validates the OTP that you have entered or resends the notification on your registered device.

- No notification is sent to your registered device regarding login failure.

Failure conditions

- The device registration might fail in the following cases.
 - Server certificate might not be trusted by end-user device.
 - NetScaler Gateway used to register for OTP is not reachable by the client.
- The notifications might fail in the following cases.
 - User device is not connected to the internet
 - Notifications on the user device are blocked
 - User does not approve the notification on the device

In these cases, the authentication server waits until the configured timeout period expires. After the timeout, the NetScaler Gateway displays a login page with the options to manually enter the OTP or to resend the notification again on your registered device. Based on the selected option, further validation occurs.

Failure logs

The following are the expected logs when the OTP push service is not reachable.

- Push notification failure when user device is not connected to the internet - Push: Failed to prepare Push Request to “`client name`” for Push service.
- Device registration failure log - Push: No devices are registered to send Push Request to cloud for “`client name`”.
- In case the user does not accept the push - Push: Response is not seen from client, for “`user name`”, checking retry options.

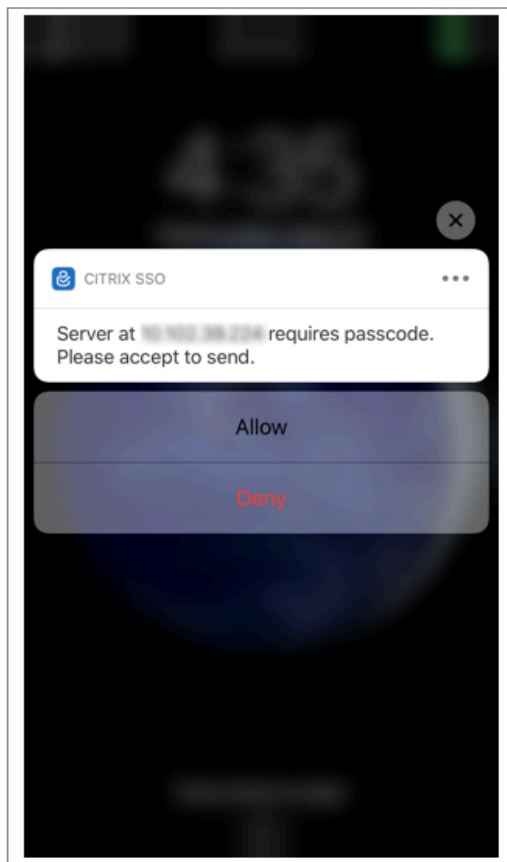

Citrix SSO app behavior on iOS –points to note

Notification shortcuts

Citrix SSO iOS app includes support for actionable notifications to enhance user experience. Once a notification is received on an iOS device, and if the device is locked or the Citrix SSO app is not in the foreground, users can use the shortcuts built into the notification to either approve or deny the login request.

To access notification shortcuts, users need to either force touch (3D touch) or long press the notification depending on the device’s hardware. Selecting the Allow shortcut action sends a login request to NetScaler. Depending on how the authentication policy is configured on the authentication, authorization, and auditing virtual server;

- The login request might be sent in the background without any need to launch the app into the foreground or unlock the device.
- The app might prompt for Touch-ID/Face-ID/Passcode as an extra factor in which case the app is launched into the foreground.

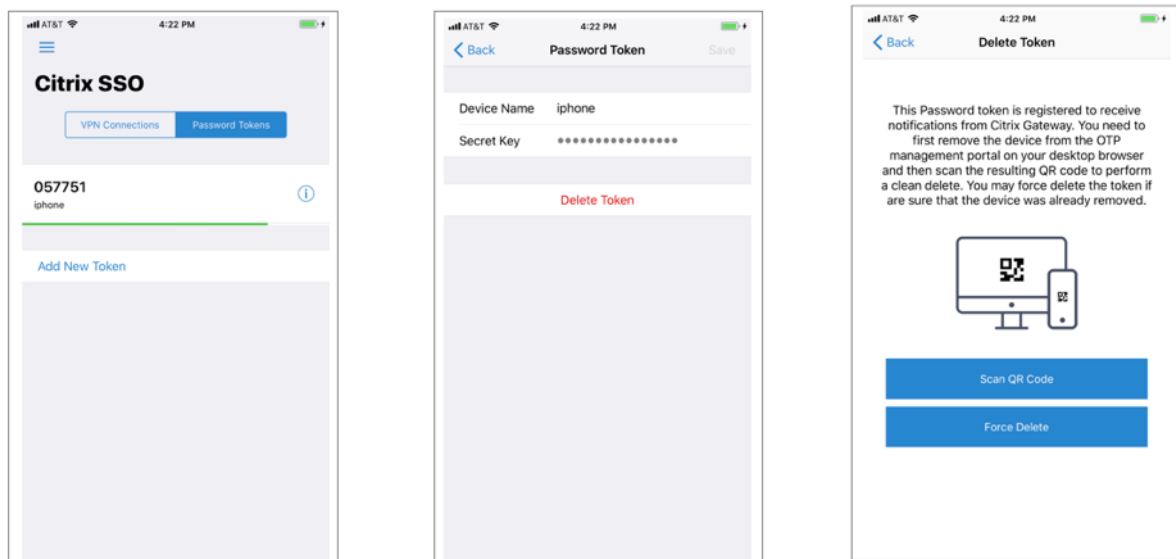

Deleting password tokens from Citrix SSO

1. To delete a password token registered for push in the Citrix SSO app, users must perform the following steps:
2. Unregister (remove) the iOS/Android device on the gateway. QR code for removing registration from the device appears.
3. Open the Citrix SSO app and tap the info button of the password token to be deleted.
4. Tap **Delete Token** and scan the QR code.

Note:

- If the QR code is valid, the token is successfully removed from the Citrix SSO app.
- Users can tap Force Delete to delete a password token without having to scan the QR code if the device is already removed from the gateway. Force deleting might result in the device continuing to receive notifications if the device has not been removed from NetScaler Gateway.

Email OTP authentication

May 2, 2023

Email OTP is introduced with NetScaler 12.1 build 51.x. The Email OTP method enables you to authenticate using the one-time password (OTP) that is sent to the registered email address. When you try to authenticate on any service, the server sends an OTP to the registered email address of the user.

To use the Email OTP feature, you must first register your alternate email ID. An alternative email ID registration is needed so that the OTP can be sent to that mail ID since you would not be able to access the primary email ID if there was an account lockout or in the event of you forgetting the AD password.

You can use Email OTP validation without email ID registration if you have provided the alternate email ID already as part of some AD attribute. You can refer to the same attribute in the email action instead of specifying the alternate email ID in the email address section.

Prerequisites

Before you configure the Email OTP feature, review the following prerequisites:

- NetScaler feature release 12.1 build 51.28 and above
- Email OTP feature is available in nFactor authentication flow only
 - For more details, refer to <https://support.citrix.com/pages/citrix-adc-authentication-how#nfactor>

- Supported for AAA-TM, NetScaler Gateway (Browser, Native plug-in, and Receiver).

Active directory setting

- Supported version is 2016/2012 and 2008 Active Directory domain function level
- NetScaler ldapBind user name must have write access to the user's AD path

Email server

- For the Email OTP solution to work, ensure that the login based authentication is enabled on the SMTP server. NetScaler supports only AUTH LOGIN based authentication for Email OTP to work.
- To ensure that the AUTH LOGIN based authentication is enabled, type the following command on the SMTP server. If the login based authentication is enabled, you notice that the text AUTH LOGIN appears in **bold** in the output.

```
root@ns# telnet <IP address of the SMTP server><Port number of the server>
ehlo
root@ns# telnet 10.106.3.
Trying 10.106.3.
Connected to 10.106.3.

For information on how to enable login based authentication, see
https://support.microfocus.com/kb/doc.php?id=7020367
```

Limitations

- This feature is supported only if the authentication back-end is LDAP.
- Already registered alternate email ID cannot be seen.
- Only the alternate email ID from the KBA Registration page cannot be updated.
- Email OTP authentication cannot be the first factor in the authentication flow. This is by design to achieve a robust authentication.

- If both Alternate email ID and KBA are configured using the same authentication action, the attribute must be the same for both.
- For the native plug-in and Receiver, registration is supported only through a browser.

Active Directory configuration

- Email OTP uses the Active Directory attribute as user data storage.
- After you register the alternate email ID, the email ID is sent to the NetScaler appliance and the appliance stores it in the configured KB attribute in the AD user object.
- The alternate email ID is encrypted and stored in the configured AD attribute.

When configuring an AD attribute, consider the following:

- Attribute name length supported must be at least 128 characters.
- Attribute type must be 'DirectoryString'.
- Same AD attribute can be used for Native OTP and Email OTP registration data.
- LDAP administrator must have write access to the selected AD attribute.

Using existing attributes

The attribute used in this example is [Userparameters](#). As this is an existing attribute within the AD user, you do not need to make any changes to the AD itself. However, you have to make sure that the attribute is not being used.

To ensure that the attribute is not used, navigate to **ADSI** and select user, right-click on the user, and scroll down to the attribute list. You must see the attribute value for **UserParameters** as **not set**. This indicates that the attribute is not being used at the moment.

Configure Email OTP

Email OTP solution consists of the following two parts:

- Email registration
- Email validation

Email ID registration

Do the following configuration by using the CLI after the KBA registration schema is created successfully:

1. Bind the portal theme and the certificate to VPN global.

```
1 bind authentication vservers authvs -portaltheme RfWebUI
2 bind vpn global -userDataEncryptionKey c1
3 <!--NeedCopy-->
```

Note:

Preceding certificate binding is required to encrypt the user data (KB Q&A and alternate mail ID Registered) stored in the AD attribute.

2. Create an LDAP authentication policy.

```
1 add authentication ldapAction ldap -serverIP 10.102.2.2 -
  serverPort 636 -ldapBase "dc=aaatm-test,dc=com" -ldapBindDn
  administrator@aaatm-test.com -ldapBindDnPassword freebsd -
  ldapLoginName samAccountName -secType SSL
2 add authentication Policy ldap -rule true -action ldap
3 <!--NeedCopy-->
```

3. Create an LDAP authentication policy for email registration.

```
1 add authentication ldapAction ldap_email_registration -serverIP
  10.102.2.2 -serverPort 636 -ldapBase "dc=aaatm-test,dc=com" -
  ldapBindDn administrator@aaatm-test.com -ldapBindDnPassword
  freebsd -ldapLoginName samAccountName -secType SSL -KBAttribute
  userParameters -alternateEmailAttr userParameters
2 add authentication Policy ldap_email_registration -rule true -
  action ldap_email_registration
3 <!--NeedCopy-->
```

4. Create an email registration login schema and policy label.

```
1 add authentication loginSchema onlyEmailRegistration -
  authenticationSchema /nsconfig/loginschema/LoginSchema/
  AltEmailRegister.xml
2 add authentication policylabel email_Registration_factor -
  loginSchema onlyEmailRegistration
3 bind authentication policylabel email_Registration_factor -
  policyName ldap_email_registration -priority 1 -
  gotoPriorityExpression NEXT
4 <!--NeedCopy-->
```

5. Bind the authentication policy to the authentication virtual server.

```
1 bind authentication vserver authvs -policy ldap -priority 1 -
  nextFactor email_Registration_factor -gotoPriorityExpression
  NEXT
2 <!--NeedCopy-->
```

6. Once you have configured all the steps mentioned in the previous sections, you must see the following GUI screen. Upon accessing via the URL for example, <https://lb1.server.com/> you are presented with an initial login page that only requires the LDAP logon credential followed by an alternate email registration page.

Note: The domain <https://lb1.server.com/> can belong to either gateway or an authentication virtual server.

Please log on

User name :

Password :

Email Registration1

Alternate Email Id

Note:

- You can use the same authentication schema for both KBA registration and for Email ID registration.
- While configuring KBA registration, you can select **Register Alternate Email** in the Email Registration section to register an alternate email ID.

Email validation

Do the following steps for Email validation.

1. Bind the portal theme and the certificate to VPN global

```
1 bind authentication vserver authvs -portaltheme RfWebUI
2 bind vpn global -userDataEncryptionKey c1
3 <!--NeedCopy-->
```

Note:

Preceding certificate binding is required to decrypt the user data (KB Q&A and alternate email ID registered) stored in the AD attribute.

2. Create an LDAP authentication policy. LDAP must be a prior factor to the email validation factor because you need the user's email ID or alternate email ID for Email OTP Validation.

```
1 add authentication ldapAction ldap1 -serverIP 10.102.2.2 -
  serverPort 636 -ldapBase "dc=aaatm-test,dc=com" - ldapBindDn
  administrator@aaatm-test.com -ldapBindDnPassword freebsd -
  ldapLoginName samAccountName -secType SSL -KBAttribute
  userParameters -alternateEmailAttr userParameters
2 add authentication Policy ldap1 -rule true -action ldap1
3 <!--NeedCopy-->
```

3. Create an email authentication policy.

```
1 add authentication emailAction email -userName sqladmin@aaa.com -
  password freebsd-encrypted -encryptmethod ENCMTHD_3 -serverURL
  "smtps://10.2.3.3:25" -content "OTP is $code" -
  defaultAuthenticationGroup emailgrp -emailAddress "aaa.user.
  attribute(\"alternate_mail\")"
2 add authentication Policy email -rule true - action email
3 <!--NeedCopy-->
```

In the previously mentioned command, **email address** is the alternate email ID user provided during KBA Registration.

4. Create an email OTP validation policy label.

```
1 add authentication policylabel email_validation_factor
2 bind authentication policylabel email_validation_factor -
  policyName email -priority 1 -gotoPriorityExpression NEXT
3 <!--NeedCopy-->
```

5. Bind the authentication policy to the authentication virtual server.

```
1 bind authentication vserver authvs - policy ldap1 -priority 1 -
  nextFactor email_validation_factor -gotoPriorityExpression NEXT
2 <!--NeedCopy-->
```

6. Once you have configured all the steps mentioned in the previous sections, you must see the following GUI screen for EMAIL OTP Validation. Upon accessing via the URL for example, <https://lb1.server.com/> you are presented with an initial login page that only requires the LDAP logon credential followed by the EMAIL OTP Validation page.

Note:

In the LDAP policy it is important to configure `alternateEmailAttr` to be able to query

the user's email id from the AD attribute.

Troubleshooting

Before analyzing the log, it is better to set the log level to debug as follows.

```
1 set syslogparams -loglevel DEBUG
2 <!--NeedCopy-->
```

Registration - Successful scenario

The following entries indicate a successful user registration.

```
1 "ns_aaa_insert_hash_keyValue_entry key:kba_registered value:1"
2 Nov 14 23:35:51 <local0.debug> 10.102.229.76 11/14/2018:18:05:51 GMT
  0-PPE-1 : default SSLVPN Message 1588 0 : "
  ns_aaa_insert_hash_keyValue_entry key:alternate_mail value:
```

```

    eyJ2ZXJzaW9uIjoiaMSIsICJraWQiOiIxbk1oWjN0T2NjLVVvZUx6NDRwZFhxdS01dTA9IiwgImtLeS
    ==.oKmv0ala0J3a9z7BcGCSEgNPMw=="
3
4 <!--NeedCopy-->

```

Registration - Failure scenario

On the user login page, you see the following error message, “Cannot Complete your request”. This indicates that the cert-key to be bound to the VPN global for encrypting the user data is missing.

```

1 Jul 31 08:51:46 <local0.info> 10.102.229.79 07/31/2020:03:21:4 6 GMT
  0-PPE-1 : default SSLVPN Message 696 0 : "Encrypt UserData: No
  Encryption cert is bound to vpn global"
2 Jul 31 08:51:46 <local0.info> 10.102.229.79 07/31/2020:03:21:46 GMT 0-
  PPE-1 : default SSLVPN Message 697 0 : "KBA Register: Alternate
  email id Encrypted blob length is ZERO aauser"
3 <!--NeedCopy-->

```

Email validation –Successful scenario

The following entries indicate a successful Email OTP Validation.

```

1 "NFactor: Successfully completed email auth, nextfactor is pwd_reset"
2 <!--NeedCopy-->

```

Email Validation –Failure scenario

On the user login page, the “Cannot Complete your request” error message is displayed. This indicates login based authentication is not enabled on the email server and the same needs to be enabled.

```

re-Captcha configuration for nFactor authentication

May 10, 2024

NetScaler Gateway supports a new first-class action `captchaAction` that simplifies re-Captcha configuration. As re-Captcha is a first-class action, it can be a factor of its own. You can inject re-Captcha anywhere in the nFactor flow.

Previously, you had to write custom WebAuth policies with changes to the RfWebUI as well. With the introduction of `captchaAction`, you do not have to modify the JavaScript.

Important:

If re-Captcha is used along with the user name or password fields in the schema, the **Submit** button is disabled until re-Captcha is met.

re-Captcha configuration

re-Captcha configuration involves two parts.

1. Configuration on Google for registering re-Captcha.
2. Configuration on NetScaler appliance to use re-Captcha as part of login flow.

re-Captcha configuration on Google

Register a domain for re-Captcha at <https://www.google.com/recaptcha/admin#l1ist>.

1. When you navigate to this page, the following screen appears.

← Register a new site

Label ⓘ
e.g. example.com 0 / 50

reCAPTCHA type ⓘ

reCAPTCHA v3 Verify requests with a score

reCAPTCHA v2 Verify requests with a challenge

Domains ⓘ

+ Add a domain, e.g. example.com

Accept the reCAPTCHA Terms of Service

By accessing or using the reCAPTCHA APIs, you agree to the Google APIs [Terms of Use](#), Google [Terms of Use](#), and to the Additional Terms below. Please read and understand all applicable terms and policies before accessing the APIs.

reCAPTCHA Terms of Service ▾

Send alerts to owners ⓘ

CANCEL SUBMIT

Note

Use reCAPTCHA v2 only. Invisible re-Captcha is still in preview.

2. After a domain is registered, the “SiteKey” and “SecretKey” are displayed.

ⓘ Adding reCAPTCHA to your site

▾ Keys

<p>Site key Use this in the HTML code your site serves to users.</p> <div style="border: 1px solid #ccc; padding: 2px;">6Ld1..._B</div>	<p>Secret key Use this for communication between your site and Google. Be sure to keep it a secret.</p> <div style="border: 1px solid #ccc; padding: 2px;">6I..._C</div>
--	---

▾ Step 1: client-side integration

Note

The “SiteKey” and “SecretKey” are grayed out for security reasons. “SecretKey” must be kept safe.

re-Captcha configuration on a NetScaler appliance

The re-Captcha configuration on the NetScaler appliance can be divided into three parts:

- Display re-Captcha screen
- Post the re-Captcha response to Google server
- LDAP configuration is second factor for user logon (optional)

Display re-Captcha screen The login form customization is done through the SingleAuth-Captcha.xml login schema. This customization is specified at authentication virtual server and is sent to UI for rendering the login form. The built-in login schema, SingleAuthCaptcha.xml, is at the `/nsconfig/loginSchema/LoginSchema` directory on the NetScaler appliance.

Important

- The SingleAuthCaptcha.xml login schema can be used when LDAP is configured as the first factor.
- Based on your use case and different schemas, you can modify the existing schema. For instance if you need only re-Captcha factor (without user name or password) or dual authentication with re-Captcha.
- If any custom modifications are done or the file is renamed, Citrix recommends copying all loginSchemas from the `/nsconfig/loginschema/LoginSchema` directory to the parent directory, `/nsconfig/loginschema`.

To configure display of re-Captcha using CLI

```
1 add authentication loginSchema singleauthcaptcha -authenticationSchema
  /nsconfig/loginschema/SingleAuthCaptcha.xml
2
3 add authentication loginSchemaPolicy singleauthcaptcha -rule true -
  action singleauthcaptcha
4
5 add authentication vserver auth SSL <IP> <Port>
6
7 add ssl certkey vserver-cert -cert <path-to-cert-file> -key <path-to-
  key-file>
8
9 bind ssl vserver auth -certkey vserver-cert
10
11 bind authentication vserver auth -policy singleauthcaptcha -priority 5
  -gotoPriorityExpression END
```

```
12 <!--NeedCopy-->
```

Post the re-Captcha response to Google server After you have configured the re-Captcha that must be displayed to the users, the admins add the configuration to the Google server to verify the re-Captcha response from the browser.

To verify re-Captcha response from the browser

```
1 add authentication captchaAction myrecaptcha -sitekey <sitekey-copied-
  from-google> -secretkey <secretkey-from-google>
2
3 add authentication policy myrecaptcha -rule true -action myrecaptcha
4
5 bind authentication vserver auth -policy myrecaptcha -priority 1
6 <!--NeedCopy-->
```

NetScaler contacts <https://www.google.com/recaptcha/api/siteverify> to validate the Captcha information. So, ensure that the site is reachable from NetScaler.

To verify if the Google site is reachable, run the script `curl -vvv https://www.google.com/recaptcha/api/siteverify`.

The following commands are required to configure if AD authentication is desired. Else, you can ignore this step.

```
1 add authentication ldapAction ldap-new -serverIP x.x.x.x -serverPort
  636 -ldapBase "cn=users,dc=aaatm,dc=com" -ldapBindDn adminuser@aaatm
  .com -ldapBindDnPassword <password> -encrypted -encryptmethod
  ENCMTHD_3 -ldapLoginName sAMAccountName -groupAttrName memberof -
  subAttributeName CN -secType SSL -passwdChange ENABLED -
  defaultAuthenticationGroup ldapGroup
2
3 add authenticationpolicy ldap-new -rule true -action ldap-new
4 <!--NeedCopy-->
```

LDAP configuration is second factor for user logon (optional) The LDAP authentication happens after re-Captcha, you add it to the second factor.

```
1 add authentication policylabel second-factor
2
3 bind authentication policylabel second-factor -policy ldap-new -
  priority 10
4
5 bind authentication vserver auth -policy myrecaptcha -priority 1 -
  nextFactor second-factor
6 <!--NeedCopy-->
```

Administrator needs to add appropriate virtual servers depending on whether load balancing virtual

server or NetScaler Gateway appliance is used for access. Administrator must configure the following command if a load balancing virtual server is required:

```
1 add lb vserver lbtest HTTP <IP> <Port> -authentication ON -  
  authenticationHost nssp.aaatm.com  
2 <!--NeedCopy-->
```

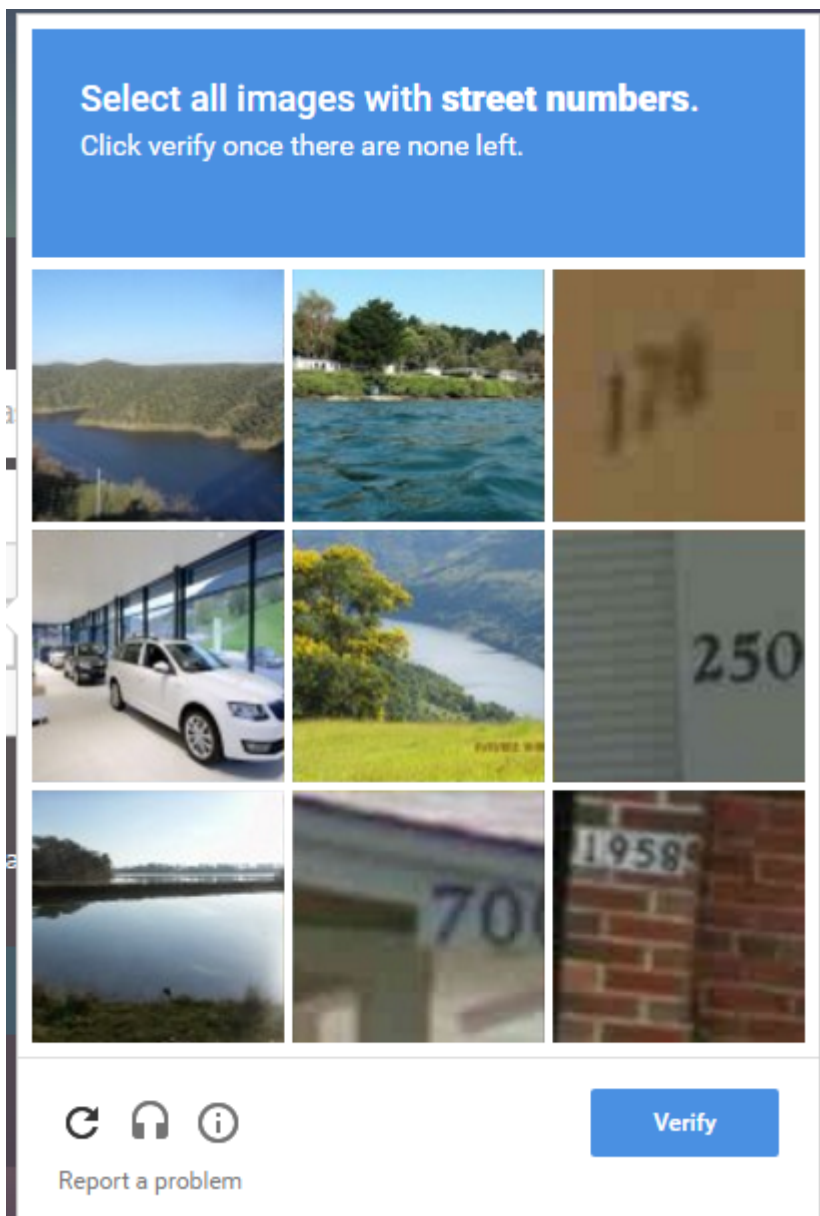

****nssp.aaatm.com**** –Resolves to authentication virtual server.

User validation of re-Captcha Once you have configured all the steps mentioned in the previous sections, you must see the following UI.

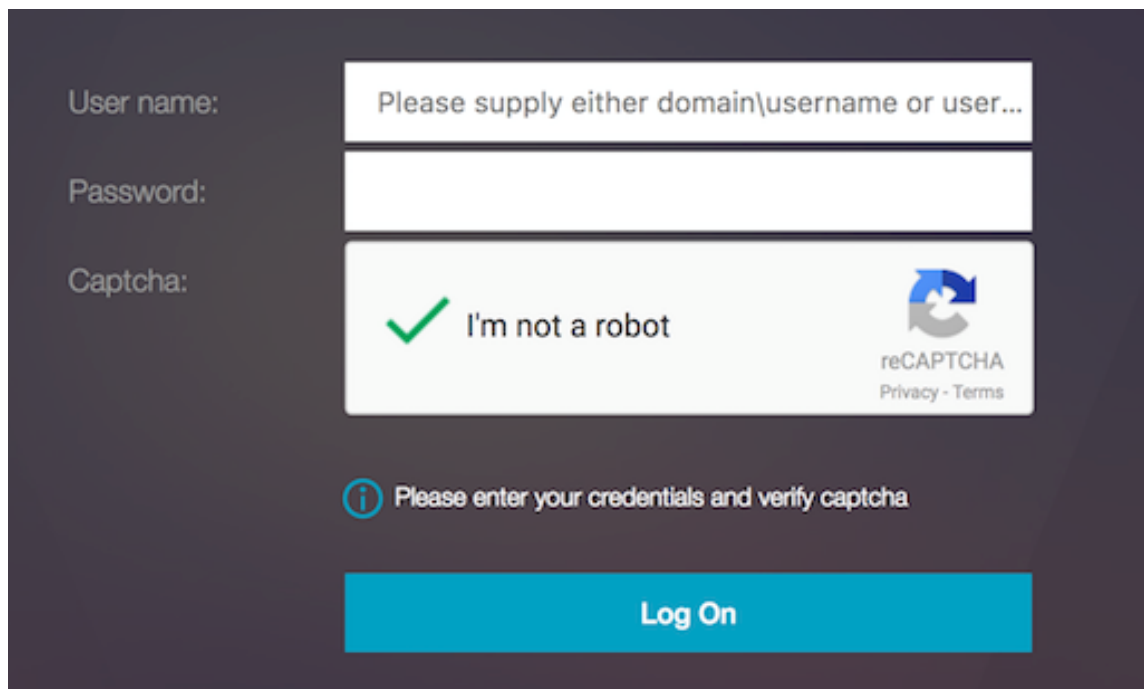

1. Once the authentication virtual server loads the login page, the logon screen is displayed. **Log On** is disabled until re-Captcha is complete.

2. Select I'm not a robot option. The re-Captcha widget is displayed.

3. You are navigated through a series of re-Captcha images, before the completion page is displayed.
4. Enter the AD credentials, select the **I'm not a robot** check box and click **Log On**. If authentication succeeds, you are redirected to the desired resource.

The image shows a login form on a dark background. It has three input fields: 'User name:' with a placeholder 'Please supply either domain\username or user...', 'Password:', and 'Captcha:'. The captcha field contains a green checkmark, the text 'I'm not a robot', and the reCAPTCHA logo with 'reCAPTCHA Privacy - Terms' text. Below the fields is an information icon and the text 'Please enter your credentials and verify captcha'. At the bottom is a large blue 'Log On' button.

Notes:

- If re-Captcha is used with AD authentication, the **Submit** button for credentials is disabled until re-Captcha is complete.
- The re-Captcha happens in a factor of its own. Therefore, any subsequent validations like AD must happen in the `next factor` of re-Captcha.

Authentication, authorization, and auditing configuration for commonly used protocols

May 2, 2023

Configuring the NetScaler appliance for authentication, authorization, and auditing needs a specific setup on the NetScaler appliance and clients' browsers. The configuration varies with the protocol used for authentication, authorization, and auditing.

For more information about configuring the NetScaler appliance for Kerberos authentication, see [Handling Authentication, Authorization and Auditing with Kerberos/NTLM](#).

Handling authentication, authorization and auditing with Kerberos/NTLM

May 2, 2023

Kerberos, a computer network authentication protocol, provides secure communication over the Internet. Designed primarily for client-server applications, it provides for mutual authentication by which the client and server can each ensure the other’s authenticity. Kerberos uses a trusted third party, referred to as Key Distribution Center (KDC). A KDC consists of an Authentication Server (AS), which authenticates a user, and a Ticket Granting Server (TGS).

Each entity on the network (client or server) has a secret key that is known only to itself and the KDC. The knowledge of this key implies authenticity of the entity. For communication between two entities on the network, the KDC generates a session key, referred to as the Kerberos ticket or service ticket. The client makes a request to the AS for credentials for a specific server. The client then receives a ticket, referred to as Ticket Granting Ticket (TGT). The client then contacts the TGS, using the TGT it received from the AS to prove its identity, and asks for a service. If the client is eligible for the service, the TGS issues a Kerberos ticket to the client. The client then contacts the server hosting the service (referred to as the service server), using the Kerberos ticket to prove that it is authorized to receive the service. The Kerberos ticket has a configurable lifetime. The client authenticates itself with the AS only once. If it contacts the physical server multiple times, it reuses the AS ticket.

The following figure shows the basic functioning of the Kerberos protocol.

Figure 1. **Functioning of Kerberos**

Kerberos authentication has the following advantages:

- **Faster authentication.** When a physical server gets a Kerberos ticket from a client, the server has enough information to authenticate the client directly. It does not have to contact a domain controller for client authentication, and therefore the authentication process is faster.
- **Mutual authentication.** When the KDC issues a Kerberos ticket to a client and the client uses the ticket to access a service, only authenticated servers can decrypt the Kerberos ticket. If the virtual server on the NetScaler appliance is able to decrypt the Kerberos ticket, you can conclude that both the virtual server and client are authenticated. Thus, the authentication of the server happens along with the authentication of the client.
- **Single sign-on** between Windows and other operating systems that support Kerberos.

Kerberos authentication may have the following disadvantages:

- Kerberos has strict time requirements; the clocks of the involved hosts must be synchronized with the Kerberos server clock to ensure that the authentication does not fail. You can mitigate this disadvantage by using the Network Time Protocol daemons to keep the host clocks synchronized. Kerberos tickets have an availability period, which you can configure.
- Kerberos needs the central server to be available continuously. When the Kerberos server is down, no one can log on. You can mitigate this risk by using multiple Kerberos servers and fallback authentication mechanisms.
- Because all the authentication is controlled by a centralized KDC, any compromise in this infrastructure, such as the user's password for a local workstation being stolen, can allow an attacker to impersonate any user. You can mitigate this risk to some extent by using only a desktop machine or laptop that you trust, or by enforcing preauthentication by means of a hardware-token.

To use Kerberos authentication, you must configure it on the NetScaler appliance and on each client.

Optimizing Kerberos authentication on authentication, authorization, and auditing

The NetScaler appliance now optimizes and improves the system performance while Kerberos authentication. The authentication, authorization, and auditing daemon remembers the outstanding Kerberos request for the same user to avoid load on Key Distribution Center (KDC), which will avoid duplicate requests.

How NetScaler implements Kerberos for client authentication

May 2, 2023

Important

Kerberos/NTLM authentication is supported only in the NetScaler 9.3 nCore release or later, and it can be used only for authentication, authorization, and auditing traffic management virtual servers.

NetScaler handles the components involved in Kerberos authentication in the following way:

Key Distribution Center (KDC)

In the Windows 2000 Server or later versions, the Domain Controller and KDC are part of the Windows Server. If the Windows Server is UP and running, it indicates that the Domain Controller and KDC are configured. The KDC is also the Active Directory server.

Note

All Kerberos interactions are validated with the Windows Kerberos Domain Controller.

Authentication service and protocol negotiation

A NetScaler appliance supports Kerberos authentication on the authentication, authorization, and auditing traffic management authentication virtual servers. If the Kerberos authentication fails, the NetScaler uses the NTLM authentication.

By default, Windows 2000 Server and later Windows Server versions use Kerberos for authentication, authorization, and auditing. If you create an authentication policy with NEGOTIATE as the authentication type, the NetScaler attempts to use the Kerberos protocol for authentication, authorization, and auditing and if the client's browser fails to receive a Kerberos ticket, the NetScaler uses the NTLM authentication. This process is referred to as negotiation.

The client may fail to receive a Kerberos ticket in any of the following cases:

- Kerberos is not supported on the client.
- Kerberos is not enabled on the client.
- The client is in a domain other than that of the KDC.
- The Access Directory on the KDC is not accessible to the client.

For Kerberos/NTLM authentication, the NetScaler does not use the data that is present locally on the NetScaler appliance.

Authorization

The traffic management virtual server can be a load balancing virtual server or a content switching virtual server.

Auditing

The NetScaler appliance supports auditing of Kerberos authentication with the following audit logging:

- Complete audit trail of the traffic management end-user activity
- SYSLOG and high performance TCP logging
- Complete audit trail of system administrators
- All system events
- Scriptable log format

Supported Environment

Kerberos authentication does not need any specific environment on the NetScaler. The client (browser) must provide support for Kerberos authentication.

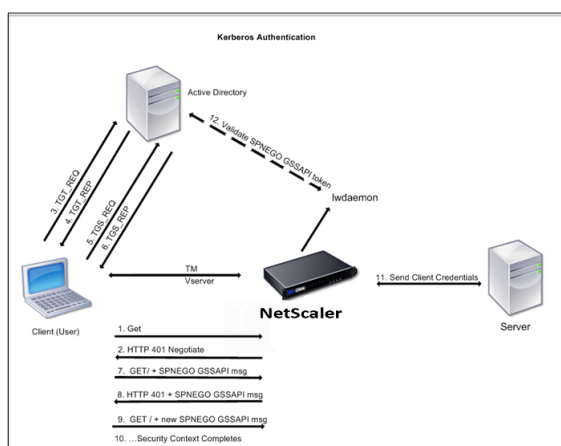

High Availability

In a high availability setup, only the active NetScaler joins the domain. In case of a failover, the NetScaler lwagent daemon joins the secondary NetScaler appliance to the domain. No specific configuration is required for this functionality.

Kerberos authentication process

The following figure shows a typical process for Kerberos authentication in the NetScaler environment.

Figure 1. Kerberos Authentication Process on NetScaler

The Kerberos authentication occurs in the following stages:

Client authenticates itself to the KDC

1. The NetScaler appliance receives a request from a client.
2. The traffic management (load balancing or content switching) virtual server on the NetScaler appliance sends a challenge to the client.
3. To respond to the challenge, the client gets a Kerberos ticket.
 - The client sends the Authentication Server of the KDC a request for a ticket-granting ticket (TGT) and receives the TGT. (See 3, 4 in the figure, Kerberos Authentication Process.)
 - The client sends the TGT to the Ticket Granting Server of the KDC and receives a Kerberos ticket. (See 5, 6 in the figure, Kerberos Authentication Process.)

Note

The above authentication process is not necessary if the client already has a Kerberos ticket whose lifetime has not expired. In addition, clients such as Web Services, .NET, or J2EE, which support SPNEGO, get a Kerberos ticket for the target server, create an SPNEGO token, and insert the token in the HTTP header when they send an HTTP request. They do not go through the client authentication process.

Client requests a service.

1. The client sends the Kerberos ticket containing the SPNEGO token and the HTTP request to the traffic management virtual server on the NetScaler. The SPNEGO token has the necessary GSSAPI data.
2. The NetScaler appliance establishes a security context between the client and the NetScaler. If the NetScaler cannot accept the data provided in the Kerberos ticket, the client is asked to get a different ticket. This cycle repeats till the GSSAPI data is acceptable and the security context is established. The traffic management virtual server on the NetScaler acts as an HTTP proxy between the client and the physical server.

NetScaler appliance completes the authentication.

1. After the security context is complete, the traffic management virtual server validates the SPNEGO token.
2. From the valid SPNEGO token, the virtual server extracts the user ID and GSS credentials, and passes them to the authentication daemon.
3. A successful authentication completes the Kerberos authentication.

Configuring kerberos authentication on the NetScaler appliance

May 5, 2023

This topic provides the detailed steps to configure Kerberos authentication on the NetScaler appliance by using the CLI and the GUI.

Configuring Kerberos authentication on the CLI

1. Enable the authentication, authorization, and auditing feature to ensure the authentication of traffic on the appliance.

```
ns-cli-prompt> enable ns feature AAA
```

2. Add the keytab file to the NetScaler appliance. A keytab file is necessary for decrypting the secret received from the client during Kerberos authentication. A single keytab file contains authentication details for all the services that are bound to the traffic management virtual server on the NetScaler appliance.

First generate the keytab file on the Active Directory server and then transfer it to the NetScaler appliance.

- Log on to the Active Directory server and add a user for Kerberos authentication using the following command.

```
1 net user <username> <password> /add
```

Note

In the **User Properties** section, ensure that the “Change password at next logon option” is not selected and the “Password does not expire” option is selected.

- Map the HTTP service to the above user and export the keytab file. For example, run the following command on the Active Directory server:

```
1 ktpass /out keytabfile /princ HTTP/owa.newacp.com@NEWACP.COM  
/pass <user password> /mapuser newacp\\dummy /ptype KRB5\  
_NT\_PRINCIPAL
```

Note

You can map more than one service if authentication is required for more than one service. If you want to map more services, repeat the above command for every service. You can give the same name or different names for the output file.

- Transfer the keytab file to the NetScaler appliance by using the unix **ftp** command or any other file transfer utility of your choice. Upload the keytab file to the `/nsconfig/krb/` directory on the NetScaler appliance.

3. The NetScaler appliance must obtain the IP address of the domain controller from the fully qualified domain name (FQDN). Therefore, Citrix recommends configuring the NetScaler with a DNS server.

```
ns-cli-prompt> add dns nameserver <ip-address>
```

Note

Alternatively, you can add static host entries or use any other means so that the NetScaler appliance can resolve the FQDN name of the domain controller to an IP address.

4. Configure the authentication action and then associate it to an authentication policy.
 - Configure the negotiate action. This configuration creates an action (profile) for an Active Directory server that is used as a Kerberos Key Distribution Center (KDC). The profile contains all the configuration data necessary to communicate with that AD KDC server.

```
ns-cli-prompt> add authentication negotiateAction <name> -domain <domain name> -domainUser <domain user name> -domainUserPasswd <domain user password> -defaultAuthenticationGroup <default authentication group> -keytab <string> -NTLMPath <string>
```

Note: For domain user and domain name configuration, go to client and use the klist command as shown in the following example:

```
Client: username @ AAA.LOCAL
```

```
Server: HTTP/onprem_idp.aaa.local @ AAA.LOCAL
```

```
add authentication negotiateAction <name> -domain -domainUser <HTTP/onprem_idp.aaa.local>
```

- Configure the negotiate policy and associate the negotiate action to this policy.

```
ns-cli-prompt> add authentication negotiatePolicy <name> <rule> <reqAction>
```

5. Create an authentication virtual server and associate the negotiate policy with it.

- Create an authentication virtual server.

```
ns-cli-prompt> add authentication vserver <name> SSL <ipAuthVserver> 443 -authenticationDomain <domainName>
```

- Bind the negotiate policy to the authentication virtual server.

```
ns-cli-prompt> bind authentication vserver <name> -policy <negotiatePolicyName>
```

6. Associate the authentication virtual server with the traffic management (load balancing or content switching) virtual server.

```
ns-cli-prompt> set lb vserver <name> -authn401 ON -authnVsName <string>
```

Note

Similar configurations can also be done on the content switching virtual server.

7. Verify the configurations by doing the following:

- Access the traffic management virtual server, using the FQDN. For example, [Sample](#)
- View the details of the session on the CLI.

```
ns-cli-prompt> show aaa session
```

Configuring Kerberos authentication on the GUI

1. Enable the authentication, authorization, and auditing feature.

Navigate to **System > Settings**, click **Configure Basic Features** and enable the authentication, authorization, and auditing feature.

2. Add the keytab file as detailed in step 2 of the CLI procedure mentioned above.

3. Add a DNS server.

Navigate to **Traffic Management > DNS > Name Servers**, and specify the IP address for the DNS server.

4. Configure the **Negotiate** action and policy.

Navigate to **Security > AAA - Application Traffic > Policies > Authentication > Advanced Policies > Policy**, and create a policy with **Negotiate** as the action type. Click **ADD** to create a new authentication negotiate server or click **Edit** to configure the existing details.

5. Bind the negotiate policy to the authentication virtual server.

Navigate to **Security > AAA - Application Traffic > Virtual Servers**, and associate the **Negotiate** policy with the authentication virtual server.

6. Associate the authentication virtual server with the traffic management (load balancing or content switching) virtual server.

Navigate to **Traffic Management > Load Balancing > Virtual Servers**, and specify the relevant authentication settings.

Note

Similar configurations can also be done on the content switching virtual server.

7. Verify the configurations as detailed in step 7 of the CLI procedure mentioned above.

Configure kerberos authentication on a client

May 2, 2023

Kerberos support must be configured on the browser to use Kerberos for authentication. You can use any Kerberos-compliant browser. Instructions for configuring Kerberos support on Internet Explorer and Mozilla Firefox follow. For other browsers, see the documentation of the browser.

To configure Internet Explorer for Kerberos authentication

1. In the **Tools** menu select **Internet Options**.
2. On the **Security** tab, click **Local Intranet**, and then click **Sites**.
3. In the **Local Intranet** dialog box, make sure that the Automatically detect intranet network option is selected, and then click **Advanced**.
4. In the **Local Intranet** dialog box, add the web sites of the domains of the traffic management virtual server on the NetScaler appliance. The specified sites become local intranet sites.
5. Click **Close** or **OK** to close the dialog boxes.

To configure Mozilla Firefox for Kerberos authentication

1. Make sure that you have Kerberos properly configured on your computer.
2. Type about:config in the URL bar.
3. In the filter text box, type network.negotiate.
4. Change network.negotiate-auth.delegation-uris to the domain that you want to add.
5. Change network.negotiate-auth.trusted-uris to the domain that you want to add.

Note: If you are running Windows, you also need to enter sspi in the filter text box and change the network.auth.use-sspi option to False.

Offload Kerberos authentication from physical servers

May 2, 2023

The NetScaler appliance can offload authentication tasks from servers. Instead of the physical servers authenticating the requests from clients, the NetScaler authenticates all the client requests before it forwards them to any of the physical servers bound to it. The user authentication is based on Active Directory tokens.

There is no authentication between the NetScaler and the physical server, and the authentication offload is transparent to the end users. After the initial logon to a Windows computer, the end user does not have to enter any additional authentication information in a pop-up or on a logon page.

In the current NetScaler appliance release, Kerberos authentication is available only for authentication, authorization, and auditing traffic management virtual servers. Kerberos authentication is not supported for SSL VPN in the NetScaler Gateway Advanced Edition appliance or for NetScaler appliance management.

Kerberos authentication requires configuration on the NetScaler appliance and on client browsers.

To configure Kerberos authentication on the NetScaler appliance

Note

The passwords used in the following sample configuration are only examples and not the actual configuration passwords.

1. Create a user account on Active Directory. When creating a user account, verify the following options in the User Properties section:
 - Make sure that you do not select the Change password at next logon option.
 - Be sure to select the Password does not expire option.
2. On the AD server, at the CLI command prompt, type:
 - `ktpass -princ HTTP/kerberos.crete.lab.net@crete.lab.net -ptype KRB5_NT_PRINCIPAL -mapuser kerbuser@crete.lab.net -mapop set -pass Citrix1 -out C:\kerbtabfile.txt`

Note

Be sure to type the above command on a single line. The output of the above command is written into the C:\kerbtabfile.txt file.

3. Upload the kerbtabfile.txt file to the /etc directory of the NetScaler appliance by using a Secure Copy (SCP) client.
4. Run the following command to add a DNS server to the NetScaler appliance.
 - `add dns nameserver 1.2.3.4`

The NetScaler appliance cannot process Kerberos requests without the DNS server. Be sure to use the same DNS server that is used in the Microsoft Windows domain.

5. Switch to the command line interface of NetScaler.
6. Run the following command to create a Kerberos authentication server:

- `add authentication negotiateAction KerberosServer -domain "crete.lab.net"-domainUser kerbuser -domainUserPasswd Citrix1 -keytab /var/mykcd.keytab`

Note

If keytab is not available, you can specify the parameters: domain, domainUser, and -domainUserPasswd.

7. Run the following command to create a negotiation policy:

- `add authentication negotiatePolicy Kerberos-Policy "REQ.IP.DESTIP == 192.168.17.200"KerberosServer<!--NeedCopy-->`

8. Run the following command to create an authentication virtual server.

- `add authentication vserver Kerb-Auth SSL 192.168.17.201 443 -AuthenticationDomain crete.lab.net<!--NeedCopy-->`

9. Run the following command to bind the Kerberos policy to the authentication virtual server:

- `bind authentication vserver Kerb-Auth -policy Kerberos-Policy -priority 100<!--NeedCopy-->`

10. Run the following command to bind an SSL certificate to the authentication virtual server. You can use one of the test certificates, which you can install from the GUI NetScaler appliance. Run the following command to use the ServerTestCert sample certificate.

- `bind ssl vserver Kerb-Auth -certkeyName ServerTestCert<!--NeedCopy-->`

11. Create an HTTP load balancing virtual server with the IP address, 192.168.17.200.

Ensure that you create a virtual server from the command line interface for NetScaler 9.3 releases if they are older than 9.3.47.8.

12. Run the following command to configure an authentication virtual server:

- `set lb vserver <name>-authn401 ON -authnVsName Kerb-Auth<!--NeedCopy-->`

13. Enter the host name [Example](#) in the address bar of the Web browser.

The Web browser displays an authentication dialog box because the Kerberos authentication is not set up in the browser.

Note

Kerberos authentication requires a specific configuration on the client. Ensure that the client can resolve the hostname, which results in the Web browser connecting to an HTTP

virtual server.

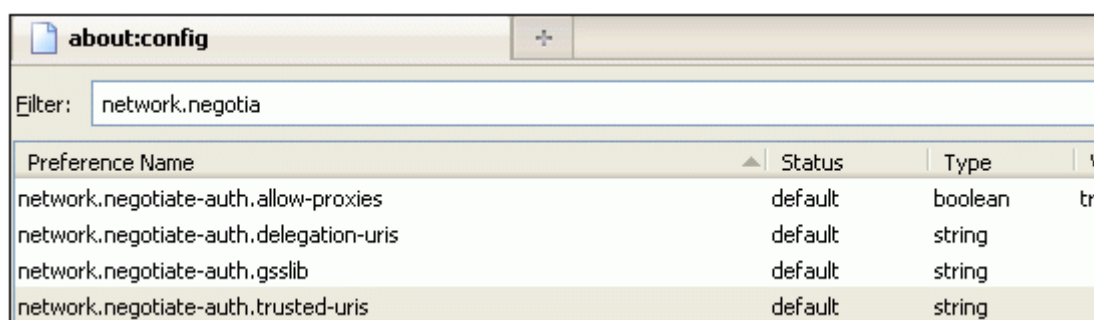

14. Configure Kerberos on the Web browser of the client computer.
 - For configuring on Internet Explorer, see [Configuring Internet Explorer for Kerberos authentication](#).
 - For configuring on Mozilla Firefox, see [Configuring Internet Explorer for Kerberos authentication](#).
15. Verify whether you can access the backend physical server without authentication.

To configure Internet Explorer for Kerberos authentication

1. Select **Internet Options** from the **Tools** menu.
2. Activate the **Security** tab.
3. Select **Local Intranet** from the Select a zone to view change security settings section.
4. Click **Sites**.
5. Click **Advanced**.
6. Specify the URL, [Example](#) and click **Add**.
7. Restart **Internet Explorer**.

To configure Mozilla Firefox for Kerberos authentication

1. Enter about:config in the address bar of the browser.
2. Click the warning disclaimer.
3. Type **Network.Negotiate-auth.trusted-uris** in the **Filter** box.
4. Double click **Network.Negotiate-auth.trusted-uris**. A sample screen is shown below.

5. In the Enter String Value dialog box, specify [www.crete.lab.net](#).
6. Restart Firefox.

Single sign-on types

May 2, 2023

NetScaler Authentication, authorization, and auditing features supports the following single sign-on types.

- **NetScaler kerberos single sign-on:** NetScaler appliances now support single sign-on (SSO) using the Kerberos 5 protocol. Users log on to a proxy, the Application Delivery Controller (ADC), which then provides access to protected resources. For details, see [NetScaler kerberos single sign-on](#).
- **SSO for Basic, Digest, and NTLM authentication:** Single Sign-On (SSO) configuration in NetScaler and NetScaler Gateway can be enabled at global level and also per traffic level. By default the SSO configuration is OFF and an administrator can enable the SSO per traffic or globally. From a security point of view, Citrix recommends administrators to turn SSO globally OFF and enable per traffic basis. This enhancement is to make SSO configuration more secure by disabling certain type of SSO methods globally. For details, see [SSO for Basic, Digest, and NTLM authentication](#).

NetScaler kerberos single sign-on

May 2, 2023

NetScaler appliances now support single sign-on (SSO) using the Kerberos 5 protocol. Users log on to a proxy, the Application Delivery Controller (ADC), which then provides access to protected resources.

The NetScaler Kerberos SSO implementation requires the user's password for SSO methods that rely on basic, NTLM, or forms-based authentication. The user's password is not required for Kerberos SSO, although if Kerberos SSO fails and the NetScaler appliance has the user's password, it uses the password to attempt NTLM SSO.

If the user's password is available, the KCD account is configured with a realm, and no delegated user information is present, the Citrix AD Kerberos SSO engine impersonates the user to obtain access to authorized resources. Impersonation is also called unconstrained delegation.

The NetScaler Kerberos SSO engine can also be configured to use a delegated account to obtain access to protected resources on the user's behalf. This configuration requires delegated user credentials, a keytab, or a delegated user certificate and matching CA certificate. Configuration that uses a delegated account is called constrained delegation.

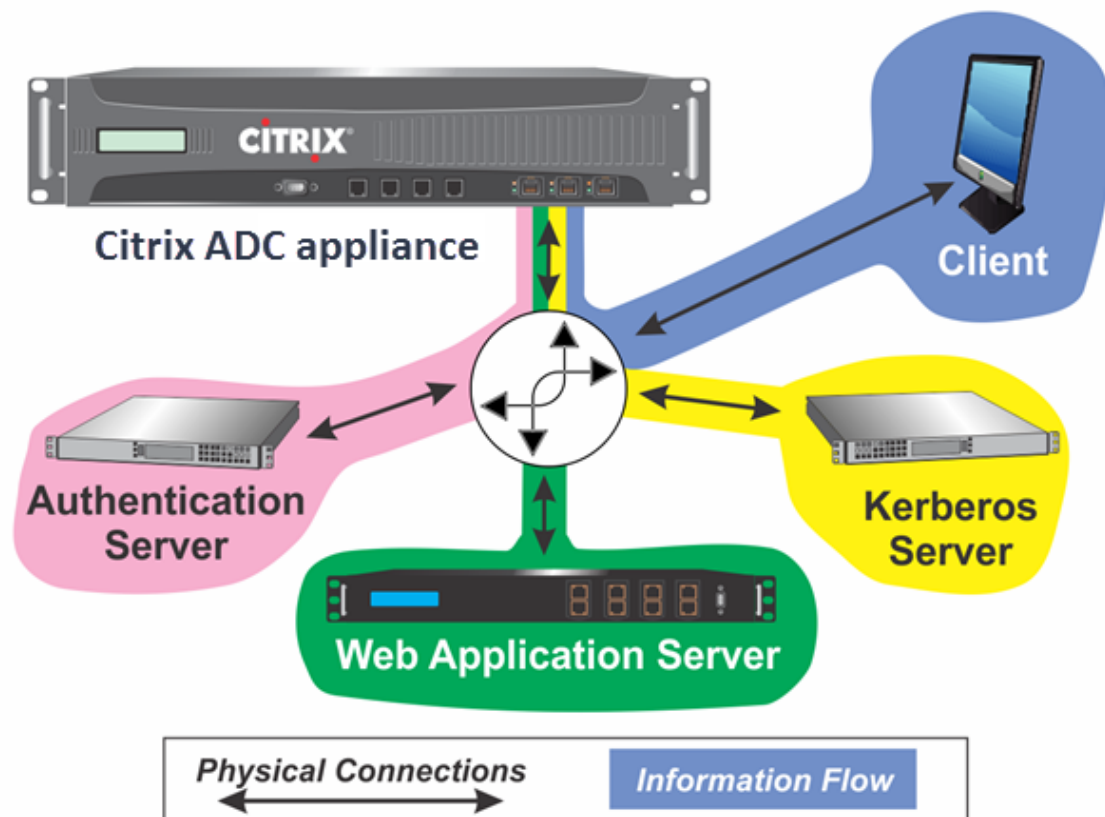

An overview of NetScaler kerberos SSO

May 2, 2023

To use the NetScaler Kerberos SSO feature, users first authenticate with Kerberos or a supported third-party authentication server. Once authenticated, the user requests access to a protected web application. The web server responds with a request for proof that the user is authorized to access that web application. The user's browser contacts the Kerberos server, which verifies that the user is authorized to access that resource, and then provides the user's browser with a service ticket that provides proof. The browser resends the user's request to the web application server with the service ticket attached. The web application server verifies the service ticket, and then allows the user to access the application.

Authentication, authorization, and auditing traffic management implements this process as shown in the following diagram. The diagram illustrates the flow of information through the NetScaler appliance and authentication, authorization, and auditing traffic management, on a secure network with LDAP authentication and Kerberos authorization. Authentication, authorization, and auditing traffic management environments that use other types of authentication have essentially the same information flow, although they might differ in some details.

Figure 1. A Secure Network with LDAP and Kerberos

The authentication, authorization, and auditing traffic management with authentication and authorization in a Kerberos environment requires that the following actions take place.

1. The client sends a request for a resource to the traffic management virtual server on the NetScaler appliance.
2. The traffic management virtual server passes the request to the authentication virtual server, which authenticates the client and then passes the request back to the traffic management virtual server.
3. The traffic management virtual server sends the client's request to the web application server.
4. The web application server responds to the traffic management virtual server with a 401 Unauthorized message that requests Kerberos authentication, with fallback to NTLM authentication if the client does not support Kerberos.
5. The traffic management virtual server contacts the Kerberos SSO daemon.
6. The Kerberos SSO daemon contacts the Kerberos server and obtains a ticket-granting ticket (TGT) allowing it to request service tickets authorizing access to protected applications.
7. The Kerberos SSO daemon obtains a service ticket for the user and sends that ticket to the traffic management virtual server.
8. The traffic management virtual server attaches the ticket to the user's initial request and sends the modified request back to the web application server.
9. The web application server responds with a 200 OK message.

These steps are transparent to the client, which just sends a request and receives the requested resource.

Integration of NetScaler Kerberos SSO with authentication methods

All authentication, authorization, and auditing traffic management authentication mechanisms support NetScaler Kerberos SSO. Authentication, authorization, and auditing traffic management supports the Kerberos SSO mechanism with the Kerberos, CAC (Smart Card) and SAML authentication mechanisms with any form of client authentication to the NetScaler appliance. It also supports the HTTP-Basic, HTTP-Digest, Forms-based, and NTLM (versions 1 and 2) SSO mechanisms if the client uses either HTTP-Basic or Forms-Based authentication to log on to the NetScaler appliance.

The following table shows each supported client-side authentication method, and the supported server-side authentication method for that client-side method.

Table 1. Supported Authentication Methods

	Basic/Digest/NTLM	Kerberos Constrained	
		Delegation	User Impersonation
CAC (Smart Card): at SSL/TLS Layer		X	X
Forms-Based (LDAP/RADIUS/TA- CACS)	X	X	X
HTTP Basic (LDAP/RA- DIUS/TACACS)	X	X	X
Kerberos		X	
NT LM v1/v2		X	X
SAML		X	
SAML Two-Factor	X	X	X
Certificate Two-Factor	X	X	X

Set up NetScaler SSO

May 2, 2023

You can configure NetScaler SSO to work in one of two ways: by impersonation or by delegation. SSO by impersonation is a simpler configuration than SSO by delegation, and is therefore preferable when your configuration allows it. To configure NetScaler SSO by impersonation, you must have the user's user name and password.

To configure NetScaler SSO by delegation, you must have the delegated user's credentials in one of the following formats: the user's user name and password, the keytab configuration that includes the user name and an encrypted password, or the delegated user certificate and the matching CA certificate.

Prerequisites for configuring NetScaler SSO

Before you configure a NetScaler SSO, you need to have your NetScaler appliance fully configured to manage traffic to and authentication for your web application servers. Therefore, you must configure either load balancing or content switching, and then authentication, authorization, and auditing, for these web application servers. You must also verify the routing between the appliance, your LDAP server, and your Kerberos server.

If your network is not already configured in this manner, perform the following configuration tasks:

- Configure a server and service for each web application server.
- Configure a traffic management virtual server to handle traffic to and from your web application server.

Following are brief instructions and examples for performing each of these tasks from the NetScaler command line. For further assistance, see [Setting up an Authentication Virtual Server](#).

Note

From NetScaler 13.1 release onwards, the traversal between Root domain and Tree domain is supported during Kerberos SSO authentication for backend server from the NetScaler appliance.

To create a server and service by using the CLI

For NetScaler SSO to obtain a TGS (service ticket) for a service, either the FQDN assigned to the server entity on the NetScaler appliance must match the FQDN of the web application server, or the server entity name must match the NetBios name of the web application server. You can take either of the following approaches:

- Configure the NetScaler server entity by specifying the FQDN of the web application server.
- Configure the NetScaler server entity by specifying the IP address of the web application server, and assign the server entity the same name as the NetBios name of the web application server.

At the command prompt, type the following commands:

```
1 - add server name <serverFQDN>
2
3 - add service name serverName serviceType port
4 <!--NeedCopy-->
```

For the variables, substitute the following values:

- **serverName**. A name for the NetScaler appliance to use to refer to this server.
- **serverFQDN**. The FQDN of the server. If the server has no domain assigned to it, use the server's IP address and make sure that the server entity name matches the NetBios name of the web application server.
- **serviceName**. A name for the NetScaler appliance to use to refer to this service.
- **type**. The protocol used by the service, either HTTP or MSSQLSVC.
- **port**. The port on which the service listens. HTTP services normally listen on port 80. Secure HTTPS services normally listen on port 443.

Example:

The following examples add server and service entries on the NetScaler appliance for the web application server was1.example.com. The first example uses the FQDN of the web application server; the second uses the IP address.

To add the server and service using the web application server FQDN, was1.example.com, you would type the following commands:

```
1 add server was1 was1.example.com
2 add service was1service was1 HTTP 80
3 <!--NeedCopy-->
```

To add the server and service using the web application server IP and NetBios name, where the web application server IP is 10.237.64.87 and its NetBios name is WAS1, you would type the following commands:

```
1 add server WAS1 10.237.64.87
2 add service was1service WAS1 HTTP 80
3 <!--NeedCopy-->
```

To create a traffic management virtual server by using the CLI

The traffic management virtual server manages traffic between the client and the web application server. You can use either a load balancing or a content switching virtual server as the traffic management server. The SSO configuration is the same for either type.

To create a load balancing virtual server, at the command prompt, type the following command:

```
1 add lb vservice <vserviceName> <type> <IP> <port>
2 <!--NeedCopy-->
```

For the variables, substitute the following values:

- **vserviceName**—A name for the NetScaler appliance to use to refer to this virtual server.
- **type**—The protocol used by the service, either HTTP or MSSQLSVC.
- **IP**—The IP address assigned to the virtual server. This would normally be an IANA-reserved, non-public IP address on your LAN.
- **port**—The port on which the service listens. HTTP services normally listen on port 80. Secure HTTPS services normally listen on port 443.

Example:

To add a load balancing virtual server called tmvserver1 to a configuration that manages HTTP traffic on port 80, assigning it a LAN IP address of 10.217.28.20 and then binding the load balancing virtual server to the wasservice1 service, you would type the following commands:

```
1 add lb vservice tmvserver1 HTTP 10.217.28.20 80
2 bind lb vservice tmvserv1 wasservice1
```

```
3 <!--NeedCopy-->
```

To create an authentication virtual server by using the CLI

The authentication virtual server manages authentication traffic between the client and the authentication (LDAP) server. To create an authentication virtual server, at the command prompt type the following commands:

```
1 add authentication vserver <authvserverName> SSL <IP> 443
2 <!--NeedCopy-->
```

For the variables, substitute the following values:

- **authvserverName**—A name for the NetScaler appliance to use to refer to this authentication virtual server. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space (), at (@), equals (=), colon (:), and underscore characters. Can be changed after the authentication virtual server is added by using the `rename authentication vserver` command.
- **IP**—The IP address assigned to the authentication virtual server. As with the traffic management virtual server, this address would normally be an IANA-reserved, non-public IP on your LAN.
- **domain**—The domain assigned to the virtual server. This would usually be the domain of your network. It is customary, though not required, to enter the domain in all capitals when configuring the authentication virtual server.

Example:

To add an authentication virtual server called `authverver1` to your configuration and assign it the LAN IP `10.217.28.21` and the domain `EXAMPLE.COM`, you would type the following commands:

```
1 add authentication vserver authvserver1 SSL 10.217.28.21 443
2 <!--NeedCopy-->
```

To configure a traffic management virtual server to use an authentication profile

The authentication virtual server can be configured to handle authentication for a single domain or for multiple domains. If it is configured to support authentication for multiple domains, you must also specify the domain for NetScaler SSO by creating an authentication profile, and then configuring the traffic management virtual server to use that authentication profile.

Note

The traffic management virtual server can be either a load balancing (lb) or content switching

(cs) virtual server. The following instructions assume that you are using a load balancing virtual server. To configure a content switching virtual server, simply substitute `set cs vserver` for `set lb vserver`. The procedure is otherwise the same.

To create the authentication profile, and then configure the authentication profile on a traffic management virtual server, type the following commands:

```
1 - add authentication authnProfile <authnProfileName> {
2   -authvserverName <string> }
3   {
4   -authenticationHost <string> }
5   {
6   -authenticationDomain <string> }
7
8 - set lb vserver \<vserverName\> -authnProfile <authnprofileName>
9 <!--NeedCopy-->
```

For the variables, substitute the following values:

- **authnprofileName**—A name for the authentication profile. Must begin with a letter, number, or the underscore character (`_`), and must consist of from one to thirty-one alphanumeric or hyphen (`-`), period (`.`) pound (`#`), space (), at (`@`), equals (`=`), colon (`:`), and underscore characters.
- **authvserverName**—The name of the authentication virtual server that this profile uses for authentication.
- **authenticationHost**—Host name of the authentication virtual server.
- **authenticationDomain**—Domain for which NetScaler SSO handles authentication. Required if the authentication virtual server performs authentication for more than one domain, so that the correct domain is included when the NetScaler appliance sets the traffic management virtual server cookie.

Example:

To create an authentication profile named `authnProfile1` for authentication of the `example.com` domain, and to configure the load balancing virtual server `vserver1` to use the authentication profile `authnProfile1`, you would type the following commands:

```
1 add authentication authnProfile authnProfile1 -authnvsName
   authvserver1
2   -authenticationHost authvserver1 -authenticationDomain example.
   com
3 set lb vserver vserver1 -authnProfile authnProfile1
4 <!--NeedCopy-->
```

Configure single sign-on

May 8, 2023

Configuring NetScaler single sign-on (SSO) to authenticate by impersonation is simpler than configuring than SSO to authenticate by delegation, and is therefore preferable when your configuration allows it. You create a KCD account. You can use the user's password.

If you do not have the user's password, you can configure NetScaler SSO to authenticate by delegation. Although more complex than configuring SSO to authenticate by impersonation, the delegation method provides flexibility in that a user's credentials might not be available to the NetScaler appliance in all circumstances.

For either impersonation or delegation, you must also enable integrated authentication on the web application server.

Enable integrated authentication on the web application server

To set up NetScaler Kerberos SSO on each web application server that Kerberos SSO manages, use the configuration interface on that server to configure the server to require authentication. Select Kerberos (negotiate) authentication by preference, with fallback to NTLM for clients that do not support Kerberos.

Following are instructions for configuring the Microsoft Internet Information Server (IIS) to require authentication. If your web application server uses software other than IIS, consult the documentation for that web server software for instructions.

To configure Microsoft IIS to use integrated authentication

1. Log on to the IIS server and open **Internet Information Services Manager**.
2. Select the website for which you want to enable integrated authentication. To enable integrated authentication for all IIS web servers managed by IISM, configure authentication settings for the Default website. To enable integrated authentication for individual services (such as Exchange, Exadmin, ExchWeb, and Public), configure these authentication settings for each service individually.
3. Open the **Properties** dialog box for the default website or for the individual service, and click the **Directory Security** tab.
4. Beside **Authentication** and **Access Control**, select **Edit**.
5. Disable anonymous access.

6. Enable Integrated Windows authentication (only). Enabling integrated Windows authentication must automatically set protocol negotiation for the web server to Negotiate, NTLM, which specifies Kerberos authentication with fallback to NTLM for non-Kerberos capable devices. If this option is not automatically selected, manually set protocol negotiation to Negotiate, NTLM.

Set up SSO by impersonation

You can configure the KCD account for NetScaler SSO by impersonation. In this configuration, the NetScaler appliance obtains the user's user name and password when the user authenticates to the authentication server and uses those credentials to impersonate the user to obtain a ticket-granting ticket (TGT). If the user's name is in UPN format, the appliance obtains the user's realm from UPN. Otherwise, it obtains the user's name and realm by extracting it from the SSO domain used during initial authentication, or from the session profile.

Note

You cannot add a user name with domain if the user name is already added without domain. If the user name with domain is added first followed by the same user name without domain, then the NetScaler appliance adds the user name to the user list.

When configuring the KCD account, you must set the realm parameter to the realm of the service that the user is accessing. The same realm is also used as the user's realm if the user's realm cannot be obtained from authentication with the NetScaler appliance or from the session profile.

To create the KCD account for SSO by impersonation with a password

At the command prompt, type the following command:

```
1 add aaa kcdaccount <accountname> -realmStr <realm>
2
3 <!--NeedCopy-->
```

For the variables, substitute the following values:

- **accountname**. The KCD account name.
- **realm**. The domain assigned to the NetScaler SSO.

Example

To add a KCD account named kcdccount1, and use the keytab named kcdvserver.keytab, you would type the following command:

```
1 add aaa kcdAccount kcdaccount1 -keytab kcdvserver.keytab
2
3 <!--NeedCopy-->
```

For information on configuring Kerberos impersonation through the NetScaler GUI, see [NetScaler support](#).

Configure SSO by delegation

To configure SSO by Delegation, you need to perform the following tasks:

- If you are configuring delegation by delegated user certificate, install the matching CA certificates on the NetScaler appliance and add them to the NetScaler configuration.
- Create the KCD account on the appliance. The appliance uses this account to obtain service tickets for your protected applications.
- Configure the Active Directory server.

Note

For more information on creating a KCD account and configuring on the NetScaler appliance, refer to the following topics:

- [Handling authentication, authorization and auditing with Kerberos/NTLM](#)
- [How NetScaler implements Kerberos for client authentication](#)
- [Configuring kerberos authentication on the NetScaler appliance](#)

Installing the client CA certificate on the NetScaler appliance

If you are configuring the NetScaler SSO with a client certificate, you must copy the matching CA certificate for the client certificate domain (the client CA certificate) to the NetScaler appliance, and then install the CA certificate. To copy the client CA certificate, use the file transfer program of your choice to transfer the certificate and private-key file to the NetScaler appliance, and store the files in `/nsconfig/ssl`.

To install the client CA certificate on the NetScaler appliance At the command prompt, type the following command:

```
1 add ssl certKey <certkeyName> -cert <cert> [(-key <key> [-password]) |
  -fipsKey <fipsKey>][-inform ( DER | PEM )][-expiryMonitor ( ENABLED
  | DISABLED | UNSET ) [-notificationPeriod <positive_integer>]] [-
  bundle ( YES | NO )]
2
```

```
3 <!--NeedCopy-->
```

For the variables, substitute the following values:

- **certKeyName.** A name for the client CA certificate. Must begin with an ASCII alphanumeric or underscore (_) character, and must consist of from one to thirty-one characters. Allowed characters include the ASCII alphanumerics, underscore, hash (#), period(.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the certificate-key pair is created. If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, “my cert” or ‘my cert’).
- **cert.** Full path name and file name of the X509 certificate file used to form the certificate-key pair. The certificate file must be stored on the NetScaler appliance, in the /nsconfig/ssl/ directory.
- **key.** Full path name and file name of the file that contains the private key to the X509 certificate file. The key file must be stored on the NetScaler appliance in the /nsconfig/ssl/ directory.
- **password.** If a private key is specified, the passphrase used to encrypt the private key. Use this option to load encrypted private keys in PEM format.
- **fipsKey.** Name of the FIPS key that was created inside the Hardware Security Module (HSM) of a FIPS appliance, or a key that was imported into the HSM.

Note

You can specify either a key or a fipsKey, but not both.

- **inform.** Format of the certificate and private-key files, either PEM or DER.
- **passplain.** Passphrase used to encrypt the private key. Required when adding an encrypted private-key in PEM format.
- **expiryMonitor.** Configure the NetScaler appliance to issue an alert when the certificate is about to expire. Possible values: ENABLED, DISABLED, UNSET.
- **notificationPeriod.** If `expiryMonitor` is ENABLED, the number of days before the certificate expires to issue an alert.
- **bundle.** Parse the certificate chain as a single file after linking the server certificate to its issuer’s certificate within the file. Possible values: YES, NO.

Example

The following example adds the specified delegated user certificate `customer-cert.pem` to the NetScaler configuration along with the key `customer-key.pem`, and sets the password, certificate format, expiration monitor, and notification period.

To add the delegated user certificate, you would type the following commands:

```

1 add ssl certKey customer -cert "/nsconfig/ssl/customer-cert.pem"
2 -key "/nsconfig/ssl/customer-key.pem" -password "dontUseDefaultPwS!"
3 -inform PEM -expiryMonitor ENABLED [-notificationPeriod 14]
4
5 <!--NeedCopy-->

```

Creating the KCD account

If you are configuring NetScaler SSO by delegation, you can configure the KCD account to use the user's log-on name and password, to use the user's log-on name and keytab, or to use the user's client certificate. If you configure SSO with user name and password, the NetScaler appliance uses the delegated user account to obtain a Ticket Granting Ticket (TGT), and then uses the TGT to obtain service tickets for the specific services that each user requests. If you configure SSO with keytab file, the NetScaler appliance uses the delegated user account and keytab information. If you configure SSO with a delegated user certificate, the NetScaler appliance uses the delegated user certificate.

Note:

For cross-realm, the `servicePrincipalName` of the delegated user must be in the format `host /<name>`. If it is not in this format, change the `servicePrincipalName` of the delegated user `<servicePrincipalName>` to `host/<service-account-samaccountname>`. You can check the attribute of the delegated user account in the domain controller. One method to change is to change the delegated user's `logonName` attribute.

To create the KCD account for SSO by delegation with a password At the command prompt, type the following commands:

```

1 add aaa kcdAccount <kcdAccount> {
2   -realmStr <string> }
3   {
4   -delegatedUser <string> }
5   {
6   -kcdPassword }
7   [-userRealm <string>]
8   [-enterpriseRealm <string>] [-serviceSPN <string>]
9 <!--NeedCopy-->

```

For the variables, substitute the following values:

- **kcdAccount** - A name for the KCD account. This is a mandatory argument. Maximum Length: 31
- **realmStr** - The realm of Kerberos. Maximum Length: 255
- **delegatedUser** - The user name that can perform kerberos constrained delegation. The delegated user name is derived from the `servicePrincipalName` of your domain controller. For cross-

realm, the servicePrincipalName of the delegated user must be in the format `host/<name>`.
Maximum Length: 255.

- **kcdPassword** - Password for Delegated User. Maximum Length: 31
- **userRealm** - Realm of the user. Maximum Length: 255
- **enterpriseRealm** - Enterprise Realm of the user. This is given only in certain KDC deployments where KDC expects Enterprise user name instead of Principal Name. Maximum Length: 255
- **serviceSPN** - Service SPN. When specified, this is used to fetch kerberos tickets. If not specified, NetScaler constructs SPN using the service FQDN. Maximum Length: 255

Example (UPN Format):

To add a KCD account named `kcdaccount1` to the NetScaler appliance configuration with a password of `password1` and a realm of `EXAMPLE.COM`, specifying the delegated user account in UPN format (as root), you would type the following commands:

```
1 add aaa kcdaccount kcdaccount1 -delegatedUser root
2 -kcdPassword password1 -realmStr EXAMPLE.COM
3
4 <!--NeedCopy-->
```

Example (SPN Format):

To add a KCD account named `kcdaccount1` to the NetScaler appliance configuration with a password of `password1` and a realm of `EXAMPLE.COM`, specifying the delegated user account in SPN format, you would type the following commands:

```
1 add aaa kcdAccount kcdaccount1 -realmStr EXAMPLE.COM
2 -delegatedUser "host/kcdvserver.example.com" -kcdPassword password1
3
4 <!--NeedCopy-->
```

Creating the KCD account for SSO by delegation with a keytab If you plan to use a keytab file for authentication, first create the keytab. You can create the keytab file manually by logging on to the AD server and using the `ktpass` utility, or you can use the NetScaler configuration utility to create a batch script, and then run that script on the AD server to generate the keytab file. Next, use FTP or another file transfer program to transfer the keytab file to the NetScaler appliance and place it in the `/nsconfig/krb` directory. Finally, configure the KCD account for NetScaler SSO by delegation and provide the path and file name of the keytab file to the NetScaler appliance.

Note:

For cross-realm, if you want to get the Keytab file as part of the KCD account, use the following command for the updated delegated user name.

In the domain controller, create an updated Keytab file.

```
ktpass /princ <servicePrincipalName-with-prefix<host/>Of-delegateUser
>@<DC REALM in uppercase> /ptype KRB5_NT_PRINCIPAL /mapuser <DC
REALM in uppercase>\<sAMAccountName> /pass <delegatedUserPassword
> -out filepathfor.keytab
```

The `filepathfor.keytab` file can be placed in the NetScaler appliance and can be used as part of the Keytab configuration in the ADC KCD account.

To create the keytab file manually Log on to the AD server command line and, at the command prompt, type the following command:

```
1 ktpass princ <SPN> ptype KRB5_NT_PRINCIPAL mapuser <DOMAIN><username>
   pass <password> -out <File_Path>
2 <!--NeedCopy-->
```

For the variables, substitute the following values:

- **SPN.** The service principal name for the KCD service account.
- **DOMAIN.** The domain of the Active Directory server.
- **username.** The KSA account user name.
- **password.** The KSA account password.
- **path.** The full path name of the directory in which to store the keytab file after it is generated.

To use the NetScaler configuration utility to create a script to generate the keytab file

1. Navigate to **Security > AAA - Application Traffic**.
2. In the data pane, under **Kerberos Constrained Delegation**, click **Batch** file to generate Keytab.
3. In the **Generate KCD (Kerberos Constrained Delegation) Keytab Script** dialog box, set the following parameters:
 - **Domain User Name.** The KSA account user name.
 - **Domain Password.** The KSA account password.
 - **Service Principal.** The service principal name for the KSA.
 - **Output File Name.** The full path and file name to which to save the keytab file on the AD server.
4. Clear the **Create Domain User Account** check box.
5. Click **Generate Script**.
6. Log on to the Active Directory server and open a command line window.
7. Copy the script from the **Generated Script** window and paste it directly into the Active Directory server command-line window. The keytab is generated and stored in the directory under the file name that you specified as **Output File Name**.

8. Use the file transfer utility of your choice to copy the keytab file from the Active Directory server to the NetScaler appliance and place it in the /nsconfig/krb directory.

To create the KCD account At the command prompt, type the following command:

```
1 add aaa kcdaccount <accountname> -keytab <keytab>
2 <!--NeedCopy-->
```

Example

To add a KCD account named kcdccount1, and use the keytab named kcdvserver.keytab, you would type the following commands:

```
1 add aaa kcdaccount kcdccount1 -keytab kcdvserver.keytab
2 <!--NeedCopy-->
```

To create the KCD account for SSO by delegation with a delegated user cert At the command prompt, type the following command:

```
1 add aaa kcdaccount <accountname> -realmStr <realm> -delegatedUser <
  user_nameSPN> -usercert <cert> -cacert <cacert>
2 <!--NeedCopy-->
```

For the variables, substitute the following values:

- **accountname**. A name for the KCD account.
- **realmStr**. The realm for the KCD account, usually the domain for which SSO is configured.
- **delegatedUser**. The delegated user name, in SPN format.
- **usercert**. The full path and name of the delegated user certificate file on the NetScaler appliance. The delegated user certificate must contain both the client certificate and the private key, and must be in PEM format. If you use smart card authentication, you must create a smart card certificate template to allow certificates to be imported with the private key.
- **cacert**. The full path to and name of the CA certificate file on the NetScaler appliance.

Example

To add a KCD account named kcdccount1, and use the keytab named kcdvserver.keytab, you would type the following command:

```
1 add aaa kcdaccount kcdccount1 -realmStr EXAMPLE.COM
2     -delegatedUser "host/kcdvserver.example.com" -usercert /certs/
  usercert
3     -cacert /cacerts/cacert
4 <!--NeedCopy-->
```

Setting up Active Directory for NetScaler SSO

When you configure SSO by delegation, in addition to creating the KCDAccount on the NetScaler appliance, you must also create a matching Kerberos Service Account (KSA) on your LDAP active directory server, and configure the server for SSO. To create the KSA, use the account creation process on the active directory server. To configure SSO on the active directory server, open the properties window for the KSA. In the **Delegation** tab, enable the following options: Trust this user for delegation to specified services only and Use any Authentication protocol. (The Kerberos only option does not work, because it does not enable protocol transition or constrained delegation.) Finally, add the services that NetScaler SSO manages.

Note:

If the Delegation tab is not visible in the KSA account properties dialog box, before you can configure the KSA as described, you must use the Microsoft `setspn` command line tool to configure the active directory server so that the tab is visible.

To configure delegation for the Kerberos service account

1. In the LDAP account configuration dialog box for the Kerberos service account that you created, click the **Delegation** tab.
2. Choose **Trust this user for delegation to the specified services only**.
3. Under Trust this user for delegation to the specified services only, choose **Use any authentication protocol**.
4. Under Services to which this account can present delegated credentials, click **Add**.
5. In the **Add Services** dialog box, click **Users** or **Computers**, choose the server that hosts the resources to be assigned to the service account, and then click **OK**.

Note:

- Constrained delegation does not support services hosted in domains other than the domain assigned to the account, even though Kerberos might have a trust relationship with other domains.
- Use the following command to create the `setspn` if a new user is created in the active directory: `setspn -A host/kcdvserver.example.com example\kcdtest`

6. Back in the **Add Services** dialog box, in the Available Services list, chooses the services assigned to the service account. NetScaler SSO supports the HTTP and MSSQLSVC services.
7. Click **OK**.

Configuration changes to enable KCD to support child domains

If the KCD account is configured with `samAccountName` for `-delegatedUser`, KCD does not work for users accessing services from child domains. In this case, you can modify the configuration on the NetScaler appliance and the Active Directory.

- Change service account `<service-account-samaccountname>` (which is configured as `delegateUser` on the KCD Account) logon name on AD in `host/<service-account-samaccountname>.<completeUSERDNSDOMAIN>` format (for example, `host/svc_act.child.parent.com`).

You can change the service account manually or by using the `ktpass` command. The `ktpass` automatically updates the service account.

```
ktpass /princ host/svc_act.child.parent.com@CHILD.PARENT.COM /  
ptype KRB5_NT_PRINCIPAL /mapuser CHILD\sv_act /pass serviceaccountpassword  
-out filepathfor.keytab
```

- Modify `delegatedUser` in KCD account on the NetScaler appliance.
- Modify the `-delegatedUser` parameter in the KCD account as `host/svc_act.child.parent.com`

Points to note when advanced encryptions are used to configure KCD account

- **Sample configuration when keytab is used:** `add kcdaccount lbvs_keytab_aes256 -keytab "/nsconfig/krb/kcd2_aes256.keytab"`
- **Sample command when keytab has multiple encryption types.** The command also captures domain user parameters: `add kcdaccount lbvs_keytab_aes256 -keytab "/nsconfig/krb/kcd2_aes256.keytab"-domainUser "HTTP/lbvs.aaa.local"`
- **Sample command when user credentials are used:** `add kcdaccount kslb2_user -realmStr AAA.LOCAL -delegatedUser lbvs -kcdPassword <password>`

Domain user information

When advanced encryption types are used for Kerberos SSO, ensure that the correct domain user information is provided. You can get the information about the user login name from Active Directory.

When configuring NetScaler SSO using Kerberos delegation When advanced encryption types are used for Kerberos SSO using delegation, the `delegatedUser` parameter of the `add aaa`

`kcdaccount` command must be the service principal name (SPN) of the user. The service principal name is case sensitive.

To know the service principal name of a user, use the `setspn -L <domain\user>` command on the Active Directory domain controller. For example, `setspn -L EXAMPLE\username`

To set the service principal name, use the `setspn` command on the Active Directory domain controller. To create a keytab file, use the `ktpass` command on the Active Directory domain controller. The following is an example of how to do so:

- **setspn:** `setspn -S host/username.example.com EXAMPLE\username`
- **keytab:** `ktpass /princ host/username.example.com@EXAMPLE.COM /ptype KRB5_NT_PRINCIPAL /mapuser EXAMPLE.COM\username /pass XXXX /crypto AES256-SHA1 -out <pathto.keytab.file>`

Once the above actions are performed on Active Directory, update the KCD account with the configured SPN by using the `add kcdaccount` or the `setkcdaccount` commands on the NetScaler CLI.

To view the SPN of the specific user account, navigate to the **User Properties** section of **Active Directory**.

When configuring NetScaler SSO using Kerberos impersonation When advanced encryption types are used for Kerberos SSO using impersonation, ensure that the SSO credentials are used with the correct service principal name of the end user. If the end user login credentials do not work with a Kerberos SSO, then configure the appropriate user expression to set the SSO user name.

When the user principal name is the correct service principal name of the end user on Active Directory, then:

- Use the `ssoNameAttribute` parameter in the `LDAPAction` command to set the SSO user name if LDAP authentication is used for end user login.

Example: `set authentication ldapAction ldap_act -ssoNameAttribute userPrincipalName`

- Use the `userExpression` parameter in the `trafficAction` command if any other authentication method is used for user login. For example, if user attribute1 has the user principal name stored, then you can use `AAA.USER.ATTRIBUTE(1)` with the traffic action.

Example: `add tm traffic action traf_act -userExpression AAA.USER.ATTRIBUTE(1)`

Generate the KCD keytab script

May 2, 2023

The KCD Keytab Script dialog box generates the keytab script, which in turn generates the keytab file necessary to configure KCD on the NetScaler.

To generate the KCD keytab script by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic**.
2. In the details pane, under **Kerberos Constrained Delegation**, click Batch file to generate keytab.
3. In the Generate KCD (Kerberos Constrained Delegation) **Keytab Script** dialog box, fill out the fields as described below.
 - **Domain User Name:** The name of the domain user.
 - **Domain Password:** The password for the domain user.
 - **Service Principal:** The service principal.
 - **Output File Name:** A filename for the KCD script file.
 - **Create Domain User Account:** Select this check box to create the specified domain user account.
4. Click **Generate Script** to generate the script. The script is generated, and appears in the **Generated Script** text box below the **Generate Script** button.
5. Copy the script, and save it as a file on your AD domain controller. You must now run this script on the domain controller to generate the keytab file, and then copy the keytab file to the /nsconfig/krb/ directory on the NetScaler appliance.
6. Click **OK**.

SSO for Basic, Digest, and NTLM authentication

May 2, 2023

Single Sign-On (SSO) configuration in NetScaler and NetScaler Gateway can be enabled at global level and also per traffic level. By default the SSO configuration is **OFF** and an administrator can enable the SSO per traffic or globally. From a security point of view, Citrix recommends administrators to turn SSO globally **OFF** and enable per traffic basis. This enhancement is to make SSO configuration more secure by dishonoring certain type of SSO methods globally.

Note:

From NetScaler feature release 13.0 build 64.35 and above, the following SSO types are dishonored globally.

- Basic authentication
- Digest Access authentication
- NTLM without Negotiate NTLM2 Key or Negotiate Sign

Non-impacted SSO types

The following SSO types are not impacted with this enhancement.

- Kerberos authentication
- SAML authentication
- Form based authentication
- OAuth bearer authentication
- NTLM with Negotiate NTLM2 Key or Negotiate Sign

Impacted SSO configurations

Following are the impacted (dishonored) SSO configurations.

Global configurations

```
1 set tmsessionparam -SSO ON
2 set vpnparameter -SSO ON
3 add tmsessionaction tm_act -SSO ON
4 add vpn sessionaction tm_act -SSO ON
5 <!--NeedCopy-->
```

Per traffic configurations

```
1 add vpn trafficaction tf_act http -SSO ON
2 add tm trafficaction tf_act -SSO ON
3 <!--NeedCopy-->
```

You can enable/disable SSO as a whole and cannot modify individual SSO types.

Security measures to be applied

As part of the security measures, security sensitive SSO types are dishonored in the global configuration but are allowed only through a Traffic action configuration.

So, if a back-end server expects Basic, Digest, or NTLM without Negotiate NTLM2 Key or Negotiate Sign, the administrator can allow SSO only through the following configuration.

Traffic Action

```
1 add vpn trafficaction tf_act http -SSO ON
2 add tm trafficaction tf_act -SSO ON
3 <!--NeedCopy-->
```

Traffic Policy

```
1 add tm trafficpolicy <name> <rule> tf_act
2 add vpn trafficpolicy <name> <rule> tf-act
3 <!--NeedCopy-->
```

Administrator must have an appropriate rule configured for traffic policy to make sure SSO is enabled for only trusted back-end server.

AAA-TM

Scenarios based on global configuration:

```
1 set tm-sessionparam -SSO ON
2 <!--NeedCopy-->
```

Workaround:

```
1 add tm trafficaction tf_act -SSO ON
2 add tm trafficpolicy tf_pol true tf_act
3 <!--NeedCopy-->
```

Bind the following traffic policy to all LB virtual server where SSO is expected:

```
1 bind lb vserver <LB VS Name> -policy tf_pol -priority 65345
2 <!--NeedCopy-->
```

Scenarios based on session Policy configuration:

```
1 add tm-sessionaction tm_act -SSO ON
2 add tm-session policy <name> <rule> tm_act
3 add tm trafficaction tf_act -SSO ON
```

```
4 add tm trafficpolicy tf_pol <same rule as session Policy> tf_act
5 <!--NeedCopy-->
```

Points of note:

- NetScaler AAA user/group for the preceding session policy must be replaced by traffic policy.
- Bind the following policy to the load balancing virtual servers for the preceding session policy,

```
1 bind lb vserver [LB VS Name] -policy tf_pol -priority 65345
2 <!--NeedCopy-->
```

- If a traffic policy with other priority is configured, the preceding command does not serve good.

The following section deals with scenarios based on conflict with multiple traffic policies associated with a traffic:

For a particular TM traffic, only one TM traffic policy is applied. Because of global setting of SSO feature changes, applying an additional TM traffic policy with low priority might not be applicable in case a TM traffic policy with high priority (that does not have required SSO configuration) is already applied. The following section describes method to ensure that such cases are handled.

Consider that the following three traffic policies with higher priority are applied to load balancing (LB) virtual server:

```
1 add tm trafficaction tf_act1 <Addition config>
2 add tm trafficaction tf_act2 <Addition config>
3 add tm trafficaction tf_act3 <Addition config>
4
5 add tm trafficpolicy tf_pol1 <rule1> tf_act1
6 add tm trafficpolicy tf_pol2 <rule2> tf_act2
7 add tm trafficpolicy tf_pol3 <rule3> tf_act3
8
9 bind lb vserver <LB VS Name> -policy tf_pol1 -priority 100
10 bind lb vserver <LB VS Name> -policy tf_pol2 -priority 200
11 bind lb vserver <LB VS Name> -policy tf_pol3 -priority 300
12 <!--NeedCopy-->
```

Error prone method - To resolve the Global SSO configuration, you add the following configuration:

```
1 add tm trafficaction tf_act_default -SSO ON
2 add tm trafficpolicy tf_pol_default true tf_act_default
3
4 bind lb vserver <LB VS Name> -policy tf_pol_default -priority 65345
5 <!--NeedCopy-->
```

Note: The preceding modification can break SSO for traffic which hits <tf_pol1/tf_pol2/tf_pol3> as for these traffic, traffic policy is not be applied.

Correct method - To mitigate this, the SSO property must be applied individually for each of the corresponding traffic actions:

For example, in the preceding scenario, for SSO to happen for the traffic hitting tf_pol1/tf_pol3, the following configuration must be applied along with .

```
1 add tm trafficaction tf_act1 <Addition config> -SSO ON
2 add tm trafficaction tf_act3 <Addition config> -SSO ON
3 <!--NeedCopy-->
```

NetScaler Gateway cases

Scenarios based on global configuration:

```
1 set vpnparameter -SSO ON
2 <!--NeedCopy-->
```

Workaround:

```
1 add vpn trafficaction vpn_tf_act http -SSO ON
2 add vpn trafficpolicy vpn_tf_pol true vpn_tf_act
3 bind the following traffic policy to all VPN virtual server where SSO
  is expected:
4 bind vpn vserver vpn_vs -policy vpn_tf_pol -priority 65345
5 <!--NeedCopy-->
```

Scenarios based on session Policy configuration:

```
1 add vpn sessionaction vpn_sess_act -SSO ON
2 add vpnsession policy <name> <rule> vpn_sess_act
3 <!--NeedCopy-->
```

Points to note:

- NetScaler AAA user/group for the preceding session policy must be replaced by traffic policy.
- Bind the following policy to the LB virtual servers for the preceding session policy, `bind lb virtual server [LB VS Name] -policy tf_pol -priority 65345`.
- If a traffic policy with other priority is configured, the preceding command does not serve good. The following section deals with scenarios based on conflict with multiple traffic policies associated with traffic.

Functional scenarios based on conflict with multiple traffic policies associated with a traffic:

For a particular NetScaler Gateway traffic, only one VPN traffic policy is applied. Because of global setting of SSO feature changes, applying an additional VPN traffic policy with low priority might not be applicable if there are other VPN traffic policies with high priority that does not have a required SSO configuration.

The following section describes method to ensure such cases are handled:

Consider there are three traffic policies with higher priority applied to a VPN virtual server:

```

1 add vpn trafficaction tf_act1 <Addition config>
2 add vpn trafficaction tf_act2 <Addition config>
3 add vpn trafficaction tf_act3 <Addition config>
4
5 add vpn trafficpolicy tf_pol1 <rule1> tf_act1
6 add vpn trafficpolicy tf_pol2 <rule2> tf_act2
7 add vpn trafficpolicy tf_pol3 <rule3> tf_act3
8
9 bind vpn vserver <VPN VS Name> -policy tf_pol1 -priority 100
10 bind vpn vserver <VPN VS Name> -policy tf_pol2 -priority 200
11 bind vpn vserver <VPN VS Name> -policy tf_pol3 -priority 300
12 <!--NeedCopy-->

```

Error prone method: To resolve the Global SSO configuration, you add the following configuration:

```

1 add vpn trafficaction tf_act_default -SSO ON
2 add vpn trafficpolicy tf_pol_default true tf_act_default
3
4 bind vpn vserver <VPN VS Name> -policy tf_pol_default -priority 65345
5 <!--NeedCopy-->

```

Note: The preceding modification can break SSO for the traffic that hits <tf_pol1/tf_pol2/tf_pol3> as for these traffic, traffic policy is not applied.

Correct method: To mitigate this, the SSO property must be applied individually for each of the corresponding traffic actions.

For example in the preceding scenario, for SSO to happen for traffic hitting tf_pol1/tf_pol3, the following configuration must be applied along with .

```

1 add vpn trafficaction tf_act1 [Additional config] -SSO ON
2
3 add vpn trafficaction tf_act3 [Additional config] -SSO ON
4 <!--NeedCopy-->

```

Rewrite for NetScaler Gateway and authentication server generated responses

November 7, 2023

Rewrite refers to the rewriting of some information in the requests or responses handled by the NetScaler appliance. Rewriting can help in providing access to the requested content without

exposing unnecessary details about the website's actual configuration. For a detailed information on rewrite concept, see [Rewrite](#)

Starting from NetScaler release build 13.0-76.29, the support for rewrite policies has been extended to NetScaler Gateway virtual server and authentication virtual server generated responses.

Note

A bind type `AAA_RESPONSE` is introduced to support rewrite policies for the NetScaler Gateway virtual server and authentication virtual server generated responses. Configure the `AAA_RESPONSE` bind type if the response generated by the authentication virtual server or the NetScaler Gateway virtual server is from the packet engine.

An example to use Rewrite

You can use Rewrite to share the resources available on on-premises NetScaler with Citrix Cloud deployment. This can be achieved securely by implementing CORS origin resource sharing. Rewrite can be used as follows to implement CORS header.

Sample configuration

```
1 add rewrite action cors_header_action insert_http_header access-control
  -allow-credentials \"true\"
2
3 add rewrite policy cors_header_pol true cors_header_action
4
5 add rewrite action non_cors_header_action insert_http_header X-Frame-
  Options \"\"DENY\"\"
6
7 add rewrite policy non_cors_header_pol true non_cors_header_action
8
9 bind authentication vserver av_cors -policy cors_header_pol -priority
  100 -type AAA_RESPONSE
10
11 bind vpn vserver av_cors -policy cors_header_pol -priority 100 -type
  AAA_RESPONSE
```

Note:

For instructions on how to configure a rewrite action and policy using the GUI, see [Rewrite](#).

Content Security Policy response header support for NetScaler Gateway and authentication virtual server-generated responses

March 18, 2024

Starting from NetScaler release build 13.0–76.29, the Content-Security-Policy (CSP) response header is supported for NetScaler Gateway and authentication virtual server-generated responses.

The Content-Security-Policy (CSP) response header is a combination of policies which the browser uses to avoid Cross Site Scripting (CSS) attacks.

The HTTP CSP response header allows website administrators to control the resources the user agent is allowed to load for a given page. With a few exceptions, policies mostly involve specifying server origins and script endpoints. This helps guard against cross-site scripting attacks.

The CSP header is designed to modify the way browsers render pages, and thus to protect from various cross-site injections, including CSS. It is important to set the header value correctly, in a way that does not prevent proper operation of the website. For example, if the header is set to prevent execution of inline JavaScript, the website must not use inline JavaScript in its pages.

The following are the advantages of the CSP response header.

- The primary function of a CSP response header is to prevent CSS attacks.
- In addition to restricting the domains from which content can be loaded, the server can specify which protocols are allowed to be used; for example (and ideally, from a security standpoint), a server can specify that all contents must be loaded using HTTPS.
- CSP helps in securing NetScaler from cross-site scripting attacks by securing files like “tmin-index.html” and “homepage.html”. The file “tmin-index.html” is related to authentication and the file “homepage.html” is related to the published apps/links.

Configuring Content-Security-Policy header for NetScaler Gateway and authentication virtual server-generated responses

To enable the CSP header, you need to configure your web server to return the CSP HTTP header.

Points to note

- By default, the CSP header is disabled.
- While enabling or disabling the default CSP policy, you are recommended to run the following command. `Flush cache contentgroup loginstaticobjects`
- For modifying the CSP for /logon/LogonPoint/index.html, modify the “Header set Content-Security-Policy” value as required under the section corresponding to the logon directory which can be found under the directory `/var/netscaler/logon`.

- For instructions on how to configure a rewrite action and policy using the GUI, see [Rewrite](#).

To configure CSP for authentication virtual server and NetScaler Gateway generated responses using CLI, type the following command at the command prompt:

```
1 set aaa parameter -defaultCSPHeader <ENABLE/DISABLE>
```

To configure CSP for NetScaler Gateway and authentication virtual server-generated responses using GUI.

1. Navigate to **NetScaler Gateway > Global Settings**, click **Change authentication AAA settings** under Authentication Settings.

2. On the **Configure AAA Parameters** page, select the **Enabled in Default CSP Header** field.

← Configure AAA Parameter

Maximum Number of Users	<input type="text" value="1000"/> ⓘ
Max Login Attempts	<input type="text"/>
NAT IP Address	<input type="text" value="0 . 0 . 0 . 0"/>
Failed Login Timeout	<input type="text"/>
Default Authentication Type*	<input type="text" value="LOCAL"/> ▾
AAA Session Log Levels	<input type="text" value="INFORMATIONAL"/> ▾
AAAD Log Level	<input type="text" value="DEBUG"/> ▾ ⓘ
<input checked="" type="checkbox"/> Enable Static Caching	
<input type="checkbox"/> Enable Enhanced Authentication Feedback	
<input type="checkbox"/> Enable Session Stickiness	
Maximum Deflate Size	<input type="text" value="1024"/>
Persistent Login Attempts*	<input type="text" value="DISABLED"/> ▾

Maximum KB Questions	<input type="text" value="2"/>
Login Encryption*	<input type="text" value="DISABLED"/> ▾
SameSite	<input type="text"/> ▾
Default CSP Header*	<input type="text" value="ENABLED"/> ▾ ⓘ
HttpOnly Cookie*	<input type="text" value="DISABLED"/> ▾

Custom Content-Security-Policy header

You can configure a custom CSP header using a rewrite policy on the VPN virtual server and authentication virtual servers for AAA endpoint-generated responses.

The following is an example for CSP header customization to include images and scripts only from the following two specified sources respectively, <https://company.fqdn.com>, <https://example.com>.

```
1 add rewrite action modify_csp insert_http_header Content-Security-
  Policy "\"default-src 'self'; script-src 'self' https://company.fqdn
  .com 'unsafe-inline' 'unsafe-eval'; connect-src 'self'; img-src http
  ://localhost:* https://example.com 'self' data: http: https;; style-
  src 'self' 'unsafe-inline'; font-src 'self'; frame-src 'self'; child
  -src 'self' com.citrix.agmacepa://* citrixng://* com.citrix.
  nsgclient://*; form-action 'self'; object-src 'self'; report-uri /
  nscsp_violation/report_uri\""
2
3 add rewrite policy csp_pol true modify_csp
4 <!--NeedCopy-->
```

To bind the policy to the authentication virtual server,

```
1 bind authentication vserver auth_vs -policy csp_pol -priority 1 -type
  AAA_RESPONSE
2
3 bind authentication vserver auth_vs -policy csp_pol -priority 2 -type
  RESPONSE
4 <!--NeedCopy-->
```

To bind the policy to the VPN virtual server,

```
1 bind vpn vserver vpn_vs -policy csp_pol -priority 1 -type AAA_RESPONSE
2
3 bind vpn vserver vpn_vs -policy csp_pol -priority 2 -type RESPONSE
4 <!--NeedCopy-->
```

Note:

The custom CSP header cannot be configured on the content switching and load balancing virtual servers for certain AAA-generated responses.

Self-service password reset

November 3, 2023

Self-service password reset is a web-based password management solution. It is available in both the authentication, authorization, and auditing feature of the NetScaler appliance and NetScaler Gateway. It eliminates the user's dependency on the administrator's assistance for changing the password.

The self-service password reset provides the end user an ability to securely reset or create a password in the following scenarios:

- User has forgotten the password.
- User is unable to log on.

Until now, if an end user forgets an AD password, the end user had to contact the AD administrator to reset the password. With self-service password reset functionality, an end user can reset the password without an administrator's intervention.

The following are some of the benefits of using self-service password reset:

- Increased productivity through the automatic password change mechanism, which eliminates the lead-time for users to wait for password resets.
- With the automatic password change mechanism, admins can concentrate on other critical tasks.

The following figure illustrates the self-service password reset flow to reset the password.

To use the self-service password reset, a user must be registered either with the NetScaler authentication, authorization, and auditing or with the NetScaler Gateway virtual server.

Self-service password reset provides the following capabilities:

- **New user self-registration.** You can self-register as a new user.
- **Configure knowledge-based questions.** As an administrator, you can configure a set of questions for users.
- **Alternate email ID registration.** You must provide an alternate email ID while registration. The OTP is sent to the alternate email ID because the user has forgotten the primary email ID password.

Note:

Starting from version 12.1 build 51.xx, alternate email ID registration can be done as stand-alone. A new login schema, **AltEmailRegister.xml** is introduced to do only alternate email

ID registration. Previously, alternate email ID registration can be done only while doing the KBA registration.

- **Reset forgotten password.** User can reset the password by answering the knowledge-based questions. As an administrator, you can configure and store the questions.

The self-service password reset provides the following two new authentication mechanisms:

- **Knowledge based question and answer.** You must register to NetScaler authentication, authorization, and auditing or to a NetScaler Gateway before selecting the knowledge-based question and answer schema.
- **Email OTP authentication.** An OTP is sent to the alternate email ID, which the user has registered during self-service password reset registration.

Note

These authentication mechanisms can be used for the self-service password reset use cases, and for any authentication purposes similar to any of the existing authentication mechanisms.

Prerequisites

Before you configure the self-service password reset, review the following prerequisites:

- NetScaler feature release 12.1, build 50.28.
- Supported version is 2016, 2012, and 2008 AD domain function level.
- The ldapBind user name bound to the NetScaler must have write access to the users AD path.

Note

Self-service password reset is supported in nFactor authentication flow only. For more information, see [nFactor Authentication through NetScaler](#).

Limitations

Following are some of the limitations of self-service password reset:

- Self-service password reset is supported on LDAPS. Self-service password reset is available only if the authentication back-end is LDAP (LDAP protocol).
- User cannot see the already registered alternate email ID.
- Knowledge-based question and answer, and email OTP authentication and registration cannot be the first factor in the authentication flow.
- For Native Plug-in and Receiver, registration is supported only through the browser.

- The minimum certificate size used for self-service password reset is 1024 bytes, and must follow the x.509 standard.
- Only an RSA certificate is supported for self-service password reset.

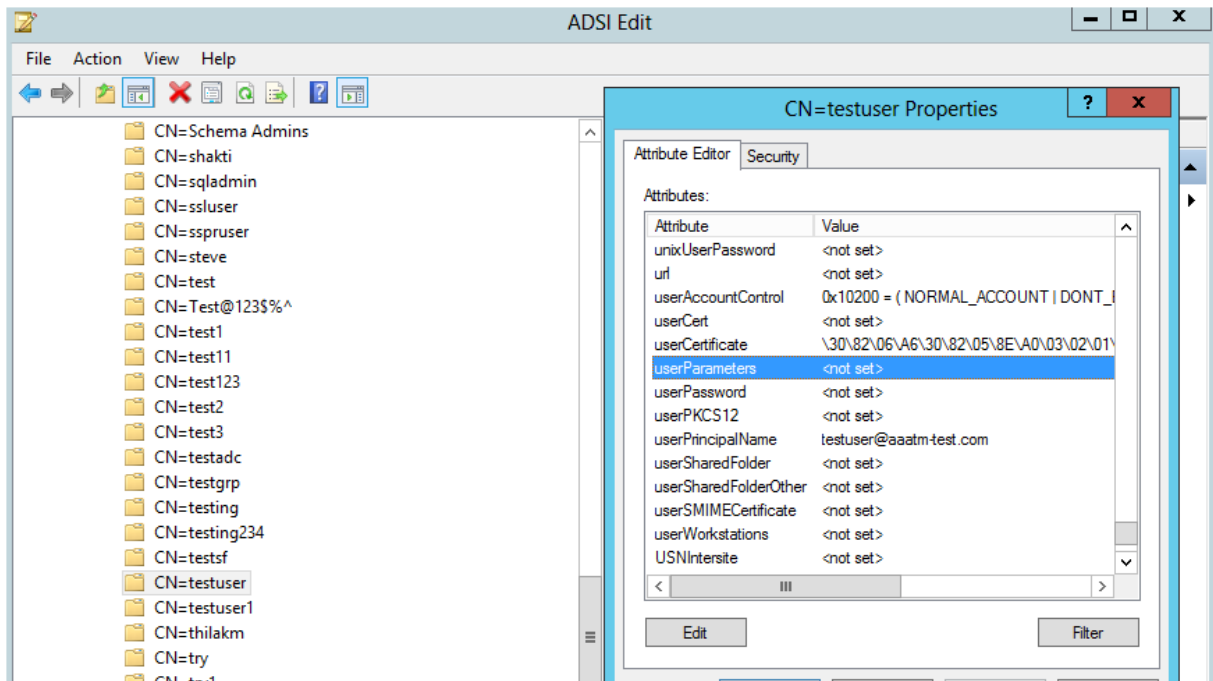

Active directory setting

The NetScaler knowledge-based question and answer, and email OTP uses an AD attribute to store users data. You must configure an AD attribute to store the questions and answers along with the alternate email ID. The NetScaler appliance stores it in the configured KB attribute in the AD user object. When configuring an AD attribute, consider the following:

- The AD attribute must support a maximum length of 32k value.
- Attribute type must be a 'DirectoryString'.
- A single AD attribute can be used for knowledge-based question and answer and alternate email ID.
- A single AD Attribute cannot be used for Native OTP and knowledge-based question and answer or alternative email ID registration.
- NetScaler LDAP administrator must have write access to the selected AD attribute.

You can also use an existing AD attribute. However, make sure that the attribute you plan to use is not used for other cases. For example, userParameters is an existing attribute within the AD user that you can use. To verify this attribute, perform the following steps:

1. Navigate to **ADSI > select user**.
2. Right-click and scroll down to attribute list.
3. On the **CN=testuser Properties** window pane, you can see the **userParameters** attribute is not set.

Self-service password reset registration

To implement the self-service password reset solution on a NetScaler appliance, you have to perform the following:

- Self-service password reset (knowledge-based question and answer/email ID) registration.
- User Logon Page (for password reset, which includes knowledge-based question and answer and email OTP validation and final password reset factor).

A set of predefined questions catalog is provided as a JSON file. As an administrator, you can select the questions and create the self-service password reset registration login schema through the NetScaler GUI. You can choose any of the following options:

- Select a maximum of four system-defined questions.
- Provide an option for users to customize two questions and answers.

To view the default knowledge-based questions JSON file from CLI

```
root@ns# cd /nsconfig/loginschema/LoginSchema/  
root@ns# cat KBQuestions.json  
[  
  {"question":"What is the last name of the teacher who gave you your first failing  
grade?"},  
  {"question":"What is the name of your favourite childhood friend?"},  
  {"question":"Where were you when you first heard about 9/11?"},  
  {"question":"What is the name of a college you applied to but didn't attend?"},  
  {"question":"What was the last name of your third grade teacher?"},  
  {"question":"What was the name of your first stuffed animal?"},  
  {"question":"What is the name of the teacher who gave you your first A?"},  
  {"question":"What is the name of the city where you got lost?"},  
  {"question":"In what city or town did your mother and father meet?"},  
  {"question":"What was your most hated food as a child?"},  
  {"question":"What was your most favourite food as a child?"},  
  {"question":"What is your favourite website?"},  
  {"question":"What is your most disliked website?"},  
  {"question":"What is your dream job?"},  
  {"question":"Why did the chicken cross the road?"},  
  {"question":"Name your first boss."},  
  {"question":"What is the name of your favorite school teacher?"},  
  {"question":"What is the name of your favorite actor or actress?"},  
  {"question":"What is the title of your favorite movie?"},  
  {"question":"In what city or town did you spend most of your youth?"}  
]
```

Note

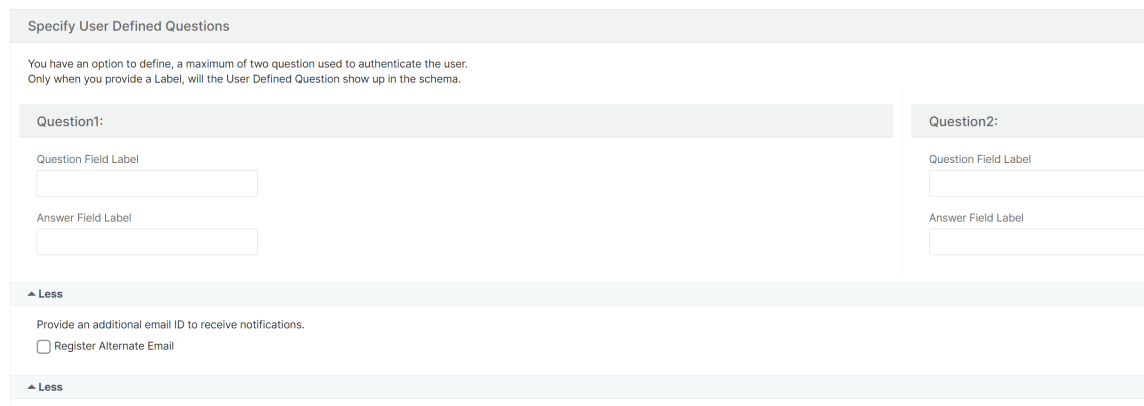

- NetScaler Gateway includes the set of system-defined questions by default. Administrator can edit the “KBQuestions.json” file to include their choice of questions.
- System-defined questions are displayed only in English and language localization support is not available for these questions.

To complete knowledge-based question and answer registration Login Schema using GUI

1. Navigate to **Security > AAA –Application Traffic > Login Schema**.
2. On the **Login Schema** page, click **Profiles**.
3. Click **Add KBA Registration Login Schema**.
4. On the **Create Authentication Login Schema** page, specify a name in the **Schema Name** field.

5. Select the questions of your choice and move it to the **Configured** list.
6. In the **User Defined Questions** section, you can provide questions and answers in the Q1 and A1 fields.
7. In the **Email Registration** section, check the **Register Alternate Email** option. You can register the **Alternate Email ID** from user registration logon page to receive the OTP.

8. Click **Create**. The login schema once generated displays all the configured questions to the end user during the registration process.

Create user registration and management workflow using CLI

The following are required before you begin the configuration:

- IP address assigned to the authentication virtual server
- FQDN corresponding to the assigned IP address
- Server certificate for authentication virtual server

To set up the device registration and management page, you require an authentication virtual server. The following figure illustrates the user registration.

To create authentication virtual server

1. Configure an authentication virtual server. It must be of type SSL and make sure to bind authentication virtual server with portal theme.

```

1 > add authentication vserver <vServerName> SSL <ipaddress> <port>
2 > bind authentication vserver <vServerName> [-portaltheme<string>]
  
```

2. Bind SSL virtual server certificate-key pair.

```

1 > bind ssl vserver <vServerName> certkeyName <string>
  
```

Example:

```

1 > add authentication vserver authvs SSL 1.2.3.4 443
2 > bind authentication vserver authvs -portaltheme RFWebUI
3 > bind ssl vserver authvs -certkeyname c1
  
```

To create LDAP logon action

```

1 > add authentication ldapAction <name> {
2 -serverIP <ipaddr|ipv6\_addr> \[-serverPort <port>] \[-ldapBase <BASE
> ] \[-ldapBindDn <AD USER>] \[-ldapBindDnPassword <PASSWORD>] \[-
ldapLoginName <USER FORMAT>]
  
```

Note

You can configure any authentication policy as the first factor.

Example:

```
1 > add authentication ldapAction ldap_logon_action -serverIP 1.2.3.4
   -serverPort 636 -ldapBase "OU=Users,DC=server,DC=com" -
   ldapBindDn administrator@ctxnsdev.com -ldapBindDnPassword
   PASSWORD -ldapLoginName samAccountName -serverport 636 -sectype
   SSL -KBAttribute userParameters
```

To create an authentication policy for LDAP logon

```
1 > add authentication policy <name> <rule> [<reqAction>]
```

Example:

```
1 > add authentication policy ldap_logon -rule true -action
   ldap_logon_action
```

To create knowledge-based question and answer registration action

Two new parameters are introduced in `ldapAction`. `KBAttribute` for KBA Authentication (Registration and validation) and `alternateEmailAttr` for registration of user's alternate email ID.

```
1 > add authentication ldapAction <name> {
2 -serverIP <ipaddr|ipv6\_addr|> \[-serverPort <port>] \[-ldapBase <
  BASE> ] \[-ldapBindDn <AD USER>] \[-ldapBindDnPassword <PASSWORD>]
  \[-ldapLoginName <USER FORMAT>] \[-KBAttribute <LDAP ATTRIBUTE>]
  \[-alternateEmailAttr <LDAP ATTRIBUTE>]
```

Example:

```
1 > add authentication ldapAction ldap1 -serverIP 1.2.3.4 -sectype
   ssl -serverPort 636 -ldapBase "OU=Users,DC=server,DC=com" -
   ldapBindDn administrator@ctxnsdev.com -ldapBindDnPassword
   PASSWORD -ldapLoginName samAccountName -KBAttribute
   userParameters -alternateEmailAttr userParameters
```

Display user registration and management screen

The “KBARegistrationSchema.xml” login schema is used to display the user registration page to the end user. Use the following CLI to display the login schema.

```
1 > add authentication loginSchema <name> -authenticationSchema <string>
```

Example:

```
1 > add authentication loginSchema kba_register -authenticationSchema /
  nsconfig/loginschema/LoginSchema/KBARegistrationSchema.xml
```

We recommend two ways of displaying the user registration and management screen: URL or LDAP Attribute.

Using URL

If the URL path contains '/register' (for example, <https://lb1.server.com/register>) then the user registration page is displayed using the URL.

To create and bind the registration policy

```
1 > add authentication policylabel user_registration -loginSchema
  kba_register
2 > add authentication policy ldap1 -rule true -action ldap1
3 > bind authentication policylabel user_registration -policy ldap1 -
  priority 1
```

To bind authentication policy to authentication, authorization, and auditing virtual server when the URL contains '/register'

```
1 > add authentication policy ldap_logon -rule "http.req.cookie.value(\
  NSC_TASS\").contains(\"register\")" -action ldap_logon
2 > bind authentication vserver authvs -policy ldap_logon -nextfactor
  user_registration -priority 1
```

To bind certificate to VPN global

```
1 bind vpn global -userDataEncryptionKey c1
```

Note

- You must bind the certificate to encrypt the user data (KB Q&A and registered alternate email ID) stored in the AD attribute.
- If the certificate expires, you must bind a new certificate and perform the registration again.

Using attribute

You can bind an authentication policy to the authentication, authorization, and auditing virtual server to check if the user is already registered or not. In this flow, any of the preceding policies before the knowledge-based question and answer registration factor must be LDAP with the KBA attribute configured. This is to check if the AD user is registered or not using an AD attribute.

Important

The rule “AAA.USER.ATTRIBUTE(“kba_registered”).EQ(“0”)”enforces new users to register for knowledge-based questions and answer and alternate email.

To create an authentication policy to check if the user is not already registered

- ```
1 > add authentication policy switch_to_kba_register -rule "AAA.USER.
 ATTRIBUTE(\"kba_registered\").EQ(\"0\")" -action NO_AUTHN
2 > add authentication policy first_time_login_forced_kba_registration -
 rule true -action ldap1
```

**To create a registration policy label and bind to the LDAP registration policy**

- ```
1 > add authentication policylabel auth_or_switch_register -loginSchema
  LSCHEMA_INT
2 > add authentication policylabel kba_registration -loginSchema
  kba_register
3
4 > bind authentication policylabel auth_or_switch_register -policy
  switch_to_kba_register -priority 1 -nextFactor kba_registration
5 > bind authentication policylabel kba_registration -policy
  first_time_login_forced_kba_registration -priority 1
```

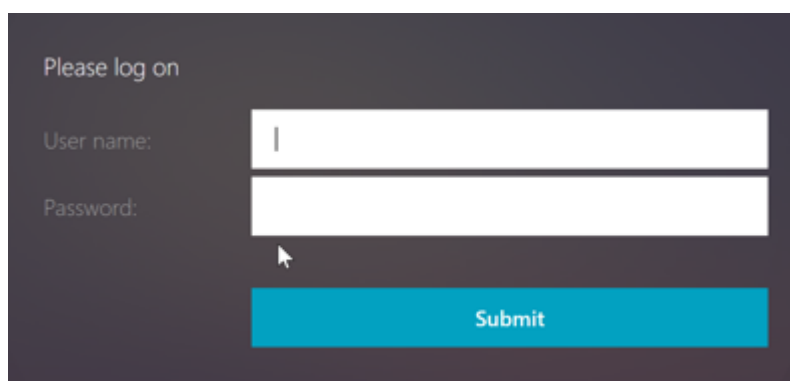

To bind authentication policy to authentication, authorization, and auditing virtual server

- ```
1 bind authentication vserver authvs -policy ldap_logon -nextfactor
 auth_or_switch_register -priority 2
```

**User registration and management validation**

Once you have configured all the steps mentioned in the previous sections, you must see the following UI screen.

1. Enter the lb virtual server URL; for example, <https://lb1.server.com>. The logon screen is displayed.

2. Enter the user name and password. Click **Submit**. The **User Registration** screen is displayed.

3. Select the preferred question from the drop-down list and enter the **Answer**.
4. Click **Submit**. The user registration successful screen is displayed.

### Configure user logon page

In this example, the administrator assumes that the first factor is the LDAP logon (for which the end user has forgotten the password). The user then follows the knowledge-based question and answer registration and email ID OTP validation, and finally resets the password using self-service password reset.

You can use any of the authentication mechanisms for self-service password reset. We recommend that you have either a knowledge-based question and answer, and email OTP, or both to achieve strong privacy and to avoid any illegitimate user password resets.

The following are required before you start configuring the user logon page:

- IP for load balancer virtual server
- Corresponding FQDN for the load balancer virtual server
- Server certificate for the load balancer

### Create load balancer virtual server by using CLI

To access the internal website, you have to create an LB virtual server to front the back-end service and delegate the authentication logic to the authentication virtual server.

```
1 > add lb vserver lb1 SSL 1.2.3.162 443 -persistenceType NONE -
 cltTimeout 180 -AuthenticationHost otpauth.server.com -
 Authentication ON -authnVsName authvs
2
3 > bind ssl vserver lb1 -certkeyname c1
```

To represent the back-end service in load balancing:

```
1 > add service iis_backendsso_server_com 1.2.3.4 HTTP 80
2
3 > bind lb vserver lb1 iis_backendsso_server_com
```

### Create LDAP action with authentication disabled as first policy

```
1 > add authentication ldapAction ldap3 -serverIP 1.2.3.4 -serverPort 636
 -ldapBase "OU=Users,DC=server,DC=com" -ldapBindDn
 administrator@ctxnsdev.com -ldapBindDnPassword PASSWORD -
 ldapLoginName samAccountName -authentication disabled
2
3 > add authentication policy ldap3 -rule aaa.LOGIN.VALUE("passwdreset").
 EQ("1") -action ldap3
```

### Create knowledge-based question and answer validation action

For knowledge-based question and answer validation in the self-service password reset flow, you need to configure the LDAP server with authentication disabled.

```
1 > add authentication ldapAction <LDAP ACTION NAME> -serverIP <SERVER IP>
 > -serverPort <SERVER PORT> -ldapBase <BASE> -ldapBindDn <AD USER> -
 ldapBindDnPassword <PASSWORD> -ldapLoginName <USER FORMAT> -
 KBAAttribute <LDAP ATTRIBUTE> - alternateEmailAttr <LDAP ATTRIBUTE>
 -authentication DISABLED
```

#### Example:

```
1 > add authentication ldapAction ldap2 -serverIP 1.2.3.4 -serverPort 636
 -ldapBase "OU=Users,DC=server,DC=com" -ldapBindDn
 administrator@ctxnsdev.com -ldapBindDnPassword PASSWORD -
 ldapLoginName samAccountName -KBAAttribute userParameters -
 alternateEmailAttr userParameters -authentication disabled
```

## To create an authentication policy for knowledge-based question and answer validation using CLI

```
1 add authentication policy kba_validation -rule true -action ldap2
```

### Create an email validation action

LDAP must be a prior factor to the email validation factor because you need the user's email ID or alternate email ID as part of the self-service password reset registration.

**Note:**

For the Email OTP solution to work, ensure that the login based authentication is enabled on the SMTP server.

To ensure that the login based authentication is enabled, type the following command on the SMTP server. If the login based authentication is enabled, you notice that the text **AUTH LOGIN** appears in bold in the output.

```
1 root@ns# telnet <IP address of the SMTP server><Port number of the
 server>
2 ehlo
```

**Example:**

```
1 root@ns# telnet 10.106.3.66 25
2 Trying 10.106.3.66...
3 Connected to 10.106.3.66.
4 Escape character is '^]'.
5 220 E2K13.NSGSanity.com Microsoft ESMTP MAIL Service ready at Fri, 22
 Nov 2019 16:24:17 +0530
6 ehlo
7 250-E2K13.NSGSanity.com Hello [10.221.41.151]

14 250-AUTH LOGIN
15 250-X-EXPS GSSAPI NTLM
16 250-8BITMIME
17 250-BINARYMIME
18 250-CHUNKING
19 250 XRDST
```

For information on how to enable login based authentication, see <https://support.microfocus.com/kb/doc.php?id=7020367>.

**To configure email action using CLI**

```
1 add authentication emailAction emailact -userName sender@example.com -
 password <Password> -serverURL "smtps://smtp.example.com:25" -
 content "OTP is $code"
```

**Example:**

```
1 add authentication emailAction email -userName testmail@gmail.com -
 password 298
 a34b1a1b7626cd5902bbb416d04076e5ac4f357532e949db94c0534832670 -
 encrypted -encryptmethod ENCMTD_3 -serverURL "smtps
 ://10.19.164.57:25" -content "OTP is $code" -emailAddress "aaa.user.
 attribute(\"alternate_mail\")"
```

**Note**

The “emailAddress” parameter in the configuration is a PI expression. Hence, this is configured to take either the default user email ID from the session or the already registered alternative email ID.

**To configure email ID using GUI**

1. Navigate to **Security > AAA –Application Traffic > policies > Authentication > Advanced Policies > Actions > Authentication Email Action**. Click **Add**.
2. On the **Create Authentication Email Action** page, fill the details, and click **Create**.

**To create an authentication policy for email validation by using CLI**

```
1 add authentication policy email_validation -rule true -action email
```

**To create an authentication policy for password reset factor**

```
1 add authentication policy ldap_pwd -rule true -action ldap_logon_action
```

**Presenting UI through Login Schema**

There are three LoginSchema’s for self-service password reset to reset the password. Use the following CLI commands to view the three Login Schema:

```
1 root@ns# cd /nsconfig/loginschema/LoginSchema/
2 root@ns# ls -ltr | grep -i password
3 -r--r--r-- 1 nobody wheel 2088 Nov 13 08:38
 SingleAuthPasswordResetRem.xml
4 -r--r--r-- 1 nobody wheel 1541 Nov 13 08:38
 OnlyUsernamePasswordReset.xml
```

```
5 -r--r--r-- 1 nobody wheel 1391 Nov 13 08:38 OnlyPassword.xml
```

### To create single authentication password reset by using CLI

```
1 > add authentication loginSchema lschema_password_reset -
 authenticationSchema "/nsconfig/loginschema/LoginSchema/
 SingleAuthPasswordResetRem.xml"
2
3 > add authentication loginSchemaPolicy lpol_password_reset -rule true -
 action lschema_password_reset
```

### Create knowledge-based question and answer and email OTP validation factor through policy label

If the first factor is LDAP logon, you can create a knowledge-based question and answer and email OTP policy labels for the next factor using the following commands.

```
1 > add authentication loginSchema lschema_noschema -authenticationSchema
 noschema
2
3 > add authentication policylabel kba_validation -loginSchema
 lschema_noschema
4
5 > add authentication policylabel email_validation -loginSchema
 lschema_noschema
```

### Create password reset factor through policy label

You can create the password reset factor through the policy label by using the following commands.

```
1 > add authentication loginSchema lschema_noschema -authenticationSchema
 noschema
2
3 > add authentication policylabel password_reset -loginSchema
 lschema_noschema
4
5 > bind authentication policylabel password_reset -policyName ldap_pwd -
 priority 10 -gotoPriorityExpression NEXT
```

Bind the knowledge-based question and answer and email policy to the previous created policies using the following commands.

```
1 > bind authentication policylabel email_validation -policyName
 email_validation -nextfactor password_reset -priority 10 -
 gotoPriorityExpression NEXT
2
```

```
3 > bind authentication policylabel kba_validation -policyName
 kba_validation -nextfactor email_validation -priority 10 -
 gotoPriorityExpression NEXT
```

### Bind the flow

You must have the LDAP logon flow created under the authentication policy for LDAP Logon. In this flow, the user clicks the forgot password link presented on the first LDAP logon page, then KBA validation followed by OTP validation and finally the password reset page.

```
1 bind authentication vserver authvs -policy ldap3 -nextfactor
 kba_validation -priority 10 -gotoPriorityExpression NEXT
```

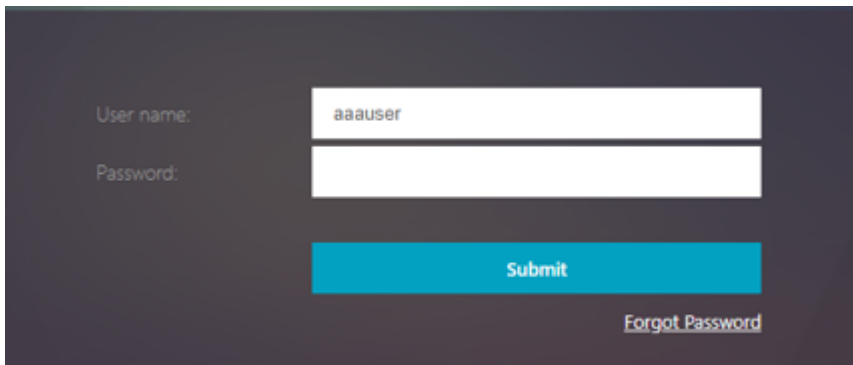

### To bind all the UI flow

```
1 bind authentication vserver authvs -policy lpol_password_reset -
 priority 20 -gotoPriorityExpression END
```

### User log on workflow to reset password

Following is a user logon workflow if the user needs to reset the password:

1. Enter the lb virtual server URL; for example, <https://lb1.server.com>. The logon screen is displayed.

The screenshot shows a dark-themed login interface. On the left, there are labels 'User name:' and 'Password:'. To the right of 'User name:' is a white input field containing the text 'aaauser'. Below the 'User name' field is another white input field for the password. At the bottom center, there is a bright blue button labeled 'Submit'. In the bottom right corner, there is a link labeled 'Forgot Password'.

2. Click **Forgot Password**. A validation screen displays two questions out of the maximum six questions and answers registered against an AD user.
3. Answer the questions, and click **Log on**. An email OTP Validation screen where you must enter the OTP received on the registered alternate email ID, is displayed.
4. Enter the email OTP. Once the email OTP validation is successful, the password reset page is displayed.
5. Enter a new password and confirm the new password. Click **Submit**. After the password reset is successful, the password reset successful screen is displayed.

You can now log on using the reset password.

## Troubleshooting

NetScaler provides an option to troubleshoot some of the basic issues that you might face while using self-service password reset. The following section helps you troubleshoot some of the issues that might occur in specific areas.

### NS Log

Before analyzing the logs, we recommend you to set the log level to debug using the `set syslogparams -loglevel DEBUG` command. When this parameter is enabled, the logs are printed in the `ns.log` file.

### Registration

The following message indicates a successful user registration.

```
1 "ns_aaa_insert_hash_keyValue_entry key:kba_registered value:1"
2 Nov 14 23:35:51 <local0.debug> 10.102.229.76 11/14/2018:18:05:51 GMT
 0-PPE-1 : default SSLVPN Message 1588 0 : "
 ns_aaa_insert_hash_keyValue_entry key:alternate_mail value:
 eyJ2ZXJzaW9uIjoiaMSIsICJraWQiOiIxYXk1oWJN0T2NjLVVvZUx6NDRwZFhxdS01dT9IiwgImtleS
 ==.oKmv0a1a0J3a9z7BcGCsegNPMw=="
```

### Knowledge-based question and answer validation

The following message indicates successful knowledge-based question and answer validation.

```
1 "NFactor: Successfully completed KBA Validation, nextfactor is email"
```

### Email ID validation

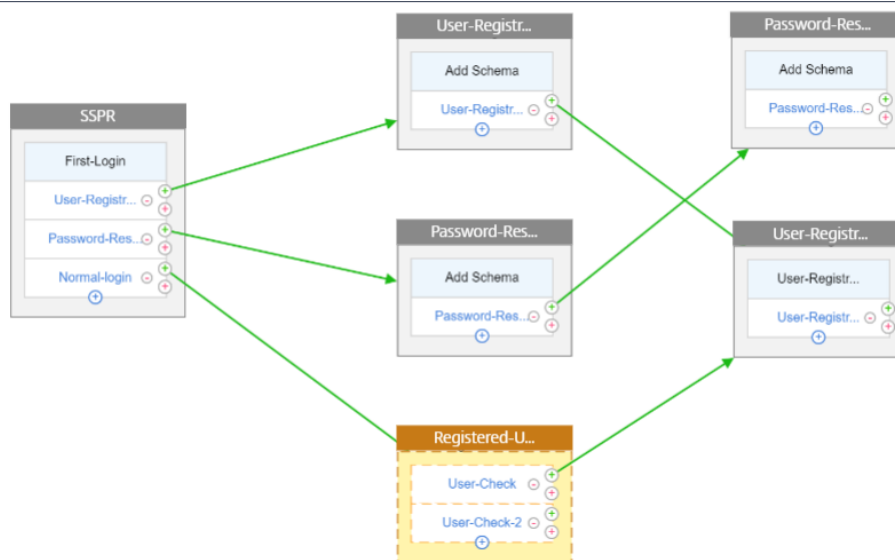

The following message indicates successful password reset.

```
1 "NFactor: Successfully completed email auth, nextfactor is pwd_reset"
```

### Configure SSPR using nFactor visualizer

Before we begin the SSPR configuration using the nFactor visualizer, we need to add the following LDAP servers:

1. Standard LDAP server with authentication enabled for user authentication and AD attribute specified.
2. LDAP server for user parameter extraction with no auth.
3. LDAP server for password reset on SSL with no auth. Also, the AD attribute to be used for storing the user details must be defined in this server.
4. LDAP server for user registration, with authentication enabled, and AD attribute specified.
5. The following figure displays the complete flow:

6. Bind the certificate globally using the following CLI command:

```
1 bind vpn global -userDataEncryptionKey Wildcard
```

**Now that the LDAP servers are added, proceed with the nFactor configuration using the visualizer**

1. Navigate to, **Security > AAA > Application Traffic > nFactor Visualizer > nFactor Flows**, click **Add** and click the plus icon inside the box.
2. Give the flow a name.
3. Click **Add Schema** that serves as the default schema. Click **Add** on the login schema page.
4. After giving the schema a name, select the schema. Click **Select** on the top right corner for the schema to be selected.

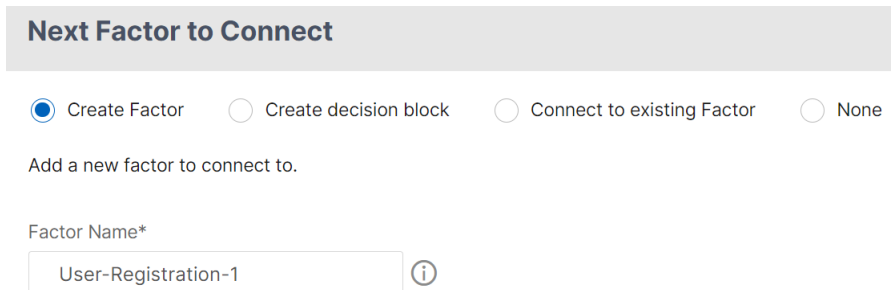

5. Click **Create** and click **OK**.

Once the default Schema is added, then we have to configure the following three flows:

- **User registration:** For explicit user registration
- **Password reset:** For password reset
- **Normal login + Registered user check:** In case the user is registered and enters the correct password, the user is logged in. In case the user is not registered it takes the user to the registration page.

**User Registration** Let us continue from where we left after adding the schema.

1. Click **Add Policy**, this checks if the user is trying to explicitly register.
2. Click **Create** and then click **Add**.
3. Click the green '+' icon, to add the next authentication factor to the user-registration flow.

4. Click **Create**.
5. Click **Add Policy** for User-Registration-1 factor.
6. Create the authentication policy. This policy extracts the user information and validates it before redirecting it to the registration page.
7. Click **Create** and then click **Add**.
8. Now click the green '+' icon to create another factor for the user registration and click **Create**. Click **Add Schema**.

9. Create the authentication login schema for user registration.
10. Click **Add Policy** and create the authentication policy.
11. Click **Create** and click **Add**.

### Password reset

1. Click the Blue '+' icon to add another policy (Password reset flow) for the parent SSPR factor.

2. In the **Choose Authentication Policy** page, click **Add** to create an authentication policy or select an existing policy in the drop-down list. This policy is triggered if the user clicks "Forgot password" on the login page.
3. Click **Add**.
4. Click the green '+' icon for the password reset authentication policy to add the next factor.

5. Click **Create**.

6. Click **Add policy** to create an authentication policy for the earlier created factor. This factor is for validating the user.
7. Click **Add**.
8. Click the green '+' icon to add the next factor for the password factor flow. This validates the answers provided for resetting the password. Click **Create**.
9. Click **Add Policy** to add an authentication policy for the factor.
10. Select the same authentication policy from the drop-down list and click **Add**.

**Choose Authentication Policy**

Select Policy\*

Password-Reset-Pol1 ▼

---

**Binding Details**

Priority\*

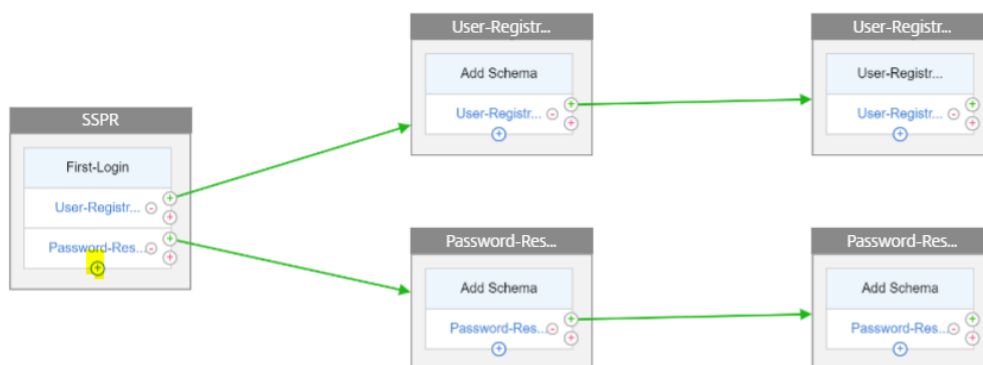

100

Goto Expression\*

NEXT ▼

**Normal login + Registered user check**

1. Click the blue '+' icon to add another authentication policy (Normal login flow) to the parent SSPR factor.

2. Click **Add**, to create an authentication policy for normal user login.
3. Click **Create** and then click **Add**.

4. Click the green '+' icon for the earlier created policy to add the next factor and select the **Create decision block** option and provide a name to the decision block.
5. Click **Create**.
6. Click **Add Policy** to create an authentication policy for this decision factor.
7. Click **Create** then click **Add**. This checks if the user is registered or not.
8. Click the green '+' icon on the decision block tile to point the user to the registration policy and select the **Connect to existing factor** option.

9. Select the registration factor from the **Connect to** drop-down list and click **Create**.
10. Now click the blue '+' icon on the decision block tile to add another policy to the decision block. This policy is for the registered user to complete the authentication.
11. Click **Add Policy** to create an authentication policy.
12. Click **Create** and click **Add**.

## Web Application Firewall protection for VPN virtual servers and authentication virtual servers

May 16, 2024

Starting from NetScaler release 14.1 build 21.57, you can protect the NetScaler Gateway virtual servers, traffic management virtual servers, and authentication virtual servers against malicious attacks by applying Web Application Firewall protection. This functionality provides an additional layer of security to your deployments as it filters incoming requests by validating them using the API schema and then authenticates users to access applications.

**Note:**

The Web App firewall protection for authentication and Gateway endpoint feature is not supported on Linux based CPX and BLX deployments.

When Web Application Firewall protection is enabled, NetScaler leverages the built-in Web Application Firewall profiles `ns-aaatm-default-appfw-profile`, `ns-aaa-default-appfw-profile`, and `ns-vpn-default-appfw-profile`. The profiles contain the associated built-in API specification files `ns-aaatm-spec`, `ns-aaa-spec`, and `ns-vpn-spec` to ensure that network traffic is secure and compliant with the API specifications.

**Note:**

We recommend that you always upgrade to the latest software version as it contains the latest security fixes.

## Licensing requirements

This feature is available with all the licenses (Standard, Enterprise, and Premium).

## Configure Web Application Firewall protection

### On the GUI

To configure Web Application Firewall protection to the virtual servers:

1. Navigate to **Security > AAA- Application Traffic > Change Authentication Settings**.
2. On the **Configure AAA Parameter** page, configure **WAF Protection**.

The following options are supported:

- Disabled - When selected, Web Application Firewall protection is not applied to any virtual server. By default, Web Application Firewall protection is not set to any value.
  - AUTH –Protects the authentication virtual server.
  - VPN –Protects the VPN virtual server.
  - AUTH and VPN –Protects the authentication, traffic management, and VPN virtual servers.
3. Click **OK**.

← Configure AAA Parameter

**On the CLI**

Run the following command to enable Web Application Firewall protection to the virtual servers:

```
set aaa parameter -wafProtection <DISABLED/AUTH/VPN>
```

**Examples:**

The following is an example of Web Application Firewall protection for the authentication virtual servers:

- The `set aaa parameter -wafProtection AUTH` command protects the authentication virtual servers.
- The `set aaa parameter -wafProtection VPN` command protects the VPN virtual servers.
- The `set aaa parameter -wafProtection AUTH VPN` command protects the authentication, VPN, and traffic management virtual servers.

**Configure security insights**

To view the violations detected by the built-in Web Application Firewall profiles, configure security insights. When configured, NetScaler sends the insight records to the AppFlow collector (configured in the analytics profile) whenever a request is sent to a virtual server. The security insight records are sent to the AppFlow collector.

**Notes:**

- Before you configure the security insights, as a pre-requisite, ensure that the ULFD mode and AppFlow feature are enabled. On the GUI, you can perform this step by navigating to **System > Settings > Modes and Features**. On the CLI, you can use the commands `en ns`

mode ULFD and enable the ns feature appflow.

- Ensure that your NetScaler instances are added in NetScaler Console. For details, see [Instance management](#).

## On the GUI

On the **Configure AAA Parameter** page, enable the **Security Insights** option. This parameter is disabled, by default.

← Configure AAA Parameter

The screenshot shows the 'Configure AAA Parameter' page with various settings. The 'Security Insights\*' dropdown menu is highlighted with a red box and is set to 'ENABLED'. Other visible settings include: Maximum Number of Users (Unlimited), Max Login Attempts (5), NUT IP Address (192.0.2.0), Failed Login Timeout (5), WAF Protection (Auth and VPN), Default Authentication Type\* (LOCAL), AAA Session Log Levels (INFORMATIONAL), AAAD Log Level (INFORMATIONAL), Enable Static Caching (checked), Enable Enhanced Authentication Feedback (unchecked), Enable Session Stickiness (unchecked), Maximum Deflate Size (1024), and Persistent Login Attempts\* (DISABLED).

## On the CLI

Run the following command to enable security insights for debug logging. This parameter is disabled, by default.

```
set aaa parameter -securityInsights <ENABLED/DISABLED>
```

## Configure AppFlow collector and analytics profile on the GUI

- Navigate to **System > Settings**. In the **Modes and Features** section and enable the ULFD mode and the AppFlow feature.
- Configure an AppFlow collector.
  - Navigate to **Configuration > System > AppFlow > AppFlow Collectors**. Configure the required parameters and click **Create**.

← Create AppFlow Collector

Name\*  
col2 ⓘ

IP Address\*  
10 . 146 . 77 . 19 ⓘ

Port\*  
5557 ⓘ

Transport  
logstream ⓘ

Create Close

- Set the configured AppFlow collector to the analytics profile. In this example, the AppFlow collector is set to the built-in analytics profile `ns-aaa-vpn-appfw-analytics-profile`.
  - Navigate to **Configuration > System > Profiles > Analytics Profiles**. In the **Basic details** section, select the AppFlow collector on the **Collectors** field.

← Configure Analytics Profile

Basic Details

Name  
ns-aaa-vpn-appfw-analytics-prof

Collectors  
col2 ⓘ Add

Type  
SECURITY INSIGHT

### Configure AppFlow collector and analytics profile on the CLI

```

1 - add appflow collector col2 -IPAddress 10.146.77.19 -port 5557 -
 Transport logstream
2
3 - set analytics profile ns-aaa-vpn-appfw-analytics-profile -collectors
 col2 -type securityinsight
4 <!--NeedCopy-->

```

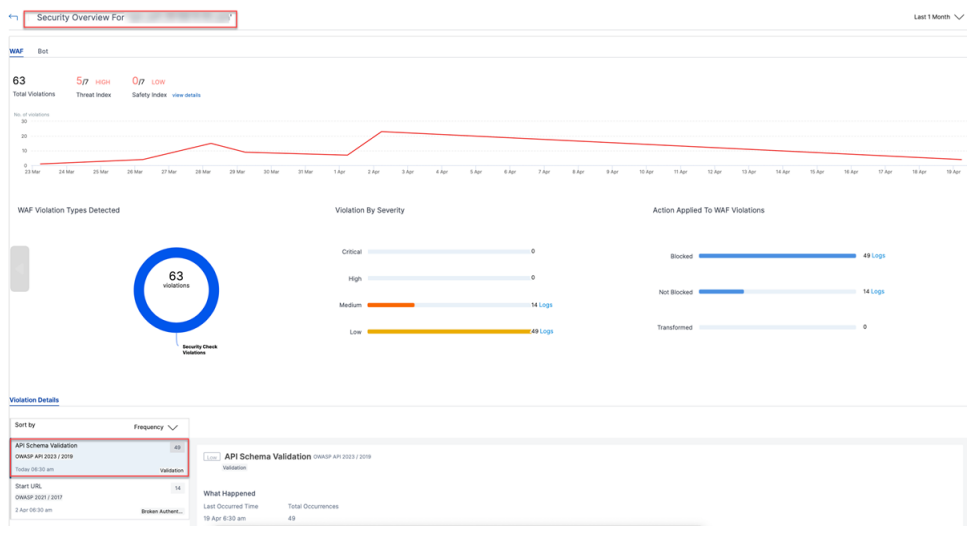

For more information about the AppFlow configuration, see [Configuring the AppFlow feature](#).

**Note:**

Security insights for this feature work only with Logstream messages. They do not work with IPFIX messages.

### View the AppFlow records on NetScaler Console

1. On the NetScaler Console on-prem GUI, navigate to **Security > Security Violations**. In the **WAF** section, select the VPN or the authentication virtual server. For more details, see [View application security violation details](#).

For a detailed view, select the URL in the **Request URL** field.

**Violation Information**

Violation information

2. Apply the appropriate licenses to your VPN or authentication virtual server.

- Verify if your virtual server is licensed.
- In **Settings > Analytics configuration** section of the NetScaler Console GUI, select your virtual server and apply the licenses. For more details, see [Manage licensing and enable analytics on virtual servers](#).

**Note:**

This step is required only if you are using NetScaler Console on-prem versions 14.1-17.38 or prior.

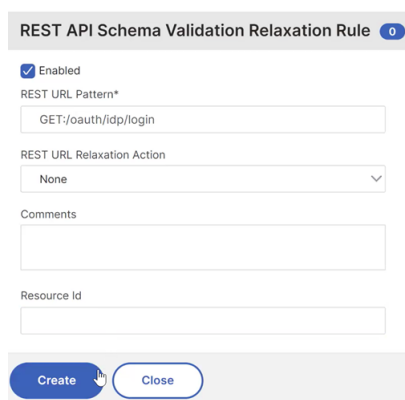

## Configure relaxation rules

You can configure a relaxation rule on the endpoint URLs or the virtual server IP addresses, to bypass certain traffic from being validated against the schema specified in the API specification file.

### On the GUI

The following is an example of a REST validation relaxation that you can apply to the "GET:/oauth/idp/login" authentication endpoint URL:

- Navigate to **Security > NetScaler Web App Firewall > Profiles**.
- Select the profile `ns-aaa-default-appfw-profile`.
- Under **Advanced Settings**, click **Relaxation Rules**.
- Select the **REST API schema validation** checkbox.
- Navigate to the beginning of the **Relaxation Rules** section and click **Edit**.
- Click **Add**.
- On the **REST API Schema Validation Relaxation Rule** page, update the required fields and click **Create**.

The screenshot shows the configuration page for a REST API Schema Validation Relaxation Rule. The page title is "REST API Schema Validation Relaxation Rule" with a blue information icon. The "Enabled" checkbox is checked. The "REST URL Pattern\*" field contains "GET:/oauth/idp/login". The "REST URL Relaxation Action" dropdown menu is set to "None". There is a "Comments" text area and a "Resource Id" text area, both currently empty. At the bottom, there are "Create" and "Close" buttons.

The following is an example of a relaxation that you can apply to a virtual server IP address:

- Under **Advanced Settings**, select **Profile Settings**.
- In the **Common Settings** section, select the **Enable Bypass List** checkbox.
- Go back to the **Advanced Settings** section and select **Global Bypass/Deny List**.
- In the **Global Bypass List** section, click **Add**.
- On the **Create AppFirewall Bypass List Binding** page, update the required fields and click **Create**.

**Create AppFirewall Bypass List Binding**

Comments

### On the CLI

The following is an example of a REST validation relaxation that you can apply to the "GET:/oauth/idp/login" authentication endpoint URL:

```

1 bind appfwprofile ns-aaa-default-appfw-profile -restValidation "GET:/
 oauth/idp/login"
2 <!--NeedCopy-->

```

The following is an example of a relaxation that you can apply to a virtual server IP address:

```

1 set appfwprofile ns-aaa-default-appfw-profile -bypasslist on
2
3 bind appfwprofile ns-aaa-default-appfw-profile -bypasslist "CLIENT.IP.
 DST.EQ(192.0.2.255)" -valueType expression
4 <!--NeedCopy-->

```

For details about the configuration of relaxation rules, see [Configure relaxation rule for API schema validation using CLI](#).

### Debug logging

The following is a sample error message that appears in the ns.log file for user requests that NetScaler Web Application Firewall blocks:

```

Mar 22 07:04:26 <local0.info> 192.0.2.4 03/22/2024:07:04:26 GMT 0-PPE
-0 : default APPFW APPFW_SCHEMA_VALUE_INCORRECT 864 0 : 10.106.31.93
107-PPE0 - ns-aaa-default-appfw-profile Parameter value incorrect as

```

per API Spec: (ns-aaa-spec) for Endpoint: (GET https://192.0.2.5/oauth/idp/login?client\_id=test&response\_type=code&scope=openid%20profile&redirect\_uri=https%3A%2F%2Foauthrp.aaa.local%2Foauth%2Flogin&state=Y3R4PU9tNzJ5WkNlTGJaSVhBb1lXM21ZVm40N0ZfQ1JzNjM10GhvWEpRWkpDVFV1ZkY5U1hoOV9Edn) <blocked>

In the preceding example, the profile name and endpoint URLs are specified to help users with the analysis and configure relaxation rules.

The following `stat` command displays the counters of the user requests blocked by the traffic management and authentication virtual servers:

```
1 stat aaa | grep -i blocked
2
3 Total AAA Waf blocked hits 0 15
4 Total AAATM Waf blocked hits 0 1
5 <!--NeedCopy-->
```

The following `stat` command displays the counters of API specification file:

```
1 stat apispec
2 API spec(s) Summary hits validate unmatched
3 ns-a...-spec 0 0 0
4 ns-aaa-spec 15 12 0
5 ns-vpn-spec 4 4 0
6 aaa 0 0 0
7 <!--NeedCopy-->
```

## Dynamic update of the new API specification files provided by NetScaler

When the Web Application Firewall protection parameter is enabled, NetScaler uses the following built-in API specification files for API schema validation.

- **ns-aaatm-spec:** This file performs API schema validation of the incoming requests to the traffic management virtual servers.
- **ns-aaa-spec:** This file performs API schema validation of the incoming requests to the authentication virtual servers.
- **ns-vpn-spec:** This file performs API schema validation of the incoming requests to the VPN virtual servers.

On the GUI, you can locate these files by navigating to **Security > NetScaler Web App Firewall > Imports > API Spec Import**.

Imports

HTML Error Page 0 XML Error Page 0 JSON Error Page 0 XML Schema 0 WSDL 0 API Spec Import 3

Add Edit Statistics Delete No action

Q Click here to search or you can enter Key : Value format

| <input type="checkbox"/> | API SPEC NAME | API SPEC FILE          | TYPE |
|--------------------------|---------------|------------------------|------|
| <input type="checkbox"/> | ns-aaatm-spec | AAATMSpecFile.json-enc | OAS  |
| <input type="checkbox"/> | ns-aaa-spec   | AuthSpecFile.json-enc  | OAS  |
| <input type="checkbox"/> | ns-vpn-spec   | vpnspec.json-enc       | OAS  |

You can dynamically update the built-in API specification files by using the API specification files that NetScaler provides. Perform the following steps on the GUI:

1. Navigate to **Security > NetScaler Web App Firewall > Imports > API Spec Import**.
2. Select the API specification file and click **Edit**.
3. On the API Spec Import Object page, click **File**.
4. Upload the new API schema file and click **Continue**.

### Notes:

- Do not rename API specification files that NetScaler provides.
- Ensure that the **Encrypted** checkbox is selected.

### API Spec Import Object

Modify API Spec

API Spec Name

## Polling during authentication

May 2, 2023

Starting from NetScaler release build 13.0.79.64, a NetScaler appliance can be configured for Polling mechanism during multifactor authentication.

If Polling is configured on a NetScaler appliance, endpoints (like a web browser or an app) can poll (probe) the appliance during authentication at the configured intervals to get the status of the submitted authentication request.

Polling can be configured to handle authentications when an endpoint drops a TCP connection while authenticating with a NetScaler appliance.

### Points to note

- The Polling configuration is supported for LDAP, RADIUS, and TACACS authentication methods.
- Client can probe authentication requests from second factor onwards.

### Why configure Polling?

Sometimes while authenticating, switching between the apps (for example a login app and an authenticator app) causes endpoints to lose connection with the NetScaler appliance leading to a break in the authentication flow. With Polling configured, this break in authentication can be avoided.

### Understanding the Polling mechanism

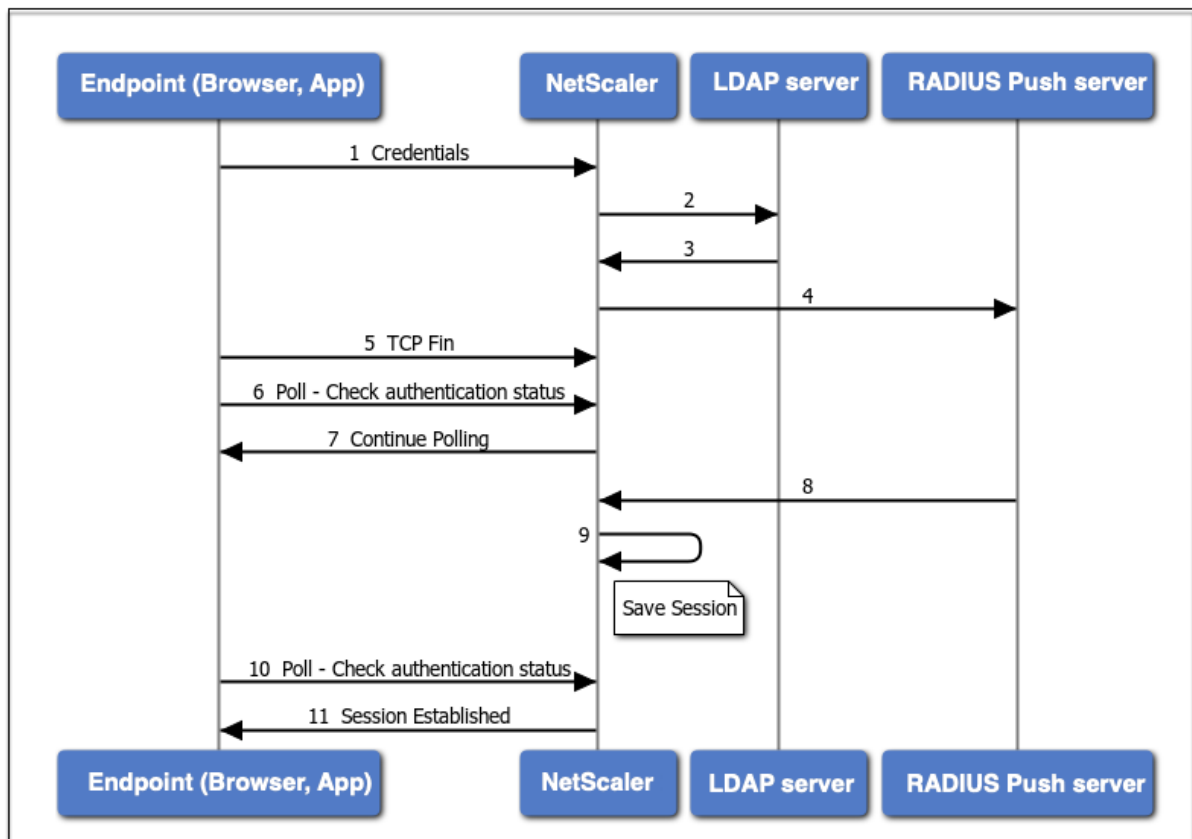

The following is an example for the flow of events during authentication without Polling configured.

The Polling mechanism enables a NetScaler appliance to resume an ongoing authentication with the endpoint without having to restart the authentication process in a rare case of a TCP connection reset at the endpoint.

1. An endpoint (App or Web browser) authenticates with credentials.
2. The user name and password is verified against an existing first factor directory (LDAP/Active Directory).
3. If the correct credentials are supplied, the authentication moves to the next factor.
4. At this point, the NetScaler appliance sends request to the RADIUS Push server.
5. While the NetScaler appliance waits for a response from the RADIUS server, the endpoint drops TCP connection.
6. The NetScaler receives a response from the RADIUS Push server.
7. As no client TCP connection is found, the NetScaler appliance drops session and the login fails.

The following is an example for the flow of events during authentication with Polling configured.

1. An endpoint (App or Web browser) authenticates with credentials.
2. The user name and password is verified against an existing first factor directory (LDAP/Active Directory).
3. If the correct credentials are supplied, the authentication moves to the next factor.
4. At this point, the NetScaler appliance sends request to the RADIUS Push server.
5. While the NetScaler appliance waits for a response from the RADIUS server, the endpoint drops TCP connection.
6. Endpoint sends a poll (probe) to the NetScaler appliance to check for the authentication status.
7. As the NetScaler appliance does not hear back from the RADIUS server, it requests the endpoint to continue polling.
8. The NetScaler appliance receives response from the RADIUS Push server.
9. As no client TCP connection is found, ADC saves the session state.
10. Endpoint again polls to check for the authentication status.
11. NetScaler appliance establishes the session and the login succeeds.

### Configure Polling using CLI

The following is a sample CLI configuration.

### Configure First factor

```
1 add authentication ldapAction ldap-new -serverIP 10.106.40.65 -
 serverPort 636 -ldapBase "dc=aaatm-test,dc=com" -ldapBindDn
 administrator@aaatm-test.com -ldapBindDnPassword 2
 f63d3659103464a4fad0ade65e2ccfd4e8440e36ddff941d29796af03e01139 -
 encrypted -encryptmethod ENCMTD_3 -ldapLoginName sAMAccountName -
 groupAttrName memberof -subAttributeName CN -secType SSL -
 alternateEmailAttr userParameters
2
3 add authentication Policy ldap-new -rule true -action ldap-new
4
5 bind authentication vserver avs -policy ldap-new -priority 1 -
 nextFactor rad_factor
6 <!--NeedCopy-->
```

### Configure Second factor

```
1 add authentication radiusAction rad1 -serverIP 10.102.229.120 -radKey 1
 b1613760143ce2371961e9a9eb5392c86a4954a62397f29a01b5d12b42ce232 -
 encrypted -encryptmethod ENCMTD_3
2
3 add authentication Policy rad -rule true -action rad1
4 <!--NeedCopy-->
```

### Configure Poll.xml login schema

```
1 add authentication loginSchema polling_schema -authenticationSchema
 LoginSchema/Poll.xml
2
3 add authentication policylabel rad_factor -loginSchema polling_schema
4
5 bind authentication policylabel rad_factor -policyName rad -priority 1
 -gotoPriorityExpression NEXT
6 <!--NeedCopy-->
```

### Configure Polling using GUI

For detailed steps on configuring multifactor authentication using GUI see, [Configuring nFactor authentication](#)

Following are the sample high level steps required for configuring NetScaler for Polling from second factor onwards.

1. Create a first factor for authentication, for example LDAP.

2. Create a second factor for authentication, for example RADIUS.
3. Add **Poll.xml** present in NetScaler (/nsconfig/loginschema/LoginSchema/) as login schema for the second factor.

## Session and traffic management

May 2, 2023

### Session settings

After you configure your authentication, authorization, and auditing profiles, you configure session settings to customize your user sessions. The session settings are:

- **The session timeout.**

Controls the period after which the user is automatically disconnected and must authenticate again to access your intranet.

- **The default authorization setting.**

Determines whether the NetScaler appliance will by default allow or deny access to content for which there is no specific authorization policy.

- **The single sign-on setting.**

Determines whether the NetScaler appliance will log users on to all web applications automatically after they authenticate, or will pass users to the web application logon page to authenticate for each application.

- **The credential index setting.**

Determines whether the NetScaler appliance uses the primary or the secondary authentication credentials for single sign-on.

To configure the session settings, you can take one of two approaches. If you want different settings for different user accounts or groups, you create a profile for each user account or group for which you want to configure custom sessions settings. You also create policies to select the connections to which to apply particular profiles, and you bind the policies to users or groups. You can also bind a policy to the authentication virtual server that handles the traffic to which you want to apply the profile.

If you want the same settings for all sessions, or if you want to customize the default settings for sessions that do not have specific profiles and policies configured, you can simply configure the global session settings.

## Session profiles

To customize your user sessions, you first create a session profile. The session profile allows you to override global settings for any of the session parameters.

### Note

The terms “session profile” and “session action” mean the same thing.

### To create a session profile by using the command line interface

At the command prompt, type the following commands to create a session profile and verify the configuration:

```
1 add tm sessionAction <name> [-sessTimeout <mins>] [-
 defaultAuthorizationAction (ALLOW | DENY)][-SSO (ON | OFF)][-
 ssoCredential (PRIMARY | SECONDARY)] [-ssoDomain <string>][-
 httpOnlyCookie (YES | NO)] [-persistentCookie (ENABLED | DISABLED
)] [-persistentCookieValidity <minutes>]
2
3 show tm sessionAction <name>
4 <!--NeedCopy-->
```

### Example

```
1 > add tm sessionAction session-profile -sessTimeout 30 -
 defaultAuthorization ALLOW
2 Done
3 > show tm sessionAction session-profile
4 1) Name: session-profile
5 Authorization action : ALLOW
6 Session timeout: 30 minutes
7 Done
8 <!--NeedCopy-->
```

### To modify a session profile by using the command line interface

At the command prompt, type the following commands to modify a session profile and verify the configuration:

```
1 set tm sessionAction <name> [-sessTimeout <mins>] [-
 defaultAuthorizationAction (ALLOW | DENY)][-SSO (ON | OFF)][-
 ssoCredential (PRIMARY | SECONDARY)] [-ssoDomain <string>][-
 httpOnlyCookie (YES | NO)] [-persistentCookie (ENABLED | DISABLED
)] [-persistentCookieValidity <minutes>]
2
3 show tm sessionAction
4 <!--NeedCopy-->
```

### Example

```
1 > set tm sessionAction session-profile -sessTimeout 30 -
 defaultAuthorization ALLOW
2 Done
3 > show tm sessionAction session-profile
4 1) Name: session-profile
5 Authorization action : ALLOW
6 Session timeout: 30 minutes
7 Done
8 <!--NeedCopy-->
```

### To remove a session profile by using the command line interface

At the command prompt, type the following command to remove a session profile:

```
1 rm tm sessionAction <name>
2 <!--NeedCopy-->
```

### To configure session profiles by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic > Session**.
2. Navigate to **Security > AAA - Application Traffic > Policies > Session**.
3. In the details pane, click the **Profiles** tab.
4. On the **Profiles** tab, do one of the following:
  - To create a new session profile, click **Add**.
  - To modify an existing session profile, select the profile, and then click **Edit**.
5. In the Create TM Session Profile or Configure TM Session Profile dialog, type or select values for the parameters.
  - Name\*—actionname (Cannot be changed for a previously configured session action.)
  - Session Time-out—sesstimeout
  - Single sign-on to Web Applications—sso
  - Default Authorization Action—defaultAuthorizationAction
  - Credential Index—ssocredential
  - Single Sign-on Domain—ssoDomain
  - HTTPOnly Cookie—httpOnlyCookie
  - Enable Persistent Cookie—persistentCookie
  - Persistent Cookie Validity—persistentCookieValidity
6. Click **Create** or **OK**. The session profile that you created appears in the Session Policies and Profiles pane.

## Session policies

After you create one or more session profiles, you create session policies and then bind the policies globally or to an authentication virtual server to put them into effect.

### To create a session policy by using the command line interface

At the command prompt, type the following commands to create a session policy and verify the configuration:

```
1 - add tm sessionPolicy <name> <rule> <action>
2 - show tm sessionPolicy <name>
3 <!--NeedCopy-->
```

#### Example

```
1 > add tm sessionPolicy session-pol "URL == /*.png" session-profile
2 Done
3 > show tm sessionPolicy session-pol
4 1) Name: session-pol Rule: URL == '/*.png'
5 Action: session-profile
6 Done
7 <!--NeedCopy-->
```

### To modify a session policy by using the command line interface

At the command prompt, type the following commands to modify a session policy and verify the configuration:

```
1 - set tm sessionPolicy <name> [-rule <expression>] [-action <action>]
2 - show tm sessionPolicy <name>
3 <!--NeedCopy-->
```

#### Example

```
1 > set tm sessionPolicy session-pol "URL == /*.png" session-profile
2 Done
3 > show tm sessionPolicy session-pol
4 1) Name: session-pol Rule: URL == '/*.png'
5 Action: session-profile
6 Done
7 <!--NeedCopy-->
```

**To globally bind a session policy by using the command line interface**

At the command prompt, type the following commands to globally bind a session policy and verify the configuration:

```
1 bind tm global -policyName <polycyname> [-priority <priority>]
2 <!--NeedCopy-->
```

**Example**

```
1 > bind tm global -policyName session-pol
2 Done
3
4 > show tm sessionPolicy session-pol
5 1) Name: session-pol Rule: URL == '/*.png'
6 Action: session-profile
7 Policy is bound to following entities
8 1) TM GLOBAL PRIORITY : 0
9 Done
10
11 <!--NeedCopy-->
```

**To bind a session policy to an authentication virtual server by using the command line interface**

At the command prompt, type the following command to bind a session policy to an authentication virtual and verify the configuration:

```
1 bind authentication vserver <name> -policy <polycyname> [-priority <
 priority>]
2 <!--NeedCopy-->
```

**Example**

```
1 bind authentication vserver auth-vserver-1 -policyName Session-Pol-1 -
 priority 1000
2 Done
3 <!--NeedCopy-->
```

**To unbind a session policy from an authentication virtual server by using the command line interface**

At the command prompt, type the following commands to unbind a session policy from an authentication virtual server and verify the configuration:

```
1 unbind authentication vserver <name> -policy <polycyname>
2 <!--NeedCopy-->
```

### Example

```
1 unbind authentication vserver auth-vserver-1 -policyName Session-Pol-1
2 Done
3 <!--NeedCopy-->
```

### To unbind a globally bound session policy by using the command line interface

At the command prompt, type the following commands to unbind a globally bound session policy:

```
1 unbind tm global -policyName <policyname>
2 <!--NeedCopy-->
```

### Example

```
1 unbind tm global -policyName Session-Pol-1
2 Done
3 <!--NeedCopy-->
```

### To remove a session policy by using the command line interface

First unbind the session policy from global, and then, at the command prompt, type the following commands to remove a session policy and verify the configuration:

```
1 rm tm sessionPolicy <name>
2 <!--NeedCopy-->
```

### Example

```
1 rm tm sessionPolicy Session-Pol-1
2 Done
3
4 <!--NeedCopy-->
```

### To configure and bind session policies by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic > Session**.
2. Navigate to **Security > AAA - Application Traffic > Policies > Session**.
3. In the details pane, on the **Policies** tab, do one of the following:
  - To create a new session policy, click **Add**.
  - To modify an existing session policy, select the policy, and then click **Edit**.
4. In the **Create Session Policy** or **Configure Session Policy** dialog, type or select the values for the parameters.

- Name\*—policyname (Cannot be changed for a previously configured session policy.)
  - Request Profile\*—actionname
  - Expression\*—rule (You enter expressions by first choosing the type of expression in the leftmost drop-down list beneath the Expression text area and then typing your expression directly into the expression text area, or by clicking **Add** to open the Add Expression dialog box and using the drop-down lists in it to construct your expression.)
5. Click **Create** or **OK**. The policy that you created appears in the details pane of the **Session Policies** and **Profiles** page.
  6. To globally bind a session policy, in the details pane, select **Global Bindings** from the **Action** drop-down list, and fill in the dialog.
    - Select the name of the session policy you want to globally bind.
    - Click **OK**.
  7. To bind a session policy to an authentication virtual server, in the navigation pane, click **Virtual Servers**, and add that policy to the policies list.
    - In the details pane, select the virtual server, and then click **Edit**.
    - In the **Advanced Selections** to the right of the detail area, click **Policies**.
    - Select a policy, or click the **plus** icon to add a policy.
    - In the **Priority** column to the left, modify the default priority to ensure that the policy is evaluated in the proper order.
    - Click **OK**.A message appears in the status bar, stating that the policy has been configured successfully.

## Global session settings

In addition to or instead of creating session profiles and policies, you can configure global session settings. These settings control the session configuration when there is no explicit policy overriding them.

### To configure the session settings by using the command line interface

At the command prompt, type the following commands to configure the global session settings and verify the configuration:

```
1 set tm sessionParameter [-sesTimeout <mins>][-
 defaultAuthorizationAction (ALLOW | DENY)][-SSO (ON | OFF)][-
 ssoCredential (PRIMARY | SECONDARY)][-ssoDomain <string>][-
 httpOnlyCookie (YES | NO)][-persistentCookie (ENABLED | DISABLED
)] [-persistentCookieValidity <minutes>]
```

```
2 <!--NeedCopy-->
```

### Example

```
1 > set tm sessionParameter -sessTimeout 30
2 Done
3 > set tm sessionParameter -defaultAuthorizationAction DENY
4 Done
5 > set tm sessionParameter -SSO ON
6 Done
7 > set tm sessionParameter -ssoCredential PRIMARY
8 Done
9 <!--NeedCopy-->
```

### To configure the session settings by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic**
2. In the details pane, under **Settings**, click Change global settings.
3. In the **Global Session Settings** dialog, type or select values for the parameters.
  - Session Time-out—`sessTimeout`
  - Default Authorization Action—`defaultAuthorizationAction`
  - Single Sign-on to Web Applications—`sso`
  - Credential Index—`ssoCredential`
  - Single Sign-on Domain—`ssoDomain`
  - HTTPOnly Cookie—`httpOnlyCookie`
  - Enable Persistent Cookie—`persistentCookie`
  - Persistent Cookie Validity (minutes)—`persistentCookieValidity`
  - Home Page—`home page`
4. Click **OK**.

### Traffic settings

If you use forms-based or SAML single sign-on (SSO) for your protected applications, you configure that feature in the Traffic settings. SSO enables your users to log on once to access all protected applications, rather than requiring them to log on separately to access each one.

Forms-based SSO allows you to use a web form of your own design as the sign-on method instead of a generic pop-up window. You can therefore put your company logo and other information you might want your users to see on the logon form. SAML SSO allows you to configure one NetScaler appliance or virtual appliance instance to authenticate to another NetScaler appliance on behalf of users who have authenticated with the first appliance.

To configure either type of SSO, you first create a forms or SAML SSO profile. Next, you create a traffic profile and link it to the SSO profile you created. Next, you create a policy, link it to the traffic profile. Finally, you bind the policy globally or to an authentication virtual server to put your configuration into effect.

## Traffic profiles

After creating at least one forms or SAML sso profile, you must next create a traffic profile.

**Note:**

In this feature, the terms “profile” and “action” mean the same thing.

### To create a traffic profile by using the command line interface

At the command prompt, type:

```
1 add tm trafficAction <name> [-appTimeout <mins>] [-SSO (ON | OFF) [-
 formSSOAction <string>]] [-persistentCookie (ENABLED | DISABLED)] [-
 InitiateLogout (ON | OFF)]
2 <!--NeedCopy-->
```

#### Example

```
1 add tm trafficAction Traffic-Prof-1 - appTimeout 10 -SSO ON -
 formSSOAction SSO-Prof-1
2 <!--NeedCopy-->
```

### To modify a session profile by using the command line interface

At the command prompt, type:

```
1 set tm trafficAction <name> [-appTimeout <mins>] [-SSO (ON | OFF) [-
 formSSOAction <string>]] [-persistentCookie (ENABLED | DISABLED)]
 [-InitiateLogout (ON | OFF)]
2 <!--NeedCopy-->
```

#### Example

```
1 set tm trafficAction Traffic-Prof-1 - appTimeout 10 -SSO ON -
 formSSOAction SSO-Prof-1
2 <!--NeedCopy-->
```

### To remove a session profile by using the command line interface

At the command prompt, type:

```
1 rm tm trafficAction <name>
2 <!--NeedCopy-->
```

Example

```
1 rm tm trafficAction Traffic-Prof-1
2 <!--NeedCopy-->
```

### To configure traffic profiles by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic > Traffic**.
2. Navigate to **Security > AAA - Application Traffic > Policies > Traffic**.
3. In the details pane, click the Profiles tab.
4. On the Profiles tab, do one of the following:
  - To create a new traffic profile, click **Add**.
  - To modify an existing traffic profile, select the profile, and then click **Edit**.
5. In the **Create Traffic Profile** or **Configure Traffic Profile** dialog box, specify values for the parameters.
  - Name\*—name (Cannot be changed for a previously configured session action.)
  - AppTimeout—appTimeout
  - Single Sign-On—SSO
  - Form SSO Action—formSSOAction
  - SAML SSO Action—samSSOAction
  - Enable Persistent Cookie—persistentCookie
  - Initiate Logout—InitiateLogout
6. Click **Create** or **OK**. The traffic profile that you created appears in the Traffic Policies, Profiles, and either the Form SSO Profiles or SAML SSO Profiles pane, as appropriate.

### Support for AAA.USER and AAA.LOGIN expressions

The AAA.USER expression is now implemented to replace the existing HTTP.REQ.USER expressions. The AAA.USER expression is applicable to handle non-HTTP traffic, such as the Secure Web Gateway (SWG) and role-based access (RBA) mechanism. The AAA.USER expressions are equivalent to HTTP.REQ.USER expressions.

You can use the expression at various actions or profiles configuration.

At the command prompt, type:

```
1 add tm trafficAction <name> [SSO (ON|OFF)] [-userExpression <string>]
2
3 add tm trafficAction <name> [SSO (ON|OFF)] [-passwdExpression <string>]
4
5 <!--NeedCopy-->
```

Example

```
1 add tm trafficAction tm_act -SSO ON -userExpression "AAA.USER.NAME"
2
3 add tm trafficAction tm_act -SSO ON -userExpression "AAA.USER.PASSWD"
4
5 add tm trafficPolicy tm_pol true tm_act
6
7 bind lb vserver lb1 -policyName tm_pol -priority 2
8 <!--NeedCopy-->
```

**Note:**

If you use HTTP.REQ.USER expression, a warning message “HTTP.REQ.USER has been deprecated. Use AAA.USER instead” appears on the command prompt.

- **AAA.LOGIN Expression.** The LOGIN expression represents pre-login, also known as the login request. The login request can be from NetScaler Gateway, SAML IdP, or from OAuth authentication. The NetScaler will abstract the required attributes from the policy configuration. The AAA.LOGIN expression contains the attributes, which can be fetched based on the following:
  - **AAA.LOGIN.USERNAME.** The user name (if found) is fetched from the current login request. The same expression applied to a non-login request (determined by an authentication, authorization, and auditing) results in an empty string.
  - **AAA.LOGIN.PASSWORD.** The user password (if found) is fetched from the current login request. The expression results in an empty string if the password is not found.
  - **AAA.LOGIN.PASSWORD2.** The second password (if found) is fetched from the login request.
  - **AAA.LOGIN.DOMAIN.** The domain information is fetched from the login request.
- **AAA.USER.ATTRIBUTE("#").** The expression is used to store user attribute. Here # can either be an integer value (between 1 and 16) or a string value. You can use these index values by using the expression AAA.USER.ATTRIBUTE("#"). The authentication, authorization, and auditing module looks up the user sessions attribute and AAA.USER.ATTRIBUTE("#") would query the hash table for that particular attribute. For example, if Attributes("samaccountname") is set, AAA.USER.ATTRIBUTE("samaccountname") would query the hash map and would fetch the value corresponding to samaccountname.

## Traffic policies

After you create one or more form SSO and traffic profiles, you create traffic policies and then bind the policies, either globally or to a traffic management virtual server, to put them into effect.

### To create a traffic policy by using the command line interface

At the command prompt, type:

```
1 add tm trafficPolicy <name> <rule> <action>
2 <!--NeedCopy-->
```

Example

```
1 add tm trafficPolicy Traffic-Pol-1 "HTTP.REQ.HEADER("Cookie").CONTAINS(
 "login=true)" Traffic-Prof-1
2 <!--NeedCopy-->
```

### To modify a traffic policy by using the command line interface

At the command prompt, type:

```
1 set tm trafficPolicy <name> <rule> <action>
2 <!--NeedCopy-->
```

Example

```
1 set tm trafficPolicy Traffic-Pol-1 "HTTP.REQ.HEADER("Cookie").CONTAINS(
 "login=true)" Traffic-Prof-1
2 <!--NeedCopy-->
```

### To globally bind a traffic policy by using the command line interface

At the command prompt, type:

```
1 bind tm global -policyName <string> [-priority <priority>]
2 <!--NeedCopy-->
```

Example

```
1 bind tm global -policyName Traffic-Pol-1
2 <!--NeedCopy-->
```

**To bind a traffic policy to a load balancing or content switching virtual server by using the command line interface**

At the command prompt, type one of the following commands:

```
1 bind lb vserver <name> -policy <policyName> [-priority <priority>]
2
3 bind cs vserver <name> -policy <policyName> [-priority <priority>]
4 <!--NeedCopy-->
```

**Example**

```
1 bind authentication vserver auth-vserver-1 -policyName Traffic-Pol-1 -
 priority 1000
2 <!--NeedCopy-->
```

**To unbind a globally bound traffic policy by using the command line interface**

At the command prompt, type:

```
1 unbind tm global -policyName <policyname>
2 <!--NeedCopy-->
```

**Example**

```
1 unbind tm global -policyName Traffic-Pol-1
2 <!--NeedCopy-->
```

**To unbind a traffic policy from a load balancing or content switching virtual server by using the command line interface**

At the command prompt, type one of the following commands:

```
1 unbind lb vserver <name> -policy <policyname>
2
3 unbind cs vserver <name> -policy <policyname>
4 <!--NeedCopy-->
```

**Example**

```
1 unbind authentication vserver auth-vserver-1 -policyName Traffic-Pol-1
2 <!--NeedCopy-->
```

**To remove a traffic policy by using the command line interface**

First unbind the session policy from global, and then, at the command prompt, type:

```
1 rm tm trafficPolicy <name>
2 <!--NeedCopy-->
```

### Example

```
1 rm tm trafficPolicy Traffic-Pol-1
2 <!--NeedCopy-->
```

## To configure and bind traffic policies by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic > Traffic**.
2. Navigate to **Security > AAA - Application Traffic > Policies > Traffic**.
3. In the details pane, do one of the following:
  - To create a new session policy, click **Add**.
  - To modify an existing session policy, select the policy, and then click **Edit**.
4. In the **Create Traffic Policy** or **Configure Traffic Policy** dialog, specify values for the parameters.
  - Name\*—policyName (Cannot be changed for a previously configured session policy.)
  - Profile\*—actionName
  - Expression—rule (You enter expressions by first choosing the type of expression in the left-most drop-down list beneath the Expression text area and then typing your expression directly into the expression text area, or by clicking Add to open the Add Expression dialog box and using the drop-down lists in it to construct your expression.)
5. Click **Create** or **OK**. The policy that you created appears in the details pane of the **Session Policies** and **Profiles** page.

## Form SSO profiles

To enable and configure forms-based SSO, you first create an SSO profile.

### Note

- Forms-based single sign-on does not work if the form is customized to include Javascript.
- In this feature, the terms “profile” and “action” mean the same thing.

## To create a form SSO profile by using the command line interface

At the command prompt, type:

```

1 add tm formSSOAction <name> -actionURL <URL> -userField <string> -
 passwdField <string> -ssoSuccessRule <expression> [-nameValuePair <
 string>] [-responseSize <positive_integer>][-nvtype (STATIC |
 DYNAMIC)][-submitMethod (GET | POST)]
2
3 show tm formSSOAction [<name>]
4 <!--NeedCopy-->

```

### Example

```

1 add tm formSSOAction SSO-Prof-1 -actionURL "/logon.php"
2 -userField "loginID" -passwdField "passwd"
3 -nameValuePair "loginID passwd" -responseSize "9096"
4 -ssoSuccessRule "HTTP.RES.HEADER("Set-Cookie").CONTAINS("LogonID")"
5 -nvtype STATIC -submitMethod GET
6 -sessTimeout 10 -defaultAuthorizationAction ALLOW
7 <!--NeedCopy-->

```

### To modify a form SSO by using the command line interface

At the command prompt, type:

```

1 set tm formSSOAction <name> -actionURL <URL> -userField <string> -
 passwdField <string> -ssoSuccessRule <expression> [-nameValuePair <
 string>] [-responseSize <positive_integer>][-nvtype (STATIC |
 DYNAMIC)][-submitMethod (GET | POST)]
2 <!--NeedCopy-->

```

### Example

```

1 set tm formSSOAction SSO-Prof-1 -actionURL "/logon.php"
2 -userField "loginID" -passwdField "passwd"
3 -ssoSuccessRule "HTTP.RES.HEADER("Set-Cookie").CONTAINS("LogonID")"
4 -nameValuePair "loginID passwd" -responseSize "9096"
5 -nvtype STATIC -submitMethod GET
6 -sessTimeout 10 -defaultAuthorizationAction ALLOW
7 <!--NeedCopy-->

```

### To remove a form SSO profile by using the command line interface

At the command prompt, type:

```

1 rm tm formSSOAction <name>
2 <!--NeedCopy-->

```

### Example

```

1 rm tm sessionAction SSO-Prof-1

```

```
2 <!--NeedCopy-->
```

### To configure form SSO profiles by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic > Policies > Traffic**.
2. In the details pane, click the **Form SSO Profiles** tab.
3. On the Form SSO Profiles tab, do one of the following:
  - To create a new form SSO profile, click **Add**.
  - To modify an existing form SSO profile, select the profile, and then click Edit.
4. In the **Create Form SSO Profile** or **Configure Form SSO Profile** dialog, specify the values for the parameters:
  - Name\*—name (Cannot be changed for a previously configured session action.)
  - Action URL\*—actionURL
  - User Name Field\*—userField
  - Password Field\*—passField
  - Expression\*—ssoSuccessRule
  - Name Value Pair—nameValuePair
  - Response Size—responsesize
  - Extraction—nvtype
  - Submit Method—submitMethod
5. Click **Create** or **OK**, and then click **Close**. The form SSO profile that you created appears in the **Traffic Policies, Profiles**, and **Form SSO Profiles** pane.

### SAML SSO profiles

To enable and configure SAML-based SSO, you first create a SAML SSO profile.

#### To create a SAML SSO profile by using the command line interface

At the command prompt, type:

```
1 add tm samlSSOProfile <name> -samlSigningCertName <string> -
 assertionConsumerServiceURL <URL> -relaystateRule <expression> -
 sendPassword (ON | OFF) [-samlIssuerName <string>]
2 <!--NeedCopy-->
```

Example

```
1 add tm samlSSOProfile saml-SSO-Prof-1 -samlSigningCertName "Example,
 Inc." -assertionConsumerServiceURL "https://service.example.com" -
 relaystateRule "true" -sendPassword "ON" -samlIssuerName "Example,
 Inc."
2 <!--NeedCopy-->
```

### To modify a SAML SSO by using the command line interface

At the command prompt, type:

```
1 set tm samlSSOProfile <name> -samlSigningCertName <string> -
 assertionConsumerServiceURL <URL> -relaystateRule <expression> -
 sendPassword (ON | OFF) [-samlIssuerName <string>]
2 <!--NeedCopy-->
```

Example

```
1 set tm samlSSOProfile saml-SSO-Prof-1 -samlSigningCertName "Example,
 Inc." -assertionConsumerServiceURL "https://service.example.com" -
 relaystateRule "true" -sendPassword "ON" -samlIssuerName "Example,
 Inc."
2 <!--NeedCopy-->
```

### To remove a SAML SSO profile by using the command line interface

At the command prompt, type:

```
1 rm tm samlSSOProfile <name>
2 <!--NeedCopy-->
```

Example

```
1 rm tm sessionAction saml-SSO-Prof-1
2 <!--NeedCopy-->
```

### To configure a SAML SSO profile by using the configuration utility

1. Navigate to **Security > AAA - Application Traffic > Policies > Traffic**.
2. In the details pane, click the **SAML SSO Profiles** tab.
3. On the **SAML SSO Profiles** tab, do one of the following:
  - To create a new SAML SSO profile, click **Add**.
  - To modify an existing SAML SSO profile, select the profile, and then click **OpenEdit**.
4. In the **Create SAML SSO Profiles** or the **Configure SAML SSO Profiles** dialog box, set the following parameters:

- Name\*
- Signing Certificate Name\*
- ACS URL\*
- Relay State Rule\*
- Send Password
- Issuer Name

5. Click **Create** or **OK**, and then click **Close**. The SAML SSO profile that you created appears in the Traffic Policies, Profiles, and SAML SSO Profiles pane.

### Session timeout for OWA 2010

You can now force OWA 2010 connections to time out after a specified period of inactivity. OWA sends repeated keepalive requests to the server to prevent timeouts. Keeping the connections open can interfere with single sign-on.

#### To force OWA 2010 to time out after a specified period by using the command line interface

At the command prompt, type the following commands:

```
1 add tm trafficAction <actname> [-forcedTimeout <forcedTimeout> -
 forcedTimeoutVal <mins>]
2 <!--NeedCopy-->
```

For <actname>, substitute a name for your traffic policy. For <mins>, substitute the number of minutes after which to initiate a forced timeout. For <forcedTimeout>, substitute one of the following values:

**-START** —Starts the timer for forced timeout if a timer has not already been started. If a running timer exists, has no effect.

**-STOP** —Stops a running timer. If no running timer is found, has no effect.

**-RESET** —Restarts a running timer. If no running timer is found, starts a timer as if the START option had been used.

```
1 add tm trafficPolicy <polname> <rule> <actname>
2 <!--NeedCopy-->
```

For <polname>, substitute a name for your traffic policy. For <rule>, substitute a rule in NetScaler Advanced policy.

```
1 bind lb vserver <vservname> -policyName <name> -priority <number>
2 <!--NeedCopy-->
```

For <vservername>, substitute the name of the authentication, authorization, and auditing traffic management virtual server. For <priority>, substitute an integer that designates the policy's priority.

#### Example

```
1 add tm trafficAction act-owa2010timeout -forcedTimeout RESET -
 forcedTimeoutVal 10
2 add tm trafficPolicy pol-owa2010timeout true act-owa2010timeout
3 bind lb vserver vs-owa2010 -policyName pol-owa2010timeout -priority 10
4 <!--NeedCopy-->
```

## Rate Limiting for NetScaler Gateway

April 1, 2024

The rate limiting feature for NetScaler Gateway enables you to define the maximum load for a given network entity or virtual entity on the NetScaler Gateway appliance. Since the NetScaler Gateway appliance consumes all the unauthenticated traffic, the appliance is often exposed to process requests at a high rate. The rate limiting feature enables you to configure the NetScaler Gateway appliance to monitor the rate of traffic associated with an entity and take preventive action, in real time, based on the traffic. For more information about how rate limiting works in a NetScaler appliance, see [Rate limiting](#).

NetScaler has the rate limiting feature that provides protection to back-end servers for an unforeseen rate. Since the feature for NetScaler did not serve the unauthenticated traffic that NetScaler Gateway handles, NetScaler Gateway needed its own rate limiting functionality. This is needed to check an unforeseen rate of requests from various sources the NetScaler Gateway appliance is exposed to. For example, unauthenticated/login/control requests and certain APIs exposed for end user or device validations.

### Common use-cases for Rate limiting

- Limit the number of requests per second from a URL.
- Drop a connection based on cookies received in request from a particular host if the request exceeds the rate limit.
- Limit the number of HTTP requests that arrive from the same host (with a particular subnet mask) and that have the same destination IP address.

## Configure Rate Limiting for NetScaler Gateway

### Prerequisites

A configured authentication virtual server.

### Points to note

- In the configuration steps, a sample limit identifier is configured. The same can be configured with all the supported parameters like stream selector, mode. For an exhaustive description of the rate limiting capabilities, see [Rate limiting](#).
- The policy can also be bound to a VPN virtual server as follows. You need a configured VPN virtual server to bind the policies using the following command.

```
1 bind vpn vserver -policy denylogin -pri 1 -type aaa_request
2 <!--NeedCopy-->
```

- AAA\_REQUEST is a newly introduced bindpoint for responder policies. The policies configured at this bind point are applied to all the incoming request at the specified virtual server. The policies are processed for the unauthenticated/control traffic first before any other processing.
- Binding the policy to the NetScaler Gateway virtual server enables rate limiting at the AAA\_REQUEST bindpoint for all the traffic consumed by NetScaler Gateway including unauthenticated requests.
- Binding the policy to an authentication virtual server rate limits the unauthenticated/control requests hitting the authentication virtual server.

**To configure rate limiting by using the command line interface, at the command prompt, type the following commands:**

```
1 add limitIdentifier <limitIdentifier name> -threshold <positive_integer>
 > -timeslice <positive_integer> -mode <mode type>
2 <!--NeedCopy-->
```

Example:

```
1 add limitIdentifier limit_one_login -threshold 10 -timeslice 4294967290
 -mode REQUEST_RATE
2 <!--NeedCopy-->
```

```
1 add responderaction denylogin respondwith ' " HTTP/1.1 200 OK\r\n\r\n "
 + " Request is denied due to unusual rate " '
2 <!--NeedCopy-->
```

```
1 add responder policy denylogin 'sys.check_limit("limit_one_login")'
 denylogin
2 <!--NeedCopy-->
```

```
1 bind authentication vserver <vserver name> -policy denylogin -pri 1 -
 type aaa_request
2 <!--NeedCopy-->
```

Example:

```
1 bind authentication vserver authvserver -policy denylogin -pri 1 -
 type aaa_request
2 <!--NeedCopy-->
```

### Parameter description

- **limitIdentifier** - Name for a rate limit identifier. Must begin with an ASCII letter or underscore (\_) character, and must consist only of ASCII alphanumeric or underscore characters. Reserved words must not be used. This is a mandatory argument. Maximum Length: 31
- **threshold** - A maximum number of requests that are allowed in the given timeslice when requests (mode is set as REQUEST\_RATE) are tracked per timeslice. When connections (mode is set as CONNECTION) are tracked, it is the total number of connections that would be let through. Default value: 1 Minimum value: 1 Maximum Value: 4294967295
- **timeSlice** - Time interval, in milliseconds, specified in multiples of 10, during which requests are tracked to check if they cross the threshold. The argument is needed only when the mode is set to REQUEST\_RATE. Default value: 1000 Minimum value: 10 Maximum Value: 4294967295
- **mode** - Defines the type of traffic to be tracked.
  - REQUEST\_RATE - Tracks requests/timeslice.
  - CONNECTION - Tracks active transactions.

### To configure Rate Limiting using the NetScaler GUI:

1. Navigate to **AppExpert > Rate Limiting > Limit Identifiers**, click **Add** and specify the relevant details as specified in the CLI section.

## ← Create Limit Identifier

|                          |                                                       |                                                                                       |
|--------------------------|-------------------------------------------------------|---------------------------------------------------------------------------------------|
| Name*                    | <input type="text" value="Gateway_limit_identifier"/> | <span>i</span>                                                                        |
| Selector                 | <input type="text" value="Top_CLIENTS"/>              | <input type="button" value="Add"/> <input type="button" value="Edit"/> <span>i</span> |
| Mode*                    | <input type="text" value="REQUEST_RATE"/>             |                                                                                       |
| Limit Type*              | <input type="text" value="BURSTY"/>                   |                                                                                       |
| Threshold                | <input type="text" value="1"/>                        |                                                                                       |
| Time Slice (msec)        | <input type="text" value="1000"/>                     |                                                                                       |
| Maximum Bandwidth (Kbps) | <input type="text" value="0"/>                        |                                                                                       |
| Traps                    | <input type="text" value="0"/>                        |                                                                                       |

2. Navigate to **AppExpert>Responder>Policies**. On the **Responder Policies** page, click **Add**.
3. On the **Create Responder Policy** page, create a responder policy with a responder action which has the limit identifier.
4. To create a responder action, Click **Add** next to **Action**.
5. On the **Create Responder Action** page, enter a name for responder action.
6. Select the type as **Respond with** from the drop-down menu.
7. In the Expression editor, configure the response message. For example, `"HTTP/1.1 200 OK \r\n\r\n"+ "Request is denied due to unusual rate"`.
8. Click **Create**.
9. To create a responder policy, on the **Create Responder Policy** page, enter a name for the responder policy.
10. In the Expression editor, configure the condition for the responder policy. For example, `'sys.check_limit("limit_one_login")'`.
11. Click **Create**.
12. Bind the responder policy to the authentication virtual server.

- Go to **Security>AAA-Application Traffic>Virtual server**.
- Select the virtual server.
- Add a policy.
- Choose the responder policy that you want to bind to the server, set the priority.
- Choose the type as **AAA-REQUEST** and click **Continue**.

**Note:**

You can also enable rate limiting at the AAA\_REQUEST bind point for the VPN virtual server.

## Configuration for the common use cases for applying rate limiting to NetScaler Gateway

The following are the examples of commands to configure common use cases.

- Limit the number of requests per second from a URL.

```

1 add stream selector ipStreamSelector http.req.url "client.ip.src
 "
2
3 add ns limitIdentifier ipLimitIdentifier -threshold 4 -
 timeslice 1000 -mode request_rate -limitType smooth -
 selectorName ip StreamSelector
4
5 add responder policy ipLimitResponderPolicy "http.req.url.
 contains(\ "myasp.asp\ ") && sys.check_limit(\ "
 ipLimitIdentifier\ ") " myWebSiteRedirectAction
6
7 bind authentication virtual server authvserver -policy denylogin
 -pri 1 -type aaa_request
8 <!--NeedCopy-->

```

- Drop a connection based on cookies received in request from `www.yourcompany.com` if the request exceeds the rate limit.

```

1 add stream selector cacheStreamSelector "http.req.cookie.value(\
 "mycookie\ ") " "client.ip.src.subnet(24) "
2
3 add ns limitIdentifier myLimitIdentifier -Threshold 2 -
 timeSlice 3000 -selectorName reqCookieStreamSelector
4
5 add responder action sendRedirectURL redirect `http://www.
 mycompany.com\ "` + http.req.url'
6
7 add responder policy rateLimitCookiePolicy
8
9 "http.req.url.contains(\www.yourcompany.com\) && sys.check_limit
 (\ "myLimitIdentifier\ ") " sendRedirectUrl
10

```

```
11 <!--NeedCopy-->
```

- Limit the number of HTTP requests that arrive from the same host (with a subnet mask of 32) and that have the same destination IP address.

```
1 add stream selector ipv6_sel " CLIENT.IPv6.src.subnet(32) " CLIENT
 .IPv6.dst
2
3 add ns limitIdentifier ipv6_id -imeSlice 20000 -selectorName
 ipv6_sel
4
5 add lb vserver ipv6_vip HTTP 3ffe:: 209 80 -persistenceType NONE
 -cltTime
6
7 add responder action redirect_page redirect "\ " `http://
 redirectpage.com/\ " "`
8
9 add responder policy ipv6_resp_pol " SYS.CHECK_LIMIT(\ " ipv6_id\
)" " redirect_page
10
11 bind responder global ipv6_resp_pol 5 END -type DEFAULT
12 <!--NeedCopy-->
```

### Bind responder policy for authentication, authorization, and auditing endpoints

To allow the packet engine to handle the requests, bind the responder policy to the authentication virtual server or the VPN virtual server by using the `AAA_REQUEST` bindpoint.

- **Example for VPN virtual server:** `bind vpn vserver vpnVs -policy resp_pol -priority 6 -type AAA_REQUEST`
- **Example for authentication virtual server:** `bind authentication vserver av_vs -policy resp_pol -priority 6 -type AAA_REQUEST`

To allow the Apache HTTP server to handle the requests, bind the responder policy to the authentication virtual server or the VPN virtual server by using the `REQUEST` bindpoint.

For example,

- **Example for VPN virtual server:** `bind vpn vserver vpnVs -policy resp_pol -priority 6 -type REQUEST`
- **Example for authentication virtual server:** `bind authentication vserver av_vs -policy resp_pol -priority 6 -type REQUEST`

For details about binding responder policies, see [Bind a responder policy](#).

## Authorizing user access to application resources

November 15, 2022

You can control the resources that an authenticated user can access within an application.

To do this, associate an authorization policy to each of the users, either individually or by associating the policy to a group of users. The authorization policy must specify the following:

- **Rule.** The resource to which access must be authorized. This can be specified by using basic or advanced expressions.
- **Action.** Whether access to the resource must be allowed or denied.

By default, access to all resources within an application is **DENIED** to all users. However, you can change this default authorization action to **ALLOW** access to all users (by setting the session parameters in session profile or by setting the global session parameters).

### Warning

For optimum security, Citrix recommends that you do not to change the default authorization action from DENY to ALLOW. Instead, it is advised to create specific authorization policies for users who need access to specific resources.

### To configure authorization by using the CLI

1. Configure the authorization policy.

```
ns-cli-prompt> add authorization policy <name> <rule> <action>
```

2. Associate the policy with the appropriate user or group.

- Bind the policy to a specific user.

```
ns-cli-prompt> bind aaa user <username> -policy <policyname>
```

- Bind the policy to a specific group.

```
ns-cli-prompt> bind aaa group <groupName> -policy <policyname>
```

### To configure authorization by using the GUI (Configuration tab)

1. Create the authorization policy.

Navigate to **Security > AAA - Application Traffic > Policies > Authorization**, click **Add** and then define the policy as required.

2. Associate the policy with the appropriate user or group.

Navigate to **Security > AAA - Application Traffic > Users** or **Groups**, and edit the relevant user or group to associate it with the authorization policy.

### Sample authorization configurations

Here are some example configurations to authorize user access to some application resources. Note that these are CLI commands. You can do similar configurations using the GUI, although you must not enclose the expression within quotes (“”).

```
1 add authorization policy authzpol1 "HTTP.REQ.URL.SUFFIX.EQ(\"gif
 \")" ALLOW
2 <!--NeedCopy-->
```

```
1 bind aaa user user1 -policy authzpol1
2 <!--NeedCopy-->
```

```
1 add authorization policy authzpol2 "HTTP.REQ.URL.SUFFIX.EQ(\"png
 \")" DENY
2 <!--NeedCopy-->
```

```
1 bind aaa group group1 -policy authzpol2
2 <!--NeedCopy-->
```

## Audit authenticated sessions

May 2, 2023

You can configure the NetScaler appliance to keep a log of all the events that are triggered in an authenticated session. Using this information, you can audit state and status information, to see the history for users in chronological order.

To do this, define an audit policy that specifies the following:

- **Log type.** The logs can be stored remotely (syslog) or locally on the NetScaler appliance (nslog).
- **Rule.** The conditions on which the logs are stored.
- **Action.** Details of the log server and other details for creating the log entries.

This audit policy can be configured at different levels: user-level, group-level, authentication, authorization, and auditing virtual server, and global system level. The policies configured at the user-level have the highest priority.

**Note**

This topic details steps for using syslog. Make necessary changes to use nslog.

**To configure syslog auditing by using the CLI**

1. Configure the audit server with the relevant log settings.

```
ns-cli-prompt> add audit syslogAction <name> <serverIP> ...
```

2. Configure the audit policy by associating the audit server.

```
ns-cli-prompt> add audit syslogPolicy <name> <rule> <action>
```

3. Associate the audit policy with one of the following entities:

- Bind the policy to a specific user.

```
ns-cli-prompt> bind aaa user <userName>-policy <policyname> ...
```

- Bind the policy to a specific group.

```
ns-cli-prompt> bind aaa group <groupName>-policy <policyname> ...
```

- Bind the policy to a authentication, authorization, and auditing virtual server.

```
ns-cli-prompt> bind authentication vserver <name> -policy <policyname> ...
```

- Bind the policy globally to the NetScaler appliance.

```
ns-cli-prompt> bind tm global -policyName <policyname> ...
```

**To configure syslog auditing by using the GUI (Configuration tab)**

1. Configure the audit server and policy.

Navigate to **Security > AAA - Application Traffic > Policies > Auditing > Syslog**, and configure the server and the policy in the relevant tabs.

2. Associate the policy with one of the following:

- Bind the policy to a specific user.

Navigate to **Security > AAA - Application Traffic > Users**, and associate the authorization policy with the relevant user.

- Bind the policy to a specific group.

Navigate to **Security > AAA - Application Traffic > Groups**, and associate the authorization policy with the relevant group.

- Bind the policy to a authentication, authorization, and auditing virtual server.  
Navigate to **Security > AAA - Application Traffic > Virtual Servers**, and associate the authorization policy with the relevant virtual server.
- Bind the policy globally to the NetScaler appliance.  
Navigate to **Security > AAA - Application Traffic > Policies > Auditing > Syslog or Nslog**, select the authorization policy, and click **Action > Global Bindings** to bind the policy globally.

## NetScaler as an Active Directory Federation Services proxy

May 2, 2023

Active Directory Federation Services (ADFS) is a Microsoft service that enables single sign-on (SSO) experience for Active Directory-authenticated clients to resources outside the enterprise data center. An ADFS server farm allows internal users to access external cloud-hosted services. But the moment external users are brought into the mix, the external users must be given a way to connect remotely and access cloud-based services through federated identity. Most enterprises do not prefer keeping the ADFS server exposed in the DMZ. Therefore, ADFS proxy plays a critical role in remote user connectivity and application access.

For more than a decade, NetScaler appliance is playing similar roles of remote user connectivity, and application access. NetScaler appliance becomes the preferred solution to be used as ADFS proxy for supporting a new ADFS implementation to enable the following services:

- Secure connectivity.
- Authentication and handling of federated identity.

For more information about NetScaler as a SAML IdP, see [NetScaler as a SAML IdP](#).

### Advantages of ADFS proxy

- Reduces the footprint in DMZ to cater the need for most of the enterprises.
- Provides an SSO experience for end users.
- Supports rich methods for pre-authentication and enables multifactor authentication.
- Supports both active and passive clients.

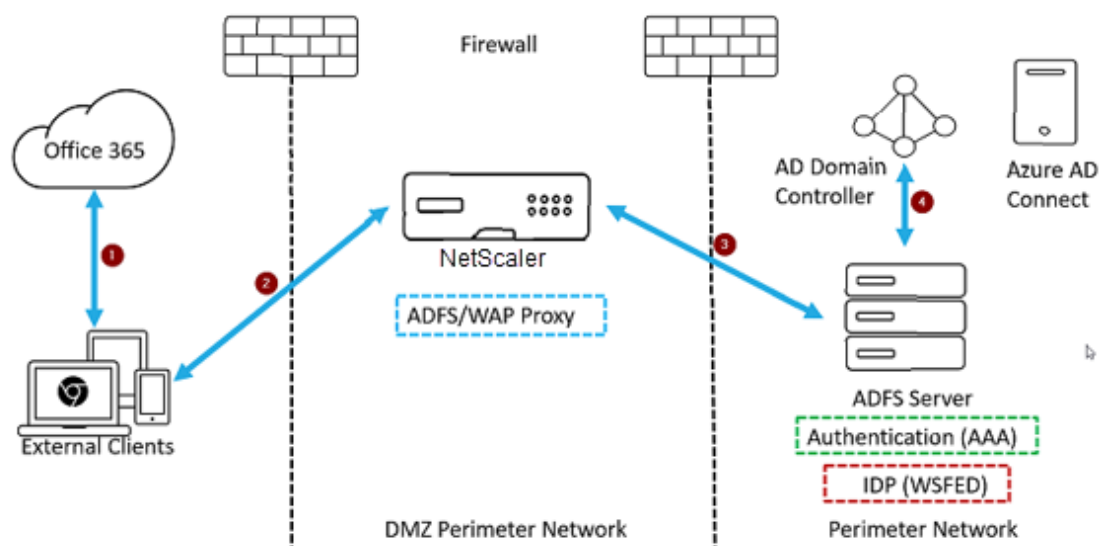

## Prerequisites for using NetScaler as ADFS proxy

Before you configure the NetScaler appliance as an ADFS proxy, make sure that the following prerequisites are met:

- A NetScaler appliance with 12.1 build or later.
- Domain ADFS server.
- Domain SSL certificate.
- Virtual IP for Content Switching virtual server.
- Enable Load Balancing, SSL Offload, Content Switching, Rewrite, and authentication, authorization, and auditing traffic management features on NetScaler appliance.

## Configure NetScaler appliance as ADFS proxy

To achieve this use case, configure NetScaler as an ADFS proxy in a DMZ zone. The ADFS server is configured along with the AD domain controller in the back-end.

1. A client request to access Microsoft Office365 gets redirected to NetScaler deployed as ADFS proxy.
2. User's credentials are passed to the ADFS server.
3. ADFS server authenticates the credentials with on-premises AD of the domain.
4. ADFS server upon successful validation of credentials with AD, generates a token which is passed to Microsoft Office365 for session establishment.

The following are the high-level steps involved in configuring NetScaler appliance before you configure as ADFS proxy.

At the NetScaler command prompt, type the following commands:

1. Create an SSL profile for the back-end and enable SNI in the SSL profile. Disable SSLv3/TLS1.

```
add ssl profile <new SSL profile> -sslprofileType backEnd -
sniEnable ENABLED -ssl3 DISABLED -tls1 DISABLED -commonName <
FQDN of ADFS>
```

2. Disable SSLv3/TLS1 for the service.

```
set ssl service <adfs service name> -sslProfile <SSL profile
created in the above step>
```

3. Enable SNI extension for back-end server handshakes.

- set vpn parameter -backendServerSni ENABLED
- set ssl parameter -denySSLReneg NONSECURE

### Configure NetScaler appliance as ADFS proxy using the CLI

The following sections are categorized based on the requirement to complete the configuration steps.

#### To configure ADFS service

1. Configure ADFS service on NetScaler for ADFS server.

```
add service <Domain_ADFS_Service> <ADFS Server IP> SSL 443 -gslb
NONE -maxClient 0 -maxReq 0 -cip DISABLED -usip NO -useproxyport
YES -sp OFF -cltTimeout 180 -svrTimeout 360 -CKA NO -TCPB NO -CMP
NO
```

#### Example

```
add service CTXTEST_ADFS_Service 1.1.1.1 SSL 443 -gslb NONE -maxClient 0 -maxReq 0 -cip
DISABLED -usip NO -useproxyport YES -sp OFF -cltTimeout 180 -svrTimeout 360 -CKA NO -TCPB
NO -CMP NO
```

2. Configure FQDN for content switching virtual server and enable SNI.

```
set ssl service <Domain_ADFS_Service> -SNIEnable ENABLED -commonName
<sts.domain.com>
```

#### Example

```
set ssl service CTXTEST_ADFS_Service -SNIEnable ENABLED -commonName sts.ctxtest.com
```

**To configure ADFS load balancing virtual server****Important**

Domain SSL certificate (SSL\_CERT) is required for secure traffic.

1. Configure ADFS load balancing virtual server.

```
add lb vserver <Domain_ADFS_LBVS> SSL <IP_address> -persistenceType
NONE -cltTimeout 180
```

**Example**

```
add lb vserver CTXTEST_ADFS_LBVS SSL 192.168.1.0 -persistenceType
NONE -cltTimeout 180
```

2. Bind ADFS load balancing virtual server to ADFS service.

```
bind lb vserver <Domain_ADFS_LBVS> <Domain_ADFS_Service>
```

**Example**

```
bind lb vserver CTXTEST_ADFS_LBVS CTXTEST_ADFS_Service
```

3. Bind an SSL virtual server certificate-key pair.

```
bind ssl vserver <Domain_ADFS_LBVS> -certkeyName <SSL_CERT>
```

**Example**

```
bind ssl vserver CTXTEST_ADFS_LBVS -certkeyName ctxtest_newcert_2019
```

**To configure content switching virtual server for domain****Note**

One free virtual IP (for example, 2.2.2.2), which is NATed to public IP is required for a content switching virtual server. It must be reachable for both external and internal traffic.

1. Create a content switching virtual server with free VIP.

```
add cs vserver <Domain_CSVS> SSL <FREE VIP> 443 -cltTimeout 180 -
persistenceType NONE
```

**Example**

```
add cs vserver CTXTEST_CSVS SSL 2.2.2.2 443 -cltTimeout 180 -
persistenceType NONE
```

2. Bind content switching virtual server to load balancing virtual server.

```
bind cs vserver <Domain_CSVS> -lbvserver <Domain_ADFS_LBVS>
```

**Example**

- `bind cs vserver CTXTEST_CSVS -lbvserver CTXTEST_ADFS_LBVS`
- `set ssl vserver CTXTEST_CSVS -sessReuse DISABLED`

3. Bind an SSL virtual server certificate-key pair.

```
bind ssl vserver <Domain_CSVS> -certkeyName <SSL_CERT>
```

**Example**

```
bind ssl vserver CTXTEST_CSVS -certkeyName ctxtest_newcert_2019
```

## Supported protocols

The Microsoft provided protocols plays a vital role in integrating with the NetScaler appliance. NetScaler as ADFS proxy supports the following protocols:

- **WS-Federation.** For details, see [Web Services Federation protocol](#).
- **ADFSPIP.** For details, see [Active Directory Federation Service Proxy Integration Protocol compliance](#).

**Note**

NetScaler appliance does not support device certificate authentication when deployed as an ADFS proxy.

## Web Services Federation protocol

May 2, 2023

Web Services Federation (WS-Federation) is an identity protocol that allows a Security Token Service (STS) in one trust domain to provide authentication information to an STS in another trust domain when there is a trust relationship between the two domains.

### Advantages of WS-Federation

WS-Federation supports both active and passive clients whereas SAML IdP supports only passive clients.

- Active clients are Microsoft native clients such as, Outlook, and Office clients (Word, PowerPoint, Excel, and OneNote).
- Passive clients are browser-based clients such as, Google Chrome, Mozilla Firefox, and Internet Explorer.

## Prerequisites for using NetScaler as WS-Federation

Before you configure the NetScaler appliance as the ADFS proxy, review the following:

- Active Directory.
- Domain SSL certificate.
- NetScaler SSL certificate and ADFS token signing certificate on ADFS server must be the same.

### Important

SAML IdP is now capable of handling the WS-Federation protocol. Therefore, to configure the WS-Federation IdP, you must actually configure the SAML IdP. You do not see any user interface explicitly mentioning WS-Federation.

## Features supported by NetScaler when configured as ADFS proxy and WS-Federation IdP

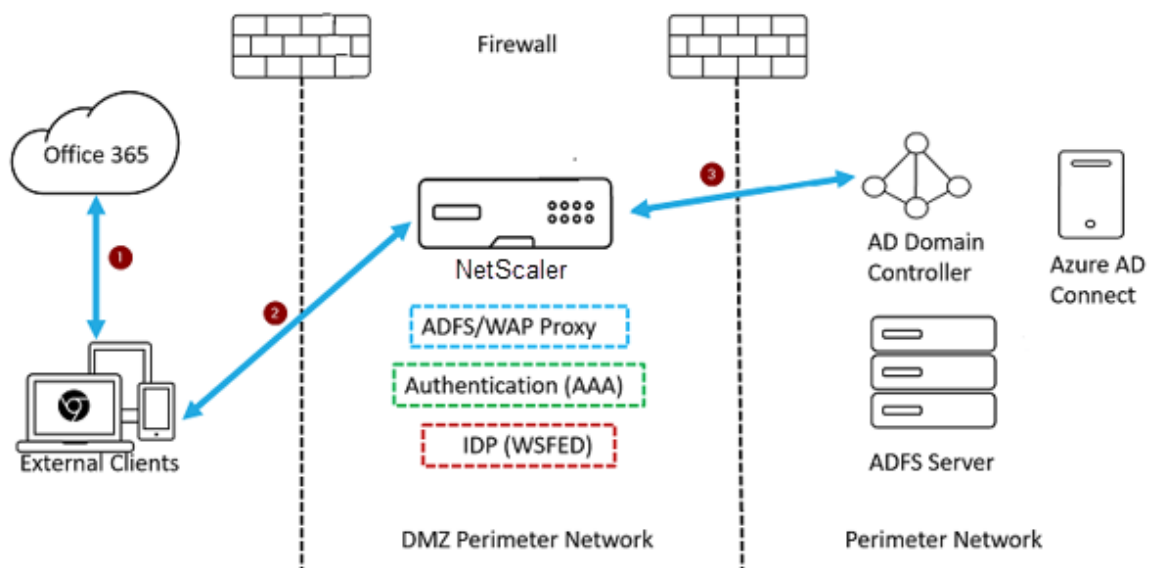

The following table lists the features supported by the NetScaler appliance when configured as an ADFS proxy and WS-Federation IdP.

| Features                                                            | Configure NetScaler appliance as ADFS |                                  |                      |
|---------------------------------------------------------------------|---------------------------------------|----------------------------------|----------------------|
|                                                                     | proxy                                 | NetScaler as WS-Federation IdP   | NetScaler as ADFSPIP |
| Load Balancing                                                      | Yes                                   | Yes                              | Yes                  |
| SSL Termination                                                     | Yes                                   | Yes                              | Yes                  |
| Rate Limiting                                                       | Yes                                   | Yes                              | Yes                  |
| Consolidation<br>(reduces DMZ server footprint and saves public IP) | Yes                                   | Yes                              | Yes                  |
| Web Application Firewall (WAF)                                      | Yes                                   | Yes                              | Yes                  |
| Authentication Offload to NetScaler appliance                       | Yes                                   | Yes (Active and Passive clients) | Yes                  |
| Single sign-on (SSO)                                                | Yes                                   | Yes (Active and Passive clients) | Yes                  |
| Multi-Factor (nFactor) authentication                               | No                                    | Yes (Active and Passive clients) | Yes                  |

| Features                         | Configure NetScaler appliance as ADFS proxy | NetScaler as WS-Federation IdP   | NetScaler as ADFSPIP |
|----------------------------------|---------------------------------------------|----------------------------------|----------------------|
| Azure multifactor authentication | No                                          | Yes (Active and Passive clients) | Yes                  |
| ADFS server farm can be avoided  | No                                          | Yes                              | Yes                  |

### Configure NetScaler appliance as WS-Federation IdP

Configure NetScaler as WS-Federation IdP (SAML IdP) in a DMZ zone. The ADFS server is configured along with the AD domain controller in the back-end.

1. The client request to Microsoft Office365 gets redirected to the NetScaler appliance.
2. The user enters the credentials for multifactor authentication.
3. NetScaler validates the credentials with AD and generates a token natively on the NetScaler appliance. The credentials are passed to Office365 for access.

**Note**

WS-Federation IdP support is done natively through the NetScaler appliance when compared to the F5 Networks load balancer.

## Configure NetScaler appliance as WS-Federation IdP (SAML IdP) using the CLI

The following sections are categorized based on the requirement to complete the configuration steps.

### To configure LDAP authentication and add policy

#### Important

For domain users, to log on to the NetScaler appliance by using their corporate email addresses, you must configure the following:

- Configure LDAP authentication server and policy on the NetScaler appliance.
- Bind it to your authentication, authorization, and auditing virtual IP address (use of an existing LDAP configuration is also supported).

```

1 add authentication ldapAction <Domain_LDAP_Action> -serverIP <Active
 Directory IP> -serverPort 636 -ldapBase "cn=Users,dc=domain,dc=com"
 -ldapBindDn "cn=administrator,cn=Users,dc=domain,dc=com" -
 ldapBindDnPassword <administrator password> -encrypted -
 encryptmethod ENCMTD_3 -ldapLoginName sAMAccountName -groupAttrName
 memberOf -subAttributeName cn -secType SSL -ssoNameAttribute
 UserPrincipalName -followReferrals ON -Attribute1 mail -Attribute2
 objectGUID
2
3 add authentication Policy <Domain_LDAP_Policy> -rule true -action <
 Domain_LDAP_Action>
4 <!--NeedCopy-->

```

#### Example

```

1 add authentication ldapAction CTXTEST_LDAP_Action -serverIP 3.3.3.3 -
 serverPort 636 -ldapBase "cn=Users,dc=ctxtest,dc=com" -ldapBindDn "
 cn=administrator,cn=Users,dc=ctxtest,dc=com" -ldapBindDnPassword
 xxxxxxxxxxxx -encrypted -encryptmethod ENCMTD_3 -ldapLoginName
 sAMAccountName -groupAttrName memberOf -subAttributeName cn -secType
 SSL -ssoNameAttribute UserPrincipalName -followReferrals ON -
 Attribute1 mail -Attribute2 objectGUID
2
3 add authentication Policy CTXTEST_LDAP_Policy -rule true -action
 CTXTEST_LDAP_Action
4 <!--NeedCopy-->

```

### To configure NetScaler as WS-Federation IdP or SAML IdP

Create WS-Federation IdP (SAML IdP) action and policy for token generation. Bind it to the authentication, authorization, and auditing virtual server later.

```

1 add authentication samlIdPProfile <Domain_SAMLIDP_Profile> -
 samlIdPCertName <SSL_CERT> -assertionConsumerServiceURL "https://
 login.microsoftonline.com/login.srf" -samlIssuerName <Issuer Name
 for Office 365 in ADFS Server> -rejectUnsignedRequests OFF -audience
 urn:federation:MicrosoftOnline -NameIDFormat persistent -NameIDExpr
 "HTTP.REQ.USER.ATTRIBUTE(2).B64ENCODE" -Attribute1 IDPEmail -
 Attribute1Expr "HTTP.REQ.USER.ATTRIBUTE(1)"
2
3 add authentication samlIdPPolicy <Domain_SAMLIDP_Policy> -rule "HTTP.
 REQ.HEADER(\"referer\").CONTAINS(\"microsoft\") || true" -action <
 Domain_SAMLIDP_Profile>
4 <!--NeedCopy-->

```

### Example

```

1 add authentication samlIdPProfile CTXTEST_SAMLIDP_Profile -
 samlIdPCertName ctxtest_newcert_2019 -assertionConsumerServiceURL "
 https://login.microsoftonline.com/login.srf" -samlIssuerName "http
 ://ctxtest.com/adfs/services/trust/" -rejectUnsignedRequests OFF -
 audience urn:federation:MicrosoftOnline -NameIDFormat persistent -
 NameIDExpr "HTTP.REQ.USER.ATTRIBUTE(2).B64ENCODE" -Attribute1
 IDPEmail -Attribute1Expr "HTTP.REQ.USER.ATTRIBUTE(1)"
2
3 add authentication samlIdPPolicy CTXTEST_SAMLIDP_Policy -rule "HTTP.REQ
 .HEADER(\"referer\").CONTAINS(\"microsoft\") || true" -action
 CTXTEST_SAMLIDP_Profile
4 <!--NeedCopy-->

```

### To configure an authentication, authorization, and auditing virtual server to authenticate the employees who log on to Office365 using corporate credentials

```

1 add authentication vserver <Domain_AAA_VS> SSL <IP_address>`
2 <!--NeedCopy-->

```

### Example

```

1 add authentication vserver CTXTEST_AAA_VS SSL 192.168.1.0
2
3 bind authentication vserver CTXTEST_AAA_VS -portaltheme RfWebUI
4 <!--NeedCopy-->

```

### To bind authentication virtual server and policy

```

1 bind authentication vserver <Domain_AAA_VS> -policy <
 Domain_SAMLIDP_Policy> -priority 100 -gotoPriorityExpression NEXT
2
3 bind authentication vserver <Domain_AAA_VS> -policy <Domain_LDAP_Policy
 > -priority 100 -gotoPriorityExpression NEXT

```

```
4 <!--NeedCopy-->
```

#### Example

```
1 bind authentication vserver CTXTEST_AAA_VS -policy
 CTXTEST_SAMLIDP_Policy -priority 100 -gotoPriorityExpression NEXT
2
3 bind authentication vserver CTXTEST_AAA_VS -policy CTXTEST_LDAP_Policy
 -priority 100 -gotoPriorityExpression NEXT
4
5 bind ssl vserver CTXTEST_AAA_VS -certkeyName ctxtest_newcert_2019
6 <!--NeedCopy-->
```

#### To configure content switching

```
1 add cs action <Domain_CS_Action> -targetVserver <Domain_AAA_VS>
2
3 add cs policy <Domain_CS_Policy> -rule "is_vpn_url || http.req.url.
 contains(\"/adfs/ls\") || http.req.url.contains(\"/adfs/services/
 trust\") || -action <Domain_CS_Action>
4 <!--NeedCopy-->
```

#### Example

```
1 add cs action CTXTEST_CS_Action -targetVserver CTXTEST_AAA_VS
2
3 add cs policy CTXTEST_CS_Policy -rule "is_vpn_url || http.req.url.
 contains(\"/adfs/ls\") || http.req.url.contains(\"/adfs/services/
 trust\") || -action CTXTEST_CS_Action
4 <!--NeedCopy-->
```

#### To bind content switching virtual server to policy

```
1 bind cs vserver CTXTEST_CS_VS -policyName CTXTEST_CS_Policy -priority
 100
2 <!--NeedCopy-->
```

## Active Directory Federation Service Proxy Integration Protocol compliance

December 15, 2023

If third-party proxies are to be used in place of the Web Application Proxy, they must support the MS-ADFSPIP protocol which specifies the ADFS and WAP integration rules. ADFSPIP integrates Active

Directory Federation Services with an authentication and application proxy to enable access to services located inside the boundaries of the corporate network for clients that are located outside of that boundary.

## Prerequisites

To successfully establish Trust between the proxy server and the ADFS farm, review the following configuration in the NetScaler appliance:

- Create an SSL profile for the back end and enable SNI in the SSL profile. Disable SSLv3/TLS1. At the command prompt, type the following command:

```
1 add ssl profile <new SSL profile> -sniEnable ENABLED -ssl3
 DISABLED -tls1 DISABLED -commonName <FQDN of ADFS>
2 <!--NeedCopy-->
```

- Disable SSLv3/TLS1 for the service. At the command prompt, type the following command:

```
1 set ssl profile <adfs service name> -sessReuse <ENABLED|DISABLED>
 -tls1 <ENABLED|DISABLED> -SNIEnable <ENABLED|DISABLED> -
 commonName <name> -denySSLReneg <YES|NO>
2 <!--NeedCopy-->
```

```
1 >**Important**
2 >
3 > For Home Realm Discovery (HRD) scenarios where authentication must be
 offloaded to the ADFS server, Citrix recommends you disable both
 authentication and SSO on the NetScaler appliance.
4
5 ## Authentication mechanism
6
7 The following are the high-level flow of events for the authentication.
8
9 1. **Establish Trust with ADFS server** – The NetScaler server
 establishes Trust with the ADFS server by registering a client
 certificate. Once the Trust is established, the NetScaler appliance
 re-establishes the trust after reboot without user intervention.
```

```
10
11 Upon certificate expiry, you must reestablish the trust by removing
12 and adding the ADFS proxy profile again.
13 1. **Published endpoints** - The NetScaler appliance automatically
14 fetches the list of published endpoints on the ADFS server post
15 trust establishment. These published endpoints filter the requests
16 forwarded to the ADFS server.
17 1. **Insert headers to client requests** - When the NetScaler
18 appliance tunnels client requests, the HTTP headers related to
19 ADFSPIP are added in the packet while sending them to the ADFS
20 server. You can implement access control at the ADFS server based on
21 these header values. The following headers are supported.
22 - X-MS-Proxy
23 - X-MS-Endpoint-Absolute-Path
24 - X-MS-Forwarded-Client-IP
25 - X-MS-Proxy
26 - X-MS-Target-Role
27 - X-MS-ADFS-Proxy-Client-IP
28 1. **Manage end-user traffic** - End-user traffic is routed securely
29 to the desired resources.
30 > **Notes:**
31 >
32 >- NetScaler uses form based authentication.
33 >
34 >- NetScaler does not support publishing of an application using
35 the Active Directory Federation Service Proxy Integration
36 Protocol compliance.
37
38 ## Configure NetScaler to support ADFS server
39
40 ### Prerequisites
41
42 - Configure Context Switching (CS) server as front-end with
43 authentication, authorization, and auditing server behind CS. At the
44 command prompt, type:
45
46 ```
47 add cs vserver cs_adfs_proxy SSL a.b.c.d 443 -cltTimeout 180 -
48 AuthenticationHost adfs.ns.com
49 <!--NeedCopy-->
```

```
1 ```
2 add cs action adfs_proxy_cs_act -targetVserver avs_adfs_proxy
3 <!--NeedCopy--> ```
4
5 ```
6 add cs policy adfs_proxy_policy -rule is_vpn_url -action
7 adfs_proxy_cs_act
```

```

7 <!--NeedCopy--> ```
8
9 ```
10 bind cs vserver cs_adfs_proxy -policyName adfs_proxy_policy -priority
 100
11 <!--NeedCopy--> ```
12
13 ```
14 bind cs vserver cs_adfs_proxy -lbvserver lb_adfs_proxy
15 <!--NeedCopy--> ```

```

- Add an ADFS service. At the command prompt, type:

```

1 add service adfs_service adfs_server SSL 443
2
3 set ssl service adfs_service -sslProfile
 ns_default_ssl_profile_backend
4
5 bind ssl service adfs_service -certkeyName adfs_trust_cert
6 <!--NeedCopy-->

```

```

1 set ssl profile ns_default_ssl_profile_backend -sessReuse ENABLED
 -tls1 DISABLED -SNIEnable ENABLED -commonName www.server.com
 -denySSLReneg NO
2 <!--NeedCopy-->

```

- Add a load balancing virtual server. At the command prompt, type:

```

1 add lb vserver lb_adfs_proxy SSL 0.0.0.0 0 -AuthenticationHost
 adfs.ns.com -Authentication ON -adfsProxyProfile
 adfs_proxy_profile
2 <!--NeedCopy-->

```

- Bind the ADFS traffic policy and the ADFS service to the load balancing virtual server. At the command prompt, type:

```

1 bind lb vserver lb_adfs_proxy adfs_service
2
3
4 bind lb vserver lb_adfs_proxy -policyName adfs_traffic_pol -
 priority 1 -type REQUEST
5 <!--NeedCopy-->

```

- Configure an SNIP address:

```

1 add ns ip p.q.r.s 255.255.255.0 -type SNIP
2 <!--NeedCopy-->

```

- Configure traffic actions and policies:

```

1 add tm trafficAction adfs_traffic_action -SSO ON -formSSOAction
 adfs_form_action

```

```

2
3 add tm formSSOAction adfs_form_action -actionURL "/adfs/ls" -
 userField UserName -passwdField Password -ssoSuccessRule "HTTP
 .RES.SET_COOKIE.EQ(\"MSISAuth\")" -nameValuePair AuthMethod=
 FormsAuthentication -submitMethod POST
4
5 add tm trafficAction adfs_traffic_action -SSO ON -formSSOAction
 adfs_form_action
6
7 add tm trafficPolicy adfs_traffic_pol "HTTP.REQ.URL.EQ(\"/adfs/ls
 /\")" adfs_traffic_action
8 <!--NeedCopy-->

```

### To configure NetScaler to work with ADFS server, you need to do the following:

1. Create an SSL CertKey profile key to use with ADFS proxy profile
2. Create an ADFS proxy profile
3. Associate the ADFS proxy profile to the load balancing virtual server

### Create an SSL certificate with private key to use with ADFS proxy profile by using the GUI

1. Navigate to **Traffic Management > SSL > Certificates > CA Certificates**.
2. In the details pane, click **Install**.  
In the **Install Certificate** dialog box, type the details, such as the certificate and key file name, and then select **Certificate Bundle**.
3. Click **Install**, and then click **Close**.

Install CA Certificate

Certificate-Key Pair Name\*  
aaa\_local

Certificate File Name\*  
Choose File | aaa\_local.cer

Notify When Expires

1 SNMP Trap destination found.

Notification Period  
30

Install Close

### Create an SSL certificate with private key to use with ADFS proxy profile by using the CLI

At the command prompt, type:

```

1 add ssl certKey aaa_local -cert aaa_local.cer -key aaa_local.key
2 <!--NeedCopy-->

```

**Note:** The Certificate file and the key file must be present in the NetScaler appliance.

### Create an ADFS proxy profile using the GUI

1. Navigate to **Configuration > Security > AAA-Application Traffic > adfsProxy Profile**.
2. Click **Add** on the **adfsProxy Profile** page.
3. On the **Create adfsProxy Profile** page, configure the following parameters:
  - Name: Assign a name to the ADFS proxy profile.
  - User name: This is the name of an account in the directory that would be used to authenticate the trust request from NetScaler acting as a proxy.
  - Password: This is the password of the account.
  - Server URL: FQDN of the ADFS server.
  - Cert Key Name: SSL certificate of the proxy that is registered at the ADFS server.
4. Click **Create**.

### Create an ADFS proxy profile using the CLI

At the command prompt, type:

```

1 add authentication adfsProxyProfile <profile name> -serverUrl <https://
 <server FQDN or IP address>/> -username <adfs admin user name> -
 password <password for admin user> -certKeyName <name of the CertKey
 profile created above>
2
3 add dns addRec adfs.server.com 10.106.30.151
4 <!--NeedCopy-->

```

Example,

```

1 add authentication adfsProxyProfile adfs_proxy_profile -userName test -
 password test -serverURL "https://adfs.server.com" -CertKeyName
 adfs_trust_cert

```

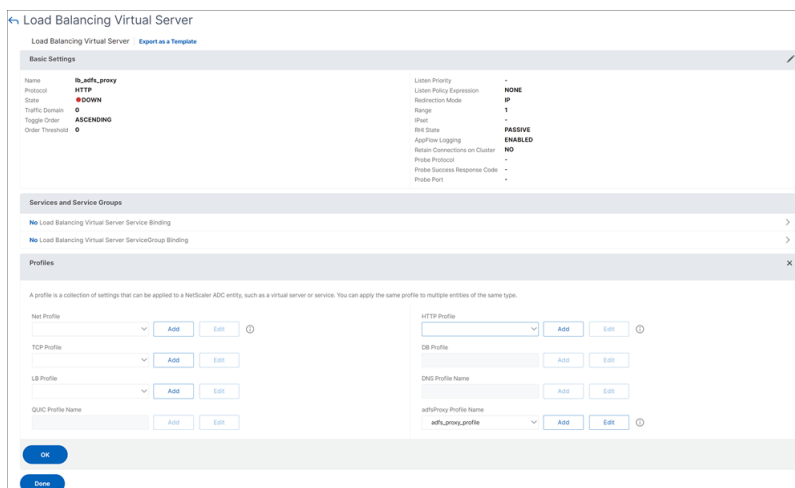

2 <!--NeedCopy-->

### Note:

The ADFS proxy and the ADFS server can establish trust only if the certificate is signed by the Certificate Authority of the ADFS server.

## Associate the ADFS proxy profile to the load balancing virtual server using the GUI

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**, and select an SSL virtual server.
2. Click **Edit**.
3. In **Advanced Settings**, click **Profiles**.
4. Select the ADFS profile created earlier.
5. Click **OK** and then click **Done**.

## Associate the ADFS proxy profile to the load balancing virtual server using the CLI

In the ADFS deployment, two virtual servers are used, one for the client traffic and the other one for metadata exchange. The ADFS proxy profile must be associated with the load balancing virtual server that is front-ending the ADFS server.

At the command prompt, type:

```
1 set ssl vserver lb_adfs_proxy -sslProfile
 ns_default_ssl_profile_frontend
2 <!--NeedCopy-->
```

## Trust renewal support for ADFSPIP

You can renew the trust of the existing certificates that are nearing to expiry or if the existing certificate is not valid. The trust renewal of certificates is done only when the trust is established between NetScaler appliance and ADFS server. To renew the trust of the certificate, you must provide the new certificate.

**Important:**

Manual intervention is required for trust renewal of new certificates.

The following example lists the steps involved in the certificate trust renewal:

1. The NetScaler appliance sends both old (SerializedTrustCertificate) and new (SerializedReplacementCertificate) certificates in POST request to the ADFS server for trust renewal.
2. The ADFS server responds with 200 OK success if trust is renewed successfully.
3. The NetScaler appliance updates the state as “ESTABLISHED\_RENEW\_SUCCESS” if the trust renewal is successful. If the trust renewal fails, the state is updated as “ESTABLISHED\_RENEW\_FAILED” and the NetScaler appliance keeps using the old certificate.

**Note:**

You cannot update the certificate key if it is already bound to an ADFS proxy profile.

### To configure the trust renewal of certificates by using the CLI

At the command prompt, type:

```
1 add ssl certKey <name> -cert <certificate file> -key <key file>
2 <!--NeedCopy-->
```

```
1 add authentication vserver <name> SSL <ipaddress> <port>
2 <!--NeedCopy-->
```

```
1 bind ssl vserver <virtual server name> -certkeyName <string>
2 <!--NeedCopy-->
```

Example:

```
1 add ssl certKey adfs_trust_cert -cert "client/client_rsa_2048.pem" -key
 "client/client_rsa_2048.ky"
2 <!--NeedCopy-->
```

**Note:**

The certificate must be issued by the Certificate Authority of the ADFS server.

```
1 add authentication vserver avs_adfs_proxy SSL 0.0.0.0
2 <!--NeedCopy-->
```

```
1 bind ssl vserver avs_adfs_proxy -certkeyName aaa_local
2 <!--NeedCopy-->
```

### Client certificate based authentication on ADFS server

Starting with Windows server 2016, Microsoft introduced a new way of authenticating users when ADFS is accessed through proxy servers. Now, end users can log in with their certificates thereby avoiding the use of a password.

End users often access ADFS through a proxy, especially when they are not in the premises. Therefore, ADFS proxy servers are required to support client certificate authentication through the ADFSPIP protocol.

When ADFS is load balanced using a NetScaler appliance, to support certificate-based authentication at the ADFS server, users need to log in to the NetScaler appliance using the certificate as well. This allows NetScaler to pass the user certificate to ADFS to provide SSO to the ADFS server.

The following diagram represents the client-certificate authentication flow.

### Client Certificate Authentication

## Configure SSO for ADFS server using client certificate

To configure SSO for the ADFS server using the client certificate, you must first configure the client certificate authentication on the NetScaler appliance. You must then bind the certificate authentication policy to the authentication, authorization, and auditing virtual server.

In addition, you must perform the following steps.

- An extra context switching virtual server with port 49443 must be configured and this context switching virtual server must point to the same load balancing virtual server which is open for all ports, which you have created earlier.
- The port 49443 must be opened on the NetScaler appliance for authentication.
- The context switching policy must be bound the same load balancing virtual server with port 443 open that you have created earlier.
- You must bind the same SSL service that you have created earlier to the load balancing virtual server.
- If you have already created an SSL profile for the back end, you must use that profile.

At the command prompt, type;

```
1 bind ssl vserver <name> -certkeyName <string>
2
3 bind ssl vserver <vServerName> -certkeyName <string>
4
5 add authentication Policy <policy name> -rule <expression> -action <
 action name>
6
7 bind authentication vserver <name> -policy <name of the policy> -
 priority <integer>
8 <!--NeedCopy-->
```

Example:

```
1 bind ssl vserver lb_adfs_proxy -certkeyName aaa_local
2
3 set ssl profile ns_default_ssl_profile_frontend -eRSA ENABLED -
 sessReuse ENABLED -denySSLReneg NONSECURE
4
5 bind ssl vserver cs_adfs_proxy -certkeyName aaa_local
6
7 add authentication Policy local_pol -rule true -action LOCAL
8
9 bind authentication vserver avs_adfs_proxy -policy local_pol -priority
 1
10
11 <!--NeedCopy-->
```

For information on configuring client certificate on the NetScaler appliance, see [Configure client certificate authentication using advanced policies](#).

## Use an on-premises NetScaler Gateway as the identity provider for Citrix Cloud

October 23, 2023

Citrix Cloud supports using an on-premises NetScaler Gateway as an identity provider to authenticate subscribers signing in to their workspaces.

By using NetScaler Gateway authentication, you can:

- Continue authenticating users through your existing NetScaler Gateway so they can access the resources in your on-premises Virtual Apps and Desktops deployment through Citrix Workspace.
- Use the NetScaler Gateway authentication, authorization, and auditing functions with Citrix Workspace.
- Provide your users access to the resources they need through Citrix Workspace using features such as pass-through authentication, smart cards, secure tokens, conditional access policies, federation.

NetScaler Gateway authentication is supported for use with the following product versions:

- NetScaler Gateway 13.0 41.20 Advanced edition or later
- NetScaler Gateway 12.1 54.13 Advanced edition or later

### Prerequisites

- Cloud Connectors - You need at least two servers on which to install the Citrix Cloud Connector software.
- Active Directory - Perform the necessary checks.
- NetScaler Gateway requirements
  - Use advanced policies on the on-premises gateway due to deprecation of classic policies.
  - When configuring the Gateway for authenticating subscribers to Citrix Workspace, the gateway acts as an OpenID Connect provider. Messages between Citrix Cloud and Gateway conform to the OIDC protocol, which involves digitally signing tokens. Therefore, you must configure a certificate for signing these tokens.

- Clock synchronization - The Gateway must be synchronized to NTP time.

For details, see [Prerequisites](#).

## Create an OAuth IdP policy on the on-premises NetScaler Gateway

### Important:

You must have generated the client ID, secret, and redirect URL in the **Citrix Cloud > Identity and Access Management > Authentication** tab. For details, see [Connect an on-premises NetScaler Gateway to Citrix Cloud](#).

### Creating an OAuth IdP authentication policy involves the following tasks:

1. Create an OAuth IdP profile.
2. Add an OAuth IdP policy.
3. Bind the OAuth IdP policy to an authentication virtual server.
4. Bind the certificate globally.

### Creating an OAuth IdP profile by using the CLI

At the command prompt, type;

```

1 add authentication OAuthIDPPProfile <name> [-clientID <string>][-
 clientSecret][-redirectURL <URL>][-issuer <string>][-audience <
 string>][-skewTime <mins>] [-defaultAuthenticationGroup <string>]
2
3 add authentication OAuthIdPPolicy <name> -rule <expression> [-action <
 string>] [-undefAction <string>] [-comment <string>][-logAction <
 string>]
4
5 add authentication ldapAction <name> -serverIP <IP> -ldapBase "dc=aaa,
 dc=local"
6
7 ldapBindDn <administrator@aaa.local> -ldapBindDnPassword <password> -
 ldapLoginName sAMAccountName
8
9 add authentication policy <name> -rule <expression> -action <string>
10
11 bind authentication vserver auth_vs -policy <ldap_policy_name> -
 priority <integer> -gotoPriorityExpression NEXT
12
13 bind authentication vserver auth_vs -policy <OAuthIDPPolicyName> -
 priority <integer> -gotoPriorityExpression END
14
15 bind vpn global -certkeyName <>
16 <!--NeedCopy-->

```

## Creating an OAuth IdP profile by using the GUI

1. Navigate to **Security > AAA –Application Traffic > Policies > Authentication > Advanced Policies > OAuth IDP**.
2. In the **OAuth IDP** page, select the **Profiles** tab and click **Add**.
3. Configure the OAuth IdP profile.

### Note:

- Copy and paste the client ID, secret, and Redirect URL values from the **Citrix Cloud > Identity and Access Management > Authentication** tab to establish the connection to Citrix Cloud.
- Enter the Gateway URL correctly in the **Issuer Name** Example: <https://GatewayFQDN.com>
- Also copy and paste the client ID in the **Audience** field as well.
- **Send Password:** Enable this option for single sign-on support. This option is disabled by default.

4. On the **Create Authentication OAuth IDP Profile** screen, set values for the following parameters and click **Create**.

- **Name:** Name of the authentication profile. Must begin with a letter, number, or the underscore character (\_). Name must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the profile is created.
- **Client ID:** Unique string that identifies SP. Authorization server infers client configuration using this ID. Maximum Length: 127.
- **Client Secret:** Secret string established by user and authorization server. Maximum Length: 239.
- **Redirect URL:** Endpoint on SP to which code/token has to be posted.
- **Issuer Name:** Identity of the server whose tokens are to be accepted. Maximum Length: 127. Example: <https://GatewayFQDN.com>
- **Audience:** Target recipient for the token sent by IdP. This token is checked by the recipient.
- **Skew Time:** This option specifies the allowed clock skew (in minutes) that NetScaler allows on an incoming token. For example, if skewTime is 10, then the token would be valid from (current time - 10) min to (current time + 10) min, that is 20 min in all. Default value: 5.
- **Default Authentication Group:** A group added to the session internal group list when this profile is chosen by IdP which can be used in nFactor flow. It can be used in the expression

(AAA.USER.IS\_MEMBER\_OF("xxx")) for authentication policies to identify relying party related nFactor flow. Maximum Length: 63

A group is added to the session for this profile to simplify policy evaluation and help in customizing policies. This group is the default group that is chosen when the authentication succeeds in addition to the extracted groups.

- **Relying Party Metadata URL:** Endpoint at which the NetScaler IdP can get details about the relying party being configured. The metadata response must include endpoints for the `jwtks_uri` for RP public keys. Maximum length is 255.
- **Refresh Interval:** The interval at which the relying party metadata is refreshed. The default interval is 50.
- **Encrypt Token:** When you select this option, the token sent by NetScaler is encrypted.
- **Signature Service:** Name of the cloud service that is used to sign the data. This is applicable only if the signature is offloaded to cloud.
- **Attributes:** Name-Value pairs of the attributes to be inserted in the ID token. Maximum length is 1047 characters.
- **Send Password:** Select this option to send the encrypted password in the ID token.

5. Click **Policies** and click **Add**.

6. On the **Create Authentication OAuth IDP Policy** screen, set values for the following parameters and click **Create**.

- **Name** –The name of the authentication policy.
- **Action** –Name of profile created earlier.
- **Log Action** –Name of the message log action to use when a request matches this policy. Not a mandatory field.
- **Undefined-Result Action** –Action to perform if the result of policy evaluation is undefined(UNDEF). Not a mandatory field.
- **Expression** –Default syntax expression that the policy uses to respond to specific request. For example, true.
- **Comments** –Any comments about the policy.

**Note:**

When **sendPassword** is set to ON (OFF by default), user credentials are encrypted and passed through a secure channel to Citrix Cloud. Passing user credentials through a secure channel allows you to enable SSO to Citrix Virtual Apps and Desktops upon launch.

**Binding the OAuthIDP policy and LDAP policy to the authentication virtual server**

1. Navigate to **Configuration > Security > AAA-Application Traffic > Policies > Authentication > Advanced Policies > Actions > LDAP**.
2. On **LDAP Actions** screen, click **Add**.
3. On the **Create Authentication LDAP Server** screen, set the values for the following parameters, and click **Create**.
  - **Name** – The name of the LDAP action
  - **ServerName/ServerIP** – Provide FQDN or IP of the LDAP server
  - Choose appropriate values for **Security Type, Port, Server Type, Time-Out**
  - Make sure **Authentication** is checked
  - **Base DN** – Base from which to start LDAP search. For example, `dc=aaa,dc=local`.
  - **Administrator Bind DN:** User name of the bind to LDAP server. For example, `admin@aaa.local`.
  - **Administrator Password/Confirm Password: Password to bind LDAP**
  - Click **Test Connection** to test your settings.
  - **Server Logon Name Attribute:** Choose “**sAMAccountName**”
  - Other fields are not mandatory and hence can be configured as required.
4. Navigate to **Configuration > Security > AAA-Application Traffic > Policies > Authentication > Advanced Policies > Policy**.
5. On the **Authentication Policies** screen, click **Add**.
6. On the **Create Authentication Policy** page, set the values for the following parameters, and click **Create**.
  - **Name** – Name of the LDAP Authentication Policy.
  - **Action Type** – Choose **LDAP**.
  - **Action** – Choose the LDAP action.
  - **Expression** – Default syntax expression that the policy uses to respond to specific request. For example, `true**`.

**Store Authentication Context Class Reference values**

NetScaler configured as an on-premises IdP can store Authentication Context Class Reference (ACR) values provided by Citrix Workspace to support the multi-domain login feature of Citrix Workspace Platform (WSP).

When Citrix Workspace sends the ACR values to the OAuth authorization endpoint of the NetScaler IdP, NetScaler stores the ACR values. You can use these ACR values to determine the next factor in the nFactor flow.

The OAuth IdP authorization endpoint `/oauth/idp/login` receives a query with the ACR value parameter in the below format. NetScaler stores the ACR value in the user sessions attribute.

```
GET /oauth/idp/login?response_type=code&scope=openid%20profile%20
ctxs_cc&acr_values=device_id:69eec33333333333+wsp:wspmultiurlmain.
cloud.com&client_id=test&redirect_uri=https%3A%2F%2Fav6.aaa.local%2
Foauth%2Flogin&state=Y3R4PXlFYkpFdEJ0eDFLN0hUY2VCc1pB0Gc2RjU3d21PcjJ2aXprZkhFS
&code_challenge_method=S256&code_challenge=IJgD-qaJZdhuGt3m262BjjMXrFT0wioV6uS
-uIY18
```

In the above example, the ACR value parameter is `acr_values=device_id:69eec33333333333+wsp:wspmultiurlmain.cloud.com`.

Following are the expression examples of how you can use ACR values in an nFactor flow.

- To retrieve the WSP URL, use the expression `aaa.user.wsp.eq("URL")` in your policy configuration.

For example,

```
add authentication policy wsp_check -rule aaa.user.wsp.eq("
wspmultiurlmain.cloud.com ") -action ldap-act
```

- To retrieve the device ID from the ACR value parameter, use the expression `aaa.user.acr_values.value("device_id").eq(value)` in your policy configuration.

For example,

```
add authentication policy acr_value_check -rule aaa.user.acr_values
.value("device_id").eq("69eec33333333333") -action ldap-act
```

- To retrieve the WSP value from the ACR value parameter, use the expression `aaa.user.acr_values.value("wsp").eq("URL")` in your policy configuration.

For example,

```
add authentication policy acr_value_check -rule aaa.user.acr_values
.value("wsp").eq("wspmultiurlmain.cloud.com") -action ldap-act
```

## Support for active-active GSLB deployments on NetScaler Gateway

May 2, 2023

NetScaler Gateway configured as an Identity Provider (IdP) using the OIDC protocol can support active-active GSLB deployments.

For more information on configuring a GSLB setup, see [Example of a GSLB setup and configuration](#).

**Important:**

Active-active GSLB with NetScaler Gateway as an OAuth IdP is not supported for Citrix Cloud.

## **GSLB active-active support for multifactor authentication using connection proxy**

Starting from NetScaler release 13.1 build 12.x, support is added for GSLB active-active deployment for multifactor authentication using connection proxy. This support is applicable for NetScaler Gateway and NetScaler authentication, authorization, and auditing scenarios. Connection proxy is used to route requests to the correct GSLB sites once the authentication succeeds. For details on connection proxy persistence, see [Connection Proxy](#).

### **How it works**

The GSLB site persistence cookie is inserted in the authentication response. Using this cookie, the NetScaler or the NetScaler Gateway appliance identifies whether the request is for a local site or a remote site. The requests are then routed accordingly.

**Important:**

- Only GSLB active-active type deployment is supported.
- Parent-child topology is not supported.
- The persistence type in the GSLB deployment must be configured as “ConnectionProxy”.

## **Configuration support for SameSite cookie attribute**

October 23, 2023

The SameSite attribute indicates the browser whether the cookie can be used for cross-site context or only for same-site context. Also, if an application intends to be accessed in a cross-site context then it can do so only via the HTTPS connection. For details, see RFC6265.

Until Feb 2020, the SameSite attribute was not explicitly set in NetScaler. The browser took the default value (None). Not setting the SameSite attribute did not impact the NetScaler Gateway and authentication, authorization, and auditing deployments.

With certain browsers upgrade, such as Google Chrome 80, there is a change in the default cross-domain behavior of cookies. The SameSite attribute can be set to one of the following values. Default value for Google Chrome is set to Lax. For certain version of other browsers, the default value for the SameSite attribute might still be set to None.

- **None:** Indicates the browser to use a cookie in cross-site context only on secure connections.
- **Lax:** Indicates the browser to use a cookie for requests on the same domain and for cross-sites. For cross-site, only safe HTTP methods like GET request can use the cookie. For example, a GET request of a one subdomain abc.example.com can read the cookie of another subdomain xyz.example.com using a GET. For cross site, only safe HTTP methods are used because Safe HTTP methods do not alter the server state. For more details, see <https://developer.mozilla.org/en-US/docs/Web/HTTP/Headers/Set-Cookie/SameSite#lax>
- **Strict:** Use the cookie only in the same site context.

If there is no SameSite attribute in the cookie, the Google Chrome assumes the functionality of SameSite = Lax.

As a result, for deployments within an iframe with cross-site context that require cookies to be inserted by the browser, Google Chrome does not share cross-site cookies. As a result, the iframe within the website might not load.

## Configure SameSite cookie attribute

A new cookie attribute named SameSite is added to the VPN and authentication, authorization, and auditing virtual servers. This attribute can be set at the global level and at the virtual server level.

To configure the SameSite attribute, you must do the following:

1. Set the SameSite attribute for the virtual server
2. Bind cookies to the patset (if the browser drops cross-site cookies)

## Setting the SameSite attribute by using the CLI

To set the SameSite attribute at the virtual server level, use the following commands.

```
1 set vpn vserver VP1 -SameSite [STRICT | LAX | None]
2 set authentication vserver AV1 -SameSite [STRICT | LAX | None]
3 <!--NeedCopy-->
```

To set the SameSite attribute at the global level, use the following commands.

```
1 set aaa parameter -SameSite [STRICT | LAX | None]
2 set vpn parameter -SameSite [STRICT | LAX | None]
3 <!--NeedCopy-->
```

**Note:** The virtual server level setting takes preference over the global level setting. Citrix recommends setting the SameSite cookie attribute at the virtual server level.

## Binding cookies to the patset by using the CLI

If the browser drops cross-site cookies, you can bind that cookie string to the existing ns\_cookies\_SameSite patset so that the SameSite attribute is added to the cookie.

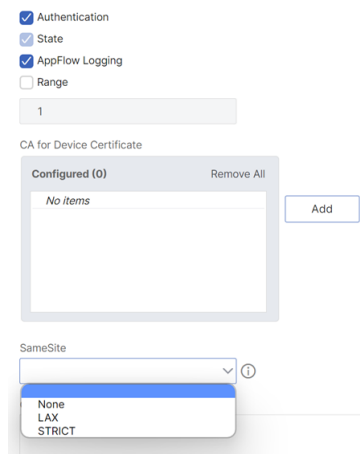

### Example:

```
1 bind patset ns_cookies_SameSite "NSC_TASS"
2 bind patset ns_cookies_SameSite "NSC_TMAS"
3 <!--NeedCopy-->
```

## Setting the SameSite attribute by using the GUI

### To set the SameSite attribute at the virtual server level:

1. Navigate to **Security > AAA –Application Traffic > Virtual Servers**.
2. Select a virtual server and click **Edit**.
3. Click the edit icon in the **Basic Settings** section and click **More**.
4. In **SameSite**, select the option as required.

### To set the SameSite attribute at the global level:

1. Navigate to **Security > AAA –Application Traffic > Change Authentication Settings**.

2. In the **Configure AAA Parameter** page, click the **SameSite** list, and select the option as required.

## Authentication, authorization, and auditing configuration for commonly used protocols

May 2, 2023

Configuring the NetScaler appliance for authentication, authorization, and auditing needs a specific setup on the NetScaler appliance and clients' browsers. The configuration varies with the protocol used for authentication, authorization, and auditing.

For more information about configuring the NetScaler appliance for Kerberos authentication, see [Handling Authentication, Authorization and Auditing with Kerberos/NTLM](#).

### Handling authentication, authorization and auditing with Kerberos/NTLM

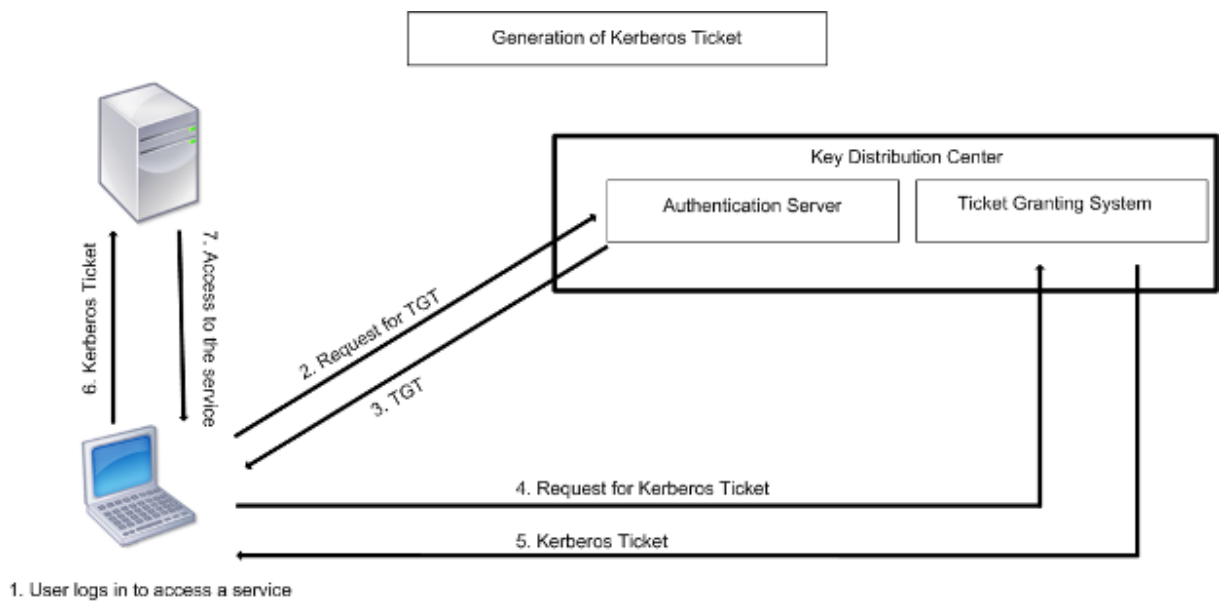

May 2, 2023

Kerberos, a computer network authentication protocol, provides secure communication over the Internet. Designed primarily for client-server applications, it provides for mutual authentication by which the client and server can each ensure the other's authenticity. Kerberos uses a trusted third party, referred to as Key Distribution Center (KDC). A KDC consists of an Authentication Server (AS), which authenticates a user, and a Ticket Granting Server (TGS).

Each entity on the network (client or server) has a secret key that is known only to itself and the KDC. The knowledge of this key implies authenticity of the entity. For communication between two entities on the network, the KDC generates a session key, referred to as the Kerberos ticket or service ticket. The client makes a request to the AS for credentials for a specific server. The client then receives a ticket, referred to as Ticket Granting Ticket (TGT). The client then contacts the TGS, using the TGT it received from the AS to prove its identity, and asks for a service. If the client is eligible for the service, the TGS issues a Kerberos ticket to the client. The client then contacts the server hosting the service (referred to as the service server), using the Kerberos ticket to prove that it is authorized to receive the service. The Kerberos ticket has a configurable lifetime. The client authenticates itself with the AS only once. If it contacts the physical server multiple times, it reuses the AS ticket.

The following figure shows the basic functioning of the Kerberos protocol.

Figure 1. **Functioning of Kerberos**

**Kerberos authentication has the following advantages:**

- Faster authentication. When a physical server gets a Kerberos ticket from a client, the server has enough information to authenticate the client directly. It does not have to contact a domain controller for client authentication, and therefore the authentication process is faster.
- Mutual authentication. When the KDC issues a Kerberos ticket to a client and the client uses the ticket to access a service, only authenticated servers can decrypt the Kerberos ticket. If the virtual server on the NetScaler appliance is able to decrypt the Kerberos ticket, you can conclude that both the virtual server and client are authenticated. Thus, the authentication of the server happens along with the authentication of the client.
- Single sign-on between Windows and other operating systems that support Kerberos.

**Kerberos authentication may have the following disadvantages:**

- Kerberos has strict time requirements; the clocks of the involved hosts must be synchronized with the Kerberos server clock to ensure that the authentication does not fail. You can mitigate this disadvantage by using the Network Time Protocol daemons to keep the host clocks synchronized. Kerberos tickets have an availability period, which you can configure.
- Kerberos needs the central server to be available continuously. When the Kerberos server is down, no one can log on. You can mitigate this risk by using multiple Kerberos servers and fallback authentication mechanisms.
- Because all the authentication is controlled by a centralized KDC, any compromise in this infrastructure, such as the user’s password for a local workstation being stolen, can allow an attacker to impersonate any user. You can mitigate this risk to some extent by using only a desktop machine or laptop that you trust, or by enforcing preauthentication by means of a hardware-token.

To use Kerberos authentication, you must configure it on the NetScaler appliance and on each

client.

## **Optimizing Kerberos authentication on authentication, authorization, and auditing**

The NetScaler appliance now optimizes and improves the system performance while Kerberos authentication. The authentication, authorization, and auditing daemon remembers the outstanding Kerberos request for the same user to avoid load on Key Distribution Center (KDC), which will avoid duplicate requests.

## **How NetScaler implements Kerberos for client authentication**

May 2, 2023

### **Important**

Kerberos/NTLM authentication is supported only in the NetScaler 9.3 nCore release or later, and it can be used only for authentication, authorization, and auditing traffic management virtual servers.

NetScaler handles the components involved in Kerberos authentication in the following way:

### **Key Distribution Center (KDC)**

In the Windows 2000 Server or later versions, the Domain Controller and KDC are part of the Windows Server. If the Windows Server is UP and running, it indicates that the Domain Controller and KDC are configured. The KDC is also the Active Directory server.

### **Note**

All Kerberos interactions are validated with the Windows Kerberos Domain Controller.

### **Authentication service and protocol negotiation**

A NetScaler appliance supports Kerberos authentication on the authentication, authorization, and auditing traffic management authentication virtual servers. If the Kerberos authentication fails, the NetScaler uses the NTLM authentication.

By default, Windows 2000 Server and later Windows Server versions use Kerberos for authentication, authorization, and auditing. If you create an authentication policy with NEGOTIATE as the authentication type, the NetScaler attempts to use the Kerberos protocol for authentication, authorization,

and auditing and if the client's browser fails to receive a Kerberos ticket, the NetScaler uses the NTLM authentication. This process is referred to as negotiation.

The client may fail to receive a Kerberos ticket in any of the following cases:

- Kerberos is not supported on the client.
- Kerberos is not enabled on the client.
- The client is in a domain other than that of the KDC.
- The Access Directory on the KDC is not accessible to the client.

For Kerberos/NTLM authentication, the NetScaler does not use the data that is present locally on the NetScaler appliance.

### **Authorization**

The traffic management virtual server can be a load balancing virtual server or a content switching virtual server.

### **Auditing**

The NetScaler appliance supports auditing of Kerberos authentication with the following audit logging:

- Complete audit trail of the traffic management end-user activity
- SYSLOG and high performance TCP logging
- Complete audit trail of system administrators
- All system events
- Scriptable log format

### **Supported Environment**

Kerberos authentication does not need any specific environment on the NetScaler. The client (browser) must provide support for Kerberos authentication.

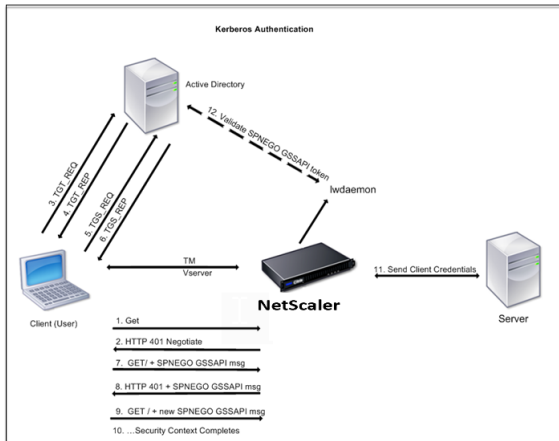

### **High Availability**

In a high availability setup, only the active NetScaler joins the domain. In case of a failover, the NetScaler lwagent daemon joins the secondary NetScaler appliance to the domain. No specific configuration is required for this functionality.

## Kerberos authentication process

The following figure shows a typical process for Kerberos authentication in the NetScaler environment.

Figure 1. Kerberos Authentication Process on NetScaler

The Kerberos authentication occurs in the following stages:

### Client authenticates itself to the KDC

1. The NetScaler appliance receives a request from a client.
2. The traffic management (load balancing or content switching) virtual server on the NetScaler appliance sends a challenge to the client.
3. To respond to the challenge, the client gets a Kerberos ticket.
  - The client sends the Authentication Server of the KDC a request for a ticket-granting ticket (TGT) and receives the TGT. (See 3, 4 in the figure, Kerberos Authentication Process.)
  - The client sends the TGT to the Ticket Granting Server of the KDC and receives a Kerberos ticket. (See 5, 6 in the figure, Kerberos Authentication Process.)

#### Note

The above authentication process is not necessary if the client already has a Kerberos ticket whose lifetime has not expired. In addition, clients such as Web Services, .NET, or J2EE, which support SPNEGO, get a Kerberos ticket for the target server, create an SPNEGO token, and insert the token in the HTTP header when they send an HTTP request. They do not go through the client authentication process.

### Client requests a service.

1. The client sends the Kerberos ticket containing the SPNEGO token and the HTTP request to the traffic management virtual server on the NetScaler. The SPNEGO token has the necessary GSSAPI data.
2. The NetScaler appliance establishes a security context between the client and the NetScaler. If the NetScaler cannot accept the data provided in the Kerberos ticket, the client is asked to get a different ticket. This cycle repeats till the GSSAPI data is acceptable and the security context is established. The traffic management virtual server on the NetScaler acts as an HTTP proxy between the client and the physical server.

#### **NetScaler appliance completes the authentication.**

1. After the security context is complete, the traffic management virtual server validates the SPNEGO token.
2. From the valid SPNEGO token, the virtual server extracts the user ID and GSS credentials, and passes them to the authentication daemon.
3. A successful authentication completes the Kerberos authentication.

## **Configuring kerberos authentication on the NetScaler appliance**

May 5, 2023

This topic provides the detailed steps to configure Kerberos authentication on the NetScaler appliance by using the CLI and the GUI.

### **Configuring Kerberos authentication on the CLI**

1. Enable the authentication, authorization, and auditing feature to ensure the authentication of traffic on the appliance.

```
ns-cli-prompt> enable ns feature AAA
```

2. Add the keytab file to the NetScaler appliance. A keytab file is necessary for decrypting the secret received from the client during Kerberos authentication. A single keytab file contains authentication details for all the services that are bound to the traffic management virtual server on the NetScaler appliance.

First generate the keytab file on the Active Directory server and then transfer it to the NetScaler appliance.

- Log on to the Active Directory server and add a user for Kerberos authentication using the following command.

```
1 net user <username> <password> /add
```

**Note**

In the **User Properties** section, ensure that the “Change password at next logon option” is not selected and the “Password does not expire” option is selected.

- Map the HTTP service to the above user and export the keytab file. For example, run the following command on the Active Directory server:

```
1 ktpass /out keytabfile /princ HTTP/owa.newacp.com@NEWACP.COM
 /pass <user password> /mapuser newacp\\dummy /ptype KRB5\
 _NT\ _PRINCIPAL
```

**Note**

You can map more than one service if authentication is required for more than one service. If you want to map more services, repeat the above command for every service. You can give the same name or different names for the output file.

- Transfer the keytab file to the NetScaler appliance by using the unix **ftp** command or any other file transfer utility of your choice. Upload the keytab file to the /nsconfig/krb/ directory on the NetScaler appliance.
3. The NetScaler appliance must obtain the IP address of the domain controller from the fully qualified domain name (FQDN). Therefore, Citrix recommends configuring the NetScaler with a DNS server.

```
ns-cli-prompt> add dns nameserver <ip-address>
```

**Note**

Alternatively, you can add static host entries or use any other means so that the NetScaler appliance can resolve the FQDN name of the domain controller to an IP address.

4. Configure the authentication action and then associate it to an authentication policy.
  - Configure the negotiate action. This configuration creates an action (profile) for an Active Directory server that is used as a Kerberos Key Distribution Center (KDC). The profile contains all the configuration data necessary to communicate with that AD KDC server.

```
ns-cli-prompt> add authentication negotiateAction <name> -domain <domain name>
-domainUser <domain user name> -domainUserPasswd <domain user password> -
defaultAuthenticationGroup <default authentication group> -keytab <string> -NTLMPath
<string>
```

**Note:** For domain user and domain name configuration, go to client and use the klist command as shown in the following example:

Client: username @ AAA.LOCAL

Server: HTTP/onprem\_idp.aaa.local @ AAA.LOCAL

```
add authentication negotiateAction <name> -domain -domainUser <HTTP/on-prem_idp.aaa.local>
```

- Configure the negotiate policy and associate the negotiate action to this policy.

```
ns-cli-prompt> add authentication negotiatePolicy <name> <rule> <reqAction>
```

5. Create an authentication virtual server and associate the negotiate policy with it.

- Create an authentication virtual server.

```
ns-cli-prompt> add authentication vserver <name> SSL <ipAuthVserver> 443 - authenticationDomain <domainName>
```

- Bind the negotiate policy to the authentication virtual server.

```
ns-cli-prompt> bind authentication vserver <name> -policy <negotiatePolicyName>
```

6. Associate the authentication virtual server with the traffic management (load balancing or content switching) virtual server.

```
ns-cli-prompt> set lb vserver <name> -authn401 ON -authnVsName <string>
```

#### Note

Similar configurations can also be done on the content switching virtual server.

7. Verify the configurations by doing the following:

- Access the traffic management virtual server, using the FQDN. For example, [Sample](#)
- View the details of the session on the CLI.

```
ns-cli-prompt> show aaa session
```

## Configuring Kerberos authentication on the GUI

1. Enable the authentication, authorization, and auditing feature.

Navigate to **System > Settings**, click **Configure Basic Features** and enable the authentication, authorization, and auditing feature.

2. Add the keytab file as detailed in step 2 of the CLI procedure mentioned above.

3. Add a DNS server.

Navigate to **Traffic Management > DNS > Name Servers**, and specify the IP address for the DNS server.

4. Configure the **Negotiate** action and policy.

Navigate to **Security > AAA - Application Traffic > Policies > Authentication > Advanced Policies > Policy**, and create a policy with **Negotiate** as the action type. Click **ADD** to create a new authentication negotiate server or click **Edit** to configure the existing details.

5. Bind the negotiate policy to the authentication virtual server.

Navigate to **Security > AAA - Application Traffic > Virtual Servers**, and associate the **Negotiate** policy with the authentication virtual server.

6. Associate the authentication virtual server with the traffic management (load balancing or content switching) virtual server.

Navigate to **Traffic Management > Load Balancing > Virtual Servers**, and specify the relevant authentication settings.

**Note**

Similar configurations can also be done on the content switching virtual server.

7. Verify the configurations as detailed in step 7 of the CLI procedure mentioned above.

## Configure kerberos authentication on a client

May 2, 2023

Kerberos support must be configured on the browser to use Kerberos for authentication. You can use any Kerberos-compliant browser. Instructions for configuring Kerberos support on Internet Explorer and Mozilla Firefox follow. For other browsers, see the documentation of the browser.

### To configure Internet Explorer for Kerberos authentication

1. In the **Tools** menu select **Internet Options**.
2. On the **Security** tab, click **Local Intranet**, and then click **Sites**.
3. In the **Local Intranet** dialog box, make sure that the Automatically detect intranet network option is selected, and then click **Advanced**.
4. In the **Local Intranet** dialog box, add the web sites of the domains of the traffic management virtual server on the NetScaler appliance. The specified sites become local intranet sites.
5. Click **Close** or **OK** to close the dialog boxes.

## To configure Mozilla Firefox for Kerberos authentication

1. Make sure that you have Kerberos properly configured on your computer.
2. Type `about:config` in the URL bar.
3. In the filter text box, type `network.negotiate`.
4. Change `network.negotiate-auth.delegation-uris` to the domain that you want to add.
5. Change `network.negotiate-auth.trusted-uris` to the domain that you want to add.

**Note:** If you are running Windows, you also need to enter `sspi` in the filter text box and change the `network.auth.use-sspi` option to `False`.

## Offload Kerberos authentication from physical servers

May 2, 2023

The NetScaler appliance can offload authentication tasks from servers. Instead of the physical servers authenticating the requests from clients, the NetScaler authenticates all the client requests before it forwards them to any of the physical servers bound to it. The user authentication is based on Active Directory tokens.

There is no authentication between the NetScaler and the physical server, and the authentication offload is transparent to the end users. After the initial logon to a Windows computer, the end user does not have to enter any additional authentication information in a pop-up or on a logon page.

In the current NetScaler appliance release, Kerberos authentication is available only for authentication, authorization, and auditing traffic management virtual servers. Kerberos authentication is not supported for SSL VPN in the NetScaler Gateway Advanced Edition appliance or for NetScaler appliance management.

Kerberos authentication requires configuration on the NetScaler appliance and on client browsers.

## To configure Kerberos authentication on the NetScaler appliance

### Note

The passwords used in the following sample configuration are only examples and not the actual configuration passwords.

1. Create a user account on Active Directory. When creating a user account, verify the following options in the User Properties section:
  - Make sure that you do not select the Change password at next logon option.

- Be sure to select the Password does not expire option.
2. On the AD server, at the CLI command prompt, type:
    - `ktpass -princ HTTP/kerberos.crete.lab.net@crete.lab.net -ptype KRB5_NT_PRINCIPAL -mapuser krbuser@crete.lab.net -mapop set -pass Citrix1 -out C:\kerbtabfile.txt`

**Note**

Be sure to type the above command on a single line. The output of the above command is written into the C:\kerbtabfile.txt file.

3. Upload the kerbtabfile.txt file to the /etc directory of the NetScaler appliance by using a Secure Copy (SCP) client.
4. Run the following command to add a DNS server to the NetScaler appliance.
  - `add dns nameserver 1.2.3.4`

The NetScaler appliance cannot process Kerberos requests without the DNS server. Be sure to use the same DNS server that is used in the Microsoft Windows domain.

5. Switch to the command line interface of NetScaler.
6. Run the following command to create a Kerberos authentication server:
  - `add authentication negotiateAction KerberosServer -domain "crete.lab.net" -domainUser krbuser -domainUserPasswd Citrix1 -keytab /var/mykcd.keytab`

**Note**

If keytab is not available, you can specify the parameters: domain, domainUser, and -domainUserPasswd.

7. Run the following command to create a negotiation policy:
  - `add authentication negotiatePolicy Kerberos-Policy "REQ.IP.DESTIP == 192.168.17.200"KerberosServer<!--NeedCopy-->`
8. Run the following command to create an authentication virtual server.
  - `add authentication vserver Kerb-Auth SSL 192.168.17.201 443 -AuthenticationDomain crete.lab.net<!--NeedCopy-->`
9. Run the following command to bind the Kerberos policy to the authentication virtual server:
  - `bind authentication vserver Kerb-Auth -policy Kerberos-Policy -priority 100<!--NeedCopy-->`

10. Run the following command to bind an SSL certificate to the authentication virtual server. You can use one of the test certificates, which you can install from the GUI NetScaler appliance. Run the following command to use the ServerTestCert sample certificate.

- `bind ssl vserver Kerb-Auth -certkeyName ServerTestCert<!-- NeedCopy-->`

11. Create an HTTP load balancing virtual server with the IP address, 192.168.17.200.  
Ensure that you create a virtual server from the command line interface for NetScaler 9.3 releases if they are older than 9.3.47.8.

12. Run the following command to configure an authentication virtual server:

- `set lb vserver <name>-authn401 ON -authnVsName Kerb-Auth<!-- NeedCopy-->`

13. Enter the host name [Example](#) in the address bar of the Web browser.

The Web browser displays an authentication dialog box because the Kerberos authentication is not set up in the browser.

**Note**

Kerberos authentication requires a specific configuration on the client. Ensure that the client can resolve the hostname, which results in the Web browser connecting to an HTTP virtual server.

14. Configure Kerberos on the Web browser of the client computer.
  - For configuring on Internet Explorer, see [Configuring Internet Explorer for Kerberos authentication](#).
  - For configuring on Mozilla Firefox, see [Configuring Internet Explorer for Kerberos authentication](#).
15. Verify whether you can access the backend physical server without authentication.

## To configure Internet Explorer for Kerberos authentication

1. Select **Internet Options** from the **Tools** menu.
2. Activate the **Security** tab.
3. Select **Local Intranet** from the Select a zone to view change security settings section.
4. Click **Sites**.
5. Click **Advanced**.
6. Specify the URL, [Example](#) and click **Add**.
7. Restart **Internet Explorer**.

## To configure Mozilla Firefox for Kerberos authentication

1. Enter `about:config` in the address bar of the browser.
2. Click the warning disclaimer.
3. Type **Network.Negotiate-auth.trusted-uris** in the **Filter** box.
4. Double click **Network.Negotiate-auth.trusted-uris**. A sample screen is shown below.

5. In the Enter String Value dialog box, specify `www.crete.lab.net`.
6. Restart Firefox.

## Troubleshoot authentication and authorization-related issues

### Troubleshoot authentication issues with `aaad.debug` module

[Troubleshoot authentication issues in NetScaler and NetScaler Gateway with `aaad.debug` module](#)

## Admin partition

May 2, 2023

A NetScaler appliance can be partitioned into logical entities called admin partitions. Each partition can be configured and used as a separate NetScaler appliance. The following figure shows the partitions of a NetScaler being used by different customers and departments:

A partitioned NetScaler appliance has a single default partition and one or more admin partitions. The following table provides further details on the two partition types:

**Note**

In a partitioned appliance, the mode BridgeBPDUs can be enabled only in the default partition and not in the administrative partitions.

**Availability:**

The NetScaler appliance ships with a single partition, which is called a default partition. The default partition is retained even after the NetScaler appliance is partitioned.

Must be explicitly created as described in [Configure admin partitions](#).

**Number of Partitions:**

One

A NetScaler appliance can have one or more (maximum of 512) admin partitions.

**User Access and Roles:**

All NetScaler users, who are not associated with a *partition-specific* command policy, can access and configure the default partition. As always, the associated command policy restricts the operations that a user can perform.

The user access and roles are created by NetScaler superusers who also specify the users for that partition. Only superusers and associated users of the partition can access and configure the admin partition.

**Note**

Partition users do not have shell access.

**File Structure:**

All files in a default partition are stored in the default NetScaler file structure.

For example, the `/nsconfig` directory stores the NetScaler configuration file and the `/var/log/` directory stores the NetScaler logs.

All files in an admin partition are stored in directory paths that have the name of the admin partition.

For example, the NetScaler configuration file (`ns.conf`) is stored in the `/nsconfig/partitions/<partitionName>` directory. Other partition-specific files are stored in the `/var/partitions/<partitionName>` directories.

Some other paths in an admin partition:

- Downloaded files: `/var/partitions/<partitionName>/download/`
- Log files: `/var/partitions/<partitionName>/log/`

**Note**

Currently, logging is not supported at partition-level. Therefore, this directory is empty and all logs are stored in the `/var/log/` directory.

- SSL CRL certificate related files: `/var/partitions/<partitionName>/netscaler/ssl`

**Resources Available:**

All NetScaler resources.

NetScaler resources that are explicitly assigned to the admin partition.

**User access and roles**

In authenticating and authorizing a partitioned NetScaler appliance, a root administrator can assign a partition administrator to one or more partitions. The partition administrator can authorize users

to that partition without affecting other partitions. The partition users are authorized to access only that partition using the SNIP address. Both the root administrator and the partition administrator can configure role based access (RBA by authorizing users to access different applications.

Administrators and user roles can be described as follows:

**Root Administrator.** Accesses the partitioned appliance through its NSIP address and can grant user access to one or more partitions. The administrator can also assign partition administrators to one or more partitions. The administrator can create a partition administrator from the default partition using an NSIP address or switch to a partition and then create a user and assign partition admin access using a SNIP address.

**Partition Administrator.** Accesses the specified partition through an NSIP address assigned by the root administrator. The administrator can assign role-based access to partition user access to that partition and also configure external server authentication using partition specific configuration.

**System User.** Accesses partitions through the NSIP address. Has access to the partitions and resources specified by the root administrator.

**Partition User.** Accesses a partition through a SNIP address. The user account is created by the partition administrator and the user has access to resources, only within the partition.

### Points to remember

Following are some points to remember when providing role-based access in a partition.

1. NetScaler users accessing the GUI through the NSIP address uses the default partition authentication configuration to log on to the appliance.
2. Partition system users accessing the GUI through a partition SNIP address uses partition specific authentication configuration to log on to the appliance.
3. Partition user created in a partition cannot log in using the NSIP address.
4. The NetScaler user bound to a partition cannot log in using the partition SNIP address.
5. System users authenticating through an external authentication server ( for example, LDAP, RADIUS, TACACS) must access a partition through a SNIP address.

### Use case for managing role based access in a partitioned setup

Consider a scenario where an enterprise organization, www.example.com has multiple business units and a centralized administrator who manages all instances in their network. However, they want to provide exclusive user privileges and environment for each business unit.

Following are the administrators and users managed by default partition authentication configuration and partition specific configuration in a partitioned appliance.

John: Root Administrator

George: Partition Administrator

Adam: System User

Jane: Partition User

John, is the root administrator of a partitioned NetScaler appliance. John manages all user accounts and administrative user accounts across partitions (for example, P1, P2, P3, P4, and P5) within the appliance. John provides granular role-based access to entities from the default partition of the appliance. John creates user accounts and assigns partition access to each account. George being a network engineer within the organization prefers to have a role based access to few applications running on partition P2. Based on user management, John creates a partition administrator role for George and associates his user account with a partition-admin command policy in the P2 partition. Adam being another network engineer prefers to access an application running on P2. John creates a system user account for Adam and associates his user account to a P2 partition. Once the account is created, Adam can log into the appliance to access the NetScaler management interface through the NSIP address and can switch to partition P2 based on user/group binding.

Suppose, Jane who is another network engineer wants to directly access an application running only on partition P2, George (partition administrator) can create a partition user account for her and associate her account with command policies for authorization privileges. Jane's user account created within the partition is now directly associated with P2. Now Jane can access the NetScaler management interface through the SNIP address and cannot switch to any other partition.

**Note**

If Jane's user account is created by a partition administrator in partition P2, the admin can access the NetScaler management interface only through the SNIP address (created within the partition). The admin is not permitted to access the interface through the NSIP address. Similarly, if Adam's user account is created by a root administrator in the default partition and is bound to a P2 partition. The admin can access the NetScaler management interface only through the NSIP address or SNIP address created in the default partition (with management access enabled). And not permitted to access the partition interface through the SNIP address created in the administrative partition.

**Configure roles and responsibilities for partition administrators**

Following are the configurations performed by a root administrator in a default partition.

Creating administrative partitions and system users –A root administrator creates administrative partitions and system users in the default partition of the appliance. The administrator then associates the users to different partitions. If you are bound to one or more partitions, you can switch from one

partition to another based on user bindings. Also, your access to one or more bound partitions is authorized only by the root administrator.

Authorizing the system user as partition administrator for a specific partition –Once a user account is created, the root administrator switches to a specific partition and authorizes the user as the partition administrator. It is done by assigning partition-admin command policy to the user account. Now, the user can access the partition as partition administrator and manage entities within the partition.

Following are the configurations performed by a partition administrator in an administrative partition.

Configuring the SNIP address in an administrative partition- The partition administrator logs on to the partition and creates a SNIP address and provides management access to the address.

Creating and Binding a Partition System User with Partition Command Policy - The partition administrator creates partition users and defines the scope of user access. It is done by binding the user account to partition command policies.

Creating and Binding a Partition System User Groups with Partition Command Policy -The partition administrator creates partition user groups and defines the scope of user group access. It is done by binding the user group account to partition command policies.

Configuring External Server authentication for external users (optional)-This configuration is done for authenticating external TACACS users accessing the partition using the SNIP address.

Following are the tasks performed in configuring role-based access for partition users in an Administrative Partition.

1. Creating an Administrative Partition –Before you create partition users in an administrative partition, you must first create the partition. As a root administrator, you can create a partition from the default partition using the configuration utility or a command line interface.
2. Switching user access from default partition to partition P2 –If you are partition administrator accessing the appliance from the default partition, you can switch from default partition to a specific partition. For example, partition P2 based on user binding.
3. Adding a SNIP address to the partition user account with management access enabled-Once you have switched your access to an administration partition. You create a SNIP address and provide management access to the address.
4. Creating and binding a partition System User with Partition Command Policy-If you are a partition administrator, you can create partition users and define the scope of user access. It is done by binding the user account to partition command policies.
5. Creating and binding partition user group with partition command policy - If you are a partition administrator, you can create partition user groups and define the scope of user access control. It is done by binding the user group account to partition command policies.

Configuring External Server authentication for external users (optional)-This configuration is done for authenticating external TACACS users accessing the partition using a SNIP address.

## Benefits of using admin partitions

You can avail the following benefits by using admin partitions for your deployment:

- Allows delegation of administrative ownership of an application to the customer.
- Reduces the cost of ADC ownership without compromising on performance and ease-of-use.
- Safeguards from unwarranted configuration changes. In a non-partitioned NetScaler appliance, authorized users of the other application can intentionally or unintentionally change configurations that are required for your application. It can lead to undesirable behavior. This possibility is reduced in a partitioned NetScaler appliance.
- Isolates traffic between different applications by the use of dedicated VLANs for each partition.
- Accelerates and allows application deployments to scale.
- Allows application-level or localized management and reporting.

Let us analyze a couple of cases to understand the scenarios in which you can use admin partitions.

### User case 1: How admin partition is used in an enterprise network

Let us consider a scenario faced by a company named **Foo.com**.

- **Foo.com** has a single NetScaler.
- There are five departments and each department has one application that requires to be deployed with the NetScaler.
- Each application must be managed independently by a different set of users or administrators.
- Other users must be restricted from accessing the configurations.
- The application or back-end must be able to share resources like IP addresses.
- The global IT department must be able to control NetScaler-level settings which must be common to all partitions.
- Applications must be independent of one another. An error in the configuration of one application must not affect the other.

A non-partitioned NetScaler would not be able to satisfy these requirements. However, you can achieve all these requirements by partitioning a NetScaler.

Simply create a partition for each of the applications, assign the required users to the partitions, specify a VLAN for each partition, and define global settings on the default partition.

### Use case 2: How an admin partition is used by a service provider

Let us consider a scenario faced by a service provider named **BigProvider**:

- BigProvider has 5 customers: 3 small enterprises and 2 large enterprises.

- **SmallBiz**, **SmallerBiz**, and **StartupBiz** need only the most basic NetScaler functionality.
- **BigBiz** and **LargeBiz** are larger enterprises and have applications that attract heavy traffic. They would like to use some of the more complex NetScaler functionality.

In a non-partitioned approach, the NetScaler administrator would typically use a NetScaler SDX appliance and provision a NetScaler instance for each customer.

The solution suits **BigBiz** and **LargeBiz** because their applications need the undiminished power of the entire non-partitioned NetScaler appliance. However, this solution might not be as cost effective for servicing **SmallBiz**, **SmallerBiz**, and **StartupBiz**.

Therefore, **BigProvider** decides on the following solution:

- Using a NetScaler SDX appliance to bring up dedicated NetScaler instances for **BigBiz** and **LargeBiz**.
- Using a single NetScaler which is partitioned into three partitions, one each for **SmallBiz**, **SmallerBiz**, and **StartupBiz**.

The NetScaler administrator (superuser) creates an admin partition for each of these customers, and specifies the users for the partitions. And also specifies the NetScaler resources for the partitions, and specifies the VLAN to be used by the traffic that is destined for each of the partitions.

## NetScaler configurations support in admin partition

September 28, 2023

NetScaler configurations can be categorized into the following three types of configurations. It depends on the Citrix configuration and the partition in which the configuration is performed.

### Note

- Admin partitions cannot be set up on a NetScaler cluster. It means that a NetScaler cluster cannot be partitioned.
- Admin partitions cannot be set up on a NetScaler 14000 FIPS appliance.
- [Case 3](#) lists the NetScaler features that are not supported in admin partitions.
- Load balancing templates are not supported in admin partitions.

### Case 1 (global configurations)

Configurations that can be performed ONLY in the default partition and which are available or impact all the admin partitions.

- Updates to built-in entities for monitors, TCP profiles, HTTP profiles, and so on.
- Updates to global parameters for syslog, NSLOG, weblog, content switching, IPSEC, SIP, DHCP, Surge protection, TCP buffering, and system collection.
- High availability (HA) configurations
- Interface and VLAN changes
- User configurations

### Case 2 (partition-specific configurations)

Configurations that can be performed independently in default and admin partitions. These configurations are applicable only to the partition in which they are performed.

- Getting traffic level statistics for a partition.
- Partition admin can update IP bindings for VLAN which is bound to that partition. But cannot update the interface bindings.
- Clearing NetScaler configurations.
- Feature-specific parameters for the following features: AppFlow, AppQoE, HTTP compression, DNS, TCP, HTTP, encryption, responder, rewrite, and SSL.
- Feature-specific configurations such as virtual servers, services, monitors.

### Case 3

Configurations that cannot be performed on admin partitions. These features can be configured in the default partition, but there is no impact on admin partitions.

**Note:**

Configurations that are supported on admin partitions for a particular release are marked as **Yes**.

| Feature        | NetScaler                   | NetScaler 12.1 | NetScaler 13.0 | NetScaler 13.1 | NetScaler 14.1 |
|----------------|-----------------------------|----------------|----------------|----------------|----------------|
| Component      | Feature                     |                |                |                |                |
| Networking     | Traffic                     | No             | No             | No             | No             |
|                | Domain                      |                |                |                |                |
| Policy         | Extensibility               | Yes            | Yes            | Yes            | Yes            |
| Load Balancing | DBS Autoscale               | Yes            | Yes            | Yes            | Yes            |
| Load Balancing | DNSSEC                      | Yes            | Yes            | Yes            | Yes            |
| Load Balancing | Diameter                    | Yes            | Yes            | Yes            | Yes            |
| Load Balancing | RTSP                        | No             | No             | No             | No             |
| Load Balancing | Sure Connect                | Deprecated     | Deprecated     | Removed        | Removed        |
| Load Balancing | Autoscale                   | Yes            | Yes            | Yes            | Yes            |
| Manageability  | Service Group               |                |                |                |                |
| Manageability  | RBA External Authentication | Yes            | Yes            | Yes            | Yes            |
| Manageability  | RISE Cisco                  | No             | Yes            | Yes            | Yes            |

## NetScaler 14.1

| Feature Component | NetScaler Feature              | NetScaler 12.1 | NetScaler 13.0 | NetScaler 13.1 | NetScaler 14.1 |
|-------------------|--------------------------------|----------------|----------------|----------------|----------------|
| Manageability     | ACI-Cisco                      | Yes            | Yes            | Yes            | Yes            |
| Manageability     | AppExpert                      | Yes            | Yes            | Yes            | Yes            |
| Manageability     | HDX Insight                    | No             | No             | No             | No             |

The preceding table lists some of the features as **Restricted Features** in the admin partition setup. The following section provides the reason why some of the features are mentioned as **Restricted Features**.

- **VRRP.** The VRRP is Restricted Feature in the admin partition because of the following:
  - VRID addition or deletion can be done only from the default partition context. However, once a VRID is created, it can be used within non-default partitions.
  - VRRP functionality is supported only over the dedicated VLANs.
  - VRRP functionality is not supported on shared VLANs, used by the admin partition. It is blocked internally. No error message is shown during configuration. The protocol is blocked on a shared VLAN (tagged or untagged) bound to a default or any administrative partition.

### Important

To support active-active deployment using VRRP, main and backup VIP must use the same VRID. Different VRIDs cannot be used.

- **Networking.** Some of the networking configurations (L2 Param and L3 Param) are not supported or valid in the partition context. If you come across any such configurations, the following error message is displayed. “ERROR: This configuration option is not supported on the non-default partition.”

## Configure admin partitions

May 2, 2023

### Important

- Only superusers are authorized to create and configure admin partitions.
- Unless specified otherwise, configurations to set up an admin partition must be done from the default partition.

By partitioning a NetScaler appliance, you are creating multiple instances of a single NetScaler appliance. Each instance has its own configurations and the traffic of each of these partitions is isolated from the other. It is done by assigning each partition a dedicated VLAN or a shared VLAN.

A partitioned NetScaler has one default partition and the admin partitions that are created. To set up an admin partition, you must first create a partition with the relevant resources (memory, maximum bandwidth, and connections). Then, specify the users that can access the partition and the level of authorization for each of the users on the partition.

Accessing a partitioned NetScaler is the same as accessing a non-partitioned NetScaler: through the NSIP address or any other management IP address. As a user, after you provide your valid logon credentials, you are taken to the partition to which you are bound. Any configurations that you create are saved to that partition. If you are associated with more than one partition, you are taken to the first partition with which you were associated. If you want to configure entities on one of your other partitions, you must explicitly switch to that partition.

After accessing the appropriate partition, the configurations that you perform are saved to that partition and are specific to that partition.

### Note

- NetScaler superusers and other non-partition users are taken to the default partition.
- Users of all the 512 partitions can log in simultaneously.

### Tip

To access a partitioned NetScaler appliance over HTTPS by using the SNIP (with management access enabled), make sure that each partition has the certificate of its partition administrator. Within the partition, the partition admin must do the following:

1. Add the certificate to the NetScaler.

```
add ssl certKey ns-server-certificate -cert ns-server.cert-key ns-server.key
```

2. Bind it to a service named `nshttps-<SNIP>-3009`, where `<SNIP>` must be replaced with the SNIP address, in this case `100.10.10.1`.

```
bind ssl service nshttps-100.10.10.1-3009 -certkeyName ns-server-certificate
```

## Partition resource limiting

In a partitioned NetScaler appliance, a network administrator can create a partition with partition resources such as memory, bandwidth, and connection limit configured as unlimited. It is done by specifying Zero as the partition resource value. Where Zero indicates the resource is unlimited on the partition and it can be consumed up to system limits. Partition resource configuration is useful when you migrate a traffic domain deployment to an administrative partition or if you do not know about the resource allocation limit for a partition in a given deployment.

Resource limit for an administrative partition is as follows:

1. **Partition memory.** It is the maximum allocated memory for a partition. You make sure to specify the values when creating a partition.

### Note

From NetScaler 12.0 onwards, when you create a partition, you can set the memory limit to Zero. If a partition is already created with a specific memory limit, you can reduce the limit to any value or set the limit as Zero.

Parameter: maxMemLimit

Maximum memory is allocated in MB in a partition. A zero value indicates the memory is unlimited on the partition and it can consume up to the system limits.

Default value: 10

2. **Partition bandwidth.** Maximum allocated bandwidth for a partition. If you specify a limit, make sure it is within the appliance's licensed throughput. Otherwise, you are not limiting the bandwidth that is used by the partition. The specified limit is accountable for the bandwidth that the application requires. If the application bandwidth exceeds the specified limit, packets are dropped.

### Note

From NetScaler 12.0 onwards, when you can create a partition, you can set the partition bandwidth limit to Zero. If a partition is already created with a specific bandwidth, you can reduce the bandwidth or set the limit as Zero.

Parameter: maxBandwidth

Maximum bandwidth is allocated in Kbps in a partition. A zero value indicates the bandwidth is unrestricted. That is, the partition can consume up to the system limits.

Default value: 10240

Maximum Value: 4294967295

3. **Partition connection.** Maximum number of concurrent connections that can be open in a partition. The value must accommodate the maximum simultaneous flow expected within the partition. The partition connections are accounted from the partition quota memory. Previously, the connections were accounted from the default partition quota memory. It is configured only on the client-side, not on the back-end server-side TCP connections. New connections cannot be established beyond this configured value.

**Note**

From NetScaler 12.0 onwards, you can create a partition with the number of open connections set to Zero. If you have already created a partition with a specific number of open connections, you can reduce the connection limit or set the limit as Zero.

Parameter: maxConnections

Maximum number of concurrent connections that can be open in the partition. A zero value indicates no limit on the number of open connections.

Default value: 1024

Minimum value: 0

Maximum Value: 4294967295

## Configure an admin partition

To configure an admin partition, complete the following tasks.

### To access in an admin partition by using the CLI

1. Log on to the NetScaler appliance.
2. Check if you are in the correct partition. The command prompt displays the name of the currently selected partition.
3. If yes, skip to the next step.
4. If no, get a list of the partitions with which you are associated and switch over to the appropriate partition.
  - `show system user <username>`
  - `switch ns partition <partitionName>`
5. Now, you can perform the required configurations just as a non-partitioned NetScaler.

### To access an admin partition by using the GUI

1. Log on to the NetScaler appliance.
2. Check if you are in the correct partition. The top bar of the GUI displays the name of the currently selected partition.
  - If yes, skip to the next step.
  - If no, navigate to **Configuration > System > Partition Administration > Partitions**, right-click the partition to which you want to switch, and select **Switch**.
3. Now, you can perform the required configurations just as a non-partitioned NetScaler.

### Add an admin partition

The root administrator adds an administrative partition from the default partition and binds the partition with VLAN 2.

### To create an administrative partition by using the CLI

At the command prompt, type:

```
1 add partition <partitionname>
```

### Switch user access from default partition to an admin partition

Now you can switch user access from default partition to partition Par1.

### To switch a user account from default partition to an admin partition by using the CLI:

At the command prompt, type:

```
1 Switch ns partition <pname>
```

### Adding SNIP address to a partition user account with management access enabled

In the partition, create a SNIP address with management access enabled.

### To add SNIP address to the partition user account with management access enabled by using the command line interface:

At the command prompt, type:

```
> add ns ip <ip address> <subnet mask> -mgmtAccess enabled
```

## Create and Bind a partition user with partition command policy

In partition, create a partition system user and bind the user with partition-admin command policies.

### To create and bind a partition system user with partition command policy by using the CLI:

At the command prompt, type:

```
> add system user <username> <password>
```

Done

## Creating and binding partition user group with partition command policy

In Partition Par1, create a partition system user group and bind the group with partition command policy such as partition admin, partition read-only, partition-operator, or partition-network.

### To create and bind a partition user group with partition command policy by using the command line interface:

```
1 > add system group <groupName>
2 > bind system group <groupname> \(-userName | -policyName <cmdpolicy> <
 priority> | -partitionName)
```

## Configuring external server authentication for external users

In partition Par1 you can configure an external server authentication to authenticate external TACACS users accessing the partition through a SNIP address.

### To configure external server authentication for external users by using the command line interface:

At the command prompt, type:

```
1 > add authentication tacacsaction <name> -serverip <IP> -tacacsSecret <
 secret key> -authorization ON -accounting ON
2 > add authentication policy <poliname> -rule true -action <name>
3 > bind system global <polycname> -priority <value>1
```

## Configure a partition system user account in a partition by using the GUI

To configure a partition user account in an administrative partition, you must create a partition user or a partition user group and bind it partition command policies. Also, you can configure the external server authentication for an external user.

**To create a partition user account in a partition by using the GUI**

Navigate to **System > User Administration**, click **Users** to add a partition system user, and bind the user to command policies (partitionadmin/partitionread-only/partition-operator/partition-network).

**To create a partition user group account in a partition by using the GUI**

Navigate to **System > User Administration**, click **Groups** to add a partition system user group and bind the user group to command policies (partitionadmin/partitionread-only/partition-operator/partition-network).

**To configure external server authentication for external users by using the GUI**

Navigate to **System > Authentication > Basic Actions** and click **TACACS** to configure a TACACS server for authenticating external users accessing the partition.

**Sample configuration**

The following configuration shows how to create a partition user or a partition user group and bind it partition command policies. Also, how to configure the external server authentication for authenticating an external user.

```
1 > add partition Par1
2 > switch ns partition Par1
3 > add ns ip 10.102.29.203 255.255.255.0 -mgmtAccessenabled
4 > add system user John Password
5 > bind system user Jane partition-read-only -priority 1
6 > add system group Retail
7 > bind system group Retail -policyname partition-network 1 (where 1 is
 the priority number)
8 > bind system group Retail -username Jane
9 > add authentication tacacssaction tacuser -serverip 10.102.29.200 -
 tacacsSecret Password -authorization ON -accounting ON
10 > add authentication policy polname -rule true -action tacacsAction
11 > bind system global polname -priority 1
```

**Command policies for a partition users and partition user groups in administrative partition**

| Commands to authorize a user account inside administrative partition                                     | Command policies available inside an administrative partition (built-in policies) | User account access type              |

### Configure an LACP Ethernet channel on the default admin partition

With the Link Aggregation Control Protocol (LACP), you can combine multiple ports into a single, high-speed link (also called a channel). An LACP-enabled appliance exchanges LACP Data Units (LACPDU) over the channel.

There are three LACP configuration modes that you can enable in the default partition of a NetScaler appliance:

1. Active. A port in active mode sends LACPDUs. Link aggregation is formed if the other end of the Ethernet link is in the LACP active or passive mode.
2. Passive. A port in passive mode sends LACPDUs only when it receives LACPDUs. The link aggregation is formed if the other end of the Ethernet link is in the LACP active mode.
3. Disable. Link aggregation is not formed.

#### Note

By default, the link aggregation is disabled in the default partition of the appliance.

LACP exchanges LACPDU between devices connected by an Ethernet link. These devices are typically referred as an actor or partner.

A LACPDU data unit contains the following parameters:

- LACP Mode. Active, passive, or disable.
- LACP timeout. The waiting period before timing out the partner or actor. Possible values: Long and Short. Default: Long.
- Port Key. To distinguish between the different channel. When the key is 1, LA/1 is created. When the key is 2, LA/2 is created. Possible values: Integer from 1 through 8. 4 through 8 is for cluster CLAG.
- Port Priority. Minimum value: 1. Maximum value: 65535. Default: 32768.
- System Priority. Uses this priority along with the system MAC to form the system ID to uniquely identify the system during LACP negotiation with the partner. Sets system priority from 1 and 65535. The default value is set to 32768.
- Interface. Supports 8 interfaces per channel on NetScaler 10.1 appliance and supports 16 interfaces per channel on NetScaler 10.5 and 11.0 appliances.

After exchanging LACPDUs, the actor and partner negotiate the settings and decide whether to add the ports to the aggregation.

## Configure and verify LACP

The following section shows how to configure and verify LACP in the admin partition.

### To configure and verify LACP on a NetScaler appliance by using the CLI

1. Enable LACP on each interface.

```
set interface <Interface_ID> -lacpMode PASSIVE -lacpKey 1<!--
NeedCopy-->
```

When you enable LACP on an interface, the channels are dynamically created. Also, when you enable LACP on an interface and set lacpKey to 1, the interface is automatically bound to channel LA/1.

#### Note

When you bind an interface to a channel, the channel parameters take precedence over the interface parameters, so the interface parameters are ignored. If a channel is created dynamically by LACP, you cannot perform the add, bind, unbind, or remove operations on the channel. A channel dynamically created by LACP is automatically deleted when you disable LACP on all interfaces of the channel.

2. Set the system priority.

```
set lacp -sysPriority <Positive_Integer><!--NeedCopy-->
```

3. Verify that LACP is working as expected.

“show interface

```
1 `` `show channel<!--NeedCopy-->
```

```
show LACP<!--NeedCopy-->
```

#### Note

In some versions of Cisco Internetwork Operating System (IOS), running the switchport trunk native VLAN <VLAN\_ID> command causes the Cisco switch to tag LACP PDUs. It causes the LACP channel between the Cisco switch and the NetScaler appliance to fail. However, this issue does not affect the static link aggregation channels configured in the previous procedure.

## Save configuration of all admin partitions from the default partition

Administrators can save the configuration of all the admin partitions at once from the default partition.

### Save all admin partitions from default partition by using the CLI

At the command prompt, type:

```
save ns config -all
```

## Support for partition and cluster based custom reports

NetScaler GUI displays only the custom reports created in the current viewing partition or in the cluster.

Previously, the NetScaler GUI used to store the Custom Report names directly to the back end file without mentioning the partition or cluster name to differentiate.

### To view the custom reports of the current partition or cluster in the GUI

- Navigate to **Reporting** tab.
- Click **Custom Reports** to view the reports created in the current partition or in the cluster.

## Support to bind VPN global certificates in a partitioned setup for OAuth IdP

In a Partitioned setup, you can now bind the certificates to VPN global for OAuth IdP deployments.

## To bind the certificates in Partitioned setup by using the CLI

At the command prompt, type:

```
1 bind vpn global [-certkeyName <string>] [-userDataEncryptionKey <string>]
```

## VLAN configuration for admin partitions

May 2, 2023

VLANs can be bound to a partition as a “Dedicated”VLAN or a “Shared”VLAN. Based on your deployment, you can bind a VLAN to a partition to isolate its network traffic from other partitions.

**Dedicated VLAN**—A VLAN bound only to one partition with the “Sharing”option disabled and must be a tagged VLAN. For example, in a client-server deployment, for security reasons a system administrator creates a dedicated VLAN for each partition on the server side.

**Shared VLAN**—A VLAN bound (shared across) to multiple partitions with the “Sharing”option enabled. For example, in a client-server deployment, if the system administrator do not have control over the client side network, a VLAN is created and shared across multiple partitions.

Shared VLAN can be used across multiple partitions. It is created in the default partition and you can bind a shared VLAN to multiple partitions. By default, a shared VLAN is bound to the default partition implicitly and hence it cannot be bound explicitly.

### Notes

- A NetScaler appliance deployed on any hypervisor (ESX, KVM, Xen, and Hyper-V) platform must comply with both the following conditions in a partition setup and traffic domain:
  - Enable the promiscuous mode, MAC changes, MAC spoofing, or forged transmit for shared VLANs with partition.
  - Enable the VLAN with port group properties of the virtual switch, if the traffic is through a dedicated VLAN.
- In a partitioned (multitenant) NetScaler appliance, a system administrator can isolate the traffic flowing to a particular partition or partitions. It is done by binding one or more VLANs to each partition. A VLAN can be dedicated to one partition or Shared across multiple partitions.
- Internal routing between partitions that are hosted on the same NetScaler appliance is not supported.

## Dedicated VLANs

To isolate the traffic flowing into a partition, create a VLAN and associate it with the partition. The VLAN is then visible only to the associated partition, and the traffic flowing through the VLAN is classified and processed only in the associated partition.

To implement a dedicated VLAN for a particular partition, do the following.

1. Add a VLAN (V1).
2. Bind a network interface to VLAN as a tagged network interface.
3. Create a partition (P1).
4. Bind partition (P1) to the dedicated VLAN (V1).

## Configure the following by using the CLI

- Create a VLAN

```
add vlan <id>
```

Example

```
1 add vlan 100
```

- Bind a VLAN

```
bind vlan <id> -ifnum <interface> -tagged
```

Example

```
1 bind vlan 100 -ifnum 1/8 -tagged
```

- Create a partition

```
Add ns partition <partition name> [-maxBandwidth <positive_integer>
>][-maxConn <positive_integer>] [-maxMemLimit <positive_integer>]
```

#### Example

```
1 Add ns partition P1 - maxBandwidth 200 - maxconn 50 - maxmemlimit
 90
2
3 Done
```

- Bind a partition to a VLAN

```
bind partition <partition-id> -vlan <id>
```

#### Example

```
1 bind partition P1 -vlan 100
```

## Configure a dedicated VLAN by using the NetScaler GUI

1. Navigate to **Configuration > System > Network > VLANs\*** and click **Add** to create a VLAN.
2. On the **Create VLAN** page, set the following parameters:
  - VLAN ID
  - Alias Name
  - Maximum Transmission Unit
  - Dynamic Routing
  - IPv6 Dynamic Routing
  - Partitions Sharing
3. In the **Interface Bindings** section, select one or more interfaces and bind it to the VLAN.
4. In the **IP Bindings** section, select one or more IP addresses and bind to the VLAN.
5. Click **OK** and **Done**.

## Shared VLAN

In a shared VLAN configuration, each partition has a MAC address, and traffic received on the shared VLAN is classified by MAC address. Only a Layer3 VLAN is recommended because it can restrict the subnet traffic. A partition MAC address is applicable and important only for a shared VLAN deployment.

**Note**

Starting from NetScaler version 12.1 build 51.16, shared VLAN in a partitioned appliance support dynamic routing protocol.

The following diagram shows how a VLAN (VLAN 10) is shared across two partitions.

To deploy a shared VLAN configuration, do the following:

1. Create a VLAN with the sharing option 'enabled', or enable the sharing option on an existing VLAN. By default, the option is 'disabled'.
2. Bind partition interface to shared VLAN.
3. Create the partitions, each with its own PartitionMAC address.
4. Bind the partitions to the shared VLAN.

**Configure a shared VLAN by using the CLI**

At the command prompt, type one of the following commands to add VLAN or set the sharing parameter of an existing VLAN:

```
1 add vlan <id> \[-sharing \{ENABLED | DISABLED\}\]
2
3 set vlan <id> \[-sharing \{ENABLED | DISABLED\}\]
4
5 add vlan 100 -sharing ENABLED
6
7 set vlan 100 -sharing ENABLED
```

### Bind a partition to a Shared VLAN by using the CLI

At the command prompt, type:

```
1 bind partition <partition-id> -vlan <id>
2
3 bind partition P1 -vlan 100
4
5 add ns partition P1 -maxBandwidth 200 -maxconn 50 -maxmemlimit 90
 -partitionMAC<mac_addr>
6
7 Done
```

### Configure a Partition MAC Address by using the CLI

```
1 set ns partition <partition name> [-partitionMAC<mac_addr>]
2
3 set ns partition P1 -partitionMAC 22:33:44:55:66:77
```

### Bind partitions to a shared VLAN by using the CLI

```
1 bind partition <partition-id> -vlan <id>
2
3 bind partition <partition-id> -vlan <id>
4
5 bind partition P1 -vlan 100
6
7 bind partition P2 -vlan 100
8
9 bind partition P3 -vlan 100
10
11 bind partition P4 -vlan 100
```

### Configure Shared VLAN by using the NetScaler GUI

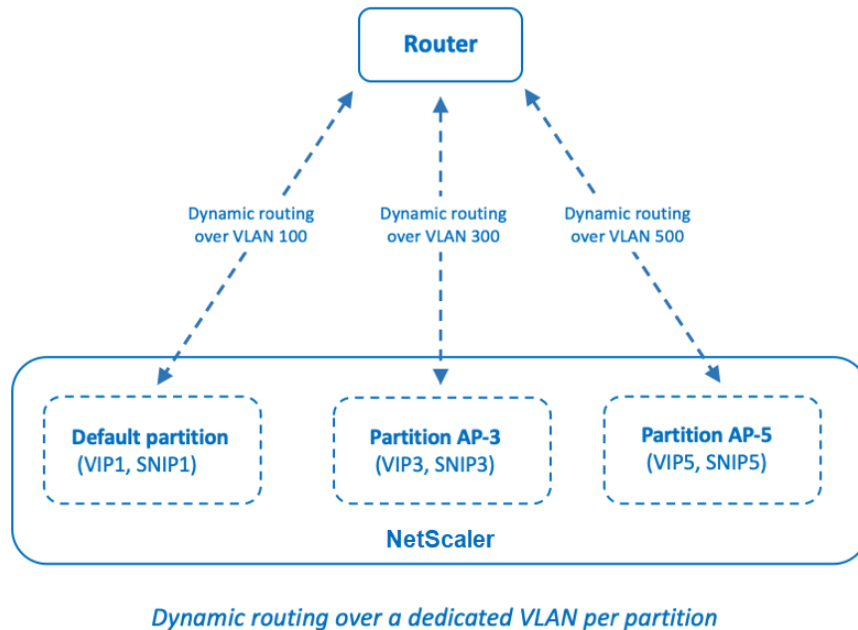

1. Navigate to **Configuration > System > Network > VLANs** and then select a **VLAN** profile and click **Edit** to set the partition sharing parameter.
2. On the **Create VLAN** page, select the **Partitions Sharing** check box.
3. Click **OK** and then **Done**.

### Dynamic routing over a shared VLAN across admin partitions

Admin partitions in a NetScaler appliance provide a way to host multiple tenants.

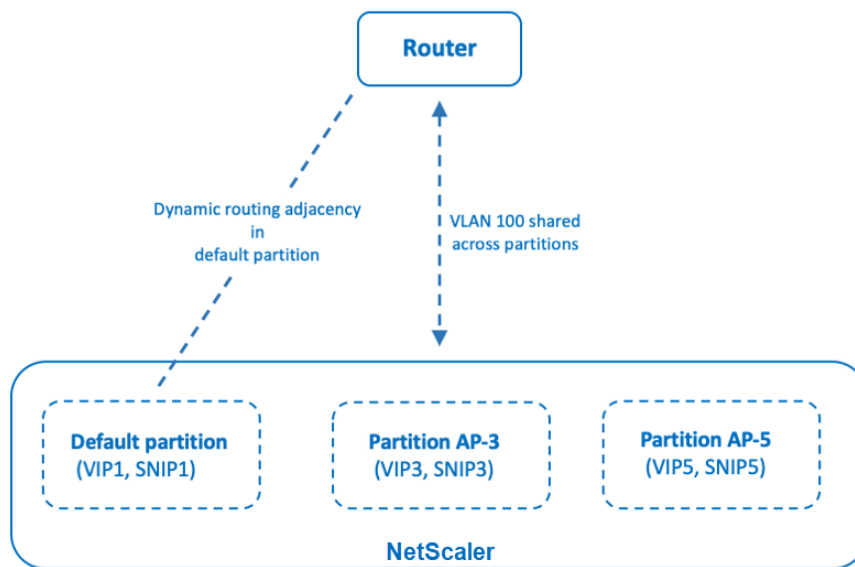

Starting from NetScaler version 12.1 build 51.16, a shared VLAN in a partitioned appliance supports the dynamic routing protocol. Routing can be configured in dedicated or shared VLANs associated with admin partitions.

**Dedicated VLAN of an admin partition.** In a dedicated VLAN, the data path for the tenant is identified using one or more VLANs. It results in strict configuration and data-path isolation for the tenant. For advertising the health of a VIP address, dynamic routing is enabled in each partition and the routing adjacency is established per partition.

**A shared VLAN across admin partitions.** In a shared VLAN, VIP addresses configured in a non-default partition can be advertised through a single adjacency or peering formed in the default partition. A SNIP address in the non-default partition is used as the next-hop for all the VIP addresses (configured with **advertiseOnDefaultPartition** option) in that non-default partition. The configured SNIP address is marked as a next-hop IP address in the routing advertisements.

Consider an example setup of admin partitions in a NetScaler appliance, VLAN 100 is shared across the default partition, and non-default partitions: AP-3 and AP-5. SNIP addresses SNIP1 is added in the default partition, SNIP3 is added in AP-3, and SNIP5 is added in AP-5. SNIP1, SNIP3, and SNIP5 are reachable over the vlan-100. VIP addresses VIP1 is added in the default partition, VIP3 is added in AP-3, and VIP5 is added in AP-5. VIP3 and VIP5 are advertised through the single adjacency or peering formed in the default partition.

*Dynamic routing over a shared VLAN across partitions*

### Before you begin

Before configuring dynamic routing over a shared VLAN in a non-default admin partition, make sure that:

- **Dynamic routing is configured on the shared VLAN in the default partition.** Configuring dynamic routing on the shared VLAN in the default partition consists of the following steps:
  1. Enable dynamic routing on the shared VLAN.
  2. Add a SNIP IP address with dynamic routing enabled. This SNIP IP address is used for dynamic routing with the upstream.
  3. Bind the SNIP IP subnet to the shared VLAN.
- **One or more dynamic routing protocol is configured on the default partition.** For more information, see [configure dynamic routing protocols](#).

### Configuration steps

Configuring dynamic routing over a shared VLAN in a non-default admin partition consists of the following steps:

1. **Add a SNIP IP address in the non-default partition.** This SNIP IP address must be in the same subnet of the SNIP IP address that is being used for dynamic routing in the default partition.

## 2. Set or enable the following parameters for advertising a VIP address, in a non-default partition, using dynamic routing.

- Host route gateway (hostRtGw). Set this parameter to the SNIP address added in the preceding step.
- Advertise on default partition (advertiseOnDefaultPartition). Enable this parameter.

### Sample configuration

Consider an example of an admin partition setup in a NetScaler appliance. A non-default admin partition AP-3 is configured on this appliance. A shared VLAN VLAN100 is bound to AP-3. The following sample configuration configures dynamic routing, through VLAN100, in AP-3.

| Steps                                                                                                                                                                             | Sample configuration                                                                                                              |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <b>On default admin partition</b>                                                                                                                                                 | -                                                                                                                                 |
| Enable dynamic routing on shared VLAN 100.                                                                                                                                        | <code>set vlan 100 -dynamicRouting enabled</code>                                                                                 |
| Add SNIP IP address 192.0.2.10 with dynamic routing enabled. This SNIP IP address is used for dynamic routing with the upstream.                                                  | <code>add ns ip 192.0.2.10 255.255.255.0 -type SNIP -dynamicRouting enabled</code>                                                |
| Bind subnet of 192.0.2.10 to shared VLAN 100.                                                                                                                                     | <code>bind vlan 100 -IPAddress 192.0.2.10 255.255.255.0</code>                                                                    |
| <b>On non-default admin partition AP-3</b>                                                                                                                                        | -                                                                                                                                 |
| Add SNIP IP address 192.0.2.30. This SNIP IP address is in the same subnet as the SNIP IP address 192.0.2.10 on the default partition.                                            | <code>add ns ip 192.0.2.30 255.255.255.0 -type SNIP</code>                                                                        |
| For advertising VIP address 203.0.113.300 using dynamic routing, enable <code>advertiseOnDefaultPartition</code> parameter and set <code>hostRtGw</code> parameter to 192.0.2.30. | <code>set ns ip 203.0.113.300 255.255.255.255 -hostRoute enabled -advertiseOnDefaultPartition enabled -hostRtGw 192.0.2.30</code> |

### Dynamic routing of IPv6 over a shared VLAN across admin partition

The `enable ns feature IPv6PT` and `set L3Param -ipv6DynamicRouting ENABLED` commands must be enabled for an IPv6 address to dynamically route over a shared VLAN in an admin

partition. The following sample configurations help you to configure dynamic routing of IPv6 over shared VLAN.

### Sample configuration

The following sample configuration configures dynamic routing, through VLAN 100, in AP-3.

| Steps                                                                                                                                                                                 | Sample configuration                                                                                                     |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| <b>On default admin partition</b>                                                                                                                                                     | -                                                                                                                        |
| Enable dynamic routing on shared VLAN 100.                                                                                                                                            | <code>set vlan 100 -dynamicRouting enabled</code>                                                                        |
| Add SNIP IP address 2001:b:c:d::1/64 with dynamic routing enabled. The SNIP IP address is used for dynamic routing with the upstream.                                                 | <code>add ns ip6 2001:b:c:d::1/64 -type SNIP -dynamicRouting enabled</code>                                              |
| Bind subnet of 2001:b:c:d::1/64 to shared VLAN 100.                                                                                                                                   | <code>bind vlan 100 -IPAddress 2001:b:c:d::1/64</code>                                                                   |
| <b>On non-default admin partition AP-3</b>                                                                                                                                            | -                                                                                                                        |
| Add SNIP IP address 2001:b:c:d::2/64. This SNIP IP address is in the same subnet as the SNIP IP address 2001:b:c:d::1/64 on the default partition.                                    | <code>add ns ip6 2001:b:c:d::2/64 -type SNIP</code>                                                                      |
| For advertising VIP address 2002::1/128 using dynamic routing, enable <code>advertiseOnDefaultPartition</code> parameter and set <code>ip6hostRtGw</code> parameter to 2001:b:c:d::2. | <code>set ns ip6 2002::1/128 - hostRoute enabled - advertiseOnDefaultPartition enabled -ip6hostRtGw 2001:b:c:d::2</code> |

The VIP present in the admin partition must be seen on VTYSH of default partition as a kernel route.

```

1 > switch partition default
2 Done
3
4 >vtysh
5 ns#
6
7 ns# sh ipv6 route kernel
8
9 IPv6 routing table
10 Codes: K - kernel route, C - connected, S - static, R - RIP, O - OSPF,
11 IA - OSPF inter area, E1 - OSPF external type 1,
12 E2 - OSPF external type 2, I - IS-IS, B - BGP
13 Timers: Uptime

```

```
14
15 K 2002::1/128 via 2001:b:c:d::2, vlan0, 01:24:15
 >> on Default Partition, VIP : 2002::1
 present in AP known via SNIP6 : 2001:b:c:d::2 is present in AP as a
 Kernel Route
```

It can be advertised to upstream by using “redistribute kernel” option under OSPFv3/BGP+ in default partition.

```
1 ns# sh run router ipv6 ospf
2 !
3 router ipv6 ospf 1
4 redistribute kernel
5 !
```

## Shared VLAN with admin partition on NetScaler SDX appliance

On an SDX appliance, you must generate and configure the PMAC address by using the Management Service user interface, before using the admin partitions with shared VLANs. Management Service enables you to generate partition MAC addresses by:

- Using a base MAC address
- Specifying custom MAC addresses
- Randomly generating MAC addresses

### Notes

- The randomly generating MAC addresses are used for other deployments other than high availability.
- After generating the partition MAC addresses, you must restart the NetScaler instance before configuring the admin partitions. For more information on generating partition MAC addresses from the SDX appliance, see [Generating Partition MAC Addresses to Configure Admin Partition on a NetScaler instance in the SDX Appliance](#).

## VXLAN support for admin partitions

May 2, 2023

In a partitioned NetScaler appliance, similar to configuring a VLAN, you can configure a VXLAN in the default partition. After configuring a VXLAN, you can bind it to an administrative partition or if a VXLAN is extending a VLAN that is bound to a partition, the appliance binds the VXLAN to the partition under

the same broadcast domain. It is applicable in unbinding a VLAN that unbinds a VXLAN from the partition.

For more information about how VXLAN works in a NetScaler appliance, see [VXLAN](#).

Also, for more information on how VLAN works in a partitioned NetScaler appliance, see [Admin Partitioning](#).

## Points to remember before configuring a VXLAN

Remember the following points before you configure a VXLAN in a partitioned NetScaler appliance:

- When you extend a VLAN over VXLAN, make sure VLAN is bound to the partition.
- Only a partition administrator must configure the IP and dynamic routing for the VXAN in the administrative partition.

A shared VXLAN is not supported in a partitioned appliance and so a VXLAN cannot be tagged to a shared VLAN or you cannot make a VLAN a shared one when it is tagged to a VXLAN.

## Supportable VXLAN configurations

Following are the supportable VXLAN configurations.

### Extending VLAN over a VXLAN in the same broadcast domain

The following CLI steps help you to extend a VLAN over a VXLAN and the opposite way within the same broadcast domain.

1. Add a VLAN in the default partition

```
1 add vlan <id>
```

2. Extend VLAN over a VXLAN within the same broadcast domain.

```
1 add vxlan <vxlan id> -vlan <id>
```

3. Configure a peer `vtep` to carry all BUM (broadcast unknown multicast) traffic.

#### Note

The `vtep` address can be a multicast address.

```
1 add bridgetable -mac <mac_addr> -vxlan <positive_integer> -vtep <ip_addr> [-vni <positive_integer>] [-deviceVlan <positive_integer>]
```

#### 4. Bind IP addresses to VXLAN.

```
1 bind vxlan <id> \[-srcIP <ip_addr>\]\[-IPAddress <ip_addr|ipv6_addr|*> \[<netmask>\]
```

#### 5. Bind VLAN to an administrative partition.

```
1 bind partition <partition-id> -vxlan <id>
2
3 add vlan 3000
4
5 add vxlan 3000 -vlan 10
6
7 add bridgetable -mac 00:00:00:00:00:00 -vxlan 3000 -vtep
 10.102.58.8 -vni 11
8
9 bind vxlan 3000 - srcIP 10.102.101.15
10
11 bind partition p1 -vlan 10
```

## SNMP support for admin partitions

May 2, 2023

A partitioned NetScaler appliance uses the SNMP infrastructure for partition rate limiting and for monitoring partition resource utilization details.

### SNMP traps for admin partition rate limiting

On a partitioned NetScaler appliance, a PARTITION-RATE-LIMIT alarm can generate nine SNMP traps for notifying a partition resource (such as bandwidth, connection, or memory) has reached its limit or returned to normal.

The following nine SNMP traps are generated when:

- **partitionCONNThresholdReached.** The number of active connections for a partition exceeds its high threshold percentage.
- **partitionCONNThresholdNormal.** The number of active connections is less than or equal to the normal threshold percentage.
- **partitionBWThresholdReached.** The partition's bandwidth usage reaches its high threshold percentage.
- **partitionMEMThresholdReached.** The current memory usage of the partition exceeds its high threshold percentage.

- **partitionMEMThresholdNormal.** The current memory usage of the partition becomes less than or equal to the normal threshold percentage.
- **partitionMEMLimitExceeded.** The current memory usage of the partition exceeds its memory limit percentage.
- **partitionCONNLimitExceeded.** The number of active connections for a partition exceeds its configured limit and new connections are being dropped.
- **partitionCONNLimitNormal.** The number of active connections for a partition goes below its configured limit and the partition can now accept a new connection.
- **partitionBWLimitExceeded.** The current bandwidth usage for a partition has exceeded its configured limit.

The threshold values for the SNMP traps are non-configurable and are the following:

- High threshold = 80% (applicable for all partition rate limit traps)
- Low threshold = 60% (applicable for all partition rate limit traps)
- Memory limit = 95% (applicable only for partition memory traps)

### Configuring PARTITION-RATE-LIMIT alarm

To configure the PARTITION-RATE-LIMIT alarm in a specific partition and enable generation of the SNMP trap messages.

1. Enable PARTITION-RATE-LIMIT Alarm
2. Configure PARTITION-RATE-LIMIT Alarm
3. Configure SNMP Trap Destination

#### To enable PARTITION-RATE-LIMIT alarm by using the CLI

At the command prompt, type the following commands:

```
1 enable snmp alarm PARTITION-RATE-LIMIT
2
3 show snmp alarm PARTITION-RATE-LIMIT
```

#### To configure PARTITION-RATE-LIMIT Alarm by using the CLI

At the command prompt, type the following command:

```
1 set snmp alarm PARTITION-RATE-LIMIT \[-state \{ ENABLED | DISABLED }\]
 \[-severity <severity>\] \[-logging \{ ENABLED | DISABLED }\]
```

### To configure the SNMP trap destination by using the CLI

At the command prompt, type the following command:

```
1 add snmp trap <trapClass> <trapDestination> \[-version <version>] \[-td
 <positive_integer>] \[-destPort <port>] \[-communityName <string>]
 \[-srcIP <ip_addr|ipv6_addr>] \[-severity <severity>] \[-
 allPartitions \{ ENABLED | DISABLED \}]
```

### To configure the PARTITION-Rate-Limit alarm by using the GUI

Navigate to **System > SNMP > Alarms**, select **PARTITION-RATE-LIMIT** alarm, and configure the alarm parameters.

### To configure the SNMP trap destination by using the GUI

Navigate to **System > SNMP > Trap**, specify the IP address of the destination device.

## SNMP monitoring for partition resource utilization

Using SNMP, you can monitor a partition's resource (such as bandwidth, connection, and memory) utilization details at real time on a NetScaler appliance. It is done by sending an SNMP request (such as SNMP GET, SNMP GET BULK, SNMP GETNEXT, or SNMP WALK) from the SNMP Manager.

#### Note

To monitor partition resources, you must configure the SNMP community in the default partition. Wherein, the *partitionTable* is maintained in the default partition, and the SNMP communication is done through the NSIP address of the appliance.

Consider a scenario where a NetScaler administrator wants to know the bandwidth usage of partition P1 on the appliance. The SNMP Manager retrieves this information by sending an SNMP GET request on the corresponding OID (*partitionCurrentBandwidth*) to the NSIP address of the appliance. The SNMP agent on the default partition retrieves and sends the current bandwidth usage of P1 to the SNMP Manager through the NSIP address.

The following table lists the SNMP counters which are part of *partitionTable* and its description:

| SNMP Parameter | SNMP OID                      | Description    |
|----------------|-------------------------------|----------------|
| partitionName  | 1.3.6.1.4.1.5951.4.1.1.88.1.1 | Partition name |

---

| SNMP Parameter              | SNMP OID                      | Description                                            |
|-----------------------------|-------------------------------|--------------------------------------------------------|
| partitionCurrentBandwidth   | 1.3.6.1.4.1.5951.4.1.1.88.1.2 | Current bandwidth usage of the partition.              |
| partitionCurrentConnections | 1.3.6.1.4.1.5951.4.1.1.88.1.3 | Current number of active connections of the partition. |
| partitionMemoryUsagePcnt    | 1.3.6.1.4.1.5951.4.1.1.88.1.4 | Current Memory usage (in percentage) of the partition. |

---

## Audit log support for admin partitions

May 2, 2023

On a partitioned NetScaler appliance, for enhanced data security, you can configure audit logging in an administrative partition by using advanced policies. For example, you might want to view logs (states and status information) of a specific partition. It has multiple users accessing different sets of features based on their levels of authorization in the partition.

### Points to remember

1. The audit logs generated from the partition is stored as a single log file (/var/log/ns.log).
2. Configure the audit log server's (syslog or ns log) subnet address as the source IP address in the partition for sending the audit-log messages.
3. The default partition uses the NSIP as the source IP address for the audit log messages by default.
4. You can display the audit-log message by using the "show audit messages" command.

For information on audit-log configuration, see [Configuring the NetScaler Appliance for Audit Logging](#).

### Configuring audit logging in partitioned NetScaler appliance

Complete the following tasks to configure audit logging in an administrative partition.

1. Configure partition subnet IP address. An IPv4 SNIP address of an administrative partition.
2. Configure audit-log (syslog and ns log) action. An Audit action is a collection of information that specifies the messages to be logged and how to log the messages on the external log server.

3. Configure audit-log (syslog and ns log) policies. Audit-log policies define log messages for the source partition to the syslog or ns log server.
4. Bind audit-log policy to sysGlobal and nsGlobal entity. Bind an audit-log policy to a system global entity.
5. Review audit-log statistics. Display the audit-log statistics and evaluate the configuration.

### Configure the following by using the CLI

1. Create a partition's subnet IP address

```
add ns ip <ip address> <subnet mask>
```

2. Create a syslog action

```
add audit syslogAction <name> <serverIP> [-serverPort <port>] -
-logLevel <logLevel> [-dateFormat (MMDDYYYY | DDMMYYYY)] [-
transport (TCP | UDP)]
```

3. Create an ns log action

```
add audit nslogAction <name> <serverIP> [-serverPort <port>] -
logLevel <logLevel> [-dateFormat (MMDDYYYY | DDMMYYYY)]
```

4. Create a syslog audit-log policies

```
add audit syslogpolicy syslog-pol1 true audit-action1
```

5. Create an ns log audit-log policies

```
add audit nslogpolicy nslog-pol1 true audit-action1
```

6. Bind an audit-log policy to syslogGlobal entity

```
bind audit syslogglobal -policyName <name> -priority <priority_integer>
> -globalBindType SYSTEM_GLOBAL
```

7. Bind an audit-log policy to nslogGlobal entity

```
bind audit nslogglobal -policyName <name> -priority <priority_integer>
> -globalBindType SYSTEM_GLOBAL
```

8. Display an audit-log statistics

```
stat audit -detail
```

### Example

```
1 add ns ip 10.102.1.1 255.255.255.0
2 add audit syslogAction syslog_action1 10.102.1.2 -logLevel
 INFORMATIONAL - dateFormat MMDDYYYY - transport UDP
3 add audit syslogpolicy syslog-pol1 true syslog_action1
4 bind audit syslogglobal -policyName syslog-pol1 -priority 1 -
 globalBindType SYSTEM_GLOBAL
```

## Storing logs

When the SYSLOG or NSLOG server collects log information from all partitions, it is stored as log messages in the ns.log file. The log messages contain the following information:

- Partition Name.
- The IP address.
- A time stamp.
- The message type
- The predefined log levels (Critical, Error, Notice, Warning, Informational, Debug, Alert, and Emergency)
- The message information.

## Display configured PMAC addresses for shared VLAN configuration

May 2, 2023

To use a partition setup with shared VLAN configuration, you need a virtual MAC address called as partition MAC (PMAC) address. The partition uses the PMAC address for its communication on the shared VLAN. A unique PMAC address is configured for each partition and it is used across all shared VLANs bound to that partition. In the case of a non-SDX platform (VPX or MPX) platform, the PMAC address can be either user specified or internally generated by a NetScaler appliance. If the PMAC address is not specified for a partition, it is internally generated when the partition is bound to the first shared VLAN. While in the case of an SDX platform, the PMAC addresses always need to be configured from the SVM tool first and then assigned to a partition.

To display a list of configured PMACs, you can use the **Show ns PartitionMAC** command. The command enables you to verify the configured PMACs either through the NetScaler CLI or GUI. The command displays all the PMAC addresses and the corresponding partitions (if assigned). In the case of a non-SDX platform, the command displays all the PMAC addresses and their corresponding partitions because the PMAC address is assigned to a partition only on need basis (when a partition bound a shared VLAN). However in the case of an SDX platform, you might have some unassigned PMACs in the list.

For information on how to generate PMAC for the SDX platform, see [Generating Partition MAC Addresses](#) topic.

## Display PMACs by using the NetScaler CLI

At the command prompt, type the following command:

```
show ns partitionMAC
```

```
1 Partition MAC Partition Name
2
3 1) f2:0c:64:da:f6:d7
4
5 2) b4:0c:43:da:f6:d2
6
7 3) a6:e7:b2:6c:48:e0
8
9 Done
```

## Display PMAC Addresses by using the NetScaler GUI

1. Sign in to the NetScaler appliance and navigate to the **Configuration > System > Partition MAC**.
2. The Partition MAC page displays a list of PMACs and its partitions.

## AppExpert

May 2, 2023

The following topics provide a conceptual reference and configuration instructions for the AppExpert and other features of the NetScaler appliance.

### Note

For information about policy extensions, see [Policy Extensions](#).

- [Action Analytics](#): Collects run-time statistics on the basis of pre-defined criteria. When used with policies, the feature also provides you with the infrastructure for automatic, real-time traffic optimization.
- [AppExpert Applications and Templates](#): Simplify configuration steps for the Citrix® NetScaler® appliance by using applications, application templates, NetScaler Gateway applications, and entity templates.

- **AppQoE:** Application level Quality of Experience (AppQoE) integrates several existing policy-based security features of the NetScaler appliance into a single integrated feature that takes advantage of a new queuing mechanism, fair queuing.
- **Entity Template:** Describes how to use entity templates to set up and configure individual NetScaler entities, such as a policy or virtual server. An entity template provides a specification and a set of defaults for the object.
- **HTTP Callouts:** An HTTP request that the NetScaler appliance generates and sends to an external application when certain criteria are met during policy evaluation.
- **Pattern Sets:** Allow string matching during the evaluation of a Advanced policy.
- **Policies and Expressions:** Rules that determine the operations that the NetScaler appliance must perform.
- **Rate Limiting:** Defines the maximum load for a given network entity or virtual entity on the NetScaler appliance.
- **Responder:** Bases responses on who sends the request, where it is sent from, and other criteria with security and system management implications.
- **Rewrite:** Rewrites information in the requests or responses handled by the NetScaler appliance.
- **String Maps:** Perform pattern matching in all NetScaler features that use the default policy syntax.

## Action analytics

May 2, 2023

The performance of your website or application depends on how well you optimize the delivery of the most frequently requested content. Techniques such as caching and compression help accelerate the delivery of services to clients, but you need to be able to identify the resources that are requested most frequently, and then cache or compress those resources. You can identify the most frequently used resources by aggregating real-time statistics about website or application traffic. Statistics such as how frequently a resource is accessed relative to other resources and how much bandwidth is consumed by those resources help you determine whether those resources need to be cached or compressed to improve server performance and network utilization. Statistics such as response times and the number of concurrent connections to the application help you determine whether you must enhance server-side resources.

If the website or application does not change frequently, you can use products that collect statistical data, and then manually analyze the statistics and optimize the delivery of content. However, if you

do not want to perform manual optimizations, or if your website or application is dynamic in nature, you need infrastructure that can not only collect statistical data but can also automatically optimize the delivery of resources on the basis of the statistics. On the NetScaler appliance, this functionality is provided by the action analytics feature. The feature operates on a single NetScaler appliance and collects run-time statistics on the basis of criteria that you define. When used with NetScaler policies, the feature also provides you with the infrastructure that you need for automatic, real-time traffic optimization.

When configuring the action analytics feature, you specify the request attributes for which you want to collect statistical data, for example, URLs and HTTP methods by configuring Advanced policy expressions in an entity called a selector. Then, you configure an identifier to configure settings such as the sampling interval and sample count. You also configure a policy that enables the appliance to evaluate traffic as specified by the selector-identifier pair. Finally, you bind the policy to a bind point to begin collecting statistics.

The appliance also provides you with a set of built-in selectors, identifiers, and responder policies that you can use to get started with the feature.

The appliance aggregates the following statistics:

- The number of requests.
- The bandwidth consumed by the requests.
- The response time.
- The number of concurrent connections.

You can configure the feature to perform run-time sorting of the records on an attribute of your choice. You can view the statistical data by using either the command-line interface or the Stream Sessions tool in the configuration utility.

## Configure a selector

October 18, 2023

A selector is a filter for identifying requests. It consists of up to five individual Advanced policy expressions that identify request attributes such as the client IP address and the URL in the request. Each expression is a non-compound Advanced policy expression and is considered to be in an AND relationship with the other expressions. The following are some examples of selector expressions:

- `HTTP.REQ.URL`
- `CLIENT.IP.SRC`
- `HTTP.RES.BODY(1000).AFTER_STR("<string>").BEFORE_STR("<string>")`
- `CLIENT.IP.SRC.SUBNET(24)`

Selectors are used in rate limiting and action analytics configurations. A selector is optional in a rate limiting configuration but is required in an action analytics configuration.

The order in which you specify parameters is significant. For example, if you configure an IP address and a domain (in that order) in one selector, and then specify the domain and the IP address (in the reverse order) in another selector, the NetScaler considers these values to be unique. This can lead to the same transaction being counted twice. Also, if multiple policies invoke the same selector, the NetScaler, again, can count the same transaction more than once.

If you modify an expression in a selector, you may get an error if any policy that invokes it is bound to a new policy label or bind point. For example, suppose that you create a selector named `myLimitSelector1`, invoke it from `myLimitID1`, and invoke the identifier from a DNS policy named `dnsRateLimit1`. If you change the expression in `myLimitSelector1`, you might receive an error when binding `dnsRateLimit1` to a new bind point. The workaround is to modify these expressions before creating the policies that invoke them.

The NetScaler appliance provides [built-in selectors](#) for some of the most common use cases.

You can also configure a selector with expressions that identify the request attributes of your choice. For example, you might want to create a record for a request that arrives with a specific header. To evaluate the header, you can add `HTTP.REQ.HEADER("<header_name>")` to the selector that you intend to use.

#### **To configure a selector by using the command line interface:**

At the command prompt, type the following commands to configure a selector and verify the configuration:

- `add stream selector <name> <rule> ...`
- `show stream selector`

#### **Example**

```
1 > add stream selector myselector HTTP.REQ.URL CLIENT.IP.SRC
2 Done
3 > show stream selector myselector
4 Name: myselector
5 Expressions:
6 1) HTTP.REQ.URL
7 2) CLIENT.IP.SRC
8 Done
9 >
10 <!--NeedCopy-->
```

#### **To modify or remove a selector by using the command line interface:**

- To modify a selector, type the set stream selector command, the name of the selector, and the rule parameter with the expressions. Enter the existing expressions that you want to retain, along with the new expressions that you want to add.
- To remove a selector, type the rm stream selector command and the name of the selector.

### To configure a selector by using the GUI:

1. Navigate to **AppExpert > Action Analytics > Selectors**.
2. In the details pane, do one of the following:
  - To create a selector, click **Add**.
  - To modify a selector, select the selector, and then click **Edit**.
3. In the **Create Selector** or **Configure Selector** page, set the following parameters:
  - **Name.** To add a name for the selector, enter the name in the **Name** field. The Name must begin with an ASCII, alphanumeric, or underscore character. The name must contain only ASCII alphanumeric, underscore, hash, period, space, colon, at, equals, and hyphen characters.
  - **Expressions.** To add the expression to the selector configuration, click **Insert**. To remove an expression from the selector configuration, in the Expression box, select the expression, and then click **Delete**. Note: In the Expressions box, enter a valid parameter. For example, enter HTTP. Then, enter a period after this parameter. A drop-down menu appears. The contents of this menu provide the keywords that can follow the initial keyword that you entered. To select the next keyword in this expression prefix, double-click the selection in the drop-down menu. The **Expressions** text box displays both the first and second keywords for the expression prefix, for example, HTTP.REQ. Continue adding expression components until the complete expression is formed.
4. Click **Insert**.
5. Continue adding up to five non-compound expressions.
6. Click **Create** and then **Close**.

## Configure a stream identifier

October 18, 2023

You configure a stream identifier to specify parameters for collecting statistical data from requests identified by a given selector. An identifier specifies the selector to be used, the statistics collection interval, the sample count, and the field on which the records are to be sorted.

The NetScaler appliance includes the following built-in stream identifiers for common use cases. All the built-in identifiers specify a sample count of 1 and an interval of 1 minute. Additionally, they sort the data on the

REQUESTS attribute. They differ only in being associated with different built-in selectors. Each built-in identifier is associated with a built-in selector of the same name (for example, the built-in identifier Top\_URL is associated with the built-in selector Top\_URL). Following are the built-in identifiers:

- Top\_URL
- Top\_CLIENTS
- Top\_URL\_CLIENTS\_LBVSERVER
- Top\_URL\_CLIENTS\_CSVSERVER
- Top\_MSSQL\_QUERY\_DB\_LBVSERVER
- Top\_MYSQL\_QUERY\_DB\_LBVSERVER

For more information about the built-in selectors, see [Configuring a Selector](#).

Note: The maximum length for storing string results of selectors (for example, HTTP.REQ.URL) is 60 characters. If the string (for example, URL) is 1000 characters long, of which 50 characters are enough to uniquely identify a string, use an expression to extract only the required 50 characters.

You cannot modify a built-in identifier's configuration. However, you can create an identifier with a configuration of your choice.

To configure a stream identifier by using the command line interface

At the command prompt, type the following commands to configure a stream identifier and verify the configuration:

- `add stream identifier <name> <selectorName> [-interval <positive_integer>] [-SampleCount <positive_integer>] [-sort <sort>]`
- `show stream identifier <name>`

## Example

```
1 > add stream identifier myidentifier Top_URL -interval 10 -sampleCount
 100
2 Done
3 <!--NeedCopy-->
```

To configure a stream identifier by using the GUI

1. Navigate to **AppExpert > Action Analytics > Stream Identifiers**.
2. In the details pane, do one of the following:
  - To create a stream identifier, click **Add**.

- To modify a stream identifier, select the identifier, and then click **Edit**.
3. In the Configure Stream Identifier page, set the following parameters:
    - Name
    - Selector
    - Interval
    - Sample Count
    - Sort
  4. Click **Create**, and then click **Close**.

## View statistics

October 18, 2023

You can view the collected statistics in tabular format in the command-line interface and in graphical format in the configuration utility.

The following table describes the collected statistics:

| Statistics         | Column name in the output of the stat stream identifier <code>&lt;identifier name&gt;</code> command | Description                                                                                                        |
|--------------------|------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Number of requests | <b>Req</b>                                                                                           | The number of requests for which records were created in the last <code>&lt;interval&gt;</code> number of minutes. |

| Statistics             | Column name in the output of the stat stream identifier <identifier name> command | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Bandwidth consumed     | <b>BandW</b>                                                                      | The total bandwidth consumed by the requests that were received in the last <interval> number of minutes. The total bandwidth of a request is the bandwidth consumed by the request and its response. The value is rounded off to the next higher or next lower integer value. So, it might differ slightly from the expected value. For example, if a request's total bandwidth consumption is 2.2 KB. One instance of the request might be shown as having consumed 2 KB. Two instances might be shown as having consumed 4 KB, but three instances might be shown as having consumed 7 KB. |
| Response time          | <b>RspTime</b>                                                                    | The average response time for all the requests received in the last <interval> number of minutes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Concurrent connections | <b>Conn</b>                                                                       | The total number of concurrent connections that are currently open.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

To view the statistical data collected for a stream identifier by using the command line

At the command prompt, type:

```
stat stream identifier <name> [<pattern> ...] [-detail] [-fullValues]
[-ntimes <positive_integer>] [-logFile <input_filename>] [-sortBy <
sortBy> [<sortOrder>]
```

## Examples

Example 1 sorts the output on the BandW column, in the descending order. Example 2 sorts the output in Example 1, on the **Req** column, and in the ascending order

### Example 1

```

1 > stat stream identifier myidentifier -sortBy BandW Descending -
 fullValues
2 Stream Session statistics
3 Req BandW
4 User1 508 125924
5 User2 5020 12692
6 User3 2025 4316
7
8 RspTime Conn
9 User1 5694 0
10 User2 109 0
11 User3 3 0
12 Done
13 <!--NeedCopy-->

```

### Example 2

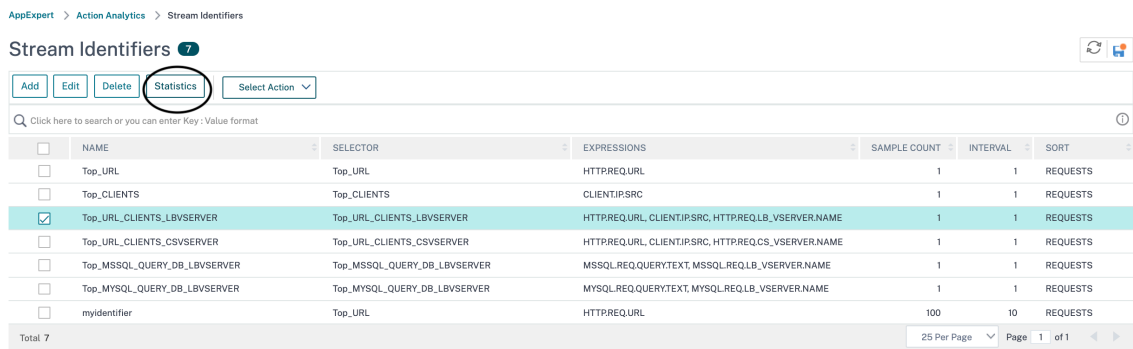

```

1 > stat stream identifier myidentifier -sortBy Req Ascending -
 fullValues
2 Stream Session statistics
3 Req BandW
4 User1 508 125924
5 User3 2025 4316
6 User2 5020 12692
7
8 RspTime Conn
9 User1 5694 0
10 User3 3 0
11 User2 109 0
12 Done
13 <!--NeedCopy-->

```

To view the statistical data collected for a stream identifier by using the GUI

1. Navigate to **AppExpert > Action Analytics > Stream Identifiers**.
2. Select the stream identifier whose sessions you want to view, and then click Statistics For information about how you can group the output based on the values collected for various selector expressions.

## Group records on attribute values

December 22, 2023

Statistical information such as the number of times a particular URL has been accessed overall and per client, and the total number of GET and POST requests per client can provide valuable insights into whether any of your resources need to be expanded to meet the demand or be optimized for delivery. To obtain such statistics, you must use an appropriate set of selector expressions, and then use the pattern parameter in the stat stream identifier command. The grouping is based on the pattern that is specified in the command. Grouping can be performed concurrently on the values of multiple expressions.

In the command-line interface, you can group the output by using patterns of your choice. In the configuration utility, the pattern depends on the choices you make when drilling down through the values of various selector expressions. For example, consider a selector that has the expressions `HTTP.REQ.URL`, `CLIENT.IP.SRC`, and `HTTP.REQ.LB_VSERVER.NAME`, in that order. The statistics home page displays icons for each of these expressions. If you click the icon for `CLIENT.IP.SRC`, the output is based on the patterns `? <IP address> ?`. The output displays statistics for each client IP address. If you click an IP address, the output is based on the patterns `* <IP address> ?` and `? <IP address> *` where `<IP address>` is the IP address you selected. In the resulting output, if you click a URL, the pattern used is `<URL> <IP address> ?`.

### To group the records on the values of selector expressions by using the command line interface

At the command prompt, enter the following command to group the records on the basis of a selector expression:

```
stat stream identifier <name> [<pattern> ...]
```

The following examples use a different pattern to demonstrate the effect of the pattern on the output of the stat stream identifier command. The selector expressions are HTTP.REQ.URL and HTTP.REQ.HEADER("UserHeader"), in that order. The requests contain a custom header whose name is UserHeader. Note that in the examples, a given statistical value changes as determined by the grouping, but the sum total of the values for a given field remains the same.

#### Example 1

In the following command, the pattern used is `? ?`. The appliance groups the output on the values collected for both selector expressions. The row headers consist of the expression values separated by a question mark (?). The row with the header `/mysite/mypage1.html?Ed` displays statistics for requests made by user Ed for the URL `/mysite/mypage1.html`.

#### Note:

You must ensure to type the following command with `"\?"` instead of `"?"`. For example, If selector uses an expression - `client.ip.src` and `client.tcp.srcport`. The Stat command to group the output on the values collected for the selector is `'stat stream identifier myidentifier \? \? -fullValues'` as given below.

```

1 > stat stream identifier myidentifier ? ? -fullValues
2 Stream Session statistics
3
4 Req BandW
5 /mysite/mypage2.html?Grace 1 2553
6 /mysite/mypage1.html?Grace 2 4
7 /mysite/mypage1.html?Ed 8 16
8 /mysite/mypage2.html?Joe 1 2554
9 /mysite/mypage1.html?Joe 5 10
10 /mysite/?Joe 1 4
11
12 RspTime Conn
13 /mysite/mypage2.html?Grace 0 0
14 /mysite/mypage1.html?Grace 0 0
15 /mysite/mypage1.html?Ed 0 0
16 /mysite/mypage2.html?Joe 0 0
17 /mysite/mypage1.html?Joe 0 0
18 /mysite/?Joe 6 0
19 Done
20 <!--NeedCopy-->

```

#### Example 2

In the following command, the pattern used is `* ?`. The appliance groups the output on the values accumulated for the second expression HTTP.REQ.HEADER("UserHeader"). The rows display statistics for all requests made by users Grace, Ed, and Joe.

**Note:**

Ensure to type the following command with “\?” instead of “?”.

```

1 > stat stream identifier myidentifier * ?
2 Stream Session statistics
3 Req BandW RspTime Conn
4 Grace 3 2557 0 0
5 Ed 8 16 0 0
6 Joe 7 2568 6 0
7 Done
8 <!--NeedCopy-->

```

**Example 3**

In the following command, the pattern used is ? \*, which is the default pattern. The output is grouped on the values collected for the first selector expression. Each row displays statistics for one URL.

**Note:**

Ensure to type the following command with “\?” instead of “?”.

```

1 > stat stream identifier myidentifier ? * -fullValues
2 Stream Session statistics
3 Req BandW
4 /mysite/mypage2.html 2 5107
5 /mysite/mypage1.html 15 30
6 /mysite/ 1 4
7
8 RspTime Conn
9 /mysite/mypage2.html 0 0
10 /mysite/mypage1.html 0 0
11 /mysite/ 6 0
12 Done
13 <!--NeedCopy-->

```

**Example 4**

In the following command, the pattern used is \* \*. The appliance displays one set of collective statistics for all the requests received, with no row title.

```

1 > stat stream identifier myidentifier * *
2 Stream Session statistics
3 Req BandW RspTime Conn
4 18 5141 6 0
5 Done
6 <!--NeedCopy-->

```

**Example 5**

In the following command, the pattern is /mysite/mypage1.html \*. The appliance displays one set of collective statistics for all the requests received for the URL /mysite/mypage1.html, with no row

title.

```
1 > stat stream identifier myidentifier /mysite/mypage1.html *
2 Stream Session statistics
3 Req BandW RspTime Conn
4 15 30 0 0
5 Done
6 <!--NeedCopy-->
```

## Clear a stream session

December 22, 2023

You can flush all the records that have been accumulated for a stream identifier.

### To clear a stream session by using the command line interface

At the command prompt, enter the following commands to clear a stream session and verify the results:

- clear stream session
- stat stream identifier

### Example

This example uses the stat stream identifier command first, so that a comparison can be made with the stat stream identifier command that is used for verifying the result of the clear stream session command.

```
1 >stat stream identifier myidentifier
2 Stream Session statistics
3 Req BandW RspTime Conn
4 /aed....html 2 0 0 0
5 / 636 303 12 0
6 Done
7 >clear stream session myidentifier
8 Done
9 >stat stream identifier myidentifier
10 Done
11 <!--NeedCopy-->
```

## To clear a stream session by using the GUI

1. Navigate to **AppExpert > Action Analytics > Stream Identifiers**.
2. Select the stream identifier whose sessions you want to clear, and then click **Clear Sessions**.

Stream Identifiers ↻ 🗑️

## Configure policy for optimizing traffic

May 2, 2023

To put the selector-identifier pair in your action analytics configuration into effect, you must associate the pair with the point in the traffic flow at which you want to collect statistics. You can do so by configuring a Advanced policy and referencing the stream identifier from the policy rule. You can use compression policies, caching policies, rewrite policies, application firewall policies, responder policies, and any other policies whose action is based on a Boolean expression.

The action analytics feature introduces a set of Advanced policy expressions and functions for collecting and evaluating data. The expression `ANALYTICS.STREAM(<identifier_name>)` is used for referencing the identifier that you want to use. The expression `COLLECT_STATS` is used to collect statistical data. Functions such as `IS_TOP(<uint>)` and `IS_TOP_FREQUENTS(<uint>)` are used for making automatic, real-time traffic optimization decisions.

- **IS\_TOP(<number>)**. Finds if a given object is in the top <number> of elements. For example, is the element among the top 10 elements. When multiple elements have the count, they are considered to be similar in nature. The sort function must be turned on to avoid an undef condition.
- **IS\_TOP\_FREQUENTS(<frequency>)**. Finds if a given object is in the top <frequency> of the elements that are in the top elements. For example, is the element among the top 50% of all

the top elements maintained. Elements having the same values are considered similar in nature. The sort function must be turned on to avoid an undef condition.

It is your policy configuration that determines whether the NetScaler appliance must only collect data from traffic or also perform an action. If the appliance must only collect statistical data, you can configure a policy with the rule `ANALYTICS.STREAM(<identifier_name>).COLLECT_STATS` and the action NOOP. The NOOP policy must be the policy with the highest priority at the bind point. This policy is sufficient if you are only collecting statistics. Traffic optimization decisions, such as what to compress or cache, must be based on manual, periodic evaluation of the statistical data.

If, in addition to collecting statistics, the appliance must also perform an action on the traffic, you must configure the `gotoPriorityExpression` parameter of the NOOP policy such that another policy that has the desired rule and action is evaluated subsequently. This second policy must have a rule that begins with the `ANALYTICS.STREAM(<identifier_name>)` prefix and a function that evaluates the data.

Following is an example of two responder policies that are configured and bound globally. The policy `responder_stat_collection` enables the appliance to collect statistics based on the identifier, `myidentifier`. The policy `responder_notify` evaluates the data that is collected.

### Example

```
1 > add responder action send_notification respondwith '"You are in the
 Top 10 list for bandwidth consumption"'
2 Done
3 > add responder policy responder_stat_collection' ANALYTICS.STREAM("
 myidentifier").COLLECT_STATS' NOOP
4 Done
5 > add responder policy responder_notify 'ANALYTICS.STREAM("myidentifier
 ").BANDWIDTH.IS_TOP(10)' send_notification
6 Done
7 > bind responder global responder_stat_collection 10 NEXT
8 Done
9 > bind responder global responder_notify 20 END
10 Done
11 <!--NeedCopy-->
```

## How to limit bandwidth consumption per user or client device

April 27, 2021

Your web site, application, or file hosting service has finite network and server resources available to it to serve all its users. One of the most important resources is bandwidth. Substantial bandwidth con-

sumption by only a subset of the user base can result in network congestion and reduced resource availability to other users. To prevent network congestion, you might have to limit a client's bandwidth consumption by using temporary service denial techniques such as responding to a client request with an HTML page if it has exceeded a preconfigured bandwidth value over a fixed time period leading up to the request.

In general, you can regulate bandwidth consumption either per client device or per user. This use case demonstrates how you can limit bandwidth consumption per client to 100 MB over a time period of one hour. The use case also demonstrates how you can regulate bandwidth consumption per user to 100 MB over a time period of one hour, by using a custom header that provides the user name. In both cases, the tracking of bandwidth consumption over a moving time period of one hour is achieved by setting the interval parameter in the stream identifier to 60 minutes. The use cases also demonstrate how you can import an HTML page to send to a client that has exceeded the limit. Importing an HTML page not only simplifies the configuration of the responder action in these use cases, but also simplifies the configuration of all responder actions that need the same response.

To limit bandwidth consumption per user or client device by using the command line interface

In the command-line interface, perform the following tasks to configure action analytics for limiting a client's or user's bandwidth consumption. Each step includes sample commands and their output.

1. **Set up your load balancing configuration.** Configure load balancing virtual server `mysitevip`, and then configure all the services that you need. Bind the services to the virtual server. The following example creates ten services and binds the services to `mysitevip`.

```
1 > add lb vserver mysitevip HTTP 192.0.2.17 80
2 Done
3 > add service service[1-10] 192.0.2.[240-249] HTTP 80
4 service "service1" added
5 service "service2" added
6 service "service3" added
7 .
8 .
9 .
10 service "service10" added
11 Done
12 > bind lb vserver vserver1 service[1-10]
13 service "service1" bound
14 service "service2" bound
15 service "service3" bound
16 .
17 .
18 .
19 service "service10" bound
20 Done
21 <!--NeedCopy-->
```

2. **Configure the stream selector.** Configure one of the following stream selectors:

- To limit bandwidth consumption per client, configure a stream selector that identifies the client IP address.

```

1 > add stream selector myselector CLIENT.IP.SRC
2 Done
3 <!--NeedCopy-->

```

- To limit bandwidth consumption per user on the basis of the value of a request header that provides the user name, configure a stream selector that identifies the header. In the following example, the name of the header is UserHeader.

```

1 > add stream selector myselector HTTP.REQ.HEADER(" UserHeader
 ")
2 Done
3 <!--NeedCopy-->

```

3. **Configure a stream identifier.** Configure a stream identifier that uses the stream selector. Set the interval parameter to 60 minutes.

```

1 > add stream identifier myidentifier myselector -interval 60 -
 sampleCount 1 -sort BANDWIDTH
2 Done
3 <!--NeedCopy-->

```

4. **Configure the responder action.** Import the HTML page that you want to send to users or clients that have exceeded the bandwidth consumption limit, and then use the page in responder action `crossed_limits`.

```

1 > import responder htmlpage http://.1.1.1/stdpages/wait.html
 crossed-limits.html
2 This operation may take some time, Please wait...
3
4 Done
5 > add responder action crossed_limits respondwithhtmlpage crossed-
 limits.html
6 Done
7 <!--NeedCopy-->

```

5. **Configure the responder policies.** Configure responder policy `myrespol1` with the rule `ANALYTICS.STREAM("myidentifier").COLLECT_STATS` and the action `NOOP`. Then, configure policy `myrespol2` for determining whether a client or user has crossed the 100 MB limit. The policy `myrespol2` is configured with the responder action `crossed_limits`.

```

1 > add responder policy myrespol1 'ANALYTICS.STREAM("myidentifier")
 .COLLECT_STATS' NOOP
2 Done
3 > add responder policy myrespol2 'ANALYTICS.STREAM("myidentifier")
 .BANDWIDTH.GT(104857600)' crossed_limits
4 Done
5 <!--NeedCopy-->

```

6. **Bind the responder policies to the load balancing virtual server.** The policy myrespol1, which only collects statistical data, must have the higher priority and a GOTO expression of NEXT.

```

1 > bind lb vserver mysitevip -policyName myrespol1 -priority 1 -
 gotoPriorityExpression NEXT
2 Done
3 > bind lb vserver mysitevip -policyName myrespol2 -priority 2 -
 gotoPriorityExpression END
4 Done
5 <!--NeedCopy-->

```

7. **Test the configuration.** Test the configuration by sending test HTTP requests, from multiple clients or users, to the load balancing virtual server and using the stat stream identifier command to view the statistics that are collected for the specified identifier. The following output displays statistics for clients.

```

1 > stat stream identifier myidentifier -sortBy BandW -fullValues
2 Stream Session statistics
3
4 Req BandW
5 192.0.2.30 5000 3761
6 192.0.2.31 29 2602
7 192.0.2.32 25 51
8
9 RspTime Conn
10 192.0.2.30 2 0
11 192.0.2.31 0 0
12 192.0.2.32 0 0
13 Done
14 >
15 <!--NeedCopy-->

```

## AppExpert applications

May 2, 2023

### Warning

The application template functionality is deprecated. As an alternative, you can use StyleBooks. For more information, see [StyleBooks](#) and [Web application firewall StyleBook](#).

An AppExpert application is a collection of configuration that you set up on the NetScaler appliance. Managing AppExpert applications is simplified by a GUI (GUI) that allows you to specify application traffic subsets and a distinct set of security and optimization policies for processing each traffic subset. Also, it consolidates deployment steps in one view, so you can quickly configure target IP addresses for clients and specify host servers.

After the AppExpert application is set up, you must verify that the application is working correctly. If necessary, you can customize the configuration to suit your requirements.

Periodically, you can verify and monitor the configuration by viewing the counters for various application components, statistics, and the Application Visualizer. You can also configure authentication, authorization, and auditing (authentication, authorization, and auditing) policies for the application.

## AppExpert application terminology

Following are the terms used in the AppExpert applications feature and the descriptions of the entities for which the terms are used:

**Public endpoint.** The IP address and port combination at which the NetScaler appliance receives client requests for the associated web application. A public endpoint can be configured to receive either HTTP or secure HTTP (HTTPS) traffic. All client requests for the web application must be sent to a public endpoint. An AppExpert application can be assigned multiple endpoints.

**Application unit.** An AppExpert application entity that processes a subset of web application traffic and load balances a set of services that host the associated content. The subset of traffic that an application unit must manage is defined by a rule. Each application unit also defines its own set of traffic optimization and security policies for the requests and responses that it manages. The NetScaler services associated with these policies are Compression, Caching, Rewrite, Responder, and application firewall.

By default, every AppExpert application with at least one application unit includes a default application unit, which cannot be deleted. The default application unit is not associated with a rule for identifying requests and is always placed last in the order of application units. It defines a set of policies for processing any request that does not match the rules that are configured for the other application units. Thereby ensuring all client requests are processed.

**Service.** The combination of the IP address of the server that hosts the web application instance and the port to which the application is mapped on the server, in the format `\<IP address\>:\<Port\>`. A web application that serves many requests is hosted on multiple servers. Each server is said to host an instance of the web application, and each such instance of the web application is represented by a service on the NetScaler appliance.

**Application unit rule.** Advanced policy expression that defines the characteristics of a traffic subset for an application unit. The following example rule is a Advanced policy expression that identifies a traffic subset that consists of four image types:

```
HTTP.REQ.URL.SUFFIX.EQ("bmp") || HTTP.REQ.URL.SUFFIX.EQ("gif") || HTTP.REQ.URL.SUFFIX.EQ("png") || HTTP.REQ.URL.SUFFIX.EQ("jpg")
```

For more information about Advanced policy expressions, see [Policies and Expressions](#).

**Traffic Subset.** A set of client requests that require a common set of traffic optimization and security policies. A traffic subset is managed by an application unit and is defined by a rule.

## How AppExpert application works

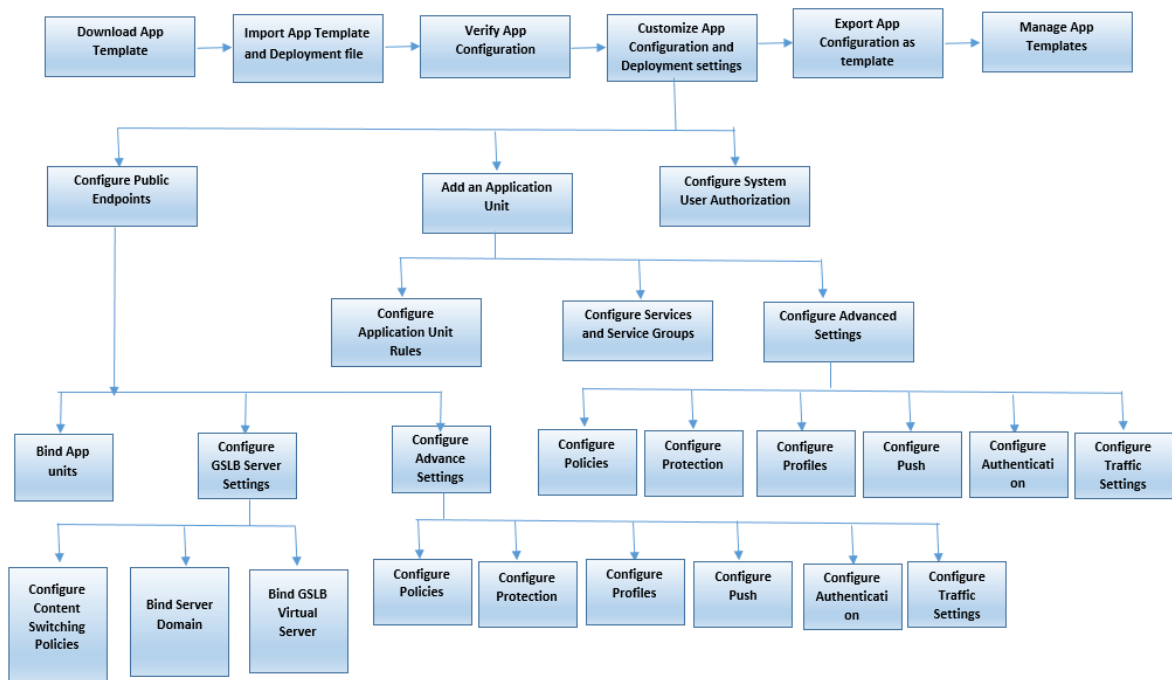

December 21, 2023

When the endpoint receives a client request, the NetScaler appliance evaluates the request against the rule that is configured for the topmost application unit. If the request satisfies this rule, the request is processed by the policies that are configured for the application unit, and then forwarded to a service. The choice of service depends on which services are configured for the application, and on settings such as the load balancing algorithm and persistence method configured for the application unit.

If the request does not satisfy the rule, the request is evaluated against the rule for the next topmost application unit. In this order, the request is evaluated against each application unit rule until the request satisfies a rule. If the request does not satisfy any of the configured rules, it is processed by the default application unit, which is always the last application unit.

You can configure multiple public endpoints for an AppExpert application. In such a configuration, by default, each application unit processes requests received by all the public endpoints and load balances all the services that are configured for the application. However, you can specify that an application unit processes traffic from only a subset of the public endpoints and load balances only a subset of the services that are configured for the AppExpert application.

The following flow diagram illustrates the AppExpert Application flow sequence for using a built-in application template.

If you prefer to create a customized application without using a template, do the following:

1. Create a custom application.
2. Configure application and deployment settings.
3. Export the configuration to new template files (optional).
4. Import the template files to other NetScaler appliances that require a similar AppExpert application configuration

## Customize AppExpert configuration

December 22, 2023

After you verify that the AppExpert application is working correctly, you can customize the configuration to suit your requirements.

After you verify that the AppExpert application configuration is working correctly, you can configure the application and the deployment settings to suit your requirements. When you import an application template and deployment file, the system automatically populates the target application with the available configuration settings (such as application units, application unit rules, policies, persistence settings, load balancing methods, profiles, and traffic settings). In this application, you can configure deployment settings such as public endpoints, services, and service groups for each traffic subset. If you want the AppExpert application to manage a traffic subset that is not included in the template,

you can either add an application unit for a traffic subset or modify the existing application unit. After you customize the configuration, you can also specify the order of evaluation for each traffic subset that the application manages.

Configuring an AppExpert application consists of the following steps:

1. [Configuring Public Endpoints](#)
2. [Configuring Application Units](#)
3. [Specifying the Order of Evaluation](#)
4. [Viewing Application Configuration using Visualizer](#)

Also, you can configure the policies that the template provided. If the AppExpert application template does not include policies for a particular NetScaler feature, such as Rewrite or application firewall, you can configure your own policies.

## Configure public endpoints

June 6, 2022

If you did not specify a public endpoint when importing an AppExpert application, you can specify public endpoints after you create the application. You can configure one public endpoint of type HTTP and one public endpoint of type HTTPS for your AppExpert application.

If endpoints are already configured for the application, you can dissociate endpoints from the AppExpert application and delete any endpoints that you no longer need. Note that when you dissociate a public endpoint from the AppExpert application, the endpoint is automatically unbound from the associated application unit, but it is not deleted from the system.

To configure public endpoints for an AppExpert application:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, right-click the application for which you want to configure public endpoints, and then click Edit.
3. In the **Applications** page, go to **Public Endpoint** section and click the pencil icon.
4. In the **Public Endpoint** slider, set the following parameters.
  - a) Public endpoint type. Select the radio button to define the endpoint type.
  - b) Name. Name of the public endpoint.
  - c) IP address. IP address of the public endpoint.
  - d) Port. Port number of the public endpoint.
  - e) Protocol. Select a protocol type as HTTP or HTTPS.
5. Click **Continue**.

6. In the **Application Units** section, select an application unit from the list.
7. Click **Continue** to set the policy and server details.
8. Click **OK** and then Done.
9. Click Close.

For more information about the parameters in the **Configure Public Endpoint** dialog box, see [Content Switching](#).

## Configure services and service groups for an application unit

June 6, 2022

When you configure a service or service group, you either modify an existing service or service group, or add new services to the AppExpert application. You add services or service groups if you did not specify them when you imported the application template. You also add services and service groups when you increase the number of servers that host instances of the application. You can configure a service and service group for an application unit only after you configure the service or service group for the AppExpert application.

To configure a service or service group for the AppExpert application:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, right-click the application and then click **Edit**.
3. In the **Applications** page, select an application unit and then click **Continue**.
4. In the **Services and Service Groups** section, do the following:
  - a) In the Service Binding slider, set the following parameters:
    - i. Service. Select a load balancing service from the list or create a new service.
    - ii. Weight. Provide a weight value for the service.
  - b) Click **Bind** and then **Done**.
  - c) In the ServiceGroup Binding slider, set the following parameters:
    - i. Service Group Name. Select a load balancing service group or create a new service group.
    - ii. Click **Bind** and then **Done**.
  - d) Click **Done**.
5. Click **Continue** to set other configurations.

## Create application units

June 6, 2022

You might need to add application units for traffic subsets that are either specific to your web application implementation or not defined in the template. When creating an application unit, you must configure a rule for the application unit.

To create an application unit for the AppExpert application:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, right-click the application for which you want to add an application unit, and then click **Add**.
3. In the **Applications** page, go to **Application Units** section and click the **pencil** icon.

To configure policy expressions for an application unit:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, right-click the application for which you want to add an application unit, and then click **Add**.
3. In the **Applications** page, go to **Application Units** section and click the **+** icon. to create a unit and add policy expressions.
4. To specify the format of the new expression, do one of the following:
  - a) To specify that you want to configure a policy expression in the Rule box, click **Classic Syntax**.
  - b) To specify that you want to configure an advanced expression in the Rule box, click **Advanced policy**.
  - c) In the Rule box, configure the expression.
5. Click **OK**.

## Configure application unit rules

December 21, 2023

You might want to configure an application unit rule to include or exclude certain types of traffic. When you configure the rule, you can also define the syntax of the expression.

To configure an application unit rule:

1. In the navigation pane of the GUI, expand AppExpert, and then click **Applications**.

2. In the details pane, right-click the application unit for which you want to modify the rule, and then click **Open**.
3. In the Configure Application Unit dialog box, do the following:
  - a) To specify the format of the new expression, do one of the following:
    - To specify that you want to configure a Advanced policy expression in the Rule box, click **Classic Syntax**.
    - To specify that you want to configure an advanced expression in the Rule box, click **Advanced policy**.
  - b) In the Rule box, configure the expression.
4. Click **OK**.

## Configure policies for application units

December 21, 2023

For an AppExpert application, you can configure policies for Compression, Caching, Rewrite, Responder, and Application Firewall. The templates that you download from the Citrix Community web site provide you with a set of policies that fulfill the most common application management requirements. You might want to fine-tune or customize these policies. If the set of policies provided for a given application unit does not include policies for a particular feature, you can create and bind your own policies for that feature.

If you create an AppExpert application without using a template, you must configure all the policies that the web application needs.

The GUI uses various icons to indicate whether or not policies are configured for a feature. For an application unit, if a policy is configured for a given feature, an icon that represents the feature is displayed. For example, if a compression policy is configured for an application unit, a compression icon is displayed in the Compression column for the application unit. For features for which no policy is configured, an icon depicting a plus sign (+) is displayed.

Note: When configuring policies for application units, you might need to configure policies and expressions that are either in the classic or Advanced policy. Additionally, when you configure Advanced policy policies, you might need to specify parameters such as Goto expressions and invoke policy banks.

For information about configuring policies and expressions in both formats, see [Policies and Expressions](#).

## Configuring compression policies

You can use either classic policies or advanced policies to configure compression, but you cannot bind compression policies of both types to the same application unit.

To configure a compression policy for an application unit:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Compression column.
3. In the Configure Compression Policies dialog box, do one or more of the following, depending on the configuration tasks you want to perform:

- Click Switch to Advanced policy if you want to configure a Advanced policy compression policy. If you want to bind or configure classic compression policies, and if you are in the Advanced policy view, you can click Switch to Classic Syntax to return to the classic policy view and begin modifying bound classic policies or create and bind new classic compression policies.

**Important:** This setting also determines what policies are displayed when you want to insert a policy. For example, if you are in the Advanced policy view, when you click Insert Policy, the list that appears in the Policy Name column will include only Advanced policy policies. You cannot bind policies of both types to an application unit.

- If you want to configure classic policies, click either Request or Response, depending on whether you want the policy to be evaluated at request-time or at response-time. You can configure both request-time and response-time classic compression policies for an application unit. After evaluating all of the request-time policies, if no match is found, the appliance evaluates response-time policies.
- To modify a compression policy that is already bound to the application unit, click the name of the policy, and then click Modify Policy. Then, in the Configure Compression Policy dialog box, modify the policy, and then click OK.  
For information about modifying a compression policy, see [Compression](#).
- To unbind a policy, click the name of the policy, and then click Unbind Policy.
- To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
- To regenerate assigned priorities, click Regenerate Priorities.
- To insert a new policy, click **Insert Policy** and, in the list that is displayed in the Policy Name column, click **New Policy**. Then, in the Create Compression Policy dialog box, configure the policy, and then click **Create**.  
For information about modifying a compression policy, see [Compression](#).
- If you are configuring a Advanced policy expression, do the following:

- In the Goto Expression column, select a Goto expression.
  - In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.
4. Click **Apply Changes**, and then click **Close**.

## Configuring Caching Policies

You can use only Advanced policy policies and expressions to configure Caching policies.

To configure Caching policies for an application unit:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Caching column.
3. In the Configure Cache Policies dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
  - Click either Request or Response, depending on whether you want the policy to be evaluated at request-time or at response-time.

You can configure both request-time and response-time Caching policies for an application unit. After evaluating all of the request-time policies, if no match is found, the appliance evaluates response-time policies.
  - To modify a Caching policy that is already bound to the application unit, click the name of the policy, and then click Modify Policy. Then, in the **Configure Cache Policy** dialog box, modify the policy, and then click **OK**.

For information about modifying a Caching policy, see [Integrated Caching](#).
  - To unbind a policy, click the name of the policy, and then click **Unbind Policy**.
  - To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
  - To regenerate assigned priorities, click **Regenerate Priorities**.
  - To insert a new policy, click **Insert Policy** and, in the list that is displayed in the Policy Name column, click **New Policy**. Then, in the **Create Cache Policy** dialog box, configure the policy, and then click **Create**.

For information about modifying a Caching policy, see [Integrated Caching](#).
  - In the Goto Expression column, select a Goto expression.
  - In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.
4. Click **Apply Changes**, and then click **Close**.

## Configuring rewrite policies

You can use only Advanced policy policies and expressions to configure Rewrite policies.

To configure Rewrite policies for an application unit:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Rewrite column.
3. In the **Configure Rewrite Policies** dialog box, do one or more of the following, depending on the configuration tasks you want to perform:

- Click either Request or Response, depending on whether you want the policy to be evaluated at request-time or at response-time.

You can configure both request-time and response-time Rewrite policies for an application unit. After evaluating all of the request-time policies, if no match is found, the appliance evaluates response-time policies.

- To modify a Rewrite policy that is already bound to the application unit, click the name of the policy, and then click **Modify Policy**. Then, in the Configure Rewrite Policy dialog box, modify the policy, and then click **OK**.

For information about modifying a Rewrite policy, see [Rewrite](#).

- To unbind a policy, click the name of the policy, and then click **Unbind Policy**.
- To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
- To regenerate assigned priorities, click **Regenerate Priorities**.
- To insert a new policy, click **Insert Policy** and, in the list that is displayed in the **Policy Name** column, click **New Policy**. Then, in the **Create Rewrite Policy** dialog box, configure the policy, and then click **Create**.

For information about modifying a Rewrite policy, see [Rewrite](#).

- In the Goto Expression column, select a Goto expression.
- In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.

4. Click **Apply Changes**, and then click **Close**.

## Configuring responder policies

You can use only Advanced policy policies and expressions to configure Responder policies.

To configure Responder policies for an application unit:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the Responder column.
3. In the **Configure Responder Policies** dialog box, do one or more of the following, depending on the configuration tasks you want to perform:
  - To modify a Filter policy that is already bound to the application unit, click the name of the policy, and then click **Modify Policy**. Then, in the Configure Responder Policy dialog box, modify the policy, and then click **OK**.  
For information about modifying a Responder policy, see [Responder](#).
  - To unbind a policy, click the name of the policy, and then click **Unbind Policy**.
  - To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
  - To regenerate assigned priorities, click **Regenerate Priorities**.
  - To insert a new policy, click Insert Policy and, in the list that is displayed in the Policy Name column, click New Policy. Then, in the Create Responder Policy dialog box, configure the policy, and then click Create.  
For information about modifying a Responder policy, see [Responder](#).
  - In the Goto Expression column, select a Goto expression.
  - In the Invoke column, specify the policy bank that you want to invoke if the current policy evaluates to TRUE.
4. Click **Apply Changes**, and then click **Close**.

## Configuring Application Firewall Policies

You can configure both classic and Advanced policy policies and expressions for Application Firewall. However, if a policy of one type is already bound globally or to a virtual server that is configured on the appliance, you cannot bind a policy of the other type to an application unit. For example, if a Advanced policy is already bound either globally or to a virtual server, you cannot bind a classic policy to an application unit.

To configure Application Firewall policies for an application unit:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, in the row for the application unit you want to configure, click the icon provided in the **Application Firewall** column.
3. In the **Configure Application Firewall Policies** dialog box, do one or more of the following, depending on the configuration tasks you want to perform:

- Click either Classic Expression or Advanced Expression depending on the type of expression you want to configure for the Application Firewall policy.

Important: This setting also determines what policies are displayed when you want to insert a policy. For example, if you select Advanced Expression, when you click **Insert Policy**, the list that appears in the **Policy Name** column will include only Advanced policy policies. You cannot bind policies of both types to an application unit. This option is not available if a policy of either type is already bound either globally or to a virtual server.

- To modify an application firewall policy that is already bound to the application unit, click the name of the policy, and then click Modify Policy. Then, in the Configure Application Firewall Policy dialog box, modify the policy, and then click OK.

For information about modifying a application firewall policy, see [Policies](#).

- To unbind a policy, click the name of the policy, and then click Unbind Policy.
- To modify the priority assigned to a policy, double-click the priority value, and then enter a new value.
- To regenerate assigned priorities, click Regenerate Priorities.
- To insert a new policy, click **Insert Policy** and, in the list that is displayed in the **Policy Name** column, click New Policy. Then, in the **Create Application Firewall Policy** dialog box, configure the policy, and then click **Create**.

For information about modifying a application firewall policy, see [Policies](#).

4. Click **Apply Changes**, and then click **Close**.

## Configure application units

December 21, 2023

To configure an application unit by using the GUI:

1. Navigate to **AppExpert > Applications > Application Unit** section and then click the plus icon to add a new application unit for a traffic subset.
2. In the **Application Unit** slider, set the following parameters:
  - Name
  - Expression

You can insert an expression either by adding the expression components manually or by using the Expression Editor link. To manually add an expression, enter a selector component and then type a period (.) to display a list from which you can select the next component. For example,

type HTTP and then type a period. A drop-down menu appears. The contents of this menu provide the keywords that can follow the initial keyword that you entered. Select a component from the drop-down menu. The Expression\* text box now displays the components that you have added to the expression (for example, HTTP.REQ). Continue adding components until the complete expression is formed.

If you prefer assistance to form the expression, you can use the Expression Editor link. On the Expression Editor page, you can form an expression by selecting components from the drop-down boxes. Select the components and click Done to insert the expression on the Application Unit page.

3. Click **Continue** to bind services and service groups.
4. Click the **Service** section to select or add a virtual service and bind it to the application unit.
5. Click **Continue** and click the **Service Group** section to select or add a virtual service group and bind it to the application unit.
6. Click **Bind** and **Continue** to configure Advanced Settings (such as Policies, Method, Persistence, Protection, Profiles, Push, Authentication, and Traffic Settings) for the application unit.
7. Click the **plus** icon in each section to set the configuration parameters.
8. Click **OK** and then **Done**.

To edit an application unit for an application by using the GUI:

Navigate to **AppExpert > Applications**, select an application and click **Edit**. In the **Application Unit** section, select an entity, click the edit icon and modify the application unit settings.

**Note:** You cannot modify the name and rule expression for an existing application unit.

NetScaler's video tutorials enable you to understand NetScaler features in an easy and simple way. Watch [https://www.youtube.com/watch?v=bJ5\\_i8fv2hc](https://www.youtube.com/watch?v=bJ5_i8fv2hc) video to learn how configure an application unit.

## Configure public endpoints for an application

December 21, 2023

To configure public endpoints for an application by using the GUI:

1. Navigate to **AppExpert > Applications**, select an application entity, and then click **Edit**.
2. In the **Public Endpoint** section, click **+** to configure a new public endpoint.
3. In the **Public Endpoint** slider, do one of the following:

- a) Click **New** to create a new endpoint.
  - b) Click **Existing Public Endpoint** to select an endpoint from the drop-down list.
4. Set the following endpoint parameters:
- a) Name
  - b) IP address
  - c) Protocol
  - d) Port
5. Click **Continue** to configure additional settings such as application units, GSLB server bindings, policies, profiles, push, traffic settings, and authentication.
6. Click **OK** and then **Done**.
7. Click **Continue** and then **Done**.

To edit a public endpoint for an application by using the GUI:

Navigate to **AppExpert > Applications**, select an application, and click **Edit**. In the **Public Endpoint** section, select an endpoint, click the pen icon, and modify the endpoint settings.

To delete a public endpoint for an application by using the GUI:

Navigate to **AppExpert > Applications > Public Endpoint**, click the pen icon to view the delete icon next to the entity.

NetScaler's video tutorials enable you to understand NetScaler features in an easy and simply way. Watch <https://www.youtube.com/watch?v=z4v-edQiVpw> video to learn how to configure a public endpoint.

## Specify the order of evaluation of application units

December 21, 2023

Application unit rules are evaluated in the order in which they are placed in the GUI. The rule that is configured for the topmost application unit is always configured first, followed by the rule that is configured for the second topmost application unit, and so on. The default application unit is always evaluated last.

When a request matches the rule that is configured for an application unit, the request is processed by the application unit, and no further matching is performed. Therefore, the order of evaluation of application units becomes an important factor if the traffic subsets for two or more application units overlap. If the traffic subsets for two or more application units overlap, you must specify the order in which an incoming request is matched against the application unit rules.

To specify the order of evaluation of application units:

1. Navigate to **AppExpert > Applications**, select an application and click **Edit**. In the **Application Unit** section, click the **Pencil** icon and then hover the cursor over the check box to the left of the name of the application unit. Click the icon that appears next to the check box and hold down the mouse to drag the application up or down to a new location in the priority list.

## Configure persistency groups for application units

December 21, 2023

You can configure a persistency group for the application units in an AppExpert application. In the context of an AppExpert application, a persistency group is a group of application units that you can treat as a single entity for the purpose of applying common persistence settings. When the application is exported to an application template file, the persistency group settings are included, and they are automatically applied to the application units when you import the AppExpert application.

To configure a persistency group for an application by using the GUI:

1. Navigate to **AppExpert > Applications**.
2. In the **Applications View** dialog box, click the name of the application for whose application units you want to configure a persistency group, and then click **Configure Persistency Groups**.
3. In the **Configure Persistency Groups** dialog box, do one of the following:
  - To add a persistency group, click **Add**.
  - To modify a persistency group, click **Open**.
4. In the **Create Persistency Group** or **Configure Persistency Group** dialog box, set the following parameters:
  - **Group Name**—Name of the persistency group. For the NetScaler appliance to recognize the persistency group as part of the application's configuration, the name of the AppExpert application must be included in the name of the persistency group, as a prefix. Therefore, by default, the appliance displays the prefix in the Group Name box, and you cannot remove that prefix. Enter a name of your choice after the prefix.
  - **Persistence**—Type of persistence for the virtual server. If you select SOURCEIP, in the IPv4 Netmask box, enter a network mask that specifies the number of bits that the appliance must consider when creating persistence sessions. If you select COOKIEINSERT, in the Cookie Domain and Cookie Name boxes, specify a domain attribute to send in the Set-Cookie directive, and a name for the cookie, respectively.
  - **Timeout**—Time period for which a persistence session is in effect.
  - **Backup Persistence**—Type of backup persistence for the group.
  - **Backup Timeout**—Time period, in minutes, for which backup persistence is in effect.

- **Application Units**—To add an application unit to the persistency group, in the Available Application Units box, click the application unit, and then click **Add**. To remove an application unit from the persistency group, in the Configured Application Units box, click the application unit, and then click **Remove**.

5. Click **OK**.

## View AppExpert applications and configure entities by using the application visualizer

December 21, 2023

The Visualizer feature shows you a graphical representation of an application's configuration. It includes the name of the public endpoint, application units assigned to the public endpoint, and the number of policies and services bound to the application. You can use the Visualizer to obtain a visual overview of an AppExpert application's configuration and configure some of the displayed entities. By default, the Visualizer displays application units, services, and monitors for the selected application.

To view an AppExpert application by using the Application Visualizer:

1. Navigate to **AppExpert > Applications**, select an application entity, and click **Visualizer**.

## Configure user authentication, authorization, and auditing

December 21, 2023

You can configure authorization for users and groups to enable them to access an AppExpert application. If the AAA user or group for which you want to configure permissions has not already been created, you can create it from AppExpert and then configure permissions for application access.

To configure AAA users and AAA user groups for an application by using the configuring utility

1. Navigate to **AppExpert > Applications**, select an application entity, and then click **Edit**.
2. In the **Advanced Settings** section, click **Authorization**, and configure authorized users and user groups.
3. Click the **AAA** user section to bind authorized users to the application.
4. In the **AAA User** slider, set the parameters .
5. Click **Continue**, and then click **Authorization Policies** in the **Advanced Settings** section.

6. In the **Authorization Policy** slider, bind an authorization policy to the application.
7. Click **Continue**, and then click the **Authorization Group** section in the **Advanced Settings** section.
8. In the **AAA Group Binding** slider, bind an authorization user group to the application.
9. Click **Continue**, and then click **Policies** in the **Advanced Settings** section.
10. In the **Policies** slider, bind an **Audit Syslog** or **Audit NSlog** policy to the application.
11. Click **Continue** and then **Done**.

To edit AAA users and AAA user groups for an application by using the GUI:

Navigate to **AppExpert > Applications > Advanced Settings** and click **Authorization**. Then click the edit icon and specify values for user or user-group authorization settings.

To delete AAA users and AAA user groups by using the GUI:

Navigate to **AppExpert > Applications**, select an application and click **Edit**. In the **Applications** page, click **Advanced Settings** and click **Authorization**. Click the delete icon next to the entity.

## Monitor a NetScaler application

December 21, 2023

After you customize the AppExpert application, you can view application statistics to make sure that the application and all its entities are working correctly. You can also use the Application Visualizer to monitor statistics associated with certain entities such as policies and virtual servers.

You can also view the hit counters for various entities at regular intervals to make sure that counters are being updated.

### View application statistics

In the **Applications** node, you can select an application and view the Statistics page for the application. On the Statistics page, you can monitor the health and states of public endpoints and application units, and view the following statistical information:

- Requests and responses per second for each of the public endpoints and application units.
- Bytes per second, at each endpoint, for incoming and outgoing traffic.
- Application unit hit counters and the number of client and server connections for each application unit.
- Statistics for the services that are bound to the application units.

On the Statistics page, you can also view CPU usage, memory usage, and system logs.

To view statistics for an application:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, click the application for which you want to view statistics, and then click **Statistics**.

## Monitoring an Application by Using the Application Visualizer

You can use the Application Visualizer to monitor the number of requests received per second at a given point in time by the vservers and the number of hits per second at a given point in time for Rewrite, Responder, and Cache policies.

To view statistical information for vservers, Rewrite policies, Responder policies, and Cache policies in the Visualizer:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, select the application for which you want to view statistical information, and then click **Visualizer**.
3. In the **Application Visualizer** window, do the following:
  - To view the statistics, click **Show Stats**.  
The statistical information is displayed on the respective nodes in the Visualizer. This information is not updated in real time and has to be refreshed manually.
  - To refresh the statistical information, click **Refresh Stats**.

## Viewing Hits

The hit counters that are provided for various AppExpert application entities enable you to monitor the functioning of public endpoints and application units. For an application, the Hits dialog box displays the total number of requests received by each configured public endpoint. For an application unit, the Hits dialog box displays the number of requests that the application unit processed from each of the public endpoints and the total hit count. For instructions on viewing hit counters, see [Verifying and Testing the Configuration](#).

## Delete an AppExpert application

December 22, 2023

If you no longer need an application and its application units, you can delete it. When you delete an AppExpert application, backend services are not deleted, and any public endpoints that the application used become available for use by other applications.

When deleting an application, you are also prompted to specify whether you want to delete any bound policies and actions that are not used elsewhere.

To delete an application unit for an application by using the GUI:

Navigate to **AppExpert > Applications**, select an application and click **Edit**. In the **Application Unit** section, click the delete icon next to the entity

## Configure application authentication, authorization, and auditing

June 6, 2022

You can configure Authentication, Authorization, and Auditing (AAA) for the applications that you configure on the appliance. An authentication policy that is configured for an application defines the type of authentication to apply when a user or group attempts to access the application. If external authentication is used, the policy also specifies the external authentication server. Authorization policies configured for an application specify whether a particular user or group can access the application. Auditing policies define the audit log type, the level at which logging is performed, and other audit server settings. Authentication and auditing policies use the classic policy format.

Authentication policies, authorization policies, and auditing policies can be configured in any order. However, before you configure AAA for an application, you must configure a public endpoint for the application.

Configuring authentication for an application involves specifying an authentication FQDN, an authentication virtual server, a server certificate, and authentication and session policies. Authentication policies are automatically bound to the authentication virtual server specified for the application.

To configure authentication for an AppExpert application:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, do one of the following:
  - a) Click Add to add an authentication for a new application.
  - b) Click Edit to modify an existing application.
3. In the **Applications** page, select an Application Unit.
4. In the **Application Unit** slider page, click Authentication from the **Advanced Settings** section.
5. In the **Authentication** section, select the authentication type as follows:

- a) Form based authentication
  - b) 401 based authentication
  - c) None
6. Click **OK** and then click **Done**.

## Configure application authorization

You can configure authorization for users and groups to enable them to access an AppExpert application. If the AAA user or group for which you want to configure permissions has not already been created, you can create it from AppExpert and then configure permissions for application access.

To configure permissions for a AAA user or group to access an AppExpert application:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, click the AppExpert application for which you want to configure a user or group access.
3. In the **Applications** page, and then click Authorization. from the **Advanced Settings** section.
4. Do one of the following:
  - If the AAA user or group for which you want to configure permissions are already in the Groups/Users tree, drag the user or group from the Groups/Users tree to the Users or Groups node in the application tree. Then, right-click the user or group and click Allow.
  - If the AAA user or group for which you want to configure permissions is not configured on the appliance, in the application tree, right-click Users or Groups, and then click Add. In the Create AAA Group or Create AAA User dialog box, fill in the values, click Create, and then click Close.

The user or group is created with the permission set to Allow. To change the permission setting, right-click the group or user, and then click the permission setting.
5. Click **Done** and then click **Close**.

## Configure application auditing

When you configure auditing policies for an application, you must specify the server to which the log messages must be directed, the format of the messages logged, and the log level. Optionally, you can configure other settings, such as the log facility and date format. Auditing policies are automatically bound to all the AppExpert application's public endpoints.

To configure auditing policies for an application:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, click the application for which you want to configure auditing policies.

3. In the Application Unit slider page, click + icon in the **Policies** section to configure the auditing policies.
4. In the **Policies** slider page, select policy type as Syslog auditing or Nslog auditing and click **Continue**.
5. In the Policy binding section, set the following parameters.
  - a) Select a policy for binding. If you do not have a policy for binding, click + to create a new policy.
  - b) To create a new auditing policy, under Policy Name, click **New Policy**, and then, in the **Policy** page do the following:
    - i. In the Name box, type a name for the policy.
    - ii. The Name box already contains the string that is required at the beginning of the server name. You cannot modify the string.
    - iii. From the Auditing Type list, select the auditing type (either SYSLOG or NSLOG).
    - iv. If the audit server you want to specify is already listed in the Server list, select the server from the list, and then, if you want to modify the server settings, click Modify. In the Configure Auditing Server dialog box, modify the settings as appropriate, and then click OK. For more information about the settings in the Configure Auditing Server dialog box, see [Auditing Authenticated Sessions](#).
    - v. If you want to configure a new audit server, click New, and then, in the Create Auditing Server dialog box, type a name for the server, specify the server IP address, port number, and other settings as appropriate. When finished, click **OK**.
    - vi. Click **Create**.
  - c) To change the priorities for the new auditing policies you created, under Priority, for each policy for which you want to change the priority, double-click the priority value and type new priority value.
  - d) To regenerate priorities, click **Regenerate Priorities**.
  - e) To unbind a policy, click the policy, and then click **Unbind Policy**.
  - f) To modify a policy, click the policy, and then click **Modify Policy**.
6. Click **Apply Changes**, and then click **Close**.

## Disabling AAA for an Application

After you configure AAA for an application, you can disable the AAA configuration for that application. When you disable AAA for an application, the configuration is not lost. You can enable AAA for the application when you want to reapply the configuration.

To enable or disable AAA for an application:

1. Navigate to **AppExpert > Applications**.

2. In the details pane, click the application for which you want to enable or disable AAA, and then do one of the following:
3. To disable AAA for the application, click **Turn Off AAA**.
4. To enable AAA for the application, click **Turn On AAA**.

## Set up a custom NetScaler application

December 21, 2023

If an AppExpert application template is not available for the Web application that you want to manage through the NetScaler appliance, or if available AppExpert application templates do not suit your requirements, you can create an AppExpert application without a template.

To create an AppExpert application without a template, you must first create an application and application units. Then, you configure public endpoints, services, and service groups. Finally, you configure the policies that determine how application traffic is evaluated and processed.

After you create the application and application units and configure policies, you must verify the configuration and test it to make sure that it is working correctly, just as you would when you configure an application by using a prebuilt AppExpert application template. Then, you must monitor the application to make sure that the application and its entities are working correctly.

### Creating an application

When you create an AppExpert application, the appliance creates a container to which you can add application units. The default application unit is not created until you create the first application unit.

To create an AppExpert application by using the GUI:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, right-click **Applications**, and then click **Add**.
3. In the **Create Application** dialog box, in Name, enter a name for the application, and then click **OK**.

### Creating application units

For each subset of traffic associated with your web application, you must create an application unit.

To create an application unit for the AppExpert application by using the GUI:

1. Navigate to **AppExpert > Applications**.

2. In the details pane, right-click the application for which you want to add an application unit, and then click **Add**.
3. Click **Create**.

## Configuring public endpoints for an AppExpert application

After you have created all the application units that you require, you must configure one or more public endpoints to enable clients to access the web application through the NetScaler appliance.

To configure public endpoints for an AppExpert application by using the GUI:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, right-click the application for which you want to configure public endpoints, and then click **Configure Public Endpoints**.
3. In the Choose Public Endpoints dialog box for the application, do one of the following:

- If the endpoints you want are listed in the dialog box, click the corresponding check boxes.
- If you want to specify all the public endpoints, click **Activate All**.
- If you want to dissociate endpoints from the AppExpert application, clear the corresponding check boxes.
- If you want to create a new public endpoint, click **Add**. Then, in the Create public endpoint dialog box, configure endpoint settings, and then click **OK**.

In the **Create public endpoint** dialog box, you can specify only the name, IP address, port, and protocol for the endpoint. You can specify additional endpoint settings after you create the public endpoint. To specify additional endpoint settings, after you create the endpoint, in the Choose Public Endpoints dialog box, click the endpoint, and then click **Open**. Then, in the **Configure Public Endpoint** dialog box, provide additional settings, and then click **OK**.

For more information about the parameters in the **Create public endpoint** and **Configure Public Endpoint** dialog boxes, see [Content Switching](#).

- If you want to modify a public endpoint, click the endpoint, and then click **Open**. Then, in the **Configure Public Endpoint** dialog box, modify settings for the endpoint, and then click **OK**.

For more information about the parameters in the Configure Public Endpoint dialog box, see [Content Switching](#).

4. Click **Close**.

## Configuring public endpoints for an application unit

For an application unit, you specify public endpoints in the same way as you would specify public endpoints for an application that is created from an AppExpert application template. For more information about specifying a subset of the endpoints for an application unit, see [Configuring Endpoints for an Application Unit](#).

To configure endpoints for an application unit by using the GUI:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, right-click the application unit for which you want to specify public endpoints, and then click **Configure Public Endpoints**.
3. In the **Choose Public Endpoints** dialog box for the application unit, do one of the following:
  - If you are specifying endpoints for the application unit for the first time, clear the check boxes that correspond to the endpoints that you do not want to be bound to the application unit.
  - If you want to specify endpoints that are listed in the dialog box but not currently bound to the application unit, click the corresponding check boxes.
4. Click **OK**.

## Configuring Services and Service Groups for an AppExpert Application

Services and service groups are available for application units only after you configure the services and service groups for the AppExpert application. Therefore, you must configure services and service groups for the AppExpert application before you configure the services for the application units. All the services and service groups that you configure for an AppExpert application must use the same protocol (either HTTP or HTTPS). The procedure for configuring services and service groups for an AppExpert application that is not created from a template is the same as that for an application created from a template.

To configure a service or service group for the AppExpert application by using the GUI:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, right-click the application for which you want to configure services or service groups, and then click **Configure Backend Services**.
3. In the Configure Backend Services dialog box, do one of the following:
  - To configure services, click the **Services** tab.
  - To configure service groups, click the **Service Groups** tab.
4. On the **Service** or **Service Groups** tab, do one of the following:

- If the services or service groups that you want are listed on the tab, click the corresponding check boxes.
- If you want to specify all the services or service groups, click **Activate All**.
- If you want to create a new service or service group, click **Add**. Then, in the **Create Service** dialog box or **Create Service Group** dialog box, configure settings for the service or service group, respectively, and then click **Create**.
- If you want to modify a service, click the service, and then click **Open**. Then, in the **Configure Service** dialog box or **Create Service Group** dialog box, configure settings for the service or service group, respectively, and then click **OK**.

For information about the settings in the **Create Service**, **Configure Service**, and **Create Service Group** dialog boxes, see [Load Balancing](#).

### Configuring services and service groups for an application unit

After you configure services and service groups, you must configure services and service groups for each application unit. However, this step is not necessary if each backend service hosts all the content associated with the web application. You configure services and service groups for an application unit if the content associated with the application unit is hosted on only a subset of the backend servers.

To configure services or service groups for an application unit by using the GUI:

1. Navigate to **AppExpert > Applications**.
2. In the details pane, right-click the application unit for which you want to configure a service or service group, and then click **Configure Backend Services**.
3. In the **Configure Backend Services** dialog box, do one of the following:
  - To configure services, click the **Services** tab.
  - To configure service groups, click the **Service Groups** tab.
4. In the **Services** or **Service Groups** tab, do one of the following:
  - Clear the check boxes that correspond to the services or service groups that you do not want configured for the application unit. Make sure that the check boxes that correspond to the services or service groups that you want configured for the application unit are selected. Then, in the **Weight** column, specify the weight that you want to assign to each configured service.
  - To specify all services or service groups, click **Activate All**.
5. On the **Method** and **Persistence** and **Advanced** tabs, specify the desired parameters.
6. Click **OK**.

## Configuring policies

The procedures for configuring policies for an AppExpert application that is created without using a template are the same as those for an AppExpert application that was created from a template. For more information, see [Configuring Policies for Application Units](#).

## NetScaler Gateway applications

May 2, 2023

When you configure an AppExpert application to manage a web application through the Citrix® NetScaler® appliance, you also create a set of application units and configure a set of traffic optimization and security policies for each unit. The policies that you configure for each application unit (policies for features such as Compression, Caching, and Rewrite) evaluate traffic that is meant only for that unit. In addition to these policies, you might want to configure Access Gateway policies for the application as a whole to optimize the application traffic when accessed through the Access Gateway. The Access Gateway Applications feature enables you to configure Access Gateway policies (Authorization, Traffic, Clientless Access, and TCP Compression) for an AppExpert application. After you configure NetScaler Gateway policies for AppExpert applications, you can include the policy configuration in the AppExpert application templates that you create.

You can also configure NetScaler Gateway policies for intranet subnets, file shares, and other network resources. Finally, you can create bookmarks for AppExpert applications and certain resources if you want users to be able to access them from the NetScaler Gateway home page.

You can configure the entities in the NetScaler Gateway Applications feature only by using the GUI.

## How an NetScaler Gateway application works

When you create an AppExpert application in the Applications node in the GUI, a corresponding Access Gateway application is automatically created in the Access Gateway Applications node. Additionally, a rule that uses the AppExpert application's configured public endpoint is automatically created for the Access Gateway application entry. If multiple endpoints are configured for the AppExpert application, the rule includes all the configured public endpoints. The NetScaler appliance uses this rule to apply any configured Access Gateway policies to the traffic received at the AppExpert application's public endpoint. Traffic received at the AppExpert application's public endpoint is first evaluated against the NetScaler Gateway policies and then evaluated against the policies configured for AppExpert application's application units.

The rule that is created for the Clientless Access policies for an Access Gateway application is an advanced expression that also uses the public endpoint that is configured for the AppExpert application. Therefore, before you configure NetScaler Gateway policies for an AppExpert application, you must configure public endpoints for the AppExpert application.

When you include the NetScaler Gateway configuration in an application template, deployment-specific information, such as IP address and port information, and the rule that is created from this information are not included in the template.

### **How a NetScaler configuration for a file share works**

On the NetScaler appliance, you can configure Authorization policies for a file share that is hosted on your organization's network.

When you create a file share, you specify a name for the file share and the network path to the file share. In the network path, you can specify either the name of the server or the server IP address. A rule that uses the components of the file share path is automatically created for the file share. This rule enables the appliance to identify requests for files hosted on the file share server. Any Authorization policies that are configured for the file share are applied to incoming requests.

The NetScaler configuration for a file share cannot be saved in AppExpert application templates.

### **How a NetScaler configuration for an intranet subnet works**

For the intranet subnets that form a part of your network, you can configure policies for Authorization, Traffic, and TCP Compression on the NetScaler appliance. When adding an intranet subnet, you specify the IP address and the netmask of the intranet subnet. A rule that uses these two parameters is automatically created for the intranet subnet. The appliance applies the configured policies to any request that has a destination IP address and netmask set to the subnet's IP address and netmask, respectively.

The NetScaler configuration for an intranet subnet cannot be saved in AppExpert application templates.

### **How other resources category works**

The Other Resources category enables you to configure Access Gateway policies for any network resource by using a rule of your choice. When you configure the NetScaler appliance to process requests for the network resource, you configure a classic expression to identify the requests that are associated with the network resource. You can configure Authorization, Traffic, Clientless Access, and TCP Compression policies for a network resource in Other Resources. The NetScaler appliance applies the configured NetScaler Gateway policies to any requests that match the configured rule.

The NetScaler configuration for a network resource in Other Resources cannot be saved in AppExpert application templates.

## Entity naming conventions

The NetScaler Gateway Applications feature enforces a naming convention for some of the entities that you create in this feature. For example, the names of the profiles that you create for Traffic policies for an intranet subnet always begin with a string that consists of the name of the intranet subnet followed by an underscore (\_). The name that you provide for the entity is appended to this string. If the name of a subnet is “subnet1,”the name of the profile begins with “subnet1\_.”When such a naming convention is required (in the text box in which you type the name of an entity, for example), the user interface automatically inserts the string with which the name of the entity must begin and does not allow you to modify it.

## Add intranet subnets

December 21, 2023

You can specify the authorization and traffic policies for traffic that is bound for the intranet subnets that are configured in your network. The rules for these policies are automatically created by using the parameters you specify for the subnet.

To configure an intranet subnet by using the GUI:

1. In the navigation pane of the GUI, expand **AppExpert**, and then click Access Gateway Applications.
2. In the details pane, do one of the following:
  - To add an intranet subnet, click **Intranet Subnets**, and then click **Add**.
  - To modify an intranet subnet, click an intranet subnet, and then click **Open**.
3. In the **Create Intranet Subnet** or **Configure Intranet Subnet** dialog box, do the following:
  - a) In the Name box, type a name for the intranet subnet you are adding. This parameter cannot be changed for an existing intranet subnet.
  - b) In the IP Address box, type the IP address of the intranet subnet.
  - c) In the Netmask box, type the netmask that will be used for the intranet subnet.
  - d) Click **Create** or **OK**, and then click **Close**.

## Add other resources

December 21, 2023

For a network resource that you add to Other Resources, you must configure Advanced policy expression that identifies the subset of traffic associated with the resource.

To configure a resource in other Resources by using the GUI:

1. In the navigation pane of the GUI, expand AppExpert, and then click **Access Gateway Applications**.
2. In the details pane, do one of the following:
  - To add a resource, click **Other Resources**, and then click **Add**.
  - To modify a resource, click a resource, and then click **Open**.
3. In the **Create Resource** or **Configure Resource** dialog box, do the following:
  - a) In the Name box, type a name for the resource you are adding. This parameter cannot be changed for an existing resource.
  - b) In the Rule box, type the rule that will identify the subset of traffic that is associated with the resource you are adding.  
Alternatively, click **Configure**, and then create the rule in the **Create Expression** dialog box.
  - c) Click **Create** or **OK**, and then click **Close**.

## Configure authorization policies

December 21, 2023

You can configure NetScaler Gateway authorization policies for AAA users and groups to access a resource.

To configure permissions for a AAA user or group to access a resource by using the GUI:

1. In the navigation pane of the GUI, expand AppExpert, and then click **Access Gateway Applications**.
2. In the details pane, in the Authorization column, click the icon for the application, file share, intranet subnet, or resource for which you want to configure authorization policies for AAA users and groups.
3. Do one of the following:

- If the AAA user or group for which you want to configure permissions is already in the Groups/Users tree, drag the user or group from the Groups/Users tree to the Users or Groups node in the <application name> tree. Then, right-click the user or group and click **Allow**.
- If the AAA user or group for which you want to configure permissions is not configured on the appliance, in the <application name> tree, right-click Users or Groups, and then click **Add**. In the Create **AAA Group** or **Create AAA User** dialog box, fill in the values, click **Create**, and then click **Close**.

The user or group is created with the permission set to Allow. To change the permission setting, right-click the group or user, and then click the permission setting.

4. Click **Close**.

## Configure traffic policies

December 21, 2023

The traffic policies that you configure for the resources in the NetScaler Gateway Applications node control client connections to the application. You do not have to configure a rule for the resource. The rule created automatically when you create the resource. You only need to associate a request profile with the traffic policy. In the traffic profile, you specify parameters such as the protocol, application time-out, and file type association.

To configure traffic policies for a resource

1. In the navigation pane of the GUI, expand AppExpert, and then click Access Gateway Applications.
2. In the details pane, in the Traffic column, click the icon provided for the application, file share, intranet subnet, or resource for which you want to configure traffic policies.
3. In the **Configure Traffic Policies** dialog box, do the following:
  - To specify an existing traffic policy, click **Insert Policy**, and then, in the Policy Name column, click the name of the policy.
  - To configure a new policy, click **Insert Policy**, and then, in the Policy Name column, click **New Policy**. In the Create Traffic Policy dialog box, in the Name box, after the underscore (\_), type a name for the policy. Then, in Request Profile, either select an existing request profile or click **New** to configure a new request profile. You can also select an existing profile and then click **Modify** to modify the profile.

For more information about configuring a traffic policy or profile, see [NetScaler Gateway](#).

- To modify a policy that you have inserted, in the Policy Name column, click the policy name, and then click **Modify Policy**. To modify only the associated profile, in the Profile column, click the name of the profile, and then click **Modify Profile**.
  - To regenerate the priorities assigned to the policies, click **Regenerate Priorities**.
  - To specify a new priority value for a policy, in the Priority column, double-click the assigned priority, and then enter the value you want.
  - To unbind a policy, click the policy, and then click **Unbind Policy**.
4. Click **Apply Changes**, and then click **Close**.

## Configure clientless access policies

December 21, 2023

Clientless access, when configured for a resource on the NetScaler appliance, allows end-users to access the resource without using the NetScaler Gateway client software. Users can use web browsers to access resources such as Outlook Web Access. You configure clientless access for a resource by configuring a clientless access policy that is associated with a clientless access profile.

To configure a clientless access policy for a resource in the NetScaler Gateway Applications node:

1. In the navigation pane of the GUI, expand **AppExpert**, and then click **Access Gateway Applications**.
2. In the details pane, in the **Clientless Access** column, click the icon for the application, file share, intranet subnet, or resource for which you want to configure a clientless access policy.
3. In the **Configure Clientless Access Policies** dialog box, do the following:
  - To specify an existing clientless access policy, click **Insert Policy**, and then, in the **Policy Name** column, click the name of the policy.
  - To configure a new clientless access policy, click **Insert Policy**, and then, in the **Policy Name** column, click **New Policy**. In the **Create Clientless Access Policy** dialog box, in the Name box, after the underscore (\_), type a name for the policy. Then, in Profile, either select an existing profile or click **New** to configure a new profile. You can also select an existing profile and then click **Modify** to modify the profile.

For more information about configuring a clientless access policy or profile, see [NetScaler Gateway](#).

  - To modify a policy that you have inserted, in the Policy Name column, click the policy name, and then click **Modify Policy**. To modify only the associated profile, in the Profile column, click the name of the profile, and then click **Modify Profile**.

- To specify a new priority value for a policy, in the Priority column, double-click the assigned priority, and then enter the value you want.
  - To unbind a policy, click the policy, and then click **Unbind Policy**.
4. Click **Apply Changes**, and then click **Close**.

## Configure TCP compression policies

December 21, 2023

You can configure TCP compression policies for an application to increase the performance of the application. TCP compression reduces network latency, reduces bandwidth requirements, and increases the speed of transmission. When configuring a TCP compression policy, you associate a compression action with the policy. The compression action specifies either Compress, GZIP, Deflate, or NoCompress as the compression type. For more information about the compression policies, and compression actions, see [NetScaler Gateway](#).

To configure a TCP compression policy for a resource in the NetScaler Gateway Applications node

1. In the navigation pane of the GUI, expand **AppExpert**, and then click **Access Gateway Applications**.
2. In the details pane, in the TCP Compression column, click the icon for the application, file share, intranet subnet, or resource for which you want to configure a TCP compression policy.
3. In the **Configure TCP Compression Policies** dialog box, do the following:
  - To specify an existing TCP compression policy, click **Insert Policy**, and then, in the **Policy Name** column, click the name of the policy.
  - To create a new TCP compression policy, click **Insert Policy**, and then, in the Policy Name column, click **New Policy**. In the Create TCP Compression Policy dialog box, in the Policy Name box, after the underscore (“\_”), type a name for the policy. Then, in Action, either select an existing action or click **New** and configure a new action. You can also click **View** to view the configured compression type.

For more information about configuring a TCP compression policy or action, see [NetScaler Gateway, Advanced Edition](#) at [NetScaler Gateway](#).
  - To modify a policy that you have inserted, in the Policy Name column, click the policy name, and then click **Modify Policy**.
  - To regenerate the priorities assigned to the policies, click **Regenerate Priorities**.
  - To specify a new priority value for a policy, in the Priority column, double-click the assigned priority, and then enter the value you want.

- To unbind a policy, click the policy, and then click **Unbind Policy**.
4. Click **Apply Changes**, and then click **Close**.

## Configure bookmarks

June 6, 2022

You can configure bookmarks for internal applications or resources that are available for an entitled user. You can then bind the bookmark to a user, user group or virtual server globally and enable it for the user in the Access Interface. The bookmark links that you create appear on the web sites panes under enterprise web sites.

For more information, see [Creating and Applying Web Links](#) topic.

## AppQoE

May 2, 2023

Application level Quality of Experience (AppQoE) integrates several existing policy-based security features of the NetScaler appliance into a single integrated feature that takes advantage of a new queuing mechanism, fair queuing. Fair queuing manages requests to load-balanced web servers and applications at the virtual server level instead of at the service level, allowing it to handle the queuing of all requests to a website or application as one group before load balancing, instead of as separate streams after load balancing.

- **Simple overload.** Any server, no matter how robust, can accept only a limited number of connections at one time. When a protected website or application receives too many requests at once, the Surge Protection feature detects the overload and queues the excess connections til the server can accept them. The AppQoE feature displays an alternate webpage that notifies users that the resource that they requested is not available.
- **Denial-of-Service (DOS) attacks.** Any public-facing resource is vulnerable to attacks whose purpose is to bring that service down and deny legitimate users access to it. The Surge Protection feature help manage DOS attacks in addition to other types of high load. In addition, the HTTP Denial-of-Service Protection feature targets DOS attacks against your websites, sending challenges to suspected attackers and dropping connections if the clients do not send an appropriate response.

Until the current version of the NetScaler operating system, these features were implemented at the service level, which means that each service was assigned its own queues. While service-level queues work, they also have some disadvantages, most of which are due to the NetScaler appliance having to load balance requests before implementing any of the protection features that rely on queuing. Implementing protection features before queuing has various advantages, some of which are listed below:

- Connections are not flushed if a service transitions state, as they are in a service-level queue.
- During periods of high load, such as a denial-of-service attack, and HTTP DoS come into play before load balancing, allowing these features to detect and divert unwanted or lower-priority traffic from the load balancer before the load balancer must cope with it.

In addition to implementing fair queuing, AppQoE integrates a set of features that each provide a different set of tools to achieve a common goal: protecting your networked resources from excessive or inappropriate demand. Putting these features into a common framework enables you to configure and implement them more easily.

## Enable AppQoE

December 22, 2023

To configure AppQoE, you must first enable the feature.

### To enable AppQoE by using the command line

At the command prompt, type the following commands:

- `enable ns feature appqoe`
- `show ns feature`

#### Example:

```
1 > enable ns feature appqoe
2 Done
3 > show ns feature
4
5 Feature Acronym Status
6 ----- -
7 1) Web Logging WL ON
8 2) Surge Protection SP ON
9 3) Load Balancing LB ON
10 ...
11 1) AppQoE AppQoE ON
```

```
12 Done
13 <!--NeedCopy-->
```

## To enable AppQoE by using the GUI

1. Navigate to **System > Settings**.
2. In the details pane, click **Configure Advanced Features**.
3. In the **Configure Advanced Features** dialog box, select the **AppQoE** check box.
4. Click **OK**.

## AppQoE actions

May 2, 2023

After enabling the AppQoE feature, you must configure one or more actions for handling request.

### Important:

No specific individual parameters are required to create an action, but you must include at least one parameter or you cannot create the action.

## To configure an AppQoE action by using the command line

At the command prompt, type the following commands:

- `add appqoe action <name> [-priority <priority>] [-respondWith ( ACS|NS)[<customfile>] [-altContentSvcName <string>] [-altContentPath <string>] [-maxConn <positive_integer>] [-delay <usecs>] [-polqDepth <positive_integer>] [-priqDepth <positive_integer>] [-dosTrigExpression <expression>] [-dosAction ( **SimpleResponse ** | **HICResponse** )]`
- `show appqoe action`

### Example

To configure priority queuing with policy queue depths of 10 and 1000 for medium and lowest priority queues, respectively:

```
1 > add appqoe action appqoe-act-basic-prhigh -priority HIGH
2 Done
3
```

```
4 > add appqoe action appqoe-act-basic-prmedium -priority MEDIUM -
 polqDepth 10
5 Done
6
7 > add appqoe action appqoe-act-basic-prlow -priority LOW -polqDepth
 1000
8 Done
9
10 > show appqoe action
11
12 1. Name: appqoe-act-basic-prhigh
13 ActionType: PRIORITY_QUEUEING
14 Priority: HIGH
15 PolicyQdepth: 0
16 Qdepth: 0
17
18 1. Name: appqoe-act-basic-prmedium
19 ActionType: PRIORITY_QUEUEING
20 Priority: MEDIUM
21 PolicyQdepth: 10
22 Qdepth: 0
23
24 1. Name: appqoe-act-basic-prlow
25 ActionType: PRIORITY_QUEUEING
26 Priority: LOW
27 PolicyQdepth: 1000
28 Qdepth: 0
29 Done
30 <!--NeedCopy-->
```

### To modify an existing AppQoE action by using the command line

At the command prompt, type the following commands:

- `set appqoe action <name> [-priority <priority>] [-altContentSvcName <string>] [-altContentPath <string>] [-polqDepth <positive_integer>] [-priqDepth <positive_integer>] [-maxConn <positive_integer>] [-delay <usecs>] [-dosTrigExpression <expression>] [-dosAction ( SimpleResponse | HICResponse )]`
- `show appqoe action`

### To remove an AppQoE action by using the command line

At the command prompt, type the following commands:

- `rm appqoe action <name>`
- `show appqoe action`

## Parameters for configuring an AppQoE action

- **name.** A name for the new action, or the name of the existing action that you want to modify. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (\_) symbols.
- **priority.** The priority queue to which the request is assigned. When a protected web server or application is heavily loaded and cannot accept additional requests, specifies the order in which waiting requests are to be fulfilled when resources are available. The choices are:
  1. **HIGH.** Fulfills the request as soon as resources are available.
  2. **MEDIUM.** Fulfills the request after it has fulfilled all requests in the HIGH priority queue.
  3. **LOW.** Fulfills the request after it has fulfilled all requests in the HIGH and MEDIUM priority queues.
  4. **LOWEST.** Fulfills the request only after it has fulfilled all requests in higher-priority queues.

If priority is not configured, then the NetScaler appliance assigns the request to the LOWEST priority queue by default.

- **respondWith.** Configures the NetScaler to take the specified Responder action when the specified threshold is reached. Must be used with one of the following settings:
  - **ACS:** Serves content from an alternate content service. Threshold: maxConn (maximum connections) or delay.
  - **NS:** Serves a built-in response from the NetScaler. Threshold: maxConn (maximum connections) or delay.
  - **NO ACTION:** Serves no alternative content. Assigns connections to the LOWEST priority queue if the maxConn (maximum connections) or delay threshold is reached.
- **altContentSvcName.** If -responseWith ACS is specified, the name of the alternative content service, usually an absolute URL to the web server that hosts the alternate content.

---

altContentPath. If -responseWith ( ACS NS ) is specified, the path to the alternative content.

---

- 
- **olqDepth.** Policy queue depth threshold value for the policy queue associated with this action. When the number of connections in the policy queue associated with this action increases to the specified number, subsequent requests are assigned to the LOWEST policy queue. Minimum value: 1 Maximum value: 4,294,967,294

- `priqDepth`. Policy queue depth threshold value for the specified priority queue. If the number of requests in the specified queue on the virtual server to which the policy associated with the current action is bound increases to the specified number, subsequent requests are assigned to the LOWEST priority queue. Minimum value: 1 Maximum value: 4,294,967,294
- `maxConn`. The maximum number of connections that can be open for requests that match the policy rule. Minimum value: 1 Maximum value: 4,294,967,294
- `delay`. The delay threshold, in microseconds, for requests that match the policy rule. If a matching request has been delayed for longer than the threshold, the NetScaler appliance performs the specified action. If NO ACTION is specified, then the appliance assigns requests to the LOWEST priority queue. Minimum value: 1 Maximum value: 599999,999
- `dosTrigExpression`. Adds an optional second-level check to trigger DoS actions.
- `dosAction`. Action to take when the appliance determines that it or a protected server is under DoS attack. Possible values: SimpleResponse, HICResponse.

These values specify HTTP challenge-response methods for validating the authenticity of incoming requests to mitigate an HTTP-DDoS attack.

In the HTTP challenge-response generation and validation process, AppQoE uses cookies to validate the client's response and verify that the client seems to be genuine. When sending a challenge, a NetScaler appliance generates two cookies:

Header cookie (`_DOSQ`). Contains client-specific information, so that the NetScaler appliance can verify the response.

Body cookie (`_DOSH`). Information used to validate the client machine. The client's browser (or the user, in the case of HIC) computes a value for this cookie. The NetScaler appliance compares that value with the expected value to verify the client.

The information that the appliance sends to the client for computing the `_DOSH` value is based on the DoS Action configuration.

1. SimpleResponse: In this case, a NetScaler appliance splits the value and generates a JavaScript code to combine the final value. A client machine capable of computing the original value is considered genuine.
2. HICResponse: in this case, a NetScaler appliance generates two single-digit numbers and generates images for those numbers. Then, using a backpatch framework, the appliance inserts those images as base64 strings.

## Limitations

1. This is not a trivial CAPTCHA implementation, which is why that term not used.

2. The validation number is based on a NetScaler-generated number that does not change for 120s. This number should be dynamic or client specific.

### To configure an AppQoE action by using the configuration utility

1. Navigate to **App-Expert > AppQoE > Actions**.
2. In the details pane, do one of the following:
  - To create a new action, click **Add**.
  - To modify an existing action, select the action, and then click **Edit**.
3. In the **Create AppQoE Action** or the **Configure AppQoE Action** screen, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in “Parameters for configuring the AppQoE Action” as follows (asterisk indicates a required parameter):
  - Name—name
  - Action type—respondWith
  - Priority—priority
  - Policy Queue Depth—polqDepth
  - Queue Depth—priqDepth
  - DOS Action—dosAction
4. Click **Create** or **OK**.

### AppQoE parameters

September 21, 2020

In the AppQoE parameters, you configure the session life of an AppQoE session, the file name of the file containing the customized response, and the number of client connections that can be placed in a queue.

### To configure the AppQoE parameter settings by using the command line

At the command prompt, type the following commands:

- `set appqoe parameter [-sessionLife <secs>] [-avgwaitingclient <positive_integer>] [-MaxAltRespBandWidth <positive_integer>] [-dosAttackThresh <positive_integer>]`
- `show appqoe parameter`

## Parameters for configuring the AppQoE parameters

- sessionLife

Number of seconds to wait after displaying alternate content before the appliance displays the same content again. Default value: 300 Maximum Minimum value: 1 Maximum value: 4,294,967,294

- avgwaitingclient

The average number of client requests that can be in the service waiting queue. Default value: 1000000 Maximum value: 4,294,967,294

- MaxAltRespBandWidth

The maximum bandwidth to consume when sending alternate responses. If the maximum is reached, the appliance quits sending the alternate content til bandwidth consumption drops. Default value: 100 Minimum value: 1 Maximum value: 4,294,967,294

- dosAtckThrsh

The denial-of-service attack threshold. The number of connections that must be waiting in queues before the appliance responds with DoS protection measures. Default value: 2000 Minimum value: 0 Maximum value: 4,294,967,294

## To configure the AppQoE parameter settings by using the GUI

1. Navigate to **AppExpert > AppQoE**.
2. In the details pane, click **Configure AppQoE Parameters**.
3. In the **Configure AppQoE params** screen, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in “Parameters for configuring the AppQoE Parameters” as follows (asterisk indicates a required parameter):
  - Session Life (secs)
  - sessionLife
  - Average waiting client—avgwaitingclient
  - Alternate Response Bandwidth Limit(Mbps) —MaxAltRespBandWidth
  - DOS Attack Threshold —dosAttackThresh
4. Click **OK**.

## AppQoE policies

May 2, 2023

To implement AppQoE, you must configure at least one policy to tell your NetScaler how to distinguish the connections to be queued in a specific queue.

### To configure an AppQoE policy by using the command line

At the command prompt, type the following command:

```
add appqoe policy <name> -rule <expression> -action <string>
```

#### Example:

The following example selects requests with a User-Agent header that contains “Android,” and assigns them to the medium priority queue. These requests come from smartphones and tablets that run the Google Android operating system.

```
1 > add appqoe action appqoe-act-primd -priority MEDIUM
2 Done
3 > add appqoe policy appqoe-pol-primd -rule "HTTP.REQ.HEADER("User-Agent
 ")".CONTAINS("Android")" -action appqoe-act-primd
4 Done
5 > sh appqoe policy appqoe-pol-primd
6 Name: appqoe-pol-primd
7 Rule: HTTP.REQ.HEADER("User-Agent").CONTAINS("Android")
8 Action: appqoe-act-primd
9 Hits: 0
10
11 Done
12 <!--NeedCopy-->
```

### Parameters for configuring an AppQoE policy

- name. A name for the AppQoE policy. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore ( ) symbols. You should chose a name that helps identify the type of action.
- rule. A NetScaler expression that tells the appliance which connections it should handle.
- action. The AppQoE action to perform when a connection matches the policy.

### To configure an AppQoE policy by using the configuration utility

1. Navigate to **App-Expert > AppQoE > Policies**.
2. In the details pane, do one of the following:
  - To create a policy, click **Add**.

- To modify an existing policy, select the policy, and then click **Edit**.
3. If you are creating a policy, in the **Create AppQoE Policy** dialog, in the Name text box, type a name for your new policy.

The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 127 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (\_) symbols. You should chose a name that helps identify the purpose and effect of this policy.

If you are modifying an existing policy, skip this step. You cannot change the name of an existing policy.

4. In the **Action** drop-down list, choose the AppQoE action to perform when the policy matches a connection. Click the plus (+) to open the **Add AppQoE Action** dialog and add a new action.
5. In the **Rule** text box, either enter the policy expression directly, or click New to create a policy expression. If you click New, perform the following steps:

- a) In the **Create Expression** dialog box, click **Add**.

- 1 In the **Add Expression** dialog box, select a common expression from the **Frequently Used Expressions** drop-down list, or use the **Construct Expression** drop-down lists to create the expression that defines which traffic to filter.

If you choose to create your own expression, you start by selecting the first term from the first drop-down list on the left side of the Construct Expression area. The choices in that list are:

- HTTP
- SYS
- CLIENT
- SERVER
- ANALYTICS
- TEXT

The default choice is HTTP. After you make a choice in the first drop-down list (or accept the default), you can choose the next term in your expression from the drop-down list to the right of it. The terms in that list and other lists that follow change depending on your previous choices. The lists offer only terms that are valid choices. Continue to select terms until you have finished the expression.

- a) When you have created the expression that you want, click **OK**. The expression is added in the **Expression** text box.
6. Click **Create**. The expression appears in the **Rule** text box.

## Entity templates

December 22, 2023

### Warning

The entity template functionality is deprecated from NetScaler 13.0 build 82.x onwards and as an alternative Citrix recommends you to use the Style Books. For more information, see [Style Books](#) topic.

An entity template is a collection of information for creating a load balancing virtual server template on a NetScaler appliance. It provides a specification and a set of defaults to be configured for a load balancing virtual server. By using a template that defines a set of defaults, you can quickly configure multiple virtual servers that require a similar configuration while eliminating several configuration steps.

You can create an entity template by exporting the load balancing virtual server details to a template file. This can be done only through the NetScaler GUI. You use the NetScaler GUI to export, import, and manage entity templates. You can share entity templates with other administrators and manage templates saved locally on your appliance or machine. You can also import entity templates from the appliance or your local computer.

Before creating a template, you should be familiar with the configuration of the load balancing virtual server.

### Load balancing virtual server template

Load balancing entity templates are created in the same way that NetScaler application templates are created. When you export a load balancing virtual server to a template file, the following two files are automatically created:

- Load balancing virtual server template file. Contains XML elements that store the values of the parameters that are configured for the load balancing virtual server. The file also contains XML elements for storing information about bound policies.
- Deployment file. Contains XML elements that store deployment-specific information such as services, service groups, and configured variables.

In the template and deployment files, each unit of configuration information is encapsulated in a specific XML element that is meant for that unit type. For example, the load balancing method parameter, `lbMethod`, is encapsulated within the `<lbmethod>` and `</lbmethod>` tags.

**Note:**

After you export a load balancing virtual server, you can add elements, remove elements, and modify existing elements before importing the configuration information to a NetScaler appliance.

**How a load balancing virtual server template works**

When you create a template for a load balancing virtual server, you specify default values for the server. You specify what values must be read-only, what values must not be displayed, and what values users can configure. You also configure the pages that compose the template import wizard. All the information and settings you provide are stored in the template file.

When a user imports the template to a NetScaler appliance, the GUI guides the user through the various pages that you configured for the template. The GUI displays the read-only parameter values and prompts the user to specify values for the configurable parameters. After the user follows the instructions, the appliance creates the entity with the configured values.

You can create or modify an entity template for a load balancing virtual server from the Traffic Management node.

To export virtual server details to a template, you must specify the following options and settings for the template:

- The default value of a parameter.
- Whether the default values are visible to users.
- Whether the default values can be changed by users.
- The number of pages in the entity import wizard, including the page names, text, and available parameters.
- The entities that must be bound to the entity for which the template is being created.

For example, when you are creating a load balancing virtual server template, you can specify the policies that you want to bind to the virtual server that you create from the template. However, only binding information is included in the template. The bound entities are not included. If the entity template is imported to another NetScaler appliance, the bound entities must exist on the appliance at import time for the binding to succeed. If none of the bound entities exist on the target appliance, the entity (for which the template was configured) is created without any bindings. If only a subset of the bound entities exist on the target appliance, they are bound to the entity that is created from the template.

When you export a template for the load balancing virtual server, the configuration settings of the entity appear in the template. All bound entities are selected by default, but you can modify bindings as necessary. As in the case of a template that is not based on an existing entity, only binding information is included and not the entities. You can either save the template with the existing configuration settings or use the settings as a basis for creating a new configuration for a template.

## Configure variables in load balancing virtual server template

Load balancing virtual server templates support the declaration of variables in the configured load balancing parameters and in bound policies and actions. The ability to declare variables enables you to replace preconfigured values with values that suit the environment into which you are importing the template.

As an example, consider the following expression configured for a policy that is bound to a load balancing virtual server for which you are creating a template. The expression evaluates the value of the accept-language header in an HTTP request.

```
HTTP.REQ.HEADER("Accept-Language").CONTAINS("en-us")
```

If you want the value of the header to be configurable at import time, you can specify the string en-us as a variable.

After you create a variable, you can do the following:

- Assign more strings to an existing variable. After you create a variable for a string, you can select and assign other parts of the same or different expression to the variable. The strings you assign to a variable need not be the same. At import time, all the strings that are assigned to the variable are replaced with the value that you provide.
- View the string or strings that are assigned to the variable.
- View a list of all the entities and parameters that use the variable

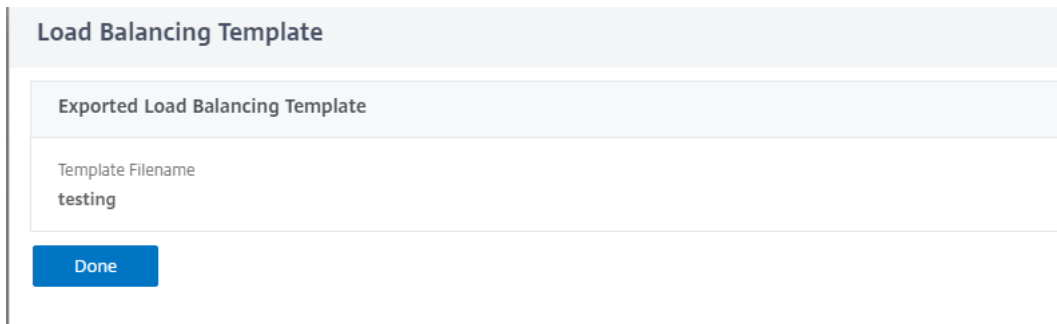

## To configure variables in a load balancing virtual server template

Complete the following procedure to configure variables for a load balancing virtual server template by using the NetScaler GUI

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**
2. In the details pane, right-click the virtual server that you want to export to a template file, and then click **Add**.
3. In the **Create Load balancing Virtual Server** page, set the virtual server parameters. For more information on configuring a load balancing virtual server, see [How load balancing works](#)
4. Once you have the set the parameters for the load balancing virtual server, click **Done**.

5. Click **Export as Template** link at the top to export the server details as a template file.
6. In the **Create Load Balancing Template** page, enter the template settings.
7. Click **Done**.

### Modify a load balancing virtual server template

You can modify only the parameters, bindings, and pages configured for a template. The name and location of the template specified when the template was created cannot be changed. The NetScaler appliance does not provide you with the option of modifying a load balancing virtual server template.

To modify a load balancing virtual server by using NetScaler GUI

1. Navigate to **Traffic Management > Load balancing > Virtual Servers**.
2. In the **Load Balancing Virtual Server** page, modify the entity parameters.
3. Click Done.
4. Click **Export as a Template** link.
5. The modified changes are now available in the load balancing virtual server template file.
6. In the **Exported Load Balancing Template** page, click **Done**.

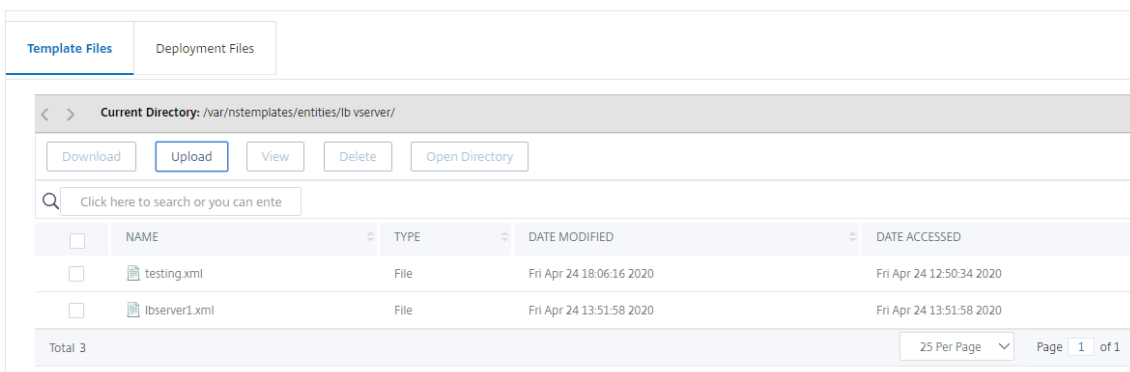

## Manage load balancing virtual server templates

You can organize load balancing virtual server template files and deployment files by using the NetScaler GUI.

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. In the **Virtual Servers** page, select **Manage Template action**.
3. In the **Load Balancing Templates** page, click **Template File** tab.
4. In the **Template Files** tab page, you can upload or download a template from and to the appliance template folder.

### ← Load Balancing Templates

The screenshot shows the 'Template Files' tab selected. The current directory is '/var/nstemplates/entities/lb vserver/'. Below the directory path are buttons for 'Download', 'Upload', 'View', 'Delete', and 'Open Directory'. A search bar is present with the text 'Click here to search or you can ente'. A table lists the files:

| <input type="checkbox"/> | NAME          | TYPE | DATE MODIFIED            | DATE ACCESSED            |
|--------------------------|---------------|------|--------------------------|--------------------------|
| <input type="checkbox"/> | testing.xml   | File | Fri Apr 24 18:06:16 2020 | Fri Apr 24 12:50:34 2020 |
| <input type="checkbox"/> | lbserver1.xml | File | Fri Apr 24 13:51:58 2020 | Fri Apr 24 13:51:58 2020 |

Total 3 files. Page 1 of 1.

5. Click **Close**.

## To upload load balancing virtual server entity template by using NetScaler GUI

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. In the **Virtual Servers** page, click **Select Action** and then select **Manage Template**.
3. In the Load Balancing Templates page, click **Template Files** tab.
4. In the **Template Files** tab page, click **Upload** to upload a template.
5. Click **Close**.

### To download load balancing virtual server entity template by using NetScaler GUI

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. In the **Virtual Servers** page, click **Select Action** and then select **Manage Template**.
3. In the **Load Balancing Templates** page, click **Template Files** tab.
4. In the Template Files tab page, select a template file and click Download.
5. Click Close.

### Example of load balancing virtual server template and deployment template

Following is an example of a template file that was created from a load balancing virtual server called “Lbvip”:

```

1 COPY
2
3 <?xml version="1.0" encoding="UTF-8" ?>

```

```
4 <template>
5 <template_info>
6 <entity_name>Lbvip</entity_name>
7 <version_major>10</version_major>
8 <version_minor>0</version_minor>
9 <build_number>40.406</build_number>
10 </template_info>
11 <entitytemplate>
12 <lbserver_list>
13 <lbserver>
14 <name>Lbvip</name>
15 <servicetype>HTTP</servicetype>
16 <ipv46>0.0.0.0</ipv46>
17 <ipmask>*</ipmask>
18 <port>0</port>
19 <range>1</range>
20 <persistencetype>NONE</persistencetype>
21 <timeout>2</timeout>
22 <persistencebackup>NONE</persistencebackup>
23 <backupperpersistencetimeout>2</backupperpersistencetimeout>
24 <lbmethod>LEASTCONNECTION</lbmethod>
25 <persistmask>255.255.255.255</persistmask>
26 <v6persistmasklen>128</v6persistmasklen>
27 <pq>OFF</pq>
28 <sc>OFF</sc>
29 <m>IP</m>
30 <datalength>0</datalength>
31 <dataoffset>0</dataoffset>
32 <sessionless>DISABLED</sessionless>
33 <state>ENABLED</state>

41
42 <!--NeedCopy-->
```

## HTTP callouts

May 2, 2023

For certain types of requests, or when certain criteria are met during policy evaluation, you might want to stall policy evaluation briefly, retrieve information from a server, and then perform a specific action that depends on the information that is retrieved. At other times, when you receive certain types of requests, you might want to update a database or the content hosted on a Web server. HTTP callouts enable you to perform all these tasks.

An HTTP callout is an HTTP or HTTPS request that the NetScaler appliance generates and sends to an external application when certain criteria are met during policy evaluation. The information that is retrieved from the server can be analyzed by Advanced policy expressions, and an appropriate action can be performed. You can configure HTTP callouts for HTTP content switching, TCP content switching, rewrite, responder, and for the token-based method of load balancing.

Before you configure an HTTP callout, you must set up an application on the server to which the callout will be sent. The application, which is called the *HTTP callout agent*, must be configured to respond to the HTTP callout request with the required information. The HTTP callout agent can also be a Web server that serves the data for which the NetScaler appliance sends the callout. You must make sure that the format of the response to an HTTP callout does not change from one invocation to another.

After you set up the HTTP callout agent, you configure the HTTP callout on the NetScaler appliance. Finally, to invoke the callout, you include the callout in a Advanced policy in the appropriate NetScaler feature and then bind the policy to the bind point at which you want the policy to be evaluated.

After you have configured the HTTP callout, you must verify the configuration to make sure that the callout is working correctly.

## How an HTTP callout works

May 2, 2023

When the NetScaler appliance receives a client request, the appliance evaluates the request against the policies bound to various bind points. During this evaluation, if the appliance encounters the HTTP callout expression, `SYS.HTTP_CALLOUT(<name>)`, it stalls policy evaluation briefly and sends a request to the HTTP callout agent by using the parameters configured for the specified HTTP callout. Upon receiving the response, the appliance inspects the specified portion of the response, and then either performs an action or evaluates the next policy, depending on whether the evaluation of the response from the HTTP callout agent evaluates to TRUE or FALSE, respectively. For example, if the HTTP callout is included in a responder policy, if the evaluation of the response evaluates to TRUE, the appliance performs the action associated with the responder policy.

If the HTTP callout configuration is incorrect or incomplete, or if the callout invokes itself recursively, the appliance raises an UNDEF condition, and updates the undefined hits counter.

The following figure illustrates the working of an HTTP callout that is invoked from a globally bound responder policy. The HTTP callout is configured to include the IP address of the client that is associated with an incoming request. When the NetScaler appliance receives a request from a client, the appliance generates the callout request and sends it to the callout server, which hosts a database of blacklisted IP addresses and an HTTP callout agent that checks whether the client's IP address is listed in the database. The HTTP callout agent receives the callout request, checks whether the client's IP address is listed, and sends a response that the NetScaler appliance evaluates. If the response indicates that the client's IP address is not blacklisted, the appliance forwards the request to the configured service. If the client's IP address is blacklisted, the appliance resets the client connection

Figure 1. HTTP Callout Entity Model

## Notes on the format of HTTP requests and responses

May 2, 2023

The NetScaler appliance does not check for the validity of the HTTP callout request. Therefore, before you configure HTTP callouts, you must know the format of an HTTP request. You must also know the format of an HTTP response, because configuring an HTTP callout involves configuring expressions that evaluate the response from the HTTP callout agent.

This section includes the following sections:

- Format of an HTTP Request
- Format of an HTTP Response

## Format of an HTTP Request

An HTTP request contains a series of lines that each end with a carriage return and a line feed, represented as either `<CR><LF>` or `\r\n`.

The first line of a request (the *message line*) contains the HTTP method and target. For example, a message line for a GET request contains the keyword GET and a string that represents the object that is to be fetched, as shown in the following example:

```
1 GET /mysite/mydirectory/index.html HTTP/1.1\r\n
2 <!--NeedCopy-->
```

The rest of the request contains HTTP headers, including a required Host header and, if applicable, a message body.

The request ends with a blank line (an extra `<CR><LF>` or `\r\n`).

Following is an example of a request:

```
1 Get /mysite/index.html HTTP/1.1\r\n
2 Host: 10.101.101.10\r\n
3 Accept: */*\r\n
4 \r\n
5 <!--NeedCopy-->
```

## Format of an HTTP Response

An HTTP response contains a status message, response HTTP headers, and the requested object or, if the requested object cannot be served, an error message.

Following is an example of a response:

```
1 HTTP/1.1 200 OK\r\n
2 Content-Length: 55\r\n
3 Content-Type: text/html\r\n
4 Last-Modified: Wed, 12 Aug 1998 15:03:50 GMT\r\n
5 Accept-Ranges: bytes\r\n
6 ETag: " 04f97692cbd1:377 " \r\n
7 Date: Thu, 19 Jun 2008 19:29:07 GMT\r\n
8 \r\n
9 <55-character response>
10 <!--NeedCopy-->
```

## Configure an HTTP callout

December 21, 2023

When configuring an HTTP callout, you specify the type of request (HTTP or HTTPS), destination, and format of the request. The expected format of the response, and, finally, the portion of the response that you want to analyze.

For the destination, you either specify the IP address and port of the HTTP callout agent. Or engage a load balancing, content switching, or cache redirection virtual server, to manage the HTTP callout requests.

In the first case, the HTTP callout requests are sent directly to the HTTP callout agent. In the second case, the HTTP callout requests are sent to the virtual IP address (VIP) of the specified virtual server. The virtual server processes the request in the same way as it processes a client request. For example, if you expect many callouts to be generated, you can configure instances of the HTTP callout agent on multiple servers, bind these instances (as services) to a load balancing virtual server, and then specify the load balancing virtual server in the HTTP callout configuration. The load balancing virtual server then balances the load on those configured instances as determined by the load balancing algorithm.

For the format of the HTTP callout request, you can specify the individual attributes of the HTTP callout request (an attribute-based HTTP callout), or you can specify the entire HTTP callout request as an advanced policy expression (an expression-based HTTP callout).

For the format of the HTTP callout request, you can specify the individual attributes of the HTTP callout request (an attribute-based HTTP callout), or you can specify the entire HTTP callout request as an Advanced policy expression (an expression-based HTTP callout).

For more information, see [policy-httpCallout](#)

---

| Parameter                                                                                  | Description                                                                                                                                                                                                                                                                   |
|--------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                                                                                       | Name of the callout, 127 character maximum                                                                                                                                                                                                                                    |
| IP address and port ( <i>ip-address / port</i> ) or Virtual server name ( <i>vserver</i> ) | IPv4 or IPv6 address of the server to which the callout is sent, or a wildcard, and the port on the server to which the callout is sent, or a wildcard. Or, the name of a load balancing, content switching, or cache redirection virtual server with a service type of HTTP. |

---

| Parameter                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HTTP Method (httpMethod)                                     | HTTP Method (httpMethod). Method used in the HTTP request that this callout sends. Valid values: GET or POST. Default: GET.                                                                                                                                                                                                                                                                                                       |
| Host expression (hostExpr)                                   | Host expression (hostExpr). Advanced text expression to configure the Host header. Maximum length: 255. The expression can be a literal value or it can be an advanced expression that derives the value. Examples: “10.101.10.11”, “http.req.header(“Host”)”                                                                                                                                                                     |
| URL stem expression (urlStemExpr)                            | URL stem expression (urlStemExpr) An advanced string expression for generating the URL stem. Maximum length: 8191. The expression can be a literal string or an expression that derives the value. Examples:<br>““/mysite/index.html””×“http.req.url”                                                                                                                                                                             |
| HTTP Headers (headers)                                       | HTTP Headers (headers). Advanced text expression to insert HTTP headers and their values in the HTTP callout request. Specify a value for every header. You specify the header name as a string and the header value as an advanced expression. Specify the headers separated by space. Such as -headers cip(client.ip.src) hdr(http.req.header(“HDR”)). The number of headers can be 8                                           |
| Expression-based request to send to the server (fullReqExpr) | Exact HTTP request that the NetScaler is to send as an advanced expression to 8191 characters. If you specify this parameter, you must omit the httpMethod, hostExpr, urlStemExpr, headers, and parameters arguments. The request expression is constrained by the feature where the callout is used. For example, an HTTP.RES expression cannot be used in a request-time policy bank or in a TCP content switching policy bank. |

---

| Parameter                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Expression-based request to send to the server (bodyExpr) | An advanced string expression for generating the body of the request. The expression can contain a literal string or an expression that derives the value (for example, client.ip.src). Mutually exclusive with -fullReqExpr.                                                                                                                                                                                                                                                                                                                                                                                                 |
| Parameters                                                | Advanced expression to insert query parameters in the HTTP request that the callout sends. Specify a value for every parameter that you configure. If the callout request uses the GET method, these parameters are inserted in the URL. If the callout request uses the POST method, these parameters are inserted in the POST body. You configure the query parameter name as a string and the value as an advanced expression. The parameter values are URL encoded. Specify the parameters separated by space like: -parameters name1("name1") name2(http.req.header("hdr")). The maximum 8 parameters can be configured. |
| Return type (returnType)                                  | Type of data that the target application returns in the response to the callout. Valid values: TEXT: Treat the returned value as a text string. NUM: Treat the returned value as a number. BOOL: Treat the returned value as a Boolean value. Note: You cannot change the return type after it is set.                                                                                                                                                                                                                                                                                                                        |

| Parameter                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Expression to extract data from the response (resultExpr) | Advanced expression that extracts HTTP.RES objects from the response to the HTTP callout. The maximum length is 8191. The operations in this expression must match the return type. For example, if you configure a return type of text, the result expression must be a text-based expression. If the return type is num, the result expression (resultExpr) must return a numeric value similar to the following: <code>“http.res.body(10000).length”</code> Note: Sometimes, if you set a return type of TEXT and the result sent from the server exceeds 16 KB, the result expression can return NULL. For example, when the result is a concatenated string that exceeds 16 KB. |
| Scheme                                                    | The type of scheme for the callout server.<br>Example: HTTP, https                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| cacheForSecs                                              | Duration, in seconds, for which the callout response is cached. The cached responses are stored in an integrated caching content group named “calloutContentGroup”. If no duration is configured, the callout responses are not cached unless a normal caching configuration is used to cache them. This parameter takes precedence over any normal caching configuration that would otherwise apply to these responses.                                                                                                                                                                                                                                                             |

**Note:** The appliance does not check for the validity of the request. You must make sure that the request is a valid request and doesn't contain any confidential information. An incorrect or incomplete HTTP callout configuration results in a runtime UNDEF condition that is not associated with an action. The UNDEF condition merely updates the Undefined Hits counter, which enables you to troubleshoot an incorrectly configured HTTP callout. However, the appliance parses the HTTP callout request to enable you to configure certain NetScaler features for the callout. This can lead to an HTTP callout invoking itself. For information about callout recursion and how you can avoid it, see [Avoiding HTTP Callout Recursion](#).

Finally, regardless of whether you use HTTP request attributes or an expression to define the format of the HTTP callout request, you must specify the format of the response from the HTTP callout agent

and the portion of the response that you want to evaluate. The response type can be a Boolean value, a number, or text. Based on this return type only, you can use the further expression methods on the callout response. If the return type is a number, then you can use the number based expression on the callout response. The portion of the response that you want to evaluate is specified by an expression. For example, if you specify that the response contains text, you can use `HTTP.RES.BODY(<unit>)` to specify that the appliance must evaluate only the first <unit> bytes of the response from the callout agent.

At the command line, you first create an HTTP callout by using the `add` command. When you add a callout, all parameters are set to a default value of NONE, except the HTTP method, which is set to a default value of GET. You then configure the callout's parameters by using the `set` command. The `set` command is used to configure both types of callouts (attribute-based and expression-based). The difference lies in the parameters that are used for configuring the two types of callouts. So, the command-line instructions that follow include a `set` command for configuring an attribute-based callout and a `set` command for configuring an expression-based callout. In the configuration utility, all of these configuration tasks are performed in a single dialog box.

Note: Before you put an HTTP callout into a policy, you can modify all configured parameters except the return type. Once an HTTP callout is in a policy, you cannot completely modify an expression that is configured in the callout. For example, you cannot change `HTTP.REQ.HEADER("myVal")` to `CLIENT.IP.SRC`. You can modify the operators and arguments that are passed to the expression. For example, you can change `HTTP.REQ.HEADER("myVal1")` to `HTTP.REQ.HEADER("myVal2")`, or `HTTP.REQ.HEADER("myVal")` to `HTTP.REQ.HEADER("myVal").AFTER_STR(<string>)`. If the `set` command fails, create an HTTP callout.

HTTP callout configuration involves configuring Advanced policy expressions. For more information about configuring Advanced policy expressions, see [Configuring Advanced policy Expressions: Getting Started](#).

## To configure an HTTP callout by using the command line interface

At the command prompt, do the following:

Create an HTTP callout.

```

1 add policy httpCallout <name> [-IPAddress <ip_addr|ipv6_addr>] [-port<
 port>] [-vServer <string>] [-returnType <returnType>] [-httpMethod (
 GET | POST)] [-hostExpr <expression>] [-urlStemExpr <expression>]
 [-headers <name(value)> ...] [-parameters <name(value)> ...] [-
 bodyExpr <expression>] [-fullReqExpr <expression>] [-scheme (http |
 https)] [-resultExpr <expression>] [-cacheForSecs <secs>] [-
 comment <string>]
2
3 <!--NeedCopy-->
```

**Example:**

```

1 add policy httpCallout mycallout -vserver lbv1 -returnType num -
 httpMethod GET -hostExpr 'http.req.header("Host")'-urlStemExpr "http
 .req.url" -parameters Name("My Name") -headers Name("MyHeader")-
 resultExpr "http.res.body(10000).length"
2
3 <!--NeedCopy-->

```

Modify the HTTP callout configuration.

```

1 set policy httpCallout <name> [-IPAddress <ip_addr|ipv6_addr|*>] [-port
 <port|*>] [-vServer <string>] [-returnType <returnType>] [-
 httpMethod (GET | POST)] [-hostExpr <string>] [-urlStemExpr <
 string>] [-headers <name(value)> ...] [-parameters <name(value)>
 ...] [-resultExpr <string>]
2
3 <!--NeedCopy-->

```

**Example:**

```

1 > set policy httpCallout mycallout -vserver lbv1 -returnType num -
 httpMethod GET -hostExpr 'http.req.header("Host")'-urlStemExpr "http
 .req.url" -parameters Name("My Name") -headers Name("MyHeader") -
 resultExpr "http.res.body(10000).length"
2 <!--NeedCopy-->

```

Configure HTTP callout using fullReqExpr parameter.

```

1 set policy httpCallout <name> [-vServer <string>] [-returnType <
 returnType>] [-fullReqExpr <string>] [-resultExpr <string>]
2 <!--NeedCopy-->

```

**Example:**

```

1 > set policy httpCallout mycallout1 -vserver lbv1 -returnType num
 fullReqExpr q{
2 "GET " + http.req.url + "HTTP/" + http.req.version.major + "." + http.
 req.version.minor.sub(1) + "\r\nHost:10.101.10.10\r\nAccept: */*\r\n
 \r\n" }
3
4
5 <!--NeedCopy-->

```

Verify the configurations of the HTTP callout.

```

1 show policy httpCallout `<name>`
2
3 sh policy httpCallout mycallout1
4 > Name: mycallout1
5 >Vserver: lbv1 (UP)
6 Effective Vserver state: UP
7 Return type: TEXT

```

```
8 Scheme: HTTP
9 Full REQ expr: "GET " + http.req.url + "HTTP/" + http.req.version.major
 + "." + http.req.version.minor.sub(1)+ "r\nHost:10.101.10.10\r\
 nAccept: */*\r\n\r\n"
10 Result expr: http.res.body(100)
11 Hits: 0
12 Undef Hits: 0
13 Done
14 >
15
16 <!--NeedCopy-->
```

### To configure an HTTP callout by using the configuration utility

1. Navigate to **AppExpert > HTTP Callouts**.
2. In the details pane, click **Add**.
3. In the **Create HTTP Callout** dialog box, configure the parameters of the HTTP callout. For a description of the parameter, hover the mouse cursor over the check box.
4. Click **Create** and then click **Close**.

## Verify the configuration

December 21, 2023

For an HTTP callout to work correctly, all the HTTP callout parameters and the entities associated with the callout must be configured correctly. While the NetScaler appliance does not check the validity of the HTTP callout parameters, it indicates the state of the bound entities, namely the server or virtual server to which the HTTP callout is sent. The following table lists the icons and describes the conditions under which the icons are displayed.

| Icon                                                                                | Indicates that                                                                                                                                                                                |
|-------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|    | The state of the server that hosts the HTTP callout agent, or the load balancing, content switching, or cache redirection virtual server to which the HTTP callout is sent is UP.             |
|    | The state of the server that hosts the HTTP callout agent, or the load balancing, content switching, or cache redirection virtual server to which the HTTP callout is sent is OUT OF SERVICE. |
|  | The state of the server that hosts the HTTP callout agent, or the load balancing, content switching, or cache redirection virtual server to which the HTTP callout is sent is DOWN.           |

Table 1. Icons That Indicate the States of Entities Bound to an HTTP Callout

For an HTTP callout to function correctly, the icon must be green at all times. If the icon is not green, check the state of the callout server or virtual server to which the HTTP callout is sent. If the HTTP callout is not working as expected even though the icon is green, check the parameters configured for the callout.

You can also verify the configuration by sending test requests that match the policy from which the HTTP callout is invoked, checking the hits counter for the policy and the HTTP callout, and verifying the responses that the NetScaler appliance sends to the client.

Note: An HTTP callout can sometimes invoke itself recursively a second time. If this happens, the hits counter is incremented by two counts for each callout that is generated by the appliance. For the hits counter to display the correct value, you must configure the HTTP callout in such a way that it does not invoke itself a second time. For more information about how you can avoid HTTP callout recursion, see [Avoiding HTTP Callout Recursion](#).

## To view the hits counter for an HTTP callout

1. Navigate to **AppExpert > HTTP Callouts**.
2. In the details pane, click the HTTP callout for which you want to view the hits counter, and then view the hits in the **Details** area.

## Invoke an HTTP callout

December 21, 2023

After you configure an HTTP callout, you invoke the callout by including the `SYS.HTTP_CALLOUT (<name>)` expression in a Advanced policy rule. In this expression, `<name>` is the name of the HTTP callout that you want to invoke.

You can use Advanced policy expression operators with the callout expression to process the response and then perform an appropriate action. The return type of the response from the HTTP callout agent determines the set of operators that you can use on the response. If the part of the response that you want to analyze is text, you can use a text operator to analyze the response. For example, you can use the `CONTAINS(<string>)` operator to check whether the specified portion of the response contains a particular string, as in the following example:

```
1 SYS.HTTP_CALLOUT(mycallout).contains("Good IP address")
2 <!--NeedCopy-->
```

If you use the preceding expression in a responder policy, you can configure an appropriate responder action.

Similarly, if the part of the response that you want to evaluate is a number, you can use a numeric operator such as `GT(int)`. If the response contains a Boolean value, you can use a Boolean operator.

Note: An HTTP callout can invoke itself recursively. HTTP callout recursion can be avoided by combining the HTTP callout expression with a Advanced policy expression that prevents recursion. For information about how you can avoid HTTP callout recursion, see [Avoiding HTTP Callout Recursion](#).

You can also cascade HTTP callouts by configuring policies that each invoke a callout after evaluating previously generated callouts. In this scenario, after one policy invokes a callout, when the NetScaler appliance is parsing the callout before sending the callout to the callout server, a second set of policies can evaluate the callout and invoke additional callouts, which can in turn be evaluated by a third set of policies, and so on. Such an implementation is described in the following example.

First, you could configure an HTTP callout called `myCallout1`, and then configure a responder policy, `Pol1`, to invoke `myCallout1`. Then, you could configure a second HTTP callout, `myCallout2`, and a

responder policy, Pol2. You configure Pol2 to evaluate myCallout1 and invoke myCallout2. You bind both responder policies globally.

To avoid HTTP callout recursion, myCallout1 is configured with a unique custom HTTP header called “Request1.” Pol1 is configured to avoid HTTP callout recursion by using the Advanced policy expression,

```
1 HTTP.REQ.HEADER("Request1").EQ("Callout Request").NOT.
2 <!--NeedCopy-->
```

Pol2 uses the same Advanced policy expression, but excludes the .NOT operator so that the policy evaluates myCallout1 when the NetScaler appliance is parsing it. Note that myCallout2 identifies its own unique header called “Request2,” and Pol2 includes a Advanced policy expression to prevent myCallout2 from invoking itself recursively.

### Example:

```
1 > add policy httpCallout myCallout1
2
3 Done
4
5 > set policy httpCallout myCallout1 -IPAddress 10.102.3.95 -port 80 -
 returnType TEXT -hostExpr
6 ""10.102.3.95"" -urlStemExpr ""/cgi-bin/check_clnt_from_database.pl\
 "" -headers Request1
7 ("Callout Request") -parameters cip(CLIENT.IP.SRC) -resultExpr "HTTP.
 RES.BODY(100)"
8
9 Done
10
11 > add responder policy Pol1 "HTTP.REQ.HEADER(\"Request1\").EQ(\"Callout
 Request\").NOT &&
12 SYS.HTTP_CALLOUT(myCallout1).CONTAINS(\"IP Matched\")" RESET
13
14 Done
15
16 > bind responder global Pol1 100 END -type OVERRIDE
17
18 Done
19
20 > add policy httpCallout myCallout2
21
22 Done
23
24 > set policy httpCallout myCallout2 -IPAddress 10.102.3.96 -port 80 -
 returnType TEXT -hostExpr
25 ""10.102.3.96\
 "" -urlStemExpr ""/cgi-bin/
 check_clnt_location_from_database.pl\
 "" -headers Request2
26 ("Callout Request") -parameters cip(CLIENT.IP.SRC) -resultExpr "HTTP.
 RES.BODY(200)"
27
28 Done
```

```
29
30 > add responder policy Pol2 "HTTP.REQ.HEADER(\"Request2\").EQ(\"Callout
 Request\").NOT &&
31 HTTP.REQ.HEADER(\"Request1\").EQ(\"Callout Request\") && SYS.
 HTTP_CALLOUT(myCallout2).CONTAINS
32 (\"APAC\")" RESET
33
34 Done
35
36 > bind responder global Pol2 110 END -type OVERRIDE
37
38 Done
39 <!--NeedCopy-->
```

## Avoid HTTP callout recursion

December 21, 2023

Even though the NetScaler appliance does not check for the validity of the HTTP callout request, it parses the request once before it sends the request to the HTTP callout agent. This parsing allows the appliance to treat the callout request as any other incoming request, which in turn allows you to configure several useful NetScaler features (such as integrated caching) to work on the callout request.

However, during this parsing, the HTTP callout request can select the same policy and therefore invoke itself recursively. The appliance detects the recursive invocation and raises an undefined (UNDEF) condition. However, the recursive invocation results in the policy and HTTP callout select counters being incremented by two counts each instead of one count each.

To prevent a callout from invoking itself, you must identify at least one unique characteristic of the HTTP callout request, and then exclude all requests with this characteristic from being processed by the policy rule that invokes the callout. You can do so by including another Advanced policy expression in the policy rule. The expression must precede the `SYS.HTTP_CALLOUT(<name>)` expression so that it is evaluated before the callout expression is evaluated. For example:

```
1 <Expression that prevents callout recursion> OR SYS.HTTP_CALLOUT(<name
 >)
2 <!--NeedCopy-->
```

When you configure a policy rule in this way, when the appliance generates the request and parses it, the compound rule evaluates to FALSE, the callout is not generated a second time, and the select counters are incremented correctly.

One way by which you can assign a unique characteristic to an HTTP callout request is to include a unique custom HTTP header when you configure the callout. Following is an example of an HTTP

callout called “myCallout.” The callout generates an HTTP request that checks whether a client’s IP address is present in a database of blacklisted IP addresses. The callout includes a custom header called “Request,” which is set to the value “Callout Request.” A globally bound responder policy, “Pol1,” invokes the HTTP callout but excludes all requests whose Request header is set to this value, thus preventing a second invocation of myCallout. The expression that prevents a second invocation is `HTTP.REQ.HEADER("Request").EQ("Callout Request").NOT`.

**Example:**

```
1 > add policy httpCallout myCallout
2 Done
3
4 > set policy httpCallout myCallout -IPAddress 10.102.3.95 -port 80 -
 returnType TEXT -hostExpr "\"10.102.3.95\"" -urlStemExpr "\/cgi-bin
 /check_clnt_from_database.pl\"" -headers Request("Callout Request")
 -parameters cip(CLIENT.IP.SRC) -resultExpr "HTTP.RES.BODY(100)"
5 Done
6
7 > add responder policy Pol1 "HTTP.REQ.HEADER(\"Request\").EQ(\"Callout
 Request\").NOT && SYS.HTTP_CALLOUT(myCallout).CONTAINS(\"IP Matched
 \")" RESET
8 Done
9
10 > bind responder global Pol1 100 END -type OVERRIDE
11 Done
12 <!--NeedCopy-->
```

**Note:**

You can also configure an expression to check whether the request URL includes the stem expression configured for the HTTP callout. To implement the solution, ensure the HTTP callout agent can respond only to HTTP callouts and not to other requests directed through the appliance. If the HTTP callout agent is an application or Web server that serves other client requests, such an expression prevents the appliance from processing those client requests. Instead, use a unique custom header as described earlier.

## Cache HTTP callout responses

December 21, 2023

For improved performance while using callouts, you can use the integrated caching feature to cache callout responses. The responses are stored in an integrated caching content group named `callout-ContentGroup` for a specified time duration.

Note: To cache callout responses, make sure that the integrated caching feature is enabled.

## To set the cache duration by using the command line interface

At the command prompt, type:

```
set policy httpCallout <name> -cacheForSecs <secs>
```

### Example:

```
1 > set httpcallout httpcallout1 -cacheForSecs 120
2 <!--NeedCopy-->
```

## To set the cache duration by using the configuration utility

1. Navigate to **AppExpert > HTTP Callouts**.
2. In the details pane, select the HTTP callout for which you want to set the cache duration and click **Open**.
3. In the **Configure HTTP Callout** dialog box, specify the **Cache Expiration Time**.
4. Verify that you have entered the correct time duration, and then click **OK**.

## Use Case: Filter clients by using an IP blacklist

December 21, 2023

HTTP callouts can be used to block requests from clients that are blacklisted by the administrator. The list of clients can be a publicly known blacklist, a blacklist that you maintain for your organization, or a combination of both.

The NetScaler appliance checks the IP address of the client against the pre-configured blacklist and blocks the transaction if the IP address has been blacklisted. If the IP address is not in the list, the appliance processes the transaction.

To implement this configuration, you must perform the following tasks:

1. Enable responder on the NetScaler appliance.
2. Create an HTTP callout on the NetScaler appliance and configure it with details about the external server and other required parameters.
3. Configure a responder policy to analyze the response to the HTTP callout, and then bind the policy globally.
4. Create an HTTP callout agent on the remote server.

## Enabling responder

You must enable responder before you can use it.

### To enable responder by using the GUI

1. Make sure that you have installed the responder license.
2. In the configuration utility, expand AppExpert, and right-click **Responder**, and then click **Enable Responder** feature.

## Creating an HTTP callout on the NetScaler appliance

Create an HTTP callout, HTTP\_Callout, with the parameter settings shown in the following table. For more information about creating an HTTP callout, see [Configuring an HTTP Callout](#) pdf.

## Configuring a responder policy and binding it globally

After you configure the HTTP callout, verify the callout configuration, and then configure a responder policy to invoke the callout. While you can create a responder policy in the Policies sub-node and then bind it globally by using the Responder Policy Manager, this demonstration uses the Responder Policy Manager to create the responder policy and bind the policy globally.

### To create a responder policy and bind it globally by usin

1. Navigate to **AppExpert > Responder**.
2. In the details pane, under **Policy Manager**, click **Policy Manager**.
3. In the **Responder Policy Manager** dialog box, click **Override Global**.
4. Click **Insert Policy**, and then, under **Policy Name**, click **New Policy**.
5. In the **Create Responder Policy** dialog box, do the following:
  - a) In **Name**, type **PolicyResponder1**.
  - b) In **Action**, select **RESET**.
  - c) In **Undefined-Result Action**, select **Global undefined-result** action.
  - d) In **Expression**, type the following Advanced policy expression:

```

1 "HTTP.REQ.HEADER("Request").EQ("Callout Request").NOT && SYS.
 HTTP_CALLOUT(HTTP_Callout).CONTAINS("IP Matched)"
2 <!--NeedCopy-->

```

- e) Click **Create**, and then click **Close**.
6. Click **Apply Changes**, and then click **Close**.

## Creating an HTTP callout agent on the remote server

You must now create an HTTP callout agent on the remote callout server that will receive callout requests from the NetScaler appliance and respond appropriately. The HTTP callout agent is a script that is different for each deployment and must be written with the server specifications in mind, such as the type of database and the scripting language supported.

Following is a sample callout agent that verifies whether the given IP address is part of an IP blacklist. The agent has been written in the Perl scripting language and uses a MySQL database.

The following CGI script checks for a given IP address on the callout server.

```

1 #!/usr/bin/perl -w
2 print "Content-type: text/html\n\n";
3 use DBI();
4 use CGI qw(:standard);
5 #Take the Client IP address from the request query
6 my $ip_to_check = param('cip');
7 # Where a MYSQL database is running
8 my $dsn = 'DBI:mysql:BAD_CLIENT:localhost';
9 # Database username to connect with
10 my $db_user_name = 'dbuser';
11 # Database password to connect with
12 my $db_password = 'dbpassword';
13 my ($id, $password);
14 # Connecting to the database
15 my $dbh = DBI->connect($dsn, $db_user_name, $db_password);
16 my $sth = $dbh->prepare(qq{
17 select * from bad_clnt }
18);
19 $sth->execute();
20 while (my ($ip_in_database) = $sth->fetchrow_array()) {
21
22 chomp($ip_in_database);
23 # Check for IP match
24 if ($ip_in_database eq $ip_to_check) {
25
26 print "\n IP Matched\n";
27
28 $sth->finish();
29 exit;
30 }

```

```
31 }
32
33 print "\n IP Failed\n";
34 $sth->finish();
35 exit;
36 <!--NeedCopy-->
```

## Use Case: ESI support for fetching and updating content dynamically

May 2, 2023

Edge Side Includes (ESI) is a markup language for edge-level dynamic Web content assembly. It helps in accelerating dynamic Web-based applications by defining a simple markup language to describe cacheable and non-cacheable Web page components that can be aggregated, assembled, and delivered at the network edge. By using HTTP callouts on the NetScaler appliance, you can read through the ESI constructs and aggregate or assemble content dynamically.

To implement this configuration, you must perform the following tasks:

1. Enable rewrite on the NetScaler appliance.
2. Create an HTTP callout on the appliance and configure it with details about the external server and other required parameters.
3. Configure a rewrite action to replace the ESI content with the callout response body.
4. Configure a rewrite policy to specify the conditions under which the action is performed, and then bind the rewrite policy globally.

### Enabling rewrite

Rewrite must be enabled before it is used on the NetScaler appliance. The following procedure describes the steps to enable the rewrite feature.

#### To enable rewrite by using the GUI

1. Make sure that you have installed the rewrite license.
2. In the configuration utility, expand AppExpert, and right-click Rewrite, and then click Enable Rewrite feature.

## Creating an HTTP Callout on the NetScaler Appliance

For more information about creating an HTTP callout, see [Configuring an HTTP Callout](#).

For more information about the parameter values, see [Parameters and Values for HTTP-Callout-2.pdf](#).

### Configuring the Rewrite Action

Create a rewrite action, Action-Rewrite-1, to replace the ESI content with the callout response body. Use the parameter settings shown in the following table.

Table 2. Parameters and Values for Action-Rewrite-1

| Parameter                                  | Value                                                                 |
|--------------------------------------------|-----------------------------------------------------------------------|
| Name                                       | Action-Rewrite-1                                                      |
| Type                                       | Replace                                                               |
| Expression to choose target text reference | “HTTP.RES.BODY(500).AFTER_STR (\"<br>\\\" ).BEFORE_STR (\"<br>\\\" )” |
| String expression for replacement text     | “SYS.HTTP_CALLOUT(HTTP-Callout-2)”                                    |

### To configure the rewrite action by using the configuration utility

1. Navigate to **AppExpert > Rewrite > Actions**.
2. In the details pane, click **Add**.
3. In the **Create Rewrite Action** dialog box, in Name, type **Action-Rewrite-1**.
4. In Type, select **REPLACE**.
5. In **Expression** to choose target text reference, type the following Advanced policy expression:

```
1 "HTTP.RES.BODY(500).AFTER_STR("<example>").BEFORE_STR("<example>")
 "
2 <!--NeedCopy-->
```

6. In the String expression for replacement text, type the following string expression:

```
1 "SYS.HTTP_CALLOUT(HTTP-Callout-2)"
2 <!--NeedCopy-->
```

7. Click **Create**, and then click **Close**.

## Creating the Rewrite Policy and Binding it Globally

Create a rewrite policy, Policy-Rewrite-1, with the parameter settings shown in the following table. You can create a rewrite policy in the Policies subnode and then bind it globally by using the Rewrite Policy Manager. Alternatively, you can use the Rewrite Policy Manager to perform both these tasks simultaneously. This demonstration uses the Rewrite Policy Manager to perform both tasks.

Table 3. Parameters and Values for Policy-Rewrite-1

| Parameter               | Value                                               |
|-------------------------|-----------------------------------------------------|
| Name                    | Policy-Rewrite-1                                    |
| Action                  | Action_Rewrite-1                                    |
| Undefined Result Action | -Global undefined-result action-                    |
| Expression              | “HTTP.REQ.HEADER(“Name”).CONTAINS ( “Callout”).NOT” |

### To configure a rewrite policy and bind it globally by using the configuration utility

1. Navigate to **AppExpert > Rewrite**.
2. In the details pane, under **Policy Manager**, click **Rewrite Policy Manager**.
3. In the **Rewrite Policy Manager** dialog box, click **Override Global**.
4. Click **Insert Policy**, and then, in the **Policy Name** column, click **New Policy**.
5. In the **Create Rewrite Policy** dialog box, do the following:
  1. In Name, type Policy-Rewrite-1.
    - a) In Action, select Action-Rewrite-1.
    - b) In Undefined-Result Action, select Global undefined-result action.
    - c) In Expression, type the following Advanced policy expression:

```
1 "HTTP.REQ.HEADER("Name").CONTAINS("Callout").NOT"
2 <!--NeedCopy-->
```

- a) Click **Create**, and then click **Close**.
6. Click **Apply Changes**, and then click **Close**.

## Use Case: Access control and authentication

May 2, 2023

In high security zones, it is mandatory to externally authenticate the user before a resource is accessed by clients. On the NetScaler appliance, you can use HTTP callouts to externally authenticate the user by evaluating the credentials supplied. In this example, the assumption is that the client is sending the user name and password through HTTP headers in the request. However, the same information could be fetched from the URL or the HTTP body.

To implement this configuration, you must perform the following tasks:

1. Enable the responder feature on the NetScaler appliance.
2. Create an HTTP callout on the appliance and configure it with details about the external server and other required parameters.
3. Configure a responder policy to analyze the response, and then bind the policy globally.
4. Create a callout agent on the remote server.

### Enabling Responder

The responder feature must be enabled before it is used on the NetScaler appliance.

#### To enable responder by using the configuration utility

1. Make sure that the responder license is installed.
2. In the configuration utility, expand AppExpert, and right-click Responder, and then click **Enable Responder feature**.

### Creating an HTTP callout on the NetScaler appliance

Create an HTTP callout, HTTP-Callout-3, with the parameter settings shown in the following table. For more information about creating an HTTP callout, see [Configuring an HTTP Callout](#).

Table 1. Parameters and Values for HTTP-Callout-3

| Parameter | Value              | Name |
|-----------|--------------------|------|
| Name      | Policy-Responder-3 |      |

Parameter

Value

Name

HTTP-Callout-3

**Server to receive callout request:**

IP Address

10.103.9.95

Port

80

**Request to send to the server:**

Method

GET

Host Expression

10.102.3.95

URL Stem Expression

“/cgi-bin/authenticate.pl”

**Headers:**

Name

Request

Value-expression

Callout Request

**Parameters:**

Name

Username

Value-expression

HTTP.REQ.HEADER(“Username”).VALUE(0)

Name

Password

Value-expression

HTTP.REQ.HEADER(“Password”).VALUE(0)

**Server Response:**

Return Type

TEXT

Expression to extract data from the response

HTTP.RES.BODY(100)

**Creating a Responder Policy to Analyze the Response**

Create a responder policy, Policy-Responder-3, that will check the response from the callout server and RESET the connection if the source IP address has been blacklisted. Create the policy with the parameters settings shown in the following table. While you can create a responder policy in the Policies subnode and then bind it globally by using the Responder Policy Manager, this demonstration uses the Responder Policy Manager to create the responder policy and bind the policy globally.

Table 2. Parameters and Values for Policy-Responder-3

| Parameter               | Value                                                                                                                                    |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| Name                    | Policy-Responder-3                                                                                                                       |
| Action                  | RESET                                                                                                                                    |
| Undefined-Result-Action | -Global undefined-result action-                                                                                                         |
| Expression              | “HTTP.REQ.HEADER(\\“Request\\”).EQ(\\“Callout Request\\”).NOT && SYS.HTTP_CALLOUT(HTTP-Callout-3).CONTAINS(\\“Authentication Failed\\”)” |

**To create a responder policy and bind it globally by using the configuration utility**

1. Navigate to **AppExpert > Responder**.
2. In the details pane, under **Policy Manager**, click **Responder Policy Manager**.
3. In the **Responder Policy Manger** dialog box, click **Override Global**.
4. Click **Insert Policy**, and then, in the **Policy Name** column, click **New Policy**.
5. In the **Create Responder Policy** dialog box, do the following:
  - a) In Name, type Policy-Responder-3.
  - b) In Action, select **RESET**.

- c) In Undefined-Result Action , select Global undefined-result action.
- d) In the Expression text box, type:

```
1 "HTTP.REQ.HEADER(\"Request\").EQ(\"Callout Request\").NOT && SYS.
 HTTP_CALLOUT(HTTP-Callout-3).CONTAINS(\"Authentication Failed
 \")"
2 <!--NeedCopy-->
```

- a) Click **Create**, and then click **Close**.
6. Click **Apply Changes**, and then click **Close**.

## Creating an HTTP Callout Agent on the Remote Server

You now need to create an HTTP callout agent on the remote callout server. The HTTP callout agent receives callout requests from the NetScaler appliance and responds appropriately. The callout agent is a script that is different for each deployment and must be written with server specifications in mind, such as the type of database and the scripting language supported.

Following is sample callout agent pseudo-code that verifies whether the supplied user name and password are valid. The agent can be implemented in any programming language of your choice. The pseudo-code is to be used only as a guideline for developing the callout agent. You can build additional functionality into the program.

### To verify the supplied user name and password by using pseudo-code

1. Accept the user name and password supplied in the request and format them appropriately.
2. Connect to the database that contains all the valid user names and passwords.
3. Check the supplied credentials against your database.
4. Format the response as required by the HTTP callout.
5. Send the response to the NetScaler appliance.

## Use Case: OWA-based spam filtering

May 2, 2023

Spam filtering is the ability to dynamically block emails that are not from a known or trusted source or that have inappropriate content. Spam filtering requires an associated business logic that indicates that a particular kind of message is spam. When the NetScaler appliance processes Outlook Web Access (OWA) messages based on the HTTP protocol, HTTP callouts can be used to filter spam.

You can use HTTP callouts to extract any portion of the incoming message and check with an external callout server that has been configured with rules that are meant for determining whether a message is legitimate or spam. In case of spam email, for security reasons, the NetScaler appliance does not notify the sender that the email is marked as spam.

The following example conducts a very basic check for various listed keywords in the email subject. These checks can be more complex in a production environment.

To implement this configuration, you must perform the following tasks:

1. Enable the responder feature on the NetScaler appliance.
2. Create an HTTP callout on the NetScaler appliance and configure it with details about the external server and other required parameters.
3. Create a responder policy to analyze the response, and then bind the policy globally.
4. Create a callout agent on the remote server.

## Enabling responder

The responder feature must be enabled before it can be used on the NetScaler appliance.

### To enable responder by using the GUI

1. Make sure that the responder license is installed.
2. In the configuration utility, expand AppExpert, and right-click **Responder**, and then click **Enable Responder** feature.

## Creating an HTTP callout on the NetScaler appliance

Create an HTTP callout, HTTP-Callout-4, with the parameter settings shown in the following table. For more information about creating an HTTP callout, see [Configuring an HTTP Callout](#).

For more information, see [Parameters and Values for HTTP-Callout-4](#) pdf.

## Creating a responder action

Create a responder action, Action-Responder-4. Create the action with the parameter settings shown in the following table.

| Parameter | Value                                                                                                                                                          |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name      | Action-Responder-4                                                                                                                                             |
| Type      | Respond with                                                                                                                                                   |
| Target    | """HTTP/1.1 200 OK\r\nServer: Microsoft-IIS/6.0\r\nX-Powered-By: ASP.NET\r\nContent-Length: 0\r\nMS-WebStorage: 6.5.6944\r\nCache-Control: no-cache\r\n\r\n""" |

Table 2. Parameters and Values for Action-Responder-4

### To create a responder action by using the configuration utility

1. Navigate to **AppExpert > Responder > Actions**.
2. In the details pane, click **Add**.
3. In the **Create Responder Action** dialog box, in Name, type **Action-Responder-4**.
4. In Type, click **Respond with**.
5. In Target, type:

```

1 "\"HTTP/1.1 200 OK\r\nServer: Microsoft-IIS/6.0\r\nX-Powered-By:
 ASP.NET\r\nContent-Length: 0\r\nMS-WebStorage: 6.5.6944\r\n
 nCache-Control: no-cache\r\n\r\n\""
2 <!--NeedCopy-->

```

6. Click **Create**, and then click **Close**.

### Creating a Responder Policy to Invoke the HTTP Callout

Create a responder policy, Policy-Responder-4, that will check the request body and, if the body contains the word “

*subject*,”invoke the HTTP callout to verify the email. Create the policy with the parameter settings shown in the following table. While you can create a responder policy in the Policies subnode and then bind it globally by using the Responder Policy Manager, this demonstration uses the Responder Policy Manager to create the responder policy and bind it globally.

| Parameter               | Value                                                                                              |
|-------------------------|----------------------------------------------------------------------------------------------------|
| Name                    | Policy-Responder-4                                                                                 |
| Action                  | Action-Responder-4                                                                                 |
| Undefined-Result-Action | -Global undefined-result action-                                                                   |
| Expression              | “HTTP.REQ.BODY(1000).CONTAINS(“urn:schemas:httpmail:subject”) && SYS.HTTP_CALLOUT(HTTP-Callout-4)” |

### To create a responder policy by using the configuration utility

1. Navigate to **AppExpert > Responder**.
2. In the details pane, under **Policy Manager**, click **Responder policy** manager.
3. In the **Responder Policy Manger** dialog box, click **Override Global**.
4. Click **Insert Policy**, and then, in the **Policy Name** column, click **New Policy**.
5. In the **Create Responder Policy** dialog box, do the following:
  - a) In Name, type **Policy-Responder-4**.
  - b) In Action, click **Action-Responder-4**.
  - c) In Undefined-Result Action, click **Global undefined-result** action.
  - d) In the **Expression** text box, type:

```

1 "HTTP.REQ.BODY(1000).CONTAINS(\"urn:schemas:httpmail:subject
 \") && SYS.HTTP_CALLOUT(HTTP-Callout-4)"
2 <!--NeedCopy-->

```
  - e) Click **Create**, and then click **Close**.
6. Click **Apply Changes**, and then click **Close**.

### Creating an HTTP callout agent on the remote server

You will now need to create an HTTP callout agent on the remote callout server. The HTTP callout agent receives callout requests from the NetScaler appliance and responds accordingly. The callout agent is a script that is different for each deployment and must be written with server specifications in mind, such as the type of database and the scripting language supported.

The following pseudo-code provides instructions for creating a callout agent that checks a list of words that are generally understood to indicate spam mails. The agent can be implemented in any programming language of your choice. The pseudo-code is to be used only as a guideline for developing the callout agent. You can build additional functionality into the program.

### To identify spam email by using pseudo-code

1. Accept the email subjecta provided by the NetScaler appliance.
2. Connect to the database that contains all the terms against which the email subject is checked.
3. Check the words in the email subject against the spam word list.
4. Format the response as required by the HTTP callout.
5. Send the response to the NetScaler appliance.

## Use Case: Dynamiccontent switching

September 21, 2020

This use case provides dynamic content switching by using an HTTP callout to get the name of the load balancing virtual server to which the request is forwarded.

1. Add a content switching virtual server.

```
1 add cs vserver cs_vserver1 HTTP 10.102.29.196 80
2 <!--NeedCopy-->
```

2. Create an HTTP callout.

```
1 add policy httpCallout http_callout1
2 <!--NeedCopy-->
```

3. Configure the HTTP callout to respond with the name of the load balancing virtual server from a request that contains the client IP address in the HTTP header “X-CLIENT-IP”.

```
1 > set policy httpCallout http_callout1 -IPAddress 10.217.14.23 -
 port 80 -returnType TEXT -hostExpr ""www.get-lbvip.com"" -
 urlStemExpr "\/index.html\" -headers X-CLIENT-IP(CLIENT.IP.
 SRC) -resultExpr "HTTP.RES.BODY(1000).AFTER_STR(\"<lbvip>\").
 BEFORE_STR(\"<lbvip\")"
2 <!--NeedCopy-->
```

4. Configure the content switching action to retrieve the callout response.

```
1 add cs action cs_action1 -targetVserverExpr 'SYS.HTTP_CALLOUT(
 http_callout1)'
2 <!--NeedCopy-->
```

Note:

You must bind a load balancing virtual server to the content switching virtual server to account for:

- The non-availability of the load balancing virtual server that the callout resolves to.
- A UNDEF condition that results from the execution of the callout.

```
1 > bind cs vserver cs_vserver1 -lbvserver default_lbvip
2 <!--NeedCopy-->
```

#### 5. Configure the content switching policy.

```
1 add cs policy cs_policy1 -rule true -action cs_action1
2 <!--NeedCopy-->
```

#### 6. Binding the content switching policy to the content switching virtual server.

```
1 bind cs vserver cs_vserver1 -policyName cs_policy1 -priority 10
2 <!--NeedCopy-->
```

## Pattern sets and data sets

January 5, 2023

Policy expressions for string matching operations on a large set of string patterns tend to become long and complex. Resources consumed by the evaluation of such complex expressions are significant in terms of processing cycles, memory, and configuration size. You can create simpler, less resource-intensive expressions by using pattern matching.

Depending on the type of patterns that you want to match, you can use one of the following features to implement pattern matching:

- A pattern set is an array of indexed patterns used for string matching during default syntax policy evaluation. Example of a pattern set: image types {svg, bmp, PNG, GIF, tiff, jpg}.
- A data set is a specialized form of pattern set. It is an array of patterns of types number (integer), IPv4 address, or IPv6 address.

The difference between a [patset](#) and a [dataset](#) is that in a [dataset](#) we compare the boundary condition. For example, if the input string is 1.1.1.11 and supposes that the 1.1.1.1 pattern is bound to a [patset](#) and a [dataset](#) of IPv4 type, then a [patset](#) and [dataset](#) is configured to check whether the IP address is present in the request. After evaluation, [patset](#) returns that the 1.1.1.1 is present in the input, but [dataset](#) evaluation is false. This is because of a boundary check-in which the IP address is not been part of some other IP address. It means, after the bound pattern there must not be any integer.

Often, you can use either pattern sets or data sets. However, in cases where you want specific matches for numerical data or IPv4 and IPv6 addresses, you must use data sets.

**Notes:**

- Pattern sets and data sets can be used only in default syntax policies.
- From release 13.1 build 42.x and later, you can bind 50000 patterns to a pattern set. With the pattern set file, only 10000 patterns can be bound to a pattern set. Also, if the pattern set is used in streaming, then only 5000 patterns can be bound to that pattern set. A pattern set for streaming is used in the rewrite action search parameter, HTTP body, or TCP payload based expression.

## How string matching works with pattern sets and data sets

May 2, 2023

A pattern set or data set contains a set of patterns, and each pattern is assigned a unique index. When a policy is applied to a packet, an expression identifies a string to be evaluated, and the operator compares the string to the patterns defined in the pattern set or data set until a match is found or all patterns have been compared. Then, depending on its function, the operator returns either a boolean value that indicates whether or not a matching pattern was found or the index of the pattern that matches the string.

**Note:** This topic explains the working of a pattern set. Data sets work the same way. The only difference between pattern sets and data sets is the type of patterns defined in the set.

Consider the following use case to understand how patterns can be used for string matching.

You want to determine whether the URL suffix (target text) contains any of the image file extensions. Without using pattern sets, you would have to define a complex expression, as follows:

```
1 HTTP.REQ.URL.SUFFIX.CONTAINS("svg") || HTTP.REQ.URL.SUFFIX.CONTAINS("
 bmp") || HTTP.REQ.URL.SUFFIX.CONTAINS("png") ||
2 HTTP.REQ.URL.SUFFIX.CONTAINS("gif") || HTTP.REQ.URL.SUFFIX.CONTAINS("
 tiff") || HTTP.REQ.URL.SUFFIX.CONTAINS("jpg")
3 <!--NeedCopy-->
```

If the URL has a suffix of “jpg,” with the above compound expression, the NetScaler appliance has to iterate through the entire compound expression sequentially, from one sub expression to the next, to determine that the request refers to a jpg image. The following figure shows the steps in the process.

When a compound expression includes hundreds of sub expressions, the above process is resource intensive. A better alternative is an expression that invokes a pattern set, as shown in the following figure.

During policy evaluation as shown above, the operator (`CONTAINS_ANY`) compares the string identified in the request with the patterns defined in the pattern set until a match is found. With the `Sample_Patset` expression, the multiple iterations through six sub expressions are reduced to just one.

By eliminating the need to configure compound expressions that perform string matching with multiple OR operations, pattern sets or data sets simplify configuration and accelerate processing of requests and responses.

## Configure a pattern set

December 22, 2023

To configure a pattern set, you must specify the strings that are to serve as patterns. You can manually assign a unique index value to each of these patterns, or you can allow the index values to be assigned automatically.

**Note:**

Pattern sets are case sensitive (unless you specify the expression to ignore case). Therefore, the string pattern “product1,” for example, is not the same as the string pattern “Product1.”

**Points to remember about index values:**

- You cannot bind the same index value to more than one pattern.
- An automatically assigned index value is one number larger than the highest index value of the existing patterns within the pattern set. For example, if the highest index value of existing patterns in a pattern set is 104, the next automatically assigned index value is 105.
- If you do not specify an index for the first pattern, index value 1 is automatically assigned to that pattern.
- Index values are not regenerated automatically if one or more patterns are deleted or modified. For example, if the set contains five patterns, with indexes from 1 through 5, and if the pattern with an index of 3 is deleted, the other index values in the pattern set are not automatically regenerated to produce values from 1 through 4.
- The maximum index value that can be assigned to a pattern is 4294967290. If that value is already assigned to a pattern in the set, you must manually assign index values to any newly added patterns. An unused index value that is lower than a currently used value cannot be assigned automatically.

Starting with NetScaler 14.1-12.x release, in addition to using a static string, you can also use an expression to derive the pattern set name and associate the pattern set in policy expression methods like `CONTAINS_ANY`, `EQUALS_ANY`, `STARTSWITH_ANY`. The pattern set name is dynamically derived from the expression and therefore reduces the number of policies that must be created for multiple pattern sets. By creating a dynamic pattern set, you can avoid repetitive configuration.

For example, in releases prior to NetScaler 14.1-12.x release, if there are four pattern sets, you have to create four policies to associate the four pattern sets. From NetScaler 14.1-12.x release onwards, in addition to using a static string, you can also use an expression to derive the pattern set name. The expression helps in reducing the configuration.

For the expression to identify the pattern set as part of its evaluation, you must configure the pattern set as dynamic using the `dynamic` keyword. The expression considers only those pattern sets that are

configured as dynamic. If you have not configured the pattern set as dynamic at the time of pattern set creation, you can set it later as well. You can set dynamic keyword only for non-default pattern sets.

As part of the expression evaluation the following checks are performed:

- If there are no pattern sets that match the expression, then it is considered as an error and the error counter is incremented.
- If there is a pattern set name that matches the expression but it is not marked as dynamic, then it is considered as an error and the error counter is incremented.

### Configure a pattern set by using the command line interface

At the command prompt, do the following:

1. Create a pattern set.

```
add policy patset <name>
```

#### Example:

```
add policy patset samplepatset
```

1. Bind patterns to the pattern set.

```
bind policy patset <name> <string> [-index <positive_integer>][
-charset (ASCII | UTF_8)] [-comment <string>]
```

#### Example:

```
bind policy patset samplepatset product1 -index 1 -comment short
description about the pattern bound to the pattern set
```

**Note:** Repeat this step for all the patterns you want to bind to the pattern set.

1. Verify the configuration.

```
show policy patset <name>
```

### Configure a pattern set by using the configuration utility

1. Navigate to **AppExpert > Pattern Sets**.
2. In the details pane, click **Add** to open the **Create Pattern Set** dialog box.
3. Specify a name for the pattern set in the Name text box.
4. Under Specify Pattern, type the first pattern and, optionally, specify values for the following parameters:

- Treat back slash as escape character—Select this check box to specify that any backslash characters that you might include in the pattern are to be treated as escape characters.
  - Index—A user assigned index value, from 1 through 4294967290.
5. Verify that you have entered the correct characters, and then click **Add**.
  6. Repeat steps 4 and 5 to add more patterns, and then click **Create**.

## Configure a dynamic pattern set

### Configure a dynamic pattern set using the CLI

At the command prompt, type the following commands:

1. Create pattern sets.  

```
add policy patset <name> - dynamic yes
```
2. Bind the patterns set to a pattern set.  

```
bind patset <name> <string>
```
3. Add a policy and use an expression instead of pattern set name.  

```
add responder policy <name> <rule> <action>
```
4. Verify the configuration.  

```
show patset -dynamicOnly
```

Example for configuring dynamic pattern set using the CLI

Create CompA\_pat and CompB\_pat as the two dynamic pattern sets.

```
1 add policy patset CompA_pat -dynamic yes
2 bind policy patset CompA_pat stringA
3 add policy patset CompB_pat -dynamic yes
4 bind policy patset CompB_pat string B
5 <!--NeedCopy-->
```

Add a policy with an expression that derives the pattern set name dynamically:

```
add responder policy samplepolicy1 http.req.hostname.contains_any("
Comp"+ http.req.url.path.get(1)+ "_pat")reset
```

Consider that `http://www.citrix.com/A/home.html` or `http://www.google.com/B/test.html` are the incoming URLs. Based on the incoming URL, the expression “Comp”+ `http.req.url.path.get(1) + “_pat”`, determines the pattern set, CompA\_pat or CompB\_pat dynamically at the run time. You need not create two separate policies for CompA\_pat and CompB\_pat.

Verify the configuration using the show command:

```
1 > show patset -dynamicOnly
2 1) Patset: CompA_pat
3 2) Patset: CompB_pat
4 Done
5 <!--NeedCopy-->
```

### Configure a dynamic pattern set using the GUI

1. Navigate to **AppExpert > Pattern Sets**.
2. Click **Add** to open the **Create Pattern Set** dialog box.
3. Specify a name for the data set in the **Name** text box.
4. Click **Insert** and specify the pattern in the Pattern field. Optionally, specify a value for the Index. Index is a user assigned value, from 1 through 4294967290.
5. Verify that you have entered the correct characters, and then click **Insert**.
6. Repeat steps 4 and 5 to add more patterns.
7. Select the **Dynamic** check-box and then click **Create**.
8. Navigate to **AppExpert > Responder > Policies > Add**.
9. Create an expression that can derive the pattern set.
10. Fill in the other mandatory fields and click Create.

### Set, unset, or remove a dynamic pattern set

To set a non default pattern set as dynamic:

```
> set patset <name> -dynamic yes
```

Example:

```
1 > set patset CompA_pat -dynamic yes
2 Done
3 <!--NeedCopy-->
```

### To unset a non default pattern set as dynamic

```
> unset patset <name> -dynamic
```

Example:

```
1 > unset patset CompA_pat -dynamic
2 Warning: [Dynamic attribute turned off. Expressions using this patset
or dataset dynamically will not work.]
3 Done
4 <!--NeedCopy-->
```

## To remove a dynamic pattern set

```
> rm patset <name>
```

Example:

```
1 > rm patset CompA_pat
2 Warning: [Dynamic patset or dataset removed. Expressions using this
 patset or dataset dynamically will not work.]
3 Done
4 <!--NeedCopy-->
```

### Note:

When you unset or remove a dynamic patset, the expression that is using this pattern set does not work.

## Configure file-based pattern sets

The NetScaler appliance supports file-based pattern sets.

### Configure file-based pattern sets by using the CLI

At the command prompt, type the following commands:

- Import a new pattern set file into the NetScaler appliance.

```
1 import policy patsetfile <src> <name> -delimiter <char> -charset
 <ASCII | UTF_8>
2 <!--NeedCopy-->
```

### Example:

```
1 import policy patsetfile local:test.csv clientids_list -
 delimiter ,
2 <!--NeedCopy-->
```

You can import a file from a local device, HTTP server, or FTP server. To add the file from your local device, the file must be available in `/var/tmp` location.

- Add a pattern set file to the packet engine.

```
1 add policy patsetfile <patset filename>
2 <!--NeedCopy-->
```

### Example:

```
1 add policy patsetfile clientids_list
2 <!--NeedCopy-->
```

- Update an existing pattern set file on the NetScaler appliance.

```
1 update policy patsetfile <patset filename>
2 <!--NeedCopy-->
```

**Example:**

```
1 update policy patsetfile clientids_list
2 <!--NeedCopy-->
```

- Bind patterns to the pattern set.

```
1 add policy patset <patset name> -patsetfile <patset filename>
2 <!--NeedCopy-->
```

**Example:**

```
1 add policy patset clientid_patset -patsetfile clientids_list
2 <!--NeedCopy-->
```

- Verify the configuration.

```
1 show policy patsetfile clientids_list
2
3 Name: clientids_list
4 Patset Name: clientid_patset
5 Number of Imported Patterns: 8
6 Number of Bound Patterns: 8
7 (All the patterns bound successfully)
8
9 Done
10 <!--NeedCopy-->
```

**Configure file-based pattern sets by using the GUI**

1. Navigate to **AppExpert-> Pattern Set Files**.
2. In the **Imported** pane, click **Import**.
3. In the **Configure Policy Patset File** page, select the file you want to import, and click **OK**.
4. Select the imported file, and click **Add**.
5. In the **Create Policy Patset File** page, enter the details, and click **Create** to add a policy pattern set.

## Configure a data set

December 21, 2023

To configure a data set, you must specify the strings that server as a pattern, assign a type (number, IPv4 address, or IPv6 address) and configure the dataset range. You can manually assign a unique index value to the pattern, or you can allow the index values to be assigned automatically. Dataset is not related to HTTP or any 7-layer protocol. It works only on text or string. There are different types of dataset such as NUM, ULONG, IPv4, IPv6, MAC, DOUBLE. You can select a type and define the dataset range based on the specified type.

**Note:**

Policy data sets are case sensitive (unless you specify the expression to ignore case). Therefore, the MAC address ff:ff:ff:ff:ff:ff for example, is not the same as the MAC address FF:FF:FF:FF:FF:FF.

The rules applied for index values of data sets are similar to pattern sets. For information about index values, see [Configuring a Pattern Set](#).

Starting with NetScaler release 14.1-12.x, in addition to using a static string, you can use an expression to bind a data set with a policy. The data set name is dynamically derived from the expression and therefore reduces the number of policies that must be created for multiple data sets. By creating a dynamic data set, you can avoid repetitive configuration.

Example: In releases prior to NetScaler 14.1-12.x release, if there are four data sets, you have to create four policies to bind the four data sets. From the release NetScaler 14.1-12.x onwards, you can use an expression instead of the data set name to bind with the policy. As part of the expression evaluation, all four data sets are evaluated and the data set name is derived. So, all the four data sets are bound to one policy using the expression.

The expression evaluation process of dynamic data sets is similar to that of pattern sets. For more information about expression evaluation, see [Configuring a Pattern Set](#).

## Configure a data set

Complete the following steps to configure a data set:

1. Add a policy dataset
2. Bind pattern to a policy dataset
3. Add a policy expression
4. Verify the policy configuration

### Add a policy dataset

At the command prompt, do the following:

```
add policy dataset <name> <type>
```

#### Example:

```
add policy dataset ds1 ipv4 -comment numbers
```

### Bind a pattern to the data set

At the command prompt, type:

```
bind policy dataset <name> <value> [-index <positive_integer>] [-endRange <string>] [-comment <string>]
```

#### Example:

```
bind policy dataset ds1 1.1.1.1 -endRange 1.1.1.10 -comment short
description about the pattern bound to the data set
```

#### Note:

You must repeat this step for all the patterns you want to bind to the data set. You can bind only up to 5000 patterns to a dataset.

And, a dataset range must not overlap with other ranges bound to a dataset and cannot include single values bound to the dataset. If you bind a dataset with an overlapping range results in an error.

#### Example:

```
1 add policy dataset ip_set ipv4
2 Done
3 bind policy dataset ip_set 2.2.2.25
4 Done
5 bind policy dataset ip_set 2.2.2.20 -endRange 2.2.2.30
6 ERROR: The range overlaps an existing range or includes a value bound
 to the dataset.
7 <!--NeedCopy-->
```

A value is considered to be in the dataset if it is either equal to a single value bound to the data set or is between the lower-value and upper-value (lower-value <= value && value <- upper-value), for a range bound to the data set.

### Use policy expression in a policy data set

At the command prompt, type:

```
add policy expression exp1 http.req.body(100).contains_any("ds1")
```

Where,

The expression checks whether there is any pattern (or pattern within the range) bound to the dataset ds1 is present in the first 100 bytes of the HTTP request body.

### Verify dataset configuration

At the command prompt, type:

```
show policy dataset ds1
```

#### Example:

```
1 > show policy dataset ds1
2 Dataset: ds1
3 Type: IPV4
4 1) Bound Dataset Range from: 1.1.1.1 through: 1.1.1.10
 Index: 1
5 <!--NeedCopy-->
```

### Configure a dynamic data set

#### Configure a dynamic data set using the CLI

At the command prompt, type the following commands:

1. Create data sets.

```
add policy dataset <name> - dynamic yes
```

Example:

```
1 add policy dataset CompA_data -dynamic yes
2 add policy dataset CompB_data -dynamic yes
3 <!--NeedCopy-->
```

2. Bind the data set to a policy.

```
bind policy dataset <name> <string>
```

Example:

```
1 bind policy dataset CompA_data stringA
2 bind policy patset CompB_data string B
3 <!--NeedCopy-->
```

3. Add a policy and use an expression instead of a data set name.

```
add responder policy <name> <rule> <action>
```

Example:

```
1 add responder policy samplepolicy1 http.req.hostname.contains_any(
 "Comp" + http.req.url.path.get(1) + "_pat") reset
2 <!--NeedCopy-->
```

4. Verify the configuration.

```
> show dataset -dynamicOnly
```

Example:

```
1 > show dataset -dynamicOnly
2 1) Dataset: CompA_data
3 2) Dataset: CompB_data
4 Done
5 <!--NeedCopy-->
```

## Configure a dynamic data set using the GUI

1. Navigate to **AppExpert > Data Sets**.
2. Click **Add** to open the **Create Data Set** dialog box.
3. Specify a name for the data set in the **Name** text box.
4. Click **Insert** and specify a value in the **Data** field. 1. Optionally, specify an Index. Index is a user assigned value, from 1 through 4294967290.
5. Verify that you have entered the correct characters, and then click **Insert**.
6. Repeat steps 4 and 5 to add more values.
7. Select the Dynamic check-box and then click **Create**.
8. Navigate to **AppExpert > Responder > Policies > Add**.
9. Create an expression that can derive the data set.
10. Add detail in the other mandatory fields and click **Create**.

## Set, unset, or remove a dynamic data set

To set a data set as dynamic:

```
> set dataset <name> -dynamic yes
```

Example:

```
> set dataset CompA_data -dynamic yes
```

To unset a data set as dynamic:

```
> unset dataset <name> -dynamic
```

Example:

```
1 > unset dataset CompA_data -dynamic
2 Warning: [Dynamic attribute turned off. Expressions using this patset
 or dataset dynamically will not work.]
3 Done
4 <!--NeedCopy-->
```

To remove a dynamic pattern set:

```
> rm dataset <name>
```

Example:

```
1 > rm dataset CompA_pat
2 Warning: [Dynamic patset or dataset removed. Expressions using this
 patset or dataset dynamically will not work.]
3 Done
4 <!--NeedCopy-->
```

**Note:**

When you unset or remove a dynamic data set, the expression that is using the data set does not work.

## Configure a data set by using the configuration utility

Follow the steps given below to configure a policy dataset:

1. Navigate to **AppExpert > Data Sets**.
2. In the details pane, under Data Sets, click **Add**.
3. In the **Configure Data Set** page, set the following parameters.
  - a) Name. Name of the policy data set.
  - b) Type. Type of value to bind to the dataset.

### Configuring data set

4. Click **Insert** to bind the dataset value of specific type.
  - a) Value. Value of the specified type associated with the dataset.
  - b) Index. The index value of the dataset.
  - c) End range. The dataset entry. This is a range `<value> to <end_range>`.
  - d) Comments. A short description about the data set.

### dataset binding

5. Click **Insert** and **Close**.
6. Enter comments.

7. Click **Create** and **Close**.

### CIDR subnet notation in IPv4 and IPv6 addresses for policy dataset

The Policy datasets for IPv4 and IPv6 address allow the bound value to be subnets using the CIDR notation. The CIDR notation specifies the address and the range of the subnet. CIDR notation `<address>/<n>`, where `<address>` is the first address in the subnet and `<n>` is an integer specifying the number of left-most bits set in the subnet mask, which defines the range of the subnet.

For example, 192.128.0.0/10 represents an IPv4 subnet starting at address 192.129.0.0 with a mask 0xFFC0000 (255.192.0.0).

#### Example:

```
1 add policy dataset ds1 ipv4
2 bind policy dataset ds1 192.128.0.0/10
3 show policy dataset ds1
4 Dataset: ds1
5 Type: IPV4
6 Bound Dataset Value: 192.128.0.0/10 Index: 1 Comment: Subnet range from
 192.128.0.0 through 192.191.255.255
7 <!--NeedCopy-->
```

An example to use this dataset in an expression:

```
1 add responder policy resp_ipv4_pol client.ip.src.typecast_text_t.
 equals_any("ds1") drop
2 <!--NeedCopy-->
```

#### Example of an IPv6 subnet:

An example of an IPv6 subnet would be 2001:db8:123::/56, which starts at address 2001:db8:123:: with a mask FFFF:FFFF:FFFF:FF00::

```
1 add policy dataset ds2 ipv6
2 bind policy dataset ds2 2001:db8:123::/56
3 show policy dataset ds2
4 Dataset: ds2
5 Type: IPV61
6 Bound Dataset Value: 2001:db8:123::/56 Index: 1 Comment: Subnet range
 from 2001:db8:123:: through 2001:db8:123:ff:ffff:ffff:ffff:ffff
7 <!--NeedCopy-->
```

The starting address of the subnet will be determined by the specified address masked by the subnet mask. A warning is issued if the specified address does not match the resulting starting address.

#### Example:

```
1 bind policy dataset ds1 192.168.0.0/10
```

```
2 Warning: Starting subnet address masked using subnet mask to create new
 starting address [192.128.0.0]
3 show policy dataset ds1
4 Dataset: ds1
5 Type: IPV4
6 Bound Dataset Value:192.168.0.0/10 Index: 1 Comment: Subnet range from
 192.128.0.0 through 192.191.255.255
7 <!--NeedCopy-->
```

An example to use this dataset in an expression:

```
1 add responder policy resp_ipv6_pol client.ipv6.src.typecast_text_t.
 equals_any("ds2") drop
2 <!--NeedCopy-->
```

## Use pattern sets and data sets

December 21, 2023

Advanced policy expressions that take pattern sets or data sets as an argument can be used to perform string matching operations.

The usage is as follows:

```
1 <text>.<operator>("<name>")
2 <!--NeedCopy-->
```

where,

- `<text>` is the expression that identifies a string in a packet. Example: HTTP.REQ.HEADER("Host").
- `<operator>` is one of the operators described in the [Pattern Set Types table](#) pdf.

For sample usage, see [Sample Usage](#).

## Sample usage

September 21, 2020

To understand the usage of pattern sets in expressions, consider the example of a pattern set named "imagetypes."

| Patterns | Index value |
|----------|-------------|
| svg      | 1           |
| bmp      | 2           |
| png      | 3           |
| gif      | 4           |
| tiff     | 5           |
| jpg      | 6           |

Table 1. Pattern set “imagentypes”

**Example 1:** Determine whether the suffix of an HTTP request is one of the file extensions defined in the “imagentypes” pattern set.

- **Expression.** `HTTP.REQ.URL.SUFFIX.EQUALS_ANY(“imagentypes”)`
- **Sample URL.** `http://www.example.com/homepageicon.jpg`
- **Result.** TRUE

**Example 2:** Determine whether the suffix of an HTTP request is one of the file extensions defined in the “imagentypes” pattern set, and return the index of that pattern.

- **Expression.** `HTTP.REQ.URL.SUFFIX.EQUALS_INDEX(“imagentypes”)`
- **Sample URL.** `http://www.example.com/mylogo.png`
- **Result.** 4 (The index value of the pattern “gif”.)

**Example 3:** Use the index value of a pattern to determine whether the URL suffix is within a specified index-value range.

- **Expression.** `HTTP.REQ.URL.SUFFIX.EQUALS_INDEX(“imagentypes”).GE(3) && HTTP.REQ.URL.SUFFIX.EQUALS(“imagentypes”).LE(5)`
- **Sample URL.** `http://www.example.com/mylogo.png`
- **Result.** TRUE (The index value of gif file types is 4.)

**Example 4:** Implement one set of policies for file extensions bmp, jpg, and png, and a different set of policies for gif, tiff, and svg files.

An expression that returns the index of a matched pattern can be used to define traffic subsets for a web application. The following two expressions could be used in content switching policies for a content switching virtual server:

- `HTTP.REQ.URL.SUFFIX.EQUALS_INDEX(“imagentypes”).LE(3)`
- `HTTP.REQ.URL.SUFFIX.EQUALS_INDEX(“imagentypes”).GE(4)`

## Variables

May 2, 2023

Variables are named objects that store information in the form of tokens. These tokens are used within and across different transactions on the NetScaler Appliance for internal computation and policy processing.

The NetScaler appliance supports creation of variables of the following types:

- **Singleton variables.** Can have a single value of one of the following types: `ulong` and `text` (max-size). The `ulong` type is an unsigned 64-bit integer, the `text` type is a sequence of bytes, and max-size is the maximum number of bytes in the sequence.
- **Map variables.** Maps hold values associated with keys: each key-value pair is called a map entry. The key for each entry is unique within the map. Maps are specified as follows:

`map (key_type, value_type, max-values).`

where,

- `key_type` is the data type of the key. It is of type `text` (max-size).
- `value_type` is the data type of the values of the map. It can be of type `ulong` or `text` (max-size).
- `max-values` is the maximum number of entries that the map can contain. It is of type `ulong`.

Values for these variables are set using assignments which must be invoked on policy actions.

### Variables Scope

A map variable or a singleton variable can have a global scope. Alternatively, the scope of a singleton variable can be limited to a single transaction.

- **Global Scope Variable** - A variable with global scope (the default) has only one instance, and that instance has the same value(s) across all cores of a NetScaler appliance and across all nodes of a cluster or HA configuration. Global variable values exist until they are explicitly deleted, until they expire, or until a standalone appliance is restarted or all nodes of a cluster or HA configuration are restarted.
- **Transaction Scope Variable** - A variable with transaction scope has a separate instance, with its own value, for each transaction processed by the NetScaler appliance. When the transaction processing is complete, the transaction variable value is deleted.

**Note:** Transaction scope variables are available in NetScaler release 10.5.e or later.

## Configure and use variables

December 21, 2023

You must first create a variable and then assign a value or specify the operation that must be performed on the variable. After performing these operations, you can use the assignment as a policy action.

**Note:** Once configured, a variable's settings cannot be modified or reset. If the variable needs to be changed, the variable and all references to the variable (expressions and assignments) must be deleted. The variable can then be re-added with new settings, and the references (expressions and assignments) can be re-added.

### To configure variables by using the command line interface

1. Create a variable.

```
1 add ns variable <name> -type <string> [-scope global] [-ifFull (undef
 | lru)] [-ifValueTooBig (undef | truncate)] [-ifNoValue (undef |
 init)] [-init <string>] [-expires <positive_integer>] [-comment <
 string>]
2 <!--NeedCopy-->
```

**Note:** Refer to the man page “man add ns variable” for description of the command parameters.

Example 1: Create a ulong variable named “my\_counter” and initialize it to 1.

```
1 add ns variable my_counter -type ulong -init 1
2 <!--NeedCopy-->
```

Example 2: Create a map named “user\_privilege\_map”. The map will contain keys of maximum length 15 characters and text values of maximum length 10 characters, with a maximum of 10000 entries.

```
1 add ns variable user_privilege_map -type map(text(15),text(10),10000)
2 <!--NeedCopy-->
```

**Note:** If the map contains 10000 unexpired entries, assignments for new keys reuse one of the least recently used entries. By default, an expression trying to get a value for a non-existent key will initialize an empty text value.

Assign the value or specify the operation to be performed on the variable. This is done by creating an assignment.

```

1 add ns assignment <name> -variable <expression> [-set <expression> | -
 add <expression> | -sub <expression> | -append <expression> | -clear
] [-comment <string>]
2 <!--NeedCopy-->

```

Note: A variable is referenced by using the variable selector (\$). Therefore,

**\$variable1** is used to refer to text or ulong variables. Similarly,

**\$variable2[key-expression]** is used to refer to map variables.

Example 1: Define an assignment named “inc\_my\_counter” that automatically adds 1 to the “my\_counter” variable.

```

1 add ns assignment inc_my_counter -variable $my_counter -add 1
2 <!--NeedCopy-->

```

Example 2: Define an assignment named “set\_user\_privilege” that adds to the “user\_privilege\_map” variable an entry for the client’s IP address with the value returned by the “get\_user\_privilege” HTTP callout.

```

1 add ns assignment set_user_privilege -variable $user_privilege_map[
 client.ip.src.typecast_text_t] -set sys.http.callout(
 get_user_privilege)
2 <!--NeedCopy-->

```

**Note:** If an entry for that key already exists, the value will be replaced. Otherwise a new entry for the key and value will be added. Based on the previous declaration for user\_privilege\_map, if the map already has 10000 entries, one of the least recently used entries will be reused for the new key and value.

1. Invoke the variable assignment in a policy.

There are two functions that can operate on map variables.

- **\$name.valueExists(key-expression).** Returns true if there is a value in the map selected by the key-expression. Otherwise returns false. This function will update the expiration and LRU information if the map entry exists, but will not create a new map entry if the value does not exist.
- **\$name.valueCount.** Returns the number of values currently held by the variable. This is the number of entries in a map. For a singleton variable, this is 0 if the variable is uninitialized or 1 otherwise.

**Example:** Invoke the assignment named “set\_user\_privilege” with a compression policy.

```

1 add cmp policy set_user_privilege_pol -rule $user_privilege_map.
 valueExists(client.ip.src.typecast_text_t).not -resAction
 set_user_privilege
2 <!--NeedCopy-->

```

## Use Case to Insert HTTP header in the Response Side

The following example shows an example of a singleton variable.

Add a singleton variable of type text. This variable can hold maximum 100 Bytes data.

```
1 add ns variable http_req_data -type text(100) -scope transaction
2 <!--NeedCopy-->
```

Add an assignment action, which will be used to store the HTTP request data into the variable.

```
1 add ns assignment set_http_req_data -variable $http_req_data -set http.
 req.body(100)
2 <!--NeedCopy-->
```

Add a rewrite action to insert HTTP header, whose value will be fetched from the variable.

```
1 add rewrite action act_ins_header insert_http_header user_name
 $http_req_data.after_str("user_name").before_str("password")
2 <!--NeedCopy-->
```

Add a rewrite policy which will evaluate in the request time, and take assignment action to store data. When we hit this policy, we'll take assignment action and store the data into the ns variable (http\_req\_data)

```
1 add rewrite policy pol_set_variable true set_http_req_data
2
3 bind rewrite global pol_set_variable 10 -type req_DEFAULT
4 <!--NeedCopy-->
```

Add a rewrite policy which will evaluate in the response time, and add an HTTP header in the response.

```
1 add rewrite policy pol_ins_header true act_ins_header
2
3 bind rewrite global pol_ins_header 10 -type res_DEFAULT
4 <!--NeedCopy-->
```

## Assignment action

In a NetScaler appliance, an assignment action bound to the policy is triggered when the policy rule evaluates to true. The action updates the value in the variable which can be used in subsequent policy rule evaluations. This way, the same variable can be updated and used for subsequent policy evaluations in the same feature. Previously, the appliance executed assignment actions only after evaluating all of the policies in the feature when the policies of the associated assignment actions evaluated to true. Therefore, the variable value set by the assignment action cannot be used in the subsequent policy rule evaluations within the feature.

This functionality can be understood better with a use case that controls access list for clients on a NetScaler appliance. The access decision is provided by a separate web service, with the request `GET /client-access?<client-IP-address>` which returns a response with “BLOCK” or “ALLOW” in the body. The HTTP callout is configured to include the IP address of the client that is associated with an incoming request. When the NetScaler appliance receives a request from a client, the appliance generates the callout request and sends it to the callout server, which hosts a database of blacklisted IP addresses and an HTTP callout agent that checks whether the client’s IP address is listed in the database. The HTTP callout agent receives the callout request, checks whether the client’s IP address is listed, and sends a response. The response is a status code, 200, 302 along with “BLOCK” or “ALLOW” in the body. Based on the status code, the appliance performs the policy evaluation. If the policy evaluation is true, the assignment action is triggered immediately and action sets the value to the variable. The appliance uses and sets this variable value for subsequent policy evaluation in the same module.

### Use case for configuring assignment action

Follow the steps below to configure assignment action and use variable for subsequent policies:

1. The access decision is provided by a separate web service, with the request which returns a response with BLOCK or ALLOW in the body.

```
GET /url-service>/url-allowed?<URL path>
```

2. Set up a map variable to hold the access decisions for URLs.

```
add ns variable url_list_map -type 'map(text(1000),text(10),10000)'
```

3. Set up an HTTP callout to send the access request to the web service.

```
add policy httpCallout url_list_callout -vserver url_vs -returnType TEXT -urlStemExpr '/url-allowed?' + HTTP.REQ.URL.PATH'-resultExpr 'HTTP.RES.BODY(10)'
```

4. Set up an assignment action to invoke the callout to get the access decision and assign it to the map entry for the URL.

```
add ns assignment client_access_assn -variable '$client_access_map [CLIENT.IP.SRC.TYPECAST_TEXT_T]'-set SYS.HTTP_CALLOUT(client_access_callout)
```

5. Set up a responder action to send a 403 response if a URL request is blocked.

```
add responder action url_list_block_act respondwith 'HTTP/1.1 403 Forbidden\r\n\r\n'
```

6. Set up a responder policy to set the map entry for the URL if it is not already set. With the immediate action enhancement, the map entry value is set when this policy is evaluated. Prior to the enhancement, the assignment was not done until all responder policies had been evaluated decision is provided by a separate web service.

```
add responder policy url_list_assn_pol '!$url_list_map.VALUEEXISTS
(HTTP.REQ.URL.PATH)'url_list_assn
```

7. Set up a responder policy to block access to a URL if its map entry value is BLOCK. With the immediate action enhancement, the map entry set by the preceding policy is available for use in this policy. Prior to the enhancement, the map entry would still be unset at this point.

```
add responder policy client_access_block_pol '$client_access_map[
CLIENT.IP.SRC.TYPECAST_TEXT_T] == "BLOCK"'client_access_block_act
```

8. Bind the responder policies to the virtual server. **Note:** We cannot globally bind the policies because we don't want to execute them for the HTTP callout on a separate virtual server.

```
bind lb vserver vs -policyName client_access_assn_pol -priority
10 -gotoPriorityExpression NEXT -type REQUEST
bind lb vserver vs -policyName client_access_block_pol -priority
20 -gotoPriorityExpression END -type REQUEST
```

### To configure variables by using the configuration utility

1. Navigate to **AppExpert > NS Variables**, to create a variable.
2. Navigate to **AppExpert > NS Assignments**, to assign value(s) to the variable.
3. Navigate to the appropriate feature area where you want to configure the assignment as an action.

## Use case for caching user privileges

December 22, 2023

In this use case, user privileges (“GOLD”, “SILVER”, and so on) must be retrieved from an external web service.

### To achieve this use case, perform the following operations

Create an HTTP callout to fetch the user privileges from the external web service.

```

1 add policy httpcallout <name> [-IPAddress <ip_addr|ipv6_addr>] [-port <
 port>] [-vServer <string>] [-returnType <returnType>] [-httpMethod (
 GET | POST)] [-hostExpr <string>] [-urlStemExpr <string>] [-headers
 <name(value)> ...] [-parameters <name(value)> ...] [-bodyExpr <
 string>] [-fullReqExpr <string>] [-scheme (http | https)] [-
 resultExpr <string>] [-cacheForSecs <secs>] [-comment <string>]
2
3 add policy httpcallout get_user_privilege -ipaddress 10.217.193.84 -
 port 80 -returnType text -httpMethod GET -hostExpr "/"
 get_user_privilege" -resultExpr 'http.res.body(5)'
4 <!--NeedCopy-->

```

Store the privileges in a variable.

```

1 add ns variable <name> -type <string> [-scope (global | transaction)
] [-ifFull (undef | lru)] [-ifValueTooBig (undef | truncate)] [-
 ifNoValue (undef | init)] [-init <string>] [-expires <
 positive_integer>] [-comment <string>]
2
3 add ns variable user_privilege_map -type map(text(15),text(10),10000) -
 expires 1200
4
5 add ns assignment set_user_privilege -variable $user_privilege_map[
 client.ip.src] -set sys.http_callout(get_user_privilege)
6 <!--NeedCopy-->

```

Create a policy to check if there is already a cached entry for the client's IP address; if not, it calls the HTTP callout to set a map entry for the client.

```

1 add cmp policy <name> -rule <expression> -resAction <string>
2
3 add cmp policy set_user_privilege_pol -rule $user_privilege_map.
 valueExists(client.ip.src).not -resAction set_user_privilege
4 <!--NeedCopy-->

```

Create a policy that compresses if the cached privilege entry for the client is "GOLD".

```

1 add cmp policy <name> -rule <expression> -resAction <string>
2
3 add cmp policy compress_if_gold_privilege_pol -rule '
 $user_privilege_map[client.ip.src].eq("GOLD")' -resAction compress
4 <!--NeedCopy-->

```

Bind the compression policies globally.

```

1 bind cmp global <policyName> [-priority <positive_integer>] [-state (
 ENABLED | DISABLED)] [-gotoPriorityExpression <expression>] [-type
 <type>] [-invoke (<labelType> <labelName>)]
2
3 bind cmp global set_user_privilege_pol -priority 10 NEXT
4
5 bind cmp global compress_if_gold_privilege_pol -priority 20 END

```

```
6 <!--NeedCopy-->
```

## Use case for limiting the number of sessions

December 22, 2023

In this use case, the requirement is to limit the number of active back-end sessions. In the deployment, each session login has login in the URL and each session logout has logout in the URL. On successful login, the back-end sets a session id cookie with a unique ten character value.

### To achieve this use case, perform the following operations:

1. Create a map variable that can store each active session. The key of the map is the session id. The expiry time for the variable is set to 600 seconds (10 minutes).

```
1 > add ns variable session_map -type map(text(10),ulong,100) -
 expires 600
2 <!--NeedCopy-->
```

2. Create the following assignments for the map variable:

- Create an entry for the session id and set that value to 1 (this value is not used).

```
1 > add ns assignment add_session -variable '$session_map[http.
 req.cookie.value("sessionid")] -set 1
2 <!--NeedCopy-->
```

- Deallocate the entry for a session ID, which implicitly decrements the value count for session\_map.

```
1 > add ns assignment delete_session -variable '$session_map[
 http.req.cookie.value("sessionid")] -clear
2 <!--NeedCopy-->
```

3. Create responder policies for the following:

- To check if a map entry exists for that session id in the HTTP request. The add\_session assignment is run if the map entry does not exist.

```
1 > add responder policy add_session_pol 'http.req.url.contains
 ("example") || $session_map.valueExists(http.req.cookie.
 value("abc"))' add_session
2 <!--NeedCopy-->
```

Note: The  
valueExists() function in the

add\_session\_pol policy counts as a reference to the session's map entry, so each request resets the expiration timeout for its session. If no requests for a session are received after 10 minutes, the session's entry will be deallocated.

- To check when the session is logged out. The delete\_session assignment is run.

```
1 add responder policy delete_session_pol "http.req.url.
 contains(\"Logout\")" delete_session
2 <!--NeedCopy-->
```

- To check for login requests and if the number of active sessions exceed 100. If these conditions are satisfied, to limit the number of sessions, the user is redirected to a page that indicates that the server is busy.

```
1 add responder action redirect_too_busy redirect "/too_busy.
 html"
2 add responder policy check_login_pol "http.req.url.contains
 (\"example\") && $session_map.valueCount > 100"
 redirect_too_busy
3 <!--NeedCopy-->
```

4. Bind the responder policies globally.

```
1 bind responder global add_session_pol 30 next
2 bind responder global delete_session_pol 10
3 bind responder global check_login_pol 20
4 <!--NeedCopy-->
```

## Policies and expressions

September 28, 2023

The following topics provide the conceptual and reference information that you require for configuring advanced policies on the NetScaler.

To know about all the advanced policy expressions supported on the NetScaler appliance, see [Policy Expressions](#)

| Topic                                    | Description                                                                                                             |
|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| Introduction to Policies and Expressions | Describes the purpose of expressions, policies, and actions, and how different NetScaler applications make use of them. |

| Topic                                                            | Description                                                                                                                                                                                                  |
|------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Configuring Advanced Policies                                    | Describes the structure of advanced policies and how to configure them individually and as policy banks.                                                                                                     |
| Configuring Advanced Expressions: Getting Started                | Describes expression syntax and semantics, and briefly introduces how to configure expressions and policies.                                                                                                 |
| Advanced Expressions: Evaluating Text                            | Describes expressions that you configure when you want to operate on text (for example, the body of an HTTP POST request or the contents of a user certificate).                                             |
| Advanced Expressions: Working with Dates, Times, and Numbers     | Describes expressions that you configure when you want to operate on any type of numeric data (for example, the length of a URL, a client's IP address, or the date and time that an HTTP request was sent). |
| Advanced Expressions: Parsing HTTP, TCP, and UDP Data            | Describes expressions for parsing IP and IPv6 addresses, MAC addresses, and data that is specific to HTTP and TCP traffic.                                                                                   |
| Advanced Expressions: Parsing SSL Certificates                   | Describes how to configure expressions for SSL traffic and client certificates, for example, how to retrieve the expiration date of a certificate or the certificate issuer.                                 |
| Advanced Expressions: IP and MAC Addresses, Throughput, VLAN IDs | Describes expressions that you can use to work with any other client-related or server-related data not discussed in other chapters.                                                                         |
| Typecasting Data                                                 | Describes expressions for transforming data of one type to another.                                                                                                                                          |
| Regular Expressions                                              | Describes how to pass regular expressions as arguments to operators in advanced expressions.                                                                                                                 |
| Expressions Reference                                            | A reference for advanced expression arguments.                                                                                                                                                               |
| Summary Examples of Advanced Expressions and Policies            | Examples of advanced expressions and policies, in both quick reference and tutorial format, that you can customize for your own use.                                                                         |

## Introduction to policies and expressions

May 2, 2023

For many NetScaler features, policies control how a feature evaluates data. A policy uses a logical expression, called as rule, to evaluate data, and applies one or more actions based on evaluation. Alternatively, a policy can apply a profile, which defines a complex action.

Some NetScaler features use Advanced policies, which provide greater capabilities than older classic policies. If you have migrated to a newer release of the NetScaler software and have configured classic policies for features that use Advanced policies, you have to manually migrate policies to advanced policy infrastructure.

## Advanced policy infrastructure

April 11, 2024

The advanced policy infrastructure enables you to analyze many pieces of data (for example, the body of an HTTP request) and to configure many operations in the policy rule (for example, transforming data in the body of a request into an HTTP header). You must bind the policy to a particular point in the processing associated with the NetScaler features. The bind point is one factor that determines when the policy will be evaluated.

## Benefits of using advanced policies

Advanced policies use a powerful expression language that is built on a class-object model, and they offer several options that enhance your ability to configure the behavior of various NetScaler features.

With advanced policy infrastructure, you can do the following:

- Perform fine-grained analyses of network traffic from layers 2 through 7.
- Evaluate any part of the header or body of an HTTP or HTTPS request or response.
- Bind policies to the multiple bind points that the advanced policy infrastructure supports at the default, override, and virtual server levels.
- Use special tools such as pattern sets, policy labels, rate limit identifiers, HTTP callouts, and variables, which enable you to configure policies effectively for complex use cases.

Also, the configuration utility extends robust GUI support for advanced policy infrastructure and expressions and enables users who have limited knowledge of networking protocols to configure policies quickly and easily. The configuration utility also includes a policy evaluation feature for advanced policies. You can use this feature to evaluate an advanced policy and test its behavior before you commit it, thus reducing the risk of configuration errors.

### **Basic components of an advanced policy**

Following are a few characteristics of an Advanced policy:

- **Name.** Each policy has a unique name.
- **Rule.** The rule is a logical expression that enables the NetScaler feature to evaluate a piece of traffic or another object. For example, a rule can enable the NetScaler to determine whether an HTTP request originated from a particular IP address, or whether a Cache-Control header in an HTTP request has the value “No-Cache.”
- **Bindings.** To ensure that the NetScaler can invoke a policy when it is needed, you associate the policy, or bind it, to one or more bind points.

You can bind a policy globally or to a virtual server. For more information, see [About policy bindings](#).

- **An associated action.** An action is a separate entity from a policy. Policy evaluation ultimately results in the NetScaler performing an action.

For example, a policy in the integrated cache can identify HTTP requests for .png or .jpeg files. An action that you associate with this policy determines that the responses to these types of requests are served from the cache.

For some features, you configure actions as part of a more complex set of instructions known as a profile.

## How different NetScaler features use policies

The NetScaler supports various features that rely on policies for operation. The following table summarizes how the NetScaler features use policies.

| Feature name          | How you use policies in the feature                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Rewrite               | To identify the data that you want to modify before serving. The policies provide rules for modifying the data. For example, you can modify HTTP data to redirect a request to a new home page, or a new server, or a selected server based on the address of the incoming request, or you can modify the data to mask server information in a response for security purposes. The URL Transformer function identifies URLs in HTTP transactions and text files for evaluating whether a URL must be transformed. |
| Responder             | To configure the behavior of the Responder function. A responder policy is based on a rule, which consists of one or more expressions. The rule is associated with an action, which is performed if a request matches the rule.                                                                                                                                                                                                                                                                                   |
| Content Switching     | To determine what server or group of servers is responsible for serving responses, based on the characteristics of an incoming request. Request characteristics include device type, language, cookies, HTTP method, content type, and associated cache server.                                                                                                                                                                                                                                                   |
| Cache Redirection     | To determine whether responses are served from a cache or from an origin server.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Compression Control   | To determine what type of traffic must be compressed.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| DNS                   | To modify various portions of DNS requests and responses                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| VPN clientless access | To determine how the NetScaler Gateway performs authentication, authorization, auditing, and other functions, and to define rewrite rules for general Web access using the NetScaler Gateway.                                                                                                                                                                                                                                                                                                                     |

| <b>Feature name</b>         | <b>How you use policies in the feature</b>                                                                                                                                                                                                                                                                        |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cache                       | To determine whether to serve a response from the cache or the origin server.                                                                                                                                                                                                                                     |
| URL Transform Policy        | To select the requests and responses that the NetScaler must transform by using the URL transformation profile.                                                                                                                                                                                                   |
| Application Firewall Policy | To assign different filtering rules to different types of web content.                                                                                                                                                                                                                                            |
| Authorization               | To provide access to the requested content without exposing unnecessary details about the website's actual configuration.                                                                                                                                                                                         |
| TM traffic                  | To set the characteristics (such as connection timeout, single sign-on, and initiating logout) of application traffic at run time.                                                                                                                                                                                |
| TM session                  | To customize user sessions after the user logs on to the Authorization, Authorization, and Accounting virtual server.                                                                                                                                                                                             |
| SSL Policies                | To define a control or a data action to be performed on requests. SSL policies can therefore be categorized as control policies and data policies. A control policy uses a control action, such as forcing client authentication. A data policy uses a data action, such as inserting some data into the request. |
| Autoscale                   | To scale the number of virtual servers up or down seamlessly and automatically according to the defined conditions.                                                                                                                                                                                               |
| AppFlow                     | To allow NetScaler to export flow data to collection tools, often to be used for network or security analysis.                                                                                                                                                                                                    |
| Content optimization        | To reduce transaction times between the clients and the servers, and reduce bandwidth consumption. Also to enhance server performance by offloading some tasks and making others more efficient.                                                                                                                  |

| <b>Feature name</b>          | <b>How you use policies in the feature</b>                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Spillover                    | To use a NetScaler rule to specify the conditions for spillover to occur. The rules give you the flexibility to configure spillover for various operational conditions.                                                                                                                                                                                                                                                                               |
| ICA                          | To dynamically generate an ICAP request, receive the ICAP response, and log content inspection data.                                                                                                                                                                                                                                                                                                                                                  |
| VPN Session                  | On a NetScaler Gateway, to configure Endpoint Analysis (EPA) to check if a user device meets certain security requirements and accordingly allow access of internal resources to the user.                                                                                                                                                                                                                                                            |
| VPN Traffic                  | On a NetScaler Gateway, to configure Endpoint Analysis (EPA) to check if a user device meets certain security requirements and accordingly allow access of internal resources to the user.                                                                                                                                                                                                                                                            |
| syslog                       | To define which messages to log to the specified syslog server.                                                                                                                                                                                                                                                                                                                                                                                       |
| nslog                        | To define which messages to log to the specified nslog server.                                                                                                                                                                                                                                                                                                                                                                                        |
| Video Optimization Detection | To create a user-defined video optimization detection policy label, to which you can bind detection policies. A policy label is a tool for evaluating a set of policies in a specified order. By using a policy label, you can configure the video optimization feature to choose the next policy, invoke a different policy label, or terminate a policy evaluation completely by looking at whether the previous policy evaluated to TRUE or FALSE. |
| Tunneling                    | To define the type of compression to be used for the tunneled traffic.                                                                                                                                                                                                                                                                                                                                                                                |
| Content Inspection           | To specify requests that the NetScaler ADC intercepts and runs the specified action.                                                                                                                                                                                                                                                                                                                                                                  |
| VPN URL                      | To create a bookmark link to an external or internal resource that appears on the Access Interface, according to type, as a website link or file share link.                                                                                                                                                                                                                                                                                          |

| Feature name                    | How you use policies in the feature                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Bot                             | To create a user-defined bot policy label, to which you can bind policies. A policy label is a tool for evaluating a set of policies in a specified order. By using a policy label, you can configure the responder feature to choose the next policy, invoke a different policy label, or terminate a policy evaluation completely by looking at whether the previous policy evaluated to TRUE or FALSE. |
| VPN intranet application policy | To define intranet applications to be made accessible through a NetScaler Gateway.                                                                                                                                                                                                                                                                                                                        |
| SmartAccess                     | To create an ICA access profile that specifies the status of the features(Default or Disabled).                                                                                                                                                                                                                                                                                                           |
| Load Balancing                  | To define how to distribute the client connections among the load-balanced servers that it manages.                                                                                                                                                                                                                                                                                                       |

---

## About actions and profiles

Policies do not themselves take action on data. Policies provide read-only logic for evaluating traffic. To enable a feature to perform an operation based on a policy evaluation, you configure actions or profiles and associate them with policies.

### Note:

Actions and profiles are specific to particular features. For information about assigning actions and profiles to features, see the documentation for the individual features.

## About actions

Actions are steps that the NetScaler takes, depending on the evaluation of the expression in the policy. For example, if an expression in a policy matches a particular source IP address in a request, the action that is associated with this policy determines whether the connection is permitted.

The types of actions that the NetScaler can take are feature specific. For example, in Rewrite, actions can replace text in a request, change the destination URL for a request, and so on. In Integrated Caching, actions determine whether HTTP responses are served from the cache or an origin server.

In some NetScaler features actions are predefined, and in others they are configurable. In some cases (for example, Rewrite), you configure the actions using the same types of expressions that you use to configure the associated policy rule.

**Note:**

Not all combinations of feature, protocol, direction, and entity are valid.

## About profiles

Some NetScaler features enable you to associate profiles, or both actions and profiles, with a policy. A profile is a collection of settings that enable the feature to perform a complex function. For example, in the application firewall, a profile for XML data can perform multiple screening operations, such as examining the data for illegal XML syntax or evidence of SQL injection.

## About policy bindings

A policy is associated with, or bound to an entity that enables the policy to be invoked. For example, you can bind a policy to request-time evaluation that applies to all virtual servers. A collection of policies that are bound to a particular bind point constitutes a policy bank.

Following is an overview of the different types of bind points for a policy:

- Request time global. A policy can be available to all components in a feature at request time.
- Response time global. A policy can be available to all components in a feature at response time.
- Request time, virtual server-specific. A policy can be bound to request-time processing for a particular virtual server. For example, you can bind a request-time policy to a cache redirection virtual server to ensure that particular requests are forwarded to a load balancing virtual server for the cache, and other requests are sent to a load balancing virtual server for the origin.
- Response time, virtual server-specific. A policy can also be bound to response-time processing for a particular virtual server.
- User-defined policy label. For advanced policy infrastructure, you can configure custom groupings of policies (policy banks) by defining a policy label and collecting a set of related policies under the policy label.
- Other bind points. The availability of additional bind points depends on type of advanced policy, and the specifics of the relevant NetScaler feature.

For additional information about advanced policy bindings, see [Bind policies that use the advanced policies](#) topic.

## About evaluation order of policies

The features in the NetScaler are processed in a certain order, which includes evaluating the policies for the feature and performing the actions selected. For more information, see [Packet flow](#).

At any one point in message processing, policy evaluation is performed depending on the combination of the following:

- Protocol (such HTTP, SIP TCP, or Diameter)
- Direction (request or response)
- Feature (such as Rewrite, Responder, or Bot)

The combinations cannot be mixed up. Policies are evaluated in groups of policies called banks (also called policy labels or bind points) in the following order:

1. Global override
2. Specific LB virtual server used
3. If any specific CS virtual server used
4. Global default

Within a bank, policies are evaluated from the lowest numbered priority to the highest. If a policy rule evaluates to false, evaluation automatically goes to the next higher numbered priority in the same bank. If there are no policy rules in the same bank, then the evaluation falls to the first policy of the next bank in the order. If there are no more policies, then policy evaluation ends. If a policy rule evaluates to true, the corresponding action or profile is remembered for possible later execution.

If the policy is evaluated to true, then the “gotoPriorityExpression” value is checked. If “gotoPriorityExpression” is “END” then policy evaluation stops. If “NEXT” then the next policy (as described above) gets evaluated. If it is an expression then that expression is evaluated and the policy with that priority is selected next.

### Note

The default “gotoPriorityExpression” value except for policy labels is “END”. However, for some features that can run all the actions, we recommend you to explicitly specify the “gotoPriorityExpression” value.

Once policy evaluation stops, the feature runs the ordered list of actions or profiles. The features either run all actions (for example Rewrite) or run one action (for example, Responder or Bot). If more than one action or profile is associated with a feature that can only run one, the standard is to run the last one. If there are no actions or profiles selected, then the feature performs its default action.

## Order of evaluation based on traffic flow

Some policies affect the outcome of other policies. Following are examples:

- If a response is served from the integrated cache, some other NetScaler features do not process the response or the request that initiated it.
- If the application firewall rejects an incoming request, no other features can process it.
- Most actions that are performed by Responder stops further processing.
- The Drop and Reset actions performed by Rewrite stops further processing.

## Advanced policy expressions

May 2, 2023

One of the most fundamental components of a policy is its rule. A policy rule is a logical expression that enables the policy to analyze traffic. Most of the policy's functionality is derived from its expression.

An expression matches characteristics of traffic or other data with one or more parameters and values. For example, an expression can enable the NetScaler to accomplish the following:

- Determine whether a request contains a certificate.
- Determine the IP address of a client that sent a TCP request.
- Identify the data that an HTTP request contains (for example, a popular spreadsheet or word processing application).
- Calculate the length of an HTTP request.

### About advanced policy expressions

Any feature that uses advanced policy infrastructure also uses Advanced expressions. For information about which features use Advanced policies, see the table [NetScaler Feature, Policy Type, and Policy Usage](#).

Advanced policy expressions have a few other uses. In addition to configuring Advanced expressions in policy rules, you configure Advanced expressions in the following situations:

- **Integrated Caching:**  
You use Advanced policy expressions to configure a selector for a content group in the integrated cache.
- **Load Balancing:**  
You use Advanced policy expressions to configure token extraction for a load balancing virtual server that uses the TOKEN method for load balancing.

- Rewrite:

You use Advanced policy expressions to configure rewrite actions.

- Rate-based policies:

You use Advanced policy expressions to configure limit selectors when configuring a policy to control the rate of traffic to various servers.

Following are a few simple examples of Advanced policy expressions:

- An HTTP request URL contains no more than 500 characters.

```
http.req.url.length \<= 500
```

- An HTTP request contains a cookie that has fewer than 500 characters.

```
http.req.cookie.length \< 500
```

- An HTTP request URL contains a particular text string.

```
http.req.url.contains(".html")
```

## Convert policy expressions using the NSPEPI tool

January 1, 2024

### Note:

You can download the NSPEPI and preconfig check tool from the public GitHub. For more information, see the [GitHub NSPEPI](#) page and [README](#) page for detailed instructions to download, install, and use the tools. We recommend customers to use the tools available in GitHub for the most complete and up-to-date version.

Classic policy-based features and functionalities are deprecated from NetScaler 12.0 build 56.20 onwards. As an alternative, NetScaler recommends you to use the Advanced policy infrastructure for the features supported by the NSPEPI tool. For the list of supported features, see [Commands or features handled by the nspepi conversion tool](#). The features that are not supported by the NSPEPI tool continue to support classic policies. For the list of unsupported features, see [NSPEPI tool unsupported features](#).

The `nspepi` tool can perform the following tasks:

1. Convert Classic policy expressions to Advanced policy expressions.
2. Convert certain Classic policies and their entity bindings to Advanced policies and bindings.

3. Convert a few more deprecated features to their corresponding non-deprecated features.
4. Convert classic filter commands to advanced filter commands.

**Note:**

After the `nspepi` tool successfully converts the `ns.conf` config file, the tool displays the converted file as a new file with a prefix, “new\_”. If the converted config file has errors or warnings, you must manually fix them as part of the conversion process. Once converted, you must test the file in the test environment and then use it to replace the actual `ns.conf` config file. After testing, you must reboot the appliance for the newly converted or fixed `ns.conf` config file.

Features that only support Classic policies or expressions are deprecated and they can be replaced by the corresponding non-deprecated features.

**Note:**

Information pertaining to the older version of the `nspepi` tool is available in a PDF format. For more information, see [Classic policy conversion using nspepi tool before 12.1-51.16](#) PDF.

## Conversion warnings and error files

Before you use the tool for your conversion, there are a few warnings to keep in mind:

1. All warnings and errors are output to the console. There is a warning file created where the configuration files are stored.
2. The warnings and error file has the same name as the input file but with a prefix “warn\_” added to the file name. During expression conversion (when using `-e`), the warnings show up in the current directory with a name “warn\_expr”.

**Note:**

This file is in a standard log file format, with date/time stamp and log level. Previous instances of the file are kept with suffixes like “.1”, “.2”, and so forth as the tool is run multiple times. At most 10 instances will be kept.

## Converted file format

When converting a configuration file (using “`-f`”), the converted file is put into the same directory as where the input configuration file exists with the same name but a prefix “new\_”.

## Commands or features handled by the nspepi conversion tool

Following are the commands handled during the auto conversion process.

- The following Classic policies and their expressions are converted to Advanced policies and expressions. The conversion includes entity bindings and global bindings.
  1. add appfw policy
  2. add cmp policy
  3. add cr policy
  4. add cs policy
  5. add ssl policy
  6. add filter action
  7. add filter policy
  8. filter policy binding to load balancing, content switching, cache redirection, and global.
- The rule parameter configured in “add lb virtual server” is converted from Classic expression to Advanced expression.
- The SPDY parameter configured in the “add ns httpProfile” or the “set ns httpProfile” command is changed to “-http2 ENABLED”.
- Named expressions (“add policy expression” commands). Each Classic named policy expression is converted to its corresponding Advanced named expression with “nspepi\_adv\_” set as the prefix. In addition, usage of named expressions for the converted Classic expressions is changed to the corresponding Advanced named expressions. In addition, every named expression has two named expressions, where one is Classic and the other one is Advanced (as shown below).
- Tunnel TrafficPolicy conversion is supported.
- Handling builtin-in classic policy bindings in CMP, CR, and Tunnel.
- Patclass feature is converted to Pat set feature.
- “-pattern” parameter in the “add rewrite action” command is converted to use “-search” parameter.
- Q and S prefixes of advanced expressions are converted to equivalent non-deprecated advanced expressions. These expressions can be seen in any command where advanced expressions are allowed.

**For example:**

```
1 add policy expression classic_expr ns_true
2 Converts to:
3 add policy expression classic_expr ns_true
4 add policy expression nspepi_adv_classic_expr TRUE
5 <!--NeedCopy-->
```

- The policyType parameter configured in the “set cmp parameter” command is removed. By default, the policy type is “Advanced”.

## Convert classic filter commands to advanced filter commands

The `nspepi` tool can convert commands based on classic filter actions such as `add`, `bind` and so forth to advanced filter commands.

However, the `nspepi` tool does not support the following filter commands.

1. `add filter action <action Name> FORWARD <service name>`
2. `add filter action <action name> ADD prebody`
3. `add filter action <action name> ADD postbody`

### Note:

1. If there are existing rewrite or responder features in `ns.conf` and their policies are bound globally with the `GOTO` expression as `END` or `USER_INVOCATION_RESULT` and the bind type is `REQ_X` or `RES_X` then the tool converts bind filter commands partially and comments out. An error is displayed for the manual conversion.
2. If there are existing rewrite or responder features and their policies are bound to virtual servers (for example, load balancing, content switching or cache redirect) of type `HTTPS` with `GOTO - END` or `USER_INVOCATION_RESULT`, the tool converts bind filter commands partially and then comments out. Warning is displayed for the manual conversion.

### Example

Following is a sample input:

```

1 add lb vserver v1 http 1.1.1.1 80 -persistenceType NONE -cltTimeout
 9000
2 add cs vserver csv1 HTTP 1.1.1.2 80 -cltTimeout 180 -persistenceType
 NONE
3 add cr vserver crv1 HTTP 1.1.1.3 80 -cacheType FORWARD
4 add service svc1 1.1.1.4 http 80
5 add filter action fact_add add 'header:value'
6 add filter action fact_variable add 'H1:%%HTTP.TRANSID%%'
7 add filter action fact_prebody add prebody
8 add filter action fact_error_act1 ERRORCODE 200 "<HTML>Good URL</HTML>"
9 add filter action fact_forward_act1 FORWARD svc1
10 add filter policy fpol_add_res -rule ns_true -resAction fact_add
11 add filter policy fpol_error_res -rule ns_true -resAction
 fact_error_act1
12 add filter policy fpol_error_req -rule ns_true -reqAction
 fact_error_act1
13 add filter policy fpol_add_req -rule ns_true -reqAction fact_add
14 add filter policy fpol_variable_req -rule ns_true -reqAction
 fact_variable
15 add filter policy fpol_variable_res -rule ns_true -resAction
 fact_variable

```

```
16 add filter policy fpol_prebody_req -rule ns_true -reqAction
 fact_prebody
17 add filter policy fpol_prebody_res -rule ns_true -resAction
 fact_prebody
18 add filter policy fpol_forward_req -rule ns_true -reqAction
 fact_forward_act1
19 bind lb vserver v1 -policyName fpol_add_res
20 bind lb vserver v1 -policyName fpol_add_req
21 bind lb vserver v1 -policyName fpol_error_res
22 bind lb vserver v1 -policyName fpol_error_req
23 bind lb vserver v1 -policyName fpol_variable_res
24 bind lb vserver v1 -policyName fpol_variable_req
25 bind lb vserver v1 -policyName fpol_forward_req
26 bind cs vserver csv1 -policyName fpol_add_req
27 bind cs vserver csv1 -policyName fpol_add_res
28 bind cs vserver csv1 -policyName fpol_error_res
29 bind cs vserver csv1 -policyName fpol_error_req
30 bind cr vserver crv1 -policyName fpol_add_req
31 bind cr vserver crv1 -policyName fpol_add_res
32 bind cr vserver crv1 -policyName fpol_error_res
33 bind cr vserver crv1 -policyName fpol_error_req
34 bind cr vserver crv1 -policyName fpol_forward_req
35 bind filter global fpol_add_req
36 bind filter global fpol_add_res
37 bind filter global fpol_error_req
38 bind filter global fpol_error_res
39 bind filter global fpol_variable_req
40 bind filter global fpol_variable_res
41 bind filter global fpol_variable_res -state DISABLED
42 bind filter global fpol_prebody_req
43 bind filter global fpol_forward_req
44 After conversion, warning/error messages will be displayed for manual
 effort.
45 Warning files:
46 cat warn_<input file name>:
47 2019-11-07 17:13:34,724: ERROR - Conversion of [add filter action
 fact_prebody add prebody] not supported in this tool.
48 2019-11-07 17:13:34,739: ERROR - Conversion of [add filter action
 fact_forward_act1 FORWARD svc1] not supported in this tool.

 fpol_prebody_req -rule ns_true -reqAction fact_prebody] not
 supported in this tool.
50 2019-11-07 17:13:38,497: ERROR - Conversion of [add filter policy
 fpol_prebody_res -rule ns_true -resAction fact_prebody] not
 supported in this tool.
51 2019-11-07 17:13:39,035: ERROR - Conversion of [add filter policy
 fpol_forward_req -rule ns_true -reqAction fact_forward_act1] not
 supported in this tool.
52 2019-11-07 17:13:39,060: WARNING - Following bind command is commented
 out because state is disabled. Advanced expressions only have a
 fixed ordering of the types of bindings without interleaving, except
 that global bindings are allowed before all other bindings and
 after all bindings. If you have global bindings in the middle of non
```

```

 -global bindings or any other interleaving then you will need to
 reorder all your bindings for that feature and direction. Refer to
 nspepi documentation. If command is required please take a backup
 because comments will not be saved in ns.conf after triggering 'save
 ns config': bind filter global fpol_variable_res -state DISABLED
53
54
55 <!--NeedCopy-->

```

Following is a sample output. All converted commands are commented.

```

1 cat new_<input file name>
2 add rewrite action fact_add insert_http_header header "\"value\""
3 add filter action fact_prebody add prebody
4 add filter action fact_forward_act1 FORWARD svc1
5 add filter policy fpol_prebody_req -rule ns_true -reqAction
 fact_prebody

```

### Convert classic filter commands to advanced feature commands if existing rewrite or responder policy bindings have goto expression END or USE\_INNVOCATION

In this conversion, if a rewrite policy bound to one or more virtual servers and if the server has END or USE\_INVOCATION\_RESULT, the tool comments out the commands.

#### Example

Following is a sample input command:

```

1 COPY
2 add filter policy fpol1 -rule ns_true -resAction reset
3 add filter policy fpol2 -rule ns_true -reqAction reset
4 add rewrite policy pol1 true NOREWRITE
5 add rewrite policylabel pl http_res
6 bind rewrite policylabel pl pol1 1
7 bind rewrite global NOPOLICY 1 USE_INVOCATION_RESULT -type RES_DEFAULT
-invoke policylabel pl
8 add responder policy pol2 true NOOP

```

```

9 add responder policylabel pl -policylabeltype HTTP
10 bind responder policylabel pl pol2 1
11 bind responder global NOPOLICY 1 USE_INVOCATION_RESULT -type
 REQ_DEFAULT -invoke policylabel pl
12 bind lb vserver v1_tcp -policyName pol1 -priority 100 -
 gotoPriorityExpression USE_INVOCATION_RESULT -type RESPONSE
13 bind cs vserver csv1_tcp -policyName pol1 -priority 100 -
 gotoPriorityExpression USE_INVOCATION_RESULT -type RESPONSE
14 bind lb vserver v1_tcp -policyName pol2 -priority 100 -
 gotoPriorityExpression USE_INVOCATION_RESULT -type REQUEST
15 bind cs vserver csv1_tcp -policyName pol2 -priority 100 -
 gotoPriorityExpression USE_INVOCATION_RESULT -type REQUEST
16 bind cr vserver crv1_tcp -policyName pol2 -priority 100 -
 gotoPriorityExpression USE_INVOCATION_RESULT -type REQUEST
17 bind lb vserver v1_http -policyName fpol1
18 bind cs vserver csv1_http -policyName fpol1
19 bind lb vserver v2_http -policyName fpol2
20 bind cs vserver csv2_http -policyName fpol2
21 bind cr vserver crv2_http -policyName fpol2
22 bind filter global fpol1 -priority 100
23 bind filter global fpol2 -priority 100
24 <!--NeedCopy-->

```

Following is a sample output command:

```

1 COPY
2 add rewrite policy pol1 true NOREWRITE
3 add rewrite policylabel pl http_res
4 bind rewrite policylabel pl pol1 1
5 add responder policy pol2 true NOOP
6 add responder policylabel pl -policylabeltype HTTP
7 bind responder policylabel pl pol2 1
8 add rewrite policy fpol1 TRUE RESET
9 add responder policy fpol2 TRUE RESET
10 #bind lb vserver v1_http -policyName fpol1 -type RESPONSE
11 #bind cs vserver csv1_http -policyName fpol1 -type RESPONSE
12 #bind rewrite global fpol1 100 -type RES_DEFAULT
13 #bind lb vserver v2_http -policyName fpol2 -type REQUEST
14 #bind cs vserver csv2_http -policyName fpol2 -type REQUEST
15 #bind cr vserver crv2_http -policyName fpol2 -type REQUEST
16 #bind responder global fpol2 100 -type REQ_DEFAULT
17 bind rewrite global NOPOLICY 1 USE_INVOCATION_RESULT -type RES_DEFAULT
 -invoke policylabel pl
18 bind responder global NOPOLICY 1 USE_INVOCATION_RESULT -type
 REQ_DEFAULT -invoke policylabel pl
19 bind lb vserver v1_tcp -policyName pol1 -priority 100 -
 gotoPriorityExpression USE_INVOCATION_RESULT -type RESPONSE
20 bind lb vserver v1_tcp -policyName pol2 -priority 100 -
 gotoPriorityExpression USE_INVOCATION_RESULT -type REQUEST
21 bind cs vserver csv1_tcp -policyName pol1 -priority 100 -
 gotoPriorityExpression USE_INVOCATION_RESULT -type RESPONSE
22 bind cs vserver csv1_tcp -policyName pol2 -priority 100 -
 gotoPriorityExpression USE_INVOCATION_RESULT -type REQUEST

```

```

23 bind cr vserver crv1_tcp -policyName pol2 -priority 100 -
 gotoPriorityExpression USE_INVOCATION_RESULT -type REQUEST-
24
25 <!--NeedCopy-->

```

## Running the nspepi tool

The following is a command line example for running the `nspepi` tool. This tool is run from the command line of the shell (you need to type the “shell” command to the NetScaler CLI to get to that). Either “-f” or “-e” must be specified to perform a conversion. Use of “-d” is intended for Citrix personnel to analyze for support purposes.

```

1 usage: nspepi [-h] (-e <classic policy expression> | -f <path to ns
 config file>)[-d] [-v] [-V]
2
3 Convert classic policy expressions to advanced policy expressions and
4 deprecated commands to non-deprecated
5 commands.
6 optional arguments:
7 -h, --help show this help message and exit
8 -e <classic policy expression>, --expression <classic policy expression
 >
9 convert classic policy expression to advanced policy
10 expression (maximum length of 8191 allowed)
11 -f <path to ns config file>, --infile <path to ns config file>
12 convert netscaler config file
13 -d, --debug log debug output
14 -v, --verbose show verbose output
15 -V, --version show program's version number and exit
16 <!--NeedCopy-->

```

### Usage Examples:

1. `nspepi -e "req.tcp.destport == 80"`
2. `nspepi -f /nsconfig/ns.conf`

Following are few examples of running the `nspepi` tool by using the CLI

### Example output for –e parameter:

```

1 root@ns# nspepi -e "req.http.header foo == \"bar\""
2 "HTTP.REQ.HEADER(\"foo\").EQ(\"bar\")"
3 <!--NeedCopy-->

```

### Example output for -f parameter:

```

1 root@ns# cat sample.conf
2 add cr vserver cr_vs HTTP -cacheType TRANSPARENT -cltTimeout 180 -
 originUSIP OFF

```

```
3 add cr policy cr_pol1 -rule ns_true
4 bind cr vserver cr_vs -policyName cr_pol1
5 <!--NeedCopy-->
```

**Running nspepi with -f parameter:**

```
1 nspepi -f sample.conf
2 <!--NeedCopy-->
```

Converted config is available in a new file `new_sample.conf`.

Check the `warn_sample.conf` file for any warnings or errors that might have been generated.

Example output of -f parameter along with -v parameter

```
1 nspepi -f sample.conf -v
2 INFO - add cr vserver cr_vs HTTP -cacheType TRANSPARENT -cltTimeout 180 -
 -originUSIP OFF
3 INFO - add cr policy cr_pol1 -rule TRUE -action ORIGIN
4 INFO - bind cr vserver cr_vs -policyName cr_pol1 -priority 100 -
 gotoPriorityExpression END -type REQUEST
5 <!--NeedCopy-->
```

Converted config is available in a new file `new_sample.conf`.

Check the `warn_sample.conf` file for any warnings or errors that might have been generated.

**Converted Config file:**

```
1 root@ns# cat new_sample.conf
2 add cr vserver cr_vs HTTP -cacheType TRANSPARENT -cltTimeout 180 -
 originUSIP OFF
3 add cr policy cr_pol1 -rule TRUE -action ORIGIN
4 set cmp parameter -policyType ADVANCED
5 bind cr vserver cr_vs -policyName cr_pol1 -priority 100 -
 gotoPriorityExpression END -type REQUEST
6
7 <!--NeedCopy-->
```

**Example output of a sample configuration with no errors or warnings:**

```
1 nspepi -f sample_2.conf
2 <!--NeedCopy-->
```

Converted config is available in a new file `new_sample_2.conf`.

Check the `warn_sample_2.conf` file for any warnings or errors that might have been generated.

**Example output of a sample configuration with warnings:**

```
1 root@ns# cat sample_2.conf
2 add policy expression security_expr "req.tcp.destport == 80" -
 clientSecurityMessage "Not allowed"
3 set cmp parameter -policyType CLASSIC
4 add cmp policy cmp_pol1 -rule ns_true -resAction COMPRESS
```

```

5 add cmp policy cmp_pol2 -rule ns_true -resAction COMPRESS
6 add cmp policy cmp_pol3 -rule TRUE -resAction COMPRESS
7 bind cmp global cmp_pol1
8 bind cmp global cmp_pol2 -state DISABLED
9 bind cmp global cmp_pol3 -priority 1 -gotoPriorityExpression END -type
 RES_DEFAULT
10 bind lb vserver lb_vs -policyName cmp_pol2
11 root@ns#
12 <!--NeedCopy-->

```

### Example of running nspepi with -f parameter:

```

1 root@ns# nspepi -f sample_2.conf
2 ERROR - Error in converting expression security_expr : conversion of
 clientSecurityMessage based expression is not supported.
3 WARNING - Following bind command is commented out because state is
 disabled. Advanced expressions only have a fixed ordering of the
 types of bindings without interleaving, except that global bindings
 are allowed before all other bindings and after all bindings. If you
 have global bindings in the middle of non-global bindings or any
 other interleaving then you will need to reorder all your bindings
 for that feature and direction. Refer to nspepi documentation. If
 command is required please take a backup because comments will not
 be saved in ns.conf after triggering 'save ns config': bind cmp
 global cmp_pol2 -state DISABLED
4 Warning - Bindings of advanced CMP policies to cmp global are commented
 out, because initial global cmp parameter is classic but advanced
 policies are bound. Now global cmp parameter policy type is set to
 advanced. If commands are required please take a backup because
 comments will not be saved in ns.conf after triggering 'save ns
 config'. Advanced expressions only have a fixed ordering of the
 types of bindings without interleaving, except that global bindings
 are allowed before all other bindings and after all bindings. If you
 have global bindings in the middle of non-global bindings or any
 other interleaving then you will need to reorder all your bindings
 for that feature and direction. Refer to nspepi documentation.
5 root@ns#
6 <!--NeedCopy-->

```

### Converted file:

```

1 root@ns# cat new_sample_2.conf
2 add policy expression security_expr "req.tcp.destport == 80" -
 clientSecurityMessage "Not allowed"
3 set cmp parameter -policyType ADVANCED
4 add cmp policy cmp_pol1 -rule TRUE -resAction COMPRESS
5 add cmp policy cmp_pol2 -rule TRUE -resAction COMPRESS
6 add cmp policy cmp_pol3 -rule TRUE -resAction COMPRESS
7 #bind cmp global cmp_pol2 -state DISABLED
8 #bind cmp global cmp_pol3 -priority 1 -gotoPriorityExpression END -type
 RES_DEFAULT
9 bind cmp global cmp_pol1 -priority 100 -gotoPriorityExpression END -
 type RES_DEFAULT

```

```
10 bind lb vserver lb_vs -policyName cmp_pol2 -priority 100 -
 gotoPriorityExpression END -type RESPONSE
11 root@ns#
12 <!--NeedCopy-->
```

**Warning file:**

```
1 root@ns# cat warn_sample_2.conf
2 2019-02-28 06:20:10,590: ERROR - Error in converting expression
 security_expr : conversion of clientSecurityMessage based expression
 is not supported.
3 2019-02-28 06:20:12,187: WARNING - Following bind command is commented
 out because state is disabled. Advanced expressions only have a
 fixed ordering of the types of bindings without interleaving, except
 that global bindings are allowed before all other bindings and
 after all bindings. If you have global bindings in the middle of non
 -global bindings or any other interleaving then you will need to
 reorder all your bindings for that feature and direction. Refer to
 nspepi documentation. If command is required please take a backup
 because comments will not be saved in ns.conf after triggering 'save
 ns config': bind cmp global cmp_pol2 -state DISABLED
4 2019-02-28 06:20:12,191: WARNING - Bindings of advanced CMP policies to
 cmp global are commented out, because initial global cmp parameter
 is classic but advanced policies are bound. Now global cmp parameter
 policy type is set to advanced. If commands are required please
 take a backup because comments will not be saved in ns.conf after
 triggering 'save ns config'. Advanced expressions only have a fixed

```

**Binding Priorities**

Advanced policies do not allow arbitrary interleaving by priority between global and non-global and between different binding types. If you rely on such interleaving of Classic policy priorities, you need to adjust the priorities to conform to the Advanced policy rules and to get the behavior you desire.

Priorities in Advanced policies are local to a bind point. A bind point is a unique combination of protocol, feature, direction, and entity (entities are specific virtual servers, users, groups, services, and either global override or global default). Policy priorities are not followed across bind points.

For a given protocol, feature, and direction, the following is the order of evaluation of Advanced policies:

- Global override.

- (Current) authentication, authorization, and auditing user.
- Authentication, authorization, and auditing groups (that the user is a member of) in order of weight - ordering is undefined if two or more groups have the same weight.
- LB virtual server that either the request was received on or that Content Switching selected.
- Content switching virtual server, cache redirection virtual server that the request was received on.
- Service selected by load balancing.
- Global default.

Within each bind point, the policies are evaluated in order of priority from lowest numbered to highest numbered. Policies are only evaluated for the protocol used and the direction that the message was received from.

### **Classic policy bindings that require manual reprioritization**

Here are some types of Classic policy bindings that require manual reprioritization to accomplish your needs. All these are for a given feature and the direction.

- Classic priorities that increase in priority number opposite to the direction of the above entity type lists. For example a content switching virtual server binding lower than a load balancing virtual server binding.
- Classic priorities that increase in number other than the order of weights of authentication, authorization, and auditing groups.
- Classic global priorities that are less than some non-global priority and the same global priorities are greater than some other non-global priority (in other words, any segment of priorities that are a non-global, followed by one or more globals, followed by a non-global).

### **The NSPEPI and check\_invalid\_config tools can be run on the CentOS and Ubuntu systems**

The following modules are the prerequisites for using these tools:

- Python
- Perl
- Python pip module
- PLY module for Python
- Switch.pm for Perl

If Python 3 is installed, create a soft link, for example, `ln -s /usr/bin/python3 /usr/bin/python`.

To install Python pip module, PLY module for Python, and Switch.pm for Perl in CentOS, run the following commands:

- `sudo yum install -y perl-Switch`
- `sudo yum install python-pip`
- `sudo yum install python-ply`

To install Python pip module, PLY module for Python, and Switch.pm for Perl in Ubuntu, run the following commands:

- `sudo apt install libswitch-perl`
- `sudo apt install python-ply`
- `sudo apt install python-pip` or `sudo apt install python3-pip`

## NSPEPI tool unsupported features

January 9, 2024

This topic provides information about the features that are not supported by the NSPEPI tool.

### Commands or features not handled by the nspepi conversion tool

The following are some commands that are not handled as part of the auto conversion process.

- Client security expressions are not handled.
- Authentication
- Authorization
- VPN
- Syslog
- Nslog
- File based Classic expressions are not handled.

#### Note:

For some features like Patclass/filter, the command syntax is changed. If there are command policies, then command policies might need to be changed depending on customer requirement.

To convert classic policies to advanced policies for the following features, reach out to NetScaler customer support:

- Sure Connect (SC)

- Priority Queuing (PQ)
- HTTP Denial of Service (HDOS)
- HTML Injection

## Binding Priorities

Advanced policies do not allow arbitrary interleaving by priority between global and non-global and between different binding types. If you rely on such interleaving of Classic policy priorities, you need to adjust the priorities to conform to the Advanced policy rules and to get the desired behavior.

Priorities in Advanced policies are local to a bind point. A bind point is a unique combination of protocol, feature, direction, and entity (entities are specific virtual servers, users, groups, services, and either global override or global default). Policy priorities are not followed across bind points.

For a given protocol, feature, and direction, the following is the order of evaluation of Advanced policies:

- Global override.
- Authentication, authorization, and auditing user (Current).
- Authentication, authorization, and auditing groups (that the user is a member of) in order of weight. The ordering is undefined if two or more groups have the same weight.
- LB virtual server that either the request was received on or that Content Switching selected.
- Content switching virtual server, cache redirection virtual server that the request was received on.
- Service selected by load balancing.
- Global default.

For authorization policy evaluation, the order is:

- Systems override.
- Load balancing virtual server that either the request was received on or that CS selected.
- Content switching virtual server that the request was received on.
- System default.

Within each bind point, the policies are evaluated in order of priority from lowest numbered to highest numbered. Policies are only evaluated for the protocol used and the direction that the message was received from.

## Warning

The following scenarios show the warnings in the `nspepi` tool:

- If the rule expression of load balancing virtual server is a boolean expression, the equivalent advanced expression results in boolean value in string format. This results in functionality change when the rule is used for `persistenceType` or `lbMethod`. To avoid the functionality change, the command is modified by removing the `keywords rule` and `persistenceType`.
- If the state field of the binding command is DISABLED. If the state is disabled, then command is not in use. The state parameter is not supported with the advanced configuration. So, if we convert this configuration then the functionality changes. If the command is required, take a backup because comments will not be saved in `ns.conf` after triggering `save ns config`.

**Warning in CMP feature conversion:**

- If a global `cmp` parameter `policy type` is set to CLASSIC and advanced policies are bound to global. Without conversion, bounded advanced policies will not be evaluated because the global policy type is set to CLASSIC. After conversion, the policy type would be converted to ADVANCED. So, if we do not comment out the existing global advanced bindings, then these bindings are evaluated and can change the functionality.
- If the global `cmp` parameter `policy type` is set to ADVANCED and classic policies are bound to global. Without conversion, these global classic bindings would not be evaluated because global policy type is ADVANCED. So, to preserve the functionality, we comment out the converted configuration, otherwise converted advanced policies are evaluated and can change the functionality.

**Note:**

All classic policy bindings with `-state` option disabled are commented out. The `-state` option is not available for Advanced policy bindings.

**Limitations of NSPEPI tool**

The following scenarios cause errors in the `nspepi` tool:

- If there is an issue when converting an expression
- If a named policy expression uses the `-clientSecurityMessage` parameter because this parameter is not supported in the Advanced policy expression
- If load balancing virtual server rule expression is a complex expression and has multiple CONTENT based expressions
- Errors in CMP feature conversion occur in the following scenarios:
  - Both classic and advanced policies are bound to global
  - Classic policies are bound and CMP parameter is advanced
  - Advanced policies are bound and CMP parameter is classic

- Classic policies are bound to a virtual server and advanced policies are bound to a global server
  - Advanced policies are bound to a virtual server and classic policies are bound to a global server
  - Classic policies are bound to a virtual server and both classic and advanced policies are bound to a global server
  - Advanced policies are bound to a virtual server and both classic and advanced policies are bound to a global server
- If the classic named expression has the same name as the callout entity name
  - If the classic expression name is invalid for the advanced expression
  - If the converted expression length is more than 1499 characters
  - If the classic expression has client security or file-based expressions

### **Classic policy bindings that require manual reprioritization**

Here are some types of Classic policy bindings that require manual reprioritization to accomplish your needs. All these are for a given feature and the direction.

- Classic priorities that increase in priority number opposite to the direction of the above entity type lists. For example, a content switching virtual server binding lower than a load balancing virtual server binding.
- Classic priorities that interleave authentication, authorization, and auditing groups. One part of one group is before some other group and yet another part is after part of that other group.
- Classic priorities that increase in number other than the order of weights of authentication, authorization, and auditing groups.
- Classic global priorities that are less than some non-global priority and the same global priorities are greater than some other non-global priority (in other words, any segment of priorities that are a non-global, followed by one or more globals, followed by a non-global).

## **Preconfiguration check tool**

February 1, 2024

### **Note:**

You can download the latest version of NSPEPI and preconfiguration check tool from public GitHub. For information on how to download the tools, see [GitHub NEPEPI](#) and [GitHub preconfiguration](#). We recommend you to use the latest version of the tool for the most complete and

up-to-date version.

The preconfiguration check tool is available from NetScaler release 12.1. You can use this tool to check if any invalid, removed, or deprecated functionality is still used in any feature configuration. The tool validates if the configuration file contains parameters or commands that are removed or deprecated from NetScaler release 13.1. The tool validates only the configuration files that are from a saved configuration, for example `ns.conf`.

If the validation result shows usage of removed or invalid commands, then you must first modify the configuration to the NetScaler recommended alternative before upgrading your appliance.

The tool also checks for classic policy expressions in feature configurations that no longer support classic expressions. You can use the `nspepi` tool to convert the classic configuration to the advanced configuration. After the successful run, the tool generates two files, one for the invalid commands and one for the deprecated parameters or commands. The file with invalid commands has the same name as the input file but with the prefix “issues\_”. The file with the deprecated commands, has the “deprecated\_” prefix.

The tool validates the following:

1. Classic policy expressions in Content Switching, Cache Redirection, AppFW, SSL, and CMP features.
2. Filter feature (also known as Content Filtering) - actions, policies, and binding.
3. SPDY in HTTP profile, sure connect (SC), priority queuing (PQ), HTTP Denial of Service (DoS), and HTML Injection features.
4. Classic expressions in load balancing persistence rules.
5. “Pattern” and “bypassSafetyCheck” parameters in Rewrite actions.
6. “patclass” configuration entity.
7. “HTTP.REQ.BODY” with no argument in Advanced expressions.
8. Q and S prefixes in Advanced expressions.
9. “PolicyType” parameter for the cmp parameter setting.
10. Deprecated commands and parameters.

## Run preconfiguration check tool in UNIX Shell

At the command prompt, type:

```
1 check_invalid_config <config_file> -buildVersion <build version>
2 <!--NeedCopy-->
```

In the command syntax,

- `<config file>` refers to the NetScaler configuration file. The file must be from a saved configuration such as `ns.conf`.

- `<build version>` refers to the build for which you want to know the deprecated and removed commands. If the build version is not specified, then by default, the tool detects the deprecated and removed commands for NetScaler release 13.1.

**Example:**

```
root@ns# check_invalid_config /nsconfig/ns.conf 13.1
```

**Run the preconfiguration check tool by using the GUI**

You can run the preconfiguration check tool as part of the upgrade process using the GUI. To run the tool, perform the following steps:

1. In a web browser, type the IP address of the NetScaler and login using the user name and password.
2. Navigate to **System > Upgrade**.
3. On the **System Upgrade** page, select the **Enable NSPEPI Tool** checkbox.
4. Click **Upgrade**.

**Sample output with invalid commands**

The following is a sample output of the configuration file having invalid commands:

```

1 root@ns# check_invalid_config sample_conf_1.conf
2
3 The following configuration lines will get errors in 13.1 and both they
 and dependent configuration will be removed from the configuration:
4 add cmp policy cmp_pol -rule ns_true -resAction GZIP
5 add cs policy cs_pol_2 -rule ns_true
6 add cs policy cs_pol_3 -domain www.abc.com
7 add cs policy cs_pol_4 -url "/abc"
8 add rewrite action act_1 replace_all "http.req.body(1000)" http.req.url
 -pattern abcd
9 add rewrite action act_123 replace_all http.req.url "\"aaaa\"" -pattern
 abcd
10 add responder action ract respondwith "Q.URL + Q.HEADER(\"abcd\")"
11 add appfw policy aff_pol_1 "http.req.body.length.gt(10)" APPFW_BYPASS
12 add appfw policy aff_pol ns_true APPFW_BYPASS
13
14 The nspepi upgrade tool can be useful in converting your configuration
 - see the documentation at https://docs.citrix.com/en-us/citrix-adc/current-release/appexpert/policies-and-expressions/introduction-to-policies-and-exp/converting-policy-expressions-nspepi-tool.html.
15
16 NOTE: the nspepi tool doesn't convert the following configurations:
17 1. SureConnect commands
18 2. PriorityQueuing commands
19 3. HTTP Denial of Service Protection commands

```

```

20 4. Classic SSL commands
21 5. HTMLInjection commands.
22
23 NOTE: No deprecated commands detected in the configuration.
24
25 <!--NeedCopy-->

```

If you get the preceding errors, you can use the `nspepi` upgrade tool to convert the configuration or manually convert the configuration. For more information, see [nspepi tool](#).

**Note:**

You can run the `nspepi` tool only on NetScaler version 12.1, 13.0 and later versions.

### Sample output with invalid and deprecated commands

The following is a sample output of the configuration file having both invalid and deprecated commands:

```

1 root@ns# check_invalid_config sample_conf_2.conf
2
3 The following configuration lines will get errors in 13.1 and both they
 and dependent configuration will be removed from the configuration:
4 add cmp policy cmp_pol -rule ns_true -resAction GZIP
5 add cs policy cs_pol_2 -rule ns_true
6 add cs policy cs_pol_3 -domain www.abc.com
7 add cs policy cs_pol_4 -url "/abc"
8 add rewrite action act_1 replace_all "http.req.body(1000)" http.req.url
 -pattern abcd
9 add rewrite action act_123 replace_all http.req.url "\"aaaa\"" -pattern
 abcd
10 add responder action ract respondwith "Q.URL + Q.HEADER(\"abcd\")"
11 add appfw policy aff_pol_1 "http.req.body.length.gt(10)" APPFW_BYPASS
12 add appfw policy aff_pol ns_true APPFW_BYPASS
13
14 The nspepi upgrade tool can be useful in converting your configuration
 - see the documentation at https://docs.citrix.com/en-us/citrix-adc/current-release/appexpert/policies-and-expressions/introduction-to-policies-and-exp/converting-policy-expressions-nspepi-tool.html.
15
16 NOTE: the nspepi tool doesn't convert the following configurations:
17 1. SureConnect commands
18 2. PriorityQueuing commands
19 3. HTTP Denial of Service Protection commands
20 4. Classic SSL commands
21 5. HTMLInjection commands.
22
23 NOTE: some deprecated commands have also been detected in the config
 file, please check ./deprecated_sample_conf_2.conf file for the
 deprecated commands.
24 <!--NeedCopy-->

```

### Sample output with no invalid commands but with deprecated commands

The following is a sample output of the configuration having deprecated commands but no invalid commands:

```
1 root@ns# check_invalid_config sample_conf_3.conf
2
3 The following configuration lines have been deprecated in 13.1 and will
 be removed in future releases:
4 [add authentication localPolicy lpol ns_true] command has been
 deprecated, please use the advanced authentication policy command
5 [add authentication certPolicy auth_pol_1 ns_true auth_act] command has
 been deprecated, please use the advanced authentication policy
 command
6 [add authentication negotiatePolicy auth_pol_2 ns_true auth_act]
 command has been deprecated, please use the advanced authentication
 policy command
7 [add authentication tacacsPolicy auth_pol_3 ns_true auth_act] command
 has been deprecated, please use the advanced authentication policy
 command
8 [add authentication samlPolicy auth_pol_4 ns_true auth_act] command has
 been deprecated, please use the advanced authentication policy
 command
9 [add authentication radiusPolicy auth_pol_5 ns_true auth_act] command
 has been deprecated, please use the advanced authentication policy
 command
10 [add authentication ldapPolicy auth_pol_6 ns_true auth_act] command has
 been deprecated, please use the advanced authentication policy
 command
11 [add authentication webAuthPolicy auth_pol_1 -rule ns_true -action
 auth_act] command has been deprecated, please use the advanced
 authentication policy command
12 [add authentication dfaPolicy auth_pol_1 -rule ns_true -action auth_act
] command has been deprecated, please use the advanced
 authentication policy command
13
14 For the complete deprecated commands, please see the output of ./
 deprecated_sample_conf_3.conf file.
15
16 No invalid config detected with the configuration.
17
18 <!--NeedCopy-->
```

### Sample output without validation errors and warnings

The following is a sample output of the configuration file having no invalid, removed, or deprecated commands:

```
1 root@ns# check_invalid_config /var/tmp/new_ns.conf
2 No invalid or deprecated config detected with the configuration.
```

## Classic policy deprecation FAQs

December 21, 2023

- **What are the classic policies deprecated from NetScaler 12.0 release onwards?**

All the features and functionalities mentioned in the [Deprecated policies](#) table are deprecated from NetScaler release 12.0 build 56.20. See the following tables (in PDF format) for deprecated feature and policy details.

- [Table 1](#) for deprecated policies and its alternative.
- [Table 2](#) for deprecated NetScaler functionalities and its alternative with configuration details.

- **How can I convert classic policy based feature and functionalities to Advanced policy?**

You can use the NetScaler proprietary `nspepi` tool to convert commands, expressions, and configurations. `nspepi` tool helps to convert all the classic expressions in the NetScaler configuration to the Advanced policy expressions. For more information about the `nspepi` tool, see [Converting policy expressions using NSPEPI tool](#).

- **From which release are classic policy based features and functionalities deprecated?**

NetScaler 12.0 build 56.20 and later.

- **From which release are the deprecated classic policy based features and functionalities removed from the NetScaler appliance?**

NetScaler version 13.1 onwards. For more information, see [Deprecated policies](#) table.

- **What steps to follow when I upgrade my appliance to a build that does not support the classic policy based features?**

Starting from NetScaler release 13.1, classic policy based features are not supported. Before you upgrade to NetScaler 13.1 or later releases, we recommend you to run the `nspepi` tool to convert the `ns.conf` file. For information about the `nspepi` tool, see [Converting policy expressions using NSPEPI tool](#).

- **How long will the deprecated features be supported on a NetScaler appliance?**

NetScaler will not support the classic policy and its usage in releases later than NetScaler release 13.0.

Classic policy and expressions are deprecated (discouraged from use and NOT removed) starting with 12.0 build 56.20. The policy and expressions continue to work in all places the same way they used to work throughout all builds of release 13.0. However, from NetScaler 13.1 release onwards, certain Classic policy based features and functionalities have been removed.

- **Do I have to reboot my appliance after converting the configuration file?**

Yes, you have to reboot the NetScaler instance after successful conversion of the `ns.config` file.

## Before you proceed

May 2, 2023

Before configuring expressions and policies, be sure you understand the relevant NetScaler feature and the structure of your data, as follows:

- Read the documentation on the relevant feature.
- Look at the data stream for the type of data that you want to configure.

You may want to run a trace on the type of traffic or content that you want to configure. This will give you an idea of the parameters and values, and operations on these parameters and values, that you need to specify in an expression.

**Note:** The NetScaler supports Advanced policy within a feature. You cannot have both types in the same feature. Over the past few releases, some NetScaler features have migrated from using policies and expressions to Advanced policy and expressions. If a feature of interest to you has changed to the Advanced policy format, you may have to manually migrate the older information. Following are guidelines for deciding if you need to migrate your policies:

- If you configured classic policies in a version of the Integrated Caching feature prior to release 9.0 and then upgrade to version 9.0 or later, there is no impact. All legacy policies are migrated to the Advanced policy format.
- For other features, you need to manually migrate classic policies and expressions to the Advanced syntax if the feature has migrated to the Advanced policy.

## Configure advanced policy infrastructure

May 2, 2023

You can create advanced policies for various NetScaler features, including DNS, Rewrite, Responder, and Integrated Caching, and the clientless access function in the NetScaler Gateway. Policies control the behavior of these features.

When you create a policy, you assign it a name, a rule (an expression), feature-specific attributes, and an action that is taken when data matches the policy. After creating the policy, you determine when it is invoked by binding it globally or to either request-time or response-time processing for a virtual server.

Policies that share the same bind point are known as a *policy bank*. For example, all policies that are bound to a virtual server constitute the policy bank for the virtual server. When binding the policy, you assign it a priority level to specify when it is invoked relative to other policies in the bank. In addition to assigning a priority level, you can configure an arbitrary evaluation order for policies in a bank by specifying Goto expressions.

In addition to policy banks that are associated with a built-in bind point or a virtual server, you can configure *policy labels*. A policy label is a policy bank that is identified by an arbitrary name. You invoke a policy label, and the policies in it, from a global or virtual-server-specific policy bank. A policy label or a virtual-server policy bank can be invoked from multiple policy banks.

For some features, you can use the policy manager to configure and bind policies.

## Rules for names in identifiers used in policies

May 2, 2023

The names of identifiers in the named expression, HTTP callout, pattern set, and rate limiting features must begin with an ASCII alphabet or an underscore (\_). The remaining characters can be ASCII alphanumeric characters or underscores (\_).

The names of these identifiers must not begin with the following reserved words:

- The words ALT, TRUE, or FALSE or the Q or S one-character identifier.
- The special-syntax indicator RE (for regular expressions) or XP (for XPath expressions).
- Expression prefixes, which currently are the following:
  - CLIENT
  - EXTEND
  - HTTP
  - SERVER
  - SYS
  - TARGET

- TEXT
- URL
- MYSQL
- MSSQL

Additionally, the names of these identifiers cannot be the same as the names of enumeration constants used in the policy infrastructure. For example, the name of an identifier cannot be IGNORECASE, YEAR, or LATIN2\_CZECH\_CS (a MySQL character set).

**Note:** The NetScaler appliance performs a case-insensitive comparison of identifiers with these words and enumeration constants. For example, names of the identifiers cannot begin with TRUE, True, or true.

## Create or modify a policy

September 21, 2020

All policies have some common elements. Creating a policy consists, at minimum, of naming the policy and configuring a rule. The policy configuration tools for the various features have areas of overlap, but also differences. For the details of configuring a policy for a particular feature, including associating an action with the policy, see the documentation for the feature.

To create a policy, begin by determining the purpose of the policy. For example, you may want to define a policy that identifies HTTP requests for image files, or client requests that contain an SSL certificate. In addition to knowing the type of information that you want the policy to work with, you need to know the format of the data that the policy is analyzing.

Next, determine whether the policy is globally applicable, or if it pertains to a particular virtual server. Also consider the effect that the order in which your policies are evaluated (which will be determined by how you bind the policies) will have on the policy that you are about to configure.

### Create a policy by using the CLI

At the command prompt, type the following commands to create a policy and verify the configuration:

```
1 - add responder|dns|cs|rewrite|cache policy <policyName> -rule <
 expression> [<feature-specific information>]
2
3 - show rewrite policy <name>
4 <!--NeedCopy-->
```

#### Example 1:

```
1 add rewrite policy "pol_remove-ae" true "act_remove-ae"
2 Done
3 > show rewrite policy pol_remove-ae
4 Name: pol_remove-ae
5 Rule: true
6 RewriteAction: act_remove-ae
7 UndefAction: Use Global
8 Hits: 0
9 Undef Hits: 0
10 Bound to: GLOBAL RES_OVERRIDE
11 Priority: 90
12 GotoPriorityExpression: END
13 Done
14 <!--NeedCopy-->
```

### Example 2:

```
1 add cache policy BranchReportsCachePolicy -rule q{
2 http.req.url.query.value("actionoverride").contains("branchReport s")
3 }
4 -action cache
5 Done
6 show cache policy BranchReportsCachePolicy
7 Name: BranchReportsCachePolicy
8 Rule: http.req.url.query.value("actionoverride").contains("
9 branchReports")
10 CacheAction: CACHE
11 Stored in group: DEFAULT
12 UndefAction: Use Global
13 Hits: 0
14 Undef Hits: 0
15 Done
16 <!--NeedCopy-->
```

**Note:** At the command line, quote marks within a policy rule (the expression) must be escaped or delimited with the q delimiter. For more information, see [Configure advanced policy expressions: Get started](#).

### Create or modify a policy by using the GUI

1. In the navigation pane, expand the name of the feature for which you want to configure a policy, and then click **Policies**. For example, you can select **Content Switching, Integrated Caching, DNS, Rewrite, or Responder**.
2. In the details pane, click **Add**, or select an existing policy and click **Open**. A policy configuration dialog box appears.
3. Specify values for the following parameters. (An asterisk indicates a required parameter. For a term in parentheses, see the corresponding parameter in “Parameters for creating or modifying a policy.”)

4. Click **Create**, and then click **Close**.
5. Click **Save**. A policy is added.

Note: After you create a policy, you can view the policy's details by clicking the policy entry in the configuration pane. Details that are highlighted and underlined are links to the corresponding entity (for example, a named expression).

## Policy configuration examples

September 21, 2020

These examples show how policies and their associated actions are entered at the command line interface. In the configuration utility, the expressions would appear in the Expression window of the feature-configuration dialog box for the integrated caching or rewrite feature.

Following is an example of creating a caching policy. Note that actions for caching policies are built in, so you do not need to configure them separately from the policy.

```
1 add cache policy BranchReportsCachePolicy -rule q{
2 http.req.url.query.value("actionoverride").contains("branchReports") }
3 -action cache
4 <!--NeedCopy-->
```

Following is an example of a rewrite policy and action:

```
1 add rewrite action myAction1 INSERT_HTTP_HEADER "myHeader" "
 valueForMyHeader"
2 add rewrite policy myPolicy1 "http.req.url.contains(\"myURLstring\")"
 myAction1
3 <!--NeedCopy-->
```

**Note:** At the command line, quote marks within a policy rule (the expression) must be escaped or delimited with the q delimiter. For more information, see [Configure advanced policy expressions: Get started](#).

## Configure and bind policies with the policy manager

May 2, 2023

### Warning:

Classic policy expressions are no longer supported from NetScaler 12.0 build 56.20 onwards and

as an alternative, Citrix recommends you to use Advanced policies. For more information, see [Advanced Policies](#).

Some applications provide a specialized Policy Manager in the NetScaler configuration utility to simplify configuring policy banks. It also lets you find and delete policies and actions that are not being used.

The Policy Manager is currently available for the Rewrite, Integrated Caching, Responder, and Compression features.

The following are keyboard equivalents for the procedures in this section:

- For editing a cell in the Policy Manager, you can tab to the cell and click F2 or press the SPACE bar on the keyboard.
- To select an entry in a drop-down menu, you can tab to the entry, press the space bar to view the drop-down menu, use the UP and DOWN ARROW keys to navigate to the entry that you want, and press the space bar again to select the entry.
- To cancel a selection in a drop-down menu, press the Escape key.
- To insert a policy, tab to the row above the insertion point and press Control + Insert, or click Insert Policy.
- To remove a policy, tab to the row that contains the policy and press Delete.

**Note:** Note that when you delete the policy, the NetScaler searches the Goto Expression values of other policies in the bank. If any of these Goto Expression values match the priority level of the deleted policy, they are removed.

### Configure policy bindings by using the policy manager

1. In the navigation pane, click the feature for which you want to configure policies. The choices are Responder, Integrated Caching, Rewrite or Compression.
2. In the details pane, click **Policy Manager**.
3. At any time before you complete configuring policy bindings, if you want to configure bindings for policies that use the Advanced Policy click the Switch to Advanced Policy button.
4. For features other than Responder, to specify the bind point, click Request or Response, and then click one of the request-time or response-time bind points. The options are Override Global, LB Virtual Server, CS Virtual Server, Default Global, or Policy Label. If you are configuring the Responder, the Request and Response flow types are not available.
5. To bind a policy to this bind point, click Insert Policy, and select a previously configured policy, a NOPOLICY label, or the New policy option. Depending on the option that you select, you have the following choices:

- **New policy:** Create the policy as described in “[Create or modify a policy](#),” and then configure the priority level, GoTo expression, and policy invocation as described in the table, “[Format of each entry in a policy bank](#).”
  - **Existing policy, NOPOLICY, or NOPOLICY\<feature name\>:** Configure the priority level, GoTo expression, and policy invocation as described in the table, “[Format of each entry in a policy bank](#).” The **NOPOLICY** or **NOPOLICY\<feature name\>** options are available only for policies that use Advanced Policies.
6. Repeat the preceding steps to add entries to this policy bank.
  7. To modify the priority level for an entry, you can do any of the following:
    - Double-click the Priority field for an entry and edit the value.
    - Click and drag a policy to another row in the table.
    - Click Regenerate Priorities.
- In all three cases, priority levels of all other policies are modified as needed to accommodate the new value. Goto Expressions with integer values are also updated automatically. For example, if you change a priority value of 10 to 100, all policies with a Goto Expression value of 10 are updated to the value 100.
8. To change the policy, action, or policy bank invocation for an row in the table, click the down arrow to the right of the entry and do one of the following:
    - To change the policy, select another policy name or select New Policy and follow the steps in [Create or modify a policy](#).
    - To change the Goto Expression, select Next, End, USE\_INVOCATION\_RESULT, or select more and enter an expression whose result returns the priority level of another entry in this policy bank.
    - To modify an invocation, select an existing policy bank, or click New Policy Label and follow the steps in [Bind a policy to a policy label](#).
  9. To unbind a policy or a policy label invocation from this bank, click any field in the row that contains the policy or policy label, and then click Unbind Policy.
  10. When you are done, click Apply Changes. A message in the status bar indicates that the policy is bound successfully.

### Remove unused policies by using the policy manager

1. In the navigation pane, click the feature for which you want to configure the policy bank. The choices are Responder, Integrated Caching, or Rewrite.
2. In the details pane, click <Feature Name> policy manager.
3. In the **Feature Name > Policy Manager** dialog box, click **Cleanup Configuration**.

4. In the **Cleanup Configuration** dialog box, select the items that you want to delete, and then click **Remove**.
5. In the Remove dialog box, click **Yes**.
6. Click **Close**. A message in the status bar indicates that the policy is removed successfully.

## Unbind a policy

January 4, 2021

If you want to re-assign a policy or delete it, you must first remove its binding.

### Unbind an integrated caching, rewrite, or compression advanced policy globally by using the CLI

At the command prompt, type the following commands to unbind an integrated caching, rewrite, or compression Advanced policy globally and verify the configuration:

```
1 - unbind cache|rewrite|cmp global <policyName> [-type req_override|
 req_default|res_override|res_default] [-priority <positiveInteger>]
2
3 - show cache|rewrite|cmp global
4 <!--NeedCopy-->
```

#### Example:

```
1 > unbind cache global_nonPostReq
2 Done
3 > show cache global
4 1) Global bindpoint: REQ_DEFAULT
5 Number of bound policies: 1
6
7 2) Global bindpoint: RES_DEFAULT
8 Number of bound policies: 1
9
10 Done
11 <!--NeedCopy-->
```

The priority is required only for the “dummy” policy named NOPOLICY.

### Unbind a responder policy globally by using the CLI

At the command prompt, type the following commands to unbind a responder policy globally and verify the configuration:

```

1 - unbind responder global <policyName> [-type override|default] [-
 priority <positiveInteger>]
2
3 - show responder global
4 <!--NeedCopy-->

```

**Example:**

```

1 > unbind responder global pol404Error
2 Done
3 > show responder global
4 1) Global bindpoint: REQ_DEFAULT
5 Number of bound policies: 1
6 Done
7 <!--NeedCopy-->

```

The priority is required only for the “dummy” policy named NOPOLICY.

**Unbind a DNS policy globally by using the CLI**

At the command prompt, type the following commands to unbind a DNS policy globally and verify the configuration:

```

1 - unbind responder global <policyName>
2
3 - unbind responder global
4 <!--NeedCopy-->

```

**Example:**

```

1 unbind dns global dfgdfg
2 Done
3 show dns global
4 Policy name : dfgdfggfgh
5 Priority : 100
6 Goto expression : END
7 Done
8 <!--NeedCopy-->

```

**Unbind an advanced policy from a virtual server by using the CLI**

At the command prompt, type the following commands to unbind an Advanced policy from a virtual server and verify the configuration:

```

1 - unbind cs vserver <name> -policyName <policyName> [-priority <
 positiveInteger>] [-type REQUEST|RESPONSE]
2
3 - show lb vserver <name>

```

```
4 <!--NeedCopy-->
```

**Example:**

```
1 unbind cs vserver vs-cont-switch -policyName pol1
2 Done
3 > show cs vserver vs-cont-switch
4 vs-cont-switch (10.102.29.10:80) - HTTP Type: CONTENT
5 State: UP
6 Last state change was at Wed Aug 19 08:56:55 2009 (+18 ms)
7 Time since last state change: 0 days, 02:47:55.750
8 Client Idle Timeout: 180 sec
9 Down state flush: ENABLED
10 Disable Primary Vserver On Down : DISABLED
11 Port Rewrite : DISABLED
12 State Update: DISABLED
13 Default: Content Precedence: RULE
14 Vserver IP and Port insertion: OFF
15 Case Sensitivity: ON
16 Push: DISABLED Push VServer:
17 Push Label Rule: none
18 Done
19 <!--NeedCopy-->
```

The priority is required only for the “dummy” policy named NOPOLICY.

### Unbind an integrated caching, responder, rewrite, or compression Advanced policy globally by using the GUI

1. In the navigation pane, click the feature with the policy that you want to unbind (for example, Integrated Caching).
2. In the details pane, click <Feature Name> policy manager.
3. In the **Policy Manager** dialog box, select the bind point with the policy that you want to unbind, for example, Advanced Global.
4. Click the policy name that you want to unbind, and then click Unbind Policy.
5. Click **Apply Changes**.
6. Click **Close**. A message in the status bar indicates that the policy is unbound successfully.

### Unbind a DNS policy globally by using the GUI

1. Navigate to **Traffic Management > DNS > Policies**.
2. In the details pane, click **Global Bindings**.
3. In the **Global Bindings** dialog box, select policy and click **unbind policy**.
4. Click **OK**. A message in the status bar indicates that the policy is unbound successfully.

## Unbind an advanced policy from a load balancing or content switching virtual server by using the GUI

1. Navigate to **Traffic Management**, and expand Load Balancing or Content Switching, and then click **Virtual Servers**.
2. In the details pane, double-click the virtual server from which you want to unbind the policy.
3. On the **Policies** tab, in the **Active** column, clear the check box next to the policy that you want to unbind.
4. Click **OK**. A message in the status bar indicates that the policy is unbound successfully.

## Create policy labels

October 31, 2023

In addition to the built-in bind points where you set up policy banks, you can also configure user-defined policy labels and associate policies with them.

Within a policy label, you bind policies and specify the order of evaluation of each policy relative to others in the bank of policies for the policy label. The NetScaler also permits you to define an arbitrary evaluation order as follows:

- You can use “goto” expressions to point to the next entry in the bank to be evaluated after the current one.
- You can use an entry in a policy bank to invoke another bank.

Each feature determines the type of policy that you can bind to a policy label, the type of load balancing virtual server that you can bind the label to, and the type of content switching virtual server from which the label can be invoked. For example, a TCP policy label can only be bound to a TCP load balancing virtual server. You cannot bind HTTP policies to a policy label of this type. And you can invoke a TCP policy label only from a TCP content switching virtual server.

After configuring a new policy label, you can invoke it from one or more banks for the built-in bind points.

## Create a caching policy label by using the CLI

At the command prompt, type the following commands to create a Caching policy label and verify the configuration:

```
1 - add cache policylabel <labelName> -evaluates req|res
2
```

```
3 - show cache policylabel<labelName>
4 <!--NeedCopy-->
```

**Example:**

```
1 > add cache policylabel lbl-cache-pol -evaluates req
2 Done
3
4 > show cache policylabel lbl-cache-pol
5 Label Name: lbl-cache-pol
6 Evaluates: REQ
7 Number of bound policies: 0
8 Number of times invoked: 0
9 Done
10 <!--NeedCopy-->
```

**Create a content switching policy label by using the CLI**

At the command prompt, type the following commands to create a Content Switching policy label and verify the configuration:

```
1 - add cs policylabel <labelName> http|tcp|rtsp|ssl
2
3 - show cs policylabel <labelName>
4 <!--NeedCopy-->
```

**Example:**

```
1 > add cs policylabel lbl-cs-pol http
2 Done
3 > show cs policylabel lbl-cs-pol
4 Label Name: lbl-cs-pol
5 Label Type: HTTP
6 Number of bound policies: 0
7 Number of times invoked: 0
8 Done
9 <!--NeedCopy-->
```

**Create a rewrite policy label by using the CLI**

At the command prompt, type the following commands to create a Rewrite policy label and verify the configuration:

```
1 - add rewrite policylabel <labelName> http_req|http_res|url|text|
 clientless_vpn_req|clientless_vpn_res
2
3 - show rewrite policylabel <labelName>
4 <!--NeedCopy-->
```

**Example:**

```
1 > add rewrite policylabel lbl-rewrt-pol http_req
2 Done
3
4 > show rewrite policylabel lbl-rewrt-pol
5 Label Name: lbl-rewrt-pol
6 Transform Name: http_req
7 Number of bound policies: 0
8 Number of times invoked: 0
9 Done
10 <!--NeedCopy-->
```

**Create a responder policy label by using the CLI**

At the command prompt, type the following commands to create a Responder policy label and verify the configuration:

```
1 - add responder policylabel <labelName>
2
3 - show responder policylabel <labelName>
4 <!--NeedCopy-->
```

**Example:**

```
1 > add responder policylabel lbl-respndr-pol
2 Done
3
4 > show responder policylabel lbl-respndr-pol
5 Label Name: lbl-respndr-pol
6 Number of bound policies: 0
7 Number of times invoked: 0
8 Done
9 <!--NeedCopy-->
```

**Note:** Invoke this policy label from a policy bank. For more information, see the “Binding a Policy to a Policy Label” section.

**Create a policy label by using the GUI**

1. In the navigation pane, expand the feature for which you want to create a policy label, and then click **Policy Labels**. For example, to create a rewrite policy label, navigate to **AppExpert > Rewrite** and then click **Policy Labels**.
2. In the details pane, click **Add**.
3. In the Name box, enter a unique name for this policy label.
4. Enter feature-specific information for the policy label. For example, for rewrite policy label specific information, see [Configure a rewrite policy label](#).

5. Click **Create**.
6. Configure one of the built-in policy banks to invoke this policy label. For more information, see the Binding a Policy to a Policy Label section. A message in the status bar indicates that the policy label is created successfully.

For more examples on creating a policy label, see the following:

- [Create an authentication policy label](#)
- [Configure content switching policy labels](#)
- [Configure a policy label in an integrated cache](#)

## Bind a policy to a policy label

As with policy banks that are bound to the built-in bind points, each entry in a policy label is a policy that is bound to the policy label. As with policies that are bound globally or to a vserver, each policy that is bound to the policy label can also invoke a policy bank or a policy label that is evaluated after the current entry has been processed. The following table summarizes the entries in a policy label.

- **Name.** The name of a policy, or, to invoke another policy bank without evaluating a policy, the “dummy” policy name NOPOLICY.

You can specify NOPOLICY more than once in a policy bank, but you can specify a named policy only once.

- **Priority.** An integer. This setting can work with the Goto expression.
- **Goto Expression.** Determines the next policy to evaluate in this bank. You can provide one of the following values:
  - **NEXT.** Go to the policy with the next higher priority.
  - **END.** Stop evaluation.
  - **USE\_INVOCATION\_RESULT.** Applicable if this entry invokes another policy bank. If the final Goto in the invoked bank has a value of END, evaluation stops. If the final Goto is anything other than END, the current policy bank performs a NEXT.
  - **Positive number:** The priority number of the next policy to be evaluated.
  - **Numeric expression.** An expression that produces the priority number of the next policy to be evaluated.

The Goto can only proceed forward in a policy bank.

If you omit the Goto expression, it is the same as specifying END.

- **Invocation Type.** Designates a policy bank type. The value can be one of the following:
  - **Request Vserver.** Invokes request-time policies that are associated with a virtual server.

- **Response Vserver.** Invokes response-time policies that are associated with a virtual server.
- **Policy label.** Invokes another policy bank, as identified by the policy label for the bank.
- **Invocation Name.** The name of a virtual server or a policy label, depending on the value that you specified for the Invocation Type.

## Configure a policy label or virtual server policy bank

May 2, 2023

After you have created policies, and created policy banks by binding the policies, you can perform additional configuration of policies within a label or policy bank. For example, before you configure invocation of an external policy bank, you might want to wait until you have configured that policy bank.

This topic includes the following sections:

- Configure a policy label
- Configure a policy bank for a virtual server

### Configure a policy label

A policy label consists of a set of policies and invocations of other policy labels and virtual server-specific policy banks. An Invoke parameter enables you to invoke a policy label or a virtual server-specific policy bank from any other policy bank. A special-purpose NoPolicy entry enables you to invoke an external bank without processing an expression (a rule). The NoPolicy entry is a “dummy” policy that does not contain a rule.

For configuring policy labels from the NetScaler command line, note the following elaborations of the command syntax:

- gotoPriorityExpression is configured as described in Table 2. Format of Each Entry in a Policy Bank of the section “Entries in a Policy Bank” in [Bind policies using advanced policy](#).
- The type argument is required. This is unlike binding a conventional policy, where this argument is optional.
- You can invoke the bank of policies that are bound to a virtual server by using the same method as you use for invoking a policy label.

### Configure a policy label by using the CLI

At the command prompt, type the following commands to configure a policy label and verify the configuration:

```

1 - bind cache|rewrite|responder policylabel <policylabelName> -
 policyName <policyName> -priority <priority> [-
 gotoPriorityExpression <gotopriorityExpression>] [-invoke reqvserver
 |resvserver|policylabel <policyLabelName>|<vserverName>]
2
3 - show cache|rewrite|responder policylabel <policylabelName>
4 <!--NeedCopy-->

```

#### Example:

```

1 bind cache policylabel _reqBuiltinDefaults -policyName _nonGetReq -
 priority 100
2 Done
3 show cache policylabel _reqBuiltinDefaults
4 Label Name: _reqBuiltinDefaults
5 Evaluates: REQ
6 Number of bound policies: 3
7 Number of times invoked: 0
8 1) Policy Name: _nonGetReq
9 Priority: 100
10 GotoPriorityExpression: END
11 2) Policy Name: _advancedConditionalReq
12 Priority: 200
13 GotoPriorityExpression: END
14
15 3) Policy Name: _personalizedReq
16 Priority: 300
17 GotoPriorityExpression: END
18 Done
19 <!--NeedCopy-->

```

### Invoke a policy label from a rewrite policy bank with a NOPOLICY entry by using the CLI

At the command prompt, type the following commands to invoke a policy label from a Rewrite policy bank with a NOPOLICY entry and verify the configuration:

```

1 - bind rewrite global <policyName> <priority> <gotoPriorityExpression>
 -type REQ_OVERRIDE|REQ_DEFAULT|RES_OVERRIDE|RES_DEFAULT -invoke
 reqvserver|resvserver|policylabel <policyLabelName>|<vserverName>
2
3 - show rewrite global
4 <!--NeedCopy-->

```

#### Example:

```

1 > bind rewrite global NOPOLICY 100 -type REQ_DEFAULT -invoke
 policylabel lbl-rewrt-pol
2 Done
3 > show rewrite global
4 1) Global bindpoint: REQ_DEFAULT
5 Number of bound policies: 1
6
7 2) Global bindpoint: REQ_OVERRIDE
8 Number of bound policies: 1
9 Done
10 <!--NeedCopy-->

```

### Invoke a policy label from an Integrated Caching policy bank by using the CLI

At the command prompt, type the following commands to invoke a policy label from an Integrated Caching policy bank and verify the configuration:

```

1 - bind cache global NOPOLICY -priority <priority> -
 gotoPriorityExpression <gotopriorityExpression> -type REQ_OVERRIDE|
 REQ_DEFAULT|RES_OVERRIDE|RES_DEFAULT -invoke reqvserver|resvserver|
 policylabel <policyLabelName>|<vserverName>
2
3 - show cache global
4 <!--NeedCopy-->

```

#### Example:

```

1 bind cache global NOPOLICY -priority 100 -gotoPriorityExpression END -
 type REQ_DEFAULT -invoke policylabel lbl-cache-pol
2 Done
3 > show cache global
4 1) Global bindpoint: REQ_DEFAULT
5 Number of bound policies: 2
6
7 2) Global bindpoint: RES_DEFAULT
8 Number of bound policies: 1
9
10 Done
11 <!--NeedCopy-->

```

### Invoke a policy label from a Responder policy bank by using the CLI

At the command prompt, type the following commands to invoke a policy label from a Responder policy bank and verify the configuration:

```

1 - bind responder global NOPOLICY <priority> <gotopriorityExpression> -
 type OVERRIDE|DEFAULT -invoke vserver|policylabel <policyLabelName>
 >|<vserverName>
2

```

```
3 - show responder global
4 <!--NeedCopy-->
```

**Example:**

```
1 > bind responder global NOPOLICY 100 NEXT -type DEFAULT -invoke
 policylabel lbl-respndr-pol
2 Done
3 > show responder global
4 1) Global bindpoint: REQ_DEFAULT
5 Number of bound policies: 2
6
7 Done
8 <!--NeedCopy-->
```

**Configure a policy label by using the GUI**

1. In the navigation pane, expand the feature for which you want to configure a policy label, and then click Policy Labels. The choices are Integrated Caching, Rewrite, or Responder.
2. In the details pane, double-click the label that you want to configure.
3. If you are adding a new policy to this policy label, click Insert Policy, and in the Policy Name field, select New Policy. For more information about adding a policy, see [Create or modify a policy](#). Note that if you are invoking a policy bank, and do not want a rule to be evaluated prior to the invocation, click Insert Policy, and in the Policy Name field select NOPOLICY.
4. For each entry in this policy label, configure the following:

- **Policy Name:**

This is already determined by the Policy Name, new policy, or NOPOLICY entry that you inserted in this bank.

- **Priority:**

A numeric value that determines either an absolute order of evaluation within the bank, or is used in conjunction with a Goto expression.

- **Expression:**

The policy rule. Policy expressions are described in detail in the following chapters. For an introduction, see [Configure advanced policy expressions: Get started](#).

- **Action:**

The action to be taken if this policy evaluates to TRUE.

- **Goto Expression:**

Optional. Used to augment the Priority level to determine the next policy or policy bank to evaluate. For more information on possible values for a Goto expression, see Table 2. Format of Each Entry in a Policy Bank of the section “Entries in a Policy Bank” in [Bind policies using advanced policy](#).

- **Invoke:**

Optional. Invokes another policy bank.

5. Click **OK**. A message in the status bar indicates that the policy label is configured successfully.

## Configure a policy bank for a virtual server

You can configure a bank of policies for a virtual server. The policy bank can contain individual policies, and each entry in the policy bank can optionally invoke a policy label or a bank of policies that you configured for another virtual server. If you invoke a policy label or policy bank, you can do so without triggering an expression (a rule) by selecting a NOPOLICY “dummy” entry instead of a policy name.

### Add policies to a virtual server policy bank by using the CLI

At the command prompt, type the following commands to add policies to a virtual server policy bank and verify the configuration:

```

1 - bind lb|cs vserver <virtualServerName> <serviceType> [-policyName <
 policyName>] [-priority <positiveInteger>] [-gotoPriorityExpression
 <expression>] [-type REQUEST|RESPONSE]
2
3 - show lb|cs vserver <virtualServerName>
4 <!--NeedCopy-->
```

### Example:

```

1 add lb vserver vs-cont-sw TCP
2 Done
3 show lb vserver vs-cont-sw
4 vs-cont-sw (0.0.0.0:0) - TCP Type: ADDRESS
5 State: DOWN
6 Last state change was at Wed Aug 19 10:04:02 2009 (+279 ms)
7 Time since last state change: 0 days, 00:02:14.420
8 Effective State: DOWN
9 Client Idle Timeout: 9000 sec
10 Down state flush: ENABLED
11 Disable Primary Vserver On Down : DISABLED
12 No. of Bound Services : 0 (Total) 0 (Active)
13 Configured Method: LEASTCONNECTION
14 Mode: IP
15 Persistence: NONE
16 Connection Failover: DISABLED
```

```
17 Done
18 <!--NeedCopy-->
```

### Invoke a policy label from a virtual server policy bank with a NOPOLICY entry by using the CLI

At the command prompt, type the following commands to invoke a policy label from a virtual server policy bank with a NOPOLICY entry and verify the configuration:

```
1 - bind lb|cs vserver <virtualServerName> -policyName NOPOLICY-REWRITE|
 NOPOLICY-CACHE|NOPOLICY-RESPONDER -priority <integer> -type REQUEST|
 RESPONSE -gotoPriorityExpression <gotopriorityExpression> -invoke
 reqVserver|resVserver|policyLabel <vserverName>|<labelName>
2
3 - show lb vserver
4 <!--NeedCopy-->
```

#### Example:

```
1 > bind lb vserver vs-cont-sw -policyname NOPOLICY-REWRITE -priority 200
 -type REQUEST -gotoPriorityExpression NEXT -invoke policyLabel lbl-
 rewrt-pol
2 Done
3 <!--NeedCopy-->
```

### Configure a virtual server policy bank by using the GUI

1. In the left navigation pane, expand **Traffic Management > Load Balancing, Traffic Management > Content Switching, Traffic Management > SSL Offload, Security > AAA - Application Traffic**, or **NetScaler Gateway**, as appropriate, and then click **Virtual Servers**.
2. In the details pane, select the virtual server that you want to configure, and then click **Open**.
3. In the **Configure Virtual Server** dialog box click the **Policies** tab.
4. To create a new policy in this bank, click the icon for the type of policy or policy label that you want to add to the virtual server's bank of policies, click **Insert Policy**. Note that if you want to invoke a policy label without evaluating a policy rule, select the NOPOLICY "dummy" policy.
5. To configure an existing entry in this policy bank, enter the following:

- **Priority:**

A numeric value that determines either an absolute order of evaluation within the bank or is used in conjunction with a Goto expression.

- **Expression:**

The policy rule. Policy expressions are described in detail in the following chapters. For an introduction, see [Configuring Advanced Policy Expressions: Getting Started](#).

- **Action:**

The action to be taken if this policy evaluates to TRUE.

- **Goto Expression:**

Optional. Determines the next policy or policy bank evaluate. For more information on possible values for a Goto expression, see the section “Entries in a Policy Bank” in [Bind policies using advanced policy](#).

- **Invoke:**

Optional. To invoke another policy bank, select the name of the policy label or virtual server policy bank that you want to invoke.

6. Click **OK**. A message in the status bar indicates that the policy is configured successfully.

## Invoke or remove a policy label or virtual server policy bank

March 2, 2023

Unlike a policy, which can only be bound once, you can use a policy label or a virtual server’s policy bank any number of times by invoking it. Invocation can be performed from two places:

- From the binding for a named policy in a policy bank.
- From the binding for a NOPOLICY “dummy” entry in a policy bank.

Typically, the policy label must be of the same type as the policy from which it is invoked. For example, you would invoke a responder policy label from a responder policy.

Note: When binding or unbinding a global NOPOLICY entry in a policy bank at the command line, you specify a priority to distinguish one NOPOLICY entry from another.

### Invoke a rewrite or integrated caching policy label by using the CLI

At the command prompt, type the one of the following commands to invoke a rewrite or integrated caching policy label and verify the configuration:

```
1 - bind cache global <policy> -priority <positive_integer> [-
 gotoPriorityExpression <expression>] -type REQ_OVERRIDE|REQ_DEFAULT|
 RES_OVERRIDE|RES_DEFAULT] -invoke reqvserver|resvserver|policylabel
 <label_name>
2
```

```

3 - bind rewrite global<policy> -priority <positive_integer> [-
 gotoPriorityExpression <expression>] -type REQ_OVERRIDE|REQ_DEFAULT|
 RES_OVERRIDE|RES_DEFAULT] -invoke reqvserver|resvserver|policylabel
 <label_name>
4
5 - show cache global|show rewrite global
6 <!--NeedCopy-->

```

**Example:**

```

1 > bind cache global _nonPostReq2 -priority 100 -type req_override -
 invoke
2 policylabel lbl-cache-pol
3 Done
4 > show cache global
5 1) Global bindpoint: REQ_DEFAULT
6 Number of bound policies: 2
7
8 2) Global bindpoint: RES_DEFAULT
9 Number of bound policies: 1
10
11 3) Global bindpoint: REQ_OVERRIDE
12 Number of bound policies: 1
13
14 Done
15 <!--NeedCopy-->

```

**Invoke a responder policy label by using the CLI**

At the command prompt, type the following commands to invoke a responder policy label and verify the configuration:

```

1 - bind responder global <policy_Name> <priority_as_positive_integer>
 [<gotoPriorityExpression>] -type REQ_OVERRIDE|REQ_DEFAULT|OVERRIDE|
 DEFAULT -invoke vserver|policylabel <label_name>
2
3 - show responder global
4 <!--NeedCopy-->

```

**Example:**

```

1 > bind responder global pol404Error1 300 -invoke policylabel lbl-
 respndr-pol
2 Done
3 > show responder global
4 1) Global bindpoint: REQ_DEFAULT
5 Number of bound policies: 2
6
7 Done
8 <!--NeedCopy-->

```

## Invoke a virtual server policy bank by using the CLI

At the command prompt, type the following commands to invoke a Virtual Server Policy Bank and verify the configuration:

```

1 - bind lb vserver <vserver_name> -policyName <policy_Name> -priority <
 positive_integer> [-gotoPriorityExpression <expression>] -type
 REQUEST|RESPONSE -invoke reqvserver|resvserver|policylabel <
 policy_Label_Name>
2
3 - bind lb vserver <vserver_name>
4 <!--NeedCopy-->

```

### Example:

```

1 > bind lb vserver lbvip -policyName ns_cmp_msapp -priority 100
2 Done
3
4 > show lb vserver lbvip
5 lbvip (8.7.6.6:80) - HTTP Type: ADDRESS
6 State: DOWN
7 Last state change was at Wed Jul 15 05:54:24 2009 (+166 ms)
8 Time since last state change: 28 days, 06:37:49.250
9 Effective State: DOWN

```

**Invoke a policy label or virtual server policy bank by using the GUI**

1. Bind a policy, as described in [Bind a policy globally](#), [Bind a policy to a virtual server](#), or [Bind a policy to a policy label](#). Alternatively, you can enter a NOPOLICY “dummy” entry instead of a policy name. You do this if you do not want to evaluate a policy before evaluating the policy bank.
2. In the Invoke field, select the name of the policy label or virtual server policy bank that you want to evaluate if traffic matches the bound policy. A message in the status bar indicates that the

policy label or virtual server policy bank is invoked successfully.

## **Remove a policy label invocation by using the GUI**

1. Open the policy and clear the Invoke field. Unbinding the policy also removes the invocation of the label. A message in the status bar indicates that the policy label is removed successfully.

## **Configure advanced policy expression: Getting started**

December 22, 2023

Advanced policies evaluate data based on information that you supply in Advanced policy expressions. An Advanced policy expression analyzes data elements (for example, HTTP headers, source IP addresses, the NetScaler system time, and POST body data). In addition to configuring an Advanced policy expression in a policy, in some NetScaler features, you configure Advanced policy expression outside of the context of a policy.

To create an Advanced policy expression, you select a prefix that identifies a piece of data that you want to analyze, and then you specify an operation to perform on the data. For example, an operation can match a piece of data with a text string that you specify, or it can transform a text string into an HTTP header. Other operations match a returned string with a set of strings or a string pattern. You configure compound expressions by specifying Boolean and arithmetic operators, and by using parentheses to control the order of evaluation.

Advanced policy expression can also contain classic expressions. You can assign a name to a frequently used expression to avoid having to build the expression repeatedly.

Policies and a few other entities include rules that the NetScaler uses to evaluate a packet in the traffic flowing through it, to extract data from the NetScaler system itself, to send a request (a “callout”) to an external application, or to analyze another piece of data. A rule takes the form of a logical expression that is compared against traffic and ultimately returns values of TRUE or FALSE.

The elements of the rule can themselves return TRUE or FALSE, string, or numeric values.

Before configuring an Advanced policy expression, you need to understand the characteristics of the data that the policy or other entity is to evaluate. For example, when working with the Integrated Caching feature, a policy determines what data can be stored in the cache. With Integrated Caching, you need to know the URLs, headers, and other data in the HTTP requests and responses that the NetScaler receives. With this knowledge, you can configure policies that match the actual data and enable the NetScaler to manage caching for HTTP traffic. This information helps you determine the type of expression that you need to configure in the policy.

## Basic elements of an advanced policy expression

May 2, 2023

An Advanced policy expression consists of, at a minimum, a prefix (or a single element used in place of a prefix). Most expressions also specify an operation to be performed on the data that the prefix identifies. You format an expression of up to 1,499 characters as follows:

```
<prefix>.<operation> [<compound-operator> <prefix>.<operation>. . .]
```

where

- <prefix>

is an anchor point for starting an expression.

The prefix is a period-delimited key that identifies a unit of data. For example, the following prefix examines HTTP requests for the presence of a header named Content-Type:

```
http.req.header("Content-Type")
```

Prefixes can also be used on their own to return the value of the object that the prefix identifies.

- <operation>

identifies an evaluation that is to be performed on the data identified by the prefix.

For example, consider the following expression:

```
http.req.header("Content-Type").eq("text/html")
```

In this expression, the following is the operator component:

```
eq("text/html")
```

This operator causes the NetScaler to evaluate any HTTP requests that contain a Content-Type header, and in particular, to determine if the value of this header is equal to the string "text/html." For more information, see "Operations."

- <compound-operator>

is a Boolean or arithmetic operator that forms a compound expression from multiple prefix or prefix.operation elements.

For example, consider the following expression:

```
http.req.header("Content-Type").eq("text/html") && http.req.url.contains(".html")
```

## Prefixes

An expression prefix represents a discrete piece of data. For example, an expression prefix can represent an HTTP URL, an HTTP Cookie header, or a string in the body of an HTTP POST request. An expression prefix can identify and return a wide variety of data types, including the following:

- A client IP address in a TCP/IP packet
- NetScaler system time
- An external callout over HTTP
- A TCP or UDP record type

In most cases, an expression prefix begins with one of the following keywords:

- CLIENT:
  - Identifies a characteristic of the client that is either sending a request or receiving a response, as in the following examples:
    - The prefix `client.ip.dst` designates the destination IP address in the request or response.
    - The prefix `client.ip.src` designates the source IP address.
- HTTP:
  - Identifies an element in an HTTP request or a response, as in the following examples:
    - The prefix `http.req.body(integer)` designates the body of the HTTP request as a multiline text object, up to the character position designated in integer.
    - The prefix `http.req.header("header_name")` designates an HTTP header, as specified in `header_name`.
    - The prefix `http.req.url` designates an HTTP URL in URL-encoded format.
- SERVER:

Identifies an element in the server that is either processing a request or sending a response.
- SYS:

Identifies a characteristic of the NetScaler that is processing the traffic.

**Note:** Note that DNS policies support only SYS, CLIENT, and SERVER objects.

In addition, in the NetScaler Gateway, the Clientless VPN function can use the following types of prefixes:

- TEXT:

Identifies any text element in a request or a response.
- TARGET:

Identifies the target of a connection.

- URL:

Identifies an element in the URL portion of an HTTP request or response.

As a general rule of thumb, any expression prefix can be a self-contained expression. For example, the following prefix is a complete expression that returns the contents of the HTTP header specified in the string argument (enclosed in quotation marks):

```
http.res.header.("myheader")
```

Or you can combine prefixes with simple operations to determine TRUE and FALSE values. For example, the following returns a value of TRUE or FALSE:

```
http.res.header.("myheader").exists
```

You can also use complex operations on individual prefixes and multiple prefixes within an expression, as in the following example:

```
http.req.url.length + http.req.cookie.length <= 500
```

Which expression prefixes you can specify depends on the NetScaler feature. The following table describes the expression prefixes that are of interest on a per-feature basis

| Feature                              | Types of Expression Prefix Used in the Feature    |
|--------------------------------------|---------------------------------------------------|
| DNS                                  | SYS, CLIENT, SERVER                               |
| Responder in Protection Features     | HTTP, SYS, CLIENT                                 |
| Content Switching                    | HTTP, SYS, CLIENT                                 |
| Rewrite                              | HTTP, SYS, CLIENT, SERVER, URL, TEXT, TARGET, VPN |
| Integrated Caching                   | HTTP, SYS, CLIENT, SERVER                         |
| NetScaler Gateway, Clientless Access | HTTP, SYS, CLIENT, SERVER, URL, TEXT, TARGET, VPN |

Table 1. Permitted Types of Expression Prefixes in Various NetScaler Features

**Note:** For details on the permitted expression prefixes in a feature, see the documentation for that feature.

### Single-element expressions

The simplest type of Advanced policy expression contains a single element. This element can be one of the following:

- true. An Advanced policy expression can consist simply of the value true. This type of expression always returns a value of TRUE. It is useful for chaining policy actions and triggering Goto expressions.
- false. An Advanced policy expression can consist simply of the value false. This type of expression always returns a value of FALSE.
- A prefix for a compound expression. For example, the prefix HTTP.REQ.HOSTNAME is a complete expression that returns a host name and HTTP.REQ.URL is a complete expression that returns a URL. The prefix could also be used in conjunction with operations and additional prefixes to form a compound expression.

## Operations

In most expressions, you also specify an operation on the data that the prefix identifies. For example, suppose that you specify the following prefix:

```
http.req.url
```

This prefix extracts URLs in HTTP requests. This expression prefix does not require any operators to be used in an expression. However, when you configure an expression that processes HTTP request URLs, you can specify operations that analyze particular characteristics of the URL. Following are a few possibilities:

- Search for a particular host name in the URL.
- Search for a particular path in the URL.
- Evaluate the length of the URL.
- Search for a string in the URL that indicates a time stamp and convert it to GMT.

The following is an example of a prefix that identifies an HTTP header named Server and an operation that searches for the string IIS in the header value:

```
http.res.header("Server").contains("IIS")
```

Following is an example of a prefix that identifies host names and an operation that searches for the string “www.mycompany.com” as the value of the name:

```
http.req.hostname.eq("www.mycompany.com")
```

## Basic operations on expression prefixes

The following table describes a few of the basic operations that can be performed on expression prefixes.

| Operation  | Determines Whether or Not                                                                                          |
|------------|--------------------------------------------------------------------------------------------------------------------|
| CONTAINS() | The object matches . Following is an example:<br>http.req.header("Cache-Control").contains("no-cache")             |
| EXISTS     | A particular item is present in an object.<br>Following is an example: http.res.header("MyHdr").exists             |
| EQ()       | A particular non-numeric value is present in an object. Following is an example:<br>http.req.method.eq(post)       |
| EQ()       | A particular numeric value is present in an object.<br>Following is an example:<br>client.ip.dst.eq(10.100.10.100) |
| LT()       | An object's value is less than a particular value.<br>Following is an example:<br>http.req.content_length.lt(5000) |
| GT()       | An object's value is greater than a particular value. Following is an example:<br>http.req.content_length.gt(5)    |

The following table summarizes a few of the available types of operations.

| Operation Type  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Text operations | Match individual strings and sets of strings with any portion of a target. The target can be an entire string, the start of a string, or any portion of text in between the start and the end of the string. For example, you can extract the string "XYZ" from "XYZSomeText". Or, you can compare an HTTP header value with an array of different strings. You can also transform text into another type of data. Following are examples: Transform a string into an integer value, create a list from the query strings in a URL, and transform a string into a time value. |

| Operation Type     | Description                                                                                                                                         |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| Numeric operations | Numeric operations include applying arithmetic operators, evaluating content length, the number of items in a list, dates, times, and IP addresses. |

## Compound advanced policy expressions

May 2, 2023

You can configure an Advanced policy expression with boolean or arithmetic operators and atomic operations. The following compound expression has a boolean AND:

```
http.req.hostname.eq("mycompany.com") && http.req.method.eq(post)
```

The following expression adds the value of two targets, and compares the result to a third value:

```
http.req.url.length + http.req.cookie.length \<= 500
```

A compound expression can have any number of logical and arithmetic operators.

The following expression evaluates the length of an HTTP request. This expression is based on the URL and cookie.

This expression evaluates the text in the header. Also, does a Boolean AND on these two results:

```
http.req.url.length + http.req.cookie.length \<= 500 && http.req.
header.contains("some text")
```

You can use parentheses to control the order of evaluation in a compound expression.

### Booleans in compound expressions

You configure compound expressions with the following operators:

- &&.

This operator is a logical AND. For the expression to evaluate to TRUE, all components must evaluate to TRUE.

Example:

```
http.req.url.hostname.eq("myHost") && http.req.header("myHeader").exists
```

- `||`.

This operator is a logical OR. If any component of the expression evaluates to TRUE, the entire expression is TRUE.

- `!`.

P Does a logical NOT on the expression.

Sometimes, the NetScaler configuration utility offers AND, NOT, and OR operators in the **Add Expression** dialog box. However, these compound expressions are of limited use. Citrix recommends that you use the operators `&&`, `||`, and `!` To configure compound expressions that use Boolean logic.

### Parentheses in compound expressions

You can use parentheses to control the order of evaluation of an expression. The following is an example:

```
http.req.url.contains("myCompany.com") || (http.req.url.hostname.eq("myHost") && http.req.header("myHeader").exists)
```

The following is another example:

```
(http.req.header("Content-Type").exists && http.req.header("Content-Type").eq("text/html")) || (http.req.header("Transfer-Encoding").exists || http.req.header("Content-Length").exists)
```

### Compound operations for strings

The following table describes operators that you can use to configure compound operations on string data.

---

| Operations that produce a string value | Description                                                                                                                                                                   |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>str + str</code>                 | Concatenates the value of the expression on the left of the operator with the value on the right.<br>Example: <code>http.req.hostname + http.req.url.protocol</code>          |
| <code>str + num</code>                 | Concatenates the value of the expression on the left of the operator with a numeric value on the right. Example: <code>http.req.hostname + http.req.url.content_length</code> |

---

| Operations that produce a string value | Description                                                                                                                                                                                                           |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>num + str</code>                 | Concatenates the numeric value of the expression on the left side of the operator with a string value on the right. Example:<br><code>http.req.url.content_length + http.req.url.hostname</code>                      |
| <code>str + ip</code>                  | Concatenates the string value of the expression on the left side of the operator with an IP address value on the right. Example:<br><code>http.req.hostname + 10.00.000.00</code>                                     |
| <code>IP + str</code>                  | Concatenates the IP address value of the expression on the left of the operator with a string value on the right. Example: <code>client.ip.dst + http.req.url.hostname</code>                                         |
| <code>str1 ALT str2</code>             | Uses string2 if the evaluation of string1 results in an undef exception or the result is a null string. Otherwise uses string1 and never evaluates string2. Example: <code>http.req.hostname alt client.ip.src</code> |

---

Operations on strings that produce a result of TRUE or FALSE

|                            | Description                                                                                                                                                                 |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>str == str</code>    | Evaluates whether the strings on either side of the operator are the same. Following is an example: <code>http.req.header("myheader") == http.res.header("myheader")</code> |
| <code>str &lt;= str</code> | Evaluates whether the string on the left side of the operator is the same as the string on the right, or precedes it alphabetically.                                        |
| <code>str &gt;= str</code> | Evaluates whether the string on the left side of the operator is the same as the string on the right, or follows it alphabetically.                                         |
| <code>str &lt; str</code>  | Evaluates whether the string on the left side of the operator precedes the string on the right alphabetically.                                                              |

---

---

**Operations on strings that produce a result of TRUE or FALSE**

| Operations on strings that produce a result of TRUE or FALSE | Description                                                                                                   |
|--------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <code>str &gt; str</code>                                    | Evaluates whether the string on the left side of the operator follows the string on the right alphabetically. |
| <code>str !== str</code>                                     | Evaluates whether the strings on either side of the operator are different.                                   |

---

**Logical operations on strings**

| Logical operations on strings     | Description                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>bool &amp;&amp; bool</code> | This operator is a logical AND. When evaluating the components of the compound expression, all components that are joined by the AND must evaluate to TRUE. Following is an example:<br><code>http.req.method.eq(GET) &amp;&amp; http.req.url.query.contains("viewReport &amp;&amp; my_pagelabel")</code>                         |
| <code>bool    bool</code>         | This operator is a logical OR. When evaluating the components of the compound expression, if any component of the expression belonging to OR evaluates to TRUE, the entire expression is TRUE. Following is an example:<br><code>http.req.url.contains(".js")    http.res.header.( "Content-Type"). Contains("javascript")</code> |
| <code>bool</code>                 | Performs a logical NOT on the expression.                                                                                                                                                                                                                                                                                         |

---

### Compound operations for numbers

You can configure compound numeric expressions. For example, the following expression returns a numeric value that is the sum of an HTTP header length and a URL length:

```
http.req.header.length + http.req.url.length
```

The following tables describe operators that you can use to configure compound expressions for numeric data.

| Arithmetic operations on numbers | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>num + num</code>           | Add the value of the expression on the left of the operator to the value of the expression on the right. Following is an example:<br><code>http.req.content_length + http.req.url.length</code>                                                                                                                                                                                                                                                                               |
| <code>num - num</code>           | Subtract the value of the expression on the right of the operator from the value of the expression on the left.                                                                                                                                                                                                                                                                                                                                                               |
| <code>num * num</code>           | Multiply the value of the expression on the left of the operator with the value of the expression on the right. Following is an example:<br><code>client.interface.rxthroughput * 9</code>                                                                                                                                                                                                                                                                                    |
| <code>num / num</code>           | Divide the value of the expression on the left of the operator by the value of the expression on the right.                                                                                                                                                                                                                                                                                                                                                                   |
| <code>num % num</code>           | Calculate the modulo, or the numeric remainder on a division of the value of the expression on the left of the operator by the value of the expression on the right. For example, the values “15 mod 4” equals 3, and “12 mod 4” equals 0.                                                                                                                                                                                                                                    |
| <code>~number</code>             | Returns a number after applying a bitwise logical negation of the number. The following example assumes that <code>numeric.expression</code> returns 12 (binary 1100): <code>~numeric.expression</code> . The result of applying the <code>~</code> operator is -11 (a binary 1110011, 32 bits total with all ones to the left). Note that all returned values of less than 32 bits before applying the operator implicitly have zeros to the left to make them 32 bits wide. |

---

| Arithmetic operations on numbers | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| number ^ number                  | <p>Compares two bit patterns of equal length and performs an XOR operation on each pair of corresponding bits in each number argument, returning 1 if the bits are different, and 0 if they are the same. Returns a number after applying a bitwise XOR to the integer argument and the current number value. If the values in the bitwise comparison are the same, the returned value is a 0. The following example assumes that numeric.expression1 returns 12 (binary 1100) and numeric.expression2 returns 10 (binary 1010): numeric.expression1 ^ numeric.expression2</p> <p>The result of applying the ^ operator to the entire expression is 6 (binary 0110). Note that all returned values of less than 32 bits before applying the operator implicitly have zeros to the left to make them 32 bits wide.</p> |
| number   number                  | <p>Returns a number after applying a bitwise OR to the number values. If either value in the bitwise comparison is a 1, the returned value is a 1. The following example assumes that numeric.expression1 returns 12 (binary 1100) and numeric.expression2 returns 10 (binary 1010): numeric.expression1   numeric.expression2</p> <p>The result of applying the   operator to the entire expression is 14 (binary 1110). Note that all returned values of less than 32 bits before applying the operator implicitly have zeros to the left to make them 32 bits wide.</p>                                                                                                                                                                                                                                            |

| Arithmetic operations on numbers | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| number & number                  | <p>Compares two bit patterns of equal length and performs a bitwise AND operation on each pair of corresponding bits, returning 1 if both of the bits contains a value of 1, and 0 if either bits are 0. The following example assumes that numeric.expression1 returns 12 (binary 1100) and numeric.expression2 returns 10 (binary 1010): numeric.expression1 &amp; numeric.expression2 The whole expression evaluates to 8 (binary 1000). Note that all returned values of less than 32 bits before applying the operator implicitly have zeros to the left to make them 32 bits wide.</p> |
| num « num                        | <p>Returns a number after a bitwise left shift of the number value by the right-side number argument number of bits. Note that the number of bits shifted is integer modulo 32. The following example assumes that numeric.expression1 returns 12 (binary 1100) and numeric.expression2 returns 3: numeric.expression1 « numeric.expression2 The result of applying the LSHIFT operator is 96 (a binary 1100000).Note that all returned values of less than 32 bits before applying the operator implicitly have zeros to the left to make them 32 bits wide.</p>                            |

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| num » num | Returns a number after a bitwise right shift of the number value by the integer argument number of bits. Note that the number of bits shifted is integer modulo 32. The following example assumes that numeric.expression1 returns 12 (binary 1100) and numeric.expression2 returns 3: numeric.expression1 » numeric.expression2 The result of applying the RSHIFT operator is 1 (a binary 0001). Note that all returned values of less than 32 bits before applying the operator implicitly have zeros to the left to make them 32 bits wide. |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Numeric operators that produce a result of TRUE or FALSE

| Description | Description                                                                                                                    |
|-------------|--------------------------------------------------------------------------------------------------------------------------------|
| num == num  | Determine if the value of the expression on the left of the operator is equal to the value of the expression on the right.     |
| num != num  | Determine if the value of the expression on the left of the operator is not equal to the value of the expression on the right. |
| num > num   | Determine if the value of the expression on the left of the operator is greater than the value of the expression on the right. |
| num < num   | Determine if the value of the expression on the left of the operator is less than the value of the expression on the right.    |

Numeric operators that produce a result of TRUE or FALSE

|            | Description                                                                                                                                |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| num >= num | Determine if the value of the expression on the left of the operator is greater than or equal to the value of the expression on the right. |
| num <= num | Determine if the value of the expression on the left of the operator is less than or equal to the value of the expression on the right     |

### Functions for data types in the policy infrastructure

The NetScaler policy infrastructure supports the following numeric data types:

- Integer (32 bits)
- Unsigned long (64 bits)
- Double (64 bits)

Simple expressions can return all of these data types. Also, you can create compound expressions that use arithmetic operators and logical operators to evaluate or return the values of these data types. Also, you can use all of these values in policy expressions. Literal constants of type unsigned long can be specified by appending the string ul to the number. Literal constants of type double contain a period (.), an exponent, or both.

**Arithmetic Operators, Logical Operators, and Type Promotion** In compound expressions, the following standard arithmetic and logical operators can be used for the double and unsigned long data types:

- +, -, \*, and /

---

%, ~, ^, &, , «, and » (do not apply to double)

---

- 
- ==, !=, >, <, >=, and <=

All of these operators have the same meaning as in the C programming language.

In all cases of mixed operations between operands of type integer, unsigned long, and double. Type promotion is done to do the operation on the operands of the same type. The operation promotes a lower precedence type to the operand with the highest precedence type. The order of precedence (higher to lower) is as follows:

- Double
- Unsigned long
- Integer

So, an operation that returns a numeric result returns a result of the highest type involved in the operation.

For example, if the operands are of type integer and unsigned long, the integer operand is automatically converted to type unsigned long. This type conversion is done in simple expressions. The type of data identified by the expression prefix does not match the type of data that is passed as the argument to the function. In the operation `HTTP.REQ.CONTENT_LENGTH.DIV(3ul)`, the prefix `HTTP.REQ.CONTENT_LENGTH` returns an integer that becomes an unsigned long. Unsigned long: the data type passed as the argument to the `DIV()` function, an unsigned long division is done. Similarly, the argument can be promoted in an expression. For example, `HTTP.REQ.HEADER("myHeader").TYPECAST_DOUBLE_AT.DIV(5)` promotes the integer 5 to type double and does double-precision division.

For information about expressions to cast data of one type to data of another type, see [Typecasting data](#).

## Specify the character set in expressions

May 2, 2023

The policy infrastructure on the NetScaler appliance supports ASCII and UTF-8 character sets. The default character set is ASCII. If the traffic for which you are configuring an expression consists of only ASCII characters, you need not specify the character set in the expression. The appliance allows all string and character literals which include binary characters. However, the UTF-8 character sets still require the string and character literals to be a valid UTF-8.

```
CLIENT.TCP.PAYLOAD(100).CONTAINS("\xff\x02")
```

In an expression, the `SET_CHAR_SET()` function must be introduced at the point in the expression after which data processing must be carried out in the specified character set. For example, in the expression `HTTP.REQ.BODY(1000).AFTER_REGEX(re/following example/).BEFORE_REGEX(re/In the`

preceding example/).CONTAINS\_ANY("Greek\_ alphabet"), if the strings stored in the pattern set "Greek\_ alphabet" are in UTF-8, you must include the SET\_CHAR\_SET(UTF\_8) function immediately before the CONTAINS\_ANY("<string>") function, as follows:

```
HTTP.REQ.BODY(1000).AFTER_REGEX(re/following example/).BEFORE_REGEX
(re/In the preceding example/).SET_CHAR_SET(UTF_8).CONTAINS_ANY("
Greek_ alphabet")
```

The SET\_CHAR\_SET() function sets the character set for all further processing (that is, for all subsequent functions) in the expression unless it is overridden later in the expression by another SET\_CHAR\_SET() function that changes the character set. Therefore, if all the functions in a given simple expression are intended for UTF-8, you can include the SET\_CHAR\_SET(UTF\_8) function immediately after functions that identify text (for example, the HEADER("<name>") or BODY(<int>) functions). In the second example that follows the first paragraph above, if the ASCII arguments passed to the AFTER\_REGEX() and BEFORE\_REGEX() functions are changed to UTF-8 strings, you can include the SET\_CHAR\_SET(UTF\_8) function immediately after the BODY(1000) function, as follows:

```
HTTP.REQ.BODY(1000).SET_CHAR_SET(UTF_8).AFTER_REGEX(re/Bücher/).
BEFORE_REGEX(re/Wörterbuch/).CONTAINS_ANY("Greek_ alphabet")
```

The UTF-8 character set is a superset of the ASCII character set, so expressions configured for the ASCII character set continue to work as expected if you change the character set to UTF-8.

## Compound expressions with different character sets

In a compound expression, if one subset of expressions is configured to work with data in the ASCII character set and the rest of the expressions are configured to work with data in the UTF-8 character set, the character set specified for each individual expression is considered when the expressions are evaluated individually. However, when processing the compound expression, just before processing the operators, the appliance promotes the character set of the returned ASCII values to UTF-8. For example, in the following compound expression, the first simple expression evaluates data in the ASCII character set while the second simple expression evaluates data in the UTF-8 character set:

```
HTTP.REQ.HEADER("MyHeader")== HTTP.REQ.BODY(10).SET_CHAR_SET(UTF_8)
```

However, when processing the compound expression, just before evaluating the "is equal to" Boolean operator, the NetScaler appliance promotes the character set of the value returned by HTTP.REQ.HEADER("MyHeader") to UTF-8.

The first simple expression in the following example evaluates data in the ASCII character set. However, when the NetScaler appliance processes the compound expression, just before concatenating the results of the two simple expressions, the appliance promotes the character set of the value returned by HTTP.REQ.BODY(10) to UTF-8.

```
HTTP.REQ.BODY(10)+ HTTP.REQ.HEADER("MyHeader").SET_CHAR_SET(UTF_8)
```

Therefore, the compound expression returns data in the UTF-8 character set.

### **Specify the character set based on the character set of traffic**

You can set the character set to UTF-8 based on traffic characteristics. If you are not sure whether the character set of the traffic being evaluated is UTF-8, you can configure a compound expression in which the first expression checks for UTF-8 traffic and subsequent expressions set the character set to UTF-8. Following is an example of a compound expression that first checks the value of “charset” in the request’s Content-Type header for “UTF-8” before checking whether the first 1000 bytes in the request contain the UTF-8 string Bücher:

```
HTTP.REQ.HEADER("Content-Type").SET_TEXT_MODE(IGNORECASE).TYPECAST_NVLIST_T
('=', ' ; ', ' ').VALUE("charset").EQ("UTF-8")&& HTTP.REQ.BODY(1000).
SET_CHAR_SET(UTF_8).CONTAINS("Bücher")
```

If you are sure that the character set of the traffic being evaluated is UTF-8, the second expression in the example is sufficient.

### **Character and string literals in expressions**

During expression evaluation, even if the current character set is ASCII, character literals and string literals, which are enclosed in single quotation marks (‘’) and quotation marks (“”), respectively, are considered to be literals in the UTF-8 character set. In a given expression, if a function is operating on character or string literals in the ASCII character set and you include a non-ASCII character in the literal, an error is returned.

#### **Note:**

The string literals in advanced policy expressions are now as long as the policy expression. The expression is allowed to be 1499 bytes or 8191 bytes long.

### **Values in hexadecimal and octal formats**

When configuring an expression, you can enter values in octal and hexadecimal formats. However, each hexadecimal or octal byte is considered a UTF-8 byte. Invalid UTF-8 bytes result in errors regardless of whether the value is entered manually or pasted from the clipboard. For example, “\x0c\x20” is an invalid UTF-8 character because “c8” cannot be followed by “20” (each byte in a multi-byte UTF-8 string must have the high bit set). Another example of an invalid UTF-8 character is “\x0c \xa9,” since the hexadecimal characters are separated by a white-space character.

## Functions that return UTF-8 strings

Only the `<text>.XPATH` and `<text>.XPATH_JSON` functions always return UTF-8 strings. The following MySQL routines determine at runtime which character set to return, depending on the data in the protocol:

- `MYSQL_CLIENT_T.USER`
- `MYSQL_CLIENT_T.DATABASE`
- `MYSQL_REQ_QUERY_T.COMMAND`
- `MYSQL_REQ_QUERY_T.TEXT`
- `MYSQL_REQ_QUERY_T.TEXT(<unsigned int>)`
- `MYSQL_RES_ERROR_T.SQLSTATE`
- `MYSQL_RES_ERROR_T.MESSAGE`
- `MYSQL_RES_FIELD_T.CATALOG`
- `MYSQL_RES_FIELD_T.DB`
- `MYSQL_RES_FIELD_T.TABLE`
- `MYSQL_RES_FIELD_T.ORIGINAL_TABLE`
- `MYSQL_RES_FIELD_T.NAME`
- `MYSQL_RES_FIELD_T.ORIGINAL_NAME`
- `MYSQL_RES_OK_T.MESSAGE`
- `MYSQL_RES_ROW_T.TEXT_ELEM(<unsigned int>)`

## Terminal connection settings for UTF-8

When you set up a connection to the NetScaler appliance by using a terminal connection (by using PuTTY, for example), you must set the character set for transmission of data to UTF-8.

## Minimum and maximum functions in an advanced policy expression

The advanced policy expressions support the below minimum and maximum functions.

1. `(<expression1>.max(<expression2>)` - returns the maximum of the two values.
2. `(<expression1>.min(<expression2>)` - returns the minimum of the two values.

## Configure advanced policy expressions in a policy

September 21, 2021

You can configure an Advanced policy expression of up to 1,499 characters in a policy. The user interface for Advanced policy expressions depends to some extent on the feature for which you are configuring the expression, and on whether you are configuring an expression for a policy or for another use.

When configuring expressions on the command line, you delimit the expression by using quotation marks (“ . . .” or ‘ . . . ’). Within an expression, you escape additional quotation marks by using a backslash (\). For example, the following are standard methods for escaping quotation marks in an expression:

```
"\"abc\""
```

```
' \"abc\"'
```

You must also use a backslash to escape question marks and other backslashes on the command line. For example, the expression `http.req.url.contains("?")` requires a backslash so that the question mark is parsed. Note that the backslash character will not appear on the command line after you type the question mark. On the other hand, if you escape a backslash (for example, in the expression `http.req.url.contains("\\http")`), the escape characters are echoed on the command line.

---

To make an entry more readable, you can escape `~$^+=&%@'?`. the quotation marks for an entire expression. At the start of the expression you enter the escape sequence “q” plus one of the following special characters: `/ { <`

---

You enter only the special character at the end of the expression, as follows:

```
1 q@http.req.url.contains("sometext") && http.req.cookie.exists@
2
3 q~http.req.url.contains("sometext") && http.req.cookie.exists~
4 <!--NeedCopy-->
```

Note that an expression that uses the `{` delimiter is closed with `}`.

For some features (for example, Integrated Caching and Responder), the policy configuration dialog box provides a secondary dialog box for configuring expressions. This dialog enables you to choose from drop-down lists that show the available choices at each point during expression configuration. You cannot use arithmetic operators when using these configuration dialogs, but most other advanced policy expression features are available. To use arithmetic operators, write your expressions in free-form format.

## Configure an Advanced policy syntax rule by using the CLI

At the command prompt, type the following commands to configure a Advanced policy rule and verify the configuration:

1. `add cache|dns|rewrite|cs policyName \*\*-rule\*\* expression  
featureSpecificParameters \*\*-action\*\*`
2. `show cache|dns|rewrite|cs policyName`

Following is an example of configuring a caching policy:

### Example:

```

1 > add cache policy pol-cache -rule http.req.content_length.le(5) -
 action INVALID
2 Done
3
4 > show cache policy pol-cache
5 Name: pol-cache
6 Rule: http.req.content_length.le(5)
7 CacheAction: INVALID
8 Invalidate groups: DEFAULT
9 UndefAction: Use Global
10 Hits: 0
11 Undef Hits: 0
12
13 Done
14 <!--NeedCopy-->

```

## Configure a Advanced policy expression by using the GUI

1. In the navigation pane, click the name of the feature where you want to configure a policy, for example, you can select Integrated Caching, Responder, DNS, Rewrite, or Content Switching, and then click **Policies**.
2. Click Add.
3. For most features, click in the **Expression** field. For content switching, click **Configure**.
4. Click the **Prefix** icon (the house) and select the first expression prefix from the drop-down list. For example, in Responder, the options are HTTP, SYS, and CLIENT. The next set of applicable options appear in a drop-down list.
5. Double-click the next option to select it, and then type a period (.). Again, a set of applicable options appears in another drop-down list.
6. Continue selecting options until an entry field (signalled by parentheses) appears. When you see an entry field, enter an appropriate value in the parentheses. For example, if you select

GT(int) (greater-than, integer format), you specify an integer in the parentheses. Text strings are delimited by quotation marks. Following is an example:

```
HTTP.REQ.BODY\ (1000) .BETWEEN\ (\ "this\ ", \ "that\ ")
```

---

To insert an operator between two parts of a compound expression, click the Operators icon (the sigma), and select the operator type. Following is an example of a configured expression with a Boolean OR (signalled by double vertical bars,

---

7. `HTTP.REQ.URL.EQ\ (\ "www.mycompany.com\ ") \ | HTTP.REQ.BODY\ (1000) .BETWEEN\ (\ "this\ ", \ "that\ ")`
8. To insert a named expression, click the down arrow next to the Add icon (the plus sign) and select a named expression.
9. To configure an expression using drop-down menus, and to insert built-in expressions, click the Add icon (the plus sign). The **Add Expression** dialog box works in a similar way to the main dialog box, but it provides drop-down lists for selecting options, and it provides text fields for data entry instead of parentheses. This dialog box also provides a Frequently Used Expressions drop-down list that inserts commonly used expressions. When you are done adding the expression, click **OK**.
10. When finished, click **Create**. A message in the status bar indicates that the policy expression is configured successfully.

### Test a Advanced policy expression by using the GUI

1. In the navigation pane, click the name of the feature for which you want to configure a policy (for example, you can select Integrated Caching, Responder, DNS, Rewrite, or Content Switching), and then click Policies.
2. Select a policy and click **Open**.
3. To test the expression, click the Evaluate icon (the check mark).
4. In the expression evaluator dialog box, select the Flow Type that matches the expression.
5. In the **HTTP Request Data** or **HTTP Response Data** field, paste the HTTP request or response that you want to parse with the expression, and click **Evaluate**. Note that you must supply a complete HTTP request or response, and the header and body should be separated by blank

line. Some programs that trap HTTP headers do not also trap the response. If you are copying and pasting only the header, insert a blank line at the end of the header to form a complete HTTP request or response.

6. Click **Close** to close this dialog box.

## Configure named advanced policy expressions

July 16, 2021

Instead of retyping the same expression multiple times in multiple policies, you can configure a named expression and refer to the name any time you want to use the expression in a policy. For example, you could create the following named expressions:

- ThisExpression:

```
http.req.body(100).contains("this")
```

- ThatExpression:

```
http.req.body(100).contains("that")
```

You can then use these named expressions in a policy expression. For example, the following is a legal expression based on the preceding examples:

---

ThisExpression

---

You can use the name of an advanced policy expression as the prefix to a function. The named expression can be either a simple expression or a compound expression. The function must be one that can operate on the type of data that is returned by the named expression.

### Example 1: Simple Named Expression as a Prefix

The following simple named expression, which identifies a text string, can be used as a prefix to the AFTER\_STR("<string>")function, which works with text data:

```
HTTP.REQ.BODY(1000)
```

If the name of the expression is top1KB, you can use top1KB.AFTER\_STR("username") instead of HTTP.REQ.BODY(1000).AFTER\_STR("username").

## Example 2: Compound named expression as a prefix

You can create a compound named expression called `basic_header_value` to concatenate the user name in a request, a colon (:), and the user's password, as follows:

```
add policy expression basic_header_value "HTTP.REQ.USER.NAME + \":\"
+ HTTP.REQ.USER.PASSWD"
```

You can then use the name of the expression in a rewrite action, as shown in the following example:

```
add rewrite action insert_b64encoded_authorization insert_http_header
authorization '"Basic " + basic_header_value.b64encode'
```

In the example, in the expression that is used to construct the value of the custom header, the B64 encoding algorithm is applied to the string returned by the compound named expression.

You can also use a named expression (either by itself or as a prefix to a function) to create the text expression for the replacement target in a rewrite.

## Configure a named Advanced policy expression by using the CLI

At the command prompt, type the following commands to configure a named expression and verify the configuration:

```
1 - add policy expression \<name\>\<value\>
2
3 - show policy expression \<name\>
4 <!--NeedCopy-->
```

### Example:

```
1 > add policy expression myExp "http.req.body(100).contains(\"the other
 \")"
2 Done
3
4 > show policy expression myExp
5 1) Name: myExp Expr: "http.req.body(100).contains("the other"
)" Hits: 0 Type : ADVANCED
6 Done
7 <!--NeedCopy-->
```

The expression can be up to 1,499 characters.

## Configure a named expression by using the GUI

1. In the navigation pane, expand **AppExpert**, and then click **Expressions**.
2. Click **Advanced Expressions**.

3. Click **Add**.
4. Enter a name and a description for the expression.
5. Configure the expression by using the process described in [Configure advanced policy expression](#). A message in the status bar indicates that the policy expression is configured successfully.

## Configure advanced policy expressions outside the context of a policy

September 21, 2020

A number of functions, including the following, can require an advanced policy expression that is not part of a policy:

- Integrated Caching selectors:

You define multiple non-compound expressions (selectlets) in the definition of the selector. Each selectlet is in an implicit logical AND relationship with the others.

- Load Balancing:

You configure an expression for the TOKEN method of load balancing for a load balancing virtual server.

- Rewrite actions:

Expressions define the location of the rewrite action and the type of rewriting to be performed, depending on the type of rewrite action that you are configuring. For example, a DELETE action only uses a target expression. A REPLACE action uses a target expression and an expression to configure the replacement text.

- Rate-based policies:

You use advanced policy expressions to configure Limit Selectors. You can use these selectors when configuring policies to throttle the rate of traffic to various servers. You define up to five non-compound expressions (selectlets) in the definition of the selector. Each selectlet is in an implicit logical AND with the others.

### Configure an advanced policy expression outside a policy by using the CLI (cache selector example)

At the command prompt, type the following commands to configure an advanced policy expression outside a policy and verify the configuration:

```

1 - add cache selector <selectorName> <rule>
2 - show cache selector <selectorName>
3 <!--NeedCopy-->

```

**Example:**

```

1 > add cache selector mainpageSelector "http.req.cookie.value("ABC_def")
 "
2 "http.req.url.query.value("_ghi")"selector "mainpageSelector" added
3 Done
4 > show cache selector mainpageSelector
5 Name: mainpageSelector
6 Expressions:
7 1) http.req.cookie.value("ABC_def")
8 2) http.req.url.query.value("_ghi")
9 Done
10 <!--NeedCopy-->

```

Following is an equivalent command that uses the more readable q delimiter, as described in [Configure advanced policy expressions in a policy](#):

```

1 > add cache selector mainpageSelector2 q~http.req.cookie.value("ABC_def")~
 ")~
2 q~http.req.url.query.value("_ghi")~selector "mainpageSelector2"
 added
3 Done
4 > show cache selector mainpageSelector2
5 Name: mainpageSelector2
6 Expressions:
7 1) http.req.cookie.value("ABC_def")
8 2) http.req.url.query.value("_ghi")
9 Done
10 <!--NeedCopy-->

```

**Advanced policy expressions: Evaluating text**

December 22, 2023

You can configure a policy with an advanced policy expression that evaluates text in a request or response. Advanced policy text expressions can range from simple expressions that perform string matching in HTTP headers to complex expressions that encode and decode text. You can configure text expressions to be case sensitive or case insensitive and to use or ignore spaces. You can also configure complex text expressions by combining text expressions with Boolean operators

You can use expression prefixes and operators for evaluating HTTP requests, HTTP responses, and VPN and Clientless VPN data. However, text expression prefixes are not restricted to evaluating these

elements of your traffic.

## About text expressions

May 2, 2023

You can configure various expressions for working with text that flows through the NetScaler appliance. Following are some examples of how you can parse text by using an Advanced policy expression:

- Determine that a particular HTTP header exists.

For example, you may want to identify HTTP requests that contain a particular Accept-Language header for the purpose of directing the request to a particular server.

- Determine that a particular HTTP URL contains a particular string.

For example, you may want to block requests for particular URLs. Note that the string can occur at the beginning, middle, or end of another string.

- Identify a POST request that is directed to a particular application.

For example, you may want to identify all POST requests that are directed to a database application for the purpose of refreshing cached application data.

Note that there are specialized tools for viewing the data stream for HTTP requests and responses. You can use the tools to view the data stream.

## About operations on text

A text-based expression consists of at least one prefix to identify an element of data and usually (although not always) an operation on that prefix. Text-based operations can apply to any part of a request or a response. Basic operations on text include various types of string matches.

For example, the following expression compares a header value with a string:

```
http.req.header("myHeader").contains("some-text")
```

Following expressions are examples of matching a file type in a request:

```
http.req.url.suffix.contains("jpeg")
```

```
http.req.url.suffix.eq("jpeg")
```

In the preceding examples, the contains operator permits a partial match and the eq operator looks for an exact match.

Other operations are available to format the string before evaluating it. For example, you can use text operations to strip out quotes and white spaces, to convert the string to all lowercase, or to concatenate strings.

**Note:**

Complex operations are available to perform matching based on patterns or to convert one type of text format to another type.

For more information, see the following topics:

- [Pattern sets and data sets.](#)
- [Regular expressions.](#)
- [Typecasting data.](#)

## Compounding and precedence in text expressions

You can apply various operators to combine text prefixes or expressions. For example, the following expression concatenates the returned values of each prefix:

```
http.req.hostname + http.req.url
```

Following is an example of a compound text expression that uses a logical AND. Both components of this expression must be TRUE for a request to match the expression:

```
http.req.method.eq(post)&& http.req.body(1024).startswith("destination=")
```

**Note:**

For more information on operators for compounding, see [Compound advanced expressions.](#)

## Categories of text expressions

The primary categories of text expressions that you can configure are:

- Information in HTTP headers, HTTP URLs, and the POST body in HTTP requests.  
For more information, see [Expression prefixes for text in HTTP requests and responses.](#)
- Information regarding a VPN or a clientless VPN.  
For more information, see [Expression prefixes for VPNs and clientless VPNs.](#)
- TCP payload information.  
For more information about TCP payload expressions, see [Advanced policy expressions: Parsing HTTP, TCP, and UDP data.](#)

- Text in a Secure Sockets Layer (SSL) certificate.

For information about text expressions for SSL and SSL certificate data, see [Advanced policy expressions: Parsing SSL certificates](#) and [Expressions for SSL certificate dates](#).

**Note:**

Parsing a document body, such as the body of a POST request, can affect performance. You may want to test the performance impact of policies that evaluate a document body.

## Guidelines for text expressions

From a performance standpoint, it typically is best to use protocol-aware functions in an expression. For example, the following expression makes use of a protocol-aware function:

```
HTTP.REQ.URL.QUERY
```

The previous expression performs better than the following equivalent expression, which is based on string parsing:

```
HTTP.REQ.URL.AFTER_STR("?")
```

In the first case, the expression looks specifically at the URL query. In the second case, the expression scans the data for the first occurrence of a question mark.

There is also a performance benefit from structured parsing of text, as in the following expression:

```
HTTP.REQ.HEADER("Example").TYPECAST_LIST_T(',').GET(1)
```

(For more information on typecasting, see [Typecasting data](#). The typecasting expression, which collects comma-delimited data and structures it into a list, typically would perform better than the following unstructured equivalent:

```
HTTP.REQ.HEADER("Example").AFTER_STR(",").BEFORE_STR(",")
```

Finally, unstructured text expressions typically have better performance than regular expressions. For example, the following is an unstructured text expression:

```
HTTP.REQ.HEADER("Example").AFTER_STR("more")
```

The previous expression would generally provide better performance than the following equivalent, which uses a regular expression:

```
HTTP.REQ.HEADER("Example").AFTER_REGEX(re/more/)
```

For more information on regular expressions, see [Regular expressions](#).

## Expression prefixes for text in HTTP requests and responses

May 2, 2023

An HTTP request or response typically contains text, such as in the form of headers, header values, URLs, and POST body text. You can configure expressions to operate on one or more of these text-based items in an HTTP request or response.

For more information on parameters, see [NetScaler Advanced Policy Expression Reference](#).

Refer to the following topics to get more details on how to configure using advanced expression.

- [Compound advanced policy expressions](#)
- [Advanced policy expressions: IP and MAC addresses, throughput, VLAN IDs](#)
- [Advanced policy expressions: parsing SSL](#)
- [Advanced policy expressions: working with dates, times, and numbers](#)
- [Basic elements of an advanced policy expression](#)
- [Advanced policy expressions: evaluating text](#)
- [Advanced policy expressions: parsing HTTP, TCP, and UDP data](#)
- [Summary examples of default syntax expressions and policies](#)

## Expression prefixes for VPNs and clientless VPNs

September 21, 2020

The Advanced policy engine provides prefixes that are specific to parsing VPN or Clientless VPN data. This data includes the following:

- Host names, domains, and URLs in VPN traffic.
- Protocols in the VPN traffic.
- Queries in the VPN traffic.

These text elements are often URLs and components of URLs. In addition to applying the text-based operations on these elements, you can parse these elements by using operations that are specific to parsing URLs. For more information, see [Expressions for extracting segments of URLs](#)

For information about VPN expression prefixes, see [VPN expression table](#).

## Basic operations on text

July 14, 2021

Basic operations on text include operations for string matching, calculating the length of a string, and controlling case sensitivity. You can include white space in a string that is passed as an argument to an expression, but the string cannot exceed 255 characters.

### String comparison functions

The following table lists basic string matching operations in which the functions return a Boolean TRUE or FALSE.

| Function                                             | Description                                                                                                                                                                                                                                                   |
|------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;text&gt;.CONTAINS(&lt;string&gt;)</code>   | Returns a Boolean TRUE value if the target contains <code>&lt;string&gt;</code> . Example:<br><code>http.req.url.contains(".jpeg")</code>                                                                                                                     |
| <code>&lt;text&gt;.EQ(&lt;string&gt;)</code>         | Returns a Boolean TRUE value if the target is an exact match with <code>&lt;string&gt;</code> . For example, the following expression returns a Boolean TRUE for a URL with a host name of "myhostabc":<br><code>http.req.url.hostname.eq("myhostabc")</code> |
| <code>&lt;text&gt;.STARTSWITH(&lt;string&gt;)</code> | Returns a Boolean TRUE value if the target begins with <code>&lt;string&gt;</code> . For example, the following expression returns a Boolean TRUE for a URL with a host name of "myhostabc":<br><code>http.req.url.hostname.startswith("myhost")</code>       |
| <code>&lt;text&gt;.ENDSWITH(&lt;string&gt;)</code>   | Returns a Boolean TRUE value if the target ends with <code>&lt;string&gt;</code> . For example, the following expression returns a Boolean TRUE for a URL with a host name of "myhostabc":<br><code>http.req.url.hostname.endswith("abc")</code>              |

---

| Function                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;text&gt;.NE(&lt;string&gt;)</code> | Returns a Boolean TRUE value if the prefix is not equal to the string argument. If the prefix returns a non-string value, the function argument is compared to the string representation of the value returned by the prefix. You can use the functions with <code>SET_TEXT_MODE (IGNORECASE)</code> or <code>SET_TEXT_MODE (NOIGNORECASE)</code> , and with both ASCII and UTF-8 character sets.                            |
| <code>&lt;text&gt;.GT(&lt;string&gt;)</code> | Returns a Boolean TRUE value if the prefix is alphabetically greater than the string argument. If the prefix returns a non-string value, the function argument is compared to the string representation of the value returned by the prefix. You can use the functions with <code>SET_TEXT_MODE (IGNORECASE)</code> or <code>SET_TEXT_MODE (NOIGNORECASE)</code> , and with both ASCII and UTF-8 character sets.             |
| <code>&lt;text&gt;.GE(&lt;string&gt;)</code> | Returns a Boolean TRUE value if the prefix is alphabetically greater than or equal to the string argument. If the prefix returns a non-string value, the function argument is compared to the string representation of the value returned by the prefix. You can use the functions with <code>SET_TEXT_MODE (IGNORECASE)</code> or <code>SET_TEXT_MODE (NOIGNORECASE)</code> , and with both ASCII and UTF-8 character sets. |
| <code>&lt;text&gt;.LT(&lt;string&gt;)</code> | Returns a Boolean TRUE value if the prefix is alphabetically lesser than the string argument. If the prefix returns a non-string value, the function argument is compared to the string representation of the value returned by the prefix. You can use the functions with <code>SET_TEXT_MODE (IGNORECASE)</code> or <code>SET_TEXT_MODE (NOIGNORECASE)</code> , and with both ASCII and UTF-8 character sets.              |

| Function                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;text&gt;.LE(&lt;string&gt;)</code> | Returns a Boolean TRUE value if the prefix is alphabetically lesser than or equal to the string argument. If the prefix returns a non-string value, the function argument is compared to the string representation of the value returned by the prefix. You can use the functions with <code>SET_TEXT_MODE (IGNORECASE)</code> or <code>SET_TEXT_MODE (NOIGNORECASE)</code> , and with both ASCII and UTF-8 character sets. |

### Calculate the length of a string

The `<text>.LENGTH` operation returns a numeric value that is equal to the number of characters (not bytes) in a string:

`<text>.LENGTH`

For example, you may want to identify request URLs that exceed a particular length. Following is an expression that implements this example:

`HTTP.REQ.URL.LENGTH < 500`

After taking a count of the characters or elements in a string, you can apply numeric operations to them. For more information, see [Advanced policy Expressions: Working with Dates, Times, and Numbers](#).

### Consider, ignore, and change text case

The following functions operate on the case (upper-case or lower-case) of the characters in the string.

---

| Function                                             | Description                                                                                        |
|------------------------------------------------------|----------------------------------------------------------------------------------------------------|
| <code>&lt;text&gt;.SET_TEXT_MODE (IGNORECASE)</code> | <code>NOIGNORECASE)</code> This function turns case sensitivity on or off for all text operations. |

---

| Function                           | Description                                                                                                                                                                    |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;text&gt;.TO_LOWER</code> | Converts the target to lowercase for a text block of up to 2 kilobyte (KB). Returns UNDEF if the target exceeds 2 KB. For example, the string “ABCd:” is converted to “abcd:”. |
| <code>&lt;text&gt;.TO_UPPER</code> | Converts the target to uppercase. Returns UNDEF if the target exceeds 2 KB. For example, the string “abcD:” is converted to “ABCD:”.                                           |

---

### Strip specific characters from a string

You can use the `STRIP_CHARS(<string>)` function to remove specific characters from the text that is returned by a Advanced policy expression prefix (the input string). All instances of the characters that you specify in the argument are stripped from the input string. You can use any text method on the resulting string, including the methods used for matching the string with a pattern set.

For example, in the expression `CLIENT.UDP.DNS.DOMAIN.STRIP\_CHARS(“.-\\_”)`, the `STRIP\_CHARS(<string>)` function strips all periods (.), hyphens (-), and underscores ( ) from the domain name returned by the prefix `CLIENT.UDP.DNS.DOMAIN`. If the domain name that is returned is “a.dom\_ai\_n-name”, the function returns the string “adomainname”.

In the following example, the resulting string is compared with a pattern set called “listofdomains”:

```
CLIENT.UDP.DNS.DOMAIN.STRIP_CHARS(“.-_”).CONTAINS_ANY(“listofdomains”)
```

**Note:** You cannot perform a rewrite on the string that is returned by the `STRIP_CHARS(<string>)` function.

The following functions strip matching characters from the beginning and end of a given string input.

| Function                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;text&gt;.STRIP_START_CHARS(s)</code> | Strips matching characters from the beginning of the input string until the first non-matching character is found and returns the remainder of the string. You must specify the characters that you want to strip as a single string within quotation marks. For example, if the name of a header is TestLang and <code>:/en_us:is its value,HTTP.RES.HEADER("TestLang").STRIP_START_CHARS(":")</code> strips the specified characters from the beginning of the value of the header until the first non-matching character e is found and returns <code>en_us</code> as a string. |
| <code>&lt;text&gt;.STRIP_END_CHARS(s)</code>   | Strips matching characters from the end of the input string to the first non-matching character is found and returns the remainder of the string. You must specify the characters that you want to strip as a single string within quotation marks. For example, if the name of a header is TestLang and <code>:/en_us:is its value,HTTP.RES.HEADER("TestLang").STRIP_END_CHARS(":")</code> strips the specified characters from the end of the value of the header until the first non-matching character s is found and returns <code>:/_en_us</code> as a string.               |

### Append a string to another string

You can use the APPEND() function to append the string representation of the argument to the string representation of the value returned by the preceding function. The preceding function can be one that returns a number, unsigned long, double, time value, IPv4 address, or IPv6 address. The argument can be a text string, number, unsigned long, double, time value, IPv4 address, or IPv6 address. The resulting string value is the same string value that is obtained by using the + operator.

### Complex operations on text

May 2, 2023

In addition to simple string matching, you can configure expressions that examine string length and text block for patterns rather than specific strings.

Be aware of the following for any text-based operation:

- For any operation that takes a string argument, the string cannot exceed 255 characters.
- You can include white space when you specify a string in an expression.

## Operations on the length of a string

The following operations extract strings by a character count.

---

| Character Count Operation                                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;text&gt;.TRUNCATE(&lt;count&gt;)</code>                    | Returns a string after truncating the end of the target by the number of characters in <code>&lt;count&gt;</code> . If the entire string is shorter than <code>&lt;count&gt;</code> , nothing is returned.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <code>&lt;text&gt;.TRUNCATE(&lt;character&gt;, &lt;count&gt;)</code> | Returns a string after truncating the text after <code>&lt;character&gt;</code> by the number of characters specified in <code>&lt;count&gt;</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <code>&lt;text&gt;.PREFIX(&lt;character&gt;, &lt;count&gt;)</code>   | Selects the longest prefix in the target that has at most <code>&lt;count&gt;</code> occurrences of <code>&lt;character&gt;</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <code>&lt;text&gt;.SUFFIX(&lt;character&gt;, &lt;count&gt;)</code>   | Selects the longest suffix in the target that has at most <code>&lt;count&gt;</code> occurrences of <code>&lt;character&gt;</code> . For example, consider the following response body: <code>peninsula</code> . The following expression returns a value of <code>sula</code> : <code>http.res.body(100).suffix('n',0)</code> . The following expression returns <code>insula</code> : <code>http.res.body(100).suffix('n',1)</code> . The following expression returns a value of <code>peninsula</code> : <code>http.res.body(100).suffix('n',2)</code> . The following expression returns a value of <code>peninsula</code> : <code>http.res.body(100).suffix('n',3)</code> . |

| Character Count Operation                                                 | Description                                                                                                                                                                                                                                                                                                                        |
|---------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;text&gt;.SUBSTR(&lt;starting_offset&gt;, &lt;length&gt;)</code> | Select a string with <code>&lt;length&gt;</code> number of characters from the target object. Begin extracting the string after the <code>&lt;starting_offset&gt;</code> . If the number of characters after the offset are fewer than the value of the <code>&lt;length&gt;</code> argument, select all the remaining characters. |
| <code>&lt;text&gt;.SKIP(&lt;character&gt;, &lt;count&gt;)</code>          | Select a string from the target after skipping over the longest prefix that has at most <code>&lt;count&gt;</code> occurrences of <code>&lt;character&gt;</code> .                                                                                                                                                                 |

### Operations on a portion of a string

Refer to the [String operations table](#) to know how to extract a subset of a larger string by using one of the operations.

### Operations for comparing the alphanumeric order of two strings

The COMPARE operation examines the first nonmatching character of two different strings. This operation is based on lexicographic order, which is the method used when ordering terms in dictionaries.

This operation returns the arithmetic difference between the ASCII values of the first nonmatching characters in the compared strings. The following differences are examples:

- The difference between “abc” and “and” is -1 (based on the third pair-wise character comparison).
- The difference between “@” and “abc” is -33.
- The difference between “1” and “abc” is -47.

Following is the syntax for the COMPARE operation.

```
<text>.COMPARE(<string>)
```

### Extract an integer from a string of bytes that represent text

Refer to the [Integer extraction table](#) to know how to treat a string of bytes that represent text as a sequence of bytes, extract 8 bits, 16 bits, or 32 bits from the sequence, and then convert the extracted bits to an integer.

## Convert text to a hash value

You can convert a text string to a hash value by using the HASH function. This function returns a 31-bit positive integer as a result of the operation. Following is the format of the expression:

```
<text>.HASH
```

This function ignores case and white spaces. For example, after the operation, the two strings Ab c and a bc would produce the same hash value.

## Encode and decode text by applying the Base64 encoding algorithm

The following two functions encode and decode a text string by applying the Base64 encoding algorithm

---

| Function       | Description                                                                                                                                                           |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| text.B64ENCODE | Encodes the text string (designated by text) by applying the Base64 encoding algorithm.                                                                               |
| text.B64DECODE | Decodes the Base64-encoded string (designated by text) by applying the Base64 decoding algorithm. The operation raises an UNDEF if text is not in B64-encoded format. |

---

## Refine the search in a rewrite action by using the EXTEND function

The EXTEND function is used in rewrite actions that specify patterns or pattern sets and target the bodies of HTTP packets. When a pattern match is found, the EXTEND function extends the scope of the search by a predefined number of bytes on both sides of the matching string. A regular expression can then be used to perform a rewrite on matches in this extended region. Rewrite actions that are configured with the EXTEND function perform rewrites faster than rewrite actions that evaluate entire HTTP bodies using only regular expressions.

The format of the EXTEND function is EXTEND(m,n), where m and n are the number of bytes by which the scope of the search is extended before and after the matching pattern, respectively. When a match is found, the new search scope comprises m bytes that immediately precede the matching string, the string itself, and the n bytes that follow the string. A regular expression can then be used to perform a rewrite on a portion of this new string.

The EXTEND function can be used only if the rewrite action in which it is used fulfills the following requirements:

- The search is performed by using patterns or patterns sets (not regular expressions)

- The rewrite action evaluates only the bodies of HTTP packets.

Also, the EXTEND function can be used only with the following types of rewrite actions:

- `replace_all`
- `insert_after_all`
- `delete_all`
- `insert_before_all`

For example, you might want to delete all instances of “<http://exampleurl.com/>” and “<http://exampleurl.au/>” in the first 1000 bytes of the body. To do this, you can configure a rewrite action to search for all instances of the string `exampleurl`, extend the scope of the search on both sides of the string when a match is found, and then use a regular expression to perform the rewrite in the extended region. The following example extends the scope of the search by 20 bytes to the left and 50 bytes to the right of the matching string:

```
add rewrite action delurl_example delete_all 'HTTP.REQ.BODY(1000)'-
search exampleurl -refineSearch 'extend(20,50).regex_select(re#http
://exampleurl.(com|au)#)'
```

## Convert text to hexadecimal format

The following function converts text to hexadecimal format and extracts the resulting string:

```
<text>.BLOB_TO_HEX(<string>)
```

For example, this function converts the byte string “abc” to “61:62:63”.

## Encrypt and decrypt text

In Advanced policy expressions, you can use the ENCRYPT and DECRYPT functions to encrypt and decrypt text. Data encrypted by the ENCRYPT function on a given NetScaler appliance or high availability (HA) pair is intended for decryption by the DECRYPT function on the same NetScaler appliance or HA pair. The appliance supports the RC4, DES3, AES128, AES192, and AES256 encryption methods. The key value that is required for encryption is not user-specifiable. When an encryption method is set, the appliance automatically generates a random key value that is appropriate for the specified method. The default method is AES256 encryption, which is the most secure encryption method and the one that Citrix recommends.

You do not need to configure encryption unless you want to change the encryption method or you want the appliance to generate a new key value for the current encryption method.

**Note:** You can also encrypt and decrypt XML payloads. For information about the functions for encrypting and decrypting XML payloads, see [Encrypt and decrypt XML payloads](#).

## Configure encryption

During startup, the appliance runs the `set ns encryptionParams` command with, by default, the AES256 encryption method, and uses a randomly generated key value that is appropriate for AES256 encryption. The appliance also encrypts the key value and saves the command, with the encrypted key value, to the NetScaler configuration file. Therefore, the AES256 encryption method is enabled for the ENCRYPT and DECRYPT functions by default. The key value that is saved in the configuration file persists across reboots even though the appliance runs the command each time you restart it.

You can run the `set ns encryptionParams` command manually, or use the configuration utility, if you want to change the encryption method or if you want the appliance to generate a new key value for the current encryption method. To use the CLI to change the encryption method, set only the `method` parameter, as shown in “**Example 1: Changing the Encryption Method.**” If you want the appliance to generate a new key value for the current encryption method, set the `method` parameter to the current encryption method and the `keyValue` parameter to an empty string (“”), as shown in “**Example 2: Generating a New Key Value for the Current Encryption Method.**” After you generate a new key value, you must save the configuration. If you do not save the configuration, the appliance uses the newly generated key value only until the next restart, after which it reverts to the key value in the saved configuration.

### Configure encryption by using the GUI

1. Navigate to **System > Settings**.
2. In the **Settings** area, click **Change Encryption** parameters.
3. In the **Change Encryption Parameters** dialog box, do one of the following:
  - To change the encryption method, in the Method list, select the encryption method that you want.
  - To generate a new key value for the current encryption method, click Generate a new key for the selected method.
4. Click **OK**.

### Use the ENCRYPT and DECRYPT functions

You can use the ENCRYPT and DECRYPT functions with any expression prefix that returns text. For example, you can use the ENCRYPT and DECRYPT functions in rewrite policies for cookie encryption. In the following example, the rewrite actions encrypt a cookie named MyCookie, which is set by a back-end service, and decrypt the same cookie when it is returned by a client:

```
1 add rewrite action my-cookie-encrypt-action replace "HTTP.RES.
 SET_COOKIE.COOKIE("MyCookie").VALUE(0)" "HTTP.RES.SET_COOKIE.COOKIE(
 "MyCookie").VALUE(0).ENCRYPT"
```

```
2
3 add rewrite action my-cookie-decrypt-action replace "HTTP.REQ.COOKIE.
 VALUE("MyCookie")" "HTTP.REQ.COOKIE.VALUE("MyCookie").DECRYPT"
4 <!--NeedCopy-->
```

After you configure policies for encryption and decryption, save the configuration to bring the policies into effect.

### **Configure encryption key for third-party encryption**

In Advanced policy expressions, you can use ENCRYPT and DECRYPT functions for encrypting and decrypting text in a request or response. The data encrypted by the ENCRYPT function on an appliance (standalone, high availability, or cluster) is intended to be decrypted by the DECRYPT function by the same appliance. The appliance supports RC4, DES, Triple-DES, AES92, and AES256 encryption methods and each of these methods use a secret key for both encryption and decryption of data. You can use any of these methods to encrypt and decrypt data in two ways - self-encryption and third-party encryption.

The self-encryption feature in an appliance (standalone, high availability or cluster) encrypts and then decrypts data by evaluating the header value. One example to understand this is the HTTP Cookie encryption. The expression evaluates the header, encrypts the HTTP cookie value in the Set-Cookie header in the outgoing response and then decrypts the cookie value when it is returned in the cookie header of a subsequent incoming request from the client. The key value is not user configurable, instead when an encryption method is configured in the set ns encryptionParams command, the appliance automatically generates a random key value for the configured method. By default, the command uses the AES256 encryption method, which is the highly secured method and Citrix recommends this method.

The third-party encryption feature encrypts or decrypts data with a third-party application. For example, a client may encrypt data in a request and the appliance decrypts the data before sending it the back-end server or vice versa. To perform this, the appliance and the third party application must share a secret key. On the appliance, you can directly configure the secret key using an encryption key object and key value is automatically generated by the appliance for a stronger encryption. The same key is manually configured on the third-party appliance so that both appliance and third-party application can use the same key for encrypting and decryption data.

Note: Using third-party encryption, you can also encrypt and decrypt XML payloads. For information about the functions for encrypting and decrypting XML payloads, see “Encrypting and Decrypting XML Payloads.”

## **Cipher methods**

A cipher method provides two functions: an encryption function that transforms a plaintext byte sequence into a ciphertext byte sequence, and a decryption function that transforms the ciphertext back to the plaintext. Cipher methods use byte sequences called keys to perform encryption and decryption. Cipher methods that use the same key for encryption and decryption are called symmetric. Cipher methods that use different keys for encryption and decryption are asymmetric. The most notable examples of asymmetric ciphers are in public key cryptography, which uses a public key available to anyone for encryption and a private key known only to the decrypter.

A good cipher method makes it infeasible to decrypt (“crack”) ciphertext if you don’t possess the key. “Infeasible” really means that cracking the ciphertext would take more time and computing resources than it is worth. As computers become more powerful and cheaper, ciphers that were formerly infeasible to crack become more feasible. Also, over time, flaws are found in cipher methods (or their implementations), making cracking easier. Newer cipher methods are therefore preferred over older ones. In general, longer length keys provide better security than shorter keys, at the cost of longer encryption and decryption times.

A cipher method can use stream ciphers or block ciphers. RC4 is the mostly secured stream ciphers and it is used only for legacy application. Block ciphers can include padding.

## **Stream ciphers**

A stream cipher method operates on individual bytes. Only one stream cipher is available on NetScaler- appliances: RC4, which uses a 128 bit (16 bytes) key length. For a given key, RC4 generates a pseudo-random sequence of bytes, call a keystream, which is X-ORed with the plaintext to produce the ciphertext. RC4 is no longer considered secure and should be used only if required by legacy applications.

## **Block ciphers**

A block cipher method operates on a fixed block of bytes. A NetScaler appliance provides two block ciphers: Data Encryption Standard (DES) and the Advanced Encryption Standard (AES). DES uses a block size of 8 bytes and (on a NetScaler appliance) two choices for key length: 64 bits (8 bytes), of which 56 bits are data and 8 bits are parity, and Triple-DES, a 192 bit (24 bytes) key length. AES has a block size of 16 bytes and (on NetScaler) three choices for key length: 128 bits (16 bytes), 192 bits (24 bytes) and 256 bits (32 bytes).

## Padding

If the plaintext for a block cipher is not an integral number of blocks, padding with more bytes might be required. For example, suppose the plaintext is “xyzyz”(hex 78797a7a79). For an 8-byte Triple-DES block, this value would have to be padded to create 8 bytes. The padding scheme must allow the decryption function to determine the length of the original plaintext after decryption. Following are some padding schemes currently in use (n is the number of bytes added):

- PKCS7: Adds n bytes of value n each. For example, 78797a7a79030303. This is the padding scheme used by OpenSSL and ENCRYPT() policy function. The PKCS5 padding scheme is the same as PKCS7.
- ANSI X.923: Adds n-1 zero bytes and a final byte of value n. For example, 78797a7a79000003.
- ISO 10126: Adds n-1 random bytes and a final byte of value n. For example, 78797a7a79xxxx03, where xx can be any byte value. The DECRYPT() policy function accepts this padding scheme, which also allows it to accept the PKCS7 and ANSI X.923 schemes.
- ISO/IEC 7816-4: Adds a 0x80 byte and n-1 zero bytes. For example, 78797a7a79800000. This is also call OneAndZeros padding.
- Zero: Adds n zero bytes. Example: 78797a7a79000000. This can only be used with plaintext that does not include NUL bytes.

If padding is used and the plaintext is an integral number of blocks, an extra block is typically added so that the decryption function can unambiguously determine the original plaintext length. For PCKS7 and 8 byte block, this would be 0808080808080808.

## Modes of operation

There are a number of different modes of operation for block ciphers, which specify how multiple blocks of plaintext are encrypted. Some modes use an initialization vector (IV), a block of data apart from the plaintext that is used to start the encryption process. It is a good practice to use a different IV for each encryption, so that the same plaintext produces different ciphertext. The IV does not need to be secret, and so is prepended to the ciphertext. Modes include:

- Electronic Codebook (ECB): Each block of plaintext is encrypted independently. An IV is not used. Padding is required if the plaintext is not a multiple of the cipher block size. The same plaintext and key always produces the same ciphertext. Because of this, ECB is considered less secure than other modes and should only be used for legacy applications.
- Cipher Block Chaining (CBC): Each block of plaintext is XORed with the previous ciphertext block, or the IV for the first block, before being encrypted. Padding is required if the plaintext is not a multiple of the cipher block size. This is the mode used with the NetScaler encryptionParams method.

- Cipher Feedback (CFB): The previous ciphertext block, or the IV for the first block, is encrypted and the output is XORed with the current plaintext block to create the current ciphertext block. The feedback can be 1 bit, 8 bits, or 128 bits. Since the plaintext is XORed with the cipher text, padding is not required.
- Output Feedback (OFB): A keystream is generated by applying the cipher successively to the IV and XORing the keystream blocks with the plaintext. Padding is not required.

**Configure encryption keys for third-party encryption** Following are the configuration tasks performed in configuring encryption key.

1. Adding an encryption key. Configures an encryption key for a specified cipher method with a specified key value.
2. Modifying an encryption key. You can edit parameters for a configured encryption key.
3. Unsetting an encryption key. Sets parameters for a configured encryption key to their default values. An encryptionKey value with the name must exist. Sets padding to DEFAULT (determined by the method), Deletes an existing IV, which causes ENCRYPT() to generate a random IV. Deletes an existing comment. The method and key value cannot be reset.
4. Removing an encryption key. Deletes a configured encryption key. The key cannot have any references.
5. Show an encryption key. Displays parameters for the configured encryption key or all configured keys. If the name is omitted, the key value is not displayed.

**Add an encryption key by using the CLI** At the command prompt, type:

```
add ns encryptionKey <name> -method <method> [-keyValue <keyvalue>] [-padding (OFF | ON)] [-iv <hexstring>] -keyValue <keyvalue> [-comment <string>]
```

Where,

```
1 <method> = (NONE | RC4 | DES3 | AES128 | AES192 | AES256 | DES | DES-
 CBC | DES-CFB | DES-OFB | DES-ECB | DES3-CBC | DES3-CFB | DES3-OFB |
 DES3-ECB | AES128-CBC | AES128-CFB | AES128-OFB | AES128-ECB |
 AES192-CBC | AES192-CFB | AES192-OFB | AES192-ECB | AES256-CBC |
 AES256-CFB | AES256-OFB | AES256-ECB) <hexstring> = hex-encoded
 byte sequence
2 <!--NeedCopy-->
```

The above encryption methods specify the operation mode with CBC as the default mode of operation. Therefore, DES, DES2, AES128, AES192, and AES256 methods are equivalent to DES-CBC, DES3-CBC, AES128-CBC, AES192-CBC, and AES256-CBC methods.

**Modify an encryption key by using the CLI** At the command prompt, type:

```
set ns encryptionKey <name> [-method <method>] [-keyValue <keyvalue>]
[-padding (OFF | ON)] [-iv <string>] [-comment <string>]
```

**Unset an encryption key by using the CLI** At the command prompt, type:

```
unset ns encryptionKey <name> [-padding] [-iv] [-comment]
```

**Remove an encryption key by using the CLI** At the command prompt, type:

```
rm ns encryptionKey <name>
```

**Show an encryption key by using the CLI** At the command prompt, type:

**Example:**

```
1 show ns encryptionKey [<name>]
2
3 add ns encryptionKey my_key -method aes256 -keyValue 26
 ea5537b7e0746089476e5658f9327c0b10c3b4778c673a5b38cee182874711 - iv
 c2bf0b2e15c15004d6b14bcd7e5e365
4 set ns encryptionKey my_key -keyValue
 b8742b163abcf62d639837bbee3cef9fb5842d82d00dfe6548831d2bd1d93476
5 unset ns encryptionKey my_key -iv
6 rm ns encryptionKey my_key
7 show ns encryptionKey my_key
8 Name: my_key
9 Method: AES256
10 Padding: DEFAULT
11 Key Value: (not disclosed)
12 <!--NeedCopy-->
```

**Add an encryption key by using the GUI** Navigate to **System > Encryption Keys** and click **Add** to create an encryption key.

**Modify an encryption key by using the GUI** Navigate to **System > Encryption Keys** and click **Edit** to modify parameters for a configured encryption key.

**Remove an encryption key by using the GUI** Navigate to **System > Encryption keys** and click **Delete**.

## ENCRYPT and DECRYPT functions for third-party encryption

Following is the ENCRYPT function used for third-part encryption.

```
ENCRYPT (encryptionKey, out_encoding)
```

Where,

Input data for the appliance is the text to be encrypted

**encryptionKey:** An optional string parameter that specifies the configured encryption key object to provide the encryption method, secret key value and other encryption parameters. If omitted, the method uses the automatically generated key value associated with the set ns encryptionParamS command.

**out\_encoding:** This value specifies how the output is encoded. If omitted, BASE64 encoding is used.

### Input:

```

1 BASE64: original PEM base64-encoding: 6 bits (0..63) encoded as one
 ASCII character:
2 0..23 = 'A'..'Z', 24..51 = 'a'..'z', 52..61 = '0'..'9
 ', 62 = '+', 63 = '/', '=' = pad byte.
3 BASE64URL: URL and Filename safe base64-encoding: same as BASE64
 except 62 = '-', 63 = '_'
4 HEX_UPPER: Hexadecimal with 0..9 = '0'..'9' and 10..15 = 'A'..'F'
 '.'
5 HEX_LOWER: Hexadecimal with 0..9 = '0'..'9' and 10..15 = 'a'..'f'
 '.'
6 HEX_COLONS: Hexadecimal with 0..9 = '0'..'9' and 10..15 = 'A'..'F'
 '; ':' between each hex byte. Matches BLOB_TO_HEX() output
 format
7 HEX: For input, accepts HEX_UPPER, HEX_LOWER, and HEX_COLONS
 format. For output, produces HEX_LOWER format
8 <!--NeedCopy-->

```

**Output:** The output is a text encrypted using the specified method and key and encoded using a specified output encoding. It inserts a generated IV before the encrypted text for block methods and modes that require an IV, and either no IV is specified for the encryptionKey or the encryptionKey is omitted.

Following is the DECRYPT function used for third-part decryption.

```
DECRYPT(encryptionKey, in_encoding)
```

Where,

Input data is an encrypted text using the specified method and key encoded using the specified input encoding. This text is expected to include a generated IV before the encrypted text for block methods and modes that require an IV, and either no IV is specified for the encryptionKey or the encryptionKey is omitted.

**encryptionKey**—An optional string parameter that specifies the configured encryptionKey object to provide the encryption method, secret key and other encryption parameters. If omitted, the method and automatically generated key associated with the encryptionParams setting will be used

**in\_encoding**—An optional enumeration parameter that specifies how the input is expected to be encoded. The values are the same as the out\_encoding of ENCRYPT. If omitted, BASE64 encoding will be expected.

The output data is an unencoded decrypted text.

**Variants and optional parameters** Following are the variants of these functions with the optional parameters:

---

| <b>Variant</b>                       | <b>Description</b>                                                       |
|--------------------------------------|--------------------------------------------------------------------------|
| ENCRYPT                              | Use encryptionParams command and BASE64 output encoding parameter.       |
| ENCRYPT(out_encoding)                | Use encryptionParams and specified output encoding parameter.            |
| ENCRYPT(encryptionKey)               | Use the specified encryptionKey and BASE64 output encoding parameter.    |
| ENCRYPT(encryptionKey, out_encoding) | Use the specified encryptionKey and output encoding parameter.           |
| DECRYPT                              | Use encryptionParams command and BASE64 input encoding parameter.        |
| DECRYPT(out_encoding)                | Use encryptionParams command and the specified input encoding parameter. |
| DECRYPT(encryptionKey)               | Use the specified encryptionKey and BASE64 input encoding parameter.     |
| DECRYPT(encryptionKey, out_encoding) | Use the specified encryptionKey and input encoding parameter.            |

---

### **Configure HMAC keys**

NetScaler appliances support a Hashed Message Authentication Code (HMAC) function that calculates a digest method or hash of input text by using a secret key shared between a message sender and message receiver. The digest method (derived from an RFC 2104 technique) authenticates the sender and verifies that the message content has not been altered. For example, when a client sends a message with the shared HMAC key to a NetScaler appliance, advanced (PI) policy expressions use the HMAC function to compute the hash-based code on the selected text. Then, when the receiver receives the

message with the secret key, it recomputes the HMAC by comparing it with the original HMAC to determine whether the message has been altered. The HMAC function is supported by standalone appliances and by appliances in a high availability configuration or in a cluster. Using it is similar to configuring an encryption key.

The `add ns hmacKey` and `set ns hmacKey` commands include a parameter that specifies the digest method and the shared secret key to use for the HMAC computation.

To configure a HMAC key, you must perform the following:

1. Adding an HMAC key. Configures an HMAC key with a specified key value.
2. Modifying an HMAC key. Modifies parameters for a configured HMAC key. The digest method can be changed without changing the key value, since the key value length is not determined by the digest. However, it is advisable to specify a new key when changing the digest.
3. Unsetting an HMAC key. Sets parameters for a configured HMAC key to their default values. An `hmacKey` object with the name must exist. The only parameter that can be unset is the comment, which is deleted.
4. Removing an HMAC key. Deletes a configured key. The key cannot have any references.
5. Show an HMAC key. Displays parameters for the configured HMAC key or all configured keys. If the name is omitted, the key value is not displayed.

### Configure a unique and random HMAC key

You can automatically generate a unique HMAC key. If your appliance is a cluster configuration, the HMAC key is generated at the start of the process and distributed to all nodes and packet engines. This ensures the HMAC key is the same for all packet engines and all nodes in the cluster.

At the command prompt, type:

```
add ns hmacKey <your_key> -digest <digest> -keyValue <keyvalue>
```

#### Example:

```
add ns hmacKey <name> -digest sha1 -keyValue AUTO
```

Where,

- Name syntax is correct and does not duplicate the name of an existing key.
- The “AUTO”keyValue can be used in the set commands to generate new keys for existing encryptionKey and hmacKey objects.

#### Note:

The automatic key generation is useful if the NetScaler appliance is encrypting and decrypting data with the key, or generating and verifying an HMAC key. Since the key value itself is already encrypted when displayed, you cannot retrieve the generated key value for use by any other

party.

**Example:**

```
add ns hmacKey my_hmac_key -digest sha1 -keyValue 0c753c6c5ef859189cacdf95b506
```

The above encryption methods specify the operation mode with CBC as the default mode of operation. Therefore, DES, DES2, AES128, AES192, and AES256 methods are equivalent to DES-CBC, DES3-CBC, AES128-CBC, AES192-CBC, and AES256-CBC methods.

**Modify an HMAC key by using the CLI**

This command modifies the parameters configured for an HMAC key. You can change the digest without changing the key value, since the key value length is not determined by the digest. However, it is advisable to specify a new key when changing the digest. At the command prompt, type:

```
1 set ns hmacKey <name> [-digest <digest>] [-keyValue <keyvalue>]
2 [-comment <string>]
3
4 <!--NeedCopy-->
```

**Unset an HMAC key by using the CLI**

This command sets parameters configured for an HMAC key with their default values. An hmacKey object with the name must exist. The only parameter that you can unset is the comment option, which is deleted. At the command prompt, type:

```
unset ns hmacKey <name> -comment
```

**Remove an HMAC key by using the CLI**

This command deletes the configured hmac key. The key cannot have references. At the command prompt, type:

```
rm ns hmacKey <name>
```

**Show an HMAC key by using the CLI**

At the command prompt, type:

```
1 show ns encryptionKey [<name>]
2
3 add ns hmacKey my_hmac_key -digest sha1 -keyValue 0
 c753c6c5ef859189cacdf95b506d02c1797407d
4 set ns hmacKey my_hmac_key -keyValue
 f348c594341a840a1f641a1cf24aa24c15eb1317
5 rm ns hmacKey my_hmac_key
6 show ns hmacKey my_hmac_key
7 Name: my_hmac_key
8 Digest: SHA1
9 Key Value: (not disclosed)
10 <!--NeedCopy-->
```

## Advanced policy expressions: Working with dates, times, and numbers

December 22, 2023

Most numeric data that the NetScaler appliance processes consists of dates and times. In addition to working with dates and times, the appliance processes other numeric data, such as the lengths of HTTP requests and responses. To process this data, you can configure advanced policy expressions that process numbers.

A numeric expression consists of an expression prefix that returns a number and sometimes, but not always, an operator that can perform an operation on the number. Examples of expression prefixes that return numbers are `SYS.TIME.DAY`, `HTTP.REQ.CONTENT_LENGTH`, and `HTTP.RES.BODY.LENGTH`. Numeric operators can work with any prefix expression that returns data in numeric format. The `GT(<int>)` operator, for example, can be used with any prefix expression, such as `HTTP.REQ.CONTENT_LENGTH`, that returns an integer.

### Format of dates and times in an expression

May 2, 2023

When configuring an advanced policy expression in a policy that works with dates and times (for example, the NetScaler system time or a date in an SSL certificate), you specify a time format as follows:

```
GMT|LOCAL [<yyyy>] [<month>] [<d>] [<h>] [<m>] [<s>]
```

Where:

- `<yyyy>` is a four-digit year after GMT or LOCAL.

- <month> is a three-character abbreviation for the month, for example, Jan, Dec.
- <d> is a day of the week or an integer for the date.

You cannot specify the day as Monday, Tuesday, and so on. You specify either an integer for a specific day of the month, or you specify a date as the first, second, third weekday of the month, and so on. Following are examples of specifying a day of the week:

- Sun\_1 is the first Sunday of the month.
  - Sun\_3 is the third Sunday of the month.
  - Wed\_3 is the third Wednesday of the month.
  - 30 is an example of an exact date in a month.
- 
- <h> is the hour, for example, 10h.
  - <s> is the number of seconds, for example, 30s.

The following example expression is true if the date is between 2008 Jan and 2009 Jan, based on GMT.

```
http.req.date.between(GMT 2008 Jan, GMT 2009 Jan)
```

The following example expression is true for March and all months that follow March in the calendar year, based on GMT:

```
sys.time.ge(GMT 2008 Mar)
```

When you specify a date and time, note that the format is case sensitive and must preserve the exact number of blank spaces between entries.

```
1 **Note:**
2
3 In an expression that requires two time values, both must use GMT or
 both must use LOCAL. You cannot mix the two in an expression.
4
5 Unlike when you use the SYS.TIME prefix in an advanced policy
 expression, if you specify SYS.TIME in a rewrite action, the
 NetScaler returns a string in conventional date format (for example,
 Sun, 06 Nov 1994 08:49:37 GMT). For example, the following rewrite
 action replaces the http.res.date header with the NetScaler system
 time in a conventional date format:
6
7 add rewrite action sync_date replace http.res.date sys.time
```

## Expressions for the NetScaler system time

May 2, 2023

The SYS.TIME expression prefix extracts the NetScaler system time. You can configure expressions that establish whether a particular event occurred at a particular time or within a particular time range according to the NetScaler system time.

The following table describes the expressions that you can create by using the SYS.TIME prefix.

- **SYS.TIME.BETWEEN(<time1>, <time2>):**

Returns a Boolean TRUE if the returned value is later than <time1> and earlier than <time2>.

You format the <time1>, <time2> arguments as follows:

- They must both be GMT or both LOCAL.
- <time2> must be later than <time1>.

For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following:

- sys.time.between(GMT 2004, GMT 2006)
- sys.time.between(GMT 2004 Jan, GMT 2006 Nov)
- sys.time.between(GMT 2004 Jan, GMT 2006)
- sys.time.between(GMT 2005 May Sun\_1, GMT 2005 May Sun\_3)
- sys.time.between(GMT 2005 May 1, GMT May 2005 1)
- sys.time.between(LOCAL 2005 May 1, LOCAL May 2005 1)

- **SYS.TIME.DAY:**

Returns the current day of the month as a number from 1 through 31.

- **SYS.TIME.EQ(<time>):**

Returns a Boolean TRUE if the current time is equal to the <time> argument.

For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following (evaluation results are shown in parentheses):

- sys.time.eq(GMT 2005) (TRUE in this example.)
- sys.time.eq(GMT 2005 Dec) (FALSE in this example.)
- sys.time.eq(LOCAL 2005 May) (Evaluates to TRUE or FALSE in this example, depending on the current time zone.)
- sys.time.eq(GMT 10h) (TRUE in this example.)
- sys.time.eq(GMT 10h 30s) (TRUE in this example.)
- sys.time.eq(GMT May 10h) (TRUE in this example.)
- sys.time.eq(GMT Sun) (TRUE in this example.)
- sys.time.eq(GMT May Sun\_1) (TRUE in this example.)

- **SYS.TIME.NE(<time>):**

Returns a Boolean TRUE if the current time is not equal to the <time> argument.

- **SYS.TIME.GE(<time>):**

Returns a Boolean TRUE if the current time is later than or equal to <time>.

For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following (evaluation results are shown in parentheses):

- sys.time.ge(GMT 2004) (TRUE in this example.)
- sys.time.ge(GMT 2005 Jan) (TRUE in this example.)
- sys.time.ge(LOCAL 2005 May) (TRUE or FALSE in this example, depending on the current time zone.)
- sys.time.ge(GMT 8h) (TRUE in this example.)
- sys.time.ge(GMT 30m) (FALSE in this example.)
- sys.time.ge(GMT May 10h) (TRUE in this example.)
- sys.time.ge(GMT May 10h 0m) (TRUE in this example.)
- sys.time.ge(GMT Sun) (TRUE in this example.)
- sys.time.ge(GMT May Sun\_1) (TRUE in this example.)

- **SYS.TIME.GT(<time>):**

Returns a Boolean TRUE if the time value is later than the <time> argument.

For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following (evaluation results are shown in parentheses):

- sys.time.gt(GMT 2004) (TRUE in this example.)
- sys.time.gt(GMT 2005 Jan) (TRUE in this example.)
- sys.time.gt(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone. )
- sys.time.gt(GMT 8h) (TRUE in this example.)
- sys.time.gt(GMT 30m) (FALSE in this example.)
- sys.time.gt(GMT May 10h) (FALSE in this example.)
- sys.time.gt(GMT May 10h 0m) (TRUE in this example.)
- sys.time.gt(GMT Sun) (FALSE in this example.)
- sys.time.gt(GMT May Sun\_1) (FALSE in this example.)

- **SYS.TIME.HOURS:**

Returns the current hour as an integer from 0 to 23.

- **SYS.TIME.LE(<time>):**

Returns a Boolean TRUE if the current time value precedes or is equal to the <time> argument.

For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following (evaluation results are shown in parentheses):

- sys.time.le(GMT 2006) (TRUE in this example.)

- `sys.time.le(GMT 2005 Dec)` (TRUE in this example.)
- `sys.time.le(LOCAL 2005 May)` (TRUE or FALSE depending on the current timezone. )
- `sys.time.le(GMT 8h)` (FALSE in this example.)
- `sys.time.le(GMT 30m)` (TRUE in this example.)
- `sys.time.le(GMT May 10h)` (TRUE in this example.)
- `sys.time.le(GMT Jun 11h)` (TRUE in this example.)
- `sys.time.le(GMT Wed)` (TRUE in this example.)
- `sys.time.le(GMT May Sun_1)` (TRUE in this example.)

- **SYS.TIME.LT(<time>):**

Returns a Boolean TRUE if the current time value precedes the <time> argument.

For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following (evaluation results are shown in parentheses):

- `sys.time.lt(GMT 2006)` (TRUE in this example.)
- `sys.time.lt.time.lt(GMT 2005 Dec)` (TRUE in this example.)
- `sys.time.lt(LOCAL 2005 May)` (TRUE or FALSE depending on the current time zone.)
- `sys.time.lt(GMT 8h)` (FALSE in this example.)
- `sys.time.lt(GMT 30m)` (TRUE in this example.)
- `sys.time.lt(GMT May 10h)` (FALSE in this example.)
- `sys.time.lt(GMT Jun 11h)` (TRUE in this example.)
- `sys.time.lt(GMT Wed)` (TRUE in this example.)
- `sys.time.lt(GMT May Sun_1)` (FALSE in this example.)

- **SYS.TIME.MINUTES:**

Returns the current minute as an integer from 0 to 59.

- **SYS.TIME.MONTH:**

Extracts the current month and returns an integer from 1 (January) to 12 (December).

- **SYS.TIME.RELATIVE\_BOOT:**

Calculates the number of seconds to the closest previous or scheduled reboot, and returns an integer.

If the closest boot time is in the past, the integer is negative. If it is in the future, the integer is positive.

- **SYS.TIME.RELATIVE\_NOW:**

Calculates the number of seconds between the current NetScaler system time and the specified time, and returns an integer showing the difference.

If the designated time is in the past, the integer is negative; if it is in the future, the integer is positive.

- **SYS.TIME.SECONDS:**

Extracts the seconds from the current NetScaler system time, and returns that value as an integer from 0 to 59.

- **SYS.TIME.WEEKDAY:**

Returns the current weekday as a value from 0 (Sunday) to 6 (Saturday).

- **SYS.TIME.WITHIN (<time1>, <time2>):**

If you omit an element of time in <time1>, for example, the day or hour, it is assumed to have the lowest value in its range. If you omit an element in <time2>, it is assumed to have the highest value of its range.

The ranges for the elements of time are as follows: month 1-12, day 1-31, weekday 0-6, hour 0-23, minutes 0-59 and seconds 0-59. If you specify the year, you must do so in both <time1> and <time2>.

For example, if the time is GMT 2005 May 10 10h 15m 30s, and it is the second Tuesday of the month, you can specify the following (evaluation results are shown in parentheses):

- sys.time.within(GMT 2004, GMT 2006) (TRUE in this example.)
- sys.time.within(GMT 2004 Jan, GMT 2006 Mar) (FALSE, May is not in the range of January to March.)
- sys.time.within(GMT Feb, GMT) (TRUE, May is in the range of February to December.)
- sys.time.within(GMT Sun\_1, GMT Sun\_3) (TRUE, the second Tuesday is between the first Sunday and the third Sunday.)
- sys.time.within(GMT 2005 May 1 10h, GMT May 2005 1 17h) (TRUE in this example.)
- sys.time.within(LOCAL 2005 May 1, LOCAL May 2005 1) (TRUE or FALSE, depending on the NetScaler system time zone.)

- **SYS.TIME.YEAR:**

Extracts the year from the current system time and returns that value as a four-digit integer.

## Expressions for SSL certificate dates

May 2, 2023

You can determine the validity period for SSL certificates by configuring an expression that contains the following prefix:

`CLIENT.SSL.CLIENT_CERT`

The following example expression matches a particular time for expiration with the information in the certificate:

```
client.ssl.client_cert.valid_not_after.eq(GMT 2009)
```

The following table describes time-based operations on SSL certificates. To obtain the expression you want, replace *certificate* in the expression in the first column with the prefix expression, “CLIENT.SSL.CLIENT\_CERT”.

- **<certificate>.VALID\_NOT\_AFTER:**

Returns the last day before certificate expiration. The return format is the number of seconds since GMT January 1, 1970 (0 hours, 0 minutes, 0 seconds).

- **<certificate>.VALID\_NOT\_AFTER.BETWEEN(<time1>, <time2>):**

Returns a Boolean TRUE value if the certificate validity is between the <time1> and <time2> arguments. Both <time1> and <time2> must be fully specified. Following are examples:

GMT 1995 Jan is fully specified.

GMT Jan is not fully specified

GMT 1995 20 is not fully specified.

GMT Jan Mon\_2 is not fully specified.

The <time1> and <time2> arguments must be both GMT or both LOCAL, and <time2> must be greater than <time1>.

For example, if it is GMT 2005 May 1 10h 15m 30s, and the first Sunday of the month, you can specify the following (evaluation results are in parentheses).

- . . .between(GMT 2004, GMT 2006) (TRUE)
- . . .between(GMT 2004 Jan, GMT 2006 Nov) (TRUE)
- . . .between(GMT 2004 Jan, GMT 2006) (TRUE)
- . . .between(GMT 2005 May Sun\_1, GMT 2005 May Sun\_3) (TRUE)
- . . .between(GMT 2005 May 1, GMT May 2005 1) (TRUE)
- . . .between(LOCAL 2005 May 1, LOCAL May 2005 1) (TRUE or FALSE, depending on the NetScaler system time zone.)

- **<certificate>.VALID\_NOT\_AFTER.DAY:**

Extracts the last day of the month that the certificate is valid, and returns a number from 1 through 31, as appropriate for the date.

- **<certificate>.VALID\_NOT\_AFTER.EQ(<time>):**

Returns a Boolean TRUE if the time is equal to the <time> argument.

For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following (evaluation results for this example are in parentheses):

- ...eq(GMT 2005) (TRUE)
- ...eq(GMT 2005 Dec) (FALSE)
- ...eq(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone)
- ...eq(GMT 10h) (TRUE)
- ...eq(GMT 10h 30s) (TRUE)
- ...eq(GMT May 10h) (TRUE)
- ...eq(GMT Sun) (TRUE)
- ...eq(GMT May Sun\_1) (TRUE)

• **<certificate>.VALID\_NOT\_AFTER.GE(<time>):**

Returns a Boolean TRUE if the time value is greater than or equal to the argument <time>.

For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):

- ...ge(GMT 2004) (TRUE)
- ...ge(GMT 2005 Jan) (TRUE)
- ...ge(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
- ...ge(GMT 8h) (TRUE)
- ...ge(GMT 30m) (FALSE)
- ...ge(GMT May 10h) (TRUE)
- ...ge(GMT May 10h 0m) (TRUE)
- ...ge(GMT Sun) (TRUE)
- ...ge(GMT May Sun\_1) (TRUE)

• **<certificate>.VALID\_NOT\_AFTER.GT(<time>):**

Returns a Boolean TRUE if the time value is greater than the argument <time>.

For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):

- ...gt(GMT 2004) (TRUE)
- ...gt(GMT 2005 Jan) (TRUE)
- ...gt(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
- ...gt(GMT 8h) (TRUE)
- ...gt(GMT 30m) (FALSE)
- ...gt(GMT May 10h) (FALSE)
- ...gt(GMT Sun) (FALSE)

- . . .gt(GMT May Sun\_1) (FALSE)

- **<certificate>.VALID\_NOT\_AFTER.HOURS:**

Extracts the last hour that the certificate is valid and returns that value as an integer from 0 to 23.

- **<certificate>.VALID\_NOT\_AFTER.LE(<time>):**

Returns a Boolean TRUE if the time precedes or is equal to the <time> argument.

For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):

- . . .le(GMT 2006) (TRUE)
- . . .le(GMT 2005 Dec) (TRUE)
- . . .le(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
- . . .le(GMT 8h) (FALSE)
- . . .le(GMT 30m) (TRUE)
- . . .le(GMT May 10h) (TRUE)
- . . .le(GMT Jun 11h) (TRUE)
- . . .le(GMT Wed) (TRUE)
- . . .le(GMT May Sun\_1) (TRUE)

- **<certificate>.VALID\_NOT\_AFTER.LT(<time>):**

Returns a Boolean TRUE if the time precedes the <time> argument.

For example, if the current time is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month, you can specify the following:

- . . .lt(GMT 2006) (TRUE)
- . . .lt(GMT 2005 Dec) (TRUE)
- . . .lt(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
- . . .lt(GMT 8h) (FALSE)
- . . .lt(GMT 30m) (TRUE)
- . . .lt(GMT May 10h) (FALSE)
- . . .lt(GMT Jun 11h) (TRUE)
- . . .lt(GMT Wed) (TRUE)
- . . .lt(GMT May Sun\_1) (FALSE)

- **<certificate>.VALID\_NOT\_AFTER.MINUTES:**

Extracts the last minute that the certificate is valid and returns that value as an integer from 0 to 59.

- **<certificate>.VALID\_NOT\_AFTER.MONTH:**

Extracts the last month that the certificate is valid and returns that value as an integer from 1 (January) to 12 (December).

- **<certificate>.VALID\_NOT\_AFTER.RELATIVE\_BOOT:**

Calculates the number of seconds to the closest previous or scheduled reboot and returns an integer. If the closest boot time is in the past, the integer is negative. If it is in the future, the integer is positive.

- **<certificate>.VALID\_NOT\_AFTER.RELATIVE\_NOW;**

Calculates the number of seconds between the current system time and the specified time and returns an integer. If the time is in the past, the integer is negative; if it is in the future, the integer is positive.

- **<certificate>.VALID\_NOT\_AFTER.SECONDS:**

Extracts the last second that the certificate is valid and returns that value as an integer from 0 to 59.

- **<certificate>.VALID\_NOT\_AFTER.WEEKDAY:**

Extracts the last weekday that the certificate is valid. Returns a number between 0 (Sunday) and 6 (Saturday) to give the weekday in the time value.

- **<certificate>.VALID\_NOT\_AFTER.WITHIN(<time1>, <time2>):**

Returns a Boolean TRUE if the time lies within all the ranges defined by the elements in <time1> and <time2>.

If you omit an element of time from <time1>, it is assumed to have the lowest value in its range. If you omit an element from <time2>, it is assumed to have the highest value of its range. If you specify a year in <time1>, you must specify it in <time2>.

The ranges for elements of time are as follows: month 1-12, day 1-31, weekday 0-6, hour 0-23, minutes 0-59 and seconds 0-59. For the result to be TRUE, each element in the time must exist in the corresponding range that you specify in <time1>, <time2>.

For example, if time is GMT 2005 May 10 10h 15m 30s, and it is the second Tuesday of the month, you can specify the following (evaluation results are in parentheses):

- . . .within(GMT 2004, GMT 2006) (TRUE)
- . . .within(GMT 2004 Jan, GMT 2006 Mar) (FALSE, May is not in the range of January to March.)
- . . .within(GMT Feb, GMT) (TRUE, May is in the range for February to December)
- . . .within(GMT Sun\_1, GMT Sun\_3) (TRUE, the second Tuesday lies within the range of the first Sunday through the third Sunday)

- . . .within(GMT 2005 May 1 10h, GMT May 2005 1 17h) (TRUE)
- . . .within(LOCAL 2005 May 1, LOCAL May 2005 1) (TRUE or FALSE, depending on the NetScaler system time zone)

- **<certificate>.VALID\_NOT\_AFTER.YEAR:**

Extracts the last year that the certificate is valid and returns a four-digit integer.

- **<certificate>.VALID\_NOT\_BEFORE:**

Returns the date that the client certificate becomes valid.

The return format is the number of seconds since GMT January 1, 1970 (0 hours, 0 minutes, 0 seconds).

- **<certificate>.VALID\_NOT\_BEFORE.BETWEEN(<time1>, <time2>):**

Returns a Boolean TRUE if the time value is between the two time arguments. Both <time1> and <time2> arguments must be fully specified.

Following are examples:

GMT 1995 Jan is fully specified.

GMT Jan is not fully specified.

GMT 1995 20 is not fully specified.

GMT Jan Mon\_2 is not fully specified.

The time arguments must be both GMT or both LOCAL, and <time2> must be greater than <time1>.

For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):

- . . .between(GMT 2004, GMT 2006) (TRUE)
- . . .between(GMT 2004 Jan, GMT 2006 Nov) (TRUE)
- . . .between(GMT 2004 Jan, GMT 2006) (TRUE)
- . . .between(GMT 2005 May Sun\_1, GMT 2005 May Sun\_3) (TRUE)
- . . .between(GMT 2005 May 1, GMT May 2005 1) (TRUE)
- . . .between(LOCAL 2005 May 1, LOCAL May 2005 1) (TRUE or FALSE, depending on the NetScaler system time zone.)

- **<certificate>.VALID\_NOT\_BEFORE.DAY:**

Extracts the last day of the month that the certificate is valid and returns that value as a number from 1 through 31 representing that day.

- **<certificate>.VALID\_NOT\_BEFORE.EQ(<time>):**

Returns a Boolean TRUE if the time is equal to the <time> argument.

For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):

- . . .eq(GMT 2005) (TRUE)
- . . .eq(GMT 2005 Dec) (FALSE)
- . . .eq(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
- . . .eq(GMT 10h) (TRUE)
- . . .eq(GMT 10h 30s) (TRUE)
- . . .eq(GMT May 10h) (TRUE)
- . . .eq(GMT Sun) (TRUE)
- . . .eq(GMT May Sun\_1) (TRUE)

• **<certificate>.VALID\_NOT\_BEFORE.GE(<time>):**

Returns a Boolean TRUE if the time is greater than (after) or equal to the <time> argument.

For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results are in parentheses):

- . . .ge(GMT 2004) (TRUE)
- . . .ge(GMT 2005 Jan) (TRUE)
- . . .ge(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
- . . .ge(GMT 8h) (TRUE)
- . . .ge(GMT 30m) (FALSE)
- . . .ge(GMT May 10h) (TRUE)
- . . .ge(GMT May 10h 0m) (TRUE)
- . . .ge(GMT Sun) (TRUE)
- . . .ge(GMT May Sun\_1) (TRUE)

• **<certificate>.VALID\_NOT\_BEFORE.GT(<time>):**

Returns a Boolean TRUE if the time occurs after the <time> argument.

For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results are in parentheses):

- . . .gt(GMT 2004) (TRUE)
- . . .gt(GMT 2005 Jan) (TRUE)
- . . .gt(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
- . . .gt(GMT 8h) (TRUE)
- . . .gt(GMT 30m) (FALSE)
- . . .gt(GMT May 10h) (FALSE)
- . . .gt(GMT May 10h 0m) (TRUE)
- . . .gt(GMT Sun) (FALSE)

- . . .gt(GMT May Sun\_1) (FALSE)

- **<certificate>.VALID\_NOT\_BEFORE.HOURS:**

Extracts the last hour that the certificate is valid and returns that value as an integer from 0 to 23.

- **\*\*<certificate>.VALID\_NOT\_BEFORE.LE(<time>)**

Returns a Boolean TRUE if the time precedes or is equal to the <time> argument.

For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):

- . . .le(GMT 2006) (TRUE)
- . . .le(GMT 2005 Dec) (TRUE)
- . . .le(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
- . . .le(GMT 8h) (FALSE)
- . . .le(GMT 30m) (TRUE)
- . . .le(GMT May 10h) (TRUE)
- . . .le(GMT Jun 11h) (TRUE)
- . . .le(GMT Wed) (TRUE)
- . . .le(GMT May Sun\_1) (TRUE)

- **<certificate>.VALID\_NOT\_BEFORE.LT(<time>):**

Returns a Boolean TRUE if the time precedes the <time> argument.

For example, if the time value is GMT 2005 May 1 10h 15m 30s, and it is the first Sunday of the month of May in 2005, you can specify the following (evaluation results for this example are in parentheses):

- . . .lt(GMT 2006) (TRUE)
- . . .lt(GMT 2005 Dec) (TRUE)
- . . .lt(LOCAL 2005 May) (TRUE or FALSE, depending on the current time zone.)
- . . .lt(GMT 8h) (FALSE)
- . . .lt(GMT 30m) (TRUE)
- . . .lt(GMT May 10h) (FALSE)
- . . .lt(GMT Jun 11h) (TRUE)
- . . .lt(GMT Wed) (TRUE)
- . . .lt(GMT May Sun\_1) (FALSE)

- **<certificate>.VALID\_NOT\_BEFORE.MINUTES:**

Extracts the last minute that the certificate is valid. Returns the current minute as an integer from 0 to 59.

- **<certificate>.VALID\_NOT\_BEFORE.MONTH:**

Extracts the last month that the certificate is valid. Returns the current month as an integer from 1 (January) to 12 (December).

- **<certificate>.VALID\_NOT\_BEFORE.RELATIVE\_BOOT:**

Calculates the number of seconds to the closest previous or scheduled NetScaler reboot and returns an integer. If the closest boot time is in the past, the integer is negative; if it is in the future, the integer is positive.

- **<certificate>.VALID\_NOT\_BEFORE.RELATIVE\_NOW:**

Returns the number of seconds between the current NetScaler system time and the specified time as an integer. If the designated time is in the past, the integer is negative. If it is in the future, the integer is positive.

- **<certificate>.VALID\_NOT\_BEFORE.SECONDS:**

Extracts the last second that the certificate is valid. Returns the current second as an integer from 0 to 59.

- **<certificate>.VALID\_NOT\_BEFORE.WEEKDAY:**

Extracts the last weekday that the certificate is valid. Returns the weekday as a number between 0 (Sunday) and 6 (Saturday).

- **<certificate>.VALID\_NOT\_BEFORE.WITHIN(<time1>, <time2>):**

Returns a Boolean TRUE if each element of time exists within the range defined in the <time1>, <time2> arguments.

If you omit an element of time from <time1>, it is assumed to have the lowest value in its range. If you omit an element of time from <time2>, it is assumed to have the highest value in its range. If you specify a year in <time1>, it must be specified in <time2>. The ranges for elements of time are as follows: month 1-12, day 1-31, weekday 0-6, hour 0-23, minutes 0-59 and seconds 0-59.

For example, if the time is GMT 2005 May 10 10h 15m 30s, and it is the second Tuesday of the month, you can specify the following (evaluation results are in parentheses):

- . . .within(GMT 2004, GMT 2006) (TRUE)
- . . .within(GMT 2004 Jan, GMT 2006 Mar) (FALSE, May is not in the range of January to March.)
- . . .within(GMT Feb, GMT) (TRUE, May is in the range of February to December.)
- . . .within(GMT Sun\_1, GMT Sun\_3) (TRUE, the second Tuesday is between the first Sunday and the third Sunday.)
- . . .within(GMT 2005 May 1 10h, GMT May 2005 1 17h) (TRUE)
- . . .within(LOCAL 2005 May 1, LOCAL May 2005 1) (TRUE or FALSE, depending on the NetScaler system time zone)

- **<certificate>.VALID\_NOT\_BEFORE.YEAR:**

Extracts the last year that the certificate is valid. Returns the current year as a four-digit integer.

## Expressions for HTTP request and response dates

July 2, 2021

The following expression prefixes return the contents of the HTTP Date header as text or as a date object. These values can be evaluated as follows:

- As a number. The numeric value of an HTTP Date header is returned in the form of the number of seconds since Jan 1, 1970.

For example, the expression `http.req.date.mod(86400)` returns the number of seconds since the beginning of the day. These values can be evaluated using the same operations as other non-date-related numeric data. For more information, see [Expression prefixes for numeric data other than date and time](#).

- As an HTTP header. Date headers can be evaluated using the same operations as other HTTP headers.

For more information, see [Advanced policy expressions: Parsing HTTP, TCP, and UDP data](#).

- As text. Date headers can be evaluated using the same operations as other strings.

For more information, see [Advanced Policy Expressions: Evaluating Text](#).

---

| Prefix        | Description                                                                                                                                                                                                                     |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HTTP.REQ.DATE | Returns the contents of the HTTP Date header as text or as a date object. The date formats recognized are: RFC822. Sun, 06 Jan 1980 08:49:37 GMT, RFC850. Sunday, 06-Jan-80 09:49:37 GMT, and ASCTIME. Sun Jan 6 08:49:37 1980. |
| HTTP.RES.DATE | Returns the contents of the HTTP Date header as text or as a date object. The date formats recognized are: RFC822. Sun, 06 Jan 1980 8:49:37 GMT, RFC850. Sunday, 06-Jan-80 9:49:37 GMT, and ASCTIME. Sun Jan 6 08:49:37 1980.   |

## Generate the day of the week, as a string, in short and long formats

September 21, 2020

The functions, `WEEKDAY_STRING_SHORT` and `WEEKDAY_STRING`, generate the day of the week, as a string, in short and long formats, respectively. The strings that are returned are always in English. The prefix used with these functions must return the day of the week in integer format and the acceptable range for the value returned by the prefix is 0-6. Therefore, you can use any prefix that returns an integer in the acceptable range. An UNDEF condition is raised if the returned value is not in this range or if memory allocation fails.

Following are the descriptions of the functions:

---

| Function                                         | Description                                                                                                                                                                                                                                                                                                                                               |
|--------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;prefix&gt;.WEEKDAY_STRING_SHORT</code> | Returns the day of the week in short format. The short form is always 3 characters long with an initial capital and the remaining characters in lower case. For example, <code>SYS.TIME.WEEKDAY.WEEKDAY_STRING_SHORT</code> returns Sun if the value returned by the <code>WEEKDAY</code> function is 0 and Sat if the value returned by the prefix is 6. |
| <code>&lt;prefix&gt;.WEEKDAY_STRING</code>       | Returns the day of the week in long format. The long form always has an initial capital, with the remaining characters in lower case. For example, <code>SYS.TIME.WEEKDAY.WEEKDAY_STRING</code> returns Sunday if the value returned by the <code>WEEKDAY</code> function is 0 and Saturday if the value returned by the prefix is 6.                     |

---

## Expression prefixes for numeric data other than date and time

September 21, 2020

In addition to configuring expressions that operate on time, you can configure expressions for the following types of numeric data:

- The length of HTTP requests, the number of HTTP headers in a request, and so on.

For more information, see [Expressions for numeric HTTP payload data other than dates](#).

- IP and MAC addresses.

For more information, see [Expressions for IP addresses and IP subnets](#).

- Client and server data in regard to interface IDs and transaction throughput rate.

For more information, see [Expressions for numeric client and server data](#).

- Numeric data in client certificates other than dates.

For information on these prefixes, including the number of days until certificate expiration and the encryption key size, see [Prefixes for numeric data in SSL certificates](#).

## Convert numbers to text

December 21, 2023

The following functions produce binary strings from a number returned by an expression prefix. These functions are particularly useful in the TCP rewrite feature as replacement strings for binary data. For more information about the TCP rewrite feature, see [Rewrite](#).

All the functions return a value of type text. The endianness that some of the functions accept as a parameter is either LITTLE\_ENDIAN or BIG\_ENDIAN.

| Function                        | Description                                                                                                                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>.SIGNED8_STRING</code>    | Produces an 8-bit signed binary string representing the number. If the value is out of range, an undef condition is raised. Example: <code>HTTP.REQ.BODY(100).GET_SIGNED8(16).SUB(3).SIGNED8_STRING</code>                                   |
| <code>.UNSIGNED8_STRING</code>  | Produces an 8-bit unsigned binary string representing the number. If the value is out of range, an undef condition is raised. Example: <code>HTTP.REQ.BODY(100).GET_UNSIGNED8(31).ADD(3).UNSIGNED8_STRING</code>                             |
| <code>.SIGNED16_STRING()</code> | Produces a 16-bit signed binary string representing the number. If the value is out of range, an undef condition is raised. Example: <code>HTTP.REQ.BODY(100).SKIP(12).GET_SIGNED16(0, BIG_ENDIAN).SUB(4).SIGNED16_STRING(BIG_ENDIAN)</code> |

| Function                          | Description                                                                                                                                                                                                                                                      |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>.UNSIGNED16_STRING()</code> | Produces a 16-bit unsigned binary string representing the number. If the value is out of range, an undef condition is raised. Example:<br><code>HTTP.REQ.BODY(100).GET_UNSIGNED16(47, LITTLE_ENDIAN).ADD(7).UNSIGNED16_STRING(LITTLE_ENDIAN)</code>              |
| <code>.SIGNED32_STRING()</code>   | Produces a 32-bit signed binary string representing the number. Example:<br><code>HTTP.REQ.BODY(100).AFTER_STR("delim").GET_SIGNED32(0, BIG_ENDIAN).SUB(1).SIGNED32_STRING(BIG_ENDIAN)</code>                                                                    |
| <code>.UNSIGNED8_STRING</code>    | Produces an 8-bit unsigned binary string representing the number. If the value is out of range, an undef condition is raised. Example:<br><code>HTTP.REQ.BODY(100).GET_UNSIGNED8(24).TYPECAST_UNSIGNED_LONG_AT.ADD(10).UNSIGNED8_STRING</code>                   |
| <code>.UNSIGNED16_STRING()</code> | Produces a 16-bit unsigned binary string representing the number. If the value is out of range, an undef condition is raised. Example:<br><code>HTTP.REQ.BODY(100).GET_UNSIGNED16(23, LITTLE_ENDIAN).TYPECAST_UNSIGNED_LONG_AT.ADD(10).UNSIGNED16_STRING</code>  |
| <code>.UNSIGNED32_STRING()</code> | Produces a 32-bit unsigned binary string representing the number. If the value is out of range, an undef condition is raised. Example:<br><code>HTTP.REQ.BODY(100).AFTER_STR("delim2").GET_UNSIGNED32(0, BIG_ENDIAN).ADD(2).UNSIGNED32_STRING(BIG_ENDIAN)</code> |

## Virtual server based expressions

July 16, 2021

The `SYS.VSERVER("<vserver-name>")` expression prefix enables you to identify a virtual server. You can use the following functions with this prefix to retrieve information related to the specified virtual server:

- **THROUGHPUT.** Returns the throughput of the virtual server in Mbps (Megabits per second). The value returned is an unsigned long number.

**Usage:** SYS.VSERVER("vserver").THROUGHPUT

- **CONNECTIONS.** Returns the number of connections being managed by the virtual server. The value returned is an unsigned long number.

**Usage:** SYS.VSERVER("vserver").CONNECTIONS

- **STATE.** Returns the state of the virtual server. The value returned is UP, DOWN, or OUT\_OF\_SERVICE. One of these values can therefore be passed as an argument to the EQ() operator to perform a comparison that results in a Boolean TRUE or FALSE.

**Usage:** SYS.VSERVER("vserver").STATE

- **HEALTH.** Returns the percentage of services in an UP state for the specified virtual server. The value returned is an integer.

**Usage:** SYS.VSERVER("vserver").HEALTH

- **RESPTIME.** Returns the response time as an integer representing the number of microseconds. Response time is the average TTFB (Time To First Byte) from all the services bound to the virtual server.

**Usage:** SYS.VSERVER("vserver").RESPTIME

- **SURGECOUNT.** Returns the number of requests in the surge queue of the virtual server. The value returned is an integer.

**Usage:** SYS.VSERVER("vserver").SURGECOUNT

### Example 1:

The following rewrite policy aborts rewrite processing if the number of connections at the load balancing virtual server LBvserver exceeds 10000:

```
add rewrite policy norewrite_pol sys.vserver("LBvserver").connections
.gt(10000)norewrite
```

### Example 2:

The following rewrite action inserts a custom header, TP, whose value is the throughput at the virtual server LBvserver:

```
add rewrite action tp_header insert_http_header TP SYS.VSERVER("
LBvserver").THROUGHPUT
```

### Example 3:

The following audit log message action writes the average TTFB of the services bound to a virtual server, to the newnslog log file:

```
add audit messageaction log_vserver_resptime_act INFORMATIONAL "\"NS
Response Time to Servers:\" + sys.vserver(\"ssl\b\").resptime + \"
millisec\""-logtoNewslog YES
```

## Advanced policy expressions: Parsing HTTP, TCP, and UDP data

April 14, 2023

You can configure advanced policy expressions to evaluate the payload in an HTTP request or response. The payload associated with an HTTP connection includes HTTP headers (standard or custom headers), body, and connection URL. Also, you can evaluate and process the payload in a TCP or a UDP packet. For HTTP connections, for example, you can check whether a particular HTTP header is present or if the URL includes a particular query parameter.

You can configure expressions to transform the URL encoding and apply HTML or XML “safe” coding for subsequent evaluation. You can also use XPATH and JSON prefixes to evaluate data in XML and JSON files, respectively.

You can also use text-based and numeric Advanced policy expressions to evaluate HTTP request and response data. For more information, see [Advanced policy expressions: Evaluating text](#) and [Advanced policy Expressions: Working with Dates, Times, and Numbers](#).

## About evaluating HTTP and TCP payload

May 2, 2023

The payload of an HTTP request or response consists of HTTP protocol information such as headers, a URL, body content, and version and status information. When you configure a Advanced policy expression to evaluate HTTP payload, you use a Advanced policy expression prefix and, if necessary, an operator.

For example, you use the following expression, which includes the `http.req.header("<header_name>")` prefix and the exists operator, if you want to determine whether an HTTP connection includes a custom header named “myHeader”:

```
http.req.header("myHeader").exists
```

You can also combine multiple Advanced policy expressions with Boolean and arithmetic operators. For example, the following compound expression could be useful with various NetScaler features,

such as Integrated Caching, Rewrite, and Responder. This expression first uses the `&&` Boolean operator to determine whether an HTTP connection includes the Content-Type header with a value of "text/html." If that operation returns a value of FALSE, the expression determines whether the HTTP connection includes a "Transfer-Encoding" or "Content-Length" header.

```
(http.req.header("Content-Type").exists && http.req.header("Content-Type").eq("text/html")) || (http.req.header("Transfer-Encoding").exists) || (http.req.header("Content-Length").exists)
```

The payload of a TCP or UDP packet is the data portion of the packet. You can configure Advanced policy expressions to examine features of a TCP or UDP packet, including the following:

- Source and destination domains
- Source and destination ports
- The text in the payload
- Record types

The following expression prefixes extract text from the body of the payload:

- `HTTP.REQ.BODY(integer)`. Returns the body of an HTTP request as a multiline text object, up to the character position designated in the integer argument. If there are fewer characters in the body than is specified in the argument, the entire body is returned.
- `HTTP.RES.BODY(integer)`. Returns a portion of the HTTP response body. The length of the returned text is equal to the number in the integer argument. If there are fewer characters in the body than is specified in integer, the entire body is returned.
- `CLIENT.TCP.PAYLOAD(integer)`. Returns TCP payload data as a string, starting with the first character in the payload and continuing for the number of characters in the integer argument.

Following is an example that evaluates to TRUE if a response body of 1024 bytes contains the string "https", and this string occurs after the string "start string" and before the string "end string":

```
http.res.body(1024).after_str("start_string").before_str("end_string").contains("https")
```

**Note:** You can apply any text operation to the payload body. For information on operations that you can apply to text, see [Advanced policy expressions: Evaluating text](#).

## Expressions for identifying the protocol in an incoming IP packet

May 2, 2023

The following table lists the expressions that you can use to identify the protocol in an incoming packet.

---

| Expression           | Description                                              |
|----------------------|----------------------------------------------------------|
| CLIENT.IP.PROTOCOL   | Identifies the protocol in IPv4 packets sent by clients. |
| CLIENT.IPV6.PROTOCOL | Identifies the protocol in IPv6 packets sent by clients. |
| SERVER.IP.PROTOCOL   | Identifies the protocol in IPv4 packets sent by servers. |
| SERVER.IPV6.PROTOCOL | Identifies the protocol in IPv6 packets sent by servers. |

---

### Arguments to the PROTOCOL function

You can pass the Internet Assigned Numbers Authority (IANA) protocol number to the PROTOCOL function. For example, if you want to determine whether the protocol in an incoming packet is TCP, you can use CLIENT.IP.PROTOCOL.EQ(6), where 6 is the IANA-assigned protocol number for TCP. For some protocols, you can pass an enumeration value instead of the protocol number. For example, instead of CLIENT.IP.PROTOCOL.EQ(6), you can use CLIENT.IP.PROTOCOL.EQ(TCP). The following table lists the protocols for which you can use enumeration values, and the corresponding enumeration values for use with the PROTOCOL function.

---

| Protocol                                                                              | Enumeration value |
|---------------------------------------------------------------------------------------|-------------------|
| Transmission Control Protocol (TCP)                                                   | TCP               |
| User Datagram Protocol (UDP)                                                          | UDP               |
| Internet Control Message Protocol (ICMP)                                              | ICMP              |
| IP Authentication Header (AH), for providing authentication services in IPv4 and IPv6 | AH                |
| Encapsulating Security Payload (ESP) protocol                                         | ESP               |
| General Routing Encapsulation (GRE)                                                   | GRE               |
| IP-within-IP Encapsulation Protocol                                                   | IPIP              |
| Internet Control Message Protocol for IPv6 (ICMPv6)                                   | ICMPv6            |
| Fragment Header for IPv6                                                              | FRAGMENT          |

---

## Use case scenarios

The protocol expressions can be used in both request-based and response-based policies. You can use the expressions in various NetScaler features, such as load balancing, WAN optimization, content switching, rewrite, and listen policies. You can use the expressions with functions such as EQ() and NE(), to identify the protocol in a policy and perform an action.

Following are some use cases for the expressions:

- In Branch Repeater load balancing configurations, you can use the expressions in a listen policy for the wildcard virtual server. For example, you can configure the wildcard virtual server with the listen policy CLIENT.IP.PROTOCOL.EQ(TCP) so that the virtual server processes only TCP traffic and simply bridges all non-TCP traffic. Even though you can use an Access Control List instead of the listen policy, the listen policy provides better control over what traffic is processed.
- For content switching virtual servers of type ANY, you can configure content switching policies that switch requests on the basis of the protocol in incoming packets. For example, you can configure content switching policies to direct all TCP traffic to one load balancing virtual server and all non-TCP traffic to another load balancing virtual server.
- You can use the client-based expressions to configure persistence based on the protocol. For example, you can use CLIENT.IP.PROTOCOL to configure persistence on the basis of the protocols in incoming IPv4 packets.

## Expressions for HTTP and cache-control headers

September 21, 2020

One common method of evaluating HTTP traffic is to examine the headers in a request or a response. A header can perform a number of functions, including the following:

- Provide cookies that contain data about the sender.
- Identify the type of data that is being transmitted.
- Identify the route that the data has traveled (the Via header).

### Note

If an operation is used to evaluate both header and text data, the header-based operation always overrides the text-based operation. For example, the AFTER\_STR operation, when applied to a header, overrides text-based AFTER\_STR operations for all instances of the current header type.

## Prefixes for HTTP headers

The [Prefixes for HTTP headers](#) table for expression prefixes that extract HTTP headers.

## Operations for HTTP headers

The [Operations for HTTP headers](#) table for operations that you can specify with the prefixes for HTTP headers.

## Prefixes for cache-control headers

The following prefixes apply specifically to Cache-Control headers.

---

| HTTP Header Prefix     | Description                                         |
|------------------------|-----------------------------------------------------|
| HTTP.REQ.CACHE_CONTROL | Returns a Cache-Control header in an HTTP request.  |
| HTTP.RES.CACHE_CONTROL | Returns a Cache-Control header in an HTTP response. |

---

## Operations for cache-control headers

You can apply any of the operations for HTTP headers to Cache-Control headers.

In addition, the following operations identify specific types of Cache-Control headers. See RFC 2616 for information about these header types.

---

| HTTP Header Operation                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>Cache-Control header.NAME(&lt;integer&gt;)</code> | Returns as a text value the name of the Cache-Control header that corresponds to the <i>nth</i> component in a name-value list, as specified by <code>&lt;integer&gt;</code> . The index of the name-value component is 0-based. If the <code>&lt;integer&gt;</code> that is specified by the integer argument is greater than the number of components in the list, a zero-length text object is returned. Following is an example: <code>http.req.cache_control.name(3).contains("some_text")</code> |

---

| HTTP Header Operation                   | Description                                                                                                                                                              |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cache-Control header.IS_INVALID         | Returns a Boolean TRUE if the Cache-Control header is not present in the request or response. Following is an example:<br><code>http.req.cache_control.is_invalid</code> |
| Cache-Control header.IS_PRIVATE         | Returns a Boolean TRUE if the Cache-Control header has the value Private. Following is an example:<br><code>http.req.cache_control.is_private</code>                     |
| Cache-Control header.IS_PUBLIC          | Returns a Boolean TRUE if the Cache-Control header has the value Private. Following is an example: <code>http.req.cache_control.is_public</code>                         |
| Cache-Control header.IS_NO_STORE        | Returns a Boolean TRUE if the Cache-Control header has the value No-Store. Following is an example: <code>http.req.cache_control.is_no_store</code>                      |
| Cache-Control header.IS_NO_CACHE        | Returns a Boolean TRUE if the Cache-Control header has the value No-Cache. Following is an example: <code>http.req.cache_control.is_no_cache</code>                      |
| Cache-Control header.IS_MAX_AGE         | Returns a Boolean TRUE if the Cache-Control header has the value Max-Age. Following is an example: <code>http.req.cache_control.is_max_age</code>                        |
| Cache-Control header.IS_MIN_FRESH       | Returns a Boolean TRUE if the Cache-Control header has the value Min-Fresh. Following is an example: <code>http.req.cache_control.is_min_fresh</code>                    |
| Cache-Control header.IS_MAX_STALE       | Returns a Boolean TRUE if the Cache-Control header has the value Max-Stale. Following is an example: <code>http.req.cache_control.is_max_stale</code>                    |
| Cache-Control header.IS_MUST_REVALIDATE | Returns a Boolean TRUE if the Cache-Control header has the value Must-Revalidate. Following is an example:<br><code>http.req.cache_control.is_must_revalidate</code>     |
| Cache-Control header.IS_NO_TRANSFORM    | Returns a Boolean TRUE if the Cache-Control header has the value No-Transform. Following is an example:<br><code>http.req.cache_control.is_no_transform</code>           |

| HTTP Header Operation                    | Description                                                                                                                                                                                  |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cache-Control header.IS_ONLY_IF_CACHED   | Returns a Boolean TRUE if the Cache-Control header has the value Only-If-Cached. Following is an example:<br><code>http.req.cache_control.is_only_if_cached</code>                           |
| Cache-Control header.IS_PROXY_REVALIDATE | Returns a Boolean TRUE if the Cache-Control header has the value Proxy-Revalidate. Following is an example:<br><code>http.req.cache_control.is_proxy_revalidate</code>                       |
| Cache-Control header.IS_S_MAXAGE         | Returns a Boolean TRUE if the Cache-Control header has the value S-Maxage. Following is an example: <code>http.req.cache_control.is_s_maxage</code>                                          |
| Cache-Control header.IS_UNKNOWN          | Returns a Boolean TRUE if the Cache-Control header is of an unknown type. Following is an example: <code>http.req.cache_control.is_unknown</code>                                            |
| Cache-Control header.MAX_AGE             | Returns the value of the Cache-Control header Max-Age. If this header is absent or invalid, 0 is returned. Following is an example:<br><code>http.req.cache_control.max_age.le(3)</code>     |
| Cache-Control header.MAX_STALE           | Returns the value of the Cache-Control header Max-Stale. If this header is absent or invalid, 0 is returned. Following is an example:<br><code>http.req.cache_control.max_stale.le(3)</code> |
| Cache-Control header.MIN_FRESH           | Returns the value of the Cache-Control header Min-Fresh. If this header is absent or invalid, 0 is returned. Following is an example:<br><code>http.req.cache_control.min_fresh.le(3)</code> |
| Cache-Control header.S_MAXAGE            | Returns the value of the Cache-Control header S-Maxage. If this header is absent or invalid, 0 is returned. Following is an example:<br><code>http.req.cache_control.s_maxage.eq(2)</code>   |

---

## Expressions for extracting segments of URLs

September 21, 2020

You can extract URLs and portions of URLs, such as the host name, or a segment of the URL path. For example, the following expression identifies HTTP requests for image files by extracting image file suffixes from the URL:

```
http.req.url.suffix.eq("jpeg") || http.req.url.suffix.eq("gif")
```

Most expressions for URLs operate on text and are described in [Expression Prefixes for Text in HTTP Requests and Responses](#). This section discusses the GET operation. The GET operation extracts text when used with the following prefixes:

- HTTP.REQ.URL.PATH
- VPN.BASEURL.PATH
- VPN.CLIENTLESS\_BASEURL.PATH

The following table describes prefixes for HTTP URLs.

| URL Prefix                      | Description                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HTTP.REQ.URL.PATH.GET()         | Returns a slash- ("/") separated list from the URL path. For example, consider the following URL: <http://www.mycompany.com/dir1/dir2/dir3/index.html?a=1>. The following expression returns dir1 from this URL: <http.req.url.path.get(1)>. The following expression returns dir2: http.req.url.path.get(2)                                                          |
| HTTP.REQ.URL.PATH.GET_REVERSE() | Returns a slash- ("/") separated list from the URL path, starting from the end of the path. For example, consider the following URL: <http://www.mycompany.com/dir1/dir2/dir3/index.html?a=1>. The following expression returns index.html from this URL: <http.req.url.path.get_reverse(0)>. The following expression returns dir3: http.req.url.path.get_reverse(1) |

## Expressions for HTTP status codes and numeric HTTP payload data other than dates

September 21, 2020

The following table describes prefixes for numeric values in HTTP data other than dates.

| Prefix                  | Description                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HTTP.REQ.CONTENT_LENGTH | Returns the length of an HTTP request as a number. Following is an example:<br><code>http.req.content_length &lt; 500</code>                                                                                                                                                                                                                                 |
| HTTP.RES.CONTENT_LENGTH | Returns the length of the HTTP response as a number. Following is an example:<br><code>http.res.content_length &lt;= 1000</code>                                                                                                                                                                                                                             |
| HTTP.RES.STATUS         | Returns the response status code                                                                                                                                                                                                                                                                                                                             |
| HTTP.RES.IS_REDIRECT    | Returns a Boolean TRUE if the response code is associated with a redirect. Following are the redirect response codes: 300 (Multiple Choices), 301 (Moved Permanently), 302 (Found), 303 (See Other), 305 (Use Proxy), and 307 (Temporary Redirect). Note: Status code 304 is not considered a redirect HTTP response status code. Status code 306 is unused. |

## SIP expressions

May 2, 2023

The NetScaler Advanced policy expressions language contains a number of expressions that operate on Session Initiation Protocol (SIP) connections. These expressions are intended to be used in policies for any supported protocol that operates on a request/response basis. These expressions can be used in content switching, rate limiting, responder, and rewrite policies.

Certain limitations apply to SIP expressions used with responder policies. Only the DROP, NOOP or RESPONDWITH actions are allowed on a SIP load balancing virtual server. Responder policies can be bound to a load balancing virtual server, an override global bind point, a default global bind point, or a sip\_udp policy label.

The header format used by the SIP protocol is similar to that used by the HTTP protocol, so many of the new expressions look and function much like their HTTP analogs. Each SIP header consists of a line that includes the SIP method, the URL, and the version, followed by a series of name-value pairs that look like HTTP headers.

Following is a sample SIP header that is referred to in the expressions tables beneath it:

```
1 INVITE sip:16@www.sip.com:5060;transport=udp SIP/2.0
2 Record-Route: <sip:200.200.100.22;lr=on>
3 Via: SIP/2.0/UDP 200.200.100.22;branch=z9hG4bK444b.c8e103d1.0;rport
 =5060;
4 received=10.102.84.18
5 Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;
6 received=10.102.84.160
7 From: "12" <sip:12@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53
 cc0185
8 To: "16" <sip:16@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185
9 Call-ID: 00127f54-ec850017-0e46f5b9-5ec149c2@10.102.84.180
10 Max-Forwards: 69CSeq: 101 INVITE
11 User-Agent: Cisco-CP7940G/8.0
12 Contact: <sip:12@10.102.84.180:5060;transport=udp>
13 Expires: 180
14 Accept: application/sdp
15 Allow: ACK,BYE,CANCEL,INVITE,NOTIFY,OPTIONS,REFER,REGISTER,UPDATE
16 Supported: replaces,join,norefersub
17 Content-Length: 277
18 Content-Type: application/sdp
19 Content-Disposition: session;handling=optiona
20 <!--NeedCopy-->
```

## SIP reference tables

The following tables contain lists of expressions that operate on SIP headers. The first table contains expressions that apply to request headers. Most response-based expressions are nearly the same as the corresponding request-based expressions. To create a response expression from the corresponding request expression, you change the first two sections of the expression from SIP.REQ to SIP.RES, and make other obvious adjustments. The second table contains those response expressions that are unique to responses and have no request equivalents. You can use any element in the following tables as a complete expression on its own, or you can use various operators to combine these expression elements with others to form more complex expressions.

## SIP request expressions

| Expression                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SIP.REQ.METHOD            | Operates on the method of the SIP request. The supported SIP request methods are ACK, BYE, CANCEL, INFO, INVITE, MESSAGE, NOTIFY, OPTIONS, PRACK, PUBLISH, REFER, REGISTER, SUBSCRIBE, and UPDATE. This expression is a derivative of the text class, so all operations that are applicable to text are applicable to this method. For example, for a SIP request of INVITE sip:16@10.102.84.181:5060;transport=udp SIP/2.0, this expression returns INVITE. |
| SIP.REQ.URL               | Operates on the SIP request URL. This expression is a derivative of the text class, so all operations that are applicable to text are applicable to this method. For example, for a SIP request of INVITE sip:16@10.102.84.181:5060;transport=udp SIP/2.0, this expression re-                                                                                                                                                                               |
| SIP.REQ.URL.PROTOCOL      | Returns the URL protocol. For example, for a SIP URL of sip:16@www.sip.com:5060;transport=udp, this expression returns sip.                                                                                                                                                                                                                                                                                                                                  |
| SIP.REQ.URL.HOSTNAME      | Returns the hostname portion of the SIP URL. For example, for a SIP URL of sip:16@www.sip.com:5060;transport=udp, this expression returns www.sip.com:5060.                                                                                                                                                                                                                                                                                                  |
| SIP.REQ.URL.HOSTNAME.PORT | Returns the port portion of the SIP URL hostname. If no port is specified, this expression returns the default SIP port, 5060. For example, for a SIP hostname of www.sip.com:5060, this expression returns 5060.                                                                                                                                                                                                                                            |

| Expression                  | Description                                                                                                                                                                                                                                                                                                |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SIP.REQ.URL.HOSTNAME.DOMAIN | Returns the domain name portion of the SIP URL hostname. If the host is an IP address, then this expression returns an incorrect result. For example, for a SIP hostname of www.sip.com:5060, this expression returns sip.com. For a SIP hostname of 192.168.43.15:5060, this expression returns an error. |
| SIP.REQ.URL.HOSTNAME.SERVER | Returns the server portion of the host. For example, for a SIP hostname of www.sip.com:5060, this expression returns www.                                                                                                                                                                                  |
| SIP.REQ.URL.USERNAME        | Returns the username that precedes the @ character. For example, for a SIP URL of sip:16@www.sip.com:5060;transport=udp, this expression returns 16.                                                                                                                                                       |
| SIP.REQ.VERSION             | Returns the SIP version number in the request. For example, for a SIP request of INVITE sip:16@10.102.84.181:5060;transport=udp SIP/2.0, this expression returns SIP/2.0.                                                                                                                                  |
| SIP.REQ.VERSION.MAJOR       | Returns the major version number (the number to the left of the period). For example, for a SIP version number of SIP/2.0, this expression returns 2.                                                                                                                                                      |
| SIP.REQ.VERSION.MINOR       | Returns the minor version number (the number to the right of the period). For example, for a SIP version number of SIP/2.0, this expression returns 0.                                                                                                                                                     |
| SIP.REQ.CONTENT_LENGTH      | Returns the contents of the Content-Length header. This expression is a derivative of thesip_header_t class, so all operations that are available for SIP headers can be used. For example, for a SIP Content-Length header of Content-Length: 277, this expression returns 277.                           |

---

| Expression              | Description                                                                                                                                                                                                                                                                                |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SIP.REQ.TO              | Returns the contents of the To header. For example, for a SIP To header of To: “16”<br><sip:16@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns “16”<br><sip:16@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185.                                     |
| SIP.REQ.TO.ADDRESS      | Returns the SIP URI, which is found in the sip_url object. All operations that are available for SIP URIs can be used. For example, for a SIP To header of To: “16”<br><sip:16@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns sip:16@sip_example.com.     |
| SIP.REQ.TO.DISPLAY_NAME | Returns the display name portion of the To header. For example, for a SIP To header of To: “16”<br><sip:16@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns 16.                                                                                             |
| SIP.REQ.TO.TAG          | Returns the “tag” value from the “tag” name value pair in the TO header. For example, for a SIP To header of To: “16”<br><sip:16@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns 00127f54ec85a6d90cc14f45-53cc0185.                                        |
| SIP.REQ.FROM            | Returns the contents of the From header. For example, for a SIP From header of From: “12”<br><sip:12@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns sip:12@sip_example.com.                                                                               |
| SIP.REQ.FROM.ADDRESS    | Returns the SIP URI, which is found in the sip_url object. All operations that are available for SIP URIs can be used. For example, for a SIP From header of From: “12”<br><sip:12@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns sip:12@sip_example.com. |

| Expression                 | Description                                                                                                                                                                                                                                                                     |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SIP.REQ.FROM.DISPLAY_NAME  | Returns the display name portion of the To header. For example, for a SIP From header of From: "12" <sip:12@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns 12.                                                                                 |
| SIP.REQ.FROM.TAG           | Returns the "tag" value from the "tag" name/value pair in the TO header. For example, for a SIP From header of From: "12" <sip:12@sip_example.com>;tag=00127f54ec85a6d90cc14f45-53cc0185, this expression returns 00127f54ec85a6d90cc14f45-53cc0185.                            |
| SIP.REQ.VIA                | Returns the complete Via header. If there are multiple Via headers in the request, returns the last Via header. For example, for the two Via headers in the sample SIP header, this expression returns Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;re |
| SIP.REQ.VIA.SENTBY_ADDRESS | Returns the address that sent the request. For example, for the Via header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;re this expression returns 10.102.84.180.                                                                                      |
| SIP.REQ.VIA.SENTBY_PORT    | Returns the port that sent the request. For example, for the Via header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;re this expression returns 5060.                                                                                                  |
| SIP.REQ.VIA.RPORT          | Returns the value from the rport name/value pair. For example, for the Via header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;re this expression returns 5060.                                                                                        |
| SIP.REQ.VIA.BRANCH         | Returns the value from the branch name/value pair. For example, for the Via header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;re this expression returns z9hG4bK03e76d0b.                                                                            |

| Expression                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SIP.REQ.VIA.RECEIVED        | Returns the value from the received name/value pair. For example, for the Via header Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;re this expression returns 10.102.84.160.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| SIP.REQ.CALLID              | Returns the contents of the Callid header. This expression is a derivative of the sip_header_t class, so all operations that are available for SIP headers can be used. For example, for a SIP Callid header of Call-ID: 00127f54-ec850017-0e46f5b9-5ec149c2@10.102.84.180, this expression returns 00127f54-ec850017-0e46f5b9-5ec149c2@10.102.84.180.                                                                                                                                                                                                                                                                                                                                              |
| SIP.REQ.CSEQ                | Returns the CSEQ number from the CSEQ, as an integer. For example, for a SIP CSEQ header of CSeq: 101 INVITE, this expression returns 101.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| SIP.REQ.HEADER()            | Returns the specified SIP header. For , substitute the name of the header that you want. For example, to return the SIP From header, you would type SIP.REQ.HEADER("From").                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| SIP.REQ.HEADER().INSTANCE() | Returns the specified instance of the specified SIP header. Multiple instances of the same SIP header can occur. Where you want a specific instance of such a SIP header (for example, a specific Via header), you can specify that header by typing a number as the . Header instances are matched from last (0) to first. In other words, SIP.REQ.HEADER("Via").INSTANCE(0) returns the last instance of the Via header, while SIP.REQ.HEADER("Via").INSTANCE(1) returns the last instance but one of the Via header, and so on. For example, if used on the example SIP header, SIP.REQ.HEADER("Via").INSTANCE(1) returns Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060. |

| Expression               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SIP.REQ.HEADER().VALUE() | Returns the contents of the specified instance of the specified SIP header. The usage is nearly the same as the previous expression. For example, if used on the SIP header example in the preceding table entry, SIP.REQ.HEADER("Via").VALUE(1) returns SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060.                                                                                                                                                                                                                                                                               |
| SIP.REQ.HEADER().COUNT   | Returns the number of instances of a particular header as an integer. For example, if used on the SIP header example above, SIP.REQ.HEADER("Via").COUNT returns 2.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| SIP.REQ.HEADER().EXISTS  | Returns a boolean value of true or false, depending upon whether the specified header exists or not. For example, if used on the SIP header example above, SIP.REQ.HEADER("Expires").EXISTS returns true, while SIP.REQ.HEADER("Caller-ID").EXISTS returns false.                                                                                                                                                                                                                                                                                                                                        |
| SIP.REQ.HEADER().LIST    | Returns the comma-separated parameter list in the specified header. For example, if used on the SIP header example above, SIP.REQ.HEADER("Allow").LIST returns ACK,BYE,CANCEL,INVITE,NOTIFY,OPTIONS,REFER,REGISTER,U You can append the string .GET() to select a specific list item. For example, to get the first item (ACK) from the above list, you would type SIP.REQ.HEADER("Allow").LIST.GET(0). To extract the second item (BYE), you would type SIP.REQ.HEADER("Allow").LIST.GET(1). Note: If the specified header contains a list of name/value pairs, the entire name/value pair is returned. |

---

| Expression                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>SIP.REQ.HEADER().TYPECAST_SIP_HEADER_T(" ")</code> | Typecasts to <code>.</code> . Any text can be typecasted to <code>thesip_header_t</code> class, after which all header-based operations can be used. After you perform this operation, you can apply all operations that can be used with <code>.</code> . For example, the expression <code>SIP.REQ.CONTENT_LENGTH.TYPECAST_SIP_HEADER_T</code> typecasts all instances of the Content-Length header. After you perform this operation, you can apply all header operations to all instances of the specified header. |
| <code>SIP.REQ.HEADER().CONTAINS()</code>                 | Returns boolean true if the specified text string is present in any instance of the specified header. Operates on all the instances of the specified header. Header instances are matched from last (0) to first.                                                                                                                                                                                                                                                                                                      |
| <code>SIP.REQ.HEADER().EQUALS_ANY()</code>               | Returns boolean true if any pattern associated with <code>matches</code> matches any content in any instance of the specified header. Operates on all the instances of the specified header. Header instances are matched from last (0) to first.                                                                                                                                                                                                                                                                      |
| <code>SIP.REQ.HEADER().CONTAINS_ANY()</code>             | Returns Boolean true if any pattern associated with <code>matches</code> matches any content in any instance of the specified header. Operates on all the instances of the specified header. Header instances are matched from last (0) to first.                                                                                                                                                                                                                                                                      |
| <code>SIP.REQ.HEADER().CONTAINS_INDEX()</code>           | Returns the index of the matching pattern associated with <code>if</code> if that pattern matches any content in any instance of the specified header. Operates on all the instances of the specified header. Header instances are matched from last (0) to first.                                                                                                                                                                                                                                                     |
| <code>SIP.REQ.HEADER().EQUALS_INDEX()</code>             | Returns the index of the matching pattern associated with <code>if</code> if that pattern matches any instance of the specified header. Operates on all the instances of the specified header. Header instances are matched from last (0) to first.                                                                                                                                                                                                                                                                    |

---

| Expression                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>SIP.REQ.HEADER().SUBSTR()</code>      | If the specified string is present in any instance of the specified header, this expression returns that string. For example, for the SIP header <code>Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;re</code> , <code>SIP.REQ.HEADER("Via").SUBSTR("rport=5060")</code> returns <code>"rport=5060"</code> . <code>SIP.REQ.HEADER("Via").SUBSTR("rport=5061")</code> returns an empty string.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <code>SIP.REQ.HEADER().AFTER_STR()</code>   | If the specified string is present in any instance of the specified header, this expression returns the string immediately after that string. For example, for the SIP header <code>Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;re</code> the expression <code>SIP.REQ.HEADER("Via").AFTER_STR("rport=")</code> returns <code>5060</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <code>SIP.REQ.HEADER().REGEX_MATCH()</code> | Returns boolean true if the specified regular expression (regex) matches any instance of the specified header. You must specify the regular expression in the following format: <code>rregular expression</code> . The regular expression cannot be larger than 1499 characters in length. It must conform to the PCRE regular expression library. See <a href="http://www.pcre.org/pcre.txt">http://www.pcre.org/pcre.txt</a> for documentation on PCRE regular expression syntax. The <code>pcrepattern</code> man page also has useful information on specifying patterns by using PCRE regular expressions. The regular expression syntax supported in this expression has some differences from PCRE. Back references are not allowed. You should avoid recursive regular expressions; although some work, many do not. The dot (.) metacharacter matches newlines. Unicode is not supported. <code>SET_TEXT_MODE(IGNORECASE)</code> overrides the (?i) internal option specified in the regular expression. |

| Expression                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SIP.REQ.HEADER().REGEX_SELECT() | If the specified regex matches any text in any instance of the specified header, this expression returns the text. For example, for the SIP header <code>Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;received=10.102.84.160</code> , the expression <code>SIP.REQ.HEADER("Via").REGEX_SELECT("received=[0-9]{1,3}.[0-9]{1,3}.[0-9]{1,3}.[0-9]{1,3}")</code> returns <code>received=10.102.84.160</code> .          |
| SIP.REQ.HEADER().AFTER_REGEX()  | If the specified regex matches any text in any instance of the specified header, this expression returns the string immediately after that text. For example, for the SIP header <code>Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;received=10.102.84.160</code> , the expression <code>SIP.REQ.HEADER("Via").AFTER_REGEX("received=")</code> returns <code>10.102.84.160</code> .                                 |
| SIP.REQ.HEADER().BEFORE_REGEX() | If the specified regex matches any text in any instance of the specified header, this expression returns the string immediately before that text. For example, for the SIP header <code>Via: SIP/2.0/UDP 10.102.84.180:5060;branch=z9hG4bK03e76d0b;rport=5060;received=10.102.84.160</code> , the expression <code>SIP.REQ.HEADER("Via").BEFORE_REGEX("[0-9]{1,3}.[0-9]{1,3}.[0-9]{1,3}.[0-9]{1,3}")</code> returns <code>received=</code> . |
| SIP.REQ.FULL_HEADER             | Returns the entire SIP header, including the terminating CR/LF.                                                                                                                                                                                                                                                                                                                                                                              |
| SIP.REQ.IS_VALID                | Returns boolean true if the request format is valid.                                                                                                                                                                                                                                                                                                                                                                                         |
| SIP.REQ.BODY()                  | Returns the request body, up to the specified length. If the specified length is greater than the length of the request body, this expression returns the entire request body.                                                                                                                                                                                                                                                               |
| SIP.REQ.LB_VSERVER              | Returns the name of the load balancing virtual server (LB vserver) that is serving the current request.                                                                                                                                                                                                                                                                                                                                      |

---

| Expression         | Description                                                                                                |
|--------------------|------------------------------------------------------------------------------------------------------------|
| SIP.REQ.CS_VSERVER | Returns the name of the content switching virtual server (CS vserver) that is serving the current request. |

---

### SIP response expressions

---

| Expression          | Description                                                                                                                                    |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| SIP.RES.STATUS      | Returns the SIP response status code. For example, if the first line of the response is SIP/2.0 100 Trying, this expression returns 100.       |
| SIP.RES.STATUS_MSG  | Returns the SIP response status message. For example, if the first line of the response is SIP/2.0 100 Trying, this expression returns Trying. |
| SIP.RES.IS_REDIRECT | Returns boolean true if the response code is a redirect.                                                                                       |
| SIP.RES.METHOD      | Returns the response method extracted from the request method string in the CSeq header.                                                       |

---

## Operations for HTTP, HTML, and XML encoding and “safe” characters

May 2, 2023

The following operations work with the encoding of HTML data in a request or response and XML data in a POST body.

- **<text>.HTML\_XML\_SAFE:**

Transforms special characters into XML safe format, as in the following examples:

A left-pointing angle bracket (<) is converted to &lt;

A right-pointing angle bracket (>) is converted to &gt;

An ampersand (&) is converted to &amp;

This operation safeguards against cross-site scripting attacks. Maximum length of the transformed text is 2048 bytes. This is a read-only operation.

After applying the transformation, additional operators that you specify in the expression are applied to the selected text. Following is an example:

```
http.req.url.query.html_xml_safe.contains("myQueryString")
```

- **<text>.HTTP\_HEADER\_SAFE:**

Converts all new line ('\n') characters in the input text to '%0A' to enable the input to be used safely in HTTP headers.

This operation safeguards against response-splitting attacks.

The maximum length of the transformed text is 2048 bytes. This is a read-only operation.

- **<text>.HTTP\_URL\_SAFE:**

Converts unsafe URL characters to '%xx' values, where "xx" is a hex-based representation of the input character. For example, the ampersand (&) is represented as %26 in URL-safe encoding. The maximum length of the transformed text is 2048 bytes. This is a read-only operation.

Following are URL safe characters. All others are unsafe:

- Alpha-numeric characters: a-z, A-Z, 0-9
- Asterix: "\*"
- Ampersand: "&"
- At-sign: "@"
- Colon: ":"
- Comma: ","
- Dollar: "\$"
- Dot: "."
- Equals: "="
- Exclamation mark: "!"
- Hyphen: "-"
- Open and close parentheses: "(", ")"
- Percent: "%"
- Plus: "+"
- Semicolon: ";"
- Single quote: "'"
- Slash: "/"
- Question mark: "?"
- Tilde: "~"
- Underscore: "\_"

- **<text>.MARK\_SAFE:**

Marks the text as safe without applying any type of data transformation.

---

**\*\*SET\_TEXT\_MODE(URL ENCODED NOURL ENCODED)\*\***

---

- Transforms all %HH encoding in the byte stream. This operation works with characters (not bytes). By default, a single byte represents a character in ASCII encoding. However, if you specify URL ENCODED mode, three bytes can represent a character.

In the following example, a PREFIX(3) operation selects the first 3 characters in a target.

```
http.req.url.hostname.prefix(3)
```

In the following example, the NetScaler can select up to 9 bytes from the target:

```
http.req.url.hostname.set_text_mode(urlencoded).prefix(3)
```

---

**\*\*SET\_TEXT\_MODE(PLUS AS SPACE NO PLUS AS SPACE)\*\***

---

- Specifies how to treat the plus character (+). The PLUS AS SPACE option replaces a plus character with white space. For example, the text “hello+world” becomes “hello world.” The NO PLUS AS SPACE option leaves plus characters as they are.
- 

**\*\*SET\_TEXT\_MODE(BACKSLASH ENCODED NO BACKSLASH ENCODED)\*\***

---

- Specifies whether or not backslash decoding is performed on the text object represented by <text>.

If BACKSLASH ENCODED is specified, the SET\_TEXT\_MODE operator performs the following operations on the text object:

- All occurrences of “\XXX” will be replaced with the character “Y” (where XXX represents a number in the octal system and Y represents the ASCII equivalent of XXX). The valid range of octal values for this type of encoding is 0 to 377. For example, the encoded text “http\72//” and http\072//” will both be decoded to <http://>, where the colon (:) is the ASCII equivalent of the octal value “72”.
- All occurrences of “\xHH” will be replaced with the character “Y” (HH represents a number in the hexadecimal system and Y denotes the ASCII equivalent of HH). For example, the encoded text “http\x3a//” will be decoded to <http://>, where the colon (:) is the ASCII equivalent of the hexadecimal value “3a”.
- All occurrences of “\uWWXX” will be replaced with the character sequence “YZ” (Where WW and XX represent two distinct hexadecimal values and Y and Z represent their ASCII equivalents of WW and XX respectively. For example, the encoded text “http%u3a2f” and

“http%u003a//” will both be decoded to `<http://>`, where “3a” and “2f” are two hexadecimal values and the colon (:) and forward slash (“/”) represent their ASCII equivalents respectively.

- All occurrences of “\b”, “\n”, “\t”, “\f”, and “\r” are replaced with the corresponding ASCII characters.

If `NO_BACKSLASH_ENCODED` is specified, backslash decoding is not performed on the text object.

---

```
** .SET_TEXT_MODE(BAD_ENCODE_RAISE_UNDEF NO_BAD_ENCODE_RAISE_UNDEF):**
```

---

- Performs the associated undefined action if either the `URLENCODED` or the `BACKSLASH_ENCODED` mode is set and bad encoding corresponding to the specified encoding mode is encountered in the text object represented by `<text>`.

If `NO_BAD_ENCODE_RAISE_UNDEF` is specified, the associated undefined action will not be performed when bad encoding is encountered in the text object represented by `<text>`.

## Expressions for TCP, UDP, and VLAN data

May 2, 2023

TCP and UDP data take the form of a string or a number. For expression prefixes that return string values for TCP and UDP data, you can apply any text-based operations. For more information, see [Advanced policy expressions: Evaluating text](#).

For expression prefixes that return numeric value, such as a source port, you can apply an arithmetic operation. For more information, see [Basic operations on expression prefixes](#) and [Compound operations for numbers](#).

The following table describes prefixes that extract TCP and UDP data from client.

---

| GET Operation                                    | Description                                                                                                                                                                                                                             |
|--------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>CLIENT.TCP.PAYLOAD(&lt;integer&gt;)</code> | Returns TCP payload data as a string, starting with the first character in the payload and continuing for the number of characters in the <code>&lt;integer&gt;</code> argument. You can apply any text-based operation to this prefix. |

---

| GET Operation                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLIENT.TCP.SRCPORT                | Returns the ID of the current packet's source port as a number.                                                                                                                                                                                                                                                                                                                                                                               |
| CLIENT.TCP.DSTPORT                | Returns the ID of the current packet's destination port as a number.                                                                                                                                                                                                                                                                                                                                                                          |
| CLIENT.TCP.OPTIONS                | Returns the TCP options set by the client. Examples of TCP options are Maximum Segment Size (MSS), Window Scale, Selective Acknowledgements (SACK), and Time Stamp Option. The COUNT, TYPE(), and TYPE_NAME() operators can be used with this prefix. For the TCP options set by the server, see the SERVER.TCP.OPTIONS prefix.                                                                                                               |
| CLIENT.TCP.OPTIONS.COUNT          | Returns the number of TCP options that the client has set.                                                                                                                                                                                                                                                                                                                                                                                    |
| CLIENT.TCP.OPTIONS.TYPE()         | Returns the value of the TCP option whose type (or option kind) is specified as the argument. The value is returned as a string of bytes in big endian format (or network byte order).<br>Parameters: type - Type value                                                                                                                                                                                                                       |
| CLIENT.TCP.OPTIONS.TYPE_NAME()    | Returns the value of the TCP option whose enumeration constant is specified as the argument. The enumeration constants that you can pass as the argument are REPEATER, TIMESTAMP, SACK_PERMITTED, WINDOW, and MAXSEG. To specify the TCP option kind instead of these enumeration constants, use CLIENT.TCP.OPTIONS.TYPE(). For other TCP options, you must use CLIENT.TCP.OPTIONS.TYPE().<br>Parameters: m - TCP option enumeration constant |
| CLIENT.TCP.REPEATER_OPTION.EXISTS | Returns a Boolean TRUE if Repeater TCP options exist.                                                                                                                                                                                                                                                                                                                                                                                         |
| CLIENT.TCP.REPEATER_OPTION.IP     | Returns the branch repeater's IPv4 address from the Repeater TCP options.                                                                                                                                                                                                                                                                                                                                                                     |
| CLIENT.TCP.REPEATER_OPTION.MAC    | Returns the branch repeater's MAC address from the Repeater TCP options.                                                                                                                                                                                                                                                                                                                                                                      |
| CLIENT.UDP.DNS.DOMAIN             | Returns the DNS domain name.                                                                                                                                                                                                                                                                                                                                                                                                                  |

---

| GET Operation                | Description                                                                                                                                                                                                                                  |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLIENT.UDP.DNS.DOMAIN.EQ(“”) | Returns a Boolean TRUE if the domain name matches the argument. The comparison is case insensitive. Following is an example:<br>client.udp.dns.domain.eq(“www.mycompany.com”)                                                                |
| CLIENT.UDP.DNS.IS_AAAAREC    | Returns a Boolean TRUE if the record type is AAAA. These types of records indicate an IPv6 address in forward lookups.                                                                                                                       |
| CLIENT.UDP.DNS.IS_ANYREC     | Returns a Boolean TRUE if it is of any record type.                                                                                                                                                                                          |
| CLIENT.UDP.DNS.IS_AREC       | Returns a Boolean TRUE if the record is type A. Type A records provide the host address.                                                                                                                                                     |
| CLIENT.UDP.DNS.IS_CNAMEREC   | Returns a Boolean TRUE if the record is of type CNAME. In systems that use multiple names to identify a resource, there is one canonical name and a number of aliases. The CNAME provides the canonical name.                                |
| CLIENT.UDP.DNS.IS_MXREC      | Returns a Boolean TRUE if the record is of type MX (mail exchanger). This DNS record describes a priority and a host name. The MX records for the same domain name specify the email servers in the domain and the priority for each server. |
| CLIENT.UDP.DNS.IS_NSREC      | Returns a Boolean TRUE if the record is of type NS. This is a name server record that includes a host name with an associated A record. This enables locating the domain name that is associated with the NS record.                         |
| CLIENT.UDP.DNS.IS_PTRREC     | Returns a Boolean TRUE if the record is of type PTR. This is a domain name pointer and is often used to associate a domain name with an IPv4 address.                                                                                        |
| CLIENT.UDP.DNS.IS_SOAREC     | Returns a Boolean TRUE if the record is of type SOA. This is a start of authority record.                                                                                                                                                    |
| CLIENT.UDP.DNS.IS_SRVREC     | Returns a Boolean TRUE if the record is of type SRV. This is a more general version of the MX record.                                                                                                                                        |
| CLIENT.UDP.DSTPORT           | Returns the numeric ID of the current packet’s UDP destination port.                                                                                                                                                                         |

---

| GET Operation                 | Description                                                                                |
|-------------------------------|--------------------------------------------------------------------------------------------|
| CLIENT.UDP.SRCPORT            | Returns the numeric ID of the current packet's UDP source port.                            |
| CLIENT.UDP.LENGTH             | Returns the numeric ID of the current packet's UDP length.                                 |
| CLIENT.UDP.CHECKSUM           | Returns the numeric ID of the current packet's UDP checksum.                               |
| CLIENT.UDP.PAYLOAD            | Returns current packet's UDP payload.                                                      |
| CLIENT.UDP.RADIUS             | Returns RADIUS data for the current packet.                                                |
| CLIENT.UDP.RADIUS.ATTR_TYPE() | Returns the value for the attribute type specified as the argument.                        |
| CLIENT.UDP.RADIUS.USERNAME    | Returns the RADIUS user name.                                                              |
| CLIENT.TCP.MSS                | Returns the maximum segment size (MSS) for the current connection as a number.             |
| CLIENT.VLAN.ID                | Returns the numeric ID of the VLAN through which the current packet entered the NetScaler. |

---

The following table describes prefixes that extract TCP and UDP data from server.

---

| GET Operation            | Description                                                                                                                                                                                                                                                                                                                     |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SERVER.TCP.DSTPORT       | Returns the numeric ID of the current packet's destination port.                                                                                                                                                                                                                                                                |
| SERVER.TCP.SRCPORT       | Returns the numeric ID of the current packet's source port.                                                                                                                                                                                                                                                                     |
| SERVER.TCP.OPTIONS       | Returns the TCP options set by the server. Examples of TCP options are Maximum Segment Size (MSS), Window Scale, Selective Acknowledgements (SACK), and Time Stamp Option. The COUNT, TYPE(), and TYPE_NAME() operators can be used with this prefix. For the TCP options set by the client, see the CLIENT.TCP.OPTIONS prefix. |
| SERVER.TCP.OPTIONS.COUNT | Returns the number of TCP options that the server has set.                                                                                                                                                                                                                                                                      |

---

| GET Operation                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SERVER.TCP.OPTIONS.TYPE()      | Returns the value of the TCP option whose type (or option kind) is specified as the argument. The value is returned as a string of bytes in big endian format (or network byte order).<br>Parameters: type - Type value                                                                                                                                                                                                                    |
| SERVER.TCP.OPTIONS.TYPE_NAME() | Returns the value of the TCP option whose enumeration constant is specified as the argument. The enumeration constants that you can pass as the argument are REPEATER, TIMESTAMP, SACK_PERMITTED, WINDOW, and MAXSEG. To specify the TCP option kind instead of these enumeration constants, use CLIENT.TCP.OPTIONS.TYPE(). For other TCP options, you must use CLIENT.TCP.OPTIONS.TYPE(). Parameters: m - TCP option enumeration constant |
| SERVER.VLAN                    | Operates on the VLAN through which the current packet entered the NetScaler.                                                                                                                                                                                                                                                                                                                                                               |
| SERVER.UDP.DSTPORT             | Returns the numeric ID of the current packet's UDP destination port.                                                                                                                                                                                                                                                                                                                                                                       |
| SERVER.UDP.SRCPORT             | Returns the numeric ID of the current packet's UDP source port.                                                                                                                                                                                                                                                                                                                                                                            |
| SERVER.UDP.LENGTH              | Returns the numeric ID of the current packet's UDP length.                                                                                                                                                                                                                                                                                                                                                                                 |
| SERVER.UDP.CHECKSUM            | Returns the numeric ID of the current packet's UDP checksum.                                                                                                                                                                                                                                                                                                                                                                               |
| SERVER.UDP.PAYLOAD             | Returns current packet's UDP payload.                                                                                                                                                                                                                                                                                                                                                                                                      |
| SERVER.VLAN.ID                 | Returns the numeric ID of the VLAN through which the current packet entered the NetScaler.                                                                                                                                                                                                                                                                                                                                                 |

## Expressions for evaluating a DNS message and identifying its carrier protocol

October 20, 2023

You can evaluate DNS requests and responses by using expressions that begin with DNS.REQ and DNS.RES, respectively. You can also identify the transport layer protocol that is being used to send the DNS messages.

The following functions return the contents of a DNS query.

---

| Function                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DNS.REQ.QUESTION.DOMAIN | Return the domain name (the value of the QNAME field) in the question section of the DNS query. The domain name is returned as a text string, which can be passed to EQ(), NE(), and any other functions that work with text.                                                                                                                                                                                                                                              |
| DNS.REQ.QUESTION.TYPE   | Return the query type (the value of the QTYPE field) in the DNS query. The field indicates the type of resource record (for example, A, NS, or CNAME) for which the name server is being queried. The returned value can be compared to one of the following values by using the EQ() and NE() functions: A, AAAA, NS, SRV, PTR, CNAME, SOA, MX, and ANY. Note: You can use only the EQ() and NE() functions with the TYPE function. Example: DNS.REQ.QUESTION.TYPE.EQ(MX) |

---

The following functions return the contents of a DNS response.

---

| Function                | Description                                                                                                                                                                                                                                                            |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DNS.RES.HEADER.RCODE    | Return the response code (the value of the RCODE field) in the header section of the DNS response. You can use only the EQ() and NE() functions with the RCODE function. Following are the possible values: NOERROR, FORMERR, SERVFAIL, NXDOMAIN, NOTIMP, and REFUSED. |
| DNS.RES.QUESTION.DOMAIN | Return the domain name (the value of the QNAME field) in the question section of the DNS response. The domain name is returned as a text string, which can be passed to EQ(), NE(), and any other functions that work with text.                                       |

| Function              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DNS.RES.QUESTION.TYPE | Return the query type (the value of the QTYPE field) in the question section of the DNS response. The field indicates the type of resource record (for example, A, NS, or CNAME) that is contained in the response. The returned value can be compared to one of the following values by using the EQ() and NE() functions: A, AAAA, NS, SRV, PTR, CNAME, SOA, MX, and ANY. You can use only the EQ() and NE() functions with the TYPE function. Example:<br>DNS.RES.QUESTION.TYPE.EQ(SOA) |

The following functions return the transport layer protocol name.

| Function          | Description                                                                                                                                                                                                                                          |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DNS.REQ.TRANSPORT | Return the name of the transport layer protocol that was used to send the DNS query. Possible values returned are TCP, DOT, and UDP. You can use only the EQ() and NE() functions with the TRANSPORT function. Example:<br>DNS.REQ.TRANSPORT.EQ(TCP) |
| DNS.RES.TRANSPORT | Return the name of the transport layer protocol that was used for the DNS response. Possible values returned are TCP, DOT, and UDP. You can use only the EQ() and NE() functions with the TRANSPORT function. Example:<br>DNS.RES.TRANSPORT.EQ(TCP)  |

The following functions return the name of the matched location when the query contains or does not contain the DNS ECS option.

| Function                                                              | Description                                                                                                                                                                                                                                                                 |
|-----------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DNS.REQ.OPT.ECS.IP.MATCHES_LOCATION                                   | Return the name of the matched location that was used in the query with the DNS ECS option.<br>Exam-<br>ple:(DNS.REQ.OPT.ECS.IP.MATCHES_LOCATION(“CH.....”))                                                                                                                |
| client.IP.SRC.MATCHES_LOCATION                                        | Return the name of the matched location that was used in the query without the DNS ECS option. Example:<br>(client.IP.SRC.MATCHES_LOCATION(“CH.....”))                                                                                                                      |
| DNS.REQ.OPT.ECS.IP.MATCHES_LOCATION OR client.IP.SRC.MATCHES_LOCATION | Common expression to be used in the policy when the DNS traffic may or may not have ECS option in the query. Example:<br>“(((DNS.REQ.OPT.ECS.IP.MATCHES_LOCATION(“CH.....”).typecast_text_t) ALT (client.IP.SRC.MATCHES_LOCATION(“CH.....” ).typecast_text_t)).eq(“true”))” |

## XPath and HTML, XML, or JSON expressions

September 21, 2020

The Advanced policy infrastructure supports expressions for evaluating and retrieving data from HTML, XML, and JavaScript Object Notation (JSON) files. This enables you to find specific nodes in an HTML, XML, or JSON document, determine if a node exists in the file, locate nodes in XML contexts (for example, nodes that have specific parents or a specific attribute with a given value), and return the contents of such nodes. Additionally, you can use XPath expressions in rewrite expressions.

The Advanced policy expression implementation for XPath comprises an Advanced policy expression prefix (such as “HTTP.REQ.BODY”) that designates HTML or XML text, and the XPATH operator that takes the XPath expression as its argument.

HTML files are a largely free-form collection of tags and text elements. You can use the XPATH\_HTML operator, which takes an XPath expression as its argument, to process HTML files. JSON files are either a collection of name/value pairs or an ordered list of values. You can use the XPATH\_JSON operator, which takes an XPath expression as its argument, to process JSON files.

- **<text>.XPATH(xpathex):**

Operate on an XML file and return a Boolean value.

For example, the following expression returns a Boolean TRUE if a node called “creator” exists under the node “Book” within the first 1000 bytes of the XML file.

```
HTTP.REQ.BODY(1000).XPATH(xpath%boolean(//Book/creator)%)
```

Parameters:

xpathex - XPath Boolean expression

- **<text>.XPATH(xpathex):**

Operate on an XML file and return a value of data type “double.”

For example, the following expression converts the string “36”(a price value) to a value of data type “double” if the string is in the first 1000 bytes of the XML file:

```
HTTP.REQ.BODY(1000).XPATH(xpath%number(/Book/price)%)
```

Parameters:

xpathex - XPath numeric expression

Example:

```
1 <Book>
2 <creator>
3 <Person>
4 <name>Milton</name>
5 </Person>
6 </creator>
7 <title>Paradise Lost</title>
8 </Book>
9 <!--NeedCopy-->
```

- **<text>.XPATH(xpathex):**

Operate on an XML file and return a node-set or a string. Node-sets are converted to corresponding strings by using the standard XPath string conversion routine.

For example, the following expression selects all the nodes that are enclosed by “/Book/creator” (a node-set) in the first 1000 bytes of the body:

```
HTTP.REQ.BODY(1000).XPATH(xpath%/Book/creator%)
```

Parameters:

xpathex - XPath expression

- **<text>.XPATH\_HTML(xpathex)**

Operate on an HTML file and return a text value.

For example, the following expression operates on an HTML file and returns the text enclosed in `<title\></title\>` tags if the title HTML element is found in the first 1000 bytes:

```
HTTP.REQ.BODY(1000).XPATH_HTML(xpath%/html/head/title%)
```

Parameters:

xpathex - XPath text expression

- **<text>.XPATH\_HTML\_WITH\_MARKUP(xpathex)**

Operate on an HTML file and return a string that contains the entire selected portion of the document, including markup such as including the enclosing element tags.

The following expression operates on the HTML file and selects all content within the `<\title>` tag, including markup.

```
HTTP.REQ.BODY(1000).XPATH_HTML_WITH_MARKUP(xpath%/html/head/title%)
```

The portion of the HTML body that is selected by the expression is marked for further processing.

Parameters:

xpathex - XPath expression

- **<text>.XPATH\_JSON(xpathex)**

Operate on a JSON file and return a Boolean value.

For example, consider the following JSON file:

```
{ "Book": { "creator": { "person": { "name": "<name>" }, "title": "<title>" } }
```

The following expression operates on the JSON file and returns a Boolean TRUE if the JSON file contains a node named "creator," whose parent node is "Book," in the first 1000 bytes:

```
HTTP.REQ.BODY(1000).XPATH_JSON(xpath%boolean(/Book/creator)%)
```

Parameters:

xpathex - XPath Boolean expression

- **<text>.XPATH\_JSON(xpathex)**

Operate on a JSON file and return a value of data type "double."

For example, consider the following JSON file:

```
{ "Book": { "creator": { "person": { "name": "<name>" }, "title": "<title>", "price": "36" } }
```

The following expression operates on the JSON file and converts the string "36" to a value of data type "double" if the string is present in the first 1000 bytes of the JSON file.

```
HTTP.REQ.BODY(1000).XPATH_JSON(xpath%number(/Book/price)%)
```

Parameters:

xpathex - XPath numeric expression

- **<text>.XPATH\_JSON(xpathex)**

Operate on a JSON file and return a node-set or a string. Node-sets are converted to corresponding strings by using the standard XPath string conversion routine.

For example, consider the following JSON file:

```
{ "Book": { "creator": { "person": { "name": '<name>' }, "title": '<title>' } }
```

The following expression selects all the nodes that are enclosed by “/Book”(a node-set) in the first 1000 bytes of the body of the JSON file and returns the corresponding string value, which is “<name><title>”:

```
HTTP . REQ . BODY (1000) . XPATH_JSON (xp%/Book%
```

Parameters:

xpathex - XPath expression

- **<text>.XPATH\_JSON\_WITH\_MARKUP(xpathex)**

Operate on an XML file and return a string that contains the entire portion of the document for the result node, including markup such as including the enclosing element tags.

For example, consider the following JSON file:

```
{ "Book": { "creator": { "person": { "name": '<name>' }, "title": '<title>' } }
```

The following expression operates on the JSON file and selects all the nodes that are enclosed by “/Book/creator” in the first 1000 bytes of the body, which is “creator:{ person:{ name:'<name>' } }.”

```
HTTP . REQ . BODY (1000) . XPATH_JSON_WITH_MARKUP (xp%/Book/creator%
```

The portion of the JSON body that is selected by the expression is marked for further processing.

Parameters:

xpathex - XPath expression

- **<text>.XPATH\_WITH\_MARKUP(xpathex):**

Operate on an XML file and return a string that contains the entire portion of the document for the result node, including markup such as including the enclosing element tags.

For example, the following expression operates on an XML file and selects all the nodes enclosed by “/Book/creator” in the first 1000 bytes of the body.

```
HTTP . REQ . BODY (1000) . XPATH_WITH_MARKUP (xp%/Book/creator%
```

The portion of the JSON body that is selected by the expression is marked for further processing.

Parameters:

xpathex - XPath expression

## Encrypt and decrypt XML payloads

May 2, 2023

You can use the XML\_ENCRYPT() and XML\_DECRYPT() functions in Advanced policy expressions to encrypt and decrypt, respectively, XML data. These functions conform to the W3C XML Encryption standard defined at “<http://www.w3.org/TR/2001/PR-xmldsig-core-20010820/>.” XML\_ENCRYPT() and XML\_DECRYPT() support a subset of the XML Encryption specification. In the subset, data encryption uses a bulk cipher method (RC4, DES3, AES128, AES192, or AES256), and an RSA public key is used to encrypt the bulk cipher key.

**Note:** If you want to encrypt and decrypt text in a payload, you must use the ENCRYPT and DECRYPT functions. For more information about these functions, see [Encrypt and decrypt text](#).

The XML\_ENCRYPT() and XML\_DECRYPT() functions are not dependent on the encryption/decryption service that is used by the ENCRYPT and DECRYPT commands for text. The cipher method is specified explicitly as an argument to the XML\_ENCRYPT() function. The XML\_DECRYPT() function obtains the information about the specified cipher method from the <xenc:EncryptedData> element. Following are synopses of the XML encryption and decryption functions:

- XML\_ENCRYPT(<certKeyName>, <method> [, <flags>])\*\*. Returns an <xenc:EncryptedData> element that contains the encrypted input text and the encryption key, which is itself encrypted by using RSA.
- XML\_DECRYPT(<certKeyName>). Returns the decrypted text from the input <xenc:EncryptedData> element, which includes the cipher method and the RSA-encrypted key.

**Note:** The <xenc:EncryptedData> element is defined in the W3C XML Encryption specification.

Following are descriptions of the arguments:

- **certKeyName:** Selects an X.509 certificate with an RSA public key for XML\_ENCRYPT() or an RSA private key for XML\_DECRYPT(). The certificate key must have been previously created by an `add ssl certKey` command.
- **method:** Specifies which cipher method to use for encrypting the XML data. Possible values: RC4, DES3, AES128, AES192, AES256.

- **flags:** A bitmask specifying the following optional key information (<ds:KeyInfo>) to be included in the <xenc:EncryptedData> element that is generated by XML\_ENCRYPT():
  - **1** - Include a KeyName element with the certKeyName. The element is <ds:KeyName>.
  - **2** - Include a KeyValue element with the RSA public key from the certificate. The element is <ds:KeyValue>.
  - **4** - Include an X509IssuerSerial element with the certificate serial number and issuer DN. The element is <ds:X509IssuerSerial>.
  - **8** - Include an X509SubjectName element with the certificate subject DN. The element is <ds:X509SubjectName>.
  - **16** - Include an X509Certificate element with the entire certificate. The element is <ds:X509Certificate>.

### Use the XML\_ENCRYPT() and XML\_DECRYPT() functions in expressions

The XML encryption feature uses SSL certificate-key pairs to provide X.509 certificates (with RSA public keys) for key encryption and RSA private keys for key decryption. Therefore, before you use the XML\_ENCRYPT() function in an expression, you must create an SSL certificate-key pair. The following command creates an SSL certificate-key pair, my-certkey, with the X.509 certificate, my-cert.pem, and the private key file, my-key.pem.

```
add ssl certKey my-certkey -cert my-cert.pem -key my-key.pem -passcrypt
kxPeMRyNity=
```

The following CLI commands create rewrite actions and policies for encrypting and decrypting XML content.

```
1 add rewrite action my-xml-encrypt-action replace "HTTP.RES.BODY(10000).
 XPATH_WITH_MARKUP(xp%/)" "HTTP.RES.BODY(10000).XPATH_WITH_MARKUP(xp
 %/).XML_ENCRYPT("my-certkey", AES256, 31)"
2
3 add rewrite action my-xml-decrypt-action replace "HTTP.REQ.BODY(10000).
 XPATH_WITH_MARKUP(xp%/xenc:EncryptedData%)" "HTTP.REQ.BODY(10000).
 XPATH_WITH_MARKUP(xp%/xenc:EncryptedData%).XML_DECRYPT("my-certkey"
)"
4
5 add rewrite policy my-xml-encrypt-policy "HTTP.REQ.URL.CONTAINS("xml-
 encrypt")" my-xml-encrypt-action
6
7 add rewrite policy my-xml-decrypt-policy "HTTP.REQ.BODY(10000).XPATH(xp
 %boolean(//xenc:EncryptedData%)" my-xml-decrypt-action
8
9 bind rewrite global my-xml-encrypt-policy 30
10
11 bind rewrite global my-xml-decrypt-policy 30
12 <!--NeedCopy-->
```

In the above example, the rewrite action `my-xml-encrypt-action` encrypts the entire XML document (`XPATH_WITH_MARKUP(xp%/%)`) in the request by using the AES-256 bulk encryption method and the RSA public key from `my-certkey` to encrypt the bulk encryption key. The action replaces the document with an `<xenc:EncryptedData>` element containing the encrypted data and an encrypted key. The flags represented by 31 include all of the optional `<ds:KeyInfo>` elements.

The action `my-xml-decrypt-action` decrypts the first `<xenc:EncryptedData>` element in the response (`XPATH_WITH_MARKUP(xp%//xenc:EncryptedData%)`). This requires the prior addition of the `xenc` XML namespace by use of the following CLI command:

```
add ns xmlnamespace xenc http://www.w3.org/2001/04/xmldoc#
```

The `my-xml-decrypt-action` action uses the RSA private key in `my-certkey` to decrypt the encrypted key and then uses the bulk encryption method specified in the element to decrypt the encrypted contents. Finally, the action replaces the encrypted data element with the decrypted content.

The rewrite policy `my-xml-encrypt-policy` applies `my-xml-encrypt-action` to requests for URLs containing `xml-encrypt`. The action encrypts the entire response from a service configured on the NetScaler appliance.

The rewrite policy `my-xml-decrypt-policy` applies `my-xml-decrypt-action` to requests that contain an `<xenc:EncryptedData>` element (`(XPATH(xp%//xenc:EncryptedData%)` returns a non-empty string). The action decrypts the encrypted data in requests that are bound for a service configured on the NetScaler appliance.

## Advanced policy expressions: Parsing SSL certificates

April 12, 2024

There are advanced policy expressions to parse SSL certificates and SSL client hello messages.

### Parse SSL certificates

You can use advanced policy expressions to evaluate X.509 Secure Sockets Layer (SSL) client certificates. A client certificate is an electronic document that can be used to authenticate a user's identity. A client certificate contains (at a minimum) version information, a serial number, a signature algorithm ID, an issuer name, a validity period, a subject (user) name, a public key, and signatures.

You can examine both SSL connections and data in client certificates. For example, you might want to send SSL requests that use low-strength ciphers to a particular load balancing virtual server farm. The following command is an example of a Content Switching policy that parses the cipher strength in a request and matches cipher strengths that are less than or equal to 40:

```
add cs policy p1 -rule "client.ssl.cipher_bits.le(40)"
```

As another example, you can configure a policy that determines whether a request contains a client certificate:

```
add cs policy p2 -rule "client.ssl.client_cert exists"
```

Or, you can configure a policy that examines particular information in a client certificate. For example, the following policy verifies that the certificate has one or more days before expiration:

```
add cs policy p2 -rule "client.ssl.client_cert exists && client.ssl.client_cert.days_to_expire.ge(1)"
```

An example for JA3 fingerprint usage:

```
add ssl policy ja3_pol -rule "CLIENT.SSL.JA3_FINGERPRINT.EQ(bb4c15a90e93a25ddc16274395bce4c6)-action reset"
```

Or, an example for JA3 fingerprint usage with patset:

```
1 add policy patset pat1
2 bind policy patset pat1 bb4c15a90e93a25ddc16274395bce4c6 -index 1
3 bind policy patset pat1 cd3c15a90e93a25ddc16274395bce6b4 -index 2
4 add ssl policy ssl_ja3_pol -rule CLIENT.SSL.JA3_FINGERPRINT.contains_any("\pat1\") -action reset
5 <!--NeedCopy-->
```

#### Note

For information on parsing dates and times in a certificate, see [Format of Dates and Times in an Expression](#) and [Expressions for SSL Certificate Dates](#).

## Prefixes for text-based SSL and certificate data

The following table describes expression prefixes that identify text-based items in SSL transactions and client certificates.

Table 1. Prefixes That Return Text or Boolean Values for SSL and Client Certificate Data

| Prefix                        | Description                                                           |
|-------------------------------|-----------------------------------------------------------------------|
| CLIENT.SSL.CLIENT_CERT        | Returns the SSL client certificate in the current SSL transaction.    |
| CLIENT.SSL.CLIENT_CERT.TO_PEM | Returns the SSL client certificate in binary format.                  |
| CLIENT.SSL.CIPHER_EXPORTABLE  | Returns a Boolean TRUE if the SSL cryptographic cipher is exportable. |

| Prefix                     | Description                                                                                                                                                                                       |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLIENT.SSL.CIPHER_NAME     | Returns the name of the SSL Cipher if invoked from an SSL connection, and a NULL string if invoked from a non-SSL connection.                                                                     |
| CLIENT.SSL.IS_SSL          | Returns a Boolean TRUE if the current connection is SSL-based.                                                                                                                                    |
| CLIENT.SSL.JA3_FINGERPRINT | Returns a Boolean TRUE if the configured JA3 fingerprint matches the JA3 fingerprint in the client hello message. <b>Note:</b> This expression is available in release 13.1 build 12.x and later. |

### Prefixes for numeric data in SSL certificates

The following table describes prefixes that evaluate numeric data other than dates in SSL certificates. These prefixes can be used with the operations that are described in [Basic Operations on Expression Prefixes](#) and [Compound Operations for Numbers](#).

Table 2. Prefixes That Evaluate Numeric Data Other Than Dates in SSL Certificates

| Prefix                                | Description                                                                                                                                                                                                                                                                                                             |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLIENT.SSL.CLIENT_CERT.DAYS_TO_EXPIRE | Returns the number of days that the certificate is valid, or returns -1 for expired certificates.                                                                                                                                                                                                                       |
| CLIENT.SSL.CLIENT_CERT.PK_SIZE        | Returns the size of the public key used in the certificate.                                                                                                                                                                                                                                                             |
| CLIENT.SSL.CLIENT_CERT.VERSION        | Returns the version number of the certificate. If the connection is not SSL-based, returns zero (0).                                                                                                                                                                                                                    |
| CLIENT.SSL.CIPHER_BITS                | Returns the number of bits in the cryptographic key. Returns 0 if the connection is not SSL-based.                                                                                                                                                                                                                      |
| CLIENT.SSL.VERSION                    | Returns a number that represents the SSL protocol version, as follows: 0. The transaction is not SSL-based: 0x002. The transaction is SSLv2: 0x300. The transaction is SSLv3: 0x301. The transaction is TLSv1: 0x302. The transaction is TLS 1.1: 0x303. The transaction is TLS 1.2: 0x304. The transaction is TLS 1.3. |

**Note**

For expressions related to expiration dates in a certificate, see [Expressions for SSL Certificate Dates](#).

**Expressions for SSL certificates**

You can parse SSL certificates by configuring expressions that use the following prefix:

CLIENT.SSL.CLIENT\_CERT

This section discusses the expressions that you can configure for certificates, except expressions that examine certificate expiration. Time-based operations are described in [Advanced Policy Expressions: Working with Dates, Times, and Numbers](#).

The following table describes the operations that you can specify for the CLIENT.SSL.CLIENT\_CERT prefix.

Table 3. Operations That Can Be Specified with the CLIENT.SSL.CLIENT\_CERT Prefix

| SSL Certificate Operation               | Description                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;certificate&gt;.EXISTS</code> | Returns a Boolean TRUE if the client has an SSL certificate.                                                                                                                                                                                                                                                                                                                                    |
| <code>&lt;certificate&gt;.ISSUER</code> | Returns the Distinguished Name (DN) of the Issuer in the certificate as a name-value list. An equals sign (“=”) is the delimiter for the name and the value, and the slash (“/”) is the delimiter that separates the name-value pairs. Following is an example of the returned DN: <code>/C=US/O=myCompany/OU=www.mycompany.com/CN=www.mycompany.com/emailAddress=myuserid@mycompany.com</code> |

SSL Certificate Operation

Description

`<certificate>.ISSUER.  
IGNORE_EMPTY_ELEMENTS`

Returns the Issuer and ignores the empty elements in a name-value list. For example, consider the following: `Cert-Issuer: /c=in/st=kar//l=bangalore //o=mycompany/ou=sales/ /emailAddress=myuserid@mycompany.com`. The following Rewrite action returns a count of 6 based on the preceding Issuer definition: `sh rewrite action insert_ssl_header Name: insert_ssl Operation: insert_http_header Target:Cert-Issuer Value:CLIENT.SSL.CLIENT_CERT.ISSUER.COUNT`. However, if you change the value to the following, the returned count is 9: `CLIENT.SSL.CLIENT_CERT.ISSUER.IGNORE_EMPTY_ELEMENTS.COUNT`

`<certificate>. SERIALNUMBER`

Returns the serial number of the certificate as an upper case hexadecimal string with no leading zeroes. For example, if the serial number of the certificate is 04daa1e44bd2e7769638a0058b4964bd, the following expression helps match the serial number `CLIENT.SSL.CLIENT_CERT.SERIALNUMBER.SET_TEXT_MODE(IGNORECASE).CONTAINS("\4daa1e44bd2e7769638a0058b4964bd\")`

- `<certificate>.extensions.has_object`

Returns the Boolean value TRUE if the client certificate has the extension with a matching OID. For example, if the client certificate has the extension with the OID 2.16.756.5.4.2.1.2.13.2.7 then the expression `client.ssl.client_cert.extensions.has_object(2.16.756.5.4.2.1.2.13.2.7)`, returns TRUE.

- `<certificate>.extensions.object(OID).has_value(value)`

Returns the Boolean value TRUE if the client certificate has the extension with a matching OID and value. For example, if the client certificate has the extension with the OID 2.16.756.5.4.2.1.2.13.2.7 and a value XB then the expression `client.ssl.client_cert.extensions.object("2.16.756.5.4.2.1.2.13.2.7").has_value("XB")` returns TRUE.

| SSL Certificate Operation                         | Description                                                                                                                                                                                                                      |
|---------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;certificate&gt;.extensions.count</code> | Number of extensions received in the client certificate. For example, if the number of extensions in the client certificate is 16 then the expression <code>client.ssl.client_cert.extensions.count.eq(16)</code> , returns TRUE |

**Note:**

You can use a well-known short name instead of OID for standard extensions. For example, the Netscape comment extension has the OID `2.16.840.1.113730.1.13` and the short name `nsComment`. You can use `nsComment` in the extension instead of `2.16.840.1.113730.1.13`

```

1 - client.ssl.client_cert.extensions.has_object(nscomment).
2 - client.ssl.client_cert.extensions.object("nscomment").
 has_value("OpenSSL Generated Client Certificate").
3
4 <!--NeedCopy-->
```

**Parse SSL client hello**

You can parse the SSL client hello message by configuring expressions that use the following prefix:

| Prefix                                                   | Description                                                                                                                 |
|----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <code>CLIENT.SSL.CLIENT_HELLO.CIPHERS.HAS_HEXCODE</code> | Matches the hex code provided in the expression with the hex codes of cipher suites received in the client hello message.   |
| <code>CLIENT.SSL.CLIENT_HELLO.CLIENT_VERSION</code>      | Version received in the client hello message header.                                                                        |
| <code>CLIENT.SSL.CLIENT_HELLO.IS_RENEGOTIATE</code>      | Returns true if a client or server initiates session renegotiation.                                                         |
| <code>CLIENT.SSL.CLIENT_HELLO.IS_REUSE</code>            | Returns true if the appliance reuses the SSL session based on the non-zero session-ID received in the client-hello message. |

---

| Prefix                                    | Description                                                                                                                                          |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLIENT.SSL.CLIENT_HELLO.IS_SCSV           | Returns true if Signaling Cipher Suite Value (SCSV) capability is advertised in the client hello message. The hex code for fallback SCSV is 0x5600.  |
| CLIENT.SSL.CLIENT_HELLO.IS_SESSION_TICKET | Returns true if session ticket extension with non-zero length is advertised in the client-hello message.                                             |
| CLIENT.SSL.CLIENT_HELLO.LENGTH            | Length received in the client hello message header.                                                                                                  |
| CLIENT.SSL.CLIENT_HELLO.SNI               | Returns the server name received in the Server Name extension of the client hello message.                                                           |
| CLIENT.SSL.CLIENT_HELLO.ALPN.HAS_NEXTPROT | Returns true if the application protocol in the ALPN extension received in the client hello message matches the protocol provided in the expression. |

---

These expressions can be used at the CLIENTHELLO\_REQ bind point. For more information, see [SSL policy binding](#).

## Advanced policy expressions: IP and MAC addresses, throughput, VLAN IDs

May 2, 2023

You can use Advanced policy expression prefixes that return IPv4 and IPv6 addresses, MAC addresses, IP subnets, useful client and server data such as the throughput rates at the interface ports (Rx, Tx, and RxDx), and the IDs of the VLANs through which packets are received. You can then use various operators to evaluate the data that is returned by these expression prefixes.

### Expressions for IP addresses and IP subnets

You can use Advanced policy expressions to evaluate addresses and subnets that are in Internet Protocol version 4 (IPv4) or Internet Protocol version 6 (IPv6) format. Expression prefixes for IPv6 addresses and subnets include IPv6 in the prefix. Expression prefixes for IPv4 addresses and subnets include IP in the prefix. Following is an example of an expression that identifies whether a request has originated from a particular IPv4 subnet.

```
1 client.ip.src.in_subnet(147.1.0.0/16)
2 <!--NeedCopy-->
```

Following are two examples of Rewrite policies that examine the subnet from which the packet is received and perform a rewrite action on the Host header. With these two policies configured, the rewrite action that is performed depends on the subnet in the request. These two policies evaluate IP addresses that are in the IPv4 address format.

```
1 - add rewrite action URL1-rewrite-action replace "http.req.header(\"
 Host\")" "\"www.mycompany1.com\""
2 - add rewrite policy URL1-rewrite-policy "http.req.header(\"Host\").
 contains(\"www.test1.com\") && client.ip.src.in_subnet(147.1.0.0/16)
 " URL1-rewrite-action
3 - add rewrite action URL2-rewrite-action replace "http.req.header(\"
 Host\")" "\"www.mycompany2.com\""
4 - add rewrite policy URL2-rewrite-policy "http.req.header(\"Host\").
 contains(\"www.test2.com\") && client.ip.src.in_subnet
 (10.202.0.0/16)" URL2-rewrite-action
5 <!--NeedCopy-->
```

**Note**

The preceding examples are commands that you type at the NetScaler command-line interface (CLI) and, therefore, each quotation mark must be preceded by a backslash (\). For more information, see [Configuring advanced policy expressions in a policy.](#)”

**Prefixes for IPV4 addresses and IP subnets**

The following table describes prefixes that return IPv4 addresses and subnets, and segments of IPv4 addresses. You can use numeric operators and operators that are specific to IPv4 addresses with these prefixes. For more information about numeric operations, see “[Basic Operations on Expression Prefixes](#)”and “[Compound Operations for Numbers.](#)”

Table 1. Prefixes That Evaluate IP and MAC Addresses

| Prefix        | Description                                                                       |
|---------------|-----------------------------------------------------------------------------------|
| CLIENT.IP.SRC | Returns the source IP of the current packet as an IP address or as a number.      |
| CLIENT.IP.DST | Returns the destination IP of the current packet as an IP address or as a number. |
| SERVER.IP.SRC | Returns the source IP of the current packet as an IP address or as a number.      |
| SERVER.IP.DST | Returns the destination IP of the current packet as an IP address or as a number. |

## Operations for IPV4 Addresses

The [Prefix for IPV4 operations](#) table describes the operators that can be used with prefixes that return an IPv4 address.

### About IPv6 expressions

The IPv6 address format allows more flexibility than the older IPv4 format. IPv6 addresses are in the hexadecimal format (RFC 2373). In the following examples, Example 1 is an IPv6 address, Example 2 is a URL that includes the IPv6 address, and Example 3 includes the IPv6 address and a port number.

#### Example 1:

```
1 9901:0ab1:22a2:88a3:3333:4a4b:5555:6666
2 <!--NeedCopy-->
```

#### Example 2:

```
1 http://[9901:0ab1:22a2:88a3:3333:4a4b:5555:6666]/
2 <!--NeedCopy-->
```

#### Example 3:

```
1 https://[9901:0ab1:22a2:88a3:3333:4a4b:5555:6666]:8080/
2 <!--NeedCopy-->
```

In Example 3, the brackets separate the IP address from the port number (8080).

Note that you can only use the '+' operator to combine IPv6 expressions with other expressions. The output is a concatenation of the string values that are returned from the individual expressions. You cannot use any other arithmetic operator with an IPv6 expression. The following syntax is an example:

```
1 client.ipv6.src + server.ip.dst
2 <!--NeedCopy-->
```

For example, if the client source IPv6 address is `ABCD:1234::ABCD`, and the server destination IPv4 address is `10.100.10.100`, the preceding expression returns `"ABCD:1234::ABCD10.100.10.100"`.

Note that when the NetScaler appliance receives an IPv6 packet, it assigns a temporary IPv4 address from an unused IPv4 address range and changes the source address of the packet to this temporary address. At response time, the outgoing packet's source address is replaced with the original IPv6 address.

**Note**

You can combine an IPv6 expression with any other expression except an expression that produces a Boolean result.

**Expression prefixes for IPv6 addresses**

The IPv6 addresses that are returned by the expression prefixes in the following table can be treated as text data. For example, the prefix `client.ipv6.dst` returns the destination IPv6 address as a string that can be evaluated as text.

The following table describes expression prefixes that return an IPv6 address.

Table 3. IPv6 Expression Prefixes That Return Text

| Prefix          | Description                                                                                                                                                                                       |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLIENT.IPV6     | Operates on the IPv6 address in with the current packet.                                                                                                                                          |
| CLIENT.IPV6.DST | Returns the IPv6 address in the destination field of the IP header.                                                                                                                               |
| CLIENT.IPV6.SRC | Returns the IPv6 address in the source field of the IP header. Following are examples:<br><code>client.ipv6.src.in_subnet</code><br>(2007::2008/64)<br><code>client.ipv6.src.get1.le(2008)</code> |
| SERVER.IPV6     | Operates on the IPv6 address in with the current packet.                                                                                                                                          |
| SERVER.IPV6.DST | Returns the IPv6 address in the destination field of the IP header.                                                                                                                               |
| SERVER.IPV6.SRC | Returns the IPv6 address in the source field of the IP header. Following are examples:<br><code>server.ipv6.src.in_subnet</code><br>(2007::2008/64)<br><code>server.ipv6.src.get1.le(2008)</code> |

**Operations for IPv6 prefixes**

The following table describes the operators that can be used with prefixes that return an IPv6 address:

Table 4. Operations That Evaluate IPv6 Addresses

| IPv6 Operation                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;ipv6&gt;.EQ(&lt;IPv6_address&gt;</code>   | Returns a Boolean TRUE if the IP address value is same as the <code>&lt;IPv6_address&gt;</code> argument. Following is an example: <code>client.ipv6.dst.eq(ABCD:1234::ABCD)</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <code>&lt;ipv6&gt;.GET1. . .GET8</code>             | Returns a segment of an IPv6 address as a number. The following example expressions retrieve segments from the ipv6 address 1000:1001:CD10:0000:0000:89AB:4567:CDEF: <code>client.ipv6.dst.get5</code> extracts 0000, which is the fifth set of bits in the address. <code>client.ipv6.dst.get6</code> extracts 89 AB. <code>client.ipv6.dst.get7</code> extracts 4567. You can perform numeric operations on these segments. Note that you cannot perform numeric operations when you retrieve an entire IPv6 address. This is because expressions that return an entire IPv6 address, such as <code>CLIENT.IPV6.SRC</code> , return the address in text format. |
| <code>&lt;ipv6&gt;.IN_SUBNET(&lt;subnet&gt;)</code> | Returns a Boolean TRUE if the IPv6 address value is in the subnet specified by the <code>&lt;subnet&gt;</code> argument. Following is an example: <code>client.ipv6.dst.eq(1000:1001:CD10:0000:0000:89AB:4567:CDEF/60)</code>                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <code>&lt;ipv6&gt;.IS_IPV4</code>                   | Returns a Boolean TRUE if this is an IPv4 client, and returns a Boolean FALSE if it is not.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <code>&lt;ipv6&gt;.SUBNET(&lt;n&gt;)</code>         | Returns the IPv6 address after applying the subnet mask specified as the argument. The subnet mask can take values between 0 and 128. For example:<br><code>CLIENT.IPV6.SRC.SUBNET(24)</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

### Expressions for MAC addresses

A MAC address consists of colon-delimited hexadecimal values in the format `##:##:##:##:##:##`, where each “#” represents either a number from 0 through 9 or a letter from A through F. DAdvanced policy ex-

pression prefixes and operators are available for evaluating source and destination MAC addresses.

### Prefixes for MAC addresses

The following table describes prefixes that return MAC addresses.

Table 5. Prefixes That Evaluate MAC Addresses

| Prefix                           | Description                                                              |
|----------------------------------|--------------------------------------------------------------------------|
| <code>client.ether.dstmac</code> | Returns the MAC address in the destination field of the Ethernet header. |
| <code>client.ether.srcmac</code> | Returns the MAC address in the source field of the Ethernet header.      |

### Operations for MAC addresses

The following table describes the operators that can be used with prefixes that return a MAC address.

Table 6. Operations on MAC Addresses

| Prefix                                               | Description                                                                                                                                                                                                                         |
|------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>&lt;mac address&gt;.EQ(&lt;address&gt;)</code> | Returns a Boolean TRUE if the MAC address value is same as the <code>&lt;address&gt;</code> argument.                                                                                                                               |
| <code>&lt;mac address&gt;.GET1. . .GET4</code>       | Returns a numeric value extracted from the segment of the MAC address that is specified in the GET operation. For example, if the MAC address is 12:34:56:78:9a:bc, the following returns 34: <code>client.ether.dstmac.get2</code> |

### Expressions for numeric client and server data

The following table describes prefixes for working with numeric client and server data, including throughput, port numbers, and VLAN IDs.

Table 7. Prefixes that evaluate numeric client and server data

---

| Prefix                          | Description                                                                                                                        |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| client.interface.rxthroughput   | Returns an integer representing the raw received traffic throughput in kilobytes per second (KBps) for the previous seven seconds. |
| client.interface.txthroughput   | Returns an integer representing the raw transmitted traffic throughput in KBps for the previous seven seconds.                     |
| client.interface.rxtxthroughput | Returns an integer representing the raw received and transmitted traffic throughput in KBps for the previous seven seconds.        |
| server.interface.rxthroughput   | Returns an integer representing the raw received traffic throughput in KBps for the previous seven seconds.                        |
| server.interface.txthroughput   | Returns an integer representing the raw transmitted traffic throughput in KBps for the previous seven seconds.                     |
| server.interface.rxtxthroughput | Returns an integer representing the raw received and transmitted traffic throughput in KBps for the previous seven seconds.        |
| server.vlan.id                  | Returns a numeric ID of the VLAN through which the current packet entered the NetScaler.                                           |
| client.vlan.id                  | Returns a numeric ID for the VLAN through which the current packet entered the NetScaler.                                          |

---

## Advanced policy expressions: Stream analytics functions

December 22, 2023

Stream Analytics expressions begin with the `ANALYTICS.STREAM(<identifier_name>)` prefix. The following list describes the functions that can be used with this prefix.

- **COLLECT\_STATS**

Collect statistical data from the requests that are evaluated against the policy and create a record for each request.

- **REQUESTS**

Return the number of requests that exist for the specified record grouping. The value returned is of type unsigned long.

- **BANDWIDTH**

Return the bandwidth statistic for the specified record grouping. The value returned is of type unsigned long.

- **RESPTIME**

Return the response time statistic for the specified record grouping. The value returned is of type unsigned long.

- **CONNECTIONS**

Return the number of concurrent connections that exist for the specified record grouping. The value returned is of type unsigned long.

- **IS\_TOP(n)**

Return a Boolean TRUE if the statistical value for the specified record grouping is one among the top n groups. Otherwise, return a Boolean FALSE.

- **CHECK\_LIMIT**

Return a Boolean TRUE if the statistic for the specified record grouping has hit the preconfigured limit. Otherwise, return a Boolean FALSE.

## Advanced policy expressions: DataStream

May 2, 2023

The policy infrastructure on the NetScaler appliance includes expressions that you can use to evaluate and process database server traffic when the appliance is deployed between a farm of application servers and their associated database servers.

This topic includes the following sections:

- Expressions for the MySQL Protocol
- Expressions for Evaluating Microsoft SQL Server Connections

### Expressions for the MySQL protocol

The following expressions evaluate traffic associated with MySQL database servers. You can use the request-based expressions (expressions that begin with `MYSQL.CLIENT` and `MYSQL.REQ`) in policies to

make request switching decisions at the content switching virtual server bind point and the response-based expressions (expressions that begin with `MYSQL.RES`) to evaluate server responses to user-configured health monitors.

- **MYSQL.CLIENT.** Operates on the client properties of a MySQL connection.
- **MYSQL.CLIENT.CAPABILITIES.** Returns the set of flags that the client has set in the capabilities field of the handshake initialization packet during authentication. Examples of the flags that are set are `CLIENT_FOUND_ROWS`, `CLIENT_COMPRESS`, and `CLIENT_SSL`.
- **MYSQL.CLIENT.CHAR\_SET.** Returns the enumeration constant assigned to the character set that the client uses. The `EQ(<m>)` and `NE(<m>)` operators, which return Boolean values to indicate the result of a comparison, are used with this prefix. Following are the character set enumeration constants:
  - `LATIN2_CZECH_CS`
  - `DEC8_SWEDISH_CI`
  - `CP850_GENERAL_CI`
  - `GREEK_GENERAL_CI`
  - `LATIN1_GERMAN1_CI`
  - `HP8_ENGLISH_CI`
  - `KOI8R_GENERAL_CI`
  - `LATIN1_SWEDISH_CI`
  - `LATIN2_GENERAL_CI`
  - `SWE7_SWEDISH_CI`
  - `ASCII_GENERAL_CI`
  - `CP1251_BULGARIAN_CI`
  - `LATIN1_DANISH_CI`
  - `HEBREW_GENERAL_CI`
  - `LATIN7_ESTONIAN_CS`
  - `LATIN2_HUNGARIAN_CI`
  - `KOI8U_GENERAL_CI`
  - `CP1251_UKRAINIAN_CI`
  - `CP1250_GENERAL_CI`
  - `LATIN2_CROATIAN_CI`
  - `CP1257_LITHUANIAN_CI`
  - `LATIN5_TURKISH_CI`
  - `LATIN1_GERMAN2_CI`
  - `ARMSCII8_GENERAL_CI`
  - `UTF8_GENERAL_CI`
  - `CP1250_CZECH_CS`
  - `CP866_GENERAL_CI`

- KEYBCS2\_GENERAL\_CI
- MACCE\_GENERAL\_CI
- MACROMAN\_GENERAL\_CI
- CP852\_GENERAL\_CI
- LATIN7\_GENERAL\_CI
- LATIN7\_GENERAL\_CS
- MACCE\_BIN
- CP1250\_CROATIAN\_CI
- LATIN1\_BIN
- LATIN1\_GENERAL\_CI
- LATIN1\_GENERAL\_CS
- CP1251\_BIN
- CP1251\_GENERAL\_CI
- CP1251\_GENERAL\_CS
- MACROMAN\_BIN
- CP1256\_GENERAL\_CI
- CP1257\_BIN
- CP1257\_GENERAL\_CI
- ARMSCII8\_BIN
- ASCII\_BIN
- CP1250\_BIN
- CP1256\_BIN
- CP866\_BIN
- DEC8\_BIN
- GREEK\_BIN
- HEBREW\_BIN
- HP8\_BIN
- KEYBCS2\_BIN
- KOI8R\_BIN
- KOI8U\_BIN
- LATIN2\_BIN
- LATIN5\_BIN
- LATIN7\_BIN
- CP850\_BIN
- CP852\_BIN
- SWE7\_BIN
- UTF8\_BIN
- GEOSTD8\_GENERAL\_CI
- GEOSTD8\_BIN

- LATIN1\_SPANISH\_CI
  - UTF8\_UNICODE\_CI
  - UTF8\_ICELANDIC\_CI
  - UTF8\_LATVIAN\_CI
  - UTF8\_ROMANIAN\_CI
  - UTF8\_SLOVENIAN\_CI
  - UTF8\_POLISH\_CI
  - UTF8\_ESTONIAN\_CI
  - UTF8\_SPANISH\_CI
  - UTF8\_SWEDISH\_CI
  - UTF8\_TURKISH\_CI
  - UTF8\_CZECH\_CI
  - UTF8\_DANISH\_CI
  - UTF8\_LITHUANIAN\_CI
  - UTF8\_SLOVAK\_CI
  - UTF8\_SPANISH2\_CI
  - UTF8\_ROMAN\_CI
  - UTF8\_PERSIAN\_CI
  - UTF8\_ESPERANTO\_CI
  - UTF8\_HUNGARIAN\_CI
  - INVALID\_CHARSET
- **MYSQL.CLIENT.DATABASE.** Returns the name of the database specified in the authentication packet that the client sends to the database server. This is the databasename attribute.
  - **MYSQL.CLIENT.USER.** Returns the user name (in the authentication packet) with which the client is attempting to connect to the database. This is the user attribute.
  - **MYSQL.REQ.** Operates on a MySQL request.
  - **MYSQL.REQ.COMMAND.** Identifies the enumeration constant assigned to the type of command in the request. The EQ(<m>) and NE(<m>) operators, which return Boolean values to indicate the result of a comparison, are used with this prefix. Following are the enumeration constant values:
    - SLEEP
    - QUIT
    - INIT\_DB
    - QUERY
    - FIELD\_LIST
    - CREATE\_DB
    - DROP\_DB
    - REFRESH

- SHUTDOWN
  - STATISTICS
  - PROCESS\_INFO
  - CONNECT
  - PROCESS\_KILL
  - DEBUG
  - PING
  - TIME
  - DELAYED\_INSERT
  - CHANGE\_USER
  - BINLOG\_DUMP
  - TABLE\_DUMP
  - CONNECT\_OUT
  - REGISTER\_SLAVE
  - STMT\_PREPARE
  - STMT\_EXECUTE
  - STMT\_SEND\_LONG\_DATA
  - STMT\_CLOSE
  - STMT\_RESET
  - SET\_OPTION
  - STMT\_FETCH
- **MYSQL.REQ.QUERY.** Identifies the query in the MySQL request.
  - **MYSQL.REQ.QUERY.COMMAND.** Returns the first keyword in the MySQL query.
  - **MYSQL.REQ.QUERY.SIZE.** Returns the size of the request query in integer format. The SIZE method is similar to the CONTENT\_LENGTH method that returns the length of an HTTP request or response.
  - **MYSQL.REQ.QUERY.TEXT.** Returns a string covering the entire query.
  - **MYSQL.REQ.QUERY.TEXT(<n>).** Returns the first n bytes of the MySQL query as a string. This is similar to HTTP.BODY(<n>).
- Parameters:**
- n - Number of bytes to be returned
- **MYSQL.RES.** Operates on a MySQL response.
  - **MYSQL.RES.ATLEAST\_ROWS\_COUNT(<i>).** Checks whether the response has at least i number of rows and returns a Boolean TRUE or FALSE to indicate the result.
- Parameters:**
- i - Number of rows

- **MYSQL.RES.ERROR.** Identifies the MySQL error object. The error object includes the error number and the error message.
- **MYSQL.RES.ERROR.MESSAGE.** Returns the error message that is retrieved from the server's error response.
- **MYSQL.RES.ERROR.NUM.** Returns the error number that is retrieved from the server's error response.
- **MYSQL.RES.ERROR.SQLSTATE.** Returns the value of the SQLSTATE field in the server's error response. The MySQL server translates error number values to SQLSTATE values.
- **MYSQL.RES.FIELD(<i>).** Identifies the packet that corresponds to the *i*th individual field in the server's response. Each field packet describes the properties of the associated column. The packet count (*i*) begins at 0.

**Parameters:**

*i* - Packet number

- **MYSQL.RES.FIELD(<i>).CATALOG.** Returns the catalog property of the field packet.
- **MYSQL.RES.FIELD(<i>).CHAR\_SET.** Returns the character set of the column. The EQ(<m>) and NE(<m>) operators, which return Boolean values to indicate the result of a comparison, are used with this prefix.
- **MYSQL.RES.FIELD(<i>).DATATYPE.** Returns an enumeration constant that represents the data type of the column. This is the type (also called enum\_field\_type) attribute of the column. The EQ(<m>) and NE(<m>) operators, which return Boolean values to indicate the result of a comparison, are used with this prefix. The possible values for the various data types are:
  - DECIMAL
  - TINY
  - SHORT
  - LONG
  - FLOAT
  - DOUBLE
  - NULL
  - TIMESTAMP
  - LONGLONG
  - INT24
  - DATE
  - TIME
  - DATETIME
  - YEAR
  - NEWDATE

- VARCHAR (new in MySQL 5.0)
  - BIT (new in MySQL 5.0)
  - NEWDECIMAL (new in MySQL 5.0)
  - ENUM
  - SET
  - TINY\_BLOB
  - MEDIUM\_BLOB
  - LONG\_BLOB
  - BLOB
  - VAR\_STRING
  - STRING
  - GEOMETRY
- **MYSQL.RES.FIELD(<i>).DB.** Returns the database identifier (db) attribute of the field packet.
  - **MYSQL.RES.FIELD(<i>).DECIMALS.** Returns the number of positions after the decimal point if the type is DECIMAL or NUMERIC. This is the decimals attribute of the field packet.
  - **MYSQL.RES.FIELD(<i>).FLAGS.** Returns the flags property of the field packet. Following are the possible hexadecimal flag values:
    - 0001: NOT\_NULL\_FLAG
    - 0002: PRI\_KEY\_FLAG
    - 0004: UNIQUE\_KEY\_FLAG
    - 0008: MULTIPLE\_KEY\_FLAG
    - 0010: BLOB\_FLAG
    - 0020: UNSIGNED\_FLAG
    - 0040: ZEROFILL\_FLAG
    - 0080: BINARY\_FLAG
    - 0100: ENUM\_FLAG
    - 0200: AUTO\_INCREMENT\_FLAG
    - 0400: TIMESTAMP\_FLAG
    - 0800: SET\_FLAG
  - **MYSQL.RES.FIELD(<i>).LENGTH.** Returns the length of the column. This is the value of the length attribute of the field packet. The value that is returned might be larger than the actual value. For example, an instance of a VARCHAR(2) column might return a value of 2 even when it contains only one character.
  - **MYSQL.RES.FIELD(<i>).NAME.** Returns the column identifier (the name after the AS clause, if any). This is the name attribute of the field packet.
  - **MYSQL.RES.FIELD(<i>).ORIGINAL\_NAME.** Returns the original column identifier (before the AS clause, if any). This is the org\_name attribute of the field packet.

- **MYSQL.RES.FIELD(<i>).ORIGINAL\_TABLE.** Returns the original table identifier of the column (before the AS clause, if any). This is the org\_table attribute of the field packet.
- **MYSQL.RES.FIELD(<i>).TABLE.** Returns the table identifier of the column (after the AS clause, if any). This is the table attribute of the field packet.
- **MYSQL.RES.FIELDS\_COUNT.** Returns the number of field packets in the response (the field\_count attribute of the OK packet).
- **MYSQL.RES.OK.** Identifies the OK packet sent by the database server.
- **MYSQL.RES.OK.AFFECTED\_ROWS.** Returns the number of rows affected by an INSERT, UPDATE, or DELETE query. This is the value of the affected\_rows attribute of the OK packet.
- **MYSQL.RES.OK.INSERT\_ID.** Identifies the unique\_id attribute of the OK packet. If an auto-increment identity is not generated by the current MySQL statement or query, the value of unique\_id, and hence the value returned by the expression, is 0.
- **MYSQL.RES.OK.MESSAGE.** Returns the message property of the OK packet.
- **MYSQL.RES.OK.STATUS.** Identifies the bit string in the server\_status attribute of the OK packet. Clients can use the server status to check whether the current command is a part of a running transaction. The bits in the server\_status bit string correspond to the following fields (in the given order):
  - IN TRANSACTION
  - AUTO\_COMMIT
  - MORE RESULTS
  - MULTI QUERY
  - BAD INDEX USED
  - NO INDEX USED
  - CURSOR EXISTS
  - LAST ROW SEEN
  - DATABASE DROPPED
  - NO BACKSLASH ESCAPES
- **MYSQL.RES.OK.WARNING\_COUNT.** Returns the warning\_count attribute of the OK packet.
- **MYSQL.RES.ROW(<i>).** Identifies the packet that corresponds to the <sup>i</sup>th individual row in the database server's response.

**Parameters:**

i - Row number

- **MYSQL.RES.ROW(<i>).DOUBLE\_ELEM(<j>).** Checks whether the <sup>j</sup>th column of the <sup>i</sup>th row of the table is NULL. Following C conventions, both indexes i and j

start from 0. Therefore, row  $i$  and column  $j$  are actually the  $(i+1)$ <sup>th</sup> row and the  $(j+1)$ <sup>th</sup> column, respectively.

**Parameters:**

$i$  - Row number

$j$  - Column number

- **MYSQL.RES.ROW(< $i$ >).IS\_NULL\_ELEM(< $j$ >).** Checks whether the  $j$ <sup>th</sup> column of the  $i$ <sup>th</sup> row of the table is NULL. Following C conventions, both indexes  $i$  and  $j$  start from 0. Therefore, row  $i$  and column  $j$  are actually the  $(i+1)$ <sup>th</sup> row and the  $(j+1)$ <sup>th</sup> column, respectively.

**Parameters:**

$i$  - Row number

$j$  - Column number

- **MYSQL.RES.ROW(< $i$ >).NUM\_ELEM(< $j$ >).** Returns an integer value from the  $j$ <sup>th</sup> column of the  $i$ <sup>th</sup> row of the table. Following C conventions, both indexes  $i$  and  $j$  start from 0. Therefore, row  $i$  and column  $j$  are actually the  $(i+1)$ <sup>th</sup> row and the  $(j+1)$ <sup>th</sup> column, respectively.

**Parameters:**

$i$  - Row number

$j$  - Column number

- **MYSQL.RES.ROW(< $i$ >).TEXT\_ELEM(< $j$ >).** Returns a string from the  $j$ <sup>th</sup> column of the  $i$ <sup>th</sup> row of the table. Following C conventions, both indexes  $i$  and  $j$  start from 0. Therefore, row  $i$  and column  $j$  are actually the  $(i+1)$ <sup>th</sup> row and the  $(j+1)$ <sup>th</sup> column, respectively.

**Parameters:**

$i$  - Row number

$j$  - Column number

- **MYSQL.RES.TYPE.** Returns an enumeration constant for the response type. Its values can be ERROR, OK, and RESULT\_SET. The EQ(< $m$ >) and NE(< $m$ >) operators, which return Boolean values to indicate the result of a comparison, are used with this prefix.

## Expressions for evaluating Microsoft SQL server connections

The following expressions evaluate traffic associated with Microsoft SQL Server database servers. You can use the request-based expressions (expressions that begin with MSSQL.CLIENT and MSSQL.REQ)

in policies to make request switching decisions at the content switching virtual server bind point and the response-based expressions (expressions that begin with MSSQL.RES) to evaluate server responses to user-configured health monitors.

| Expression                | Description                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MSSQL.CLIENT.CAPABILITIES | Returns the OptionFlags1, OptionFlags2, OptionFlags3, and TypeFlags fields of the LOGIN7 authentication packet, in that order, as a 4-byte integer. Each field is 1 byte long and specifies a set of client capabilities.                                                                                                                                                                          |
| MSSQL.CLIENT.DATABASE     | Returns the name of the client database. The value returned is of type text.                                                                                                                                                                                                                                                                                                                       |
| MSSQL.CLIENT.USER         | Returns the user name with which the client authenticated. The value returned is of type text.                                                                                                                                                                                                                                                                                                     |
| MSSQL.REQ.COMMAND         | Returns an enumeration constant that identifies the type of command in the request sent to a Microsoft SQL Server database server. The value returned is of type text. Examples of the values of the enumeration constant are QUERY, RESPONSE, RPC, and ATTENTION. The EQ() and NE() operators, which return Boolean values to indicate the result of a comparison, are used with this expression. |
| MSSQL.REQ.QUERY.COMMAND   | Returns the first keyword in the SQL query. The value returned is of type text.                                                                                                                                                                                                                                                                                                                    |
| MSSQL.REQ.QUERY.SIZE      | Returns the size of the SQL query in the request. The value returned is a number.                                                                                                                                                                                                                                                                                                                  |
| MSSQL.REQ.QUERY.TEXT      | Returns the entire SQL query as a string. The value returned is of type text.                                                                                                                                                                                                                                                                                                                      |
| MSSQL.REQ.QUERY.TEXT()    | Returns the first n bytes of the SQL query. The value returned is of type text. Parameters: n - Number of bytes                                                                                                                                                                                                                                                                                    |
| MSSQL.REQ.RPC.NAME        | Returns the name of the procedure that is being called in a remote procedure call (RPC) request. The name is returned as a string.                                                                                                                                                                                                                                                                 |

| Expression                                                                 | Description                                                                                                                                                                                                                                                                                                                               |
|----------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MSSQL.REQ.RPC.IS_PROCID                                                    | Returns a Boolean value that indicates whether the remote procedure call (RPC) request contains a procedure ID or an RPC name. A return value of TRUE indicates that the request contains a procedure ID and a return value of FALSE indicates that the request contains an RPC name.                                                     |
| MSSQL.REQ.RPC.PROCID                                                       | Returns the procedure ID of the remote procedure call (RPC) request as an integer.                                                                                                                                                                                                                                                        |
| MSSQL.REQ.RPC.BODY <b>Note:</b> Not available for releases before 10.1.    | Returns the body of the SQL request as a string in the form of parameters represented as “a=b” clauses separated by commas, where “a” is the RPC parameter name and “b” is its value.                                                                                                                                                     |
| MSSQL.REQ.RPC.BODY(n) <b>Note:</b> Not available for releases before 10.1. | Returns part of the body of the SQL request as a string in the form of parameters represented as “a=b” clauses separated by commas, where “a” is the RPC parameter name and “b” is its value. Parameters are returned from only the first “n” bytes of the request, skipping the SQL header. Only complete name-value pairs are returned. |
| MSSQL.RES.ATLEAST_ROWS_COUNT(i)                                            | Checks whether the response has at least i number of rows. The value returned is a Boolean TRUE or FALSE value. Parameters: i - Number of rows                                                                                                                                                                                            |
| MSSQL.RES.DONE.ROWCOUNT                                                    | Returns a count of the number of rows affected by an INSERT, UPDATE, or DELETE query. The value returned is of type unsigned long.                                                                                                                                                                                                        |
| MSSQL.RES.DONE.STATUS                                                      | Returns the status field from the DONE token sent by a Microsoft SQL Server database server. The value returned is a number.                                                                                                                                                                                                              |
| MSSQL.RES.ERROR.MESSAGE                                                    | Returns the error message from the ERROR token sent by a Microsoft SQL Server database server. This is the value of the MsgText field in the ERROR token. The value returned is of type text.                                                                                                                                             |

| Expression                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MSSQL.RES.ERROR.NUM           | Returns the error number from the ERROR token sent by a Microsoft SQL Server database server. This is the value of the Number field in the ERROR token. The value returned is a number.                                                                                                                                                                                                                                       |
| MSSQL.RES.ERROR.STATE         | Returns the error state from the ERROR token sent by a Microsoft SQL Server database server. This is the value of the State field in the ERROR token. The value returned is a number.                                                                                                                                                                                                                                         |
| MSSQL.RES.FIELD().DATATYPE    | Returns the data type of the ith field in the server response. The EQ() and NE() functions, which return Boolean values to indicate the result of a comparison, are used with this prefix. For example, the following expression returns a Boolean TRUE if the DATATYPE function returns a value of datetime for the third field in the response:<br>MSSQL.RES.FIELD(<2>).DATATYPE.EQ(datetime)<br>Parameters: i - Row number |
| MSSQL.RES.FIELD().LENGTH      | Returns the maximum possible length of the ith field in the server response. The value returned is a number. Parameters: i - Row number                                                                                                                                                                                                                                                                                       |
| MSSQL.RES.FIELD().NAME        | Returns the name of the ith field in the server response. The value returned is of type text. Parameters: i - Row number                                                                                                                                                                                                                                                                                                      |
| MSSQL.RES.ROW().DOUBLE_ELEM() | Returns a value of type double from the jth column of the ith row of the table. If the value is not a double value, an UNDEF condition is raised. Following C conventions, both indexes i and j start from 0 (zero). Therefore, row i and column j are actually the (i + 1)th row and the (j + 1)th column, respectively. Parameters: i - Row number<br>j - Column number                                                     |

| Expression                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>MSSQL.RES.ROW().NUM_ELEM(j)</code>     | Returns an integer value from the <i>j</i> th column of <i>i</i> th row of the table. If the value is not an integer value, an UNDEF condition is raised. Following C conventions, both indexes <i>i</i> and <i>j</i> start from 0 (zero). Therefore, row <i>i</i> and column <i>j</i> are actually the ( <i>i</i> + 1)th row and the ( <i>j</i> + 1)th column, respectively. Parameters: <i>i</i> - Row number <i>j</i> - Column number |
| <code>MSSQL.RES.ROW().IS_NULL_ELEM(j)</code> | Checks whether the <i>j</i> th column of the <i>i</i> th row of the table is NULL and returns a Boolean TRUE or FALSE to indicate the result. Following C conventions, both indexes <i>i</i> and <i>j</i> start from 0 (zero). Therefore, row <i>i</i> and column <i>j</i> are actually the ( <i>i</i> + 1)th row and the ( <i>j</i> + 1)th column, respectively. Parameters: <i>i</i> - Row number <i>j</i> - Column number             |
| <code>MSSQL.RES.ROW().TEXT_ELEM(j)</code>    | Returns a text string from the <i>j</i> th column of <i>i</i> th row of the table. Following C conventions, both indexes <i>i</i> and <i>j</i> start from 0 (zero). Therefore, row <i>i</i> and column <i>j</i> are actually the ( <i>i</i> + 1)th row and the ( <i>j</i> + 1)th column, respectively. Parameters: <i>i</i> - Row number <i>j</i> - Column number                                                                        |
| <code>MSSQL.RES.TYPE</code>                  | Returns an enumeration constant that identifies the response type. Following are the possible return values: ERROR, OK, and RESULT_SET. The EQ() and NE() operators, which return Boolean values to indicate the result of a comparison, are used with this expression.                                                                                                                                                                  |

## Typecasting data

September 21, 2020

You can extract data of one type (for example, text or an integer) from requests and responses and transform it to data of another type. For example, you can extract a string and transform the string to

time format. You can also extract a string from an HTTP request body and treat it like an HTTP header or extract a value from one type of request header and insert it in a response header of a different type.

After typecasting the data, you can apply any operation that is appropriate for the new data type. For example, if you typecast text to an HTTP header, you can apply any operation that is applicable to HTTP headers to the returned value.

For more information about typecasting data, see the [Typecasting Operations](#) pdf.

## Regular expressions

December 21, 2023

When you want to perform string matching operations that are more complex than the operations that you perform with the `CONTAINS("<string>")` or `EQ("<string>")` operators, you use regular expressions. The policy infrastructure on the Citrix® NetScaler® appliance includes operators to which you can pass regular expressions as arguments for text matching. The names of the operators that work with regular expressions include the string `REGEX`. The regular expressions that you pass as arguments must conform to the regular expression syntax that is described in "<http://www.pcre.org/pcre.txt>." You can learn more about regular expressions at "<http://www.regular-expressions.info/quickstart.html>" and at "<http://www.silverstones.com/thebat/Regex.html>."

The target text for an operator that works with regular expressions can be either text or the value of an HTTP header. Following is the format of a Advanced policy expression that uses a regular expression operator to operate on text:

```
<text>.<regex_operator>(re<delimiter><regex_pattern><delimiter>)
```

The string `<text>` represents the Advanced policy expression prefix that identifies a text string in a packet (for example, `HTTP.REQ.URL`). The string `<regex_operator>` represents the regular expression operator. The regular expression always begins with the string `re`. A pair of matching delimiters, represented by `<delimiter>`, enclose the string `<regex_pattern>`, which represents the regular expression.

The following example expression checks whether the URL in an HTTP packet contains the string `*.jpeg` (where `*` is a wildcard) and returns a Boolean `TRUE` or `FALSE` to indicate the result. The regular expression is enclosed within a pair of slash marks (`/`), which act as delimiters.

```
http.req.url.regex_match(re/.<asterisk>\.jpeg/)
```

Regular expression operators can be combined to define or refine the scope of a search. For example, `<text>.AFTER_REGEX(reregex_pattern1).BEFORE_REGEX(reregex_pattern2)`

specifies that the target for string matching is the text between the patterns `regex_pattern1` and `regex_pattern2`. You can use a text operator on the scope that is defined by the regular expression operators. For example, you can use the `CONTAINS("<string>")` operator to check whether the defined scope contains the string `abc`:

```
<text>.AFTER_REGEX(re/regex_pattern1).BEFORE_REGEX(re/regex_pattern2 /).CONTAINS("abc")
```

**Note**

The process of evaluating a regular expression inherently takes more time than that for an operator such as `CONTAINS("<string>")` or `EQ("<string>")`, which work with simple string arguments. You should use regular expressions only if your requirement is beyond the scope of other operators.

## Basic characteristics of regular expressions

May 2, 2023

Following are notable characteristics of regular expressions as defined on the NetScaler appliance:

- A regular expression always begins with the string “re” followed by a pair of delimiting characters (called delimiters) that enclose the regular expression that you want to use.

For example, `re#<regex_pattern>#` uses the number sign (#) as a delimiter.

- A regular expression cannot exceed 1499 characters.
- Digit matching can be done by using the string `\d` (a backslash followed by d).
- White space can be represented by using `\s` (a backslash followed by s).
- A regular expression can contain white spaces.

Following are the differences between the NetScaler syntax and the PCRE syntax:

- The NetScaler does not allow back references in regular expressions.
- You should not use recursive regular expressions.
- The dot meta-character also matches the newline character.
- Unicode is not supported.
- The operation `SET_TEXT_MODE(IGNORECASE)` overrides the (?i) internal option in the regular expression.

## Operations for regular expressions

July 14, 2021

The following table describes the operators that work with regular expressions. The operation performed by a regular expression operator in a given Advanced policy expression depends on whether the expression prefix identifies text or HTTP headers. Operations that evaluate headers override any text-based operations for all instances of the specified header type. When you use an operator, replace <text> with the Advanced policy expression prefix that you want to configure for identifying text.

| Regular Expression Operation | Description                                                                                                                                                                                                                                                                                                                     |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>.BEFORE_REGEX()</code> | Selects the text that precedes the string that matches the argument. If the regular expression does not match any data in the target, the expression returns a text object of length 0. The following expression selects the string "text" from "text/plain". <code>http.res.header("content-type").before_regex(re/#/#)</code> |
| <code>.AFTER_REGEX()</code>  | Selects the text that follows the string that matches the argument. If the regular expression does not match any text in the target, the expression returns a text object of length 0. The following expression extracts "Example" from "myExample":<br><code>http.req.header("etag").after_regex(re/my/)</code>                |
| <code>.REGEX_SELECT()</code> | Selects a string that matches the argument. If the regular expression does not match the target, a text object of length 0 is returned. The following example extracts the string "NS-CACHE-9.0: 90" from a Via header:<br><code>http.req.header("via").regex_select(re!NS-CACHE-\d.\d:\s*\d{1,3}!)</code>                      |

| Regular Expression Operation | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>.REGEX_MATCH()</code>  | <p>Returns TRUE if the target matches a argument of up to 1499 characters. The regular expression must be of the following format: <code>reregular expression&lt; delimiter&gt;</code> Both delimiters must be the same. Additionally, the regular expression must conform to the Perl-compatible (PCRE) regular expression library syntax. For more information, go to <a href="http://www.pcre.org/pcre.txt">http://www.pcre.org/pcre.txt</a>. In particular, see the <code>pcrepattern</code> man page. However, note the following: Back-references are not allowed. Recursive regular expressions are not recommended. The dot metacharacter also matches the newline character. The Unicode character set is not supported. <code>SET_TEXT_MODE(IGNORECASE)</code> overrides the <code>(?i)</code> internal option specified in the regular expression. The following are examples:</p> <pre>http.req.hostname.regex_match(re/[[:alpha:]]+(abc){2,3}/)</pre> <p>and</p> <pre>http.req.url.set_text_mode(urlencoded).regex_match(re#(a*b</pre> <p>The following example matches <code>ab</code> and <code>aB</code>:</p> <pre>http.req.url.regex_match(re/a(?i)b/)</pre> <p>The following example matches <code>ab</code>, <code>aB</code>, <code>Ab</code> and <code>AB</code>:</p> <pre>http.req.url.set_text_mode(ignorecase).regex_match(re/ab/)</pre> <p>The following example performs a case-insensitive, multiline match in which the dot meta-character also matches a newline character:</p> <pre>http.req.body.regex_match(re/(?ixm) (^ab (.*) cd\$) /)</pre> |

## Summary examples of advanced policy expressions and policies

December 22, 2023

The following table provides examples of Advanced policy expressions that you can use as the basis

for your own Advanced policy expressions.

Table 1. Examples of Advanced policy Expressions

| Expression Type                                                                            | Sample Expressions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Look at the method used in the HTTP request.                                               | <code>http.req.method.eq(post)</code><br><code>http.req.method.eq(get)</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Check the Cache-Control or Pragma header value in an HTTP request (req) or response (res). | <code>http.req.header("Cache-Control").contains("no-store")</code><br><code>http.req.header("Cache-Control").contains("no-cache")</code><br><code>http.req.header("Pragma").contains("no-cache")</code><br><code>http.res.header("Cache-Control").contains("private")</code><br><code>http.res.header("Cache-Control").contains("public")</code><br><code>http.res.header("Cache-Control").contains("must-revalidate")</code><br><code>http.res.header("Cache-Control").contains("proxy-revalidate")</code><br><code>http.res.header("Cache-Control").contains("max-age")</code> |
| Check for the presence of a header in a request (req) or response (res).                   | <code>http.req.header("myHeader").exists</code><br><code>http.res.header("myHeader").exists</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Look for a particular file type in an HTTP request based on the file extension.            | <code>http.req.url.contains(".html")</code><br><code>http.req.url.contains(".cgi")</code><br><code>http.req.url.contains(".asp")</code><br><code>http.req.url.contains(".exe")</code><br><code>http.req.url.contains(".cfm")</code><br><code>http.req.url.contains(".ex")</code><br><code>http.req.url.contains(".shtml")</code><br><code>http.req.url.contains(".htx")</code><br><code>http.req.url.contains("/cgi-bin/")</code><br><code>http.req.url.contains("/exec/")</code><br><code>http.req.url.contains("/bin/")</code>                                                 |

| Expression Type                                                                                 | Sample Expressions                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Look for anything that is other than a particular file type in an HTTP request.                 | <code>http.req.url.contains(".png").not ; http.req.url.contains(".jpeg").not</code>                                                                                                                                                                                                                                                                                                                                         |
| Check the type of file that is being sent in an HTTP response based on the Content-Type header. | <code>http.res.header("Content-Type").contains("text")http.res.header("Content-Type").contains("application/msword")http.res.header("Content-Type").contains("vnd.ms-excel")http.res.header("Content-Type").contains("application/vnd.ms-powerpoint"); http.res.header("Content-Type").contains("text/css"); http.res.header("Content-Type").contains("text/xml"); http.res.header("Content-Type").contains("image/)</code> |
| Check whether this response contains an expiration header.                                      | <code>http.res.header("Expires").exists</code>                                                                                                                                                                                                                                                                                                                                                                              |
| Check for a Set-Cookie header in a response.                                                    | <code>http.res.header("Set-Cookie").exists</code>                                                                                                                                                                                                                                                                                                                                                                           |
| Check the agent that sent the response.                                                         | <code>http.res.header("User-Agent").contains("Mozilla/4.7")http.res.header("User-Agent").contains("MSIE")</code>                                                                                                                                                                                                                                                                                                            |
| Check if the first 1024 bytes of the body of a request starts with the string "some text".      | <code>http.req.body(1024).contains("some text")</code>                                                                                                                                                                                                                                                                                                                                                                      |

The following table shows examples of policy configurations and bindings for commonly used functions.

Table 2. Examples of Advanced policy Expressions and Policies

---

| Purpose                                                                                                                            | Example                                                                                                                                                                                                                                                                                                       |
|------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Use the rewrite feature to replace occurrences of <code>http://</code> with <code>https://</code> in the body of an HTTP response. | <pre>add rewrite action httpRewriteAction replace_all http.res.body(50000) "\"https://\" "-search http://add rewrite policy demo_rep34312 "http.res. body(50000).contains(\"http://\") " httpRewriteAction</pre>                                                                                              |
| Replace all occurrences of “abcd” with “1234” in the first 1000 bytes of the HTTP body.                                            | <pre>add rewrite action abcdTo1234Action replace_all " http.req.body(1000) "\"1234\""- search abcd add rewrite policy abcdTo1234Policy "http.req.body (1000).contains(\"abcd\")" abcdTo1234Action bind rewrite global abcdTo1234Policy 100 END - type REQ_OVERRIDE</pre>                                      |
| Downgrade the HTTP version to 1.0 to prevent the server from chunking HTTP responses.                                              | <pre>add rewrite action downgradeTo1.0 Action replace http.req.version. minor "\"0\""add rewrite policy downgradeTo1.0Policy "http.req. version.minor.eq(1)"downgradeTo1 .0Action bind lb vserver myLBVserver -policyName downgradeTo1.0Policy -priority 100 -gotoPriorityExpression NEXT -type REQUEST</pre> |

| Purpose                                                                                                                                                                                                                 | Example                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remove references to the HTTP or HTTPS protocol in all responses, so that if the user's connection is HTTP, the link is opened by using HTTP, and if the user's connection is HTTPS, the link is opened by using HTTPS. | <pre>add rewrite action remove_http_https replace_all " http.res.body(1000000). set_text_mode(ignorecase)""\"//\" "-search "re~https?::// HTTPS?:://~ "add rewrite policy remove_http_https true remove_http_https bind lb vserver test_vsvr -policyName remove_http_https -priority 20 - gotoPriorityExpression NEXT -type RESPONSE</pre> |
| Rewrite instances of http: to https: in all URLs.                                                                                                                                                                       | <pre>add responder action httpToHttpsAction redirect "\" https://\" + http.req.hostname + http.req.url"add responder policy httpToHttpsPolicy "!CLIENT.SSL. IS_SSL"httpToHttpsAction bind responder global httpToHttpsPolicy 1 END -type OVERRIDE</pre>                                                                                    |
| Modify a URL to redirect from URL A to URL B. In this example, "file5.html" is appended to the path.                                                                                                                    | <pre>add responder action appendFile5Action redirect "\"http ://\" + http.req.hostname + http. req.url + \"/file5.html\"""add responder policy appendFile5Policy "http.req.url. eq(\"/testsite\")" appendFile5Action bind responder global appendFile5Policy 1 END - type OVERRIDE</pre>                                                   |

---

| Purpose                                                                                                                                                                           | Example                                                                                                                                                                                                                                                                                                           |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Redirect an external URL to an internal URL.                                                                                                                                      | <pre>add rewrite action act_external_to_internal REPLACE 'http.req.hostname.server'"www. my.host.com"'add rewrite policy pol_external_to_internal 'http. req.hostname.server.eq("www. external.host.com")' act_external_to_internal bind rewrite global pol_external_to_internal 100 END -type REQ_OVERRIDE</pre> |
| Redirect requests to www.example.com that have a query string to www.Webn.example.com. The value n is derived from a server parameter in the query string, for example, server=5. | <pre>add rewrite action act_redirect_query REPLACE q#http .req.header("Host").before_str(". example.com")'"Web"+ http.req. url.query.value("server"# add rewrite policy pol_redirect_query q#http.req.header("Host").eq(" www.example.com")&amp;&amp; http.req.url. contains("?")'act_redirect_query#</pre>       |

---

## Tutorial examples of advanced policies for rewrite

December 21, 2023

With the rewrite feature, you can modify any part of an HTTP header, and, for responses, you can modify the HTTP body. You can use this feature to accomplish several useful tasks, such as removing unnecessary HTTP headers, masking internal URLs, redirecting webpages, and redirecting queries or keywords.

In the following examples, you first create a rewrite action and a rewrite policy. Then you bind the policy globally.

This document includes the following details:

- Redirecting an External URL to an Internal URL
- Redirecting a Query
- Rewriting HTTP to HTTPS
- Removing Unwanted Headers
- Reducing Web Server Redirects
- Masking the Server Header
- Converting plain text to URL encoded string and the opposite way

For more information about the commands and syntax descriptions, see [Rewrite Command Reference](#) page.

### Redirecting an external URL to an internal URL

This example describes how to create a rewrite action and rewrite policy that redirects an external URL to an internal URL. You create an action, called `act_external_to_internal`, that performs the rewrite. Then you create a policy called `pol_external_to_internal`.

#### To redirect an external URL to an internal URL by using the CLI

- To create the rewrite action, at the command prompt, type:

```
add rewrite action act_external_to_internal REPLACE "http.req.hostname
.server" "\host_name_of_internal_Web_server\"
```

- To create the rewrite policy, at the NetScaler command prompt, type:

```
add rewrite policy pol_external_to_internal "http.req.hostname.server
.eq(\"host_name_of_external_Web_server\")"act_external_to_internal
```

- Bind the policy globally.

#### To redirect an external URL to an internal URL by using the configuration utility

1. Navigate to **AppExpert > Rewrite > Actions**.
2. In the details pane, click **Add**.
3. In the **Create Rewrite Action** dialog box, enter the name `act_external_to_internal`.
4. To replace the HTTP server host name with the internal server name, choose **Replace** from the Type list box.
5. In the header name field, type **Host**.
6. In the string expression for a replacement text field, type the internal host name of your Web server.

7. Click **Create** and then click **Close**.
8. In the navigation pane, click **Policies**.
9. In the details pane, click **Add**.
10. In the Name field, type `pol_external_to_internal`. This policy detects connections to the Web server.
11. In the **Action** drop-down menu, choose the action `act_external_to_internal`.
12. In the Expression editor, construct the following expression:

```
1 HTTP.REQ.HOSTNAME.SERVER.EQ("www.example.com")
2 <!--NeedCopy-->
```

1. Bind your new policy globally.

## Redirecting a query

This example describes how to create a rewrite action and rewrite policy that redirects a query to the proper URL. The example assumes that the request contains a Host header set to `**www.example.com**` and a GET method with the **string** `/query.cgi?server=5`. The redirect extracts the domain name from the host header and the number from the query string, and redirects the user's query to the server **Web5.example.com**, where the rest of the user's query is processed.

### Note:

Although the following commands appear on multiple lines, you must enter them on a single line without line breaks.

## To redirect a query to the appropriate URL using the CLI

- To create a rewrite action named `act_redirect_query` that replaces the HTTP server host name with the internal server name, type:

```
add rewrite action act_redirect_query REPLACE http.req.header("Host")
.before_str(".example.com") '"Web" + http.req.url.query.value("server
")'
```

- To create a rewrite policy named `pol_redirect_query`, type the following commands at the NetScaler command prompt. This policy detects connections, to the Web server, that contain a query string. Do not apply this policy to connections that do not contain a query string:

```
add rewrite policy pol_redirect_query 'http.req.header("Host").eq(www
.example.com)&& http.req.url.contains("?")'act_redirect_query
```

- Bind your new policy globally.

Because this rewrite policy is highly specific and must be run before any other rewrite policies, it is advisable to assign it a high priority. If you assign it a priority of 1, it is evaluated first.

## Rewriting HTTP to HTTPS

This example describes how to rewrite Web server responses to find all URLs that begin with the string “HTTP” and replace that string with “https.” You can use it to avoid having to update webpages after moving a server from HTTP to HTTPS.

### To redirect HTTP URLs to HTTPS by using the CLI

- To create a rewrite action named `act_replace_http_with_https` that replaces all instances of the string “HTTP” with the string “https,” enter the following command:

```
add rewrite action act_replace_http_with_https replace_all 'http.res.
body(100)' "https"-search text("http")
```

- To create a rewrite policy named `pol_replace_http_with_https` that detects connections to the Web server, enter the following command:

```
add rewrite policy pol_replace_http_with_https TRUE act_replace_http_with_https
NOREWRITE
```

- Bind your new policy globally.

To troubleshoot this rewrite operation, see “[Case Study: Rewrite Policy for Converting HTTP Links to HTTPS not Working.](#)”

## Removing Unwanted Headers

This example explains how to use a Rewrite policy to remove unwanted headers. Specifically, the example shows how to remove the following headers:

- **Accept Encoding header.** Removing the Accept Encoding header from HTTP responses prevents compression of the response.
- **Content Location header.** Removing the Content Location header from HTTP responses prevents your server from providing a hacker with information that might allow a security breach.

To delete headers from HTTP responses, you create a rewrite action and a rewrite policy, and you bind the policy globally.

**To create the appropriate Rewrite action by using the CLI**

At the command prompt, type one of the following commands to either remove the Accept Encoding header and prevent response compression or remove the Content Location header:

- `add rewrite action "act_remove-ae"delete_http_header "Accept-Encoding"`
- `add rewrite action "act_remove-cl"delete_http_header "Content-Location"`

**To create the appropriate Rewrite policy by using the CLI**

At the command prompt, type one of the following commands to remove either the Accept Encoding header or the Content Location header:

- `add rewrite policy "pol_remove-ae"true "act_remove-ae"`
- `add rewrite policy "pol_remove-cl"true "act_remove-cl"`

**To bind the policy globally by using the CLI**

At the command prompt, type one of the following commands, as appropriate, to globally bind the policy that you have created:

- `bind rewrite global pol_remove-ae 100`
- `bind rewrite global pol_remove-cl 200`

**Reducing Web Server Redirects**

This example explains how to use a Rewrite policy to modify connections to your home page and other URLs that end with a forward slash (/) to the default index page for your server, preventing redirects and reducing load on your server.

**To modify directory-level HTTP requests to include the default home page by using the CLI**

- To create a Rewrite action named `action-default-homepage` that modifies URLs that end in a forward slash to include the default home page `index.html`, type:

```
add rewrite action "action-default-homepage"replace http.req.url.path
"/index.html"
```

- To create a Rewrite policy named policy-default-homepage that detects connections to your home page and applies your new action, type:

```
add rewrite policy "policy-default-homepage"q\|#http.req.url.path.EQ(
"/")"action-default-homepage"\|#
```

- Globally bind your new policy to put it into effect.

## Masking the Server Header

This example explains how to use a Rewrite policy to mask the information in the Server header in HTTP responses from your Web server. That header contains information that hackers can use to compromise your website. While masking the header will not prevent a skilled hacker from finding out information about your server, it makes hacking your Web server more difficult and encourage hackers to choose less well protected targets.

### To mask the Server header in responses from the CLI

1. To create a Rewrite action named act\_mask-server that replaces the contents of the Server header with an uninformative string, type:

```
add rewrite action "act_mask-server"replace "http.RES.HEADER(\"Server
\")\"\"\"Web Server 1.0\"\"\"
```

1. To create a Rewrite policy named pol\_mask-server that detects all connections, type:

```
add rewrite policy "pol_mask-server"true "act_mask-server"
```

1. Globally bind your new policy to put it into effect.

## How to convert plain text to URL encoded string and the opposite way

The following expressions convert plain text to URL encoded string and the opposite way:

1. URL\_RESERVED\_CHARS\_SAFE (string to URL ENCODED).

### Example:

```
1 ("abc def&123").URL_RESERVED_CHARS_SAFE
2 Output will be
3 " abc%20def%26123 " which is url encoded.
4 <!--NeedCopy-->
```

1. SET\_TEXT\_MODE(URL ENCODED).DECODE\_USING\_TEXT\_MODE. (URL ENCODED to string)

**Example:**

```
1 ("abc%20def%26123").SET_TEXT_MODE(URL ENCODED).DECODE_USING_TEXT_MODE
2 Output will be
3 " abc def&123 "
4 <!--NeedCopy-->
```

## Rewrite and responder policy examples

August 31, 2021

Following are some examples for rewrite and responder policies:

**Example 1: To add a local Client-IP header by using the command line interface**

```
1 add rewrite action act_ins_client insert_http_header NS-Client 'CLIENT.
 IP.SRC'
2 add rewrite policy pol_ins_client http.req.is_valid act_ins_client
3 bind rewrite global pol_ins_client 300 END
4
5 namem@obelix:~$ curl -v http://10.10.10.10/testsite/file5.html
6 * Hostname was NOT found in DNS cache
7 * Trying 10.10.10.10...
8 * Connected to 10.10.10.10 (10.10.10.10) port 80 (#0)
9 > GET /testsite/file5.html HTTP/1.1
10 > User-Agent: curl/7.35.0
11 > Host: 10.10.10.10
12 > Accept: */*
13 >
14 < HTTP/1.1 200 OK
15 < Date: Tue, 10 Nov 2020 10:06:48 GMT
16 * Server Apache/2.2.15 (CentOS) is not blacklisted
17 < Server: Apache/2.2.15 (CentOS)
18 < Last-Modified: Thu, 20 Jun 2019 07:16:04 GMT
19 < ETag: "816c5-5-58bbc1e73cdd3"
20 < Accept-Ranges: bytes
21 < Content-Length: 5
22 < Content-Type: text/html; charset=UTF-8
23 < NS-Client: 10.102.1.98
24 <
25 * Connection #0 to host 10.10.10.10 left intact
26 JLEwxt_namem@obelix:~$
27
28 <!--NeedCopy-->
```

**Example 2: Mask the HTTP Server Type**

```
1 add rewrite action Action-Rewrite-Server_Mask REPLACE HTTP.RES.HEADER("
 Server") "\"Web Server 1.0\""
2 add rewrite policy-Rewrite-Server_Mask HTTP.RES.IS_VALID Action-Rewrite
 -Server_Mask NOREWRITE
3 namem@obelix:~$ curl -v http://10.10.10.10/testsite/file5.html
4 * Hostname was NOT found in DNS cache
5 * Trying 10.10.10.10...
6 * Connected to 10.10.10.10 (10.10.10.10) port 80 (#0)
7 > GET /testsite/file5.html HTTP/1.1
8 > User-Agent: curl/7.35.0
9 > Host: 10.10.10.10
10 > Accept: */*
11 >
12 < HTTP/1.1 200 OK
13 < Date: Tue, 10 Nov 2020 10:15:42 GMT
14 * Server Web Server 1.0 is not blacklisted
15 < Server: Web Server 1.0
16 < Last-Modified: Thu, 20 Jun 2019 07:16:04 GMT
17 < ETag: "816c5-5-58bbc1e73cdd3"
18 < Accept-Ranges: bytes
19 < Content-Length: 5
20 < Content-Type: text/html; charset=UTF-8
21 <
22 * Connection #0 to host 10.10.10.10 left intact
23 JLEwxt_namem@obelix:~$
24 <!--NeedCopy-->
```

**Example 3: Respond by redirecting to different url when a url is received**

```
1 > add responder action act1 redirect "\"www.google.com\""
2 Done
3 > add responder policy pol1 'HTTP.REQ.URL.CONTAINS("file")' act1
4 Done
5 > bind responder global pol1 1
6 Done
7 >
8
9 name:~$ curl -v http://10.10.10.10/testsite/file5.html
10 * Hostname was NOT found in DNS cache
11 * Trying 10.10.10.10...
12 * Connected to 10.10.10.10 (10.10.10.10) port 80 (#0)
13 > GET /testsite/file5.html HTTP/1.1
14 > User-Agent: curl/7.35.0
15 > Host: 10.10.10.10
16 > Accept: */*
17 >
18 < HTTP/1.1 302 Found : Moved Temporarily
19 < Location: www.google.com
20 < Connection: close
```

```

21 < Cache-Control: no-cache
22 < Pragma: no-cache
23 <
24 * Closing connection 0
25 name@obelix:~$
26 <!--NeedCopy-->

```

#### Example 4: Respond with a message which can be any expression or a text

```

1 add responder action act123 respondwith "\"Please reach out to
 administrator\""
2 add responder policy pol1 "HTTP.REQ.URL.CONTAINS(\"file\")" act123
3 bind responder global pol1 100 END
4
5 name@obelix:~$ curl -v http://10.10.10.10/testsite/file5.html
6 * Hostname was NOT found in DNS cache
7 * Trying 10.10.10.10..Responder Action and Policy:
8
9 >add responder action Redirect-Action redirect "\"https://xyz.abc.com/
 dispatcher/SAML2AuthService?siteurl=w mav\"" -responseStatusCode 302
10
11 >add responder policy Redirect-Policy "HTTP.REQ.HOSTNAME.CONTAINS(\"abc
 \")" Redirect-Action
12
13 Binding to LB Virtual Server:
14
15 >bind lb vserver Test1_SF -policyName Redirect-Policy -priority 100 -
 gotoPriorityExpression END -type REQUEST.
16 * Connected to 10.10.10.10 (10.10.10.10) port 80 (#0)
17 > GET /testsite/file5.html HTTP/1.1
18 > User-Agent: curl/7.35.0
19 > Host: 10.10.10.10
20 > Accept: */*
21 >
22 * Connection #0 to host 10.10.10.10 left intact
23 Please reach out to administratort_name@obelix:~$
24 <!--NeedCopy-->

```

#### Example 5: Respond with an HTML imported page

```

1 import responder htmlpage http://10.10.10.10)/testsite/file5.html
 page112
2 add responder action act1 respondwithHtmlpage page1
3 add responder policy pol1 true act1
4 bind responder global pol1 100
5
6 name@obelix:~$ curl -v http://10.10.10.10)/testsite/file5.html
7 * Hostname was NOT found in DNS cache
8 * Trying 10.10.10.10...

```

```
9 * Connected to 10.10.10.10 (10.10.10.10) port 80 (#0)
10 > GET /testsite/file5.html HTTP/1.1
11 > User-Agent: curl/7.35.0
12 > Host: 10.102.58.140
13 > Accept: */*
14 >
15 < HTTP/1.1 200 OK
16 < Content-Length: 5
17 < Content-Type: text/html
18 <
19 * Connection #0 to host 10.10.10.10 left intact
20 JLEwxt_name@obelix:~$
21 <!--NeedCopy-->
```

### Example 6: Redirect URL based on HOSTNAME using Responder Policy

```
1 Responder Action and Policy:
2
3 >add responder action Redirect-Action redirect "\"https://xyz.abc.com/
4 dispatcher/SAML2AuthService?siteurl=wmapv\"" -responseStatusCode 302
5
6 >add responder policy Redirect-Policy "HTTP.REQ.HOSTNAME.CONTAINS(\"abc
7 \")" Redirect-Action
8
9 Binding to LB Virtual Server:
10
11 >bind lb vserver Test1_SF -policyName Redirect-Policy -priority 100 -
12 gotoPriorityExpression END -type REQUEST
13
14 <!--NeedCopy-->
```

## Rate limiting

May 2, 2023

The rate limiting feature enables you to define the maximum load for a given network entity or virtual entity on the NetScaler appliance. The feature enables you to configure the appliance to monitor the rate of traffic associated with the entity and take preventive action, in real time, based on the traffic rate. This feature is particularly useful when the network is under attack from a hostile client that is sending the appliance a flood of requests. You can mitigate the risks that affect the availability of resources to clients, and you can improve the reliability of the network and the resources that the appliance manages.

You can monitor and control the rate of traffic that is associated with virtual and user-defined entities, including virtual servers, URLs, domains, and combinations of URLs and domains. You can throttle the

rate of traffic if it is too high, base information caching on the traffic rate, and redirect traffic to a given load balancing virtual server if the traffic rate exceeds a predefined limit. You can apply rate-based monitoring to HTTP, TCP, and DNS requests.

To monitor the rate of traffic for a given scenario, you configure a *rate limit identifier*. A rate limit identifier specifies numeric thresholds such as the maximum number of requests or connections (of a particular type) that are permitted in a specified time period called a *time slice*.

Optionally, you can configure filters, known as *stream selectors*, and associate them with rate limit identifiers when you configure the identifiers. After you configure the optional stream selector and the limit identifier, you must invoke the limit identifier from a Advanced policy. You can invoke identifiers from any feature in which the identifier may be useful, including rewrite, responder, DNS, and integrated caching.

You can globally enable and disable SNMP traps for rate limit identifiers. Each trap contains cumulative data for the rate limit identifier's configured data collection interval (time slice), unless you specified multiple traps to be generated per time slice. For more information about configuring SNMP traps and managers, see [SNMP](#).

## Configure a stream selector

December 21, 2023

A traffic stream selector is an optional filter for identifying an entity for which you want to throttle access. The selector is applied to a request or a response and selects data points (keys ) that can be analyzed by a rate stream identifier. These data points can be based on almost any characteristic of the traffic, including IP addresses, subnets, domain names, TCP or UDP identifiers, and particular strings or extensions in URLs.

A stream selector consists of individual Advanced policy expressions called selectlets. Each selectlet is a non-compound Advanced policy expression. A traffic stream selector can contain up to five non-compound expressions called selectlets. Each selectlet is considered to be in an AND relationship with the other expressions. Following are some examples of selectlets:

```
1 http.req.url
2 http.res.body(1000>after_str("car_model").before_str("made_in"))
3 "client.ip.src.subnet(24)"
4 <!--NeedCopy-->
```

The order in which you specify parameters is significant. For example, if you configure an IP address and a domain (in that order) in one selector, and then specify the domain and the IP address (in the reverse order) in another selector, the NetScaler considers these values to be unique. This can lead

to the same transaction being counted twice. Also, if multiple policies invoke the same selector, the NetScaler, again, can count the same transaction more than once.

Note: If you modify an expression in a stream selector, you may get an error if any policy that invokes it is bound to a new policy label or bind point. For example, suppose that you create a stream selector named `myStreamSelector1`, invoke it from `myLimitID1`, and invoke the identifier from a DNS policy named `dnsRateLimit1`. If you change the expression in `myStreamSelector1`, you might receive an error when binding `dnsRateLimit1` to a new bind point. The workaround is to modify these expressions before creating the policies that invoke them.

### To configure a traffic stream selector by using the command line interface

At the command prompt, type:

```
1 add stream selector <name> <rule> ...
2 <!--NeedCopy-->
```

#### Example:

```
1 add stream selector myStreamSel HTTP.REQ.URL CLIENT.IP.SRC
2 <!--NeedCopy-->
```

### To configure a stream selector by using the configuration utility

Navigate to AppExpert > Rate Limiting > Selectors, click Add and specify the relevant details.

## Configure a traffic rate limit identifier

December 21, 2023

A rate limit identifier checks if the amount of traffic exceeds a specified value, within a particular time interval. The identifier returns a “Boolean TRUE” if the amount of traffic exceeds a limit within a particular time interval. When you include a limit identifier in the compound dAdvanced policy expression in a policy rule, you must include a stream selector. If you do not specify, the limit identifier is applied to all requests or responses identified by the compound expressions.

#### Note:

The maximum length for storing string results (for example, `HTTP.REQ.URL`) is 60 characters. If the string (for example, `URL`) is 1000 characters long, out of which 50 characters are long enough to uniquely identify a string, you can use an expression to extract required 50 characters.

## To configure a traffic limit identifier from the command line interface

At the command prompt, type:

```
1 add ns limitIdentifier <limitIdentifier> -threshold <positive_integer>
 -timeSlice <positive_integer> -mode <mode> -limitType (BURSTY |
 SMOOTH) -selectorName <string> -maxBandwidth <positive_integer> -
 trapsInTimeSlice <positive_integer>
2 <!--NeedCopy-->
```

### Argument description

**limitIdentifier.** Name for a rate limit identifier. Must begin with an ASCII letter or underscore (\_) character, and must consist only of ASCII alphanumeric or underscore characters. Reserved words must not be used. This is a mandatory argument. Maximum Length: 31

**threshold.** A maximum number of requests that are allowed in the given timeslice when requests (mode is set as REQUEST\_RATE) are tracked per timeslice. When connections (mode is set as CONNECTION) are tracked, it is the total number of connections that would be let through. Default value: 1 Minimum value: 1 Maximum Value: 4294967295

**timeSlice.** Time interval, in milliseconds, specified in multiples of 10, during which requests are tracked to check if they cross the threshold. This argument is needed only when the mode is set to REQUEST\_RATE. Default value: 1000 Minimum value: 10 Maximum Value: 4294967295

**mode.** Defines the type of traffic to be tracked.

1. REQUEST\_RATE. Tracks requests/timeslice.
2. CONNECTION. Tracks active transactions.

**limitType.** Defines the type of limit.

- **Smooth:** Spreads the load evenly across each time slice of the set time frame. Use for application traffic that is consistent.
- **Bursty:** Allows the requests to pass through if the load is below the set threshold. Use for application traffic that is sporadic. It is helpful if the load peaks anytime within the set time frame.

For example, the set maximum requests are 100 and the time frame is 10 seconds. If your application receives 80 requests in the first second, these limit types behave differently. The bursty limit type allows the requests to pass through because the load is below the set threshold. However, the smooth limit type allows only 10 requests per second. So, it applies the configured action for the excess load.

**selectorName.** Name of the rate limit selector. If this argument is NULL, rate limiting will be applied on all traffic received by the virtual server or the NetScaler (depending on whether the limit identifier is bound to a virtual server or globally) without any **filtering**. **Maximum Length: 31**

**maxBandwidth.** Maximum bandwidth permitted, in kbps. Minimum value: 0 Maximum value: 4294967287

**Example:**

Configuring traffic rate limit identifier in BURSTY mode:

```
1 add ns limitIdentifier 100_request_limit -threshold 100 -timeSlice 1000
 -mode REQUEST_RATE -limitType BURSTY -selectorName
 limit_100_requests_selector -trapsInTimeSlice 30
2 <!--NeedCopy-->
```

Configuring traffic rate limit identifier in SMOOTH mode:

```
1 add ns limitIdentifier limit_req -mode request_rate -limitType smooth -
 timeslice 1000 -Threshold 2000 -trapsInTimeSlice 200
2 <!--NeedCopy-->
```

**To configure a traffic limit identifier by using the configuration utility**

Navigate to AppExpert > Rate Limiting > Limit Identifiers, click Add and specify the relevant details.

**Configure and bind a traffic rate policy**

December 21, 2023

You implement rate-based application behavior by configuring a policy in an appropriate NetScaler feature. The feature must support Advanced policies. The policy expression must contain the following expression prefix to enable the feature to analyze the traffic rate:

```
1 sys.check_limit(<limit_identifier>)
2 <!--NeedCopy-->
```

Where `limit_identifier` is the name of a limit identifier.

The policy expression must be a compound expression that contains at least two components:

- An expression that identifies traffic to which the rate limit identifier is applied. For example:

```
1 http.req.url.contains("my_aspx.aspx").
2 <!--NeedCopy-->
```

- An expression that identifies a rate limit identifier, for example, `sys.check_limit("my_limit_identifier")`. This must be the last expression in the policy expression.

## To configure a rate-based policy by using the command line interface

At the command prompt, type the following command to configure a rate-based policy and verify the configuration:

```
1 add cache|dns|rewrite|responder policy <policy_name> -rule expression
 && sys.check_limit("<LimitIdentifierName>") [<feature-specific
 information>]
2 <!--NeedCopy-->
```

Following is a complete example of a rate-based policy rule. Note that this example assumes that you have configured the responder action, `send_direct_url`, that is associated with the policy. Note that the `sys.check_limit` parameter must be the last element of the policy expression:

```
1 add responder policy responder_threshold_policy "http.req.url.contains(
 "myindex.html") && sys.check_limit("my_limit_identifier)"
 send_direct_url
2 <!--NeedCopy-->
```

For information about binding a policy globally or to a virtual server, see [“Binding Advanced policy Policies.”](#)

## To configure a rate-based policy by using the configuration utility

1. In the navigation pane, expand the feature in which you want to configure a policy (for example, Integrated Caching, Rewrite, or Responder), and then click Policies.
2. In the details pane, click Add. In Name, enter a unique name for the policy.
3. Under Expression, enter the policy rule, and make sure that you include the `sys.check_limit` parameter as the final component of the expression. For example:

```
1 http.req.url.contains("my_aspx.aspx") && sys.check_limit("
 my_limit_identifier")
2 <!--NeedCopy-->
```

4. Enter feature-specific information about the policy.

For example, you may be required to associate the policy with an action or a profile. For more information, see the feature-specific documentation.

5. Click Create, and then click Close.
6. Click Save.

## View the traffic rate

December 21, 2023

If traffic through one or more virtual servers matches a rate-based policy, you can view the rate of this traffic. The rate statistics are maintained in the limit identifier that you named in the rule for the rate-based policy. If more than one policy uses the same limit identifier, you can view the traffic rate as defined by hits to all of the policies that use the particular limit identifier.

### To view the traffic rate by using the command line interface

At the command prompt, type the following command to view the traffic rate:

```
1 show ns limitSessions <limitIdentifier>
2 <!--NeedCopy-->
```

#### Example:

```
1 sh limitSession myLimitSession
2 <!--NeedCopy-->
```

### To view the traffic rate by using the configuration utility

1. Navigate to AppExpert > Rate Limiting > Limit Identifiers.
2. Select a limit identifier whose traffic rate you want to view.
3. Click the Show Sessions button. If traffic through one or more virtual servers has matched a rate limiting policy that uses this limit identifier (and the hits are within the configured time slice for this identifier), the Session Details dialog box appears. Otherwise, you receive a “No session exists” message.

## Testing a rate-based policy

December 21, 2023

To test a rate-based policy, you can send traffic to any virtual server to which a rate-based policy is bound.

**Task overview: Testing a rate-based policy**

1. Configure a stream selector (optional) and a rate limit identifier (required). For example:

```

1 add stream selector sel_subnet Q.URL "CLIENT.IP.SRC.SUBNET(24)"
2 add ns limitIdentifier k_subnet -Threshold 4 -timeSlice 3600 -mode
 REQUEST_RATE -limittype smooth -selectorName sel_subnet -
 trapsInTimeSlice 8
3 <!--NeedCopy-->

```

2. Configure the action that you want to associate with the policy that uses the rate limit identifier. For example:

```

1 add responder action resp_redirect redirect "\"http://
 response_site.com/\\""
2 <!--NeedCopy-->

```

3. Configure a policy that uses the sys.check\_limit expression prefix to call the rate limit identifier. For example, the policy can apply a rate limit identifier to all requests arriving from a particular subnet, as follows:

```

1 add responder policy resp_subnet "SYS.CHECK_LIMIT(\"k_subnet\")"
 resp_redirect
2 <!--NeedCopy-->

```

4. Bind the policy globally or to a virtual server. For example:

```

1 bind responder global resp_subnet 6 END -type DEFAULT
2 <!--NeedCopy-->

```

5. In a browser address bar, send a test HTTP query to a virtual server. For example:

```

1 http://<IP of a vserver>/testsite/test.txt
2 <!--NeedCopy-->

```

6. At the NetScaler command prompt, type:

```

1 show ns limitSessions \<limitIdentifier\>
2 <!--NeedCopy-->

```

**Example**

```

1 > sh limitSession k_subnet
2 1) Time Remaining: 98 secs Hits: 2
 Action Taken: 0
3 Total Hash: 1718618 Hash String: /test.txt
4 IPs gathered:
5 1) 10.217.253.0
6 Active Transactions: 0
7 Done
8 >

```

```
9 <!--NeedCopy-->
```

7. Repeat the query and check the limit identifier statistics again to verify that the statistics are being updated correctly.

## Examples of rate-based policies

May 2, 2023

This topic lists some examples of rate-based policies.

### Limit the number of requests from a URL

Run the following commands to limit the number of requests per second from a URL:

```
1 add stream selector ipStreamSelector http.req.url "client.ip.src" add
 ns limitIdentifier ipLimitIdentifier -threshold 4 -timeSlice 1000 -
 mode request_rate -limitType smooth -selectorName ipStreamSelector
2
3 add responder action myWebSiteRedirectAction redirect "\"http: //www.
 mycompany .com/\\""
4
5 add responder policy ipLimitResponderPolicy "http.req.url.contains(\"
 myasp.asp\") && sys.check_limit(\"ipLimitIdentifier\")"
 myWebSiteRedirectaction
6
7 bind responder global ipLimitResponderPolicy 100 END -type default
8 <!--NeedCopy-->
```

### Cache a response for the request URL

Run the following commands to cache a response if the request URL rate exceeds 5 per 20000 milliseconds:

```
1 add stream selector cacheStreamSelector http.req.url add ns
 limitIdentifier cacheRateLimitIdentifier -threshold 5 -timeSlice
 2000 -selectorName cacheStreamSelector
2
3 add cache policy cacheRateLimitPolicy -rule "http req.method.eq(get) &&
 sys.check_limit \"cacheRateLimitIdentifier\"" -action cache
4
5 bind cache global cacheRateLimitPolicy -priority 10
6 <!--NeedCopy-->
```

## Drop a connection based on cookies

Run the following commands to drop a connection based on the cookies received in requests from `www.mycompany.com` if the requests exceed the rate limit:

```

1 add stream selector reqCookieStreamSelector "http req.cookie «value(\"
 mycookie\")" "client.ip.src.subnet(24)"
2
3 add ns limitIdentifier myLimitIdentifier -Threshold 2 -timeSlice 3000 -
 selectorName reqCookieStreamSelector
4
5 add responder action sendRedirectUrl redirect '\http://www.mycompany.
 com\" + http.req.url' -bypassSafetyCheck YES
6
7 add responder policy rateLimitCookiePolicy "http.req.url.contains(\"
 www.yourcompany.com\") && sys check_limit(\"myLimitIdentifier\")"
 sendRedirectUrl
8 <!--NeedCopy-->
```

## Drop a DNS packet from a particular IP address

Run the following commands to drop a DNS packet if the requests from a particular client IP address and DNS domain exceed the rate limit:

```

1 add stream selector dropDNSStreamSelector client udp.dns.domain client.
 ip.src
2 add ns limitIdentifier dropDNSRateIdentifier -timeslice 20000 -mode
 request_rate -selectorName dropDNSStreamSelector -maxBandwidth 1 -
 trapsintimeslice 20
3
4 add dns policy dnsDropOnClientRatePolicy "sys check_limit (\"
 dropDNSRateIdentifier\")" -drop yes
5 <!--NeedCopy-->
```

## Limit the number of HTTP requests from the same host

Run the following commands to limit the number of HTTP requests that arrive from the same host with a subnet mask of 32 and have the same destination IP address:

```

1 add stream selector ipv6_sel "CLIENT.IPv6.src.subne (32)" CLIENT.IPv6.
 dst Q.URL
2 add ns limitIdentifier ipv6_id -imeSlice 20000 -selectorName ipv6_sel
3 add lb vserver ipv6_vip HTTP 3ffe::209 80 -persistenceType NONE -
 cltTimeout 180
4 add responder action redirect_page redirect "\http://redirectpage.com
 /\\"
5 add responder policy ipv6_resp_pol "SYS.CHECK_LIMIT(\"ipv6_id\")"
 redirect_page
```

```
6 bind responder global ipv6_resp_pol 5 END -type DEFAULT
7 <!--NeedCopy-->
```

## Sample use cases for rate-based policies

December 22, 2023

The following scenarios describe two uses of rate-based policies in global server load balancing (GSLB):

- The first scenario describes the use of a rate-based policy that sends traffic to a new data center if the rate of DNS requests exceed 1000 per second.
- In the second scenario, if more than five DNS requests arrive for a local DNS (LDNS) client within a particular period, the additional requests are dropped.

### Redirecting Traffic on the Basis of Traffic Rate

In this scenario, you configure a proximity-based load balancing method, and a rate-limiting policy that identifies DNS requests for a particular region. In the rate-limiting policy, you specify a threshold of 1000 DNS requests per second. A DNS policy applies the rate limiting policy to DNS requests for the region “Europe.GB.17.London.UK-East.ISP-UK.” In the DNS policy, DNS requests that exceed the rate limiting threshold, starting with request 1001 and continuing to the end of the one-second interval, are to be forwarded to the IP addresses that are associated with the region “North America.US.TX.Dallas.US-East.ISP-US.”

The following configuration demonstrates this scenario:

```
1 add stream selector DNSSelector1 client.udp.dns.domain
2
3 add ns limitIdentifier DNSLimitIdentifier1 -threshold 5 -timeSlice 1000
 -selectorName DNSSelector1
4
5 add dns policy DNSLimitPolicy1 "client.ip.src.matches_location(\"Europe
 .GB.17.London.*.*\") &&
6 sys.check_limit(\"DNSLimitIdentifier1\")" -preferredLocation "North
 America.US.TX.Dallas.*.*"
7
8 bind dns global DNSLimitPolicy1 5
9 <!--NeedCopy-->
```

## Dropping DNS Requests on the Basis of Traffic Rate

In the following example of global server load balancing, you configure a rate limiting policy that permits a maximum of five DNS requests in a particular interval, per domain, to be directed to an LDNS client for resolution. Any requests that exceed this rate are dropped. This type of policy can help protect the NetScaler from resource exploitation. For example, in this scenario, if the time to live (TTL) for a connection is five seconds, this policy prevents the LDNS from requerying a domain. Instead, it uses data that is cached on the NetScaler.

```

1 add stream selector LDNSSelector1 client.udp.dns.domain client.ip.src
2
3 add ns limitIdentifier LDNSLimitIdentifier1 -threshold 5 -timeSlice
 1000 -selectorName LDNSSelector1
4
5 add dns policy LDNSPolicy1 "client.udp.dns.domain.contains(\".\") &&
 sys.check_limit(\"LDNSLimitIdentifier1\")" -drop YES
6
7 bind dns global LDNSPolicy1 6
8
9 show gslb vserver gvip
10
11 gvip - HTTP State: UP

## Rate limiting for traffic domains

March 20, 2024

You can configure rate limiting for traffic domains. The following expression in the NetScaler expressions language identifies the traffic associated with traffic domains.

- `client.traffic_domain.id`

You can configure rate limiting for traffic associated with a particular traffic domain, a set of traffic domains, or all traffic domains.

For more information on how to configure IP rate limiting with NetScaler, see the following video:

[This is an embedded video. Click the link to watch the video](#)

For configuring rate limiting for traffic domains, you perform the following steps on a NetScaler appliance by using the configuration utility or the NetScaler command line:

1. Configure a stream selector that uses the `client.traffic_domain.id` expression for identifying the traffic, associated with traffic domains, to be rate limited.
2. Configure a rate limit identifier that specifies parameters such as maximum threshold for traffic to be rate limited. You also associate a stream selector to the rate limiter in this step.
3. Configure an action that you want to associate with the policy that uses the rate limit identifier.
4. Configure a policy that uses the `sys.check_limit` expression prefix to call the rate limit identifier, and associate the action with this policy.
5. Bind the policy globally.

Consider an example in which two traffic domains, with IDs 10 and 20, are configured on NetScaler NS1. On traffic domain 10, LB1-TD-1 is configured to load balance servers S1 and S2; LB2-TD1 is configured to load balance servers S3 and S4.

On traffic domain 20, LB1-TD-2 is configured to load balance servers S5 and S6; LB2-TD2 is configured to load balance servers S7 and S8.

The following table lists some examples of rate limiting policies for traffic domains in the example setup.

| Purpose                                                                                                                           | CLI commands                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Limit the number of requests to 10 per second for each of the traffic domains.                                                    | <pre>add stream selector tdratelimit-1 CLIENT.TRAFFIC_DOMAIN.ID add ns limitIdentifier limitidf-1 -threshold 10 -selectorName tdratelimit-1 -trapsInTimeSlice 0 add responder policy ratelimit-pol “sys.check_limit(\“limitidf-1\”)”DROP bind responder global ratelimit-pol 1</pre>                                                                               |
| Limit the number of requests to 5 per client per second for each of the traffic domains.                                          | <pre>add stream selector tdandclientip CLIENT.IP.SRC,CLIENT.TRAFFIC_DOMAIN.ID add ns limitIdentifier td_limitidf -threshold 5 -selectorName tdandclientip -trapsInTimeSlice 5 add responder policy tdratelimit-pol “sys.check_limit(\“td_limitidf\”)”DROP bind responder global tdratelimit-pol 2</pre>                                                            |
| Limit the number of requests sent for a particular traffic domain (for example traffic domain 10) to 30 requests every 3 seconds. | <pre>add stream selector tdratelimit CLIENT.TRAFFIC_DOMAIN.ID add ns limitIdentifier td10_limitidf -threshold 30 -timeSlice 3000 -selectorName tdratelimit -trapsInTimeSlice 5 add responder policy td10ratelimit “client.traffic_domain.id==10 &amp;&amp; sys.check_limit(\“td10_limitidf\”)”DROP bind responder global td10ratelimit 3</pre>                     |
| Limit the number of connections to 5 per client per second for a particular traffic domain (for example traffic domain 20).       | <pre>add stream selector tdandclientip CLIENT.IP.SRC CLIENT.TRAFFIC_DOMAIN.ID add ns limitIdentifier td20_limitidf -threshold 5 -mode CONNECTION -selectorName tdandclientip -trapsInTimeSlice 5 add responder policy td20_ratelimit “client.traffic_domain.id==20 &amp;&amp; sys.check_limit(\“td20_limitidf\”)”DROP bind responder global td20_ratelimit 4</pre> |

## Configure rate limit at packet level

December 6, 2021

You can configure a stream selector and a responder policy to collect statistics at the packet level flowing through all the connections identified by the selector. If the number of packets per second exceed the configured threshold, the policy applies the configured action (RESET or DROP). You can configure these policies for all types of virtual servers. Packets of all sizes are considered.

### **To configure rate limiting at packet level, perform the following tasks**

1. Enable load balancing
2. Add stream selector
3. Add stream identifier
4. Add responder policy
5. Add load balancing virtual server
6. Bind responder policy

### **To enable load balancing feature**

At the command prompt, type:

```
1 enable ns feature lb
2 <!--NeedCopy-->
```

### **To add a stream selector**

At the command prompt, type:

```
1 add stream selector packetlimitselector client.ip.src client.tcp.
 srcport client.ip.dst client.tcp.dstport
2 <!--NeedCopy-->
```

### **To add a stream identifier**

At the command prompt, type:

```
1 add stream identifier packetlimitidentifier packetlimitselector -
 interval 1
2 <!--NeedCopy-->
```

### **To enable tracking of ACK only packets**

At the command prompt, type:

```
1 set stream identifier packetlimitidentifier - trackAckOnlyPackets
 ENABLED
2 <!--NeedCopy-->
```

### To add a responder policy

At the command prompt, type:

```
1 add responder policy packet_rate_sessionpolicy "ANALYTICS.STREAM(\"
 packetlimitidentifier\").COLLECT_STATS(\"PACKET_LIMIT\", <
 max_threshold_PPS>, ACTION, 0/1)" NOOP
2 <!--NeedCopy-->
```

Where,

- <max\_threshold\_PPS> is the maximum number of packets allowed through the connection per second.
- ACTION can be DROP or RESET.
- 0 or 1 represents the limit type; 0 represents the BURSTY limit type and 1 represents the SMOOTH limit type.

### Example:

```
1 add responder policy packet_rate_sessionpolicy "ANALYTICS.STREAM(\"
 packetlimitidentifier\").COLLECT_STATS(\"PACKET_LIMIT\", 40, RESET,
 0)" NOOP
2 <!--NeedCopy-->
```

### To add a load balancing virtual server

At the command prompt, type:

```
1 add lb vserver <name> <serviceType> <ip> <port>
2
3 add lb vserver Vserver-lb-1 HTTP 10.102.20.200 80
4 <!--NeedCopy-->
```

### To bind a responder policy

After the selector and the responder policy are configured, the policy can be bound globally or to the specific virtual server.

At the command prompt, type either of the following commands:

```
1 bind responder global <policyName> <priority> [<gotoPriorityExpression
 >] [-type <type>] [-invoke (<labelType> <labelName>)]
2 <!--NeedCopy-->
```

OR

```
1 bind lb vserver <name>@ (-policyName <string>@ [-priority <
 positive_integer>])
2 <!--NeedCopy-->
```

**Examples:**

```
1 bind responder global packet_rate_sessionpolicy 101 END -type
 REQ_DEFAULT
2
3 bind responder global packet_rate_sessionpolicy 102 END -type
4
5 bind lb vserver v1 -policyname packet_rate_sessionpolicy -priority 10
6 <!--NeedCopy-->
```

## Responder

May 2, 2023

**Warning**

Filter features using classic policies are deprecated and as an alternative Citrix recommends you to use the rewrite and responder features with advanced policy infrastructure.

Today's complex Web configurations often require different responses to HTTP requests that appear, on the surface, to be similar. When users request a webpage, you may want to provide a different page depending on the user geographical location, browser specification, or languages the browser accepts and the order of preference. You might want to drop the connection if the request is coming from an IP range that has been generating DDoS attacks or initiating hacking attempts.

Responder supports protocols such as TCP, DNS (UDP), and HTTP. With responder enabled on your appliance, server responses can be based on who sends the request, where it is sent from, and other criteria with security and system management implications. The feature is simple and quick to use. By avoiding the invocation of more complex features, it reduces CPU cycles and time spent in handling requests that do not require complex processing.

For handling sensitive data such as financial information, if you want to ensure that the client uses a secure connection to browse a site, you can redirect the request to a secure connection by using <https://> instead of <http://>.

To use a responder, do the following:

- Enable a responder feature on the appliance.
- Configure a responder action. The action can be to generate a custom response, redirect a request to a different webpage, or reset a connection.
- Configure a responder policy. The policy determines the requests (traffic) on which an action has to be taken.
- Bind each policy to a bind point put it into effect. A bind point refers to an entity at which the NetScaler appliance examines the traffic to see if it matches a policy. For example, a bind point can be a load balancing virtual server.

You can specify a default action for requests that do not match any policy, and you can bypass the safety check for actions that would otherwise generate error messages.

The Rewrite feature of NetScaler helps in rewriting some information in the requests or responses handled by NetScaler. The following section shows some differences between the two features.

### **Comparison between Rewrite and Responder options**

The main difference between the rewrite feature and the responder feature is as follows:

Responder cannot be used for response or server-based expressions. Responder can be used only for the following scenarios depending on client parameters:

- Redirecting an HTTP request to new websites or webpages
- Responding with some custom response
- Dropping or resetting a connection at request level

If there is a responder policy, the NetScaler examines the request from the client, takes action according to the applicable policies, sends the response to the client, and closes the connection with the client.

If there is a rewrite policy, the NetScaler examines the request from the client or response from the server, takes action according to the applicable policies, and forwards the traffic to the client or the server.

In general, it is recommended to use a responder if you want the appliance to reset or drop a connection based on a request-based parameter. Use a responder to redirect traffic, or respond with custom messages. Use rewrite for manipulating data on HTTP requests and responses.

### **Enable the responder feature**

December 21, 2023

To use the Responder feature, you must first enable it.

To enable the responder feature by using the NetScaler CLI:

At the command prompt, type the following commands to enable the responder feature and verify the configuration:

- `enable ns feature <feature>`
- `show ns feature`

**Example:**

```

1 enable ns feature Responder
2 Done
3 > show ns feature
4
5 Feature Acronym Status
6 ----- -
7 1) Web Logging WL ON
8 2) Surge Protection SP ON
9 .
10 .
11 .
12 19) Responder RESPONDER ON
13 20) NetScaler Push push OFF
14 Done
15 >
16 <!--NeedCopy-->

```

To enable the responder feature by using the GUI:

1. In the navigation pane, expand **System**, and then click **Settings**.
2. In the details pane, under **Modes** and **Features**, click **Change advanced features**.
3. In the **Configure Advanced Features** dialog box, select the **Responder** check box, and then click **OK**.
4. In the **Enable/Disable Feature(s)?** dialog box, click **YES**. A message appears in the status bar, stating that the feature has been enabled.

## Configure a responder action

December 22, 2023

After enabling the responder feature, you must configure one or more actions for handling requests. The responder supports the following types of actions:

- **Respond with.** Sends the response defined by the Target expression without forwarding the request to a web server. (The NetScaler appliance substitutes for and acts as a web server.) Use this type of action to manually define a simple HTML-based response. Normally the text for a Respond with action consists of a web server error code and brief HTML page.
- **Respond with SQL OK.** Sends the designated SQL OK response defined by the Target expression. Use this type of action to send an SQL OK response to an SQL query.
- **Respond with SQL Error.** Sends the designated SQL Error response defined by the Target expression. Use this type of action to send an SQL Error response to an SQL query.
- **Respond with HTML page.** Sends the designated HTML page as the response. You can choose from a drop-down list of HTML pages that were previously uploaded, or upload a new HTML page. Use this type of action to send an imported HTML page as the response. The appliance responds with a custom header in the `respondwithhtmlpage` responder action. You can configure up to eight custom headers. The imported HTML page is stored in the `/var/download/responder` directory.
- **Redirect.** Redirects the request to a different webpage or web server. A Redirect action can redirect requests originally sent to a “dummy” website that exists in DNS, but for which there is no actual web server, to an actual website. It can also redirect search requests to an appropriate URL. Normally, the redirection target for a Redirect action consists of a complete URL.

Configure a responder action by using the CLI:

Displays the current settings for the specified responder action. If no action name is provided, display a list of all responder actions currently configured on the NetScaler appliance, with abbreviated settings.

At the command prompt, type the following commands to configure a responder action and verify the configuration:

- `add responder action <name> <type> <target>`
- `show responder action`

**Parameters:**

- **Name.** Name of the responder action. Maximum Length: 127
- **type.** Type of responder action. It can be: (respondwith).
- **target.** An expression specifying what to respond with.
- **htmlpage.** Option specifying to respond with an html page.
- **hits.** The number of times the action has been taken.
- **referenceCount.** The number of references to the action.

- **undefHits**. The number of times the action resulted in UNDEF.
- **comment**. Any type of information about this responder action.
- **builtin**. Flag to determine whether responder action is built in or not.

**Example:**

```
1 Create a responder action that displays a “ Not Found ” error page for
 URLs that do not exist:
2
3 > add responder action act404Error respondWith "HTTP/1.1 404 Not Found
 \r\n\r\n"+ HTTP.REQ.URL.HTTP_URL_SAFE + " does not exist on the web
 server."
4 Done
5
6 > show responder action
7
8 1) Name: act404Error
9 Operation: respondwith
10 Target: "HTTP/1.1 404 Not Found" + HTTP.REQ.URL.HTTP_URL_SAFE + " does
 not exist on the web server."
11 Hits: 0
12 Undef Hits: 0
13 Action Reference Count: 0
14 Done
15
16 Create a responder action that displays a “ Not Found ” error page for
 URLs that do not exist:
17
18 add responder action act404Error respondWith "HTTP/1.1 404 Not Found\r
 \n\r\n"+ HTTP.REQ.URL.HTTP_URL_SAFE + " does not exist on the web
 server."
19 Done
20 > show responder action
21
22 1) Name: act404Error
23 Operation: respondwith
24 Target: "HTTP/1.1 404 Not Found" + HTTP.REQ.URL.HTTP_URL_SAFE + " does
 not exist on the web server."
25 Hits: 0
26 Undef Hits: 0
27 Action Reference Count: 0
28 Done
29
30 <!--NeedCopy-->
```

Modify an existing responder action by using the CLI:

At the command prompt, type the following command to modify an existing responder action and verify the configuration:

- `set responder action <name> -target <string>`

- `show responder action`

**Example:**

```
1 set responder action act404Error -target '"HTTP/1.1 404 Not Found\r\n\r\n"' + HTTP.REQ.URL.HTTP_URL_SAFE + " does not exist on the web server."
2 Done
3 > show responder action
4
5 1) Name: act404Error
6 Operation: respondwith
7 Target: "HTTP/1.1 404 Not Found" + HTTP.REQ.URL.HTTP_URL_SAFE + " does not exist on the web server."
8 Hits: 0
9 Undef Hits: 0
10 Action Reference Count: 0
11 Done
12
13 <!--NeedCopy-->
```

Remove a responder action by using the CLI:

At the command prompt, type the following command to remove a responder action and verify the configuration:

- `rm responder action <name>`
- `show responder action`

**Example:**

```
1 rm responder action act404Error
2 Done
3
4 > show responder action
5 Done
6
7 <!--NeedCopy-->
```

Add custom headers in `responsewithhtmlpage` responder action by using the CLI:

A NetScaler appliance can now respond with custom headers in the `responsewithhtmlpage` responder action. You can configure up to eight custom headers. Previously, the appliance responded only with `Content-type: text/html` and `Content-Length: <value>` static headers.

**Note:**

In the custom header configuration, you can also over-write the “Content-Type” header value.

At the command prompt, type the following command:

```
add responder action <name> <type> (<target> | <htmlpage>)[-comment <string>] [-responseStatusCode <positive_integer>] [-reasonPhrase <expression>] [-headers <name(value)> ...]
```

Where,

**name:** Name for the responder action. Must begin with a letter, number, or the underscore character (\_), and must contain only letters, numbers, and the hyphen (-), period (.), hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Can be changed after the responder policy is added.

**Type:** Type of responder action. Available settings function as follows:

1. **respondwith <target>** - Respond to the request with the expression specified as the target.
2. **respondwithhtmlpage** - Respond to the request with the uploaded HTML page object specified as the target.
3. **redirect** - Redirect the request to the URL specified as the target.
4. **sqlresponse\_ok** - Send an SQL OK response.
5. **sqlresponse\_error** - Send an SQL ERROR response. This is a mandatory argument. Possible values: `noop`, `respondwith`, `redirect`, `respondwithhtmlpage`, `sqlresponse_ok`, `sqlresponse_error`

**Target:** Expression specifying what to respond with. Typically a URL for redirect policies or a default-syntax expression. In addition to NetScaler default-syntax expressions that refer to information in the request, a string builder expression can contain text and HTML, and simple escape codes that define new lines and paragraphs. Enclose each string builder expression element (either a NetScaler default-syntax expression or a string) in double quotation marks. Use the plus (+) character to join the elements.

**htmlpage:** For `respondwithhtmlpage` policies, name of the HTML page object to use as the response. You must first import the page object. Maximum Length: 31

**Comment:** Any type of information about this responder action. Maximum Length: 255

**responseStatusCode:** HTTP response status code, for example 200, 302, 404, and so forth The default value for the `redirect` action type is 302 and for `respondwithhtmlpage` is 200 Minimum value: 100 Maximum value: 599

**reasonPhrase:** Expression specifying the reason phrase of the HTTP response. The reason phrase may be a string literal with quotes or a PI expression. For example: `"Invalid URL: "+ HTTP.REQ.URL` Maximum Length: 8191

**Headers:** One or more headers to insert into the HTTP response. Each header is specified as `"name (expr) , "` where `expr` is an expression that is evaluated at runtime to provide the value for the named header. You can configure a maximum of eight headers for a responder action.

Configure a responder action by using the GUI:

1. Navigate to **AppExpert > Responder > Actions**.
2. In the details pane, do one of the following:
  - To create an action, click **Add**.
  - To modify an existing action, select the action, and then click **Open**.
3. Click **Create** or **OK**, depending on whether you are creating an action or modifying an existing action.
4. Click **Close**. A message appears in the status bar, stating that the feature has been enabled.
5. To delete a responder action, select the action, and then click **Remove**. A message appears in the status bar, stating that the feature has been disabled.

Add an expression by using the **Add Expression** dialog box

1. In the **Create Responder Action** or **Configure Responder Action** dialog box, click **Add**.
2. In the **Add Expression** dialog box, in the first list box choose the first term for your expression.
  - HTTP. The HTTP protocol. Choose this if you want to examine some aspect of the request that pertains to the HTTP protocol.
  - SYS. One or more protected websites. Choose this if you want to examine some aspect of the request that pertains to the recipient of the request.
  - CLIENT. The computer that sent the request. Choose this if you want to examine some aspect of the sender of the request.
  - ANALYTICS. The analytics data associated with the request. Choose this if you want to examine request metadata.
  - SIP. A SIP request. Choose this if you want to examine some aspect of a SIP request. When you make your choice, the rightmost list box lists appropriate terms for the next part of your expression.
3. In the second list box, choose the second term for your expression. The choices depend upon which choice you made in the previous step, and are appropriate to the context. After you make your second choice, the Help window below the Construct Expression window (which was blank) displays help describing the purpose and use of the term you just chose.
4. Continue choosing terms from the list boxes that appear to the right of the previous list box, or typing strings or numbers in the text boxes that appear to prompt you to enter a value, until your expression is finished.

## Configuring the Global HTTP Action

You can configure the global HTTP action to invoke a responder action when an HTTP request times out. To configure this feature, you must first create the responder action that you want to invoke. Then, configure the global HTTP timeout action to respond to a timeout with that responder action.

Configure the global HTTP action by using the CLI:

At the command prompt, type the following command:

- `set ns httpProfile -reqTimeoutAction <responder action name>`
- `save ns config`

For `<responder action name>`, replace the name of the responder action.

## Configure an HTML page import

When a NetScaler appliance responds with a custom message, we can respond with an HTML file. You can import the file using the `import responder htmlpage` command and then use this file in `add responder action <act name> respondwithhtmlpage <file name>` command. You can also import the file through the NetScaler GUI. You can import a desired HTML page into the appliance folder and upload the page during responder run time.

### Import an HTML page by using the CLI

At the command prompt, type:

```
import responder htmlpage [<src>] <name> [-comment <string>] [-
overwrite] [-CAcertFile <string>]
```

#### Example:

```
import responder htmlpage http://www.example.com/page.html my-responder
-page -CAcertFile my_root_ca_cert
```

Where,

A CA certificate is used for verifying the client certificate. The certificate has to be imported using the `import ssl certfile` CLI command or equivalent through an API or GUI. If a certificate name is not configured, then default root CA certificates are used for the certificate verification.

### Import an HTML page from the local filesystem

You can also import an HTML page from the local filesystem. To import, copy the file using SCP or any other way to the `/var/tmp/` directory and then import it using the “local:” keyword. For example:

```
import responder htmlpage local:my_local_file.html my_local_file
```

Where `my_local_file.html` is present at “`/var/tmp/`” directory.

**Note**

“local:” keyword only searches the file in the “/var/tmp/” directory. For non-default partitions, you need to copy the file into the partition specific tmp directory that is present at /var/partitions/<partition name>/tmp.

**Import an HTML page by using the GUI**

1. Navigate to **AppExpert > Responder > HTML Page Imports**.
2. In the **Responder HTML Imports** details pane, click **Add**.
3. In the **HTML Page Import Object** page, set the following parameters:
  - a) Name. Name of the HTML page.
  - b) Import From. Imported from file, text, or text.
  - c) URL. Select to enter the URL location of the HTML file.
  - d) File. Select the HTML file from the appliance directory.
  - e) Text. Select the HTML file as a text.
4. Click **Continue**.
5. Verify responder HTML page details.
6. Click **Done**.

### HTML Page Import Object

| View Responder Details        |                           |
|-------------------------------|---------------------------|
| Name<br>Test-HTML-page-import | Import From<br><b>URL</b> |

| File Contents                                                                       |
|-------------------------------------------------------------------------------------|
| CA Certificate File<br><input type="text" value="Click to select"/> >               |
| Comment<br><input type="text" value="A brief description about the page import"/> ⓘ |
| File Contents*                                                                      |

To edit an HTML page, you can select a file and click **Edit Responder HTML Page File** from the **Select Action** drop-down list.

## Configure a responder policy

December 21, 2023

After you configure a responder action, you must next configure a responder policy to select the requests to which the NetScaler appliance should respond. A responder policy is based on a rule, which consists of one or more expressions. The rule is associated with an action, which is performed if a request matches the rule.

**Note:** For creating and managing responder policies, the GUI provides assistance that is not available at the NetScaler command prompt.

To configure a responder policy by using the NetScaler command line:

At the command prompt, type:

- `add responder policy <name> <expression> <action> [<undefaction >]-appFlowaction <actionName>`
- `show responder policy <name>`

### Example:

```

1 > add responder policy policyThree "CLIENT.IP.SRC.IN_SUBNET
 (222.222.0.0/16)" RESET
2 Done
3 > show responder policy policyThree
4
5 Name: policyThree
6 Rule: CLIENT.IP.SRC.IN_SUBNET(222.222.0.0/16)

```

```
7 Responder Action: RESET
8 UndefAction: Use Global
9 Hits: 0
10 Undef Hits: 0
11 Done
12 <!--NeedCopy-->
```

To modify an existing responder policy by using the NetScaler command line:

At the command prompt, type:

- `set responder policy <name> [-rule <expression>] [-action <string>] [-undefAction <string>]`
- `show responder policy <name>`

To remove a responder policy by using the NetScaler command line:

At the command prompt, type:

- `rm responder policy <name>`
- `show responder policy`

#### Example:

```
1 >rm responder policy pol404Error
2 Done
3
4 > show responder policy
5 Done
6 <!--NeedCopy-->
```

To configure a responder policy by using the GUI:

1. Navigate to **AppExpert > Responder > Policies**.
2. In the details pane, do one of the following:
  - To create a policy, click **Add**.
  - To modify an existing policy, select the policy, and then click **Open**.
3. Click **Create** or **OK**, depending on whether you want to create a policy or modify an existing policy.
4. Click **Close**. A message appears in the status bar, stating that the feature has been configured.

## Bind a responder policy

December 21, 2023

To put a policy into effect, you must bind it either globally, so that it applies to all traffic that flows through the NetScaler, or to a specific virtual server, so that the policy applies only to requests whose destination IP address is the VIP of that virtual server.

When you bind a policy, you assign a priority to it. The priority determines the order in which the policies you define are evaluated. You can set the priority to any positive integer.

In the NetScaler operating system, policy priorities work in reverse order—the higher the number, the lower the priority. For example, if you have three policies with priorities of 10, 100, and 1000, the policy assigned a priority of 10 is performed first, then the policy assigned a priority of 100, and finally the policy assigned an order of 1000. The responder feature implements only the first policy that a request matches, not any additional policies that it might also match, so policy priority is important for getting the results you intend.

You can leave yourself plenty of room to add other policies in any order, and still set them to evaluate in the order you want, by setting priorities with intervals of 50 or 100 between each policy when you globally bind it. You can then add more policies at any time without having to reassign the priority of an existing policy.

For additional information about binding policies on the NetScaler, see [Policies and Expressions](#).

**Note:**

Responder policies are bound to TCP-based virtual servers.

To globally bind a responder policy by using the NetScaler command line:

At the command prompt, type the following command to globally bind a responder policy and verify the configuration:

- `bind responder global <policyName> <priority> [<gotoPriorityExpression> > [-type <type>] [-invoke (<labelType> <labelName>)]`
- `show responder global`

**Example:**

```
1 > bind responder global poliError 100
2 Done
3 > show responder global
4 1) Global bindpoint: REQ_DEFAULT
5 Number of bound policies: 1
6
7 Done
8 <!--NeedCopy-->
```

To bind responder policy to a specific virtual server by using the NetScaler command line:

At the command prompt, type:

- `bind lb vserver <name> -policyname <policy_name> -priority <priority>`
- `show lb vserver vs-loadbal <name>`

**Example:**

```

1 > bind lb vserver vs-loadbal -policyName policyTwo -priority 100
2 Done
3 > show lb vserver
4 1) vs-loadbal (10.102.29.20:80) - HTTP Type: ADDRESS
5 State: OUT OF SERVICE
6 Last state change was at Wed Aug 19 09:05:47 2009 (+211 ms)
7 Time since last state change: 2 days, 00:58:03.260
8 Effective State: DOWN
9 Client Idle Timeout: 180 sec
10 Down state flush: ENABLED
11 Disable Primary Vserver On Down : DISABLED
12 Port Rewrite : DISABLED
13 No. of Bound Services : 0 (Total) 0 (Active)
14 Configured Method: LEASTCONNECTION
15 Mode: IP
16 Persistence: NONE
17 Vserver IP and Port insertion: OFF
18 Push: DISABLED Push VServer:
19 Push Multi Clients: NO
20 Push Label Rule: none
21 2) vs-cont-sw (0.0.0.0:0) - TCP Type: ADDRESS
22 State: DOWN
23 Last state change was at Wed Aug 19 10:03:46 2009 (+213 ms)
24 Time since last state change: 2 days, 00:00:04.260
25 Effective State: DOWN
26 Client Idle Timeout: 9000 sec
27 Down state flush: ENABLED
28 Disable Primary Vserver On Down : DISABLED
29 No. of Bound Services : 0 (Total) 0 (Active)
30 Configured Method: LEASTCONNECTION
31 Mode: IP
32 Persistence: NONE
33 Connection Failover: DISABLED
34 Done
35 <!--NeedCopy-->

```

To globally bind a responder policy by using the GUI:

1. Navigate to **AppExpert > Responder > Policies**.
2. On the **Responder Policies** page, select a responder policy, and then click **Policy Manager**.
3. In the **Responder Policy Manager** dialog box Bind Points menu, select Default Global.
4. Click **Insert Policy** to insert a new row and display a drop-down list of all unbound responder policies.
5. Click one of the policies on the list. That policy is inserted into the list of globally bound responder policies.

6. Click **Apply Changes**.
7. Click **Close**. A message appears in the status bar, stating that the configuration has been successfully completed.

To bind a responder policy to a specific virtual server by using the GUI:

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. On the **Load Balancing Virtual Servers** page, select the virtual server to which you want to bind the responder policy, and then click **Open**.
3. In the **Configure Virtual Server (Load Balancing)** dialog box, select the **Policies** tab, which displays a list of all policies configured on your NetScaler appliance.
4. Select the check box next to the name of the policy you want to bind to this virtual server.
5. Click **OK**. A message appears in the status bar, stating that the configuration has been successfully completed.

## Set the default action for a responder policy

December 21, 2023

The NetScaler appliance generates an undefined event (UNDEF event) when a request does not match a responder policy. The appliance then performs the default action assigned to undefined events. By default, the action forwards the request to the next feature such as load balancing, content filtering and so forth. This default behavior ensures the requests do not require any specific responder action to be sent to your Web servers. Also, the clients receive access to the content that they have requested.

If one or more websites your NetScaler appliance protects receive a significant number of invalid or malicious requests, however, you might want to change the default action to either reset the client connection or drop the request. In this type of configuration, you would write one or more responder policies that would match any legitimate requests, and simply redirect those requests to their original destinations. Your NetScaler appliance would then block any other requests as specified by the default action you configured.

You can assign any one of the following actions to an undefined event:

- **NOOP**. The NOOP action aborts responder processing but does not alter the packet flow. So that the appliance continues to process requests that do not match any responder policy, and eventually forwards them to the requested URL unless another feature intervenes and blocks or redirects the request. This action is appropriate for normal requests to your Web servers and is the default setting.

- **RESET.** If the undefined action is set to RESET, the appliance resets the client connection, informing the client that it must re-establish its session with the Web server. The action is appropriate for repeat requests for webpages that do not exist, or for connections that might be attempts to hack or probe your protected websites.
- **DROP.** If the undefined action is set to DROP, the appliance silently drops the request without responding to the client in any way. This action is appropriate for requests that appear to be part of a DDoS attack or other sustained attack on your servers.

**Note:** UNDEF events are triggered only for client requests. No UNDEF events are triggered for responses.

To set the undefined action by using the NetScaler command line:

At the command prompt, type the following command to set the undefined action and verify the configuration:

- `set responder param -undefAction (RESET|DROP|NOOP)[-timeout < msecs>]`
- `show responder param`

Where,

timeout - Maximum time in milliseconds to allow for processing all the policies and their selected actions without interruption. If the timeout is reached then the evaluation causes an UNDEF to be raised and no further processing is performed.

Minimum value: 1

Maximum value: 5000

**Example:**

```
1 >set responder param -undefAction RESET -timeout 3900
2 Done
3 > show responder param
4 Action Name: RESET
5 Timeout: 3900
6 Done
7 >
8 <!--NeedCopy-->
```

## Set the undefined action by using the GUI

1. Navigate to **AppExpert > Responder**, and then under **Settings**, click the **Change Responder Settings** link.
2. In the **Set Responder Params** page, set the following parameters:

- a) Global Undefined-Result Action. Undefined-result action is preferred in an unhandled processing exception in the responder policies and actions. Select **NOOP**, **RESET**, or **DROP**.
- b) Timeout. Maximum time in milliseconds to allow for processing all the policies and their selected actions without interruption. If the timeout is reached then the evaluation causes an UNDEF to be raised and no further processing is performed.

3. Click **OK**.

## ← Configure Responder Params

## Responder action and policy examples

December 21, 2023

Responder actions and policies are powerful and complex, but you can get started with relatively simple applications.

### Example: Blocking Access from Specified IPs

The following procedures block access to your protected Web site(s) by clients originating from the CIDR 222.222.0.0/16. The responder sends an error message stating that the client is not authorized to access the URL requested.

To block access by using the NetScaler command line:

At the command prompt, type the following commands to block access:

- add responder action act\_unauthorized respond with “HTTP/1.1 403 Forbidden\r\n\r\n”+ “Client: “+ CLIENT.IP.SRC + “is not authorized to access URL:”+ “HTTP.REQ.URL.HTTP\_URL\_SAFE”

- add responder policy pol\_un “CLIENT.IP.SRC.IN\_SUBNET (222.222.0.0/16)”act\_unauthorized
- bind responder global pol\_un 10

To block access by using the GUI:

1. In the navigation pane, expand **Responder**, and then click **Actions**.
2. In the details pane, click **Add**.
3. In the **Create Responder Action** dialog box, do the following:
  - a) In the **Name** text box, type act\_unauthorized.
  - b) Under Type, select Respond with.
  - c) In the Target text area, type the following string: “HTTP/1.1 403 Forbidden\r\n\r\n”+ “Client: “+ CLIENT.IP.SRC + “is not authorized to access URL:”+ HTTP.REQ.URL.HTTP\_URL\_SAFE
  - d) Click **Create**, and then click **Close**.  
The responder action you configured, named act\_unauthorized, now appears in the **Responder Actions** page.
4. In the navigation pane, click **Policies**.
5. In the details pane, click **Add**.
6. In the **Create Responder Policy** dialog box, do the following:
  - a) In the Name text box, type pol\_unauthorized.
  - b) Under **Action**, select act\_unauthorized.
  - c) In the **Expression** window, type the following rule: CLIENT.IP.SRC.IN\_SUBNET(222.222.0.0/16)
  - d) Click **Create**, then click **Close**.  
The responder policy you configured, named pol\_unauthorized, now appears in the **Responder Policies** page.
7. Globally bind your new policy, pol\_unauthorized, as described in [Binding a Responder Policy](#).

### Example: Redirecting a client to a new URL

The following procedures redirect clients who access your protected Web site(s) from within the CIDR 222.222.0.0/16 to a specified URL.

To redirect clients by using the NetScaler command line:

At the command prompt, type the following commands to redirect clients and verify the configuration:

- add responder action act\_redirect redirect "<<http://www.example.com/404.html>>"
- show responder action act\_redirect
- add responder policy pol\_redirect “CLIENT.IP.SRC.IN\_SUBNET(222.222.0.0/16)”act\_redirect
- show responder policy pol\_redirect

- bind responder global pol\_redirect 10

**Example:**

```
1 > add responder action act_redirect redirect `http://www.example.com
 /404.html "`
2 Done
3
4 > add responder policy pol_redirect "CLIENT.IP.SRC.IN_SUBNET
 (222.222.0.0/16)" act_redirect
5 Done
6 <!--NeedCopy-->
```

To redirect clients by using the GUI:

1. Navigate to **AppExpert > Responder > Actions**.
2. In the details pane, click **Add**.
3. In the **Create Responder Action** dialog box, do the following:
  - a) In the **Name** text box, type act\_redirect.
  - b) Under Type, select **Redirect**.
  - c) In the **Target** text area, type the following string: "<http://www.example.com/404.html>>"
  - d) Click **Create**, then click **Close**.  
The responder action you configured, named act\_redirect, now appears in the **Responder Actions** page.
4. In the navigation pane, click **Policies**.
5. In the details pane, click **Add**.
6. In the **Create Responder Policy** dialog box, do the following:
  - a) In the **Name** text box, type pol\_redirect.
  - b) Under **Action**, select act\_redirect.
  - c) In the **Expression** window, type the following rule: CLIENT.IP.SRC.IN\_SUBNET(222.222.0.0/16)
  - d) Click **Create**, then click **Close**.  
The responder policy you configured, named pol\_redirect, now appears in the **Responder Policies** page.
7. Globally bind your new policy, pol\_redirect, as described in [Binding a Responder Policy](#).

## Diameter support for responder

December 21, 2023

The Responder feature now supports the Diameter protocol. You can configure Responder to respond to Diameter requests as it does HTTP and TCP requests. For example, you could configure Responder to respond to requests from a specific Diameter origin with a redirect to a web page enhanced for mobile devices. A number of NetScaler expressions have been added that support examination of the Diameter header and the attribute-value pairs (AVPs). These expressions support lookup of specific AVPs by index, ID or name, examine the information in each AVP, and send an appropriate response.

To configure Responder to respond to a Diameter request:

At the command prompt, type the following commands:

- `add responder action <actname> RESPONDWITH "DIAMETER.NEW_REDIRECT (\\"aaa://host.example.com\\")"`

For <actname>, substitute a name for your new action. The name can consist of from one to 127 characters in length, and can contain letters, numbers, and the hyphen (-) and underscore (\_) symbols. For `aaa://host.example.com`, substitute the URL of the diameter host to which you want to redirect connections.

- `add responder policy <polname> "diameter.req.avp(264).value.eq("host1.example.net)" <actname>`

For <polname>, substitute a name for your new policy. As with <actname>, the name can consist of from one to 127 characters in length, and can contain letters, numbers, and the hyphen (-) and underscore (\_) symbols. For `host1.example.net`, substitute the name of the originating host of the requests that you want to redirect. For <actname>, substitute the name of the action that you just created.

- `bind lb vserver <vservname> -policyName <polname> -priority <priority> -type REQUEST`

For <vservname>, substitute the name of the load balancing virtual server to which you want to bind the policy. For <polname>, substitute the name of the policy you just created. For <priority>, substitute a priority for the policy.

### Example:

To create a Responder action and policy to respond to Diameter requests that originate from “host1.example.net” with a redirect to “host.example.com”, you could add the following action and policy, and bind the policy as shown.

```
1 > add responder action act_resp-dm-redirect RESPONDWITH "DIAMETER.
 NEW_REDIRECT(\\"aaa://host.example.com\\")"
2 Done
3
4 > add responder pol_resp-dm-redirect "diameter.req.avp(264).value.eq(\\"
 host1.example.net\\")" act_resp-dm-redirect
5 Done
```

```
6
7 > bind lb vserver vs1 -policyName pol_resp-dm-redirect -priority 10 -
 type REQUEST
8 Done
9 <!--NeedCopy-->
```

## RADIUS support for responder

December 21, 2023

The NetScaler expressions language contains expressions that can extract information from and manipulate RADIUS requests. These expressions enable you to use the Responder feature to respond to RADIUS requests. Your responder policies and actions can use any expression that is appropriate or relevant to a RADIUS request. The available expressions enable you to identify the RADIUS message type, extract any attribute-value pair (AVP) from the connection, and send different responses on the basis of that information. You can also create policy labels that invoke all responder policies for RADIUS connections.

You can use RADIUS expressions to construct simple responses that do not require communication with the RADIUS server to which the request was sent. When a responder policy matches a connection, the NetScaler constructs and sends the appropriate RADIUS response without contacting the RADIUS authentication server. For example, if the source IP address of a RADIUS request is from a subnet that is specified in the responder policy, the NetScaler can reply to that request with an access-reject message, or can simply drop the request.

You can also create policy labels to route specific types of RADIUS requests through a series of policies that are appropriate to those requests.

**Note:** The current RADIUS expressions do not work with RADIUS IPv6 attributes.

The NetScaler documentation for expressions that support RADIUS assumes familiarity with the basic structure and purpose of RADIUS communications. If you need more information about RADIUS, see your RADIUS server documentation or search online for an introduction to the RADIUS protocol.

### Configuring Responder Policies for RADIUS

The following procedure uses the NetScaler command line to configure a responder action and policy, and bind the policy to a RADIUS-specific global bind point.

To configure a Responder action and policy, and bind the policy:

At the command prompt, type the following commands:

- `add responder action <actName> <actType>`
- `add responder policy <polName> <rule> <actName>`
- `bind responder policy <polName> <priority> <nextExpr> -type <bindPoint>` where `<bindPoint>` represents one of the RADIUS-specific global bind points.

## RADIUS Expressions for Responder

In a responder configuration, you can use the following NetScaler expressions to refer to various portions of a RADIUS request.

### Identifying the Type of Connection:

- `RADIUS.IS_CLIENT`. Returns TRUE if the connection is a RADIUS client (request) message.
- `RADIUS.IS_SERVER`. Returns TRUE if the connection is a RADIUS server (response) message.

### Request Expressions:

- `RADIUS.REQ.CODE`. Returns the number that corresponds to the RADIUS request type. A derivative of the `num_at` class. For example, a RADIUS access request would return 1 (one). A RADIUS accounting request would return 4.
- `RADIUS.REQ.LENGTH`. Returns the length of the RADIUS request, including the header. A derivative of the `num_at` class.
- `RADIUS.REQ.IDENTIFIER`. Returns the RADIUS request identifier, a number assigned to each request that allows the request to be matched to the corresponding response. A derivative of the `num_at` class.
- `RADIUS.REQ.AVP(<AVP Code No>).VALUE`. Returns the value of first occurrence of this AVP as a string of type `text_t`.
- `RADIUS.REQ.AVP(<AVP code no>).INSTANCE(instance number)`. Returns the specified instance of the AVP as a string of type `RAVP_t`. A specific RADIUS AVP can occur multiple times in a RADIUS message. `INSTANCE(0)` returns the first instance, `INSTANCE(1)` returns second instance, and so on, up to sixteen instances.
- `RADIUS.REQ.AVP(<AVP code no>).VALUE(instance number)`. Returns the value of specified instance of the AVP as a string of type `text_t`.
- `RADIUS.REQ.AVP(<AVP code no>).COUNT`. Returns the number of instances of a specific AVP in a RADIUS connection, as an integer.
- `RADIUS.REQ.AVP(<AVP code no>).EXISTS`. Returns TRUE if the specified type of AVP exists in the message, or FALSE if it does not.

### Response Expressions:

RADIUS response expressions are identical to RADIUS request expressions, except that RES replaces REQ.

**Typecasts of AVP Values:**

The ADC supports expressions to typecast RADIUS AVP values to the text, integer, unsigned integer, long, unsigned long, ipv4 address, ipv6 address, ipv6 prefix and time data types. The syntax is the same as for other NetScaler typecast expressions.

**Example:**

The ADC supports expressions to typecast RADIUS AVP values to the text, integer, unsigned integer, long, unsigned long, ipv4 address, ipv6 address, ipv6 prefix and time data types. The syntax is the same as for other NetScaler typecast expressions.

```
1 RADIUS.REQ.AVP(8).VALUE(0).typecast_ip_address_at
2 <!--NeedCopy-->
```

**AVP Type Expressions:**

The NetScaler supports expressions to extract RADIUS AVP values by using the assigned integer codes described in RFC2865 and RFC2866. You can also use text aliases to accomplish the same task. Some examples follow.

- RADIUS.REQ.AVP (1).VALUE or RADIUS.REQ.USERNAME.value. Extracts the RADIUS user-name value.
- RADIUS.REQ.AVP (4). VALUE or RADIUS.REQ. ACCT\_SESSION\_ID.value. Extracts the Acct-Session-ID AVP (code 44) from the message.
- RADIUS.REQ.AVP (26). VALUE or RADIUS.REQ.VENDOR\_SPECIFIC.VALUE. Extracts the vendor-specific value.

The values of most commonly-used RADIUS AVPs can be extracted in the same manner.

**RADIUS Bind Points:**

Four global bind points are available for policies that contain RADIUS expressions.

- RADIUS\_REQ\_OVERRIDE. Priority/override request policy queue.
- RADIUS\_REQ\_DEFAULT. Standard request policy queue.
- RADIUS\_RES\_OVERRIDE. Priority/override response policy queue.
- RADIUS\_RES\_DEFAULT. Standard response policy queue.

**RADIUS Responder-Specific Expressions:**

- RADIUS\_RESPONDWITH. Respond with the specified RADIUS response. The response is created with NetScaler expressions, both RADIUS expressions and any others that are applicable.
- RADIUS.NEW\_ANSWER. Sends a new RADIUS answer to the user.
- RADIUS.NEW\_ACCESSREJECT. Rejects the RADIUS request.
- RADIUS.NEW\_AVP. Adds the specified new AVP to the response.

## Use Cases

Following are use cases for RADIUS with responder.

### Blocking RADIUS Requests from a Specific Network

To configure the responder feature to block authentication requests from a specific network, begin by creating a responder action that rejects requests. Use the action in a policy that selects requests from the networks that you want to block. Bind the responder policy to a RADIUS-specific global bind point, specifying:

- The priority
- END as the nextExpr value, to ensure that policy evaluation stops when this policy is matched
- RADIUS\_REQ\_OVERRIDE as the queue to which you assign the policy, so that it is evaluated before policies assigned to the default queue

To configure Responder to block logons from a specific network\*\*

- `add responder action <actName> <actType>`
- `add responder policy <polName> <rule> <actName>`
- `bind responder global <polName> <priority> <nextExpr> -type <bindPoint>`

### Example:

```
1 > add responder action rspActRadiusReject respondwith radius.
 new_accessreject
2 Done
3
4 > add responder policy rspPolRadiusReject client.ip.src.in_subnet
 (10.224.85.0/24) rspActRadiusReject
5 Done
6
7 > bind responder global rspPolRadiusReject 1 END -type
 RADIUS_REQ_OVERRIDE
8 <!--NeedCopy-->
```

## DNS support for the responder feature

December 21, 2023

You can configure the responder feature to respond to DNS requests as it does to HTTP and TCP requests. For example, you could configure it to send DNS responses over UDP and ensure that the DNS

requests from the client are sent over TCP. A number of NetScaler expressions support examination of the DNS header in the request. These expressions examine specific header fields and send an appropriate response.

- **DNS Expressions.** In a responder configuration, you can use the following NetScaler expressions to refer to various portions of a DNS request:

| Expressions                      | Descriptions                                                  |
|----------------------------------|---------------------------------------------------------------|
| DNS.NEW_RESPONSE                 | Creates a new empty DNS response based on the request.        |
| DNS.NEW_RESPONSE <AA, TC, rcode> | Creates a new DNS response based on the specified parameters. |

- **DNS Bind Points.** The following global bind points are available for policies that contain DNS expressions.

| Bind Points      | Descriptions                            |
|------------------|-----------------------------------------|
| DNS_REQ_OVERRIDE | Priority/override request policy queue. |
| DNS_REQ_DEFAULT  | Standard request policy queue.          |

In addition to the default bind points, you can create policy labels of type DNS and bind DNS policies to them.

## Configuring Responder Policies for DNS

The following procedure uses the NetScaler command line to configure a responder action and policy and bind the policy to a responder-specific global bind point.

To configure Responder to respond to a DNS request:

At the command prompt, type the following commands:

1. `add responder action <actName> <actType>`

For <actname>, substitute a name for your new action. The name can be 1 to 127 characters in length, and can contain letters, numbers, hyphen (-), and underscore (\_) symbols. For <actType>, substitute a responder action type, *respondWith*.

2. `add responder policy <polName> <rule> <actName>`

For `<polname>`, substitute a name for your new policy. For `<actname>`, the name can be 1 to 127 characters in length, and can contain letters, numbers, hyphen (-), and underscore (\_) symbols. For `<actname>`, substitute the name of the action that you just created.

3. `bind responder policy <polName> <priority> <nextExpr> -type <bindPoint>`

For `<bindPoint>`, specify one of the responder-specific global bind points. For `<polName>`, substitute the name of the policy that you just created. For `<priority>`, specify the priority of the policy.

### Sample configuration - Enforce all DNS request over TCP:

To enforce all the DNS requests over TCP, create a responder action that will set the TC bit and rcode as NOERROR.

```
1 > add responder action resp_act_set_tc_bit respondwith DNS.NEW_RESPONSE
 (true, true, NOERROR)
2 Done
3
4 > add responder policy enforce_tcp dns.REQ.TRANSPORT.EQ(udp)
 resp_act_set_tc_bit
5 Done
6
7 >bind lb vserver dns_udp -policyName enforce_tcp -type request -
 priority 100
8 Done
9 <!--NeedCopy-->
```

## MQTT support for responder

May 2, 2023

The Responder feature supports the MQTT protocol. You can configure responder policies to take an action based on the parameters in the incoming MQTT message.

The action responds with any of the following to a new connection:

- DROP
- RESET
- NOOP
- A responder action to initiate a new MQTT CONNACK response.

## Configuring responder policies for MQTT

After enabling the responder feature, you must configure one or more actions for handling MQTT requests. Then, configure a responder policy. You can bind the responder policies globally, or to a specific load balancing virtual server or content switching virtual server.

The following bind points are available to bind the responder policies globally:

- MQTT\_REQ\_DEFAULT
- MQTT\_REQ\_OVERRIDE
- MQTT\_JUMBO\_REQ\_DEFAULT
- MQTT\_JUMBO\_REQ\_OVERRIDE

The following bind points are available to bind the responder policies to a content switching or load balancing virtual server:

- REQUEST
- MQTT\_JUMBO\_REQ (this bind point is used only for Jumbo packets)

## To configure the responder to respond to an MQTT request by using CLI

At the command prompt, type the following commands:

Configure a responder action.

```
1 add responder action <actName> <actType>
2 <!--NeedCopy-->
```

- For `actname`, substitute a name for your new action. The name can be 1–127 characters in length, and can contain letters, numbers, hyphen (-), and underscore (\_) symbols.
- For `actType`, substitute a responder action type, `respondwith`.

### Example:

```
1 add responder action mqtt_connack_unsup_ver respondwith MQTT.
 NEW_CONNACK(132)
2 <!--NeedCopy-->
```

Configure a responder policy. The NetScaler appliance responds to the MQTT requests that are selected by this responder policy.

```
1 add responder policy <polName> <rule> <actname>
2 <!--NeedCopy-->
```

- For `polname`, substitute a name for your new policy.
- For `actname`, substitute the name of the action that you created.

**Example:**

```

1 add responder policy reject_lower_version "MQTT.HEADER.COMMAND.EQ(
 CONNECT) && MQTT.VERSION.LT(3)" mqtt_connack_unsup_ver
2 <!--NeedCopy-->

```

Bind the responder policy to a specific load balancing virtual server or content switching virtual server. The policy applies only to the MQTT requests whose destination IP address is the VIP of that virtual server.

```

1 bind lb vserver <name> -policyName <policy_name> -priority <priority>
2
3 bind cs vserver <name> -policyName <policy_name> -priority <priority>
4 <!--NeedCopy-->

```

- For `policy_name`, substitute the name of the policy that you have created.
- For `priority`, specify the priority of the policy.

**Example:**

```

1 bind lb vserver lb1 -policyName reject_lower_version -priority 50
2
3 bind cs vserver mqtt_frontend_cs -policyName reject_lower_version -
 priority 5
4 <!--NeedCopy-->

```

**Use case1: Filter clients based on the user name or client ID**

The administrator can configure an MQTT responder policy to reject the connection based on the user name or client ID in the MQTT CONNECT message.

**Sample configuration for filtering clients based on the client ID**

```

1 add policy patset filter_clients
2 bind policy patset filter_clients client1
3
4 add responder action mqtt_connack_invalid_client respondwith MQTT.
 NEW_CONNACK(2)
5
6 add responder policy reject_clients "MQTT.HEADER.COMMAND.EQ(CONNECT) &&
 mqtt.connect.clientid.equals_any(\"filter_clients\")"
 mqtt_connack_invalid_client
7
8 bind cs vserver mqtt_frontend_cs -policyName reject_clients -priority 5
9 <!--NeedCopy-->

```

## Use case2: Limit the maximum message length of MQTT messages to handle jumbo packets

The administrator can configure an MQTT responder policy to drop the client connection if the length of the message exceeds a certain threshold, or take necessary action based on the requirement.

To handle jumbo packets, the responder policies with any of the following rule patterns are bound to the jumbo bind point:

- MQTT.MESSAGE\_LENGTH
- MQTT.COMMAND
- MQTT.FROM\_CLIENT
- MQTT.FROM\_SERVER

Policies bound to jumbo bind points are evaluated only for jumbo packets.

### Sample configuration for limiting the maximum message length of MQTT messages

```
1 set lb parameter -dropmqttjumbomessage no
2
3 add responder policy drop_large_message MQTT.MESSAGE_LENGTH.GT(100000)
 reset
4
5 bind cs vserver mqtt_frontend_cs -policyName drop_large_message -
 priority 10
6 <!--NeedCopy-->
```

In this example, the `dropmqttjumbomessage` parameter is set to NO. Therefore, the ADC appliance processes the messages with length greater than 64,000 bytes and less than 1,00,000 bytes. The messages with length greater than 1,00,000 bytes are reset.

## How to redirect HTTP request to HTTPS using responder

December 21, 2023

This article explains how to configure the responder feature with a load balancing virtual server IP addresses and redirect client requests from HTTP to HTTPS.

Consider a scenario where a user might attempt to access a secure website by sending an HTTP request. Instead of dropping the request, you might want to redirect the request to a secure website. You can use the responder feature to redirect the request to the secure website without changing the path and the URL query which the user attempts to access.

## How NetScaler responder redirects a request from HTTP to HTTPS

The following illustration shows a step by step flow of how the appliance redirects a request.

To configure the Responder feature along with the Load Balancing VIP addresses of a NetScaler appliance to redirect client requests from HTTP to HTTPS, complete the following procedure.

### Enable the responder feature on the appliance

To enable the responder feature on the appliance, navigate to **System > Settings > Configure Advanced Features** and select **Responder**.

### Create a responder action

To create a responder action, perform the following steps:

1. Navigate to **AppExpert > Responder > Actions** and click **Add**.
2. Specify an appropriate name, such as `http_to_https_actn`, in the **Name** field.
3. Select **Redirect** as **Type**.
4. In the **Expression** field, type the following expression:
 

```
"https://" + HTTP.REQ.HOSTNAME.HTTP_URL_SAFE + HTTP.REQ.URL.PATH_AND_QUERY.HTTP_URL_SAFE.
```
5. Click **Create**.

### Create responder policy

To create a responder policy, perform the following steps:

1. Navigate to **AppExpert > Responder > Policies** and click **Add**.
2. Specify an appropriate name, such as http\_to\_https\_pol, in the **Name** field.
3. From the **Action** list, select the action name that you have created.
4. From the **Undefined Action list**, select RESET.
5. Type the **HTTP.REQ.IS\_VALID** expression in the **Expression** field as shown in the following screenshot.

**Create Responder Policy**

Comments

**Create** **Close**

### Create a monitor

To create a monitor for which the status is always marked as UP, perform the following steps:

1. Navigate to **Traffic Management > Load Balancing > Monitors**, click **Add**.
2. Specify an appropriate name, such as localhost\_ping, in the **Name** field.
3. In the **Destination IP** field, specify the 127.0.0.1 as the IP address.

## ← Create Monitor

TROFS String

## Create a service

To create a service, perform the following steps:

1. Navigate to **Load Balancing > Services** and click **Add**.
2. Specify an appropriate name, such as Always\_UP\_service, in the **Name** field.
3. Specify a non-existent IP address in the **Server** field.
4. Specify 80 in the **Port** field.
5. Add the created monitor from the **Available Monitors** list.

## Create a Load Balancing Virtual Server

1. Navigate to **Load Balancing > Services** and then click **Add**.
2. Specify an appropriate name in the **Name** field.
3. Specify the IP address of the website in the **IP Address** field.
4. Select HTTP from the **Protocol** list.
5. Type 80 in the Port field.
6. Click the **Policies** tab.
7. Bind the Responder policy that you created to the HTTP Load Balancing VIP address of the website.
8. Create a secure Load Balancing virtual server that has the IP address of the website and port as 443.

To create a configuration similar to the preceding procedure from the command line interface of the appliance, run the following commands:

```
1 enable ns feature responder
2 add responder action http_to_https_actn redirect "\"https://\" + http.
 req.hostname.HTTP_URL_SAFE + http.REQ.URL.PATH_AND_QUERY.
 HTTP_URL_SAFE"
3 add responder policy http_to_https_pol HTTP.REQ.IS_VALID
 http_to_https_actn RESET
4 add lb monitor localhost_ping PING -LRTM ENABLED -destIP 127.0.0.1
5 add service Always_UP_service 1.2.3.4 HTTP 80 -gslb NONE -maxClient 0 -
 maxReq 0 -cip ENABLED dummy -usip NO -sp OFF -cltTimeout 180 -
 svrTimeout 360 -CKA NO -TCPB NO -CMP YES
6 bind lb monitor localhost_ping Always_UP_service
7 add lb vserver http_site.com HTTP 10.217.96.238 80 -persistenceType
 COOKIEINSERT -timeout 0 -cltTimeout 180
8 bind lb vserver http_site.com Always_UP_service
9 bind lb vserver http_site.com -policyName http_to_https_pol -priority 1
 -gotoPriorityExpression END
10 <!--NeedCopy-->
```

**Notes:**

- The status of the port 80 Load Balancing Redirect virtual server must be UP for the redirect to work.
- Web browsers might not redirect correctly if the HTTPS virtual server is not active.
- This redirect setup allows for situations where multiple domains are bound to the same IP address.
- If the client sends an invalid HTTP request to the redirect virtual server, then the appliance sends a RESET message code.

## Troubleshooting

May 2, 2023

If the responder feature does not work as expected after you have configured it, you can use some common tools to access NetScaler resources and diagnose the problem.

### Resources for Troubleshooting

For best results, use the following resources to troubleshoot an integrated cache issue on a NetScaler appliance:

- The ns.conf file
- The relevant trace files from the client and the NetScaler appliance

In addition to the above resources, the following tools expedite troubleshooting:

- The iehttpheaders or a similar utility
- The Wireshark application customized for the NetScaler trace files

### Troubleshooting Responder Issues

- **Issue**

The Responder feature is configured, but the responder action is not working.

**Resolution**

- Verify that the feature is enabled.
- Check the hit counters of any of the policies to see if the counters are getting incremented.
- Verify that the policies and actions are configured correctly.

- Verify that the actions and policies are bound appropriately.
- Record the packet traces on the client and the NetScaler appliance, and analyze the them to get some pointer to the issue.
- Record the iehhttpHeaters packet traces on the client and verify the HTTP requests and responses to get some pointer to the issue.

- **Issue**

You need to create a maintenance page.

- **Resolution**

1. Configure the services and virtual Server.
2. Configure a backup virtual server with a service bound to it. This ensures that the status of the Web site is always displayed as UP.
3. Configure the primary virtual server to use the backup virtual server as a backup.
4. Create a responder action with an appropriate target. Following is an example for your reference:

```
add responder action sorry_page respondwith q{ "HTTP/1.0 200 OK"+
"\r\n\r\n"+ "<html><body>Sorry, this page is not available</body>
</html>" + "\r\n" }
```

5. Create a responder policy and bind the action to it.
6. Bind the responder policy to the backup virtual Server.

## Rewrite

June 22, 2023

**Warning:**

Filter features using classic policies are deprecated and as an alternative Citrix recommends you to use the rewrite and responder features with advanced policy infrastructure.

Rewrite refers to the rewriting of some information in the requests or responses handled by the NetScaler appliance. Rewriting can help in providing access to the requested content without exposing unnecessary details about the website's actual configuration. A few situations in which the rewrite feature is useful are as follows:

- To improve security, the NetScaler can rewrite all the `http://links` to `https://` in the response body.

- In the SSL offload deployment, the insecure links in the response have to be converted into secure links. Using the rewrite option, you can rewrite all the `http://links` to `https://` for making sure that the outgoing responses from NetScaler to the client have the secured links.
- If a website has to show an error page, you can show a custom error page instead of the default 404 Error page. For example, if you show the home page or site map of the website instead of an error page, the visitor remains on the site instead of moving away from the website.
- If you want to launch a new website, but use the old URL, you can use the Rewrite option.
- When a topic in a site has a complicated URL, you can rewrite it with a simple, easy-to-remember URL (also referred to as ‘cool URL’).
- You can append the default page name to the URL of a website. For example, if the default page of a company’s website is `http://www.abc.com/index.php`, when the user types ‘abc.com’ in the address bar of the browser, you can rewrite the URL to ‘abc.com/index.php’.

When you enable the rewrite feature, NetScaler can modify the headers and body of HTTP requests and responses.

To rewrite HTTP requests and responses, you can use protocol-aware NetScaler policy expressions in the rewrite policies you configure. The virtual servers that manage the HTTP requests and responses must be of type

HTTP or

SSL. In HTTP traffic, you can take the following actions:

- Modify the URL of a request
- Add, modify, or delete headers
- Add, replace, or delete any specific string within the body or headers.

To rewrite TCP payloads, consider the payload as a raw stream of bytes. Each of the virtual servers that managing the TCP connections must be of type TCP or SSL\_TCP. The term TCP rewrite is used to refer to the rewrite of TCP payloads that are not HTTP data. In TCP traffic, you can add, modify, or delete any part of the TCP payload.

For examples to use the rewrite feature, see [Rewrite Action and Policy Examples](#).

## Comparison between Rewrite and Responder options

The main difference between the rewrite feature and the responder feature is as follows:

Responder cannot be used for response or server-based expressions. Responder can be used only for the following scenarios depending on client parameters:

- Redirecting an HTTP request to new websites or webpages
- Responding with some custom response

- Dropping or resetting a connection at request level

If there is a responder policy, the NetScaler examines the request from the client, takes action according to the applicable policies, sends the response to the client, and closes the connection with the client.

If there is a rewrite policy, the NetScaler examines the request from the client or response from the server, takes action according to the applicable policies, and forwards the traffic to the client or the server.

In general, it is recommended to use a responder if you want the NetScaler to reset or drop a connection based on a client or request-based parameter. Use the responder to redirect traffic, or respond with custom messages. Use rewrite for manipulating data on HTTP requests and responses.

### **How rewrite works**

A rewrite policy consists of a rule and action. The rule determines the traffic on which rewrite is applied and the action determines the action to be taken by the NetScaler. You can define multiple rewrite policies. For each policy, specify the bind point and priority.

A bind point refers to a point in the traffic flow at which the NetScaler examines the traffic to verify whether any rewrite policy can be applied to it. You can bind a policy to a specific load balancing or content switching virtual server, or make the policy global if you want the policy to be applied to the entire traffic handled by the NetScaler. These policies are referred to as global policies.

In addition to the user-defined policies, the NetScaler has some default policies. You cannot modify or delete a default policy.

For evaluating the policies, NetScaler follow these order:

- Global policies
- Policies bound to specific virtual servers
- Default policies

**Note:**

NetScaler can apply a rewrite policy only when it is bound to a point.

NetScaler implements the rewrite feature in the following steps:

- The NetScaler appliance checks for global policies and then checks for policies at individual bind points.
- If multiple policies are bound to a bind point, the NetScaler evaluates the policies in the order of their priority. The policy with the highest priority is evaluated first. After evaluating each policy, if the policy is evaluated to TRUE, it adds the action associated with the policy the associated

action is performed. A match occurs when the characteristics specified in the policy rule match the characteristics of the request or response being evaluated.

- For any policy, in addition to the action, you can specify the policy that must be evaluated after the current policy is evaluated. This policy is referred to as the ‘Go to Expression’. For any policy, if a Go to Expression (gotoPriorityExpr) is specified, the NetScaler evaluates the Go to Expression policy. It ignores the policy with the next highest priority.

You can specify the priority of the policy to indicate the Go to Expression policy; you cannot use the name of the policy. If you want the NetScaler to stop evaluating other policies after evaluating a particular policy, you can set the Go to Expression to ‘END’.

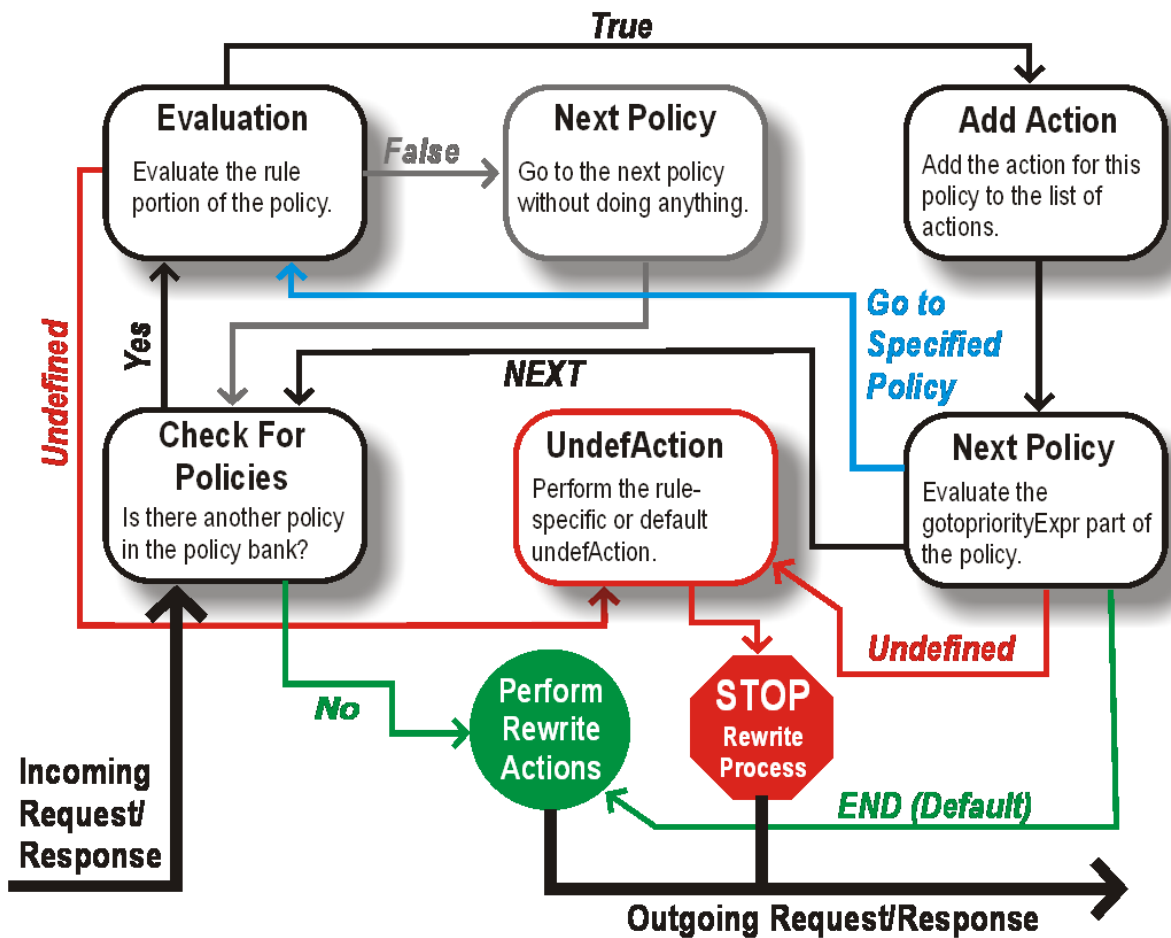

- After all the policies are evaluated or when a policy has the Go to Expression set as END, the NetScaler starts performing the actions according to the list of actions.

For more information about configuring rewrite policies, see [Configuring a Rewrite Policy](#) and about binding rewrite policies, see [Binding a Rewrite Policy](#).

The following figure illustrates how NetScaler processes a request or response when the rewrite feature is used.

Figure 1. The Rewrite Process

### Policy Evaluation

The policy with the highest priority is evaluated first. NetScaler does not stop the evaluation of rewrite policies when it finds a match. It evaluates all the rewrite policies configured on the NetScaler.

- If a policy evaluates to TRUE, the NetScaler follows the procedure below:
  - If the policy has the Go to Expression set to END, the NetScaler stops evaluating all the other policies and starts performing the rewrite.
  - The gotoPriorityExpression can be set to 'NEXT', 'END', some integer or 'INVOCATION\_LIST'. The value determines the policy with the next priority. The following table shows the action taken by NetScaler for each value of the expression.

Value of the expression	Action
NEXT	The policy with the next priority gets evaluated.
END	Evaluation of policies stops.

Value of the expression	Action
<an integer>	Policy with specified priority gets evaluated.
INVOCATION_LIST	Goto NEXT or END is applied based on the result of the invocation list.

- If a policy evaluates to FALSE, the NetScaler continues the evaluation in the order of priority.
- If a policy evaluates to UNDEFINED (cannot be evaluated on the received traffic due to an error), the NetScaler performs the action assigned to the UNDEFINED condition (referred to as undefAction) and stops further evaluation of policies.

The NetScaler starts the actual rewriting only after the evaluation is complete. It refers to the list of actions identified by policies that are evaluated to TRUE, and starts the rewriting. After implementing all the actions in the list, the NetScaler forwards the traffic as required.

**Note:**

Ensure that the policies do not specify conflicting or overlapping actions on the same part of the HTTP header or body, or TCP payload. When such a conflict occurs, the NetScaler encounters an undefined situation and aborts the rewrite.

## Rewrite Actions

On the NetScaler appliance, specify the actions to be taken such as adding, replacing, or deleting text within the body, or adding, modifying, or deleting headers, or any changes in the TCP payload as rewrite actions. For more information about rewrite actions, see [Configuring a Rewrite Action](#).

The following table describes the steps the NetScaler can take when a policy evaluates to TRUE.

Action	Result
Insert	The rewrite action specified for the policy is carried out.
NOREWRITE	The request or response is not rewritten. NetScaler forwards the traffic without rewriting any part of the message.
RESET	The connection is aborted at the TCP level.
DROP	The message is dropped.

**Note:**

For any policy, you can configure the underaction (action to be taken when the policy evaluates to UNDEFINED) as NOREWRITE, RESET, or DROP.

To use the Rewrite feature, take the following steps:

- Enable the feature on the NetScaler.
- Define rewrite actions.
- Define rewrite policies.
- Bind the policies to a bind point to bring a policy into effect.

**Enable rewrite**

Enable the rewrite feature on the NetScaler appliance if you want to rewrite the HTTP or TCP requests or responses. If the feature is enabled, NetScaler takes rewrite action according to the specified policies. For more information, see [How rewrite works](#).

To enable the rewrite feature by using the command line interface

At the command prompt, type the following commands to enable the rewrite feature and verify the configuration:

- enable ns feature REWRITE
- show ns feature

**Example:**

```

1 > enable ns feature REWRITE
2 Done
3 > show ns feature
4
5 Feature Acronym Status
6 ----- -
7 1) Web Logging WL OFF
8 2) Surge Protection SP ON
9 .
10 .
11 .
12 1) Rewrite REWRITE ON
13 .
14 .
15 1) NetScaler Push push OFF
16 Done
17 <!--NeedCopy-->

```

To enable the rewrite feature by using the GUI

1. In the navigation pane, click **System**, and then click **Settings**.
2. In the details pane, under Modes and Features, click **Configure basic features**.
3. In the **Configure Basic Features** dialog box, select the Rewrite check box, and then click **OK**.
4. In the **Enable/Disable Feature(s)** dialog box, click **Yes**. A message appears in the status bar, stating that the selected feature was enabled.

## Configuring a Rewrite Action

### Warning

The Pattern function in a rewrite action is deprecated from NetScaler 12.0 build 56.20 onwards and as an alternative, Citrix recommends you to use the Search rewrite action parameter.

A rewrite action indicates changes made to a request or response prior to sending it to a server or client.

Expressions define the following:

- Rewrite action type.
- Location of the rewrite action.
- Rewrite action configuration type.

For Example, a DELETE action only uses a target expression. A REPLACE action uses a target expression and an expression to configure the replacement text.

After enabling the rewrite feature, you need to configure one or more actions unless a built-in rewrite action is sufficient. All of the built-in actions have names beginning with the string `ns_cvpn`, followed by a string of letters and underscore characters. Built-in actions perform useful and complex tasks such as decoding parts of a clientless VPN request or response or modifying JavaScript or XML data. The built-in actions can be viewed, enabled, and disabled, but cannot be modified or deleted.

### Note:

Action types that can be used only for HTTP rewrite are identified in the **Rewrite Action Type** column.

For more information, see **Type parameter**.

## Create a rewrite action by using the command line interface

At the command prompt, type the following commands to create a rewrite action and verify the configuration:

- `add rewrite action <name> <type> <target> [<stringBuilderExpr>] [-search <expression>] [refineSearch <expression>] [-comment<string>]`
- `show rewrite action <name>`

For more information, see the [Rewrite Action Types and their Arguments](#) table.

The rewrite feature has the following built-in actions:

- NOREWRITE - Sends the request or response to the user without rewriting it.
- RESET - Resets the connection and notifies the user's browser, so that the user can resend the request.
- DROP - Drops the connection without sending a response to the user.

One of the following flow types is implicitly associated with every action:

- Request - Action applies to the request.
- Response - Action applies to the response.
- Neutral - Action applies to both requests and responses.

### Name

Name for the user-defined rewrite action. Must begin with a letter, number, or the underscore character (`_`), and must contain only letters, numbers, and the hyphen (`-`), period (`.`) hash (`#`), space (), at (`@`), equals (`=`), colon (`:`), and underscore characters. Can be changed after the rewrite policy is added.

### Type parameter

The **Type** parameter shows the type of user-defined rewrite action.

Following are the values of the **Type** parameter:

- `REPLACE <target> <string_builder_expr>`. Replaces the target string with the string-builder expression.

### Example:

```
1 > add rewrite action replace_http_act replace http.res.body(100) "
 new_replaced_data"
2 Done
3 > sh rewrite action replace_http_act
4 Name: replace_http_act
5 Operation: replace
6 Target: http.res.body(100)
```

```

7 Value:"new_replaced_data"
8 Hits: 0
9 Undef Hits: 0
10 Action Reference Count: 0
11 Done
12
13 <!--NeedCopy-->

```

- **REPLACE\_ALL** <target> <string\_builder\_expr1> -(search)<s> - In the request or response specified by <target>, replaces all occurrences of the string defined by <pattern\_to\_search> with the string defined by <string\_builder\_expr>. You can use the search option to find the strings to be replaced.

**Example:**

```

1 > add policy patset pat_list_2
2 Done
3 > bind policy patset pat_list_2 "www.abc.com"
4 Done
5 > bind policy patset pat_list_2 "www.def.com"
6 Done
7 > add rewrite action refineSearch_act_31 replace_all "HTTP.RES.BODY
 (100000)" "\"https://\""-search "patset(\"pat_list_2\")" -
 refineSearch "EXTEND(7,0).REGEX_SELECT(re#http://#)"
8 Done
9
10 > sh rewrite action refineSearch_act_31
11 Name: refineSearch_act_31
12 Operation: replace_all
13 Target:HTTP.RES.BODY(100000)
14 Refine Search:EXTEND(7,0).REGEX_SELECT(re#http://#)
15 Value:"https://"
16 Search: patset("pat_list_2")
17 Hits: 0
18 Undef Hits: 0
19 Action Reference Count: 0
20 Done
21
22 <!--NeedCopy-->

```

- **REPLACE\_HTTP\_RES** <string\_builder\_expr>. Replaces the complete HTTP response with the string defined by the string-builder expression.

**Example:**

```

1 > add rewrite action replace_http_res_act replace_http_res "'HTTP/1.1
 200 OK\r\n\r\nSending from ADC'"
2 Done
3 > sh rewrite action replace_http_res_act
4 Name: replace_http_res_act
5 Operation: replace_http_res

```

```

6 Target:"HTTP/1.1 200 OK
7 Sending from ADC"
8 Hits: 0
9 Undef Hits: 0
10 Action Reference Count: 0
11 Done
12
13 <!--NeedCopy-->

```

- **REPLACE\_SIP\_RES** <target>. Replaces the complete SIP response with the string specified by <target>.

**Example:**

```

1 > add rewrite action replace_sip_res_act replace_sip_res "HTTP/1.1 200
 OK\r\n\r\nSending from ADC"
2 Done
3 > sh rewrite action replace_sip_res_act
4 Name: replace_sip_res_act
5 Operation: replace_sip_res
6 Target:"HTTP/1.1 200 OK
7 Sending from ADC"
8 Hits: 0
9 Undef Hits: 0
10 Action Reference Count: 0
11 Done
12
13 <!--NeedCopy-->

```

- **INSERT\_HTTP\_HEADER** <header\_string> <contents\_string\_builder\_expr>. Inserts the HTTP header specified by `header_string` and header contents specified by `contents_string_builder_expr`.

**Example:**

```

1 > add rewrite action ins_cip_header insert_http_header "CIP" "CLIENT.IP
 .SRC"
2 Done
3 > sh rewrite action ins_cip_header
4 Name: ins_cip_header
5 Operation: insert_http_header
6 Target:CIP
7 Value:CLIENT.IP.SRC
8 Hits: 0
9 Undef Hits: 0
10 Action Reference Count: 0
11 Done
12
13 <!--NeedCopy-->

```

- **DELETE\_HTTP\_HEADER** <target>. Deletes the HTTP header specified by <target>

**Example:**

```

1 > add rewrite action del_true_client_ip_header delete_http_header "True
 -Client-IP"
2 Done
3 > sh rewrite action del_true_client_ip_header
4 Name: del_true_client_ip_header
5 Operation: delete_http_header
6 Target:True-Client-IP
7 Hits: 0
8 Undef Hits: 0
9 Action Reference Count: 0
10 Done
11
12 <!--NeedCopy-->

```

- **CORRUPT\_HTTP\_HEADER** <target>. Replaces the header name of all occurrences of the HTTP header specified by <target> with a corrupted name, so that it will not be recognized by the receiver Example: MY\_HEADER is changed to MHEY\_ADER.

**Example:**

```

1 > add rewrite action corrupt_content_length_hdr corrupt_http_header "
 Content-Length"
2 Done
3 > sh rewrite action corrupt_content_length_hdr
4 Name: corrupt_content_length_hdr
5 Operation: corrupt_http_header
6 Target:Content-Length
7 Hits: 0
8 Undef Hits: 0
9 Action Reference Count: 0
10 Done
11
12 <!--NeedCopy-->

```

- **INSERT\_BEFORE** <string\_builder\_expr1> <string\_builder\_expr1> . Finds the string specified in <string\_builder\_expr1> and inserts the string in <string\_builder\_expr2> before it.

```

1 > add rewrite action insert_before_ex_act insert_before http.res.body
 (100) "Add this string in the starting"
2 Done
3 > sh rewrite action insert_before_ex_act
4 Name: insert_before_ex_act
5 Operation: insert_before
6 Target:http.res.body(100)
7 Value:"Add this string in the starting"
8 Hits: 0
9 Undef Hits: 0
10 Action Reference Count: 0

```

```

11 Done
12
13 <!--NeedCopy-->

```

- `INSERT_BEFORE_ALL <target> <string_builder_expr1> -(search) <string_builder_expr2>`. In the request or response specified by `<target>`, locates all occurrences of the string specified in and inserts the string specified in before it. You can use the search option to find the strings.

**Example:**

```

1 > add policy patset pat
2 Done
3 > bind policy patset pat abcd
4 Done
5 > add rewrite action refineSearch_act_1 insert_before_all http.res.body
 (10) 'target.prefix(10) + "refineSearch_testing" -search patset("
 pat") -refineSearch extend(10,10)
6 Done
7 > sh rewrite action refineSearch_act_1
8 Name: refineSearch_act_1
9 Operation: insert_before_all
10 Target:http.res.body(10)
11 Refine Search:extend(10,10)
12 Value:target.prefix(10) + "refineSearch_testing"
13 Search: patset("pat")
14 Hits: 0
15 Undef Hits: 0
16 Action Reference Count: 0
17 Done
18
19 <!--NeedCopy-->

```

- `INSERT_AFTER <string_builder_expr1> <string_builder_expr2>`. Inserts the strings specified by `string_builder_expr2` after the string `string_builder_expr1`.

**Example:**

```

1 > add rewrite action insert_after_act insert_after http.req.body(100) '
 "add this string after 100 bytes"
2 Done
3 > sh rewrite action insert_after_act
4 Name: insert_after_act
5 Operation: insert_after
6 Target:http.req.body(100)
7 Value:"add this string after 100 bytes"
8 Hits: 0
9 Undef Hits: 0
10 Action Reference Count: 0
11 Done

```

```

12
13 <!--NeedCopy-->

```

- **INSERT\_AFTER\_ALL** <target> <string\_builder\_expr1> -(search)<string\_builder\_expr2>. In the request or response specified by <target>, locates all occurrences of the string specified by <string\_builder\_expr2> and inserts the string specified by <string\_builder\_expr1> after it. You can use the search facility to find the strings.

**Example:**

```

1 > add rewrite action refineSearch_act_2 insert_after_all http.res.body
 (100) "refineSearch_testing" -search text("abc") -refineSearch
 extend(0, 10)
2 Done
3 > sh rewrite action refineSearch_act_2
4 Name: refineSearch_act_2
5 Operation: insert_after_all
6 Target:http.res.body(100)
7 Refine Search:extend(0, 10)
8 Value:"refineSearch_testing"
9 Search: text("abc")
10 Hits: 0
11 Undef Hits: 0
12 Action Reference Count: 0
13 Done
14
15 <!--NeedCopy-->

```

- **DELETE** <target>. Deletes the string specified by target.

**Example:**

```

1 > add rewrite action delete_ex_act delete http.req.header("HDR")
2 Done
3 > sh rewrite action delete_ex_act
4 Name: delete_ex_act
5 Operation: delete
6 Target:http.req.header("HDR")
7 Hits: 0
8 Undef Hits: 0
9 Action Reference Count: 0
10 Done
11
12 <!--NeedCopy-->

```

- **DELETE\_ALL** <target> -(search)<string\_builder\_expr>. In the request or response specified by <target>, locates and deletes all occurrences of the string specified by <string\_builder\_expr>. You can use the search facility to find the strings.

**Example:**

```

1 >add rewrite action refineSearch_act_4 delete_all "HTTP.RES.BODY(50000)
 " -search text("Windows Desktops") -refineSearch "EXTEND(40,40).
 REGEX_SELECT(re#\s`*`<AppData>.`*`\s`*`<\/AppData>#)"
2 Done
3 > show REWRITE action refineSearch_act_4
4 Name: refineSearch_act_4
5 Operation: delete_all
6 Target:HTTP.RES.BODY(50000)
7 Refine Search:EXTEND(40,40).REGEX_SELECT(re#\s`*`<AppData>.`*`\s`*`<\/
 AppData>#)
8 Search: text("Windows Desktops")
9 Hits: 0
10 Undef Hits: 0
11 Action Reference Count: 0
12 Done
13
14 <!--NeedCopy-->

```

- `REPLACE_DIAMETER_HEADER_FIELD <target> <field value>`. In the request or responses modify the header field specified by `<target>`. Use `Diameter.req.flags.SET(<flag>)` or `Diameter.req.flags.UNSET<flag>` as stringbuilder expression to set or unset flags.

**Example:**

```

1 > add rewrite action replace_diameter_field_ex_act
 replace_diameter_header_field diameter.req.flags diameter.req.flags.
 set(PROXIABLE)
2 Done
3 > sh rewrite action replace_diameter_field_ex_act
4 Name: replace_diameter_field_ex_act
5 Operation: replace_diameter_header_field
6 Target:diameter.req.flags
7 Value:diameter.req.flags.set(PROXIABLE)
8 Hits: 0
9 Undef Hits: 0
10 Action Reference Count: 0
11 Done
12
13 <!--NeedCopy-->

```

- `REPLACE_DNS_HEADER_FIELD <target>`. In the request or response modifies the header field specified by `<target>`.

**Example:**

```

1 > add rewrite action replace_dns_hdr_act replace_dns_header_field dns.
 req.header.flags.set(AA)
2 Done
3 > sh rewrite action replace_dns_hdr_act
4 Name: replace_dns_hdr_act

```

```

5 Operation: replace_dns_header_field
6 Target:dns.req.header.flags.set(AA)
7 Hits: 0
8 Undef Hits: 0
9 Action Reference Count: 0
10 Done
11
12 <!--NeedCopy-->

```

- **REPLACE\_DNS\_ANSWER\_SECTION <target>**. Replace the DNS answer section in the response. This is applicable for A and AAAA records only. Use `DNS.NEW_RRSET_A` and `NS.NEW_RRSET_AAAA` expressions to configure the new answer section.

**Example:**

```

1 > add rewrite action replace_dns_ans_act replace_dns_answer_section
 DNS.NEW_RRSET_A("1.1.1.1", 10)
2 Done
3 > sh rewrite action replace_dns_ans_act
4 Name: replace_dns_ans_act
5 Operation: replace_dns_answer_section
6 Target:DNS.NEW_RRSET_A("1.1.1.1", 10)
7 Hits: 0
8 Undef Hits: 0
9 Action Reference Count: 0
10 Done
11
12 <!--NeedCopy-->

```

- **CLIENTLESS\_VPN\_DECODE<target>**. Decodes the pattern specified by the target In clientless VPN format.

**Example:**

```

1 > add rewrite action cvpn_decode_act_1 clientless_vpn_decode http.req.
 body(100)
2 Done
3 > sh rewrite action cvpn_decode_act_1
4 Name: cvpn_decode_act_1
5 Operation: clientless_vpn_decode
6 Target:http.req.body(100)
7 Hits: 0
8 Undef Hits: 0
9 Action Reference Count: 0
10 Done
11
12 <!--NeedCopy-->

```

- **CLIENTLESS\_VPN\_DECODE\_ALL<target>-search<expression>**. Decodes ALL the patterns specified by search parameter In clientless VPN format.

**Example:**

```
1 > add rewrite action act1 clientless_vpn_decode_all http.req.body(100)
 -search text("abcd")
2 Done
3 > sh rewrite action act1
4 Name: act1
5 Operation: clientless_vpn_decode_all
6 Target:http.req.body(100)
7 Search: text("abcd")
8 Hits: 0
9 Undef Hits: 0
10 Action Reference Count: 0
11 Done
12
13 <!--NeedCopy-->
```

- `CLIENTLESS_VPN_ENCODE<target>`. Encodes the pattern specified by target in clientless VPN format.

**Example:**

```
1 > add rewrite action cvpn_encode_act_1 clientless_vpn_encode http.req.
 body(100)
2 Done
3 > sh rewrite action cvpn_encode_act_1
4 Name: cvpn_encode_act_1
5 Operation: clientless_vpn_encode
6 Target:http.req.body(100)
7 Hits: 0
8 Undef Hits: 0
9 Action Reference Count: 0
10 Done
11
12 <!--NeedCopy-->
```

- `CLIENTLESS_VPN_ENCODE_ALL<target>-search<expression>`. Encodes ALL the patterns specified search parameter in clientless VPN format.

**Example:**

```
1 > add rewrite action act2 clientless_vpn_encode_all http.req.body(100)
 -search text("abcd")
2 Done
3 > sh rewrite action act2
4 Name: act1
5 Operation: clientless_vpn_encode_all
6 Target:http.req.body(100)
7 Search: text("abcd")
8 Hits: 0
9 Undef Hits: 0
10 Action Reference Count: 0
```

```

11 Done
12
13 <!--NeedCopy-->

```

- **CORRUPT\_SIP\_HEADER**<target>. Replaces the header name of all occurrences of the SIP header specified by <target> with a corrupted name, so that the receiver doesn't recognize it.

**Example:**

```

1 > add rewrite action corrupt_sip_hdr_act corrupt_sip_header SIP_HDR
2 Done
3 > sh rewrite action corrupt_sip_hdr_act
4 Name: corrupt_sip_hdr_act
5 Operation: corrupt_sip_header
6 Target:SIP_HDR
7 Hits: 0
8 Undef Hits: 0
9 Action Reference Count: 0
10 Done
11
12 <!--NeedCopy-->

```

- **INSERT\_SIP\_HEADER** <header\_string\_builder\_expr> <contents\_string\_builder\_expr>. Inserts the SIP header specified by <header\_string\_builder\_expr> and header contents specified by <contents\_string\_builder\_expr>.

**Example:**

```

1 > add rewrite action insert_sip_hdr_act insert_sip_header SIP_HDR "
 inserting_sip_header"
2 Done
3 >sh rewrite action insert_sip_hdr_act
4 Name: insert_sip_hdr_act
5 Operation: insert_sip_header
6 Target:SIP_HDR
7 Value:"inserting_sip_header"
8 Hits: 0
9 Undef Hits: 0
10 Action Reference Count: 0
11 Done
12
13 <!--NeedCopy-->

```

- **DELETE\_SIP\_HEADER**<target>. Deletes the SIP header specified by <target>

**Example:**

```

1 > add rewrite action delete_sip_hdr delete_sip_header SIP_HDR
2 Done
3 > sh rewrite action delete_sip_hdr

```

```
4 Name: delete_sip_hdr
5 Operation: delete_sip_header
6 Target:SIP_HDR
7 Hits: 0
8 Undef Hits: 0
9 Action Reference Count: 0
10 Done
11
12 <!--NeedCopy-->
```

### Target parameter

The Target parameter is an expression that specifies which part of the request or response to rewrite.

### StringBuilderExpr

The StringBuilderExpr is an expression that specifies the content that is to be inserted into the request or response at the specified location. This expression replaces a specified string.

#### Example 1. Inserting an HTTP Header With the Client IP:

```
1 > add rewrite action insertact INSERT_HTTP_HEADER "client-IP" CLIENT.IP
 .SRC
2 Done
3 > show rewrite action insertact
4 Name: insertact
5 Operation: insert_http_header
6 Target:Client-IP
7 Value:CLIENT.IP.SRC
8 BypassSafetyCheck : NO
9 Hits: 0
10 Undef Hits: 0
11 Action Reference Count: 0
12 Done
13
14 <!--NeedCopy-->
```

#### Example 2. Replacing Strings in a TCP Payload (TCP Rewrite):

```
1 > add rewrite action client_tcp_payload_replace_all REPLACE_ALL
2 'client.tcp.payload(1000)' '"new-string"' -search text("old-string")
3 Done
4 > show rewrite action client_tcp_payload_replace_all
5 Name: client_tcp_payload_replace_all
6 Operation: replace_all
7 Target:client.tcp.payload(1000)
8 Value:"new-string"
9 Search: text("old-string")
```

```
10 BypassSafetyCheck : NO
11 Hits: 0
12 Undef Hits: 0
13 Action Reference Count: 0
14 Done
15 >
16 <!--NeedCopy-->
```

### Search a part of the request or response to rewrite

The Search functionality helps to find all the Instances of the required pattern in the request or response.

The Search functionality is required to be used in the following Action types:

- INSERT\_BEFORE\_ALL
- INSERT\_AFTER\_ALL
- REPLACE\_ALL
- DELETE\_ALL
- CLIENTLESS\_VPN\_ENCODE\_ALL
- CLIENTLESS\_VPN\_DECODE\_ALL

The Search functionality cannot be used with the following Action types:

- INSERT\_HTTP\_HEADER
- INSERT\_BEFORE
- INSERT\_AFTER
- REPLACE
- DELETE
- DELETE\_HTTP\_HEADER
- CORRUPT\_HTTP\_HEADER
- REPLACE\_HTTP\_RES
- CLIENTLESS\_VPN\_ENCODE
- CLIENTLESS\_VPN\_DECODE
- INSERT\_SIP\_HEADER
- DELETE\_SIP\_HEADER
- CORRUPT\_SIP\_HEADER
- REPLACE\_DIAMETER\_HEADER\_FIELD
- REPLACE\_DNS\_ANSWER\_SECTION
- REPLACE\_DNS\_HEADER\_FIELD
- REPLACE\_SIP\_RES

The following Search types are supported:

- Text - a literal string  
Example: -search text (“hello”)
- Regular Expression - pattern that is used to match multiple strings in the request or response  
Example: -search regex(re~^hello\*~)
- XPATH - An XPATH expression to search XML.  
Example: -search xpath(xp%/a/b%)
- JSON - An XPATH expression to search JSON.  
Example: -search xpath\_json(xp%/a/b%)
- HTML - An XPATH expression to search HTML  
Example: -search xpath\_html(xp%/html/body%)
- Patset - This searches all the patterns bound to the patset entity.  
Example: -search patset(“patset1”)
- Dataset - This searches all the patterns bound to the dataset entity.  
Example: -search dataset(“dataset1”)
- AVP - AVP number that is used to match multiple AVPs in a Diameter/Radius Message  
Example: -search avp(999)

### Refine the search results

You can use the Refine Search functionality to specify the additional criteria to refine the search results. Refine Search functionality can only be used if Search functionality is used.

The Refine search parameter always starts with the “extend(m,n)” operation, where ‘m’ specifies some bytes to the left of the search result and ‘n’ specifies several bytes to the right of the search result to extend the selected area.

If the configured rewrite action is:

```
1 > add rewrite action test_refine_search replace_all http.res.body(10) '
 "testing_refine_search" -search text("abc") -refineSearch extend
 (1,1)
2 And the HTTP response body is abcxxx456.
3
4 <!--NeedCopy-->
```

Then, the search parameter finds pattern “abc” and since the refineSearch parameter is also configured to check an extra 1 byte to the left and an extra one byte to the right of the matched pattern. The resultant replaced text is: abcx. So, the output of this action is `testing_refine_searchxxx456`.

### Example 1: Using the Refine search functionality in INSERT\_BEFORE\_ALL action type.

```
1 > add policy patset pat
2 Done
3 > bind policy patset pat abcd
```

```

4 Done
5 > add rewrite action refineSearch_act_1 insert_before_all http.res.body
 (10) 'target.prefix(10) + "refineSearch_testing" -search patset("
 pat") -refineSearch extend(10,10)
6 Done
7 > sh rewrite action refineSearch_act_1
8 Name: refineSearch_act_1
9 Operation: insert_before_all
10 Target:http.res.body(10)
11 Refine Search:extend(10,10)
12 Value:target.prefix(10) + "refineSearch_testing"
13 Search: patset("pat")
14 Hits: 0
15 Undef Hits: 0
16 Action Reference Count: 0
17 Done
18
19 <!--NeedCopy-->

```

**Example 2: Using the Refine search functionality in INSERT\_AFTER\_ALL action type.**

```

1 > add rewrite action refineSearch_act_2 insert_after_all http.res.body
 (100) "'refineSearch_testing" -search text("abc") -refineSearch
 extend(0, 10)
2 Done
3 > sh rewrite action refineSearch_act_2
4 Name: refineSearch_act_2
5 Operation: insert_after_all
6 Target:http.res.body(100)
7 Refine Search:extend(0, 10)
8 Value:"refineSearch_testing"
9 Search: text("abc")
10 Hits: 0
11 Undef Hits: 0
12 Action Reference Count: 0
13 Done
14
15 <!--NeedCopy-->

```

**Example 3: Using the Refine search functionality in REPLACE\_ALL action type.**

```

1 > add policy patset pat_list_2
2 Done
3 > bind policy patset pat_list_2 "www.abc.com"
4 Done
5 > bind policy patset pat_list_2 "www.def.com"
6 Done
7 > add rewrite action refineSearch_act_31 replace_all "HTTP.RES.BODY
 (100000)" "\"https://\"" -search "patset(\"pat_list_2\")" -
 refineSearch "EXTEND(7,0).REGEX_SELECT(re#http://#)"
8 Done
9 > sh rewrite action refineSearch_act_31
10 Name: refineSearch_act_31

```

```

11 Operation: replace_all
12 Target:HTTP.RES.BODY(100000)
13 Refine Search:EXTEND(7,0).REGEX_SELECT(re#http://#)
14 Value:"https://"
15 Search: patset("pat_list_2")
16 Hits: 0
17 Undef Hits: 0
18 Action Reference Count: 0
19 Done
20
21 <!--NeedCopy-->

```

**Example 4: Using the Refine search functionality in DELETE\_ALL action type.**

```

1 >add rewrite action refineSearch_act_4 delete_all "HTTP.RES.BODY(50000)
 " -search text("Windows Desktops") -refineSearch "EXTEND(40,40).
 REGEX_SELECT(re#\s*<AppData>.*\s*<\/AppData>#)"
2 > show REWRITE action refineSearch_act_4
3 Name: refineSearch_act_4
4 Operation: delete_all
5 Target:HTTP.RES.BODY(50000)
6 Refine Search:EXTEND(40,40).REGEX_SELECT(re#\s*<AppData>.*\s*<\/AppData
 >#)
7 Search: text("Windows Desktops")
8 Hits: 0
9 Undef Hits: 0
10 Action Reference Count: 0
11 Done
12 >
13 <!--NeedCopy-->

```

**Example 5: Using the Refine Search functionality in CLIENTLESS\_VPN\_ENCODE\_ALL action type.**

'''

```

add rewrite action act2 clientless_vpn_encode_all http.req.body(100) -search text("abcd")
Done
sh rewrite action act2
Name: act1
Operation: clientless_vpn_encode_all
Target:http.req.body(100)
Search: text("abcd")
Hits: 0
Undef Hits: 0
Action Reference Count: 0
Done

```

'''

**Example 6: Using the Refine Search functionality in CLIENTLESS\_VPN\_DECODE\_ALL action type.**

```
1 > add rewrite action act1 clientless_vpn_decode_all http.req.body(100)
 -search text("abcd")
2 Done
3 > sh rewrite action act1
4 Name: act1
5 Operation: clientless_vpn_decode_all
6 Target:http.req.body(100)
7 Search: text("abcd")
8 Hits: 0
9 Undef Hits: 0
10 Action Reference Count: 0
11 Done
12 >
13 <!--NeedCopy-->
```

**Modify an existing rewrite action by using the command line interface**

At the command prompt, type the following commands to modify an existing rewrite action and verify the configuration:

- `set rewrite action <name> [-target <expression>] [-stringBuilderExpr <expression>] [-search <expression>] [-refineSearch <expression >] [-comment <string>]`

At the command prompt, type the following commands to verify the modified configuration

- `show rewrite action <name>`

**Example:**

```
1 > set rewrite action insertact -target "Client-IP"
2 Done
3 > show rewrite action insertact
4
5 Name: insertact
6 Operation: insert_http_header Target:Client-IP
7 Value:CLIENT.IP.SRC
8 Hits: 0
9 Undef Hits: 0
10 Action Reference Count: 0
11 Done
12
13 <!--NeedCopy-->
```

## Remove a rewrite action by using the command line interface

At the command prompt, type the following commands to remove a rewrite action:

```
rm rewrite action <name>
```

### Example:

```
1 > rm rewrite action insertact
2 Done
3
4 <!--NeedCopy-->
```

## Configure a rewrite action by using the configuration utility

1. Navigate to **AppExpert > Rewrite > Actions**.
2. In the details pane, do one of the following:
  - To create an action, click **Add**.
  - To modify an existing action, select the action, and then click **Edit**.
3. Click **Create** or **OK**. A message appears in the status bar, stating that the Action has been configured successfully.
4. Repeat steps 2 through 4 to create or modify as many rewrite actions as you want.
5. Click **Close**.

Rewrite Actions 2

Hide built-in Rewrite Actions

<input type="checkbox"/>	NAME	TYPE	TARGET EXPRESSION
<input type="checkbox"/>	NOREWRITE	noop	
<input checked="" type="checkbox"/>	ns_aaatm_def_insert_after_onload	insert_after	http.RES.body(5000).SET_TEXT_MODE(IGNORECASE).REGEX_SELECT(re\$body[!s = \"\\a-zA-Z0-9-:]*

Total 2 25 Per Page Page 1 of 1

## Add an expression by using the Add Expression dialog box

1. In the **Create Rewrite Action** or **Configure Rewrite Action** dialog box, under the text area for the type argument you want to enter, click **Add**.

2. In the **Add Expression** dialog box, in the first list box choose the first term for your expression.
  - **HTTP**. The HTTP protocol. Choose this if you want to examine some aspect of the request that pertains to the HTTP protocol.
  - **SYS**. The protected websites. Choose this if you want to examine some aspect of the request that pertains to the recipient of the request.
  - **CLIENT**. The computer that sent the request. Choose this if you want to examine some aspect of the sender of the request.

When you make your choice, the rightmost list box lists appropriate terms for the next part of your expression.

1. In the second list box, choose the second term for your expression. The choices depend upon which choice you made in the previous step, and are appropriate to the context. After you make your second choice, the Help window below the Construct Expression window (which was blank) displays help describing the purpose and use of the term you just chose.
2. Continue choosing terms from the list boxes that appear to the right of the previous list box, or typing strings or numbers in the text boxes that appear to prompt you to enter a value, until your expression is finished.

For more information about the PI expressions language and creating expressions for responder policies, see [“Policies and Expressions.”](#)

If you want to test the effect of a rewrite action when used on sample HTTP data, you can use the Rewrite Expression Evaluator.

## Rewrite TCP payloads

Target expressions in actions for TCP rewrite must begin with one of the following expression prefixes:

- **CLIENT.TCP.PAYLOAD**. For rewriting TCP payloads in client requests. For example, `CLIENT.TCP.PAYLOAD(10000).AFTER_STR(“string1”)`.
- **SERVER.TCP.PAYLOAD**. For rewriting TCP payloads in server responses. For example, `SERVER.TCP.PAYLOAD(1000).B64DECODE.BETWEEN(“string1”,“string2”)`.

## Evaluate a rewrite action by using the Rewrite Action Evaluator dialog box

1. In the **Rewrite Actions** details pane, select the rewrite action that you want to evaluate, and then click **Evaluate**.
2. In the Rewrite Expression Evaluator dialog box, specify values for the following parameters. (An asterisk indicates a required parameter.)

**Rewrite Action**—If the rewrite action you want to evaluate is not already selected, select it from the drop-down list. After you select a Rewrite action, the Details section displays the details of the selected Rewrite action.

**New**—Select New to open the Create Rewrite Action dialog box and create a rewrite action.

**Modify**—Select Modify to open the Configure Rewrite Action dialog box and modify the selected rewrite action.

**Flow Type**—Specifies whether to test the selected rewrite action with HTTP Request data or HTTP Response data. The default is Request. If you want to test with Response data, select Response.

**HTTP Request/Response Data\***—Provides a space for you to provide the HTTP data that the Rewrite Action Evaluator is used for testing. You can paste the data directly into the window, or click Sample to insert some sample HTTP headers.

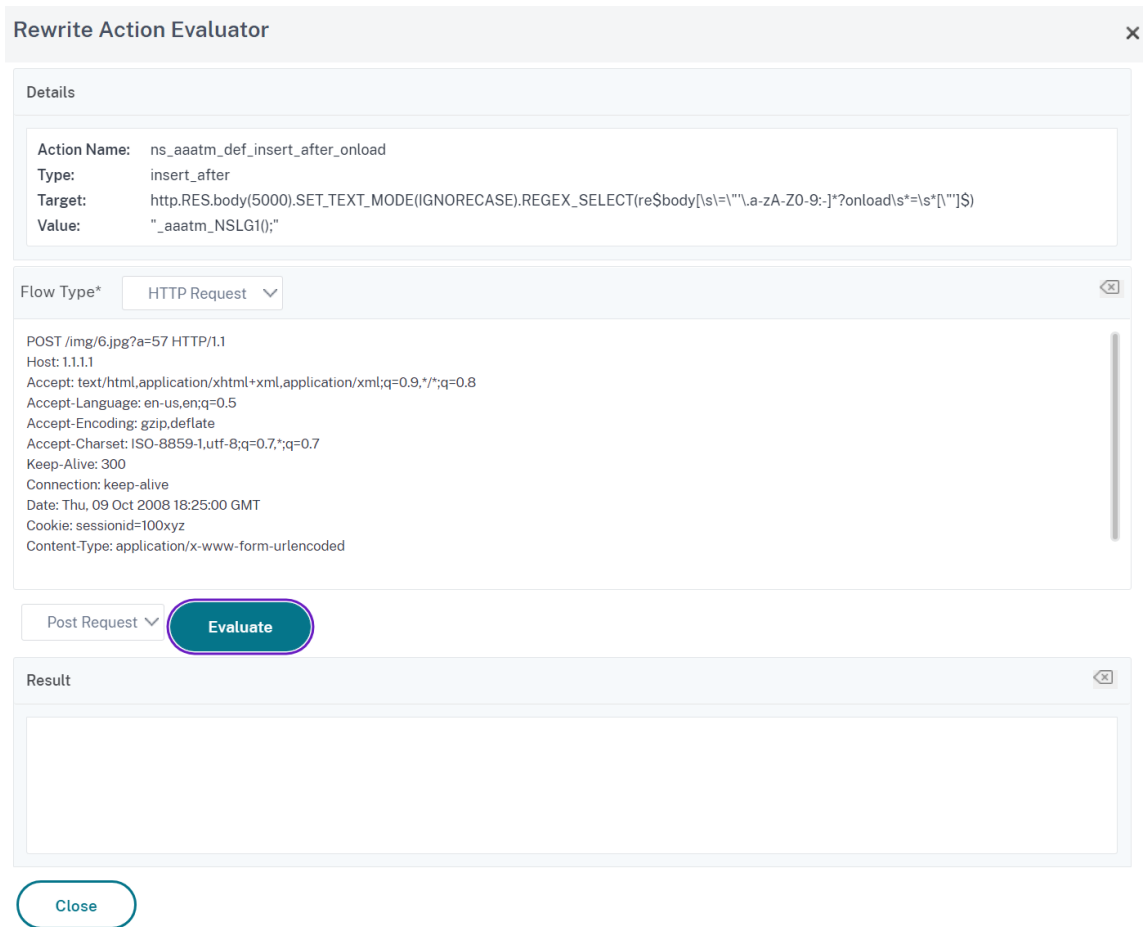

**Show end-of-line**—Specifies whether to show UNIX-style end-of-line characters (\n) at the end of each line of sample HTTP data.

**Sample**—Inserts sample HTTP data into the HTTP Request/Response Data window. You can choose either GET or POST data.

**Browse**—Opens a local browse window so that you can choose a file containing sample HTTP data from a local or network location.

**Clear**—Clears the current sample HTTP data from the HTTP Request/Response Data window.

3. Click Evaluate. The **Rewrite Action Evaluator** evaluates the effect of the Rewrite action on the sample data that you chose, and displays the results as modified by the selected **Rewrite** action in the **Results** window. Additions and deletions are highlighted as indicated in the legend in the lower left-hand corner of the dialog box.
4. Continue evaluating Rewrite actions until you have determined that all of your actions have the effect that you wanted.
  - You can modify the selected rewrite action and test the modified version by clicking **Modify** to open the **Configure Rewrite Action** dialog box, making and saving your changes, and then clicking Evaluate again.
  - You can evaluate a different rewrite action using the same request or response data by selecting it from the **Rewrite Action** drop-down list, and then clicking **Evaluate** again.
5. Click **Close** to close the **Rewrite Expression Evaluator** and return to the **Rewrite Actions** pane.
6. To delete a rewrite action, select the rewrite action you want to delete, then click **Remove** and, when prompted, confirm your choice by clicking **OK**.

## Configure rewrite policy

After you create any needed rewrite actions, you must create at least one rewrite policy to select the requests that you want the NetScaler appliance to rewrite.

A rewrite policy consists of a rule, which itself consists of one or more expressions, and an associated action that is performed if a request or response matches the rule. Policy rules for evaluating HTTP requests and responses can be based on almost any part of a request or response.

Even though you cannot use TCP rewrite actions to rewrite data other than the TCP payload, you can base the policy rules for TCP rewrite policies on the information in the transport layer and the layers below the transport layer.

If a configured rule matches a request or response, the corresponding policy is triggered and the action associated with it is carried out.

**Note:**

You can use either the command line interface or the GUI to create and configure rewrite policies.

Users who are not thoroughly familiar with the command line interface and the NetScaler Policy expression language will usually find using the GUI much easier.

To add a new rewrite policy by using the command line interface

At the command prompt, type the following commands to add a new rewrite policy and verify the configuration:

- `<add rewrite policy <name> <expression> <action> [<undefaction>]`
- `<show rewrite policy <name>`

Example 1. Rewriting HTTP Content

```
1 > add rewrite policyNew "HTTP.RES.IS_VALID" insertact NOREWRITE
2 Done
3 > show rewrite policyNew
4 Name: policyNew
5 Rule: HTTP.RES.IS_VALID
6 RewriteAction: insertact
7 UndefAction: NOREWRITE
8 Hits: 0
9 Undef Hits: 0
10
11 Done
12 <!--NeedCopy-->
```

Example 2. Rewriting a TCP Payload (TCP Rewrite):

```
1 > add rewrite policy client_tcp_payload_policy CLIENT.IP.SRC.EQ
 (172.168.12.232) client_tcp_payload_replace_all
2 Done
3 > show rewrite policy client_tcp_payload_policy
4 Name: client_tcp_payload_policy
5 Rule: CLIENT.IP.SRC.EQ(172.168.12.232)
6 RewriteAction: client_tcp_payload_replace_all
7 UndefAction: Use Global
8 LogAction: Use Global
9 Hits: 0
10 Undef Hits: 0
11
12 Done
13 >
14 <!--NeedCopy-->
```

To modify an existing rewrite policy by using the command line interface

At the command prompt, type the following commands to modify an existing rewrite policy and verify the configuration:

- `<set rewrite policy <name> -rule <expression> -action <action> [<undefaction>]`

- `<show rewrite policy <name>`

**Example:**

```
1 > set rewrite policyNew -rule "HTTP.RES.IS_VALID" -action insertaction
2 Done
3
4 > show rewrite policyNew
5 Name: policyNew
6 Rule: HTTP.RES.IS_VALID
7 RewriteAction: insertaction
8 UndefAction: NOREWRITE
9 Hits: 0
10 Undef Hits: 0
11
12 Done
13 <!--NeedCopy-->
```

To remove a rewrite policy by using the command line interface

At the command prompt, type the following command to remove a rewrite policy:

```
rm rewrite policy <name>
```

**Example:**

```
1 > rm rewrite policyNew
2 Done
3 <!--NeedCopy-->
```

To configure a rewrite policy by using the GUI

1. Navigate to **AppExpert > Rewrite > Policies**.
2. In the details pane, do one of the following:
  - To create a policy, click Add.
  - To modify an existing policy, select the policy, and then click Open.
3. Click **Create** or **OK**. A message appears in the status bar, stating that the Policy has been configured successfully.
4. Repeat steps 2 through 4 to create or modify as many rewrite actions as you want.
5. Click **Close**. To delete a rewrite policy, select the rewrite policy you want to delete, then click **Remove** and, when prompted, confirm your choice by clicking **OK**.

**Bind rewrite policy**

After creating a rewrite policy, you must bind it to put it into effect. You can bind your policy to Global if you want to apply it to all traffic that passes through your NetScaler, or you can bind your policy to a specific virtual server or bind point to direct only that virtual server or bind the point's incoming

traffic to that policy. If an incoming request matches a rewrite policy, the action associated with that policy is carried out.

Rewrite policies for evaluating HTTP requests and responses can be bound to virtual servers of type HTTP or SSL, or they can be bound to the REQ\_OVERRIDE, REQ\_DEFAULT, RES\_OVERRIDE, and RES\_DEFAULT bind points. Rewrite policies for TCP rewrite can be bound only to virtual servers of type TCP or SSL\_TCP, or to the OTHERTCP\_REQ\_OVERRIDE, OTHERTCP\_REQ\_DEFAULT, OTHERTCP\_RES\_OVERRIDE, and OTHERTCP\_RES\_DEFAULT bind points.

**Note:**

The term OTHERTCP is used in the context of the NetScaler appliance to refer to all TCP or SSL\_TCP requests and responses that you want to treat as a raw stream of bytes regardless of the protocols that the TCP packets encapsulate.

When you bind a policy, you assign it a priority. The priority determines the order in which the policies you define are evaluated. You can set the priority to any positive integer.

In the NetScaler operating system, policy priorities work in reverse order - the higher the number, the lower the priority. For example, if you have three policies with priorities of 10, 100, and 1000, the policy assigned a priority of 10 is applied first, then the policy assigned a priority of 100, and finally the policy assigned an order of 1000.

Unlike most other features in the NetScaler operating system, the rewrite feature continues to evaluate and implement policies after a request matches a policy. However, the effect of a particular action policy on a request or response will often be different depending on whether it is performed before or after another action. Priority is important to get the results you intended.

You can leave yourself plenty of room to add other policies in any order, and still set them to evaluate in the order you want, by setting priorities with intervals of 50 or 100 between each policy when you bind it. If you do this, you can add more policies at any time without having to reassign the priority of an existing policy.

When binding a rewrite policy, you also have the option of assigning a goto expression (gotoPriorityExpression) to the policy. A goto expression can be any positive integer that matches the priority assigned to a different policy that has a higher priority than the policy that contains the goto expression. If you assign a goto expression to a policy, and a request or response matches the policy, the NetScaler will immediately go to the policy whose priority matches the goto expression. It skips over any policies with priority numbers that are lower than that of the current policy, but higher than the priority number of the goto expression, and not evaluate those policies.

To globally bind a rewrite policy by using the command line interface

At the command prompt, type the following commands to globally bind a rewrite policy and verify the configuration:

- `bind rewrite global <policyName> <priority> [<gotoPriorityExpression>] [-type <type>] [-invoke (<labelType> <labelName>)]`
- `show rewrite global`

**Example:**

```

1 >bind rewrite global policyNew 10
2 Done
3
4 > show rewrite global
5 1) Global bindpoint: RES_DEFAULT
6 Number of bound policies: 1
7
8 2) Global bindpoint: REQ_OVERRIDE
9 Number of bound policies: 1
10
11 Done
12 <!--NeedCopy-->

```

To bind rewrite policy to a specific virtual server by using the command line interface

At the command prompt, type the following commands to bind the rewrite policy to a specific virtual server and verify the configuration:

- `bind lb vserver <name>@ (<serviceName>@ [-weight <positive_integer>]) | <serviceGroupName>@ | (-policyName <string>@ [-priority <positive_integer>] [-gotoPriorityExpression <expression>] [-type ( REQUEST | RESPONSE )] [-invoke (<labelType> <labelName>)] )`
- `show lb vserver <name>`

**Example:**

```

1 > bind lb vserver lbvip -policyName ns_cmp_msapp -priority 50
2 Done
3 >
4 > show lb vserver lbvip
5 lbvip (8.7.6.6:80) - HTTP Type: ADDRESS
6 State: DOWN
7 Last state change was at Wed Jul 15 05:54:24 2009 (+226 ms)
8 Time since last state change: 28 days, 01:57:26.350
9 Effective State: DOWN
10 Client Idle Timeout: 180 sec
11 Down state flush: ENABLED
12 Disable Primary Vserver On Down : DISABLED
13 Port Rewrite : DISABLED
14 No. of Bound Services : 0 (Total) 0 (Active)
15 Configured Method: LEASTCONNECTION
16 Mode: IP
17 Persistence: NONE
18 Vserver IP and Port insertion: OFF
19 Push: DISABLED Push VServer:

```

```

20 Push Multi Clients: NO
21 Push Label Rule: none
22
23 1) Policy : ns_cmp_msapp Priority:50
24 2) Policy : cf-pol Priority:1 Inherited
25 Done
26 <!--NeedCopy-->

```

To bind a rewrite policy to a bind point by using the GUI

1. Navigate to **AppExpert > Rewrite > Policies**.
2. In the details pane, select the rewrite policy you want to globally bind, and then click **Policy Manager**.
3. In the **Rewrite Policy Manager** dialog box, in the **Bind Points** menu, do one of the following:
  - a) If you want to configure bindings for HTTP rewrite policies, click **HTTP**, and then click either **Request** or **Response**, depending on whether you want to configure request-based rewrite policies or response-based rewrite policies.
  - b) If you want to configure bindings for TCP rewrite policies, click **TCP**, and then click either **Client** or **Server**, depending on whether you want to configure client-side TCP rewrite policies or server-side TCP rewrite policies.
4. Click the bind point to which you want to bind the rewrite policy. The **Rewrite Policy Manager** dialog box displays all the rewrite policies that are bound to the selected bind point.
5. Click **Insert Policy** to insert a new row and display a drop-down list with all available, unbound rewrite policies.
6. Click the policy you want to bind to the bind point. The policy is inserted into the list of rewrite policies bound to the bind point.
7. In the **Priority** column, you can change the priority to any positive integer. For more information about this parameter, see priority in “Parameters for binding a rewrite policy.”
8. If you want to skip over policies and go directly to a specific policy if the current policy is matched, change the value in the Goto Expression column to equal the priority of the next policy to be applied.. For more information about this parameter, see gotoPriorityExpression in “Parameters for binding a rewrite policy.”
9. To modify a policy, click the policy, and then click **Modify Policy**.
10. To unbind a policy, click the policy, and then click **Unbind Policy**.
11. To modify an action, in the Action column, click the action you want to modify, and then click **Modify Action**.
12. To modify an invoke label, in the **Invoke** column, click the invoke label you want to modify, and then click **Modify Invoke Label**.
13. To regenerate the priorities of all the policies that are bound to the bind point you are currently configuring, click **Regenerate Priorities**. The policies retain their existing priorities relative to the other policies, but the priorities are renumbered in multiples of 10.

14. Click **Apply Changes**.
15. Click **Close**. A message appears in the status bar, stating that the Policy has been configured successfully.

To bind a rewrite policy to a specific virtual server by using the GUI

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**.
2. In the details pane list of virtual servers, select the virtual server to which you want to bind the rewrite policy, and then click **Open**.
3. In the **Configure Virtual Server (Load Balancing)** dialog box, select the **Policies** tab. All policies configured on your NetScaler appear on the list.
4. Select the check box next to the name of the policy you want to bind to this virtual server.
5. Click **OK**. A message appears in the status bar, stating that the Policy has been configured successfully.

## Configure rewrite policy labels

If you want to build a more complex policy structure than is supported by single policies, you can create policy labels and then bind them as you would policies. A policy label is a user-defined point to which policies are bound. When a policy label is invoked, all the policies bound to it are evaluated in the order of the priority you configured. A policy label can include one or multiple policies, each of which can be assigned its own result. A match on one policy in the policy label can result in proceeding to the next policy, invoking a different policy label or appropriate resource, or an immediate end to policy evaluation and the return of control to the policy that invoked the policy label.

A rewrite policy label consists of a name, a transform name that describes the type of policy included in the policy label, and a list of policies bound to the policy label. Each policy that is bound to the policy label contains all of the elements described in [Configuring a Rewrite Policy](#).

Note: You can use either the command line interface or the GUI to create and configure rewrite policy labels. Users who are not thoroughly familiar with the command line interface and the NetScaler Policy Infrastructure (PI) language usually find using the GUI much easier.

To configure a rewrite policy label by using the command line interface

To add a rewrite policy label, at the command prompt, type the following command:

```
add rewrite policylabel <labelName> <transform>
```

For example, to add a rewrite policy label named polLabelHTTPResponses to group all policies that work on HTTP responses, you would type the following:

```
add rewrite policy label polLabelHTTPResponses http_res
```

To modify an existing rewrite policy label, at the **NetScaler** command prompt, type the following command:

```
set rewrite policy <name> <transform>
```

**Note:**

The set rewrite policy command takes the same options as the add rewrite policy command.

To remove a rewrite policy label, at the **NetScaler** command prompt, type the following command:

```
rm rewrite policy <name>
```

For example, to remove a rewrite policy label named polLabelHTTPResponses, you would type the following:

```
rm rewrite policy polLabelHTTPResponses
```

To configure a rewrite policy label by using the GUI

1. Navigate to **AppExpert > Rewrite > Policy Labels**.
2. In the details pane, do one of the following:
  - To create a policy label, click **Add**.
  - To modify an existing policy label, select the policy, and then click **Open**.
3. Add or remove policies from the list that is bound to the policy label.
  - To add a policy to the list, click **Insert Policy**, and choose a policy from the drop-down list. You can create a policy and add it to the list by choosing New Policy in the list, and following the instructions in [Configuring a Rewrite Policy](#).
  - To remove a policy from the list, select that policy, and then click Unbind Policy.
4. Modify the priority of each policy by editing the number in the Priority column. You can also automatically renumber policies by clicking Regenerate Priorities.
5. Click **Create** or **OK**, and then click **Close**.

To remove a policy label, select it, and then click **Remove**. To rename a policy label, select it and then click **Rename**. Edit the name of the policy, and then click **OK** to save your changes.

## Content-length header behavior in a streaming rewrite action

December 22, 2023

Content-Length header is one of the ways to indicate the length of the message (in bytes) in an HTTP request or response. Apart from the Content-Length header, you can also specify the length of the message by using one of the following ways:

- Chunked encoding

- FIN Termination

In a streaming process, the NetScaler sends data continuously after processing the rewrite action. As the data is sent continuously and not held by the NetScaler, the actual length of the message that would be sent to the client is unknown. Therefore, the correct value of the Content-Length header cannot be mentioned in the response.

To support the streaming process, the rewrite feature of NetScaler converts the way to indicate the length of the message from the Content-Length header to the FIN termination. As part of the conversion, the NetScaler corrupts the Content-Length header by rearranging the first four characters of the header name.

In HTTP, the client is expected to ignore headers that it does not understand. So the client does not understand the corrupted Content-Length header name and therefore ignores the header. To improve the performance of the NetScaler, the header is corrupted instead of deleted. Corrupting the header name instead of deleting avoids recomputing the checksum because the checksum is not changed if the same bytes are in a different order.

For example, consider the following HTTP request:

```
1 GET / HTTP/1.1
2 Accept: application/x-ms-application, image/jpeg, application/xaml+xml,
 image/gif, image/pjpeg, application/x-ms-xbap, application/vnd.ms-
 excel, application/vnd.ms-powerpoint, application/msword, /
3 Accept-Language: en-GB
4 User-Agent: Mozilla/4.0 (compatible; MSIE 7.0; Windows NT 6.1; WOW64;
 Trident/7.0; SLCC2; .NET CLR 2.0.50727; .NET CLR 3.5.30729; .NET CLR
 3.0.30729; Media Center PC 6.0; .NET4.0C; .NET4.0E; CMDTDF; MS-RTC
 LM 8)
5 Accept-Encoding: gzip, deflate
6 Host: test.example.net
7 Connection: Keep-Alive
8 <!--NeedCopy-->
```

In a working scenario, the response between NetScaler and the back-end server for this HTTP request is as follows:

```
1 HTTP/1.1 200 OK
2 Content-Length: 10967
3 Connection: close
4 var SERVER_URL = 'https\x3a\x2f\x2ftest.example.net\x2f';
5 var WEB_SERVER_HOST = 'test.example.net';
6 <!--NeedCopy-->
```

But the response received by the client from NetScaler in a non-working scenario is as follows. The Content-Length header is renamed to ntcoent-Length.

```
1 HTTP/1.1 200 OK
2 ntCoent-Length: 10967
3 nnCoection: close
```

```

4 var SERVER_URL = 'https\x3a\x2f\x2ftest.example.net\x2f';
5 var WEB_SERVER_HOST = 'test.example.net';
6 <!--NeedCopy-->

```

In general, the client applications support all the three ways of transaction - Content-Length header, Chunked encoding, and FIN Termination. So, the conversion from Content-Length header to FIN Termination must not cause any issue. But, if the application doesn't work because of this modification, then you must Disable the streaming process.

## How to disable the streaming process in a rewrite policy

You can disable the streaming process in a rewrite policy using one of the following ways:

1. Add a non-streaming action associated with a rewrite policy that is bound at a higher priority. The action must be in such a way that it doesn't modify the response.

For example:

```

add rewrite action non_stream_act replace_all HTTP.RES.BODY
(1000000)HTTP.RES.FULL_HEADER -search text("pattern_which_will_not_match_i
")

```

The value of the body in this rewrite action must be more than the value on which the current streaming action is working.

2. Instead of the streaming configuration, use the non-streaming configuration.

### Note:

Moving from streaming to non-streaming processing might impact the performance of the NetScaler.

For example, a streaming configuration can be converted to a non-streaming configuration as follows:

### Streaming Configuration:

```

1 add rewrite action rw_act_1 replace_all HTTP.RES.BODY(1000) "\"
 http\"" -search text("http")
2
3 add policy patset pat_list
4 bind policy patset pat_list abcd
5 bind policy patset pat_list defg
6
7 add rewrite action rw_act_2 replace_all HTTP.RES.BODY(1000) "\"
 replaced_data\"" -search patset("pat_list")
8 <!--NeedCopy-->

```

### Non-streaming configuration:

```
1 add rewrite action rw_act_1 replace_all HTTP.RES.BODY(1000) "\"
 http\"" -search regex(re/http/)
2
3 add rewrite action rw_act_1 replace_all HTTP.RES.BODY(1000) "\"
 http\"" -search regex(re/abcd|defg/)
4 <!--NeedCopy-->
```

## Rewrite action and policy examples

December 21, 2023

The examples in this section demonstrate how to configure rewrite to perform various useful tasks. The examples occur in the server room of Example Manufacturing Inc., a mid-sized manufacturing company that uses its Web site to manage a considerable portion of its sales, deliveries, and customer support.

Example Manufacturing has two domains: example.com for its Web site and email to customers, and example.net for its intranet. Customers use the Example Web site to place orders, request quotes, research products, and contact customer service and technical support.

As an important part of Example's revenue stream, the Web site must respond quickly and keep customer data confidential. Example therefore has several Web servers and uses NetScaler appliances to balance the Web site load and manage traffic to and from its Web servers.

The Example system administrators use the rewrite features to perform the following tasks:

### **Example 1: Delete old X-Forwarded-For and Client-IP Headers**

Example Inc. removes old X-Forwarded-For and Client-IP HTTP headers from incoming requests.

### **Example 2: Adding a Local Client-IP Header**

Example Inc. adds a new, local Client-IP header to incoming requests.

### **Example 3: Tagging Secure and Insecure Connections**

Example Inc. tags incoming requests with a header that indicates whether the connection is a secure connection.

### **Example 4: Mask the HTTP Server Type**

Example Inc. modifies the HTTP Server: header so that unauthorized users and malicious code cannot use that header to determine the HTTP server software it uses.

### **Example 5: Redirect an External URL to an Internal URL**

Example Inc. hides information about the actual names of its Web servers and the configuration of its server room from users, to make URLs on its Web site shorter and easier to remember and to improve security on its site.

#### **Example 6: Migrating Apache Rewrite Module Rules**

Example Inc. moved its Apache rewrite rules to a NetScaler appliance, translating the Apache PERL-based script syntax to the NetScaler rewrite rule syntax.

#### **Example 7: Marketing Keyword Redirection**

The marketing department at Example Inc. sets up simplified URLs for certain predefined keyword searches on the company's Web site.

#### **Example 8: Redirect Queries to the Queried Server.**

Example Inc. redirects certain query requests to the appropriate server.

#### **Example 9: Home Page Redirection**

Example Inc. recently acquired a smaller competitor, and it now redirects requests to the acquired company's home page to a page on its own Web site.

#### **Example 10: Policy-based RSA Encryption**

Example Inc. encrypt HTTP predefined and user-defined header or body content by using PEM RSA public key.

Each of these tasks requires that the system administrators create rewrite actions and policies and bind them to a valid bind point on the NetScaler.

## **Example 1: Delete Old X-Forwarded-For and client-IP headers**

December 22, 2023

Example Inc. wants to remove old X-Forwarded-For and Client-IP HTTP headers from incoming requests, so that the only X-Forwarded-For headers that appear are the ones added by the local server. This configuration can be done through the NetScaler command line or the configuration utility. The Example Inc. system administrator is an old-school networking engineer and prefers to use a CLI where possible, but wants to be sure he understands the configuration utility interface so that he can show new system administrators on the team how to use it.

The examples below demonstrate how to perform each configuration with both the CLI and the configuration utility. The procedures are abbreviated on the assumption that users will already know the basics of creating rewrite actions, creating rewrite policies, and binding policies.

- For more detailed information about creating rewrite actions, see [Configuring a Rewrite Action](#).

- For more detailed information about creating rewrite policies, see [Configuring a Rewrite Policy](#).
- For more detailed information about binding rewrite policies, see [Binding a Rewrite Policy](#).

### To delete old X-Forwarded and Client-IP headers from a request by using the command line interface

At the command prompt, type the following commands in the order shown:

```

1 add rewrite action act_del_xfor delete_http_header x-forwarded-for
2 add rewrite action act_del_cip delete_http_header client-ip
3 add rewrite policy pol_check_xfor 'HTTP.REQ.HEADER("x-forwarded-for").
 EXISTS' act_del_xfor
4 add rewrite policy pol_check_cip 'HTTP.REQ.HEADER("client-ip").EXISTS'
 act_del_cip
5 bind rewrite global pol_check_xfor 100 200
6 bind rewrite global pol_check_cip 200 300
7 <!--NeedCopy-->

```

### To delete old X-Forwarded and Client-IP headers from a request by using the configuration utility

In the Create Rewrite Action dialog box, create two rewrite actions with the following descriptions.

Name	Type	Argument(s)
act_del_xfor	delete_http_header	x-forwarded-for
act_del_cip	delete_http_header	client-ip

In the Create Rewrite Policy dialog box, create two rewrite policies with the following descriptions.

Name	Expression	Action
pol_check_xfor	'HTTP.REQ.HEADER( "x-forwarded-for").EXISTS'	act_del_xfor
pol_check_cip	'HTTP.REQ.HEADER("client-ip" ) .EXISTS'	act_del_cip

Bind both policies to global, assigning the priorities and goto expression values shown below.

Name	Priority	Goto Expression
pol_check_xfor	100	200
pol_check_cip	200	300

All old X-Forwarded-For and Client-IP HTTP headers are now deleted from incoming requests.

## Example 2: Add a local client-IP header

December 21, 2023

Example Inc. wants to add a local Client-IP HTTP header to incoming requests. This example contains two slightly different versions of the same basic task.

### To add a local Client-IP header by using the command line interface

At the command prompt, type the following commands in the order shown:

```

1 add rewrite action act_ins_client insert_http_header NS-Client 'CLIENT.
 IP.SRC'
2 add rewrite policy pol_ins_client 'HTTP.REQ.HEADER("x-forwarded-for").
 EXISTS || HTTP.REQ.HEADER("client-ip").EXISTS' act_ins_client
3 bind rewrite global pol_ins_client 300 END
4 <!--NeedCopy-->

```

### To add a local Client-IP header by using the configuration utility

In the Create Rewrite Action dialog box, create a rewrite action with the following description.

Name	Type	Argument(s)
act_ins_client	insert_http_header	NS-Client 'CLIENT.IP.SRC'

In the Create Rewrite Policy dialog box, create a rewrite policy with the following description.

Name	Expression	Action
pol_ins_client	'HTTP.REQ.HEADER("x-forwarded-for").EXISTS    HTTP.REQ.HEADER("client-ip").EXISTS'	act_ins_client

Bind policy to global, assigning the priorities and goto expression values shown below.

Name	Priority	Goto Expression
pol_ins_client	100	Next

### Example 3: Tag secure and insecure connections

December 22, 2023

Example Inc. wants to tag incoming requests with a header that indicates whether or not the connection is a secure connection. This helps the server keep track of secure connections after the NetScaler has decrypted the connections.

To implement this configuration, you would begin by creating rewrite actions with the values shown in the following tables. These actions label connections to port 80 as insecure connections, and connections to port 443 as secure connections.

Action Name	Type of Rewrite Action	Header Name	Value
Action-Rewrite-SSL_YES	INSERT_HTTP_HEADER	SSL	YES

Action Name	Type of Rewrite Action	Header Name	Value
Action-Rewrite-SSL_NO	INSERT_HTTP_HEADER	SSL	NO

You would then create a rewrite policy with the values shown in the following tables. These policies check incoming requests to determine which requests are directed to port 80 and which are directed to port 443. The policies then add the correct SSL header.

Policy Name	Action Name	Undefined Action	Expression
Policy-Rewrite-SSL_YES	Action-Rewrite-SSL_YES	NOREWRITE	CLIENT.TCP.DSTPORT.EQ(443)
Policy-Rewrite-SSL_NO	Action-Rewrite-SSL_NO	NOREWRITE	CLIENT.TCP.DSTPORT.EQ(80)

Finally, you would bind the rewrite policies to NetScaler, assigning the first policy a priority of 200, and the second a priority of 300, and setting the goto expression of both policies to END.

Each incoming connection to port 80 now has an SSL:NO HTTP header added to it and each incoming connection to port 443 has an SSL:YES HTTP header added to it.

## Example 4: Mask the HTTP server type

December 21, 2023

Example Inc. wants to modify the HTTP Server: header so that unauthorized users and malicious code cannot use the header to identify the software that the HTTP server uses.

To modify the HTTP Server: header, you would create a rewrite action and a rewrite policy with the values in the following tables.

Action Name	Type of Rewrite Action	Expression to choose target reference	String expression for replacement text
Action-Rewrite-Server_Mask	REPLACE	HTTP.RES.HEADER("Server")	"Web Server 1.0"

Policy Name	Action Name	Undefined Action	Expression
Policy-Rewrite-Server_Mask	Action-Rewrite-Server_Mask	NOREWRITE	HTTP.RES.IS_VALID

### Example commands:

```
> add rewrite action Action-Rewrite-Server_Mask REPLACE HTTP.RES.HEADER("Server") "\"Web Server 1.0\""
```

```
> add rewrite policy-Rewrite-Server_Mask HTTP.RES.IS_VALID Action-Rewrite-Server_Mask NOREWRITE
```

You would then globally bind the rewrite policy, assigning a priority of 100 and setting the Goto Priority Expression of the policy to END.

The HTTP Server: header is now modified to read “Web Server 1.0,”masking the actual HTTP server software used by the Example Inc. Web site.

## Example 5: Redirect an external URL to an internal URL

January 25, 2022

Example Inc. wants to hide its actual server room configuration from users to improve security on its Web servers.

To improve security, you would create a rewrite action with the values as shown in the following tables. For request headers, the action in the table modifies [www.example.com](http://www.example.com) to [web.hq.example.net](http://web.hq.example.net). For response headers, the action does the opposite, translating [web.hq.example.net](http://web.hq.example.net) to [www.example.com](http://www.example.com).

Action Name	Type of Rewrite Action	Expression to choose target reference	String expression for replacement text
Action-Rewrite-Request_Server_Replace	REPLACE	HTTP.REQ.HOSTNAME.SERVER	“web.hq.example.net”
Action-Rewrite-Response_Server_Replace	REPLACE	HTTP.RES.HEADER(“Server”)	“www.example.com”

The first policy checks incoming requests to see if they are valid. If they are valid, it performs the Action-Rewrite-Request\_Server\_Replace action. The second policy checks responses to see if they originate at the server [web.hq.example.net](http://web.hq.example.net). If they do, it performs the Action-Rewrite-Response\_Server\_Replace action.

Examples of rewrite action and policy for redirecting an external URL.

```
add rewrite action Action-Rewrite-Request_Server_Replace REPLACE HTTP
.REQ.HOSTNAME.SERVER "Web.hq.example.net"

add rewrite action Action-Rewrite-Response_Server_Replace REPLACE
HTTP.RES.HEADER("Server") "www.example.com"

add rewrite policy Rewrite-Request_Server_Replace HTTP.REQ.HOSTNAME
.SERVER.EQ("www.example.com")Action-Rewrite-Request_Server_Replace
NOREWRITE
```

```
add rewrite policy Rewrite-Response_Server_Replace HTTP.REQ.HEADER("Server").EQ("Web.hq.example.net")Action-Rewrite-Response_Server_Replace
```

Finally, you would bind the rewrite policies, assigning each a priority of 500 because they are in different policy banks and does not conflict. Set the goto expression to NEXT for both bindings.

```
bind rewrite global Policy-Rewrite-Request_Server_Replace 500 END - type REQ_DEFAULT
```

```
bind rewrite global Policy-Rewrite-Response_Server_Replace 500 END - type RES_DEFAULT
```

All instances of `www.example.com` in the request headers are now changed to `web.hq.example.net`, and all instances of `web.hq.example.net` in response headers are now changed to `www.example.com`.

## Example 6: Migrate Apache rewrite module rules

December 21, 2023

Example Inc., is currently using the Apache rewrite module to process search requests sent to its Web servers and redirect those requests to the appropriate server on the basis of information in the request URL. Example Inc. wants to simplify its setup by migrating these rules onto the NetScaler platform.

Several Apache rewrite rules that Example currently uses are shown below. These rules redirect search requests to a special results page if they do not have a SiteID string or if they have a SiteID string equal to zero (0), or to the standard results page if these conditions do not apply.

The following are the current Apache rewrite rules:

- RewriteCond %{REQUEST\_FILENAME} ^/search\$ [NC]
- RewriteCond %{QUERY\_STRING} !SiteId= [OR]
- RewriteCond %{QUERY\_STRING} SiteId=0
- RewriteCond %{QUERY\_STRING} CallName=DisplayResults [NC]
- RewriteRule ^.\*\$ results2.html [P,L]
- RewriteCond %{REQUEST\_FILENAME} ^/search\$ [NC]
- RewriteCond %{QUERY\_STRING} CallName=DisplayResults [NC]
- RewriteRule ^.\*\$ /results.html [P,L]

To implement these Apache rewrite rules on the NetScaler, you would create rewrite actions with the values in the following tables.

Action Name	Type of Rewrite Action	Expression to choose target reference	String expression for replacement text
Action-Rewrite-Display_Results_NulSiteID	REPLACE	HTTP.REQ.URL	“/results2.html”
Action-Rewrite-Display_Results	REPLACE	HTTP.REQ.URL	“/results2.html”

You would then create rewrite policies with the values as shown in the tables below.

Policy Name	Action Name	Undefined Action	Expression
Policy-Rewrite-Display_Results_NulSiteID	Action-Rewrite-Display_Results_NulSiteID	NOREWRITE	HTTP.REQ.URL.PATH.SET_TEXT_MO “/search”) && (!HTTP.REQ.URL.QUERY.CONTAINS( “SiteId=”)    HTTP.REQ.URL.QUERY.CONTAINS( “SiteId=0”)    HTTP.REQ.URL.QUERY.SET_TEXT_M “Call- Name=DisplayResults” )
Policy-Rewrite-Display_Results	Action-Rewrite-Display_Results	NOREWRITE	HTTP.REQ.URL.PATH.SET_TEXT_MO “/search”)    HTTP.REQ.URL.QUERY.SET_TEXT_M “Call- Name=DisplayResults” )

Finally, you would bind the rewrite policies, assigning the first a priority of 600 and the second a priority of 700, and then set the goto expression to NEXT for both bindings.

The NetScaler now handles these search requests exactly as the Web server did before the Apache rewrite module rules were migrated.

## Example 7: Marketing keyword redirection

December 21, 2023

The marketing department at Example Inc. wants to set up simplified URLs for certain predefined keyword searches on the company’s Web site. For these keywords, it wants to redefine the URL as shown below.

- External URL:

`http://www.example.com/<marketingkeyword>`

- Internal URL:

`http://www.example.com/go/kwsearch.asp?keyword=<marketingkeyword>`

To set up redirection for marketing keywords, you would create a rewrite action with the values in the following table.

Action Name	Type of Rewrite Action	Expression to choose target location	String expression for replacement text
Action-Rewrite-Modify_URL	INSERT_BEFORE	HTTP.REQ.URL.PATH.GET(1)	go/kwsearch.aspkeyword=" "

You would then create a rewrite policy with the values in the following table.

Policy Name	Action Name	Undefined Action	Expression
Policy-Rewrite-Modify_URL	Action-Rewrite-Modify_URL	NOREWRITE	HTTP.REQ.HOSTNAME.SERVER.EQ("www.example.com")

Finally, you would bind the rewrite policy, assigning it a priority of 800. Unlike the previous rewrite policies, this policy should be the last to be applied to a request that matches its criteria. For this reason, NetScaler administrator sets its Goto Priority Expression to END.

Any request using a marketing keyword is redirected to the keyword search CGI page, whereupon a search is performed and all remaining policies are skipped.

### Example 8: Redirect queries to the queried server

December 21, 2023

Example Inc. wants to redirect query requests to the appropriate server, as shown here.

- `<Request: GET /query.cgi?server=5HOST: www.example.com`

- `<Redirect URL: <http://web-5.example.com/>`

To implement this redirection, you would first create a rewrite action with the values in the following table.

Action Name	Type of Rewrite Action	Expression to choose target reference	String expression for replacement text
Action-Rewrite-Replace_Hostheader	REPLACE	HTTP.REQ.HEADER("Host").BEFORE_STR(".example.com")	"server-" HTTP.REQ.URL.QUERY.VALUE("web")

You would then create a rewrite policy with the values in the following table.

Policy Name	Action Name	Undefined Action	Expression
Policy-Rewrite-Replace_Hostheader	Action-Rewrite-Replace_Hostheader	NOREWRITE	HTTP.REQ.HEADER("Host").EQ("www.example.com")

#### Example commands:

```
> add rewrite action Action-Rewrite-Server_Mask REPLACE HTTP.RES.HEADER("Server")"\Web Server 1.0\""
```

Done

```
> add rewrite policy Rewrite-Server_Mask HTTP.RES.IS_VALID Action-Rewrite-Server_Mask NOREWRITE
```

Done

Finally, you would bind the rewrite policy, assigning it a priority of 900. Because this policy should be the last policy applied to a request that matches its criteria, you set the goto expression to END.

Incoming requests to any URL that begins with `<http://www.example.com/query.cgi?server>=` are redirected to the server number in the query.

## Example 9: Home Page Redirection

April 25, 2023

New Company, Inc. recently acquired a smaller competitor, Purchased Company, and wants to redirect the home page for Purchased Company to a new page on its own Web site, as shown here.

- Old URL: [http://www.purchasedcompany.com/%5C\\*](http://www.purchasedcompany.com/%5C*)
- New URL: <http://www.newcompany.com/products/page.htm>

To redirect requests to the Purchased Company home page, you would create rewrite actions with the values in the following table.

Action Name	Type of Rewrite Action	Expression to choose target reference	String expression for replacement text
Action-Rewrite-Replace_URLr	REPLACE	HTTP.REQ.URL.PATH_AND_QUERY	“/products/page.htm”
Action-Rewrite-Replace_Host	REPLACE	HTTP.REQ.HOSTNAME	“www.newcompany.com”

```

1 add rewrite action action-Rewrite-Replace_URLr REPLACE HTTP.REQ.URL.
 PATH_AND_QUERY “ /products/page.htm ”
2
3 add rewrite action action-Rewrite-Replace_Host REPLACE HTTP.REQ.
 HOSTNAME “ www.newcompany.com ”
4 <!--NeedCopy-->

```

You would then create rewrite policies with the values in the following table.

Policy Name	Action Name	Undefined Action	Expression
Policy-Rewrite-Replace-None	Action-Rewrite-Replace-None	NOREWRITE	!HTTP.REQ.HOSTNAME.SERVER.EQ( “www.purchasedcompany.com” )
Policy-Rewrite-Replace-Host	Action-Rewrite-Replace_Host	NOREWRITE	HTTP.REQ.HOSTNAME.SERVER.EQ( “www.purchasedcompany.com” )

```

1 add rewrite policy Policy-Rewrite-Replace-None !HTTP.REQ.HOSTNAME.
 SERVER.EQ(“ www.purchasedcompany.com ”) Action-Rewrite-Replace-None
 NOREWRITE
2
3 add rewrite policy Policy-Rewrite-Replace-Host HTTP.REQ.HOSTNAME.SERVER
 .EQ(“ www.purchasedcompany.com ”) Action-Rewrite-Replace_Host
 NOREWRITE
4 <!--NeedCopy-->

```

Finally, you would bind the rewrite policies globally, assigning the first a priority of 100 and the second a priority of 200.

```
1 bind rewrite global Policy-Rewrite-Replace-None 100
2
3 bind rewrite global Policy-Rewrite-Replace-Host 200
4 <!--NeedCopy-->
```

Requests to the acquired company's old Web site are now redirected to the correct page on the New Company home page.

## Example 10: Policy-based RSA encryption

December 21, 2023

The RSA algorithm uses the PKEY\_ENCRYPT\_PEM() function to encrypt HTTP predefined and user-defined header or body content. The function accepts only RSA public keys (not private keys) and the encrypted data cannot be longer than the length of the public key. When the data being encrypted is shorter than the key length, the algorithm uses RSA\_PKCS1 padding method.

In a sample scenario, the function can be used with B64ENCODE() function in a rewrite action to replace an HTTP header value with a value encrypted by an RSA public key. The data being encrypted is then decrypted by the recipient using the RSA private key.

You can implement the feature by using a rewrite policy. To do this, you must complete the following tasks:

1. Add RSA public key as a policy expression.
2. Create rewrite action.
3. Create rewrite policy.
4. Bind rewrite policy as global.
5. Verify RSA encryption

### Policy-based RSA encryption by using NetScaler command interface

Complete the following tasks to configure policy-based RSA encryption by using the NetScaler command interface.

#### To add RSA public key as a policy expression by using the NetScaler command interface:

```
1 add policy expression pubkey '"-----BEGIN RSA PUBLIC KEY-----
MIGJAoGBAKl5vgQEj73Kxp+9
yn1v5gPR1pnc4oLM2a0kaWwB0sB6rzCIy6znwnvwCY1xRvQhRlJSAyJbLoL7wZFIJ2FOR8Cz
```

```

+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o79az597eNPAjsHZ/C2oL/+6qY5a/
f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=-----END RSA PUBLIC KEY-----"
2 <!--NeedCopy-->

```

**To add rewrite an action to encrypt an HTTP header request by using the NetScaler command interface:**

```

add rewrite action encrypt_act insert_http_header encrypted_data
HTTP.REQ.HEADER("data_to_encrypt").PKEY_ENCRYPT_PEM(pubkey).B64ENCODE

```

**To add rewrite policy by using the NetScaler command interface:**

```

1 add rewrite policy encrypt_pol 'HTTP.REQ.HEADER("data_to_encrypt").
 EXISTS' encrypt_act
2 <!--NeedCopy-->

```

**To bind rewrite policy global by using the NetScaler command interface:**

```

bind rewrite global encrypt_pol 10 -type RES_DEFAULT

```

**To verify RSA encryption by using the NetScaler command interface:**

```

1 >curl -v -H "data_to_encrypt: Now is the time that tries men's souls"
 http://10.217.24.7/`
2
3 * About to connect() to 10.217.24.7 port 80 (#0)
4
5 * Trying 10.217.24.7...
6
7 * connected
8
9 * Connected to 10.217.24.7 (10.217.24.7) port 80 (#0)

```

Subsequent execution of this curl command with the same data to encrypt shows that the encrypted data is different each execution. This is because the padding inserts random bytes at the beginning of the data to encrypt, causing the encrypted data to be different each time.

## Policy-based RSA encryption by using the GUI

The GUI enables you to complete the following tasks:

### To add RSA public key as a policy expression by using the GUI:

1. Sign into the NetScaler appliance and navigate to **Configurations > AppExpert > Advanced Expressions**.
2. In the details pane, click **Add** to define an RSA public key as an advanced policy expression.
3. In Create Expression page, set the following parameters:
  - a) Expression name. Name of the advanced expression.
  - b) Expression. Define RSA public key as an advanced expression using the Expression Editor.
  - c) Comments. A brief description of the expression.
4. Click **Create**.

### To add rewrite an action to encrypt an HTTP header request by using the GUI:

1. Sign into the NetScaler appliance and navigate to **Configurations > AppExpert > Rewrite > Actions**.
2. In the details pane, click **Add** to add a rewrite action.
3. In the **Create Rewrite Action** screen, set the following parameters:
  - a) Name. Name of the rewrite action.
  - b) Type. Select action type as INSERT\_HTTP\_HEADER.
  - c) Use the action type to insert a header. Enter the name of the HTTP header that needs to be rewritten.
  - d) Expression. Name of the advanced policy expression associated to the action.
  - e) Comments. A brief description of the rewrite action.
4. Click **Create**.

#### **To add rewrite advanced policy by using the GUI:**

1. Sign into the NetScaler appliance and navigate to **Configurations > AppExpert > Rewrite > Policies**.
2. In the **Rewrite Policies** page, click **Add** to add a rewrite policy.
3. In the **Create Rewrite Policy** page, set the following parameters:
  - a) Name. Name of the rewrite policy.
  - b) Action. Name of the rewrite action to perform if the request or response matches this rewrite policy.
  - c) Log Action. Name of message log action to use when a request matches this policy.
  - d) Undefined-Result Action. Action to perform if the result of policy evaluation is undefined.
  - e) Expression. Name of the advanced policy expression that triggers the action.
  - f) Comments. A brief description of the rewrite action.
4. Click **Create**.

#### **To bind rewrite policy global by using the GUI:**

1. Sign into the NetScaler appliance and navigate to **Configurations > AppExpert > Rewrite > Policies**.
2. In the **Rewrite Policies** screen, select a rewrite policy that you want to bind and click **Policy Manager**.
3. In the Rewrite Policy Manager page, in the Bind Points section, set the following parameters:
  - a) Bind Point. Select the binding point as Default Global.
  - b) Protocol. Select the protocol type as HTTP.
  - c) Connection Type. Select the connection type as Request.
  - d) Click **Continue** to view the **Policy Binding** section.
  - e) In the **Policy Binding** section, select the rewrite policy and set the bind parameters.
4. Click **Bind**.

## Example 11: Policy-based RSA encryption with no padding operation

May 2, 2023

The `PKEY_ENCRYPT_PEM_NO_PADDING()` policy function uses the RSA algorithm with no padding operation before performing RSA encryption. The policy function works just like the `PKEY_ENCRYPT_PEM()` function, except it uses `RSA_NO_PADDING` method instead of `RSA_PKCS1_PADDING`. The `pkey` parameter is a text string with a PEM-encoded RSA public key. Similar to `PKEY_ENCRYPT_PEM()`, you can use a policy expression for the key.

You can implement the feature by using a rewrite policy. To do this, you must complete the following tasks:

1. Add RSA public key as a policy expression.
2. Create rewrite action.

### Policy-based RSA encryption by using NetScaler command interface

Complete the following tasks to configure policy-based RSA encryption by using the NetScaler command interface.

**To add RSA public key with no padding policy expression by using the NetScaler command interface:**

```
1 add expression rsa_pub_key_4096 '"-----BEGIN RSA PUBLIC KEY-----" + "
 MIICGgKCAgEArrwBldKd48xrpOSRPMrg+eNA000DU6t5b/WYQLdElqNv7WpEfBrA" +
 \"nwI2s619gEU1r4zoLqL7L5ALtt5Z+F0JBYf0zBz0ky0GtEJ5iX5GP4QxT65J3nHH"
 + "4MTF3acmjvXxcLmaKXEFlaVIzW7FTTr3Luw/CnOjflAB403Q6F9VBVvQm0VYWnqoI"
 + \"+0q1VIg6Q1pAcvdKBi0f85BBofE5EiBZ/1Jt0CdbSv568l+8
 ve7BnSuncFHoRR30" + "/"
 VfSsDuNWZf7n3RNMzxEuIA72UGPzNYFQzvcP0dzd0aN7jAXw0mgC/NSvKzGKHlo" +
 \"mUYYBzLVQdDMZWnd6jSzsBRXSXxsNEy/RuXwplrA5epo7JdCoMkfeI4vUXm6MNR8"
 + "TQdFqIc1pdn0sbRf9ec62XbcfR7P8CDTsmLSaagx3rjenPdB+LTWKw2VUF+YONIG"
 + \"jM3fyFef9ovVhLhS5HvMqFGs8P75W+
 d7B0IbIu3EngACiEJOpYSsETD4WgPK6Iyv" + "
 j6cxsLeYMtELTb0fBIIqysCHdmjF3M1lqdp4dKs3+W798GJZYM5MxZKUzrBi0Xu" +
 \"e7GtSh2aimsfQureUD+0z0RN2umeDsYcA1ghXMclDP+jLS1lnrv0Yvo+TKcm9b8G"
 + "uR/drbcrcsGyWFW+bsAu3AWz9S6TePurP5unRmNNvXpH5DRgsYl3d50CAwEAAQ=="
 + '"-----END RSA PUBLIC KEY-----\"'
2 <!--NeedCopy-->
```

**To add rewrite action for no padding policy expression by using the NetScaler command interface:**

```
add rewrite action rsa_encrypt_act insertHTTPHeader encrypted 'HTTP.
REQ.HEADER("plaintext").PKEY_ENCRYPT_PEM_NO_PADDING(rsa_pub_key_4096)
```

## Policy-based RSA encryption with no padding option by using the GUI

The GUI enables you to complete the following tasks:

### To add RSA public key for no padding operation as a policy expression by using the GUI:

1. Sign into the NetScaler appliance and navigate to **Configurations > AppExpert > Advanced Expressions**.
2. In the details pane, click **Add** to define an RSA public key as an advanced policy expression.
3. In Create Expression page, set the following parameters:
  - a) Expression name. Name of the advanced expression.
  - b) Expression. Define RSA public key as an advanced expression using the Expression Editor.  
**Note:** The maximum string length is of 255 characters in a policy expression. For any key longer than 1024-bits, you have to break the key into smaller chunks and concatenate the chunks together as “chunk1”+ “chunk2”+ ...
  - c) Comments. A brief description of the expression.
4. Click **Create**.

### To add rewrite an action by using the GUI:

1. Sign into the NetScaler appliance and navigate to **Configurations > AppExpert > Rewrite > Actions**.
2. In the details pane, click **Add** to add a rewrite action.
3. In the **Create Rewrite Action** screen, set the following parameters:
  - a) Name. Name of the rewrite action.
  - b) Type. Select action type as INSERT\_HTTP\_HEADER.
  - c) Use the action type to insert a header. Enter the name of the HTTP header that needs to be rewritten.
  - d) Expression. Name of the advanced policy expression associated to the action.
  - e) Comments. A brief description of the rewrite action.
4. Click **Create**.

## Example 12: Configure rewrite to change the host name and URL in client request on NetScaler appliance

May 2, 2023

Rewrite feature on a NetScaler appliance is used to convert the URL available in the client request to another URL that the back end server can understand. You can achieve the following benefits by using the rewrite feature:

- Enhances the security by hiding the actual URL to the resource, which is requested by the client.
- Prevents the unauthorized user access from gaining access to the network resources.

Consider an example where your current organization is acquired by another organization. It becomes a difficult job for admins to inform about the new web address to every user of the acquired organization. In this scenario, using rewrite feature becomes convenient to change the host name and URL in the client requests for the website of the acquired organization. You can use rewrite to change the URLs in the client request temporarily when the website is under maintenance.

The following section describes the procedure to change the host name and URL in a client request using rewrite feature.

Consider an example where the user enters a `http://www.example.com` URL in the web browser. The website administrator wants the NetScaler appliance to convert the preceding URL in the client request as `http://myexample.example.net.in/resource/inventory/s?t=112`.

In the preceding example, the website administrator wants the NetScaler appliance to replace the “example.com” domain name with “myexample.example.net.in” and the URL with “resource/inventory/s?t=112”.

### Perform the following by using the CLI

1. Log on to the NetScaler appliance using SSH.
2. Add rewrite actions.
  - `add rewrite action rewrite_doman_url_repalce_act replace HTTP.REQ.URL "\"http://myexample.example.net.in/resource/inventory/s?t=112\""`
3. Add rewrite policies for the rewrite actions.
  - `add rewrite policy rewrite_domain_url_pol HTTP.REQ.HOSTNAME.EQ("www.example.com")rewrite_doman_url_repalce_act`
4. Bind the rewrite policies to a virtual server.
  - `bind lb vserver rewrite_LB -policyName rewrite_domain_url_pol -priority 100 -gotoPriorityExpression END -type REQUEST`

## URL transformation

December 21, 2023

The URL transformation feature provides a method for modifying all URLs in designated requests from an external version seen by outside users to an internal URL seen only by your Web servers and IT staff. You can redirect user requests seamlessly, without exposing your network structure to users. You can also modify complex internal URLs that users may find difficult to remember into simpler, more easily remembered external URLs.

### Note

Before you can use the URL transformation feature, you must enable the Rewrite feature. To enable the Rewrite feature, see [Enabling the Rewrite Feature](#).

URL transform feature rewrites URLs in HTML response body and is not applied to JavaScript and other variables.

To begin configuring URL transformation, you create profiles, each describing a specific transformation. Within each profile, you create one or more actions that describe the transformation in detail. Next, you create policies, each of which identifies a type of HTTP request to transform, and you associate each policy with an appropriate profile. Finally, you globally bind each policy to put it into effect.

## Configure URL transformation profiles

December 21, 2023

A profile describes a specific URL transformation as a series of actions. The profile functions primarily as a container for the actions, determining the order in which the actions are performed. Most transformations transform an external hostname and optional path into a different, internal hostname and path. Most useful transformations are simple and require only a single action, but you can use multiple actions to perform complex transformations.

You cannot create actions and then add them to a profile. You must create the profile first, and then add actions to it. In the CLI, creating an action and configuring the action are separate steps. Creating a profile and configuring the profile are separate steps in both the CLI and the configuration utility.

## To create a URL transformation profile by using the NetScaler command line

At the NetScaler command prompt, type the following commands, in the order shown, to create a URL transformation profile and verify the configuration. You can then repeat the second and third commands to configure additional actions:

- `add transform profile <profileName> -type URL [-onlyTransformAbsURLinBody (ON|OFF)] \[-comment <comment>]`
- `add transform action <name> <profileName> <priority>`
- `set transform action <name> [-priority <priority>] [-reqUrlFrom <expression>] [-reqUrlInto <expression>] [-resUrlFrom <expression>] [-resUrlInto <expression>] [-cookieDomainFrom <expression>] [-cookieDomainInto <expression>] [-state (ENABLED|DISABLED)] [-comment "<string>"]`
- `show transform profile <name>`

### Example:

```

1 > add transform profile shoppingcart -type URL
2 Done
3 > add transform action actshopping shoppingcart 1000
4 Done
5 > set transform action actshopping -priority 1000 -reqUrlFrom 'shopping
 .example.com' -reqUrlInto 'www.example.net/shopping' -resUrlFrom '
 www.example.net/shopping' -resUrlInto 'shopping.example.com' -
 cookieDomainFrom 'example.com' -cookieDomainInto 'example.net' -
 state ENABLED -comment 'URL transformation for shopping cart.'
6 Done
7 > show transform profile shoppingcart
8 Name: shoppingcart
9 Type: URL onlyTransformAbsURLinBody: OFF
10 Comment:
11 Actions:
12
13 1) Priority 1000 Name: actshopping ENABLED
14 Done
15 <!--NeedCopy-->

```

## To modify an existing URL transformation profile or action by using the NetScaler command line

At the NetScaler command prompt, type the following commands to modify an existing URL transformation profile or action and verify the configuration:

Note: Use a `set transform profile` or `set transform action` command, respectively. The `set transform profile` command takes the same arguments as does the `add transform profile` command, and `set`

transform action is the same command that was used for initial configuration.

- `set transform action <name> [-priority <priority>] [-reqUrlFrom <expression>] [-reqUrlInto <expression>] [-resUrlFrom <expression>] [-resUrlInto <expression>] [-cookieDomainInto <expression>] [-state (ENABLED|DISABLED)] [-comment "<string>"]`
- `show transform profile <name>`

#### Example:

```

1 > set transform action actshopping -priority 1000 -reqUrlFrom '
 searching.example.net' -reqUrlInto 'www.example.net/searching' -
 resUrlFrom 'www.example.net/searching' -resUrlInto 'searching.
 example.com' -cookieDomainInto 'example.net' -state ENABLED -comment
 'URL transformation for searching cart.'
2 Done
3 > show transform profile shoppingcart
4 Name: shoppingcart
5 Type: URL onlyTransformAbsURLinBody: OFF
6 Comment:
7 Actions:
8
9 1) Priority 1000 Name: actshopping ENABLED
10 Done
11 <!--NeedCopy-->

```

### To remove a URL transformation profile and actions by using the NetScaler command line

First remove all actions associated with that profile by typing the following command once for each action:

- `rm transform action <name>` After you have removed all actions associated with a profile, remove the profile as shown below.
- `rm transform profile <name>`

### To create a URL transformation profile by using the configuration utility

1. In the navigation pane, expand **Rewrite**, expand URL Transformation, and then click **Profiles**.
2. In the details pane, click **Add**.
3. In the **Create URL Transformation Profile** dialog box, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in “Parameters for configuring URL transformation profiles” as follows (asterisk indicates a required parameter):

- Name\*—name

- Comment—comment
  - Only transform absolute URLs in response body—onlyTransformAbsURLinBody
4. Click **Create**, and then click **Close**. A message appears in the status bar, stating that the Profile has been configured successfully.

### **To configure a URL transformation profile and actions by using the configuration utility**

1. In the navigation pane, expand **Rewrite**, expand URL Transformation, and then click **Profiles**.
2. In the details pane, select the profile you want to configure, and then click **Open**.
3. In the **Configure URL Transformation Profile** dialog box, do one of the following.
  - To create a new action, click **Add**.
  - To modify an existing action, select the action, and then click **Open**.
4. Fill in the **Create URL Transformation Action** or **Modify URL Transformation Action** dialog box by typing or selecting values for the parameters. The contents of the dialog box correspond to the parameters described in “Parameters for configuring URL transformation profiles” as follows (asterisk indicates a required parameter):
  - Action Name\*—name
  - Comments—comment
  - Priority\*—priority
  - Request URL from—reqUrlFrom
  - Request URL into—reqUrlInto
  - Response URL from—resUrlFrom
  - Response URL into—resUrlInto
  - Cookie Domain from—cookieDomainFrom
  - Cookie Domain into—cookieDomainInto
  - Enabled—state
5. Save your changes.
  - If you are creating a new action, click **Create**, and then **Close**.
  - If you are modifying an existing action, click **OK**.  
A message appears in the status bar, stating that the Profile has been configured successfully.
6. Repeat step 3 through step 5 to create or modify any additional actions.
7. To delete an action, select the action, and then click Remove. When prompted, click OK to confirm the deletion.
8. Click **OK** to save your changes and close the Modify URL Transformation Profile dialog box.

9. To delete a profile, in the details pane select the profile, and then click **Remove**. When prompted, click **OK** to confirm the deletion.

## Configure URL transformation policies

December 21, 2023

After you create a URL transformation profile, you next create a URL transformation policy to select the requests and responses that the NetScaler should transform by using the profile. URL transformation considers each request and the response to it as a single unit, so URL transformation policies are evaluated only when a request is received. If a policy matches, the NetScaler transforms both the request and the response.

Note: The URL transformation and rewrite features cannot both operate on the same HTTP header during request processing. Because of this, if you want to apply a URL transformation to a request, you must make sure that none of the HTTP headers it will modify are manipulated by any rewrite action.

### To configure a URL transformation policy by using the NetScaler command line

You must create a new policy. On the command line, an existing policy can only be removed. At the NetScaler command prompt, type the following commands to configure a URL transformation policy and verify the configuration:

- `<add transform policy <name> <rule> <profileName>`
- `<show transform policy <name>`

#### Example:

```
1 > add transform policy polsearch HTTP.REQ.URL.SUFFIX.EQ("Searching")
 prosearching
2 Done
3 > show transform policy polsearch
4 1) Name: polsearch
5 Rule: HTTP.REQ.URL.SUFFIX.EQ("Searching")
6 Profile: prosearching
7 Priority: 0
8 Hits: 0
9 Done
10 <!--NeedCopy-->
```

## To remove a URL transformation policy by using the NetScaler command line

At the NetScaler command prompt, type the following command to remove a URL transformation policy:

```
rm transform policy <name>
```

### Example:

```
1 > rm transform policy polsearch
2 Done
3 <!--NeedCopy-->
```

## To configure a URL transformation policy by using the configuration utility

1. In the navigation pane, expand **Rewrite**, expand URL Transformation, and then click **Policies**.
2. In the details pane, do one of the following:
  - To create a new policy, click **Add**.
  - To modify an existing policy, select the policy, and then click **Open**.
3. In the **Create URL Transformation Policy** or **Configure URL Transformation Policy** dialog box, type or select values for the parameters. The contents of the dialog box correspond to the parameters described in “Parameters for configuring URL transformation policies” as follows (asterisk indicates a required parameter):
  - Name\*—name (Cannot be changed for a previously configured policy.)
  - Profile\*—profileName
  - Expression—rule

If you want help with creating an expression for a new policy, you can either hold down the Control key and press the space bar while your cursor is in the Expression text box. To create the expression, you can type it directly as described below, or you can use the Add Expression dialog box.

4. Click **Prefix**, and choose the prefix for your expression.

Your choices are:

- HTTP—The HTTP protocol. Choose this if you want to examine some aspect of the request that pertains to the HTTP protocol.
- SYS—The protected Web site(s). Choose this if you want to examine some aspect of the request that pertains to the recipient of the request.
- CLIENT—The computer that sent the request. Choose this if you want to examine some aspect of the sender of the request.

- **SERVER**—The computer to which the request was sent. Choose this if you want to examine some aspect of the recipient of the request.
- **URL**—The URL of the request. Choose this if you want to examine some aspect of the URL to which the request was sent.
- **TEXT**—Any text string in the request. Choose this if you want to examine a text string in the request.
- **TARGET**—The target of the request. Choose this if you want to examine some aspect of the request target.

After you choose a prefix, the NetScaler displays a two-part prompt window that displays the possible next choices at the top, and a brief explanation of what the selected choice means at the bottom. The choices depend on which prefix you chose.

5. Select your next term.

If you chose HTTP as your prefix, your choices are REQ, which specifies HTTP requests, and RES, which specifies HTTP responses. If you chose another prefix, your choices are more varied. For help on a specific choice, click that choice once to display information about it in the lower prompt window.

When you are certain which choice you want, double-click it to insert it into the Expression window.

1. Type a period, and then continue selecting terms from the list boxes that appear to the right of the previous list box. You type the appropriate text strings or numbers in the text boxes that appear to prompt you to enter a value, until your expression is finished.
2. Click **Create** or **OK**, depending on whether you are creating a new policy or modifying an existing policy.
3. Click **Close**. A message appears in the status bar, stating that the Policy has been configured successfully.

### **To add an expression by using the Add Expression dialog box**

1. In the **Create Responder Action** or **Configure Responder Action** dialog box, click **Add**.
2. In the **Add Expression** dialog box, in the first list box choose the first term for your expression.
  - **HTTP**. The HTTP protocol. Choose this if you want to examine some aspect of the request that pertains to the HTTP protocol.
  - **SYS**. The protected Web site(s). Choose this if you want to examine some aspect of the request that pertains to the recipient of the request.
  - **CLIENT**. The computer that sent the request. Choose this if you want to examine some aspect of the sender of the request.

- **SERVER.** The computer to which the request was sent. Choose this if you want to examine some aspect of the recipient of the request.
  - **URL.** The URL of the request. Choose this if you want to examine some aspect of the URL to which the request was sent.
  - **TEXT.** Any text string in the request. Choose this if you want to examine a text string in the request.
  - **TARGET.** The target of the request. Choose this if you want to examine some aspect of the request target.
- When you make your choice, the rightmost list box lists appropriate terms for the next part of your expression.
3. In the second list box, choose the second term for your expression. The choices depend upon which choice you made in the previous step, and are appropriate to the context. After you make your second choice, the Help window below the Construct Expression window (which was blank) displays help describing the purpose and use of the term you just chose.
  4. Continue choosing terms from the list boxes that appear to the right of the previous list box, or typing strings or numbers in the text boxes that appear to prompt you to enter a value, until your expression is finished.

## Globally binding URL transformation policies

December 21, 2023

After you have configured your URL transformation policies, you bind them to Global or a bind point to put them into effect. After binding, any a request or response that matches a URL transformation policy is transformed by the profile associated with that policy.

When you bind a policy, you assign a priority to it. The priority determines the order in which the policies you define are evaluated. You can set the priority to any positive integer. In the NetScaler OS, policy priorities work in reverse order - the higher the number, the lower the priority.

Because the URL transformation feature implements only the first policy that a request matches, not any additional policies that it might also match, policy priority is important for achieving the results that you intend. If you give your first policy a low priority (such as 1000), you tell the NetScaler to perform it only if other policies with a higher priority do not match a request. If you give your first policy a high priority (such as 1), you tell the NetScaler to perform it first, and skip any other policies that might also match. You can leave yourself plenty of room to add other policies in any order, without having to reassign priorities, by setting priorities with intervals of 50 or 100 between each policy when you globally bind your policies.

Note: URL transformation policies cannot be bound to TCP-based virtual servers.

## To bind a URL transformation policy by using the NetScaler command line

At the NetScaler command prompt, type the following commands to globally bind a URL transformation policy and verify the configuration:

- `bind transform global <policyName> <priority>`
- `show transform global`

### Example:

```
1 > bind transform global polisearching 100
2 Done
3 > show transform global
4 1) Policy Name: polisearching
5 Priority: 100
6
7 Done
8 <!--NeedCopy-->
```

## To bind a URL transformation policy by using the configuration utility

1. In the navigation pane, expand Rewrite, then expand URL Transformation, and then click **Policies**.
2. In the details pane, click **Policy Manager**.
3. In the **Transform Policy Manager** dialog box, choose the bind point to which you want to bind the policy\*\*. The choices are:
  - **Override Global.** Policies that are bound to this bind point process all traffic from all interfaces on the NetScaler appliance, and are applied before any other policies.
  - **LB Virtual Server.** Policies that are bound to a load balancing virtual server are applied only to traffic that is processed by that load balancing virtual server, and are applied before any Default Global policies. After selecting LB Virtual Server, you must also select the specific load balancing virtual server to which you want to bind this policy.
  - **CS Virtual Server.** Policies that are bound to a content switching virtual server are applied only to traffic that is processed by that content switching virtual server, and are applied before any Default Global policies. After selecting CS Virtual Server, you must also select the specific content switching virtual server to which you want to bind this policy.
  - **Default Global.** Policies that are bound to this bind point process all traffic from all interfaces on the NetScaler appliance.
  - **Policy Label.** Policies that are bound to a policy label process traffic that the policy label routes to them. The policy label controls the order in which policies are applied to this traffic.

4. Select Insert Policy to insert a new row and display a drop-down list with all available, unbound URL transformation policies.
5. Select the policy you want to bind, or select New Policy to create a new policy. The policy that you selected or created is inserted into the list of globally bound URL transformation policies.
6. Make any additional adjustments to the binding.
  - To modify the policy priority, click the field to enable it, and then type a new priority. You can also select Regenerate Priorities to renumber the priorities evenly.
  - To modify the policy expression, double click that field to open the Configure Transform Policy dialog box, where you can edit the policy expression.
  - To set the Goto Expression, double click field in the Goto Expression column heading to display the drop-down list, where you can choose an expression.
  - To set the Invoke option, double click field in the Invoke column heading to display the drop-down list, where you can choose an expression.
7. Repeat steps 3 through 6 to add any additional URL transformation policies you want to globally bind.
8. Click **OK** to save your changes. A message appears in the status bar, stating that the Policy has been configured successfully.

## **RADIUS support for the rewrite feature**

May 2, 2023

The NetScaler expressions language includes expressions that can extract information from and manipulate RADIUS messages in requests and responses. These expressions enable you to use the rewrite feature to modify portions of a RADIUS message before sending it to its destination. Your rewrite policies and actions can use any expression that is appropriate or relevant to a RADIUS message. The available expressions enable you to identify the RADIUS message type, extract any attribute-value pair (AVP) from the connection, and modify RADIUS AVPs. You can also create policy labels for RADIUS connections.

You can use the new RADIUS expressions in Rewrite rules for a number of purposes. For example, you could:

- Remove the domain\ portion of the RADIUS user-name AVP to simplify single sign-on (SSO).
- Insert a vendor-specific AVP, such as the MSISDN field used in telephone company operations to contain subscriber information.

You can also create policy labels to route specific types of RADIUS requests through a series of policies that are appropriate to those requests.

**Note:**

RADIUS for Rewrite has the following limitations:

- The NetScaler does not re-sign rewritten RADIUS requests or responses. If the RADIUS authentication server requires signed RADIUS messages, authentication will fail.
- The currently available RADIUS expressions do not work with RADIUS IPv6 attributes.

The NetScaler documentation for expressions that support RADIUS assumes familiarity with the basic structure and purpose of RADIUS communications. If you need more information about RADIUS, see your RADIUS server documentation or search online for an introduction to the RADIUS protocol.

## Configuring Rewrite Policies for RADIUS

The following procedure uses the NetScaler command line to configure a rewrite action and policy and bind the policy to a rewrite-specific global bind point.

### To configure a Rewrite action and policy, and bind the policy:

At the command prompt, type the following commands:

- `add rewrite action <actName> <actType>`
- `add rewrite policy <polName> <rule> <actName>`
- `bind rewrite policy <polName> <priority> <nextExpr> -type <bindPoint>` where `<bindPoint>` represents one of the rewrite-specific global bind points.

## RADIUS Expressions for Rewrite

In a rewrite configuration, you can use the following NetScaler expressions to refer to various portions of a RADIUS request or response.

### Identifying the Type of Connection:

- `RADIUS.IS_CLIENT`  
Returns TRUE if the connection is a RADIUS client (request) message.
- `RADIUS.IS_SERVER`  
Returns TRUE if the connection is a RADIUS server (response) message.

### Request Expressions:

- `RADIUS.REQ.CODE`

Returns the number that corresponds to the RADIUS request type. A derivative of the num\_at class. For example, a RADIUS access request would return 1 (one). A RADIUS accounting request would return 4.

- `RADIUS.REQ.LENGTH`

Returns the length of the RADIUS request, including the header. A derivative of the num\_at class.

- `RADIUS.REQ.IDENTIFIER`

Returns the RADIUS request identifier, a number assigned to each request that allows the request to be matched to the corresponding response. A derivative of the num\_at class.

- `RADIUS.REQ.AVP(<AVP Code No>).VALUE`

Returns the value of first occurrence of this AVP as a string of type text\_t.

- `RADIUS.REQ.AVP(<AVP code no>).INSTANCE(instance number)`

Returns the specified instance of the AVP as a string of type RAVP\_t. A specific RADIUS AVP can occur multiple times in a RADIUS message. INSTANCE (0) returns the first instance, INSTANCE (1) returns second instance, and so on, up to sixteen instances.

- `RADIUS.REQ.AVP(<AVP code no>).VALUE(instance number)`

Returns the value of specified instance of the AVP as a string of type text\_t.

- `RADIUS.REQ.AVP(<AVP code no>).COUNT`

Returns the number of instances of a specific AVP in a RADIUS connection, as an integer.

- `RADIUS.REQ.AVP(<AVP code no>).EXISTS`

Returns TRUE if the specified type of AVP exists in the message, or FALSE if it does not.

### **Response Expressions:**

RADIUS response expressions are identical to RADIUS request expressions, except that RES replaces REQ.

### **Typecasts of AVP Values:**

The ADC supports expressions to typecast RADIUS AVP values to the text, integer, unsigned integer, long, unsigned long, ipv4 address, ipv6 address, ipv6 prefix and time data types. The syntax is the same as for other NetScaler typecast expressions.

### **Example:**

The ADC supports expressions to typecast RADIUS AVP values to the text, integer, unsigned integer, long, unsigned long, ipv4 address, ipv6 address, ipv6 prefix and time data types. The syntax is the same as for other NetScaler typecast expressions.

```
1 RADIUS.REQ.AVP(8).VALUE(0).typecast_ip_address_at
2 <!--NeedCopy-->
```

### **AVP Type Expressions:**

The NetScaler supports expressions to extract RADIUS AVP values by using the assigned integer codes described in RFC2865 and RFC2866. You can also use text aliases to accomplish the same task. Some examples follow.

- `RADIUS.REQ.AVP (1).VALUE` or `RADIUS.REQ.USERNAME.value`  
Extracts the RADIUS user-name value.
- `RADIUS.REQ.AVP (4). VALUE` or `RADIUS.REQ. ACCT\\_SESSION\\_ID.value`  
Extracts the Acct-Session-ID AVP (code 44) from the message.
- `RADIUS.REQ.AVP (26). VALUE` or `RADIUS.REQ.VENDOR\\_SPECIFIC.VALUE`  
Extracts the vendor-specific value.

The values of most commonly-used RADIUS AVPs can be extracted in the same manner.

### **RADIUS Bind Points:**

Four global bind points are available for policies that contain RADIUS expressions.

- `RADIUS_REQ_OVERRIDE`  
Priority/override request policy queue.
- `RADIUS_REQ_DEFAULT`  
Standard request policy queue.
- `RADIUS_RES_OVERRIDE`  
Priority/override response policy queue.
- `RADIUS_RES_DEFAULT`  
Standard response policy queue.

### **RADIUS Rewrite-Specific Expressions:**

- `RADIUS.NEW_AVP`  
Returns the specified RADIUS AVP as a string.

- `RADIUS.NEW_AVP_INTEGER32`

Returns the specified RADIUS AVP as an integer.

- `RADIUS.NEW_AVP_UNSIGNED32`

Returns the specified RADIUS AVP as an unsigned integer.

- `RADIUS.NEW_VENDOR_SPEC_AVP(<ID>, <definition>)`

Adds the specified extended vendor specific AVPs to the connection. For `<ID>`, substitute a long number. For `<definition>`, substitute a string that contains the data for the AVP.

- `RADIUS.REQ.AVP_START`

Returns the location between the end of the RADIUS header and the start of the AVPs. Used in rewrite actions.

**Example:**

```
1 add rewrite action insert1 insert_after radius.req.avp_start radius
 .new_avp(33, "NEW AVP")
2 <!--NeedCopy-->
```

- `RADIUS.REQ.AVP_END`

Returns the location at the end of radius message (or in other words end of all AVPs) in radius message. Used when performing rewrite actions.

**Example:**

```
1 add rewrite action insert2 insert_before radius.req.avp_end "radius
 .new_avp(33, \"NEW AVP\")"
2 <!--NeedCopy-->
```

- `RADIUS.REQ.AVP_LIST`

Returns the location at the start of the AVPs in a RADIUS message, and the length of the RADIUS message, excluding the header. In other words, returns all AVPs in a RADIUS message. Used to perform Rewrite actions.

**Example:**

```
1 add rewrite action insert3 insert_before_all radius.req.avp_list "
 radius.new_avp(33, \"NEW AVP\")" -search "avp(33)"
2 <!--NeedCopy-->
```

### Valid Rewrite-Action Types for RADIUS:

The Rewrite action types that can be used with RADIUS expressions are:

- `INSERT_AFTER`

- INSERT\_BEFORE
- INSERT\_AFTER\_ALL
- INSERT\_BEFORE\_ALL
- DELETE
- DELETE\_ALL
- REPLACE
- REPLACE\_ALL

All `INSERT_ actions` can be used to insert a RADIUS AVP into a RADIUS connection.

## Use Cases

Following are use cases for RADIUS with rewrite.

### Rewriting the User-Name AVP

To configure the rewrite feature to remove the Domain\ string from the RADIUS user-name AVP, begin by creating a rewrite REPLACE action as shown in the example below. Use the action in a Rewrite policy that selects all RADIUS requests. Bind the policy to a global bind point. When you do so, set the priority the appropriate level to allow any block or reject policies to take effect first, but ensure that all requests that are not blocked or rejected are rewritten. Set the Goto Expression (gotoPriorityExpr) to NEXT to continue policy evaluation, and attach the policy to the RADIUS\_REQ\_DEFAULT queue.

#### Example:

```
1 add rewrite action rwActRadiusDomainDel replace radius.req.user_name q/
 RADIUS.NEW_AVP(1,RADIUS.REQ.USER_NAME.VALUE.AFTER_STR(" "))/
2 add rewrite policy RadiusRemoveDomainPol true rwActRadiusDomainDel
3 <!--NeedCopy-->
```

#### Note:

The rewrite policy for RADIUS is not applicable to a gateway virtual server. If a gateway virtual server is used a load balancing then RADIUS needs to be configured and the rewrite policy needs to be bound to a RADIUS load balancing virtual server.

### Inserting a Vendor-Specific AVP

To configure Rewrite action to insert a Vendor-Specific AVP containing the contents of the MSISDN field, begin by creating a rewrite INSERT action that inserts the MSISDN field into the request. Use the action in a Rewrite policy that selects all RADIUS requests. bind the policy to global, setting the priority to an appropriate level and the other parameters as shown in the following example.

**Example:**

```
1 add rewrite action rwActRadiusInsMSISDN insert_after radius.req.
 avp_start RADIUS.NEW_VENDOR_SPEC_AVP(<VENDOR ID>, "RADIUS.NEW_AVP(<
 Attribute Code>, <MSISDN>)")
2 add rewrite policy rwPolRadiusInsMSISDN true rwActRadiusInsMSISDN
3 bind rewrite global rwPolRadiusInsMSISDN 100 NEXT -type
 RADIUS_REQ_DEFAULT
4 <!--NeedCopy-->
```

## Diameter support for rewrite

December 21, 2023

The Rewrite feature now supports the Diameter protocol. You can configure Rewrite to modify Diameter requests and response as you would HTTP or TCP requests and responses, allowing you to use Rewrite to manage the flow of Diameter requests and make necessary modifications. For example, if the “Origin-Host” value in a Diameter request is inappropriate, you can use Rewrite to replace it with a value that is acceptable to the Diameter server.

### To configure Rewrite to modify a Diameter request

To configure the Rewrite feature to replace the Origin-Host in a diameter request with a different value, at the command prompt, type the following commands:

- `<add rewrite action <actname> replace “DIAMETER.REQ.AVP(264, \“NetScaler.example.net\”)”`  
For `<actname>`, substitute a name for your new action. The name can consist of from one to 127 characters in length, and can contain letters, numbers, and the hyphen (-) and underscore (\_) symbols. For `NetScaler.example.net`, substitute the Host-Origin that you want to use instead of the original Host-Name.
- `add rewrite policy <polname> “diameter.req.avp(264).value.eq(\“host.example.com\”)”<actname>`  
For `<polname>`, substitute a name for your new policy. As with `<actname>`, the name can consist of from one to 127 characters in length, and can contain letters, numbers, and the hyphen (-) and underscore (\_) symbols. For `host.example.com`, substitute the name of the Host-Origin that you want to change. For `<actname>`, substitute the name of the action that you just created.
- `bind lb vserver <vservname> -policyName <polname> -priority <priority> -type REQUEST`  
For `<vservname>`, substitute the name of the load balancing virtual server to which you want to bind the policy. For `<polname>`, substitute the name of the policy you just created. For `<priority>`, substitute a priority for the policy.

**Example:**

To create a Rewrite action and policy to modify all Diameter Host-Origins of “host.example.com” to “NetScaler.example.net”, you could add the following action and policy, and bind the policy as shown.

```
1 > add rewrite action rw_act_replace_avp replace "diameter.req.avp(264)"
 "diameter.new.avp(264, \"NetScaler.example.net\")"
2 > add rewrite policy rw_diam_pol "diameter.req.avp(264).value.eq(\"
 client.realm2.net\")" rw_act_replace_avp
3 > bind lb vserver vs1 -policyName rw_diam_pol -priority 10 -type
 REQUEST
4
5 Done
6 <!--NeedCopy-->
```

## DNS support for rewrite

December 26, 2023

You can configure the rewrite feature to modify DNS requests and responses, as you would for HTTP or TCP requests and responses. You can use rewrite to manage the flow of DNS requests, and make necessary modifications in the header, or in the answer section. For example, if the DNS response does not have the AA bit set in the header flag, you can use rewrite to set the AA bit in the DNS response and send it to the client.

### DNS Expressions

In a rewrite configuration, you can use the following NetScaler expressions to refer to various portions of a DNS request or response:

See [Expressions and Descriptions](#)

### DNS Bind Points

The following global bind points are available for policies that contain DNS expressions.

---

Bind Points	Description
DNS_REQ_OVERRIDE	Override request policy queue.
DNS_REQ_DEFAULT	Standard request policy queue.

---

---

Bind Points	Description
DNS_RES_OVERRIDE	Override response policy queue.
DNS_RES_DEFAULT	Standard response policy queue.

---

In addition to the default bind points, you can create policy labels of type DNS\_REQ or DNS\_RES and bind DNS policies to them.

### Rewrite Action Types for DNS

- **replace\_dns\_answer\_section**—This action replaces the DNS answers section with the defined expression in the DNS policy.
- **replace\_dns\_header\_field**—Checks the opcode type in the DNS request. Returns True or False, indicating whether the opcode type in the DNS request matches the specified opcode type. This action replaces the DNS header section with the defined expression in the DNS policy.

### Configuring Rewrite Policies for DNS

The following procedure uses the NetScaler command line to configure a rewrite action and policy and bind the policy to a rewrite-specific global bind point.

#### Configure Rewrite action and policy, and bind the policy for DNS

At the command prompt, type the following commands:

1. `add rewrite action <actName> <actType>`

For `<actname>`, substitute a name for your new action. The name can be 1 to 127 characters in length, and can contain letters, numbers, hyphen (-), and underscore (\_) symbols. For `<actType>`, specify the rewrite action types provided for DNS expressions.

2. `add rewrite policy <polName> <rule> <actName>`

For `<polname>`, substitute a name for your new policy. For `<actname>`, the name can be 1 to 127 characters in length, and can contain letters, numbers, hyphen (-), and underscore (\_) symbols. For `<actname>`, substitute the name of the action that you just created.

3. `bind rewrite global <polName> <priority> <gotoPriorityExpression>  
-type <bindPoint>`

For `<polName>`, substitute the name of the policy that you just created. For `<priority>`, specify the priority of the policy. For `<bindPoint>`, substitute one of the rewrite -specific global bind points.

### Example:

#### Set the AA bit of DNS request to load balance virtual server.

The following commands configure the NetScaler appliance to act as an authoritative DNS server for all the queries that it serves.

```
1 add rewrite action set_aa replace_dns_header_field dns.req.header.flags
 .set(aa)
2 add rewrite policy pol !dns.req.header.flags.is_set(aa) set_aa
3 bind rewrite global pol 100 -type dns_res_override
4 <!--NeedCopy-->
```

#### Modify the response answer and header section.

If the server responds with an NX domain, you can set the rewrite action to replace the response with specified IP address. A NOPOLICY-REWRITE enables you to invoke an external bank without processing an expression (a rule). This entry is a dummy policy that does not contain a rule but directs the entry to a policy label or virtual server specific policy banks.

```
1 add rewrite action set_aa_res replace_dns_header_field "dns.res.header.
 flags.set(aa)"
2 add rewrite action modify_nxdomain_res replace_dns_answer_section "dns.
 new_rrset_a(\"10.102.218.160\",300)"
3 add rewrite policy set_res_aa true set_aa_res
4 add add rewrite policy modify_answer "dns.RES.HEADER.RCODE.EQ(nxdomain)
 && dns.RES.QUESTION.TYPE.EQ(A)"
5 modify_nxdomain_res
6 add rewrite policylabel MODIFY_NODATA dns_res
7 bind rewrite policylabel MODIFY_NODATA modify_answer 10 END
8 bind rewrite policylabel MODIFY_NODATA set_res_aa 11 END
9 bind lb vserver v1 -policyName NOPOLICY-REWRITE -priority 11 -
 gotoPriorityExpression END -type
10 RESPONSE -invoke policylabel MODIFY_NODATA
11 <!--NeedCopy-->
```

### Limitations:

- Rewrite policies are evaluated only if the NetScaler appliance is configured as a DNS proxy server and there is a cache miss.
- If the Recursion Available (RA) flag in the header is set to YES, the RA flag will not be modified in the rewrites.
- If the RA flag in the header is set to YES, the CD flag in the header is modified regardless of any rewrite action.

## MQTT support for rewrite

December 21, 2023

The rewrite feature supports the MQTT protocol. You can configure rewrite policies to take actions based on the parameters in the MQTT client requests and server responses.

### Rewrite action for MQTT

The rewrite action for MQTT indicates the changes made to the MQTT request or response before sending it to a server or client.

#### Expression:

```
add rewrite action <name> <rewrite_type> <target> <rewrite_action>
```

### Rewrite type for MQTT

Depending on the type of rewrite expression rule that is used, the following MQTT rewrite types are supported:

- `replace_mqtt`
- `insert_before_mqtt`
- `insert_after_mqtt`
- `delete_mqtt`
- `insert_mqtt`

### Rewrite target for MQTT

In the following sample examples, the MQTT rewrite feature uses policy expressions to indicate the part of the request to be modified (target) and the modification to be performed (string expression):

- Rewrite a client ID in the connect packet using the `replace_mqtt` action type.

```
add rewrite action rwact1 replace_mqtt MQTT.CONNECT.CLIENTID "\"xyz\""
```

- Rewrite a topic in the publish request using the `replace_mqtt` action type.

```
add rewrite action rwact1 replace_mqtt MQTT.PUBLISH.TOPIC "\"testing/test123\""
```

- Rewrite to insert a property using the insert\_mqtt action type.

```
add rewrite action rwact1 insert_mqtt MQTT.NEW_PROPERTY("prop1",
"test")
```

- Delete a topic using the delete\_mqtt action type.

```
add rewrite action rwact2 delete_mqtt MQTT.SUBSCRIBE.TOPIC_FILTERS
.TOPIC(1)
```

### Rewrite action for MQTT

The following are the predefined rewrite actions for MQTT:

- MQTT.NEW\_KEEPALIVE(interval)
- MQTT.NEW\_PACKET\_IDENTIFIER(packetID)
- MQTT.NEW\_REASON\_CODE(retCode)
- MQTT.NEW\_PUBLISH(topic\_name, payload)
- MQTT.NEW\_CONNECT\_USERNAME(username)
- MQTT.NEW\_CONNECT\_WILL\_MESSAGE(will\_topic, will\_payload, will\_Qos, will\_retain)
- MQTT.NEW\_TOPIC(topic, qos)
- MQTT.NEW\_TOPIC(topic)
- MQTT.NEW\_PROPERTY(key, value)

#### Example for the predefined rewrite action:

```
add rewrite action rwact1 replace_mqtt MQTT.CONNECT.KEEPALIVE MQTT.
NEW_KEEPALIVE(90)
```

#### Example for the user defined rewrite action:

```
add rewrite action rwact1 replace_mqtt MQTT.CONNECT.USERNAME "\"user1
\""
```

### Rewrite policy for MQTT

A rewrite policy for MQTT consists of a rule and action. The rule determines the MQTT traffic on which rewrite is applied and the action determines the action to be taken by the NetScaler appliance.

#### Expression:

```
add rewrite policy <name> <rewrite_rule> <rewrite_action>
```

#### Example:

```
add rewrite action insert_mqtt_username insert_mqtt MQTT.NEW_CONNECT_USERNAME
("user1")
```

```
add rewrite policy rewrite_mqtt_username "MQTT.COMMAND.EQ(CONNECT)&&
MQTT.CONNECT.USERNAME.LENGTH.EQUALS(0)insert_mqtt_username
```

## Bind points for MQTT

You can bind a rewrite policy globally, or to a specific load balancing virtual server or content switching virtual server.

The following are the global bind points:

- MQTT\_REQ\_DEFAULT
- MQTT\_REQ\_OVERRIDE
- MQTT\_RES\_DEFAULT
- MQTT\_RES\_OVERRIDE

### Expression:

- `bind rewrite global <policyName> <priority> [-type MQTT_REQ_OVERRIDE | MQTT_REQ_DEFAULT | MQTT_RES_OVERRIDE | MQTT_RES_DEFAULT]`
- `bind lb|cs vserver <virtualServerName> -policyName <policyName> -priority <positiveInteger> -type REQUEST|RESPONSE`

### Example:

- `bind rewrite global pol1 10 -type MQTT_REQ_DEFAULT`
- `add/bind lb vserver v1 -policyName pol1 -type reqEST -priority 10`

## Configure a rewrite policy for MQTT

To configure a rewrite policy, follow the steps and type the commands at the command prompt:

1. Enable the rewrite feature on the NetScaler appliance.

```
enable ns feature REWRITE
```

2. Add a rewrite action.

```
add rewrite action rwact1 replace_mqtt MQTT.CONNECT.KEEPALIVE
MQTT.NEW_KEEPALIVE(10)
```

3. Add a rewrite policy.

```
add rewrite policy pol1 MQTT.COMMAND.EQ(CONNECT) rwact1
```

4. Configure an MQTT load balancing virtual server.

```
add lb vserver v1 MQTT 1.1.1.1 1883
```

5. Bind the rewrite policy globally, or to a specific load balancing virtual server.

```
bind rewrite global pol1 10 -type MQTT_REQ_DEFAULT
```

```
add/bind lb vserver v1 -policyName pol1 -type REQUEST -priority 10
```

### Use case 1: Replace the user name in the MQTT CONNECT message with the certificate name

The administrator can configure an MQTT rewrite policy to replace the user name with the client's certificate name.

Let us consider an example. The client request has an `MQTT CONNECT` message, which contains the user name as "admin". This user name must be replaced with the serial number (16 digit) that is extracted from the client certificate (cert name).

The following figure shows the workflow:

1. A Transport Control Protocol (TCP) request is sent to the load balancer.
2. In the load balancer, the user name is replaced with the certificate name.
3. The request is forwarded to the MQTT broker.
4. This new user name is used for authorization through the webhook payload.

### Sample Configuration:

```
add rewrite action mqtt_rw_unameact1 replace_mqtt MQTT.CONNECT.
USERNAME CLIENT.SSL.CLIENT_CERT.SERIALNUMBER
```

```
add rewrite policy mqtt_rw_uname_pol1 "MQTT.COMMAND.EQ(CONNECT)"
mqtt_rw_unameact1
```

```
bind cs vserver mqtt_frontend_cs -policyName mqtt_rw_uname_pol1 -
priority 10 -gotoPriorityExpression END -type REQUEST
```

## Use case 2: Provide subscription to a new TOPIC

The administrator can provide a subscription to a new TOPIC. Let us consider an example. A client request has subscription to TOPIC 1. The administrator can configure a rewrite policy to provide subscription to a new TOPIC 2. The subscription can be inserted before or after.

### Sample Configuration:

- `add rewrite action act2 insert_before_mqtt MQTT.TOPIC_FILTERS.TOPIC(1)MQTT.NEW_TOPIC(topic2, 2)`
- `add rewrite policy policy2 "MQTT.COMMAND.EQ(SUBSCRIBE)&& MQTT.SUBSCRIBE. TOPIC_FILTERS.TOPIC.CONTAINS(\"test\")"act2`

## String maps

May 2, 2023

You can use string maps to perform pattern matching in all NetScaler features that use the default policy syntax. A string map is a NetScaler entity that consists of key-value pairs. The keys and values are strings in either ASCII or UTF-8 format. String comparison uses two new functions, `MAP_STRING(<string_map_name>)` and `IS_STRINGMAP_KEY(<string_map_name>)`.

A policy configuration that uses string maps performs better than one that does string matching through policy expressions, and you need fewer policies to perform string matching with a large number of key-value pairs. String maps are also intuitive, simple to configure, and result in a smaller configuration.

### How String Maps Work

String maps are similar in structure to pattern sets (a pattern set defines a mapping of index values to strings; a string map defines a mapping of strings to strings) and the configuration commands for string maps (commands such as `add`, `bind`, `unbind`, `remove`, and `show`) are syntactically similar to configuration commands for pattern sets. Also, as with index values in a pattern set, each key in a string map must be unique across the map. The following table illustrates a string map called `url_string_map`, which contains URLs as keys and values.

Key	Value
/url_1.html	<a href="http://www.redirect_url_1.com/url_1.html">http://www.redirect_url_1.com/url_1.html</a>
/url_2.html	<a href="http://www.redirect_url_2.com/url_2.html">http://www.redirect_url_2.com/url_2.html</a>
/url_3.html	<a href="http://www.redirect_url_1.com/url_1.html">http://www.redirect_url_1.com/url_1.html</a>

Table 1. String Map “url\_string\_map”

The following table describes the two functions that have been introduced to enable string matching with keys in a string map. String matching is always performed with the keys. Additionally, the following functions perform a comparison between the keys in the string map and the complete string that is returned by the expression prefix. The examples in the descriptions refer to the preceding example.

For completed information about the two functions introduced for enabling string matching with keys in a string map, see [String Map Function](#) table pdf.

## Configuring a String Map

You first create a string map and then bind key-value pairs to it. You can create a string map from the command line interface (CLI) or the configuration utility.

To configure a string map by using the command line interface

At the command prompt, do the following:

1. Create a string map.

```
add policy stringmap <name> -comment <string>
```

1. Bind a key-value pair to the string map.

```
bind policy stringmap <name> <key> <value> [-comment <string>]
```

### Example:

```
1 bind policy stringmap url_string_map1 "/url_1.html" "http://www.
 redirect_url_1.com/url_1.html"
2 <!--NeedCopy-->
```

## To configure a string map by using the NetScaler GUI

Navigate to **AppExpert > String Maps**, click **Add** and specify the relevant details.

### Example: responder policy with a redirect action

The following use case involves a responder policy with a redirect action. In the example below, the first four commands create the string map `url_string_map` and bind the three key-value pairs used in the earlier example. After creating the map and binding the key-value pairs, you create a responder action (`act_url_redirects`) that redirects the client to the corresponding URL in the string map or to `www.default.com`. You also configure a responder policy (`pol_url_redirects`) that checks whether requested URLs match any of the keys in `url_string_map` and then performs the configured action. Finally, you bind the responder policy to the content switching virtual server that receives the client requests that are to be evaluated.

```
add stringmap url_string_map
bind stringmap url_string_map /url_1.html http://www.redirect_url_1.com/url_1.html
bind stringmap url_string_map /url_2.html http://www.redirect_url_2.com/url_2.html
bind stringmap url_string_map /url_3.html http://www.redirect_url_1.com/url_1.html
'add responder action act_url_redirects redirect 'HTTP.REQ.URL.MAP_STRING("url_string_map") ALT "www.default.com"'
add responder policy pol_url_redirects TRUE act_url_redirects
bind cs vserver csw_redirect -policyname pol_url_redirects -priority 1 -type request
```

### To configure a string map by using the NetScaler GUI

Follow the procedure given below to configure a string map.

1. On the navigation pane, expand **AppExpert** and click **String Maps**.
2. On the details pane, click **Add**.
3. In the **Create String Map** page, set the following parameters:
  - Name. Name of the string map.
  - Configure key value. ASCII based key value entry bound to the string map
  - Comments. A short description about the key values bound to the string map.
4. Click **Create** and **Close**.

## URL sets

December 21, 2023

This feature enables you to blacklist one million URLs. The section includes the following topics:

- [Getting Started](#)
- [Using Advanced Policy Expressions for URL Evaluation](#)
- [Configuring a URL Set](#)
- [URL Pattern Semantics](#)
- [Blacklisted URL Categories](#)

## Getting started

December 22, 2023

To prevent access to restricted websites, a NetScaler appliance uses a specialized URL matching algorithm. The algorithm uses a URL set that can contain a list of URLs up to 1 million (1,000,000) blocked entries. The global limit is 1 million entries. You can either add one URL set with 1 million entries or multiple URL sets containing 1 million entries in total.

**Note:**

Avoid using many URL sets. We recommend you to use limited number of URL sets based on the memory available for the URL set.

Each entry can include metadata that defines URL categories and category groups as indexed patterns. The appliance can also periodically download highly sensitive URL sets managed by internet enforcement agencies (with government websites) or internet organizations. Once the URL set is downloaded from a website and imported into the appliance, the appliance encrypts the URL sets (as required by these agencies). The encrypted URL sets are kept confidential and the entries are not tampered.

The NetScaler appliance uses advanced policies to determine whether an incoming URL must be blocked, allowed, or redirected. These policies use advanced expressions to evaluate incoming URLs against blacklisted entries. An entry can include metadata. For entries that have no metadata, you can use an expression that evaluates the URL based on an exact string match. For other URLs, you can use an expression that evaluates the URL's metadata, in addition to an expression that checks for an exact string match.

### **Use Case for Safe Internet Access Policies for ISPs/Telcos**

A URL set enables an ISP (ISP) or a Telco customer to enforce government mandated safe internet access policies such as:

1. Block access to illegal internet sites (child abuse, drugs, and so on)
2. Safe browsing for children

A NetScaler appliance enables you to periodically download URL sets managed by internet enforcement agencies or independent internet organizations. The appliance periodically downloads the list and updates it securely. The list is stored as confidential URL sets so that it is not tampered or human readable. The periodically downloaded URL set functions as a blacklisted set for URL evaluation purposes.

If you have a private URL set and the contents of the list are kept confidential and the network administrator does not know about the blacklisted URLs present in the list. To make sure the policy is configured correctly and the correct list is referenced, you must configure the Canary URL and add it to the URL set. Using the Canary URL, the administrator can request through the appliance uses the private URL set to ensure it is looked up for every URL request.

### **Advanced policy expressions for URL evaluation**

December 21, 2023

The following table describes the expressions you can use to evaluate incoming URLs with entries in an URL set.

**Note:** HTTP.REQ.URL is generalized to be used as <URL expression>

Expression	Operation
<URL expression>.URLSET_MATCHES_ANY	Evaluates to TRUE if the URL exactly matches any entry in the URL set.
<URL expression>. .GET_URLSET_METADATA(<URLSET>)	The GET_URLSET_METADATA() expression returns the associated metadata if the URL exactly matches any pattern within the URL set. An empty string is returned if there was no match.
<URL expression>.GET_URLSET_METADATA(<URLSET>).EQ(<METADATA>)	Evaluates to TRUE if the matched metadata is equal to <METADATA>.
<URL expression>. .GET_URLSET_METADATA(<URLSET>).TYPECAST_LIST_T(';').GET(0).EQ(<CATEGORY>)	Evaluates to TRUE if the matched metadata is at the beginning of the category. This pattern can be used to encode separate fields within metadata, but match only the 1st field.
HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL)	Joins the host and URL parameters, which can then be used as a <URL expression> for matching.

## Configure URL set

December 21, 2023

You can perform the following tasks to configure a URL set and restrict URLs on a NetScaler platform:

1. Import a URL set (download and encrypt it). Importing a URL set in a NetScaler appliance allows you:
  - To download the URL file.
  - To add the file to the appliance.
  - To encrypt the file.

Until you add the URL set to the system, it is not visible to the user.

You can download a set in the following ways:

- Download a URL set once from a remote server and specify it as `http://myserver.com/file_with_urlset.csv`
- add a file under the `/var/tmp/` path inside ADC and use the command, as in the example:

```

1 > shell cat /var/tmp/test_urlset.csv
2 example.com
3 google.com
4 > import policy urlset top10
5 k -url local:test_urlset.csv -delimiter "," -rowSeparator "n" -interval
 10 -privateSet -canaryUrl http://www.in.gr
6 Done
7
8 <!--NeedCopy-->

```

The imported URL set is further categorized into different categories and category groups in the database. This is valid only if categories exist in the metadata of the URL set file.

**Note:** There can be a chance that you might have URL patterns without metadata.

Once you have imported the file, you can update, delete, or display file properties. After the file is pushed into the appliance, you can modify the entries by more adding rows.

The imported set is then stored in an encrypted file format on the NetScaler directory. The imported list contains millions of URL entries. To the following ‘The imported list can contain up to 1 million URL entries. Otherwise, the appliance returns an error message saying that the value exceeds the limit. If the imported URL set has blacklisted entries with metadata, the metadata it is detected by the appliance when it is imported.

Once you import a URL set and add it into the appliance, the URL set is available for advanced policies to identify the correct URL set during incoming URL evaluation. `HTTP.REQ.HOSTNAME.APPEND(HTTP.REQ.URL).URLSET_MATCHES_ANY(<URL set name>)`

1. Updating a URL set on the NetScaler appliance. Once you have pushed the file into the appliance, at this interval you can manually update a URL file by using command line interface.
2. Exporting a URL set. If you prefer a backup of the URL set, you can export the list of URL patterns and save a copy of it to a destination URL. Before you export, check whether the URL set is marked as private. If is marked private, the URL set cannot be exported. Export functionality does not work with private set. So a new url set `myurl` would be imported without private set defined, and then it would be exported to another file in a local path, as below:

```

1 > shell touch /var/tmp/test_urlset_export.csv
2 Done
3 > shell cat /var/tmp/test_urlset_export.csv
4 Done
5 > shell cat /var/tmp/test_urlset.csv

```

```

6 example.com
7 google.com
8 Done
9 > export urlset myurl -url local:test_urlset_export.csv
10
11 > import urlset myurl -url local:test_urlset.csv
12 Done
13 (a non-private urlset is imported)
14
15 <!--NeedCopy-->

```

1. Removing a URL set. If you want to delete a URL set of blacklisted entries, you can use the remove command to delete the URL set from the NetScaler appliance.
2. Displaying a URL set. You can display the properties of a URL set by using the show command.

**Note:** URLs with query part are removed during import.

#### Example:

```

1 show urlset
2 Name: top100 PatternCount: 100 Delimiter: RowSeparator: Interval: 0
3 Done
4 <!--NeedCopy-->

```

### Import a URL set with meta by using the command line interface

At command prompt, type:

```

1 import urlset <name> [-overwrite] [-delimiter <character>] [-
 rowSeparator <character>] [-url] <url> [-interval <seconds>] [-
 privateSet] [-canaryUrl <URL>]
2 <!--NeedCopy-->

```

Where,

Delimiter is a CSV file record with default value set as 44.

rowSeparator is a CSV file row separator with default value set as 10.

Interval is the time interval in secs, rounded to the nearest 15 minutes at which the update of the url set occurs.

CanaryURL is a URL used for testing when the contents of the url set is kept confidential.

Example

```

import policy urlset -url local:test_urlset.csv -delimiter ","-
rowSeparator "n"-interval 10 -privateSet -canaryUrl http://www.in.
gr

```

## Perform explicit subdomain match for an imported URL set

You can now perform an explicit subdomain match for an imported URL set. A new parameter, “subdomainExactMatch” is added to the “import policy URLset” command. When you enable the parameter, the URL Filtering algorithm performs an explicit subdomain match. For example, if the incoming URL is “news.example.com” and if the entry in the URL set is “example.com,” the algorithm does not match the URLs.

At the command prompt, type:

```
import policy urlset <name> [-overwrite] [-delimiter <character>] [-rowSeparator <character>] -url <URL> [-interval <secs>] [-privateSet] [-subdomainExactMatch] [-canaryUrl <URL>]
```

### Example:

```
import policy urlset forth_urlset -url local:test_urlset.csv -interval 3600 -subdomainExactMatch
```

## To show the URL set by using the command line interface

At the command prompt, type:

```
show urlset <name>
```

### Example:

At the command prompt, type:

```
1 URLset Count
2 ----- -
3 1) top1k 100
4 Done
5
6 > show urlset top1k
7 Count Delimiter Interval RowSeparator
8 ----- -
9 100 , 0 0x0a
10 Done
11 >
12
13 <!--NeedCopy-->
```

## To show the URL set imported by using the command line interface

At the command prompt, type:

```
show urlset -imported
```

**Example:**

At the command prompt, type:

```
1 URLset
2 -----
3 1) top1k
4 Done
5 <!--NeedCopy-->
```

**To show URL set by using the command line interface**

At the command prompt, type:

```
show urlset <name>
```

**To export a URL set by using the command line interface**

At the command prompt, type:

```
export urlset <name> <url>
```

**To add a URL set by using the command line interface**

At the command prompt, type:

```
add urlset <urlset_name>
```

**To update a URL set by using the command line interface**

At the command prompt, type:

```
update urlset <name>
```

**To remove a URL set command by using the command line interface**

At the command prompt, type:

```
remove urlset <name>
```

**Example:**

Note:

Before you import or export a URLset, you must make sure the `test_urlset_export.csv`

and `test_urlset.csv` files are created and available under the `/var/tmp` directory.

```
1 import policy urlset -url local:test_urlset.csv -delimiter "," -
 rowSeparator "\n" -interval 10 -privateSet -overwrite -canaryUrl
 http://www.in.gr
2
3 add policy urlset top10k
4
5 update policy urlset top10k
6
7 sh policy urlset
8
9 sh policy urlset top10k
10
11 export policy urlset urlset1 -url local:test_urlset_export.csv
12
13 import policy urlset top10k -url local:test_urlset.csv - privateSet
14
15 add policy urlset top10k
16
17 update policy urlset top10k
18
19 show policy urlset top10k
20 <!--NeedCopy-->
```

### Display imported URL sets

You can now display imported URL sets in addition to added URL sets. To do this, a new parameter “imported” is added to the “show url set” command. If you enable this option, the appliance displays all imported URL sets and distinguishes the imported URL sets from the added URL sets.

At the command prompt, type:

```
show policy urlset [<name>] [-imported]
```

#### Example:

```
show policy urlset -imported
```

### To import a URL set by using the GUI

Navigate to **AppExpert > URL Sets**, click **Import** to download the URL set.

### To add a URL set by using the GUI

Navigate to **AppExpert > URL Sets**, click **Add** to create a URL set file for the downloaded URL set.

### To edit a URL set by using the GUI

Navigate to **AppExpert > URL Sets**, select a URL set and click **Edit** to modify.

### To Update a URL set by using the GUI

Navigate to **AppExpert > URL Sets**, select a URL set and click **Update URL Set** to update the URL set with the latest modifications made to the file.

### To Export a URL set by using the GUI

Navigate to **AppExpert > URL Sets**, select a URL set, and click **Export URL Set** to export the URL patterns in a set to a destination URL and save it in that location.

## URL pattern semantics

December 21, 2023

The following table shows the URL patterns used for specifying the list of pages you to want to filter. For example, the URL pattern, <http://www.example.com/bar> matches a single page <http://www.example.com/bar>. To cover all the pages where the URL starts with [www.example.com/bar](http://www.example.com/bar), you must explicitly add a '\*' at the end.

For more information, see [URL pattern metadata mapping](#) table.

## URL Categories

September 21, 2020

Following is a list of blacklisted categories.

## AppFlow

May 2, 2023

The NetScaler appliance is a central point of control for all application traffic in the data center. It collects flow and user-session level information valuable for application performance monitoring, analytics, and business intelligence applications. It also collects webpage performance data and database information. AppFlow transmits the information by using the Internet Protocol Flow Information eXport (IPFIX) format, which is an open Internet Engineering Task Force (IETF) standard defined in RFC 5101. IPFIX (the standardized version of Cisco's NetFlow) is widely used to monitor network flow information. AppFlow defines new Information Elements to represent application-level information, webpage performance data, and database information.

Using UDP as the transport protocol, AppFlow transmits the collected data, called *flow records*, to one or more IPv4 collectors. The collectors aggregate the flow records and generate real-time or historical reports.

AppFlow provides visibility at the transaction level for HTTP, SSL, TCP, SSL\_TCP flows, and HDX Insight flows. You can sample and filter the flow types that you want to monitor.

### Note

For more information on HDX Insight, see [HDX Insight](#).

AppFlow use actions and policies to send records for a selected flow to specific set of collectors. An AppFlow action specifies which set of collectors receive the AppFlow records. Policies, which are based on Advanced expressions can be configured to select flows for which flow records are sent to the collectors specified by the associated AppFlow action.

To limit the types of flows, you can enable AppFlow for a virtual server. AppFlow can also provide statistics for the virtual server.

You can also enable AppFlow for a specific service, representing an application server, and monitor the traffic to that application server.

Note: This feature is supported only on NetScaler nCore builds.

## How AppFlow Works

In the most common deployment scenario, inbound traffic flows to a Virtual IP address (VIP) on the NetScaler appliance and is load balanced to a server. Outbound traffic flows from the server to a mapped or subnet IP address on the NetScaler and from the VIP to the client. A flow is a unidirectional collection of IP packets identified by the following five tuples: sourceIP, sourcePort, destIP, destPort, and protocol.

The following figure describes how the AppFlow feature works.

Figure 1. NetScaler Flow Sequence

As shown in the figure, the network flow identifiers for each leg of a transaction depend on the direction of the traffic.

The different flows that form a flow record are:

Flow1: <Client-IP, Client-Port, VIP-IP, VIP-port, Protocol>

Flow2: <NS-MIP/SNIP, NS-port, Server-IP, Server-Port, Protocol>

Flow3: <Server-IP, Server-Port, NS-MIP/SNIP, NS-Port, Protocol>

Flow4: <VIP-IP, VIP-port, Client-IP, Client-Port, Protocol>

To help the collector link all four flows in a transaction, AppFlow adds a custom transactionID element to each flow. For application-level content switching, such as HTTP, it is possible for a single client

TCP connection to be load balanced to different back end TCP connections for each request. AppFlow provides a set of records for each transaction.

## Flow Records

AppFlow records contain standard NetFlow or IPFIX information, such as time stamps for the beginning and end of a flow, packet count, and byte count. AppFlow records also contain application-level information (such as HTTP URLs, HTTP request methods and response status codes, server response time, and latency). Webpage performance data (such as page load time, page render time, and time spent on the page). And database information (such as database protocol, database response status, and database response size). IPFIX flow records are based on templates that need to be sent before sending flow records.

## Templates

AppFlow defines a set of templates, one for each type of flow. Each template contains a set of standard Information Elements (IEs) and Enterprise-specific Information Elements (EIEs). IPFIX templates define the order and sizes of the Information Elements (Internet Explorer) in the flow record. The templates are sent to the collectors at regular intervals, as described in RFC 5101.

A template can include the following EIEs:

- transactionID

An unsigned 32-bit number identifying an application-level transaction. For HTTP, it corresponds to a request and response pair. All flow records that correspond to this request and response pair have the same transaction ID. In the most common case, there are four `uniFlow` records that correspond to this transaction. If the NetScaler generates the response by itself (served from the integrated cache or by a security policy), there might be only two flow records for this transaction.

- connectionID

An unsigned 32-bit number identifying a layer-4 connection (TCP or UDP). The NetScaler flows are bidirectional, with two separate flow records for each direction of the flow. This information element can be used to link the two flows.

For the NetScaler, a connectionID is an identifier for the connection data structure to track the progress of a connection. In an HTTP transaction, for instance, a given connectionID might have multiple transactionID elements corresponding to multiple requests that were made on that connection.

- tcpRTT

The round trip time, in milliseconds, as measured on the TCP connection. It can be used as a metric to determine the client or server latency on the network.

- `httpRequestMethod`

An 8-bit number indicating the HTTP method used in the transaction. An options template with the number-to-method mapping is sent along with the template.

- `httpRequestSize`

An unsigned 32-bit number indicating the request payload size.

- `httpRequestURL`

The HTTP URL requested by the client.

- `httpUserAgent`

The source of incoming requests to the Web server.

- `httpResponseStatus`

An unsigned 32-bit number indicating the response status code.

- `httpResponseSize`

An unsigned 32-bit number indicating the response size.

- `httpResponseTimeToFirstByte`

An unsigned 32-bit number indicating the time taken to receive the first byte of the response.

- `httpResponseTimeToLastByte`

An unsigned 32-bit number indicating the time taken to receive the last byte of the response.

- `flowFlags`

An unsigned 64-bit flag used to indicate different flow conditions.

### **EIEs for webpage performance data**

- `clientInteractionStartTime`

Time at which the browser receives the first byte of the response to load any objects of the page such as images, scripts, and style sheets.

- `clientInteractionEndTime`

Time at which the browser received the last byte of response to load all the objects of the page such as images, scripts, and style sheets.

- `clientRenderStartTime`

Time at which the browser starts to render the page.

- clientRenderEndTime

Time at which a browser finished rendering the entire page, including the embedded objects.

### **EIEs for database information**

- dbProtocolName

An unsigned 8-bit number indicating the database protocol. Valid values are 1 for MS SQL and 2 for MySQL.

- dbReqType

An unsigned 8-bit number indicating the database request method used in the transaction. For MS SQL, valid values are 1 is for QUERY, 2 is for TRANSACTION, and 3 is for RPC. For valid values for MySQL, see the MySQL documentation.

- dbReqString

Indicates the database request string without the header.

- dbRespStatus

An unsigned 64-bit number indicating the status of the database response received from the web server.

- dbRespLength

An unsigned 64-bit number indicating the response size.

- dbRespStatString

The response status string received from the web server.

## **Configuring the AppFlow feature**

May 2, 2023

You can configure AppFlow in the same manner as most other policy-based features. First, you enable the AppFlow feature. Then you specify the collectors to which the flow records are sent. After that, you define actions, which are sets of configured collectors. Then you configure one or more policies and associate an action to each policy. The policy tells the NetScaler appliance to select requests the flow records of which are sent to the associated action. Finally, you bind each policy either globally or to the specific virtual server to put it into effect.

You can further set AppFlow parameters to specify the template refresh interval and to enable the exporting of httpURL, httpCookie, and httpReferer information. On each collector, you must specify the NetScaler IP address as the address of the exporter.

**Note**

For information about configuring the NetScaler as an exporter on the collector, see the documentation for the specific collector.

The configuration utility provides tools that help users define the policies and actions. It determines exactly how the NetScaler appliance export records for a particular flow to a set of collectors(action.) The command line interface provides a corresponding set of CLI-based commands for experienced users who prefer a command line.

**Enabling AppFlow**

To be able to use the AppFlow feature, you must first enable it.

**Note**

AppFlow can be enabled only on nCore NetScaler appliances.

**Enable the AppFlow feature by using the command line interface**

At the command prompt, type one of the following commands:

```
1 enable ns feature AppFlow
2
3 <!--NeedCopy-->
```

**Enable the AppFlow feature by using the configuration utility**

Navigate to **System > Settings**, click **Configure Advanced Features**, and select the **AppFlow** option.

**Specifying a Collector**

A collector receives AppFlow records generated by the NetScaler appliance. To send the AppFlow records, you must specify at least one collector. By default, the collector listens to IPFIX messages on UDP port 4739. You can change the default port, when configuring the collector. Similarly, by default, NSIP is used as the source IP for AppFlow traffic. You can change this default source IP to a SNIP address when configuring a collector. You can also remove unused collectors.

## Specify a collector by using the command line interface

### Important

Starting from NetScaler release 12.1 build 55.13, you can specify the type of collector that you want to use. A new parameter “Transport” is introduced in the `add appflow collector` command. By default, the collector listens to IPFIX messages. You can change the type of collector to either `logstream` or `ipfix` or rest by using “Transport” parameter. For more information on configuration, see the example.

At the command prompt, type the following commands to add a collector and verify the configuration:

```
1 - add appflow collector <name> -IPAddress <ipaddress> -port <
 port_number> -netprofile <netprofile_name> -Transport <Transport>
2
3 - show appflow collector <name>
4
5 <!--NeedCopy-->
```

### Example

```
1 add appflow collector col1 -IPAddress 10.102.29.251 -port 8000 -
 netprofile n2 -Transport ipfix
2
3 <!--NeedCopy-->
```

## Specify multiple collectors by using the command line interface

At the command prompt, type the following commands to add and send same data to multiple collectors:

```
1 add appflow collector <collector1> -IPAddress <IP>
2
3 add appflow collector <collector2> -IPAddress <IP>
4
5 add appflow action <action> -collectors <collector1> <collector2>
6
7 add appflow policy <policy> true <action>
8
9 bind lbserver <lbserver> -policy <policy> -priority <priority>
10 <!--NeedCopy-->
```

## Specify one or more collectors by using the configuration utility

Navigate to **System > AppFlow > Collectors**, and create the AppFlow collector.

## Configure an AppFlow Action

An AppFlow action is a set collector, to which the flow records are sent if the associated AppFlow policy matches.

### Configure an AppFlow action by using the command line interface

At the command prompt, type the following commands to configure an AppFlow action and verify the configuration:

```
1 add appflow action <name> --collectors <string> ... [-
 clientSideMeasurements (Enabled|Disabled)] [-comment <string>]
2
3 show appflow action
4
5 <!--NeedCopy-->
```

#### Example

```
1 add appflow action apfl-act-collector-1-and-3 -collectors collector-1
 collector-3
2
3 <!--NeedCopy-->
```

### Configure an AppFlow action by using the configuration utility

Navigate to **System > AppFlow > Actions**, and create the AppFlow action.

## Configure an AppFlow Policy

After you configure an AppFlow action, you must next configure an AppFlow policy. An AppFlow policy is based on a rule, which consists of one or more expressions.

#### Note

For creating and managing AppFlow policies, the configuration utility provides assistance that is not available at the command line interface.

### Configure an AppFlow policy by using the command line interface

At the command prompt, type the following command to add an AppFlow policy and verify the configuration:

```

1 add appflow policy <name> <rule> <action>
2
3 show appflow policy <name>
4
5 <!--NeedCopy-->

```

**Example**

```

1 add appflow policy apfl-pol-tcp-dsprt client.TCP.DSTPORT.EQ(22) apfl-
 act-collector-1-and-3
2
3 <!--NeedCopy-->

```

**Configure an AppFlow policy by using the configuration utility**

Navigate to **System > AppFlow > Policies**, and create the AppFlow policy.

**Add an expression by using the Add Expression dialog box**

1. In the Add Expression dialog box, in the first list box choose the first term for your expression.

-

HTTP

The HTTP protocol. Choose the option if you want to examine some aspect of the request that pertains to the HTTP protocol.

-

SSL

- 1 The **protected** websites. Choose the option **if** you want to examine some aspect of the request that pertains to the recipient of the request. -
- 2 CLIENT
- 3
- 4 The computer that sent the request. Choose the option **if** you want to examine some aspect of the sender of the request. When you make your choice, the rightmost list box lists appropriate terms **for** the next part of your expression.

2. In the second list box, choose the second term for your expression. The choices depend upon which choice you made in the previous step, and are appropriate to the context. After you make your second choice, the Help window below the Construct Expression window (which was blank) displays help describing the purpose and use of the term you just chose.
3. Continue choosing terms from the list boxes that appear to the right of the previous list box, or typing strings or numbers in the text boxes that appear to prompt you to enter a value, until your expression is finished.

## Bind an AppFlow Policy

To put a policy into effect, you must bind it either globally, so that it applies to all traffic that flows through the NetScaler, or to a specific virtual server, so that the policy applies only to the traffic related to that virtual server.

When you bind a policy, you assign it a priority. The priority determines the order in which the policies you define are evaluated. You can set the priority to any positive integer.

In the NetScaler operating system, policy priorities work in reverse order—the higher the number, the lower the priority. For example, if you have three policies with priorities of 10, 100, and 1000, the policy assigned a priority of 10 is performed first. Later, the policy assigned with a priority of 100, and finally the policy assigned an order of 1000.

You can leave yourself plenty of a room to add other policies in any order, and still set them to evaluate in the order you want. You can achieve by setting priorities with intervals of 50 or 100 between each policy when you globally bind it. You can then add more policies at any time without having to change the priority of an existing policy.

### Globally bind an AppFlow policy by using the command line interface

At the command prompt, type the following command to globally bind an AppFlow policy and verify the configuration:

```
1 bind appflow global <policyName> <priority> [<gotoPriorityExpression [-
 type <type>] [-invoke (<labelType> <labelName>)]
2
3 show appflow global
4
5 <!--NeedCopy-->
```

#### Example

```
1 bind appflow global af_policy_lb1_10.102.71.190 1 NEXT -type
 REQ_OVERRIDE -invoke vserver google
2
3 <!--NeedCopy-->
```

### Bind an AppFlow policy to a specific virtual server by using the command line interface

At the command prompt, type the following command to bind an AppFlow policy to a specific virtual server and verify the configuration:

```
1 bind lb vserver <name> -policyname <policy_name> -priority <priority>
2
3 <!--NeedCopy-->
```

**Example**

```
1 bind lb vserver google -policyname af_policy_google_10.102.19.179 -
 priority 251
2
3 <!--NeedCopy-->
```

**Globally bind an AppFlow policy by using the configuration utility**

Navigate to **System > AppFlow**, click **AppFlow policy Manager**, and select the relevant Bind Point (Default Global) and Connection Type, and then bind the AppFlow policy.

**Bind an AppFlow policy to a specific virtual server by using the configuration utility**

Navigate to **Traffic Management > Load Balancing > Virtual Servers**, select the virtual server, and click **Policies**, and bind the AppFlow policy.

**Enable AppFlow for Virtual Servers**

If you want to monitor only the traffic through certain virtual servers, enable AppFlow specifically for those virtual servers. You can enable AppFlow for load balancing, content switching, cache redirection, SSL VPN, GSLB, and authentication virtual servers.

**Enable AppFlow for a virtual server by using the command line interface**

At the command prompt, type:

```
1 set cs vserver <name> <protocol> <IPAddress> <port> -appflowLog ENABLED
2
3 <!--NeedCopy-->
```

**Example**

```
1 set cs vserver Vserver-CS-1 HTTP 10.102.29.161 80 -appflowLog ENABLED
2
3 <!--NeedCopy-->
```

**Enable AppFlow for a virtual server by using the configuration utility**

Navigate to **Traffic Management > Content Switching > Virtual Servers**, select the virtual server, and enable AppFlow Logging option.

## Enable AppFlow for a Service

You can enable AppFlow for services that are to be bound to the load balancing virtual servers.

### Enable AppFlow for a service by using the command line interface

At the command prompt, type:

```
1 set service <name> -appflowLog ENABLED
2
3 <!--NeedCopy-->
```

#### Example

```
1 set service ser -appflowLog ENABLED
2
3 <!--NeedCopy-->
```

### Enable AppFlow for a service by using the configuration utility

Navigate to **Traffic Management > Load Balancing > Services**, select the service, and enable AppFlow Logging option.

## Set the AppFlow Parameters

You can set AppFlow parameters to customize the exporting of data to the collectors.

### Set the AppFlow Parameters by using the command line interface

#### Important

- Starting from NetScaler release 12.1 build 55.13, you can use the NSIP to send **Logstream** records instead of the SNIP. A new parameter “logstreamOverNSIP” is introduced in the `set appflow param` command. By default, the “logstreamOverNSIP” parameter is DISABLED, you must “ENABLE” it. For more information on configuration, see the example.
- Starting from NetScaler release 13.0 build 58.x release, you can enable the Web SaaS application option in AppFlow feature. It can be enabled to receive the data usage of Web or SaaS applications from the Citrix Gateway service. For more information on configuration, see the example.

At the command prompt, type the following commands to set the AppFlow parameters and verify the settings:

```

1 - set appflow param [-templateRefresh <secs>] [-appnameRefresh <secs>]
 [-flowRecordInterval <secs>] [-udpPmtu <positive_integer>] [-
 httpUrl (**ENABLED** | **DISABLED**)] [-httpCookie (**ENABLED** |
 DISABLED)] [-httpReferer (**ENABLED** | **DISABLED**)] [-
 httpMethod (**ENABLED** | **DISABLED**)] [-httpHost (**ENABLED**
 | **DISABLED**)] [-httpUserAgent (**ENABLED** | **DISABLED**)] [-
 httpXForwardedFor (**ENABLED** | **DISABLED**)] [-clientTrafficOnly
 (**YES** | **NO**)] [-webSaaSAppUsageReporting (**ENABLED** | **
 DISABLED**)] [-logstreamOverNSIP (**ENABLED** | **DISABLED**)]
2
3 - show appflow Param
4
5 <!--NeedCopy-->

```

**Example**

```

1 set appflow Param -templateRefresh 240 -udpPmtu 128 -httpUrl enabled -
 webSaaSAppUsageReporting ENABLED -logstreamOverNSIP ENABLED
2
3 <!--NeedCopy-->

```

**Set the AppFlow parameters by using the configuration utility**

Navigate to **System > AppFlow**, click **Change AppFlow Settings**, and specify relevant AppFlow parameters.

**Support for subscriber ID obfuscation**

Starting from NetScaler release 13.0 build 35.xx, the AppFlow configuration is enhanced to support “subscriberIdObfuscation” algorithm for obfuscating MSISDN in layer 4 or layer 7, AppFlow records. However, before configuring the algorithm as MD5 or SHA256, you must first enable it as an AppFlow parameter. The parameter is disabled by default.

**Configure the subscriber ID obfuscation algorithm by using the CLI**

At the command prompt, type:

```

1 set appflow param [-subscriberIdObfuscation (ENABLED | DISABLED) [-
 subscriberIdObfuscationAlgo (MD5 | SHA256)]]
2
3 <!--NeedCopy-->

```

**Example**

```

1 set appflow param - subscriberIdObfuscation ENABLED -
 subscriberIdObfuscationAlgo SHA256

```

```
2
3 <!--NeedCopy-->
```

### Configure the subscriber ID obfuscation algorithm by using the GUI

1. Navigate to **System > AppFlow**.
2. In the AppFlow detailed pane, click **Change AppFlow Setting** under **Settings**.
3. In Configure AppFlow Settings page, set the following parameters:
  - **Subscriber ID Obfuscation.** Enable the option for obfuscation MSISDN in L4/L7 AppFlow records.
  - **Subscriber ID Obfuscation Algo.** Select algorithm type as MD5 or SHA256.
4. Click **OK** and **Close**.

## ← Configure AppFlow Settings

Flow Record Export Interval

UDP Max Transmission Unit

Subscriber ID Obfuscation ⓘ

Subscriber ID Obfuscation Algo

Security Insight Record Interval

TCP Attack Counter Interval

### Example: Configure AppFlow for DataStream

The following example illustrates the procedure for configuring AppFlow for DataStream using the command line interface.

```
1 enable feature appflow
2
3 add db user sa password freebsd
4
5 add lbvserver lb0 MSSQL 10.102.147.97 1433 -appflowLog ENABLED
6
7 add service sv0 10.103.24.132 MSSQL 1433 -appflowLog ENABLED
8
9 bind lbvserver lb0 sv0
10
```

```
11 add appflow collector col0 -IPAddress 10.102.147.90
12
13 add appflow action act0 -collectors col0
14
15 add appflow policy pol0 "mssql.req.query.text.contains('select')" act0
16
17 bind lbvserver lb0 -policyName pol0 -priority 10
18
19 <!--NeedCopy-->
```

When the NetScaler appliance receives a database request, the appliance evaluates the request against a configured policy. If a match is found, the details are sent to the AppFlow collector configured in the policy.

## Configure the metrics collector

Metrics collector is a service that you can enable on NetScaler to collect and export metrics from NetScaler to various endpoints. You can export metrics in two formats: Avro and Prometheus. The exported metrics can be processed and visualized to get meaningful insights. By default, the metrics collector supports the export of time-series analytics data every 30 seconds. However, you can configure it as a value from 30 to 300 seconds so that you can decide the interval for exporting the time-series analytics profile data.

Do the following to configure a metrics collector using the CLI.

1. Configure a collector service with IP address, protocol, and port using the following command.

```
1 add service <metrics_service_name> <ip-address> <protocol> <port>
```

### Example:

```
1 add service metrics_service1 192.168.1.1 HTTP 5563
```

2. Configure the analytics time series profile to send metrics data to the collector service. Specify the collector service, frequency for exporting metrics, and output mode.

```
1 set analytics profile ns_analytics_time_series_profile -collectors
 <metrics_service_name> -type timeseries -metrics ENABLED
 metricsExportFrequency <30-300> -outputMode <avro/prometheus>
```

### Example:

```
1 set analytics profile ns_analytics_time_series_profile -collectors
 metrics_service1 -type timeseries -metrics Enabled
 metricsExportFrequency 90 -outputMode prometheus --serveMode
 PUSH
```

**Note:**

This example uses the default time series profile `ns_analytics_time_series_profile`. If you want to create a time series profile, you can use the `add analytics profile` command.

In this example, metrics export frequency is set as 90 seconds and export mode is specified as Prometheus.

Verify the metrics collector configuration using the `show analytics profile <analytics-profile-name>` command:

```
1 show analytics profile ns_analytics_time_series_profile
2
3 Name: ns_analytics_time_series_profile
4 Collector: metrics_service1
5 Profile-type: timeseries
6 Output Mode: Prometheus
7 Metrics: ENABLED
8 Schema File: schema.json
9 Metrics Export Frequency: 90
10 Events: DISABLED
11 Auditlog: DISABLED
12 Serve mode: Pull
13 Reference Count: 0
```

### Debugging metrics collector

The required debugging logs are stored at `/var/nslog/metricscollector.log` location.

### Metrics File generation

The `metrics_<format>_log.*` files are generated under the `/var/nslog/` folder location.

### Dynamic schema support in metrics collector

With the support of dynamic schema counters, a schema file containing a list of counters can be updated at run time based on the requirement. By default, `/var/metrics_conf/schema.json` file is configured with a list of counters.

**Note:**

The metrics collector default schema file `/var/metrics_conf/schema.json` can be installed on a NetScaler appliance by `installns` procedure.

## Configure the metrics collector to subscribe counters using the CLI

Start the metrics export by configuring a collector service.

At the command prompt, type:

```
1 set analytics profile ns_analytics_time_series_profile -metrics ENABLED
 -collectors <collector_name> -schemaFile schema.json -outputMode <
 avro | prometheus>
2
3 <!--NeedCopy-->
```

### Note:

`schema.json` is the default `schemaFile` configuration.

A new schema file with a required set of counters can be configured using the CLI command for the metrics collector to export. The schema file must be present at the `/var/metrics_conf/` location.

The schema file containing all the list of counters (`reference_schema.json`) supported by stats infra is present in the `/var/metrics_conf/` location. This file can be used as a reference to build a custom list of counters.

## Configure a schema file using the CLI

```
1 set analytics profile ns_analytics_time_series_profile -metrics ENABLED
 -collectors <collector name> -schemaFile <schema file_name> -
 outputMode <avro | prometheus>
2
3 <!--NeedCopy-->
```

A new schema file with the required counters can be added and configured using the preceding CLI command for metrics collector to export.

The reference schema file with all the list of counters (`reference_schema.json`) supported by stats infra are present in `/var/metrics_conf/` location. This file can be used as a reference to build a custom list of counters.

## Check the CLI configuration output at the command prompt:

```
1 show analytics profile ns_analytics_time_series_profile
2
3 Name: ns_analytics_time_series_profile
4 Collector: <collector_name>
5 Profile-type: timeseries
6 Output Mode: avro
7 Metrics: ENABLED
8 Schema File: schema.json
```

```
9 Events: ENABLED
10 Auditlog: DISABLED
11 Serve mode: Push
12 Reference Count: 0
13
14 <!--NeedCopy-->
```

### Steps to update the list of counters exported

The following procedure describes the steps to update the list of exported counters:

1. Update the custom/new schema file.
2. Disable or enable metrics using the `-metrics` option shown in the CLI configuration for the updated schema file to be used.

### Multiple time-series profile support

The metrics collector supports up to three time-series profile configurations on the NetScaler appliance.

You can configure each time series to have the following.

- Collector.
- Schema file containing the required set of counters to be exported.
- The data format in which the metrics are to be exported.
- The option to enable or disable metrics audit logs and events.

With the multiple time-series profile support, the metrics collector can simultaneously export a different set (based on the schema file configured) of metrics to different collectors in different formats (AVRO, Prometheus, Influx).

### Add time-series profile using the CLI

At the command prompt, type:

```
1 add analytics profile <profile_name> -type timeseries
2 <!--NeedCopy-->
```

### Configure time-series profile using the CLI

At the command prompt, type:

```
1 set analytics profile <profile_name> -metrics <DISABLED|ENABLED> -
 auditlogs <DISABLED|ENABLED> -events <DISABLED|ENABLED> -collectors
 <collector_name> -schemaFile schema.json -outputMode <avro | influx
 | prometheus>
2
3 <!--NeedCopy-->
```

### Log file-naming conventions with multiple time-series profile support

- Avro log files are generated as `metrics_avro_<profile_name>_log.*`.
- Prometheus log files are generated as `metrics_prom_<profile_name>.log`.

#### Notes:

- Even though metrics can be enabled on all the configured time-series profiles, events and audit logs can be enabled only on one profile.
- The dynamic schema feature is supported from version 13.1 build 23.16 onwards.
- The multiple time-series profile is supported from version 13.1 build 33.6 onwards.

## Exporting performance data of webpages to AppFlow collector

May 2, 2023

The EdgeSight Monitoring application provides webpage monitoring data with which you can monitor the performance of various Web applications served in a NetScaler environment. You can now export this data to AppFlow collectors to get an in-depth analysis of the webpage applications. AppFlow, which is based on the IPFIX standard, provides more specific information about web application performance than does EdgeSight monitoring alone.

You can configure both load balancing and content switching virtual servers to export EdgeSight Monitoring data to AppFlow collectors. Before configuring a virtual server for AppFlow export, associate an AppFlow action with the EdgeSight Monitoring responder policy.

The following webpage performance data is exported to AppFlow:

- **Page Load Time.** Elapsed time, in milliseconds, from when the browser starts to receive the first byte of a response until the user starts to interact with the page. At this stage, all the page content might not be loaded.
- **Page Render Time.** Elapsed time, in milliseconds, from when the browser receives the first byte of response until either all page content has been rendered or the page load action has timed out.

- **Time Spent on the Page.** Time spent by users on a page. Represents the time from one page request to the next one.

AppFlow transmits the performance data by using the Internet Protocol Flow Information eXport (IP-FIX) format, which is an open Internet Engineering Task Force (IETF) standard defined in RFC 5101. The AppFlow templates use the following enterprise-specific Information Elements (IEs) to export the information:

- **Client Load End Time.** Time at which the browser received the last byte of a response to load all the objects of the page such as images, scripts, and style sheets.
- **Client Load Start Time.** Time at which the browser receives the first byte of the response to load any objects of the page such as images, scripts, and Style sheets.
- **Client Render End Time.** Time at which a browser finished rendering the entire page, including the embedded objects.
- **Client Render Start Time.** Time at which the browser started rendering the page.

### **Prerequisites for exporting performance data of webpages to AppFlow collectors**

Before associating the AppFlow action with the AppFlow policy, verify that the following prerequisites have been met:

- The AppFlow feature has been enabled and configured.
- The Responder feature has been enabled.
- The EdgeSight Monitoring feature has been enabled.
- EdgeSight Monitoring has been enabled on the load balancing or content switching virtual servers bound to the services of applications for which you want to collect the performance data.

### **Associating an AppFlow action with the EdgeSight monitoring responder policy**

To export the webpage performance data to the AppFlow collector, you must associate an AppFlow action with the EdgeSight Monitoring responder policy. An AppFlow action specifies which set of collectors receive the traffic.

### **To associate an AppFlow action with the EdgeSight Monitoring Responder policy by using the CLI**

At the command prompt, type:

```
1 set responder policy <name> -appflowAction <action_Name>
2 <!--NeedCopy-->
```

**Example**

```
1 set responder policy pol -appflowAction actn
2 <!--NeedCopy-->
```

**To associate an AppFlow action with the EdgeSight Monitoring Responder policy by using the GUI**

1. Navigate to **AppExpert > Responder > Policies**.
2. In the details pane, select an EdgeSight Monitoring responder policy, and then click **Open**.
3. In the **Configure Responder Policy** dialog box, in the **AppFlow Action** drop-down list, select the AppFlow action associated with the collectors to which you want to send the webpage performance data.
4. Click **OK**.

**Configuring a virtual server to export EdgeSight statistics to AppFlow collectors**

To export EdgeSight statistics information from a virtual server to the AppFlow collector, you must associate an AppFlow action with the virtual server.

**To associate an AppFlow action with a Load Balancing or Content Switching virtual server by using the GUI**

1. Navigate to **Traffic Management > Load Balancing > Virtual Servers**. You can also navigate to **Traffic Management > Content Switching > Virtual Servers**.
2. In the details pane, select a virtual server, or multiple virtual servers, and then click **Enable EdgeSight Monitoring**.
3. In the Enable EdgeSight Monitoring dialog box, select the **Export EdgeSight statistics to Appflow** check box.
4. From the AppFlow Action drop-down list, select the **AppFlow** action. The AppFlow action defines the list of AppFlow collectors to which it exports EdgeSight Monitoring statistics. If you have selected multiple load balancing virtual servers, the same AppFlow Action is associated with the responder policies bound to them. You can later change the AppFlow Action configured for each of the selected Load Balancing virtual server individually, if necessary.
5. Click **OK**.

**Session reliability on NetScaler high availability pair**

May 2, 2023

When a network disruption or a device failover occurs during an ICA session, session reconnection can use one of two mechanisms: session reliability or Auto Client Reconnect.

**Session reliability.** The preferred mode, is a smooth experience for the user. The disruption is barely noticeable for brief network interruptions.

**Auto client reconnect.** The fallback option, involves restarting the client. This mechanism is disruptive for the user and is not always supported.

Receivers can reconnect their ICA sessions seamlessly using the ICA session reliability feature, when HDX Insight is enabled.

This feature works both in standalone and in a NetScaler HA pair configuration, and even when a NetScaler failover happens.

**Note:**

- NetScaler appliances must be running on software version 11.1 build 49.16 or later.
- You must not enable or disable session reliability mode when the NetScaler appliances have active connections.
- Enabling or disabling the feature when connections are still active causes HDX Insight to stop parsing those sessions after a failover occurs. It results in the loss of information about the sessions.
- Session reliability on a high availability setup is disabled by default for NetScaler software version 11.1 49.16 or later. Session reliability is supported on a high availability setup only if both the nodes of the setup run the same build (for example, release 11.1 build 53). In other words, session reliability is not supported on a high availability setup if both the nodes run different builds (for example, one node has release 11.1 build 53 whereas the other has release 11.1 build 56). Session reliability for SSL VDA is supported if the following conditions are met:
  - The “EnableSRonHAFailover” parameter in the `set ica parameter` command must be YES.
  - The HTTPS must be used instead of HTTP while configuring the virtual server.
- When HDX Insight is enabled, basic encryption applications and desktops reconnect after high availability failover even if the EnableSRonHAFailover parameter is disabled.

**To configure Session reliability by using CLI:**

1. At the command line, use the default system administrator credentials to log on to the system.
2. To enable session reliability on HA failover, at the prompt, type: `set ica parameter EnableSRonHAFailover YES`
3. To disable session reliability on HA failover, at the prompt, type: `set ica parameter EnableSRonHAFailover NO`

**To Enable Session reliability on HA failover by using GUI:**

1. In a web browser, type the IP address of the primary NetScaler instance in the HA pair (for example, <http://192.168.100.1>).
2. In **User Name** and **Password**, enter the administrator credentials.
3. On the **Configuration** tab, navigate to **System > Settings**, and click **Change ICA Parameters**.
4. In the **Change ICA Parameters** section, select **Session Reliability on HA Failover**.
5. Click **OK**.

## Limitations

- Enabling this feature results in increased bandwidth consumption which is due to ICA compression being turned off by the feature. And the extra traffic between the primary and secondary nodes to keep them in sync.
- This feature is supported in Active-Passive mode only. Active-Active mode is not currently supported.
- When HDX Insight is enabled, and session reliability on the HA knob is set to NO, only ACR reconnect mode is supported in the NetScaler high availability failover scenario. The HA knob does not disable session reliability if HDX Insight is disabled.

The **Session Reconnect Semantics** table is as follows:

### Session reconnects semantics

Status	EnableSRonHAFailover Yes	EnableSRonHAFailover No (Default)
HDX Insight enabled	Session reconnect for ICA	Session reconnect for ICA
	Session works	Sessions does not work
HDX Insight disabled	Session reconnect for ICA	Session reconnect for ICA
	Session works	Sessions works

### Points to note

- Session reliability for ICA sessions works out of the box with NetScaler Gateway.
- Session reliability for ICA sessions does not work when both the following conditions are met:
  - HDX Insight is enabled
  - EnableSRonHAFailover is set to NO
- Setting the EnableSRonHAFailover knob to either YES or NO does not make any difference, when HDX Insight is disabled.

## API security

May 17, 2024

API security plays an important role in protecting sensitive data by enforcing access controls, authentication, and encryption on the API traffic and ensuring that only authorized entities can access and transmit confidential information securely.

NetScaler allows you to secure the API traffic by validating the incoming API traffic against the imported API specification. An API specification defines the design of an API, including endpoints, methods, parameters, and data formats.

Perform the following configuration to secure the API traffic:

- [Import API Specification](#)
- [API specification validation](#)
- [API traffic visibility using API specification validation](#)

Starting from NetScaler release 14.1 build 21.x, you can protect the authentication and VPN endpoint URLs hosted by NetScaler using a built-in API specification. NetScaler checks the URL traffic to ensure that it is not a potential attack. By default, this feature is disabled. For information on how to enable it, see [Authentication methods](#).

**Note:**

The Web App firewall protection for authentication and Gateway endpoint is not supported on Linux based CPX and BLX deployments.

## Import API Specification

May 16, 2024

API specification defines the design of an API, including endpoints, methods, parameters, and data formats. The import API specification capability allows you to import the open API specification, which is generally used to describe the REST API. When the Web App Firewall performs a validation check on a user's request for an API-based web service, it validates the request against the schema specified in the API specification file for that web service. NetScaler supports schema validations for a REST API with payload being application JSON and ProtoBuf for gRPC API requests.

NetScaler supports the following specification formats:

- Open API - Swagger 2.0, OAS 3.0,3.1
- ProtoBuf - v3 and v2

## Manage API specification files

You can validate incoming API traffic against the imported API specification by assigning it to a profile and setting a relaxation rule to either block or allow the traffic. You can also use the imported API specification in creating policy expressions. Importing an API specification consists of two steps:

1. Import the API specification - Import an API specification to NetScaler through a URL or from the system.
2. Add the API specification to NetScaler - When you add an API specification to NetScaler, the file is validated, converted into an internal format, and an API specification entity is created. The API specification entity created will be used in policy expressions and Web App Firewall profiles.

### Note:

Ensure that the uploaded Open API Swagger 2.0, OAS 3.0, and 3.1 specification files do not contain any references to external files. If you need to use details from an external file, consolidate the information into a single file using open-source tools and then upload it.

## Manage API specification files using the CLI

The following parameters are used in the CLI commands:

- Name - Name of the API specification file that is uploaded.
- Source - URL (protocol, host, path, and name) for the location to store the imported specification file.
- Spec Name - The name of the entity that is created from the uploaded API specification.
- Type - Input format of the API specification.  
Default Value: OAS

To import an API specification file, type:

```
import api specFile <name> <src>
```

Example:

```
import apispec testapispec.json http://www.example.com/testapispec.json
```

To add an API specification file, type:

```
add api spec <Name> -File <string> -Type <string>
```

Example:

```
add api spec testapispec -File testapispec.json -Type OAS
```

To update an API specification file, import a new specification file that needs to be updated.

At the command prompt, type:

```
update api spec <specName> -File <string> -Type <string>
```

Example:

```
update api spec testapispec -File testapispec.json -Type OAS
```

**Note:**

If the type attribute is not specified, OAS is the default type.

To view all the endpoints, type:

```
show api spec <specName>
```

Example:

```
show api spec testapispec
```

To delete the API specification, type:

```
rm api spec <specName>
```

Example:

```
rm api spec testapispec
```

**Note:**

Before removing the API specification, make sure it is not being used by any profile or policy.

### Manage API specification files using the GUI

1. Navigate to **Security > NetScaler Web App Firewall > Imports**.
2. On the **Imports** page, select the **API Spec Import Page** tab, and then click **Add**.
3. On the **API Spec Import Object** page, select any one of the following options for the **Import From** parameter:
  - a) URL: A web URL on a website accessible to the appliance.
  - b) File: A file on a local or networked hard disk or other storage device.
4. Click **Continue**.
5. On the **API Spec Import Object** page, enter the following details:
  - a) API Spec Name –The name of the entity that is created from the uploaded API specification.  
Note: Both the API file name and the API Spec Name entered should be the same.
  - b) API Spec Type –Select the type of specification.  
Types: REST (OpenAPI/Swagger), and gRPC(PROTO).  
Default Type: REST (OpenAPI/Swagger)

c) Click **Done**.

The newly added entity is listed in the **Imports** page under the **API Spec Import Page tab**.

### **View the statistics of API specification and API endpoints**

You can view the following statistics for all the API specifications and API endpoints:

- API specifications hits - Requests matching any endpoint of the API specification.
- API specification successful validations - Requests matching any endpoint of the API specification and in conformance with the API schema.
- API specification unmatched requests - Requests not matching any endpoint of the API specification.
- API endpoints hits - Requests matching a specific endpoint.
- API endpoints successful validations - Requests matching a specific endpoint and in conformance with the API schema.

### **View API specifications and API endpoint statistics using the CLI**

At the command prompt, type:

```
stat apispec <apispec name>
```

Example

```
stat apispec testapispec
```

### **View API specifications and API endpoint statistics using the GUI**

1. Navigate to **Security > NetScaler Web App Firewall > Imports**.
2. On the Imports page, select the **API Spec Import tab**, and then click **Statistics**.  
The API specification summary is displayed.
3. To view the endpoint summary, click any of the API specifications.  
The API endpoint summary is displayed for the selected API specification.

## **API specification validation**

April 15, 2024

API specification ensures seamless data transfer between systems through an API (Application Programming Interface). It guarantees that the data exchanged follows a predefined structure or format, thereby enhancing the overall reliability and security of the system.

An API specification defines the endpoint, schema, and parameters. Schema validation is a process that allows you to check if the incoming traffic adheres to the schema you provided in the API specification. By associating an API specification to a Web App Firewall profile, you can specify which incoming traffic is allowed, and which is either blocked or logged. Validating incoming traffic against the imported API specifications helps to ensure that network traffic is secure and compliant.

There are several API types that are commonly used in software development. These types determine how data is structured and exchanged between different software systems. NetScaler supports the following API types:

- Representational State Transfer (REST)
- Google Remote Procedure Call (gRPC)

API specifications define the design of an API, including endpoints, methods, parameters, and data formats. These specifications ensure consistency, interoperability, and ease of use when developing and consuming APIs. NetScaler supports the following specification formats:

- Open API (formerly known as Swagger)
- ProtoBuf (Protocol Buffers)

Note: You can import, add, update, and delete API specification files using the GUI or the CLI. For more information, see [Imports](#).

### Assign API Spec to a profile using CLI

Configure a Web App Firewall profile with an API specification file to validate the traffic. You can configure an action used when the validation fails using the `restAction` (for REST APIs) or `grpcAction` (for gRPC APIs) parameter.

At the command prompt, type:

```
set appfw profile <Profile Name> -apispec <API spec entity name>
```

- ```
1 - Profile name - The name of the profile.
2 - API spec entity name - The name of the entity that is created from
   the uploaded API specification.
```

Assign API Spec to a profile using GUI

1. Navigate to **Security > NetScaler Web App Firewall > Profiles** and click **Add**.
2. Select the required file for an API Spec Schema and click **Ok**

Assign API Spec to an existing profile using GUI

1. Navigate to **Security > NetScaler Web App Firewall > Profiles**
2. Select a user-defined profile and click **Edit**.
3. On the **NetScaler Web App Firewall Profile** page, click the **Edit** icon.
4. Select the required file for an API Spec Schema and click **Ok**.

Configure REST and gRPC API schema validation using CLI

At the command prompt, type:

```
1 set appfw profile <profile name> -restAction [block log none stats]
2 set appfw profile <profile name> -grpcAction [block log none stats]
3 <!--NeedCopy-->
```

Configure REST and gRPC API schema validation using GUI

To configure or modify the REST and gRPC API schema validation:

1. Navigate to **Security > NetScaler Web App Firewall > Profiles****.
2. Select a user-defined profile and click **Edit**.
3. On the **NetScaler Web App Firewall Profile** page, Under the **Advanced Settings** section, click **Security Checks**.
4. In the **Security Checks** section, select **REST API Schema Validation** or **gRPC API Schema Validation** and Click **Action Settings**.
5. In the **Actions** page, set the **Action parameter**. You can either select or clear the option.
6. Click **Ok**.

Note:

Unselect the Start URL option before configuring the security check for API Schema Validation.

Configure relaxation rule for API schema validation using CLI

Configure a relaxation rule to bypass certain traffic from being validated against the schema specified in the API specification linked with the web App Firewall profile.

To configure the relaxation rule for REST API schema validation, at the command prompt, type:

```
bind appfw profile <profile name> -restValidation <REST relaxation pattern> -ruleAction <Log|None>
```

- REST relaxation pattern - The URL pattern for which the relaxation is applied. Patterns can include variables as well as wildcard definitions, as described in proto of Google APIs Current link: <https://github.com/googleapis/googleapis/blob/master/google/api/http.proto>

The URL specified is not required to be part of the API specification.

Note:

The prefix of the pattern should have an HTTP method (ie. GET, PUT, POST, DELETE, PATCH) followed by a colon (:).

Example:

- GET:/v1/{name=messages/*} - Allows three segment URLs starting with /v1/messages and the method is GET.
- PATCH:/v1/messages/{message_id=**} - Allows anything with /v1/messages prefix and the method is PATCH.
- POST:/v1/lists/** - Allows anything with /v1/lists prefix and the method is POST.
- ://engineering/** - Allows any URL that has the second segment as engineering regardless of the method.

- Log or None - Specifies whether logs are generated for bypassed traffic matching the rule. When action is set to log, relaxed URLs and corresponding rules are dumped into system logs. When the action is set to log, the relaxed URLs and the corresponding rule are recorded in the system logs.

To configure the relaxation rule for gRPC API schema validation, at the command prompt, type:

```
bind appfw profile <profile name> -grpcValidation <gRPC pattern> - ruleAction <Log|None>
```

- gRPC pattern - The pattern of gRPC endpoint(s) for which the relaxation is applied. The gRPC method specified is not required to be part of the API specification.

Example:

- citrix.api.doc.AddBook - Allows the RPC AddBook in package citrix.api.doc.
- test.api.** - Allows all RPCs in packages, starting with test.api.
- *.engineering.** - Allows all RPCs that have engineering as the second segment of the package name.

Log

None - Specifies whether logs are generated for bypassed traffic matching the rule.

•

Configure relaxation rule for API schema validation using GUI

REST API schema validation

1. Navigate to **Security > NetScaler Web App Firewall > Profiles**.
2. Select a user-defined profile and click **Edit**.
3. On the **NetScaler Web App Firewall Profile** page, Under the **Advanced Settings** section, click **Relaxation Rule**.
4. Select the **REST API Schema Validation** and click **Edit**.
5. In the **REST API Schema Validation Relaxation Rules** page, click **Add**.
6. In the **REST API Schema Validation Relaxation Rule** page, specify the following details:
 - a) Enabled - Select the option to enable the relaxation rule.
 - b) Rest URL Pattern - Enter the URL pattern for which the relaxation is applied.
 - c) REST URL Relaxation Action - Select an action.
 - d) Comments- Description of the expression.
 - e) Resource ID - Unique ID to identify the resource.
 - f) Click **Create**.

The newly added REST API schema validation relaxation rule is listed on the REST API Schema Validation Relaxation Rules page.

gRPC API schema validation

1. Navigate to **Security > NetScaler Web App Firewall > Profiles**.
2. On the **Profiles** page, select a profile and click **Edit**.
3. On the **NetScaler Web App Firewall Profile** page, under the **Advanced Settings** section, click **Relaxation Rule**.
4. Select the **gRPC API Schema Validation** and click **Edit**.
5. In the **gRPC API Schema Validation Relaxation Rules** page, click **Add**.
6. In the **gRPC API Schema Validation Relaxation Rule** page, specify the following details:
 - a) Enabled - Select the option to enable the relaxation rule.
 - b) gRPC Method Pattern - Enter the gRPC Method pattern for which the relaxation is applied
 - c) REST URL Relaxation Action - Select any one of the actions.
 - d) Comments- Description of the expression.
 - e) Resource ID - Unique ID to identify the resource.
 - f) Click **Create**.

The newly added gRPC API schema validation relaxation rule is listed in the gRPC API Schema Validation Relaxation Rules page.

Advanced policy expressions using API specification

April 15, 2024

You can import unified API specifications onto the Web App Firewall imports page and then create an advanced policy expression using the API specifications. You can configure the appropriate actions for the incoming API traffic based on the expressions. An API specification contains the endpoint, schema, and parameters. The incoming API traffic can be of type gRPC or REST.

You can use the `http.req.api` expression to identify the endpoints in the incoming requests defined in the API specification.

Syntax:

```
http.req.api ("API_Spec_Name")
```

Example:

```
set responder policy reject -rule !"http.req.api(\"myspec\").endpoint  
(\"POST\"\", \"/v1/pet/\")
```

The system rejects all the traffic if the traffic does not match the endpoints specified in the API specification.

Advanced policy expression for API schema

You can create advanced policy expressions for the API using the following operations:

Prerequisites.

Import the API specification file using the import option in the Web App Firewall.

For more information, see [Imports](#).

Expression to match traffic by HTTP method

Use an HTTP string method to restrict matching APIs. This string can contain one or more HTTP methods separated by “

”or can contain a wild card (*). When more than one method is specified, the expression evaluates to an OR condition between the methods.

For example, GET or PUT or DELETE matches an incoming request with the HTTP method GET OR PUT OR DELETE.

Example:

- Single HTTP method

```
http.req.api("petstore").method("POST").text("id").eq("1")
```

- Multiple Method

```
http.req.api("petstore").method("GET|DELETE").exists
```

Expression to match traffic by URL

PATH (URL string) is used to match the endpoints that include wildcards. The single asterisk (*) matches a single segment while the double asterisk (**) matches all possible segments prefixed before the double asterisk.

Example:

- `http.api("petstore").path("/v1/pets/*/find")`
It matches the incoming traffic only with `/v1/pets/*/find`
- `http.api("petstore").path("/v1/pets/**")`
It matches all endpoints starting with `/v1/pets`

Expression to match traffic by API name

Use the APINAME (name string) expression to restrict the matching traffic by API name. You can also use the API name string by running the show command as shown in the following example:

```
1 show api spec gspec
2 Name: gspec
3 File: gfile
4 Type: OAS
5 <!--NeedCopy-->
```

- The `operation ID` serves as the endpoint name if the file type is OAS.

Example: To validate the incoming traffic against the endpoint from the following OAS:

```
operationId: adexchangebuyer.accounts.list
```

Use the following policy expression:

```
http.req.api("schema").apiname("adexchangebuyer.accounts.list").exists
```

- The `service name` and `rpc name` serves as the endpoint name if the file type is proto.

In the following example, EchoService.Echo is the endpoint:

```
service EchoService
```

```
{
```

```
  rpc Echo(EchoReq) returns (EchoResp)
```

```
{
  option (google.api.http) = {
    get: "/v1/{name=messages/*}"
  };
}
```

Access values from the API specification

You can access the fields in the API specifications by name, path, query parameters, JSON body, or gRPC body. To define the type of the parameter, use PI expressions. The following types are supported:

- num - An integer value.
- ulong - A long integer value.
- bool - A boolean value.
- double - A double value.
- text - A string of any length.

Example:

To validate the incoming traffic using numeric parameter that matches the value one, use the following expression:

```
http.req.api("petstore.proto").APIName("TestPet").NUM("test_num1").eq(1)
```

Access value from the repeated fields

To access repeated objects in APIs, use the second parameter as the repeating index. Accessing outside the array results in an undefined value.

Example:

To retrieve the fifth tag in the 'FindPets' endpoint use:

```
http.req.api("petstore.proto", "FindPets").TEXT("tags", 5).contains("mytag")
```

To retrieve the fifth tag in the repeated tags string, use:

```
/v1/pets?tags=1&tags=2&tags=3&tags=4&tags=mytag&tags=6
```

Access values from the nested objects

Objects can be nested inside other objects. The same field name can occur in nested objects in the same document. However, the full access name must still be unique.

To access nested fields, concatenate the field names with a “.”(dot) as a separator.

Example: use `kennel.location.state` to retrieve California from the following JSON.

```
{
  "kennel": {
    "location": {
      "state": "California"
    }
  }
}
```

Expression

```
http. req.api("petstore.proto", "TestPet").text( "kennel.location.
state").contains("California")
```

Access value using object expression

The `Object()` expression is used when accessing subfields of repeated objects. If there are two or more objects configured with different values, you can create an expression to validate the object specific to one value.

For example, in the following JSON body, the object “foo” has two values, which are one and none.

```
{
  "foo":
  [
    {
      "bar": "one"
    },
    {
      "bar": "none"
    }
  ]
}
```

To compare the value to none, you can configure the expression as follows:

```
HTTP. req.api("schema").object("foo",1).text("bar").eq("none")
```

API traffic visibility using API specification validation

April 15, 2024

NetScaler provides an option to export additional information as part of the HTTP transactions related to the HTTP APIs when it determines the traffic as API traffic.

For more information on exporting the HTTP transaction logs, see [Export transaction logs directly from NetScaler to Splunk](#).

Enable API traffic visibility with the API specification using the CLI

1. Create the API profile

At the command prompt, type:

```
add api profile <name>
```

2. Enable the API visibility

At the command prompt, type

```
set api profile <name> -apiVisibility <ENABLED/DISABLED>
```

3. Bind the specification to the profile

At the command prompt, type:

```
bind -apiprofile <name> -apiSpec <name>
```

4. Assign the profile to a virtual server

At the command prompt, type:

```
set cs vserver <name> -apiprofile <name>
```

Example:

```
1 add api profile test_apiprofile1
2 set api profile test_apiprofile1 -apiVisibility enabled
3 bind api profile test_apiprofile1 -apispec testapi spec name
4 set cs vserver vserver_test1 -apiprofile test_apiprofile1
5 <!--NeedCopy-->
```

If the incoming traffic matches the endpoint in the API specification, then `apiEndpoint`, `apiSpecName`, and `isApi` parameters are sent in the HTTP transaction logs.

Enable API traffic visibility without the API Specification using the CLI

1. Create the API profile

At the command prompt, type:

```
add api profile <name>
```

2. Enable the API visibility

At the command prompt, type:

```
set api profile <name> -apiVisibility <ENABLED/DISABLED>
```

3. Assign the profile to virtual server

At the command prompt, type:

```
set cs vserver <name> -apiprofile <name>
```

Example:

```
1 add api profile test_apiprofile
2 set api profile <test_apiprofile> -apiVisibility enabled
3 set cs vserver vserver_test -apiprofile test_apiprofile
4 <!--NeedCopy-->
```

If the incoming traffic is API traffic, then isApi parameter is sent in the HTTP transaction logs.

Enable API traffic visibility using GUI

1. Navigate to **System > Profiles > API Profiles**.
2. Click **Add**.
3. On the **API Profiles** page, enter a Name for the API profile.
4. Select **API Visibility**, and click **OK**.
5. To enable API traffic visibility, bind the API Specification file.
 - a) On the **API Profiles** page, under **Advanced Settings**, click **API Spec**.
 - b) In the **API SPEC Binding** section, click **>** and select the required API specification.
 - c) Click **Bind** and then click **Close**.
6. Click **Done**.

NetScaler Web App Firewall

June 12, 2023

The NetScaler Web App Firewall offers easy to configure options to meet a wide range of application security requirements. Web App Firewall profiles, which consist of sets of security checks, can be used

to protect both the requests and the responses by providing deep packet-level inspections. Each profile includes an option to select basic protections or advanced protections. Some protections might require use of other files. For example, xml validation checks might require WSDL or schema files. The profiles can also use other files, such as signatures or error objects. These files can be added locally, or they can be imported ahead of time and saved on the appliance for future use.

Each policy identifies a type of traffic, and that traffic is inspected for the security check violations specified in the profile that is associated with the policy. The policies can have different bind points, which determine the scope of the policy. For example, a policy that is bound to a specific virtual server is invoked and evaluated for only the traffic flowing through that virtual server. The policies are evaluated in the order of their designated priorities, and the first one that matches the request or response is applied.

- Quick Deployment of Web App Firewall Protection

You can use the following procedure for quick deployment of Web App Firewall security:

1. Add a Web App Firewall profile and select the appropriate type (html, xml, JSON) for the security requirements of the application.
2. Select the required level of security (basic or advanced).
3. Add or import the required files, such as signatures or WSDL.
4. Configure the profile to use the files, and make any other necessary changes to the default settings.
5. Add a Web App Firewall policy for this profile.
6. Bind the policy to the target bind point and specify the priority.

- Web App Firewall entities

Profile—An Web App Firewall profile specifies what to look for and what to do. It inspects both the request and the response to determine which potential security violations must be checked and what actions must be taken when processing a transaction. A profile can protect an HTML, XML, or HTML and XML payload. Depending on the security requirements of the application, you can create either a basic or an advanced profile. A basic profile can protect against known attacks. If higher security is required, you can deploy an advanced profile to allow controlled access to the application resources, blocking zero day attacks. However, a basic profile can be modified to offer advanced protections, and conversely. Multiple action choices (for example, block, log, learn, and transform) are available. Advanced security checks might use session cookies and hidden form tags for controlling and monitoring the client connections. Web App Firewall profiles can learn the triggered violations and suggest the relaxation rules.

Basic Protections—A basic profile includes a preconfigured set of Start URL and Deny URL relaxation rules. These relaxation rules determine which requests must be allowed and which must be denied. Incoming requests are matched against these lists and the configured actions are applied. This allows the user to be able to secure applications with minimal configuration

for relaxation rules. The Start URL rules protect against forceful browsing. Known web server vulnerabilities that are exploited by hackers can be detected and blocked by enabling a set of default Deny URL rules. Commonly launched attacks, such as Buffer Overflow, SQL, or Cross-site scripting can also be easily detected.

Advanced Protections—As the name indicates, advanced protections are used for applications that have higher security requirements. Relaxation rules are configured to allow access to only specific data and block the rest. This positive security model mitigates unknown attacks, which might not be detected by basic security checks. In addition to all the basic protections, an advanced profile keeps track of a user session by controlling the browsing, checking for cookies, specifying input requirements for various form fields, and protecting against tampering of forms or cross-site request forgery attacks. Learning, which observes the traffic and deploys the appropriate relaxations, is enabled by default for many security checks. Although easy to use, advanced protections require due consideration, because they offer tighter security but also require more processing and do not allow use of caching, which can affect performance.

Import—Import functionality is useful when Web App Firewall profiles must use external files, that is, files hosted on an external or internal web server, or that have to be copied from a local machine. Importing a file and storing it on the appliance is useful, especially in situations where you have to control access to external websites, or where compilation takes a long time, large files have to be synced across HA deployments, or you can reuse a file by copying it across multiple devices. For example:

- WSDLs hosted on external web servers can be imported locally before blocking access to external websites.
- Large signature files generated by an external scan tool such as Cenzic can be imported and precompiled, using schema on the NetScaler ADC appliance.
- A customized HTML or XML error page can be imported from an external web server or copied from a local file.

Signatures—Signatures are powerful, because they use pattern matching to detect malicious attacks and can be configured to check both the request and the response of a transaction. They are a preferred option when a customizable security solution is needed. Multiple choices (for example, block, log, learn, and transform) are available for the action to take when a signature match is detected. The Web App Firewall has a built-in default signature object consisting of more than 1,300 signature rules, with an option to get the latest rules by using the auto-update feature. Rules created by other scan tools can also be imported. The signature object can be customized by adding new rules, which can work with the other security checks specified in the Web App Firewall profile. A signature rule can have multiple patterns and can flag a violation only when all the patterns are matched, thereby avoiding false positives. Careful selection of a literal `fastmatch` pattern for a rule can significantly optimize processing time.

Policies—Web App Firewall Policies are used to filter and separate the traffic into different

types. This provides the flexibility to implement different levels of security protections for the application data. Access to highly sensitive data can be directed to advanced security-check inspections, while less sensitive data is protected by basic-level security inspections. Policies can also be configured to bypass security-check inspection for harmless traffic. Higher security requires more processing, so careful design of the policies can provide desired security along with optimized performance. The priority of the policy determines the order in which it is evaluated, and its bind point determines the scope of its application.

Highlights

1. Ability to secure a wide range of applications by protecting different types of data, implementing the right level of security for different resources, and still getting maximum performance.
2. Flexibility to add or modify a security configuration. You can tighten or relax security checks by enabling or disabling basic and advanced protections.
3. Option to convert an HTML profile to an XML or Web2.0 (HTML+XML) profile and conversely, providing the flexibility to add security for different types of payload.
4. Easily deployed actions to block attacks, monitor them in logs, collect statistics, or even transform some attack strings to render them harmless.
5. Ability to detect attacks by inspecting incoming requests, and to prevent leakage of sensitive data by inspecting the responses sent by the servers.
6. Capability to learn from the traffic pattern to get recommendations for easily editable relaxation rules that can be deployed to allow exceptions.
7. Hybrid security model that applies the power of customizable signatures to block attacks that match specified patterns, and provides the flexibility to use the positive-security-model checks for basic or advanced security protections.
8. Availability of comprehensive configuration reports, including information about PCI-DSS compliance.

FAQs and Deployment Guide

June 2, 2023

Q: Why is NetScaler Web App Firewall the preferred choice for securing applications?

With the following features, the NetScaler Web App Firewall offers a comprehensive security solution:

- **Hybrid security model:** NetScaler hybrid security model allows you to take advantage of both a positive security model and a negative security model to come up with a configuration ideally suited for your applications.
 - **Positive security model** protects against Buffer Overflow, CGI-BIN Parameter Manipulation, Form/Hidden Field Manipulation, Forceful Browsing, Cookie or Session Poisoning, Broken ACLs, Cross-Site Scripting (cross-site scripting), Command Injection, SQL Injection, Error Triggering Sensitive Information Leak, Insecure Use of Cryptography, Server Misconfiguration, Back Doors and Debug Options, Rate-Based Policy Enforcement, Well Known Platform Vulnerabilities, Zero-Day Exploits, Cross Site Request Forgery (CSRF), and leakage of Credit Card and other sensitive data.
 - **Negative security model** uses a rich set signatures to protect against L7 and HTTP application vulnerabilities. The Web App Firewall is integrated with several third party scanning tools, such as those offered by Cenzic, Qualys, Whitehat, and IBM. The built-in XSLT files allow easy importation of rules, which can be used in conjunction with the native-format Snort based rules. An auto-update feature gets the latest updates for new vulnerabilities.

The positive security model might be the preferred choice for protecting applications that have a high need for security, because it gives you the option to fully control who can access what data. You allow only what you want and block the rest. This model includes a built-in security check configuration, which is deployable with few clicks. However, keep in mind that the tighter the security, the greater the processing overhead.

The negative security model might be preferable for customized applications. The signatures allow you to combine multiple conditions, and a match and the specified action are triggered only when all the conditions are satisfied. You block only what you don't want and allow the rest. A specific fast-match pattern in a specified location can significantly reduce processing overhead to optimize performance. The option to add your own signature rules, based on the specific security needs of your applications, gives you the flexibility to design your own customized security solutions.

- **Request as well as response side detection and protection:** You can inspect the incoming requests to detect any suspicious behavior and take appropriate actions, and you can check the responses to detect and protect against leakage of sensitive data.
- **Rich set of built-in protections for HTML, XML and JSON payloads:** The Web App Firewall offers 19 different security checks. Six of them (such as Start URL and Deny URL) apply to both HTML and XML data. Five checks (such as Field Consistency and Field Format) are specific to HTML, and eight (such as XML Format and Web Service Interoperability) are specific to XML payloads. This feature includes a rich set of actions and options. For example, URL Closure enables you to control and optimize the navigation through your website, to safeguard against forceful browsing without having to configure relaxation rules to allow each and every legitimate URL. You have the option to remove or x-out the sensitive data, such as credit-card numbers, in the

response. Be it SOAP Array attack protection, XML denial of Service (XDoS), WSDL scan prevention, Attachment check, or any number of other XML attacks, you have the comfort of knowing that you have an ironclad shield protecting your data when your applications are protected by the Web App Firewall. The signatures allow you to configure rules using XPATH-Expressions to detect violations in the body as well as the header of a JSON payload.

- **GWT:** Support for protecting Google Web Toolkit applications to safeguard against SQL, cross-site scripting and Form Field Consistency check violations.
- **Java-free, user friendly graphical user interface (GUI):** An intuitive GUI and preconfigured security checks make it easy to deploy security by clicking a few buttons. A wizard prompts and guides you to create the required elements, such as profiles, policies, signatures, and bindings. The HTML5 based GUI is free of any Java dependency. It's performance is significantly better than that of the older, Java based versions.
- **Easy to Use and automatable CLI:** Most of the configuration options that are available in GUI are also available in the command line interface (CLI). The CLI commands can be executed by a batch file and are easy to automate.
- **Support for REST API:** The NetScaler NITRO protocol supports a rich set of REST API's to automate Web App Firewall configuration and collect pertinent statistics for ongoing monitoring of security violations.
- **Learning:** The Web App Firewall's ability to learn by monitoring traffic to fine tune security is very user friendly. The learning engine recommends rules, which makes it easy to deploy relaxations without proficiency in regular expressions.
- **RegEx editor support:** Regular expression offer an elegant solution to the dilemma of wanting to consolidate rules and yet optimize search. You can capitalize on the power of regular expressions to configure URLs, field names, signature patterns, and so on. The rich built-in GUI RegEx editor offers you a quick reference for the expressions and provides a convenient way to validate and test your RegEx for accuracy.
- **Customized error page:** Blocked requests can be redirected to an error URL. You also have the option to display a customized error object that uses supported variables and NetScaler advanced policy (advanced PI expressions) to embed troubleshooting information for the client.
- **PCI-DSS, stats, and other violation reports:** The rich set of reports makes it easy to meet the PCI-DSS compliance requirement, gather stats about traffic counters, and view violation reports for all profiles or just one profile.
- **Logging and click-to-rule from log:** Detailed logging is supported for native as well as CEF format. The Web App Firewall offers you the ability to filter targeted log messages in the syslog viewer. You can select a log message and deploy a corresponding relaxation rule by a simple click of a button. You have the flexibility to customize log messages and also have support for generating web logs. For additional details, see [Web App Firewall Logs](#) topic.

- **Include violation logs in trace records:** The ability to include log messages in the trace records makes it very easy to debug unexpected behavior such as reset and block.
- **Cloning:** The useful Import/Export profile option allows you to clone the security configuration from one NetScaler appliance to others. Export learned data options make it easy to export the learned rules to an Excel file. You can then get them reviewed and approved by application owner before applying them.
- **An AppExpert template** (a set of configuration settings) can be designed to provide appropriate protection for your websites. You can simplify and expedite the process of deploying similar protection on other appliances by exporting these cookie-cutter templates to a template.

For additional details, see [AppExpert template topic](#).

- **Sessionless security checks:** Deploying sessionless security checks can help you reduce the memory footprint and expedite the processing.
- **Interoperability with other NetScaler features:** The Web App Firewall works seamlessly with other NetScaler features, such as rewrite, URL transformation, integrated caching, CVPN, and rate limiting.
- **Support of PI expressions in policies:** You can leverage the power of advanced PI expressions to design policies to implement different levels of security for different parts of your application.
- **Support for IPv6:** The Web App Firewall supports both IPv4 and IPv6 protocols.
- **Geolocation based security protection:** You have the flexibility of using NetScaler advanced policy (PI Expressions) for configuring location based policies, which can be used in conjunction with a built-in location database to customize firewall protection. You can identify the locations from which malicious requests originate, and enforce the desired level of security-check inspections for requests that originate from a specific geographical location.
- **Performance:** Request-side **streaming** significantly improves performance. As soon as a field is processed, the resulting data is forwarded to the back end while evaluation continues for the remaining fields. The improvement in processing time is especially significant when handling large posts.
- **Other security features:** The Web App Firewall has several other security settings that can help ensure the security of your data. For example, the **Confidential Field** lets you block leakage of sensitive information in the log messages, and **Strip HTML Comment** allows you to remove the HTML comments from the response before forwarding it to the client. **Field Types** can be used to specify what inputs are allowed in the forms submitted to your application.

Q: What do I need to do to configure Web App Firewall?

Do the following:

- Add an Web App Firewall profile and select the appropriate type (html, xml, web2.0) for the security requirements of the application.
- Select the required level of security (basic or advanced).
- Add or import the required files, such as signatures or WSDL.
- Configure the profile to use the files, and make any other necessary changes to the default settings.
- Add an Web App Firewall policy for this profile.
- Bind the policy to the target bind point and specify the priority.

Q: How do I know what profile type to choose?

The Web App Firewall profile offers protection for both HTML and XML payloads. Depending on the need of your application, you can choose either a HTML profile or XML profile. If your application supports both HTML and XML data, you can choose a Web2.0 profile.

Q: What is the difference between basic and advanced profiles? How do I decide which one I need?

The decision to use a basic or an advance profile depends on the security need of your application. A basic profile includes a preconfigured set of Start URL and Deny URL relaxation rules. These relaxation rules determine which requests are allowed and which are denied. Incoming requests are matched with the preconfigured rules, and the configured actions are applied. The user can secure applications with minimal configuration of relaxation rules. The Start URL rules protect against forceful browsing. Known web server vulnerabilities that are exploited by hackers can be detected and blocked by enabling a set of default Deny URL rules. Commonly launched attacks, such as Buffer Overflow, SQL, or Cross-Site Scripting can also be easily detected.

As the name indicates, advanced protections are for applications that have higher security requirements. Relaxation rules are configured to allow access to only specific data and block the rest. This positive security model mitigates unknown attacks, which might not be detected by basic security checks. In addition to all the basic protections, an advanced profile keeps track of a user session by controlling the browsing, checking for cookies, specifying input requirements for various form fields, and protecting against tampering of forms or Cross-Site Request Forgery attacks. Learning, which observes the traffic and recommends the appropriate relaxations, is enabled by default for many security checks. Although easy to use, advanced protections require due consideration, because they offer tighter security but also require more processing. Some advance security checks do not allow use of caching, which can affect performance.

Keep the following points in mind when deciding whether to use basic or advanced profiles:

- Basic and advanced profiles are just starting templates. You can always modify the basic profile to deploy advanced security features, and vice versa.
- Advanced security checks require more processing and can affect performance. Unless your application needs advanced security, you might want to start with a basic profile and tighten the security as required for your application.
- You do not want to enable all security checks unless your application needs it.

Q: What is a policy? How do I select the bind point and set the priority?

Web App Firewall policies can help you sort your traffic into logical groups for configuring different levels of security implementation. Carefully select the bind points for the policies to determine which traffic is matched against which policy. For example, if you want every incoming request to be checked for SQL/cross-site scripting attacks, you can create a generic policy and bind it globally. Or, if you want to apply more stringent security checks to the traffic of a virtual server hosting applications that contain sensitive data, you can bind a policy to that virtual server.

Careful assignment of priorities can enhance the traffic processing. You want to assign higher priorities to more specific policies and lower priorities to generic policies. Note that the higher the number, the lower the priority. A policy with a priority of 10 is evaluated before a policy that has a priority of 15.

You can apply different levels of security for different kinds of contents, e.g. requests for static objects like images and text can be by-passed by using one policy and requests for other sensitive contents can be subjected to a much stringent check by using a second policy.

Q: How do I go about configuring the rules to secure my application?

The Web App Firewall makes it very easy to design the right level of security for your web-site. You can have multiple Web App Firewall policies, bound to different Web App Firewall profiles, to implement different levels of security-check inspections for your applications. You can initially monitor the logs to observe what security threats are being detected and which violations are being triggered. You can either manually add the relaxation rules or take advantage of the Web App Firewall's recommended learned rules to deploy the required relaxations to avoid false positives.

The NetScaler Web App Firewall offers **visualizer** support in GUI, which makes rule management very easy. You can easily view all the data on one screen, and take action on several rules with one click. The biggest advantage of the visualizer is that it recommends regular expressions to consolidate several rules. You can select a subset of the rules, basing your selection on the delimiter and Action URL. Visualizer support is available for viewing 1) learned rules and 2) relaxation rules.

1. The visualizer for learned rules offers the option to edit the rules and deploy them as relaxations. You can also skip (ignore) rules.

2. The visualizer for deployed relaxations offers you the option to add a new rule or edit an existing one. You can also enable or disable a group of rules by selecting a node and clicking the **Enable** or **Disable** button in the relaxation visualizer.

Q: What are signatures? How do I know which signatures to use?

A signature is an object that can have multiple rules. Each rule consists of one or more patterns that can be associated with a specified set of actions. The Web App Firewall has a built-in default signature object consisting of more than 1,300 signature rules, with an option to get the latest rules by using the **auto-update** feature to get protection against new vulnerabilities. Rules created by other scan tools can also be imported.

Signatures are very powerful because they use pattern matching to detect malicious attacks and can be configured to check both the request and the response of a transaction. They are a preferred option when a customizable security solution is needed. Multiple action choices (for example, block, log, learn, and transform) are available for when a signature match is detected. The default signatures cover rules to protect different types of applications, such as web-cgi, web-coldfusion, web-frontpage, web-iis, web-php, web-client, web-activex, web-shell-shock, and web-struts. To match the needs of your application, you can select and deploy the rules belonging to a specific category.

Signature-usage tips:

- You can just make a copy of the default signature object and modify it to enable the rules you need and configure the actions you want.
- The signature object can be customized by adding new rules, which can work in conjunction with other signature rules.
- The signature rules can also be configured to work in conjunction with the security checks specified in the Web App Firewall profile. If a match indicating a violation is detected by a signature as well as a security check, the more restrictive action is the one that gets enforced.
- A signature rule can have multiple patterns and be configured to flag a violation only when all the patterns are matched, thereby avoiding false positives.
- Careful selection of a literal fast-match pattern for a rule can significantly optimize processing time.

Q: Does the Web App Firewall work with other NetScaler features?

The Web App Firewall is fully integrated into the NetScaler appliance and works seamlessly with other features. You can configure maximum security for your application by using other NetScaler security features in conjunction with the Web App Firewall. For example, **AAA-TM** can be used to authenticate the user, check the user's authorization to access the content, and log the accesses, including invalid login attempts. **Rewrite** can be used to modify the URL or to add, modify or delete headers, and

Responder can be used to deliver customized content to different users. You can define the maximum load for your website by using **Rate Limiting** to monitor the traffic and throttle the rate if it is too high. **HTTP Denial-of-Service (DoS)** protection can help distinguish between real HTTP clients and malicious DoS clients. You can narrow the scope of security-check inspection by binding the Web App Firewall policies to virtual servers, while still optimizing the user experience by using the **Load Balancing** feature to manage heavily used applications. Requests for static objects such as images or text can bypass security check inspection, taking advantage of **integrated caching** or **compression** to optimize the bandwidth usage for such content.

Q: How is the payload processed by the Web App Firewall and the other NetScaler features?

A diagram showing details of the L7 packet flow in a NetScaler appliance is available in the [Processing Order of Features](#) section.

Q: What is the recommended workflow for Web App Firewall deployment?

Now that you know the advantages of using the state-of-the-art security protections of the NetScaler Web App Firewall, you might want to collect additional information that can help you design the optimal solution for your security needs. Citrix recommends that you do the following:

- **Know your environment:** Knowing your environment will help you to identify the best security protection solution (signatures, security checks, or both) for your needs. Before you begin configuration, you must gather the following information.
 - **OS:** What kind of OS (MS Windows, Linux, BSD, Unix, others) do you have?
 - **Web Server:** What web server (IIS, Apache or NetScaler Enterprise Server) are you running?
 - **Application:** What type of applications are running on your application server (for example, ASP.NET, PHP, Cold Fusion, ActiveX, FrontPage, Struts, CGI, Apache Tomcat, Domino, and WebLogic)?
 - Do you have customized applications or off-the-shelf (for example, Oracle, SAP) applications? What version you are using?
 - **SSL:** Do you require SSL? If so, what key size (512, 1024, 2048, 4096) is used for signing certificates?
 - **Traffic Volume:** What is the average traffic rate through your applications? Do you have seasonal or time-specific spikes in the traffic?
 - **Server Farm:** How many servers do you have? Do you need to use load balancing?
 - **Database:** What type of database (MS-SQL, MySQL, Oracle, Postgres, SQLite, nosql, Sybase, Informix and so forth.) do you use?

- **DB Connectivity:** What kind of data base connectivity do you have (DSN, per-file connection string, single file connection string) and what drivers are used?
- **Identify your security needs:** You might want to evaluate which applications or specific data need maximum security protection, which ones are less vulnerable, and the ones for which security inspection can safely be bypassed. This will help you in coming up with an optimal configuration, and in designing appropriate policies and bind points to segregate the traffic. For example, you might want to configure a policy to bypass security inspection of requests for static web content, such as images, MP3 files, and movies, and configure another policy to apply advanced security checks to requests for dynamic content. You can use multiple policies and profiles to protect different contents of the same application.
- **License requirement:** NetScaler offers a unified solution to optimize the performance of your application by taking advantage of a rich set of features such as load balancing, content switching, caching, compression, responder, rewrite, and content filtering, to name a few. Identifying the features that you want can help you decide which license you need.
- **Install and baseline a NetScaler appliance:** Create a virtual server and run test traffic through it to get an idea of the rate and amount of traffic flowing through your system. This information will help you to identify your capacity requirement and select the right appliance (VPX, MPX, or SDX).
- **Deploy the Web App Firewall:** Use the Web App Firewall wizard to proceed with a simple security configuration. The wizard walks you through several screens and prompts you to add a profile, policy, signature, and security checks.
 - **Profile:** Select a meaningful name and the appropriate type (HTML, XML or WEB 2.0) for your profile. The policy and signatures will be auto-generated using the same name.
 - **Policy:** The auto-generated policy has the default Expression (true), which selects all traffic and is bound globally. This is a good starting point unless you have in mind a specific policy that you want to use.
 - **Protections:** The wizard helps you take advantage of the hybrid security model, in which you can use the default signatures offering a rich set of rules to protect different types of applications. **Simple** edit mode allows you to view the various categories (CGI, Cold Fusion, PHP, and so forth.). You can select one or more categories to identify a specific set of rules applicable to your application. Use the **Action** option to enable all the signature rules in the selected categories. Make sure that blocking is disabled, so that you can monitor the traffic before tightening the security. Click **Continue**. In the **Specify Deep protections** pane, you can make changes as needed to deploy the security check protections. In most cases, basic protections are sufficient for initial security configuration. Run the traffic for a while to collect a representative sample of the security-inspection data.
 - **Tightening the security:** After deploying Web App Firewall and observing the traffic for a while, you can start tightening the security of your applications by deploying relaxations and then enabling blocking. **Learning**, **Visualizer**, and **Click to deploy rules** are useful

features that make it very easy to tweak your configuration to come up with just the right level of relaxation. At this point, you can also change the policy expression and/or configure additional policies and profiles to implement desired levels of security for different types of content.

- **Debugging:** If you see unexpected behavior of your application, the Web App Firewall offers various options for easy debugging:
 - * **Log.** If legitimate requests are getting blocked, your first step is to check the ns.log file to see if any unexpected security-check violation is being triggered.
 - * **Disable feature.** If you do not see any violations but are still seeing unexpected behavior, such as an application resetting or sending partial responses, you can disable the Web App Firewall feature for debugging. If the issue persists, it rules out the Web App Firewall as a suspect.
 - * **Trace records with log messages.** If the issue appears to be Web App Firewall related and needs closer inspection, you have the option to include security violation messages in an nstrace. You can use “Follow TCP stream” in the trace to view the details of the individual transaction, including headers, payload, and the corresponding log message, together on the same screen. Details of how to use this functionality are available at [Appendixes](#).

Introduction to NetScaler Web App Firewall

March 22, 2024

The NetScaler Web App Firewall prevents security breaches, data loss, and possible unauthorized modifications to websites that access sensitive business or customer information. It does so by filtering both requests and responses, examining them for evidence of malicious activity, and blocking requests that exhibit such activity. Your site is protected not only from common types of attacks, but also from new, as yet unknown attacks. In addition to protecting web servers and websites from unauthorized access, the Web App Firewall protects against vulnerabilities in legacy CGI code or scripts, web frameworks, web server software, and other underlying operating systems.

The NetScaler Web App Firewall is available as a stand-alone appliance, or as a feature on a NetScaler virtual appliance (VPX). In the Web App Firewall documentation, the term NetScaler refers to the platform on which the Web App Firewall is running, regardless of whether that platform is a dedicated firewall appliance, a NetScaler on which other features have also been configured, or a NetScaler VPX.

To use the Web App Firewall, you must create at least one security configuration to block connections that violate the rules that you set for your protected websites. The number of security configurations that you might want to create depends on the complexity of your website. Sometimes, a single configuration is sufficient. In other cases, particularly those that include interactive websites, websites that

access database servers, online stores with shopping carts, you might need several different configurations to best protect sensitive data without wasting significant effort on content that is not vulnerable to certain types of attacks. You can often leave the defaults for the global settings, which affect all security configurations, unchanged. However, you can change the global settings if they conflict with other parts of your configuration or you prefer to customize them.

Web application security

Web application security is network security for computers and programs that communicate by using the HTTP and HTTPS protocols. This is a broad area in which security flaws and weaknesses abound. Operating systems on both servers and clients have security issues and are vulnerable to attack. Web server software and website enabling technologies such as CGI, Java, JavaScript, PERL, and PHP have underlying vulnerabilities. Browsers and other client applications that communicate with web-enabled applications also have vulnerabilities. Websites that use any technology but the simplest of HTML, including any site that allows interaction with visitors, often have vulnerabilities of their own.

In the past, a breach in security was often just an annoyance, but today that is seldom the case. For example, attacks in which a hacker gained access to a web server and made unauthorized modifications to (defaced) a website used to be common. They were usually launched by hackers who had no motivation beyond demonstrating their skills to fellow hackers or embarrassing the targeted person or company. Most current security breaches, however, are motivated by a desire for money. The majority attempt to accomplish one or both of the following goals: to obtain sensitive and potentially valuable private information, or to obtain unauthorized access to and control of a website or web server.

Certain forms of web attacks focus on obtaining private information. These attacks are often possible even against websites that are secure enough to prevent an attacker from taking full control. The information that an attacker can obtain from a website can include customer names, addresses, phone numbers, social security numbers, credit card numbers, medical records, and other private information. The attacker can then use this information or sell it to others. Much of the information obtained by such attacks is protected by law, and all of it by custom and expectation. A breach of this type can have serious consequences for customers whose private information is compromised. At best, these customers have to exercise vigilance to prevent others from abusing their credit cards, opening unauthorized credit accounts in their name, or appropriating their identities outright (identity theft). At worst, the customers may face ruined credit ratings or even be blamed for criminal activities in which they had no part.

Other web attacks are aimed at obtaining control of (or *compromising*) a website or the server on which it operates, or both. A hacker who gains control of a website or server can use it to host unauthorized content, act as a proxy for content hosted on another web server, provide SMTP services to

send unsolicited bulk email, or provide DNS services to support such activities on other compromised web servers. Most websites that are hosted on compromised web servers promote questionable or outright fraudulent businesses. For example, most phishing websites and child exploitation websites are hosted on compromised web servers.

Protecting your websites and web services against these attacks requires a multilayered defense capable of both blocking known attacks with identifiable characteristics and protecting against unknown attacks, which can often be detected because they look different from the normal traffic to your websites and web services.

For more information on security check, see [Overview of security checks](#).

Known web attacks

The first line of defense for your websites is protection against the large number of attacks that are known to exist and have been observed and analyzed by web security experts. Common types of attacks against HTML-based websites include:

- **Buffer overflow attacks.** Sending a long URL, long cookie, or long information to a web server causes the system to hang, crash, or provide unauthorized access to the underlying operating system. A buffer overflow attack can be used to gain access to unauthorized information, to compromise a web server, or both.
- **Cookie security attacks.** Sending a modified cookie to a web server, usually in hopes of obtaining access to unauthorized content by using falsified credentials.
- **Forceful browsing.** Accessing URLs on a website directly, without navigating to the URLs with hyperlinks on the home page or other common start URLs on the website. Individual instances of forceful browsing might indicate a user who bookmarked a page on your website, but repeated attempts to access nonexistent content, or content that users must never access directly, often represent an attack on website security. Forceful browsing is normally used to gain access to unauthorized information, but can also be combined with a buffer overflow attack in an attempt to compromise your server.
- **Web form security attacks.** Sending inappropriate content to your website in a web form. Inappropriate content can include modified hidden fields, HTML, or code in a field intended for alphanumeric data only, an overly long string in a field that accepts only a short string, an alphanumeric string in a field that accepts only an integer, and a wide variety of other data that your website does not expect to receive in that web form. A web form security attack can be used either to obtain unauthorized information from your website or to compromise the website outright, usually when combined with a buffer overflow attack.

Two specialized types of attacks on web form security deserve special mention:

- **SQL injection attacks.** Sending an active SQL command or commands in a web form or as part

of a URL, with the goal of causing an SQL database to run the command or commands. SQL injection attacks are normally used to obtain unauthorized information.

- **Cross-site scripting attacks.** Using a URL or a script on a webpage to violate the same-origin policy, which forbids any script from obtaining properties from or modifying any content on a different website. Since scripts can obtain information and modify files on your website, allowing a script access to content on a different website can provide an attacker the means to obtain unauthorized information, to compromise a web server, or both.

Attacks against XML-based web services normally fall into at least one of the following two categories: attempts to send inappropriate content to a web service, or attempts to breach security on a web service. Common types of attacks against XML-based web services include:

- **Malicious code or objects.** XML requests that contain code or objects that can either directly obtain sensitive information or can give an attacker control of the web service or underlying server.
- **Badly-formed XML requests.** XML requests that do not conform to the W3C XML specification, and that can therefore breach security on an insecure web service
- **Denial of service (DoS) attacks.** XML requests that are sent repeatedly and in high volume, with the intent of overwhelming the targeted web service and denying legitimate users access to the web service.

In addition to standard XML-based attacks, XML web services and Web 2.0 sites are also vulnerable to SQL injection and cross-site scripting attacks, as described below:

- **SQL injection attacks.** Sending an active SQL command or commands in an XML-based request, with the goal of causing an SQL database to run that command or commands. As with HTML SQL injection attacks, XML SQL injection attacks are normally used to obtain unauthorized information.
- **Cross-site scripting attacks.** Using a script included in an XML based application to violate the same-origin policy, which does not allow any script to obtain properties from or modify any content on a different application. Since scripts can obtain information and modify files by using your XML application, allowing a script access to content belonging to a different application can give an attacker the means to obtain unauthorized information, to compromise the application, or both

Known web attacks can usually be stopped by filtering website traffic for specific characteristics (signatures) that always appear for a specific attack and must never appear in legitimate traffic. This approach has the advantages of requiring relatively few resources and posing relatively little risk of false positives. Therefore, it is a valuable tool in fighting attacks on websites and web services, and configuring basic signature protection.

Unknown web attacks

The greatest threat against websites and applications does not come from known attacks, but from unknown attacks. Most unknown attacks fall into one of two categories: newly launched attacks for which security firms have not yet developed an effective defense (zero-day attacks), and carefully targeted attacks on a specific website or web service rather than many websites or web services (spear attacks). These attacks, like known attacks, are intended to obtain sensitive private information, compromise the website or web service and allow it to be used for further attacks, or both of those goals.

Zero-day attacks are a major threat to all users. These attacks are usually of the same types as known attacks; zero-day attacks often involve injected SQL, a cross-site script, a cross-site request forgery, or another type of attack similar to known attacks. Usually, they target vulnerabilities that the developers of the targeted software, website, or web service either are unaware of or have learned about. Security firms have therefore not developed defenses against these attacks, and even if they have, users have not obtained and installed the patches or performed the workarounds necessary to protect against these attacks. The time between discovery of a zero-day attack and availability of a defense (the vulnerability window) is shrinking, but perpetrators can still count on hours or even days in which many websites and web services lack any specific protection against the attack.

Spear attacks are a major threat, but to a more select group of users. A common type of spear attack, a spear phishes, is targeted at customers of a specific bank or financial institution, or (less commonly) at employees of a specific company or organization. Unlike other phishes, which are often crudely written forgeries that a user with any familiarity with the actual communications of that bank or financial institution can recognize, spear phishes are letter perfect and convincing. They can contain information specific to the individual that, at first look, no stranger must know or be able to obtain. The spear phisher is therefore able to convince the target to provide the requested information, which the phisher can then use to loot accounts, to process illegitimately obtained money from other sources, or to gain access to other, even more sensitive information.

Both of these types of attack have certain characteristics that can usually be detected, although not by using static patterns that look for specific characteristics, as do standard signatures. Detecting these types of attacks requires more sophisticated and more resource-intensive approaches, such as heuristic filtering and positive security model systems. Heuristic filtering looks, not for specific patterns, but for patterns of behaviors. Positive security model systems model the normal behavior of the website or web service that they are protecting, and then block connections that do not fit within that model of normal use. URL based and web-form based security checks profile normal use of your websites, and then control how users interact with your websites, using both heuristics and positive security to block anomalous or unexpected traffic. Both heuristic and positive security, properly designed and deployed, can catch most attacks that signatures miss. However, they require considerably more resources than do signatures, and you must spend some time configuring them properly to avoid false positives. They are therefore used, not as the primary line of defense, but as backups to signatures or other less resource-intensive approaches.

By configuring these advanced protections in addition to signatures, you create a hybrid security model, which enables the Web App Firewall to provide comprehensive protection against both known and unknown attacks.

How NetScaler Web App Firewall works

When you install the Web App Firewall, you create an initial security configuration, which consists of a policy, a profile, and a signatures object. The policy is a rule that identifies the traffic to be filtered, and the profile identifies the patterns and types of behavior to allow or block when the traffic is filtered. The simplest patterns, which are called signatures, are not specified within the profile, but in a signatures object that is associated with the profile.

A signature is a string or pattern that matches a known type of attack. The Web App Firewall contains over a thousand signatures in seven categories, each directed at attacks on specific types of web servers and web content. NetScaler updates the list with new signatures as new threats are identified. During configuration, you specify the signature categories that are appropriate for the web servers and content that you need to protect. Signatures provide good basic protection with low processing overhead. If your applications have special vulnerabilities or you detect an attack against them for which no signature exists, you can add your own signatures.

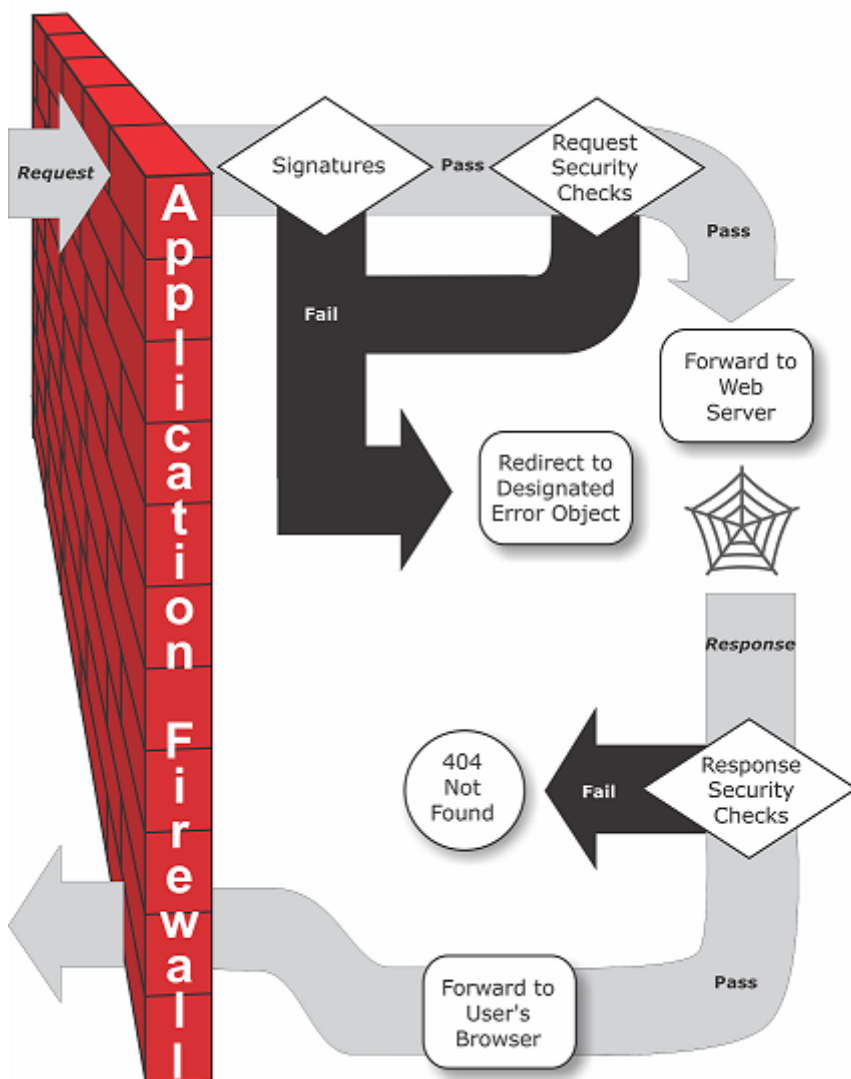

The more advanced protections are called security checks. A security check is a more rigorous, algorithmic inspection of a request for specific patterns or types of behavior that might indicate an attack or constitute a threat to your protected websites and web services. It can, for example, identify a request that attempts to perform a certain type of operation that might breach security, or a response that includes sensitive private information such as a social security number or credit card number. During configuration, you specify the security checks that are appropriate for the web servers and content that you need to protect. The security checks are restrictive. Many of them can block legitimate requests and responses if you do not add the appropriate exceptions (relaxations) when configuring them. Identifying the needed exceptions is not difficult if you use the adaptive learning feature, which observes normal use of your website and creates recommended exceptions.

The Web App Firewall can be installed as either a Layer 3 network device or a Layer 2 network bridge between your servers and your users, usually behind your company's router or firewall. It must be installed in a location where it can intercept traffic between the web servers that you want to protect and the hub or switch through which users access those web servers. You then configure the network to send requests to the Web App Firewall instead of directly to your web servers, and responses to the Web App Firewall instead of directly to your users. The Web App Firewall filters that traffic before forwarding it to its final destination, using both its internal rule set and your additions and modifications. It blocks or renders harmless any activity that it detects as harmful, and then forwards the remaining traffic to the web server. The following figure provides an overview of the filtering process.

Note:

The figure omits the application of a policy to incoming traffic. It illustrates a security configuration in which the policy is to process all requests. Also, in this configuration, a signatures object has been configured and associated with the profile, and security checks have been configured in the profile.

Figure 1. A Flowchart of Web App Firewall Filtering

As the figure shows, when a user requests a URL on a protected website, the Web App Firewall first examines the request to ensure that it does not match a signature. If the request matches a signature, the NetScaler Web App Firewall either displays the error object (a webpage located on the Web App Firewall appliance and which you can configure by using the imports feature) or forwards the request to the designated error URL (the error page). Signatures do not require as many resources as do security checks, so detecting and stopping attacks that are detected by a signature before running any of

the security checks reduces the load on the server.

If a request passes signature inspection, the Web App Firewall applies the request security checks that have been enabled. The request security checks verify that the request is appropriate for your website or web service and does not contain material that might pose a threat. For example, security checks examine the request for signs indicating that it might be of an unexpected type, request unexpected content, or contain unexpected and possibly malicious web form data, SQL commands, or scripts. If the request fails a security check, the Web App Firewall either sanitizes the request and then sends it back to the NetScaler appliance (or NetScaler virtual appliance), or displays the error object. If the request passes the security checks, it is sent back to the NetScaler appliance, which completes any other processing and forwards the request to the protected web server.

When the website or web service sends a response to the user, the Web App Firewall applies the response security checks that have been enabled. The response security checks examine the response for leaks of sensitive private information, signs of website defacement, or other content that must not be present. If the response fails a security check, the Web App Firewall either removes the content that must not be present or blocks the response. If the response passes the security checks, it is sent back to the NetScaler appliance, which forwards it to the user.

NetScaler Web App Firewall features

The basic Web App Firewall features are policies, profiles, and signatures, which provide a hybrid security model as described in [Known Web Attacks](#), [Unknown Web Attacks](#), and [How the Web App Firewall Works](#). Of special note is the learning feature, which observes traffic to your protected applications and recommends appropriate configuration settings for certain security checks.

The imports feature manages files that you upload to the Web App Firewall. These files are then used by the Web App Firewall in various security checks, or when responding to a connection that matches a security check.

You can use the logs, statistics, and reports features to evaluate the performance of the Web App Firewall and identify possible needs for more protections.

How NetScaler Web App Firewall modifies application traffic

The NetScaler Web App Firewall affects the behavior of a web application it protects by modifying the following:

- Cookies
- HTTP Headers
- Forms/Data

NetScaler Web App Firewall session cookie

To maintain the state of the session, NetScaler Web App Firewall generates its own session cookie. This cookie is passed only between the web browser and the NetScaler Web Application Firewall and not to the web server. If a hacker tries to modify the session cookie, Web App Firewall drops the cookie before forwarding the request to the server and treats the request as a new user session. The session cookie is present as long as the web browser is open. When the web browser is closed, the Application Firewall session cookie becomes invalid. The state of the session maintains the information of the URLs and forms visited by the client.

The configurable Web App Firewall session cookie is `citrix_ns_id`.

Starting from NetScaler build 12.1 54 and 13.0, the cookie consistency is sessionless, and adding the session cookie `citrix_ns_id` generated by the appliance is not enforced. For more information on configuring cookies, see [Engine settings](#).

NetScaler Web App Firewall cookies Many web applications generate cookies to track user or session specific information. This information can be user preferences or shopping cart items. A web application cookie can be one of the following two types:

- **Persistent Cookies** - These cookies are stored locally on the computer and used again the next time you visit the site. This type of cookie usually contains information about the user, such as, logon, password, or preferences.
- **Session or Transient Cookies** - These cookies are used only during the session and are destroyed after the session is terminated. This type of cookie contains application state information, such as, shopping cart items or session credentials.

Hackers can attempt to modify or steal application cookies to hijack a user session or masquerade as a user. The Application Firewall prevents such attempts by hashing the application cookies and then adding more cookies with the digital signatures. By tracking the cookies, the Application Firewall ensures that the cookies are not modified or compromised between the client browser and the Application Firewall. The Application Firewall does not modify the application cookies.

The NetScaler Web App Firewall generates the following default cookies to track the application cookies:

- **Persistent Cookies:** `citrix_ns_id_wlf`. Note: wlf stands for will live forever.
- **Session or Transient Cookies:** `citrix_ns_id_wat`. Note: wat stands for will act transiently.

To track the application cookies, the Application Firewall groups the persistent or session application cookies together and then hash and sign all the cookies together. Thus, the Application Firewall generates one `wlf` cookie to track all persistent application cookies and one `wat` cookie to track all application session cookies.

The following table shows the number and types of cookies generated by the Application Firewall based on the cookies generated by the web application:

| Before NetScaler Web App Firewall | To |
|---|---|
| One persistent cookie | Persistent cookie: <code>citix_ns_id_wlf</code> |
| One transient cookie | Transient cookie: <code>citix_ns_id_wat</code> |
| Multiple persistent cookies, Multiple transient cookies | One Persistent cookie: <code>citix_ns_id_wlf</code> ,
One Transient cookie: <code>citix_ns_id_wat</code> |

NetScaler Web App Firewall allows encrypting the application cookie. Application Firewall also provides an option to proxy the session cookie sent by the application, by storing it with the rest of the Application Firewall session data and not sending it to the client. When a client sends a request to the application that includes an Application Firewall session cookie, Application Firewall inserts the application sent cookie back into the request before sending the request on to the origin application. Application Firewall also allows adding the HTTPOnly and/or Secure flags to cookies.

How the application firewall affects HTTP headers

Both HTTPs requests and HTTPs responses use headers to send information about one or more HTTPs' message. A header is a series of lines with each line containing a name followed by a colon and a space, and a value. For example, the Host header has the following format:

```
Host: www.citrix.com
```

Some header fields are used in both request and response headers, while others are appropriate only for either a request or a response. The Application Firewall might add, modify, or delete some headers in one or more HTTPs request or response to maintain the security of the application.

Request headers dropped by NetScaler Web App Firewall Many of the request headers related to caching is dropped to view every request within the context of a session. Similarly, if the request includes an encoding header to allow the web server to send compressed responses, the Application Firewall deletes this header so the contents in the uncompressed server response is inspected by the Web App Firewall to prevent any leakage of sensitive data to the client.

The Application Firewall drops the following request headers:

- Range—Used to recover from a failed or partial file transfers.
- If-Range—Allows a client to retrieve a partial object when it contains a part of that object in its cache already (conditional GET).

- If-Modified-Since –If the requested object is not modified since the time specified in this field, an entity is not returned from the server. You get an HTTP 304 not modified error.
- If-None-Match –Allows efficient updates of cached information with a minimum amount of overhead.
- Accept-Encoding –What encoding methods are allowed for a particular object, such as gzip.

Request header modified by NetScaler Web App Firewall If a web browser uses the HTTP/1.0 or earlier protocols, the browser continually opens and closes the TCP socket connection after receiving each response. This adds overhead to the web server and prevents maintaining session state. The HTTP/1.1 protocol allows the connection to remain open during the session. The Application Firewall modifies the following request header to use HTTP/1.1 between the Application Firewall and the web server regardless of the protocol used by the web browser:

Connection: keep-alive

Request headers added by NetScaler Web App Firewall The Application Firewall acts as a reverse proxy and replaces the original source IP address of the session with the IP address of the Application Firewall. Therefore, all requests logged in the web server log indicate that the requests are sent from the Application Firewall.

Response header dropped by NetScaler Web App Firewall The Application Firewall might block or modify content such as removing credit card numbers or stripping comments, and this might result in a mismatch in size. To prevent such a scenario, the Application Firewall drops the following header:

Content-Length –Indicates the size of the message sent to the recipient.

Response Headers Modified by NetScaler Web App Firewall Many of the response headers modified by the Application Firewall are related to caching. Caching headers in HTTP(S) responses must be modified to force the web browser to always send a request to the web server for the latest data and not use the local cache. However, some ASP applications use separate plug-ins to display dynamic contents and might require the ability to cache the data temporarily in the browser. To allow temporary caching of data when Advanced Security protections such as FFC, URL closure, or CSRF checks are enabled, Application Firewall adds or modifies the cache-control headers in the server response using the following logic:

- If Server sends Pragma: no-cache, then the Application Firewall does not do any modification.
- If Client Request is HTTP 1.0, then Application Firewall inserts Pragma: no-cache.
- If Client Request is HTTP 1.1 and has Cache-control: no-store, then Application Firewall does not make any modification.

- If Client Request is HTTP 1.1 and Server Response has Cache-Control header with no store or no cache directive, then Application Firewall does not make any modification.
- If Client Request is HTTP 1.1 and Server Response has either No Cache-control Header or Cache-Control header does not have no store or no-cache directive, the Application Firewall completes the following tasks:
 1. Inserts Cache-control: max-age=3, must-revalidate,private.
 2. Inserts X-Cache-Control-orig = Original value of Cache-Control Header.
 3. Deletes Last-Modified header.
 4. Replaces Etag.
 5. Inserts X-Expires-Orig=Original value of the Expire Header sent by the server.
 6. Modifies the Expires Header and sets the expiration date of the webpage to the past, so it is always picked up again.
 7. Modifies Accept-Ranges and sets it to none.

To replace temporarily cached data in the client browser when Application Firewall changes the response such as, for StripComments, X-out/Remove SafeObject, xout or remove Credit Card or URL Transform, Application Firewall takes the following actions:

1. Deletes Last-Modified from server before forwarding to client.
2. Replaces Etag with a value determined by Application Firewall.

Response headers added by NetScaler Web App Firewall

- **Transfer-Encoding:** Chunked. This header streams information back to a client without having to know the total length of the response before sending the response. This header is required because the content-length header is removed.
- **Set-Cookie:** The cookies added by the Application Firewall.
- **Xet-Cookie:** If the session is valid and if the response is not expired in cache, you can serve from cache and do not have to send a new cookie because the session is still valid. In such a scenario, the Set-Cookie is changed to Xet-Cookie. For the web browser.

How form data is affected

The Application Firewall protects against attacks that attempt to modify the content of the original form sent by the server. It can also protect against Cross-site Request forgery attacks. The Application Firewall accomplishes by inserting the hidden form tag as_fid in the page.

Example: `<input type="hidden" name="as_fid" value="VRgWq0I196Jmg/+LOY7C" />`

The hidden field `as_fid` is used for field consistency. This field is used by Application Firewall to track all fields of the form including the hidden field name/value pairs and to ensure that none of the fields of the form sent by the server are changed on the client side. The CSRF check also uses this unique form tag `as_fid` to ensure that the forms submitted by the user were served to the user in this session and no hacker is attempting to hijack the user session.

Sessionless form check Application Firewall also offers an option to protect form data using sessionless field consistency. This is useful for applications where the forms might have large number of dynamic hidden fields that lead to high memory allocation per session by the Application Firewall. The sessionless field consistency check is accomplished by inserting another hidden field `as_ffc_field` for only POST requests or for both GET and POST requests based on the configured setting. The Application Firewall changes the method GET to POST when it forwards the form to the client. The appliance then reverts the method to GET when submitting it back to the server. The `as_ffc_field` value can be large because it contains the encrypted digest of the form being served. The following is an example of the sessionless form check:

```
1 <input type="hidden" name="as_ffc_field" value="CwAAAAVIGLD/  
   luRRi1Wu1rbYrFYargEDc05xVAXsEnMP1megXuQfiDTGbwk0fpgndMHqfMbzFAFdjwR+  
   TOm1oT  
2 +u+Svo9+NuloPhtnbkxGtNe7gB/o8GlxEcK9ZkIIv3oIL/  
   nIPSRWJljpgWgafzVx7wtugNwnn8/  
   GdnhneLCJTaYU7ScnC6LexJDLisI1xsEeONWt8Zm  
3 +vJTa3mTebDY6LVyhDpDQfBgI1XLgflTexAUzSNWHYyloqPruGYfnRPw+  
   DIGf6gGwn1BYLEsRHKNbjJBrKp0Jo9JzhEqdtZ1g3bMzEF9PocPvM1HpvI5T6VB  
4 /YFunUFM4f+bd7EAVcugdhovzb71CsSQX5+qcC1B8WjQ==" />  
5 <!--NeedCopy-->
```

HTML comment stripping The Application Firewall also offers an option to strip all HTML comments in the responses before sending them to the client. This affects not only forms, but all response pages. The Application Firewall locates and removes any text embedded between “<!--” and “-->” comment tags. The tags remain to indicate that a comment existed in that location of the HTML source code. Any text embedded within any other HTML or JavaScript tags is ignored.

Some applications might not work correctly if they have JavaScript incorrectly embedded within comment tags. A comparison of the page source code before and after the comments were stripped by Application Firewall can help in identifying if any of the stripped comments had the required JavaScript embedded in them.

Credit card protection The Application Firewall offers an option to inspect the headers and body of the response and either removes or x-outs the Credit Card numbers before forwarding the response to the client. Currently Application Firewall offers protection for the following major credit cards: American Express, Diners Club, Discover, JCB, MasterCard, and Visa. The x-out action works independent

of the Block action.

Safe object protection Similar to Credit Card numbers, leakage of other sensitive data can also be prevented by using Application Firewall Safe Object security check to either remove or x-out the sensitive content in the response.

Cross-site scripting transforms action When the transform is enabled for cross-site scripting, the Web App Firewall changes "<" into "%26lt;" and ">" into "%26gt;" in the requests. If the checkRequestHeaders setting in the Web App Firewall is enabled, then the Web App Firewall inspects the Request Headers and transforms these characters in Header and cookies also. The transform action does not block or transform values that were originally sent by the server. There is a set of default attributes and tags for cross-site scripting which the Web App Firewall allows. A default list of denied cross-site scripting patterns is also provided. These can be customized by selecting the signatures object and clicking the **Manage SQL/cross-site scripting Patterns dialogue** in the GUI.

Transforming SQL special characters Application Firewall has the following default transformation rules for SQL special characters:

| From | To | Transformation |
|-------------------------------|----|-------------------------|
| ' (single quote that is, %27) | ” | Another single quote |
| \ (backslash that is %5C) | | Another backslash added |
| ;(semicolon that is %3B) | | Dropped |

When the transformation of special characters is enabled and the checkRequestHeaders is set to ON, then the transformation of special characters happens in Headers and cookies also.

Note: Some request headers such as User-Agent, Accept-Encoding usually contain semicolons and might be impacted by SQL transformation.

NetScaler Web App Firewall behavior wherein it corrupts the EXPECT header

1. Whenever NetScaler receives an HTTP request with the EXPECT header in it, NetScaler sends the EXPECT: 100 -continue response to client on behalf of the back end server.
2. This behavior is because Application Firewall protections must be run on the entire request before forwarding the request to the server, NetScaler must get the entire request from the client.
3. On receiving a 100 **continue** response, the client sends the remaining portion of request that completes the request.
4. NetScaler then runs all the protections and then forwards the request to the server.

5. Now as NetScaler is forwarding the complete request the EXPECT header that came in the initial request becomes obsolete as a result NetScaler corrupts this header and sends it to the server.
6. Server on receiving the request ignores any header which is corrupted.

Configuring the Web App Firewall

May 2, 2023

You can configure the NetScaler Web App Firewall (Web App Firewall) by using any of the following methods:

- **Web App Firewall Wizard.** A dialog box consisting of a series of screens that step you through the configuration process.
- **NetScaler Web Interface AppExpert Template.** A AppExpert template (a set of configuration settings) that are designed to provide appropriate protection for websites. This AppExpert template contains appropriate Web App Firewall configuration settings for protecting many websites.
- **NetScaler GUI.** The web-based configuration interface.
- **NetScaler Command Line Interface.** The command line configuration interface.

Citrix recommends that you use the Web App Firewall Wizard. Most users will find it the easiest method to configure the Web App Firewall, and it is designed to prevent mistakes. If you have a new NetScaler or VPX that you will use primarily to protect websites, you may find the Web Interface AppExpert template a better option because it provides a good default configuration, not just for the Web App Firewall, but for the entire appliance. Both the GUI and the command line interface are intended for experienced users, primarily to modify an existing configuration or use advanced options.

The Web App Firewall Wizard

The Web App Firewall wizard is a dialog box that consists of several screens that prompt you to configure each part of a simple configuration. The Web App Firewall then creates the appropriate configuration elements from the information that you give it. This is the simplest and, for most purposes, the best way to configure the Web App Firewall.

To use the wizard, connect to the GUI with the browser of your choice. When the connection is established, verify that the Web App Firewall is enabled, and then run the Web App Firewall wizard, which prompts you for configuration information. You do not have to provide all of the requested information the first time you use the wizard. Instead, you can accept default settings, perform a few relatively straightforward configuration tasks to enable important features, and then allow the Web App Firewall to collect important information to help you complete the configuration.

For example, when the wizard prompts you to specify a rule for selecting the traffic to be processed, you can accept the default, which selects all traffic. When it presents you with a list of signatures, you can enable the appropriate categories of signatures and turn on the collection of statistics for those signatures. For this initial configuration, you can skip the advanced protections (security checks). The wizard automatically creates the appropriate policy, signatures object, and profile (collectively, the security configuration), and binds the policy to global. The Web App Firewall then begins filtering connections to your protected websites, logging any connections that match one or more of the signatures that you enabled and collecting statistics about the connections that each signature matches. After the Web App Firewall processes some traffic, you can run the wizard again and examine the logs and statistics to see if any of the signatures that you have enabled are matching legitimate traffic. After determining which signatures are identifying the traffic that you want to block, you can enable blocking for those signatures. If your website or web service is not complex, does not use SQL, and does not have access to sensitive private information, this basic security configuration will probably provide adequate protection.

You may need additional protection if, for example, your website is dynamic. Content that uses scripts may need protection against cross-site scripting attacks. Web content that uses SQL—such as shopping carts, many blogs, and most content management systems—may need protection against SQL injection attacks. Websites and web services that collect sensitive private information such as social security numbers or credit card numbers may require protection against unintentional exposure of that information. Certain types of web-server or XML-server software may require protection from types of attacks tailored to that software. Another consideration is that specific elements of your websites or web services may require different protection than do other elements. Examining the Web App Firewall logs and statistics can help you identify the additional protections that you might need.

After deciding which advanced protections are needed for your websites and web services, you can run the wizard again to configure those protections. Certain security checks require that you enter exceptions (relaxations) to prevent the check from blocking legitimate traffic. You can do so manually, but it is usually easier to enable the adaptive learning feature and allow it to recommend the necessary relaxation. You can use the wizard as many times as necessary to enhance your basic security configuration and/or create additional security configurations.

The wizard automates some tasks that you would have to perform manually if you did not use the wizard. It automatically creates a policy, a signatures object, and a profile, and assigns them the name that you provided when you were prompted for the name of your configuration. The wizard also adds your advanced-protection settings to the profile, binds the signatures object to the profile, associates the profile with the policy, and puts the policy into effect by binding it to Global.

A few tasks cannot be performed in the wizard. You cannot use the wizard to bind a policy to a bind point other than Global. If you want the profile to apply to only a specific part of your configuration, you must manually configure the binding. You cannot configure the engine settings or certain other global configuration options in the wizard. While you can configure any of the advanced protection

settings in the wizard, if you want to modify a specific setting in a single security check, it may be easier to do so on the manual configuration screens in the GUI.

For more information on using the Web App Firewall Wizard, see [The Web App Firewall Wizard](#).

The NetScaler Web Interface AppExpert Template

AppExpert Templates are a different and simpler approach to configuring and managing complex enterprise applications. The AppExpert display in the GUI consists of a table. Applications are listed in the left-most column, with the NetScaler features that are applicable to that application appearing each in its own column to the right. (In the AppExpert interface, those features that are associated with an application are called *application units*.) In the AppExpert interface, you configure the interesting traffic for each application, and turn on rules for compression, caching, rewrite, filtering, responder and the Web App Firewall, instead of having to configure each feature individually.

The Web Interface AppExpert Template contains rules for the following Web App Firewall signatures and security checks:

- **Deny URL check.** Detects connections to content that is known to pose a security risk, or to any other URLs that you designate.
- **Buffer Overflow check.** Detects attempts to cause a buffer overflow on a protected web server.
- **Cookie Consistency check.** Detects malicious modifications to cookies set by a protected website.
- **Form Field Consistency check.** Detects modifications to the structure of a web form on a protected website.
- **CSRF Form Tagging check.** Detects cross-site request forgery attacks.
- **Field Formats check.** Detects inappropriate information uploaded in web forms on a protected website.
- **HTML SQL Injection check.** Detects attempts to inject unauthorized SQL code.
- **HTML Cross-Site Scripting check.** Detects cross-site scripting attacks.

For information on installing and using an AppExpert Template, see [AppExpert Applications and Templates](#).

The GUI

The GUI is a web-based interface that provides access to all configuration options for the Web App Firewall feature, including advanced configuration and management options that are not available from any other configuration tool or interface. Specifically, many advanced Signatures options can be configured only in the GUI. You can review recommendations generated by the learning feature only in the GUI. You can bind policies to a bind point other than Global only in the GUI.

For a description of the GUI, see [The Web App Firewall Configuration Interfaces](#). For more information on using the GUI to configure the Web App Firewall, see [Manual Configuration By Using the GUI](#).

For instructions on configuring the Web App Firewall by using the GUI, see [Manual Configuration By Using the GUI](#). For information on the citrix-adc GUI, see [The Web App Firewall Configuration Interfaces](#).

The NetScaler command line interface

The NetScaler command line interface is a modified UNIX shell based on the FreeBSD bash shell. To configure the Web App Firewall from the command line interface, you type commands at the prompt and press the Enter key, just as you do with any other Unix shell. You can configure most parameters and options for the Web App Firewall by using the NetScaler command line. Exceptions are the signatures feature, many of whose options can be configured only by using the GUI or the Web App Firewall wizard, and the learning feature, whose recommendations can only be reviewed in the GUI.

For instructions on configuring the Web App Firewall by using the NetScaler command line, see [Manual Configuration By Using the Command Line Interface](#).

Enable NetScaler Web App Firewall

January 9, 2024

Before you can create a security configuration, you must enable the NetScaler Web App Firewall feature on the appliance.

Points to remember

- If you are configuring a dedicated NetScaler Web App Firewall appliance or upgrading an existing appliance, the feature is already enabled. You do not have to perform either of the procedures described here.
- If you have a new NetScaler or VPX, you must enable the NetScaler Web App Firewall feature before you configure it.
- If you are upgrading a NetScaler or VPX from a previous version, you must first enable the NetScaler Web App Firewall feature before you configure it.

Note:

If you are upgrading a NetScaler or VPX from a previous version, you might need to update the licenses on your appliance before you enable NetScaler Web App Firewall. Check with your

NetScaler representative or reseller to obtain the correct license.

Enable NetScaler Web App Firewall by using the command interface

At the command prompt, type the following command:

```
enable ns feature AppFW
```

Enable the Web App Firewall by using the GUI

1. Navigate to **System > Settings**.
2. In the details pane, click **Configure Advanced Features**.
3. In the **Configure Advanced Features** page, select **NetScaler Web App Firewall**.
4. Click **OK**.

The Web App Firewall wizard

May 2, 2023

Unlike most wizards, the NetScaler Web App Firewall Wizard is designed not just to simplify the initial configuration process, but also to modify previously created configurations and to maintain your Web App Firewall setup. A typical user runs the wizard multiple times, skipping some of the screens each time.

The Web App Firewall Wizard automatically creates profiles, policies, and signatures.

Opening the wizard

To run the Web App Firewall Wizard, open the GUI and follow these steps:

1. Navigate to **Security > Application Firewall**.
2. In the details pane, under **Getting Started**, click **Application Firewall Wizard**. The wizard opens.

For more information about the GUI, see [The Web App Firewall Configuration Interfaces](#).

The Wizard screens

The Web App Firewall wizard displays the following screens on a tabular page:

1. Specify Name: on this screen, when creating a new security configuration, specify a meaningful name and the appropriate type (HTML, XML or WEB 2.0) for your profile. The default policy and signatures are auto-generated by using the same name.

Profile Name

The name can begin with a letter, number, or the underscore symbol, and can consist of from 1 to 31 letters, numbers, and the hyphen (-), period (.), pound (#), space (), at (@), equals (=), colon (:), and underscore (_) symbols. Choose a name that makes it easy for others to tell what content your new security configuration protects.

Note:

Because the wizard uses this name for both the policy and the profile, it is limited to 31 characters. Manually created policies can have names up to 127 characters in length.

When modifying an existing configuration, you select **Modify Existing Configuration** and then, in the Name drop-down list, select the name of the existing configuration that you want to modify.

Note:

Only policies that are bound to global or to a bind point appear in this list; you cannot modify an unbound policy by using the Application Firewall wizard. You must either manually bind it to Global or a bind point, or modify it manually. (For manual modification, in the GUI) **Application Firewall > Policies > Firewall** pane, select the policy and click **Open**.

Profile Type

You also select a profile type on this screen. The profile type determines the types of advanced protection (security checks) that can be configured. Because certain kinds of content are not vulnerable to certain types of security threats, restricting the list of available checks saves time during configuration. The types of Web App Firewall profiles are:

- Web Application (HTML). Any HTML-based website that does not use XML or Web 2.0 technologies.
- XML Application (XML, SOAP). Any XML-based Web service.
- Web 2.0 Application (HTML, XML, REST). Any Web 2.0 site that combines HTML and XML-based content, such as an ATOM-based site, a blog, an RSS feed, or a wiki.

Note: If you are unsure which type of content is used on your website, you can choose Web 2.0 Application to ensure that you protect all types of web application content.

2. Specify Rule: on this screen, you specify the policy rule (expression) that defines the traffic the current configuration examines. If you create an initial configuration to protect your websites and web services, you can accept the default value, **true**, which selects all web traffic .

If you want this security configuration to examine, not all HTTP traffic that is routed through the appliance, but specific traffic, you can write a policy rule specifying the traffic that you want it to examine. Rules are written in NetScaler expressions language, which is a fully functional object-oriented programming language.

Note: In addition to the default expressions syntax, for backward compatibility the NetScaler operating system supports the NetScaler classic expressions syntax on NetScaler Classic and nCore appliances and virtual appliances. Classic expressions are not supported on NetScaler Cluster appliances and virtual appliances. Current users who want to migrate their existing configurations to the NetScaler cluster must migrate any policies that contain classic expressions to the default expressions syntax.

- For a simple description of using the NetScaler expressions syntax to create Web App Firewall rules, and a list of useful rules, see [Firewall Policies](#).
- For a detailed explanation of how to create policy rules in NetScaler expressions syntax, see [Policies and Expressions](#).

4. Select Signatures: on this screen, you select the categories of signatures that you want to use to protect your websites and web services.

This is not a mandatory step, and you can skip it if you want to and go to the **Specify Deep Protections** screen. If the Select Signatures screen is skipped, only a profile and associated policies are created, and the signatures are not created.

You can select **Create New Signature** or **Select Existing Signature**.

If you are creating a new security configuration, the signature categories that you select are enabled, and by default they are recorded in a new signatures object. The new signatures object is assigned the same name that you entered on the Specify name screen as the name of the security configuration.

If you have previously configured signatures objects and want to use one of them as the signatures object associated with the security configuration that you are creating, click **Select Existing Signature** and select a signatures object from the Signatures list.

If you are modifying an existing security configuration, you can click Select Existing Signature and assign a different signatures object to the security configuration.

If you click Create New Signature, you can choose the edit mode as **Simple** or **Advanced**.

1. Specify Signature Protections (Simple mode)

The simple mode allows for easy configuration of the signature, with a preset list of protection definitions for common applications such as IIS (Internet Information Server), PHP and ActiveX. The default

categories in Simple mode are:

- CGI. Protection against attacks on websites that use CGI scripts in any language, including PERL scripts, Unix shell scripts, and Python scripts.
- Cold Fusion. Protection against attacks on websites that use the Adobe Systems® ColdFusion® Web development platform.
- FrontPage. Protection against attacks on websites that use the Microsoft® FrontPage® Web development platform.
- PHP. Protection against attacks on websites that use the PHP open-source Web development scripting language.
- Client side. Protection against attacks on client-side tools used to access your protected websites, such as Microsoft Internet Explorer, Mozilla Firefox, the Opera browser, and the Adobe Acrobat Reader.
- Microsoft IIS. Protection against attacks on websites that run the Microsoft Internet Information Server (IIS)
- Miscellaneous. Protection against attacks on other server-side tools, such as Web servers and database servers.

On this screen, you select the actions associated with the signature categories that you selected on the Select Signatures screen. The actions that you can configure are:

- Block
- Log
- Stats

By default the Log and Stats actions are enabled but not the Block action. To configure actions, click **Settings**. You can change the action settings of all the selected categories by using the **Action** drop-down list.

1. Specify Signature Protections (Advanced mode)

The advanced mode allows for more granular control over the signature definitions and provides significantly more information. Use the advanced mode if you want complete control over signature definition.

The contents of this screen are the same as the contents of the Modify Signatures Object dialog box, as described in [Configuring or Modifying a Signatures Object](#). In this screen, you can configure actions either by clicking the **Actions** drop-down list or the actions menu, which appears as a circle with three dots.

7. Specify Deep Protections: on this screen, you choose the advanced protections (also called security checks or simply checks) that you want to use to protect your websites and web services. Which

checks are available depends on the profile type that you chose on the Specify Name screen. All checks are available for Web 2.0 Application profiles.

For more information, see [Overview of Security Checks](#) and see [Advanced Form Protections Checks](#).

You configure the actions for the advanced protections that you have enabled. The actions that you can configure are:

- **Block:** blocks connections that match the signature. Disabled by default.
- **Log:** logs connections that match the signature for later analysis. Enabled by default.
- **Stats:** maintains statistics, for each signature, that show how many connections it matched and provide certain other information about the types of connections that were blocked. Disabled by default.
- **Learn.** Observe traffic to this website or web service, and use connections that repeatedly violate this check to generate recommended exceptions to the check, or new rules for the check. Available only for some checks. For more information about the learning feature see [Configuring and Using the Learning Feature](#), and how learning works and how to configure exceptions (relaxations) or deploy learned rules for a check, see [Manual Configuration By Using the GUI](#).

To configure actions, select the protection by clicking the check box, and then click **Action Settings** to select the required actions. Select other parameters, if required, and then click **OK** to close the Action Settings window.

To view all logs for a specific check, select that check, and then click **Logs** to display the Syslog Viewer, as described in [Web App Firewall Logs](#). If a security check is blocking legitimate access to your protected website or web service, you can create and implement a relaxation for that security check by selecting a log that shows the unwanted blocking, and then clicking **Deploy**.

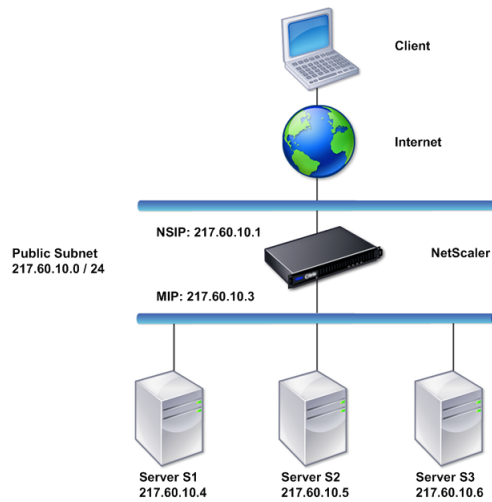

After you completing specifying Action Settings, click **Finish** to complete the wizard.

Following are four procedures that show how to perform specific types of configuration by using the Web App Firewall wizard.

Create a new configuration

Follow these steps to create a new firewall configuration and signature objects, by using the Application Firewall wizard.

1. Navigate to **Security > Application Firewall**.
2. In the details pane, under **Getting Started**, click ****Application Firewall**. The wizard opens.

3. On the **Specify Name** screen, select ****Create New Configuration**.
4. In the **Name** field, type a name, and then click **Next**.
5. In the **Specify Rule** screen, click **Next** again.
6. In the **Select Signatures** screen, select **Create New Signature** and **Simple** as the edit mode, and then click **Next**.
7. In the **Specify Signature Protections** screen, configure the required settings. For more information about which signatures to consider for blocking and how to determine when you can safely enable blocking for a signature, see [Signatures](#).
8. In the **Specify Deep Protections** screen configure the required actions and parameters in **Action Settings**.
9. When you complete, click **Finish** to close the Application Firewall wizard.

Modify an existing configuration

Follow these steps to modify an existing configuration and existing signature categories.

1. Navigate to **Security > Application Firewall**.
2. In the details pane, under **Getting Started**, click **Application Firewall Wizard**. The wizard opens.
3. On the **Specify Name** screen, select **Modify Existing Configuration** and, in the **Name** drop-down list, choose the security configuration that you created during new configuration, and then click **Next**.

4. In the **Specify Rule** screen, click **Next** to keep the default value “true.” If you want to modify the rule, follow the steps described in [Configure a Custom Policy Expression](#).
5. In the **Select Signatures** screen, click **Select Existing Signature**. From the **Existing Signature** drop-down list, select the appropriate option, and then click **Next**. The advanced signature protection screen appears.
Note: If you select an existing signature, the default edit mode for signature protected is advanced.
6. In the Specify Signature Protections screen, configure the required settings and click **Next**. For more information about which signatures to consider for blocking and how to determine when you can safely enable blocking for a signature, see [Signatures](#).
7. In the **Specify Deep Protections** screen, configure the settings and click **Next**.
8. After you complete, click **Finish** to close the **Web App Firewall Wizard**.

Create a new configuration without signatures

Follow these steps to use the Application Firewall Wizard to skip the Select Signatures screen and create a new configuration with just the profile and the associated policies but without any signatures.

1. Navigate to **Security > Application Firewall**.
2. In the details pane, under **Getting Started**, click **Application Firewall Wizard**. The wizard opens.
3. On the **Specify Name** screen, select **Create New Configuration**.
4. In the **Name** field, type a name, and then click **Next**.
5. In the **Specify Rule** screen, click **Next** again.
6. In the **Select Signatures** screen, click **Skip**.
7. In the **Specify Deep Protections** screen configure the required actions and parameters in **Action Settings**.
8. When you complete, click **Finish** to close the Application Firewall Wizard.

Configure a custom policy expression

Follow these steps to use the Application Firewall Wizard to create a specialized security configuration to protect only specific content. In this case, you create a new security configuration instead of modifying the initial configuration. This type of security configuration requires a custom rule, so that the policy applies the configuration to only the selected Web traffic.

1. Navigate to **Security > Application Firewall**.
2. In the details pane, under **Getting Started**, click **Application Firewall Wizard**.
3. On the Specify Name screen, type a name for your new security configuration in the Name text box, select the type of security configuration from the Type drop-down list, and then click **Next**.

4. On the **Specify Rule** screen, enter a rule that matches only that content that you want this web application to protect. Use the **Frequently Used Expressions** drop-down list and the **Expression Editor** to create a custom expression. When you complete, click **Next**.
5. In the **Select Signatures** screen, select the edit mode, and then click **Next**.
6. In the **Specify Signature Protections** screen, configure the required settings.
7. In the **Specify Deep Protections** screen configure the required actions and parameters in **Action Settings**.
8. When you complete, click **Finish** to close the **Application Firewall Wizard**.

Manual configuration

August 10, 2021

If you want to bind a profile to a bind point other than Global, you must manually configure the binding. Also, certain security checks require that you either manually enter the necessary exceptions or enable the learning feature to generate the exceptions that your websites and Web services need. Some of these tasks cannot be performed by using the Web App Firewall wizard.

If you are familiar with how the Web App Firewall works and prefer manual configuration, you can manually configure a signatures object and a profile, associate the signatures object with the profile, create a policy with a rule that matches the web traffic that you want to configure, and associate the policy with the profile. You then bind the policy to Global, or to a bind point, to put it into effect, and you have created a complete security configuration.

For manual configuration, you can use the GUI (a graphical interface) or the command line. Citrix recommends that you use the GUI. Not all configuration tasks can be performed at the command line. Certain tasks, such as enabling signatures and reviewing learned data, must be done in the GUI. Most other tasks are easier to perform in the GUI.

Replicating configuration

When you use the GUI (GUI) or the command line interface (CLI) to manually configure the Web App Firewall, the configuration is saved in the `/nsconfig/ns.conf` file. You can use the commands in that file to replicate the configuration on another appliance. You can cut and paste the commands into the CLI one by one, or you can save multiple commands in a text file in the `/var/tmp` folder and run them as a batch file. Following is an example of running a batch file containing commands copied from the `/nsconfig/ns.conf` file of a different appliance:

```
> batch -f /var/tmp/appfw_add.txt
```

Warning:

Import commands are not saved in the ns.conf file. Before running commands from the ns.conf file to replicate the configuration on another appliance, you must import all the objects used in the configuration (for example, signatures, error page, WSDL, and Schema) to the appliance on which you replicate the configuration. The add command to add a Web App Firewall profile saved in an ns.conf file might include the name of an imported object, but such a command might fail when run on another appliance if the referenced object does not exist on that appliance.

For more information on import or export details for replicating configuration, see [Signature export](#), and [Common import export](#) topics.

Manual configuration by using the NetScaler GUI

February 9, 2024

If you need to manually configure the Web App Firewall feature, Citrix recommends you to use the NetScaler GUI procedure.

To create and configure signatures object

Before you can configure the signatures, you must create a signatures object from the appropriate default signatures object template. Assign the copy a new name, and then configure the copy. You cannot configure or modify the default signatures objects directly. The following procedure provides basic instructions for configuring a signatures object. For more detailed instructions, see [Manually Configuring the Signatures Feature](#).

1. Navigate to **Security > NetScaler Web App Firewall > Signatures**.
2. In the details pane, select the signatures object that you want to use as a template, and then click **Add**.

Your choices are:

- **Default Signatures.** Contains the signatures rules, the SQL injection rules, and the cross-site scripting rules.
 - **XPath Injection.** Contains all of the items in the Default Signatures, and in addition, contains the XPath injection rules.
3. In the **Add Signatures Object** dialog box, type a name for your new signatures object, click **OK**, and then click **Close**. The name can begin with a letter, number, or the underscore symbol, and

can consist of from one to 31 letters, numbers, and the hyphen (-), period (.) pound (#), space (), at (@), equals (=), and underscore (_) symbols.

4. Select the signatures object that you created, and then click **Open**.
5. In the **Modify Signatures Object** dialog box, set the **Display Filter Criteria** options at the left to display the filter items that you want to configure.

As you modify these options, the results that you specify are displayed in the Filtered Results window at the right. For more information about the categories of signatures, see [Signatures](#).

6. In the **Filtered Results** area, configure the settings for a signature by selecting and clearing the appropriate check boxes.
7. When finished, finished, click **Close**.

To create a Web App Firewall profile by using the GUI

Creating a Web App Firewall profile requires that you specify only a few configuration details.

1. Navigate to **Security > NetScaler Web App Firewall > Profiles**.
2. In the details pane, click **Add**.
3. In the **Create Web App Firewall Profile** dialog box, type a name for your profile.

The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 31 letters, numbers, and the hyphen (-), period (.) pound (#), space (), at (@), equals (=), colon (:), and underscore (_) symbols.

4. Choose the profile type from the drop-down list.
5. Click **Create**, and then click **Close**.

To configure a Web App Firewall profile by using the GUI

1. Navigate to **Security > NetScaler Web App Firewall > Profiles**.
2. In the details pane, select the profile that you want to configure, and then click **Edit**.
3. In the **Configure Web App Firewall Profile** dialog box, on the **Security Checks** tab, configure the security checks.
 - To enable or disable an action for a check, in the list, select or clear the check box for that action.
 - To configure other parameters for those checks that have them, in the list, click the blue chevron to the far right of that check. In the dialog box that appears, configure the parameters. These vary from check to check.

You can also select a check and, at the bottom of the dialog box, click **Open** to display the **Configure Relaxation** dialog box or **Configure Rule** dialog box for that check. These dialog boxes also vary from check to check. Most of them include a **Checks** tab and a **General** tab. If the check supports relaxations or user-defined rules, the **Checks** tab includes an **Add** button, which opens yet another dialog box, in which you can specify a relaxation or rule for the check. (A relaxation is a rule for exempting specified traffic from the check.) If relaxations have already been configured, you can select one and click **Open** to modify it.

- To review learned exceptions or rules for a check, select the check, and then click **Learned Violations**. In the **Manage Learned Rules** dialog box, select each learned exception or rule in turn.
 - To edit the exception or rule, and then add it to the list, click **Edit & Deploy**.
 - To accept the exception or rule without modification, click **Deploy**.
 - To remove the exception or rule from the list, click **Skip**.
- To refresh the list of exceptions or rules to be reviewed, click **Refresh**.
- To open the **Learning Visualizer** and use it to review learned rules, click **Visualizer**.
- To review the log entries for connections that matched a check, select the check, and then click **Logs**. You can use this information to determine which checks are matching attacks so that you can enable blocking for those checks. You can also use this information to determine which checks are matching legitimate traffic, so that you can configure an appropriate exemption to allow those legitimate connections. For more information about the logs, see [Logs, Statistics, and Reports](#).
- To completely disable a check, in the list, clear all of the check boxes to the right of that check.

4. On the **Settings** tab, configure the profile settings.

- To associate the profile with the set of signatures that you previously created and configured, under **Common Settings**, choose that set of signatures in the **Signatures** drop-down list.

Note:

You may must use the scroll bar on the right of the dialog box to scroll down to display the **Common Settings** section.

- To configure an HTML or XML Error Object, select the object from the appropriate drop-down list.

Note:

You must first upload the error object that you want to use in the Import pane.

- To configure the default XML Content Type, type the content type string directly into the Default Request and Default Response text boxes, or click Manage Allowed Content Types to manage the list of allowed content types.
5. If you want to use the learning feature, click Learning, and configure the learning settings for the profile. For more information, see [Configure and Learning feature](#).
 6. Click **OK** to save your changes and return to the Profiles pane.

Configuring a Web App Firewall rule or relaxation

You configure two different types of information in this dialog box, depending upon which security check you are configuring. In most cases, you configure an exception (or relaxation) to the security check. If you are configuring the Deny URL check or the Field Formats check, you configure an addition (or rule). The process for either of these is the same.

To configure a relaxation rule by using the NetScaler GUI

1. Navigate to **Security > NetScaler Web App Firewall > Profiles**.
2. In the **Profiles** pane, select the profile you want to configure, and then click **Edit**.
3. In the **Configure Web App Firewall Profile** page, click **Relaxation Rule** from **Advanced Settings** section. The **Relaxation Rule** section contains the complete list of Web App Firewall relaxation rules.
4. Click a security rule that you want to configure, and then click **Edit**.
5. The URL Relaxation Rules page contains a list of actions and that you can configure for this rule and a list of existing relaxations or rules. The list might be empty if you have not either manually added any relaxations or approved any relaxations that were recommended by the learning engine. Beneath the list is a row of buttons that allow you to add, modify, delete, enable, or disable the relaxations on the list.
6. To add or modify a relaxation or a rule, do one of the following:
 - To add a new relaxation, click **Add**.
 - To modify an existing relaxation, select the relaxation that you want to modify, and then click **Open**.

The **Start URL Relaxation Rule** page is displayed. Except for the title, these dialog boxes are identical.

7. Fill in the dialog box as described below. The dialog boxes for each check are different. The list below covers all elements that might appear in any dialog box.
 - **Enabled check box**—Select to place this relaxation or rule in active use; clear to deactivate it.
 - **Attachment Content Type**—The Content-Type attribute of an XML attachment. In the text area, enter a regular expression that matches the Content-Type attribute of the XML attachments to allow.
 - **Action URL**—In the text area, enter a PCRE-format regular expression that defines the URL to which data entered into the web form is delivered.
 - **Cookie**—In the text area, enter a PCRE-format regular expression that defines the cookie.
 - **Field Name**—A web form field name element may be labeled Field Name, Form Field, or another similar name. In the text area, enter a PCRE-format regular expression that defines the name of the form field.
 - **From Origin URL**—In the text area, enter a PCRE-format regular expression that defines the URL that hosts the web form.
 - **From Action URL**—In the text area, enter a PCRE-format regular expression that defines the URL to which data entered into the web form is delivered.
 - **Name**—An XML element or attribute name. In the text area, enter a PCRE-format regular expression that defines the name of the element or attribute.
 - **URL**—A URL element may be labeled Action URL, Deny URL, Form Action URL, Form Origin URL, Start URL, or simply URL. In the text area, enter a PCRE-format regular expression that defines the URL.
 - **Format**—The format section contains multiple settings that include list boxes and text boxes. Any of the following can appear:
 - **Type**—Select a field type in the Type drop-down list. To add a new field type definition, click Manage—
 - **Minimum Length**—Type a positive integer that represents the minimum length in characters if you want to force users to fill in this field. Default: 0 (Allows field to be left blank.)
 - **Maximum length**—To limit the length of data in this field, type a positive integer that represents the maximum length in characters. Default: 65535
 - **Location**—Choose the element of the request that your relaxation applies to from the drop-down list. For HTML security checks, the choices are:

- FORMFIELD—Form fields in web forms.
- HEADER—Request headers.
- COOKIE—Set-Cookie headers.

For XML security checks, the choices are:

- ELEMENT—XML element.
- ATTRIBUTE—XML attribute.
- **Maximum Attachment Size**—The maximum size in bytes allowed for an XML attachment.
- **Comments**—In the text area, type a comment. Optional.

Note: For any element that requires a regular expression, you can type the regular expression, use the Regex Tokens menu to insert regular expression elements and symbols directly into the text box, or click **Regex Editor** to open the **Add Regular Expression** dialog box, and use it to construct the expression.

8. To remove a relaxation or rule, select it, and then click **Delete**.
9. To enable a relaxation or rule, select it, and then click **Enable**.
10. To disable a relaxation or rule, select it, and then click **Disable**.
11. To configure the settings and relationships of all existing relaxations in an integrated interactive graphic display, click **Visualizer**, and use the display tools.

Note:

The **Visualizer** button does not appear on all check relaxation dialog boxes.

12. To review learned rules for this check, click Learning and perform the steps in [To configure and use the Learning feature](#)
13. Click **OK**.

To configure the Learned Rules by using the NetScaler GUI

1. Navigate to **Security > NetScaler Web App Firewall > Profiles**.
2. In the **Profiles** pane, select the profile, and then click **Edit**.
3. In the **NetScaler Web App Firewall Profile** page, click **Learned Rules** from **Advanced Settings**. In the **Learned Rules** section you can see a list of security checks that are available in the current profile and that support the learning feature.
4. To configure the learning thresholds, select a security check, and click **Settings**.
5. In the **Dynamic Profiling and Learning Rules Settings** page, you can set the settings. For more information, see [Dynamic profile settings](#)

- **Minimum number threshold.** Depending on which security check's learning settings you are configuring, the minimum number threshold might refer to the minimum number of total user sessions that must be observed, the minimum number of requests that must be observed, or the minimum number of times a specific form field must be observed, before a learned relaxation is generated. Default: 1
 - **Percentage of times threshold.** Depending on which security check's learning settings you are configuring, the percentage of times threshold might refer to the percentage of total observed user sessions that violated the security check, the percentage of requests, or the percentage of times a form field matched a particular field type, before a learned relaxation is generated. Default: 0
6. To remove all learned data and reset the learning feature, so that it must start its observations again from the beginning, select **Remove All Learned Data** action.

Note:

This button removes only learned recommendations that have not been reviewed and either approved or skipped. It does not remove learned relaxations that have been accepted and deployed.
 7. To restrict the learning engine to traffic from a specific set of IPs, click **Trusted Learning Clients**, and add the IP addresses that you want to use to the list.
 - a) To add an IP address or IP address range to the Trusted Learning Clients list, click **Add**.
 - b) In the **AppFirewall Profile to Trusted Client Binding** page, click **Add**.
 - c) Select the **Enabled** check box to enable the feature.
 - d) In Trusted Learning Client** box, type the IP address or an IP address range in CIDR format.
 - e) In the **Comments** text area, type a comment that describes this IP address or range.
 - f) Click **Create** and **Close**.
 8. To modify an existing IP address or range, click the IP address or range, and then click **Edit**. Except for the name, the dialog box that appears is identical to the Add Trusted Learning Clients dialog box.
 9. To disable or enable an IP address or range, but leave it on the list, click the IP address or range, and then click **Disable** or **Enable**, as appropriate.
 10. To remove an IP address or range completely, click the IP address or range, and then click **Delete**.
 11. Click **Close** to return to the **NetScaler Web App Firewall Profile** page.

To create a NetScaler Web App Firewall policy by using the NetScaler GUI

1. Navigate to **Security > NetScaler Web App Firewall > Policies > Firewall**.
2. In the **Policies** page, click **NetScaler Web App Firewall Policy** link.
3. In the NetScaler Web App Firewall Policies page, click **Add**.
4. In the Create NetScaler Web App Firewall Policy page, set the following parameters.
 - a) Name. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 128 letters, numbers, and the hyphen (-), period (.) pound (#), space (), at (@), equals (=), colon (:), and underscore (_) symbols.
 - b) Profile. Select the profile that you want to associate with this policy from the Profile drop-down list. You can create a profile to associate with your policy by clicking New, and you can modify an existing profile by clicking **Modify**.
 - c) Expression. In the Expression text area, create a rule for your policy.
 - d) Log Action. Add a log action or you can modify an existing log action.
 - e) Comments. A brief description about the policy.
5. Click **Create** or **OK**, and then click **Close**.

To create or configure a Web App Firewall rule (expression)

The policy rule, also called the *expression*, defines the web traffic that the Web App Firewall filters by using the profile associated with the policy. Like other NetScaler policy rules (or *expressions*), Web App Firewall rules use NetScaler expressions syntax. This syntax is powerful, flexible, and extensible. It is too complex to describe completely in this set of instructions. You can use the following procedure to create a simple firewall policy rule, or you can read it as an overview of the policy creation process.

1. If you have not already done so, navigate to the appropriate location in the Web App Firewall wizard or the NetScaler GUI to create your policy rule:
 - If you are configuring a policy in the Web App Firewall wizard, in the navigation pane, click **NetScaler Web App Firewall Wizard**, then in the details pane click **NetScaler Web App Firewall Wizard**, and then navigate to the **Specify Rule** tab page.
 - In the **Specify Rule** page, choose the prefix for your expression from the drop-down list. Your choices are:
 - **HTTP**. The HTTP protocol. Choose this if you want to examine some aspect of the request that pertains to the HTTP protocol.
 - **SYS**. One or more protected websites. Choose this if you want to examine some aspect of the request that pertains to the recipient of the request.

- **CLIENT.** The computer that sent the request. Choose this if you want to examine some aspect of the sender of the request.
- **SERVER.** The computer to which the request was sent. Choose this if you want to examine some aspect of the recipient of the request.

After you choose a prefix, the Web App Firewall displays a two-part prompt window that displays the possible next choices at the top, and a brief explanation of what the selected choice means at the bottom.

2. Choose your next term.

If you chose HTTP as your prefix, your only choice is REQ, which specifies the Request/Response pair. (The Web App Firewall operates on the request and response as a unit instead of on each separately.) If you chose another prefix, your choices are more varied. For help on a specific choice, click that choice once to display information about it in the lower prompt window.

When you have decided which term you want, double-click it to insert it into the Expression window.

3. Type a period after the term you just chose. You are then prompted to choose your next term, as described in the previous step. When a term requires that you type a value, fill in the appropriate value. For example, if you choose HTTP.REQ.HEADER(""), type the header name between the quotation marks.
4. Continue choosing terms from the prompts and filling in any values that are needed, until your expression is finished.

Following are some examples of expressions for specific purposes.

- **Specific web host.** To match traffic from a particular web host:

```
HTTP.REQ.HEADER("Host").EQ("shopping.example.com")
```

For shopping.example.com, substitute the name of the web host that you want to match.

- **Specific web folder or directory.** To match traffic from a particular folder or directory on a Web host:

```
HTTP.REQ.URL.STARTSWITH("https://www.example.com/folder")
```

For www.example.com, substitute the name of the web host. For folder, substitute the folder or path to the content that you want to match. For example, if your shopping cart is in a folder called /solutions/orders, you substitute that string for folder.

- **Specific type of content: GIF images.** To match GIF format images:

```
HTTP.REQ.URL.ENDSWITH(".png")
```

To match other format images, substitute another string in place of .png.

- **Specific type of content: scripts.** To match all CGI scripts located in the CGI-BIN directory:

```
HTTP.REQ.URL.STARTSWITH("https://www.example.com/CGI-BIN")
```

To match all JavaScripts with .js extensions:

```
HTTP.REQ.URL.ENDSWITH(".js")
```

For more information about creating policy expressions, see [Policies and Expressions](#).

Note:

If you use the command line to configure a policy, remember to escape any double quotation marks within NetScaler expressions. For example, the following expression is correct if entered in the GUI:

```
HTTP.REQ.HEADER("Host").EQ("shopping.example.com")
```

If entered at the command line, however, you must type this instead:

```
HTTP.REQ.HEADER("Host").EQ("shopping.example.com")
```

To add a firewall rule (expression) by using the Add Expression dialog box

The **Add Expression** dialog box (also referred to as the Expression Editor) helps users who are not familiar with the NetScaler expressions language to construct a policy that matches the traffic that they want to filter.

1. If you have not already done so, navigate to the appropriate location in the Web App Firewall wizard or the NetScaler GUI:
 - If you are configuring a policy in the **Web App Firewall** wizard, in the navigation pane, click **Web App Firewall**, then in the details pane click **Web App Firewall Wizard**, and then navigate to the **Specify Rule** screen.
 - If you are configuring a policy manually, in the navigation pane, expand **Web App Firewall**, then **Policies**, and then **Firewall**. In the details pane, to create a policy, click **Add**. To modify an existing policy, select the policy, and then click **Open**.
2. On the **Specify Rule** screen, in the **Create Web App Firewall Profile** dialog box, or in the **Configure Web App Firewall Profile** dialog box, click **Add**.
3. In the **Add Expression** dialog box, in the Construct Expression area, in the first list box, choose one of the following prefixes:
 - **HTTP**. The HTTP protocol. Choose this if you want to examine some aspect of the request that pertains to the HTTP protocol. The default choice.
 - **SYS**. One or more protected websites. Choose this if you want to examine some aspect of the request that pertains to the recipient of the request.

- **CLIENT.** The computer that sent the request. Choose this if you want to examine some aspect of the sender of the request.
 - **SERVER.** The computer to which the request was sent. Choose this if you want to examine some aspect of the recipient of the request.
4. In the second list box, choose your next term. The available terms differ depending on the choice you made in the previous step, because the dialog box automatically adjusts the list to contain only those terms that are valid for the context. For example, if you selected HTTP in the previous list box, the only choice is REQ, for requests. Because the Web App Firewall treats requests and associated responses as a single unit and filters both, you do not need to specify responses separately. After you choose your second term, a third list box appears to the right of the second. The Help window displays a description of the second term, and the Preview Expression window displays your expression.
 5. In the third list box, choose the next term. A new list box appears to the right, and the Help window changes to display a description of the new term. The Preview Expression window updates to display the expression as you have specified it to that point.
 6. Continue choosing terms, and when prompted filling in arguments, until your expression is complete. If you make a mistake or want to change your expression after you have already selected a term, you can simply choose another term. The expression is modified, and any arguments or more terms that you added after the term that you modified is cleared.
 7. When you have finished constructing your expression, click OK to close the Add Expression dialog box. Your expression is inserted into the Expression text area.

To bind a Web App Firewall policy by using the NetScaler GUI

1. Do one of the following:
 - Navigate to **Security > Web App Firewall**, and in the details pane, click **application firewall policy manager**.
 - Navigate to **Security > NetScaler Web App Firewall > Policies > Firewall**, and in the “NetScaler Web App Firewall Policies” pane, click **Policy Manager**.
2. In the **Application Firewall Policy Manager** dialog, choose the bind point to which you want to bind the policy from the drop-down list. The choices are:
 - **Override Global.** Policies that are bound to this bind point process all traffic from all interfaces on the NetScaler appliance, and are applied before any other policies.
 - **LB Virtual Server.** Policies that are bound to a load balancing virtual server are applied only to traffic that is processed by that load balancing virtual server, and are applied before any Default Global policies. After selecting LB Virtual Server, you must also select the specific load balancing virtual server to which you want to bind this policy.

- **CS Virtual Server.** Policies that are bound to a content switching virtual server are applied only to traffic that is processed by that content switching virtual server, and are applied before any Default Global policies. After selecting CS Virtual Server, you must also select the specific content switching virtual server to which you want to bind this policy.
 - **Default Global.** Policies that are bound to this bind point process all traffic from all interfaces on the NetScaler appliance.
 - **Policy Label.** Policies that are bound to a policy label process traffic that the policy label routes to them. The policy label controls the order in which policies are applied to this traffic.
 - **None.** Do not bind the policy to any bind point.
3. Click **Continue**. A list of existing Web App Firewall policies appears.
 4. Select the policy you want to bind by clicking it.
 5. Make any additional adjustments to the binding.
 - To modify the policy priority, click the field to enable it, and then type a new priority. You can also select **Regenerate Priorities** to renumber the priorities evenly.
 - To modify the policy expression, double-click that field to open the **Configure Web App Firewall Policy** dialog box, where you can edit the policy expression.
 - To set the Goto Expression, double-click field in the **Goto Expression** column heading to display the drop-down list, where you can choose an expression.
 - To set the Invoke option, double-click field in the Invoke column heading to display the drop-down list, where you can choose an expression.
 6. Repeat steps 3 through 6 to add any additional Web App Firewall policies you want to globally bind.
 7. Click **OK**. A message appears in the status bar, stating that the policy has been successfully bound.

Manual configuration By using the command line interface

May 2, 2023

Note:

If you need to manually configure the Web App Firewall feature, Citrix recommends you to use the NetScaler GUI procedure.

You can configure the Web App Firewall features from the **NetScaler** command interface. However, there are important exceptions. You cannot enable signatures from the command interface. There are around 1,000 default signatures in seven categories and the task is too complex for the command

interface. You can enable or disable features and configure parameters from the command line, but cannot configure manual relaxations. While you can configure the adaptive learning feature and enable learning from the command line, you cannot review learned relaxations or learned rules and approve or skip them. The command line interface is intended for advanced users who are familiar in using the NetScaler appliance and Web App Firewall.

To manually configure the Web App Firewall by using the NetScaler command line, use a telnet or secure shell client of your choice to log on to the NetScaler command line.

To create a profile by using the command line interface

At the command prompt, type the following commands:

- `add appfw profile <name> [-defaults (basic | advanced)]`
- `set appfw profile <name> -type (HTML | XML | HTML XML)`
- `save ns config`

Example

The following example adds a profile named pr-basic, with basic defaults, and assigns a profile type of HTML. This is the appropriate initial configuration for a profile to protect an HTML website.

```
1 add appfw profile pr-basic -defaults basic
2 set appfw profile pr-basic -type HTML
3 save ns config
4 <!--NeedCopy-->
```

To configure a profile by using the command line interface

At the command prompt, type the following commands:

- `set appfw profile <name> <arg1> [<arg2> ...]` where `<arg1>` represents a parameter and `<arg2>` represents either another parameter or the value to assign to the parameter represented by `<arg1>`. For descriptions of the parameters to use when configuring specific security checks, see [Advanced Protections](#) and its subtopics. For descriptions of the other parameters, see “Parameters for Creating a Profile.”
- `save ns config`

Example

The following example shows how to configure an HTML profile created with basic defaults to begin protecting a simple HTML-based website. This example turns on logging and maintenance of statis-

tics for most security checks, but enables blocking only for those checks that have low false positive rates and require no special configuration. It also turns on transformation of unsafe HTML and unsafe SQL, which prevents attacks but does not block requests to your websites. With logging and statistics enabled, you can later review the logs to determine whether to enable blocking for a specific security check.

```
1 set appfw profile -startURLAction log stats
2 set appfw profile -denyURLAction block log stats
3 set appfw profile -cookieConsistencyAction log stats
4 set appfw profile -crossSiteScriptingAction log stats
5 set appfw profile -crossSiteScriptingTransformUnsafeHTML ON
6 set appfw profile -fieldConsistencyAction log stats
7 set appfw profile -SQLInjectionAction log stats
8 set appfw profile -SQLInjectionTransformSpecialChars ON
9 set appfw profile -SQLInjectionOnlyCheckFieldsWithSQLChars ON
10 set appfw profile -SQLInjectionParseComments checkall
11 set appfw profile -fieldFormatAction log stats
12 set appfw profile -bufferOverflowAction block log stats
13 set appfw profile -CSRFtagAction log stats
14 save ns config
15 <!--NeedCopy-->
```

To create and configure a policy

At the command prompt, type the following commands:

- `add appfw policy <name> <rule> <profile>`
- `save ns config`

Example

The following example adds a policy named `pl-blog`, with a rule that intercepts all traffic to or from the host `blog.example.com`, and associates that policy with the profile `pr-blog`.

```
1 add appfw policy pl-blog "HTTP.REQ.HOSTNAME.DOMAIN.EQ("blog.example.com
  ")" pr-blog
2 <!--NeedCopy-->
```

To bind a Web App Firewall policy

At the command prompt, type the following commands:

- `bind appfw global <policyName> <priority>`
- `save ns config`

Example

The following example binds the policy named pl-blog and assigns it a priority of 10.

```
1 bind appfw global pl-blog 10
2 save ns config
3 <!--NeedCopy-->
```

To configure session limit per PE

At the command prompt, type the following commands:

- `set appfw settings <session limit>`

Example

The following example configures the session limit per PE.

```
1 > set appfw settings -sessionLimit 500000`
2
3 Done
4

Signatures

May 2, 2023

The Web App Firewall signatures provide specific, configurable rules to simplify the task of protecting your websites against known attacks. A signature represents a pattern that is a component of a known attack on an operating system, web server, website, XML-based web service, or other resource. A rich set of preconfigured Web App Firewall built-in or native rules offers an easy to use security solution, applying the power of pattern matching to detect attacks and protect against application vulnerabilities.

You can create your own signatures or use signatures in the built-in templates. The Web App Firewall has two built-in templates:

- **Default Signatures:** This template contains a preconfigured list of over 1,300 signatures, in addition to a complete list of SQL injection keywords, SQL special strings, SQL transform rules, and SQL wildchar characters. It also contains denied patterns for cross-site scripting, and allowed

attributes and tags for cross-site scripting. This is a read-only template. You can view the contents, but you cannot add, edit, or delete anything in this template. To use it, you must make a copy. In your own copy, you can enable the signature rules that you want to apply to your traffic, and specify the actions to be taken when the signature rules match the traffic.

The Web App Firewall signatures are derived from the rules published by [Snort](#), which is an open source intrusion prevention system capable of performing real-time traffic analysis to detect various attacks and probes.

- ***Xpath Injection Patterns:** This template contains a preconfigured set of literal and PCRE keywords and special strings that are used to detect XPath (XML Path Language) injection attacks.

Blank Signatures: In addition to making a copy of the built-in *Default Signatures template, you can use a blank signatures template to create a signature object. The signature object that you create with the blank signatures option does not have any native signature rules, but, just like the *Default template, it has all the SQL/cross-site scripting built-in entities.

External-Format Signatures: The Web App Firewall also supports external format signatures. You can import the third party scan report by using the XSLT files that are supported by the NetScaler Web App Firewall. A set of built-in XSLT files is available for the following scan tools to translate external format files to native format:

- Cenzic
- Deep Security for Web Apps
- IBM AppScan Enterprise
- IBM AppScan Standard.
- Qualys
- Qualys Cloud
- Whitehat
- Hewlett Packard Enterprise WebInspect
- Rapid7 Appspider
- Acunetix

Security protection for your application

Tighter security increases processing overhead. Signatures provide the following deployment options to help you to optimize the protection of your applications:

- **Negative Security Model:** With the negative security model, you use a rich set of preconfigured signature rules to apply the power of pattern matching to detect attacks and protect against application vulnerabilities. You block only what you don't want and allow the rest. You can add your own signature rules, based on the specific security needs of your applications, to design your own customized security solutions.

- **Hybrid security Model:** In addition to using signatures, you can use positive security checks to create a configuration ideally suited for your applications. Use signatures to block what you don't want, and use positive security checks to enforce what is allowed.

To protect your application by using signatures, you must configure one or more profiles to use your signatures object. In a hybrid security configuration, the SQL injection and cross-site scripting patterns, and the SQL transformation rules, in your signatures object are used not only by the signature rules, but also by the positive security checks configured in the Web App Firewall profile that is using the signatures object.

The Web App Firewall examines the traffic to your protected websites and web services to detect traffic that matches a signature. A match is triggered only when every pattern in the rule matches the traffic. When a match occurs, the specified actions for the rule are invoked. You can display an error page or error object when a request is blocked. Log messages can help you to identify attacks being launched against your application. If you enable statistics, the Web App Firewall maintains data about requests that match a Web App Firewall signature or security check.

If the traffic matches both a signature and a positive security check, the more restrictive of the two actions are enforced. For example, if a request matches a signature rule for which the block action is disabled, but the request also matches an SQL Injection positive security check for which the action is block, the request is blocked. In this case, the signature violation might be logged as `<not blocked >`, although the request is blocked by the SQL injection check.

Customization: If necessary, you can add your own rules to a signatures object. You can also customize the SQL/cross-site scripting patterns. The option to add your own signature rules, based on the specific security needs of your applications, gives you the flexibility to design your own customized security solutions. You block only what you don't want and allow the rest. A specific fast-match pattern in a specified location can significantly reduce processing overhead to optimize performance. You can add, modify, or remove SQL injection and cross-site scripting patterns. Built-in RegEx and expression editors help you configure your patterns and verify their accuracy.

Auto-update: You can manually update the signature object to get the latest signature rules, or you can apply the auto-update feature so that the Web App Firewall can automatically update the signatures from the cloud-based Web App Firewall updates service.

Note:

If new signature rules are added during auto-update, they are disabled by default. You must periodically review the updated signatures and enable the newly added rules that are pertinent for protecting your applications.

You must configure CORS to host signatures on IIS servers.

Signature auto update feature does not work on the local web server when you access the URL from the NetScaler GUI.

Getting started

Using Citrix signatures to protect your application is easy and can be accomplished in a few simple steps:

1. Add a signature object.
 - You can use the Wizard that prompts you to create the entire Web App Firewall configuration, including adding the profile and policy, selecting and enabling signatures, and specifying actions for signatures and positive security checks. The signatures object is created automatically.
 - You can create a copy of the signatures object from the *Default Signatures template, use a blank template to create a signature with your own customized rules, or add an external format signature. Enable the rules and configure the actions that you want to apply.
1. Configure the target Web App Firewall profile to use this signatures object.
2. Send traffic to validate the functionality

Highlights

- The Default signatures object is a template. It cannot be edited or deleted. To use it, you must create a copy. In your own copy, you can enable the rules and the desired action for each rule as required for your application. To protect the application, you must configure the target profile to use this signature.
- Processing signature patterns has overhead. Try to enable only those signatures that are applicable for protecting your application, rather than enabling all signature rules.
- Every pattern in the rule must match to trigger a signature match.
- You can add your own customized rules to inspect incoming requests to detect various types of attacks, such as SQL injection or cross-site scripting attacks. You can also add rules to inspect the responses to detect and block leakage of sensitive information such as credit card numbers.
- You can make a copy of an existing signature object and tweak it, by adding or editing rules and SQL/cross-site scripting patterns, to protect another application.
- You can use auto-update to download the latest version of the Web App Firewall default rules without need for ongoing monitoring to check for the availability of the new update.
- A signature object can be used by more than one profile. Even after you have configured one or more profiles to use a signature object, you can still enable or disable signatures or change the action settings. You can manually create and modify your own custom signature rules. The changes apply to all the profiles that are currently configured to use this signature object.
- You can configure signatures to detect violations in various types of payloads, such as HTML, XML, JSON, and GWT.
- You can export a configured signatures object and import it to another NetScaler appliance for easy replication of your customized signature rules.

Signatures are patterns that are associated with a known vulnerability. You can use signature protection to identify the traffic that attempts to exploit these vulnerabilities, and take specific actions.

Signatures are organized into categories. You can optimize the performance and reduce the processing overhead by enabling only the rules in the categories that are appropriate for protecting your application.

Manually configuring the signatures feature

December 4, 2020

To use signatures to protect your websites, you must review the rules, and enable and configure the ones that you want to apply. The rules are disabled by default. Citrix recommends that you enable all rules that are applicable to the type of content that your website uses.

To manually configure the signatures feature, use a browser to connect to the GUI. Then, create a signatures object from a built-in template, an existing signatures object, or by importing a file. Next, configure the new signatures object as explained in [Configuring or Modifying a Signatures Object](#).

Adding or removing a signature object

May 2, 2023

You can add a new signature object to the Web App Firewall by:

- Copying a built-in template.
- Copying an existing signatures object.
- Importing a signatures object from an external file.

The signature file includes CPU usage, latest applicable year, and severity level details. You can see the CPU usage, latest year, and CVE severity level every time a signature file is modified and uploaded periodically. After observing these values, you can decide to enable or disable the signature on the appliance.

You must use the GUI to copy a template or existing signatures object. You can use either the GUI or the command line to import a signatures object. You can also use either the GUI or the command line to remove a signatures object.

To create a signatures object from a template

1. Navigate to **Security > NetScaler Web App Firewall > Signatures**.
2. In the details pane, select the signatures object that you want to use as a template.

Your choices are:

- **Default Signatures.** Contains the signatures rules, the SQL injection rules, and the cross-site scripting rules.
- **XPath Injection.** Contains the XPath injection patterns.
- **Any existing signatures object.**

Attention:

If you do not choose a signatures type to use as a template, the Web App Firewall prompts you to create signatures from scratch.

3. Click **Add**.
4. In the Add Signatures Object dialog box, type a name for your new signatures object, and then click OK. The name can begin with a letter, number, or the underscore symbol, and can consist of from one to 31 letters, numbers, and the hyphen (-), period (.) pound (#), space (), at (@), equals (=), and underscore (_) symbols.
5. Click **Close**.

To create a signatures object by importing a file

1. Navigate to **Security > NetScaler Web App Firewall > Signatures**.
2. In the details pane, click **Add**.
3. In the **Add Signatures Object** dialog box, select the format of the signatures you want to import.
 - To import a NetScaler format signatures file, select the **Native Format** tab.
 - To import an external signatures format file, select the **External Format** tab.
4. Choose the file that you want to use to create your signatures object.
 - To import a native NetScaler format signatures file, in the Import section select either Import from Local File or Import from URL, then type or browse to the path or URL to the file.
 - To import a Cenzic, IBM AppScan, Qualys, or Whitehat format file, in the XSLT section select Use Built-in XSLT File, Use Local File, or Reference from URL. Next, if you chose Use Built-in XSLT File, select the appropriate file format from the list. If you chose Use Local File or Reference from URL, then type or browse to the path or URL to the file.
5. Click **Add**, and then click **Close**.

To create a signatures object by importing a file by using the command line

At the command prompt, type the following commands:

- **import** appfw signatures <src> <name> [-xslt <string>] [-comment <string>] [-overwrite] [-merge] [-sha1 <string>]
- save ns config

Example #1

The following example creates a signatures object from a file named signatures.xml and assigns it the name MySignatures.

```
1 import appfw signatures local:signatures.xml MySignatures
2 save ns config
3 <!--NeedCopy-->
```

To add individual signatures by using CLI

You can select signatures by their IDs or category and then set actions. At the command prompt, run the following command:

```
1 import appfw signature <source> <name> [-sigRuleId | -sigCategory] [Rule
  -IDs | Category name] -Enabled [ON | OFF] [-Action LOG BLOCK]
2 <!--NeedCopy-->
```

• Examples to use signature IDs

The following example enables the signatures by their rule IDs and sets the log and block actions:

```
1 import appfw signature DEFAULT object_name -sigRuleId 1001 9882
  2000 1250 810 -Enabled ON -Action LOG BLOCK
2 <!--NeedCopy-->
```

The following example adds the signature by its ID without enabling it:

```
1 import appfw signature DEFAULT object_name -sigRuleId 810 -
  Enabled OFF
2 <!--NeedCopy-->
```

• Examples to use signature category

The following example enables the signatures by the `web-misc` category and sets the log and block actions:

```
1  import appfw signature DEFAULT object_name -sigCategory web-misc
   -Enabled ON -Action LOG BLOCK
2  <!--NeedCopy-->
```

The following example adds the signatures by the `web-misc` category without enabling it:

```
1  import appfw signature DEFAULT object_name -sigCategory web-misc
   -Enabled OFF
2  <!--NeedCopy-->
```

To remove a signatures object by using the GUI

1. Navigate to **Security > NetScaler Web App Firewall > Signatures**.
2. In the details pane, select the signatures object that you want to remove.
3. Click **Remove**.

To remove a signatures object by using the command line

At the command prompt, type the following commands:

- `rm appfw signatures <name>`
- `save ns config`

Configuring or modifying a signatures object

January 9, 2024

You configure a signatures object after creating it, or modify an existing signatures object, to enable or disable signature categories or specific signatures, and configure how the Web App Firewall responds when a signature matches a connection.

To configure or modify a signatures object

1. Navigate to **Security > NetScaler Web App Firewall > Signatures**.
2. In the details pane, select the signatures object that you want to configure, and then click **Open**.
3. In the **Modify Signatures Object** dialog box, set the **Display Filter Criteria** options at the left to display the filter items that you want to configure.

As you modify these options, the results that you requested are displayed in the Filtered Results window at the right.

- To display only selected categories of signatures, check or clear the appropriate signature-category check boxes. From release 13.1 build 48.x, you can use CVE on the left panel to view the vulnerabilities published for the selected year.

The signature categories are:

| Name | Type of Attack that this Signature Protects Against |
|-------------|---|
| cgi | CGI scripts. Includes Perl and UNIX shell scripts. |
| client | Browsers and other clients. |
| coldfusion | websites that use the Adobe Systems ColdFusion application server. |
| frontpage | websites that use Microsoft's FrontPage server. |
| iis | websites that use the Microsoft Internet Information Server (IIS). |
| misc | Miscellaneous attacks. |
| php | websites that use PHP |
| web-activex | websites that contain ActiveX controls. |
| web-struts | websites that contain Apache struts, which are java-ee based applets. |
| CVE | Lists the CVEs that are published for the selected year. |

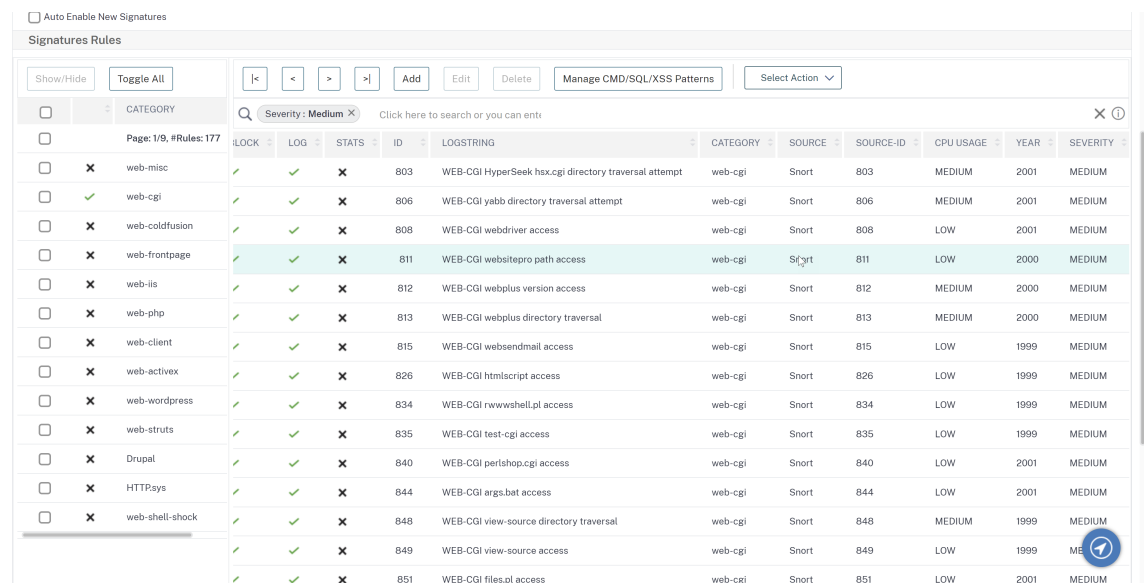

- To display only signatures that have specific check actions enabled, select the ON check box for each of those actions, clear the ON check boxes for the other actions, and clear all of the OFF check boxes. To display only signatures that have a specific check action disabled, select their respective OFF check boxes and clear all of the ON check boxes. To display signatures regardless of whether they have a check action enabled or disabled, select or clear both the ON and the OFF check boxes for that action. The check actions are:

| Criterion | Description |
|-----------|---|
| Enabled | The signature is enabled. The Web App Firewall checks only for signatures that are enabled when it processes traffic. |
| Block | Connections that match this signature are blocked. |

| Criterion | Description |
|-----------|--|
| Log | A log entry is produced for any connection that matches this signature. |
| Stats | The Web App Firewall includes any connection that matches this signature in the statistics that it generates for that check. |

- To further filter the details that are displayed in the result window, use the search bar above the result window and perform the following steps:
 - Select the properties that you want to filter in the search bar.
 - Type the value, and press the enter button.
 It further filters the content that are already displayed in the result window and lists the details based on the entered value.

Example: In the following image, web-CGI is selected as a category in the Display Filter Criteria options at the left. The web-CGI signature details are listed in the result window at the right. To further filter the details based on the severity, in the search bar, severity is selected as a property and medium is entered as a value. The web-CGI signature with medium severity are listed in the result window.

- To reset all display filter criteria to the default settings and display all signatures, click Show All.

Note

The number of items listed in the filtered result window is 20. The pagination is available above

the Display Filter Criteria options on the left.

1. For information about a specific signature, select the signature, and then click the blue double arrow in the More field. The Signature Rule Vulnerability Detail message box appears. It contains information about the purpose of the signature and provides links to external web-based information about the vulnerability or vulnerabilities that this signature addresses. To access an external link, click the blue double arrow to the left of the description of that link.
2. Configure the settings for a signature by selecting the appropriate check boxes.
3. If you want to add a local signature rule to the signatures object, or modify an existing local signature rule, see [The Signatures Editor](#).
4. If you have no need for SQL injection, cross-site scripting, or Xpath injection patterns, click OK, and then click Close. Otherwise, in the lower left-hand corner of the details pane, click Manage SQL/cross-site scripting Patterns.
5. In the Manage SQL/cross-site scripting Patterns dialog box, Filtered Results window, navigate to the pattern category and pattern that you want to configure. For information about the SQL injection patterns, see [HTML SQL Injection Check](#). For information about the cross-site scripting patterns, see [HTML Cross-Site Scripting Check](#).
6. To add a new pattern:
 - a) Select the branch to which you want to add the new pattern.
 - b) Click the **Add** button directly below the lower section of the **Filtered Results** window.
 - c) In the Create Signature Item dialog box, fill in the Element text box with the pattern that you want to add. If you are adding a transformation pattern to the transform rules branch, under Elements, fill in the From text box with the pattern that you want to change and the To text box with the pattern to which you want to change the previous pattern.
 - d) Click **OK**.
7. To modify an existing pattern:
 - a) In the **Filtered Results** window, select the branch that contains the pattern that you want to modify.
 - b) In the detail window beneath the **Filtered Results** window, select the pattern that you want to modify.
 - c) Click **Modify**.
